After the Marshall Plan

THE magnificent experiment of the Marshall Plan came officially to an end at the beginning of this week. Of its original objectives, the restoration of prewar standards of industrial and economic production in Western Europe has been more than achieved. Economic cooperation between the participating nations has been notably increased and even if internal monetary stability is still to seek, inflationary forces have been held to some extent in check, even through the upheaval of the Korean war. Only one of the aims has eluded the Marshall nations. In spite of nearly doubling their exports to North America between 1948 and 1951, their dollar deficit, which stood at over \$5 billion in 1948, still stood at nearly \$4 billion in 1951. The dollar gap remains, although the Marshall Plan is over.

The failure of the plan in this respect must be attributed not to any lack of generosity on the American side or to any lack of effort in Europe. It failed because it was based upon the false assumption that the restoration of Europe to prewar levels of activity would of itself restore the prewar balance and pattern in world trade. In fact, that balance had been precarious all through the thirties and the war years hastened and confirmed a trend that had been observable for at least two decades—the emergence of the United States as the great creditor nation in world trade.

This in itself would have done no harm to the international economy if America, like Britain in the century before, had been a crowded industrial island compelled to seek abroad supplies of food and raw materials, markets for its manufactures and opportunities for its capital. But since it did none of these things to an adequate extent, its sales to Europe even before the war had to be paid for in part by the shipment of gold. The Marshall Plan, by restoring Europe's war-weakened economy, made the dollar deficit smaller than it might have been; Europe was enabled to stay precariously solvent. But the remaining gap can no longer be treated as a product of wartime upheaval; it represents the secular trend.

This continuing dollar deficit remains the central economic problem of the free world. It does not, of course, follow that there will not be occasional periods, as there were during 1950 and 1951, when a fortunate concatenation of circumstances will enable the non-dollar world for a time to earn as many dollars as it needs. Nor does it follow that the European nations will not be able to balance their dollar accounts, if they have to, by brute force, by the most rigid and discriminating refusal to purchase American or Canadian goods. Indeed, if they are left to grapple with the problem by themselves, this is all they can do, since it is no longer possible to expect a massive further increase in their own direct sales in America, after the great effort already made, and in view of the signs of reviving protectionism in America. But this method of bridging the dollar gap would be as painful as the former would be fortuitous. If the free world is to trade freely, then some means will have to be found by which the

non-dollar countries can obtain more dollars than, for all the help they have had under the Marshall Plan they have yet discovered ways of earning. Millions of words have been written about the balance-of-payments problems of the European countries. But the really intractable problem, to which nobody has yet begun to find a solution, is that of the American balance of payments. How on earth can it be brought into equilibrium?

It is true that there are some reasons for hopefulness in the long run, which have recently been illumined by the report on "Resources for Freedom" which was released in Washington last week, and on which some comment appears elsewhere in this issue. It is possible to foresee a time when the United States, not by choice or policy but by compulsion, will have to buy from the rest of the world enormous quantities of raw materials. This is a real hope. But many people will think that the calculations of the authors of the report have a steady bias of optimism, and the direct hope they hold out is to the primary producers of the world rather than to the manufacturing countries of Western Europe. Moreover, even if the future trend of America's purchases is as sharply upward as the report envisages, that does not exclude the possibility that there will still be bad years. And, as a final reservation, all this is still some way off. In the meantime, the world will continue to be plagued, more years than not, by the dollar deficit.

Canada's New Horizons

WHILE Canada was celebrating its national day last Tuesday, the foreign exchange markets in London and New York were expressing their congratulations in a way calculated to enhance Canada's pride in its economic progress. On that day the Canadian dollar rose to a premium of 3 cents against the United States dollar. Some Canadians of modest mind prefer to regard the fact that the Canadian dollar looks over the head—and not merely in the face—of the American dollar as a mark of the depreciation of the American dollar, signifying no special virtue of the Canadian dollar. But if there is a single symbol of the results of Canada's hard work and the growth of Canadian self-confidence, it is perhaps to be found in the high value that the outside world now puts upon Canadian money. There is just the right mixture of pride and tact in notices that tell the American tourist that his dollars will be accepted at par by the Montreal stores or the Vancouver hotels. The tourists from the south no doubt have to be cosseted; but the Canadian newsprint industry can afford to take a much tougher line with American newspaper publishers and has lately raised the price of newsprint by ten dollars in order to offset the "depreciation" of the American dollar.

Canada has known booms—and the aftermath of booms—before. They were the booms of physical pioneering and the westward extension of the frontier through the prairies to the Pacific. Canada's present boom differs from its several forerunners in the fact that it is continent-wide; it represents the extension of economic frontiers throughout a country that the pioneers had already opened up by road, rail, river and air. In Canadian terms, the fact that the development of the Labrador ironfields involves 400 miles of new railroad is incidental. So equally is the comparative remote-

Let no one suppose, however, that this is a plea for the resuscitation of the Marshall Plan. Its methods had two cardinal defects. By making the European countries beg for their dollars every year, it risks corrupting both them and Congress and turning an alliance of self-respect into a confederacy of clients. And by treating each country separately, on an assessment of "need," it has put a premium upon failure to achieve solvency. As an act of restoration after a great war, the Marshall principle was superbly imaginative. As a permanent system of subsidising American exports, it would only undermine the objectives it was supposed to support.

It must not be imagined that, in the heat of the presidential campaign, any thought will be given to this dreary problem in America. But when next January there is a new President in the White House, whoever he may be and whatever policies he has enunciated during the campaign, he will find himself faced with the old inescapable chain of reasoning. The world cannot be saved for freedom without an alliance of the free nations. Nations cannot be allied politically and militarily if they are cutting each other's throats commercially. So long as there is a dollar deficit, the non-dollar countries have no option but to restrict and discriminate. Therefore, policies to remove the dollar deficit are just as essential to the grand objective of containing communism as atomic bombs or submarines.

ness of Kitimat, four hundred miles north from Vancouver, where prodigies of work and skill are reversing the flow of rivers to drive half a million horse-power of electric generators; the power, carried through fifty miles of mountain country, will smelt a hundred thousand tons of aluminium a year and eventually half a million tons. So again is the potential development of natural gas in the Peace River territory of northern Alberta and British Columbia, for which the real market lies hundreds of miles to the south-west in Vancouver and in the north-western states beyond the frontier. Great developments, exploiting Canada's abounding natural resources, are proceeding in areas remote from each other and remote, too, from the major markets in the United States. With all this there is also important industrial development, of which the new factory belt on the outskirts of Montreal is only one example.

No boom was ever painless, but the Canadian boom perhaps comes nearest to earning that distinction. Canada is not merely favoured with abundant material resources. It has had the good sense—or the good luck—to provide itself with good government. Its economic affairs have been handled with a skill unexampled throughout the world. It has found, in the short space of two or three years, a degree of self-confidence that is the proper mark of a country entering upon the early stages of economic maturity. Already occupied with a load of work that less vigorous countries might stretch over a generation, Canada has the faith, and professes to have the capacity, to proceed with the gigantic St. Lawrence Seaway scheme and to disregard Washington's refusal to participate. It would certainly be unwise to reach the conclusion that too much is being attempted too quickly. It is true that the defence programme has yet to make its full impact on the Canadian economy.

But the rise in both industrial and agricultural productivity since the war has been so astonishing that Canada may well be able to provide guns, factories and butter all at the same time.

To this, some may object that Canada's advance would have been impossible without the enormous inflow of American capital in recent years. In 1950 the United States invested \$960 million in Canada, much of it "hot money" that was speculating on an imminent revaluation of the Canadian dollar, then standing at a discount of 5 cents or more. Last year's inflow was smaller—\$560 million—and consisted to a much greater extent of long-term investment funds. Perpetual dependence on a dollar trade deficit, filled by dollar borrowing from the United States, would indeed have its dangers. In fact, there is reason to believe that Canadian foreign payments have lately been in balance, and that the inflow of American capital is equalled by Canadian investment in American securities. The terms of trade have been swinging in Canada's favour. During 1951, export prices rose by 12 per cent, while import prices rose by no more than 4 per cent. In several of Canada's important exports—newsprint is the best example—the Canadians have seen to it that the appreciation of their dollar is compensated by higher export prices. And, to crown the record, internal prices are now falling perceptibly while earnings are still rising fast.

In this immense surge of development, British participation remains modest. Since the end of the war, investment in Canada by non-residents has increased from \$7,092 million to \$9,424 million, and the bulk of the new capital has come from the United States. In the last two years the value of British investment in Canada has increased slightly from \$1,694 million to \$1,772 million. This is a pallid reflection of the contribution that could be made, in more auspicious circumstances, by British capital, management and labour to the development of Canada's resources. Not only is the total of British investment more or less static; the constituent investments themselves are static. Permission for British investors to "switch" in Canadian securities would need the agreement of the Canadian authorities, and conceivably this could be obtained on terms not onerous to Britain. It can hardly be doubted that the result would be to promote much more detailed knowledge of what is happening in Canada than now prevails in this country. To take one example, there is a general idea in this country that oil has been found in Alberta. But there is little conception of the potentialities there and in neighbouring provinces, no idea of the time and the resources that will be needed

to develop these riches, and no notion of the long-sighted way in which the provincial government of Alberta—still nominally a Social Credit government—is dealing with a major economic revolution. If an example were needed of the steadiness with which Canadians are handling the greatest boom of their history, the record of the Alberta Government surely supplies it. The result has been a phenomenon in modern politics—a revolution to the right, a taming of wild ideas, and the adoption of policies of development and conservation that evoke admiration throughout Canada interrupted by only occasional growls of impatience from oilmen.

Although Canada's boom has been admirably managed, it poses serious questions that will be answered only in the next decade or two. Much of the new development is in enormous projects intended to serve an expanding American economy. The authority of the Paley Commission was given only last week to gigantic projections of American needs of primary materials. In the long term, the fact that the United States is no longer able to supply more than a part of its essential requirements of industrial materials will be the greatest safeguard for the Canadian economy. In the shorter run, there may be occasional risks in having so many eggs—and such big eggs—in one basket. A relatively modest setback in American demand—coupled, as it would no doubt be, with outcries from American producers of primary materials—could seriously shake the assumptions on which much of the investment in newsprint, iron ore, non-ferrous metals, and even oil and natural gas has been made. It will take time before this degree of dependence on the American market will be reduced by the growth of Canadian industry and a rise in Canadian consumption.

Indeed, Canada with all its resources lacks one vital factor of production—labour. Its willingness to accept new citizens who can make a contribution to Canadian development is as heartening as England's reception of the politically and economically oppressed down the centuries. The opportunities reflect Canada's needs—the simple facts of lush resources awaiting only the application of capital and labour to provide astonishing productivity and prosperity. No doubt population will expand with economic progress, but the capacity of Canada to absorb suitable immigrants will persist for years to come, limited only by its ability to provide the social investment to meet the basic needs of new communities. The Canadian taste is for the personal venture, the acceptance of risk, and willingness to work hard. Those who are prepared to accept such terms ought to find opportunity enough in Canada's widening economic horizons.

A Streetcar Named Defunct

AT 12.29 a.m. on Sunday morning the last tram in London is due to be welcomed with appropriate ceremony at its terminus. This weekend marks also one of the biggest stages in the Birmingham Corporation's gradual replacement of trams by buses. The joint victory of the bus and the trolley bus is, in Britain, almost complete. Municipal tramway operators can now be counted on the fingers: in England, they are Birmingham, Blackpool, Leeds, Liverpool, Sheffield and Sunderland; in Scotland, there are Aberdeen, Dundee, Edinburgh and Glasgow. Of these, only three—Aberdeen, Blackpool and Dundee—have still made no definite moves towards replacing their trams by other means of street passenger transport; Glasgow, exceptionally, is both building new trams and for some routes turning over to trolley buses. The Isle of Man has some trams, and in Wales there are two company-owned tramways, both in part having the character of light railways rather than street cars—the Llandudno and Colwyn Bay and the Swansea and Mumbles. The second has carried passengers since 1807 and one can look on it as either the first horse tramway in the world or the oldest passenger-carrying railway, according to taste.

The story of the tram in Britain is exceptional. In many countries it still flourishes and is continuously being brought up to date. The reasons for its decline and fall here are not entirely economic. English prejudice and the English love of horses played a part. The horse tram on city streets originated in New York in 1832; it offered a pleasant alternative to bus travel over the atrocious road surfaces out to Harlem. The rails, raised above the surface, did not make the road appreciably bumpier for other vehicles than it already was. But conditions were different in 1860, when George Francis Train tried to transplant the American-style tram to Britain. The projecting step rail caused a storm of protest. His Birkenhead line survived, but the Metropolitan Board of Works objected—because of the danger to other traffic—to his experiments in the Bayswater Road, Victoria Street and Kennington Road; the tracks had to be removed.

By 1870 the familiar grooved rail, flush with the street surface, had been introduced, and several undertakings obtained powers to build tramways in London. But the rough treatment of private carriages by Train's primitive tracks had created a permanent prejudice. Trams were never allowed into the West End and the City of London allowed them to violate its territory only to a very limited extent, and that only in this century. The London tramway system thus grew up a one-sided and misshapen thing. It never served the heart of the capital, nor the inner western suburbs—a disability without parallel in other big European cities.

The general Act regulating tramways, the Act of 1870, was also responsible for some disabilities. In the days when the tram's motive unit dealt sharp blows with its hooves, there could be little quarrel with the clause compelling tramway undertakings to maintain the road between the tracks. The same obligation for the 18 inches on either side of the track has often been considered unfair in the days of electric traction, though

there is evidence in its favour. More serious was the power of compulsory purchase given to local authorities. In effect, the municipality could take a system over at about its scrap value after 21 years or at 7-year intervals thereafter. Operating companies were therefore tempted to let their systems run down when a possible takeover was imminent, and the uncertainty made decisions about electrifications particularly complicated. Some tramway companies also suffered from having to deal with several separate local authorities; some authorities demanded pedestrian subways and public lavatories as the price of their assent to tramway schemes, and the London United company was even involved in building a riverside promenade at Barnes, in a district where its tracks never in fact penetrated.

Although it was not much used, steam traction helped to strengthen the prejudice against trams. The trams sometimes frightened horses and tram drivers were liable to prosecution for emitting steam or smoke or making a noise. It was said that, on the other hand, carters who obstructed trams could seldom be brought to book. Yet the advantages of the tram in an industrial town were obvious, and eventually something like a tramway mania began. The electric tram dates from experiments at Blackpool with a conduit system in 1884 and at Leeds with the overhead system in 1891. Progress was somewhat slow at first, but the boom began in 1897. The attitude of local authorities had changed. Earlier, many had either resisted tramways or hampered them by insisting that the operating companies should, in effect, contribute to local government expenses. But at the turn of the century local authorities were playing an active part in tramway development. They vied with each other in giving their ratepayers the latest social amenity, an electric tram service, though even at this stage one of the tramway combines—the British Electric Traction combine was the principal—often had to stimulate local authorities to action.

It was the electric tram that first made it easy for industrial workers to live in housing estates distant from the factories, but its influence was purely preparatory to that of the motor-bus. Very soon the tramways were faced with the problem of housing developments more than an easy walking distance from their routes. Was capital expenditure on an extension or branch justified? By the time the unhappy tramway manager had made up his mind—and even if no complication of local authority boundaries entered into the problem—some enterprising competitor had probably begun a motor-bus service without the tramway's high initial cost or legal complications, and requiring much less traffic in order to be profitable. Here, of course, is the root of the difference between tramway economics in this country and abroad. In Britain the urban population has in this century spread relatively thinly into the suburbs; the bus can operate correspondingly in services economically. In countries where the towns have grown upwards as much as outwards, the tram can still provide very economical service on routes where the traffic is heavy.

Even so, the tramways built in British towns were not

seriously threatened as long as motor buses cost as much per mile to run as did the trams. The change came in the decade after 1922, during which the cost of running a bus was almost halved. The diesel engine followed, and as soon as its teething troubles in bus service were over the fate of the tram was sealed. The buses could run as cheaply, or more cheaply, over the tram routes and then fan out in the suburbs and countryside to give something like door-to-door service. Why, then, keep the trams going too? Moreover, costs per mile are not the whole story. In Bristol, for example, the scheduled speed of the tram was 7 m.p.h.; the bus now operates at 11 m.p.h. The gradual removal of the London trams has undoubtedly helped to keep down traffic congestion and the buses have proved to give faster and more regular service. The most telling figures are these: although trams with 73 seats are replaced by buses with 56 seats, the number of buses needed to replace the trams is not in the proportion of 73 to 56; it is only 77 to 75. In 1950, when the London buses and trolley buses were making a moderate surplus on their operations, the trams cost £1,250,000 more than their receipts of £2,360,000. Apart from the high cost of track renewal, a tram today costs £8,000 to £11,000 according to design, while the price of a bus ranges from £3,500 to £5,000 and a trolley bus may cost a little more than £6,000. The capital cost per seat provided is about the same for bus and trolley bus—and about half what it is for a tram. Working expenses vary a lot; in Glasgow, bus and tram costs are relatively close together, but where London buses cost 24.87 pence per car-mile and the trolley buses 26.38 pence, the trams cost 31.23 pence.

The first tramways to be abandoned were, inevitably, the small systems. Sheerness went in 1917, Taunton—the rudimentary section of what should have been a Somerset interurban line—in 1921. But these were the straws before the wind. The total route mileage of tramways increased until 1923—it was then 2,624 miles—and began its steep decline in 1927. The record number of passengers—4,800 million—was carried in 1919-20

Commonwealth Development—V

The Human Factor

NO discussion on Commonwealth development would be complete without reference to the problems of migration. Despite all the technological improvements of the past fifty years or so, development still requires a vast amount of labour. It is no doubt true that every £1 million of investment (allowance being made for changes in the value of money) now requires a smaller total amount of labour than it did, say, at the beginning of the century, when railways still had to be built by gangs of navvies. But if new areas are to be opened up there must still be people to help in the process. In the dominions, the supply of labour is far from adequate; in the colonies, labour exists but it requires education and training.

The two possible sources of this larger supply of labour are the natural increase in population in the developing areas and immigration (with the counter-problems of emigration). Vital statistics for colonial territories are

but the trams were almost as busy eight years later, when the record of nearly 400 million car-miles was run. The tramways in the London area had their busiest year, carrying 1,082 million passengers, as late as 1929-30, but by then the London United system was already preparing for its first trolley buses, which were put to work in 1931. The more mobile electric vehicle showed itself to be both less costly and more popular than the tram; on some routes the changeover increased the traffic by 25 per cent. It had, of course, the advantage, compared with conversion to motor buses, of preserving some of the capital investment in the tram lines and of enabling electricity suppliers—often municipal undertakings—to keep an important customer. It is, however, the diesel bus—which since the war has proved to offer some balance of advantage over the trolley bus—that has now banished the tram south of the Thames.

But while the tram has almost disappeared for the British traveller, it retains some importance for British industry. Some electrical engineering firms have kept closely in touch with technical developments in tramcar design, such as the American PCC car that has rubber-sandwich wheels for quiet running and which accelerates and brakes smoothly. Modern tramcars have been built here not only for Blackpool, Glasgow and Leeds, but also for customers abroad. The tram is still a major means of urban transport in Europe, with the exception of France. Apart from the fact that many Continental towns spread less than their British equivalents in population, plentiful supplies of hydro-electric power have sometimes provided a motive for retaining trams; so, perhaps, have autarkic economic ideas. And the need to relieve traffic congestion has not been so pressing as in London. Yet there are signs that on the Continent also the tram will not go on for ever. In Bruges the tramway system was abandoned because its awkward layout discouraged traffic and the success of the buses has encouraged projects for removing the railbound means of street transport from other moderate-sized Belgian towns. It may be that in taking the tram to its terminus modern Britain is, as happens perhaps too rarely, showing the way.

sparse, but in some areas there undoubtedly exist large untapped resources of labour, which after elementary training and with appropriate supervision could be used for the less skilled tasks. Native labour can also be trained for skilled jobs, though the period of training may need to be much longer and the subsequent supervision much closer than in industrialised countries. This was shown both during the war and more recently in the East African groundnut scheme. Nevertheless, in general, the colonies can find the labour force for their own development; what they need from outside is a relatively small intake of organisers, technicians, supervisors and training staff, of whom few if any would settle permanently. The same is true, with a few obvious modifications, of the Asiatic dominions.

In the white dominions, on the other hand, the required increase in the labour supply is far in excess of the

normal increase in population; immigration is a necessary part of any development plan. North America was developed by immigration in the last century. But there is no possibility of simply repeating the American experiment in the dominions. For one thing, immigrants nowadays will not accept the conditions of a pioneer's life. They have to be provided with houses, public utilities, social amenities and the expensive trappings of a welfare state. Secondly, in the nineteenth century, population was growing rapidly not only in the lands that received the migrants, but also in those from which they came—the pressure of population was, in fact, as often as not, the cause of their movement. The European countries lost hundreds of thousands of their citizens and still saw their own populations rise. There are countries in Europe—Italy and Poland, for example—of which this is still true. But it is not true of most of the countries of Western Europe. In particular, it is not true of Great Britain. If there is to be large-scale migration, it will, in most cases, involve a fall in total population in the sending countries.

There are, unfortunately, no reliable figures to measure the size of movement that would be necessary for an accelerated programme of Commonwealth development. The figure of £500 million was hazarded in an earlier article as a guess at the minimum annual investment of capital required to finance such a plan. As a similar guess—intended as no more than an indication of the order of magnitude—such a plan, unless it were very heavily biased in favour of the colonies and the Asiatic dominions, might require the net movement of at least 250,000 persons a year into the white dominions. This guess is based on the experience of the past few years and, if anything, it errs on the low side, because in recent years much of the development in the dominions has been concentrated in the consumer goods industries, which need less labour per unit of investment than the

If the movement is from the more densely populated areas to the less densely populated ones, then clearly Britain will have to provide most of the immigrants—that is, the white immigrants. It will be seen from the second chart that in the first three years after the war net immigration into the southern dominions averaged 46,000 a year, with South Africa as the largest country taking 18,000 and Australia next with over 16,000. Between 1949 and 1951, the net immigration rate rose very sharply to 160,000 a year and 138,000 alone went to Australia. In both periods Britain was the major source, supplying between 80,000 and 90,000 people. Immigrants could be obtained from other countries, but as all four dominions permit free entry only to people

CHART II

of European race and colour, the sources are somewhat limited. Australia has set the example in recent years by taking large numbers from the European continent, particularly Italians, Dutch and displaced persons. But if the Commonwealth is to remain predominantly British in its outlook and tradition, the proportion of immigrants coming from these islands must not be allowed to fall too low. It is true that the United States has shown that a large undeveloped country can take in vast numbers of people of all different nationalities and fuse them into one nation. This is not denied. But it must remain doubtful whether under such conditions the bond of loyalty and family affection that unites the Commonwealth could be maintained.

The conclusion of the argument is, therefore, that a large-scale programme of Commonwealth development, if it is to follow the lines that are generally agreed to be

THE ECONOMIST,
22 RYDER STREET, LONDON, S.W.1

desirable, depends upon fairly large numbers of people being willing to emigrate from the United Kingdom. To many people, this presents only the difficulties of organisation, transport and propaganda. To them, no question of its desirability arises; is not Great Britain already over-populated and incapable of feeding itself? Would not mass emigration be as advantageous to this crowded island as it would be to the empty dominions?

The argument whether or not Britain is now over-populated in any defined sense of the term is an interesting one, with many ramifications, and dependent in part upon the future trends of world commerce which cannot now be foreseen. It is not, however, necessary to argue it out in this article, for there is one preliminary point that is enough for the present purpose. It is obvious that Britain cannot feed itself from its domestic agricultural output; that has been true for over a hundred years, and is of no particular significance. If there is a new difficulty in feeding the population of Britain it arises out of the difficulties that Britain may experience in the future in paying for the imported food it requires. It follows, therefore, that any emigration from this island that in fact reduced its capacity to export more than its need to import, so far from easing the British economic problem, would make it worse.

The real trouble about mass emigration is that the dominions want skilled labour from the young and active

CHART III

age-groups, and it is just these age-groups that are necessary to maintain Britain's export potential. The third chart is an attempt to illustrate this point in graphical but approximate form. Since the main constituent of imports is food, every inhabitant of these islands, of any age, has an import requirement. But only those of working age contribute anything to exports. The two curves show the approximate variation through life of the import and export potential of the average British citizen. If Britain's trade problem is to be cured by emigration, then the very young and the very old should be sent overseas, because their import requirements are greater than their export potentials. To send away the middle age groups only exacerbates Britain's problem by reducing its ability to export more than its need to import.

If migration is not to hurt Britain, then the emigrants must represent a cross-section of the age distribution of the population because in that way the loss of exports will be more nearly offset by a corresponding reduction in imports. There would be no difficulty in getting such a cross-section to leave Britain, as most emigrants desire to take with them their families and relations. The

question is more whether the dominions will accept these extra and less productive people. Immigration now involves considerable capital outlay for the receiving country, because people must be enticed to come—houses have to be built, water and electricity provided, roads made, schools, hospitals and other services organised—and this capital outlay may in fact limit the number of immigrants a country is willing to take; it will certainly limit the number of non-productive dependants that it will be willing to accept.

What is more, emigrants have nowadays been educated and trained at public expense; their personal capital has been provided for them by those who stay behind and bear a larger share of the burden of the national debt. It would not be practical politics (though it would be strictly logical and equitable) to require a payment from the receiving country for each emigrant sent, to discharge his social debt to his native land. But at least it is essential in Britain's own interest to resist the requirement that emigrants, in addition to their personal capital, should take liquid capital with them, too.

The problem of migration can, therefore, be summarised quite simply as follows. Colonial development is unlikely to be inhibited by lack of manpower and the movement of labour to these areas is likely to be small, specialised and temporary. It is the dominions that will require large numbers of white settlers and most of them will have to come from Britain. But if migration is not to add to Britain's already severe economic troubles, the dominions must accept a cross-section of the British population. They must welcome not only the strapping young man and his family, but also his mother and, if necessary, his grandmother, too. An essential condition of migration is that "Granny must go."

(To be concluded)

The Coming Election

The strange events of the last five years that have overruled decisions previously formed, and changed the most rooted political creeds, suggest the probability of similar events occurring in the next five years, though no one can foresee what they will be. A ready appreciation of new truth, a political *coup d'œil* to judge at once of a new position and a kind of military courage to occupy it, are amongst the most essential qualities of modern statesmen and of the members of a body that is as much an executive council as a legislative assembly. The great changes that have of late rapidly occurred, and the still greater that may occur yet more rapidly, make all the political maxims on which parties were heretofore formed no longer available for national guidance. The electors, while they adhere steadily to all their tried friends, therefore will do well to distrust men full of professions of veneration for the past, who appeal to obsolete prejudices, and seek to override all discretion and judgment in the present generation by the shibboleths of a past age. In choosing legislators, it ought not to be forgotten that all legislation applies to the future; over the past the law-makers have no power; and he will best serve the interests of society who knows only so much of what is past as will enable him to form a correct judgment of what is to come.

The Economist

primary industries. Further, not all the necessary labour was drawn from overseas. Indeed, one of the major problems in Australia and South Africa has been the fact that the development of these secondary industries drew labour away from primary production.

Where are these people to come from? A rough idea of the possible geographical movement within the Commonwealth can be obtained from a comparison of the population densities of the various member countries, which is shown in the first of the accompanying charts.

NOTES OF THE WEEK

Under Cover

The Economist appears this week with a cover—or, more properly, a title page—for the first time since 1941. Before the war, though the paper appeared from time to time in different guises, the leading article never appeared on the outside page. Indeed, to place it there would have been considered indecent exposure, and only the compulsions of wartime paper rationing could have brought us to so radical a departure. As so often happens, however, the unthinkable turned out to have some advantages, and readers of *The Economist* have become so used to plunging straight into the leading article that we have hesitated to revert to prewar practice.

Now, however, a compulsion of a different kind intervenes. There has been a gratifying increase in recent years in the support that *The Economist* has received from advertisers, and it is this, more than anything else, that has enabled us to keep the price of the paper at the prewar level. But the volume of advertising has now become so great that it is difficult to find room for it and the paper has on occasions presented the appearance of being almost interleaved, which we feel neither our readers nor our advertisers would desire. The revival of the cover is the first of several steps designed to get over this difficulty.

Readers of *The Economist*, we have observed, though they are varied in their politics, are all conservative in their tastes, and we feel impelled to apologise for any change in the appearance of the paper. Experience has, however, also shown that, once a change is made, within a few weeks it either meets with general acceptance or at least ceases to be a cause of offence. We trust it will be so on this occasion.

Lessons of the Yalu

The evidence that the raids last week on the North Korean power stations were regarded as part of a normal military programme provides both a defence and an indictment of the commanders on the spot. To those who know what can happen in a large headquarters it explains—but only just—why General Mark Clark did not know what was being done in his name. To those who see only the political aspect of the affair it shows that Uno's direction of affairs in Korea is inadequate. The Americans are cleared of the suspicion of deliberate discourtesy towards the British Ministers who visited the UN Commander; but the staff officers in Tokyo and Korea are not cleared of the suspicion that they lack both political understanding and the opportunity to consult people who have it. It is, however, not at all clear that the political consequences of the bombing are disastrous; so little is known of what happens in Peking that those who claim to understand the psychology of the Chinese Communists have few facts to go on.

Two points seem to be inadequately understood in this country. Thousands of miles from Korea it is hard to grasp—and the European press has done little to help—that fighting goes on day in, day out, in spite of the interminable truce negotiations. The Commanders on the spot feel it their duty to do everything possible to hold their positions and protect the lives of the hundreds of thousands of troops under them. They have had on their hands a tough and dangerous campaign, costing human casualties and four to five million pounds a day. British people see little evidence of this; Americans can read two to three columns a day about it in the *New York Times*. To use air superiority decisively is the obvious way of making good the known deficiencies at the front-line.

As to the effect of these events on the truce negotiations,

the outcry in the West about the Yalu raids appears to have surprised the Communists. There was a long pause before any noticeable propaganda reaction took place. The Russians merely reported what the Chinese said, which was little. Now that there has been an uproar they are naturally trying to exploit it. But there seems to be no reason to believe that the Chinese, if they were sincerely seeking a truce on acceptable terms before the raids, will not go on negotiating. The evidence of their willingness to proceed towards a truce, how-

ever slowly, is considerable. It consists, apart from diplomatic indications, in the mass of sheer detail on which agreement has been painstakingly reached across the table at Panmunjom. But if a truce is to be clinched in the next stage, it must fulfil three conditions: that all UN prisoners are returned; that no more concessions of principle can be made by the United Nations (the immediate task is to convince the Communists of this); and that the Chinese do not lose face from the refusal of many of their soldiers to return to China.

Commanders Without Masters

The power-station controversy will have done some good if it sets people thinking about the principles on which defence partnerships are to be conducted in conditions of unofficial war. Because these groups are large—14 nations strong in Nato and 17 strong in Korea—governments have to delegate some authority, and it rightly falls on the most powerful. So long as things go well, no one worries much about the loss of a certain amount of national control over strategy, foreign policy and resources. As soon as they go badly, everyone worries furiously and tries to regain control by more liaison, consultation, channels and cables. The military commander feels the lead still tighter on the collar and the basic difficulty of giving him political direction at his own desk is ignored.

It is difficult not to suspect that serious thought on this matter is avoided in Whitehall because it is always hoped there that Anglo-American consultation will again take the form it had under President Roosevelt and Mr Churchill. But there are at least five governments in Nato—and the Germans will soon make a sixth—which will refuse to recognise the divine right of Washington and London to direct the political and military strategy of free Europe. The question, as the French say, imposes itself: how is political authority to be delegated and exercised in a powerful military alliance?

A hypothetical example makes the difficulty clear. Suppose that American troops in Germany are attacked by a

posse of Communist SS from Eastern Germany. What discretion has the local commander? Does he take orders from the officer commanding American troops in Germany, or from the Commander-in-Chief of Allied Land Forces—General Juin—or from General Ridgway? Or does the whole incident have to be referred to the Standing Group in Washington, representing the American, British and French chiefs of staff? If so, at what stage do the political advisers have their say? General Eisenhower used to complain that as Supreme Commander for the Atlantic alliance he had no political master. Does Mr Churchill really believe that the last word on organisation between allies was said in 1944?

Labour After the Bombs

The Opposition's mildly phrased motion of censure on the Government, for failing to get itself consulted about the Yalu bombing, produced an uninformative debate in the House of Commons on Tuesday. It did little to clarify either the Far Eastern situation or methods of consultation with the United States. It did a great deal to widen the dissensions within the Labour party. For the first time, Mr Bevan's friends have publicly demonstrated their repudiation of the official Labour leaders on a major issue of foreign policy as well as on the general issue of rearmament. Significantly, Mr Michael Foot was chosen to pour scorn on the official Labour motion. This open attack on the party's front bench was, indeed, every bit as important as the Bevanites' vote against the rearmament programme last March. It followed on the heels of a bitter attack on Mr Attlee's leadership at the meeting of the Parliamentary Labour party earlier in the day. There the issue was pressed to a vote; nearly a half of the Labour members are reported to have been absent or to have abstained, and of the rest only twice as many supported Mr Attlee as Mr Bevan.

It is therefore clear that Mr Bevan feels himself strong enough to maintain the onslaught against Mr Attlee's leadership that he launched—at that stage in his fortnightly journal, not at Westminster—just before the Whitsun recess, on the issue of Labour's attitude to German rearmament. He has certainly forced Mr Attlee to abandon completely the guise of being above the internal party struggle that has often been effective in the past, and to come down into the dusty arena of open—and personal—controversy. There, moreover, Mr Attlee fights with few effective allies. On foreign affairs, Mr Morrison is an embarrassment and Mr Shinwell, despite his vehement efforts to monopolise time at the despatch box, of little use. Nor has Mr Gaitskill developed into an effective successor to Sir Stafford Cripps. The loyalty to Mr Attlee among the less articulate members of the party remains deep, but many are apparently now reluctant to vote against Mr Bevan. The significance of this is not that Mr Attlee is in danger of being ousted from the party leadership before he chooses to retire. But it does mean that if Mr Bevan can damage the prestige of Mr Attlee, and therefore of his supporters, his path to the leadership within perhaps a few years looks to be greatly shortened. The path, though short, may well be too steep for him, but by every sign he is now set on it with all his vehemence and ruthlessness.

The Bevan Party

Mr Bevan's friends have already established for themselves in Parliament many of the rights, and are employing many of the tactics, of a party. It would be an understatement to call them a fourth party. The small band of Liberals show—Mr Grimond apart—little Parliamentary vigour, and the Bevanites have almost elbowed them out of the way to become the real third party. They can intervene swiftly in every controversy thanks to Mr Bevan's right, as a Privy Councillor, to be called in debate. They obviously select their spokesmen for each major occasion, and lacking whips

they still have enough group discipline to attend party meetings in solid numbers and to co-ordinate their activities in other ways.

All this is the result, it is true, not of Mr Bevan's skill but of the front bench's fumbling. But the organised development of Bevanism has got to a point at which the Transport House steamroller cannot be relied on to flatten it. Is the majority of the Labour party honest enough to see that a split is still a split if it takes the form *imperium in imperio*? If that were recognised, the loyalists would no doubt be sufficiently shocked to move vigorously to Mr Attlee's defence. If it is not recognised, Mr Bevan may add a great deal to his influence even if he fails eventually.

Wages and Subsidies

On Monday the House of Commons turned to the debate on the cost of living put off from last week. It contributed little to public enlightenment and less to the reputations of those who took part. Mr Shinwell and other Labour speakers apparently had two aims. One, natural enough, was to pin as much blame as possible for higher prices on to the Government. The other, which approached a new peak in irresponsibility, seemed to be to exaggerate the extent of the rise in prices and to give every possible encouragement to large and universal claims for higher wages.

The Government spokesmen, on their side, were mainly occupied in saying "you were worse than us" and "you started a lot of what the consumer has suffered since last October." There is justification for both points, but they hardly help to stop the spiral of rising wages and prices with which the economy is threatened in 1952. Nor is it an answer to the unions' claims to say that, if wages are stable, manufactured goods will get no dearer than they are, while food prices will not be raised farther until family allowances are increased in the autumn. Until then, expenditure on food subsidies will remain well above the annual rate of £250 million that Mr Butler laid down in March; an estimate of £310 million for their cost in this financial year.

More Divorce Petitions

In 1951 nearly a third more people than in 1950 filed petitions for dissolution of marriage. Husbands were the chief petitioners when divorce was at its peak just after the war; now, as before the war, wives put in more petitions, and last year they filed nearly three-fifths of the total.

has now been made public. The Budget speech was obscure on this point, and it is not clear whether any more of Mr Butler's intended surplus has been whittled away by the postponement of further increases in food prices.

The hard political fact is that when the Government has reduced the food subsidies, however gently, the trade unions certainly will not agree to any deliberate arrangement for keeping wages stable. But it is nonsense for Labour speakers to identify this as a cause, rather than an excuse or at most an aggravation, for heavy wage claims. The attitude of the unions and of the Labour party makes it impossible to think that there would have been wage restraint if the subsidies had been kept at £410 million. Even Mr Gaitskell, in his rather unhappy speech on the third reading of the Finance Bill last week, went out of his way to undermine appeals for restraint by pointing out that many Tories attacked restraint when Labour preached it. The Government is certainly right to cut the subsidies rather than pay the black-mail—and inflationary—price that would have been exacted for voluntary, and temporary, stability in wages. But it would be better still to have an economic policy tough enough to put any widespread payment of higher wages beyond the means of industry.

Bad Omens in Egypt

To the consternation of many honest men inside and outside Egypt, Hilaly Pasha's government fell last weekend. It is succeeded by a team led by Sirry Pasha. The immediate cause of its fall had to do with its fight against corruption. That the new ministry will not continue this is virtually guaranteed by the presence of at least one member of the new cabinet.

Hilaly's chief trouble was that, though many educated middleclass Egyptians respected the way in which he was attempting to restore public order and financial morality out of the wreckage left by the Wafd, he had no support in two important quarters. The Palace did not like him: some of its inmates, such as Karim Tabet Pasha (the new Minister of State for Palace Affairs) hated and feared his intentions. Worse still, he had no following among the political parties. It was in his nature to work slowly, as he liked to use orthodox channels. Therefore he had nothing to show for the long hours he had spent on the aspects of policy to which he attached importance—the arrangements with Britain for evacuating the canal zone, the talks with the Sudanese, electoral reform prior to elections in the autumn, his intended investigation into the corruption of the last few years. When the people into whose affairs he was about to inquire sought to push him over, there was no one to speak up for him and little to show for his pains.

The British might have done better to make over the Canal Zone the kind of gesture that would have given evidence that he had done well; they need not have waited upon the outcome of the Sudanese talks to give him a helping hand. But it is doubtful whether he would, even so, have had the stamina to withstand the persecution to which he was being subjected both by the Wafd and by members of the Palace entourage. The alarming conclusion to be drawn from the week's events is that the ruling class in Egypt has not the will to support a man of principle.

Pacific Defence Council

The first meeting of the new Pacific Defence Council has now been arranged to take place in Honolulu, the cross-roads of the Pacific, during the first week of August. Mr Acheson will fly there to meet the Ministers for External Affairs of Australia and New Zealand. Their decision to consult marks the beginning of what the Menzies Government in Australia hopes may become a new period of political and military association between the free nations of the Pacific.

It is still a very far cry from the comparatively adult North Atlantic Treaty Organisation to the embryonic Pacific Defence Council; and this council is not to be confused with the specific projects for a Pacific pact that have occasionally been aired during the past three years. It is the product of the American security guarantee to Australia and New Zealand which came into force last April, at the same time as the Japanese Peace Treaty. At present it includes only these three governments; but this is the first regional organisation of any importance to emerge in the Pacific area and, while its structure has still to be decided, one of its tasks may eventually be to pave the way for a full Pacific pact. At present such a pact is out of the question, since it would only invite a Communist drive on any country not a member, and there is no prospect of including countries such as Indonesia and Burma.

In the Pacific there is an even greater difference between the stature of the United States and that of other countries than there is in the Atlantic region. During the past few years this has led to a monopolylogue by Washington, not necessarily any more welcome to American statesmen than to those of other countries. Two of the main tasks of the Pacific Defence Council will therefore be to determine how best to direct American strength into those channels best suited to the interests of the area as a whole, and to establish, if possible, a working relationship between any Pacific and Atlantic defence planning through liaison with the Standing Group of Nato. For these tasks, which raise very wide issues both for the United States and for the Commonwealth, the Council is expected to set up a permanent political committee and a strategic planning board, probably in Washington, together with a subsidiary military headquarters somewhere in the Pacific.

A Political Authority for Europe

M. Schuman, the French Foreign Minister, startled many people in London with his suggestion, made privately to Mr Eden last week and stated publicly on his return to Paris, that his government wishes to press full speed ahead with the political federation of Western Europe. He proposes that the task of planning a European political authority should be given to the international Assembly of the Schuman Pool as soon as it is set up. It is expected to be functioning by October. The French Government has pointed out that the Treaty for the European Defence Community (EDC) assigns just this task to its own Assembly, but that the Treaty is not likely to be ratified for some time. On the other hand, the Coal and Steel Pool has already been approved by the parliaments of its six nation members, and the French would therefore like simply to transfer this crucial act of policy from EDC to the Pool.

Behind the French initiative is an understandable concern to avoid delay in building a political structure for Western Europe. A new note of urgency, however, suggests that there are further reasons, among them the hope of winning parliamentary support for the defence community when the treaty establishing it ultimately comes up for ratification by the French National Assembly. General De Gaulle has repeatedly condemned this treaty on the grounds that to create a European Army without establishing a parallel international political authority is nonsensical, and would enable a new *Wehrmacht* to dominate Western Europe. French Socialists have spoken in much the same vein. Among members of the French Cabinet there is probably growing sympathy for this view and a fear that, without strong political controls, the Germans could drag France into battle for the lost eastern territories.

There had been no previous inkling in London of radical alteration in the timetable for European unification. It was assumed that the French, with the Schuman Pool ratified, would concentrate on making a success of this experiment in partial economic integration and would next proceed to create the EDC; only then would they start to talk seriously about

a European political authority. It is very probable that the new proposal of the French Government will greatly ease the path of EDC through the French Assembly. In so far as it does, it is bound to be regarded sympathetically by the British. They want urgently the German military contribution to Atlantic defence (the prospects of which are discussed in an article on page 28). Britain has, of course, no intention of becoming a seventh member of the six-nation group; but the policy of associating itself as an observer with European ventures in integration will certainly be maintained, and may even be extended to the new enterprise, if it is accepted by the other five participants.

The Civil List

A new reign involves a new Civil List. For many reigns past, the monarch has surrendered to the Exchequer the hereditary revenues of the Crown and has received back from Parliament an annual grant fixed at the beginning of the reign for its entire duration. This is a delicate matter, handled by that favourite device of the British constitution for handling delicate matters, a Select Committee of the House of Commons. This time, though the Select Committee was not unanimous, there appears to have been little difference over the sums to be paid. The total is to be £475,000 a year. This is £65,000 more than King George VI received; but it is virtually the same as was voted to Edward VII and George V, although the value of money is now barely a third of what it was then. Clearly there will be little scope for extravagance, at least in the royal connotation of the word.

It was over the definition of the word that the most serious difference of opinion in the Committee arose. Mr Attlee, with the support of his Labour colleagues, wished to add a rider calling for "less formality at the Court." This was resisted by the government representatives. But many people will think that Mr Attlee was right. Modern taste draws a distinction between the services that the Crown performs for and in the sight of the whole people; no abatement in these would be popular—indeed, it might even be argued that the Queen is not being given enough money to maintain the proper splendour of public ceremonial. But there are also functions that the monarch performs behind closed doors for the benefit of a very restricted circle of those who choose to regard themselves as Society and from which the ordinary taxpayer is completely excluded. It is these that might well be curtailed—though the saving would be less in money than in the strain on the Queen's ability to endure tedium cheerfully.

Mr Attlee was surely right on another point. To try to fix the amount of the Civil List for the whole of a reign which, in all human probability, will be a very long one is foolish, especially in a century when the value of money is so mercurial. The arrangements proposed by the Select Committee make a gesture towards this uncertainty by providing a contingencies fund of £95,000 a year. But this sum is quite arbitrary and may prove to be utterly inadequate. To review the total too often would expose the Crown to frequent parliamentary debates, which no one ought to desire—this is the objection to the proposal to transfer much of the expenditure that now falls on the Queen to departmental votes, which can be re-examined every year. Mr Attlee's suggestion was for a review every ten years, which would have been a sensible compromise. The majority preferred to assume that Queen Elizabeth will have a power to command the movement of economic waves that was denied to her predecessor King Canute.

Irish Government Survives

For the last few weeks Mr de Valera's Government in the Irish Republic has lived in the shadow of three impending by-elections. It was generally thought that the chances

of its candidates had been ruined by a budget in which taxation was abruptly increased and the food subsidies removed. A defeat in all three constituencies, followed by a forced dissolution and the return of the inter-party government to power, seemed quite likely. As things turned out, *Fianna Fail* and *Fine Gael* exchanged seats and the third was held by *Fianna Fail*. Mr de Valera thus maintains his precarious parliamentary majority. He has also—what is a good deal more important and perhaps contains a lesson for the British Labour party—inflicted a severe blow on the growing confidence of the opposition. No doubt the Government was in a happier position in these three constituencies than it would be in a general election. Also, the removal of the food subsidies does not become effective until this week-end. The fact remains that Mr de Valera has held seats that the opposition was confident of winning.

The talk of a dissolution has died away—but not, perhaps, for long. The problems of budgetary stability are growing increasingly serious and sooner or later the Government must turn and face them. It is already plain that economy in expenditure is a recipe that the government will force on the public but will refuse to use for itself. Expenditure "above the line" has greatly increased. The cost of the programme of capital investment, even so far as it has been disclosed, seems wildly out of proportion to the amount that might be borrowed from the public. By the autumn, these problems will be plain to all. It does not appear that the opposition, on its side, has used its time to formulate an economic policy that accepts the fact that there is no more Marshall Aid and that the economic temperature has fallen. Its leaders' speeches at the by-elections consisted chiefly of promises to remove the increases in taxation and to restore the subsidies. They are possibly lucky that the electors were not impressed and did not return them to power to fulfil their promises.

Federation Debates

The plan for Central African federation has reached a further stage with the appointment of a commission to consider in detail the organisation of the federal public service. There are to be two other special commissions: a fiscal commission to estimate the effect of federation on the public expenditure of the whole area and the cost of federal services; and a judicial commission to consider the constitution and jurisdiction of the federal Supreme Court. When these three commissions have reported, a new—and final—conference on federation will be held.

In the meantime, debates have taken place in the United Kingdom and Southern Rhodesian Parliaments, and the difference of emphasis between the two governments is significant. In the House of Lords, Lord Salisbury emphasised the safeguards for Africans. In Salisbury, Sir Godfrey Huggins devoted most of his speech to explaining the advantages of federation for Southern Rhodesia. In doing so he appeared to belittle the safeguards on which Lord Salisbury laid such stress. But Sir Godfrey Huggins is having almost as hard a task in persuading his countrymen that they have nothing to lose by federation as the British Government has with the Africans of the protectorates. The opposition party in the Southern Rhodesian Parliament is making capital out of the alleged reversion to Colonial Office control. Sir Godfrey consequently emphasised that it would be the Secretary of State for Commonwealth Relations to whom disputed legislation would be referred, whereas the White Paper was careful to leave the identity of the Secretary of State open. He also emphasised that federation, as at present outlined, was not the last stage in Southern Rhodesia's emancipation, a hint which will not escape critics of federation in this country, who say that once a demand for dominion status is pressed by the federal government, it will be hard to refuse.

If Southern Rhodesian Europeans can be persuaded that they have everything to gain and little to lose by federation, are the Africans to rely only on promises that they have nothing to lose? The British Government's difficulty is that it seems unable to offer them any attraction other than vague promises of economic betterment, whereas they are still confronted with an economic colour bar maintained by some of the people who are most in favour of federation. In these circumstances, it is grossly misleading to say that African opposition is solely caused by agitators.

Koreans in Japan

The recent Communist riots in Japan, when acid was thrown at an American general in his car, have called attention to an aspect of the Korean question which tends to be overlooked: the existence of a large Korean community within Japan. The bulk of the rioters in this and other similar outbreaks belonged to the Korean community, which provides the Japanese Communist party with its most militant and violent followers. Nearly all the Koreans in Japan, numbering several hundred thousand, came there as unskilled labourers at a time when Korea was under Japanese sovereignty, and particularly in the period of Japan's economic expansion based on armaments and the industrialisation of Manchuria. Since Korea has become a separate state (or states), the immigrants have become aliens, and with Japan's restricted postwar industry and ever-growing population they have become a superfluous and unwanted element in the economy.

A few returned to Korea after Japan's surrender in 1945, but the majority preferred to remain, partly because city life offered attractions not to be found in their own country and partly because their position as a "liberated" people gave them a privileged status in the early days of the Allied occupation. The Japanese police no longer dared to touch them,

however provocative their behaviour; they were organised by the Communists and made full use of the opportunity given them to demonstrate their antipathy towards Korea's former masters. With the conclusion of the peace treaty, the question of repatriating this hostile alien element has naturally been raised. The United States has an interest in the matter, for the Korean Communists are out to make trouble for the American garrisons no less than for the Japanese Government.

There does not appear to be any good reason why a national state should be compelled to retain within its borders a body of immigrants who have no valid claim to its citizenship and are continually fomenting disorder. Repatriation, on the other hand, would be difficult. On the assumption that Korea will continue to be divided between a Communist North and a non-Communist South, Koreans in Japan might be allowed to choose to which half of their country they would be repatriated; but either North or South Korea or both might refuse to receive the migrants who thus opted. The Communist Koreans might be expected to opt for going to North Korea, but they would no doubt be more useful politically to the cause of Communism if they went to South Korea (or stayed in Japan); the South Koreans, on their side, would no doubt refuse to accept repatriates from Japan without being sure that they were not Communists. This is one of the questions which will have to be considered when the time comes to negotiate a political settlement in Korea; certainly the present situation in Japan cannot be left as it is.

More Coal for Europe

Western Europe's plan to increase total production by 25 per cent over the next five years has had at least one important effect. It has made the coal-producing countries take immediate steps to increase their output. When the general plan announced last September was broken down into detail it was found that it would involve large imports of

American coal even after 1956 unless exceptional measures were immediately taken to increase Europe's coal production. The Committee of Ministers that was set up to organise the new output drive is now confident that coal production at the end of 1953 will be running at a level some 36 million metric tons larger than in 1951, or 10 million tons more than was first envisaged. If this trend is maintained, the com-

Beer costs quite a bit. But it would cost even more if it weren't for refrigeration!

For beer needs yeast to ferment it. And luckily the brewer can use the same yeast again and again — if the yeast works *only* when it has work to do. So he keeps his yeast inactive between-times by storing it in a chill room at 36-40°F. Refrigeration solves the brewer's problem. And plenty of other people's problems too!

AN IMPORTANT ANNOUNCEMENT

to smokers of good cigars

LARAS cigars, rolled in Jamaica in the finest Havana leaf by Por Larranaga, will soon be re-named Larra cigars. This is being done to avoid confusion with the name of a certain manufacturer of pipe tobacco. The Larra is truly a most excellent cigar. It could hardly be otherwise, for it is a piece of craftsmanship in the Por Larranaga tradition.

LARRA CIGARS by POR LARRANAGA

Makers of fine cigars for over 100 years

EARLY IN THE 1890's, Commander Henry Bradwardine Jackson — knowing nothing of the work of Marconi — first conceived the idea that torpedo boats might announce their approach to a capital ship by the use of wireless waves. In 1895, in the torpedo-school ship 'Defiance' at Devonport, he began secret experiments on Admiralty instructions. Before the end of the year he had succeeded in transmitting, from one end of the ship, signals of sufficient intensity to ring an electric bell in the receiving circuit at the other. After meeting Marconi, who first visited England the following summer, he went rapidly ahead with the evolution of naval wireless telegraphy, making vital contributions to the development of world communications. The tempo of modern life has certainly quickened since 1895, when Albert E. Reed first developed the production of super-calendered newsprint. In the reclaimed straw paper mill he had acquired the previous year, his first machines produced but six cwt. of paper an hour. Compare with this the six tons an hour reeled off the modern high-speed machines in the great Aylesford mills of the Reed Paper Group — their continually-expanding production including newsprint, kraft and tissue papers. For to-day the Reed Paper Group with its great resources and technical experience is one of the largest paper-making organisations in the world.

mittee thought that "exceptional imports" could be dispensed with by 1954. In fact, imports of American coal into Western Europe are expected to show a sharp fall this year—and none is expected to be purchased in the second half. But this happy state of affairs has been due more to a decline in consumption than to a further increase in production. Before long the committee may well be confronted with the task, not of smoothing out technical bottlenecks but of urging countries to increase output at a time when markets are dwindling.

Britain's coal production is expected to increase only modestly this year but much more sharply next year, though output per manshift is forecast to show a smaller rise then. In Germany and Belgium output per manshift is expected to increase more next year than this year; in France and the Saar it is to increase but at a lower rate and in the Netherlands it is to show no change. Both Britain and Germany are depending on a larger underground labour force next year, while France hopes to reduce its number of underground workers, if productivity continues to rise. But even if Britain's output in 1953 is only slightly larger than the 229 million metric tons expected this year (and output is already running at a slightly higher annual rate), Western Europe's total would still amount to 490 million tons, which would be back to its 1937 level.

* * *

Ordeal by Silverman

Mr Lever's Defamation Bill received a third reading in the House of Commons last Friday with a margin of time to spare of no more than four minutes. The opposition it had encountered was small in numbers but loud in voice: it included Mr Sidney Silverman. Nevertheless, the House of Lords now has ample time to pass the Bill this session.

Friday's debate was chiefly concerned with the clause widening the defence of fair comment in libel actions. The argument was complicated because the existing legal rules are complex. In substance, the advocates of the clause argue that a defence of fair comment should hold good provided that the core, or "sting," of the libel is proved to be based on fact. Under the law as it stands now, a defence of fair comment depends on proving the truth of every statement of fact contained in the publication complained of, however minor or unimportant it may be. No newspaper likes to ask that it should be excused from errors of fact, but the debated clause does not do this. What it does do is allow the Court—probably a jury—to say that the substance of an account is true and that it would be unjust to give damages to a man who has suffered nothing worse than the publication of a fair account, and comment on, his activities.

The Bill makes several long overdue changes in the law of defamation. It clears up the uncertainty over whether a broadcast is to be treated as libel or slander. It gives the newspaper a chance to make amends for the unintentional libel without running the risk of having to pay heavy damages as well. It rationalises the defence of fair comment. It clarifies and brings up to date the classification of public proceedings which a newspaper may report with the protection of qualified privilege—that is, which it may report without the risk of being sued for libel when it has done no more than tell the public what was actually said or done. It gives greater protection to the printer, who, as the law stands, is in the position, in effect, of guaranteeing that the author has not libelled anyone. And it limits the right of a man to recover damages for loss of reputation where his reputation is not one which in fact has any pecuniary value. The Bill has omissions, in the sense that many people would like to see this, that or the other provision added to it. But this is not an argument against it. It is reformist in the best sense of that word, and it is to be hoped that no differences between Lords and Commons will handicap it in the last furlong of its run.

More Police at More Pay

The report of Her Majesty's Inspectors of Constabulary paints a gloomy picture of inadequate recruitment and heavy wastage, especially among probationers, during the year ended last September. Since then, the picture has been drastically changed; after the pay increase of August, 1951, recruitment increased and the proportion of men leaving the police force fell by more than a half. The situation confronting police authorities has been, ever since the war, not unlike that which hospitals, education authorities, and the railways have found so intractable. Their pay was quite adequate to attract and hold workers when it was combined with considerable advantages in security of employment, pension rights, and special welfare provisions. But the same relative rates of pay have lost their pulling and holding power in the setting of the full employment welfare state, where the same advantages can be enjoyed, together with higher earnings, in other occupations. The 1951 pay increase for the police seems to have restored the balance, at least for a time; though the force is still short of establishment, at least the deficit is diminishing instead of growing. Once again, it has been shown that economic incentives do work when they are given a chance.

No probable success in recruitment, however, is likely to resolve the difficulty of "preserving" (in the Inspector's words) "the primary job of the police, which is preventive and protective." Too much time has to be spent on, among other things, paper work and "the tactful exercise of authority in securing a reasonable compliance with the numerous regulations which are a feature of current conditions." Even without the continuing crime wave (to which the weakening of the "preventive and protective" role of the police has admittedly contributed) the proper enforcement of the "numerous regulations" would call not only for a police force well up to establishment but in all probability for establishment on a larger scale.

Shorter Notes

The Minister of Agriculture's decision to appoint a departmental committee to re-examine methods of dealing with foot-and-mouth disease is the more welcome because it is belated. The slaughter policy has proved to be too costly to be maintained without the fullest further investigation of alternatives. The committee will not be set up until after the present outbreak has abated, and there are certainly strong arguments against changing policies at this stage. But some points are apparent. Whatever the decision about slaughter, there ought to be more vigorous measures to control the movement of people and of other animals in the neighbourhood of an infected farm. It would be worth a great deal of inconvenience to both country dwellers and ramblers—and even some slaughter of dogs—in order to check the spread of the disease more effectively than present policies have done.

Professor S. H. Frankel writes to point out that his essay on "Some Conceptual Aspects of International Economic Underdeveloped Territories," which was commented on in *The Economist* of June 14th, can most readily be obtained by students in this country not direct from Princeton University but by application to the Institute of Colonial Studies, 10, Keble Road, Oxford.

*

Correction.—It is regretted that, in the second diagram on social service expenditure on page 805 of the issue of June 21st, the proportions of the cost borne by the insurance fund and local rates were reversed. The diagram should have shown that 11.0 per cent was raised by local rates and 20.5 per cent by the insurance fund; the remaining 68.5 per cent came from central government taxation.

Letters to the Editor

Facing the Crisis

Sir,—In conditions of full employment labour has to be attracted into undermanned industries by making them relatively more attractive. It is impossible to eliminate the need for wage adjustments for this purpose, or to make them in any direction except upwards; and for the present, at any rate, it is impossible to revoke existing connections between wages and the cost of living which also give rise, directly and indirectly, to widespread increases in income. Therefore we cannot avoid additional money being injected into our economic system even when production is not increased.

If the money is left there, each dose of it further increases inflation. If it is removed in the budget, as part of the general annual adjustment of the nation's finances, the removal appears as something the Chancellor can decide to do or not to do annually at his option; whereas it is really something that must be done whenever the occasion demands, on pain of continual debasement of the currency and of the value of past savings. It is quite inappropriate that an argument should have to be sponsored afresh every year, by the most controversial figure in the whole of party politics, about a purely consequential action that is necessary for preserving the balance of the nation's accounts. No wonder that for several budgets past the job has never been more than half done.

Moreover, the connection between the money injected into the economy and the money removed from it becomes so obscure as to defeat the ordinary man's vision entirely. Each section of the public, seeing the advantage that accrues to itself whenever additional new money is destined for its own pocket, is bluffed out of seeing that similar "benefits" for all sections have to be paid for by all sections, leaving no net result. This confusion, which engenders a belief that real income can be maintained and even increased by wage increases independently of the value of production, misleads people into joining in a competitive scramble for wage and salary increases and makes it impossible to convince them that a sustained national effort at real work is necessary if we are to save our standard of living from falling.

There seems to be only one way of getting out of this situation. That is to link all "unreal" increases of income in the hands of individuals and groups directly to the removal of the same total amount of money from the community as a whole, so that the second would on all occasions quickly and clearly follow the first.

There is nothing impossible about such a proposal. It does not differ fundamentally from what we try to do at present. Suppose that an approximate figure for the total "unreal" increase in personal incomes were published at (say) quarterly intervals—surely not an impossible task with the statistical material now available—

together with a short note of the main factors contributing to it, and that this amount of money were collected from the community in general and sterilised as soon as practicable thereafter. We should then for the first time be compelled to realise the impossibility of improving or maintaining the standards of the whole community merely by adding to its money supply, and it would at last be possible for the rights and wrongs of wage claims to be judged by the community against a knowledge of their cost. The fact that increases would be currently and obviously paid for would in itself discourage unwarrantable claims.

Anyone who is watching the signs of the times must agree that there can be no certainty that Great Britain's present standard of living can always be maintained in future. At present we have no means of accepting a fall, if one is necessary. This omission only guarantees us ultimate disaster, in place of probable early discomfort. In face of the irresistible force of outside circumstances it would be merely futile for our monetary system to be prepared to turn out more and more money in an attempt to prove that our standard of living is an immovable body, that can never be pushed back. But that is just the way in which it tries to behave at present.

The right approach to the problem is surely to try to see what must be done and to make sure that there is no fundamental impossibility about doing it. Detailed ways and means, and the possible objections to them, must be seen against a thoroughly understood background of necessities—and then it is always possible to find a way through or round the difficulties.—Yours faithfully,
O. M. MEARES
Guildford.

Federation Moves On

Sir,—You conclude your article on Central African federation with a question which I hope you will allow me to answer: "Why is federation considered essential and not merely desirable"? Federation is urgently needed first to provide the wider framework of political security required to encourage capital investment and quicker development of natural resources; secondly federation is needed to form a strong pro-British bloc of territories capable of withstanding the northward expansion of the illiberal racial policy of *apartheid* and thus to safeguard both black and white interests in the region.

With federation it is a question of now or never. To postpone the scheme of closer union now would discredit United Kingdom leadership in the eyes of Rhodesians and deprive her of moral authority. Far more dangerous, failure to act now would also discredit, if not overthrow, those liberal Central African leaders who have identified themselves with the cause of federation and partnership between the races. Their fall would open the way for their extremist opponents to import the racist policies

of the south. There is therefore no alternative to federation now, except economic stagnation and racial strife.—Yours faithfully,
J. H. WALLACE
United Central Africa Association,
London, S.W.1

Sir,—In emphasising the opposition by Africans to last year's federation proposals and in making scant and only indirect reference to the attitude of the Europeans in Central Africa, your article ignores two facts. First, since the officers of the Provincial Administration were not allowed to propound but only to explain the proposals (and it is to these officers that the African turns for advice) the field was left clear to opponents of the scheme, African and European alike, who wished to condemn it. Such African opposition as has been evinced has undoubtedly been coloured by this. Secondly, the interests of the Europeans in Central Africa must be safeguarded as well as those of the Africans. It is as important to allay the European fear of being swamped by a majority with lower living standards as to allay the African fear of being debarred from progress by a minority with higher living standards.

Federation is necessary because it provides the only effective way to partnership between the races, and on racial partnership depends the future prosperity of Central Africa.—Yours faithfully,

J. P. McDONAGH
London, S.W.19

The Soviet Press

Sir,—The article in *The Economist* of June 14th gives a correct and vivid picture of the Soviet press. There are, however, two points on which I should like to comment. Firstly, when you say that "not long ago three-quarters of the population were illiterate" in Russia, the reader may get the impression that this was the state of affairs when the Communists seized power; in fact, it is more than fifty-five years since three-quarters of the Russian population were illiterate; according to the census of 1897, 27 per cent of those ten years of age and over were literate. The estimates of literacy given by Soviet authorities for 1914 are in the region of 40 per cent.

Secondly, it would be interesting to know the basis for the assertion that "for some time to come the mass of Soviet readers will probably continue to swallow what is handed out to them." I can find no evidence for this in my own experience of life in the Soviet Union, which lasted until 1943. It is rather the case that, if anything, Russian readers tend to disbelieve what they find in the Soviet press, and there is no question that this is so with regard to what they read of conditions inside the Soviet Union itself, since the contradiction with their own experience is too marked.—Yours faithfully,

S. V. UTECHIN
New College, Oxford

Books and Publications

Seventeenth Century Tourists

English Travellers Abroad, 1604-1667.
479 pages. 30s.

By John Walter Stoye. Jonathan Cape.

Today, when the movements of English travellers are so restricted, Mr Stoye's book arouses immediate nostalgia. Yet in the seventeenth century, as now, western Europe was divided by rival creeds and lay in the shadow of war. English travellers slipped cautiously and warily behind the curtain of the Counter-Reformation, and in Italy they faced the risks of physical imprisonment or spiritual seduction. Fortunately there were the deviationist states of France and Venice. In France, not only was the government friendly but English travellers could make active contacts with the resistance movement of the Huguenots, whose towns and castles on the Loire became a popular tourist centre. In Venice, anti-papalism and the presence of an English ambassador eased the lot of the traveller. In spite of wars and ideological perils a foreign tour became, in the first half of the seventeenth century, a recognised feature in the education of Englishmen.

Mr Stoye is able to show that the formal pattern of the Grand Tour is already discernible in the reign of Charles I. He is concerned not only with tracing the emergence of this pattern but also with showing how a study of English travellers can be made to reflect light on to the working of patronage in English society and politics. Complete with tutor and household the young English aristocrat with political ambitions crossed France to Italy in elaborate state to acquire knowledge and sophistication. For many tutors this connection with a great family provided an entry into the world of office and influence. Mr Stoye's work throws much light on the origins of the diplomatic service of the Stuarts, and he has skilfully uncovered the tracks of many minor officials who have hitherto been isolated names.

The stream of travel broadened as the century progressed, and with it the influence of western Europe on English culture. Mr Stoye has brought together much valuable and interesting information on the debt owed by English architecture to the notebooks compiled and the books and prints bought abroad; on how agents and ambassadors acquired paintings for patrons and friends; and on the admiration excited by Italian music. But his treatment of the intellectual and cultural consequences of English travel is the least satisfactory part of the book. In seeking to relate his study to the present concern with patronage as the governing principle of English seventeenth century society, he has become needlessly absorbed in the careers of the lesser men. This deflection of interest leads him to devote a whole chapter to the unrevealing career of William Aylesbury, tutor to the second Duke of Buckingham. As against this there are but a few scattered refer-

ences to Hobbes, a much travelled tutor and refugee, and only a brief, misleading mention of Robert Boyle. Mr Stoye has scanned Boyle's account of his Italian tour in vain for any evidence that scientific discussion there first stimulated his enthusiasm, and quotes Aubrey to suggest that he was chiefly impressed by the architectural sights of Rome. But Boyle was only fifteen at the time; and his own account records that he spent much time at Florence in reading "the new paradoxes of the great star-gazer Galileo."

In stressing the confused medley of impression and trinkets brought back by the majority of travellers Mr Stoye has obscured the impetus and direction given by travel to the main currents of English thought, particularly in science and mathematics. If he could have defined his inquiries more clearly he would have contributed more to our understanding of England's great debt to its travellers at a peculiarly formative period; and he would not have had to resort to the pedagogic trick of ending overcrowded chapters by tabulated summaries of their points. Nevertheless he has written a learned book on a good subject, humane and vivacious in its treatment.

Prisons and Prisoners

The English Prison and Borstal Systems.

By Lionel W. Fox. Routledge and Kegan Paul. 479 pages. 30s.

Some twenty years ago Mr Fox wrote a very good book on English prisons, and now from his proud eminence as Chairman of the Prison Commissioners he has written another one. Much of it will be used rather as a work of reference than as fireside reading; but there is a good deal in it for the general reader, and one must hope that it will reach a wide public.

The first part of the book is devoted to the history of imprisonment and several pages of it to the abstract justification of punishment, which used so much to exercise the mind of Archbishop Temple but is surely the most sterile of all human debates. Punishment is a branch of administration not of metaphysics; and if no one ever wrote another sentence about punishment in the abstract the world would lose nothing by the change. But the history of punishment is very important, and Mr Fox deals with it in an excellent summary—through John Howard, Elizabeth Fry, Romilly, Buxton, Ruggles-Brise and Alexander Paterson to the Criminal Justice Act of 1948. Indeed, the most original part of the book—and the part that will be studied most carefully—is the chapter on persistent offenders, which is concerned mainly with preventive detention and

corrective training as catered for by the Act.

Preventive detention has been part of the prison machinery for a number of years and the 1948 Act only altered its status. But corrective training is a new piece of equipment which the Act brought in for the first time; and the success of the Act will be judged largely by the working of this device. When a prisoner is convicted (for a third time) of a serious offence, he may be sentenced to corrective training for not less than two and not more than four years, with the idea that he shall receive special education to fit him for a new start in life. He will be taken first to Reading gaol where he will be watched and in due course despatched to an appropriate place for passing the rest of his sentence. If he is suitable he will go to an open regional training prison; if less promising, to a closed one; if not promising at all, to a corrective training prison, which too often differs very little from the ordinary gaol, and is sometimes actually one or two wings of a place like Wormwood Scrubs. In 1951 out of 2,129 men under corrective training only 367 were in the regional training prisons—a somewhat depressing figure.

For the scheme to work well two conditions are necessary: (1) there must be adequate prison accommodation of the right kind, and (2) the courts must

republican or democrat?

If you are one who will be following the U.S. Presidential Conventions beginning July 7, TIME Magazine offers you a free booklet which should make the American political system easier to understand — and the Presidential contest more fun to keep up with. This Convention guide tells you, in 24 pages, the history, highlights and high-jinks of past conventions . . . gives you the ground rules, procedures and personalities of the 1952 conventions.

Send a postcard to TIME-LIFE International (E), 4 Dean St., W.I., and we'll be glad to forward you the booklet.

use the punishment intelligently. Unhappily neither condition has so far been achieved. There is a shortage of the right kind of accommodation and the courts have been too wholesale in their employment of the new weapon. It is believed that one court actually sent to corrective training a man who celebrated his seventieth birthday while he was in prison serving the sentence. Picture the unhappy Governor—expecting a spring chicken and given a very old boiling fowl. What did the court think he could do with the man?

Anglo-Irish Finances

Ireland: Finances of Partition. By Labras O'Nualainn. *Clonmore and Reynolds*, Dublin. 196 pages. 18s.

Mr O'Nualainn's dislike of partition has led him to the positive achievement of investigating the complicated financial relationship between Great Britain and Northern Ireland. His survey is well and thoroughly done. Certainly, there are some slips in political history and no particular good is served by some uncomplimentary references to the majority in the north. But when he forgets his politics, the author's survey seems complete within the limits hinted at when he says that "many private understandings and agreements exist between members of the two governments which have a vital bearing on the subject and yet remain unpublished and unknown. . . ."

The conclusion reached regarding the extent of the imperial contribution made by Northern Ireland is that, over the

When in London

The Economists' Bookshop would welcome a visit from any of its clients who will be in London this summer. The range of the Bookshop's interests is not confined to British publications, or to books on economics and the social sciences although it specialises in these subjects. At **The Economists' Bookshop** you will also find the world's leading books on art, geography, history, and many other topics.

The Economists' Bookshop

11-12 Clements Inn Passage,
Aldwych, London, W.C.2.

period 1921-50, its true total was £81½ million or an average of under £3 million a year. Moreover, it is argued, this sum obscures the fact that there has been no true imperial contribution except during the boom years of wartime. This conclusion will no doubt be disputed; ever since the Union, discussion of Anglo-Irish financial relations has turned on questions of what are to be regarded as purely Irish services, but the author's case seems well argued. There is a delightful quotation from Philip Snowden in the 1920s to the effect that "Sir James Craig has hardly been off the doormat of the Treasury for twenty-four hours during the last four years, begging for money from the British Exchequer."

More power to him, will be the instinctive reaction on both sides of the border. But the more interesting implications of the quotation, as of the book as a whole, are those that are not immediately controversial. Equal social services with Britain entail equal taxation with Britain, and it is hard to believe that the present weight and scope of taxation does not inflict disproportionate hardship on industry and trade in Northern Ireland. There seems a true clash of interest here which Mr O'Nualainn might well examine in fuller detail. In the meantime, he has thrown a great deal of light on an exceptionally complicated subject.

Documents on the Constitution

The Law and Working of the Constitution: Documents, 1660-1914. By W. C. Costin and J. Steven Watson. *Adam and Charles Black*. Vol. I, 1660-1783. 465 pages. 21s. Vol. II, 1784-1914. 531 pages. 24s.

As the title of this work indicates, Mr Costin and Mr Watson have sought to bring together a series of texts designed to show the several parts of the constitution "in working order and not as a collection of exhibits in a museum." They have been as much concerned with the subtle operations of the understandings and conventions which give life to the systems as with its formal aspects. In order to carry out this undertaking, they have taken their material from a remarkably wide variety of sources, many of which have not usually been drawn upon in works of this kind. Their scholarship is here well rewarded by a work which makes a distinct contribution to the study of constitutional history.

Each volume is divided into four sections. The first section includes the statutes which are so many milestones in the development of the constitution; the second is devoted to Parliamentary proceedings and the extracts illustrate particularly well how the House of Commons has, since 1660, understood its role, asserted its constitutional position and organised its work; the third section is concerned with judicial decisions which have vitally affected the theory and practice of the constitution.

It is the last section, however, which gives this work its particular character and justifies the authors' claim to

originality. They have taken literally the observation that "the British Constitution is not written down in books but is flexible in the sense of being found in the minds and practice of each generation." They have, therefore, selected a wide variety of texts from letters, speeches, biographies, memoirs, reports, memoranda and political treatises; here will be found the reflections, recriminations and recommendations of the students and practitioners of the constitution at different periods on topics such as the party system, the organisation of the Cabinet, the role of the Prime Minister and similar matters upon which the constitutional texts throw little or no light.

The authors wisely forsook the temptation of providing a potted historical introduction to selections which span two and a half centuries. They have also, save for some explanatory notes to a number of texts, let the documents speak for themselves. Although this is not a work for the general reader, it will undoubtedly be of real and lasting value to all students of constitutional history.

Bird's-Eye View

Elements of Indian Economics. By G. B. Jathar and the late S. G. Beri. *Oxford University Press*. 200 pages. 8s. 6d.

Mr Jathar's and Mr Beri's most admirable "Introduction to Economics," designed to introduce the young student to economise in general and to the economy of India in particular, has now deservedly reached its fifth edition. The volume under review is Part II of this work, and contains a brief survey of the economic resources, trends and problems of the Indian sub-continent, together with a summary (in Appendix I) of the distribution of resources between the Indian Union and Pakistan at the partition in 1947.

The main features and merits of the work are the admirably objective attitude adopted throughout by the authors; the clear, accurate and concise method of selection and presentation of facts and figures, and of exposition in general; the tolerance and sense shown in touching upon controversial topics; and the excellent maps illustrating economic features, which have been brought up-to-date and adapted to show how the situation was affected by partition. It would be hard to imagine a better introduction to the whole subject for the young Indian student and for foreign readers who want a brief but reliable bird's eye view before beginning a more detailed study of particular problems.

The chief weakness of the work—a defect that is probably unavoidable in a volume of this size—is that sources are neither discussed nor even given. The result can be tantalising. For instance, when it is stated that rural debt is estimated to stand at about Rs. 1,200 crores at present (compared with Rs. 900 crores in 1931), one wants to know by whom, when, and by what methods this estimate was made. In spite of this defect, however, the great merit of this slim little volume is that it will stimulate further reading and study.

Could this be YOU?

Not with our briefcase! It's built to avoid embarrassment on overnight business trips—to carry travel literature, business papers and pyjamas . . . but quite separately! Outside, there is a capacious pocket that zips open to accommodate newspapers and books. Inside, two large foolscap compartments will accommodate a plethora of plump files and . . . ssh! . . . discreetly zipped off is a private compartment for overnight gear.

With English lever lock and fittings of solid brass, a single handle and press studs in the base for slimming, this handsome 17" x 11½" case is available in Golden Tan, Brown or Black: selected hog-grained leather, £7.10.0; smooth polished hide, £9.9.0. Zip folio cases to match available separately at £2.0.0 and £2.5.0 each, respectively.

Post free in U.K. In U.S.A., \$23.75, \$27.50, \$7.25 and \$8 respectively, carriage and insurance free. Subject to 20% U.S.A. Customs Duty payable in U.S.A.

Immediate despatch. Obtainable only direct from the makers. Money-back guarantee of satisfaction.

UNICORN LEATHER CO. Ltd. (Dept. E.T7) Woodhill Works, Bury, Lancs.

CAN-OPENERS

A LIGHT engineering firm in the north of England had difficulty in obtaining the type of steel they required for the manufacture of can-opener blades. An alternative grade of steel was tried which it was hoped would prove suitable if heat-treated, but the results were not satisfactory. The firm consulted I.C.I. General Chemicals Division, who maintain a heat treatment section at Oldbury as part of their service to the engineering industry.

Sample blades sent to Oldbury for examination were first tested for surface hardness and their internal structure was then examined under a microscope. The next step was to heat-treat unhardened blades experimentally in a bath containing molten sodium cyanide. Four different methods of treatment were tried to enable the manufacturers to determine the most suitable. The blades produced by one of these methods proved entirely satisfactory. Demonstrated at the firm's works by an I.C.I. technical service man, this heat treatment process enabled the manufacturer to continue production and maintain the quality of his products.

An Annuity

will offset reductions in income

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

AMERICAN SURVEY

Challenge to Technology

Washington, D.C.

NO President has ever appointed as many commissions and committees to inquire into, and report on, various problems as Mr Truman. And at one time some notice used to be taken of their findings. The Harriman Committee got the Marshall Plan under way and the Hoover Commission on reorganisation of the government made any number of valuable recommendations, some of which have been put into practice, although altogether too many have been sabotaged by a Congress more interested in prerogatives than in principles or efficiency. But in the last year or two a number of important reports have sunk without trace. The Gray Report on foreign economic policies was forgotten in a few days and the work of Mr Paley's Materials Policy Commission has had a mixed welcome, and is also likely to be forgotten.

The reason for this coolness towards what the *Washington Post* calls "one of the most successful attempts ever made to put in proper perspective this nation's role in the world economy and to show the interdependence of nations" is the current offensive against blueprints, planning and controls—except controls on immigration. The House of Representatives was much too interested in other matters to read the Paley Report during the week it came out; it was passing amendments to the Defence Production Act taking away from the Administration its power to do anything about materials—raw or finished—except let the situation rip, leaving the consumer to survive as best he might.

In the full flood of this mood, the *Wall Street Journal* commented on the report by saying that

if the Government of the United States will attend to the matter of keeping law and order, and if it will get its fat, stupid self out of trying to govern economic matters, the people, left to themselves, will find ways to accommodate themselves to changes just as they always have when and where governments have left them free to do so.

These are hard words to come from the representative of an industry which has been begging its own government to bring pressure on the Canadian Government so that newspaper publishers can avoid having to accommodate themselves to the recent change in the price of newsprint. And it is not necessary to read the Paley Report to know that the timber resources of the United States have been "treated more as a mine product than a crop" until quite recently by private companies and that the improvement in

forest management in this century, which is considerable but not yet adequate, is almost entirely the result of government injecting "its fat, stupid self" into the problem.

However, although it can be predicted with confidence that nothing at all will be done about the Paley Report at the moment, it will remain as a record of a valuable piece of research and a moderate and intelligent appraisal of the position over the next twenty-five years. It includes a number of recommendations of value to every government in the world. The most important are those which refer to the tasks and opportunities before the technologists, on whom the Paley Commission rightly puts the responsibility for the future. Although the report is nowhere alarmist, as the reports of some earlier committees—notably those which inquired into the oil resources of the United States—have been, it certainly warns the reader that there are some materials of which supplies may become embarrassingly short and others whose rising real costs will interfere with the continued improvement in the standard of living.

Technology must therefore, it says, complete such tasks as finding a use for the enormous supplies of silicon which are available in the earth's crust and finding a way of removing oxygen from the atmosphere in industrially useful concentrations at a reasonable cost. It points out that

few of the demands made upon technology by the materials problem lie in any realm of high scientific difficulty. The realm of difficulty for technology lies elsewhere—in costs. We can transmute lead into gold—at a price. . . . The all-embracing problem for technology is to do the things that must be done to ensure a steady concentrated flow of materials, rich in diversity, at costs that will make possible their wider and wider utilisation. The wonders of science are not at issue here; what is at issue is the hard fact of economics.

There is no doubt that American industry was the first to appreciate the value of technology and that it spends hundreds of millions of dollars a year on research and development of its products. What, however, it does not do—and can hardly be expected to do—is to spend money on the development of alternatives to materials which may become critically short or to take the kind of risks which were involved in, for instance, the production of atomic energy. And it is hard to see who, except the government, could undertake the cost of solving the problem of harnessing the rays of the sun. Certainly no corporation would consider itself justified in doing so as long as it was able

to buy adequate supplies of the present sources of energy.

Yet the *Journal of Commerce* finds something sinister in the commission's statement that

we believe in private enterprise as the most efficacious way of performing industrial tasks in the United States. We believe in a minimum interference with its patterns but this does not mean we believe the minimum must be zero. Private enterprise itself has often asked for help or restraints from government; we have thus long experienced a mixture of private and public influences on our economy.

The *Journal* remarks that this is the way every single planner in Washington argues his point. This seems a little hard on the unfortunate Mr Paley, who is not a planner in Washington, but the chairman of the board of the Columbia Broadcasting System, one of the pillars of an industry which displays its pure commercial base at fifteen-minute intervals.

But CBS, with the other broadcasting networks, has recently become aware that television is beginning to provide, in its small way, some of the problems of developing atomic energy or harnessing the sun. It is becoming too expensive to be carried on its commercial base. The advertiser has not got the money needed to support all the television stations which the new regulations will allow and to pay the production costs of the programmes.

In other industries a way has been found for the government to bear part of the burden in the name of national defence, which is the umbrella under which all those wanting subsidies now shelter from the storms of the free enterprise system. An example of something too big for the free enterprise system, as it was once understood, to handle, the new liner, the *United States*, is at present on its way across the Atlantic to Southampton, with two-thirds of its cost paid by the taxpayer. Meanwhile another "planner in Washington," the Comptroller-General, continues to complain bitterly that the unfortunate taxpayer has been robbed. Too many people, the Republican Governor Warren said last week, "believe that what is done for them by the government is social progress and what is done for others is socialism." All these things are, in these times, no doubt necessary, but why is it also necessary to preserve the fiction that they have anything to do with the free enterprise system, unless, as the case of the *United States* suggests, the free enterprise system is merely becoming a system in which the enterprising get things free?

Campaign Traditions Up-to-Date

Washington, D.C.

It is, perhaps, because there are so many literate citizens in the United States who can understand what is going on—every year about half a million men and women emerge from institutions of higher learning with degrees and a larger percentage of American Negroes than of Englishmen get a university education—that American elections are so protracted. The campaigns begin imperceptibly more than twelve months before polling day and gradually gain momentum until the first Tuesday after the first Monday in November. But the most fascinating period is when, before and during the nominating conventions, bitter battles are being fought between the contenders for the presidential nomination within each party. The war between the parties, which begins when the candidates have been chosen, is usually dull by comparison—as dull as modern mass warfare is when compared with a medieval tournament or gladiatorial combat. During the tournament stage, a dozen or

more knights are galloping about sticking their lances into all and sundry, while their supporters are busily manufacturing banners with very strange devices.

The Onward March of Technology has helped a good deal to make this struggle between personalities diverting. It is not only that buttons reading "I Like Ike" or "Win With Taft" can now be made to glow in the dark or that the magic words can be, and are, embroidered on nylon stockings. The whole of recent technological progress sometimes seems to have been aimed at making it easier, as well as more expensive, to "put over a personality." Theodore Roosevelt had to use his own lungs when he wanted to be heard; his cousin Franklin could whisper into a microphone and the entire nation listened. General Eisenhower, as he discovered to his cost at Abilene, can also be seen on television from coast to coast as he peers at his manuscript. And any candidate can make a stirring speech one night in New York and hold a press conference early next morning in San Francisco. There is now no rest for the unfortunate voter; if he turns his back for a moment, Senator Kefauver is kissing his baby.

There are, however, certain traditions which, even in this age, must be observed. Mr Taft observed one of them when he noted the reappearance, after a four-year absence, of that necessary ingredient of every election—the "right-thinking citizen"—and made the correct use of such citizens by appealing to them in support of a particularly flagrant piece of political chicanery, the attempt to steal Texas votes from General Eisenhower.

But the Senator has failed in some respects. He has deserted tradition in favour of modernity by organising "Belles for Bob." This may well be no more than the frantic attempt of a man whom Mr Alistair Cooke described once, and for all time, as a "grapefruit with glasses on" to prove that, like Mr James Thurber's men, he is attractive to "my sort of women," but, in a more serious aberration, the Senator has himself written a book called, of all things, "A Foreign Policy for Americans" instead of hiring some ghost to produce a "campaign biography." The campaign biography is one of the time-honoured methods of impressing the public with a candidate's merits, though it must be admitted that, at the moment, none of this year's crop is on the best-seller list, while "Mr President" (the story of the man who is not a candidate for re-election), "Working with Roosevelt" and even the second volume of "The Memoirs of Herbert Hoover" are.

The most popular subject for biographies, campaign or not, this year is undoubtedly General Eisenhower, although Mr John Gunther's "Eisenhower: the Man and the Symbol" is not in the campaign category. It contains the much-quoted passage:

Perhaps his chief defect, both in general and as a Presidential candidate, is lack of definition. This, in turn connotes lack of depth. He has little talent for abstract thought and seems to lack a fixed body of coherent philosophical belief.

In campaign biographies the hero never has defects and there is never anything lacking in him.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

A GREAT NEW TYRE BUILT TO CUT RUNNING COSTS

THE
de Luxe
All-Weather Tyre by
GOOD YEAR

New all the way through!
New Carcass! New Tread!
New Shoulders! New Side-
walls! Tougher—Stronger
—Steadier—Safer—The
New de Luxe by Goodyear
is the greatest car-tyre value
obtainable at the Standard
Price Level.

It will save you money. The tread is thicker, tougher, wider, flatter, for longer mileage. The strong, resilient cord carcass combines reliable sidewall construction with comfortable riding. The smart, rugged shoulders protect the sidewalls. The famous diamond-tread design, still further improved,

ensures greatest grip on all surfaces and safer cornering. By all standards the new de Luxe is the right tyre for the times, at the right price, and obtainable now at your regular supplier.

When next you buy a tyre—insist on Goodyear

Technology has also permitted other new developments in this field this year. The first campaign biography in pictures alone, "This Is Ike," has been published and the first long-playing gramophone record of a candidate's life, "Ike From Abilene." This is a particularly meritorious effort, produced, with orchestral effects, in the tense and pretentious manner which has become obligatory for all self-respecting broadcast drama. The narrator, a film star, begins with deceptive simplicity, "If you want to know a man, you take a look at what he does, where he lives, what his friends say about him," and, when the swell of music has died down, continues, "Our story begins in the small town of Abilene, Kansas, population 6,000. It's a quiet little town today. . . ."

Then he introduces the cast of characters. The first is the editor of the local newspaper, who "remembers back to 1892 when the Eisenhowers first came to Abilene and settled in the south side of town on the other side of the railroad tracks." As proof there is a loud "moo," which is described as "the actual sound of the train that runs in front of the Eisenhower home." Then comes a man who grew up with the General and remembers how he used to go round from house to house selling vegetables from a little cart, and 90-year-old Mr Charley Harger, who confirms that the General came from the right kind of home for an American President by asserting that his father "never earned more than \$1,500 a year in his life." It is something of a surprise to hear, later in the record, the familiar voices of Mr Churchill and President Roosevelt—and it may have been a political mistake to include them—uttering adult praise of one who, until that point, had been "only a farm boy from Kansas."

American Notes

Converging on Chicago

General Eisenhower, the man who a few months ago intended to wait in Paris until summoned by popular acclaim to be the Republican candidate for the Presidency, is now travelling across the United States on a Victory Special train, appealing for support as he goes. He will arrive in Chicago in time for a last-minute attempt to influence delegates in his favour before the Republican nominating convention opens on Monday. Nothing could illustrate better how far his campaign has failed to go according to plan. But Senator Taft's position is only slightly more satisfactory. He is already in Chicago, desperately trying to lay the ghost of "Taft-Can't-Win-the-Election" that haunts him in every corner. He is also trying to draw a veil of respectability over his henchmen's abduction of the convention machinery, by frequent offers to compromise with the Eisenhower camp, knowing very well that he can trust his supporters to repudiate him on this point.

The kidnappers are making sure of their captive as *The Economist* goes to press; the Republican National Committee is hearing the cases of the rival delegations, supporting respectively General Eisenhower and Senator Taft, from various states. So far, except for one delegate from Kansas thrown to the General, all the disputed delegates have been put on Mr Taft's plate and there is no reason to suppose the committee will deny him the important Louisiana and Texas groups either. The Eisenhower supporters will certainly take the fight to the credentials committee and on to the convention floor, and there it will be carried on before a nation-wide television audience. That audience will also have the benefit of General MacArthur's keynote address on Monday, expected to prove one of his

most emotional efforts and one that may ensure him the Vice-Presidential nomination if Mr Taft is chosen. The other set speeches will all be by the more notorious of Senator Taft's supporters, including Senator McCarthy.

General Eisenhower's friends hope that the sight and sound of the Taft steam-roller in action will cause a popular revulsion that will sweep the General into the nomination. Senator Taft, however, trying to create the impression that his victorious advance is irresistible, insists that he will have

"Unpledged Delegate"

Herblock in the Washington Post

the necessary clear majority of 604 votes on the first ballot; the latest Associated Press figures give him 492 certain votes to General Eisenhower's 412. Mr Taft will not be called upon to substantiate his claims before Wednesday, for first the platform, the party's statement of policy and principles, must be decided. The voting on the foreign policy plank, the one on which Mr Taft and the General differ most widely, may provide a clear indication of their relative strength, in spite of Mr John Foster Dulles's efforts to build a bridge on which both can stand. The struggle over the contested delegates will not necessarily have been decided at this stage, or even when voting on the nominations begins. Meanwhile the Taft supporters will probably be seated temporarily and allowed to vote. There are over 70 votes involved and these may well prove decisive.

Controls Squeak Through

As the temperature soared in Washington, the House rebellion against controls melted away, once the Senate had firmly refused to take part in any midsummer madness. Having made its stand for freedom (and the pressure groups) the House was evidently not sorry, in an election year, to be relieved of the responsibility of ending controls. Consequently, the Administration has secured a better Bill than seemed possible when the House voted to end virtually all

price stabilisation, and Mr Truman has signed it, reluctantly, but in time to prevent the mobilisation controls contained in the Defence Production Act from expiring last Monday.

The astonishing burst of speed with which the differences between two apparently irreconcilable Bills were composed in conference means there is one less fence between Congress and the adjournment it hopes to achieve by the end of this week. It wants to be able to go off to the nominating conventions and on to the campaign, if not with a clear conscience—desks are still piled high with unfinished business—at least without being bound to come back afterward.

One of the Administration's consolations is the elimination, in the new Act, of amendments which would have made impossible the continued allocation of free world supplies of scarce materials. Another is the defeat of a House provision restricting imports of goods containing materials whose use is controlled in the United States—something the glass industry had hoped would make an effective substitute for a tariff increase. The House succeeded, however, in preventing more than a nominal relaxation in curbs on the imports of cheeses, fats and oils.

The power to allocate scarce materials was continued for another year. Wage and price controls in substantially their present form—the main exception is authority over fruit and vegetable prices—were given a less generous lease of life, only until April 30th; the question is, in effect, passed to the new Congress. Rent controls die on September 30th unless extended by local option. The power to control hire-purchase credit has gone, however, and so has that over housing credit, unless the number of houses started seems likely, on the basis of three months' experience, to exceed 1,200,000 in the year. (The annual rate is now 1,100,000 and only once, in 1950, has it been greater than this.) In other words, the Administration is left responsible for damming up the torrent, if inflation revives, but deprived of control over some of its important tributaries. In Mr Truman's view, the Act is a "gamble with inflation."

The fact that this is an election year probably helped to save the framework of the Wage Stabilisation Board. The House, despite trade union indignation, had voted to replace the present body, on which the trade unions, industry and the public are equally represented, and which is charged with having been unduly generous to the steel workers, by an all-public board. But it gave way in conference, and the board will continue to be constituted as it was, though its members must win Senate confirmation, and it loses its power to intervene in industrial disputes or issue general orders for wage increases.

Break in the Steel Clouds

The House agreed with the Senate that the President should use the powers he already has to deal with the steel strike before being given new authority to seize the steel plants, and in the renewed Defence Production Act Mr Truman is therefore requested to invoke the Taft-Hartley Act against the steel workers. Reluctant as he is to accede, he will soon have no alternative, for industry is being slowly strangled by the month-long stoppage, affecting about 87 per cent of the steel mills and cutting off 1,900,000 tons of steel each week, and will be choking to a standstill if no settlement comes in the next few days. Defence as well as civilian work will be stopped; tanks and trucks for the army have already been seriously affected. For the agreement made between the representatives of the companies and the union in Washington, that steel for military purposes should not be held up, did not survive the attempts to work out its details in the steel towns. Trade unionists felt their position would be

weakened by any resumption of output and managers knew that such partial operations could only be at a loss.

Meanwhile, however, hopes of a settlement are beginning to appear. It is largely because Mr Truman knows they would be clouded over if he used the Taft-Hartley Act that he is postponing as long as possible the request for an injunction against the strike. Before the stoppage began, stocks of steel were substantial; the industry did not expect to be working to capacity much longer and doubted if consumers would pay the higher prices that are considered an essential part of any settlement. Now it will be next year before the effects of the strike cease to be felt by consumers, and as a result the steel companies are no longer afraid of a price rise—although the government price controllers are not yet ready to allow the \$5 a ton that is wanted. The union, with its members also feeling the pinch, is on its side now prepared to make concessions on the union shop question, the main issue outstanding.

During the past ten days, contracts have been signed with a number of small steel companies, and some time ago an agreement was apparently reached with the Bethlehem Steel Company. This would not have been the first time that this firm had led the rest of the "Big Six" into a contract, but on this occasion it felt bound to consult them first and they found that there was still an unacceptable element of compulsion in the compromise on the union shop. Soon after, however, the Pittsburgh Steel Company, an important producer although not one of the six giants, did accept the terms offered to the Bethlehem Company and a possible pattern for a settlement can now be discerned. New employees would be required to join the union when they enter the shop, but would be given an opportunity to resign after three weeks without losing their jobs. Wage increases under the Pittsburgh contract depend on those reached eventually with the industry as a whole; it appears to be accepted that these will probably involve a rise of about 22 cents an hour altogether.

The Bars Stay Up

President Truman's message vetoing the McCarran-Walter Bill was one of his best, and an impressive indictment of the restrictive ideas on immigration the Bill perpetuates. But he failed, though by only two votes, to rally the support needed in the Senate to uphold the veto. It was the first time Congress had overridden a veto of a major piece of legislation since the Taft-Hartley Act became law. Five presidential candidates, four of them Democrats, were off campaigning. Fair Deal Democrats and a handful of progressive Republicans could not withstand the coalition of southern Democrats with the bulk of the Republicans. In the House seventeen votes more than the two-thirds majority necessary to override were secured.

The new Act comes into effect in six months. No one denies that it makes some changes for the better. Race, that is Oriental race, will no longer be a bar to obtaining American citizenship and every free country in Asia will now be entitled to an immigration quota of 100 a year, though this is even less generous than it looks. But the Act also makes changes for the worse. Prejudice and distrust of anything foreign are reflected in the dangerous ease with which it will now be possible to exclude or deport individual aliens, under standards as vague, and as subjective, as a "purpose to engage in activities prejudicial to the public interest."

The real count against the Act, however, is one of wasted opportunity. Its sponsors spent three years and over half a billion dollars codifying restrictive laws which do not reflect the ideals or meet the modern needs of either the United States or the free world. Only 154,658 immigrants, some 300 more than at present, will be admitted each year. The continuance of a quota system based on Nordic superiority and the national origins of the American people in 1920 is embittering to many of America's new and faithful allies. The Turks, for example, may die bravely in Korea, but they are entitled to an annual quota of only 225. The refusal to allow unused quotas to be transferred means that many refugees unlucky enough to have been born in eastern or southern Europe must give up any hope of ever building a new life in the land of the free, unless special legislation is enacted. It was Mr Truman's very reasonable suggestion that a bi-partisan commission might have been appointed to devise a more rational and humane immigration policy, in keeping with America's traditions, with its new leadership of the free nations, and with its need for manpower.

To Senator McCarran, the veto was "un-American." Minor alterations had been made in the Bill to induce the President to approve it; pressure had been brought upon the State Department and the Department of Justice to ensure that they would advise the President to sign. Mr Truman was courageous enough and astute enough to refuse. This is one of the regrettably rare cases in which right and political advantage manifestly march together. The veto puts the Administration on record against discrimination. And Mr Truman is convinced that the votes of minority groups, welded together, can make a decisive contribution to a Democratic victory in November.

Transatlantic Tourists

The bouquets showered on the United States Lines' fast new luxury liner, the *United States*, on her debut this week included one heavy brickbat, President Truman's request to the Attorney-General to investigate whether the government subsidies of about \$45 million, which made the building of the ship possible, had been unduly large. These subsidies were intended to cover the difference between foreign and American shipbuilding costs, and the special features that enable the vessel to become a troop carrier in time of war. They do not apply to such refinements, difficult to justify to anyone but publicity experts, as a special type of freezer, producing ice "unique in its purity," and the

most luxurious dog kennels ever designed, air conditioned and in dimensions suited to all sizes and shapes of "canine passenger." From now on the ship will be carrying 2,000 passengers from New York to Europe every fortnight, and when, later this season, new French and Dutch vessels also come into service, there will be a substantial alleviation of the perennial postwar shortage of all but luxury transatlantic passenger space.

The difficulty of obtaining accommodation on ships and aircraft during the summer season has been one reason why the number of Americans coming to Europe, and therefore the amount earned by the tourist industry, Western Europe's largest single source of dollars, has been less than they might have been. Even this year, when all records are being broken and the season has been extended at both ends, only about 400,000 Americans are expected to cross the Atlantic for pleasure, very few more than in the previous peak years of 1929 and 1930. Yet since then the population has increased by 35 million and the annual national income has nearly tripled. It is calculated that, if the same percentage of the population visited Europe now as in the last period of prosperity, the European tourist industry might double its present contribution, of about \$500 million a year, to the reduction of the dollar deficit.

Another reason why a smaller proportion of Americans are going to Europe now is that far fewer of them came from there in the first place. In 1929 some 60 per cent of American visitors were returning to the lands of their birth, now the proportion is far lower. A third reason has been fear of war, particularly strong in 1950 and 1951, but less acute this year. The main deterrent to European travel has, nevertheless, undoubtedly been the high cost of the journey. A magazine survey has estimated that about 45 per cent of Americans would like to spend their holidays in Europe but only about 5 per cent can afford to do so. However, many of them are already taking advantage of the new air tourist service, and it may not be long before half the Americans going to Europe fly there. At about \$500 for the round trip this is not yet as cheap as the tourist class fare by sea, but it is so much quicker that it makes even a fortnight's holiday worth while.

Shorter Notes

Hopes that the United States would bring its customs procedures up to date and would carry out its obligations under the General Agreement on Tariffs and Trade have been lost in the rush of business before the close of the Congressional session. The Senate, influenced perhaps also by the increasing protectionist sentiment among certain American manufacturers, has indefinitely postponed consideration of the Customs Simplification Bill already passed by the House last autumn.

Congress has rewarded its favourite service, the Marine Corps, by taking it from under the wing of the Navy and establishing it as an independent fourth service. The Corps is not, however, to be permanently represented on the Joint Chiefs of Staff, although its Commandant will sit with them whenever matters directly concerning the Corps are discussed. The Bill passed last week also sets the minimum strength of the Corps at three divisions and three air wings. The present strength of the Marines is about 237,000 officers and men, slightly below the full combat strength of 260,000 envisioned in the Bill.

In extending the wartime powers of the President until April 1st, Congress eliminated twelve of the controversial clauses, including the authority to seize railway and other transport facilities. The Bill as finally passed contains 48 of the 60 emergency powers that the President held until an official state of peace was reached when the United States ratified the Japanese treaty.

going
great
guns

ONE of the most effective pieces of ordnance in use at Trafalgar was the Carronade — from the Falkirk foundries of Carron Company. Today the diversity of Carron Company's manufactures ranges from cooking appliances to colliery haulage gears. They have on their books some 8000 'live' customers, 2000 suppliers and 2500 employees. The wages,

ledger and analysis work involved in this complex organisation is handled by a Hollerith installation. Payroll work can be accomplished in 10½ hours a week. Purchase Ledgers and Analysis are straightforward jobs for punched card mechanisation. Sales Ledger work involves the preparation of between 3000 and 4000 monthly statements, and this occupies the installation for one day only per month. Carron Company's is by no means a large Hollerith installation — yet by skilful planning its one Sorter, one Balancer and one Tabulator carry the burden of producing all the accounting and statistical data that the Company's Management requires.

CARRON

THE ROYAL CHARTER COMPANY FOUNDED IN 1759

Would a better
Canteen help production
in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

THE WORLD OVERSEAS

Outlook for a German Army

IT is still uncertain whether Germany will ratify the convention replacing the Occupation Statute and the treaty setting up the European Defence Community. The first reading of the treaties by the *Bundestag* has been fixed for next week; and after committees have worked on them, the crucial final readings are due to take place in the first week of September. But the Upper House has also to debate them, and there Dr Adenauer's chances of a majority hang by a thread. Above all, the Supreme Court has to make its decision on the constitutional issue. Nevertheless, the embryo Ministry of Defence in Bonn, under Herr Theodor Blank, is working on the assumption that the EDC will exist next February. The interim committees of the community started work in Paris this week, the German military delegation being led by ex-Generals Speidel and Heusinger.

The size of the peacetime German contingent and the rough timetable for recruiting and equipping it are now known. There are to be twelve German units, comprising altogether about half-a-million men. The units, or divisions, will be formed in the first place out of the cadres of professional soldiers, who will have to be re-trained to use the latest types of arms. About 100,000 professionals will train 400,000 conscripts. As soon as the EDC treaty is ratified, a conscription law will be introduced. Two age groups will have to be called up, as allowance has to be made for men to be rejected for one reason or another. According to the present constitution, the conscription law will have to exempt conscientious objectors. A large number of Germans will certainly claim exemption, but few will be able to prove that their pacifism is more than a determination not to be killed, or have sons and husbands killed, "for foreign interests."

According to the EDC treaty, the twelve German units should be set up by 1954. This programme will not be fulfilled, as it presupposed that the treaty would be ratified by the end of August. Assuming that the treaty comes into operation next February, the German experts estimate that their first three or four units will be trained and equipped by October of next year; but this, too, is an optimistic forecast, which presupposes that there will be no hold-up in American supplies of equipment.

The basic unit in the land forces of EDC will be a group, corresponding to a division. An infantry group will consist of 13,000 men (to be increased in time of war); tank groups will consist of 12,600 men and mechanised groups of a like number. The army corps will normally be formed out of three or four such divisions of different nationalities and will have an integrated multi-national staff. With auxiliary services, an army corps will not exceed 80,000 men.

The basic unit of the air force is to be "half a brigade," that is, 1,200 to 1,800 men and 75 aircraft. Its equipment will be homogeneous, but it will have no logistic support. These units will be integrated into a tactical air command consisting of several half-brigades of various nationalities. At the higher level of integration will come the "tactical air force" and the various auxiliary services will be joined together under this force. Thus, the services will not be attached to the national units, but to "integrated superior echelons." Naval forces will be in basic national units only, linked under a common command.

The cost of setting up and maintaining Germany's twelve divisions has been estimated by Herr Blank at DM 40 billion

and by American experts at DM 30 billion, or over \$7 billion over the next three years. The Americans have agreed to supply almost all the heavy equipment needed for the first three or four divisions, as well as DM 200 million of light equipment. This will be passed on to the Germans in accordance with the programme of the Supreme Command (Shape). The former occupation powers will also lighten the Germans' financial load by allowing the use of their airfields in the Federal Republic. It can be said that the Federal Treasury will in the first stage of rearmament only bear the cost of maintenance of the German troops. In addition, however, the German defence contribution will include payments up to June 30, 1953, for the cost of maintaining non-German troops on German soil.

Bonn Let Off Lightly

Altogether, the Germans have undertaken to pay DM 850 million a month for all defence expenses, to the end of June next year. The question whether they are getting off lightly or not can best be answered by considering the amount which has been allocated to defence, including occupation costs, in the current German budget. This is only DM 8.8 billion (£800 million) out of total estimated budgetary expenditure of DM 24 billion. This means that for the current German financial year, only 8 per cent of the gross national product, taken at factor cost, is to be spent on defence. (This figure is reached by taking the official German estimate of the gross national product at factor cost for 1952-53, which the Three Wise Men of Nato considered to be much too low.) For the time being, therefore, the Germans have no cause for alarm. The gross national product is going up continuously, even before any armament production has begun. The Minister of Finance, Dr Schäffer, has given an assurance that defence costs will be borne without either cutting social welfare expenditure—which is, in fact, being increased—or creating inflationary pressure. The contribution of each country in the EDC will be fixed by a common budget, but not before 1954. In the meantime, there will be an effort to co-ordinate expenditure as far as possible.

Industrial circles in Western Germany are extremely anxious to know how the EDC provisions affect them. So far the outlook is confused. The EDC treaty lays down that certain weapons shall not be produced in strategically exposed areas. In theory this would cut out Germany, but if necessary this clause can be waived. The Federal Government's convention with the occupation powers removes all restrictions on German industry; but a letter from Dr Adenauer undertakes that it will not produce certain categories, including large warships, atomic weapons, guided missiles and military aircraft—provided the German forces receive arms as good as those of the other members of the EDC. The Bonn Government and the heavy industrialists are much more anxious to expand exports than they are to produce arms. Moreover, it is only a short time ago that the heads of famous armament firms were imprisoned by the Allies; and they are hardly likely to forget or forgive this treatment.

Nevertheless, it is fairly certain that some German plants will produce some types of weapons. One factor which will tend to foster a new arms industry is the Germans' deter-

mination that their troops shall have the best weapons, and their conviction that some American equipment is not so good as that used by the *Wehrmacht*. They are sure that some German infantry weapons are superior to anything produced elsewhere, and German tanks used in the latter part of the war are also thought in some quarters to be better than anything the American forces have on show in Germany. But it is realised that at the outset America must be relied upon to provide heavy equipment, if only because it would take at least two years to produce German tanks.

When Europe Orders Arms

The EDC Commissariat, or European Defence Ministry, will, according to the treaty, decide all such matters. It is supposed to work out an integrated plan of standardised production. The Commissariat's order for the whole Community will be placed not through national ministries, but through local branches of the Commissariat. The Germans are waking up with misgiving to the fact that an important influence on the economy of each member of the EDC will be exercised by this supra-national organisation. As a consolation, German officials point out that the treaty undertakes to consider each nation's individual economic needs. But the fear is growing that the Commissariat of the EDC, as well as the High Authority of the Schuman pool, will develop into a super-planning bureaucracy.

Very large expenditures will be involved in the Commissariat's orders. Eighty-five per cent of each country's allocation for defence is to be spent internally; but the remaining 15 per cent may be spent elsewhere. In addition, the US Mutual Security Agency will place orders, either for American forces or as "offshore purchases" for other members of Nato. Germany, with unused manpower, technical skill and factories which are still capable of expansion, is in a unique position to fulfil Nato and EDC orders—if the Germans are willing. So far, however, only the textile manufacturers and other producers of goods of a semi-civilian nature are really eager, and many are antagonistic to the prospect of turning over their factories at great capital cost to the production of arms.

Gains for the Dutch Labour Party

[FROM OUR CORRESPONDENT]

PEOPLE used to think that Dutch politics, with its proportional representation, its coalition governments, its slow-running national character, would never show big surprises. They got the shock of their lives on June 25th when the general elections gave Dr Drees's Labour Party 30 instead of 27 seats of the hundred available in the Dutch Parliament. This gives it as many seats as the centrist Catholic People's Party, and represents a larger number of votes; so that Drees, as outgoing Prime Minister, has already been invited to form a new cabinet.

Until June 25th almost everybody had expected Professor Romme, the leader of the Catholic People's Party, to be the next prime minister. His party, at that time holding 32 seats, was thought to be for a long time to come the largest one, mainly owing to the birthrate in the catholic provinces of southern Holland, and to his juggling—so far successful—to keep the majority of Catholics (38 per cent of all Dutch belong to the Roman-Catholic Church) in one party. This policy was already threatened after the war when the pre-war Social Democrats joined hands with a number of left-wing Protestants and Catholics to form a Labour party more or less on the British pattern: wide, anti-marxist and defi-

nately not anti-religious. During the Indonesian struggle Catholic unity was threatened from the right wing. Hr Welter, a former cabinet minister, rallied a few conservative Catholics in a split-off party which wanted to keep Indonesia as "the Dutch East Indies." Neither of these tendencies was strong, however, until at these last elections a considerable number of Catholic votes split off from Professor Romme's unity party, helping Labour to jump from 27 to 30 and Hr Welter's party from one to two seats. Part of this movement was no doubt caused by an internal rift in the Catholic People's Party, where a junta of integralist theorists and reactionary businessmen had made a bid for party leadership. This caused visible distress to Catholic trade unionists, who saw their rank and file already swinging left, out of the People's Party (and the unique Dutch phenomenon of a Catholic TU Congress) and into Labour's ranks. Whether this present shift is caused simply by this tug-of-war inside the People's Party or is due to underlying trends of a more permanent character remains to be seen.

Shifts to Right and Left

It is an established fact, however, that there was not only a shift to the left, but also a shift to the right; indeed, there were several shifts. First, Labour gained from the Communists, who slipped farther down to six seats (eight in 1948, ten in 1946). For this, presumably, the fair weather and the temporarily low unemployment figures are as much to be thanked as the growing disgust with Stalinist slogans. Secondly, the Catholic People's Party lost a considerable number of votes to Hr Welter's party, which is not only reactionary as far as Indonesia is concerned, but also lures many a conservative businessman away from Professor Romme's fold. Last, and not least, the Liberal party "For Freedom and Democracy," whose one representative in the cabinet, the foreign minister, Hr Stikker, became well known as chairman of the OEEC, got nine seats, one more than in 1948. It must be borne in mind that these Liberals are about as liberal in the English or American sense of the word as the French Radicals are radical—that is to say, not at all.

BUSINESS ABROAD

The Economist Intelligence Unit issues reports every three months on economic and commercial conditions in 43 countries:

Argentina	Denmark	Kenya	S. Rhodesia
Australia	Egypt	Malaya	Spain
Belgium	Finland	Mexico	Sweden
Borneo	France	Netherlands	Switzerland
Brazil	India	New Zealand	Turkey
Burma	Indo-China	Norway	Union of
Canada	Indonesia	Pakistan	S. Africa
Chile	Israel	Persia	Uruguay
China	Italy	Philippines	U.S.A.
Colombia	Japan	Portugal	Venezuela
Cuba	Jugoslavia	Siam	W. Germany

The reports are designed to provide in concise form, with a comprehensive statistical appendix, the information required by those with business interests abroad. They are obtainable by annual subscription or singly.

Further particulars from:

THE ECONOMIST INTELLIGENCE UNIT

22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1

Their political descent is from the French revolution (and from German liberal professors in the first half of the 19th century, incidentally), but their present platform is typically "the revolt of the taxpayers": lower taxes, freedom for business, keep the trade unions back, and so on. Thus, the slight swing in this direction must be counted as "right-wing" too.

Threat of Unemployment

Summing up, it is not easy to say what the "lesson of the elections" exactly is. Labour's gains will no doubt mean a strong emphasis on social policies like housing and social security, on a wages policy guided by the trade unions (although since the war the Dutch trade unions have used their influence with commendable restraint), and, particularly for the next winter, on policies to maintain employment. It is predicted that there will be 200,000 unemployed by then, and drastic steps must be taken to prevent the number getting so high, and to lessen the consequences for the unfortunate unemployed. A special commissioner for employment policies, with some coordinating powers, has just been appointed by the outgoing cabinet. The cabinet itself will probably again consist of half a dozen Labour people and half a dozen from the Catholic People's Party, with a sprinkling of men from smaller parties. It is improbable that the Liberals will be acceptable in a cabinet dominated by Labour, but there is just a chance that a few people from the Protestant right-wing parties may join.

No foreigner, on having the Dutch political parties explained to him, can learn enough to pretend to understand the hairsplitting, and to some people hair-raising, differences between these two parties, one being called anti-revolutionary because it thinks the principles of the French revolution slightly diabolical and the other Christian-Historical because it thinks history divinely inspired up to about the same time. To the unsophisticated outsider the anti-revolutionaries, who lost a seat, are more conservative; and one expects the new cabinet to be joined by one or two from the Christian-Historicals, a party in which practically all shades of political opinion, from reactionary to progressive, are represented.

There is always the chance, of course, that Labour will insist on a programme which proves unacceptable to all right-wing parties and, perhaps for that very reason, also to the Catholic People's Party. In such a case a situation can arise in which Labour goes into opposition; but it is evident from Professor Romme's public statements that he would not particularly like a coalition of his party with right-wingers and without Labour, in view of the further drain of Catholic trade unionists who would then tend still more to vote Labour.

Changes in Foreign Policy

Whatever happens, there will probably be some change in Holland's foreign policy. In the first place, Professor Lief-tinck, Labour's much-criticised but generally respected finance minister, will not return, as he is going to Turkey for the International Bank, and Hr Stikker also has announced long ago that he wants to leave the foreign ministry. He has frantically tried to keep this department under one hand, but rumours say that either a separate ministry "for European Affairs" (whatever that may mean) is under consideration, or a division of work between one minister and several under-secretaries—instead of the one for East-Asian affairs Holland now has.

More attention to European integration is possible, although Dr Drees is known to be as sceptical about quick-integration illusions as Hr Stikker always was. Much, of course, depends on the choice of persons, and the only thing which can be predicted is that Holland will move in the direction of European unity—perhaps slowly, but with an inevitability which is presumably evident to any candidate for the ministry of foreign affairs.

Lean Years for Israel—II

Defeating the Deficit

AN article in last week's number of *The Economist* described how the Government of Israel is attempting to combat one of its two major enemies—inflation at home. The second enemy, the onslaught of which is reinforced by the first, is the deficit in its foreign trade. Unless the efforts to combat inflation at home are successful, imports cannot be paid for. And for imports to Israel do not merely mean so much rise or fall in the standard of living; they are the bricks and mortar for building the industrialised and mechanised economy which alone can bring economic survival.

Those measures which mitigate inflation also contribute directly to the balance of international payments. The limitation on immigrants contributes directly, inasmuch as every 100,000 new entrants add £1 10 million to the import bill or subtract £1 10 million from the goods already available to the rest of the country, without, to begin with at least, adding anything to the sum of domestic production. In 1951, there were 174,000 new entrants; in 1952, on present reckoning, there will be no more than about 75,000. Secondly, there is the government's reluctant decision to modify the social standards of the new state. Any country which is maintaining a high standard of social service by inflationary methods of finance is inevitably stimulating any natural unbalance in its overseas payments. Thirdly, there is the specific remedy adopted in the differential exchange rates, which should in theory weaken the demand for imported goods, some of which cost in consequence twice as much as before.

A glance at the balance of payments on this page, is enough to show how fragile is Israel's lifeline and how delicate the balance which must be struck.

ISRAEL'S BALANCE OF PAYMENTS 1950
Provisional Figures for 1951, and Estimates for 1952
(£1 Million)

Total.....	113.4	124.0	130.0	Total.....	113.4	124.0	130.0

* Provisional. † Estimates.

In 1951, physical imports totalled £1 116 million, or about £1 24 million more than in the preceding year. In 1952, they are estimated at £1 120 million, and this may be taken as an irreducible minimum, below which the construction of the state of Israel would be severely prejudiced. Those who would make light of Israel's predicament must remember two things; first, that the small rise in imports between 1950 and 1951 covers not only the rise in world prices but also an increase in the non-productive population of nearly 200,000; secondly, that Israel is importing, and making conscious efforts to import, an abnormally high proportion of producers goods. There is little fat in the projected import programme of £1 120 million for the current year, and conditions for the Israeli consumer are already lean.

The prospects of raising the £1 130 million with which to pay for basic imports, freight and invisibles are uncertain. The balance in 1951 depended, and in 1952 must continue to depend, on several variables which have little if anything to

do with physical effort inside Israel. One of the chief of these is the continued charity of American Jewry. In 1951, the United Jewish Appeal (UJA) raised £1 15 million. In 1952, it is estimated to raise the same. Whether this figure is reached or not, there is no doubt that the friends of Israel in America are increasingly anxious to see the bottom of the pit into which they are pouring their bounty. Their contributions, as those of potential bond-holders in the Israel Bond Issue launched in the United States, will be closely related to the success or failure of the Israeli Government in producing some signs of economic stability at home.

Then there are the two loans from the Export-Import Bank, of which \$35 million remain. This balance is little more than half the drawings in 1951, and servicing starts this year. On the other hand, the US Government grant-in-aid only begins to come into full effect during the current year. The sterling balances, a once important source of painless earnings, are now finally exhausted by the last drawings early this year. And "imports without payment," another major item on the credit side (down for £1 19 million in the current year) have their own snags. One effect has been to help to depress the free Israeli pound to the point where it can no longer be sold at any price on the European exchange markets. The government clearly believes that the system has other effects which make it worthwhile; but it is retained at a price.

Finally, there are the physical goods themselves. Nature has for once smiled on the oppressed, and there has been a bumper grain harvest—four times the 1951 crop and three times the average yield. This means lower imports of food. In 1952, for the first time, Israel should have to import no feeding stuffs; it is already self-supporting in dairy produce.

Prospects of Scraping Through

Shortage of sterling will be Israel's greatest single problem in its current trade. In 1947, Palestine-British trade was not too far from balance at £1 17 million to £1 13 million. Then came the war; more than half the citrus groves were destroyed; the potash mines closed, and there was no income from Haifa. In 1951, Israel ran a deficit in visible trade with Britain of over £1 6 million or 50 per cent of its imports from Britain. It paid out of its sterling balances. In 1952, it must still import much the same amount (£1 8 to £1 10 million out of the £1 12 million is for oil) and it has no balances left. Mr Horowitz of the Israel Treasury came to London last April to seek Mr Butler's help, both financially from the Exchequer, and, morally with the oil companies. He was offered no ready answer, and he left with £1 6 million still to find.

So much for the immediate future. A tough struggle and an imperfect result; but if American Jewry repeats its usual generosity, Israel will just scrape through in 1952. For the more distant future, all that can be said is that the remedy is slowly passing more into Israel's own hands. Agriculture in Israel is growing stronger and that particular drain on foreign exchange proportionately weaker. By 1955, if the government's target is fulfilled, Israel will grow enough food to support 2 million people except for bread grains and meat. Already the springs in the north and the new tractors in the Negev are being harnessed to the production of Israel's food more efficiently than ever before. Two new factories for steel and concrete water-pipes are already helping to channel more of Israel's water southwards to the desert areas. In contrast, the mineral deposits underneath the desert and in the Dead Sea are more often talked about than they can be counted on as a source of salvation. Despite a draft oil bill before the Knesset this week, no oil has yet been found; potash and phosphate deposits at Sdom will for some time cost more foreign exchange to work and carry than they can earn in exports.

There are, however, two other major factors in its favour. The first is the falling trend of world prices, which, for a

country which depends so largely on imports, and imported raw materials in particular, will help to tip the scales in the right direction. The second factor, of overriding importance, is the German debt. As yet there is no settlement; but any settlement that was acceptable to Israel would inevitably include substantial currency-free imports of German goods.

Less Aid from America

On the debit side, however, the worst is by no means over. Apart from the new charges for loan servicing and the perils of the "import without payment" system, there are continually new problems in the making. In the first place, there are Israel's own exports, at the moment no more than 15 per cent of the total outgoings required. To raise this percentage to anything approaching a balance on visible trade will take a long time and heavy investment, both local and foreign. For it means building new industries, planting new trees, and constructing new ships and communications. It also requires a steady market for the semi-essential goods that are likely to be Israel's staple manufactures; and that market, in the present state of world demand, is no longer a certainty.

Then there is the bonds drive in America, which is scheduled to raise £1 20 million in dollars in the current year. Though the \$500 million issue was intended to be taken up over a period of three years, the cream of the contributions comes in the first flush; only £1 20 million was collected last year and the rest will be much slower, harder work. Finally, there is the attitude of the world at large to the struggle of Israel and to the fate of Jewry. In America, where Israel's most influential friends reside, the enthusiasm is no longer fierce or fresh enough to withstand the effects of a possible slump; the downward trend of the UJA is warning of this. Lastly, there is always the danger of new programmes in other

Yesterday's business,

tomorrows prospects,

today's

FINANCIAL

TIMES

Men who mean Business read

THE FINANCIAL TIMES

every day

parts of the world, and new effluxes of refugees from Europe or the Middle East who must be absorbed and paid for.

The future, then, is not secure. It cannot, for a long time to come, be secure in the sense that exports and invisible earnings will balance the cost of essential imports. In spite of all progress at home, Israel must continue in the coming years to rely on factors outside its control. The chief of these is the attitude of the US government and of the Jewish community, in the United States. There, it looks as though the state in adolescence will inevitably evoke less enthusiasm than the state in youth. But from Germany, if American aid were to fall away, comes a second chance of a miraculous salvation. If it materialises, it will be no exception to the experience of the past that God seems to provide for his chosen people against all the devices of nature and economics.

Rhee Goes the Way of Chiang

[FROM OUR SPECIAL CORRESPONDENT IN KOREA]

THE resemblances between President Rhee's South Korea of 1952 and President Chiang Kai-shek's China of 1947-48 are strong, increasing and alarming. Inflation, corruption, bribery, government monopolies, martial law and now the mass arrest of political opponents are all symptoms and conditions of a national sickness that may well become mortal. They threaten the undefeated United Nations soldiers on the battlefield with civil collapse and betrayal in the rear.

The devoted economic representatives of the United Nations—UNCACK (U.N. Civil Assistance Command in Korea), on the tactical and "do-it-now" level, and UNKRA (U.N. Korean Relief Administration), on the strategic long-range level—are fighting a gallant rearguard action of resuscitation. It appears at the moment to be the only hope for South Korea's survival as a nominal democracy. This is the real crisis in Korea, overshadowing even the threat of a new offensive from the north, and certainly eclipsing the wretched muddle over military police efficiency in Koje Island, which was cleaned up as soon as a suitable and efficient commandant was appointed. As in Nationalist China, local merchants are refusing to accept Korean money in transactions with Americans: the biggest note in circulation (1,000 won) is worth only six cents on the free market. The traders demand U.S. military currency—which is illegal, and can be cancelled by a fresh issue—or greenbacks. The retail price index, with the figure for January, 1948, representing 100, had risen to 328 when the war began two years ago. In mid-May it had soared to 6,026. Trade restrictions are as harsh as those that throttled Chiang's import-export commerce. Despite the protests of UNCACK, tariffs are barring the entrance of urgently needed machinery, trucks and repair parts. Forced sale of national bonds, again to the Chiang pattern, is also hamstringing business: importers must buy bonds amounting to 25 per cent of the duty on all imports. Most of the real trade has accordingly passed to smugglers.

Scandalous Corruption

The scandals of misappropriation in the South Korean army, of misuse and open theft of American supplies (most of the official South Korean police jeeps in Seoul have been stolen), of black-market trafficking in military commodities, of adulteration of locally made munitions like grenades bought with U.S. dollars—all these shameful crimes have accumulated and multiplied during the uneasy lull of the Panmunjom talks. Like Rhee's arrest of political opponents in defiance of United Nations protests, they must apparently be either ignored or philosophically accepted as the price of alliance by the harassed United States command. At the

height of the Rhee *coup d'état* in Pusan it was compelled to make a public apology, through some luckless young lieutenant in Psychological Warfare, for a radio utterance that was construed as "an intrusion into South Korean national affairs."

Despite this explosive and still deteriorating situation, the able and realistic directors of UNKRA and UNCACK, hampered and discouraged on all sides, persist in their planned work of amelioration with enthusiasm and success. In the most disheartening circumstances, they are resettling on their former farms more than 1,700,000 South Koreans displaced by war and guerilla activities, while providing relief for more than three million refugees.

A typical case is the Pak Ki Su family from the war-devastated village of Suongham-ni. Pak, 52, a farmer, his wife and two daughters fled from their three-quarter-acre farm in May of last year and have since lived on U.N. help in a refugee camp near Kwanju. Last month the area around Suongham-ni was declared "safe from guerilla molestation" and the Pak family, equipped with blankets, clothing and a 14-day supply of rice, was transported by UNCACK truck to the site of their farm. The village which had once housed 350 persons was just blackened ruins; but Pak found many of his neighbours back at work and, waiting for him, 200 board feet of lumber, nails and cement, all supplied by the United Nations. He dug out the foundation stones from the pile of rubble that had been his home and, while his wife mixed mud with straw to form the mortar for the walls of their new home, his daughters scoured the countryside for long-stranded grass for the roof. Within 10 days, the Paks had moved from the army tent, in which they had been living, to their new home, and Pak attacked the year-old weeds on his field with farming tools also supplied by the United Nations. While the community was thus being reborn, a mobile dispensary rolled through three or four times a week, dispensing medicine and checking on inoculations.

Five Year Plan

Assuming that an uneasy peace will come, or that at least the invaders will not strike farther south, Sir Arthur Rucker, deputy agent general of UNKRA, envisages a five-year plan to establish a balanced economy for South Korea, founded on agriculture, fishing and mining. He makes the fundamental point, however, that this economy cannot sustain an army or an armaments programme. The three main points of the present plan are: firstly, an undertaking to provide from UN sources most of the civilian staff needed to act in an advisory capacity in assisting the South Korean Republic in engineering, agricultural rehabilitation, and welfare work. From 200 to 300 experts will be needed, of whom about 100 will be drawn from the World Health Organisation. Second comes the recruiting of a long-term planning staff, comprising a small nucleus of permanent workers, who will be augmented by transient teams of experts from specialised UN and national agencies.

Third is the planning of a series of relief projects for specialised development, which will be supplementary and additional to the general programme of overall restoration by the Civil Assistance Command. These projects will include chicken-breeding, supply of pigs, goats, seedlings and fishing nets, provision of drills and other mining equipment, establishment of an ore-checking laboratory, a mining school and a language institute. Many industries are starved for capital and advances will be sought from the Reconstruction Credit Corporation. A sum of \$18 million is already available from United Nations funds. UNKRA estimates that projects now in hand and contemplated until the end of the year will cost from 15 to 20 million dollars.

The testing time will come when more funds are needed. If the money is not forthcoming, nothing, it would now seem, can save the United Nations' first experiment in statemaking from anarchy and collapse.

All in the dark, Mr. Andrews?

When the fuses have blown, when the key-hole can't be found, when the lighter runs out of petrol we turn, almost without thinking, to the sure aid of the match. The match is one example among many hundreds in which chemicals by Albright & Wilson, usually anonymously, but so often importantly, serve the world at large. Every match made in Britain and countless millions of others besides rely on Albright & Wilson's phosphorus products for the light they give.

IN THE OIL INDUSTRY

AMONG the problems that oilwell drillers have to solve are the cooling of their drill (which may be three miles or more below ground, at the bottom of a hole only a foot or two wide) and the removal from the hole of the earth and rock that the drill cuts away. The surprising answer to these problems (and to one or two others as well) is — mud. It is special mud, of course — a thick and sometimes rather milky fluid which costs just about as much as milk. It is pumped continuously down the slender, jointed steel tube that drives the drill; it flows through the drill itself, fills the hole outside the tube, and so flows back to the surface, carrying the drill-cuttings with it. The returned mud is sieved, to remove the cuttings, and used again. But if the earth round the hole is porous, as it usually is, the mud may lose so much water by seepage that its circulation cannot be maintained.

Starch for sealing a porous surface

A common way out of this difficulty is to add to the mud some substance that will blanket the porous surfaces of the hole with a more or less waterproof coating. A substance that is widely used for the purpose with ordinary clay muds is common starch. The effect of the starch is to bind particles of clay from the mud into an impervious plaster on the porous surfaces.

The provision of starch in large quantities for the use of oilwell drillers is one example of the kind of service that the Brown & Polson Group performs for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to:

GLOBAL OPERATIONS

SYMBOLIC of Anglo-Iranian's global operations, these Hortonspheres are used for the pressure storage of liquefied butane gas in the Company's refinery at Grangemouth, Scotland. By 1953 the yearly output of Anglo-Iranian's four refineries in the United Kingdom will be some ten and a half million tons. This will increase the country's total refining capacity to twenty-six million tons a year, to which Anglo-Iranian's output will be the largest single contribution.

In Australia, plans are going ahead for the construction of the largest refinery in that continent. Throughout their existing overseas refineries, Anglo-Iranian and its associated companies are rapidly increasing output to meet the world's demand for petroleum products.

The Gold Loss Analysed

BECAUSE of the Chancellor's special statement on the condition of the gold and dollar reserves on June 12th, the customary quarterly statement was awaited with rather less public interest—and certainly less anxiety—than had previously been shown. Yet the close juxtaposition of the two statements makes the latest one the more informative, and the impression it conveys is less reassuring than that made three weeks ago—despite the fact that the loss of gold over the three months proves to be less than it was over the 2½ months.

The net loss of gold and dollars that had occurred between the end of March and June 12th was a "little under £10 million"—say, \$25 million. By the end of June this loss had been reduced to \$15 million. But during the last eighteen days of June some substantial two-way transactions occurred and sufficient is known about them to allow some interesting deductions to be made. Since the gold reserve on March 31st was \$1,700 million, by June 12th it must have stood at about \$1,675 million. It is known that since then a payment of \$47 million in gold has been made to EPU. On the other hand, the Chancellor has now revealed that some \$102 million was received from the United States in this short period. By themselves, therefore, these two transactions would have raised the gold reserve to \$1,730 million by the end of June. In fact, it amounted at that rate to only \$1,685 million, so that it can be assumed that during these 2½ weeks \$45 million (say, £16 million) was lost by the Exchange Equalisation Account in bridging the gap between the supply and demand for dollars in the exchange market, or in meeting official requirements outside the market. This is a serious rate of loss. It is fully in keeping with the behaviour of the exchange market in this period, during the greater part of which the dollar-sterling rate was held only narrowly above the point at which the Bank of England must intervene by providing dollars at its lower "gold point" of \$2.78.

Although the quarterly statement was not presented in its customary form (indeed the Chancellor used the term "deficit" to mean the fall in reserves, whereas previously it has been restricted to the deficiency on gold and dollar account before allowing for special receipts), sufficient information has been given to permit a fair comparison with the longer-term trend. This is shown in the accompanying table. It should be emphasised that the "net deficit" relates to the dollar payments and receipts of the whole sterling area (in so far as those on behalf of its overseas members are canalised through London). It will be seen that this deficit, which had been reduced from the astronomical level of \$940 million in the last quarter of 1951 to \$636 million in the first quarter of 1952, was further reduced to \$216 million in the second quarter. The fact that this latest deficit produced only a small fall in the reserves was wholly due to the receipt of \$201 million net of American aid during the quarter—

a sum equal to two-thirds of the aid that had been expected for the full year 1951-52.

In accounting for the smaller size of the deficit, the Chancellor stressed the fact that Britain had begun to see the effects of its cuts in imports from the dollar area and also of the comparable action taken by other members of the sterling area following the Commonwealth Finance Ministers meeting last January. Doubtless remembering his cross examination in the House of Commons after the June 12th statement, Mr Butler was careful to emphasise that the fall in imports to Britain "has not involved a reduction in the total quantity of stocks of essential imported foods and raw materials." On the other hand, he admitted that the past quarter has benefited from certain seasonal influences. In particular, sales of wool, cocoa and certain other sterling area commodities were especially heavy in this period; no appreciable dollar earnings will accrue from them in the present quarter. Another exceptional factor that must have fortified the reserve during the past quarter—a factor, however, to which the Chancellor did not refer—has been the covering of the short position in sterling as a result of the repayment of sterling credit facilities compelled by the restrictions on such credits ordained by the Bank of England.

If allowance is made for this adventitious and non-recurring influence, and for the seasonal factors, the performance of the sterling area in keeping its dollar deficit for the past quarter down to \$216 million cannot be

GOLD AND DOLLAR RESERVES
In \$ Million

	Net Dollar Surplus or Deficit	US Aid	Net Change in Gold Reserve	Gold and Dollar Reserve at End of Period

1952 1st "	- 636	1	- 635	1,700
2nd "	- 216	201	- 15	1,685

regarded with equanimity; the Chancellor frankly recognises this. He reminded the House of Commons this week of two remarks he had made on June 12th—that "the task before us is long and hard"; and that "we shall continue to take whatever further measures prove necessary to maintain confidence in sterling." The dollar balance of payments is now burdened by the payments on the North American credits raised after the end of the war. These payments fall to be made later in the year; this fact, together with adverse seasonal factors, makes it difficult to envisage here and now that strong upward swing in the reserve that would obviate the need for "further measures."

Particularly is this so as the sterling area has not only to face the strain of its direct dollar payments; it also remains deep "in the red" with the European Payments Union, the gold payments to which are, of course, reflected in the gold and dollar deficits to which the Chancellor referred. The June deficit in the European clearing, the provisional figures of which were published this week, amounts to £17.1 million, which is not reflected in the end-June statement of the gold reserves. This deficit includes £2.4 million due to EPU by way of debit interest on the overdraft maintained by Britain over the past six months, so that the month's net trading deficit was apparently £14.7 million, compared with one of £17.7 million in May and £20.2 million in April. The position is improving—but much too slowly to provide grounds for reassurance. Although the British quota in EPU is exhausted, so that deficits must now be paid as to 100 per cent in gold, the deficit for June will not lead to an equivalent gold payment by Britain to EPU. The actual gold payment will be £8,171,000. This abnormal difference between the deficit and the gold payment is explained by the relief that Britain receives from the special EPU arrangement with Belgium, whereby \$25 million of the Belgian credit to EPU is being converted into a bilateral credit to Britain. This credit is to be repaid by Britain by deliveries of armaments to Belgium over the next two years. This involves an immediate transfer of \$25 million from the Belgian credit balance with EPU to be applied to a reduction of the British overdraft, thereby correspondingly reducing Britain's gold payment this month. This procedure is that agreed at the recent meeting of the Managing Board of EPU and ratified by the

Standards for Steel Development

IN 1945, when the British steel industry drew up its first postwar development plan, the paramount objective was a quick increase in output. The second plan, which is to be published this autumn, again provides for major expansion. The plan proposes that the industry's capacity, already some 17 million ingot tons a year compared with 14 million tons in 1945, will rise to some 20-21 million tons. But this time particular emphasis is being placed upon "reducing costs and improving quality." This need provided ample justification for sending a steel productivity team to America last May. The British steel industry is not unduly humble towards the American steel industry, and does not need to be. But it cannot afford to ignore any lessons it can draw from the latest experience of the largest and most rapidly developing steel industry in the world. And the team's report—which is the longest, the best documented, and on any view the most important of those sponsored by the Anglo-American Council on Productivity—has come in time to set technical standards for the new development, on which £60 million is to be spent annually for several years.

The vast differences in the industrial environments of American and British steel hardly require emphasis. The sheer area of America and the vast investment in transport that it requires, the scale of American industry and oil production and the high domestic consumption of steel in houses and kitchen equipment together provide

Ministerial Council of OEEC. In terms of British gold and dollar reserves, it means that immediate credit is being taken in gold, to the extent of about £9 million, for exports due to take place over the next two years.

Against this anticipation of earnings, however, there should be offset a larger deferred receipt, namely, \$40 million that Britain should have received in the past quarter under the so-called Katz-Gaitskell agreement that guaranteed to Britain reimbursement by the United States of any gold lost to EPU as a result of drafts by EPU members upon their "existing" sterling resources, i.e., balances accumulated before EPU began in mid-1950. No funds were available to the United States Mutual Security Agency to meet this liability last month, but the necessary resources have probably become available upon the opening of the new financial year in the United States. This amount should therefore be received during the current quarter. This sum will be the last of Britain's receipts made under the agreement in question. Even though Britain may incur further gold losses as a result of utilisation by EPU members of what remains of their "existing" sterling resources, the United States' commitment to make good such losses is at an end.

When the tangle of non-recurring and seasonal factors, the best covering and American aid (on the continuance of which reliance should not be placed), has been cut through, it becomes evident that the sterling area continues to run a gold and dollar deficit that does not justify ministerial claims that a position of "equipoise" and of "holding the line" has been reached. Much has to be accomplished before even that result is secured.

the world's largest market for steel. The Lake Superior reserves of high-grade ore, married to the coking coal of Pennsylvania and West Virginia, account for the concentration of 90 per cent of American steel production (or almost half the world's) into the north-east of the United States. The high investment necessary in transport of steel-making materials, the high cost of labour, the standardisation of American demand, and the more rapid and recent development of the industry, have contributed to the concentration of American output, which is six times the British, into large works using large producing units. The older British industry has a considerable investment in a number of steelworks that contain some plant still too valuable to be scrapped, and their layout and balance limits the size and character of new plant. The tempo of development in recent years in the two countries is particularly important. In both, there was little expansion in the twenties. In the late thirties, Britain increased its output by 50 per cent; but during the war, not at all. It was not until about 1940 that American output passed the 1928-29 level; but during the war, with direct and indirect government assistance, its capacity was increased by 12 million tons. Inevitably, America disposes of much more up-to-date plant.

Can technical comparisons between the two industries, then, yield constructive results? Some would argue that as home trade delivered prices for heavy products in Britain average under £30 compared with £35 in the

United States, there is no virtue in comparing the two industries. But that is no answer; international comparisons of this sort are always rather dangerous, and in the case of steel especially so. The time may be approaching when steel will not be so easy to sell. The team has taken greater pains than perhaps any other in devising effective measurements of productivity; its conclusions are summarised in Table I. Briefly, plant productivity in America is on the average 1.5 to 2.8 times as great as in Britain; and as American manning of plant is lower, labour productivity there is twice as high. These advantages no doubt arise largely from factors that could never be made equal in the two countries. Nevertheless, they emphasise the need for some changes in plant and in technique in the British steel industry, in spite of the fact that its labour productivity has already risen by about 24 per cent since 1946.

By far the most important reason for the American margin of productivity comes from size of plant. The average American works making bulk steel has 2.9 times the capacity of the average British; the average steel furnace (basic openhearth) taps 5 to 35 per cent more steel; the average blast furnace has 2.8 times the yearly output. Comparisons of size—or of productivity—are less germane for rolling mills, owing to variations in product. The size distribution of furnaces and works in the two countries in 1950 is shown in the chart. British furnaces making iron for steelmaking still average only just over half the capacity of American blast furnaces operating on comparable ore burdens. In a few years' time, as more of the larger blast furnaces included in the first development plan come in, a considerable increase in average size will take place.

In the United States, blast furnaces and steel furnaces are traditionally driven harder than in Britain; and this higher intensity of operation is the second major factor in higher American productivity. This is made possible partly by an abundance of better materials; in Britain, fuel is more scarce, and the quality of ores is lower than is used in the United States. British fuel consumption in the blast furnace is lower than American, and the driving rate is to some extent limited by the need for economy in coke. The team would probably not advocate that British steel furnaces should be driven at American rates; in steel-making, indeed, the Ameri-

can industry has fewer useful examples to offer the British industry, and in design and instrumentation, the British standard is better. In general, it may be said that the team finds less to emulate in American practice than in American sizes of plant—though America's more efficient maintenance and repair of steel furnaces, and the lower rate of fuel consumption in soaking pits, are

TABLE I. PLANT AND OPERATIVE PRODUCTIVITIES

largely matters of organisation and rate of working. The report says carefully that the American steelworker "does not work harder." The productivity achieved by this American workman is greater because "he has to push his control levers, tap his furnaces and performs the many other operations in his daily duties rather more frequently, and every time he pushes a lever or taps a furnace a larger amount of steel is moved."

*

Since it believes the main American advantage is in size, the team's most specific recommendations naturally concern plant and are directed mainly to the planning of new development. It recommends, indeed, detailed standards for the main units of production, and from these recommends an optimum size of plant for British

conditions. The hearth diameter of a blast furnace, it holds, should not be less than 25 feet for imported ore burdens and 27 feet for home ore; openhearth furnaces using cold metal should tap 150 tons, fixed furnaces using hot metal 225 tons, and tilting furnaces using hot metal, 350 tons. The minimum size for an integrated steel works, assuming two blast furnaces and 65 per cent hot metal, with six to ten openhearth furnaces operating 44 weeks in the year, would thus be 750,000—1 million tons a year, and this accords with the capacities considered advisable for primary rolling mills. For a cold metal steelworks, a range of 500,000-850,000 tons a year might be advisable; but little expansion is likely to take place in Britain in this class of works.

These calculations would imply that the 20-21 million tons of annual output at which the industry is now aiming might best be produced in no more than 30 bulk steel plants. Today, Britain has 40 such plants, producing an average of 325,000 tons a year. Most of its blast furnaces, steel furnaces, and rolling mills, too, are well below the standards suggested; and some of the development agreed upon in 1945 fell short of the capacities now recommended. The plan now being finally drafted involves a large amount of new construction: pig iron out-

COMPARATIVE RETURNS FROM STEELMAKING

put for steelmaking is to be raised to 12½ million tons a year (providing thus 62½ per cent of steel ingots compared with 45 per cent in 1951). Presumably, too, it must accelerate the so far delayed process of scrapping obsolete plant. This planning implies two important things. First, it means the concentration of the industry in a smaller number of plants and extending on those plants. Secondly, it implies that if the steel industry is to be denationalised, the eggs when unscrambled will be very different from those that were originally broken.

But how far can a dual process of expansion and scrapping be carried? That is not a question for the productivity report to answer; but certain of the figures it quotes illustrate the problem clearly. To build a new integrated steel works today, it records, may cost £75 a ton of annual ingot capacity. That means capital charges of, say, £8 or more a ton of steel. Yet its highly approximate but also highly instructive breakdown of steel production costs (Table II) shows that the "balance" over material and labour and transport costs—which includes non-productive wages and salaries, taxation and dividends as well as profits ploughed back—may be only about 25 per cent of the final price—at present prices, about £7 5s. a ton for British steel. The costs, of course, vary widely for different steelworks. But upon such an average

margin, the building of large new integrated steelworks could hardly be lucrative. A cheaper form of expansion by extending existing capacity—for example making Margam, Corby, or Dorman Long larger, rather than building new plants—may be possible, conceivably at £50 or less a ton of annual capacity. In its second development plan, therefore, the British steel industry seems inevitably committed to that policy of "patching" than has brought it criticism in earlier years. To the extent that it can shave costs throughout the iron and steel production processes, it may free itself for more flexible development; but the table also emphasises how

limited a section of costs these processes represent. On the average three-fifths of the total costs of steel may represent materials and coke; inland transport alone accounts for some sixteen per cent of the price. It is natural, therefore, that the industry should be anxious to extend its own control over orefields and coke-making, and should be pressing British Railways for more efficient handling of its materials and products. But it would perhaps have been justified in putting more emphasis upon another point that concerns an outside industry. Iron and steel plant today costs roughly as much in Britain as it does in the United States. Yet the British plant manufacturer probably pays no more for materials and in profits, and his labour—probably the largest component in his costs—earns only a third of American wages. Greater efficiency in this capital equipment industry, cheaper plant, and thus lower capital charges to be borne on the back of steel prices, would make an outstanding contribution to the installation of more efficient plant in the British steel industry—and accelerate the scrapping of technically obsolescent plant that has today, perforce, to be retained.

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Exchequer Deficit

TO some observers of Britain's financial scene, and especially to certain overseas observers, one of the most puzzling of recent tendencies has been the fact that the credit squeeze, despite its undoubted effectiveness in curtailing private credit, has not been clearly reflected in the behaviour of the volume of money as a whole. In the first two months of the current fiscal year, for example, its effects were strongly apparent in the movement of those assets of the banks that mainly represent finance for the private sector of the economy: in this period the clearing banks' advances and holdings of investments and commercial bills dropped by over £130 million, whereas in the similar period of 1951 the first two of these items rose by £43 million and the third item (not then separately disclosed) was probably rising too. Yet in these two months net bank deposits (which form the bulk of the total supply of money) rose by £12 million, to £5,697 million, or by only £30 million less than they rose in April-May, 1951. A broadly similar pattern emerges, moreover, if the comparison is extended to the first five months of the two calendar years. To the knowledgeable observer of banking statistics, this disparity between the behaviour of bank deposits and of these particular assets signifies that the effects of the contraction of bank finance to the private sector of the economy are being substantially offset by an expansion of bank finance to the public sector.

The extent of Government borrowings from the banking system in recent months has taken even well-placed domestic observers by surprise; and some overseas commentators have lately been drawing very sombre conclusions from it, arguing that if the budget were balanced "overall," as the Chancellor implied last March, no such borrowing would occur. The recent scale of borrowing is, therefore, being cited as proof that the budget plans have already gone seriously awry, and that the disinflationary intentions of the new monetary policy are being defeated by the failure of the Government to discipline its own finances. It has been repeatedly argued in these columns that the budget, even in its original form, was insufficiently tough to match the fundamental and longterm need to re-shape the British economy; but it is certainly premature to deduce from the evidence of these few months that the budget forecasts themselves have already been hopelessly falsified. Despite the concessions wrung from him during the debates on the Finance Bill, the Chancellor is still entitled to claim that the broad structure of his budget remains intact. This being so, the important question is whether the increase in Government borrowings means, as the overseas commentators have tended to suppose, that expenditure is seriously outrunning expectations. The Exchequer return for the first quarter of this fiscal year affords a convenient opportunity to examine this question; on this occasion, therefore, it deserves a closer scrutiny than is generally accorded to a statement that is notoriously unreliable as a guide to the outturn of the complete financial year.

Before scrutinising this document, however, it will be well to clear away one possible source of misconception. Even if the national accounts were to be balanced "overall" for 1952-53 as a whole, whereas in 1951-52 they

showed a deficit of about £140 million (an "above-line" surplus of £380 million being swallowed up by the "below-line" deficit), this would not necessarily mean that the Government would lean less heavily on the banking system or other domestic lenders than it did last year. Britain was then running a huge deficit on its external balance of payments, and most of the sterling equivalent of this deficit accrued as overseas finance to the Government (e.g., in return for sales of gold). Now the annual rate of total external deficit is much below the astronomical level attained at the end of 1951, so the volume of finance secured by the Government from overseas has been sharply contracted. Unfortunately, however, the rate of total external deficit in this past half-year has not been smaller, and may have been appreciably larger, than that for the first half of 1951 (when the annual rate was officially estimated at £186 million). The increase in Government borrowings from the domestic banking system over the rate obtaining in the first half of last year cannot, therefore, be attributed to any loss of finance from overseas sources. The explanation has to be sought in the pattern of the Government's domestic finances.

★

The Exchequer return shows that in the three months to June 30 the Government has needed substantially bigger sums for its domestic purposes. Expenditure "above-line," including provision for specific sinking funds, required £1,072 million, an increase of £240 million on the similar period of 1951-52, or only £22 million less than the true increase for which the budget estimates provided for the full year (i.e. before allowing for the nominal relief recorded in the accounts by a new form of accounting of £85 millions of expected Defence Aid from the United States). Nor is this all. The full intentions of the budget, it will be recalled, were not shown in the formal accounts, because the reduction of the bill for food subsidies (by £160 million, to £250 million, in a full year) and the partially offsetting reliefs in the form of increased social payments (£80 million in a full year) were to be accounted later; in the current year they were expected to produce the same net effect as in a full year, i.e. to reduce expenditure by £80 million. If allowance is made for this, the Government's extra expenditure in the first quarter has already exceeded by £60 million the addition expected in the year as a whole (if the item of Defence Aid is left out of the reckoning). On the other hand, the above-line revenue has so far been fortified by only a fraction (actually £25 million)

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

The Economist Intelligence Unit

22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

of the £228 million gain that the Chancellor originally expected for the year. In consequence, the "above-line" account for the quarter shows a deficit of £201 million, instead of the surplus of £14 million shown last year—a deterioration of £215 million that contrasts with the improvement of £46 million envisaged for the year after making the adjustments noted above.

On the evidence so far available, however, there is no reason to suppose that this apparently ominous experience in the first quarter will not be substantially counter-balanced later in the year. Apart from the general consideration that the figures for the first quarter are always a poor guide to the whole year, several special influences are discernible. In the first place, there is no doubt that defence expenditure accounts for a large part, probably more than half, of the £240 million increase in expenditure. During 1951-52 defence outlays were rising fast, whereas now they are tending to flatten out; it is virtually certain, therefore, that the first quarter's spending this year represents much more nearly one-quarter of the year's gross provision (£1,462 million) than it did last year (when roughly £1,110 million was spent). It is evident, therefore, that it must have shown an increase of appreciably more than £100 million. Secondly, the cost of the debt service has risen by £23 million, the sharpness of this rise being partly due to the fact that six months' interest was paid during the quarter on the £1,000 million of Serial Funding stocks. Thirdly, as the Minister of Food explained in the debate on the cost of living on Monday, the major part of the increases in food prices required to achieve the proposed £160 million saving in the annual rate of the subsidy bill has been deferred to enable it to be synchronised with the reliefs. In consequence, the cost of subsidies cannot yet be running much below last year's rate of £410 million; for the year as a whole it is expected to drop to £309 million, and supplementary estimates have now been introduced to reduce the budget estimates to this figure. In addition, there is some reason to believe that the financing of purchases has temporarily raised the working capital requirements of both the Ministry of Food and the Ministry of Materials.

Finally, it should be noted that the biggest element in the expected revenue gain is one that will not accrue until later in the period; an additional £137 million was estimated for profits tax, which so far has provided only £9.7 million more. The yield from income tax, at nearly £46 million more for the quarter, appears, however, to be well up to expectations (£135 million more), despite the fact that the quarter has borne for PAYE wage-earners (though possibly not for all salary earners) its full proportionate share of the reliefs granted in the budget. Two sources of revenue, however, do seem to be lagging; customs and excise, from which an additional £64 million was expected for the year, have so far gained only £4½ million, while death duties, expected to fall by £8 million, have already fallen by nearly £13 million, or by 25 per cent.

On the whole, it seems reasonable to conclude that these special influences explain at least three-quarters of the apparent deterioration in the above-line account. The unexplained margin of perhaps £50 million is obviously too small to form a basis of any firm conclusions about the year's trends. On the other hand, it should be noted that the position contemplated in the

budget will, in any case, be worsened by the payments required to implement the Danckwerts award to the doctors (the net cost of this, according to a further Supplementary Estimate this week, will be £35.6 million—subject to tax) and by a further £13 million, representing the estimated cost, in this current fiscal year, of the recent concessions given in purchase tax rates and "D" levels.

Unfortunately, however, the deterioration in the above-line account explains only part of the additional pressure of governmental borrowings from the banks. Net expenditure "below-the-line," which in the full year was expected to drop by some £18 million to £506 million, has risen during the quarter by nearly 25 per cent—from £123 million to £154 million—principally because of the violent increase in new lendings to local authorities, which during the quarter have absorbed fully one-third of the £360 million (against £365 million) they were expected to require in the full year. In consequence, the Exchequer account as a whole shows a deficit of £355 million, compared with one of only £109 million in the first quarter of 1951/52 and with a budgeted deficit of £80 million for 1952/53 as a whole (again excluding Defence Aid). Moreover, whereas last year virtually the whole of the first quarter's deficit was financed by net borrowings outside the banking system (principally against tax reserve certificates, which yielded £81 million net), in this past quarter encashments of tax certificates and small savings have appreciably exceeded the new subscriptions.

By comparison with last year, the deterioration under the three heads of tax certificates, savings certificates and defence bonds amounts to no less than £115 million. Last year, of course, receipts from small savings were still feeling the stimulus of the new securities introduced in the previous February, whilst this year all three securities have been suffering from the competition of the higher yields obtainable in the market. As a Note on page 44 records, the Treasury has now attempted to meet this difficulty by raising the effective yield basis on defence bonds to 4 per cent for the full ten-year term. It has simultaneously announced that it does not intend to raise the rate on savings certificates. There remains the case of tax reserve certificates, on which the ½ per cent tax-free interest now looks unattractive even by comparison with the 2 per cent offered by the banks on deposit accounts. If this rate were brought into line with the market pattern, it seems probable that the Government's need to rely upon direct borrowings from the banking system would be perceptibly reduced. In view of the character of the monies in question, the true disinflationary effect of any such change might be very small; but it would at least help to rationalise the pattern of rates—and to reduce the risk that the behaviour of bank deposits may continue to give false impressions abroad.

Insurance Survey

Next week's issue of *The Economist* will include the annual INSURANCE SURVEY.

The Survey will be supported by statistical reviews of the business of the leading offices in the *Records and Statistics Supplement*.

Business Notes

Cables and Monopoly

The report of the Monopoly Commission on the electric cable industry is measured and critical. Those who had imagined that the two principal trade associations, the Cable Makers' Association and the Covered Conductors Association, were sitting targets for this kind of investigation may be surprised at the qualified approval that the commission gives to several aspects of their activities. But the report makes a sharp distinction in its recommendations regarding the trade in mains and supertension cables, on the one hand, and the trade in lighter cables known as "covered conductors." At present, members of these associations quote common prices for all types of cable. Together they are responsible for about 80 per cent of British production, and the independent producers who supply the balance usually quote prices slightly below those of the associations' members. The Commission recommends that the system of common prices for rubber cable and the CCA system of

Type of Cable	Home Sales in 1948	Average net profit on sales earned by members and associates		Percentage by value of supply made by independents in 1948	Name of any large buyers	Large buyers' purchases as percentage of total supplies of each type in 1948
		1938	1948			
Mains (not exceeding 33 kV)	£'000 16,789	Per cent 7.0	Per cent 5.4	Per cent 21.0	Electricity Authorities	Per cent 73.1
Super tension (over 33 kV)	403	10.8	3.8	Nil	Electricity Authorities	87.3
Rubber and plastic	18,254	11.5	15.1	24.0	Utilities, Govt. Depts. ...	12.6
					Electricity Authorities	5.9
Submarine	821	20.5	11.0	Nil	Cable & Wireless Ltd.	68.2
					Govt. Depts. ...	31.8
Telephone	5,343	23.0	8.7	Nil	Govt. Depts. ...	90.6
Cables insulated with cotton, silk, art silk, enamel, glass & asbestos	8,299	11.4	7.8	8.8	Govt. Depts. ...	5.1

common prices for covered conductors should be brought to an end. At the same time, it is prepared to accept the trade argument that unrestricted price competition might lead to an undesirable reduction in the quality of cables and to allow the CMA and the CCA to fix minimum prices "giving no more than a reasonable profit to the lowest cost producer of each type of cable," with supervision by the appropriate government department.

The members of the commission have evidently been impressed by the work of the associations in testing new products before they were put on the market, and by the high regard in which consumers here and abroad hold the CMA quality standard; until the recent evolution of a British Standard for cables, this was the only guide to quality that users had. The report recommends, therefore, that the practice of submitting new products for approval should be continued in spite of the "restriction of members' freedom that it involved."

Selling to a Single Buyer

There are certain features about the trade in mains and supertension cables that, in the Commission's view, put it beyond the test of normal competitive standards. For mains and supertension cables there is only one important buyer, the British Electricity Authority; the Post Office is the biggest customer for telephone cable, and Cable and Wireless Limited for submarine cables. Each of these bodies is strong enough to strike realistic bargains with the industry,

and on occasions they already insist on an independent cost investigation before tenders for bulk orders are accepted. The commission has taken the view that there is little risk that buyers such as these will be "exploited." But for other than bulk orders, the industry has adopted the practice of permitting one company to quote either a lower price or an earlier delivery date than the rest of the members to get an order that is then privately allocated between firms without the purchasers' knowledge. So far as this practice "ensures that the maker most fitted to carry out the order gets it," there are sound arguments for it. But the commission sees no reason why it should be done under the guise of competitive tendering, nor why it should be concealed from the consumer. The obvious effect must be to limit either new entry into the industry or any real expansion of individual capacity. But apart from this practice, the commission argues that to insist on completely free competition in the market for heavy cables might be positively harmful in that it would jeopardise close technical collaboration between makers that is especially valuable when new products are being developed, as supertension cables are now being developed.

Thus, the commission's strongest criticisms are directed towards the trade in lighter cables used for domestic and industrial wiring. Here it recommends the discontinuance not only of the common price policy and of all exclusive dealings and rebates that commit dealers and dealers' associations to buy only from members of the manufacturers' associations, but also of those internal arrangements that fix selling quotas for each company, and impose percentage penalties for infringing quotas that are higher than the profit likely to be earned on the extra orders. It now remains to be seen in what form these conclusions are to be implemented.

Progress on German Debts

In spite of the continued absence of the American bondholders' representative from the German debt talks in London, the negotiations are making satisfactory progress. Tentative agreements were reached last week between the German delegation and the main groups of creditors. Herr Abs, leader of the German delegation, then travelled to Bonn for further consultations with his government and has since returned to London, presumably to put the finishing touches to the agreements. The differences between the American and other national groups of creditors were discussed at the highest level during Mr Dean Acheson's visit to London. This disagreement on the gold and dollar clause appears to be the main obstacle to further immediate progress in the negotiations. It solely affects the committee dealing with the bonded debts of the Reich and public authorities. Despite the absence of the American representatives, this committee's discussions have reached the stage at which agreement could be reached at any moment. The standstill committee reached tentative agreement some time ago and that agreement has been presented and approved by the general creditors' committee. The committee dealing with industrial bonded debts is also on the verge of agreement, while the committee on commercial and miscellaneous debts may need a few more days before an agreement can be secured.

The German commitments involved in the tentative agreements reached by the four committees reach a total considerably in excess of the 170 million Deutsche marks which was the global sum indicated for prewar external creditors in Germany's original offer. The revised total commitments would appear to be nearer 300 million Deutsche marks. It remains to be seen whether the German Federal Government is prepared to shoulder this additional liability

or whether any attempt will be made to offset the larger payments to private creditors by some reduction in the amounts paid, at least in the next few years, to the three allied governments in respect of their postwar credits to Germany. A further minor hurdle may be presented by the creditors' wish to be paid in Deutsche marks wherever their debtors show willingness to honour their obligations in this way and the German Government's refusal to increase the volume of blocked marks against which German Exchange Control will have to contend. This, however, should not be a major obstacle to final agreement. The satisfactory progress made by the negotiations has been reflected in continuing strength and activity in German and also in Japanese Bonds which during the past week have provided the showpiece of the stock markets.

Ford Takes a Chance

The Ford Motor Company's decision to reduce export prices by 10 per cent for passenger cars and 7½ per cent for commercial vehicles has been taken when the motor industry is working on much reduced margins of profit per unit. It is a step carefully timed to prepare the way for a rising volume of exports later in the year. On the basis of its current export performance, the Ford Company can presumably expect to receive a generous allocation of steel in the last quarter of the year, when supplies to the industry will be increased. Without a price incentive, the company might have had to work hard to find foreign buyers for the extra vehicles; but a 10 per cent reduction may well offset or anticipate cuts in the prices of Ford's major European competitors. To take a specific example, during June, the Ford Anglia was selling in Belgium for the equivalent of £423 and the Prefect for £477. The German Volkswagen was selling at £441. A 10 per cent reduction in the price of the Prefect makes it cheaper than the Volkswagen, although the latter's price is liable to change so rapidly that this comparison may not be maintained for long. Among the slightly bigger models, the Ford Consul was selling for the equivalent of £655 compared with £568 for the German-built Opel Olympia, a car of roughly the same power. If the Consul's price is reduced by the full 10 per cent it would evidently be closely competitive.

The 5 per cent cut that is being made at the same time in home prices can hardly be designed to stimulate sales since the company has one of the longest home order books in the industry. It may, however, be a precautionary move intended to circumvent anti-dumping laws in certain markets abroad. These laws are liable to be invoked whenever there are signs of a widening gap between home prices and export prices. It now remains to be seen whether the rest of the industry will allow the Ford Company to take the credit for being the only big car producers to cut prices in the face of rising costs.

A New Defence Bond

The Treasury has always been slow to adjust the terms of "small" savings securities to changes in the yields obtainable in the market; and since the change in monetary policy the sales of these securities have in consequence been sharply reduced. Now a first move is being made to remove these disparities. The Chancellor announced last week that the existing issue of Defence Bonds, the Fifth Issue of 3 per cent Bonds that was launched early last year, will be withdrawn at the end of August and will be replaced on September 1st by a new issue of 3½ per cent Bonds. The Treasury is reverting to the earlier practice, dropped in last year's issue, of offering a tax-free bonus on redemption of bonds held for a minimum term. The new bonds will be redeemable at £103 for each £100 if held for ten years, when they will be repayable on application, and not automatically. Bonds encashed within five years will be repaid at par (on six months notice) but

between five and ten years will command 101 (on three months notice). The notice period may be waived at the request of the holder, but there will then be a corresponding deduction of interest—unless the purpose is the winding-up of a deceased holder's estate. The redemption yield on bonds held for ten years will be equivalent to nearly 4 per cent gross to a holder subject to tax at the standard rate, and on this basis is reasonably in line with the market. The nearest comparable securities—the 2½ per cent Funding Stock, 1956-61, and the 3 per cent Savings Bonds, 1955-65—last week offered redemption yields, to latest date, of £4 1s. 8d. per cent and £4 8s. 0d. per cent respectively; and these securities are, of course, subject to the risks of market fluctuation, from which Defence Bonds are protected by the preencashment facilities. On the other hand, it has to be borne in mind that the type of investor for whom the Defence Bonds are supposed to be designed is generally subject to a sub-standard rate of tax and is in any case more interested in the "coupon" rate than in the redemption yield.

For this reason, the response to this issue is more likely to come from the "once-for-all" purchaser of more substantial means who buys the full permitted holding of £1,000. The limit of £3,500 on holdings of existing issues (including the special Conversion issue of the new bonds that is now offered to holders of 3 per cent Bonds maturing between September 1st and December 31st next) is retained. Lord Mackintosh, the chairman of the National Savings Committee, suggested last week that this fact may induce an increase in purchases of the 3 per cent Bonds, during the next few weeks, by those whose holdings are still below the limit. He may be right; but these securities scarcely look attractive, as the recent record shows. In the first quarter of this fiscal year, although redemptions at maturity raised total repayments to nearly £36 million (against £12½ million in the comparable period of 1951), new sales dropped from £12.4 to £9.9 million. Lord Mackintosh also announced that no change is to be made in the terms of Savings Certificates, on the ground that their yield over ten years is already equivalent to £5 16s. per cent gross (also at 9s. 6d. in the £). It is hard to see how a yield basis that looked appropriate to the authorities eighteen months ago can still seem appropriate to them now.

Higher Bill Rates

During the past month the monetary authorities have been keeping the short loan market on a perceptibly tighter rein, and the "special buyer" has seemed to be increasingly reluctant to smooth out day-to-day deficiencies in the credit supply available to the discount market. In particular, it has this week left the market to face the full pressure of the banks' arrangements for their end-June balance sheets. This change of emphasis in official management of the credit position is the more significant in that it has been taking place at a time when the Treasury has been substantially expanding its borrowings on floating debt. Even before the half-year-end influences began to make themselves felt, the combined effect of the cautious attitude of the special buyer and of the increase in the offerings of Treasury bills at the tenders had been to drive the discount houses to borrow at the Bank of England, on its usual "penalty" terms, more frequently than had previously been necessary. Hence the additional disturbance caused by the half-year-end produced a situation that is without precedent for more than twenty years. Discount houses were "in the Bank" on five of the six business days ended on June 30th; and on only one of these days did the special buyer give any aid—for a small amount.

This increasing recourse by the market to costly finance—borrowing at the Bank must be for a minimum period of seven days, charged at 3½ per cent—and the signs of a toughening of the official attitude have inevitably produced

THE UNITED COMMERCIAL BANK LIMITED

(Incorporated in India, Liability of Members is limited)

Head Office:

2 ROYAL EXCHANGE PLACE,
CALCUTTA

G. D. BIRLA, Esq., Chairman.

a stiffening of Treasury bill rates. The sharpest rise occurred a fortnight ago, when the average allotment rate at the Treasury bill tender rose from £2 8s. 0.36d. per cent to £2 8s. 8.25d. per cent; but last week there was a further rise, to £2 9s. 0.44d. per cent. This is the highest rate since the new monetary policy was launched; at the first tender after the increase in Bank rate on budget day, the average rate was just over 2½ per cent. The increase would probably have been sharper still had it not been for the market's fear that, if it widened too substantially its gross margin over the clearing banks' 2 per cent charge for call money lent against Treasury bills, the banks might feel entitled to raise their charges. If the Treasury bill rate is prevented from rising further now, it will be principally for this reason—unless, of course, the authorities reverse their recent tactics and restrain the rise by giving more liberal aid at moments of money pressure. There is also the consideration that the pace of Treasury borrowing has recently slackened slightly: last week the excess of tender Treasury bill issues over maturities was £30 million (and this is likely to be the excess for the coming week too), compared with the additional £40 or £50 million a week that was being raised for some time previously.

Rearmament and Rayon

It will take more than Monday's promise of £1,250,000 worth of military orders to restore confidence in the rayon industry. Production rose very slightly in May from the disastrously low level reached in April, but by comparison with last November's production peak of 36 million pounds of yarn, an increase of 2.9 million pounds—from 16.6 million to 19.5 million—can be described only as an improvement from worse to bad. For what it is worth, this gradual rise can be expected to continue, for in mid-June four of Courtaulds' factories, at Carrickfergus, Wolverhampton, Aber and Castle, reopened after being shut down for four to five weeks. Each is operating on severely reduced

schedules and there is certainly no immediate prospect of the industry's output returning to the 1951 production levels of 30 to 35 million pounds of yarn a month.

The most that the Ministry of Supply can promise is to place limited orders (the quantities were apparently not impressive enough for Mr Sandys to give) for rayon underwear, sheets, pillow cases and lining materials. Rayon drills and other fabrics will be tested; this process can take years, but the industry will no doubt be grateful for the opportunity to show potential customers that there is no inherent defect in rayon which prevents it from figuring more conspicuously in military specifications.

The producers' own optimism is partially responsible for the severity of the slump in rayon; they continued to produce for stock long after orders had fallen below the level

needed to absorb a high rate of production. But the course of the depression has upset many preconceived notions about the behaviour of a buyer's market. Rayon, being the cheapest yarn on the market, might have been expected to escape more lightly than the higher priced cotton and wool, but the contrary appears to have been the case. A slow recovery in the volume of trade in cotton goods is reported from Lancashire, even at prices which appear to be considerably higher than rayon prices. The rayon industry has also to compete with the short memory of the market. The fact that rayon prices did not rise when other textile prices were rising so fast eighteen months ago is not accepted by buyers as an excuse for not reducing them now, when other prices are falling. The fall in prices of some fine cotton yarns has caused the spinners of rayon staple to reduce their prices by amounts varying from 2d. to 1s. a pound; this may promote a recovery in rayon staple, production of which has fallen from 16.7 million pounds last November to 5.5 million pounds in April, and 7.1 million pounds in May. But the rayon producers seem unwilling to follow the spinners' lead and reduce the prices of either continuous filament or staple fibre at this stage.

Power from Olympus

The first details released about the Bristol Aeroplane Company's Olympus jet engine shows that it ranks among the most powerful in the world with 9,750 pounds static thrust. This in itself is not of any great military significance, for a number of engines are capable of giving powers of around 10,000 pounds. But if the Olympus can give such an output on a fuel consumption as low as the designers suggest—0.766 pounds of fuel for each pound's thrust per hour compared with a rough average of one pound for existing engines—it could become the first jet engine to be put in a long-range bomber without imposing a crippling reduction on potential bomb-load to carry the necessary fuel. The designers have solved this problem by dividing the axial compressor of the engine into a high powered and low powered unit, each driven separately from a separate shaft. They claim that this gives the engine the fuel economy of high compression ratios with the easier handling associated with medium compression ratios; but this may not be achieved without cost, for the complications of the engine's design will pose a problem for the production engineers.

The Olympus is the first jet to be built by Bristol, and it may in some respects be regarded as a bid to make up ground lost to companies such as Rolls Royce, de Havilland and Armstrong-Siddeley. Each of these companies has been accumulating experience in design and in production of military engines during a period when Bristol has concentrated on the design of civil turbo-prop engines for the Brabazon and now for the Britannia airliner. No company of this size can afford to be excluded from the military market for any length of time. It is one in which British designers have been outstandingly successful since the war, and while there is a ready market for British designs abroad—the Olympus was bought by Curtiss Wright in America more than two years ago—competition for orders between companies at home is stronger, and more deadly than outside appearances might suggest.

Fire at Creswell

On the night of September 25, 1950, 80 miners died in a fire at Creswell colliery in Derbyshire, one of the best equipped mines in the country. Because the burning seam was sealed off for several months, the report on the fire has only recently been published. Like so many serious accidents, what could have been an insignificant outbreak became, through an uncanny set of coincidences, a major tragedy. The repair of a torn conveyor belt during the evening was stopped by the overman in charge of the night

shift because a length of coal remained to be cleared. During the night, pieces of the belt became wedged against the chute at the transfer point between two conveyors. The friction between these fragments and the moving belt set fire to the fabric which burned too strongly to be put out by sand and portable extinguishers. It could probably have been put out by water from the hydrants, but when the hoses were connected the water supply failed because the mechanical pump that fed it during the night was out of order and no provision had been made to adjust the valves of the surface tanks that fed it by day.

It is possible that more of the men at the coal face might have escaped if they had been given earlier and more urgent warning of the fire, and if repairs to the line had not delayed the train sent to bring them out. But apart from the human errors and ill-fated coincidences that played so large a part in the Creswell disaster, the report reveals that it was still possible for a well-equipped and well-managed mine to contain two serious fire hazards. One was the highly inflammable conveyor belting. The material used at Creswell, and throughout the industry, was rubber covered cotton duck, which has been shown by subsequent tests to burn rapidly under friction. Since the Creswell fire occurred, the Coal Board has intensified its tests of safer materials; it has been shown that if rubber is replaced by polyvinyl chloride, the plastic material will melt and put out any fire started in the cotton part of the belt. The substitution of this new material for rubber would increase the cost of the belting from 30s. to 42s. 6d. a yard, but the real reason why it has not been substituted on any scale is lack of production. There are 18 million feet of conveyor belting in use underground, of which 9 million feet are being replaced every year. Until producers change over to making plastic belting, as they are expected to do, the Coal Board can only get a few thousand feet of it a year.

The second danger brought out by the investigation was the use of a single air intake. The air at Creswell was driven at considerable pressure $1\frac{1}{2}$ miles to the coal face down an air intake that was also used by the coal conveyors, and drawn out through a separate return road along which the men travelled. When fire broke out in the intake route, smoke and fumes were driven rapidly down to the coal face, and then back along the return route where they caught up with the escaping men, all of whom died of carbon monoxide poisoning. Had there been more than one intake, this might not have happened. It is clearly impossible for the Coal Board to drive second air intakes along all the seams that now lack them, but they will in future be provided for all new seams and all developing seams. The cost in terms of money will be heavy. In terms of lives, it has already been paid.

Productivity in Lancashire

The cotton industry's attitude to questions involving the re-equipment of mills and the redeployment of labour has made it an easy Aunt Sally, but a follow-up report by the Anglo-American Productivity Council shows that while advance has been lamentably slow, there have been sounder reasons for the delay than the loose accusation of obscurantism that is so frequently levelled against the industry. If it is to be justified, expenditure on new machinery and on machine refinements must go hand in hand with a reassessment of individual work loads. Few of the possible improvements result in any increase in individual output; the bulk of them serve to lighten working conditions. It follows that unless workers agree to mind more machines, and to do so without demanding a directly proportionate increase in wages, the result of such improvements is to increase the costs of production by the amount spent on re-equipment and not to reduce them. In mills where such agreement has been reached, results are spectacular. In one mill the

man-hours needed to handle 100 pounds of cotton in the ring room has been reduced from 12.08 in 1947 to 9.34 in January, 1951, and the figure of 5.6 hours should eventually be reached. Production per man-hour in the ring room of another mill has been increased by 30 per cent, while costs have fallen by 10 per cent.

In all too many cases, local union opposition has prevented similar schemes from being adopted, even though the general principle of redeployment has union approval. No figures are given in the survey for the sums spent on new machinery, but only 141 mills have actually introduced work-study schemes. This is an increase by numbers of 37 in the past 18 months; 30 per cent of all the members of the Master Cotton Spinners' Federations have introduced work-study schemes compared with the 25 per cent that had introduced them by the beginning of 1951.

There is some reason to fear that the present high level of unemployment in Lancashire will increase union prejudice to redeployment as well as management prejudice to spending money on new machinery that does not of itself make any contribution to higher output or a reduction in costs. During the past two years methods of increasing productivity have taken second place to those designed solely to increase production. The depression in Lancashire ought to make many managements look closely at their production costs for the first time in many months, for although Lancashire prices have been reduced by cutting profit margins, they are not falling as fast as those of their competitors in other countries. At the same time, the exodus of unemployed textile labour to other industries might lead to a scarcity of labour in individual mills when trade revives—of which there are now faint signs. This in turn might reduce local union opposition to redeployment. These are, however, only suppositions. Some companies have always been conspicuous for their enterprise. There are few signs yet of any real change of heart among the remainder.

We've solved some problems in our time!

IN 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would pre-heat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity inside a diameter of $1\frac{1}{4}$ inches and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and

Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

Fluctuations in New Issues

At first glance at the totals of capital issues, the capital market appears to have been far busier in the first half of this year than it was in 1951. But this impression is subject to two important qualifications. If the net sum of £148.5 million raised by the British Electricity Authority is excluded from the half yearly total of new issues, the increase in activity in the capital market, though still apparent, becomes far less marked. Moreover, the revival in equity issues largely took place in the first quarter of the year—before the increase in Bank rate imposed a new structure of interest rates on the market. The accompanying table, based on a more detailed analysis published in the *Records and Statistics* supplement, shows that equity issues by British and overseas companies totalled £78.6 million in the first six months of this year compared with £39.3 million in the first half in 1951 and with £41.9 million in the second half. Of this total, £55.6 million was raised before the end of

March. The increase in debenture stock issues in the second quarter of 1952, when £12.1 million was raised in this way, is largely accounted for by the Distillers issue of £10 million 5 per cent loan stock, with all the overwhelming attractions of rights of conversion into ordinary shares in the future. Fortunately, there are some signs that the new money raised in the capital market has been flowing in the right direction—towards the capital goods industries. Companies in the electrical manufacturing industries, for example, raised nearly £15.1 million in the first quarter of this year and another £6.1 million in the quarter that followed. But the fall of raw material prices from their giddy 1951 levels, coupled with the decline in demand in some industries, is clearly affecting industry's calculations of permanent capital needs. Requirements that seemed so pressing only nine months ago have been radically revised. Who shall say that the monetary weapon does not work?

Cheaper Jute

The outlook for the world jute industry remains confused and prices continue to fall. This week the Pakistan Government was forced to abandon its minimum internal price for loose jute because it could not fulfil its promise to buy all the accumulated stocks that were offered at the fixed price. As the export duty was also reduced the cost of Pakistan jute to overseas buyers has come down by about £30 a ton. The Jute Control in Dundee can now buy good quality jute at about £95 a ton although its selling price remains unchanged at £125 a ton. The Control will doubt-

less cut its price shortly, but the administrative delay in bringing British prices into line with world levels is adding to Dundee's difficulties. British manufacturers have a long standing complaint that the Control's price policy has placed them at a disadvantage with their overseas competitors.

This year the Government itself is likely to experience some of the disadvantages of government trading. The Control has found that jute buying is no longer the profitable business that it was when prices were rising last year, indeed it is believed to have incurred a £5 million loss on stocks when prices of raw jute and jute goods were cut last month. This reduction in prices did not produce the expected recovery in the industry and most of the spinners and manufacturers are still working only three days a week.

Now that world jute prices are at long last below the mid-1950 level, jute can again claim to be the cheapest packing material. A campaign to publicise the cheapness of jute is being conducted in the United States where several substitutes had been developed under the stimulus of last year's high prices. The Pakistan jute growing industry, however, faces a more immediate danger. This year's Indian crop should be sufficient to cover the requirements of the Indian jute mills which have previously drawn a large part of their raw jute from Pakistan. The world crop will probably amount to about 11 million bales, and in addition there is a carryover of 1½-2 million bales from the 1951 crop so that total supplies next season may reach about 13 million bales. At present, world consumption is only running about 8 million bales. Even if it rises to 10 million bales next year (6 million bales for the Indian mills and 4 million bales exported as raw jute) there will still be an unhealthy surplus.

Industrial Production

Preliminary estimates of industrial production in May (1946=100) suggest that the index is likely to reach 148.9 compared with 139 in April and with 144 in May last year. Such a direct comparison can be misleading because while Easter fell in April this year, it was a month earlier last year and so was Whitsun. The index for 1951 showed the same 10 point increase between March and April, from 141 to 151 that took place between April and May this year, while the Whitsun holiday brought the May, 1951, index down again, to 144. On the average, production during the first five months of this year shows almost no change on 1951. There have been unmistakable signs in recent months that the rate of industrial production was no longer increasing, but the detailed figures for April this year show that it may in fact have started to fall in certain important sectors. But for the rising rate of building, the April index would probably have been much lower, for while the building index was, at 135, only two points down on March (and 6 points up on April, 1951) the manufacturing index fell from 154 to 143 compared with 147 in March and 158 in April the previous year.

Delays in British Exports

The "warning" from South Africa's Minister of Transport, Mr Sauer, that British manufacturers must carry out their promises of delivery if they hope to keep their markets, was specifically related to railway rolling stock; but it is worth attention in other industries. The Minister is reported to have said that he had cancelled some orders in Britain and placed them with other countries. This might cost more; but the goods arrived by the dates for which they were promised.

In the manufacture of railway equipment, as in a wide range of British engineering industries, the delivery periods now being quoted are generally longer than those offered by foreign manufacturers. To a large extent, this is one consequence of the fact that British order books are longer; it cannot be altered much without increases in labour, capacity or materials that are not practicable in the short run. But failure to deliver by the date promised is less easily excused. It is widespread. One important British company operating at home and overseas, which makes huge purchases of goods

DELAYS IN DELIVERY OF A SAMPLE OF INDUSTRIAL EQUIPMENT AND STORES

	Britain			USA	Continent
	Early 1950	Early 1951	Present Time	1952	1952
Delivered "on time" (i.e., to deliveries quoted)...	50	57	60	81	75
Up to 3 months late....	69	80	87	92	97
Up to 6 months late....	81	86	95	97	99
Up to 12 months late....	86	90	98	...	...
Up to 15 months late....	90	92	99	...	...

in this country mainly for "export" to its own plants throughout the world, has for some considerable time maintained a record of the "degree of lateness" with which these goods arrive, from British and foreign suppliers. Recent results of this survey are shown in the accompanying table.

About a fifth of the goods in question are specialised capital equipment, and a large proportion of the remainder are general stores and equipment of which some need to be made to specifications not ordinarily used in Britain. The total purchases, in this respect, might not be a bad sample of the goods Britain sends overseas. The table shows an

improvement in the "degree of lateness" of British deliveries; but it shows hardly any change in the percentage of British goods that are actually delivered as promised. During the last year there appears to have been a slight drop in the percentage of American and Continental goods that arrive by the date promised; but both groups of manufacturers keep their delivery promises much better than the British do. This is not the best of signs for the future of British exports in an increasingly competitive world market; it may already be tending to offset the advantage in price that many British engineering products still possess.

Shorter Notes

The new fire precautions to be observed on the railways appear to be the result of personal intervention by Lord Leathers in the controversy between the Ministry of Transport's inspecting officer of railways and the Railway Executive. Lord Leathers has announced that in future no highly inflammable finishes would be used in carriage interiors, that all train crews would be given a special fire routine, and that new sleeping cars would be all-steel, with emergency exits in the windows and a centre exit in addition to those at each end of the coach.

*

On July 1st the Ministry of Materials increased the price at which it sells virgin aluminium ingots from £154 to £157 a ton delivered at consumers' works. According to the Ministry the increase was necessary because of the further appreciation in the Canadian dollar. The price was last increased at the beginning of April when it was put up from £148 a ton.

Company Notes

Rolls-Royce.—Two questions arise from an examination of the full accounts of Rolls-Royce for last year. The first is whether the stream of profits from rearmament will lead automatically to increased equity dividends; the second concerns the company's prospects when rearmament comes to an end. That may be looking far ahead, but the chairman, Lord Hives, gave a none too reassuring answer to the second question. He points out that the present defence programme "can only be regarded as a gigantic stockpiling operation in any circumstances short of war." To some extent therefore the present level of activity must be at the expense of future orders—short of war itself. Nor can the aircraft engine industry expect to receive at the end of the rearmament boom a similar fillip as that given to development and production at the end of the last war by the replacement of reciprocating engines by gas turbines.

In the short run, the first question on rearmament and increased dividends appears to have been answered favourably by last year's increase in the total dividend to 15 per cent, paid on the ordinary capital as increased by a 100 per cent scrip bonus, as compared with a dividend of 25 per cent in 1950 on the original capital of £1,533,333. Lord Hives indicates that last year's increase in turnover and in trading profits (from £1,575,120 to the record figure of £2,210,943) owed little to governmental assistance and that a good part of future earnings will have to be ploughed back to meet the cost of a further expansion in fixed and working capital. The plant and facilities so far provided by the government made very little contribution to turnover last

year and Lord Hives suggested that the effect of governmental aid is not likely to be reflected in production and profits until 1953. The chief source of the increase in revenue last year was "the increased and more up-to-date production facilities" provided by the

company itself. The group, as well as financing an increase in stocks from £2,686,190 to £4,276,059, spent rather more than £1,350,000 on fixed assets, bringing the total sum spent since the end of the war to over £4 million. Although the government will bear part of the cost of fresh extensions, the company will still have to find a good part of the finance needed for capital development from its own resources; at the end of last year commitments on capital account already totalled £1,025,000. At the moment the group's liquid resources appear to be no more than adequate to meet these commitments. Pre-

sumably therefore in the initial stages of the rearmament programme the directors will be still inclined to place the emphasis upon the reinforcement of reserves rather than on meeting any claims for an increase in equity distribution. And the common fund available both for dividend payments and reserve appropriations will be reduced by the incidence of EPL.

Patons and Baldwins.—Shareholders in Patons and Baldwins had been prepared for the worst by the guarded warning made by the directors when the interim ordinary dividend was cut from 5 to 4 per cent at the end of last January. Even so the sharpness of the reversal of the company's fortunes that turned a trading surplus of £3,252,023 into a loss of £916,500 in the year to May 3rd was a harder blow than might have been expected. This deficit is struck after writing down the stocks of wool tops and yarns to their market value on May 3rd. As the group's stocks were valued at nearly £14 million at the beginning of the financial year and as wool prices have more than halved since this date the losses on stocks must have been heavy indeed. After crediting a surplus on the sale of property of £184,457, an exchange profit of £69,472, and tax refunds of £277,508 the net group deficit has been reduced to £482,660, as compared with a net group surplus of £1,278,235; this deficit has been struck after charging £97,597 as tax on the year's distributions.

Fortunately for the company and its shareholders, the directors had made a special provision against such a fall in wool prices

by building up a contingencies reserve of £2,800,000. By writing back £700,000 from this reserve the directors have been able to cover the trading loss, to pay the fixed preference dividends, and to pay a total equity dividend for the year of 10 per cent; this has been done at the expense of only a slight draft on the carry forward of £30,590. The halving of the ordinary dividend can be regarded as a satisfactory outcome of a year of troubles. The stock market certainly has not been plunged into gloom by the statement by Patons and Baldwins; after the announcement the company's £1 ordinary shares were marked down 4s. to 42s. 10d., but on the following day the price recovered to 44s. 10d., to offer a forward-looking yield of 4 9/8 per cent.

Boots Pure Drug.—The procedure adopted by Boots Pure Drug of not presenting a consolidated balance sheet is far from helpful. The company's practice of drawing up separate accounts for its main geographical trading divisions provides supplementary information, but this is no effective substitute for a balance sheet giving the group's position as a whole. Shareholders also have other reasons to complain of the presentation of the accounts for the year to March 31st. No fresh information apart from the bare accounts is given—and there is one surprising omission. When the preliminary statement of profits was published group trading profits were shown after making special provisions for stock losses. In the full accounts gross profits are shown to have increased from £3,785,738 to £4,049,970, but no mention is made of the stock losses provision; the directors would have done well to give shareholders some information on the extent of these losses. Shareholders will have to await the annual general meeting to discover how the group fared last year and how it will fare in the current year. All that can be reasonably

Ordinary dividends (per cent)	18	23
General reserve	282,151	388,536
Property reserve, etc.	110,443	77,521
Added to group carry forward	33,944	2,182

	Years to Dec. 31, 1950	1951
Fixed assets, less depreciation	7,307,372	7,931,651
Net current assets	2,822,038	6,582,617
Stocks	5,983,574	7,443,932
Cash	—	139,695
Bank overdraft, less cash	875,380	—
Reserves	6,559,564	7,630,995
Ordinary capital	1,920,000	5,120,000

surmised from the accounts is that an ordinary dividend of 20 per cent will be paid in the current year if earnings are maintained. That this is the directors' intention may be assumed from the payment of a final dividend of 10 per cent on the ordinary capital of £5,120,000, as increased by the rights issue of 5,120,000 5s. ordinary shares at 16s. each last March; this payment followed two interim dividends of 5 per cent each after a 100 per cent scrip bonus had been distributed but before the rights issue.

The cash issue of equity shares has lightened the burden of financing heavier commitments in working capital, but there are still some signs of strain in the balance sheets. In the parent company's balance sheet the bank overdraft, which was shown after deducting cash in hand at £875,380, has been replaced by a cash balance of £130,685; but in the consolidated balance sheet of the subsidiary companies' amounts owing to the banks, less cash in hand, have increased from £674,137 to £900,325. Mean-

£5,983,374 to £7,443,932 and the value of stocks held by subsidiaries from £5,803,291 to £6,402,072. A fall in raw material prices and a prompter settlement of the National Health Service accounts would ease the financial burden this year, but the group still has heavy capital commitments—of the order of £956,000—to meet.

Whitbread.—Taxation is the principal theme of the statement made by Col. W. H. Whitbread. The chairman puts last year's results in proper perspective by pointing out that the greater part of the increase in group trading profits (from £1,801,871 to £2,163,420) was swallowed up in taxation and that group net profits showed an increase of only £46,592. To hammer the point home, Colonel Whitbread adds that while taxable profits are four times as much as in 1938 the burden of taxation has increased in the same period by nearly six times. Moreover, plant has to be replaced at three times its original cost—"a factor which does not seem to be sufficiently recognised by the revenue authorities." Once taxation has been taken into account the return on the company's efforts to increase its export trade is only slight. Last year the company increased the value of its total exports by 50 per cent and the value of its exports to hard currency areas by about 33 per cent. The company may not repeat its success in the export markets this year, for import restrictions have already nearly wiped out the useful volume of trade developed in Australia in 1951.

Whitbread is yet another company whose attempts to replace plant and machinery and to install additional equipment have been hampered by high rates of tax. Last year the company spent nearly £700,000 on bottling depots, licensed and unlicensed properties and other fixed assets. At the same time about £300,000 more was locked up in stocks and about £460,000 more in debtors, as a direct result of the increase in trade. The company decided to finance these developments by the issue of £2,000,000 4 per cent debenture stock, 1964-84, at 98½ last Novem-

ber. The chairman remarks that "such favourable terms of borrowing may not recur for some time"; presumably the underwriters, who had to take up 80 per cent of the issue and who have seen the price of the stock fall to 89½, would make a more rueful comment. Thanks to this issue the company's cash resources are more than ample enough to meet outstanding capital commitments of £473,000. The reinforcement of liquid resources, together with the expansion in business, presumably lay behind the directors' decision to increase last year's equity distribution from 18 to 23 per cent; this dividend represented only 2.2 per cent of the parent company's gross revenue, as compared with the beer duty that absorbed 44.8 per cent of the gross receipts. Colonel Whitbread adds that the figures and estimates for 1952 justify confidence in the immediate future—a confidence that stockholders, aware of the company's considerable interests in

COMPANY MEETINGS

STEEL BROTHERS AND COMPANY

HIGHER EARNINGS OFFSET BY RAPACITY OF TAX COLLECTORS

GROSS INEQUITY OF PRESENT SYSTEM

MR J. K. MICHIE'S REVIEW OF WIDESPREAD INTERESTS

The sixty-first annual general meeting of Steel Brothers and Company, Limited, was held on July 1st in London.

The following is the statement by the chairman and managing director, Mr J. K. Michie, which had been circulated with the report and accounts for the year ended December 31, 1951:—

Since my last report was written we have suffered a sad loss through the death of Mr W. T. Howison, who had been a member of the board since 1930 and a member of the staff since 1904. His wise counsel is greatly missed.

As from January 1, 1952, Mr G. S. Nicoll, CBE, and Mr A. McGilvray, both of whom joined our Eastern staff in 1919, were appointed to the board as manager directors, and their accession strengthens our counsels and lessens the burden on our managing directors.

In our accounts for the year 1951 which accompany this statement balance-sheet totals are again up, while profits of the parent company at £783,462, against £708,130, again show a considerable increase despite the need for writing down stocks at December 31st. Due, however, to the rapacity of tax collectors, who this year take £474,000, against £415,000 last year, and the provisions necessary against the further considerable fall in the values of our stocks which has happened since January 1st, the balance available for dividends and reserves is smaller.

As I reported last year, 1951 began well, but trading became progressively slower and more difficult, and most markets continue to show the same trend. In textiles especially it seems difficult to find equilibrium.

BURMA

My reading of the present situation is that the financial position of the Government is relatively stronger than its political and physical control of the country. In certain districts law and order has deteriorated further, while there is as yet no sign of a settlement of the Karen problem. The prices Burma is able to obtain for her still very limited exportable surplus of rice have reached new heights, and this has greatly strengthened her balance-of-payments position, though not the spending power of the people; but in the longer term the economics of the country cannot but be adversely affected by the loss of control of the teak forests and of tin and rubber producing areas and by the lack of progress in increasing rice production.

The financial and economic policies of the Government have made trading increasingly difficult. The great bulk of Burma's exports is handled or influenced by and through Government agencies and the tender system by which "free" rice is sold in our opinion is far from a satisfactory method.

There is a comparatively low ceiling to the prices the cultivators can get for their paddy and the country's spending power is being accumulated in the coffers of Government which is unwilling or unable to release it. More encouragement to the cultivator it seems to me would have effects which would redound not only to the benefit of the trade

of the country but also through the contentment of the people to the strength of its Government. In these circumstances our rice business continues to be confined largely to acting as procuring and shipping agents for certain Colonial Governments.

In default of adequate supplies of logs our saw mills continue silent and for the same reasons opportunities for trading in Burma timbers are limited.

Due to heavy overtrading by a large section of importers and dealers at the end of 1950 and early last year, and also because of the lack of funds in the hands of the cultivators, the import trade had a very poor year. For a large part of 1951 stocks were extremely difficult to move, and what looked cheap a year ago by December 31st had become dear.

Despite the loss of production from one of our estates which is still in the hands of an insurgent group we had a good year in rubber.

In co-operation with the Burmah Oil Company, Limited, and the British Burma Petroleum Company, Limited, our subsidiary, the Indo-Burma Petroleum Company, Limited, continues to produce, refine and distribute the maximum possible of petroleum products which conditions in Burma allow, and conversations with Government continue regarding the formation of a joint venture to take over the production and refining of mineral oil now done jointly by the three companies.

The plant at Thayetmyo of the Burma Cement Company, Limited, is now in full operation. This is another industry in which the Government of Burma seems disposed to take a financial interest, but it is unlikely that finality will be reached for some time.

Strand Hotels, Limited, Rangoon, had another good year and in response to an insistent demand steps have been taken to increase its accommodation.

INDIA

As in other countries, trading in Indian markets has been difficult and restricted, due to falling prices for her produce, but we were able to do a fair export business in gunnies from Calcutta. Our food procurement agency for the Indian Tea Association has again worked smoothly, despite many difficulties of supply, transport and distribution. Our managing and selling agencies for the Indo-Burma Petroleum Company, Limited, and Assam Sillimanite, Limited, ran a normal course.

PAKISTAN

The fall in jute and cotton prices during the second half of the year following on the uncertainty in the previous quarter turned a very promising year's trading into a very moderate one, particularly in Western Pakistan.

Until confidence or buying power returns import markets in Pakistan are likely to remain difficult, for there is still a certain amount of surplus stocks of some standing to be digested.

It is hoped that Governments such as

Pakistan and India will accept the change from a sellers' to a buyers' market by taking off their heavy export duties. Something has been done in this respect, but it is not enough, and price support systems are no substitute for ensuring exports and collecting foreign currencies.

Export taxes merely mask real values at both ends. Producers do not get their fair share of proceeds, while overseas buyers naturally cannot but suspect the prices they are asked to pay. In the final event the strain comes on the currency of any producing country which follows a policy of, on the one hand, collecting an export duty and, on the other, taking over and carrying what exporters cannot dispose of.

HONG KONG

As was natural, the volume of trade passing through Hong Kong last year fell considerably, and although satisfied with our share this had its effect on our results.

JAPAN

During 1951 the volume of our trade in our two offices, Tokyo and Osaka, increased considerably, although in themselves the branches did not show a profit.

SIAM

Our efforts to engage in the "free" export trade in rice were unsuccessful and the prospects of re-entering it in present circumstances seem to be somewhat remote. The Siam Rice Agency continued its good work. Trading at Bangkok, partly due to exchange fluctuations, continued to be difficult and speculative, although we endeavour to eliminate the second element, as far as this is possible.

CEYLON

Prices of most of her produce fell during the period, but despite this Ceylon again had a prosperous year and our subsidiary, Messrs E. B. Creasy and Company, Limited, did well. The effects of the continued fall in prices of tea, rubber and copra are, however, now being felt and will manifest themselves in this year's results.

MIDDLE EAST

Our associate company, Messrs Spinney's (1948), Limited, which operates in Iraq, Syria, Lebanon and Cyprus, had a satisfactory year. Currency difficulties again restricted our agency operations in Israel.

EAST AFRICA

Our associates Messrs A. Baumann and Company, Limited, continue to develop their business on sound and satisfactory lines, helped by continued good markets for coffee and sisal. Steels (Tanganyika Forests), Limited, during 1951 were still encountering teething troubles and the company has not yet reached the profit-earning stage, though that should not long be delayed.

British Guiana.—The development of British Guiana Timbers, Limited, under our managing agency continues, but as it is over-

whelmingly a CDC concern it is not for me to comment on its progress or results.

CARBUTT AND COMPANY (1928) LIMITED.

Our home subsidiary again had a satisfactory experience as considerable quantities of rice were imported into this country in 1951, but here, again, prospects are uncertain.

A development during 1951 was the acquisition of a 50 per cent interest in Yorkshire Agricultural Driers, Limited, a company with a capital of £20,000 which is engaged in the growing and important dried grass industry.

MACTAGGART AND EVANS, LIMITED

Results were again slightly on the wrong side, but the crying need for chemical and industrial research in this country makes us confident that this company has a sound as well as a useful future.

OIL PROSPECTING IN ENGLAND

Some years ago we made an unsuccessful effort to find mineral oil in England at Edale in Derbyshire. Recently our geological staff have made further investigations and as a consequence we applied for and have received prospecting licences covering an area of 400 square miles in Lancashire. Some oil has been found in the vicinity by the D'Arcy Syndicate and we are moderately hopeful. It is expected that drilling operations will be started within a few months.

PROSPECTS

As I have already indicated and as is universally known we are all in the process of assessing whether we are in the midst of a recession or of something bigger of the same nature and most people are taking the normal precaution of doing without as much as possible. However populations increase so consumption goes on and it is difficult to see any close parallel between present conditions and those which some of us saw and experienced in 1921.

I expect therefore to see healthier markets in the second half of the year.

Meantime as you will see from the profit and loss account we have created a (taxed) reserve of 1951 profits of £77,400, against the fall in values of our stocks carried forward at December 31, 1951. Even with this help we do not expect to emulate last year's results and if we did EPL would immediately skim off more than the cream.

Much has been said and written about present taxation but I cannot refrain from a further illustration of its gross inequity as affecting our own company.

First there are no adequate reciprocal agreements between the United Kingdom and India or Pakistan and this ensures that we are left with little over one-third of any profits made in these countries. Then, in so far as 1951 is concerned, profits tax at 50 per cent on dividends means, in effect, that the rates of interest on our three classes of Preference and Preferred Ordinary stocks were raised respectively from 6 per cent to over 7½ per cent, from 7½ per cent to 9½ per cent, and from 8 per cent to 10 per cent, all at the expense of the Ordinary shareholders. I think this is the correct way to express the tax in its application to prior charges.

Under the new Finance Act we now have a remission of 3½ per cent only of this tax, but the imposition of an excess profits levy of 30 per cent on profits over a standard which, in our case, cannot but be inequitable. Enterprise nowadays is a means of survival only, for it is certainly not allowed to make a profit commensurate with the risks taken, and under such a financial regime British commerce and industry cannot but be a de-

clining force in world trade with inevitably a lower standard of living for all.

STAFF

Again our staff throughout our service have truly earned the thanks which I am sure you will wish to express to them at the annual general meeting.

The report and accounts were adopted.

THE ORION INSURANCE COMPANY, LIMITED

The twenty-second annual general meeting of The Orion Insurance Company Limited will be held on July 17th at 70-72, King William Street, London, E.C.

The following is an extract from the statement by the chairman, Sir Sirani Ralli, Bart., MC, which has been circulated with the report and accounts for the year ended December 31, 1951.

There are no major changes to report this year in the general organisation of the company's business, the year under review having been largely devoted to consolidation of our interests both at home and overseas.

MARINE DEPARTMENT

In the marine department the net premium income for 1951 amounted to £1,215,517 compared with £968,856 for 1950. The sum of £90,000 has been transferred to profit and loss account out of the 1949 closed underwriting account.

The marine fund now stands at £1,220,866 (100.4 per cent) and having regard to the fact that no provision is required in respect of the outstanding liability on our 1940/45 underwriting accounts, which are fully reinsured, the fund is regarded as satisfactory.

The 1950 underwriting account is developing satisfactorily, but, as I intimated in my statement last year, the background for both hull and cargo underwriting has undoubtedly deteriorated and the first-year settlements on the 1951 underwriting account are higher than we have experienced for several years. It is extremely difficult to forecast the ultimate outcome of these two accounts although it is quite obvious that under present conditions we cannot expect a continuance of the very favourable results we have experienced in the marine department over the past few years.

FIRE, ACCIDENT AND MISCELLANEOUS DEPARTMENT

The premium income of this account for 1951 amounted to £827,080 compared with £704,449 for 1950. The maintenance of the unexpired risks reserve on the usual conservative basis of 50 per cent has involved a financing charge of £61,315, and this, in conjunction with the unfavourable outcome of liability business written in previous years, has necessitated the transfer into this account of a sum of £2,535 from profit and loss account.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

After bringing in gross interest and dividends of £109,377 (£84,308) and the net transfer from revenue accounts of £87,465 (£41,243) and after deducting directors' fees £2,000 (same), other expenses and audit fee £27,671 (£9,381). Overseas taxation £2,590 (£1,746) and providing the sum of £145,000 (£91,000) for United Kingdom taxation, the net balance for the year amounts to £19,581 (£21,424). To this has to be added the sum

of £91,110 brought forward from 1950, making a balance of £110,691 available for distribution.

Your directors recommend the payment of a dividend of 10 per cent, less income tax, for the year 1951 (same) which requires a net sum of £21,000, and, after transferring £2,000 to staff contingency reserve, there remains a balance of £87,691 to be carried forward.

The total of investments shown in the balance sheet is £2,491,269, of which a large proportion is held in short-dated British, United States and Commonwealth Government Securities.

Despite the severe fall in security prices in 1951 the market value or, where there is no quotation, the estimated value of the investments at December 31, 1951, was in excess of their book value.

The total assets of the company now stand at £4,342,722 compared with £3,861,023.

GENERAL REMARKS

To all our friends, both at home and overseas, many of whom we have had the pleasure of seeing in London, or of visiting in their own countries, during the past year, we tender our thanks for the valued support they have given us and for their unremitting efforts on behalf of the company throughout the past year.

THOMAS ROBINSON, SONS AND COMPANY, LIMITED

LARGER TURNOVER

The thirtieth annual general meeting of Thomas Robinson, Sons and Company, Limited, was held on July 2nd at Hull, Mr Thomas Robinson, the chairman, presiding.

The following is an extract from his circulated statement for the year 1952:

You will be glad to note the increase in our trading profit. There was again a sharp rise in expenses, but this was offset by the increase in our turnover, which for the first time exceeded £10 million.

All our subsidiaries made good progress. In spite of the threatened tinplate shortage Derbyshire Cannery Limited, had a record year both on turnover and on profit, and fully maintained the high reputation they have earned for first-class quality. Ernest Ostler, Limited, who are wholesale bakers and food manufacturers, helped by the extension to the main factory which provides better working conditions, also showed marked improvement in spite of the shortage of raw materials, and in spite of further sharp increases in expenses, and particularly of petrol and transport costs, paper, packaging, wages and gas. This was a very creditable performance under difficult conditions.

You will be asked to approve a final dividend of 25 per cent on the ordinary shares, which makes a total of 35 per cent for the year.

I am still optimistic about our future. In recent years the scope of our business has been much increased, and we are firmly established in the distribution of many other classes of foods in addition to our better known role as egg and provision merchants. Last year about 35 per cent of our turnover was on eggs and about 65 per cent on dairy produce, canned goods and general provisions. The opening months of 1953 compared favourably with last year.

(The report was adopted.)

UNION MINIERE DU HAUT-KATANGA

A YEAR OF FURTHER PROGRESS

RECORD COPPER OUTPUT

The annual general meeting of the Union Minière du Haut-Katanga, held in Brussels on June 26th, approved the accounts for the year ending December 31, 1951.

Mr Gaston Blaise was in the chair.

Gross profit was 4,130,279,201 francs. Deduction of depreciation, reserve for profits tax and other charges left a net profit of 2,560,281,683 francs. The amount carried forward from 1950 of 111,804,549 francs gave a balance available for distribution of 2,672,086,232 francs.

After bringing forward 77,437,865 francs and deducting appropriations to the reserve fund, the special reserve and contingencies fund, the available balance was 1,575,142,676 francs. A dividend for 1951 of 1,000 francs net per share was approved by the meeting. Taking into account the 500 francs already paid in accordance with the resolution of the extraordinary meeting of shareholders held on November 22, 1951, there remains a dividend balance amounting to 500 francs net per share.

MR E. SENGIER'S STATEMENT

Mr E. Sengier, chairman of the executive committee, addressing the meeting, began by confirming, with pleasure, that in 1951, as in 1950, everything went well and favourable factors only were recorded.

On the one hand, substantially increased profits have enabled the board to propose the distribution of a dividend increased by one third to 1,000 francs net per share, after payment of more than 2 billion francs for taxes and duties, allotment of 1 billion francs to the reserves and of 800 million francs to the amortisation account.

On the other hand, important construction works have been accomplished within the scheduled time and according to our programme. Thanks to the above-mentioned reserves and amortisations these works have been financed by the profits of the year.

If one looks back over the past seven years, i.e. from 1945 to 1951, one finds that the roughly 35 billion francs deriving from our various receipts were utilised as follows:

Production expenses, 15 billion, i.e. about 42 per cent;

Taxes and royalties, 8 billion, i.e. about 23 per cent;

Net dividends, 5 billion, i.e. about 14 per cent;

Capital expenditure, 6 billion, i.e. about 18 per cent;

Investments and increase in bank deposits, 1 billion, i.e. about 3 per cent.

The receipts of the 1951 financial year amount to 8 billion 800 million francs. Three items of the 1951 expenses, which are a counterpart of these receipts, compare as follows:

1. Remuneration of European and native staff, 1,009 million, i.e. about 11.4 per cent of the receipts;

2. Net dividends to shares subscribed in cash, 978 million, i.e. about 11.1 per cent of the receipts;

3. Taxes, duties, dividends to shares statutorily held by the Government and participation of same in the royalties paid to the

Comité Spécial du Katanga, 2,410 million, i.e. about 27.4 per cent of the receipts.

CONSTRUCTION WORK

1951 and 1952, said Mr Sengier, are two extremely important financial years which will be marked by the accomplishment of a great part of the construction works meant to ensure the future of our company.

From 1953 or 1954 on, we expect to be able to spend annually about 800 million francs for our construction works, corresponding to a more or less normal annual amortisation figure.

Taking into account figures already known and assuming normal sales, it may be expected that the 1952 results will be higher than those of 1951. This would enable us to meet the capital expenditure in connection with the above-mentioned construction works while maintaining or improving our present cash situation.

Our company's results are not only related to metal quotations but also to costs, said Mr Sengier, and this year again these costs compare favourably with those of our competitors.

This statement is a tribute to the ability and the devotion of our entire staff which constitutes the most valuable asset of the company.

RESULTS AND COSTS

Regarding results and costs, the Union Minière has the benefit of two favourable conditions:

(1) Some important elements of its copper production costs vary with the metal quotation, e.g. transport tariffs, duties and taxes, royalties, which if they share in the increase of prices, also participate in the reduction of profits resulting from fall in copper prices;

(2) It produces other metals than copper, in particular cobalt, the price of which is generally not influenced by variations in copper prices.

Our production of zinc, further stated Mr Sengier, although a secondary activity for our company, is important for the Belgian zinc industry, which finds there a substantial part of its supplies.

During the seven postwar years, Katanga will have supplied the Belgian zinc plants with 740,000 tons of concentrates containing 370,000 tons of zinc of a total value of 3 billion 800 million francs.

The part played by our company in the Belgian economy can easily be measured if we say that our sales in dollars from 1945 to 1952 will have reached a total of some 220 million dollars.

PRESENT SITUATION OF METALS MARKETS

Speaking of the present situation of the metals market, Mr Sengier reminded that the attitude of the large copper producers, including this company, to sell their production at official quotations, as well as the regulation agreed upon between governments for the allotment of the metal have certainly checked unsound speculative movements which only affected a small proportion of the world production.

He said he considered 27.5 cents per lb of copper a price exceeding the average quotation on which the profits of a period of several years might be estimated.

There were unfavourable factors, such as the increase of about 250,000 tons that may occur in the near future in the world production and the tendency to substitute aluminium and plastics for copper. But, on the other hand, the constant improvement of the standard of living was definitely a favourable factor which would lead to an increased consumption of electrical equipment, and as a consequence to an increased consumption of copper.

This trend and the stockpile needs had led the United States to import during 1949, 1950 and 1951 respectively 400,000, 530,000 and 350,000 tons of copper mainly from Chilean mines.

PROPOSED INCORPORATION OF PART OF RESERVES

In our annual reports, further said Mr Sengier, we kept you informed about the capital expenditure programme necessary to maintain or increase our deliveries of saleable products.

In principle, replacements of installations or works indispensable to maintain operation at the level of progress are financed by the maintenance fund, the amortisation account and the renewals fund, but works intended to develop our industrial equipment must be financed with cash.

We chose to use our available cash which is the counterpart of our reserves.

This method logically leads to incorporate a part of the reserves to the capital of the company.

Consequently your board intends to summon an extraordinary general meeting before the end of the year, to submit to you the proposition of increasing the company's capital from 3 billion francs to 5 billion francs by incorporation of part of the reserves. This new capital will be represented by the already existing 1,242,000 social shares, which will not be altered in any way.

I trust that the information contained in the report to the general meeting, together with the information I have just given you, will reassure the shareholders for the future.

The Government of the Colony and the Comité Spécial du Katanga to whose confidence we pay tribute will be further convinced from year to year that our main concern has been the general interest of the country and the moral and material fate of the Congolese population, which is under our care and which leads a happy family life in our social centres.

RECORD COPPER OUTPUT

The report circulated to shareholders shows that in 1951 out of a world copper output estimated at 2,600,000 metric tons, Union Minière produced 191,959 tons, as against 175,920 tons in 1950.

This figure, the highest one ever reached since the origin of the company, as well as the production of 5,715 tons of cobalt, could not have been realised without the electrical energy supplied by the Bia power plant, the

output of which is nearly half that of the Francqui power plant.

Ore mined during the year totalled 4,762,000 tons, as against 4,317,066 tons in 1950.

Thanks to further research, the ore reserves have still increased in spite of the ore mined during the year.

Besides copper and cobalt, the uranium-radium ore production has been carried on and the radium content recovered in relation with the commercial demand.

110,836 tons of crude and 43,130 tons of roasted zinc concentrates were delivered to the Belgian zinc industry at a moment when zinc ores were strongly wanted.

As a by-product of the roasting operation, 24,316 kilos of cadmium were recovered by Sogechim.

Refining of blister copper by the Société Générale Métallurgique de Hoboken yielded 118,046 kilos of silver and 14.7 kilos of gold.

The workings in connection with the development of the company's operations have been actively pushed on during the year 1951.

At the Kambove-West mine, a future underground mine, surface installations have been assembled.

In the Western group of mines, the electric haulage has further been extended to railway lines of the company's own system.

Both concentrators at Kolwezi and at Kipushi have been enlarged in view of meeting the increased production of the mines that they serve.

Additional equipment has been put into service in the Jadotville plants. In particular, a copper refining furnace and a 3,000 kVA cobalt electric furnace have been fired during 1951.

POWER SUPPLIES

For the moment the company consumes the power produced by two hydro-electric power stations: the Francqui and Bia stations on the Lufira River.

Early in 1953 the Delcommune power station, which is at present in course of erection at the Lualaba River, will enter into production, with an installed power of 120,000 kVA.

For the further future, a second power station on the Lualaba River, to be named Le Marinel Power Station, should be erected downstream of the Delcommune power station. It will work under a fall of more than 200 m, and will have an installed power of 300,000 kVA.

With these four power stations of a total installed power of 530,000 kVA at its disposal, Union Minière will be in a position to produce about 2.5 billion kWh per average year.

SOCIAL ACHIEVEMENTS

At the end of 1951 the Congolese population living in the social centres of the company numbered 59,610 persons.

The health situation is excellent and constantly increasing owing to the close co-operation between the services in charge of the native labour and the medical service.

In 1951, for the first time, a bonus has been deposited to the savings account of those Congolese workers who have been occupied in the company since more than three years.

Moreover, the company's programme of social achievements towards the development of family life among Congolese people has been pursued.

Tribute was rendered to the members of the religious missions and social workers who devoted themselves to the accomplishment of this task.

GUARDIAN ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING—

JULY 1, 1952

CHAIRMAN: THE RIGHT HON. LORD BLACKFORD, DSO, DL, JP

LIFE DEPARTMENT

Net new sums assured amounted to £9,886,471, being an increase of £3,698,414 over the corresponding figure for 1950. The mortality experience was satisfactory.

The net rate of interest earned on the fund, which increased during the year by £2,213,962 to £18,106,473, was £4 2s. 11d. per cent.

FIRE DEPARTMENT

The net premium income at £3,737,265 showed an increase of £474,370 over the previous year. The loss ratio was 40.4 per cent, a decrease of 2 per cent on the previous year. The amount transferred to profit and loss was £534,682.

ACCIDENT AND GENERAL DEPARTMENTS

The net premiums were £3,869,062 against £3,056,674 in 1950. The loss ratio was 56.8 per cent and the amount transferred to profit and loss £71,461.

MARINE DEPARTMENT

The net premiums amounted to £1,622,487 against £1,225,529 the previous year, and the first year's claims were 27.4 per cent of the premiums. £222,000 has been transferred to profit and loss, leaving the fund at £1,846,018, representing 113.8 per cent of the premium income.

REDEMPTION ASSURANCE ACCOUNT

A valuation at the end of the year revealed a surplus of £16,034, of which £5,000 has been transferred to profit and loss, leaving the amount of the fund at £2,575,409.

PROFIT AND LOSS

After making full provision for taxation, including that on the profits for the year, and transferring £222,000 to investment reserve and £13,394 to general reserve, and providing for the final dividend recommended by the directors of 2s. 6d. (less income tax) on each ordinary share and meeting the cost of the preference dividend for the year, the balance carried forward was £271,319.

BALANCE SHEET

A valuation of the Stock Exchange securities was made at December 31st last, and notwithstanding the general setback in all classes of securities during the latter part of the year, a surplus was shown in the aggregate on both the life and the shareholders' funds after taking into account the investment reserves.

All the principal classes of insurance transacted; also trustee and executor business.

Head Office:

68, King William Street, London, E.C.4.

METROPOLITAN RAILWAY SURPLUS LANDS

INCREASE IN RENTS RECEIVABLE

SIR BERNARD DOCKER'S STATEMENT

The nineteenth annual general meeting of the Metropolitan Railway Surplus Lands Company, Limited, will be held on July 10th in London.

The following are extracts from the circulated statement by the chairman, Sir Bernard Docker, KBE:

Perhaps the most important and certainly encouraging feature of the company's profit and loss account is the increase in the rents receivable. During the year the net rents have increased by about £9,000 to £144,318 and are over £30,000 more than those for the year to March, 1950. This increase, while not spectacular, does confirm the expectations, which I expressed last year, of expanding revenue over the next few years. We have been able to do a good deal more this year by way of repairs. These have cost us about £1,000 more after withdrawing £4,500 from the provision for repairs.

In the balance sheet, the fixed assets, being the freehold and leasehold properties, less depreciation, have increased by nearly £50,000 to £2,572,613. Cash at bank and in hand is £313,311, and we are in the fortunate position of having such a comparatively large sum available for property investment at a time relatively favourable to the investor.

We have recommended a dividend of 3½ per cent and a bonus of 1 per cent.

ORTHEM ESTATES

I have explained to you on previous occasions our reasons for incorporating Orthem Estates, Limited, and for financing its trading activities, and I think you will all be aware that, in 1949, some doubt was expressed whether what we had done was within the powers of our Memorandum of Association. Counsel having confirmed this doubt, we arranged that Orthem Estates, Limited, should buy no more properties, and since that time the subsidiary company has been in process of realising its assets.

It has been suggested to us that we should take the necessary powers to permit us to continue to own and lend money to Orthem Estates, Limited, or a similar subsidiary company. We have considered this suggestion and have formed the opinion that it would be advantageous for us to continue to own a trading subsidiary company, and for it to resume active trading. Therefore, we have given you notice of a special resolution to be moved in the name of the board, to enable this to be done.

We accept the view that any investment of this character should be subsidiary to our main business of permanent property investment, and accordingly, the resolution to be put before you, if carried, will limit our powers of direct investment of this nature to ten per cent of our issued capital.

AN OUTSTANDING QUESTION

We have not found it possible yet, in spite of every effort on our part to do so, to resolve by friendly agreement the question between ourselves and the London Transport Executive to which I referred in my statement last year. We have recently consulted on this question again with learned counsel and it may well be that a lawsuit will be the only means of resolving this matter. We shall not lightly embark on liti-

gation, however, if we find any chance at all of arriving at a solution by agreement within a reasonable period, but we are, nevertheless, determined to settle this matter.

It is always difficult and often foolhardy to venture any opinion of future prospects,

although fluctuations in economic conditions have a rather less marked effect on the results of a property investment concern than is the case with the majority of commercial companies. On the other hand, I do feel that shareholders are entitled to all informa-

tion we can give, and so I will say that we have grounds for hoping that our revenue over the next two or three years will expand sufficiently for us to be able to maintain the total distribution we have recommended this year.

GUEST, KEEN AND NETTLEFOLDS

PROGRESS OF OVERSEAS INTERESTS

MR J. H. JOLLY'S STATEMENT

The fifty-second annual general meeting of Guest, Keen and Nettlefolds, Limited, was held on June 26th at Birmingham, Mr J. H. Jolly (chairman of the company) presiding.

The following is an extract from the statement by the chairman for the 52 weeks ended December 29, 1951.

The major variation from last year is the increase of almost £7 million in the totals of the issued capital and reserves of the group, which now amount to £48,556,526. Nearly £4 million of this increase arises from the net surplus on the transfer of our investments in nationalised companies, after allowing for the subsequent fall in the value of the Government securities and after deducting the distribution of 5s. per unit to the stockholders in June, 1951. The balance of approximately £3 million has been provided out of the profits of the year either in the form of depreciation reserves (that is, that proportion of depreciation not written off fixed assets) or as retentions of profit in the subsidiaries and the parent company.

CAPITAL AND RESERVES

Of the £48,556,526 capital and reserves at December 29, 1951, the capital employed attributable to the ordinary stockholders amounted to approximately £41 million. Since March 31, 1947, the capital employed has increased by £21,441,171, which has been provided as follows:—

An issue of capital in 1949 subscribed by ordinary stockholders (including premium on issue)	4,273,920
Undistributed capital and revenue profits retained in the group	17,167,251
	21,441,171

Had it not been for this issue in 1949, which supplemented the previous issue in 1946, and the conservation of profits to a high degree, we could not have gone forward with the plans which are now contributing to the increased profits of the company.

Although the ordinary stockholders' capital employed has more than doubled in this period, the dividend rate has increased only by about one-third.

On this occasion the ordinary dividend rate is advanced from 14 per cent to 15 per cent. As a board we would like to see it higher, since at this rate of dividend the return on the actual capital employed attributable to ordinary stockholders is only 4.13 per cent; in your interests, however, we must have regard to important factors that are not receiving sufficient attention in some quarters. Today a business has to pay for capital equipment and maintenance a much greater price per unit of production than in 1939 (prewar)—in many cases three or more times as much; and the cost of introducing the necessary additional capital has also advanced considerably. A further point to be remembered is that until this inflationary tendency is checked and reversed, the working capital required for stock in trade and

debtors is considerably greater, as evidenced by the increase of almost £6 million for these two items in the year under review.

TAXATION

Far from getting relief, we are facing, from January 1, 1952, a further impost by way of the proposed Excess Profits Levy in the Finance Bill. As presented in its original form it can be regarded as a misguided concession to party political propaganda. Subject to amendments that may possibly be made before the Bill reaches the Statute Book, its provisions are most arbitrary and complex in character. In the case of this group, due to the changes in structure over the period since the first of the "standard" years, it is impossible at this stage to assess the full effect of this new form of taxation on future profits.

TRADING CONDITIONS

Fortunately, by overcoming many difficulties, supplies of various kinds came along better during the year than at one time seemed possible and enabled a good volume of turnover to be attained. It is this high rate of production that produces the extra profit: sooner or later a falling off in demand will make inroads into this high rate of productivity and profit margins will fall.

IRON AND STEEL

Last year I had the dismal task of reporting the transfer to the Iron and Steel Corporation of our various interests in iron and steel making companies. The present Government is pledged to make it possible for the return of these to free enterprise, with an adequate measure of public supervision. At the time of writing, the Bill to effect this has not been submitted to Parliament. Its implementation will not be without difficulties for various reasons and not least the changed value of money since nationalisation took place.

In regard to the iron and steel companies that we owned directly prior to nationalisation, we are prepared to consider purchasing them, subject to fair financial terms on reacquisition, and the extent to which free enterprise may be allowed. These considerations cannot be resolved until further information is forthcoming.

OVERSEAS INTERESTS IN THE BRITISH COMMONWEALTH

At the present time it is in Australia that our largest manufacturing interests overseas are located. The Dominion had a chequered financial history throughout 1951, the outstanding circumstances being a violent inflationary spiral and continued shortages of coal and iron and steel production. It is probably a temporary phase in the growth of a young Dominion but, coupled with the dilatory mechanism of price control, in 1951 it caused a set-back in the profits of the Lysaght and Nettlefolds companies. Fortunately in 1952 there is some improvement and when the Australian Government has mastered the present economic problems

we are confident of a return to prosperity of our interests there.

India: The results for 1951 were good and would have been considerably better but for the great shortage of steel from which India suffers. The country needs at least another million tons of steel a year and we should welcome the news that definite steps to achieve it were likely in the near future. It would be of great benefit to our own subsidiary—Guest Keen Williams, Limited, in Calcutta—and to India's trade generally.

Canada: The Lysaght Company at Hamilton and the Mills Scaffold and Concrete Specialities Company have both had improved trading results in 1951. Consideration will be given in due course to the possibility of broadening the base of our trading and manufacturing in Canada if surveys now being made prove favourable.

South Africa: The steel furniture manufacturing company established by Joseph Sankey and Sons, Limited, at Johannesburg, has made progress during the year, but has been hampered by the shortage of steel supplies and the restrictions on imports of raw materials imposed as a temporary measure by the South African Government: when sufficient steel supplies are available in the Dominion, the company is expected to make satisfactory profits.

The Twisteel Company in South Africa has had a good year and should make further progress. Having established itself satisfactorily in the Union territory, we are about to form a company in Southern Rhodesia to manufacture the Twisteel products there. In the initial stages, large profits cannot be expected, but, as the Rhodesias develop, the financial results should be interesting.

The South African market in bolts and nuts, screws and railway fastenings is a growing one, and the Union Government is fostering home production. We came to the conclusion that instead of setting up a separate company for those products, it was preferable to increase our shareholding to 49 per cent in South African Bolts and Nuts (Pty.) Limited (Saban), accompanied by a trade agreement to place our technical knowledge on wood screws, etc., at the disposal of the South African Company. As the industrial importance of the Union of South Africa grows, we feel the investment will be justified.

HOME MANUFACTURING COMPANIES

I do not propose on this occasion to refer in detail to the activities of the manufacturing companies at home. Satisfactory as their results have been under the leadership of Mr Kenneth Peacock and the chairmen of the various subsidiary companies, they would have been augmented if there had not been shortages of raw materials in some directions. Good progress, though not as rapid as we had hoped, has been made with extensions at various works. Your thanks are due to the several managements for the manner in which they have maintained production and a good share of the export trade, while coping with the dislocation

inevitably caused by works extensions going on at the same time.

The first few months of the 1952 financial year's trading have opened well and if volume of production can be maintained we shall look forward to a good year. But I would say that the emphasis is on the word "volume" as, in the interests of our customers, we have to work on narrow profit margins. A high level of production is all important to enable this to be done and, at the same time, to achieve a satisfactory return on stockholders' funds.

The report and accounts were adopted.

LONDON AND MANCHESTER ASSURANCE COMPANY LIMITED

CONSIDERABLE NEW BUSINESS INCREASE

The eighty-third annual general meeting of London and Manchester Assurance Company Limited, was held on July 2nd at the Chief Office, Finsbury Square, London, E.C.2.

Mr A. H. Dawes, the chairman, in the course of his speech, said:—

I am pleased to be able to report that our new business increased considerably last year. In the ordinary branch the new sums assured amounted to £5,199,838, an increase of over £700,000 on the previous year's figure, while in the industrial branch the new sums assured totalled £5,050,991, an increase of over £500,000. The total premium income in the two branches advanced by nearly £200,000 and exceeded £5½ million. The total income of the company (excluding the fire and general branch) was £7,397,267, an increase of £321,254.

These results are very satisfactory because they indicate not only the continued development of your company, but also a helpful contribution to national thrift. Fundamentally life assurance is a form of saving; indeed, it is now the largest single source of personal savings in the country. In times like the present adequate voluntary saving and restraint in immediate spending are essential.

Ordinary Branch: The premium income for the year was £2,567,779, an advance of £113,619 on the preceding year.

Industrial Branch: The premium income in this branch exceeded £3 million for the first time and reached the figure of £3,055,605, being £83,246 more than in the previous year.

EXPENSE RATIO

The expense ratio in the ordinary branch changed little by comparison with the previous year. The actual figure on this occasion is 13.56 per cent, compared with 13.63 per cent. If the contribution to the Staffs' Pension Fund is included, the expense ratio becomes 14.22 per cent, compared with 14.25 per cent.

The expense ratio of 28.90 per cent in the industrial branch compares with 27.77 per cent for the previous year, the increase being due mainly to increased staff remuneration. If the contribution to the Staffs' Pension Fund is included, the figure is 30.80 per cent, compared with 29.54 per cent for the previous year.

The gross rates of interest earned on the ordinary branch and industrial branch life funds were £4 9s. 8d. per cent and £4 9s. 7d.

per cent respectively, compared with £4 4s. 3d. per cent and £4 3s. 7d. per cent for the previous year. The corresponding net yields were £3 9s. per cent and £3 19s. 10d. per cent, compared with £3 4s. 11d. per cent and £3 13s. 6d. per cent.

ALLOCATION OF SURPLUS

Prices of Stock Exchange securities do not yet appear to have become stabilised and in consequence the directors think it would be a wise precaution to wait until the outlook shows some indication of becoming settled before contemplating a distribution of surplus by way of reversionary bonus. They have, therefore, in the ordinary branch decided to declare the same rate of bonus as last year, but to confine it to policies which become claims by death (except policies less than one year in force) or survival before the date of the next annual general meeting. Accordingly, the carry forward has been considerably increased and now stands at £523,915.

In the industrial branch, following the pattern adopted in the ordinary branch, that part of our profit-sharing plan which normally provides a reversionary bonus has been temporarily altered to give bonuses at the same rates as last year, but only to qualifying policies which, before the date of the next annual general meeting, become claims by death or are freed for the full sum assured. The carry forward has been maintained at the high figure of over £400,000.

Fire and General Branch: This branch has again made steady progress. The premium income was higher by £10,672 at £223,802 and the profit of £17,874 has been carried to the profit and loss account.

The report was adopted.

HIGHAMS LIMITED

CHANGED TRADING CONDITIONS

The forty-fourth ordinary general meeting of Highams Limited was held on July 2nd in London, Mr Eli Higham (the chairman) presiding.

The following is an extract from his circulated statement: Your directors recommend a final dividend of 12½ per cent plus a bonus of 2½ per cent, which, together with the interim dividend and bonus, make a total of 27½ per cent for the year, less income tax.

The profit is considerably less than last year. I would like to deal with the reasons for this reduction. The year under review shows a marked recession in textiles generally and resistance by the public to high prices. This must be due in some measure to the increased cost of living with its effect on purchasing power. These factors have all contributed to the slackening in demand for textiles, resulting in a complete change-over from a sellers' to a buyers' market, together with a sharp drop in prices. This decline in values had to be faced, resulting in an amount in excess of £180,000 being written off the group's stocks, thereby reducing this year's profits by that amount.

We have been wise in facing the big fall in values fairly and squarely, which should assist your company to maintain sales, production and employment at your various branches.

I feel that we can face the future with reasonable confidence in the knowledge that we are a vertical organisation producing cotton sheets, pillow cases, blankets, tablecloths, etc., which are necessities as opposed to luxuries, and are, in the main, entirely free from purchase tax.

The report was adopted.

GEORGE WIMPEY & COMPANY

SATISFACTORY RESULTS

The thirty-third annual general meeting of George Wimpey & Co., Limited, was held on June 30th in London.

Sir Godfrey Mitchell (Chairman of the Company), who presided, in the course of his speech, said:—

The amount of work completed during 1951 exceeded by a substantial margin that for any previous year of the company's history, but as I foreshadowed in my address to you last year, it has been a period of great difficulty. Rising costs and shortages of materials and labour combined with adverse weather to produce circumstances needing sustained effort to overcome and to achieve the satisfactory results before you.

OVERSEAS

Overseas we continue to consolidate our position and to explore the possibilities of new markets, and during the year extensive contracts were carried out in the Middle and Far East, Australia and West Africa.

During 1951 we completed some 6,800 dwellings. The greater proportion of these were built by our "No-Fines" concrete technique and included our 3-storey flats. Large numbers of traditional brick houses were also built.

During the year our work as main civil engineering contractors at London Airport and at the Port Talbot Steel Works was practically completed and we have every reason to be proud of our association with these vast projects on which we carried out work amounting in all to some £20,650,000.

WORK FOR OIL COMPANIES

Our contracts for the Oil Companies at Grangemouth, Ellesmere Port and the Isle of Grain are proceeding well and our entry into the field of erection and fabrication of oil refinery process units together with the installation of the complex mechanical and electrical refinery equipment has proved to be an outstanding success.

We again produced over 2 million tons of coal during 1951—a tonnage representing 20 per cent of the total national opencast coal output.

Profits are slightly up from £528,000 in 1950 to £540,000 in 1951, and in view of the difficulties I believe you will consider this to be a satisfactory result. It is proposed to pay a dividend of 20 per cent of our Ordinary shares, and after payment of the Preference Dividends, to set aside £150,000 for Income Tax Equalisation of Initial Allowances on plant and to transfer £300,000 to General Reserve, leaving £175,000 to be carried forward to next year.

CAPITALISATION OF RESERVES AND BONUS ISSUE

You will be asked to consider Resolutions to increase the Authorised Share Capital of this Company to £2 million and to capitalise £800,000 of the General Reserve Account to be issued as a bonus to Ordinary Shareholders in the proportion of four new Ordinary shares for every one existing Ordinary share held.

Looking to the future, we have more work on hand than ever before, but even so, there is no easy road ahead and the many difficulties which beset us will continue to require the utmost effort if they are to be successfully overcome.

The report was adopted and the Bonus Issue approved.

THE BUTTERLEY COMPANY, LIMITED

YEAR OF STEADY ACHIEVEMENT

FULL ORDER BOOKS

MR E. FITZWALTER WRIGHT'S SPEECH

The sixty-fifth annual general meeting of The Butterley Company, Limited, was held at the Registered Office of the Company, Butterley Iron Works, near Derby, on June 27, 1952.

Mr E. Fitzwalter Wright (chairman of the board of directors) presided.

The secretary (Mr P. Elliott) read the notice convening the meeting, and the report of the auditors.

The chairman said: Ladies and Gentlemen, since our last meeting, Mr W. P. Mellen has accepted an invitation to join our board, and he now offers himself for re-election. Mr Mellen has made his career in the City of London and is a partner in the firm of Joseph Sebag & Co., the company's brokers. He has acquired a wide knowledge of finance, and we have already found his advice of great value to us. I warmly commend his re-election to you.

WELCOME INCREASE IN PROFIT

You will see from the accounts that there has been a welcome increase in the profit for the year. The profit on the consolidated profit and loss account is up from £205,071 for 1950 to £280,378 before taxation. In arriving at these figures, the usual deductions from our trading profits have been made, but there are two items to which I should like to draw your attention. The first is the figure for depreciation, which you will see is up from £56,694 to £87,047. This is due to an increase in the charge we have made against our motor vehicles. During the year the opportunity arose of ridding ourselves of many prewar models and taking in exchange vehicles manufactured in 1950 or later. These qualified for the initial allowance of 40 per cent, and our saving in income tax has been charged in our accounts as increased depreciation.

The other item is consideration for coal supporting ironworks buildings, £25,480. This is yet another curious and quite unfair result of nationalisation. In the old days we were the freehold owners of most of the coal underlying the Butterley and Codnor Park areas, and would never have dreamed of working the pillars of coal left for the support of our two ironworks. This fact was quite properly taken into account when the value of our freehold coal was determined under the Coal Act, 1938, under which all unworked coal was nationalised, and we received almost nothing for the coal in these particular pillars, on the ground that they would never be worked by us. But when the Coal Industry Nationalisation Act came into force there was nothing to prevent the National Coal Board from working these pillars, provided they paid for the damage they did.

We therefore had to take the risk of having our works put out of commission, or buy the coal back to prevent it being worked. I am sure we chose the right alternative, but I shall always regard it as most unfair that we ever had to make the choice at all.

A NOTABLE ACHIEVEMENT

The increase in our trading profit is accounted for in part by increases in profits in our engineering and brickworks departments, a notable achievement, in view of the difficulties we in common with all engineers have experienced in the supply of raw

materials. But the chief part has been played by a most welcome improvement in the results of the Civil Engineering Department. The effects of a thorough re-organisation of the department are now beginning to be felt, and though the results are not yet by any means as good as I believe they should be, I am hopeful that continued improvement will be maintained.

I do not think there is anything else in the accounts I need comment upon, except to direct your attention to a new note—Note 2 of the notes to accounts—in which there is set out the way we have dealt with the moneys we have so far received on account of compensation for our colliery properties.

COMPENSATION: N. DERBYSHIRE

This brings me to a subject which I dealt with pretty fully last year, namely, the procedure for the determination of the compensation due to us. I am very glad that I have better news for you this year. You will all be aware that the coal owners of North Derbyshire came to an agreement last autumn to set up a tribunal to value their T.S. assets; that tribunal did its work with quite admirable expedition, and, as I think, fairness, and its award was made known in April. So far as the company is concerned their valuation of our T.S. assets in the North Derbyshire district amounted to £2,452,386, which after deduction of the capital outlay refunds already received and scaling down to fit in with the total amount available for North Derbyshire, gives a net award of £1,936,667.

I regard that figure with quiet satisfaction, and I should like on behalf of the board, and I am sure the shareholders, to thank all those both inside the company and those former servants of ours who have now transferred their allegiance to the National Coal Board for the skill and devotion they all brought to the preparation and presentation of our case. In particular I should wish to mention Major Noel Webster, who is our chief professional adviser in these matters, for the extremely able way in which he conducted our affairs.

NOTTINGHAMSHIRE

Things have moved more slowly in Nottinghamshire. For a long time it seemed impossible to persuade certain companies that on balance the interests of their shareholders would be better served by a speedy settlement outside the Act and Regulations. But I am happy to say that in the last few weeks real progress has been made, and though no agreement has actually been signed yet, I am very hopeful that it will be achieved in the very near future. If events bear me out in this, I see no reason why an award dividing the sum available for the Notts T.S. assets should not be made during the autumn.

We decided not to make an application for a further payment of compensation at the June distribution, although I have no doubt that quite a substantial payment would have been forthcoming if we had asked for it. Meantime of course, interest will be accruing upon it. As I have often told you, it is our intention to put before you at the proper time proposals for reducing the capital of the company by returning part of it to the shareholders. Obviously the total amount it will be wise to return will depend on the amount

we eventually receive in compensation, and this we shall not know for certain for a good long time yet. But I see no reason why we should not deal with the matter by stages, and subject to what I have to say later, and provided we receive a further substantial payment on account of compensation in December, I shall hope to put proposals before you early in the New Year.

A COMPLICATION

But a complication has been introduced by the Excess Profits Levy provisions of the Finance Bill. It seems clear that we shall have to calculate our EPL standard on 8 per cent of the value of the net assets of the group as at December 31, 1951, and we are advised that the valuation of our transferred interests may be taken into that calculation.

It will not therefore be possible accurately to assess our EPL standard until all the valuations of our transferred interests are completed, but presumably we shall have to try to agree with the Inland Revenue authorities a provisional EPL standard for the time being. The EPL standard will be reduced by 12 per cent of the amount of any decrease in the capital employed in the business, brought about for example by a return of capital to the shareholders.

Until, therefore, the Finance Bill is passed and we have received authoritative advice on its final provisions, and have been able to agree with the Inland Revenue what our provisional EPL standard shall be, it is impossible to be precise about when the return of capital will be made, or how much it will amount to. It would clearly be unfair to keep our shareholders in suspense a moment longer than necessary, and they will be informed of further developments as soon as possible.

POSITION IN AUSTRALIA

May I now deal—necessarily briefly—with the events which have happened in the company over the past year. Our agreement with the Sunshine Harvester Co. of Australia has been terminated. You will remember that this agreement, entered into during the war, provided for us to assemble into complete machines, parts and sub-assemblies imported from Australia, and we undertook to be responsible for a spares service for Sunshine machines in this country.

Events have made it impossible for the Sunshine company to continue to import the parts into this country, and at their suggestion the agreement has been terminated and our stocks of spares transferred to Messrs Massey Harris Limited. Owners of Sunshine machines therefore can be assured of a first rate spares service, and it only remains for me to put on record our regret that our association with the Sunshine Company, which was throughout of the most friendly character, has come to an end.

ARRANGEMENT WITH AIR PRODUCTS, INC.

Last year I told you of the arrangement we had come to with Air Products, Inc., for the manufacture by us under licence of their oxygen generating plants. I am glad to say that good progress has been made in this matter, and we were happy to welcome over here a few months ago Mr Leonard Pool,

President of Air Products, Inc. He expressed himself as very well satisfied with what we are doing.

Our first plant should be in operation in about six weeks time, and we have acquired valuable experience in its manufacture. Three other plants on order from the Air Ministry are in course of manufacture, and although we have experienced great difficulties in the supply of raw materials—notably copper—our part of the plant should be ready in schedule time. There is, I believe, a great future for this business, and we are arranging for manufacturing space to be made available for these plants not only in the new shops at Hughes & Lancaster but at Codnor Park as well.

FOOT AND MOUTH DISEASE

In common with all other farmers, we labour under great anxiety about the present outbreak of foot and mouth disease. I need hardly tell you that every possible precaution is being taken, and we can only hope that we shall be spared. There has been no increase in the amount of our land requisitioned for opencast coal mining, but I would not be surprised if further demands were made upon us. As I have been very critical in the past about the methods used for the restoration of opencast land, it seems only fair to tell you that recent restorations seem to have been done more carefully and efficiently than in the early days of opencast mining.

We are very pleased with the new venture in East Notts which I told you about last year, and the results of the farms department are most encouraging. Profits or losses in farming are very difficult to assess year by year; much depends on the annual valuation. But to give you some idea of the progress we have made, I may tell you that our sales from the farms have increased steadily from just over £15,000 in 1948 to over £60,000 last year, and I fully expect them to be over £100,000 this year. There can be no doubt that efficient farming is a profitable occupation.

CURRENT YEAR'S OUTLOOK

Generally throughout the company and its subsidiaries it has been a year of steady achievement, as the accounts show. We are constantly being warned of the imminence of a trade recession, and all of us know that the demand for certain consumer goods shows signs of slackening. But I am bound to say that so far as this company is concerned we have so far been unaffected. Our order books are as full, if not fuller, than they were a year ago, and enquiries continue to come in at a satisfactory rate. While I should be the last to say that we could expect to escape altogether the effects of a major depression, our results up to date have been better than in the corresponding period of last year, and I see no reason for anxiety about the next six months.

Our relations with our staff and workpeople continue as cordial as ever, and I would like to thank them for the exemplary way in which they carry out their duties and for the loyalty and support we always receive from them.

I now have pleasure in moving: "That the directors' report and balance sheet, which carries with it the directors' recommendation of the payment on June 30, 1952 of a final dividend on the ordinary capital of 6 per cent, less income tax, (making 9 per cent, less income tax, for the year), which will absorb £56,700, and the carrying forward of the balance of £222,802, be received, approved and adopted."

The report and accounts were adopted; the retiring directors, Mr L. R. Honeywill, Mr A. P. Coote, and Mr W. P. Mellen, were re-elected; the auditors, Messrs Price Waterhouse & Company, were re-appointed, and the proceedings terminated with a vote of thanks to the chairman.

THE CLAN LINE STEAMERS, LTD.

INDUSTRY A NATIONAL ASSET

The sixty-second annual general meeting of The Clan Line Steamers, Limited, was held on June 26th at 2 St. Mary Axe, London, E.C.

The Rt. Hon. Lord Rotherwick, chairman, having dealt with certain matters in the accounts, continued as follows:—

I regret that it is still necessary to draw attention to the high level of taxation in this country. I referred last year to the withdrawal of initial allowances. To add further to our difficulties we have to contend, from January 1st this year, with an excess profits levy, the implications of which cannot yet be fully appraised, although the bold policy of fleet replacement adopted by this group has meant that satisfactory profits were earned during the standard period. Our fiscal system has become so involved that it is no longer possible for the average business man to grasp the significance of income tax, profits tax and excess profits levy on a business deal, without first consulting an army of experts in this particular field of Government activity. It is wrong that commercial decisions should have to be considered in the light of the incidence of taxation. It is with regret, and a considerable amount of concern, that I observe that the Chancellor has not yet found it possible to give relief to the shipping industry on profits which are ploughed back into the business in order to finance the replacement of ships. Building costs are still rising and it must be very obvious that depreciation calculated on the cost of ships at present in existence will not provide the funds necessary to replace them at the end of their useful lives. Excluding initial allowances, which ceased on April 5th this year, the allowance given in the computation of taxable profits is 5 per cent on the original cost of the vessel. Accordingly, any additional provision which is required has to be found out of profits which are subject to a minimum charge for taxation of 10s. in the £1. The shipping industry is a national asset and surely it is better to allow companies to keep sufficient profits to maintain their fleets than to force them to apply in due course for a Government grant for this purpose. That the shipping industry is a national asset is recognised not only by our Government, which lays down certain requirements in the design of new ships to adapt them for wartime use, but also by the Americans, who are prepared to make a substantial contribution towards the cost of building the "United States" on the grounds that in the event of war this vessel can be converted into a troop carrier.

The principal business of this group of companies is the carrying of goods between members of the Commonwealth and Empire. Consequently, any restriction of trade with our partners is of great importance to us. Unfortunately at the time there are many instances of such restriction, brought about to some extent at least by the provision of the Geneva Trade Agreement which precludes us from giving more favourable treatment to our partners than we give to other nations.

By the terms of the Washington Loan Agreement we undertook to do our best to achieve multilateral trading, but, so far as I am aware, no single country has ratified the Geneva Agreement and, accordingly, I suggest that as this agreement is proving harmful to our trade, and consequently harmful to world trade, we should take an early opportunity of denouncing it so that we may increase trade between our partners and thereby stimulate world trade.

I am not unmindful that restrictions have been imposed subsequent to a meeting in London of the Commonwealth Finance

Ministers and, if this means that the present restrictions are designed to ascertain the true trading position of each partner with a view to establishing an increased trade based on a solid foundation, the temporary disorganisation may prove in the end to be well worth while. It is impossible to believe that trade with our partners cannot be so increased that it will leave a profit margin for all concerned. Let there should be any confusion as to what I mean by profit margin, let me say that I consider that there should be a profit element in wages so that any person who is prepared to work hard can acquire those extras which are such an incentive to increased production.

Today is the time to adopt bold imaginative policies. At home we should have as little Government interference as possible. We should design a system of taxation which encourages greater effort either in the field of production or in the expansion of trade. It is always difficult to advance from a weak position, but having secured our defences we can build up our strength by a sufficient expansion of our Commonwealth and Empire trade. This will allow this group of nations to resume a position of leadership in the trading world and ensure a future undisturbed by dollar deficiencies.

DIVIDENDS

The final dividend recommended by the board is 30 per cent, which, with the interim payment of 5 per cent, makes a total distribution of 35 per cent, compared with 30 per cent for the previous year. Having regard to the profits earned by the group, I think this modest increase is fully justified. I must warn you, however, that this rate of dividend can only be maintained if the profits for the year are sufficient to provide for normal depreciation based on original cost, together with a margin to cover the increased cost of fleet replacement, which, as I have explained, has to be provided out of income on which tax is payable.

FUTURE PROSPECTS

You will expect me to say something about future prospects. It is impossible to look very far ahead, but I think that the profit for the current year will be satisfactory, although, as I have said already, costs continue to rise and some services are not making a fair contribution to profits.

During the course of the year I have done a certain amount of foreign travelling, and it is very apparent that most nations are attempting to become self supporting. Industry is being developed and by the use of differential rates of exchange this development is being effectively subsidised. I do not like this juggling with exchange rates, but if everyone else is doing it, it becomes imperative that we should have an answer. I certainly feel that it might increase exports to the dollar area if traders doing business with dollar countries were allowed to use freely a proportion of the dollars which they earn. This I know has been adopted in certain European countries. I know of articles, the export of which would not in any way reduce our standard of life and which are not being exported simply because the price on the home market exceeds the export price. If the trader in these goods was allowed to retain a proportion of his dollar earnings he, in turn, would be able to import other goods on which he could make a profit which would compensate him for the apparent loss which he sustains on the original sale and the nation would benefit not only from the goods imported, but also from that part of the

exchange which was not released to the trader.

The report and accounts were adopted and the proposed dividends confirmed.

N. GREENING AND SONS, LIMITED

RECORD GROUP RESULTS

The seventieth annual ordinary general meeting of N. Greening and Sons, Limited, was held on June 30th at the company's office at Warrington.

In the absence of Mr H. R. Yorke, MC, chairman, who was indisposed, Mr C. G. Fraser (managing director) presided.

The following is a summary of the chairman's circulated statement:—

It is once again my pleasure and privilege to comment upon another most successful year. Sales of the parent company which embrace our main production of woven wire, perforated metals and wire products show an increase of 41 per cent, as compared with the previous year, and I am sure you would wish me to express our thanks and appreciation to the management, staff and all employees and agents of the company for the co-operative effort that has made these results possible.

ACCOUNTS

Trading profits of the group, including interest and other income, amount to £277,541, compared with £191,634 last year—an increase of 45 per cent. The major part of this increase arises from the completion of many of the plans for development and expansion on which we have been working for the last four or five years, but a part also arises from raw material price increases during the year.

The amount charged for depreciation at £25,983 is based on the Inland Revenue allowances, as is our usual practice. Taxation again represents a very heavy burden and the combined provision for Excess Profits Levy, profits tax and income tax absorbs no less than £146,456.

The net profit remaining after this taxation provision is £103,352, but in order to maintain the real capital employed in the business, we have deemed it advisable to appropriate £15,000 to fixed asset replacement and £60,000 to general reserve before providing for a final dividend of 15 per cent, making 20 per cent for the year, which is the same rate as last year.

BONUS SHARE ISSUE

You will see from the notice of the annual general meeting that it is proposed to obtain the approval of shareholders to a capitalisation of reserves and issue of bonus shares. Two steps are involved in this operation. First, we have capitalised £80,000 of the reserves of our subsidiary, the Greening Wire Company, Limited, with a corresponding increase of £80,000 in the capital reserve of the parent company. Secondly, we propose utilising the whole of this increased capital reserve together with £84,461 of the general reserve for the issue to ordinary shareholders on June 30th of 800,000 new ordinary shares of 5s. each credited as fully paid in the ratio of one new share for every share held on June 18th. General reserve in the consolidated balance sheet will then stand at £195,539, which is still a very substantial figure.

REVIEW OF THE YEAR

The Greening Wire Company has been suffering throughout almost the whole year from an acute shortage of wire rods. In the last two months of the year a fair tonnage of imported wire rods became available, but

unfortunately these rods were neither of the quality nor the size suitable for our normal trade and therefore of only limited assistance.

Progress was made during the year in the expansion and development of the newest subsidiary, F. and G. W. Stonier and Company, Limited, within the limitations imposed by the existing buildings and lay-out of plant and equipment. Unfortunately owing to the cuts in the building programme imposed by the government there has been an unexpected delay in obtaining the necessary licence for the new factory at Warrington and in fact only within the past few weeks has the licence been granted.

Substantial progress has been made in the production of electrically deposited mesh which we are now marketing under the registered trade name of "Perflec." Interest in this product has been most encouraging and suggests that there is a useful market for this specialised material when we are in a position to produce a full range of specifications.

TRADING CONDITIONS

As I forecast last year, the year just ended has been a period of material shortages and it is a tribute to the resources of the management that under these conditions it has been possible to make a substantial increase in the volume of production and sales of all departments.

A particularly pleasing feature of the past year's sales has been the remarkable increase in direct exports which were over 40 per cent higher than the previous year—and in face of increasing competition, I think you will agree that this is a considerable achievement.

The report and accounts were adopted and the resolutions for increase of the share capital and issue of bonus shares were passed unanimously.

LANADRON RUBBER ESTATES LIMITED

SIR ERIC MACFADYEN'S ADDRESS

The forty-fourth annual general meeting of Lanadron Rubber Estates Limited was held on June 30th in London, Sir Eric Macfadyen, the chairman, presiding.

The following are extracts from his circulated address: The sales of our 1951 output averaged out at just over three shillings per lb on a crop of 3,833,632 lb. The crop harvested was substantially lower than in the previous years, mainly on account of the sale of our two old estates, Ledbury and Kinrara. As against that higher prices resulted in total earnings at £606,862 being somewhat above those of 1950.

The gross profit, treating Malayan Export Duty of £66,170 as a cost of production, was £294,555. Malayan and British income tax and profits tax require £140,063, and bring the available balance down to £154,492. With the carry forward from 1950, the balance available is £170,579.

The proposed allocations and the 7½ per cent dividend already paid leave us with £53,612; and we recommend a final dividend of 7½ per cent, making 15 per cent in all, which will permit of an increase of £12,987 in the carry forward. Until quite recently my colleagues and I counted on being able to bring the year's distribution up to 20 per cent, if not 25 per cent. Clearly, however, the recent steep drop in the rubber market dictates caution.

I do not wish to be taken to be a pessimist about the outlook. I believe the industry is healthier at a level of prices which encourages demand.

The report was adopted.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

CAPITALISATION OF RESERVES

The annual general meeting of this company was held on June 27th in London.

Sir Frederick Godber, the chairman, said: My Lords, ladies and gentlemen,—You will, I feel sure, learn with regret that reasons of health compelled Mr B. Th. W. van Hasselt to express the wish to relinquish his position as an active managing director of the group as from December 31, 1951. I am glad, however, to be able to tell you that we shall continue to have the benefit of his advice and experience, as he will remain on the board of the three parent operating companies.

Since my statement went to press, some of the worst features of the Excess Profits Levy and, in particular, as affecting the group, the feature regarding the taxation of "franked income," have been removed or mitigated in the passage of the Bill.

STRIKE IN AMERICA

I referred in my statement also to the problems which had arisen during the course of 1951 and subsequently from the loss of supplies from Iran. These problems were recently intensified by the strike in certain sections of the United States oil industry which started on April 30th last, as a result of which at one period refinery capacity of the order of 2½ million barrels per day, or 35 per cent of the total refinery capacity of the United States, was out of action.

Though a large number of settlements have been made and the majority of the refineries have restarted work, that of the Shell Oil Company at Houston, together with the adjacent chemical plant, is still strike-bound. Immediate consequences arose in international aviation business, and the majority of governments thought it advisable in order to conserve an already delicately balanced stock situation to restrict deliveries to aircraft. The resumption of work in the US refineries has enabled airline restrictions to be lifted, but the aviation spirit supply position for civil purposes remains a problem which will need to be continually watched.

DIVIDEND AND BONUS

The chairman concluded by moving the adoption of the report of the directors and the payment of a final dividend of 1s. 6d. and a bonus of 6d. per ordinary share or £1 unit of stock, free of income tax.

Sir Robert Waley Cohen, KBE, seconded the resolution and it was carried unanimously.

Resolutions were passed sanctioning the increase of the authorised capital to £88 million by the creation of 25 million new ordinary shares of £1 each, the capitalisation of £10,902,939 from capital reserve and the issue of 10,902,939 new ordinary shares credited as fully paid to the shareholders.

Sir Edward R. Peacock, GCVO, said: One realises the very heavy burden of responsibility borne by the chairman and directors, particularly under the conditions of this baffling and changing world at present. Yet today they have given us the report of a most successful year.

We must also not overlook that great army of people that carry out their plans here and throughout the world. Without them the directors could do nothing. I am sure you will wish to join in a very warm vote of thanks to the chairman, to the directors and to the staff here and abroad, for their splendid work and the results shown today.

The chairman's acknowledgment concluded the proceedings.

HIELD BROTHERS, LIMITED

CONSIDERABLE MEASURE OF SUCCESS ACHIEVED

The thirtieth annual general meeting of Hield Brothers, Limited, was held at Briggella Mills, Bradford, on June 27th, Mr David H. Hield (the chairman) presiding.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year ended March 31, 1952:—

It is with satisfaction that your board submits to you its report for the year ended March 31, 1952. It covers a period of boom and slump in our industry, with fluctuations in the prices of raw wool more violent than ever before recorded.

The period of rising prices was accompanied by overwhelming buying demand—the period of falling prices has seen almost a cessation of demand in many markets. Trading has been unusually difficult under such abnormal conditions, and the results achieved and now placed before you reflect a considerable measure of success, and for this success I am glad to take this opportunity of paying the highest tribute to the initiative and ability of your managing directors.

We have valued our stocks at market levels prevailing at March 31st last, with the result that our trading profit at £197,962 shows a diminution of £166,197, compared with our record figures for 1951. We are leaving intact the reserves set aside in recent years to meet the heavy fall in wool prices which we anticipated. The current level of wool prices is far from stable and is still over five times that of prewar, and we must guard against the contingency of a further fall.

THE OUTLOOK

During the past year we maintained the volume of our output and trading activity as compared with 1951, and our mills are still on full-time working, which, is, in part, due to the execution of old orders.

The outlook, however, is not promising. Many overseas markets are closed to us for political or other reasons beyond our control; there is consumer's resistance the world over; stocks are heavy; competition is keen for what business is available and our profit margins are seriously reduced. Trading conditions are most difficult and no major improvement can be expected.

You will note our fixed assets stand at £218,672, showing an increase of £12,957. Our net liquid assets, after providing for taxation on current profits, are £903,744, showing an increase on last year of £24,094. Provision has been made for all known or anticipated liabilities.

The work put in hand two years ago for reconditioning a large part of our Briggella Mill has been completed.

Our Canadian branch was visited during the year by Mr R. H. Hield. It has in general had a similar experience to the English business, but slump conditions in Canada have been more severe, and still continue.

Several of our important overseas markets have been visited during the year by directors or a senior member of our sales staff.

We are unlikely to feel the effects of the Excess Profits Levy as the "standard" period fortunately coincides with a prosperous period for this company, and the highly competitive conditions prevailing today suggest that future profits will be such that we shall not fall within its scope.

This year your board recommends that

the dividend on the preference stock shall be the same as last year, and that 25 per cent be paid on the ordinary stock of the company.

The board, on behalf of the stockholders, accord their thanks to all employees for their loyal and vigorous efforts throughout a strenuous and anxious period.

The report was adopted.

ENGINEERING COMPONENTS LIMITED

RECORD PRODUCTION AND SALES

The seventeenth annual general meeting of Engineering Components Limited, was held on June 25th in London, Mr C. C. Griffith, MC (the chairman) presided, and the following is an extract from his statement:—

The group profit for the year amounts to £698,610, compared with £414,779 for 1950.

Production and sales during the year have broken all previous records, in spite of raw material difficulties which progressively increased as the year went on, and it says much for those concerned with supplies and production, that a record output was achieved.

Both our direct and indirect export business has, during the year under review, increased considerably, and it has been our policy that where components of ours were fitted to equipment destined for the export market, to make special concessions in the way of prices. Our Abergavenny factory has extended its output very considerably. A record turnover has been achieved and this branch of our works is now contributing to the profits of the group.

Our subsidiary company in Australia has also had a record year. With so many uncertainties in front of us, it is quite impossible to forecast the future. I feel quite confident, however, that provided we as a company are able to buy our raw materials at world prices, and restrictions are kept within reason, we can compete successfully with all manufacturers at home or abroad.

The report was adopted.

ODHAM'S PRESS, LIMITED

LARGER CIRCULATION

The thirty-second annual general meeting of Odham's Press, Limited, was held on June 26th in London.

Mr A. C. Duncan, FCA, the chairman, in the course of his speech, said: Whilst our gross revenue shows a satisfactory increase over the previous year of £2,600,000, production costs, on the other hand, are up by £2,775,000, with the result that our trading profit is down by £175,000, which is somewhat less than seven-eighths of one per cent of the turnover, a modest reduction, as you will agree, in the circumstances.

With regard to our newspapers, I am happy to say that their circulations show a healthy upward trend following the decline which I believe all newspapers experienced after the increase in selling prices in May last. Our periodicals, too, are all in a healthy position. The circulation of our Big Three, namely *Woman*, *John Bull* and *Illustrated*, account for a weekly sale of about 4,300,000 copies.

Our trade journals are all maintaining their progress, and, on the whole, are maintaining

and improving their prestige and their circulations. These, sixteen in number, cover a wide field of industrial interest. Most of these are published under the aegis of our subsidiary company, Tothill Press, Limited. It probably will be of interest to the shareholders to know that, expressed in terms of weekly sales, the circulations of our journals exceed 23,000,000 copies a week.

While the results for the year disclose a reduction in trading profit, I would point out in this connection that, as compared with the prices of paper twelve months previously, newsprint had increased by about £24 per ton, and other types of paper by amounts ranging from £32 to £50 per ton.

The report was adopted.

WORTHINGTON-SIMPSON

INCREASED OUTPUT

The sixty-first annual general meeting of Worthington-Simpson, Limited, was held on July 1st in London, Sir Samuel R. Beale, KBE, the chairman, presiding.

The following is an extract from his circulated statement:—

I am very pleased to be able to submit to you again a most satisfactory report and statement of accounts in respect of the year under review. The progress of the company which I visualised two years ago and referred to in my report has continued in spite of many difficulties and frustrations. The output for the year 1951 was somewhat higher than that for the previous year, and as a result the trading profit at £593,954 shows an increase on the 1950 figure of £37,794. After making full provision for all charges, including taxation, a net profit on the year of £217,363 is shown, against £201,375 for 1950.

In spite of the extremely heavy rate of taxation, the accounts show a very sound financial position. In addition to the usual dividend distribution, it is proposed to distribute a share bonus of one new 10s. ordinary share for every ten ordinary shares held.

Our order book has reached an all-time record, including as it does heavy demands for power station equipment and marine pumping equipment. Turnover in our smaller standard lines of pumps and compressors is very good and increasing.

The report and accounts were adopted and the proposed dividend of 20 per cent for the year, was approved, as was also the distribution of a share bonus.

TIMOTHY WHITES & TAYLORS LIMITED

NEW HIGH SALES RECORD

The twenty-third ordinary general meeting of Timothy Whites & Taylors Limited was held on July 3rd in London, Mr Louis Nicholas, JP, FCA (the chairman) presiding.

The following is an extract from his circulated statement:—

The sales of the company and its retail subsidiaries for the year ending December, 1951, established another high record in the history of the group.

The trading profit and sundry income of the group amounted to £1,169,143 as against £1,135,360 for the previous year. The provision made for taxation is £561,285 as against £508,160 last year.

The capital and revenue reserves of the group now stand at £3,212,401, equal to nearly six times the amount of the paid-up ordinary share capital and, if this amount is added to the amount of such capital, it will be seen that the dividend upon the ordinary shares before deduction of income tax is only equal to approximately 4.87 per cent upon such sum.

The group has, throughout the year, continued its policy of expansion and development and has opened 13 shops which are proving to be useful additions to the chain. On the other hand, five shops which in the opinion of your directors did not justify retention, have been closed.

With regard to the current year, retail trading conditions are more difficult. Sales show a slight reduction compared with the corresponding period of last year.

The report was adopted.

NORTH CENTRAL WAGON AND FINANCE COMPANY

MR E. DUNCAN TAYLOR ON HIRE PURCHASE RESTRICTIONS

The ninety-second annual general meeting of North Central Wagon and Finance Company, Limited, was held on June 25th at Rotherham.

Mr E. Duncan Taylor, FCA, the chairman, said:—

The group profit for the year was £417,774. After providing for taxation, preference

dividend, a dividend of 3d. per share, less tax, on the ordinary capital, transferring £35,000 to reserve account and £5,000 to pensions reserve, the parent company carries forward £72,166 (against £54,073) and the group £150,471 (against £135,493).

The directors recommend in addition to the ordinary dividend, a similar distribution to that made a year ago of 4½d. for each ordinary share, not subject to tax, out of realised accretions to capital; these together represent a return of just under 6½ per cent, subject to income tax, on the paid-up capital and free reserves at December 31, 1951.

The figures reflect our continued expansion and widening activities which resulted in a group profit, before taxation, of £417,774, as compared with £327,186 a year ago, but provision for taxation £310,751 (74 per cent of group profit), compared with £215,827 (66 per cent) more than absorbs the increased profit.

I do not think the man in the street really appreciates the extent or the effect of taxation of profits and I feel it is the duty of all those in charge of large commercial and industrial undertakings to show clearly how the state deprives industry of its resources, destroys incentive to economy and discourages new developments.

Free reserves increased during the year by £34,433 to £739,905, compared with a paid-up capital of £625,000, and our reserves for future taxation have increased by £101,155 to £536,538.

HIRE PURCHASE

On February 1, 1952, restrictions on hire purchase materialised in the shape of Statutory Instrument No. 121, which specifies the minimum initial rental or deposit to be paid by the hirer and the maximum period over

which a hire purchase agreement may run. The Order does not apply to all classes of goods and in so far as it covers motor-cars for private use and certain luxury goods, it cannot be criticised, but the same cannot be said of its application to passenger and goods transport vehicles, many of which cost up to £5,000 each. It is possible that the inclusion of these vehicles was intended to reduce competition with the railways, but, be that as it may, the Order, coupled with the increased cost of petrol, oil and wages, has made it difficult if not impossible for the small operator to pursue his modest and normal renewal programme or in some cases even to earn his living and to pay his way.

Our hire purchase activities are not concerned with the sale of goods classed as luxuries or non-essentials, but mainly with the provision of industrial and commercial machinery, tools, appliances and equipment and the means of transport essential to the life of the business community and the workers engaged therein.

We have been notified of an arbitrary cut of 10 per cent in our bank overdrafts. In the national interest this cut would be borne willingly if we were sure all others engaged in hire purchase operations were being dealt with similarly.

On July 1st last, through North Central Partnerships, Limited, we became associated with the well-known merchant banking house of Seligman Brothers.

The past year saw a considerable increase in our export trade financing, and this is reflected in the increase in our acceptances on customers' account and in our contingent liability in respect of bills rediscounted, and consolidated balance sheet total of nearly £9 million, which is a record.

The report and accounts were adopted and the retiring directors re-elected.

HER MAJESTY'S COLONIAL SERVICE

Applications are invited for the following post:—

Assistant Controller, Department of Foreign Exchange Control, Singapore (27434/1). Candidates must be between 35 and 45 years old, have passed the final examination of the Institute of Bankers in London, and have had at least 10 years' experience in all branches of exchange control in the foreign division of a United Kingdom bank.

The appointment will be on a 3 years' contract in the first instance. The salary scale is £721-£1,421 inclusive of expatriation pay; a cost of living allowance and special Singapore allowance are also payable. Quarters or rent allowance in lieu are provided and free passage for the officer, his wife and children under 10. Leave is normally at the rate of 45 days for each year of resident service. Income tax is at local rates. A gratuity is payable on satisfactory completion of service.

Intending candidates should apply, in writing, to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1, giving brief details of their age, qualifications and experience. They should mention this paper and quote the reference number 27434/1.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

The Council of the College is about to proceed to the appointment of a Principal. Particulars of the appointment can be obtained from the Registrar.

CHARTERED or Incorporated Accountant required as Secretary and Chief Accountant for engineering works in North of England. Some industrial experience is necessary and the applicant should be aged 30-40. Commencing salary £1,500-£1,750 according to qualifications and experience, with pension scheme. Assistance would be given if necessary, over housing. Applications, with full particulars of education, qualifications, experience and salaries earned, should be sent to Robson, Morrow & Co., Box No. 002, 69, New Cavendish Street, London, W.1.

OLD-ESTABLISHED firm of management consultants have vacancies in their Control Division for qualified accountants with sound knowledge of costing and office organisation and methods. Applicants should have had practical commercial and industrial experience in an executive position, be enthusiastic to take a practical part in promoting the efficiency of British industry, able to work as a member of a team, willing to travel. The positions are responsible ones and will be suitably remunerated. Applications to Harold Whitehead & Partners, Ltd., 31, Palace Street, S.W.1.

AUSTRALIAN, aged 42, desires permanent position in U.K. or overseas with British financial or industrial organisation. Background experience covers wide field of economic research including industrial development and Australian and international tariff procedures, reports for underwriters, government departments, etc., or matters of public and private finance.—Box 989.

M.A. (ST. ANDR.), M.Sc. ECON. (LOND.), 32, ex-officer, extensive teaching and research experience in Economics and related subjects, would be glad to hear of interesting industrial or research post; also willing to undertake independent commissions in general industrial, financial research and market appraisal.—Box 986.

Transport Travesty

WHEN the Government's White Paper on transport policy appeared a couple of months ago, it seemed inconceivable that the Bill could be as bad. Yet it has been spelled out in a Bill virtually devoid of principles. The preamble sets down the first purpose of the Bill "to provide for the disposal of the British Transport Commission's road haulage property." It might have left the rest unsaid. This is the main purpose, and it is a political purpose to which the other provisions of the Bill are incidental. When all the clauses are stripped of their legal curlicues, an ill-considered set of propositions is exposed. Clause I imposes on the Commission the duty of disposing "as quickly as is reasonably practicable" of its road haulage undertaking; this, indeed, is explicit. But few of the other clauses are precise, and most of them deal in delegation of the worst kind, with the familiar phrases cropping up in line after line—"if the Minister gives his consent" or "the Minister may give directions" or "as the Minister may allow" or "provided that if the Minister is of opinion. . . ." Expediency could hardly go further. What is to happen to the railways is almost as obscure as the objects of a South Sea company. The financing of the levy on road transport, which is intended to balance the loss of traffic from the railways to privately-owned road haulage, is scarcely more intelligible in detailed exposition in the Bill than it was in impressionistic outline in the White Paper.

The Government declared last May that the road haulage undertaking of the Commission "should revert to private enterprise" and proposed that it should be divided into "operable units" and offered to the public for disposal by open tender. A Road Haulage Disposal Board is to be set up to supervise at every stage and in every detail the work of the Commission in divesting itself of its road haulage undertaking. The "operable unit" of the White Paper becomes a "transport unit" in the Bill, and the change has brought little clarity of meaning. No transport unit may exceed fifty motor vehicles or a fleet of more than two hundred tons unladen weight—save, of course, with the consent of the Minister. By what calculus are these low limits supposed to guarantee efficiency? The Commission is told to choose transport units to attract the small scale operator into the business, but at the same time to secure the best possible price. It is supposed to do all this without delay, and on the best terms available, and without avoidable disturbance of the transport system of the country. The Minister, it need hardly be said, can direct the Commission to sell any road haulage assets. Those members of the Commission to whom the Minister has offered a year's extension of contract (not necessarily in the same posts) will surely wonder about the attractions of taking over this confused and thankless set of responsibilities. The vehicles so sold will be free to work over any distance, no longer limited to a 25-mile radius. The railways can keep such road transport that they had at the end of 1947, but no more.

What is to happen to the staff while this knock-down sale is going

Binding Cases

Because of increased size, THE ECONOMIST will this year have to be bound in quarterly instead of half-yearly volumes, and RECORDS & STATISTICS in half-yearly instead of yearly volumes. Suitable binding cases are now available in stiff, dark blue cloth covers, with gilt lettering on the spine. These cases provide a firm and effective binding, and the year can also be stamped on the spine if required. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

on? Why is there no standard of pricing in the Bill? Will the Commission be left, when the dust has settled on the chaotic process of disposal, with a residue of road haulage business that no one will buy because it is unprofitable? These are obvious questions on which assurances are needed. But there is one major question of principle that must be raised before the rest of this strange Bill is scrutinised. The White Paper talked of improving the ability of the railways to compete with other forms of transport and of re-establishing a measure of competition between road and rail in long-distance journeys. The implications of competition between the two forms of transport were discussed in these columns at the time. They are concerned primarily with the degree of public obligation that is imposed on each of them. Both road and rail haulage have attributes of monopoly and the railways through more than a century have been subjected to public obligations which, in their origins at any rate, were intended as safeguards against monopoly. Road haulage undertakings—particularly those picked up cheaply with a free guarantee of operation for at least five years—also enjoy many attributes of monopoly. But the Bill says nothing at all about public obligations for the road haulier. He can choose his loads, quote his own charges and work when he likes. "Competition," in these circumstances, has little meaning. Effective competition between the two forms of transport would have meant relieving the railways of many of the burdensome public obligations that have been imposed on them. It was always safe to assume that this Government—and, perhaps, no Government—would not muster the courage to make competition effective. Bounteous transport, preferably below cost, has virtually become one of the Rights of Man.

*

Thus the Bill fully confirms what was apparent in the White Paper—that the Government's policy for transport has no time for such quaint economic conceits as the desirability of providing adequate transport in various forms at the lowest real cost. Certainly the elaborate equalisation scheme between road and rail that it sets out will not achieve this aim. It is doubtful if the railways will have any greater discretion in fixing their charges than they now have; indeed, if a road haulier thinks that the railways are charging a rate "which, if continued, must result in a loss" he can complain to the Transport Tribunal, and the latter can order the charge to be revised. What sort of "competition" is this? The levy on road vehicles—an unpopular proposal that will be fought hard by the industry that the Government is seeking to restore—will not provide a competitive balance between road and rail either. It is to be raised as an addition to the vehicle licence duty and paid into a separate Transport Fund, under the inevitable control of the Minister. The White Paper suggested that the levy would yield an annual sum of £4 million, and no doubt the elaborate game of numbers set out in the Bill will secure this result.

Whether it is the right result is another question. The fund will be applied in the first instance to compensating the Commission (whose capital obligations are apparently to remain unchanged) for the loss incurred in the disposal of their road transport. There is no indication in the Bill whether the levy will be sufficient for this purpose. Secondly, the fund will pay to the Commission the

amount which "in the opinion of the Minister" represents losses resulting from the disturbance of its road haulage business. Finally, it will pay over (after a period of delay ranging up to three years) a sum representing a highly artificial estimate of the loss to the railways of business attracted to the roads. This estimate will present a poser to the Transport Tribunal, which will have to take into account evidence of changes in the use by traders of different forms of transport, and the number of vehicles in service, and also make "due allowance" for general fluctuations in trade. If the Commission fails to make economies that would reduce the loss of net revenue, it will get so much the less compensation—another matter that the Minister, in the last resort, can decide for himself.

*

To expect the Commission to work efficiently and with any sense of public dignity under conditions of this kind is fantastic. This elaborate contrivance will not be acceptable to the private road hauliers, to the railways, or to the public. It would be a wise course of policy for the Government to accept that judgment immediately and, before it is too late, do some real thinking on transport policy. There is scarcely a single matter in the Bill which suggests that thought has been brought to bear on the realities of transport. Even such a comparatively straightforward matter as the reorganisation of the railways is conditioned by ifs and buts. Within twelve months of the passing of the Act "or such longer period as the Minister may allow" the Commission must submit a scheme, to provide (among other things) for the abolition "if it has not already been abolished" of the Railway Executive. The intention is to decentralise, but no principles are laid down. Is it necessarily right that the Commission should formulate the scheme, when it will in future be concerned only with the railways and London Transport? What kind of controlling body is required for these services? The most coherent suggestion is for a Commission of ten with a chairman "and such other members, if any, as the Minister thinks fit" rendering full-time service. This suggests a reversion to the principle of a part-time directorate; if so, it is welcome. But it leaves to be explained the organisation for which the Commission will be responsible. Neither the Commission nor the Railway Executive can survive in their present form. One must make a meal of the other. Is it necessarily right that the parent should eat the child, as the Bill seems to assume?

On Thursday, the Government disclosed that the Bill will not be debated in this session. The Government should make good use of this delay. As it is, the Bill bears all the marks of haste, lack of fundamental thought, and back-bench pressure to secure a victory for "free enterprise" in road haulage. If the enterprise were free—and free equally for the railways—that would not be a matter for complaint. But on no objective assessment is such an outcome possible from this Bill. It will promote confusion and inefficiency. It gives astonishing powers to the Minister to make up his mind on fundamental questions at his own convenience. It is an attempt to secure political favour at the expense of all serious consideration of transport economics and organisation. It is, indeed, inconceivable that this represents the final and mature thought of Conservative ministers on the future of the country's biggest industry.

Europe in a Hurry

THE nations of the Atlantic alliance would breathe a sigh of relief if they could be convinced that a way had been found to fix the relations between France and Germany in a permanent friendship, profitable to both peoples. The present opportunity is obvious: divided Germany is weak and France is strong in friendships as never before in this century. But the difficulty is also obvious: what kind of relationship between these two nations could survive the resurgence of German political and economic strength which is beginning? M. Schuman and those Frenchmen who support him want the ties to be formal and tight, so that any German attempt to break them would be—to put it bluntly—tantamount to an act of war. Dr Adenauer and those who support him are also ready for formal ties because—it seems—they believe not only in the unity of Western Europe but also in the role that Germany could play in it. Where they see the hope of German leadership, sceptical Frenchmen see the risk of German domination.

At this point in the argument Europeans turn to this country in the hope that Britain, by some means or other, might provide the mediator, the casting vote, the permanent chairman in new institutions. And the answer comes back—sympathetically, perhaps even reluctantly, from Mr Eden and rather more bluntly from the Labour Party—that it cannot be done. The tighter the organisations of European unity the less active Britain can be in them; the looser the ties, the more Britain can do to prevent their breaking. For thinking in Whitehall is influenced not only by the need to keep full independence in dealings with the Commonwealth but also by the conviction that formal—especially federal—arrangements do not offer a practicable way of securing co-operation between modern governments. What suits British official thinking is the method of Nato: close co-operation between governments on essential and carefully defined tasks, with each maintaining its own freedom of action and the authority of its national parliament. And it looks as if that is also the present preference of the United States in organisations of which it is itself a member, in spite of its incessant pressure on Western Europe to achieve full integration.

In short, the present state of affairs is thoroughly unsatisfactory. Many Europeans believe they can achieve peace and strength only through formal integration; the British insist that the method is not practicable; the Americans insist that it should be used without being certain whether it is practicable or not, and without any intention of entering into such arrangements themselves. A European movement for federation, British attachment to Commonwealth methods, and the uncertain development of Nato towards its declared ideal of an Atlantic Community are at odds—and it is not at all clear that they can be reconciled.

The question has now come up in a form which may bring differences to a head. M. Schuman proposes to attempt now the formation of a political authority for the six nations which are to take part in the coal and steel pool and—if their parliaments agree—in the European Defence Community. As he expects some delay in the setting up of the latter institution, he wants to use the establishment of the former for taking the first step.

Under the EDC treaty a political authority would have been created only after a period of preliminary organisation and experiment. Now it is proposed that the political Assembly for the coal and steel pool—which may be in action by October—should itself set about authority-making forthwith.

*

This is not so much a change of objective as a change of timing, and the reasons for haste are obvious. With a European political authority in prospect the French Assembly might just accept German rearmament and ratify the EDC Treaty in the autumn. With Dr Adenauer in power—perhaps only for another nine months—the Bundestag might just accept the authority as a pledge of French sincerity. It might also be possible to solve the smouldering problem of the Saar by putting the territory under a European authority; certainly no other solution has been suggested. At a time when Soviet policy is doing all in its power to prevent a German merger with the West, the Germans would be asked to make up their minds not about half the problem of European unity but about the whole of it.

The calculation is legitimate and there is much to be said for attempting a revolutionary act of European policy. Gradualism offers no real assurance to the French, as they see Germans about to rearm; and it offers only distant hopes to those Germans—and they are neither numerous nor steadfast—who see in European institutions the best hope of controlling their own nationalism. Moreover, there are many Europeans who feel—as few in this country feel—that the days of the nation state in Europe are past, and who argue that the coal and steel pool and the European army just will not work without a political authority over them. On the other hand, it is impossible to stifle scepticism. Will France really give up control of its army and its defence policy? For that is what the EDC means in the long run. Will the Germans really tie themselves into a European partnership in which their control over defence—and therefore over foreign policy—is shared and their control over heavy industry sharply reduced? Is public opinion really ripe to accept the economic changes and the reduction in parliamentary authority which M. Schuman's idea portends?

There is only one answer to the sceptics: it is that hard-headed men like Dr Adenauer and M. Monnet—not always for the same reasons—believe the movement towards integration to be not only desirable but possible. So do many politicians among their supporters. What is more, when they ask for an alternative policy, there is no answer satisfactory to most Europeans. Some people urge that the task of enlisting and holding Germany could be better done "in the framework of Nato." In theory this should be possible; in practice it is not. The ties within Nato are loose and their efficacy depends largely on a spirit which grew up in the war, on the lack of any real conflict of interest between members, and on American leadership. Of evolution towards a formal and final Atlantic community there is no sign, whatever statesmen may say; and it is formality—indeed, finality—that the apostles of a new Europe are preaching.

It has often been urged in these columns that Europeans should find their way to unity not through ambitious general plans but by co-operation in practical tasks, and should recognise that economic integration would not be possible without prior political arrangements. For eighteen months now they have been doing just this; the Schuman plan and the plan for a European defence force are the result of long, difficult and expert negotiation. If they now feel that they can go no further without a political authority, their views deserve respect. The British can argue that their own experience in the Commonwealth and Nato is different, and point to the value of loose and informal partnership; but they forget that their Commonwealth experience is based not on a need of bringing nations together but on a need to prevent nations that had outgrown British control from splitting apart. And they forget, too, that the methods of Nato are essentially based on those of Anglo-American co-operation during the war.

It would be regrettable, therefore, if the respect and influence that Mr Eden has regained for the British Government in Europe were used to restrain M. Schuman's initiative. The British proposal that the political direc-

tion of Europe's specialist organisations be set up within the Council of Europe was good, in so far as it showed eagerness to keep this country—as a Strasbourg member—in close contact with them. The six governments which propose to submit defence, coal and steel to supranational control would have been associated with the other governments of the council, Britain among them, which think of unity in more general terms. But it is not good enough to be put up as an alternative to a single European political authority, if M. Schuman and others believe they can get one established. In the long run nothing would better suit this country—and the United States—than to see six governments of Europe represented in the Atlantic Council by one European minister. The balance of power in Nato would be more even, its efficiency would increase, and there would be some hope of discovering whether an Atlantic Community with new forms of political and economic association is desirable and possible. The task for British statesmanship is to encourage M. Schuman and those who think like him, and to show imagination and ingenuity about ways of associating this country with a political authority for Western Europe.

Commonwealth Development—VI

The Burden of Development

THIS series of articles has been concerned with the general and more basic problems of Commonwealth development. There are, of course, in addition many technical problems that would have to be solved, of which only the most summary mention can be made in this concluding article. An accelerated programme of development could not be framed until the basic conditions had been met; but it could not be completed successfully until the technical difficulties had been overcome.

Lack of transport is perhaps the most important of them; it already hinders development in the dominions as well as in the colonies, and would set limits to any further expansion. In certain areas there are serious physical obstacles to the construction of new roads and railways; everywhere, however, the main essentials are time and money. Most primary products are more suited to rail traffic than to road. But, in spite of the various labour-saving devices now used in railroad construction, a railway track costs at least £10,000 a mile in good country and immeasurably more in difficult country. The cheapest earth road costs about £2,500 a mile; but, when the track is completed, road transport requires more men per 100 tons of traffic than a railway. The cost of installing airlines would hardly be lower unless existing airports can be used. But whatever method of transport is adopted, there are all the ancillary services to be provided: the stations, the warehouses, loading bays, cranes, enlargement of the ports and so on. And all this takes time and money. It is of little point to increase production until the extra output can be transported to the ports and shipped to market. Both East and West Africa have learnt that lesson from bitter experience in recent years. Any rapid expansion in transport facilities would mean the employment of large amounts of capital and labour without showing any immediate results.

Then in the colonies—though much less so in the dominions—there is the problem of land tenure. Agricultural development involves a greater use of capital on the land: mechanical cultivation, use of fertilisers, improved seeds, insecticides and so on. But in many parts of Africa the native holdings consist of scattered plots, and it would be politically difficult or impossible to establish plantations, since that would mean either dispossessing the native or redistributing the ownership of land. It may be possible to introduce primitive forms of co-operative farming, particularly co-operative cultivation, by resorting to contract ploughing and harvesting, with a central organisation owning the equipment and carrying out the operations for an agreed fee. Native customs also often present barriers to development; for example, the wealth of a family is in many places determined by the number of cattle owned, irrespective of quality, whereas to increase meat production it may be desirable to keep smaller numbers of high-grade beasts. Again, some African peoples possess a highly developed acquisitive motive, and respond to a price incentive; others do not, so that each community has to be treated differently. All these difficulties can be overcome with patience, careful supervision and sympathetic encouragement. But it would take many years and the rate of development would be determined by sociological rather than economic factors.

Those who think that Commonwealth development is a simple matter requiring only energy and goodwill in official circles are sadly mistaken. It is a stupendous task that can yield results only in ten to twenty years' time. Yet during the period of development it will impose sacrifices both on the countries initiating the development and on those being developed. It is no panacea for Britain's present economic ills. Indeed the United Kingdom would first have to regain its

economic strength before it could shoulder its part of the burden. It is true that Britain could not hope—even on the most optimistic assumptions—to pursue, entirely unaided, any plan of development that would amount to an annual investment of the order of £500 million. Help would have to come from outside; capital and capital equipment from the United States, labour from Europe. And this outside participation need be no bad thing, for the Commonwealth has never been regarded as an exclusive, national organisation—certainly not in its economic relations. But, even so, Britain would still have to play a major role in Commonwealth development, and this has serious consequences for Britain's internal economic policy.

If, for example, Britain were expected to meet half the cost, the problem would be to save £250 million a year, over and above what is needed at home, for investment in the Commonwealth. There are only two ways in which that can be done without inflation: by increasing productivity at a rate even faster than that already mortgaged for domestic schemes; or by reducing consumption and government expenditure. In the absence of some outstanding new incentive to productivity, it would be very rash to count on any speeding-up in the present rate. If, therefore, there is to be more development in the Commonwealth, there must be less consumption at home.

Nor is this the only requirement. The export of capital requires an equivalent surplus in the balance of payments. A British contribution of £250 million a year to Commonwealth development involves an increase in exports or a cut in imports of nearly 10 per cent in either case. Moreover, it is not 10 per cent of the present level, but of the levels needed to secure balance. The painful struggle of 1952 has not merely to be won; if the United Kingdom is to play its part in Commonwealth development, the struggle has to be gone through all over again. This also would plainly require cuts, and perhaps severe cuts, in the level of personal consumption in the United Kingdom.

In terms of practical politics, the sacrifice that would have to be made here and now in order to develop Commonwealth resources would be fewer new houses, new factories and new schools, less re-equipment and modernisation of industry, dearer food (because of a further reduction in food subsidies) and a reduced range of consumer goods. But the sacrifice would be less to the extent that output and productivity would be increased. Those who advocate British participation in grandiose schemes of development—whether within the Commonwealth or in other parts of the world—without making it clear that such schemes require of the British people either harder work or lower standards of living are either displaying their own ignorance or else deliberately deceiving their audiences. Lord Beaverbrook and the Labour Party should note this equally.

So much for the price that Commonwealth development would impose on Britain. There are also other considerations. If the Commonwealth is to be developed there must be a plan in the sense of knowing the broad direction that must be taken. There cannot, however, be a pre-determined programme. It must be possible to discern the route; it is not necessary—indeed it would be wrong—to pin-point every milestone. Nobody knows

what the future holds in store, and development must be conceived over a period of ten to twenty years. A programme that takes into account all the possible changes would be an unworkable blue-print. One based on an official guess would be too risky. Each commodity and each project must be treated individually and on its own merits. Flexibility is essential in any development project, but flexibility requires some mechanism to indicate when changes have to be made. That mechanism is a properly functioning pricing system, which can indicate both consumers' needs and producers' costs. This is not a naive plea for a return to *laissez-faire*. There will undoubtedly have to be some minimum price guarantees, or even long-term contracts—either national or international—in order to limit the risks from political uncertainties as well as from economic uncertainties. But unless there is some yardstick by which changes in consumers' requirements can be measured, and by which producers' costs can be compared, development could lead to a waste of resources and to impoverishment rather than to prosperity. The Government's part in Commonwealth development, therefore, is not only to encourage, to exhort and in certain circumstances to direct, but also to ensure that effective demand is a true measure of requirements—in other words that the amount of money in people's hands is not significantly larger than the supply of goods available.

There is another condition that governments must respect. They must be willing to promote a greater degree of international specialisation of labour, so that countries can focus their energies on what they can do best. This should be self-evident, for development necessarily involves an expansion in the volume of international trade. Yet it is surprising how few countries realise that it applies to their own domestic economic policies. It implies that uneconomic industries in countries that are trying to develop their export potentialities should not be artificially stimulated or even encouraged, and that barriers to trade should be removed not imposed. If primary producers are to export their increased output, they must accept in return payment in other people's industrial goods.

To many people, the cost of development, when fully set out, may seem heavy—to some, too heavy. The sacrifice seems all the greater because for the past six years the world has been trying to achieve the impossible. It thought it could enjoy a higher standard of living without producing more goods, and indeed without saving and investing on a larger scale. If Britain wishes to maintain its position as a world power, or indeed if it wishes to maintain its present standard of living, it must develop the resources of the Commonwealth. A recent official report from the United States has estimated that by 1975 American imports of raw materials will be some 25 per cent larger in volume than at present—and this allows for an increase in American domestic production of raw materials. When America becomes such a large purchaser of the world's supplies—and its import requirements have been increasing almost annually since the end of the war—Britain will be unable to prevent the independent members of the Commonwealth (or, indeed, those which at the moment are dependent members) from selling their output for dollars. Unless their total output has been increased correspondingly, Britain will be faced with the prospect of less food and fewer raw materials.

These articles, with their emphasis on burdens and difficulties, are not meant to be an argument against developing the Commonwealth. Quite on the contrary; in the long run the only alternative to Commonwealth development is starvation and unemployment. The price that has to be paid for development is not so much a sharp reduction in the standard of living, as the abandonment of those false economic ideas that made people believe that they could eat their cake and have it too. The rulers of Soviet Russia have, in this respect, been much more clear-sighted than the democracies. They have always seen that the way to more consumption in the future is less consumption now. But that does not mean that the British communists can be expected to support a movement for longer hours and smaller rations in order to build up the Commonwealth. They, like the Bevanites,

will continue to demand Commonwealth development at somebody else's expense.

For those who can think clearly, the lesson is both simple and unescapable. Commonwealth development provides no quick means of escape from Britain's present troubles. Indeed, the United Kingdom's restoration to economic health is a vital prerequisite to its participation in this development, side by side if necessary with the United States and other countries. But to achieve results by 1975, the first steps must be taken now. And the very first requirement of all is to create a larger margin of savings at home and a credit surplus on the balance of payments, no matter how unpleasant the medicine or unpopular the treatment.

(Concluded)

An Alternative Vote

FEAR that British liberties may be submerged in the rise of the managerial state has become the new orthodoxy; "decentralisation" is now the catchword of Fabians as much as of liberals. That is healthy, but it would be a pity to apply it to the state alone. The politicians might well ask themselves whether their own party bureaucracies do not constitute a more pressing danger to effective democracy than is the power of Whitehall.

If the alarming concentration of power in the hands of the two main party organisations requires any demonstration, it is provided by the mere fact that in Britain today constitutional reform is hardly discussed. Two elections in succession have produced dangerously narrow majorities in Parliament. These islands are undoubtedly being governed badly, for this and other reasons, at a time when they need to be governed supremely well. Yet no one challenges the electoral system that produces the governments. This system is the election of Parliament by non-transferable votes in single-member constituencies. It is the only democratic method that will almost always confine political division to two main parties. That is no particular benefit to the politicians themselves; most could still get into Parliament if there were more parties and many would have a better chance of ministerial office. But it is of the greatest benefit to the established party organisations as such—to the managers and organisers. Any change would lessen their power by introducing one or more rivals.

This, no doubt, is the reason why there has been no serious discussion of electoral reform since the last time that party divisions were fluid—in 1918. Then, indeed, opinions were very different; the Speaker's conference recommended that the alternative vote should be used in every single-member constituency and that the large towns returning more than two members should have a form of proportional representation. These proposals were rejected largely by accident. The provision for proportional representation was too revolutionary for the House of Commons; the House of Lords was in favour of that but against the alternative vote. The compromise took the odd if easy form of dropping both suggestions. And thereafter non-transferable voting ensured—at first with the powerful aid of Lloyd George—that the Liberal

party was squeezed out; the two entrenched parties decided that all was well with the electoral system, and that was that.

It is surely time that the assumption was questioned. The case against allowing the electorate anything but a simple choice between two alternatives has always rested on the belief that political opinions are immensely varied; if given the chance provided by proportional representation, they will not coalesce into fewer than four or so parties. In the days before the suffrage was really popular, and before the modern techniques of mass propaganda existed, this was probably true. But is it not becoming less true? There is at least some danger that nowadays one or two opinions may dominate the voters all too easily. Should the bias of the electoral system still be set so firmly towards squeezing out minority parties?

The classical case against multi-party politics certainly still stands. If there are three or more major parties, the voter cannot directly choose a government: he can only choose a party, which may enter into one of several possible combinations. Government in these circumstances is always weak, because the combinations may break, and it is often irresponsible, because faults cannot be brought home directly to the offending party. Such arguments should still rule out a system of proportional representation. But it is at least worth considering whether the British system may not have developed too far the other way by all but excluding even a small third party.

The electoral method that allows some life to minority parties without breeding them in profusion is the alternative vote. This is the smallest possible electoral reform. It involves no departure from the existing single-member constituencies. It merely means that when there are more than two candidates the voter can express a second as well as a first preference. If one candidate gets more than 50 per cent of the first preferences, the alternative votes are ignored. But where a candidate would now be elected on a minority vote, there is a second count. The votes of the candidate at the bottom of the poll are divided among the others according to the second preferences expressed. This gives little encouragement to small minorities but it means that bodies of voters

as large as the Liberals can support their own candidate, in the first place, without fear of wasting their votes if the contest between the two main parties is closely fought.

*

In principle, at least, this measure of flexibility would be highly desirable. The party machine as such has become immensely more powerful since liberal democrats constructed their theories in favour of the two-party system. The effect is now to confine opinion within a far more rigid mould than the theorists ever expected. No one can challenge the two mammoth organisations. The individual politician must swallow his conscience and stay inside the party because the only alternative is electoral suicide. Each organisation is tempted to stretch itself, to cover up differences of opinion, in order always to hold on to nearly 50 per cent of the popular vote. Politics therefore becomes a manoeuvre on very narrow ground, aimed primarily at capitalising the grievances of people with little interest in politics. The result at present, with the parties so evenly matched, is that the two-party system fails even to produce its principal theoretical benefit—a strong government with a secure majority in Parliament.

There is another, and more serious, ill-effect. The choice put to the electorate is becoming more and more formalised. The effect of the choice may depend on the manoeuvres of the politicians quite as much as it does under a multi-party system. The difference—for the worse—is that the manoeuvres go on not between several parties but inside two parties, each united by little but its determination not to split. The result may be a very poor expression of the popular will. For example, an electorate exasperated by the Tories might be driven to vote for the Labour party even under Mr Bevan's leadership, although it would certainly prefer, if it had any say in the matter, a Labour party led by Mr Morrison.

This possibility, if nothing else, should make the Tories interested in electoral reform. The two-party system has become a force driving British politics to an extremism that—whether of Left or of the Right—is certainly not what the majority of voters want. To weaken its bonds is the most certain and direct way of making Britain unlikely ever to have a left-wing Socialist government. This change would remove, that is to say, the main fear which haunts Conservative politicians. It would achieve what can safely be taken as the main desire of almost all those—a majority—who voted Conservative or Liberal last year. Do the politicians ignore it simply because the party machine would not like it? Some Conservatives would confess the error in the past but argue that while they are in power there is no point in talking about electoral reform, because it requires either a specific mandate or the agreement of the Opposition. The argument is dubious. Labour made constitutional changes—reducing the powers of the House of Lords and abolishing university representation—without a mandate, without two-party agreement, and without any reason to suppose that public opinion was behind it on these issues.

The Conservatives have a mandate to restore the university seats. Public opinion on other electoral reforms is unknown, because the two main parties have kept the issue out of discussion. But it is as reasonable as most

assumptions of the kind to think that all Liberal and most Conservative voters would favour the alternative vote. And is Labour opposition certain? The one likely effect of introducing the alternative vote at the next election would be to put fresh life into the Liberal party. "Fresh life" might not mean much. One may doubt whether the alternative vote would, immediately at any rate, put a single Liberal member into Parliament. That is why the Liberal party itself wants proportional representation, not the alternative vote. But what is important to the cause of democracy is not more Liberal members. It is that the two main parties should be forced to court the Liberal vote, instead in confining themselves to negative abuse of each other. Under the alternative vote, there would be many more Liberal candidates; and, since Liberal votes with a second preference would no longer be "wasted," many of the candidates would probably draw an appreciable volume of support from both the Labour and the Conservative candidates. This visible demonstration of the strength of middle opinion could hardly fail to have a moderating influence on both the main parties; they would have to frame their policies with a more deliberate eye to the second preferences of Liberals. That should be welcomed by trade unionists who still fear that the Tories may grind down the workers by excesses of deflation and the like. And while the Left-wing would no doubt prefer to keep everyone free from moderating influences, Mr Attlee and Mr Morrison might be glad of anything that could add weight to their arguments against Mr Bevan.

This reasoning does not suggest that the Labour party might support legislation for the alternative vote if it were introduced. But it does mean that the present leaders of the Labour party might avoid committing themselves to its repeal when they returned to office. Certainly repeal would be a poor campaigning issue, and there is at least some chance that the alternative vote might command what amounted in practice, though not formally, to agreement between the parties. At the worst, it would be no more contentious than the denationalisation that the Conservatives are contemplating.

*

These arguments are not conclusive. The British electoral system has worked too well too long, while most other systems have worked too badly, for changes to be contemplated lightly, however great the immediate difficulties. Yet there is no doubt that the present two-party system has grown too rigid and ought to be loosened. The decisive question is whether it can be loosened a little without dissolving altogether. If the alternative vote meant that eventually the Liberals—or any other third party—would grow to approximately the same stature as the others, it would do no good. It would produce weak governments without making public opinion more powerful.

On present appearances, however, this is unlikely. It would be strange if even the alternative vote made the Liberals a principal political party again. If the two main parties have the self-confidence to believe this, the case for electoral reform deserves more careful thought than it has been given—particularly by Mr Churchill and his colleagues, and most of all by the Tory back-benchers who are anxious for the Government to show its mettle.

NOTES OF THE WEEK

A Note to End Notes?

It is a sign of fast-changing times that Dr Adenauer has successfully asserted his government's right to have a say in shaping the Western Note to Moscow on the subject of German unity. It has long been evident that the Germans will not wait until the new conventions with the Allies are ratified before claiming the rights that they grant in return for a contribution to joint defence; nor will it be possible to take the new freedom away if the treaties are, in fact, never ratified. The road to German independence cannot now be retraced.

The Western Note has now been despatched, but events in the eastern zone suggest that the Soviet Government may have decided in advance that its proposals will be unacceptable. Their last communication, sent on the eve of signature of the Bonn treaties, was a Note to end Notes, indicating the Russian conclusion that their bid for a German peace treaty would get nowhere so long as Dr Adenauer remained in power. It is clear that the East German Government has received, and is carrying out, orders to organise a change of government in Western Germany.

Germans to Deal With Germans

The abduction from West Berlin of Dr Walter Linzse, an economist working for the Association of Freedom-Loving Lawyers, adds another revolting item to the long list of similar Communist crimes. The motive was clear enough. The Soviet German authorities are making a drive against organisations that foster resistance or secure information in the eastern zone, and the lawyers' association is very active in this field. One of its leaders claimed recently that it had a representative in every important centre of government or industry in the Pieck Republic.

A number of other incidents have occurred in recent weeks along the frontier between Eastern and Western Germany; the People's Police have penetrated into western territory and seized citizens or farms. To counter this type of action Dr Adenauer has appealed to the occupying powers to increase the strength of their forces along the frontier; for 10,000 men in the Federal frontier police are inadequate to guard it. So far, however, his request has not been granted. The whole question is likely to become more acute in future. General Zaisser's People's Police will doubtless become more aggressive and, if the Bonn treaties are ratified, they may even obstruct the Allies in Berlin and on the highway leading into the city. There are good reasons for thinking that the Russians intend increasingly to use the East Germans—former Nazis and Communists alike—as a shield for their actions in Germany. They have appeared to give formal approval to a policy of violence which had already been proclaimed by the Eastern German Communist leaders and the present campaign to enlarge the People's Police and set up a national army in their Soviet Zone points in the same direction. The plan is that the Germans themselves should overthrow the Adenauer Government and force talks between Eastern and Western Germans which would lead to a peace treaty on Soviet terms.

So far, the Soviet policy makers have vastly miscalculated the strength of West German opposition to the Americans and to European defence. They fail to understand that few Germans are inclined to move from opposition to revolutionary action so long as their economic situation is comparatively good. But it would greatly help Soviet plans if British or American troops were to fire upon Eastern Germans

in some incident in Berlin or on the frontier. Cleavage between Eastern and Western Germans has, indeed, gone remarkably far, but national feeling against foreigners would rise above this if American bullets killed even People's Policemen. To avoid such incidents, and at the same time to protect Western Germans who defy the Communists, a leaf should be taken out of Moscow's book. The Allies should help Western Germany to strengthen its police forces and, as far as possible, let Germans deal with Germans.

Prussian Heroes

It is quite wrong—Soviet German propagandists are explaining—to think that lessons for today cannot be drawn from the lives of the great Prussians "just because the putrid odour of fascist forgeries still attaches to names such as Scharnhorst and Gneisenau." By an orgy of historical analogies, in which America plays the role of Napoleonic France, they are attempting to convince former officers of the *Wehrmacht* that the hour calls for Germans to ally themselves with Russia and not with Nato. The present campaign may be regarded as the latest phase of a move which began ten years ago, when Field-Marshal Paulus, General von Seydlitz and other prisoners of war founded the League of German Officers and appealed for collaboration with Russia in the overthrow of Hitler.

The special task of winning what is called the "front line generation who fought for Hitler" has been entrusted to the National-Democratic Party in the Soviet Zone. One of the deputy chairmen of the party is a former commanding general, Vincenz Mueller, and another of its leaders was formerly adjutant to Field-Marshal Paulus. The party's recent conference was held at Leipzig, and Russo-German tributes were laid on the memorial which commemorates the battle of 1813, in which Prussia owed victory largely to its Russian ally. It was at Leipzig that Herr Grotewohl chose to announce the formation of a People's Army, to which former officers and Nazi party members are expected to rally.

One of the most disquieting aspects of this appeal to the pro-Russian tradition in the former Prussian army is that it is also directed against France and Britain. Herr Bolz, chairman of the National-Democratic Party, declared at Leipzig that Germany had been defeated in the two last wars because it had fought against the vital national rights of other nations. In contrast he cited not only the wars of 1813-1815 but the Franco-Prussian war of 1870. These were both, he said, occasions on which the Germans had triumphed because they fought for their national rights and the freedom and unity of their Fatherland. It is also worth noting that General Yorck, the Prussian general who took his army over to the Russians on the eve of battle at Taurroggen, is not mentioned in current propaganda—doubtless because German desertion to the Russian side once war had started would not be good enough for Stalin's purpose. The German army must be his ally from the outset. It is strange to recall that the Allies formally abolished Prussia after the war. Perhaps Stalin intends some day to revive it as a People's Democracy.

Timetable for Denationalisation

The publication this week of the Transport Bill is the most important event in the calendar of the Conservative Government's first Parliamentary year. Not only is it the first denationalisation measure, but it has appeared so late in the session that any possibility of introducing the Steel Bill this year is ruled out. Indeed, the Transport Bill itself

can hardly become law before, at the earliest, next March. The Government has wisely recognised that it is caught in a hopeless jam with its Parliamentary timetable and the only thing to do is to postpone much of the work originally intended for this session. Mr Crookshank announced on Thursday that the summer recess will begin in a few weeks' time with no action taken on the Transport Bill. Ministers obviously have no desire, with other problems pressing on them on all sides, to shorten the recess, and they cannot recall Parliament early in October without throwing out of gear the arrangements for the Tories' annual conference at Scarborough that month. A new session will therefore begin soon after Parliament reassembles in the middle of October, and the Transport Bill will be reintroduced then. The second reading debate may be expected in November and the committee stage seems certain to be extended beyond Christmas.

The official attitude of ministers is still that the Steel Bill will be introduced during the new session, but many Conservative MPs are disposed to believe this when they actually see the Bill in their hands. In any event, it is now safe to say that even if the Steel Bill is introduced and passed as quickly as possible, the sale of any of the assets of the Iron and Steel Corporation can hardly begin until some time in 1954.

At first sight these delays, both in transport and in steel, suggest that it is more difficult to denationalise than to nationalise an industry, that counter-revolution is a harder thing to carry out successfully by Parliamentary methods than is revolutionary change. But this is surely not so. It is not Parliament as such that is making denationalisation slower than nationalisation. The two reasons are, first, the difference in political atmosphere that a narrow majority creates and, secondly, the hesitations within the Government's own ranks. It is to ministers' credit that they have not emulated the Socialists, and plunged into immense schemes with little preparation. It is, however, their own fault that they had not cleared their minds in advance as to how they were going to denationalise steel and transport.

The Spiral Starts

The Agricultural Wages Board this week recommended that the minimum wage for farm workers should be increased by 5s., to £5 13s. a week. If this award could be considered in isolation, if everything else were going to stand still, it might be fair and reasonable. In fact, it must be regarded as only the beginning of a spiral of rising wages and prices that, at the best, will leave trade union members as a whole no better off and that is more likely to make everyone in the country worse off.

Mr Deakin, speaking as a guest at the miners' annual conference at Scarborough, had the courage to make a qualified defence of wage restraint, but the miners had already endorsed their leaders' claim for a rise of 30s. a week, which if it were granted would add some £50 million a year to the cost of coal. But even this claim is hardly more disturbing than the speech made on Monday by Mr Arthur Horner, the general secretary of the miners' unions. He argued that there should be higher pay in the mines in order to attract more men, but on the other hand the miners need not worry about a surplus of coal, since they could always stop working on Saturdays and take longer holidays. The two halves of the argument are, to say the least, unbalanced: in order to raise output the miners must have more money; but, when output has been increased, the way to reduce it is to work less. If this is really the miners' attitude, the National Coal Board's prospects of holding sizeable export markets for long are poor indeed.

The miners' conference also heard, however, a vigorous denunciation by its president of the members of the union

who refused to work with Italians. Every delegate at the conference, Sir William Lawther said, should hang his head in shame. He condemned strikes for political objectives with equal bluntness: they could only lead to national suicide and would not help the Labour party to return to power. But why do the national leaders of the trade unions emphasise these truths so much more readily at conferences, away from and after the event, rather than on the spot when strikes occur and Italians are sent home?

Housing Subsidies and Sales

The Housing Bill was read a third time on Tuesday, after being little altered by the House of Commons. It remains a thoroughly bad measure. Its main purpose is to insulate housing from the Government's own economic policy by increasing subsidies in line with interest charges. So long as he gets some more houses built, Mr Macmillan does not seem to mind (any more than the Opposition) that each new house will cost the taxpayer 60 per cent more. The details of the new subsidies are also unsatisfactory. The special subsidies for flats built on expensive sites have been increased more than proportionately, to astronomical figures. This encourages extravagant public housing—for a flat may cost up to twice as much as a house to build, irrespective of the site chosen. It also encourages local authorities to cram the centres of towns with far too many people.

It is, however, the other parts of the Housing Bill that have aroused contention in Parliament. The provision for extending improvement grants to houses occupied by farm workers under a contract of service provoked much talk about the wickedness of subsidising the tied cottage. This is beside the point. So long as tied cottages exist—and, after all, the Labour Government did not abolish them—there is no reason for excluding their occupants from the benefit of improvement schemes.

ADVERTISING

WISDOM . . .

Buyers are human beings

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.

We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

The other contentious provision in the Bill is that facilitating the sale of council houses by local authorities. This is a Conservative gesture to the ideals of home ownership. Its actual effects will probably be small. Local councils already have the power to sell houses; they will now be released from the obligation to sell at full market price. Instead, the minister can, but need not, lay down the conditions of sale, and the Council may reserve the right of pre-emption for five years.

Whether or not the Opposition is right in thinking that these safeguards are inadequate, the Government's action is certainly inopportune. The prime function of local councils is to provide houses to rent for those who cannot afford to buy them. To reduce the total stock of such houses would both increase the real distress arising from housing shortages and hamper the mobility of labour. If councils do sell, common justice to the ratepayers who are having to subsidise council housing so lavishly suggests that they should be compelled to get the best price possible. This Conservative gesture may be a slight one, but it is none the less foolish.

Rats, Lice and Deans

The Dean of Canterbury is one of those national misfortunes which the British people bears with such exemplary patience. But foreigners who suffer from his mischief-making peregrinations are apt to be less indulgent, and during the last few years much of the time of British information officers abroad has been taken up in explaining that he is not really the head of the Church of England by Law Established. When the Dean declared in Etchmiadzin that about a quarter of the territory of Turkey ought to belong to Soviet Armenia, fears that Britain was about to appease Russia by a partition of the Middle East persisted for some time among the Turks.

The latest excursion of the Dean into the field of international politics has been even more malignant, and it is to be noted that, although he professes to be concerned only with truth and Christian principles, his campaign in support of the Communist charges of germ warfare in the Far East is directed exclusively against America, without any accusation against the British Government or America's other allies in Korea. This is Moscow's tactical line; it is clear from the nature of the case that, if germ warfare had been waged on a large scale, as the Communists say it has, it could not have been done without the knowledge and consent of the non-American contingents in Korea and their governments. But the Communist purpose is to use the germ warfare stigma to bring about a moral isolation of America, and therefore the implication of other nations is avoided—a fact which alone shows how calculated and artificial the propaganda is.

The Foreign Office has, fortunately, responded promptly to the Dean's display of "irrefutable proof" on his return from China by stating that the British Government is "satisfied that there is no truth whatsoever in the disgraceful and fraudulent accusations that have been made" and by pointing out that the Communists "have three times turned down our offers of impartial investigation into these charges." In the United Nations Security Council Mr Malik has now applied the veto to the American proposal for an investigation by the International Red Cross, and has announced that he will also veto an American resolution that, in view of the refusal of an investigation, the charge should be presumed unfounded. By carrying the matter to the Security Council and making it a major issue there, the American Government has shown its disagreement with those who hold that the best way of dealing with such accusations is to ignore them. It has been a bad week for this horrible campaign. The Dean has made the "evidence" sound and look ludicrous; Mr Malik has made the attitude of his government look completely unreasonable. But it remains important that all

the UN governments with forces in Korea should go on exposing the charms with the full weight of scientific authority. The Communist campaign against the atomic bomb was killed by argument and exposure; the same can be done with this one.

Peasants versus Pinay

Because there has been no French political crisis during the past few months, a false impression of economic recovery has been given. In fact, the much vaunted gold loan, the pivot of M. Pinay's economic policy, has been only a partial success. It was launched with three objects in view. First, to bridge the inflationary gap of 300 billion francs; so far about 200 billion francs have been subscribed. Secondly, to entice the French people, more particularly the peasants, to disgorge their gold hoards so as to replenish the central reserves; but only 30 tons of gold have come in. Thirdly, to re-establish confidence in long-term lending; here the general response has been poor. The French Treasury should now have sufficient funds to tide it over three, perhaps even six months; but the central gold reserves are still very low.

It is true that France has been able to repay the OEEC loan of \$100 million made to it last February, but only because American off-shore purchases were hurried through in time. Provided adequate American aid is forthcoming, the French franc is fairly secure, though some officials are beginning to talk about "partial convertibility" with a "floating franc"—a franc-dollar exchange rate that would be allowed to move freely between two agreed limits. This, of course, would be devaluation under another name.

Acceptance by the French chamber on Tuesday of the sliding-scale for wages was really a vote of confidence in M. Pinay, and it may prove to be an important anti-inflationary measure. Admittedly, the scale works only upwards, and ensures an automatic wage increase for every five per cent rise in the cost of living index; but there can be only one increase in any four month period, and the base point from which the five per cent is calculated is three per cent above the present level of the cost of living index. In other words, prices could rise quite significantly before wages moved upwards again, and no compensating increase has been given for the rise in prices since last September. The main advantage of this measure is that it restricts the possibilities of action by the Communist-dominated unions to push up wages. They cannot call a strike before October and the sliding-scale will produce a temporary wage-freeze.

The real test of M. Pinay's government will come later this month, when the annual price fixing for wheat is due. The peasants want a large increase; but M. Pinay has been trying to bring prices down, and has been singularly successful. Since March retail prices have fallen by five to six per cent, after rising continuously for twenty-two months. To agree at this stage to a higher price of wheat would set in motion once more the inflationary spiral. The industrialists have so far co-operated with M. Pinay; but they are unlikely to continue that co-operation unless he takes a firm line with the peasants—particularly as the villages have conspicuously failed to support the gold loan.

* * *

Sticking to the Planning Act

The Government's attempts to clear up the tangle in town and country planning are unlikely to cut very deep. The vexed issue of development charges was raised again last week in an adjournment debate in the House of Commons and it brought from the Government an unequivocal declaration of support for the main structure of the 1947 Planning Act. Mr Marples, the Parliamentary Secretary to the Ministry of Housing, declared that "As a whole, it has

How far? How fast? The fastest birds of the air today are delta-winged, jet-driven.

ZAGREB
INTERNATIONAL TRADE FAIR
September 13th - 28th. 1952

In the fortnight that the Zagreb Fair was open last year, over 2½ million pounds worth of business was transacted. This year the Fair promises to be bigger and busier than ever, all stand space has been taken, and initial reports show that there will be a record attendance by visitors and business men from every part of the world. Among the wide range of Yugoslav goods of interest to foreign buyers will be machines, machine-tools, foodstuffs, tobacco, soft and hard wood, chemicals, glassware, minerals, ores, pharmaceuticals, medicinal herbs, national handicrafts, sports requisites, building materials, leather, etc. In addition firms from many foreign countries will exhibit their products on a larger scale than ever before.

SPECIAL TRAVEL FACILITIES FOR FAIR VISITORS

Special facilities, open to visitors to the Fair, include 50% fare reductions on all travel inside Yugoslavia, and free Visas.

If you are interested in presenting your goods to international buyers there is still some space available in the official Fair catalogue, but applications should be submitted immediately.

Further information about the Zagreb International Trade Fair can be obtained from:—

been an invaluable measure." Certainly the Conservatives have never been hostile to the principles of town and country planning, and the 1947 Act has gained special support because it gave opportunities for conserving agricultural land and protecting the countryside. Nevertheless, the vigour of Mr Marples's endorsement will be a surprise to the many people who expected some early and fairly drastic amendment.

Mr Marples agreed, of course, that there are "many hardships, amounting to almost an injustice, in the levying of the development charge." It appears to be arbitrary and there is no provision for appeals; moreover, it puts up the costs of development and acts as a tax on enterprise. The Government's intention is apparently to try to weed out these defects in legislation that may be introduced next session. It can hardly be blamed for not having hit on a satisfactory scheme yet; the complexities are unending and the professional advice is anything but unanimous.

One significant point has, however, been stressed. Mr Marples said that the revised scheme must not saddle the nation with "an unending bill of charges." As the Act stands the Government will pay £300 million in outright compensation; if this is done, either the taxpayer will never be reimbursed or the development charges can never be drastically modified. If, on the other hand, the global compensation fund is scrapped and compensation is given in individual cases as they arise, the tally of claims may stretch out indefinitely. This is perhaps what the Government most fears. Certainly the dilemma is difficult, but the balance of advantage probably lies in abandoning the fund provided that the continuing rights to compensation are strictly circumscribed by reference to planning standards. But whatever the choice of method, the cost falling on public funds should certainly be kept within the present limits.

Strikes for Security

The strike against redundancy is a comparatively new phenomenon in industrial relations. Unlike the strike against victimisation, to which it bears a strong family resemblance, it has never had official trade union support. It is a rank-and-file or shop-steward tactic, and it harmonises remarkably well with the openly declared Communist scheme for freezing labour in non-defence industry by direct action against dismissals. It is also worth recalling that two years ago the Moscow-controlled World Federation of Trade Unions expressed, at a conference in Budapest, its particular interest in strengthening organisation within international companies; the Ford factory at Dagenham presumably comes into that category.

But whatever may be the covert motives of some of the strike organisers, there is no evidence that the workers themselves—whether at Dagenham this week or at the S. Smith clock-making works a few weeks ago—are sacrificing their pay because the Communist party thinks they should. What they are striking for is something at once less politically obnoxious and more economically unrealistic; it is the unconditional right of the worker once attached to a particular firm to draw an income from that firm whether there is any work for him or not—a right which no management, not even a management of full-fledged syndicalists operating in the most stagnant of Utopias, could possibly concede. Such a right would make sense only if the worker were "on the strength" exactly as a soldier is on the strength of his unit. The counterpart of the soldier's security, with pay coming in whether there is work to be done or not, is a military servitude which, translated into industrial serfdom, would certainly not appeal to the Dagenham strikers. It is the more pity that, as is so often the case, the official union leaders let the strike go on for some time before speaking decisively against it.

At the same time, however, one should recognise that the strike against redundancy raises certain genuine and unanswered questions. The notion of the employee's permanent freehold without mutual obligation is certainly nonsensical; but the opposite extreme of casual employment with its hour-to-hour insecurity is also economically objectionable and socially detestable. Where, between the two extremes, is the reasonable and realistic contract of employment? The answer certainly differs from industry to industry, firm to firm, and type to type of worker. If, in any industry or firm, the answer is wrongly given, the workers genuinely have something about which to protest. The particular case of the Ford strikers could indeed hardly be weaker; a management may have a moral obligation to tide its workers over a slack period caused by its own deliberate policy or by managerial errors, but a shortage of components caused by an unofficial strike at a subsidiary is a different matter. Nevertheless, as the extreme pressure of hyper-full employment slackens and the incentive to hoard labour lessens accordingly, it is proper that the general question of job security, its nature and its limitations, should receive the public attention it deserves.

Coercing the Farmers

A discussion pamphlet* written by Mr H. D. Walston, himself a large farmer, poses some interesting questions about the future agricultural policy of the Labour party. The old Socialist panacea, the nationalisation of the land, is pushed well to the periphery of debate. It would constitute "a tremendous legislative and administrative job," of dubious value under present conditions, and Mr Walston evidently believes that effective control of land use is possible without invoking the ghost of Herbert Spencer. His main suggestions are intended to improve the machinery of control that has already been enacted.

This has failed, the pamphlet argues, to increase farming efficiency. The fact that only about one in 200 farmers is under supervision for bad farming (a procedure which other critics have pointed out to be cumbersome and ineffective) while a negligible number are dispossessed annually for inefficiency, proves to Mr Walston that the county executive committees are showing "far too much leniency." He makes the strange and heinous suggestion that the decision to evict farmers might be transferred to the agricultural-land tribunal (at present a court of appeal), which would thus combine the roles of prosecutor and judge.

Mr Walston recognises that agricultural rents are much too low to encourage a high level of production, but he takes fright at the "undeserved income" that higher rents would give to the landlord; and he doubts the practicability of the alternative device of levying a tax on the occupation of land. (But could not agriculture be re-rated?) Again, he deplores the inflexibility of the present price review procedure, arguing that no group of farmers should permanently expect a fixed margin of profit, but his only suggestion is that the review might be carried out by an independent tribunal—which is constitutionally quite unacceptable. In sum, his economic proposals amount to little except an attempt to meet the serious shortage of tenants' capital by enacting an agricultural credit bank. This would work through local boards and be empowered to lend up to £5,000 on the security of the borrower's character.

The Minister of Agriculture has several times recently expressed his impatience with inefficient farmers. Mr Walston's views are a stronger version of the same approach. Both Conservative and Labour parties know that land in Britain can no longer be wasted or under-farmed, but both

* "Our Daily Bread," by H. D. Walston. Labour Party. 4d.

seem unable to set about the improvement of farming efficiency by the use of rational economic measures; and both are therefore drifting towards a policy of coercing farmers with the aid of instructions and evictions. It is surprising and disturbing that such threats to the traditional liberties of person and property do not arouse more anger.

Improvement in Malaya

Evidence accumulates that the Malayan Communists are at last failing. During June, when the emergency entered its fifth year and the Chinese radio spoke openly for the first time of both Russian and Chinese aid being sent to the Malayan rebels, the number killed, captured or surrendered was a record—150, compared with the previous highest total of 143 in April. The High Commissioner, General Sir Gerald Templer, shrewdly attaches the greatest importance to the number of voluntary surrenders, since this suggests a decline in morale. Moreover, the men who give themselves up are usually effective propagandists against their former colleagues. But the efficiency of the security forces is unquestionably growing, and in the long run this should itself have a notable effect on civilian morale.

It may be trite to say that no single factor is the key to the Malayan problem. But in fact much of General Templer's success is now proved to be due to his ability to make an impact on the problem as a whole. As the *Straits Times* points out, with the "new air of resolution" in Kuala Lumpur, plans which had in some cases been under consideration by the Administration for months before he arrived have now taken shape almost overnight. Among the most important and delicate of recent decisions has been a more moderate policy for imposing the death penalty on guerrillas. Although opposed, understandably, by many planters, greater leniency in doubtful cases should encourage surrenders.

The Conventions

At present the probabilities are against the Whig party succeeding in the approaching contest in the Presidency. The Conventions, by which the parties in the States come to an agreement amongst themselves as to the person to whom they are to give their undivided support, have met at Baltimore. The Democrats have chosen Mr. or General Franklin Pierce as their candidate for the Presidency, and Mr. Rufus King as their candidate for the Vice-Presidency. These gentlemen in the end united a large majority of the suffrages of their party, and will be supported by the whole Democratic strength. They are emphatic in declaring against all monopolies for the benefit of the few at the expense of the many, and as they stand by the compromise on the slave question, there is more probability of their gathering strength day by day than of being divided and weakened. The Whig party—much divided—has chosen General Winfield Scott by a bare majority, and has rejected both Mr. Fillmore and Mr. Webster. Though the decision is as usual acquiesced in, it does not give satisfaction. General Scott is a mere military man, and many of the enlightened members of his party fear the growth of the military spirit, and would have preferred one of his opponents eminent exclusively for civil wisdom. The division amongst General Scott's supporters is likely to deaden their zeal and promote the success of their opponents. Four years ago the prospect was the success of the Whig party and increased duties; now, the prospect is the success of the Democratic party and a reduced tariff.

The Economist

July 10, 1852

This issue is characteristic of the difficulty of balancing short and long term interest in Malaya. There is no possibility at this stage of any general relaxation of measures to meet the emergency; but the British authorities must never take their eyes off the final objective. This is a united and satisfied Malaya, governed without bitterness in the way of its own choice and relying on its own police and military resources. Whatever the speed of constitutional and political development, the British need to start withdrawing some of their troops at the earliest possible moment. It is therefore good news that recruiting begins this month for the first unit of the Malayan National Army, to supplement the existing Malay Regiment and to include men of every race in the peninsula.

More Direct Aid to Vietnam

Though the British left-wing outcry over the behaviour of the American command in Korea left the French comparatively cold, they have special reasons for being interested in any new steps towards closer consultation in the Far East. For one thing, the British will henceforth have a Deputy Chief of Staff at General Mark Clark's headquarters, and his military duties can hardly now exclude political consultation. For another, the French are deeply concerned with the demands of the Korean war on American resources, since these affect the amount of supplies available for Indo-China. With the increase of American military aid to probably over \$450 million for the year beginning July 1st, this question assumes an even greater importance than in the past.

The recent successful visit to Washington of M. Letourneau, the French Minister and High Commissioner for Indo-China, was concerned primarily with the detailed uses which are to be made of this huge flow of American help. Unless the Korean war flares up anew, the chances are that, while the Vietminh will not obtain materially more Chinese aid than in the past, the French and Vietnamese forces will henceforth receive substantially more of the modern arms, aircraft, and motor and amphibious transport that they have long needed.

Although M. Letourneau and his American hosts also came to a new understanding about the status and duties of the US Military Advisory Group in Vietnam, former suspicions on both sides will still need careful handling. But it is not in anyone's interest to hold back the arming of the Vietnamese national armies or to postpone the earliest possible transfer of the maximum degree of responsibility to their commanders. The Vietnamese have now enrolled about a quarter of a million men, and 20 battalions are officered wholly by Vietnamese. This is the force for which American arms are increasingly and urgently needed if the French are to start, as they should, withdrawing their own troops.

Another Development Area?

The textile slump has strengthened demands for more variety of industry in the cotton areas, and a number of local authorities have now asked the Government to designate as a development area the weaving district round Blackburn and Burnley, if no more of the county. It is true that these north-eastern cotton towns have suffered more than the rest of Lancashire from over-specialisation. They suffered more from unemployment in the thirties and more from migration of population in the forties than the areas further south. In the districts where spinning rather than weaving predominates—that is, the area of Bolton, Oldham and Rochdale—alternative industries, such as engineering, have gained a much greater foothold.

The weaving area's concern about its dependence on cotton is no panic outcry of recent months. But though the

advantages to Blackburn and Burnley of widening their industrial scope are undeniable, the case for a development area is dubious on three counts. First, until late last year there was no serious unemployment there and already the cotton slump shows signs of turning the corner. The essentially long-term decision to develop an area should not be influenced by, and cannot relieve, a brief recession. It is true that there has been, and still is, a relative decline in population, but as a *fait accompli* this is an argument against stimulating development. Secondly, the advantages enjoyed by development areas consist chiefly in their lion's share of licences for capital investment. A new area can at present develop only at the expense of the seven already existing. Development spread thin is no longer development. Finally, the whole experiment in government-inspired location of light industries remains, to say the least, unproved. These new factories have yet to show that they can survive in keen competition for low-cost production when inflationary conditions cease to buoy them up. A slower kind of haste to diversify the weaving district, without direct government intervention, may well be a sounder proposition in the long run.

Plan for Middlesex

The county council of Middlesex, dealing with a population of 2,269,000, is the second largest local authority in England. Its development plan, now available for public inspection, has to deal with what has become an artificial entity—an arc of suburban and industrial areas adjacent to the County of London. Its problems cannot be separated from those of Greater London. Between the wars when development as a "dormitory" for London workers was facilitated by large extensions of the underground railways, the population of Middlesex increased by as many as 850,000. The plan is intended to call a halt to this process and, ultimately, even to reduce the county's population to a round two million. Although the general policy is certainly right, a reduction in population hardly seems realistic.

The problem areas of Middlesex are the overcrowded inner boroughs such as Tottenham, Willesden and Acton, which share all the difficulties of London and possess little vacant land for building. The plans for the redevelopment of these older parts of the county are rather disappointing. Of the eleven definite proposals for establishing comprehensive development areas, all but one are small in scale. Redevelopment seems to be treated as a residuary legatee; for the next five years, at any rate, building resources will be monopolised by the provision of new houses. The aim is gradually to switch these resources from the inner congested areas to the outer districts of the county and beyond. It is hoped that 10 per cent of the labour force engaged on new construction, both public and private, will have shifted to new towns and reception areas beyond the county by 1956; this would be the start of a larger outward movement.

But Middlesex is not only a dormitory; it is an important industrial area. Indeed, the proportion of industrial employment is above the average for Greater London. The most that the plan may achieve is to avoid further industrialisation. Much of the existing industry is modern and there are considerable labour shortages. The difficulty of moving people out of the county is thus obvious.

There are, however, many vacant sites in the outer areas of the county. At present they are, according to the plan, being built on at undesirable low densities. By contrast, space is so scarce in the inner areas that development is going on at net densities of 100 rooms per acre—which is undeniably high. Surely the correct course is to make a much fuller and prompter use of building land in those outer areas which are accessible to the main centres of employment? It is desirable to prevent the further growth of Greater London,

but it is still more essential to provide properly for the need of the people who, on any realistic reckoning, must continue to work there.

Fishing in Deep Waters

The function of the White Fish Authority, appointed last year, is to promote the efficiency and prosperity of the industry whilst remembering that consumers want "a plentiful supply of white fish at reasonable prices." The task is complex as well as vague, and its first annual report (HMSO 1s.) finds the authority thinking aloud about its choice of measures. It has general regulatory powers but no public funds to spend, so that any scheme of reorganisation or development must (quite rightly) be self-supporting. Its status and the manifold problems of the industry alike point to a policy of cautious piecemeal improvement rather than of drastic regulation.

The industry's difficulties were underlined by the sudden collapse of fish prices in November, 1949. This situation forced each section of the industry to canvass stopgap remedies for its particular problems. The best equipped and most prosperous section is the trawler owners who fish distant waters for cod and haddock, and who applied a scheme of restricting their catch which, in the authority's view, was unavoidable in the circumstances of 1950 but is certainly undesirable. The severe depression among the near and middle water trawler fleets was met by a public subsidy, intended as an inducement to keep vessels at sea. In fact, this subsidy—which cost more than £1 million last year—is a deterrent to effective action. The proper remedies, in the authority's view, are, first, the replacement of obsolete vessels—for which "a certain grouping of ownership" is necessary—and, secondly, international measures to mitigate the grave overfishing of the North Sea and other waters. The depressed conditions of inshore fishermen, who also receive public subsidies as a temporary measure, can only be cured by promoting co-operation and mutual trading both in buying their equipment and in selling their catch.

These measures will need to be supported by improvements in marketing. The authority suggests the introduction of a price stabilisation fund, financed by a levy on fishermen's receipts, as a means of maintaining reasonable minimum prices in times of glut. Freezing facilities would be greatly enlarged to absorb surpluses. In addition, a transport equalisation scheme is proposed as a means of broadening the market for fish—which at present is unduly confined to London and other big centres, to which transport rates are low. This proposal, which is encountering considerable opposition, would also serve to aid the smaller ports.

This is an encouraging if inconclusive report. The authority has set its face against a policy either of public subsidisation or of eliminating foreign competition. In other words, it has—unlike some regulatory bodies—remembered both the taxpayer and the consumer. It recognises that the fishing industry must and can save itself by its own exertions. The graver defects of marketing, which involve much waste and redundancy, have still to be tackled, but the authority has shown that it is also ready to fish—cautiously—in these deeper waters.

British Insurance

The annual survey of British Insurance will be found on pages 129 to 140 of this issue of *The Economist* and on pages 29 to 37 of the *Records and Statistics Supplement*.

Legal Sovereignty for Individuals

The "open shop" dispute between certain trade unions and the Dundee publishers, Messrs. D. C. Thomson & Co., is proceeding in two forms, and it would be hard to say which raises the more important issues. The actual dispute itself is still the subject of an enquiry ordered by the Minister of Labour. Its other form is the case in the courts, brought by Messrs. Thomson against officials of certain trade unions. In Scotland, the Court of Session reserved judgment last week. In England, Mr Justice Upjohn refused to continue certain temporary injunctions he gave when the case began, Messrs Thomson's appealed, and the Court of Appeal dismissed the appeal. As leave to appeal to the House of Lords was granted, it would be improper to comment on the merits of the case, but the issues themselves are involved enough to require an explanation. In effect, Messrs. Thomson are claiming that the defendants, the trade union officials, used their positions and influence to compel other concerns, notably the suppliers of paper and printing inks, to break their supply contracts with Thomson's. The union officials do not accept that contention; even so, one important issue remains. What are the legal limits, if any, to the actions they can take, and advise their members to take, *vis-à-vis* Thomson's?

In the Court of Appeal, the Master of the Rolls put the position in this way. In a decision in 1901, Lord Macnaghten had said that any violation of a legal right, including rights under a contract, committed knowingly and without justification, gave rise to an action for damages. Was that statement, the Master of the Rolls continued, true in its broadest sense or was it properly to be limited, and if so how? It was opposed to another proposition of law, that a man, whatever his motive, was free to exercise his legal rights even though he knew that by doing so he would cause injury to another; but, equally, that proposition required qualification. His Lordship's conclusion was that a man is entitled to do, and to induce others to do, any acts which are in themselves lawful and which involved no breach of contract, regardless of their effect on others; from which it follows that the motives urging him to do so are irrelevant and make no difference to the legal consequences. In this lies the importance of the principle involved in the case, irrespective of either the facts or the merits of the Thomson dispute. On the Court of Appeal's view, each man is, so to speak, still a sovereign state, entitled to use his rights, and to induce others to use their rights, from whatever motives he chooses, provided that he does not go so far as to produce the breach of a contract he knows to exist. It is this solid nineteenth century doctrine of the independence of the individual—of his freedom from social, as distinct from legal, obligations—that the trade union officials have argued in this dispute. It is, perhaps, permissible to wonder if they have done so in full consciousness of all its possible applications.

Doctors in Conference

This year's representative meeting of the British Medical Association will be remembered mainly, apart from the jubilation caused by the Danckwerts award, for the repudiation by the constituencies of two important motions proposed by the centre. In fact, one—that the representatives should accept the council's memorandum of evidence to the Royal Commission on Marriage and Divorce—was withdrawn before it was debated.

Ever since this memorandum was published in April, there have been angry letters of protest in the *British Medical Journal*. Although the memorandum was supposed to present the medical aspects of divorce, the boundary between what is medical and what is not is in this case hazy. Consequently, the memorandum offended the susceptibilities of doctors in their capacity as ordinary citizens. Some resented, for religious reasons, any extension of the grounds of divorce. Others objected, in particular, to the proposal

that after a period of years, and where there is no prospect of reconciliation, divorce should be allowed by mutual agreement; and to the proposal that the so-called offending party should petition for a divorce in special circumstances and when the other party refuses to do so. Perhaps what annoyed doctors most was the fact that the memorandum was submitted to the Royal Commission as having the authority of the British Medical Association when, in fact, it was drawn up jointly by a committee of the council and of the Royal Medico-Psychological Association and had not been submitted for the approval of the association as a whole. Leave will now be sought to withdraw it from the evidence presented to the Royal Commission, though it may be submitted again later as the evidence of a section of the profession.

The other matter on which individual doctors showed themselves more conservative than their leaders concerned medical ethics. The chairman of the central ethical committee proposed a motion that, in special and rare circumstances, a doctor should tell a third party "professional secrets" in order to protect innocent persons or the patient himself. The epileptic who insists on driving a car, the tuberculous young woman who insists on looking after children, is the sort of case quoted. The representatives, however, refused to accept the recommendation—not, it should be said, because they felt that doctors have no social obligations but because the situation can always be resolved commonsensically. The dramatic situation envisaged in the recommendation arises so rarely that it does not need special ethical rules. The most powerful argument against laying down such rules was that, especially when given prominence in the press, it would destroy people's confidence in professional secrecy. Certainly it would in that event do far more harm than good.

Marshal Tito on his Dignity

When Marshal Tito says, as he is reported to have said at Nish on July 6th, that "alliances should be formed in the souls of the people" and not through formal pacts, he might be thought guilty of a temporary deviation into liberalism. In fact, the sentimental language expresses the shrewd realism of a man who understands that aid is to be had from the Americans and the British without political undertakings on his part, and that better terms are to be got by standing aside from the Atlantic Treaty queue than by joining it. So long as that is so, his insistence on no formal defence arrangements with other governments will continue. There is no good reason to believe that the Greeks and Turks, in the present exchange of courtesies and visits between neighbours, will move him from this position.

It is perfectly clear to Marshal Tito that the proclaimed ideals of the North Atlantic alliance make membership of it impossible for his government. If he expects protection against the Russians from that quarter it is under the auspices of the United Nations, which is less sensitive than Nato about the degree of personal liberty and democratic government granted by its members to their peoples. There is also a marked tendency among Yugoslav spokesmen to insist that normal relations with the Soviet Union are impossible "so long as its present policy continues." It is tempting to ask what would be Yugoslav policy if there were a change in that policy and its direction. Is it possible that Marshal Tito expects one day a change of personalities and policies in Moscow which would permit Yugoslavia to return to former ideas of a Slav-Communist bloc? If so, this is a possibility to be kept in mind by those who direct American and British foreign policy. If Marshal Tito's advisers are calculating that the friendship of the West is needed only in times of danger, they may find that the friends take a similar view. It takes two to make a satisfactory marriage of convenience.

NEWS FROM THE FISHING INDUSTRY

£250 a day...

... that's about what it costs to keep a modern distant-water trawler like this at sea. Fuel oil and crew's pay account for about two-thirds of it. Then there are food, repairs and fishing gear, depreciation and insurance. Every single item in the vessel's running costs has increased fantastically since before the war.

For a voyage of 20 days (an average trip) such a trawler must bring home fish worth £5,000 before her owners manage to break even. A spell of bad weather often means that many vessels return from the fishing grounds with less than half this value in their fish-rooms. A longer period at sea wouldn't help. Weight of catch might rise, but quality and value would fall.

Running costs for the smaller near-water vessels are proportionately just as high. Furthermore, the choice varieties of fish they seek are steadily becoming scarcer through over-fishing. How can this problem of over-fishing be solved? Protection for the near-water grounds by international agreement would provide the only real answer, and efforts to bring this about are constantly being made. Such agreements, however, inevitably take time. Meanwhile, the abolition of controls has helped to some extent for, once again, trawlermen have personal incentives to seek new fishing grounds... once again enterprise is being actively encouraged and skill and daring properly rewarded.

British trawlers know their job!

Issued by the British Trawlers' Federation Ltd.

Letters to the Editor

Bipartisan Agriculture.

Sir,—While admitting the "inevitability of gradualness" in rural economy and the general soundness of the Government's agricultural policy, I question whether, in face of the grim food outlook, the nation can any longer afford such "gradualness" as is represented by the continuance of the supervisory functions of the County Agricultural Executive Committees. It is true that these committees are being now officially aroused to greater activity in dealing with the worst laggards of the industry. But, considering the nature of the human material upon which the same process as heretofore is to be exercised, is it certain, or indeed probable, that a markedly better use of our farm lands or an appreciably larger food output therefrom will be effected? In other words, will anything short of dispossession in most cases satisfy either public opinion or the public appetite?

Assuming that those farmers who are not, by any reasonable test, "pulling their weight" number at least 15 per cent and that many of them might benefit from experienced and more emphatic "guidance" from these committees, at least half—say 7½ per cent—are, owing to age, physical infirmity, wholly inadequate capital or chronic laziness, "incurable." Would it not be true national economy for the state to pension off these persons, with compensation on a reasonably generous scale? Such compensation would, in the aggregate, surely be a mere trifle compared with the amounts, paid or contemplated, in other industries on their nationalisation, denationalisation or renationalisation! Alternatively, or concurrently, the state might provide them with "priority" cottages at a nominal rent, or rent free. But for losing their homes, several of them would have retired ere now.

Agricultural landowners might perhaps at the same time have restored to them, as a duty, not a right, and subject to appeal, the power of dispossessing, with tax-provided compensation, extremely inefficient farm tenants, with the sanction of a penalty if they neglected to perform this duty.

I humbly submit that such a two-fold process, if made applicable to present occupiers only—with replacement from the ranks of the ever-lengthening queue of trained young farmers—would not only prove a profitable national investment but clear the ground for the return to a freer economy.

Subsidies are a curse to the relatively efficient and public-spirited farmers of Great Britain. If it were not for the inefficient minority and for those small men, not "family farmers," whose minimum wage bill makes their employees better off than themselves, they would be largely unnecessary. Government subsidisation of our farming community, constantly varying in its objectives and so prone to political misrepresentation,

renders our basic and most vital industry unstable and insecure. Increased confidence flowing from its gradual disappearance would of itself materially augment our food supply.—Yours faithfully,

Lydney, Glas.

Rhee Goes the Way of Chiang

Sir,—Your special correspondent's article makes depressing reading. The "planned work of amelioration," ably carried on amidst widespread corruption, is a poor swap for the early idealism of the "pilot project," which was to blaze a western trail in Asia. One notes, too, the view of Sir Arthur Rucker, quoted by your correspondent, that the proposed five-year plan for South Korea cannot sustain an army or an arms programme. Presumably this means an indefinite United Nations military commitment in Korea, since, if peace is attained, withdrawal—even if strategically permissible—would seem politically impossible.

Two conclusions, I think, cannot be avoided. Firstly, never again, while the present Great Power division of the world exists, must we fall for the delusion that the United Nations can take decisive military action against an aggressor. Secondly, while the wisdom of exporting democratic forms of government to relatively primitive alien communities may, in general terms, be questioned, in Korea where this has been done and much blood shed in defence of the state created, it is a legalistic quibble to say that the United Nations may not intervene in its manifestly corrupt internal affairs. Common sense and probity of purpose alike demanded determined United Nations intervention to prevent President Rhee from "rigging" the constitution in his favour.—Yours faithfully,

Weybridge, Surrey L. A. JACKSON

Balance of Power

Sir,—On page 651 of your issue of June 7th the doctrine of *Realpolitik* was weighed in the balance and found wanting. If the sceptical reviewer had turned over to the leading article of the issue, he would have discovered some impressive evidence of the progress which that school of thought has made even among those who are still regarded as being of the right faith.

"It is not a balance of power that creates peace but an overwhelming preponderance of power on the side that has no interest in war." The argument is that one country, by casting its weight the other way, would overthrow a precarious balance which is still the most reliable protection of peace under present conditions. This danger exists, as long as there is in either scale an alliance of free countries each of which may change its policy. The balance, in other words, depends on the unchanged will of the allied powers to stick together. Once

established, it certainly should not be taken for granted. Alliances present a never-ending task, and balances may be disturbed. Is that sufficient reason to replace the balance of power maintained by an alliance by a system of "overwhelming preponderance"?

If one replaces the precarious balance of groups, which are matched in their strength, by an evident preponderance of the "good," then one destroys the moderating influence which only a system of balance can exercise in a lawless society of otherwise uncontrolled powers. The good who "are not interested in war" are not always good, and they are often mistaken. Nothing corrupts as thoroughly as preponderance. Masses can be misled and are subject to mass hysterias. The belief in superior strength is often deceptive; even if well founded it does not necessarily promote peace, especially not if the stronger is afraid that the weaker may catch up in time. The belief in moral superiority leads to crusades rather than to peace. Taking human beings as they are the unprejudiced observer will prefer a balance, which makes successful defence probable and successful attacks difficult, to the seductions of preponderance. The economist will share this opinion since a balance is cheaper than a preponderance. Moreover, while balanced power facilitates negotiation between the opposite camps, preponderant power suggests dictation and frightens allies as well as adversaries.

I fully agree with the specific political conclusions of your article, but in a time which likes generalisations a wrong argument is a dangerous thing. Those who are afraid of the risks of the balance of power may assume too lightly the bigger risks of a preponderance whose preparation was always regarded in the past as a threat to peace.—Yours faithfully,

FREDERIC E. DESSAUER

Montreal

Jews Behind the Curtain

Sir,—Your correspondent's statement that Jewish emigration "has never been permitted from Soviet Russia" is inaccurate. In the early thirties, when I officiated in Moscow as secretary to one of the foreign legations, Jews were allowed to emigrate under a special dollar-earning scheme, whereby they were issued with passports and exit permits at special "fees," amounting to anything between \$250 and \$2,000, and payable in hard currency by sponsors, usually relatives living abroad. Payment had to be made to "Intourist" offices.

Many thousands of Jews, excluding, however, men of military age, were able to avail themselves of this opportunity to leave the Soviet Union at a time when a very large proportion of the highest posts in the party and administration were held by Jews. These emigrants were dollar exports.—Yours faithfully,

London, N.3

The Webb Story

"Diaries, 1912-1924." By Beatrice Webb. Edited by Margaret Cole. Longmans. 272 pages. 24s.

Not the least astonishing thing about Beatrice Webb is the fact that throughout a lifetime mercilessly packed with a dozen lifetimes' work she unfailingly kept up her personal diary. Earlier volumes, up to 1911, provided the foundation material for "My Apprenticeship" and "Our Partnership"; the present instalment, reproduced with a skilful minimum of editing by her disciple Mrs. Margaret Cole, carries the Webb story on from 1912 to 1924, through the years of the Great War, the turmoils and disillusionments which followed, and the formation of the first Labour Government. To call it a fascinating record is an understatement. It is a week-by-week, often day-by-day, account of the ideas, personalities and events which confusedly combined to shape the Labour movement; it is a case-history of political action, a shrewd commentary on public affairs in general, a piece of self-revelation by a complex and enigmatic character.

The diary does not, of course, present either a deliberately connected narration or a methodical analysis. Any individual thread—the fortunes of the Fabian Society, the course of the uneasy alliance between the trade unions and the Independent Labour Party, the foreign relations of British Labour—must be traced through and pieced together from scattered entries with the aid of a very occasional summing up. There is practically no attempt to fill in the background of those events in which the Webbs were neither personally concerned nor especially interested. Paradoxically, the economic field gets even less attention than the military. The Webb antennae responded sensitively to vibrations from Westminster or Eccleston Square; never, at this period or any other, were they tuned in to the City.

These deficiencies, however, whether inherent in the nature of a personal diary or arising from limitations of interest and awareness, count for little beside the vividness and the scrupulous honesty of this inside story. The successive character sketches alone would make it worth reading. There are, of course, the "intellectual spirits," Bernard Shaw (seen at his most objectionable during the Casement affair) and the profoundly distrusted "actor-conjuror" Lloyd George. There are Snowden and Ramsay MacDonald, whose actions in 1931 appear, in the light of these entries, prophetically characteristic. There is an even more prophetic glimpse of Sir Oswald Mosley ("... rottenness somewhere..."). There are, for contrast, the Irish poet Æ and the Indian poet Tagore; the former a "sensationally delightful person," who, however, "bores Sidney," the latter arousing a "latent feeling of anger" at his "quite obvious dislike of all that the

Webbs stand for." There are a gallery of trade union leaders in and out of Parliament, most of whom induced in Beatrice Webb the deepest discouragement and misgivings. "Stupid untrained persons"—"a hopeless lot"—"appalling slackness, moral, intellectual, and practical"—"maddening muddle-headedness."... It was one thing to study Industrial Democracy from the outside, quite another to work with and through its representatives.

No doubt this sense of working with "bent sticks," as well as the crushing denial which war and its aftermath opposed to the cheerful creed of progress in which she had grown up, accounts for the atmosphere of depression and pessimism which hangs over most of the diary. Beatrice Webb saw herself, in 1924, as an old woman nearing death; and there is something very moving in her selfless rejoicing over her husband's delight at his new political career, which broke up the partnership and imposed on her a mass of arduous, unwanted and subordinate work. Her relation with Sidney is indeed a beautiful thing throughout, made up of comradeship and tenderness, delicacy and mutual knowledge. And therein lies the last, unsolved enigma. Had the Webbs really been those "two typewriters clicking as one," it would be easy to pigeonhole them as useful but inhuman freaks, the last and most soulless of the Utilitarians. Had Beatrice Webb not left the record of one perfect relationship, her devoted sense of duty, even her unformulated but powerful religious sense that "the discovery of the laws of nature... is an act of piety" might leave this first superficial impression untouched.

As it is, one tries vainly to reconcile this capacity for rich and delicate human feeling with the lack of any other disinterested human tie, with the contempt for impulse and emotion, for spontaneity and aesthetic pleasure; above all with the picture of a much older Beatrice Webb, vivid and alert as a girl, talking about Russia, not denying the tyranny which long ago she had stigmatised as "devilish," nor the chauvinism, nor the use of hostages, nor yet the deliberate mass starvation of opponents, nor even the judicial torture of the innocent, but blandly and imperturbably accepting and justifying them all. "As I near the end of life," she writes in 1920, "I become more contemptuous of cynicism, more convinced that what we know as 'goodness' is in accordance with the 'nature of things.'" Not for one moment doubting her sincerity, seeing it attested throughout her long, heroically disinterested life, one is left wondering still, hearing behind the voice which speaks in the diary another devotedly public-spirited voice—that of Bernard Shaw's Inquisitor.

The African Case

Report on Southern Africa. By Basil Davidson. Jonathan Cape. 286 pages. 16s.

This well-written book will take a leading place in the rising flood of comment about Africa, not because it is all fair comment by an experienced foreign observer, but because the African side of the case is presented very readably by a skilled writer. Indeed the particular job that Mr Davidson has set out to do could hardly have been done better. It is an important job because events have been spinning in Africa at an ever faster pace since the end of the war, and during the next few years decisions will have to be taken which may determine the continent's course for a generation.

This book is in four parts, three of them devoted to the Union of South Africa and the last to British Africa—Basutoland, representing the protectorates, and the Rhodesias, with a chapter on the question of federation. Mr Davidson and his publishers have managed to bring his story as up to date as April of this year. On South Africa, he presents the evidence not only against the Nationalists but against the whole white population. If taken at its face value, all that he so ably says is true. But it fails to be completely convincing because he never fairly presents the arguments on the other side. South Africa today is certainly a sad, frustrated and frightened place. Even many Nationalists act partly out of a spirit of mere defiance of the age in which they live. But although white South Africa is still very far from accepting the race relationships which Mr Davidson demands of it, it is by no means so confident about its present methods of tackling its tremendous problems as he suggests.

Mr Davidson treats the South African question under the three headings of the countryside, the towns and the growing industrialisation. He paints a heart-rending picture of the working of the apartheid laws; he describes many of his own fascinating journeyings and experiences; he gives a useful background of history, statistics and quotations; he dissects the goldmining industry and its close dependence on migratory labour. But it is in his treatment of the new South African industries that he most shrewdly sees what may well prove the main gleam of hope. These represent an economic revolution which already renders physical segregation absurd and threatens white political supremacy. "The irresistible forces of economic integration," Mr Davidson says,

move on their way; and Mr Simale, African worker, begins to earn £6 5s. a week and to know new needs, and think new thoughts, and nurse new ambitions... and to feel, little by little,

that power, saving power, comes slowly to his hand.

In the last part of his book, Mr Davidson gives a rapid survey of the neighbouring British territories on lines similar to his treatment of South Africa. While he strongly opposes central African federation because the present interests and activities of the white settlers run counter to those of the Africans, he sees improving African prospects as he travels north. The four specific northern advantages over Southern Rhodesia are the development of co-operatives, African trade unions, the principle of African urban land tenure, and political representation.

Mr Davidson's book cannot be dismissed. Although it represents the viewpoint of the humanitarian and idealist rather than the statesman and realist, it presents a clear challenge to the existing order. It is as a challenge and not as a report on southern Africa that it should be read.

Naval Hors-d'Oeuvres

My Naval Life. By Stephen King-Hall. Faber and Faber. 287 pages. 18s.

Commander King-Hall has a highly developed faculty for enjoying life and his book, reflecting this zest, abounds in good stories. Cadet King-Hall summoned before his Term Officer, a young Lieutenant, who seemed so imposing as to "rank with but after God"; Midshipman King-Hall in Africa, dashing to the rescue of a station master "locked in his office telegraphing frantically that no less than seven lions were walking up and down the platform"; Lieutenant King-Hall hiring a bath chair from Harrods during the taxi scarcity of the First World War, and in it propelling his girl back to her home in Eaton Square after dances ("She much appreciated the bath chair and on reaching Hyde Park Corner, I used to squeeze into the conveyance in order to free-wheel down Grosvenor Place at four o'clock in the morning"); these and many other episodes are related with gusto.

For those in search of more substantial fare, the book is less satisfactory. There is a good eye-witness account of Jutland and some penetrating criticisms are made of the Navy of the First World War and before; but the Commander does not develop these criticisms as fully as their interest seems to warrant. This is a pity for the book would have gained considerably in substance had he done so. As it is, this first part of Commander King-Hall's biography can scarcely be regarded as more than a naval hors-d'œuvre intended, perhaps, to whet the reader's appetite for the civilian main dish to follow. "My twenty years in the Navy prepared me for something," writes the Commander; but he does not disclose what it is. Those readers who find themselves unable to guess will have to wait for the publication of the second volume, "My Civilian Life," in which all will be revealed. The royalties of the present book have been given to the Hansard Society.

Economic Prehistory

Prehistoric Europe: The Economic Basis. By J. G. D. Clark. Methuen. 349 pages. 60s.

Without economic prehistory there can be no prehistory. From studying man's past life through the remains of his material equipment, together with his physical environment, what prehistoric archaeologists apprehend most directly is its economic side—the balancing of material means against physical conditions which gave him his subsistence. Indeed, primarily and basically, man's economic and his social and spiritual life were intertwined. Disengagement from the quest for subsistence has come to him only in patches and piecemeal, when it has come at all; his social and spiritual enrichment has depended on an economic surplus won by effort—its own activity of social and spiritual culture working in and through material. All social philosophers have needed their theories of prehistoric life. But it is only well within the present century that the possibility has dawned of making these something more than "imaginary history," as Malinowski rudely called it, through the use of evidences found by factual prehistory. And these evidences will be best understood—since they consist of material things found—where what they attest of prehistoric life is most obviously its material, economic basis.

Older prehistorians, while adequate evidences were accumulating slowly, were content to sketch their economic story with broad generalisations, got either by projecting historic evidences back into prehistory, or by picking only the crudest and simplest inferences from archaeological findings or physical environment. But in Europe today, despite many gaps due to perishable materials and defective exploration, the evidences accumulated are sufficient, in statistical bulk and accuracy of detail, to enable Dr Clark to devote the whole of this large book to the basic economic activities of our prehistoric forerunners and ancestors, and make it the first systematic study of its kind. From the end of the Ice Age to the Roman Empire, he deals with plant-gathering, hunting and fowling, fishing, sealing, and arable farming; how houses and settlements were built, how tools and weapons and equipment of all kinds were made, and how trade was plied and travel and transport contrived by land and water over and all round our continent and islands.

As befits the Disney Professor-elect of Archaeology in the University of Cambridge, Dr Clark's command of the archaeological evidences is masterly; he can use surviving folk culture and historical sources, too; and he sets the whole in its frame of geography, climatology and all the ecological sciences, so as to bring out vividly man's relationships with the plant and animal sharers of his habitat, and his use of its resources at each stage of his early economic development. Maps, illustrations, and documentation are abundant and good. All economic historians will

gain by studying this book; the general reader will find it full of information, to be browsed at pleasure.

1789 and All That

The Revolutionary Movement in France, 1815-1871. By John Plamenatz. Longmans. 184 pages. 16s.

Among the most important of the many legacies of the French Revolution to subsequent French history was a Republican movement which endured through the Bourbon Restoration, brought about the downfall of the July Monarchy, survived the failure of the Second Republic and lived to see the collapse of the Second Empire and the establishment of the Third Republic upon its ruins. It is with this movement, by which he means "the activities of all the groups that wanted to destroy the monarchy, whether Bourbon or Bonapartist," that Mr Plamenatz is here concerned. The story he has to tell is exceedingly complex, not least because Republicanism meant radically different things to different groups within its ranks. For a majority of its leaders it meant various shades of what might be called Liberal-Conservatism; for a minority, the Republic was understood as "social" in character and purpose. There never was, in fact, one movement, but a series of uneasy aggregations, shattered by such episodes as the massacres of June, 1848, or the civil war by which the Paris Commune was crushed in 1871. The one link between the various groups was their common admiration for the French Revolution, though here again, as de Tocqueville incisively noted in his "Recollections," division was enhanced by divergent interpretations of the "meaning" of the Revolution.

Mr Plamenatz labours under a self-denying ordinance which forbids him to discuss the "underlying causes" of the movement he examines. He would rather, he suggests, "look at the things themselves." Whatever may be the merits of this approach, it certainly demands a far more detailed analysis than is possible within the confines of such a short book. As a result, the historical record presented here is far from adequate; we are taken on a hurried tour of the main events of the period under consideration and proceed from one revolution to the next with only a brief glance at the ideas and motives of their various protagonists. Mr Plamenatz's unwillingness to risk a deeper probe into the social, economic and political aspirations of the various groups making up the Republican movement produces a picture in which chance, accident and personal characteristics play a wholly disproportionate part.

Mr Plamenatz rightly refuses to view revolutions as inevitable, or their course, once they have occurred, as pre-ordained. But the causes of their appearance and the reasons for the persistence of the Republican movement in France require a much more detailed analysis than he provides. It is eminently true that "there was no need for 20,000 Frenchmen to die in Paris in

1871"; but, even on the assumption that "a little goodwill and good sense" could have prevented the holocaust, the reasons why they were not forthcoming in 1871 or in 1848 are surely vital considerations in an appraisal of the period. As an introduction to the history of the Republican movement in France until the establishment of the Third Republic, this book may perhaps serve the needs of the student. But it is not the book which Mr Plamenatz's command of the material could have made possible.

Adopting Children

Child Adoption in the Modern World.
By Margaret Kornitzer. Putnam. 403 pages. 16s.

This book illuminates a fascinating and surprisingly obscure subject. During the last twenty-five years child adoption has increased enormously in most of the Western world, and particularly in the English speaking parts of it. In England and Wales there were nearly 3,000 legal adoptions in 1927 (the first year in which the law recognised them); by 1938 the figure was over 6,000; and by 1946 it had risen to 21,000, to fall again to 17,700 in 1949. No reliable statistics are available for the United States, but informed guesses quoted by Miss Kornitzer suggest a minimum of 16,000 in 1938, 50,000 in 1944 and nearly 75,000 in 1950. But while the number adopted has increased sharply, the demand has been far from satisfied.

Profit Measurement and Price Changes

By K. Lacey. This authoritative book comes at a most opportune time . . . when present-day prices have risen between two and three times the pre-war level. It demonstrates the necessity of a system under which profits are computed on the basis of maintaining intact the "real" capital. The book is written primarily for accountants and economists, but it will prove of interest and assistance to all who are interested in economic stability. " . . . an important contribution to this problem."

SIR HENRY CLAY in the Foreword.

In the United Kingdom there are now about ten would-be adopters for every available child, while one big American agency which receives about 5,000 applications a year only manages to satisfy about 150 of them.

Yet we really know very little about the subject—why more people wish to adopt children, what agencies they use, or the long term effects of adoption on the child. Miss Kornitzer's handbook, written mainly for social workers and would-be adopters, covers all these aspects and much else besides.

The accounts of adoption in the Commonwealth, Europe and America, are necessarily sketchy. The rest of the book however, in which Miss Kornitzer writes of the United Kingdom from first-hand experience, will certainly be of practical use. She covers both the formal side—the law, the roles of local authorities and adoption societies, and the rules governing placing, probation and supervision—and the personal problems which arise. She discusses the right age for adopting children, difficult and "unadoptable" children, the position of the natural mother and "telling the child."

The book is written in a cosy, common-sense style which is most endearing, although its haphazard arrangement is at times annoying. "Over-conscientiousness in adoption can lead to tensivity in the relationship and tensivity is the devil" is a typical remark. "Only the toughest and most loving of hearts can see in the perverse and enuretic child one who needs more—not less—compassion and patience from everyone concerned." It is not only adopted parents who will benefit from reading Miss Kornitzer.

Shorter Notices

The Development of Bank Debits and Clearings and their use in Economic Analysis. By George Garvy. Published by The Board of Governors of the Federal Reserve System. 175 pages.

Figures of bank clearings, from which the velocity of circulation of money can be derived, are statistics of long standing; they were first published in New York in 1853, and in the days before national income was calculated were among the most important indicators of business activity. They suffered, however, from both technical and analytical defects. Clearing figures as such—in the uncorrected form used in America up to 1918 and in Britain up to this day—exclude cheques deposited for credit and chargeable against other accounts at the same bank and miss (or misconstrue) other forms of money turnover.

It was to cure some of these technical faults that the Federal Reserve replaced them by its weekly reports on "debts to individual accounts" twenty-four years ago. Even in this corrected form, however, the statistics of bank debits are no very accurate guide to the movement of gross national product, since they include financial transactions, payments for second-hand property and duplicated payments for identical goods at different stages of production and distribution. Since they can be collated much more quickly than national income statistics, however, Mr Garvy justly claims that they are still worth study as early indicators of cyclical

change, and his book provides analysts with a valuable summary of their uses, abuses and traps.

Company Meetings. By W. F. Talbot. Stevens and Sons. 178 pages. 22s. 6d.

The public meetings of companies are normally characterised by either extreme routine or conflict. In the one case, the danger is that matters of importance may be overlooked; in the other, that an inexperienced chairman or secretary may be outmanoeuvred into an indefensible position. In both cases, knowledge, experience and vigilance in company officials are of the greatest importance. This book covers familiar ground; its value, which is considerable, lies in its arrangement and in its comprehensiveness. Its scope can best be shown by a short list of its contents: Part I: the requisites of a valid meeting, notices, the position and duties of the chairman, the quorum, motions and resolutions, voting, polls and proxies, the conduct of the discussion, privilege and the admission of the public and the press. Part II: board and general meetings, and secretarial duties before, during and after general meetings. The book also contains a most useful collection of forms and precedents and extracts from the appropriate rules and orders. It can confidently be recommended to all company directors and secretaries as a useful working guide.

Whitehall to West Indies. By Frank Norman. Bodley Head. 256 pages. 21s.

We are now slowly beginning to learn a little about the influences that the social services characteristic of the welfare state have had on the lives of the citizens who benefit from them, but we have hardly as yet recognised the need for studying the extent to which those services have moulded the experiences or shaped the personalities of the public servants responsible for their administration. This volume of reminiscences will provide a useful case-study for the inquirer who takes up this task. Mr Norman has devoted his life for some forty years to the service of society, and it is plainly apparent from what he tells us about his experiences that the civil service and the social services, the Board of Education, the Ministry of Labour, the International Labour Office and the Government of Jamaica have been stern masters demanding the bulk of his energies and interests, which he has gladly given up to them. One gathers, indeed, that Mr Norman has gained a large part of the pleasures of life from the duties of his public employment.

The peak of Mr Norman's career came when he acted as British Government delegate at the meetings of the ILO governing body. He appears to have become deeply involved as a person as well as an official in this work, which exposed him to a measure of criticism; it is interesting to note, however, that he kept on good terms with his trade union and other critics, which caused the German and Austrian delegates to suspect him of being an astute double-dealer. As Mr Norman's career advanced, he became more and more involved in issues of policy, but, the ILO apart, he seems to have found it difficult to make up his own mind about them. This is most apparent in the concluding chapters on the West Indies, where he served as Labour Adviser to the Jamaican Government and the Colonial Office. Though brought into direct contact with important issues of economic and colonial policy in this region, he has less of interest to say about people and problems in the West Indies than he has about those encountered lower down in the more restricted landscape of Whitehall.

THE 'CONSORT'

*A car to be proud of
for many a long year—*

SINCE it was introduced, the Consort has won nothing but praise from owners and critics alike. A car conforming to Daimler standards of luxury and elegance, it is at the same time most manageable in traffic and reasonably economical to run. And of course the famous fluid transmission* makes it the most pleasant and restful of cars to drive. For the man with a position to keep up, for the firm with its prestige to think of, the Daimler Consort is the natural choice. Write to us for the name of your nearest Daimler distributor or dealer: and we are sure that he will be able to arrange a very reasonable delivery date for your Consort.

*Licensed under Daimler & Fiat-Sinclair patents

FROM THE 'AUTOCAR' ROAD TEST

'The presence of the fluid flywheel gives almost infinite top gear performance down to zero speed.'

'No car is easier to drive. . .'

'This car swings along very satisfactorily at 60 plus, and up to a full 70 m.p.h., which is not by any means the maximum. . .'

'There is a very strong impression of safety about the behaviour at all times.'

'It is a restful car, psychologically as well as physically, to the driver and passengers.'

ILLITERACY AND CREDULITY thrive in the semi-darkness of ill-lit villages in backward lands. Where there is no progress politically nurtured unrest progresses quickest. It is more than a metaphor to say that the diesel engine is spreading the light where there has been darkness and ignorance. With the diesel engine comes the means of electrification for poverty-stricken villages, the ability to irrigate and grow crops in the desert. Foremost producers of the diesel engine are THE BRUSH ABOE GROUP. In 1951 over 70% of their production went to those parts of the earth most in need of diesel electric power. In India alone more than 20,000 diesel engines manufactured by the

Group have been installed in the last two years. Under the Group's Tube Well scheme plans are already advanced for irrigation in the Ganges valley—an undertaking which will necessitate the construction of nearly 1,000 tube wells powered by BRUSH ABOE. In conjunction with the Indian Government BRUSH ABOE are conducting experiments in the electrification of remote villages. It is anticipated that these experiments will lead to far greater productivity which will eventually raise the standard of living in the under-developed areas of this great nation. Yet these are only isolated examples of the immense contribution of BRUSH ABOE to world development.

AMERICAN SURVEY Republican Revolts

Chicago, Illinois

JUST before this most fascinating of Republican conventions began, it had got around that Governor Fine, the sphinx of Pennsylvania, was saying that whichever of the two principal candidates for the presidential nomination won the first argument on the convention rules by as much as one hundred votes would probably be nominated. So when, on the afternoon of the opening day, General Eisenhower was seen to have won by one hundred and ten votes, the excitement was tense and the Eisenhower bandwagon was plainly in motion.

The second crucial test came on Wednesday evening over which of the two delegations from Georgia, supporting respectively General Eisenhower and Senator Taft, should be seated. Here again, after some suspense, General Eisenhower was the winner and, although Senator Taft had picked up some votes that he did not have on the first test (possibly because this was not from the legal point of view the strongest of the anti-Taft cases), the writing now appeared to be on the wall. Even without the contested southern delegates that he had now won, General Eisenhower had 607 votes in these preliminary trials—enough to be nominated if he could hold on to them—and Senator Taft had only 531.

By this time—midnight on Wednesday—even those who, calloused by many a convention, know that nothing is really ever in the bag until the end of the final ballot, were to be heard conceding that it would now take some sort of a miracle for Mr Taft to catch the Republican elephant. This message, sent before the balloting for the nomination has begun, will similarly have to remain posed on, but not yet over, the edge of the astonishing revelation that so guileless and inexperienced a candidate as General Eisenhower may be able to ride through as tough a convention as this to beat a professional of such driving ambition and political skill as Mr Taft.

If it turns out that the Republican old guard cannot put Mr Taft across and if, in the last desperate deals, the hopes of the compromise candidates wither and die, then something of more than passing interest will have been demonstrated. For there is no mystery about the motives of the old guard, or about why the convention was required to accept Taft officials and Taft orators, or why certain Taft delegates from Texas, Louisiana and Georgia with no more obvious right to their seats than burglars have to their loot

were recognised by the Taft-controlled Republican National Committee.

The keynote speech of General MacArthur ceremoniously unveiled the glass in which the truth was reflected and Mr Herbert Hoover came along behind him and polished it for greater clarity. All who looked could then see that what was being attempted in Chicago was a supreme, and possibly a final, counter-revolution against all that President Roosevelt had done and President Truman had consolidated in America during the last twenty years. Against those in the Republican party who have been convinced that the United States must break with its past and fulfil a new destiny at home and abroad are ranged those who have never accepted such a doctrine, have never believed in the wisdom or rectitude of the New Deal and the Fair Deal and have never abandoned the dream of American isolation and self-sufficiency. Justice

to the old guard and to Senator Taft himself requires a recognition that they passionately and probably unshakably believe that they have been summoned to a holy crusade to save a nation on the brink of the abyss of socialism and internationalism which, in their creed, are synonyms for disaster and chaos.

General MacArthur's keynote speech made all this nakedly plain. The proposition might have been clothed with some of the decent obscurities that other speakers were using if General MacArthur had not for the last fifteen months sat brooding like St Simon Stylites at the top of the pillar New Yorkers know as the Waldorf Tower. As it was, he appeared to be unaware of the temper of his times or even of the ideas that Mr John Foster Dulles, with the consent of both major candidates, was writing into the Republican statement of policy

—ambiguous as that document later turned out to be.

So General MacArthur dramatically warned his audience not to place any reliance on collective security, advocated withdrawal "in due time" of American ground forces abroad and scornfully dismissed as parasites America's allies in western Europe, comparing them unfavourably with "the free peoples of Asia and Middle East" (not specifically identified) who wanted no American garrisons but only military equipment that would be put into the hands of men eager and able "to turn the tide decisively against Communism."

This was the old guard reaction on such a heroic scale and it was so obviously going to embarrass the Republican

Herblock in the Washington Post

presidential candidate, whoever he might be, in the months before November that it deserved the priority it received in many newspapers. But General MacArthur was no less revealing in the long passages in which he dealt with the home front. He represented every act of a Democratic Administration, whose social and economic policies have five times in free elections returned it to office, as part of a conspiracy whose object was to attain despotic power and which was now

reinstating those very excesses and abuses for which the British crown was indicted in 1776 by our Declaration of Independence.

The television cameras, reproducing the scene for an audience of perhaps seventy million, picked up the ovation General MacArthur received before he began to speak and an hour later mercilessly recorded the closing applause which, by convention standards, was almost perfunctory. The nation had a final glimpse of the civilian-suited general being patted on the back by the politicians and being led off the platform back to his aeroplane and to his high pillar.

Mr Hoover on the following night was more circumspect. He did not advise the party to withdraw its trust in collective security, though he also found that "the will is lacking" in America's western allies. He joined Mr Taft in advocating "less armies and an overwhelming striking force at less cost," which he promised would "extend our effectiveness to all menaced countries." And like Senator Taft he was at pains to show he was no isolationist:

I do not propose that we retreat into our shell like a turtle. I do propose the deadly strategy of a rattlesnake. Neither did his denunciation of the Administration's policies at home contain self-actuating booby-traps. He contrived, however, to detect behind the Administration's "plush curtain of tax and spend" the sinister ghosts of Mussolini, Karl Marx and Lord Keynes, mixing "poison for the American people."

The *New York Times* later noted of General MacArthur and Mr Hoover that

both orators left their audience with the impression that the Democratic party has somehow come into power by a *coup d'état* and that it is now the opportunity of the Republicans to free the great masses of the American people from the shackles of a small and wilful tyranny.

Something like this may well be what the old guard believes. The efficient Taft majority on the Republican National Committee has seen to it that other and differing beliefs, such as those of Governor Dewey, who was excluded from the platform along with the party's other liberals, have not been placed before the convention.

But the Taft organisation did not allow enough for the pressure which General Eisenhower and his managers were able to exert through the argument that a party needs to satisfy a television-equipped electorate that its hands are clean. This was made into a burning national issue during the arguments over the contested delegations and it was this which decided such men as Governor Fine of Pennsylvania. He knew long ago that 836,000 Republicans had voted for General Eisenhower in the presidential primary in his state, and that only 178,000 had voted for Senator Taft. If this expression of the popular will was carrying any weight with Mr Fine, he concealed it admirably during the weeks when both the Eisenhower and Taft factions were ardently courting him. It was not the votes of the million Republicans in Pennsylvania, who had put him in his present high office, but the one hundred and ten extra delegate votes in Chicago, which put General Eisenhower on the road to nomination, that at long last brought a decisive smile to the face of the sphinx.

Deficit Ahead

[FROM A CORRESPONDENT IN NEW YORK]

THE Treasury has just announced that it ended the 1952 fiscal year on June 30th with its cash budget approximately in balance. As a measure of the influence of the federal government's operations on the economy, this is the budget that matters; the deficit of \$4 billion shown in the administrative budget, which does not include receipts on account of the social security insurance scheme, does not for this reason indicate the money actually taken from individuals and businesses and returned to them through cash payments for goods and services. This deficit was, however, less than one-half as large as the President expected early this year, and the small cash surplus offered a sharp contrast to the cash deficit of \$4 or \$5 billion forecast in January. Revenues for the fiscal year, exceeding \$62 billion, were the highest on record, being almost 50 per cent above the highest of the war years. Expenditures were the greatest since 1945, but were substantially below predicted levels, largely because spending on the Mutual Security Agency account—foreign aid—was about \$2.5 billion less than expected, and because expenditures for military purposes and on ex-servicemen fell \$1.25 billion below the earlier estimates.

It is a reasonably safe assumption that the rate of spending by the services and by the Mutual Security Agency will increase significantly over the next six months. It is estimated that defence and related expenditures for the first half of the 1953 fiscal year, which began on July 1st, will exceed \$25 billion, while the other expenses of the federal government will come to about one-half that amount. Under the terms of the Mills' plan for accelerating corporate income tax payments, the Treasury will collect in the next six months only 30 per cent of corporate tax liabilities; the other 70 per cent was collected in the past six months. Next year the plan calls for payment of 80 per cent of corporate tax liability (on 1952 income) in the quarters ending in March and June; the Treasury, therefore, will find its expenditures rising for the rest of this year, while its receipts will be falling. It will have a substantial cash operating deficit in the coming six months, probably of about \$8 to \$10 billion.

The Treasury has already attacked the problem of financing this cash requirement by selling a six-year 2½ per cent bond, accepting subscriptions for more than \$4 billion. Payment for these bonds was made on July 1st; with this added to the large tax receipts received on the June 15th quarterly payment date, the Treasury now has a comfortable working balance to carry it through two or three of the lean months ahead. It is obvious, however, that the Treasury will have to come to the market by the end of this quarter

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

THE TREASURY'S CASH BUDGET
(billion dollars)

A hundred million customers

Starting next January, a new edition of LIFE will be published fortnightly in the Spanish language for the people of Latin America. The initial circulation will be over 100,000—and those hundred thousand will represent the most influential and forward-looking elements among the 101,000,000 Spanish-speaking citizens of the republics of Latin America... the people who lead trends and influence opinion.

By speaking to them in the exact idiom of their own tongue, LIFE will bring them a clearer interpretation of international views and ideas, new inventions and products—and a better understanding of people, places and events.

Latin America is the great market of the future for exporters. Competition is keen and growing keener. Make your name and reputation known in Latin America—book space in LIFE Spanish-language edition. Enquiries to:

to make at least a beginning on meeting its additional requirements. It is widely expected that this next financing will take the form of short-term bills maturing on the March and June, 1953, tax payment dates. Such obligations have proved to be attractive investments for corporations saving tax money out of income during the second half of the calendar year in preparation for making the actual payments in the first half of the next calendar year.

The Treasury's success with its 2½ per cent bond made its failure a month earlier with a long-term 2½ per cent bond seem even more dismal than it had first appeared. Up to 75 per cent of the subscribed amount of the first offering was payable in outstanding 2½ per cent bonds, which were freely available in the market at a discount. In effect, therefore, the Treasury was offering investors a return of 3½ per cent on the quarter of their subscription paid for in cash. The new bonds, however, were non-marketable, and holders wishing to obtain cash for them at any future time would have had to convert them first into five-year 1½ per cent notes and then sell the notes (probably at a discount) in the market. These terms reflected the Treasury's preoccupation with ingenious devices intended to insulate the debt from the market forces of supply and demand. The sorry reception given to the issue by investors probably furnished convincing evidence that such devices more than offset the comparatively attractive yield, and it may well prove to have been the Treasury's last attempt to avoid the test of the market.

When the 2½ per cent bond was so well received that the books were closed after only one day, there was a spate of explanation that the success was assured because non-bank investors were willing to buy with funds borrowed from banks to which they would sell the bonds immediately after allotments had been confirmed. (Non-bank investors were given preference in order to reduce the inflationary results of bank payment for the bonds.) It was widely predicted that these "free riders" would take quick profits, the bonds would thus go into the banking system after only a short detour, and the full inflationary impact of the financing would be felt immediately. Indeed, some so-called experts argued that the inflationary addition to the money supply would be multiplied because the banks would not only create the deposits to pay for the bonds, but would have the deposits returned to them as bank reserves, capable of supporting a further five- or six-fold expansion in bank credit, when the Treasury spent the proceeds. Most of the predictions seemed to be based on the conclusion that failure of the 2½ per cent issue had demonstrated there were no non-bank funds seeking investment. It now begins to appear that not nearly all of the new issue will move in the near future into the banking system; many savings institutions and insurance companies have concluded that the new bonds will provide a high-yielding secondary reserve of liquid funds. In any event, the Treasury has tapped more non-bank money with the 2½ per cent bond than it did with the 2½ per cent fiasco.

This development is perhaps just as well for the commercial banks, since they are having enough difficulty obtaining reserves from the central bank as it is. Although many observers interpreted the Federal Reserve Board's relaxation of the selective credit controls on hire-purchase and real estate construction, even before Congress made it mandatory, as a sign that the central bank was participating in a "save-the-boom" effort by the Administration, shrewder bankers have noted that since the end of March the money market has experienced its longest period of tightness since early 1933, when runs on the banks put a severe strain on their resources. It therefore seems more probable that the central bank, finding its general quantitative credit measures

proving increasingly effective, decided that it could safely allow the supplementary controls to wither on the vine, particularly since they had produced more resentment than any other restrictive measures in use.

The new bond issue has meant that the commercial banks must find something like \$500 million in reserves to support the increase in deposits created to absorb it. (Commercial banks which are members of the Federal Reserve System are required by law to maintain reserves against their deposits with the Federal Reserve Banks. Banks in Chicago and New York must hold an additional \$240 in reserves for every \$1,000 increase in their deposits; "excess reserves" are the difference between required reserves and those actually held by the member banks.) So far the central bank has been extremely niggardly in providing those reserves, and has

SOURCE: FEDERAL RESERVE BOARD.

made it clear that it is doing so most reluctantly. The commercial banks have been forced to borrow large sums from the Federal Reserve Banks in order to meet their reserve requirements. This method of providing reserves temporarily is in sharp contrast to the injection of more permanent funds through purchases of government securities in the pegged markets of more than a year ago. There is no doubt that the central bank will be called upon to furnish additional reserves in the next six months, when agricultural and business borrowings will increase seasonally. It is becoming increasingly evident, however, that these reserves will be doled out grudgingly and that the indebtedness of the banks to the Federal Reserve will provide the latter with an increasing measure of influence over the banks' lending policies.

Stevenson Fingers His Hat

The Vice-President, Mr Barkley of Kentucky, is the latest candidate to throw his hat into the presidential ring, already crowded with Democratic headgear, and it is possible that his is the one which the Democrats may be forced to pick up. For he is a Southerner who supports Mr Truman's Fair Deal and an experienced fighter who is liked by voters as well as politicians. No other active contender for the Democratic presidential nomination draws so much strength from so many sections of the party but, largely because of his advanced age, Mr Barkley is far from being the strongest conceivable candidate. Yet this is what the Democrats must have if they are to achieve the victory which now seems to be within sight, although by no means yet within grasp, as a result of the bitter quarrel over the Republican nomina-

tion and of the comparatively poor showing made by General Eisenhower in his pre-convention trials.

There is, however, another potential Democratic candidate who has all Mr Barkley's ability to bridge the party's divisions and who has proved himself a winner in local elections—Governor Adlai Stevenson of Illinois. He has obstinately refused to throw his hat into the ring, but last week, under pressure from the machine politicians, he at last consented to finger it hopefully. He announced that, while he was still determined not to participate in any movement to conscript himself for presidential service, and while he (unlike other people) therefore thought it improbable that such a movement would develop, he would, if it did develop, decide what to do in the light of conditions then existing. This equivocal statement was so much more definite than anything that Mr Stevenson had said earlier that it has been taken to mean that he would not refuse to jump into the ring after his hat if it were thrown in for him, even if that meant fighting General Eisenhower.

Mr Stevenson went on to say that the Democratic candidate should be one who could unite the northern and southern wings of the party, and to show how he would do so: it was, he said, the responsibility of the state government to protect the civil rights of Negroes, but if it failed in this, then he feared that the federal government would have to step in. This compromise was too dictatorial for Governor Byrnes of South Carolina and several other southern leaders, yet it was not enthusiastic enough for Mr Truman. Nevertheless, it seems probable that he still favours Mr Stevenson as his successor—and in spite of hints to the contrary Mr Truman still insists he will not run again himself. He does not, however, intend to announce his preference until the convention has actually begun; when that time comes the party is likely to take his advice.

Congress off to the Races

A gallant little rearguard, consisting of 14 Senators and 100 Representatives, remained in Washington on Monday to cover the exodus of Republicans to the grandstand in Chicago and of Democrats anxious to get into trim for their own races a fortnight hence. The task of those who stayed was to tie up the loose ends and relieve Congress of the necessity of coming back later. In its last hectic seventeen-hour meeting, Congress, though it failed to agree on atomic energy funds, managed to pass nearly \$50 billion in appropriations. The lion's share of this was \$46 billion for the services. The Bill carried almost \$5 billion less than Mr Truman had asked, but it was very welcome, not only because it restored the \$600 million for aircraft procurement lopped off by the House, and thus cleared the way for a 143-group Air Force by the middle of 1953, but also because it eliminated the House spending limit. The defence authorities have a healthy bank balance, thanks to unspent appropriations from earlier years, but a \$46 billion limit would have wrecked rearmament schedules. Military spending can now proceed to the expected tune of \$52 billion in the next twelve months. The Navy also succeeded in obtaining a second aircraft carrier, but it will have to find the money by scuttling other building plans.

Mr Cannon, chairman of the House Ways and Means Committee, estimates that Congress cut some \$10 billion from the President's requests. This may be optimistic, but already government employees are being missed, particularly from the economic stabilisation agencies which Congress voted to continue in name, but has denied the funds to function effectively. But neither haste nor economy were allowed to interfere with aid to deserving voters: time was found to pass the \$1 billion a year GI Bill for educational and other benefits for ex-servicemen, social security benefits and pensions of civil servants were raised, and combat pay for men serving in Korea was approved. Congress, believing

charity begins at home, also exempted the first \$3,000 of legislators' living expenses in Washington from taxation.

It was the supplementary appropriation Bill for foreign aid and atomic energy which caused the real eleventh-hour trouble. Foreign aid sailed through with a minor cut: \$6 billion has been appropriated, \$4.3 billion of it for Europe, as against \$6.4 billion authorised (the President asked for \$7.9 billion). But on atomic energy the House dug in its toes. Irritated by the cloak of security flung over a request for over \$3 billion, which it suspected concealed extravagance, it voted only \$1.45 billion and added a rider forbidding the commission to embark on any project unless it had the money to complete it. The rider remains, despite the Administration's urgent hints that a flood of powerful new atomic weapons is just around the corner. But President Truman's threat to call Congress back into special session to remove it is not likely to materialise. The Representatives who stayed behind took the responsibility of raising the funds for the commission to \$2.9 billion, something which makes the rider academic.

The President should, however, be able to find some other excuse for recalling Congress, if he wishes to repeat his successful strategy of 1948. But in 1948 it was the imperfections of a Republican Congress which were put on parade. The present Congress is Democratic by a small majority in the Senate and a larger one in the House, though it has rebuffed the President again and again, particularly on domestic issues. Mr Truman may therefore prefer not to call attention to its defects.

Steel Strike—or Lockout?

Despite the urging of both Houses of Congress, President Truman seems more determined than ever not to use the Taft-Hartley Act to secure a suspension of the steel strike, now in its sixth week. This is the longest stoppage in the industry since the war, and the shortage of steel is acute.

Automobile production this week is only 30 per cent of normal and unemployment is serious; what is worse still is that, according to the Office of Defence Mobilisation, lack of steel has halted or slowed down production of ammunition, tanks, and other defence goods. Even if the strike were settled immediately, it would take weeks for the pipelines to refill. There is no prospect now that steel can be derationed before next June; despite the expansion programme, the supply this year, at 99 million tons, will be 6 million tons less than it was last year. Direct losses through the strike now total 13 million tons. What worries the industry even more is the loss of iron ore caused by the sympathetic strike in Minnesota. Next winter's supplies have to be brought across the Great Lakes before they freeze over, and already about 10 million tons have been lost.

Mr Truman's new reason for refusing to use the Taft-Hartley Act in what is now unquestionably an emergency is that the stoppage is not a strike at all, but the result of a "conspiracy against the public interest" on the part of the six largest producers. This is, not unexpectedly, also the view of the union, which has brought a charge of refusal to bargain against them before the National Labour Relations Board. The big six have agreed to stand together, and pressure from the other five apparently accounts for the withdrawal of the Bethlehem Steel Company and some smaller producers from agreements they were ready to sign. The steel companies insist that joint negotiations are necessary to give them the strength to deal with a union covering the entire steel industry, and they draw the line at "compulsory unionism." In fact, however, it was an exceedingly weak form of union shop which the union accepted in its settlement with the Pittsburgh Steel Company, and its leaders are convinced that the industry is only too glad to see stocks run down since, once the strike is over, it will be able to charge higher prices. If this is true, a settlement should not be far off; stocks are reaching the vanishing point, and so are steelworkers' savings.

The Administration, which has taken the union's side throughout, has failed, in one respect, to help it "divide and rule." Companies which have settled with the union must wait for a general agreement before receiving price relief beyond that available already under the Capehart amendment, which allows price increases to cover cost rises up to July of last year. So far only one large company has claimed its Capehart relief. Clearly there is no temptation to individual firms to come to an agreement if all it means is that they are allowed to sell steel at a loss—at 1951 prices while they are paying 1952 wages and freight rates.

No Peace for Lattimore

There are two fallacies in the report, issued in good time for the election, of Senator McCarran's subcommittee on internal security on its eighteen months' investigation of the Institute of Pacific Relations in general and of Professor Owen Lattimore of Johns Hopkins University in particular. In the first place, in claiming that a small group with Communist sympathies, which is supposed to have controlled the institute, kept American policy in the Far East on a course favourable to Communism, the report is not only exaggerating the influence of the institute on the United States government, but is also exaggerating the influence that that government could have on events in China. In the second place, in alleging that Mr Lattimore committed perjury on five occasions during his lengthy evidence, the report, as has become a habit with such Congressional committees, not only makes no allowance for the difficulty of remembering details of long-past occurrences and opinions, but also appears to take it for granted that the unsubstantiated evidence of a converted Communist, Mr Louis Budenz, is to be preferred to that of Mr Lattimore. This is perhaps partly because Mr

Budenz told the committee what it wanted to hear, and partly because it resented Mr Lattimore's courageous resistance to its thirteen days of browbeating.

It has to be admitted that his replies to this latest inquisition did not always tally exactly with those he had given earlier in answer to Senator McCarthy's charges, but this is hardly enough to prove that Mr Lattimore was "a conscious articulate instrument of the Soviet conspiracy," as the report alleges. If the committee has its way, a grand jury will consider whether charges of perjury should be brought against Mr Lattimore in the courts, and also against Mr John Paton Davies, a State Department official now in Germany, who has already been cleared by the loyalty board. Mr Lattimore is therefore unlikely to have much time to use the passport which the State Department is now prepared to give him. The Department has finally apologised for its much publicised ban on his going abroad, which was founded on a baseless story told by an intoxicated travel agent, who is now under indictment for giving this false information to an employee of the Central Intelligence Agency.

The accusations made against the Institute of Pacific Relations itself in the committee's report are almost as controversial as those against Mr Lattimore. Half the institute's funds have in the past come from the Rockefeller and Carnegie Foundations, most of the rest from a number of well-known business firms, who were certainly not trying to further Communism. Nor was this the purpose of the eminent scholars responsible for the research work on the Far East done by the institute. This is its prime function, but it has also engaged in a good deal of propaganda and publicity work, a branch of its activities which does unfortunately sometimes seem to have been made use of by Communist sympathisers. But the report proves little, if anything, more than that both the institute and Professor Lattimore have not always shown sound political judgment.

Puerto Rico Celebrates the Fourth

Puerto Ricans were able to celebrate American Independence Day with double enthusiasm this year, for Congress had approved the island's new constitution, and Mr Truman had made a point of signing it on July 3rd. The new charter, drawn up by Puerto Ricans themselves, makes the island a commonwealth, literally, in the Spanish, a "free associated state." In fact, what it gains is complete home rule. Puerto Ricans were already American citizens, with the right to elect their own Legislature and Governor. The few appointments which the American President still had power to make are now transferred to the Governor; Congress has given up its right to repeal laws passed by the Puerto Rican Legislature. Federal law still runs, but the Puerto Ricans pay no taxes to the mainland, although they enjoy the services of the US Coast Guard, Weather Bureau, Post Office, and so forth.

The wording of the Constitution suggests that statehood may be the eventual aim, and there are also strong supporters of complete independence. But Puerto Rico is too dependent on the United States, both as an outlet for its surplus population and as a market for its goods, to be able to afford independence yet. Statehood could not confer more self-government than the new Constitution does, and the voting representation to which it would entitle Puerto Rico in Congress would have to be paid for in taxes the island could ill afford. The Governor, Sr Munoz Marin, feels a period of political "repose" is now desirable, to enable his countrymen to concentrate on their economic problems; Puerto Rico is desperately poor as well as overcrowded. But he suggested, in a speech on July 4th, that the next step might be to provide that American laws might not take effect in Puerto Rico without ratification by the commonwealth legislature. This would create something similar to dominion status inside the American system for the first time.

Such a step should be within Puerto Rico's new powers, although, for a time, it seemed that Congress might spoil a

magnanimous gesture by insisting on the right to pass upon all amendments to the new constitution. The Puerto Ricans had already had to give way to the demand of the House that they curtail their Bill of Rights; Congress, which insisted that one should be included, was not prepared to approve one which went beyond that in the American Constitution and, on the model of the United Nations Declaration of 1948, recognised the rights to work, to protection against illness, to free elementary and secondary education, and to a standard of living adequate for health and well-being. Fortunately, in conference, the Senate was persuaded to give up any American veto over future constitutional changes. The steady progress of Puerto Rico to self-rule constitutes another impressive demonstration—the Philippines was the first—that the United States practices what it preaches about colonialism and self-government for dependent peoples.

Shorter Notes

In spite of election controversies, the Senate forgot its differences when voting on the ratification of the substitute German peace treaty and on the amendment to the North Atlantic Treaty which extends its guarantees to western Germany. Both were ratified by far more than the necessary two-thirds majority, with only five adverse votes in each case.

The visit of Mr Acheson, the Secretary of State, to Brazil, his first official trip to a country south of the United States border, had no specific reason since there are already plenty of normal channels for dealing with such matters as loans. Mr Acheson's purpose, in which he seems to have succeeded, was to give Brazilians a better understanding of why United States aid has had to be concentrated on Europe, and to explain once more that this does not denote any lessening of interest in the other countries of the western hemisphere.

THE WORLD OVERSEAS

Comeback of the Wafd

(By a Special Correspondent)

HOW much can Sirry Pasha do for Egypt in its present "critical" economic and political state? (The adjective quoted is King Farouk's.) After a fortnight in the saddle, his own ambitions are beginning to be clear. He hopes to be more than a mere caretaker till the elections in October. He wants "national unity," and so has released the secretary general of the Wafd party, Fuad Serag el Din Pasha, whom his predecessor had thought to be gravely responsible for the riots of January 26th in Cairo and had placed under arrest. He wants to come to a direct agreement with the Sudanese and has invited Sir Abdul Rahman el Mahdi Pasha—the chief protagonist of an independent Sudan—to meet him and talk things over. He wants to raise the standard of living by increasing food crops, and has set up a committee to work on the subject. Even for a premier blessed with nation-wide support all this would be a tall order. Its achievement is a virtual impossibility for a cabinet of independents which has at its heels the Wafd, pining for office and justifiably certain that it will win the elections provided they are free as, under Sirry, they are sure to be.

A survey of the fate of his predecessor suggests that he is to a large extent the Wafd's prisoner, and will retain its support only to the extent that he does not interfere with its plans. Hilaly Pasha's reign began in March with a short respite from such pressure. For a matter of weeks, he appeared to have the backing of a majority of the politically-minded, although he had neither party nor public following in the country. People were tired of the Wafd, with its over-concentration on the "national aspirations" vis à vis Great Britain, its manipulation of the cotton bourse, its "exceptional promotions" of toadies, and its two-year record of brushing aside the need for social improvements at home. When Hilaly first placed Serag el Din Pasha under house arrest all anti-Wafdists vastly enjoyed the many cartoons depicting his fate; people would have been glad to see it meted out to other Wafdist leaders. But Hilaly, though he hinted at possibilities of further action, never took it. He was busy negotiating with the British, believing that the British Government, in its pleasure at finding a reasonable man in office, would make considerable concession to him personally. He planned to fight a general election as the man who had at last realised Egypt's national aspirations by negotiation and without the loss of a drop of Egyptian blood. He therefore ignored the plea of supporters who urged him not to rely on getting results from Britain, and instead to strike at the Wafd while tempers against it were running high in the country.

Caution About Corruption

The farthest he went in this direction was to allow his able Minister of the Interior, Mortada el Maraghy Pasha, to replace about twenty senior Wafdist officials by supporters of his own government, and to encourage these to make corresponding changes among the *mudirs* of villages, who exercise important influence among illiterate voters during elections. Maraghy simultaneously undertook a thorough reorganisation of the police force with the aim of restoring its former non-party character. Committees enquiring into the "origin of fortunes" (as corruption is euphemistically called in Egypt)

went cautiously—which means slowly—about their work; no one was actually brought to book.

The Wafd now took heart. In April, its leaders turned the ground floor of Nahas Pasha's mansion in Cairo Garden City into a propaganda bureau. It knew that because Hilaly had failed to discredit them, his technique no longer found favour in the Palace. From the moment in April when he announced that the elections had been postponed he became the prey to well organised rumours that the King had dismissed him. Though he had nothing to show for his fairly fruitful talks with the British, he believed that he would be able to remain in office throughout the summer. He underestimated the power exercised by a few millionaires, whose main motive was a desire—like his own—to see the British make concessions. Failing this, they had other plans. They belong to a small group of rich men who, between January 1950 and January 1952, contributed generously to Wafd funds in order that they might not be bothered with tiresome questions concerning foreign exchange, land tax and import duties, and who, by April, longed for an end to the searching methods of Hilaly and his finance minister, and decided that both must go. Their confidence that they can, by stages, restore the Wafd is not preventing them, and many others, from transferring week by week at least a part of their capital abroad.

Undermining Hilaly

Emissaries of these millionaires and former Palace favourites therefore set about undermining Hilaly's position. No such action is taken in Egypt without first finding out how much foreign support is likely to be available for any successor. During the putting forth of feelers, even British residents were cautiously sounded as to their views about a return of the Wafd. By means of social and sociable approaches, a veritable onset was made upon the American Embassy; there Mr Caffery was known to think that the extension of the Egyptian crown's authority to the Sudan was a trifling matter; he is therefore regarded by Egyptians as favouring Egypt's aspirations in general.

Simultaneously, the Wafdist paper *Al Misri* switched from a rabidly anti-foreign to a pro-American policy. These tactics had exactly the effect upon Hilaly that the Wafd desired; they shattered his confidence by suggesting that no one was on his side. Immediately before his resignation he accused the Wafd of approaching an unnamed "foreign embassy" and offering Egyptian participation in the Middle East Command in return for help with getting him dismissed and the Wafd back to office. The social efforts already mentioned caused all Egyptian eyes to turn to the American Embassy. Mr Caffery, with the limelight upon him, felt constrained to put out a denial of any such attempt to interfere in domestic politics; but the mischief was done. He was not consciously party to any bargain, but the point to note is that all Egyptians believe that he became involved. This week a Cairo newspaper is unkindly wondering which of two conflicting Wafd commitments the party will observe when it resumes office: that made to its supporters to make no bargain with the West or that made to Washington to enlist in the Middle East defence organisation.

For the moment, therefore, Sirry has the support of the

friends that matter: the King and the Wafd. But it is highly doubtful whether either would continue support if crossed. Neither is ready to face and to back the uncomfortable measures that could alone put right the current upset caused in Egypt's cotton-based economy by a combination of former Wafd policy and of fluctuating world prices. The Wafd has only too plainly recovered from the fright that it received on beholding the violence of the forces it unleashed on Black Saturday. Already, its newspapers are urging Sirry to restore the "exceptional promotion" of its friends and relations that Hilaly so painstakingly undid. It seems to be ready to put the clock back, regardless of the possibility that it might once again be unable to control the mob—once its servant—that became on January 26th its master. No doubt it feels that its relations with Washington—if it has thought about these at all except as a stepping-stone to power—can be adjusted later. The danger of Communist disorders is always an ample excuse for procrastination, or even for the breaking of undertakings, if any such have been given.

A Fresh Stage in Korea

THE news from Korea suggests that the truce talks are edging closer towards a conclusion than at any previous time. The bombing of the North Korean power stations probably has little to do with this either one way or the other: the talks have no more been affected by the political naivety of American military planners than by the Bevanite ballyhoo in Britain. At Panmunjom the key task is, as it has been for several weeks, to convince the Chinese that the Allies' refusal to return prisoners who do not want to go back is final. Although the UN negotiators have long been hammering away at this, the Chinese are not yet quite convinced. When they are, provided there has been no further basic change in the military or political background, the moment will have come to work out a plan for repatriating willing prisoners, while omitting the unwilling.

Hitherto there has never been any proper chance that such a plan could be evolved, since neither side has accepted as genuine or permanent the stand taken by the other. The Chinese and North Koreans have believed—always rightly—that another turn of the screw, through either further delay or higher demands, could wring more concessions from the Allies. The UN Allies, in their turn, have taken many months to act on the supposition, which only time and the gradual widening of the area of actual agreement have substantiated, that the Chinese will really accept an armistice on feasible terms. These two attitudes spring from the fact that neither side regards itself as having been beaten in the field. Granted that the Chinese do want an armistice—as the evidence suggests—that no reasonable American wishes to prolong or extend the war, and that, at the same time, no more concessions can be made by the United Nations, the sole remaining question of the prisoners of war is clearly now open to a joint effort of settlement of a kind never previously possible.

No Mediation by India

How can this question be solved? During the past few weeks the Indians have tried to discover through diplomatic channels common ground between the Chinese point of view and that of the British, as representing the United Nations. As a result there have been reports that the Indians might play the role not only of honest broker but of mediating neutral, even going so far as to take part in the re-screening of prisoners. Such a possibility does not, however, exist. The Indians themselves are already combatants on the United Nations side, by virtue of their ambulance unit in Korea; their role, and a most useful one, is to interpret only and to take soundings in private, out of the public eye.

It is likewise certain that any attempt to carry out a neutral screening of prisoners at this stage could only do more harm than good. Not only would it be virtually impossible to find any agreed neutrals—the International Red Cross, after all, is passionately regarded by the Communists as an "instrument of the imperialists"—but no amount of genuine re-screening would make any appreciable difference to the number of Chinese prisoners, about three quarters of the total, who refuse to go back to Communist China. It has been the Koreans, rather than the Chinese, who have been difficult to screen, since very few Americans talk Korean; and it has until recently been the Korean camps which were impossible to enter. On the other hand, many Americans now in Korea talk Chinese, and the screening of the Chinese has been efficient, fair and thorough. Since it is these 15,000 Chinese prisoners who now cause the deadlock, neutral confirmation of their refusal to return would only add insult to Peking injury.

A solution, therefore, must lie along different lines from these. Fortunately, the opportunity for it already seems to be emerging. At the truce talks both sides are already suggesting that the lists of prisoners presented earlier this year require revision. But, if new lists are to be made, they will be very different lists, and this time there will be no need for them all to be handled in the same way. Once the Chinese understand that the United Nations will sign a truce only if all their own prisoners are returned—a very small number compared with the captured Communists—and if no Chinese or Koreans are repatriated unwillingly, it should not be impossible for Peking to accept the public handling only of those lists which cover the men to be returned. The other lists need never appear at the conference table, whatever the Chinese may or may not care to say about the United Nations for the record. This week, for instance, they branded the idea as a "brazen and adventurous plot." Naturally any such arrangement, needing the tacit agreement of the Chinese, would depend on their also genuinely wanting a truce. Since there seems to be no other way out, and since a week or two at least is bound to pass before the new lists can in fact be completed, an opportunity exists to explore in secret these possibilities and the detailed arrangements that would be necessary to implement them.

Sweden and the Soviet Outrages

[FROM OUR SCANDINAVIAN CORRESPONDENT]

"WHAT kind of people do they think we are?" might, to transpose the Churchillian phrase, fairly be used to describe the surge of anger and resolution which swept across Sweden when people learnt of Russia's recent callous and high-handed actions in the Baltic. As events unfolded and the technique of bland denial, truculent rectitude, counter-charge and partial indirect admission was applied to the Swedes, annoyance turned to contempt. "The Baltic Interlude," as it is called in the press, no longer fills the papers but it is never far from Swedish minds. For the Russian actions moved Sweden more deeply than any event since the war, shaking the belief that behaviour which is legally neutral can ensure political neutrality and reviving the deep, old distrust of Russian imperialism.

What happened can be established with reasonable accuracy from the timetable of events, but certain disputed details are unlikely ever to be solved. A Douglas DC-3 aircraft of the Swedish Air Force—the type known to the R.A.F. as a "Dakota"—unarmed and with a crew of eight, was flying over the Baltic a few miles east of Gotland on the morning of June 13th. It was in regular radio contact with its base. When it failed to come up on schedule and did not

'ENGLISH ELECTRIC'

The 6.15 is but one link in the chain of electric power that transports thousands of passengers daily between cities and their suburbs. These links include the turbines and generators which provide the electricity, the transformers, switchgear and substation equipment which deliver current to the track, and the traction motors and control gear on the train. The ENGLISH ELECTRIC Company not only supplies all these vital links, but complete trains as well.

bringing you

'ENGLISH ELECTRIC' has electrified more than 60 railways in 5 continents, bringing faster, cleaner and more comfortable travel to millions of men, women and children. In the field of transport alone 'ENGLISH ELECTRIC' has over 40 years of specialised experience.

Wherever electricity can play its part, by land, sea or air—in industry or the home, 'ENGLISH ELECTRIC' generates and adapts it for the use of mankind.

reply to repeated signals, the alarm was sounded and a search began. In a Note of June 21st the Swedes asked the Russians directly whether they had shot the aircraft down. The Russians avoided a straight answer, but claimed on June 24th that two foreign aircraft of unknown nationality violated Soviet territory near Ventspils (Windau) and were driven off by Russian fighters at almost exactly the time that the last signals were heard from the DC-3. This is generally taken to be an indirect admission that they shot it down. Since an expert police inquiry subsequently concluded that the holes in the punctured rubber dinghy—the only trace so far found of the aircraft—were caused by bullets, there is little doubt that they did so. In its Note of July 1st the Swedish Government recorded its conviction that the DC-3, as well as a Catalina air/sea rescue flying boat that searched for it were shot down by the Russians.

About the Catalina there can be no doubt. It was attacked north-west of the island of Dagö early on June 16th by two MIG 15's and its crew rescued by a German ship. The Russians explain their behaviour by alleging that the machine violated their territory, refused repeated orders to land, and fired first at the Russian fighters. All of this has been denied by the Swedes and is generally disbelieved, not least because the Russians knew a rescue search was in progress and had been asked to co-operate in it.

Aircraft Carriers on Manoeuvres?

To explain this sudden display of violence one must put oneself in the place of the Russians. If one assumes an aggressive and neurotically suspicious attitude to foreign activities in general and, for this exercise, to Swedish activities in particular, a plausible explanation can be advanced. In the last few months a high officer of the Swedish Air Force and the Swedish Premier had both been to the United States. At the beginning of June a British submarine flotilla visited Stockholm, to be followed a few days afterwards by a senior R.A.F. officer. All this could look very sinister: and occasional outbursts in the Soviet press and radio have construed it—at least the visits to America—in a bad light. Then in the middle of June the Soviet Baltic Fleet held manoeuvres somewhere south of Gotland. According to reports of Danish fishermen, scores of aircraft were involved and two aircraft-carriers. There have also been stories of amphibious exercises. If these accounts are substantially true, they are important. They imply that the Russians were carrying out exercises of a type new to them—landing operations with carrier-borne air support. In any case it is certain that they were engaged in sea and air manoeuvres. In these circumstances they might well have been so suspicious of any foreign aircraft that stumbled into—or was sent to investigate—their manoeuvres that they shot it down, particularly if it had an "American" silhouette and the visibility was rather poor, as the official Swedish report shows it was. When, later the same day, another foreign aircraft flew over Soviet territory at Dagö one can imagine Russian suspicions confirmed and defences alerted. (The Swedes have apologised for the inadvertent violation of Soviet territory at Dagö, in bad visibility in the afternoon of June 13th by a Catalina searching for the DC-3.) Thus, when they picked up a third aircraft coming towards their coast on June 16th they sent fighters out and shot it down. This was the Catalina whose crew the German ship picked up.

Such, then, could be the explanation of Soviet behaviour. But for such actions over international waters there can be no excuse. The Soviet Union tends to consider the Baltic as a *mare clausum*. This attitude is reflected by the comment of a Finnish Communist newspaper that the Swedes got what they deserved for trespassing on a Russian "training area." The crucial question in regard to recent events, however, is whether they were deliberate, in the sense that Russian aircraft had orders to shoot at any Swedish aircraft observed near Russian units or Soviet territory; or whether they were incidental, in the sense that the Russians shot at what-

ever aircraft were found in what they considered their own air space. It seems most probable that the second assumption is true; in other words, that these regrettable incidents do not represent a new stage in Soviet relations with Sweden, but a continuation by more violent means of the hectoring policy that has been pursued since the war, with the attempted assertion of a 12-mile limit to the territorial waters of the Baltic States, the seizure of fishing boats or their shadowing to Swedish harbours, and so on.

Self-Criticism in China

One of the principal objectives of the Chinese Communists since they have been in power has been the spiritual subjugation of the country's intelligentsia. Conditions have been different from what they were formerly in Russia, for whereas the Russian Revolution wiped out or drove into exile a large part of this class as it existed in Russia in 1917, the great majority of Chinese intellectuals have remained in China and accepted the new regime; indeed, the Communists there owed their victory largely to the alienation of the intellectuals from the Kuomintang and their confidence in the promises of democratic moderation which the Communists made for tactical purposes in the period of the civil war. But for this very reason it has been all the more necessary for the Communists to carry out a thorough subjugation of this class, for, although it temporarily inclined towards them, it retained (apart from a small number of Communists of long standing) independent, critical standards of judgment, and, if disillusioned, could become a formidable factor of spiritual resistance to the regime. During the present century the Chinese intelligentsia, consisting of writers, journalists, scientists, and university and school teachers, has largely inherited the prestige and influence of the old Confucian *literati*, and its idealism and dissatisfaction with the existing order of things have been a major factor of political instability in China over two generations. The universities in particular maintained an independent position, and police action against professors and students, whether directed by "war-lords" or by the Kuomintang, always aroused popular resentment and sympathy for the victims.

Taming the Intellectuals

The Communists, however, have a new technique for taming the literary and academic class. They do not proceed by way of direct violence, though the mass executions which have been going on in China for many months past provide a menace for ultimate application against stubborn opponents. Nor is it intended physically to eliminate large numbers of intellectuals, for the policy is to make use of them in education and propaganda, and the original men of Yenan cannot provide from their own ranks all the knowledge and ability required in this field. In order, therefore, that their services may be used without leaving them any independence of mind or public or semi-public influence in their own right, their reputations as individuals, and even their own self-respect, must be systematically destroyed. The process for achieving this is one which has been borrowed from Russia and is somewhat similar to that employed to obtain confessions in propaganda trials in Communist countries; the Chinese Communists, however, seem to have added certain refinements of their own.

Briefly, the method is that the person to be discredited, perhaps a well-known writer or university professor, is told that in order to prove his loyalty to the regime and help his country by exposing the malignant influences of imperialism and what not, he must make a public speech of "self-criticism," confessing and denouncing his former erroneous opinions and actions against the people. He is told that there is no question of a criminal charge, and that, if his self-criticism is satisfactory, he has nothing to fear. But once he has submitted to the demand for "self-criticism," he is not

going to be let off easily. What follows has been described by the eminent Chinese writer and former Ambassador to the United States, Dr Hu Shih, as "psycho-analysis in public." The audience which he must address includes his professional colleagues, students, acquaintances and others who have been compulsorily assembled to hear him; it also includes specially trained Communist party interrogators, who have been investigating his past life and making a dossier of everything which is in any way discreditable or could be represented in an unfavourable light.

The victim first makes his own "self-criticism," in which he deplores his past errors and sins, but tries to preserve for himself some credit for decency of character or good intentions. Then the interrogators get to work with a ruthless cross-examination; this is called "criticism of self-criticism." The meeting may last from five to ten or twelve hours. The victim is driven from one retreat to another until his confession reaches the lowest depth of self-abasement and degradation. He must denounce his parents, his teachers and his friends, and impute to himself the basest motives in everything he has ever done, said or written. If he resists the process, he is sent away to compose a new self-criticism to be produced at another meeting; and the performance is repeated until his confession is accepted as adequate by the party interrogators and by the audience which takes its cue from them.

"Character Suicide"

In America the term "character-assassination" is in use to describe a campaign of personal detraction and slander against a public figure. The Communist method of "self-criticism," as applied under pressure from the party both within and outside its ranks, may be described as "character-suicide." A man who has been thoroughly processed in this way cannot retain any esteem either from himself or from his fellow men for his previous life and views. He is not, however, a lost soul, because, after having thus confessed his utter worthlessness, he is now saved by the new truth which has been revealed to him. By grace of the party he can lead a new life; he has no merit of his own, but the People's Republic can make him its instrument, and he may even be appointed to a position of authority. Psychologically, it seems that a man who has been broken by "criticism of self-criticism" becomes genuinely converted; the technique exploits a sense of guilt and inadequacy which is normally latent in the unconscious mind of a human being, so that he sees himself in the light of his enforced autobiography and cannot find any spiritual refuge except in the saving doctrine which is preached to him. As a professor of Peking University recently declared:

I had been unconscious of many defects until . . . I began to realise these defects as a result of the method of criticism of my self criticism. When I realised the sharpness and effectiveness of this weapon . . . I deeply regretted that I had not learned earlier to use it.

The only alternative, in present-day China, to such self-humiliation for those marked down by the party for public example, is that taken by two Canton merchants who made anti-Communist speeches through a megaphone from the roof of a high building and then hurled themselves into the street.

Staff Troubles in Uno

[BY A CORRESPONDENT]

THE difficulties of building an international secretariat are as well known as the need for one. If Geneva came closer to the ideal than does New York there are many reasons in this divided world which make it so. None of them is much comfort to the Secretary General of the United Nations at the present moment. Mr Lie is caught between two traditional schools of thought, both as hard to reconcile as they

were in 1920. The first has the ideal of international loyalty very much at heart, thinks that the best possible men should be chosen for available posts, regardless of nationality. This school believes that when members of the secretariat fall foul of political passions in their own countries they should be defended and protected by the Secretary General with the full support of member states. The second school deeply distrusts "internationalism." For employment by the United Nations differs from employment by any other political organisation only in that the claim to transcending national interest makes it the more suspect. National interest comes first, and supranational loyalties a very bad second.

This is an old dispute, but it is at the moment by no means academic. It has blown up again in the wake of the American drive to extirpate sympathy for communism from the United States.

The *New York Times* stated that fifteen Americans in the Uno Secretariat have been dismissed or asked to resign, and that Uno plans to dismiss at least twice that number "who are suspected of having taken part in illegal Communist activities." A division chief in the Technical Assistance Administration has left under a cloud; so has an economic affairs officer. A Division Director on the ECOSOC staff, who knew both men, has been called for questioning by a Congressional Committee investigating persons suspected of disloyalty, and by a Federal Grand Jury in New York which has similar powers. The ECOSOC director's record is free of Communist connections; but so feverish is the hunt for American subversives, and in an election year so profitable, that the mere fact of being called for questioning creates a damaging suspicion.

Uno is, of course, unhappy about all this, but certain elements in the American government, supported by part of the public, have very little moral sense of the problem. The Federal Bureau of Investigation, owing much of its present power to its pursuit of Communist sympathisers, beats any bush for fresh game. They feed suspects to the Department of Justice, charged under the Smith Act with prosecuting Americans who are Communists, and under the McCarran Act with fending off any foreigner who was ever a member of the Communist party in any country.

Sensitive Morale

If, in the process, these departments thrust a heavy hand into Uno, and destroy the sensitive international morale which has been so carefully fostered, this is not their concern. They are merely doing their duty under American laws. There is always the chance that by sticking in their thumb they may pull out a vulnerable plum which will win them promotion. Since a US District Attorney successfully prosecuted Alger Hiss and was rewarded with a judgeship, the road for the ambitious in the Justice Department has been clearly marked. Their efforts are applauded by that part of the population which identifies patriotism with witch-hunting.

So far Uno officials themselves have not helped matters, having failed to announce a policy. Staff problems have beset the organisation since the beginning. The fact that these American pressures come at a time when temporary contracts are being replaced by longer-term ones is an added complication. When dead wood is being removed, a dubious twig can let it be known that the pruning is due to political pressures. The general attitude on the executive floor is one of hand-wringing and dismay. At a press conference held by the Secretary General shortly before he left for Europe, reporters tried to get some statement of policy. Would the Secretary General purge his staff under American pressures? Would he defend his staff from nationalist attacks? All such questions were turned aside on the ground that they were based on hearsay. It is understood that Uno deals officially with governments only through their foreign offices. Apparently the high command also shuts its eyes to relevant matter printed in responsible newspapers.

Shell Chemicals

Plant a seed and raise a crop . . . and Nature will quickly provide an assortment of insect pests and fungus diseases to attack it! The more effective control of these pests and diseases, and the selective destruction of weeds, are major interests of Shell Chemicals, not only to aid the professional grower, but also to help the week-end gardener who finds a deep and satisfying pleasure in 'making things grow.' For use in gardens the materials supplied to the fruit-grower and market gardener are not always suitable in their original form; Shell therefore introduced Shell Garden Sprays specially for the amateur. These products have been designed for simple application and quick results, out-of-doors and in the greenhouse. Whether it be greenfly on the roses, maggot in the peas, 'big bud' in black currants, weeds in the lawn — the busy amateur can now tackle them and their kind with ease and success.

Gardeners may obtain a useful Spraying Calendar free on request to

WHEN IT'S A QUESTION OF TIME...

closing the gap...

Some said, when mass production came into its own, that something vital went out of industry, that means would have to be found to close the gap between Management and Man. Means have been found. Today, through Internal Broadcasting, the voice of Management can be heard instantaneously, by every worker, in even the farthest parts of the works. Thus is encouraged that happy atmosphere in which production can thrive. T.R. Internal Broadcasting can also provide speedy staff location, music for workers and time signals, all essential to modern industrial efficiency.

Today's need for maximum output has an increased demand for T.M. Service — Internal Broadcasting, Time Control, Staff Location and Internal Telephones — that new installations can now be undertaken only in organisations engaged upon work of National Importance.

This ostrich attitude may be convenient at the moment, but it is full of perils for the future. The dangerous pattern of American political persecution has by now become clear enough. Certain reformed Communists confess their sins and make lists of people with whom they have associated. Close or casual, these associations are then examined, and the process of examination in turn widens the circle of suspicion. If the victims work for an organisation its whole structure may be made to appear riddled with Communism, and all confidence in it destroyed. The obvious example is the State Department, an organic part of the American government. Had it not been for the staunch and forthright courage of Secretary Acheson and President Truman, the damage done to the department by this kind of persecution would have been much worse. As things are, the smear campaign is still effective enough to prevent State from rescuing the United Nations staff from attacks by Justice.

Uno, though it has headquarters on American soil and derives much of its power from American support, is much less well grounded in American life than the State Department. Not mentioned in the American constitution, only seven years old, and subject to partisan criticism from birth, it has still to win the kind of solid acceptance which is given to the state house and the city hall. Communist nations are among its foundation members—one more source of suspicion for the unthinking. These nations quite properly have their quota of citizens employed in the secretariat. Thus the prevailing doctrine of guilt by association, if not firmly checked, by the Secretary General, could implicate every American who meets foreign Communists in the corridors, sits beside them in the cafeteria, or huddles with them in the doorway when a storm blows up. To sensible people this sounds absurd, but zealots and professional informers are offered a happy hunting ground.

Pressures from Outside

These matters directly concern the American members of the secretariat, but indirectly they affect the morale of the whole staff, and the delegations dependent on their work. They may imperil the whole American relationship with Uno. They may also make it harder for the Secretary-General to withstand other pressures from other countries where political passions run higher and change more frequently than in the United States.

What is obviously needed is bold clarification of the issue, and a stiffening of spines in the office of the Secretary General. If he does not know what to do, it is time his advisers told him. Mr Lie is, after all, the agreed choice of some sixty chancelleries. Because his continuance in office has been uncertain since he fell out of Soviet favour, he is more than ever in need of counsel and support from experienced member nations. If Britain and France, to name only two, could frame with Mr Lie a policy that would be both firm and fair they would strengthen the position of tentatively interested Americans, who in turn have their own troubles.

Some countries can afford to make relations with Uno a routine foreign office matter. But the United States government must canvass wide public support for the organisation. The country is not a monolith. A great wave of public emotion liquidated an isolationist past and carried America into the United Nations. That feeling is still latent, and can be enlisted to block the isolationists and extreme nationalists who distrust and would destroy all international co-operation. But the friends of Uno must insist upon a positive policy to meet the crisis. If they are given only fuzzy statements of high principle by the secretariat they can hardly be expected to leap to the alarm bell. The honeymoon which followed this multiple marriage of nations is now long over. They are in their new home and starting out on the work which will either lead to lifelong union or divorce. One of the first needs is that the staff should settle down and straighten out its allegiance for good.

Belgium and the E.D.C.

[FROM OUR CORRESPONDENT]

SOME insight into the difficulties of devising the constitution of a united Europe can be had from looking at the issues which troubled Belgian minds while the treaty for a Defence Community was in the making. Belgium is a small country, which has, on the face of it, much to gain from international co-operation, whose politics are exceptionally stable, and whose government is exceptionally homogeneous. None the less, it has its doubts and backward glances about taking a new step towards the unification of Europe. For it has its historical tradition, its somewhat complicated constitution, and a population whose long-standing opinions about international relations are not changed overnight. Above all, the Belgians are sceptical about the attitude of the grand partners in this new alliance, France and Germany. They note and remember that neither country has welcomed the defence treaty with open arms; and they strongly suspect that, the immediate effect of the treaty far from producing new strength, may well be to precipitate internal unrest.

The Belgian position is most easily understood by examining the particular points on which their interventions in the negotiations were concentrated. It was the questions of the period of military service, and the size of the national defence budget which meant most to the Belgian public. Their military service is now fixed at two years, a term dictated by the effective military strength required to fulfil Belgium's obligations to Nato; but it is longer than the term accepted by its allies. The Belgians dislike this inequality of effort and have firmly announced that they will adapt their present term of service to the period finally agreed by the Council of Ministers for the Defence Community as a whole—which would probably mean reducing it. From the first, the Socialists have opposed a two-year term of service, and if the government changed its mind the effect on public morale needs would be considerable.

The problem of national defence budgets is of direct importance mainly in its effects on the parliamentary parties, particularly as its solution may involve some breach with the traditions and working of the constitution and parliamentary routine. This is the real reason why the Belgian delegation to the EDC talks insisted so firmly on the supremacy of the Council of Ministers in budgetary matters. From the first they argued that the approval of the defence community's budget must be by unanimous vote of the ministers, and thus in effect decided on an international, rather than supranational desire. In this way the Belgians hoped to preserve the maximum control by the national parliament and executive over the financial obligations of their country to the new community.

It is too early to predict with any certainty how the currents of opinion will flow in the future. Some idea of them can, however, be gained from the recent debate on the Schuman Plan. One of the most notable features of this debate was the behaviour of the Socialists. In the senate, they had abstained ; on the vote in the chamber, taken on June 12th, they voted solidly in favour and followed the impassioned lead of M. Spaak. The result was 165 votes for 13 against and 13 abstentions. Chief among the absentees was the president of the Chamber himself, who remained to the last unconvinced that the treaty did not contravene the Belgian constitution, and who feared the consequences for the parliamentary regime of so startling a step towards international co-operation.

Yet the lesson of this debate is encouraging. In each political party inside Belgium there are to be found both the friends and the foes of a united Europe. But when it came to the test, in the final debate on the Schuman Plan, the friends of Europe succeeded in carrying with them a very large proportion of parliament in the face of numerous reservations by many distinguished speakers.

THE BUSINESS WORLD

Tools for the Land

THE Royal Show closed last Friday week—if not in a blaze of triumph, then at least in a modest glow of success. The Royal is the highlight of the farming year, the biggest agricultural show of its kind in the world. It opened on July 1st under two handicaps; the West country site was beyond the reach of numbers of regular visitors, and the risk of foot-and-mouth disease caused the cancellation of all the livestock exhibits except for such show attractions as horses and bees. For these reasons, the 93,318 paying visitors, compared with the 131,333 who went to Cambridge last year, represented the lowest attendance since 1938; but this response, in such circumstances, affords a remarkable measure of the box-office value of the machinery industry that was left to provide the principal magnet for visitors.

This is an industry that has grown out of all recognition since the war. Its growth is in one sense the inevitable consequence of the increased prosperity of British farming and of the high wages that are forcing British farmers to use machines as a means of saving labour. But, in a more technical sense, the development owes much to the new blood that came in with the entry of motor manufacturers, Standard and Nuffield, who joined Ford in spreading ideas of standardisation and mass production in an industry too long inhibited by the fetishes of designing for local soil requirements. It owes, perhaps, most of all to the aggravating but inevitably stimulating personality of Harry Ferguson who, by making a success of his own business, has driven his competitors, in self-defence, to make a success of theirs.

The best measure of the growth is in the figures for production of tractors. From a modest 10,000 tractors in 1938, the industry has expanded to a point where it produced 137,000 tractors last year. Production in the first four months of 1952 has been running at an annual rate of 133,000, but this slight decline is mainly due to shortage of materials. The output of farm implements is not so easy to measure, but the combined value of all British-made implements, from ploughs to combines, rose from £25.5 million in 1948 to nearly £39 million last year. Comparable figures by value are not available for earlier years; but it is known, for example, that the number of ploughs produced has risen from 150,000 in 1938 to 800,000 last year. Output of combine harvesters has, of course, much surpassed this rate of growth; at 17,000 last year, it had almost doubled in three years.

Farmers have spent more freely on machinery than they did before the war, but their purchases have by no means kept pace with the rise in output. The industry has been able to expand on such a scale only by looking abroad for a large part of its market. It has been greatly helped in its search by the dollar shortage. The names of American and Canadian manufacturers such as Allis-Chalmers, International Harvester and Massey-Harris have an international status. But large portions of the

world markets have been closed to them, except in the rare cases where particular types of machines cannot be supplied from a non-dollar source. Yet some of the dollar-starved countries are beginning to mechanise their farming on a scale inconceivable by British standards.

The prospect of developing these world markets in the absence of North American competition has made it possible for tractor manufacturers to put down production lines capable of turning out 200 to 300 tractors a week, a scale of investment that could never have been justified on the strength of the home market alone. Of the 137,144 tractors produced last year, 112,577 were sold abroad, and exports have continued to rise; although the Australian restrictions during the first four months of 1952 may reduce the total for the year, overseas sales have been running at an annual rate of 123,600. The value of these exports last year amounted to £41 million. Nearly half the total number went to the sterling area, 8 per cent to the American continent, and 43 per cent to the rest of the world. In the first four months of 1952, sterling area exports dropped to 37 per cent of the rising total and American sales also fell, to less than 6 per cent—so that sales to other countries accounted for more than 57 per cent. This increase in non-sterling sales has occurred at a time when the pattern of exports of other vehicles has been moving in the opposite direction; for this reason the allocations of steel to tractor manufacturers were not cut with anything like the same severity as those for cars and commercial vehicles. Exports of implements have not risen in the same proportion. They meet more severe import restrictions than tractors, but have increased in value from £5.8 million in 1948 to £12.4 million last year and should rise this year to about £18 million.

To put these figures in perspective, it should be noted that production and exports of tractors last year were barely one third as much as the production and exports of cars. But there are only two big tractor makers, Ford and Ferguson, compared with six big motor manufacturers. The concentration of tractor production in the hands of these two companies has had far-reaching effects on the industry, and on the companies themselves. Until the arrival of Harry Ferguson, tractors were used on what can best be described as the "iron horse" principle, that is, the tractor pulled the implements that formerly had been pulled by the horse. Ferguson designed a method of coupling implements directly on to the tractor, with a hydraulic system to lift the tools out of the ground when the tractor turned at the end of the field. This has several practical advantages, but the most important is that it becomes possible to do much the same work with a less powerful, and therefore cheaper, tractor. Ferguson never mass-produced his own tractors and implements; instead he contracted to have them

built on a fixed-profit basis by companies with mass production facilities. His agreement with the American Ford Company was broken at the end of the war; and its legacy was the law-suit for patent infringements that dragged wearily on until last summer, by which time the principles of the disputed patents were in general use. The tractor industry has, in fact, copied Ferguson's idea of direct-mounted implements, but has not followed his methods of doing business. He now has a manufacturing arrangement with the Standard Motor Company that suits both parties admirably. Ferguson gets the benefit of Standard's beautifully equipped Banner Lane factory, while the motor company benefits from certain production economies (such as the use of the same engine for the Vanguard car as for the tractor) and also acquires an insurance against the vicissitudes of the car market without having to enter into any of the complexities of tractor distribution. The Ferguson implements (as distinct from tractors) are being built by a number of engineering companies that have, like Standard, no direct connection with farming.

The Ford Motor Company, which has been building tractors at Dagenham since the mid-twenties, has had to travel part of the way along this same road. When the new Fordson tractor was unveiled last winter, a range of "Ford-approved" implements was also announced. These are implements built and marketed by established implement manufacturers but designed specifically to operate with the new Fordson and its particular system of direct mounting. This makes it almost certain that a farmer with a Fordson will buy the specified implement, and it takes some of the sales responsibility from the implement manufacturer, who also benefits directly from Ford sales and Ford advertising. But not all mechanised farmers have either a Ferguson or a Fordson, nor do they all like direct-mounted implements. Farmers are characteristically suspicious of "new" ideas (novelty might wear off after 20 years) and are not over-anxious to pay an additional £90 odd for a tractor's hydraulic system. Therefore, although the chosen implement makers have welcomed the agreements offered by Ford, they are taking pains to emphasise their independence and their ability to supply implements for any tractor, British or American, and any system of attachment.

Meanwhile, at a small factory at Leamington, Ford is building a narrow range of the most essential implements, such as ploughs and disc harrows. These Ford-built implements are simple, standardised tools, giving a long production. Farmers who want fancy ploughs must go to specialists such as Ransomes, Sims and Jefferies, who will offer them a choice of ploughs ranging from one to six furrows, shallow ploughs, deep digging ploughs, reversible ploughs and disc ploughs of various sizes and depths, ploughs for crawler tractors, for medium-sized tractors, horticultural tractors—and horses. One result is that Ransomes are working under all the disadvantages involved in short runs and the need to carry heavy stocks of spares. But they have an international reputation as plough builders and can sell them in every market of the world, with the possible exception of the American continent. The same cannot be said of either the Fordson tractor or the Ford plough; but the specialised implement makers must sometimes wonder whether the game is worth the candle.

The Nuffield tractor has never been produced on a

scale comparable to that of the Ford or Ferguson, although many experts believe that it could have captured a much bigger share of the market than it has done. In many ways it was more attractive than the old Fordson (though the new Fordson has eliminated most of these differences). But Nuffield went into the farming market without Ford's experience in tractor distribution or Standard's freedom from marketing problems, and this could have been the Nuffield tractor's main handicap.

The medium-sized David Brown tractor, together with its full range of implements, is built by a company with extensive engineering resources, so these problems do not arise. The scale of production, however, does not compare with that of Ford or Ferguson. Together, these four medium-powered tractors, all of them less than 50 horsepower, accounted for 113,000 out of the 137,000 tractors built in this country last year. The balance was made up of the heavier tractors built on a very limited scale by companies such as Massey-Harris and Marshalls, and again David Brown. To this total of agricultural tractors should be added another 40,000 horticultural tractors, of 10 horsepower and less, that are extending mechanisation to market gardens, orchards and vineyards.

The British implement industry has been mainly concerned with providing the actual tillage implements, the ploughs, harrows, mowers, dairy equipment and threshing machines without which the land cannot be farmed. Competition is intense, and each company can safeguard its goodwill with home and foreign buyers only by making concessions in design to what the farmers believe are the requirements of their own district. The strongest companies have, like Ransomes, tried to overcome some of the overwhelming drawbacks of diversified design by mechanising the earlier stages of production, since implement assembly itself defies full mechanisation. To this end Ransomes opened three years ago a fully mechanised central foundry that serves all the company's assembly plants.

In recent years a new element has crept in. Farm labour has become too expensive to be used to man-handle crops or seedlings or manure or potatoes, and farmers are being obliged to use machines that contribute nothing in themselves to good farming but simply apply factory principles of mechanical handling to farm operations. The combine harvester is one such machine, another is the pick-up baler. It is no exaggeration to say that these developments have caught the British industry unawares, with the result that the non-dollar world's requirements have had to be met first by imports from the United States and Canada, and now by the output of factories opened in Britain by American and Canadian manufacturers. The three North American companies now establishing themselves

British Insurance

The annual survey of British Insurance will be found on pages 129 to 140 of this issue of *The Economist* and on pages 29 to 37 of the *Records and Statistics Supplement*.

in Britain—Massey-Harris, Allis-Chalmers and International Harvester—are likely, as a result of this move, to turn out to be the British industry's most serious competitors. They are concentrating production for the time being on implements such as combines and balers that are made, if at all, only on the most limited scale by the British industry. But each company has a complete and highly reputed range of tractors and implements, several items of which are in production here. All three were showing tractors at the Royal that are, like the International Harvester "Farmall," directly competitive with the British designs.

The plans of these overseas companies have been held up by the shortage of materials and restrictions on building, but within the next two years they will each be bringing large new factories into production. The prestige of American and Canadian machinery is high, both here and abroad, and if these companies can overcome the handicap resulting from the dollar poverty of potential customers, by producing their implements in the sterling area, it seems inevitable that they will recapture some of the foreign, and even of the British market, where the British industry has enjoyed near-monopoly during the past seven years. It is not easy to forecast the consequences of this competition ; but if, as seems likely, the farming market has reached the peak of its expansion, an increase in the number of producers surely means that someone will suffer.

This must happen if farming techniques remain unchanged, but there is a possibility that the process set

in motion by Harry Ferguson may be carried to its logical conclusion. Just as Ferguson made the tillage implement an integral part of the tractor, so some engineers are now beginning to think in terms of power-driven implements. Today, some combines are towed by tractor, some move under their own power. The former type takes two men to operate it, a tractor driver and a combine operator. The latter could be managed by one. It is not clear how far this principle can be carried, already farming is threatened with over-capitalisation,

PRODUCTION OF FARM IMPLEMENTS (£ Million)				
	Tractors		Machinery	
	Home	Export	Home	Export
1948.....	3.15	19.9	19.62	5.8
1949.....	10.79	17.35	19.23	6.0
1950.....	11.46	28.3	22.55	8.6
1951.....	10.65	40.9	26.46	12.4
1952 (provisional).	—	37	—	18

and many costly implements are used for only a few days out of the 365. The methods of working through contractors, farming syndicates or co-operatives are all possible ways of avoiding this risk, but none of them is ideally suited to farming requirements. Like the farmer, the farm machinery industry does not respond easily to changes, but high and rising labour costs make the acceptance of these new ideas inevitable if the machinery industry can devise a way of putting them into practice. If it does not do so, a second Harry Ferguson will.

Business Notes

Markets' Midsummer Dream

The tormenting fears that lately gripped the markets seem to have given place to a midsummer dream that is still casting its magic ahead. Since June 24th, when the industrial share index of *The Financial Times* reached its worst since 1949 (at 103.1) and many gilt-edged stocks dropped to their lowest levels for twenty years, a better tone has spread through Throgmorton Street. During the past week the improvement has become still more apparent, especially in the equity markets. The origin of this kindly spell seems to have been the calming of the fears widely entertained, particularly overseas, that the "hump" of the strain on the reserves, long supposed to be located at midsummer, might not be surmounted without a new upheaval. As Mr Butler has lately tried to emphasise, it was never reasonable to assume that the passing of this particular point would mean that the lights would all be set at green on the road ahead. But the widely held view abroad that the end-June experience might be the signal for a new devaluation of sterling or for a "freeing" of the exchange from its parity had certainly caused a wide "short" position in sterling. As a subsequent note records, the covering of part of this position has now produced a sharp rally in sterling. This in itself, as well as parallel reasoning by investors, has had its reflection in Throgmorton Street. The markets, in more senses than one, have lost their hump—for the present at least.

In the industrial markets, where the connection between sterling's fate and transfers of manpower to essential industry is obviously no better understood than by the public generally, the spell has been made to look more kindly still by the signs of incipient revival in retail trade and in textiles and by the decline in total unemployment. Such influences as these had by Wednesday last impelled the industrial share index up to 108.5, a gain of nearly 3 points on the week and one of over 5 points since midsummer. In gilt-edged the movement has been less pronounced this week, but prices are now well above their worst levels—generally by at least a full point in the longer stocks.

The opportunity offered by this better mood has been promptly presented to Australia for the launching of its long-discussed refinancing of the £11,789,000 of 3½ per cent stock, 1950-52, that matures on September 15th next. Underwriting was arranged on Wednesday, and the cash lists will open and close on Tuesday next, for an issue of 4½ per cent stock, 1960-62, offered at 98 for both cash and conversion applications. The redemption yield of 4½ per cent offers a small turn beside the nearest comparable Australian Government securities in the London market, but the tax-free redemption ingredient is naturally much less, since Australia had of course long since converted all those dear issues of the twenties and early thirties that carried coupon rates of 4½ per cent or more. Australia's position now is certainly in marked contrast to that of the days when relief was being given to Britain by repayments of sterling loans, by gifts from sterling balances and by the rapid expansion of these balances themselves. At their peak last summer they stood at £700 million; they are now stated to have "grounded" at what is regarded as the rock-bottom level of £240 million. There is ample demonstration here of Australia's need to cut sterling imports more severely than dollar imports. Meanwhile, in the twelve months to end-June, the Commonwealth's dollar trade showed a deficit of £30 million; in the main phase of the wool boom, the eleven months to end-May, 1951, there was a dollar surplus of £68 million. The new dollar loan from the International Bank, discussed in a later note this week, will span only a small part of this wide difference.

Rally in Sterling

In the early part of this week sterling made a striking rally in the foreign exchange market though by no means all of it has been held ; some appreciable net gains were achieved. This is notably true of the rate against the Canadian dollar, which from last week's low point of \$2.67½ has recovered this week to \$2.70¾. The rate of sterling against the US dollar moved from \$2.78¼ at the close of last week to \$2.79½ touched on Wednesday, but subsequently dropped back to \$2.78¾. A number of factors help to explain these rather sharp movements. There can be no doubt that a certain volume of bear covering has taken place. In North America, and particularly in Canada, rumours of a devaluation or freeing of sterling by June 30th, or soon after, had been rife for some weeks past and speculators had taken appropriate positions. When the June 30th "hump" and the statement on the gold reserves were passed without verifying these predictions, some of the speculators tended to run to cover. This probably explained the sharp reaction in Canadian dollars. The Canadian dollar has also weakened appreciably against the US dollar in the past few days. From a rate of 104 touched last week, it has weakened to 102.90.

The sharpness of the recovery of sterling in the earlier part of this week suggests that certain special transactions were involved; the covering of speculative positions may well have been reinforced by operations of a more official character. The temporary character of the influences that caused the sharp recovery of sterling at the beginning of this week was revealed by the set-back in terms of the US dollar that became apparent on Thursday. Transferable sterling remains remarkably strong and has been quoted up to \$2.66 this week. At this figure it is at a discount of less than 5 per cent under the official spot rate. This hardening of the rate is the combined effect of a slower rate of creation of transferable sterling supplies now that Britain's deficit with Western Europe is settled as to 100 per cent in gold and of increased demand following the steady improvement in the technique of using transferable sterling in international trade.

More Light on the Dollar Deficit

Not content with having made two separate statements on the state of the gold and dollar reserves in June, the Chancellor of the Exchequer, in answer to a Parliamentary question at the end of last week, gave some significant supplementary explanations that affect some of the deductions based on the earlier information. In his latest statement Mr Butler has not only shown the distribution of the gold and dollar deficit between each of the months in the quarter, but has allocated to each of these the amount of defence aid received from the United States. The relevant information can best be shown in the following table:

	\$ MILLION		
	Gold and Dollar Deficit	US Aid	Change in Reserves
April	63	25	-38
May	65	81	+16
June	88	95*	+7
Quarter's Total..	216	201	-15

* \$96 million of Military Aid, less \$1 million refund of previously received ERP Aid.

This information, it will be seen, departs in an important respect from that given on June 12th, when the Chancellor stated that some \$100 million of defence aid had been received since March 31st. His subsequent announcement that \$202 million of defence aid had been received by the end of

June naturally led to the deduction that about \$102 million of this was received in the last eighteen days of June. Relating this to the already published figures of gold lost to EPU, it seemed to follow that over this period of 2½ weeks about \$45 million was lost by the Exchange Equalisation Account in bridging the gap between the supply and demand for dollars in the exchange market or in meeting official requirements outside the market. In the light of the amended information, however, the position would not appear to have been so serious as this. Defence aid in the whole of June amounted to \$96 million, and exceeded the payment to EPU by \$49 million. Since the gold reserve rose by only \$7 million, the loss by the Exchange Equalisation Account for the above purposes must have been \$42 million for the month as a whole.

During the interchange in Parliament last week, Mr Gaiskill took the same point as that made in these columns: he complained that the Chancellor was treating the gold and dollar "deficit" as the net loss of gold, i.e., only \$15 million during the quarter, and pointed out that it would be more correct to say that the deficit in this quarter was \$216 million, since the American aid ought to be excluded (as, indeed, it had been in previous official statements). The authorities have now, in effect, conceded the point. It would obviously be foolish, as well as misleading, to try to treat defence aid in this respect differently from Marshall Aid. In any case, though the defence aid received during the past quarter actually applied to many commodities, including steel and copper, that may have had a direct use for defence, some of them will obviously not be used thus directly. A hopeless tangle will be caused in the statistics if any attempt is made to exclude from the gold and dollar deficit items covered by Mutual Security aid—except the tanks, guns and military aircraft that are provided directly under that aid and presumably do not figure in the returns of overseas trade.

The apple and the downfall!

It happened when he reached out too far for a large apple and came down from the tree with an almighty crash! He couldn't walk again for months, but the accident taught him something. Lying in bed while his business expenses mounted, he learned the true value of his 'General' Personal Accident Policy.

Peace of mind costs very little

£4 a year covers business and professional men for £10 a week accident benefit (and pro rata). Similar attractive rates for other occupations.

It's worth while finding out more about this and other benefits of the 'General' Personal Accident Policies—just send the coupon.

Less Unemployment

For the second successive month, total unemployment in Britain has declined. But whereas between April and May the drop was merely a few hundreds, the June figures record 27,400 fewer people out of work than a month earlier. Some reduction is usual in these months, particularly because of seasonal falling-off in unemployment among agricultural workers. But, until May, mounting dismissals in the textile industries were dwarfing all other movements. The significance of the June improvement is that textile workers shared in it—the first drop recorded since the textile slump began some eight or nine months before.

This does not imply that the textile depression is over. A decline over the month of 6,000 in textile unemployment shrinks somewhat in importance when 136,700 are still workless in these industries, but since there was a sharp rise of 5,700 in the number out of work in the jute industry, the improvement for cotton workers alone may have been greater. Some workers may have transferred to other industries, but

it is unlikely that this movement has been suddenly accelerated. It looks, rather, as if the tide may just be on the point of turning for the cotton industry. On the other hand, 3,700 more people were out of work in the clothing industry in June than in the previous month, mostly in the tailoring section of the trade.

Outside the textile and clothing industries, 102,000 more people were out of work in June than at the same date last year. But then postwar unemployment was at its lowest point and was fantastically small by any standard. Looking back two years and again excluding textiles and clothing, 281,700 people were out of work in June, 1952, compared with 265,300 in June, 1950—an increase of only 16,400. Fewer men had been workless this June for any length of time, even when textile workers are included. These comparisons show the extent to which unemployment troubles are still confined to the textile and clothing industries. It is still the numbers temporarily stopped or out of work for a week to two that are most swollen. And, although numbers working short time in manufacturing have been increasing and reached 304,000 in May, there were still 1,159,000 working overtime—nearly as many as were doing so last September.

The Banks' Investments Depreciation

The first two of the half-yearly statements from clearing banks have come, as an agreeable surprise. It is well known, and indeed is obvious, that the further sharp fall in gilt-edged during the half-year involved all the banks in paper losses (quite apart from cash losses on investments realised) that have made additional heavy demands upon inner reserves already severely depleted by the heavy fall in the market during 1951 and in earlier postwar years. The two "northern" clearing banks, Martins and the District, have, however, succeeded in presenting half-year-end accounts that show their investments still valued, in the traditional way, at "under market value" and yet have avoided any drafts upon their published reserves. In the half-yearly statements the balance of profit and loss account is, of course, merged in "deposits and other accounts," so that it is not possible to ascertain whether the provision for investment depreciation has affected this portion of the total of disclosed reserves. But, in any case, the achievement is heartening, for, when the change of monetary policy occurred last autumn, both these banks were carrying investment portfolios that represented a higher proportion of their deposits than the average proportion for the clearing banks as a whole. Martins' excess over the average was only slight, but the District's investment ratio, at 30.5 per cent, was more than 5 per cent above it.

The accounts of these two banks should not be regarded as indicative of the pattern to be expected in the accounts of the "Big Five" banks that will be published in the middle of next week. It is generally understood that, after joint discussions of the problem, most of these banks will depart from the traditional practice of showing their investments at or under market value. The valuation basis is likely to be "at or under cost"; and the extent to which this diverges from market value will be indicated by a supplementary note on the accounts. Another interesting departure that is expected is a joint statement from the banks explaining to the public the reasons for the change in the form of the accounts. One of the five banks is expected to adhere to its traditional formula.

Australia Gets the Dollars

Mr Menzies' visit to Washington put the finishing touches to the long discussions that have been proceeding for the grant of a further loan from the International Bank for Reconstruction and Development to the Government of Australia. It was announced this week that the new loan will amount to \$50 million. It will be for a term of twenty years and bear interest at 4½ per cent, including the 1 per cent commission that under the Bank's Articles of Agreement is allocated to a special reserve. This is the second loan the International Bank has made to Australia. In August, 1950, a loan of \$100 million was made to finance capital development. About two-thirds of that loan has been disbursed; the balance will have been spent by early in 1953. The new loan for \$50 million will help to carry forward the development programme well into 1954. It is reassuring to learn that about one-third of the new loan will be used for development in the coalmining, iron and steel and electric power industries and in railway and road transport development. The balance will be used mainly in increasing the production of non-ferrous metals and for "other industrial development." The International Bank points out that development will be carried out in industries that are directly related to basic economic activities such as agriculture, transportation, fuel and power, and in industries that can produce hitherto imported goods on a competitive basis. At a time when Britain and the rest of the world urgently need food, when Australia is

setting up secondary industries that have to be protected behind tariff walls and is vainly contending against the drift of population from country to the towns, these assurances concerning the outlay of the Bank's loans are welcome.

The loan will provide the Commonwealth with foreign exchange with which to pay for some of the import of capital goods needed for these programmes. The proceeds of the loan will be "untied"; in accordance with the Articles of Agreement of the Bank, Australia will be free to use the dollars to finance imports from any part of the world, including the rest of the sterling area. If, therefore, Britain can tender competitively for the capital goods in question the results of this operation should be an accretion of the gold reserves of the sterling area. The domestic expenditure involved in the development programme will, as heretofore, be financed in Australian pounds, partly out of public funds and partly out of the savings of business enterprises and individuals.

Confidence in Coal

The Minister of Fuel and Power was able to give the House of Commons a far more encouraging picture of the country's fuel supplies than seemed likely early in the year. His present confidence is based on a complete change in the labour situation at the mines; whereas, last winter, the Coal Board expected to show a net loss of 10,000 men this year, and a consequent loss of a critical 4½ to 5½ million tons of coal, manpower has in fact increased by 23,000. A high proportion of these new recruits are boys, and all of them will need at least nine months training. But they make it reasonable to expect that production will reach about 226 million tons this year, compared with 223 million last year. Whether this figure is in fact reached depends very much on how rapidly these new men can be absorbed. The immediate effect of their recruitment is to a drop in output per shift—it is down to 1.19 tons compared with 1.21 last summer—as experienced workers are taken off existing faces to open up new ones. This fall in productivity has not been, and cannot be, fully allowed for in the production estimates.

Mr Lloyd estimated that the expected increase in output should make it possible to raise coal exports this year from 7 to 12½ million tons, bringing in about £60 million in foreign exchange. He did not say, however, how far this prospect has been opened up by the drop in inland consumption that has taken place this year. While production during the first 26 weeks has risen from 112.9 million tons in 1951 to 114.4 million tons this year, inland consumption has fallen from 108.5 million to 106.7 million tons, owing to a combination of fine weather and local unemployment. It is this, as much as the extra labour, that explains why "production is up—not as much as we should like but still up; stocks are up still more, and exports are up still more than that." Total exports for the year to June 28th were 5.4 million tons, compared with 3.3 million in the corresponding period last year.

Not all the fuel industries appear to expect home consumption to remain lower than it was last year; a 10 per cent reduction in electricity consumption has again been recommended during peak hours this winter, when unrestricted demand reaches 14 million Kw. On Monday Mr Lloyd gave more information about the methods of getting electricity to the consumer than he did about actual supplies. The new 275,000 volt grid, eventually to be raised to 400,000 volts, will be the means of linking power stations built on the Midland coal fields with electricity consumers in the south, which will both cut the tonnage of coal that has to be carried from north to south by the railways and make it possible to burn in the power stations low-grade coal that does not justify the cost of transport.

Rubber Earns Fewer Dollars

If the experience of rubber is typical, the sterling area's dollar earnings from commodities have been sharply reduced this year. Earnings from rubber during the first six months probably amounted to only \$100 million—or about half the total for January to June, 1951. Only to a relatively small extent was this decline due to a fall in the actual quantity of rubber exported; the main cause has been the steep decline in prices. In the first five months of the year 145,000 tons of rubber was exported from the Commonwealth to the United States, compared with 170,000 tons in the same period last year. Exports from Malaya (including re-exports of Indonesian rubber) fell particularly sharply during April and May, but this fall was partly offset by an increase in sales from United Kingdom stocks earlier in the year.

Part of the decline in Malayan exports to the United States was probably due to the drop in re-exports of rubber from Indonesia, Sarawak and Siam. A large part of the output of these territories is usually sent to Malaya for processing before being re-exported. Indonesia supplies most of the rubber for this triangular trade, and much of it is smuggled out to avoid payment of the export duty. This illicit trade has fallen sharply this year, because since February the Indonesian exchange regulations have given a much stronger incentive to direct dollar exports; though these exports already showed a substantial increase in the first quarter of this year, when they reached 75,000 tons (compared with only 17,000 tons in the same quarter of 1951).

Rubber output in Malaya and Indonesia is declining because of reduced tapping by the smallholders. The fall in production has been most marked in Indonesia, where output this year has reached only 360,000 tons compared with some 440,000 tons in the first half of last year. Although estate production increased by 50 per cent over its 1951 level, smallholder output fell by one third. In Malaya total output has fallen from 308,000 tons in the first half of last year to 280,000 tons this year. Estate production was virtually unchanged, but smallholders' output fell by about 15 per cent. World production is also falling, and up to June amounted to 850,000 tons, compared with 972,000 tons in the same period last year. Consumption, however, has fallen less steeply—from 805,000 tons in January to June, 1951, to 750,000 tons this year. Purchases for the stockpile are believed to have reached 200,000 tons. Indeed, American stockpiling this year (despite earlier pronouncements to the contrary) seems to have been as heavy as it was twelve months ago, and has been more than sufficient to absorb the surplus output. These figures explain the present steadier tone in the market. If it continues, it should help to arrest the alarming drop in dollar earnings.

Copper Rises Again

The British price of copper rose again last weekend, when the Ministry of Materials increased its selling price from £281 to £287 a ton. The reason given for this latest rise is that it "follows the conclusion of a further round of negotiations between the Ministry of Materials and the Commonwealth suppliers." This is, apparently, only another stop-gap measure, for the Ministry and the suppliers are to meet again to discuss future pricing. The new price is equivalent to 33½ cents a lb for electrolytic copper in New York and it is still below the so-called world market level. If anything, prices in the New York market have hardened during the past week or so, and 35 cents a lb is no longer merely a vain hope of the Chilean producers. According to some market reports, this price has already been paid for significant quantities.

The events of the past two months have shown up the defects of government trading. Nowadays British buyers must either be content to buy all their supplies "spot" or, if they wish to buy forward, they must foresee not only the

trend of the market but also the mental contortions of departmental officials, for the Ministry in recent weeks has vacillated from one policy to another. If private trade in metals cannot yet be restored, then the Ministry of Materials should at least make it clear how it intends to fix its prices, and then stick to that policy. It would be better to follow a quotation of an American journal than to have these constant negotiations with producers, which often leave both sides dissatisfied. Now that the Northern Rhodesian copper mining companies have agreed to pay a higher price for coal from the Wankie mines—they are to pay the same price as consumers in Southern Rhodesia, actually 14s. 3d. a ton f.o.r. Wankie—they may be more anxious to receive the "world" price for their copper. But production costs for copper, as a result of the increased cost of coal, are expected to rise by only 4s. 6d. a ton.

* * *

Blue Riband Economics

The new passenger liner *United States* made history on her maiden voyage by this week crossing the Atlantic between Ambrose Light and Bishop Rock in 3 days 10 hours 40 minutes, at an average speed of 35.59 knots. The fastest previous passage was made by the *Queen Mary* in 1938, when she took 10 hours 2 minutes longer to do the same crossing at an average speed of 31.69 knots. The difference between these two performances is some measure of the technical progress that has been achieved in shipbuilding and marine engineering in the intervening years. Both vessels are quadruple-screw turbine steamships, but to achieve her speed the machinery of the *United States* does not develop as much shaft horse power as the *Queen Mary* (believed to be in the region of 200,000 h.p.); it has been housed in a much smaller hull, together with accommodation for nearly the same number of passengers and crew. A significant feature of the design of the *United States* has been the incorporation of some 2,000 tons of aluminium alloy in her superstructure and interior fittings, so the total displacement is probably little more than half that of either of the *Queens*. It is principally this relationship between weight and dimensions that accounts for the remarkable speed of the *United States*. Her actual gross tonnage is 53,330, compared with 81,237 for the *Queen Mary*.

The question of speed for a passenger liner cannot, of course, be considered apart from the economics of operation. Speed is the most expensive factor in the cost of a ship, first because of the initial installation required to produce it and the sacrifices of cargo space or passenger space that that involves, and secondly because of the heavy consumption of fuel that it entails. It is open to question, therefore, whether the speed of the *United States* is a commercial proposition, particularly in view of the fact that sea transport cannot hope to compete with air transport in the matter of speedy transit. The *United States*, on the other hand, has been deliberately designed for use as a troop transport in wartime, and in that role she will be able to carry 12,000 troops at speeds of probably up to 40 knots; during the war, it will be recalled, the *Queens* each carried some 15,000 troops at uneconomic speeds. It is for these "defence features," of which speed is among the most important, that the United States Government has contributed no less than \$42 million, including the so-called "shipbuilding differential subsidy," to the total of some \$70 million that the vessel cost.

The fact remains that the entry of the *United States* into commercial service on the North Atlantic raises the thorny problem of uneconomic competition. Built largely with state funds, the *United States* is being operated by a company that also receives an "operating subsidy," in competition with British and other foreign companies that are in the business to make a living by paying their way—and, incidentally, to earn much-needed dollars. The strategic arguments in favour of the *United States* are strong, but her

Look on the railway

... or on the roads

... you see DURALUMI

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

Have you considered the advantages light alloys can bring to your business? You may perhaps not have heard all the latest developments. A request to us to call upon you would place you under no obligation whatsoever.

Just look at those television masts

Yes, regular forest of them. Council estate, too. Nothing surprising in that, according to the B.B.C., more than half the sets in the country are owned by working class families

I wish there was the same demand for my products

Have you tried to create one?

I'm spending quite a bit on advertising

In what papers? Do you go in the Daily Mirror, for example?

Good gracious no. Personally I don't like it

That's no reason for not advertising in it. The fact

is, whether you like it or not, the Daily Mirror is the greatest mass market medium in the world. More than four million families read it every day

Working class, most of them?

Of course, but you and I can't afford to be snobbish about that. As I said when we passed that estate just now — look at those television masts

DAILY MIRROR

HIGHEST DAILY NET SALE IN THE WORLD

entry into commercial competition with state support raises controversial international and economic problems to which the American authorities have so far turned a blind eye. Those problems are shortly to be intensified by the forthcoming entry into service of thirty-five *Mariner* class cargo liners, with speeds of 20 knots, built at the taxpayers' expense, to be operated in commercial service by private companies in receipt of government subsidies.

Stores Foresee Hard Times

The first sign of a recovery in retail sales was recorded in the statistics for March, and the latest Board of Trade returns show that the tempo of sales was still improving in May. The index of weekly sales (which has been re-calculated on a new base of 1950=100) rose from 101 in April to 109, and there is no reason to suspect that this improvement has not continued. But in recent weeks the chairman of Harrods has thought it necessary to warn shareholders that his company may not be able to maintain its present dividend, and soon afterwards the John Lewis group announced cuts of 5 per cent in all salaries below £600, 10 per cent in those between £1,000 and £2,000 and 20 per cent in those above £2,000. For some months there have been signs that department stores, and especially those in the central London area, have come up against special trading difficulties in addition to the broad effects of the sales recession that they shared with all types of retailer, and they do not appear to be attracting as big a share of the improved trade as some of their competitors. In May, when sales of non-food merchandise by the big retailers were 3 per

cent higher than a year ago, those of the department stores were actually 1 per cent lower. A comparison with other types of large retailer shows that sales by the multiples were 7 per cent higher, and those by the co-operatives 2 per cent lower. May, however, was the first month in which the co-operatives have shown a bigger fall in trade, compared with the previous year, than the department stores. The evidence is not conclusive, but the accompanying chart does suggest that the multiple stores are capturing a higher proportion of the rising sales than either of their big competitors.

The special difficulties of trading in the west end of London seem likely to affect the stores' prospects for the remainder of their financial year. Harrods and John Lewis have the great proportion of their interests concentrated in this area. So, of course, has Fortnum and Mason, a company that has lately made a number of internal changes. When, that has lately made a number of internal changes. When, in May, sales of non-food merchandise in the country as a whole were 3 per cent higher than in the previous year (when the retail boom was nearly over), sales in the central (when the retail boom was nearly over), sales in the central and west end areas were 3 per cent lower. For the first four months of the retail trading year (i.e., February-May) sales are down by 7 per cent for the country as a whole, but sales are down by 17 per cent in these particular London districts. Taken together, these trends suggest that it is the better-class goods that have suffered most from the retail slump of the past nine

or ten months, although here and there individual luxury retailers have prospered. The department store is not an economical method of retailing; it involves carrying heavy stocks of a wide variety of merchandise, in violation of the fundamental principles of good stock-keeping. The stores are therefore especially vulnerable to any sharp recession in sales or to rapid falls in price such as have taken place in the past months. They also feel with particular severity the loss on stock valuations that results from reduction in rates of purchase tax.

Scottish Banks' New Charges

An important change in the traditional system of bank charges in Scotland was announced by the seven Scottish banks last week, and will take effect on September 1st. The Scottish banks have never followed the system—always important and now very widespread in England—of charging a commission for the conduct of current bank accounts; they equally abstained from the practice, common in England until the Daltonian intervention in monetary policy in 1945, of allowing interest on current account balances. Instead, they have worked on a principle that has always seemed peculiar to people in England, of levying an *ad valorem* charge on the recipient of a cheque for the work of collecting it for him. The general rule has been to charge 1s. per cent on any cheque paid into or encashed at a branch other than that upon which it was drawn, though exceptions have been granted for London cheques and for certain "local" cheques in Scotland. This system has long been a source of grievance among beneficiaries of cheques, especially those to whom it was unfamiliar; but it also has the anomalous result that the banking charges bore no definable or consistent relationship to the cost of providing facilities to those directly benefiting from them—the account-holders, in their capacity of drawers of cheques. Partly for these reasons, and partly because the Scottish banks, like their bigger brothers in England, have been feeling the pressure both of rising costs and (probably even more acutely) of falling gilt-edged, they have now decided to move towards a system resembling the English practice.

From September 1st the traditional practice of charging for cheque collections is to be discontinued. Instead, the banks will levy a specific charge on current account-holders of 6d. for each cheque (except for cash drawings on the drawee branch), with a minimum charge of 10s. a half-year. This new system, though resembling the English practice, will of course be much more formalised, in line with the Scottish tradition of standardisation of banking charges and allowances. An even more striking difference is that the commission charges are to be subject to an offset, in the shape of an allowance of interest on all current account balances exceeding £100. The allowance will be at the rate of 6d. per month for each complete £100 in the lowest daily credit balance shown during the month, but the total allowance will never be permitted to exceed the total of the charges due for cheque drawings. These two devices provide the elements of a rational system of charges; but it remains to be seen whether the banks will find the chosen levels satisfactory from the standpoint of their revenues. The average cost of handling cheques is estimated for Scotland, as for England, to be fully 1s. per item, so that some small accounts may still be unremunerative on a direct reckoning. Customers whose accounts make special demands will, however, be subject to additional charges, to be settled by negotiation.

EMI Changes Speed

Like a timid bather, Electric and Musical Industries Limited is carefully testing the temperature of the water before taking its plunge into the market for long-playing records. It is sending to the United States a batch of tape

recordings and one or two long-playing "masters," to be distributed there by RCA-Victor which, since the ending of EMI's agreement with the American Columbia company, is the only channel for the placing of EMI's recordings in the United States. The tape recordings will be transposed by Victor on to two types of long-playing record, a 12-inch disc making 33½ revolutions a minute on the turntable and playing for about 25 minutes a side, and a 7-inch disc played at 45 rpm. and lasting only as long as the traditional 78 rpm records. The decision to launch into the short 45 rpm records has presumably been based on the fact that some of EMI's most popular works are far too short for the long 33 rpm record that has so far provided the main appeal of the long-playing catalogues.

The handful of long-playing "masters" sent to Victor are presumably duplicates of those being recorded in preparation for the release of the first long-playing "His Master's Voice" records on the home market in October. EMI has still not announced the speed chosen for these records. The company has delayed its action in this sphere for a full two years after its main rival, Decca, had introduced "LP" to Britain; the delay being attributed to its unwillingness to make a premature choice between the speeds (and sizes) of micro-groove records. Of the two American companies handling EMI records in the United States, Columbia favoured 33½ rpm while Victor launched the smaller 45 rpm record (with an abnormally large centre hole to accommodate a special record changer, and therefore requiring a special auxiliary spindle). This divergence presented a pretty problem in diplomacy to EMI. Appearances suggest that it has been solved by adopting both systems, but not before Columbia had terminated its agreements with EMI and found a new European distributor for its records. Columbia, four years ago, was the first company to put long-playing records on the market, and access to its extensive catalogue of 33 rpm records would have made EMI's task of catching up with Decca much easier than it will be without that assistance. Victor has only a small 33 rpm catalogue, and it is significant that some of the recordings sent to America have been made from old records in EMI's 78 rpm catalogue. The quality of recordings transposed from short- to long-playing records by other companies has not generally been regarded as satisfactory. It is, however, the only way in which a company can build up a comprehensive long-playing catalogue at short notice, and EMI appears confident that it has evolved a technique for doing so that overcomes earlier defects. If so, it will earn the gratitude of an increasingly discriminating record-buying public—and one that is especially exacting in its demands for "LP."

Cotton's Bid for Freedom

On its first test, the restoration of partial freedom to the cotton market has provoked only a moderate response. Only 47 firms covering 60 mills with a total of 5 million spindles (15 per cent of the spindle capacity of Britain) have elected to buy the whole of their raw cotton privately; 162 firms comprising 210 mills with a total of 23 million spindles (68 per cent of the industry) have elected to continue to buy wholly from the Raw Cotton Commission. The remaining 15 firms (55 mills with a total number of spindles amounting to 6 million) have decided to buy part of their cotton supplies privately and part through the commission. A few firms have still to reply. On the basis of last year's consumption, 29 per cent of Britain's cotton imports will now be handled privately. This proportion is higher than was first expected, but it is hardly a resounding demonstration of Lancashire's faith in private purchase. Those mills that have contracted out will begin to import their own supplies from September 1st; but until these shipments arrive, the commission will continue to supply them.

The decisions that have been taken are not irrevocable;

spinners will be allowed to review their choice at the beginning of each season. In addition, during the first year those that have contracted out may, under certain conditions, resume buying from the commission. Given these safeguards, it is, perhaps, surprising that less than a sixth of the cotton industry has decided to return to private buying, particularly as Lancashire has not been slow to criticise the RCC. The complicated procedure of licensing and the system of exchanging "dollar-entitlements" no doubt scared all but the bravest of spinners. If this dual system of private and government purchase is to be successful, both sides must work together. There will undoubtedly be mistakes and difficulties, but the temptation to blame the other must be resisted. The commission, for its part, must accord the same cover facilities to the spinners who have contracted out as to those who have elected to remain with it, for it continues to operate the cover scheme for the whole industry. These new buying arrangements must be accepted as an experiment—an experiment that is intended to discover not only the best method of procuring raw cotton for Lancashire but also a way to restore freedom to other controlled markets that deal in dollar commodities.

Another "No" to Premier Petrol

Once again, an unsuccessful approach has been made to the Government to allow the sale of branded, and therefore first-grade, petrol in the U.K. This time the request was put forward by the Shell and B.P. interests, following the refusal in February when there was a joint approach with other companies. The Shell and Anglo-Iranian groups, whose products are distributed in this country by Shell-Mex and B.P., have almost completed a £100 million programme of refinery expansion. This programme includes the construction of four of Britain's six catalytic crackers, which are specialised refinery units from which the best quality petrol is produced. The potential sales of premier grade petrol are, no doubt, a matter of speculation; the already high cost of motoring might tend to reduce the consumption of premier grade petrol below the pre-war level, when two out of three motorists bought premier grades. On the other hand, the additional cost is proportionately much less than it was when the petrol tax was only 9d. a gallon against 2s. 6d. today, and the added efficiency secured by running a vehicle on premier grades may tempt commercial users to buy the better quality petrol, particularly since many light goods vehicles today have precisely the same engines as private cars.

Mr Geoffrey Lloyd has said that he is very anxious that the best qualities of petrol should once again be on sale in this country. There are indeed strong technical arguments for the return of premier grade petrols. These include not only the savings in consumption that would result but also the need to satisfy the motor industry's requirements for a better quality petrol in order to provide an adequate proving ground for British vehicles to be sold abroad. There is also the consideration that the "cat crackers" will be yielding large quantities of those gases, such as ethylene and butylene, on which is based the rapidly developing petroleum chemical industry, itself a great dollar saver. Meanwhile, the cracking plants, unless they can be used for the purpose for which they were designed, must of necessity be uneconomical (Shell's Stanlow plant cost between £8 million and £9 million) while the motorist and the motor industry are being deprived of a first quality product. At every stage, there has always been some impediment to using these plants for the purposes for which they were designed; dollars are short, or Abadan is seized, or the time is inopportune. This habit of saying "no" is becoming tedious. In view of the substantial issues at stake—issues affecting the export prospects of the British motor industry as well as the petroleum industry—a public review of the complicated factors that are involved would be welcome.

Burmah Oil Plans

A capital programme that may cost Burmah Oil between £20 and £25 million in the next five or six years is the latest development to rectify the shortage of refinery capacity outside the United States that has faced the oil industry since the seizure of Abadan. At the annual meeting of Burmah Oil, Sir Kenneth Harper revealed that the company, in alliance with Shell, is to build a new refinery at Bombay to supply a large part of the Indian market formerly supplied from Abadan. Burmah Oil's share in the cost of this new refinery will be about £9 million.

The curtailment of refinery capacity occurred when demand in the Far East, as throughout the rest of the world, was rapidly increasing. To meet this expansion in trade, Shell and Burmah Oil are co-operating further in a plan to build new installations and depots to extend their distributing capacity in India and Pakistan; Burmah Oil will provide about £6½ million of the money required for these projects. The building of tankers, together with expenditure on another capital project as yet unspecified and still under consideration, might swell the total of Burmah Oil's new investment during the next few years to £25 million. The company hopes to finance these developments without approaching the market for new money. At the end of last year it held about £13½ million in short-dated government securities, but the full costs of the plans that have been decided upon, or are in mind, will call for the continued ploughing back of a high proportion of net earnings. If this prospect is not sufficient to convince shareholders that dividend restraint will be the order of the day, they will note Sir Kenneth's warning that the proposed scrip bonus of ordinary shares does not imply any promise of an increased distribution of profits in the future.

Efficiency in Steel Construction

The report of the Anglo-American Productivity Team on methods of preparing and erecting big steel structures suggests that superior efficiency in American production is not confined to the highly mechanised, mass-production industries. Both in producing bridge and structural steel-work and in erecting bridges and steel-framed buildings the output per man and speed of erection is higher in the United States than in Britain. Yet, according to the team, "the breakdown of skills and operations common in mechanised industries cannot be used to any great extent."

A number of reasons are suggested. In the first place, where large fabricated sections have to be handled in the works, shop lay-out and handling devices can help the regular flow of materials, and cut down the labour needed to handle the materials and finished sections. Two other factors simplify work on the shop floor—the specialisation of production and preparation of detailed drawings before fabrication is started. American companies building mechanical handling plant tend to specialise on certain components, such as chains and sprockets. They will sell as much as three-fifths of their output and are content to buy their other requirements.

Much of the report is highly technical. It contains suggestions that the British standard for welded joints should be reviewed so that thinner plates may be used, with consequent economies. British steel fabricators are also handicapped, it appears, by the inability of British road or rail transport to carry finished structural units as large as those transported to the erection site by American railroads. This makes for higher assembly costs on the site. But the report makes one general, and highly important, point about the "economical and flexible use of labour"—which is all the more significant because it is dealing with precisely those industries where it has not proved possible to break down skilled operations into a number of simple, repetitive jobs.

This brings the team straight up against the problem of British trade union organisation. Demarcation rules and shop practices will make it difficult to introduce into this country the flexibility that so impressed the team in America. And, apart from the record of speedier erection in the USA steel erectors at work on American building sites do not enjoy either a guaranteed week or payment for "wet-time."

Entrepôt in Tea

The announcement by the Indian Government last week that it has agreed to the resumption of the re-export of Indian tea by Britain to the Continent is not likely to increase Mincing Lane's tea trade, at least not for the present. British re-exports of tea are permitted only under special licence, and the British Government must determine when full scale re-export is to be resumed. It will not alter the present arrangements so long as consumers in this country are unable to buy all the tea they require. However, this does not necessarily mean that the re-export trade must wait until rationing is ended; if, when the ration is increased to 2½ oz. per week this month, consumption does not rise to the full amount, the question might be reviewed. The British Government would undoubtedly never consent to lift the ban on re-exports to only one area, as India now proposes.

Last year when the London tea market was reopened, India and Ceylon were anxious to prevent the rebirth of London as the world's tea centre; they hoped instead to maintain Colombo and Calcutta as the international markets. This year, tea faces a buyers' market and the growers are clearly worried by the weakness in prices. India's first concern now is to expand tea consumption wherever possible;

UNITED KINGDOM'S RE-EXPORTS OF TEA

and London, although no longer the all-important market it once was, could still play a vital part. Admittedly, many countries grew accustomed to doing without Mincing Lane during the war and have continued to import much of their tea direct from the Far East, but there is still no other market that possesses such a wide knowledge of blending and tasting and where teas from almost all countries in the world can be obtained.

Before the war re-exports of tea from this country averaged about 70 million lb a year, but in 1951 they amounted to only 13 million lb. The resumption of the Indian tea trade with the continent would not bridge the gap, as coffee is the principal beverage on the continent and only a small quantity of tea is consumed. Ireland was this country's best customer for tea before the war, but since 1947 it has obtained tea direct from its own buying mission in the Far East. The second largest market for Britain's tea trade before the war was the United States, but it is unlikely to regain its prewar size. Almost all tea now reaches America direct from the tea growing countries.

Consent of Her Majesty's Treasury has been obtained to this issue in compliance with the Order made under Section 1 of the Borrowing (Control and Guarantees) Act, 1946.

GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA CONVERSION LOAN

OFFER OF CONVERSION TO HOLDERS OF

£11,789,758 Commonwealth of Australia 3½ per Cent. Registered Stock, 1950-1952,

into

GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA

4½ PER CENT. REGISTERED STOCK, 1960-1962,

at the rate of £98 per cent.

Interest payable 15th March and 15th September.

Six months' Interest will be paid on 15th March, 1953.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that Trustees may invest in the Stock, subject to the provisions set forth in the Trustee Act, 1925.

Commonwealth Bank of Australia is authorised by the Government of the Commonwealth of Australia to offer to holders of £11,789,758 Commonwealth of Australia 3½ per cent. Registered Stock, 1950-1952, maturing 15th September, 1952, Conversion of their holdings, in whole or in part, into an equal nominal amount of Government of the Commonwealth of Australia 4½ per cent. Registered Stock, 1960-1962, on the terms set forth in this prospectus.

Principal of the new Loan will be repaid in London at par on 15th September, 1962, the Government of the Commonwealth of Australia having the option to redeem the Stock at par, in whole or in part, on or after 15th September, 1960, on giving three months' notice by public advertisement. The Loan, which has been approved by the Australian Loan Council, is authorised by Acts No. 26 of 1919, No. 18 of 1921, No. 5 of 1928, No. 4 of 1929 and No. 46 of 1944, of the Parliament of the Commonwealth of Australia, and is issued in accordance with a law passed by that Parliament by which the Commonwealth of Australia, as from 1st July, 1929, took over the debts of the various States. The direct liability of the Commonwealth to Stockholders and Bondholders in respect of the Loans so taken over was confirmed in the Financial Agreements (Commonwealth Liability) Act, which became law in March, 1932.

Holders who convert will receive on 15th September, 1952, a cash payment of £2 per cent. representing the difference between the issue price of the new Stock and the redemption price of the old Loan. They will also receive the usual six months' interest payable on that date.

Six months' interest on the new Stock will be paid on 15th March, 1953. Holders accepting the offer of conversion must lodge their acceptances on the appropriate forms accompanied by the relative Stock Certificates, at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2. These forms have been posted to the Stockholders or, in the case of joint accounts, to the Stockholder first named in such accounts. Any Commonwealth of Australia 3½ per cent. Registered Stock, 1950-1952, not converted will be paid off at par on 15th September, 1952, together with the six months' interest then due. The books of the Commonwealth of Australia 3½ per cent. Registered Stock, 1950-1952, will be finally closed for transfers on the evening of 14th August, 1952. Instructions as to the disposal of redemption moneys must be lodged at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2, on the prescribed forms, which will be forwarded in due course. The Stock now offered will be registered and transferable in any amount by deed, at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2. Stamp duty on all transfers will be paid by the Government of the Commonwealth of Australia. Interest warrants will be transmitted by post at the Stockholders' risk, and in the case of joint accounts, the warrants will be forwarded to the person first named in the account, unless instructions to the contrary be given.

Commonwealth of Australia Stocks issued and payable in London and the interest thereon, the property of persons not domiciled in Australia, are not, and will not be, subject to any taxes, duties or levies in Australia. All Commonwealth Loans, all Loans issued by the several States and now taken over by the Commonwealth, and all Loans guaranteed by the Commonwealth, carry a Sinking Fund in accordance with the provisions of the National Debt Sinking Fund Act, 1923-1934, and the Financial Agreement Act.

In the case of all such Loans, the following contributions to the Sinking Fund must be made out of Commonwealth and State Revenues:

(a) On the present Conversion Loan and all Loans existing on 30th June, 1927, including such Loans when converted into other Loans, a minimum of 7s. 6d. Australian currency per £100 per annum.

(b) On any new Loan, 10s. Australian currency per £100 per annum.

In the case of Loans raised in the United Kingdom the contributions stated above are in respect of each £100 sterling.

The amount of Sinking Fund moneys for use in London during the year ending 30th June, 1952, has not yet been allocated by the National Debt Commission, but it is expected to be approximately £3,126,000 Sterling.

Commonwealth Bank of Australia is further authorised to offer for subscription in cash Government of the Commonwealth of Australia 4½ per cent. Registered Stock, 1960-1962, to an amount sufficient to make up, with the Stock converted, the above total of £11,789,758.

PRICE OF ISSUE £98 per cent.

Payable £10 0 0 per cent on Application.

£18 0 0 " " " 7th August, 1952.

£70 0 0 " " " 15th September, 1952.

£98 0 0 per cent.

An interest payment of 2s. 4d. (less tax) per £100 Stock will be made on 15th September, 1952.

Cash applications on the prescribed forms will be received at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2, and must be for even amounts of £100 of Stock and be accompanied by a deposit of £10 per cent. on the amount applied for.

In the event of partial allotment, the surplus from the amount paid as deposit will be returned to the applicant. In case of default in the payment of any instalment at its due date the amount previously paid will be liable to forfeiture, and the relative allotment to cancellation.

Payment in full may be made on or after allotment, but no discount will be allowed. Scrip Certificates to Bearer in respect of Cash Allotments will be issued in denominations of £1,000, £500 and £100, in exchange for Allotment Letters. These Certificates must be surrendered to COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2, at the time the final instalment is paid, for exchange into Registered Stock Certificates.

COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2, Interest Coupons for 2s. 4d. (less tax) per £100 Stock, payable 15th September, 1952, will be attached to the Scrip Certificates.

The revenues of the Commonwealth of Australia alone are liable in respect of this Stock and the interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of Her Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the interest thereon, or for any matter relating thereto.—40 and 41 Vict., cap. 59, sec. 19.

A commission of 5s. per £100 Stock will be paid to Bankers and Stockbrokers on allotments made in respect of conversion acceptances and cash applications bearing their stamp.

Prospectuses, with Statistical Statement relating to the Commonwealth of Australia, may be obtained from Commonwealth Bank of Australia, Stock Department, 8, Old Jewry, London, E.C.2; from Messrs. R. Nilsson & Co., 6, Threadneedle Street, London, E.C.2; and at the Offices of the Government of the Commonwealth of Australia, Australia House, Strand, London, W.C.2.

COMMONWEALTH BANK OF AUSTRALIA,

8, Old Jewry, London, E.C.2.

11th July, 1952.

The List for Cash Applications will open on Tuesday, 15th July, 1952, and will be closed at 3 p.m. on that day.

The List for Conversions will be closed at 3 p.m. on Monday, 21st July, 1952.

This Form may be used

Application Sheet No. Allotment No.

APPLICATION FOR GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA 4½ PER CENT. REGISTERED STOCK, 1960-1962.

To COMMONWEALTH BANK OF AUSTRALIA,
STOCK DEPARTMENT, 8, OLD JEWRY, LONDON, E.C.2.

I/we hereby apply for

(say pounds) of Government of the Commonwealth of Australia 4½ per cent. Registered Stock, 1960-1962, according to the Prospectus of 11th July, 1952, and undertake to pay £98 for every £100 of Stock, and to accept the same or any less amount that may be allotted to me/us, and to pay for the same in conformity with the terms of the said Prospectus.

I/we enclose the required deposit of £, being £10 per cent. on the amount applied for.

I/we declare that the applicant(s) is/are not resident outside the Scheduled Territories and that the security is not being acquired by me/us as the nominee(s) of any person(s) resident outside those Territories.

Signature

Please write distinctly. Name in full

[BLOCK LETTERS] (State Title, if any, or whether Mr., Mrs. or Miss)

Address

15th July, 1952.

* If this declaration cannot be made it should be deleted and a Form D (obtainable from a Banker or Stockbroker) completed as to declaration 2A and the Certificate appended thereto should accompany this application.

† The Scheduled Territories comprise the British Commonwealth (except Canada), the Irish Republic, British Trust Territories, British Protectorates and Protected States, Burma, Iraq, Iceland, the Hashemite Kingdom of the Jordan, Libya.

‡ The definition of "nominee" is given in the Bank of England's Notice E.C. (Securities) 1.

N.B.—Applications must be for amounts of not less than £100 and in multiples of £100.

Cheques should be made payable to BEARER and should be crossed thus:

Commonwealth Bank of Australia,
a/c Australian Loan.

Company Notes

Courtaulds.—Sir John Hanbury-Williams' statement accompanying the full accounts of Courtaulds can be regarded as an interim report. As it was written in June, Sir John is wisely reserving his comments upon the immediate trading outlook until the annual general meeting to be held at the end of this month. Sir John indicates that the present slump in sales has been largely confined to dress fabrics and household materials, and he specifically mentions that demand for industrial rayons has not been affected to the same extent—thanks possibly to the demands created by rearmament. Owing to the lack of up-to-date statistics, Sir John could offer no clear-cut answer to the question whether the present world potential in rayon production exceeds foreseeable demand. But after pointing out that if the prewar and postwar periods are compared, consumption of rayon per head has not changed substantially—thanks to the growth of the North American market—he thought it reasonable to assume that consumption per head will increase in line with any improvements in living standards. He adds that the recession should weed out the inefficient producers, but that "care should be exercised by all to limit further expansion—at any rate until the future is less obscure."

Consolidated earnings:—	Years to March 31,	
	1951	1952
Trading profit	18,392,835	20,353,292
Total income	20,224,670	23,153,859
Depreciation	2,484,748	3,184,898
Taxation	9,049,664	10,293,449
Net profit	8,689,862	9,675,766
Ordinary dividends	1,447,500	1,417,900
Ordinary dividends (per cent)	11½	11½
Retained by subsidiaries	1,556,527	2,158,452
Fixed assets replacement reserve	1,704,692	1,912,674
Stock replacement reserve	2,600,000	2,800,000
Added to carry forward	168,175	88,489

After this cautious statement, with its admission that the slump in the textile trade is world wide, the news that Courtaulds is pushing ahead with capital developments abroad comes as a distinct contrast. But the inter-weaving of the two themes of capital development and the present recession in trade does not necessarily indicate an unbounded and general optimism in the future. It may rather suggest that the company believes that the overseas market holds out the promise of a brighter future than does the market at home. It is noteworthy that, apart from the development of pulp mills in Natal, these capital developments are largely being fostered in the United States, Canada, and Australia—countries, in fact, that should enjoy a further improvement in living standards in the next few years.

The development of Courtaulds' overseas interests seems in no way to have been abated by the trade recession, for the group's outstanding capital commitments amount to £16 million. The capital programme, however, has given the group's finances an odd twist. The parent company has sold about £11 million of its holdings in government securities at a small profit and invested most of the proceeds in shares in overseas subsidiaries, which in turn have re-invested these new funds, presumably only temporarily, in government securities.

This re-orientation of the group's finances has taken place at a time when more of the group's resources had to be locked away in working capital. Sir John explains that the substantial increases in stocks were partly due to the rise in prices but more especially to the accumulation of raw materials and finished stocks as a result of the decline in sales. As

the mills were kept running for some time while output was exceeding sales, the group has built up substantial stocks that will have to be liquidated before the mills can return to more normal production. At the annual general meeting Sir John may be able to indicate with more precision when this is likely to occur.

English Sewing Cotton.—Following a boom in sales in 1951, English Sewing Cotton has been badly hit by the almost complete cessation of demand for weaving and knitting yarns, so that, at the moment "sales are poor, stocks are high and mills are operating on reduced production schedules." Mr Leslie Shaw, the chairman, is not content to draw attention to the company's recent troubles; he also warns shareholders that accounts drawn up in accordance with conventional accounting principles often create a false impression of prosperity. Computed by these standards, the group's trading profits show a slight increase from £1,321,107 to £1,370,438, but Mr Shaw points out that if profits were computed on a more realistic basis after allowing for the cost of replacing fixed and current assets a less satisfactory picture would emerge. Last year's inflation of prices was in fact responsible for about half of the rise in the book value of stocks of £1.4 million (to a total of £4.2 million). Given the present tax requirements, which count the results of price inflation as "profits," all the directors can do is to increase the stock reserve to £1 million by the appropriation of £500,000 from profits.

Consolidated earnings:—	Years to Dec. 31,	
	1950	1951
Trading profit	1,321,107	1,370,438
Total income	1,635,267	1,686,585
Depreciation	174,708	179,960
Taxation	670,268	749,582
Net profit	757,021	724,476
Ordinary dividends	135,000	131,250
Ordinary dividends (per cent)	12½	12½
Retained by subsidiaries	79,149	54,385
General reserve	500,000	500,000
Stock reserve	Dr 2,427	Dr 6,391

Looking towards the time when the present excess stocks will be liquidated and when "reasonably steady employment for efficient producers" can be expected, Mr Shaw makes some forthright comments on double-shift working. He suggests that there will have to be a marked change in attitude on the question of shift working if the industry is to be re-equipped economically and wisely. To replace the present spinning equipment in this country of 18 million mule spindles and 10½ million ring spindles would, on current methods of working, require 22 million ring spindles at a cost of between £300 and £350 million. But if "Lancashire's machinery were to operate a reasonable number of hours per annum" the need would be for only 7 million spindles at a cost of between £100 and £120 million. The company's own policy is to introduce shift working wherever practicable after making a careful assessment of the social problems which may qualify its economic advantages. In pursuit of this policy the company has leased a factory in Northern Ireland which will be equipped with modern plant and operated on shift working; this factory should be ready for production by 1955. Rationalisation may indeed be the only long-term solution for an industry that is now having to fight hard for any business it can secure.

EXCHEQUER RETURNS

For the 5 days ended July 5, 1952, total ordinary revenue was £65,444,000, against ordinary expenditure of £59,706,000 and issues to sinking funds £511,000. Thus, including sinking fund allocations of £6,877,000 the deficit accrued since April 1, 1952, was £195,738,000 compared with a surplus of £18,960,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE MERCANTILE AND GENERAL REINSURANCE COMPANY

FURTHER EXPANSION OF BUSINESS

TOTAL LIFE FUND EXCEEDS £2 MILLION

MR HUGH K. GOSCHEN'S STATEMENT

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on July 29th at the company's chief office, 25-31 Moorgate, London, E.C.

The following is a statement by the chairman, Mr Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1951:—

During the year Mr Julian S. Crossley was elected to the board in succession to the late Sir William M. Goodenough. We feel sure that Mr Crossley's special knowledge and experience of so many parts of the world where we do business will be of great value to us. We are most fortunate in having secured his services.

I look forward once more to proposing at the annual general meeting a vote of thanks to our management and staff. I am sure that the traditions of the company have been well maintained, and for this we have to thank our general manager, Mr Calburn, our managers, and other officials and every member of the staff.

This year we have been able to bring forward by several months the date of the publication of our accounts. As you will see, however, from the note on the balance-sheet, this has necessitated our having to make estimates in those cases where we have not received details of all the quarterly accounts from our ceding companies. Every care has been taken in making these estimates and we are satisfied that when the final results are received they will vary little in the aggregate from the figures shown here.

During the year the authorised share capital of the company was increased by £150,000 and the paid-up share capital by £50,000. These increases arise from the two resolutions which were passed at the annual general meeting on September 25, 1951.

RECORD PREMIUM INCOME

I am pleased to be able to report a further expansion of business and, on the whole, satisfactory results. The net premium income has soared to a new record figure of just under six million, as against nearly five and a half million in 1950—an increase of about 9 per cent. It is interesting to note the net premium increases of the years since the war: 1946—14 per cent; 1947—26 per cent; 1948—39 per cent; 1949—19 per cent; 1950—27 per cent. Our net premium income in 1951 was, in fact, almost three and a half times that of 1945. Whilst the expansion is due in part to the ever-widening range of our activities and personal connections, such phenomenal rates of increase are to be attributed for the most part to inflation, which has been so universal during recent years.

It is now evident that at least in some parts of the world this upward movement of prices has been halted and, if this becomes general, one of the major factors which has contributed to our increases in premium income will disappear. I think it is unlikely, therefore, that we shall continue to show the

same expansion in future years. During a period of generally favourable results competition for reinsurance business is intensified, the demand for reciprocity increases, and the professional reinsurer inevitably feels more keenly the competition of the direct-writing offices. Even so, there remains over the whole field of our activities a continuing demand for the specialised organisation and essentially long-term business outlook of the professional reinsurer. The continued support we receive in such times from our friends at home and overseas encourages us to redouble our efforts to respond to their needs with a prompt, efficient, and comprehensive reinsurance service, and to adapt ourselves the more readily to the rapidly changing conditions which are a feature of these unsettled times.

RESULTS OF THE VARIOUS DEPARTMENTS

In the fire department our business was well maintained, though the increase in premium income was modest by post-war standards, due in part to a change in accounting methods made necessary by the earlier closing of our books. Although the year was not without its disastrous losses from fire and windstorm, we were able to close our fire account with a satisfactory margin of profit.

In the accident department the result of the motor business was adverse. General third party and aviation, and common law liability at home, also give cause for some concern. Thanks, however, to the satisfactory burglary, personal accident, and other miscellaneous classes, no loss was sustained on balance.

Our marine account is making steady progress. As you will see, we have transferred an amount of £25,000 from profit and loss to this account. This does not mean that the account has made a loss—on the contrary, the experience has been favourable—but we felt that it was desirable to give this fund, which is still young and perhaps unbalanced, further strength. After this transfer the fund will stand at 136.67 per cent of the premiums. As will be seen, the account has been charged as usual with its share of tax.

You will notice that we are publishing for the first time a separate balance-sheet for the life department, although the figures for that department continue to be included in the company's general balance-sheet. The life department has specialised in reinsurance on the risk premium basis for over a quarter of a century, and approximately two-thirds of its business is transacted on that basis. As only the death risk is reassured, the actuarial reserves applicable to the principal policies are held by the ceding offices; for this reason the portion of the life fund which relates to this section of our business is relatively small. However, the reserves which relate to the business transacted on original terms have grown in recent years and the total life fund now exceeds £2 million. The directors have accordingly decided that the time is now opportune for the segregation of the life assets.

The new business figures of the life department show that it has lost none of its vigour; the net sums assured amounted to £8,748,697, compared with £6,503,654 in 1950. The gross sums assured in 1951 were £14,205,837, as compared with the 1950 total of £9,564,046. A part of the increase in the gross sums assured results from the use of the clearing house facilities for big cases which we provide. Approximately 50 per cent of our gross business was transacted within the United Kingdom.

INVESTMENT POSITION

The investments of the company show an increase of over £1 million. I have referred before to the difficulties inherent in an investment portfolio built up very largely in recent years in a time of cheap money; we do not have that cushion between book cost and market values which is the pride of many of the older companies. It is, therefore, satisfactory to be able to record that, in spite of a most difficult year when we had to contend with the policy of the new Government of credit restriction and higher interest rates with a consequent adjustment in market values of securities, we are still able to show a small margin between the market value and book cost. I must, however, add that the fall in prices since the end of the year has inevitably reduced the total market value of our investments, with the result that we have felt it prudent to make a transfer from profit and loss account of a further £25,000 to the reserves that we hold against such eventualities.

Our Canadian company, The Mercantile and General Reinsurance Company of Canada, Ltd., started business on January 1, 1952, as a licensed reinsurer in all the major classes except life and marine. Mr Calburn, who has just returned from a visit to Toronto, reports that the business is growing satisfactorily and is being developed on sound lines. We shall have to consider increasing the resources of this company during the coming year.

The excess profits levy, for which this year's Budget provides, could hardly have been designed in a way which would penalise more effectively this company with its small issued capital and its rapidly expanding business. Recent amendments have gone some way to mitigate the provisions which affected us so unfairly, but no amount of amendment will alter the fact that it is a tax on enterprise and efficiency and therefore a bad tax which should be stopped altogether as soon as possible.

NATION'S ECONOMIC PROBLEMS

The new Government, which came into power after the election last October, was immediately faced with the problem of the rapidly diminishing gold and dollar reserves of the sterling area; drastic import cuts were made and other measures taken. It seems that these measures have gone some way to meeting the short-term problem for the Chancellor of the Exchequer was able to tell us on June 12 that the dollar drain in the

sterling area had been reduced from £334 million over the last three months of 1951 to £10 million over the two and a half months previous to his statement. Whilst, however, it can be said that the short-term position is being held, we still have to work out a long-term policy, to expand our export trade and to rebuild our foreign investments on which the economic strength of our

country has for long been based. This will require courage and vision.

Such a policy is nowhere better reflected than in the growth of the British insurance market, which has bestowed such priceless benefits both upon our own community and throughout the world. The fact that this industry has brought in the past and continues to bring a vital contribution to imme-

diately prosperity should not make us forget that its own fortunes and the reserves upon which it rests are the result of a long-term outlook. So, too, is it the policy of this company, rather than to see a quick return, to render service and to help in ironing out the inevitable ups and downs of the insurers as a contribution towards the general prosperity both now and in the future.

BURMAH OIL COMPANY, LIMITED

CAPITALISATION OF RESERVES

PROGRAMME OF CAPITAL EXPENDITURE

INCREASING EXPANSION OF TRADING

SIR KENNETH B. HARPER'S ADDRESS

The fiftieth annual general meeting of the members of the Burmah Oil Company, Limited, was held on Friday, July 4, 1952, in the Merchants' Hall, 30, George Square, Glasgow.

Sir Kenneth B. Harper, chairman of the company, presided.

The chairman said:

Ladies and gentlemen, with your permission I propose holding as read the notice convening our meeting and would call on the secretary to read the auditors' report.

The secretary, having read the report of the auditors,

The chairman said: Ladies and gentlemen, the accounts and director's report have been in your hands for three weeks, and I do not propose to refer in detail to the figures this morning but if any shareholder has any question to ask I shall be glad to answer it when, in a few minutes, I formally move that the accounts and report be adopted.

PROPOSED CAPITALISATION OF RESERVES

You will have noted, I hope with approval, the directors' intention to seek the Capital Issues Committee's consent to capitalise £6,868,257 from reserves and issue that number of Ordinary shares of £1 each among the present stockholders in the proportion of one for two. It has for many years been the directors' policy to finance expansion of the company's business and operations out of accumulated undistributed profits and from time to time to convert part of those accumulated reserves into share capital so as to bring the share capital more into line with the capital employed in the business. The present conversion is a continuation of that policy. If the Capital Issues Committee's consent is received an extraordinary general meeting will be called to give shareholders the opportunity, which I am sure they will be pleased to take, to pass the necessary resolutions.

I must make it clear that this increase in share capital does not imply any promise of increased distribution of profits in the future.

PROGRAMME OF CAPITAL EXPENDITURE

You will see in the balance sheet that excluding the investments in our wholly owned subsidiary companies, and what we call trading investments (that is our shareholdings in Burmah-Shell, Candles Ltd., and Oil Well Engineering Co. Ltd.) and excluding also our investments in Anglo-Iranian and Shell, the company had a surplus of current assets over current liabilities at the end of the year amounting to about £19 million, including about £13½ million in the form of

British Government securities. (These stocks, by the way, are all short dated so we have escaped the full severity of the fall in price of Government securities.) You will be interested to know what the board proposes to do with the liquid portion of this surplus.

We have before us during the next five or six years a considerable programme of capital expenditure, due partly to catching up with replacements and developments which were held back by the war and partly to catering for the increasing expansion of our trading business.

The three new tankers which we are building will cost between them about £2 million. Events at Abadan, from which we have drawn the greater part of our supplies of petroleum products since we lost our Burma production, have caused us to review our future supply position and we have decided to build a refinery at Bombay in conjunction with Shell to supply a large part of our requirements for the Indian market. Our share of the cost of this refinery is estimated at some £9 million. Then to cater for the distribution of the steadily increasing trade in both India and Pakistan, Burmah-Shell have a programme of expansion of their installations, depots and other facilities and our Pakistan Trading Company is planning to build a new installation at Chittagong. Our share of financing these two items will amount to about £6½ million.

At least one other project is under consideration and our capital programme over the next five or six years may therefore amount to £20 to £25 million; a very considerable figure, especially if we allow ourselves to look back nostalgically to costs as they were before the war. Costs of steel and other materials and of labour in our spheres in the East are both about three times what they were in 1938. It was of course obvious to all of us very soon after the war that we should have to expect increases of that order for several years at best and shareholders have shown their appreciation of that inescapable fact by agreeing uncomplainingly to the large sums we have been placing to reserve in recent years, but as a result of this policy we hope (I say it without prejudice) to be able to finance all the new expenditure I have just referred to without going to the market for more money; and I need hardly add that every one of these capital developments is designed to bring you in in due course a better return on your money than is obtainable from the securities in which it is at present invested.

EXCESS PROFITS LEVY

You will want to have an indication of what the Excess Profits Levy is likely to

cost us. The answer, of course, depends on the amount of taxable profit, which I cannot forecast but on the basis of the 1951 level of profits and taking into account not only the levy but the various alterations in the incidence of Profits Tax, we estimate that the additional tax payable would have been about £200,000. I shall not comment on this regrettable political commitment, except to say that it contradicts the Government's own policy of encouraging production by private enterprise.

POSITION IN BURMA

Turning to the events of 1951, I wish I could report greater progress in restoring stability in Burma. So far as one can see, the various insurgent groups which have been campaigning, separately or together, since 1948 against the established Government made no headway last year. On the other hand the Government brought very little more of the country under their control. It would seem, in fact, that neither side is strong enough to make a marked impression on the other, and yet one cannot help feeling that in a country in the state that Burma has been in for so long, conditions do not just stand still; they either improve or they get worse and all of us who wish to see Burma at internal peace again are anxious that a marked and substantial improvement will soon become visible.

Our own relations with the Union Government are most friendly.

JOINT VENTURE

Our plans for what has become known as a joint venture, to restore and develop the oil industry in Burma through the medium of a local company of which the three British oil companies and the Union Government would be the shareholders, made some advance in the past year. The terms have now been agreed, subject to acceptance by the Union Government of the oil companies' valuation of the assets to be passed over to the new company. The oil companies put this at the rupee equivalent of £15 million, in their estimation a proper and by no means excessive valuation. The Government's acceptance of this valuation is awaited.

This joint venture cannot immediately provide any new or increased employment. The oil companies are already producing and refining petroleum products at Chauk to the extent that they can be economically distributed by the available means of transport to the markets they can reach, and extension of these operations depends on the Government's success in bringing more of the country under their control.

DENIAL SUITS

The denial suits which we filed in 1948 drag on inactive and the present position is that application has been made to the Burma Court to decide and pronounce, as a preliminary issue, on the question whether or not the Burma Government is legally liable for compensation, without going into the details of the amount of loss and compensation involved.

INDIA AND PAKISTAN

Except in Burma, where it is still unsafe for parties to work in isolated jungle areas, we are carrying on our usual programme of prospecting for new sources of crude oil. Although the proportion of successes to failures has in the past, unfortunately, been a good deal lower in Burma, India and Pakistan than is usual in, for instance, USA or the Middle East, we must continue the search so long as there are reasonably promising areas to prospect in the countries in which we operate, as our scientists assure us there still are. Successful results would be of great benefit not only to us, but also to the countries concerned. Last year we were testing, or preparing to test, six areas in India and Pakistan, but so far no strike of oil has been reported from these wells.

The important producing and refining operations of the Assam Oil Company at Digboi continued successfully during the year. In Pakistan small production continued to be obtained at Chakwal, in the Punjab.

Our relations with the Central Governments of India and Pakistan and with the Governments of the States and Provinces in which our subsidiary and associated companies operate were as cordial as ever and were reflected in the trust imposed by the Governments in the companies at the time supplies from Abadan were cut off.

TRADING

The demand for petroleum products in India and Pakistan continued to expand, the increase over 1950 in our sales of all products being 21 per cent. While this was a substantial increase, the demand in these countries is still relatively very small when one compares it with countries like the USA and United Kingdom. For example, in the year 1938 the consumption of petroleum products per head of the population was 300 gallons in the United States, 56 gallons in the United Kingdom and 1 gallon in India and Pakistan. In 1951 consumption per head had risen in the United States to 578 gallons, in the United Kingdom to 104 gallons, and in India and Pakistan to 3 gallons. There is, unfortunately, no comparison to be drawn between the standards of living in the United Kingdom and the United States and the standard in these Eastern countries, but the figures indicate that as standards of living advance in the East there will be scope for a steady expansion of the demand for petroleum products.

In general, trading in petroleum products was agreeably free from restrictions both in India and in Pakistan, though the restrictions on trading between India and Pakistan, affecting us particularly in East Pakistan, to which I referred last year, unfortunately still remain.

Prices f.o.b. Gulf of Mexico, which is the basis of oil prices the world over, showed a very slight upward tendency during the year, but there was a substantial increase in freight rates, resulting in higher market prices, which in our markets are already loaded with import or excise duties and in some with sales taxes also. About half the price of motor spirit in India and Pakistan is due to such taxes. They are a favourite source of revenue to Governments because they are so easy to collect, but they are a heavy burden for the

consumer to carry on what is no longer a luxury product.

ABADAN—SUPPLY PROBLEM

The supplies of petroleum products we needed for our trade in 1951 totalled over 1 million tons, and with our Burma production so severely curtailed only about 26 per cent of this came from our own oilfields. The balance had to be imported and until July last year came almost entirely from Abadan. When, therefore, Abadan closed down an immediate supply problem arose for our suppliers and for us and all of Abadan's former customers. To replace production at the rate of 30 million tons a year, which was the amount which was suddenly cut off, was a major and inevitably costly operation; not only the finding of the oil itself, but the re-routing of tankers to load at ports which could supply it, and that, for the most part, meant re-routing to ports at the other side of the world. The magnitude of this operation can be imagined from the fact that in the critical two months there would ordinarily have been about 400 tankers loading at Anglo-Iranian's two ports in Iran. That the transformation was effected without any country in the world having to ration its distribution one can only describe as a remarkable achievement on the part of the international oil industry. The problem of maintaining supplies to meet consumers' needs has engaged the attention of committees, set up under the aegis of the Governments both in the United Kingdom and the United States, and they have rendered the greatest assistance.

LABOUR

The level of employment of labour by our companies remained steady last year in India and Pakistan and rose by a few hundred in Burma in line with a small increase in activity there. Relations generally were good, though negotiations with the unions continued to suffer from the application of the labour policies in those countries, particularly in India. The lack of discipline inevitably resulting from the too ready reference by the Government to adjudicators of what are often excessive demands by the unions and the amenableness of Indian adjudicators in responding to them are apt to frustrate the intention of the Trade Disputes Acts to get management and labour together. Until recently the Government of Pakistan appeared to set their face against the Indian practice of adjudication, but there are now signs that they, too, are tending to follow it. Despite the ever-present threat of litigation, the high standards of our welfare and terms of employment ensure that there is fundamental satisfaction among our men, which is greatly aided by wise and sympathetic understanding of the workers by our supervisory staffs.

It may be of interest to you to know that in the production, refining and marketing of petroleum and its products we provide direct employment for about 22,000 men and women at home and abroad. Our shareholders number about 46,000. Those who supply the tools and the capital are therefore just about double the number of those who supply the brains and the labour. The third partner in business nowadays, the Governments, provide neither capital nor labour, but they took 58 per cent of our 1951 profits.

TANKERS

Our small fleet of tankers continued to operate satisfactorily during the year. It has always been the board's policy to keep our ships in the best possible condition, and this has undoubtedly been repaid by their long service, aided by the loyal and efficient services of our officers and engineers. The three new tankers now building are small

ships of 8,400 tons each, suitably designed for the Eastern ports with which we trade. The first of them was launched six weeks ago and is expected to come into service in October this year. We expect delivery of the other two about the middle of next year.

STAFF

I would ask you to accord your appreciation of the continued good work of the staffs of our group of companies, both at home and in the East, ashore and afloat, under the guidance of your managing director, Mr Abraham, and of Mr Eadie, whose appointment a year ago as assistant managing director was so fitting. You will have appreciated from what I have said today that difficulties of many different kinds arise from day to day in the conduct of the business and we are fortunate in the managements and staff we have to deal with them.

Mr Abraham, Mr Eadie, and Colonel Spens all visited our Eastern properties last year. I shall be asking Colonel Spens to second the adoption of the report and accounts and I hope he will take that opportunity to give you some impressions from his visit.

I now beg to propose that the report of the directors and the audited statement of accounts including the balance sheet and profit and loss account to December 31, 1951, presented to this meeting be received, approved and adopted, and I call upon Colonel Spens to second this motion.

Colonel Spens, in seconding the motion, said that having been a director since 1936, he felt it was high time that he went to see the property of the company.

Along with Mr Eadie, the assistant managing director, he went to Rangoon to our oilfields at Chauk in Burma, and Digboi in Assam, Golmuri where the Tinsplate Company is situated, which is associated with Tata, to Chittagong in Eastern Pakistan, to Chakwal in Pakistan near Rawalpindi, where we also have oilfields, and our prospecting area in Baluchistan. He also saw the activities of our associated distributing company Burmah-Shell in India and Pakistan.

So far as Rangoon was concerned, he said that he was much impressed with our good relations with the Burmese Government, particularly those of Mr Abraham, the managing director, and those in charge of the management on the spot.

As regards all the other activities, he was greatly struck with the loyalty of the staffs, and their esprit de corps. He met many Scotsmen, and he was very glad to find that so many Scotsmen were associated with what is essentially a Scottish company. He met many of the covenanted Asian staffs, and felt that they had exactly the same feeling about the company as the British members thereof. In his opinion, all our relations with the Governments of Burma, India and Pakistan were good, and the company was respected and indeed admired. Finally, he stressed again the loyal and efficient service which had been got from the staffs which he was sure would always continue.

The report and accounts were unanimously adopted.

The final dividend of 2s. 6d. and the bonus of 1s. 2.4d. per £1 unit on the ordinary stock, both less income-tax at 9s. 6d. in the £, recommended by the directors, were approved and declared payable on July 18th, and the balance of £586,981 was carried forward.

Sir Kenneth B. Harper and Colonel Hugh B. Spens, CBE, DSO, DL, the directors retiring by rotation, were unanimously re-elected.

The proceedings terminated with a vote of thanks to the chairman.

J. LYONS AND COMPANY

PROGRESS LIMITED BY CONTROLS

MR M. GLUCKSTEIN ON AN EFFICIENT INDUSTRY

The fifty-eighth annual general meeting of J. Lyons and Company, Limited, was held on July 7th in London, Mr M. Gluckstein, the chairman, presiding.

The following is the chairman's circulated statement:—

In October last we were very grieved at the death of our colleague, Mr W. H. Gaunt. Joining the company 32 years previously, at a time when our transport was rapidly developing, he was primarily concerned with it and distribution. He was a man of wide interests and experience, and a leading authority in the transport world. His zeal for work, his humanity and his many interests are remembered by all with whom he was in touch, and they were many.

During the year Mr W. A. Coyte, also a director, retired, having reached, he felt, an age at which he wished to free himself of the strains of an active business life. He was chief engineer of the company and had served it for over 40 years. He was held by us all in high esteem. We were sorry to lose the benefit and pleasure of his association with us, and we wish him many years of good health and happiness in his retirement.

In December last we appointed to the board Mr Ivor F. Salmon. We continue our policy of creating a reserve of younger men ready to undertake higher responsibility and thus to maintain continuity in policy and management. Mr Ivor Salmon has had a long and thorough training in the business, and we welcome him to the seat on the Board for which he is so well qualified.

Our present articles restrict the number of directors to a maximum of 24, of whom not more than 14 may be ordinary directors. In view of the increasing ramifications of the business, we think it desirable to be able to accelerate the promotion of some of those younger men to whom I have referred in the previous paragraph. A resolution will accordingly be submitted to the meeting increasing the maximum number to 30, of whom not more than 20 may be ordinary directors.

TRADING RESULTS

The accounts which are presented with this statement are of the fifty-eighth year of the company and include the balance sheet and profit and loss account of the company and the consolidated balance sheet and profit and loss account of the group comprising the company and its subsidiaries.

The net profit for the year is £615,075, which compares with last year's figure of £610,262. Dividends on preference and preferred ordinary stocks for the year have absorbed £260,511. We are recommending the payment of final dividends on the ordinary, "A" ordinary and proportional profit capital at the same rates as last year, which, with the interim dividends paid in December last, will take £297,234. Included in this figure is a full year's dividend on the £660,000 "A" ordinary stock issued at the close of the previous year.

I think we may feel that these results are not, under present circumstances, unsatisfactory. Looking round at the company's wide range of activities we see limited progress—limited, of course, by causes beyond our control and not by any lack of effort. We have been able to complete a considerable extension to our factory at Rannoch Road in Fulham. This is principally for the production of frozen cooked foods, including a wide variety of sandwiches, which we

are making available under the name "Frood" for sale overseas and by shopkeepers and caterers throughout the country. We have also during the year been able to reopen some more of the tearooms which the war had closed. In London the meal voucher business, which we named the "Lyons Luncheon Club," continues to grow both at the Corner Houses and tearooms, and it clearly serves a real need especially for the office worker. In addition to maintaining our full range of products, we continue to put new ones before the housewife. Quaffy, the quick coffee, has been available for some time, and we have now added Chico, an instantly made coffee and chicory product, at a lower price. Our private catering department wins praise, not only at the Chelsea Flower Show, Wimbledon, and elsewhere in and around London, but also much further afield, for example, the catering arrangements for the opening of the wonderful new Abbey Steel Works at Margam, Glamorgan.

IMPOSITION OF NEW BURDENS

It will not be expected that, in a year in which the country's financial and raw materials position has been so difficult, we as a company have found things easy. Many restrictions are still imposed on us. There have been cuts in rations and in imports of unrationed foods. We have also suffered our full share of the accumulated effects of years in which taxation has made the proper replacement of capital assets more and more difficult, and of Budgets that have had the effect of reducing the standard of living to one low level of equality rather than of offering inducements to get above that level by work, efficiency and thrift. The last Budget seems to have begun a change which is welcome if it is the forerunner of others which will relieve the burdens on industry, for it seeks to restore incentive to the individual. Unhappily it stops at the individual and, instead of incentives for industry, it imposes new burdens. Perhaps they are necessary this year—on that there may be differences of opinion—but it is clear to everyone that our very livelihood depends on our industries competing in overseas markets. Should not the Government recognise that, where there has been monetary depreciation, it is useless to exhort industry to increase production unless steps are taken to encourage investment of additional capital by affording further tax relief in respect of all profit that is ploughed back into the business.

PRICE FACTOR

We are much concerned at the increases we are being forced to make in some of our prices. They are made only after close examination of the increased costs that compel them, and after every effort to avoid them. They are deferred as long as possible. Our policy will still be to increase the volume of business by reducing prices wherever and whenever that can be done.

None the less we welcomed the modifications proposed by the Government to the food subsidies, for although this meant some increases in our prices which we do not like, how could we object to proposals which, we hope, will lead to an increase in the quantities of food available. In the case of tea, the withdrawal of the subsidy is to be followed by an increase in the ration and, after that, the ending of rationing should be justified long before the end of the year.

TRIBUTE TO STAFF

I am glad to be able to say again that throughout the business we continue to enjoy the loyal and enthusiastic co-operation of our staff of all ranks without which we could not have overcome the many difficulties. There are two sides to loyalty, and I hope that our staff will continue to feel that their loyalty to the company is matched by the company's interest in them. Even those who are new to our service quickly seem to absorb from their fellow-workers of longer service that tradition of loyalty and enthusiastic endeavour in the company's interests, to which I have referred before and which has always characterised our staff. I am sure you will wish to be associated with us in this tribute to them.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said:—

I only wish to add a word or two to the statement that was sent out with the accounts. I said there that we shall continue our endeavours not merely to avoid increasing prices but to reduce them whenever and wherever that becomes possible, but the nation cannot hope to see prices fall so long as the cost of Government is so high: on average since the war it has been increasing by nearly £100 million a year. There are signs that the present Government is making some effort to check this appalling progress, though the effort does not appear yet to be vigorous enough, nor to extend as far as it should.

The very high level of taxation is making it impossible for industry to maintain, still less to increase, capital assets. I know this is constantly being said by chairmen of companies. I make no apology for doing the same; it cannot be too often repeated. Taxation relief in respect of profits retained in the business is grossly inadequate. The Excess Profits Levy and the withdrawal of initial allowances will add to a tax burden which is already excessive and make it increasingly difficult for industry even to maintain its existing volume of production at a time when the need is to increase it. We recognise that rearmament is essential and that industry must make its contribution towards the cost; but industry is also faced with constant increases in the cost of renewing its tools, and if it cannot do so it can neither keep the country's labour force in employment, nor continue in full its contribution to the country's recovery. This applies, of course, to the catering industry as much as to any other.

To decry British catering seems to have become a national sport with no close season. I claim that the industry needs no vindication despite all its special handicaps. It is both efficient and enterprising, its prices compare favourably with those in any other country, and it has shown itself able to meet all emergencies and exceptional demands.

Whenever we have a great State function, such as the Coronation to be held in 1953, there is always so much talk about the expected crowds that the public assumes it will be difficult to get meals and refreshments. That assumption is unjustified, and I hope no one will be discouraged from coming on that account. We, and others in the catering trade, have long experience of the extra demands made on these occasions and we may be relied upon to meet them.

The report and accounts were unanimously adopted.

LAPORTE CHEMICALS LIMITED

FURTHER PROGRESS

PROJECTED PROVISION OF £2 MILLION OF NEW CAPITAL

MR L. P. O'BRIEN ON FORWARD PLANS

The forty-fifth annual general meeting of Laporte Chemicals Limited, was held on July 10th, in London, Mr L. P. O'Brien, chairman and managing director, presiding.

The following is an extract from his circulated statement:

I am happy to report a further advance in the earnings of the Laporte Group, although normally that is what one would look for in view of the retention in the business of considerable sums of undistributed surpluses in recent years, and because of the large sums spent annually on fruitful research. An increased capacity for production of the main specialities of the group occurred in time to take advantage of a strong demand. The sales figures in both home and export markets established records by weight and by value but there was a noticeable slackening off in forward demand in the January-March, 1952, quarter, which has continued to this date. Despite this slackening in demand, the main plants continued to run at full capacity and the surplus earned in the last quarter held level with the average of the three previous quarters.

In connection with the matter of reorganisation, we have wound up five of the subsidiary companies in order to simplify the structure of our group, to economise and add to its efficiency by cutting out unnecessary inter-company work. Associated Phosphate Manufacturers Limited, Wm. Burton and Sons (Bethnal Green) Limited and Genoxide Limited have been wound up. Their surplus assets, after discharge of liabilities, have been taken over by the parent company and the respective businesses are now being conducted on a departmental basis.

EXPANSION PROJECTS

Laporte Acids, Limited, is now engaged in building at Hunt Works a new sulphuric acid plant designed to burn pyrites; the rated capacity is 100 tons per day of 100 per cent acid. A significant part of the output of this new plant has been sold for some years ahead.

Our continually expanding hydrogen peroxide business is the mainstay of the parent company, and the fact that efficiencies and outputs have been improved is a source of gratification to your directors but, on the other hand, looking ahead, the research department is continually striving to evolve still cheaper and better methods of manufacture.

Some major projects planned by the Laporte Group for cutting down expenses and making more goods are held up for lack of permission to embark on new capital jobs at the present time, but as circumstances permit we shall put our plans into operation.

The biggest job in hand at present is the building by our subsidiary, National Titanium Pigments, Limited, of the new titanium oxide plant with its attendant new sulphuric acid plant at Battery Works, Stallingborough, North Lincolnshire. These plants are likely to be completed by March, 1953. Meanwhile, N.T.P. results for last year were satisfactory, based on the limited output at Luton.

DIVIDEND INCREASED TO 12½ PER CENT

Referring to the consolidated profit and loss account, the surplus arising from last

year's operations before deducting depreciation and taxation is £988,341—that is, 17 per cent more than for the previous year. Then there is, a non-recurring item of £62,507, also subject to taxation. The total income after depreciation was £887,802 (subject to taxation) against the previous £690,137. When we estimate how much we shall set aside for future taxation liabilities for 1952-53, we find we need £493,128—an increase of £160,225 over the previous year.

The accounts disclose the amount available for allocation as £633,993.

After detailing the various allocations, the statement continues: We propose to pay a final gross dividend of 9½ per cent, making the total dividend on the ordinary stock 12½ per cent, less tax—an increase of 2½ per cent, leaving £323,435 to be carried forward, an addition this time of £134,842.

Despite the total income of about £1 million, cash was bound to be down after the rate at which we have been spending it on capital jobs. By the end of May, 1952, the group had exhausted its cash balances and is now relying on bank credits, which need to be paid back in the early autumn. Consequently, later in the year you may expect to receive a communication from the company outlining its plans for raising about £2 million of additional capital.

CONFIDENCE IN THE FUTURE

We face the future with confidence, but everywhere there are indications that for some time ahead people here and abroad will be curtailing expenditure, and we shall be exceptionally fortunate if our group does not feel the effect of it to some extent. On the other hand, there are strong factors in our favour. (1) We are manufacturers of essential chemical products for which there are found new outlets in both bad and good times because this is the chemical and engineering age. (2) There is a healthy, world-wide hunger for an even better standard of living and chemical industries under modern conditions will be in the foreground to supply the ever-widening needs of the other basic industries, and also of the so-called secondary industries. (3) Within the possibilities of the postwar times, British chemical industries (including Laporte) have made and will yet make great scientific progress by new discoveries and have created new productive capacities and built up strong reserves. In this connection the Laporte Group rejoices in the prosperity of other chemical and allied industries, included among whom are our largest customers. (4) There is a good feeling between employers and employees, who work well together to overcome difficulties as they arise.

Certainly our forward plans are based on the firm belief that when our group extensions now in hand are completed we shall need to go still further to meet the demands of present and potential customers. So we shall not be too perturbed if orders slacken off while some of our buyers use up some of their stocks before gaining confidence to renew their orders.

The report was adopted.

ASSOCIATED WEAVERS

SIR FRANK NEWNES ON RECORD TURNOVER

NEW MOQUETTE FABRIC CREATED

The sixteenth annual general meeting of Associated Weavers Limited, will be held at the Savoy Hotel, London, on July 30, 1952.

The following are extracts from the statement by the chairman, Sir Frank H. Newnes, Bart, which has been circulated with the report and accounts for the year ended March 31, 1952.

For the year under review your group's turnover, despite a falling off in sales during the second half of the year, was once again a record both as to exports and home trade, but, in spite of this and due to circumstances outside our control, our consolidated profit for the year dropped. The net profit after all expenses but before deducting taxation was £300,538, against £430,709 for the previous year. This result was, however, the second best in your company's history, which we consider is by no means unsatisfactory when taking into consideration that, during the whole of the year, prices of the raw materials we use continued to fall and so did our selling prices, with the result that we suffered continuously from stock losses. Our main export markets are still closed, either by reason of controls or saturation, and this had, and is still having, its effect on our sales.

The directors, therefore, do not consider it wise to increase the total amount distributed in dividend. They have already paid 10 per cent, less tax, on the ordinary stock before it was increased by the most recent capital bonus. They now recommend a final dividend of 18 per cent, less tax, making a total of 28 per cent for the year, requiring £42,575 net, against £42,891 net last year.

The group's current assets at March 31st last of £999,386 were more than three times our current liabilities and included £118,672 cash at bank and in hand, which figure by May 31, 1952, had risen to £300,939.

During the latter part of the year our Moquette Division created a new and very attractive "Twin Pile Weave" fabric, which met with instantaneous success and which, by reason of a new technique in weaving, as well as its designs and styling, we are able to sell at a very economical price. We fully believe that this fabric will further enhance the popularity of moquette as a furniture covering now and in the future.

The complete re-equipment of the Carpet Division with the most modern machinery is proceeding, and it is hoped that the new plant will be completely installed and running by the middle of 1953. In April the carpet industry was freed further from controls and we welcome this action by the Board of Trade, which will enable us to develop new styles and qualities unfettered by restrictive regulations. On June 2, 1952, with other British carpet manufacturers, we reduced our prices, roughly by 10 per cent. It is still too early to assess what effect this reduction will have on demand. In the meantime the popularity of our "Weavercraft" carpet squares continues to grow, although recently sales have been considerably affected by fear of purchase tax alterations.

The equipment of our Spinning Division is now complete and is one of the most up-to-date of its type in this country.

During the year under review our subsidiary, Armoxide Limited, continued to increase its sales in both export and home markets, both figures being a record for the company. Here, again, I am pleased to record that we produced a new type of plastic

cloth, which we named "Florestin," which met with outstanding success at the British Furniture Trades Exhibition early this year.

With regard to the current year, none of the past difficulties of raw material shortages exist, but one cannot overlook the fact that

as a result of circumstances outside our control there still are serious problems to overcome. While these difficulties continue they must adversely affect our trading results, although our group turnover and profits to date are better than might be expected in

view of current circumstances.

In conclusion, may I again thank our executive staff, employees, our sales organisation and their agents throughout the world for the teamwork which has enabled us once again to achieve such satisfactory results.

WIGGINS TEAPE & COMPANY (1919) LIMITED

A TRIPLE RECORD

SATISFACTORY PROGRESS OF NEW PROJECTS

MR L. W. FARROW ON CURRENT YEAR'S PROSPECTS

The thirty-third annual general meeting of Wiggins Teape & Company (1919) Limited, was held on Thursday, July 3rd, in London, Mr L. W. Farrow, CBE, the chairman, presiding.

The following is an extract from the statement by the chairman, circulated with the report:—

The results for 1951 have proved, in every respect, a record in the history of the company. This can be accounted for as follows: (1) the productions of paper, including those from our new projects and other manufactured goods exceeded those of any previous year, (2) the sales of our own productions and those of merchant papers were an all-time record both at home and overseas, and (3) the sales in quantities exceeded both the productions of our mills and purchases made, thus we were reducing our stocks of paper.

The record sales of our own productions and those of merchant papers would even in a time of normal business have produced considerably increased profits, but to these profits must be added: (1) profits accruing from stocks of raw materials held at favourable prices when prices of paper were advanced; and (2) profits resulting from sales of finished products out of stock.

NEW PROJECTS

I have referred in my statements during the past four years to our three new projects in this country, namely (1) the new machine at Chartham Mill for the manufacture of tracing paper, (2) the new machine at Glory Mill for increasing the productions of photographic base paper, and (3) the Bridgend Paper Mill in South Wales for the manufacture of tissue paper. All these new projects made satisfactory progress during 1951 and contributed their quota of the profits earned. I do not propose to refer specifically to these projects in my statements in the future, as the construction and running-in periods are, I am glad to say, completed.

The South African Pulp and Paper Industries, Limited, in which your company has a substantial interest, again had a record year of trading profit during 1951. Your directors continue to be very satisfied with this overseas investment and our relations with the management of SAPPI remain most cordial.

Our subsidiary, Pirie Appleton and Company, Limited, and its group of companies overseas, continued to make satisfactory progress.

CAPITAL EXPENDITURE

Now that the constructional work on our new projects has been completed it is appropriate to refer to the sums expended on capital account since the end of the late war. These amount to £4,911,435 and, in addition, your company has had to find large sums of

cash, amounting to £4,357,025, for the increased working capital required by the expansion of the group's business and the rise in prices, an aggregate of £9,268,460. Against this total, a sum of £4,498,560 has been raised (including £2 million second debentures raised during the year), leaving a sum of £4,769,900, of which £806,911 has been capitalised by the issue of bonus ordinary capital and £3,962,989 remains as an addition to our various reserve accounts and provisions.

It will be appreciated from the foregoing remarks and the figures referred to that every penny of profit earned, remaining after the payment of taxation, interest and very modest dividends, has been required to provide the group with funds to meet the expansion in the working capital of the group, brought about by the inflation in prices. Notwithstanding the record profits earned, owing to the drain on the cash resources of the group by the incidence of very high taxation, it was necessary to supplement the amount of profits ploughed back into the business by the issue of £2 million 4½ per cent second debentures.

With regard to the accounts, the only change in the capital structure during the year has been the issue of second debentures to which I have referred.

The unsecured bank loan of £500,000 which appeared in our last balance sheet has been paid off and the amount owing on acceptance credits has been reduced to £270,000 out of the proceeds of the debenture issue. The balance of the acceptance credits has been extinguished since the date of the balance sheet.

A sum of £533,598 has been set aside out of the group profits for the year to cover the computed actuarial liability in respect of pensions granted by the group companies and supplementary pensions payable under revised pension schemes to members of the staff and operatives who have retired at the date of the balance sheet.

GROUP RESULTS

The consolidated trading profits of the group for 1951 after providing for all expenses and increases in revenue reserves amounted to £5,023,541, compared with £1,814,713 for 1950. After allowing for taxation dividends applicable to outside shareholders and profits retained in subsidiary companies, etc., the profit of Wiggins Teape & Company (1919) Limited amounts to £1,610,208, compared with £854,330 for 1950.

A sum of £695,913 has been transferred to reserves against stocks of paper and raw materials, bringing that reserve up to £1 million, which, of course, has borne tax. Your directors are confident that this sum is more than ample to cover any losses which may arise on these stocks due to reductions

in prices of raw materials, having regard to the fact that such losses, when they occur, will be a charge against profits for taxation purposes.

Your directors are recommending a final dividend of 4½ per cent, together with a bonus of 1 per cent, both free of tax, making, with the interim, a total of 6½ per cent, free of tax, on the ordinary stock for the year 1951, compared with 4½ per cent, free of tax, for the year 1950. After transferring £1,218,000 to general reserve, bringing that reserve to a total of £1,766,089, the carry forward is slightly increased to £62,667.

THE CURRENT YEAR

With regard to the current year, there has been a serious recession in the demand for paper and paper products, not only in this country, but throughout the world. So far as the home market is concerned, several factors have operated to bring this about. Significant among these is the recession in other trades, notably in the cotton, woollen and rayon industries, where reduced outputs have brought lessened demands for many types of paper. Also, owing to fear of a severe shortage of paper, stockists and consumers acquired large stocks which they are now anxious to reduce before placing new orders. Finally, buyers of paper have been expecting reductions in prices following the fall in the prices of raw materials and consequently have ordered only their barest requirements. However, reductions in the prices of most types of paper have now been made, but it is too early to gauge their effect.

In the export markets, restrictions and quotas have been imposed by many countries, mainly due to the need for conserving currencies in their efforts to balance their imports and exports.

With regard to the outlook for your own group, the future is unpredictable, but I am able to inform you that we have made satisfactory profits during the first five months of the year before taking into account depreciation of our stock values of paper and raw material, for which ample provision has been made in the 1951 accounts.

THANKS TO STAFF

It is my pleasant duty once again to refer to our employees, both at home and abroad, and to express to them our sincere appreciation for their untiring co-operation, loyal service and praiseworthy work during the past year. We are proud of our company and we are sure that this feeling is shared by our employees in the mills, warehouses and offices both in this country and overseas, who have always given of their best to keep the name of Wiggins Teape right in the forefront as papermakers and synonymous with quality and good service.

The report and accounts were adopted.

SMITH'S POTATO CRISPS

DEMAND UNABATED

The twenty-third ordinary general meeting of Smith's Potato Crisps (1929) Limited, was held on July 9th, in London.

Mr F. Le Neve-Foster, the chairman, in the course of his speech, said: The results which I have to place before you today are satisfactory. The profit of the group before taxation is £242,585 as against £232,885 last year. After making the appreciably larger provision which is necessary for taxation, the net profit is £92,458 as against £101,633, a slight fall. The increased profit is attributable to larger profits in the subsidiary companies which have been more than sufficient to offset the fall of approximately £10,000 in the results of the parent company. This is due mainly to the improved profits which we have derived from our farms belonging to the Estates Company. So far as the parent company is concerned, we have encountered many difficulties arising from increased costs.

DIVIDEND AND APPROPRIATIONS

The directors recommend a final dividend of 20 per cent, plus a cash bonus of 5 per cent, both less income tax, making a total distribution equivalent to 32½ per cent for the year, which is the same distribution as we have made for the past years. Some of you may have seen a reference to our results in one of the leading daily newspapers, wherein, after referring to your company as "a little blue chip," the directors were chided for not increasing the dividend. While we feel highly complimented in your company being referred to as "a little blue chip," a compliment which we think is fully justified, we feel that the criticism of parsimony to the shareholders is not deserved. Of the net group profits for the year of £92,458, we are distributing £64,194, leaving a margin of £28,264 in respect of profits retained, which can hardly be said to be excessive.

Smith's Potato Estates, Limited, taken all round, had a good season and we believe that the policy of up-grading and improvement which we have pursued at the farms during the last few years is beginning to bear some fruit. Perhaps the greatest problem which faces this country today is the necessity for increased production of home-grown food. We are proud of our contribution towards this end.

The demand for our product continues unabated. Wherever food is served or sold, Smith's Crisps will be found. They are universally popular at picnics and in the home. Quality is ever our watchword. There are no crisps like Smith's.

RISING COSTS

The effect of rising costs, materials, etc., has been severely felt by many of our small competitors, and, as a result, several of them have closed down and gone out of business. Our supplies are still limited by rationing of essential materials, but we are not prepared to sacrifice the quality of our product, which is the keynote of our success, by the use of inferior materials.

Taking a world view, it looks as if supplies of many commodities are becoming more plentiful and commodity prices for the most part show a definite downward trend.

Under Mr Smith's inspiration, I have every confidence that, come what may, with the unrivalled and dominating position we have established in the trade and the experience we have gained and the resources available, this company will continue to give an account of itself which is worthy of its record in the past.

The report was adopted.

SPEAR & JACKSON, LIMITED

(Saw and Tool Makers)

GROUP SALES PROGRESS

VERY SATISFACTORY LIQUID POSITION

MR A. K. WILSON ON THE WORLD-WIDE HIGH REPUTATION

The forty-seventh annual general meeting of Spear & Jackson, Limited, was held on July 4th in Sheffield.

Mr A. K. Wilson, chairman and managing director, presided.

The following is an extract from his circulated statement:—

The sales of both the parent company and of the group show an increase compared with the year 1950, but, in spite of this, profits for 1951 are lower than those for 1950. This is due to the sharp rise in the cost of all our materials during 1951 and to increases in wages. Selling prices have been adjusted, but it must be borne in mind that competition in many markets has greatly increased and, in revising prices, regard must be had to the extreme importance as long-term policy, of retaining the company's widespread goodwill even at rather lower profit margins. Our subsidiaries all show increased sales and the Canadian company shows an increased profit. The American company has made a useful profit, although this is less than that for 1950. The South African company has made a small loss.

PROFIT AND LOSS ACCOUNTS

Consolidated Account of the Group.—The trading profit of the group is £265,986, compared with £278,770, and the net profit after meeting all charges and providing for the estimated taxation liabilities on the profits of the year is £88,543, compared with £104,173.

The balance carried to the appropriation account of Spear & Jackson, Limited, is £48,458, compared with £72,172.

Appropriation Account of Spear & Jackson, Limited.—After bringing forward from last year £30,808 and adding Spear & Jackson's own profit, £48,458, and the net dividends from subsidiaries, £2,754, the amount

available is £82,020, compared with £101,867 last year.

DIVIDENDS

The dividend on the preference shares for the year has been paid, which required a net sum of £2,100. The directors recommend a dividend on the ordinary shares for the year of 17½ per cent, requiring a net sum of £15,159, the same as for last year. After giving effect to these appropriations and recommendations the balance to be carried forward to next year is £29,761, compared with £30,808 last year.

BALANCE SHEETS

Taxation liabilities on the profits of the year have been provided for and adequate reserves made in respect of outstanding matters affecting Excess Profits Tax liabilities.

The liquid position of the company and of the group, and the position as a whole shown by the two balance sheets, is again very satisfactory.

GENERAL

Conditions, particularly in the export markets, became increasingly difficult owing to growing competition and the adoption by many countries of varying systems of import limitation. Shortage of labour has also remained a problem. However, the demand for our products throughout the year has remained in excess of our maximum output.

As I have said earlier in my statement, costs of production rose sharply during the year, and still continue to rise, but in spite of this we do our utmost, whilst maintaining our high standards of quality, to produce our products at competitive prices. To this end research is continuously being carried on and an order has been placed for a modern electric arc furnace, which will strengthen our steel-making resources and, at the same time, further improve the quality of our steels.

The rearmament programme has, as yet only partially affected us. We are in close touch with the authorities and are giving them every assistance possible. It is recognised, however, that the essential nature of our products to industry and to agriculture renders it desirable that our normal production should not be interfered with more than is absolutely necessary.

FUTURE PROSPECTS

I said last year that it was difficult and dangerous to forecast far ahead under existing conditions, and these words can be repeated with greater emphasis to-day. Although growing competition and increasing restrictions imposed by overseas countries on imports is a serious matter, I feel confident that with our worldwide sales organisation and high reputation we shall obtain a share of orders, both in the home and overseas markets, which will enable us to maintain full production.

In conclusion I would again express to the company's management, staff, and employees the board's appreciation of the high standard of workmanship maintained and the output obtained.

The report and accounts were adopted.

BRITISH INSURANCE

Last week the Chairman of the British Insurance Association claimed that the premium income of British insurers throughout the world exceeded £1,000 million. Perhaps one-third of these premiums are for ordinary and industrial life assurance; of the two-thirds that is received for fire accident and marine insurance overseas business accounts for several hundred million pound annually. The three articles that follow on the industry's achievements and problems form the first section of this year's survey of British Insurance. This week's issue of the Records and Statistics Supplement contains detailed analyses and statistical comparisons for the leading offices and for every branch of insurance business.

New Investment Perspective

THE total assets of British insurance companies must now exceed £3,500 million, and nearly three quarters of them are held in stock exchange securities. It seems probable therefore that the depreciation caused by last year's cataclysm in the markets amounted to well over a hundred million pounds. For the purely life offices and the life departments of the composite offices, the percentage depreciation last year can, in fact, be roughly estimated since most of their assets are held in British securities. According to the Actuaries' Investment Index, Old Consols fell by 13.4 per cent last year, debentures by 13.5 per cent, and preference shares by 11.8 per cent, while ordinary shares rose by 2.4 per cent. If these movements are weighted according to the average distribution of insurance assets in 1950, they suggest a fall of 7 per cent in their total assets (after making allowance for the stable value of mortgages, real property and cash). The non-life assets of the composite offices probably fared rather better than this, for many of their investments are held overseas to cover liabilities under

their large foreign business. These overseas investments include many United States Government bonds, which fell by up to 5 per cent last year, compared with a fall of upwards of 10 per cent in the types of British Government securities most favoured by the life funds.

Last year's depreciation would have been bad enough in itself, even if it had not come at the end of a quinquennium that comprised four bad investment years and only one moderately good one (1950). Between December, 1946, and December, 1951, 3 per cent Savings Bonds 1965-75 (which are perhaps more representative of the gilt-edged holdings of life funds than 2½ per cent Consols) fell by 24.3 per cent, while—to quote the Actuaries' Index again—debentures fell by 25.3 per cent, preference shares by 33.3 per cent and ordinary shares by 13.4 per cent. It is true that market prices at the end of 1946 were grossly inflated above the average prices at which the then existing assets had been bought, and that most of the £1,000 million odd of securities bought since 1946 were also purchased at prices some way below the Daltonian peak. Nevertheless, the depreciation on new

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country-house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write Major B. Carnegie, "Stronvar, Balquhitter, Perthshire."

PROFESSOR JOSUE DE CASTRO (Chairman of the Council of the Food and Agricultural Organisation of U.N., author of "World Hunger") will speak on "The Work of the United Nations Organisation" on Tuesday, July 15th, St. Paul's Cathedral, 6 p.m.

YOUNG MAN (24), Honours B.Sc. (Econ.), experienced statistics and research, now in motor industry, seeks market research or statistical post in London area.—Box 998.

APPLICATIONS are invited from young male research officers for the post of Market Research Assistant in the Sales Promotion Department of large progressive Company near Baker Street and Marylebone Stations. A degree in economics is desirable, but candidates must have experience in market research and the use of statistical methods. Commencing salary approximately £500 per annum according to qualifications and experience. Permanent pensionable post.—Write, giving full particulars of qualifications, experience and age to Box M.306, Willing's, 362, Gray's Inn Road, London, W.C.1.

DELIGHTFUL OLD COUNTRY COTTAGE burnt down. Protect YOUR home with a "Waterloo" Modern Fire Extinguisher (non-damaging). From £8. Write for leaflet and price list.—Read and Campbell, Ltd. (Dept. L.1), 75, Victoria Street, London, S.W.1. Phone: ABBey 2802-5762.

investments must have been substantial—particularly for those companies that have been expanding their life and annuity funds most rapidly since the end of the war.

It so happens that two such offices, the Eagle Star and Legal and General, published a quinquennial valuation of their assets and liabilities at the end of last year. The provisions that they made are instructive. Eagle Star provided £3,500,000 to meet depreciation on assets standing in the balance sheet (before writing off this depreciation) at £47.5 million; its total life funds in December, 1946, had amounted to only £22.5 million. Legal and General wrote £3,950,000 off assets totalling £164.4 million (before depreciation); its total assets (including some non-life funds) had amounted to £91.7 million five years before. (It is worth incidental notice that freehold and leasehold properties of this office showed a further and pronounced rise last year from £34.1 million to £46.6 million.) Depreciation provisions by other life offices that valued their liabilities at the end of last year are shown in detail in the current issue of the *Records and Statistics* supplement. They tell much the same story as the figures of Eagle Star and Legal and General, and so do the balance sheets issued at the end of last year by many companies for which no actuarial valuation fell due last year. The latter often attached a note to their balance sheets which either indicated that depreciation had been fully covered out of hidden reserves or else disclosed the amount of any short fall between the market and balance sheet values of their assets—although they were under no statutory obligation to do so.

The extent of the depreciation in non-life assets last year is not so easy to assess. Aggregate market values of non-life assets still exceed balance-sheet values for most, though not all, of the offices. But fifteen out of the twenty leading composite offices whose results are analysed in the current issue of *Records and Statistics* found it advisable to make transfers to non-life reserves of one type or another at the end of last year; since the number of such transfers was larger than in 1950 it seems reasonable to assume that some non-life funds were also feeling the pinch of depreciated investment values and depleted reserves by the end of 1951.

The figures analysed so far take the story only up to the end of last year. One insurance company, however, draws up its accounts at a later date than the others. The financial year of the London and Manchester ended on March 24th and this office has, therefore, had to face the additional depreciation since the turn of the year, including that resulting from the Budget. It is not surprising, therefore, that the company (which showed total assets, before depreciation, of £45 million) has increased its investment reserve fund from £1,225,000 to £4,350,000. During the first six months of this year, according to the Actuaries' Investment Index, 2½ per cent Consols depreciated by 9.8 per cent, debentures by 4.8 per cent, preference shares by 5.4 per cent and ordinary shares by as much as 16.1 per cent. This additional depreciation, on top of that already suffered since the end of 1946, suggests that only a few life offices could to-day certify that the present value of their assets still exceeds their balance sheet value after deducting any published reserve fund.

The differing procedures adopted to meet last year's depreciation of investments call for careful interpretation of the tables on page 133 that summarise the distribution

of insurance companies' portfolios last year and of the tables in *Records and Statistics* that analyse them in greater detail. In previous years, most offices had a hidden but variable margin between balance sheet and market values for each category of investment; National Mutual Life, which has consistently valued its stock exchange assets at market prices (maintaining an investment reserve fund to absorb investment profits and losses) was an exception. At the end of 1951, however, some of the offices whose hidden reserves were exhausted wrote down the values of the assets to current market values; the true distribution of their assets between various categories is thus now shown in the tables. Other offices, however, provided for depreciation out of published investment reserves, while others did not make any provision for depreciation at all; the distribution of their assets shown in the tables is therefore only approximately correct.

Following the practice initiated in this survey in 1951, Tables IIA and IIB provide separate analyses of the distribution of assets in the life and non-life funds of the leading offices. A substantial proportion of non-life assets is invested in overseas Government securities (especially United States Government bonds); British Government securities represent a much lower percentage of total assets for non-life than for life business, but cash and agents' and other balances are much higher; this is partly a matter of policy, because of the risk of large claims arising at any time, and partly a book-keeping arrangement connected with the system of agents' accounts and reinsurance treaties that sometimes obliges the non-life offices to grant credit for substantial sums and considerable periods.

Table I shows that the reduction in both the absolute amount and the proportion of total assets invested in gilt-edged, which began in 1949 and gathered pace in 1950, speeded up still further last year; nevertheless British Government securities still account for 32 per cent of total assets compared with only 17 per cent in 1938. These sales of gilt-edged and the net addition to the companies' funds enabled the offices included in the table to invest £212 million in other securities in 1951. As in 1950, the largest increases were in mortgages and debentures; the former rose by £51.8 million to comprise 11.3 per cent of total assets (10.2 per cent in 1950) and the latter by £38.8 million to comprise 11.1 per cent of total assets (10.4 per cent in 1950). Ordinary shares and properties also rose substantially last year, the former by £33.1 million to comprise 10.8 per cent of total assets (10.3 per cent in 1950) and the latter by £30.1 million to comprise 6.8 per cent of total assets (6.2 per cent in 1950). Cash and agents' balances of the 43 companies increased last year by £31.3 million to represent 8.2 per cent of total assets.

Table III shows that last year the average yield on the life and annuity funds of the leading offices began—but only began—to reflect the better returns that had been obtainable for some time on new money, as well as the widespread increases in ordinary dividends in 1951. Yields shown by offices that have provided for investment depreciation by transfers from life and annuity funds show larger increases than those that made no such provision; for this and other reasons the yields secured last year by some of the offices differ materially from the average and some show a much larger increase on the yield secured in 1950 than others.

From The London Assurance, which has been serving the public
for more than 200 years, comes this Vehicle of Information to tell
you about our omnibus collection of Insurance Policies.

"How to be Well Assured"
The many different kinds of
Life Assurance we provide
deserve a volume to them-
selves—and they have one.
Our booklet "How to be
Well Assured" has helped
many people to find the Life
Policy that suits them exactly.
Would it help you?

Valuable Advice

"Rings on her fingers and
bells on her toes, she shall
have cover wherever she
goes" if her jewellery, furs
and other valuables are safe-
guarded by our All-Risks
Policy.

No harm in asking

If you would know more
about any of the policies
outlined here, if we can
provide information about
any other particular policies
or about insurance problems
generally, pray make what
use of us you wish. Our
address is 1, King William
Street, Department M.6
London, E.C.4.

Aftermathematics

After a fire on business
premises the reckoning must
include not only material
losses but also reduced
earning power and trading
profits. An ordinary Fire
Policy plus our Loss of
Profits Policy sums up what
is needed.

THE LONDON ASSURANCE

Very good people to deal with

The Mark
that ensured

PROTECTION

In the early days, the Sun Fire Office used to provide
each policy-holder with a special plaque or 'mark'
bearing the number of his policy. This was affixed to
the insured premises and in the event of fire, the
Company's fire-fighters were authorised to extinguish
the blaze only after the premises had been identified as
being 'Sun Insured.'

Eventually, this practice was discontinued as Public
Fire Brigades developed, but for more than two
centuries the 'Sun' emblem has been recognised as the
symbol of Service and Security to be sought wherever
insurance is arranged.

BRITISH INSURED.

*They are taking no avoidable risks with this golden
crop—the wool for which nation will bid against nation.
It's insured on the sheep's back, in the shearing shed, on
truck and train and ship till it reaches the distant ports.
British Insurance Companies cover it all the way.*

**British Insurance Companies
back World Enterprise**

Issued by the British Insurance Association

In general, therefore, the figures shown in the tables call for cautious interpretation. But the broad picture presented by them is clear: In 1951 the 43 offices whose portfolios are summarised here, and which probably account for some 85 per cent of the total business transacted by the British insurance industry, showed an increase of £183½ million in their invested funds. Of this, £33.1 million went into ordinary shares, £8.1 million into preference shares and £38.8 million

into debentures. Without this massive annual new investment the stock markets would be even more unhappy than they are today. The accumulated investments of the insurance companies, and particularly those of the life and annuity funds, suffered from heavy depreciation on market values last year; but the depreciation that insurance investors really have to fear is that caused by moratoria on debenture services and passed dividends. There is no sign of such troubles on the horizon.

Valuations and Values

AT intervals of not more than five years every life office in this country has to carry out an actuarial valuation of its liabilities and submit a return on it to the Board of Trade; this return has to be accompanied by a certificate stating that "the assets set forth in the balance sheet are in the aggregate fully of the value stated therein less any investment reserve fund taken into account." The annual balance sheets published by each life office must also state "how the values of the stock exchange securities are arrived at." These are the two main obligations laid on insurance companies by the Assurance Companies Act of 1909. They do not specifically lay down the basis on which the valuation of the assets is to be made. In practice, however, the Act has always been interpreted as requiring that the valuation of marketable Stock Exchange securities should be at current market prices. For example, the Sun Life which valued its redeemable securities by the amortisation method at its recent valuation (for December 31, 1951), certified nevertheless that the total value of its quoted securities based on middle market prices was greater than the values shown in the balance sheet less the investment reserve fund.

Up to last year almost every life office could have issued a similar statement with its ordinary annual balance sheet, and some voluntarily did so. But last year's fall in security values has changed the situation radically. Several life assurance balance sheets made up at December 31, 1951, last showed that depreciation suffered up to that date had wiped out the margin between balance sheet and current values (whether previously retained in the form of hidden or published reserves). And there can be little doubt that the substantial further depreciation that has been experienced so far this year has reduced the current market values of many life funds to less than aggregate book values.

This raises problems in accounting terms which, fortunately, are less serious in real terms. The reserve that a life office has to hold in order to remain in sound shape is the aggregate amount that, when augmented by future premiums and net interest earnings, less expenses of management, will enable the office to meet its liabilities as they emerge. The office has to estimate three main unknowns—the future rate of mortality (which determines when the liability will emerge), the future cost of management, and the net rate of interest that it may earn on its invested funds. The first two of these are assessed on a conservative basis, so as to provide an ample margin for contingencies. There remains the question of the valuation rate of interest.

As is shown in Table III on page 133, the average net rate of interest on the life and annuity funds of 43 offices rose by 3s. 8d. per cent to £3 13s. 8d. per

cent last year. The rise in the yield on the assets at current market prices was, of course, considerably greater than this. The net yield on 2½ per cent Consols (allowing for tax at 7s. 6d.) rose last year by nearly 7s. per cent, while the net redemption yield on 20-year Government securities rose by more than 15s. per cent; a large proportion of life fund gilt-edged and debenture holdings (which accounted for 56.9 per cent of total assets at the end of 1950) are dated stocks and most of them now stand at a substantial discount, so that the increase in net redemption yields was particularly large last year. It seems clear, therefore, that all offices could legitimately have raised the net rate of interest assumed in their valuations by ½ per cent last year, and that many of them could have raised it by more than this.

Despite this, most offices undertaking valuations at the end of last year made only very conservative estimates of the increases in future yields on their funds. The average net rate of interest adopted in ordinary life assurance valuations made at the end of 1950 was 2½ per cent, while for those made at the end of last year it was a shade under 2½ per cent. In other words, the offices assessed their future liabilities at a greater total than they need legitimately have done and were estimating the eventual accumulation of their funds, at compound interest, at a lower future capital sum than present interest rates would justify. In consequence, the amount released from their actuarial reserves was smaller than it would otherwise have been, and some of last year's depreciation of investments was met by drafts out of trading profits. The actual releases from actuarial reserves following a given increase in valuation rates of interest is different for each office because the composition of business is different, but only the Wesleyan and General disclosed the amounts involved last year. It announced that in its ordinary branch an increase in the valuation rate of interest from 2½ per cent at the end of 1950 to 2¾ per cent at the end of 1952 released £289,000 (2.8 per cent) from actuarial reserves of £10,453,000. A release of this order is broadly representative of that which can be expected from an increase of one-quarter per cent in the rate of interest under a "net premium" valuation. The Wesleyan also announced a transfer to investment reserve of £370,000 last year, so that £81,000 of the depreciation that it suffered on its investments was met out of the year's trading profits.

It will be seen that valuation rates of interest, besides rising by less than they legitimately could have done last year, also started from a low level. In part this is due to the fact that under the "net premium" method of valuation, no specific provision is made for future bonuses on with-profits policies. The offices therefore assume a rate of interest that is 1 per cent or

FUNDS EXCEED £30,000,000

A FREELY MARKETABLE INVESTMENT IN A TRUST SPREAD OVER THE SHARES OF THE LEADING 30 BRITISH INSURANCE COMPANIES

INSURANCE UNITS

AT THE PRESENT TIME these Trust Units are particularly suitable for investors who seek a stable income combined with good prospects of capital appreciation.

Long Term Attractions

The insurance companies, whose shares constitute "Insurance-Units," have a common policy of maintaining a wide margin between what they pay out in dividends and what they earn. In the case of virtually all companies (with the exception of the Life companies, where other considerations apply), dividends are covered, often by a handsome margin, by income from investments. Other profits are added to the invested funds, thus increasing the income from which dividends are paid.

Dividend Prospects

Several of the insurance companies whose shares are included in the Trust Fund have recently declared increased dividends, and there are good prospects that these payments should be at least maintained.

Purchase of Units

The price of the Units is within the reach of the small investor, who is freed from any personal liability for calls on partly-paid shares included in the Trust Fund. Ask any Stockbroker or Bank for full details.

Offer price 9th July, 20/4½ x.d. Yield, calculated in accordance with Board of Trade requirements, 4½/7½%.

more below the net rate that they actually expect to earn, in order to make an arbitrary provision for future bonuses on with-profits policies. If depreciation in the market value of the assets of any office were to be exceptionally severe, this margin could be reduced, thereby releasing part of the reserves. Last year, however, the margin most definitely was not reduced, so that no office met part of its depreciation by anything that could be called a draft on future bonuses.

The picture that emerges from this survey is clearly encouraging. Those offices whose inner and published investment reserves were wiped out last year were able to meet the situation by reducing their liabilities to

a smaller extent than would have been justified. The further depreciation that has occurred this year can legitimately be met by increases in the valuation rate of interest; other adjustments of a more technical nature could also be made to the reserves, which are in several respects considerably stronger than is theoretically necessary. Provided that business in the books continues to expand, it can fairly be said that rising rates of interest are good for the life offices in spite of the concurrent capital losses that, in the end, need not be sustained on dated securities—and conversely that falling rates are bad, as was evident during the ill-fated Daltonian experiment.

British Insurance Overseas

A NUMBER of British offices transact such a large part of their non-life business overseas that it is only a slight exaggeration to say that for them the home market is of relatively minor importance. The British Insurance Association declared in 1948 that the overseas business of all United Kingdom insurers, including Lloyds' underwriters, accounted for 70 per cent of their total business. This estimate was made before devaluation and there has since been a sharp increase in the proportion of the total business, in terms of sterling, transacted in North America. The law calls for no differentiation in the statutory returns between home and overseas business—except for life assurance, where foreign business is significant but not important. Detailed information is, however, published overseas, in particular in the United States, where British insurers conduct a large business. Total fire, marine and casualty premium income of all United States stockholding companies, domestic and foreign, amounted in 1951 to \$5,720 million. Of this total, British offices last year secured \$618 million or 10.8 per cent; the proportion has been about 11 per cent since the war, compared with 14.9 per cent in 1940. The regrettable decline in the British

share of the expanding American insurance market is due largely to the postwar dollar shortage. Stringent requirements in the United States governing unearned premium reserves and provisions for outstanding claims call for the infusion of new dollar transfers if premium income is to be expanded rapidly; without such transfers, the growth of premium income is limited by the natural growth of the statutory reserves as they are built up from retained profits. The British offices have in the circumstances been compelled to regulate the rate of increase in their American business.

The accompanying table brings up to date the information given in an article in *The Economist* of October 1, 1949. Last year 57.6 per cent of the non-life premium income of the Royal-Liverpool and London and Globe group came from the United States. This group, alone amongst British insurers, still converts US dollars into sterling at \$4.86 = £1; at the current rate of exchange, the group's aggregate premium income would have been of the order of £98 million instead of £68.8 million shown in the accounts and the proportion of United States to total business 70 per cent instead of 57.6 per cent. The proportion for the Commercial Union was 42.2 per cent and that for the General Accident 61.2 per cent. Total premiums written by the British offices in America for fire, casualty and marine insurance expanded by \$25.1 million (5.1 per cent) in 1949, \$28.9 million (5.5 per cent) in 1950 and by \$67.2 million (12.2 per cent) in 1951.

Statutory underwriting profits in the United States considerably understate the profits actually earned, because insurers are required to set up unearned premium reserves equal to the whole of the premium for that part of the original term of the insurance that is unexpired at the date of the accounts. Many insurances in America are effected in advance for a number of years (usually three) and the unearned premiums represent a high proportion of the total premium payable. If acquisition costs (commission and management expenses) are put at 40 per cent, which is accepted in America as a fair figure, it follows that true profits will be understated during a period when premiums are expanding (as they have been for many years) by no less than 40 per cent of the difference between the premiums written and the premiums earned in a given year. This degree of under-

(a) The United States Companies are Associates and not Subsidiaries.

statement may thus involve a considerable statutory underwriting "loss" on long-term business. The aggregate premiums earned (that is, premiums written in the year, *plus* the year's release from unearned premium reserve for old business *minus* the appropriate additions to that reserve for new business) corresponding to the premiums written shown in the table were \$504.0 million in 1949, \$520.2 million in 1950 and \$572.0 million in 1951. The adjusted underwriting profits of the British offices after adding 40 per cent of each year's increase in the unearned premium reserve was \$57.7 million in 1949, \$15.8 million in 1950 and \$6.8 million in 1951—rather more satisfactory than the statutory results. The basis of American insurance accountancy has recently been altered in the State of New York, where an important part of all United States insurance business is transacted. Where premiums on long-term contracts are payable in instalments, only the amount actually paid during a given year is to be brought into account instead of, as hitherto, the whole of the premium. The new procedure will cause a "reduction" in premiums written—which correspond to the premium income from American business included by British insurance companies in their accounts—but it will not affect the amount of premiums earned on the American basis in each year, as it will be compensated for by a corresponding reduction in the statutory unearned premium reserves.

There is no reason to think that the average experience of British insurers in America last year differed materially from that of American companies. Fire insurance was normally profitable, but "extended coverage" insurance, which includes windstorm damage, continued to be unsatisfactory for many offices, because of late reported losses from the disastrous windstorms that swept through the north-eastern United States in November, 1950. Other classes of insurance were reasonably profitable in America, as elsewhere, with the marked exception of motor and employers' liability insurance. Both factors involved insurers in heavy losses; in motor insurance, soaring repair and replacement costs far outran increased premium rates, and both classes were affected by unprecedentedly high court awards for damages. The loss experience of all insurers, domestic and foreign, in motor insurance was so bad last year that immediate and substantial increases in premium rates were authorised by the Commissioners of Insurance in most of the states. This move was unprecedented; in a regulated insurance business such as casualty insurance, applications for rate increases have to be submitted to the Insurance Commissioner of each state, and have hitherto been granted only after considerable and costly delay. These increases should go some way towards bringing American motor insurance business towards balance, and the further rate increases that were recently requested, if granted, should put it on a profitable basis in 1953 if not in 1952 unless claims again increase.

Although United States business of the British insurance companies accounts for about one-half of their total non-life premium income, it makes an erratic and on the average none too generous contribution to profits. In Canada, where the reserve requirements are much the same as in the United States, British insurers secure a larger proportion (about 40 per cent) of the total premium income. Fire losses in Canada returned to normal last year after exceptional fire wastage in 1950 from two

serious conflagrations. Motor insurance losses in Canada increased sharply during 1951 making the business unprofitable to insurers there as elsewhere in the world.

British insurers operate directly or indirectly in practically every other country in the world. Many countries overseas are trying to retain as much insurance business as possible within their own boundaries and many are fostering their domestic insurance industries, sometimes by outright discrimination against foreign insurers. State reinsurance organisations are common, notably in South America. Onerous controls to which British insurance is subjected all over the world may be aimed primarily at safeguarding local policyholders. But too often the next stage is to protect an indigenous insurance industry by forcing foreign insurers to conduct their business under relatively disadvantageous conditions. That the British insurance industry continues to operate successfully and, on the average, profitably throughout the world is due partly to the reputation it has acquired over many years for scrupulous dealing and the most careful attention to local laws and requirements.

*

Reasonably comprehensive statistics are available of the overseas life assurance business of the British insurance companies. In 1949, the latest year for which the statutory returns to the Board of Trade are available, £65.0 million (12.3 per cent) of the total new sums assured by such companies represented overseas business. Statistics published by the Life Offices' Association and the Associated Scottish Life Offices for the first time last year showed that overseas new sums assured in 1950 amounted to £75.3 million (12.7 per cent) out of total new business of £593.2 million; as the total includes the considerable new business transacted in the United Kingdom by Commonwealth offices, the proportion of aggregate new business transacted overseas in 1950 by the United Kingdom offices was rather greater than 12.7 per cent. The Gresham Life, the Legal and General, the Mercantile and General (which transacts reinsurance business only), Norwich Union Life and Prudential account for a large proportion of all the overseas life business of British offices, and of these the Prudential alone accounted for 44 per cent of the whole in 1950. As all but a small proportion of the profits accrue to the with-profits policyholders in the form of bonuses, the transaction of life assurance business overseas does not yield any significant contribution to insurance earnings abroad. It is, however, important for prestige.

The information published by the British Insurance Association in 1948 included an estimate of the average overseas earnings of British insurers, including Lloyds underwriters, of £33 million taking into account both underwriting profits and interest earnings on the invested reserves. It is unfortunate that no later authoritative estimate is available; the devaluation of sterling in 1949 may have added about £10 million to this estimate, but, on the other hand 1950 and 1951 were lean years for insurance companies in America. Published underwriting profits in America in 1950 were only 0.6 per cent of premiums and there was an overall underwriting loss in 1951 compared with the average profit of 6 per cent of premium income that forms the basis of the Association's estimate. These results, however, greatly understate the true addition to the equity of British insurance business in the United States during the last two years.

Defeat for Isolation

ONE thing can now be said with confidence about the next President of the United States, and it is of the first importance to the free world. He will not be an isolationist or a neo-isolationist, whether the Republicans or the Democrats are victorious in November. The collapse of the Taft forces in Chicago, the very citadel of isolation, and the sudden landslide, on the first ballot, to General Eisenhower, mean that under a Republican Administration the main direction and emphasis of American foreign policy would remain unchanged. There will be no paralysis in Washington during the campaign, as there might have been if Senator Taft had won the nomination. The new Administration can be counted upon not to beat any hasty retreats from the international leadership America has assumed, and not to plunge into any reckless adventures in the Pacific.

It has been argued that the outcome would not have been very different if Senator Taft had been the Republican choice. Foreign policy would have been in the thick of the campaign, but it would have been reasonably certain throughout that Senator Taft would not win the Presidency and that another Democrat would be returned to carry on Mr Truman's foreign policies. But this argument takes no account of the reasonable feeling of many Americans that twenty years is long enough for any party to remain in power; the scandals of the past two years suggest that there are cobwebs which only a new broom can reach. It also ignores the great desirability of associating the Republicans as closely as possible with the revolution in foreign affairs which has taken place in the past decade, and giving them a sobering taste of responsibility. This might not transform the McCarthys and the Kems, but they would be kept on a shorter rein, if only because of the power of a President of their own party to grant or withhold patronage and other favours.

It is generally agreed that what undid Senator Taft's carefully laid plans to capture the nomination, whatever the cost to his party, was the conviction that he could not win the election and that he would drag other Republicans down to defeat with him. No Gallup poll could be found to suggest that Senator Taft could beat any Democrat, while General Eisenhower seemed able to lead the whole field. But although the political leaders from the wavering States were cynically determined to back a winner for the nomination, it is more reassuring that, in their cold judgment, the American people could not be persuaded to support the extreme and inconsistent policies and the unscrupulous tactics of Senator Taft's faction. When a party is out of power in Washington, its state governors have their fingers most firmly on the public pulse. All twenty-five Republican governors demanded fair play at the convention; only three supported Senator Taft. The mythical monster conjured up by the Communists and neutralists of an America half war-mongering and half retreatist, half MacArthur and half Hoover, was blown sky-high at Chicago.

General Eisenhower has yet to prove that he can be an inspired

political leader, but he has already provided, as Mr Walter Lippmann has pointed out, a rallying point for Republicans of moderate and responsible opinions on foreign affairs. The question is whether he can consolidate his victory over the old guard, and redeem, in his campaign for the Presidency, the lapses and compromises of his campaign for the nomination. Fortunately, the speed and completeness of his triumph at Chicago mean that the General has accumulated relatively few political debts. He lost no time in paying a mollifying visit to Senator Taft, but the vice-presidency has gone, not to Mr Knowland, the "Senator from Formosa" or to Senator Dirksen, the demagogic nominator of Senator Taft, but to Mr Nixon, the junior Senator from California. He was chosen because he would add appeal to the team, not as a sop to the defeated. Mr Nixon is a remarkable vote-getter in a politically critical state, and his selection will please the booming west coast; he has youth; and though once connected with the Un-American Activities Committee—he put the first finger on Alger Hiss—he has never been guilty of Senator McCarthy's excesses.

None of the disasters that have been averted in Chicago mean that, if the Republicans are victorious, an Eisenhower Administration will usher Europe into the promised land. General Eisenhower himself, for all his European experience and sympathies, is a mid-westerner by outlook and a cautious man with a dollar. Moreover, he will have to consider his own rank and file, who are chiefly concerned to bring expenditures and taxes down; it will not be easy to convince the Republican party, traditionally a high tariff group, that more imports and a more liberal trade policy are the only alternative to continued heavy foreign expenditures.

The real difficulty about a Republican Administration, however, is that it is almost certain to be saddled with a

Republican Congress in which the backward-looking elements of the party greatly outnumber those who secured the nomination of General Eisenhower. The House follows the Presidential election returns and, if there is a Republican majority, the committee chairmanships, in most cases, fall through the seniority rule into the hands of the old guard. To some extent this would also happen in the Senate, though Senator Wiley has been working hard to show that he is big enough to fill Senator Vandenberg's boots and there is a leavening of other modern-minded Republicans. The further irony is that some of the worst Republican Senators may be swept back to Washington if there is an Eisenhower flood. The odds this year, however, are all against a Republican sweep in the Senate, and if General Eisenhower is elected, he probably will be able to rely on a coalition of Democrats and liberal Republicans to carry through his international policies.

But so far the General has only won the first battle. He has still to win the last. On this it would be foolish to prophesy and the Democrats will enter the contest with high hopes, particularly if they can convince Governor Stevenson of Illinois that it is his duty to run. They start with the advantage that there are several million more registered Democrats than there are Republicans. Voters who have come of age in the past twenty years have known nothing but a Democratic Administration. The Democratic candidate, whoever he may be, will be able to offer prosperity with one hand and a crusade for human rights with the other. It is a formidable combination, and General Eisenhower, unlike Mr Willkie and Governor Dewey, may well suffer from not being a progressive at home. All that is certain is that it will be a disaster for the liberal wing of the Republican party if, having for the fourth time forced the choice of an internationalist candidate, the party once more goes down to defeat.

Exports and Arms

THE Prime Minister announced on Wednesday, during some vigorous questioning in the House of Commons, that the Government will soon announce "the very serious measures which are being taken in all fields in order to enable us to pay our way." The wisdom of this vague warning may be questioned, but there should be general relief that the House of Commons is to have a full discussion of the economic situation. Much has changed since the Budget debates began last March. It is essential to show, before Parliament rises for the summer, that opinion and policy are being kept in touch with events.

On one matter general agreement ought now to be easier than it was in the Budget debates. Then unemployment was increasing and some members on both sides of the House saw reasons for fearing that it would go on increasing. It has not. The slump so widely prophesied for 1952 has proved to be a mirage. This does not mean, of course, that a slump cannot happen. It does mean that the danger of a slump should not remain a factor in calculations of immediate policy. The number of people out of work is now showing its normal seasonal fall. There are signs that even the recession in textiles is past its worst. And elsewhere there have scarcely been even the beginnings of a recession. If the textile and clothing trades are excluded, unemployment last

month was almost identical with unemployment in any June from 1948 to 1950. The abnormal time was the summer of 1951, when inflation was at its most acute; a mad scramble for labour and raw materials all but eliminated unemployment—and the country imported far more than it exported. No one thought at the time that such a position could or should be sustained. Yet the only sense in which there is now a slump, or even a general recession, is that the economy has returned from this inflationary extremity to the condition of earlier postwar years—that is, to a level of employment as high as the most optimistic ever thought practicable.

Both Government and Opposition ought to be able to take this as their starting-point in the debate. It makes most of the speeches on the Budget out of date. The main burden of criticism of Mr Butler's policy, from both sides of Parliament, was that it was too tough, that it might produce too much deflation. Four months ago, when unemployment was rising, this line of argument was unconvincing but it was at least plausible. Now it has been proved wrong. Criticism can take only one form. Whatever the party views may be on particular matters, on the central issue the question must be this: Is the Government's policy still about right, or is it too mild to bring Britain's payments into balance? Any suggestion that it is too tough can be laughed out of court.

The Chancellor's speech in the debate may be expected to fall into two parts. He may be able to give some reasons for believing that the apparent ineffectiveness of his policy is mainly a lag in time. But unless he can show that it will very quickly become more effective, he must also announce new measures that will not so much reinforce as transform his policy. There is no other way that can give any real hope of solvency or any firm confidence that the country will scrape without disaster through the first year of this government's life.

It is too early to make confident guesses at the balance of payments in the first half of the year. But the visible gap between imports and exports has been £470 millions, compared with £550 millions in the first half of 1951. The improvement is perilously small. In recent months, it is true, the import cuts have begun to have a clear effect. From April to June the volume of imports was about 11 per cent smaller than in the same three months of 1951. But at the same time the volume of exports has fallen by 13 per cent. The gap between imports and exports has been narrowed only to the extent that the terms of trade have become more favourable to Britain; compared with the same period last year, export prices have risen more than import prices. It would be hazardous to rely on a continuing change of this kind. Indeed, Mr Butler himself seems to think it unlikely. The burden of his speech at Exeter last week-end was that British export prices are already so high as to endanger their competitive power in foreign markets. If prices are forced up by rises in wages, much trade—even in engineering products—will be lost.

The only new point in policy that Mr Butler has raised since the Budget is this appeal to the unions not to press for wage increases. No one can doubt that restraint is important; if wages are pushed up fast, the chances of increasing, or even maintaining, British exports will be small indeed. But this does not mean that appeals for wage restraint, even if they are successful, can play a positive part in restoring the British economy. Mr Butler is using the only argument that can be put to the unions: if they will be content with present wages, prices will on balance be constant or may even fall. The workers will therefore remain at least as well off as they are. But when production is not increas-

Moscow-Peking Axis

FOR more than a year and a half the Chinese People's Republic has been carrying on a war with the support of Russia as a non-belligerent ally. No Russian soldier has been in action on the battlefield, but China has been given indispensable help in the shape of armaments and specialist training for its forces. In the last resort there has been also the latent threat of direct Russian intervention if the war were extended to Manchuria. Now that there is a prospect, in spite of continually repeated delays and deadlocks in the truce negotiations, of an end to the Korean war, there is much speculation about whether Russo-Chinese ties are likely to remain as close as they are at present or are to be loosened when the pressure of the war in Korea is no longer operative. This question is related to the fact that this is the year by the end of which Moscow is bound by the Mao-Stalin treaty of February, 1950, to retrocede to China the rights in the Manchurian railways, Port Arthur and Dairen,

ing, people can in fact remain as well off only if the country continues to import more than it exports. If the external gap is to be closed—without running down stocks to a dangerous extent, without crippling industrial investment even more than Mr Butler already proposed to do, and without a further slowing down of rearmament—then the consumption of the British people cannot remain as high as it is. The choice lies in how far they should consume fewer imports and how far they should consume fewer British goods in order to make bigger exports possible. In either event the cut can be made effective only if incomes are reduced or if prices rise more than incomes. Wage restraint, as Mr Butler appeals for it, would not achieve either of these aims.

The need is now, as it has so often been before, to reduce the real demands on the British economy. There are, admittedly, no demands that can easily be cut. Certainly industrial investment ought not to suffer any more. Politically, the most popular thing to do would be to cut the rearmament programme; there are disturbing indications that this is Mr Churchill's intention. It is true that solvency must be put first; but security ought to come a very close second. There are many things—300,000 houses among them—that should be far lower down the scale. For the Conservatives to retreat still further from Labour's rearmament programme, rather than sacrifice their inflated housing programme, would be one of the grossest surrenders of principle to popularity that British politicians have ever made.

Mr Butler must be expected to be more courageous. His policy depended on the assumption that, if everything turned out as well as could be, Britain's foreign payments might just be balanced without cutting into consumption at home. The present signs are that consumption is being maintained, but the payments gap is not being closed and rearmament is making slower progress than was intended. Can Mr Butler show that those fears are unjustified, that a dramatic improvement in exports may be confidently expected quite soon? There is, unfortunately, no reason to think that he can; and if he cannot, he surely will not be content merely to tinker with his policy until Parliament reassembles in the autumn. To do so might conceivably invite a crisis before the autumn.

secured to Russia by the secret Yalta agreement of February, 1945, and the subsequent agreement with Chiang Kai-shek in the autumn of the same year.

From a Russian point of view there has never been any reason for renouncing the strong strategic position conferred by these treaty rights except the assumption that Communist China would be a reliable ally. The Yalta agreement restored the position which Tsarist Russia had held in Manchuria before 1905; this was Stalin's price paid by the United States and Britain, at China's expense and without its consent, for his entry into the war against Japan. Faced with the decision of the Big Three, the Chinese Government, then headed by Chiang Kai-shek, was compelled to make the cessions already agreed on. The pill was sugared for Chiang by a Russian undertaking to hand over Manchuria, apart from the cessions, to the Chinese ("National") government after a period of Russian military occupation.

However, the subsequent behaviour of the Russians in obstructing the entry of Chiang's forces into Manchuria and turning over captured Japanese arms dumps to the Chinese Communists showed that, even with the position they had gained by the Yalta cessions, they were not willing for Manchuria to be controlled by a Chinese government friendly to America. This policy did not necessarily imply, in the autumn of 1945, an unlimited commitment to the side of the Chinese Communists—there is reason to believe that Moscow at that time doubted their capacity to win the whole of China—but rather the aim of having a separate Soviet-sponsored regime in Manchuria on the lines of the Japanese "Manchukuo." With the victory of the Communists throughout China, the separation of Manchuria has become superfluous from the Russian point of view—but always provided that the present regime in Peking is regarded as loyal and reliable.

When Mao Tse-tung returned from Moscow in February, 1950, he was able to show the Chinese people a treaty in which Russia had retroceded to Communist China the rights which had previously been extorted from Chiang Kai-shek. This gained Chinese patriotic approval for both Mao and Stalin; but the fact that Russia did not undertake actually to transfer the rights to China before either the conclusion of a peace treaty with Japan or the end of 1952 (whichever might be the earlier) suggests that Stalin was determined to put Mao on probation for a period before finally parting with such valuable guarantees.

There were early in 1950 widespread expectations in this country, and to a lesser extent in America, that the Chinese Communists, once in power, would not wish to bind themselves too closely to Russia. Tito's example was fresh in the minds of political observers and the Communists of China appeared to have been much less indebted to Russian support than those of Eastern Europe; Chinese national pride and traditional anti-foreign feeling were also quoted as ground for believing that even a Communist China would never submit to a Russian control of its foreign policy. Among those who nourished such hopes of a good understanding with the new China there are some who still argue that if the United Nations in Korea had never gone north of the 38th parallel, if Formosa had not been denied to Peking and if China's seat in the United Nations had been given to the People's Government, all would have been well. In general, however, the optimism about China which used to be so prevalent in official and business circles was based on an underestimate of the importance of ideology in determining the behaviour of Communist leaders. Particularly in China, foreigners who had had long experience of the country and had been accustomed to deal with politicians of "war-lord" and Kuomintang days were unable to believe that Marxist-Leninists would act in accordance with a conception of the world as divided into two irreconcilable "camps." However unreal and fantastic this conception may appear to the liberal mind, it is what Communists believe and act on, and nothing but disappointment and catastrophe has ever come from dealing with them on the assumption that it is not.

For Communists in power, alliance with other Communist states against the free world (that is, against

the "imperialist camp") is something to be taken for granted. The case of Tito does not disprove this generalisation, for he did not want to be a Titoist; he had to be, as the only alternative to his political elimination. Moscow overreached itself in trying to carry out a purge in Belgrade, and instead of obedience met an act of defiance which it was impossible to condone. But there is reason for thinking that the lesson has been well learnt in Moscow, and that Stalin will not again make such a mistake with a satellite or allied state which cannot be directly coerced (as can Poland or Rumania) by Soviet troops stationed in its territory. Certainly in relation to China (which is in any case a country on an altogether different scale from the nations of eastern Europe), there is no evidence that Moscow has attempted the kind of interference that drove Tito out of the fraternity of Communist states. On the contrary, such reports as filter through indicate that the Russians there are extremely careful to avoid giving any impression of domineering the Chinese. For example, in Manchurian factories where Japanese technicians used to give orders directly to Chinese workmen, the Russian advisers who have replaced them always use a Chinese intermediary. One curious feature of the present situation is said to be that

Chinese industrial managers now seek Russian advisers in order that, if anything goes wrong, the Russian can be blamed.

There is no doubt that the Russians are rapidly building up China into a considerable military power. The equipment which is being lavishly supplied is of excellent quality. But this military development, while greatly increasing China's capacity to make trouble for the "imperialist camp," cannot in any foreseeable future make China a real rival in power to the Soviet Union. There are no signs that Russia is trying to build up the industry of China at a pace corresponding to the arming of men. Apart from oil-drilling machinery for the new oilfield in the north-west, there does not appear to have been so far any really large-scale supply of capital goods from Russia to China, as distinct from finished war material. It may be that Russia could not in any case afford to industrialise China at high speed from its own resources; but, whatever the possibilities, a policy of arming, without industrialising, China appears best suited to the Soviet interest of maximising the power of the Communist world block while retaining its leadership in Moscow. For the Chinese Communists it offers an attractive prospect of cutting a figure in world affairs in keeping with what Chinese in general think it should be and of ability to pursue a strong forward policy in South

East Asia. Although China remains by far the weaker partner in the Moscow-Peking Axis, it can take far greater risks; for whereas Russia cannot count on being able to make a major aggressive move without risking an all-out war complete with atomic bombing, there does not seem to be any reason why China should not indulge in a series of adventures with immunity from such counter-attack.

The fact that any war against China is regarded by Western strategists as a strategic diversion—the "wrong war in the wrong place"—gives Peking a capacity for mischief which is not likely to diminish even if the Korean war is brought to an end. For Russia it is most

The Census—I.

A Nation of Clerks

THE preliminary results of the 1951 Census have now been published in the first of two volumes (HMSO, 17s. 6d.) based, for the sake of speed, on a representative sample of one out of every hundred. Although the sample was chosen with reasonable care, its smallness no doubt introduces some degree of error here and there. But for most general purposes the snapshot record is good enough, and the Census Office is to be congratulated on making so much available in so short a time—with the welcome innovation that figures are given for the whole of Britain, instead of Scotland being confined to separate and differently arranged volumes.

No Census was needed to show that the population is ageing, but over twenty years the change is so sharp that it must be noted first. Longevity, it should be said, is entirely responsible for the considerable increase in the number of pensioners. In spite of the rise in living standards, people do not—fortunately—retire from work earlier than they did in 1931; indeed, if anything, they go on working longer.

The British people live longer than they did in 1931, but they marry earlier. The increase in the number of young married couples is particularly marked in England and Wales rather than in Scotland. But even in the country as a whole the proportion of women marrying between the ages of 20 and 24 has almost doubled. In 1931, out of every 100 women in this age group 25 were married; in 1951, the proportion was 47 out of every 100. Not nearly so many men are married as young as this, but they, too, are marrying earlier than

1—AGE DISTRIBUTION (Great Britain)				
In Age Group	% of Men		% of Women	
	1931	1951	1931	1951
0-14	25.5	23.9	23.0	21.3
15-24	17.9	13.1	17.0	12.8
25-34	15.9	14.8	16.0	14.1
35-44	13.0	15.7	14.1	14.9
45-54	11.9	13.6	12.5	13.7
55-64	9.2	9.6	9.4	11.1
65-74	5.0	6.4	5.7	8.2
75 and over	1.7	2.8	2.4	4.1
All ages	100.0	100.0	100.0	100.0

satisfactory to be able to make trouble for the democracies, to extend, pin down and exhaust their forces, by encouraging China to pursue policies which can be undertaken in safety because of Russia's direct or indirect protection. For the Peking Government the partnership works well and it is difficult to see how Britain or America could bid China away from it as long as they do not intend either to hand over Japan to Communism or to accept a Chinese hegemony over South East Asia. It is best for British and American statesmen to prepare for a long period of cold war and armed containment in the Far East without hoping too much from their powers of diplomatic seduction.

they used to do. Sociologists may vie with economists in finding reasons for this, but the higher real earnings of the younger workers must be one of the most important. It certainly seems that the housing shortage has been little deterrent to marriage.

For women, the change has not been just a matter of marrying earlier if at all. Well into the middle age groups, a greater proportion of women are married today than twenty years ago. Here there can be no doubt about the main reason; although there are still fewer men than women at these ages, the deficiency is appreciably less than it was.

This ratio between the sexes depends, of course, first on their relative numbers at birth and then on their differing rates of survival. More baby boys are usually born than girls, but they are more difficult to rear and at all ages the death rate is higher for men. Indeed, women are now outliving men to an even greater extent than before. Among every five people over 65, three are women. But the high proportion of boy babies born during and since the war has increased the male superiority among children. When this generation reaches marrying age there should, therefore, be comparatively few superfluous women—as the demographers have been ungracious enough to call them.

The Census shows how wrong it is to suppose that almost all men marry women rather younger than themselves. A million and a quarter husbands have wives whose ages fall in a higher age group than their own.

The Census provides little new information about divorce. It records only those divorced people who have not re-married; unfortunately, no questions were asked about the age at which marriages were dissolved. But divorced men more often re-marry than do divorced women, since at all ages more women are returned as divorced. For every 1,000 married women between the ages of 30 and 44, there are about 16 divorced women; for men the proportion is about nine.

The most important section of the Census is the occupational classification, showing what kind of jobs people do rather than the industry for which they work. It gathers together all the clerks, all the business managers, all the professional people, whether they work for the National Coal Board or for a cotton mill. It shows how

many are employers of others and how many work on their own. For the first time since 1931 it is possible to see exactly what the British worker does.

It is not surprising to find that although the number of people working, or looking for work, has risen in England and Wales by nearly 8 per cent, there are fewer working on their own account. Some of the home trades, such as dressmaking, have declined sharply. There are a few—but only a very few—more employers and managers, though in many industries the number of foremen for every thousand workers has increased.

Attempts to compare in detail occupations now and

twenty years ago are hampered by the statistician's familiar boggy—small changes in classification. In Table 4, such adjustments for these changes as are possible have been made. The decline in agriculture, mining and textiles and the development of engineering

3—WORKING POPULATION, 1931 AND 1951
(England and Wales)
(Thousands)

Status	Men		Women

4—MAIN CHANGES IN OCCUPATIONS
(England and Wales)

Occupation	Numbers occupied (Thousands)		% change from 1931 to 1951
	1931	1951	
Expanding:			
Defence	290	708	+144
Chemical trades	51	105	+106
Clerks, typists, etc.	1,273	2,124	+67
Professional and technical	799	1,249	+56
Metals, engineering	1,692	2,487	+47
Building, contracting, painting and decorating..	901	1,137	+26
Miscellaneous	2,693	2,911	+8
Other manufacturing occupations	1,179	1,199	+2
Contracting:			
Commerce and finance	2,071	2,001	-3
Transport and communications	1,635	1,532	-6
Agriculture and fishing	1,200	1,061	-12
Clothing and leather trades	842	736	-13
Personal service	2,406	1,890	-21
Textiles	858	564	-34
Mining and quarrying	963	604	-37
All occupations	18,853	20,308	+8

and chemicals are the well-known industrial trends shown by the ordinary employment statistics. The two most striking facts brought out by the Census are the increased number of professional and technical workers and the monstrous growth of clerks and typists; this group now absorbs one out of every ten workers in the country. About 500,000 of these are typists or secretaries; the remainder are costing and accounting

5—THE OLD AND THE RISING PROFESSIONS
(England and Wales)

	Numbers (thousands)			
	Men		Women	
	1931	1951	1931	1951
Clergy (Church of England), Roman Catholic priests, etc.	20.0	17.6	...	0.4
Doctors and radiographers	4.0	7.6	8.6	6.3
Dentists	26.5	33.0	2.8	8.9
Teachers (excluding music)	11.1	11.4	0.4	0.9
Judges, magistrates, barristers	79.5	121.8	181.8	182.9
Solicitors	3.0	3.1	0.1	...
Architects and town planners	15.8	16.6	0.1	0.4
Accountants	9.1	15.0	0.1	0.9
Authors, editors, journalists	13.8	26.2	0.1	0.8
Civil engineers and surveyors	15.8	20.3	3.2	6.4
Mechanical and electrical engineers	21.8	52.5	0.1	0.2
Scientific workers (including laboratory assistants)	11.1	41.5	...	...
Painters, sculptors, etc.	25.6	89.1	2.7	22.2
	10.2	9.8	5.7	5.6

clerks, book-keepers, office machine operators and a multitude of different categories of clerical workers. It is to be hoped that some day the Census Office will sort them out more clearly. In the age of form-filling and filing, that would be no more than common justice.

What of the professions? Table 5—in which the new figures have been adjusted (for example, by omitting article clerks) in order to bring them into line with the old—shows how differently the professions have fared since 1931. Law and dentistry, for example, have expanded very little, and the Church of England has fewer clergymen; Roman Catholic priests, on the other hand, have nearly doubled in number, although there are fewer nuns. The boom has been in the engineering and scientific professions—where numbers have doubled or trebled—and in accountancy. Women teachers remain about as numerous as in 1931, although considerably more men are teaching.

For every 1,000 men in the labour force there are 442 women today, compared with 424 in 1931. Women clerks and typists have more than doubled in numbers; domestic servants have almost halved. There are 130,000 more women shop assistants in England and Wales alone—but men shop assistants have decreased by more than that. The textile industry employs 200,000 fewer women although it still remains one of the chief occupations for women. A most striking change is that 20 out of every 100 married women are going out to work, compared with only ten in 1931. The last table shows that the factories and "charring," rather than the offices, are the most popular workplaces for those women with homes to look after as well.

There is much else that can be traced in the Census of Occupations: the decline of craftsmen such as the cabinet maker and the stone mason while the plumbers and the bricklayers grow in number; the growing use of the telephone and even the coming of the automatic

6—THE MAIN WOMEN'S OCCUPATIONS
(Great Britain)

Occupation	Women Workers (Thousands)	Women as % of Total Workers	Married Women as % of All Women Workers
Clerks, typists, secretaries	1,416	61	26
Domestic servants	783	93	38
Shop assistants	614	68	37
Textile workers	419	65	50
Garment workers	394	83	37
Nurses	237	89	21
Charwomen and office cleaners	233	94	69
Metal manufacture and engineering	225	8	52
Teachers	217	61	27
Shopkeepers or managers	180	29	49
Hotel, restaurant, etc., proprietors and managers	111	47	50

Waitresses	87	77	45
Telephone operators	66	76	28
Social welfare workers	12	54	29
Librarians	11	73	9

lift, for lift attendants are fewer than they were twenty years ago; it shows the wireless and the talkies putting musicians out of a job, the welfare state sweeping the hawk off the streets and taking down the pawnbroker's sign. But of more immediate political importance are the census findings about housing, which will be reviewed in a second article.

NOTES OF THE WEEK

Further Left

Mr Bevan and his friends scored another success this week in their campaign to edge the Labour party to the Left. After long discussion, the Labour MPs on Wednesday adopted a policy statement opposing German rearmament at this stage; its terms were not exactly what Mr. Bevan wished but they were far from what Mr Attlee would have preferred. The final resolution—condemning German rearmament as “inopportune” and reasserting the so-called Attlee conditions—was moved from the centre of the party, not from the Bevanite wing, and showed unmistakably that the great majority of the party is out of sympathy with the stand that its leaders are trying to maintain on foreign affairs.

The reasons for this loss of sympathy are open to argument. Some Labour members on the Right and in the centre of the party say that Mr Attlee and his colleagues have forfeited support precisely because their stand for what they did in office has been half-hearted. If they had been firmer, the majority of the Parliamentary party would have accepted the views of the front bench more loyally. However that may be, the eyes of both the Right and the Left are now turning more and more away from the attitudes of MPs to those of the constituency parties. Both sides are now chiefly interested in the elections to the party's national executive committee at the annual conference in September. And therefore, it seems, the concern of ex-Ministers to stick to the previous policies will become more and more vestigial.

This is the only possible explanation of Mr Shinwell's speech last week-end. Mr Shinwell was a surprisingly good Minister of Defence. He listened to his official advisers. He won praise from Mr Churchill for his willingness to push through, against the feelings of his own party, the measures that had been shown to him to be necessary for the country's safety. But it was a different Mr Shinwell who spoke last Sunday. He advocated a cut in the period of national service on the ground that the country now has enough trained reserves. Few people ought to know better than the ex-Minister of Defence that the extended call-up was designed primarily to provide the men needed for current British commitments in Europe and the East, not to train more reserves. The speech was made, one must conclude, not by Mr Shinwell the ex-Minister but by Mr Shinwell the candidate for election to the party's national executive—from which he was ousted last year by one of Mr Bevan's followers.

When Labour is in office membership of the executive matters little; but in opposition it becomes a highly desirable prize for every Labour leader. Everything done or said inside the party during the next few weeks will be influenced by this election; it must be hoped that the outside world will understand this, as it has to try to understand the peculiarities of American politics in election year. Mr Bevan's group is determined to increase its power—it holds four of the seven seats in the choice of the constituency parties—and the more orthodox leaders are equally anxious at least to hold their position. Since no open electioneering is allowed, some strange postures will be struck and some strange sentiments uttered before the outcome of the voting is settled.

No German Unity Now

The essential fact that emerges from the diplomatic exchanges over German unity is that the Soviet Government feels able to risk free elections in Germany only if American forces have first withdrawn. It doubtless reckons that if they left Germany they would soon leave France too. Then Germans could vote without much risk to the Russians or their friends in the eastern zone. The last Soviet Note of

May 23rd, read in conjunction with the threats that came from German Communist leaders, indicated that Moscow had already given up hope of achieving its object by the tactics pursued for the last year and a half. It was evidently decided some time ago that the Adenauer government in Western Germany must be overthrown before anything could be done. For that purpose ex-Nazis and business men must be won over to the Communist-led National Front by the Soviet offer of a national army and trade behind the iron curtain.

The Politburo appears to think that what Mao Tse-tung achieved against the Kuomintang and the Americans in China could be repeated in Germany. The Communists are appealing to national sentiment and the Eastern Democratic Republic is being turned into the Yenan of Germany—an efficient, militarised base from which to win the whole country. All the announcements made last week at the conference of the Socialist Unity Party (which are discussed in an article on page 175) indicate that German unity is still far away, and that Moscow does not expect it to be achieved either in peace or freedom.

Moscow in a Corner

Soviet proposals have from the outset given priority to securing a peace treaty and the withdrawal of foreign—especially American—forces from Germany. Elections have never been more than a price for a peace treaty, which the Russians would pay unwillingly and only on terms that would safeguard their position in Germany. Forced by western arguments into a corner, they have had to admit in a vague way that they did not intend a freely-elected sovereign German government to take part in the peace negotiations. They wanted treaty talks to start at once, on lines laid down in earlier Notes, and they proposed that the German government should be under four-power control until the treaty was operating—or longer. Moreover, the commission to examine conditions for free elections was to be composed of representatives of the four powers.

The Note that was sent to Moscow by the western governments last week showed that there is as much difference between the composite style of the foreign offices and that of the Politburo as there is between their policies. It confined itself to essential points and made them with exemplary clarity.

The western representatives, now including Dr Adenauer, demand that an all-German government shall be freely elected before negotiations on a peace treaty begin. An impartial commission must decide whether conditions for free elections exist and the German government thus formed must be able to take a share as equal partner in negotiating the treaty. That treaty must not prohibit the Germans from joining defensive European and Atlantic alliances. As a start on this basis, the western Note proposes a four-power conference on how to form the proposed impartial commission. A point has therefore been reached in the long exchanges where the differences between the two sides stand out clearly. Indeed, the gap is so wide that it is hard to see how it can be bridged.

Parliamentary Pay

The salaries of MPs are perhaps unique in having remained unchanged since 1946, and there ought to be general sympathy with the Opposition's suggestion to the Government that a rise should be considered. It is right that

political life should mean some financial sacrifice for the majority of members, or at least that they should not stand for Parliament for the sake of gain. It is right, too, that members should not greet every rise in the cost of living by awarding themselves more money. But the rise has been steep since 1946. While it is true that MPs can claim larger expenses and so get more of their £1,000 a year tax free, this is a small compensation; and it is harder to earn money outside Parliament now that narrow majorities enforce constant attendance there.

The last rise, from £600 to £1,000, was made on the recommendation of a select committee, and if the Government treats the Opposition's approach favourably it will no doubt appoint another committee. The terms of reference should certainly include the plight of junior ministers, which is worse than that of most MPs. Their salaries of £1,500 were left unchanged in 1946, although they were allowed to keep also £500 of the member's salary that they had previously forfeited on accepting office. As ministers are debarred from all other means of earning, the financial sacrifice involved in accepting a junior ministry can easily be prohibitive.

It is obviously difficult, politically, to increase MPs' salaries while calling for general retrenchment; for this reason, compensation for higher living costs may well be sought in some other way. One possibility would be to make the £1,000 a year completely tax free; but it is a bad principle to exempt MPs from the income tax that they impose on the rest of the nation. Free postage would not save a great deal on ordinary constituency correspondence and it opens the door to postal electioneering at the state's expense, which would give the sitting member an advantage over his opponents in an election. Free secretarial assistance would relieve most members of their biggest expense; but the pool typist would be a poor substitute for the private secretary, and from the state's point of view this compensation would be unnecessarily generous. Probably the best solution is to make a straight addition to salary and trust the public to recognise that if the calibre of members and ministers is not to fall, the financial penalties of a political career cannot grow heavier indefinitely.

No Martyrdom for the Dean

Mr Churchill gave, on Tuesday, the right and inevitable answer to the demand for the establishment of a tribunal to inquire into the behaviour of the Dean of Canterbury. “Foolish, unpleasant and venomous things” may be said by those exercising the right of free speech; but “on the whole we would rather lump them.” Milton put the matter a little differently some three hundred years ago, but the principle remains the same. Even were the issue to be stated on the less exalted grounds of mere expediency, it is exceedingly doubtful whether the official gagging or punishment of this remarkable cleric would achieve, on balance, any useful end. He may now be valuable to the Communist cause as an active and unmolested propagandist; he would be very much more useful as a martyr. This consideration applies, to some extent, even to any action which might (as a statement of the Attorney-General's suggests) be taken against him under existing law; it applies incomparably more strongly to the setting up of a special tribunal to consider his particular case and to any penalties to which he might in the upshot be subjected.

Matters might be much worse. Instead of displaying himself as a progressively self-discredited ventriloquist's dummy the Dean might, after all, have presented the appearance of an ordinarily sensible, ordinarily honest-minded, not particularly gullible seeker after truth courageously proclaiming his discoveries. He might have been a subtle, intellectually powerful propagandist, capable of presenting the most outrageous falsehoods in such a way as

to carry conviction or at least to raise doubts. He might have possessed a crowd-compelling charm of personality or the daemonic force of fanaticism. The dilemma with which he confronts the liberal-minded would then have been sharp indeed. As it is, he appears precisely the sort of champion whom one would wish to find in the ranks of a bad cause. One might almost hold that if he did not exist it would be necessary to invent him; only then the invention would probably be dismissed as fantastic. He provides, for the education of the public, the essential and invaluable *reductio ad absurdum* of the whole class of fellow travellers; thanks to him, no publicist of his kidney will be able for a long time to come to fulminate against American germ warfare without automatically evoking a disrespectful *obbligato* accompaniment on invisible chopsticks.

M. Pinay Earns a Holiday

The substantial achievements standing to M. Pinay's credit since he took over the French Government last March have been very largely political. By splitting the Gaullist parliamentary group and attaching over thirty of its deputies to his conservative coalition, he has made possible the formation of a constitutional administration of the Right. Thus he has ended the frustration of the long line of centre coalitions whose internal differences reduced government to *immobilisme* and discredited parliament itself.

So long as the combined strength of the anti-parliamentary parties—Communists and Gaullists—stood at 220, the only possible constitutional administration had to stretch from socialists on the Left to conservatives and “independents” on the Right. Such teams had so little in common that they either did nothing or else collapsed as soon as they were compelled to do something. By the beginning of this year, it began to look less and less likely, under such conditions, that constitutional government could survive in France.

M. Pinay has revived hopes of stable government, sent the Assembly away on holiday and can now look forward to several months of quiet work before it meets again in the autumn. This is a breathing space he urgently needs for, in spite of his success in creating a conservative alliance, it will take immense ingenuity and patience on his part to hold it together when the stern issues of economic and foreign policy come up for decision.

The difficulty lies in the fact that to survive economically France needs to lower prices, invest—not hoard—more of its savings, increase productivity and enlarge its markets. Among M. Pinay's supporters are industrialists who accept these necessities. They are drawn mainly from heavy industry and are at present prepared to go forward with the Schuman Plan and other schemes to modernise and rationalise European industry. But the parliamentary coalition still depends entirely upon the support of peasants, traders, small businessmen—in short, the solid, unchanged, centre core of French individualism. These groups are behind the maintenance of high prices, protected markets and hoarded gold. The drama of the Pinay administration will lie in the discovery whether the streamlined conservatism of large industrialists and the old-fashioned conservatism of France's “little men” can work together when the economic issues that divide them really emerge.

New Supply Pattern for Nato?

The changes in the American military command in Europe, announced last week from Washington, have some important implications, economic as well as military, for Western Europe. The United States European Command, headed by General Thomas Handy, has been abolished and General Matthew Ridgway now becomes Commander-in-Chief of all American military units in Europe, apart from

those in Berlin, Austria and Trieste which will remain under the direct control of Washington. General Ridgway has also been given responsibility for the logistic problems of all American forces in Europe, including the organisation of supply lines and the co-ordination of "off-shore" purchases of military equipment in Europe. It is reported that the task of organising logistic support will be given to General Handy, acting as deputy to General Ridgway with headquarters in the Paris area.

The reorganisation will clearly place American forces in a stronger position for defence. At the same time, the creation of a centralised logistics establishment in Europe should also ensure that American offshore buying of military equipment for its own units is a businesslike and effective operation. It should ensure that the three American services do not compete for war materials produced in European factories and it should facilitate the placing of orders which in the past have sometimes been held up in Washington by men unfamiliar with what Europe could offer.

The recent changes will have little or no direct effect on General Ridgway's position as Commander of the Allied Forces in Europe or on the supply organisation of the non-American Nato units. All the European member nations of Nato remain individually responsible for supplying their own national units. The American reorganisation, however, might well set a pattern for the European Defence Community when it comes into being; and perhaps even Britain might adopt the same principle to co-ordinate British and Commonwealth arms and supplies with its partners in the Atlantic alliance.

Dollar Orders for Europe

American purchases of arms in Western Europe are beginning to reach sizeable dimensions. This week Mr William Draper, United States Special Representative in Europe, announced that the United States had placed nearly \$700 million worth of military orders with European factories in the fiscal year which ended on June 30th.

The items ordered include ammunition, special transport vehicles, auxiliary combat craft, and electronic and engineering equipment. France received by far the largest share of the contracts—some 50 per cent of the total—in accordance with an agreement reached with the United States at the Lisbon Conference. Under that agreement the United States undertook, in return for a French pledge to increase its defence contribution, to provide a substantial portion of aid in the form of military procurement in order to strengthen the French budget and to ease the dollar balance of payments.

Mr Draper gave this breakdown of the dollar orders:

US \$ million		US \$ million	
France	335.5	Greece	11
Italy	129	Denmark	6
United Kingdom ...	69	Norway	6
Belgium	46	Luxembourg	.3
Netherlands	38	Non-Nato Countries	43

Total 683.8

Some \$600 million of the total comes from funds allocated to the Mutual Security Agency and the items purchased will go to Nato nations, other than the United States. Another \$84 million has been financed by the Department of Defence for purchase of equipment in Europe that will be used by United States forces.

During the coming months, the new project to increase European aircraft production should further swell the offshore procurement programme. Last week it was announced in Paris that the American Government had accepted in principle the plan put forward by Nato for expanded aircraft production in Europe with American assistance. The plan calls for increased European production of some \$250 million, 60 per cent of which will be financed by the United States.

It can hardly be said often enough that the offshore procurement programme is one of the most beneficial aspects of transatlantic military co-operation. For Europeans it means the opportunity to earn dollars and thus to substitute the principle of partnership for patronage. And, so far as the Atlantic community as a whole is concerned, it may well pave the way for greater standardisation of the military equipment used by all the Nato forces.

Scotland's Industrial Future

Some interesting criticisms of development area policy, as it applies to Scotland, are contained in the report* of a committee appointed by the Scottish Council. This report is timely since there are indications that the postwar industrial boom in Scotland is at an end. The volume of new factory construction has declined since 1949. In the debate last week on Scottish industry, many members pressed the claims of their constituencies to a greater share of industrial employment. But, as the committee's report points out,

The number of new factories built every year in Scotland is small in relation to the number of towns seeking industrial development. . . . The Government cannot simply ladle in fresh employment whenever it wishes out of a bottomless bucket of enterprise.

The committee in fact appreciates, with a welcome realism, the limitations set on a policy for the location of industry. The general distribution of industry in Scotland cannot and should not in its view be altered. Government guidance and aid can, however, facilitate gradual adjustments and can settle which areas should be specially favoured. Present policy favours one half of Scotland at the expense of the other half. In particular the Glasgow development area, which accounts for over half the industrial employment in Scotland, has received the lion's share of postwar expansion. Of 281 new factories constructed in Scotland in the five years 1946-1950, 211 were in the Glasgow area and nearly all of these were financed by the Government.

The report believes that it is wrong to make unemployment, or the fear of it, the exclusive criterion of policy on location. In any case, the level of unemployment in the rest of Scotland is not appreciably lower now than in its three development areas. Many other parts of the country, such as the decaying fishing ports of the east coast, have as good a claim to special aid as Glasgow. But the whole of Scotland cannot be made a development area or the point of the policy would be lost. The report seeks a solution in a more flexible policy, under which Government assistance for new industry would be available to any area if circumstances warrant. In particular, the developing mining areas and certain of the country towns, with which the report is primarily concerned, should get a larger share of new enterprise, presumably at the expense of the Glasgow area. The dynamic requirements of industrial development, for instance on the South Fife coalfield, should take precedence over the need to prop up existing communities. Carefully applied, this policy would also serve the important social aim of relieving the grave congestion of population and housing in the Glasgow area. It would not achieve miracles, but it should ensure that Government aid is distributed with more discrimination and less conservatism than at present.

National Parks in Dispute

The Minister of Housing and Local Government has been under fire in two successive weeks for his administration of the National Parks Act. He can console himself that this would have happened whatever he had done. The Act itself was an uneasy compromise between national and local

* Report of the Committee on Local Development in Scotland. Published by the Scottish Council. 5s.

interests, and no balance struck by Mr Macmillan in its administration would have pleased everyone.

Under the Act, the normal machinery of administration for a national park was to be a joint planning board; this would contain a proportion of Ministerial nominees, the representatives of the national interest in the park, and would have its own planning officer and an adequate budget. The model was followed for the first park, the Peak District, where it is working satisfactorily. It was modified in the case of the Lake District. Now it has been abandoned altogether in the case of Snowdonia, where planning will be left to the local authorities concerned, aided by a joint advisory committee.

The differences, as Mr Macmillan complained, seem rather small—especially to a Minister who must contend with the fervent objections of Welsh nationalism. Nevertheless the critics, who include the main amenity societies, feel that the principle of the national parks is being betrayed. The Minister himself weakened his case by agreeing that the parks are areas where the claims of amenity and of public access should be paramount—a definition that indeed goes too far. But the critics fear that the principle will not be fully observed by local authorities, who are subject to local pressures for development and who have a strong interest in financial economy. Local authorities must foot part of the bill, and it has been pointed out that rateable value is usually in inverse proportion to natural beauty.

The Minister deserves sympathy against such criticisms. Presumably it is still intended that one tenth of the area of England and Wales shall eventually be turned into national parks. If so, it is clearly impracticable—as well as undesirable—to sever so much of the country from the local planning authorities. Nor can highly preferential treatment be given to an area of this size when all local authorities have new responsibilities and powers to protect amenity everywhere, not in the national parks alone. The more idealistic conception of the parks would probably be better served if there were no more than two or three of them, which then might have a truly national administration and be adequately financed. But this is not the present arrangement, and as things are Mr Macmillan's susceptibility to local pressures hardly warrants blame.

Bomb on Clapham

In Kensington this week civil defence officers from the London region have been studying the effects of an atomic explosion in relation to the organisation and plans for dealing with it. The study will be particularly concerned with damage to buildings and essential public services; it is a sequel to the one held last year, which dealt with casualties and welfare organisation.

For the purpose of the study it will be assumed that an atom bomb is exploded over Clapham Junction, at 11 a.m. a year hence. It is a bomb equivalent to 20,000 tons of TNT

—the size of the bomb dropped on Nagasaki. It could, of course, be as much as five times greater than this, but it is thought that enemy designers may favour the smaller types of bomb. It is assumed to explode at a height of 700 feet, compared with 2,000 feet at which the bombs were exploded over Japan—for the lower height would cause more destruction to framed buildings, which were relatively little damaged in Japan, as well as to underground services. It is assumed also that the population would have had enough warning to get to their Anderson shelters or strutted basements—although it is hard to see what justification there is for assuming that in one year's time they would have any shelters to go to.

The study will show how various regional organisations are being tied into the operational plan for London. As well as the regional organisations for transport and telecommunications, there is an emergency organisation of building contractors, panels are being set up among factories which could help each other, and the public utility undertakings are represented on a committee to advise on priorities for repairs. The study of a definite incident ought to bring some realism and urgency into the deliberations of these organisations, as well as into the long-drawn discussion of the local committees. But progress is very slow. For months now the planners have been considering the use of mobile columns of rescuers to operate from the periphery of target areas; but the long-expected experimental column will not be in operation until early next year. Civil defence remains an exercise in small-scale democracy rather than in military operations.

Consultation on South East Asia

The visit to Singapore of M. Letourneau, the French Resident Minister in Indo-China, has again focused attention on the need to plan joint action against Communism in South-East Asia. M. Letourneau was doubtless able to give Mr Malcolm MacDonald, the United Kingdom's Commissioner-General in South-East Asia, and the three British Service commanders whom he met, a survey of his recent useful visit to Washington. There was also considered for the first time the establishment of a permanent office, perhaps in Singapore, through which the Americans, British and French could be kept fully informed of each other's experience and plans. This would be an improvement on the present system, whereby the exchange of ideas largely depends on personal visits.

There are, however, three separate problems of consultation, and the proposed permanent agency, while no doubt of value, could hardly do more than scratch the surface of the real difficulties. There is, first of all, a problem of local consultation between the three western powers; but, as Mr MacDonald himself has just pointed out, the regular exchanges of information agreed upon at the military staff

talks in May of last year have been working well. The other two concern the basic policies of the three powers for assisting each other, and the amount of agreement they manage to reach with local leaders for bringing Asians themselves into the struggle against their Communist compatriots. Basic policies can only be settled in Washington, and alignment with Asians is primarily a matter of British and French attitudes inside Malaya and Indo-China.

In Washington, the intermittent discussions of the past few months have not so far produced any final agreement on the planning that would be required if the Vietminh challenge in Indo-China were to be reinforced with more active Chinese aid. The rock on which all such discussions ultimately founder is western failure to agree on how to treat Communist China.

India's Reshuffle

As part of the first major diplomatic reshuffle since Indian independence, a change is being made at India House in London. Mr Krishna Menon, the retiring High Commissioner, had handed over to Mr G. B. Kher after nearly five years of historic trail blazing. As he said in a farewell speech, the outstanding feature of his term of office has been the growth of truly cordial relations between Britain—first under a Labour and then under a Conservative government—and the new India. It has, in its own way, represented the beginning of a new era in human affairs. Mr Menon's lifetime of struggle has been fitly and happily rewarded. Mr Kher, his successor, enters on his post with great experience of public service as the Chief Minister of Bombay. He has Gandhian characteristics of humility and friendliness and is sure of a warm and widespread welcome.

Other changes are the replacement of Sardar Panikkar in Peking by Mr Ragavan from Prague, and of Professor Radhakrishnan in Moscow by Mr K. P. S. Menon, who has been Mr Nehru's close adviser in Delhi since Sir Girja Bajpai went to govern Bombay. Mr G. L. Mehta, with industrial planning experience, is going to Washington, and Sardar Panikkar, after more than one false start, is in due course to go to Cairo. While these changes put a new emphasis into India's foreign representation, they leave Mr Nehru's own team of direct advisers in Delhi rather weak. The change comes at a moment when Communist pressure at home has begun to show the tactics of the Communist powers abroad in a different light. The next few months may therefore be important in moulding India's foreign policies, and it is a pity that Mr Nehru enters them without either a foreign minister or any experienced senior official to help him in Delhi.

All the News that Fits the Print

If newspapers had more newsprint their first concern would be to present more international news. That is the unanimous verdict given by a panel of five editors—Australian, British, Chilean, Dutch and Finnish—in the latest bulletin of the recently founded International Press Institute. Other editors would confirm that there is no lack of material on foreign affairs; it floods in, in the form of dispatches from correspondents and agencies, and of syndicated background articles, only to be mercilessly cut and often finally pushed out by home news. Editors are therefore discouraged from sending special correspondents to report on developments of great significance—for example, the rapid postwar evolution of tropical Africa—which cannot be presented in snippets. It means that foreign news is often printed in such condensed form as to be utterly incomprehensible except to a few initiates; and that whole regions—Latin America for one—are virtually ignored by the press in other countries because their affairs are less urgent than those of, say, Germany or the Far East.

It is doubtful whether unlimited newsprint would produce a foreign editor's utopia. Fuller foreign reporting would make many newspapers too heavy for the average reader unless balanced by more pure entertainment. The correspondent in Lagos, Lima or Labrador might see his dispatches at last used in full, but only a minority of devoted readers would get past the distractions of the feature pages, gossip columns and strip cartoons to read them. Experience in North America, which is not short of newsprint, tends to confirm this fear. To take in the foreign news content of a United States daily paper at breakfast or in the crowded bus is a feat of agility, concentration and aversion from fleshly delights. In that country of massive dailies people turn increasingly to weekly news magazines to keep themselves abreast of events.

It has to be accepted that the most widely read newspapers owe their success to their deliberately popular style; give them extra newsprint and the extra pages would probably yield to fashion notes, sensational revelations and humorous columnists—not to analyses of Yugoslavia's economic problems or of the strategic significance of Nepal. It is sad to see the diplomatic and foreign correspondents so strictly rationed for space; but there is no sign that most readers object.

Facts on the Thomson Dispute

The Court of Enquiry set up by the Minister of Labour to investigate the dispute between D. C. Thomson and Company and members of the National Society of Operative Printers and Assistants published its report at the end of last week. It is an absorbing case history in industrial relations. The court has produced no solution, but it has set out both the facts and the considerations involved. Both sides, it considers, have acted within their legal rights, but have they been wise?

The Thomson dispute really began in 1926. In April of that year Thomson's signed an agreement with the Dundee Typographical Society, which contained a provision that no employee should leave a regular situation without giving or receiving a full fortnight's notice. Less than a month later Thomson's men were called out by that union in support of the General Strike. The management at Thomson's was, in its own words, "very, very vexed" and as result it decided to employ only men who did not belong to a union, and to make that clear to each man before he was engaged. The management was legally free to act in that way and the unions did not seriously suggest that the conditions of work at Thomson's had been depressed by this practice. After the war, however, they felt a crusading urge to recruit into their ranks men in Thomson's employ. In January, a man suspected of being a union member was dismissed. He was a union member, and he took his case to his union (Natsopa). In March another employee, also a union member, met with trouble. Whether he was dismissed or himself gave notice was a matter of conflict, but he himself thought he had been dismissed. He, too, saw his union organiser, and from that interview came the decision by the union members in Thomson's to strike, later followed by a national campaign by the unions against the firm, which in return challenged them at law.

Thomson's legal suits are still pending. But the original dispute results from a clash between the basic principles involved in industrial relations. The claim of a man to be free to join a union is met by the claim of an employer to be free to employ non-union men only. The claim that trade union solidarity demands that men should break contracts the union has negotiated for them is met by the claim that, unless collective agreements are honoured, it will be of no interest to management to negotiate another. Those who think of industrial relations in terms of the class struggle

**Behind which door
is the solution
to your
sales problems?**

Late, and unlamented, is the day of the one man solution to any advertising problem. You need a combination of talents.

In to-day's marketing conditions, the most effective advertising is inevitably the result of the most carefully thought out promotion plan.

Such plans are best prepared by a team of experts, each member contributing experience and knowledge of an important phase of agency service, and each working towards a single goal: Sales.

This month marks the seventh anniversary of the appearance of the first advertisement prepared by Young & Rubicam Ltd. Since July 1945, clients of Y. & R. London expect, and get, this full team operation—with effective sales results for a wide variety of fine products. You will find current Y. & R. clients, and the products handled through this agency, listed in the box at your right.

Progress in Electronics

In the Mullard laboratories

Electronic devices for the study of ultra-fast phenomena are among recent Mullard contributions to the progress of electronics. They include image converters capable of recording phenomena at a speed of one hundred-millionth of a second. Such initiative in research and thoroughness in development are characteristic of the ceaseless work of the Mullard laboratories.

In the Mullard factories

Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes, and components are produced for Britain's electronics industry. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

will, of course, fight this battle in a spirit of "no surrender." Those who feel that industrial relations, like treaties, demand some surrender of full legal sovereignty, of the right to treat anything as a scrap of paper as convenient, will look for a compromise.

Little Cuts and Pinpricks

The closing of several picture and museum galleries over the last few months has raised a rather comical storm of indignation in Parliament and the press. The champions of culture have vied with each other in finding bad words for the Government's cuts in its grants. But the recent restrictions are in fact only a slight worsening of a position which has exasperated serious students for years. Can it be possible that members of the Opposition have been suffering in silence, year after year, the failure to repair, restaff and reopen far larger numbers of prewar galleries than those now under discussion? Or was this week's debate the first they had heard of the matter? They are evidently well content that the British Museum reading room should continue to close at five o'clock. There is, in fact, something sadly opportunist and unconvincing in this sudden show of zeal.

To denounce a cut as "cheese-paring" just because the saving of £30,000 is only a little one is obvious nonsense. Given the unpleasant need to make cuts in Government expenditure, why should the national museums escape scot-free, while equally worthy causes suffer indiscriminately because they are the objects of bigger grants? Members of the Opposition, even though their own experience of making cuts is sadly limited, must surely realise that a big cut in a big grant means "cheese-paring economics" too—a whole series of them. Priorities there must be, but this chorus of howls at one pinprick will not help to establish them sanely.

On the Atlantic Community

The birth of a new voluntary organisation named Friends of Atlantic Union has, not unexpectedly, led existing bodies such as the United Nations Association and Federal Union to voice a little concern over the growing number of voluntary groups working in the field of world affairs. It is argued, with reason, that many people fully endorse both the United Nations idea and the movement towards Atlantic and European unity, but cannot find either the time or the money to lend active support to three or four different organisations. Less intelligent members of the public are confused by the existence of so many societies, each appearing wholly admirable in purpose, and fall back all the more easily into apathy.

The apparently simple solution of a merger of such bodies is not practicable, even if it were desirable. The United Nations exists; close Atlantic partnership exists, but short of union; and federal union does not exist at all. In each case the job of inquiry and propaganda to be done is different. The Friends of Atlantic Union might well discover that Nato could do some important things better than Uno does them; and they might come to the conclusion that federation is not a possible method of Atlantic union. It is too much to believe that a single organisation could survive either such disagreements or the administrative strains that would be set up.

The idea of the Atlantic community needs far more research and thought than anyone has yet given to it. There are political, economic and constitutional problems to be considered and the whole experience of Nato to be examined. The organisations which are now objecting—albeit mildly—to the appearance of a new body can hardly claim either that they have done this work or that their terms of reference would allow them to do it.

Witness from Russia

It is a pity that wiser use is not made of the Russians who, from time to time, move westward and seek asylum. Recently a young engineer called Volchansky arrived from eastern Germany, apparently discontented with his work and life. In due course the office of the American High Commissioner released a statement by him in general terms and the man himself appeared before a press conference. The gist of what he said is that the Soviet leaders are deterred from aggressive war by fear of internal revolution, that "a disturbed and resentful people would be able to liberate themselves upon receiving arms," and that it should be a western war aim to "overthrow the Soviet regime."

Two things may be said about this reported statement. One is that no individual short of Beria himself would be entitled to make such a sweeping judgment about the Russian people. The other is that such statements do positive harm at a time when quite a lot of people are wondering what Mr John Foster Dulles means by substituting "liberation" for "containment." It is proper that the American High Commissioner's office should allow accurate, first-hand information from a Soviet refugee to reach the press; it is not proper that it should sponsor inflammatory general statements—in Germany of all countries.

Whigs and Democrats

In the United States of America, the respective claims of the two great parties to our sympathies are more equally balanced than at first appears. The "Whigs" there are the Conservative party—as far as a party with such a name can be said to have any existence in a new country like America. The "Democrats" answer to our extreme Radicals. . . . The "Democrats" are right on the great material question of the day—Free Trade. . . . They demand the freest commercial intercourse with all nations. In a word, they are in America the defenders of that system which we believe not only to be founded on truth and justice, but to carry in its train the fullest development and the highest prosperity of the world. . . . But on nearly all other points we regard their tendencies as dangerous and their principles as wrong. . . . They are strongest among the daring, reckless, and unquiet spirits of the South and West. They include the most wild and ignorant of the population. It is among them that the opposers and defiers of established authority are principally found. . . . On matters of foreign policy, also, their principles are indefensible, and their morality is lax. . . . They are constantly on the verge of involving their country in wars and quarrels on the most trivial pretext and the smallest provocation. . . . The Whigs, as a whole, are a far more educated class than their competitors. They have far more notion of the decorums and dignities of policy, and of those laws of justice and morality which belong to civilised and international life. . . . They are the advocates of the supremacy of the law, on those occasions when it comes into collision with the popular passions of the hour. . . . They have, generally speaking, more comprehension than the Democrats, of the intellectual and moral, as contradistinguished from the mere material, interests of their nation and of humanity; they represent a more cultivated people, and a higher stage of civilisation. But they favour a Protective tariff. . . . Like most men and parties their views are warped and darkened by their immediate pecuniary interests. . . . While the Democrats would be most disposed to quarrel with us on territorial questions, the Whigs would be most likely to declare hostilities against us in a war of tariffs. . . . It is, therefore, not easy to say to which party we should wish success. Both, we hope, will become yearly more enlightened.

The Economist

July 17, 1852

Letters to the Editor

Federation Moves On

Sir,—In their letters in your issue of July 5th, your correspondents write of the importance of partnership between Africans and Europeans, but they nowhere define what such a partnership ought to entail—nor have other commentators. Surely, the ultimate objective of partnership must be full equality of opportunity between African and European. This implies that eventually—and that day is, no doubt, far distant—the two peoples will come to compose a multi-national and multi-racial society. But this concept surely implies that such a society will not be divided along lines of race or colour, but along lines of skill and mental capacity in which members of both races will be found performing all the various economic functions proper to a modern society. In consequence not only will Africans be found doing skilled jobs and occupying professional and administrative posts but Europeans will be found occupying unskilled and manual trades.

Is this really what the advocates of partnership desire? It is not enough to say that they are not averse to the idea of African advancement unless they are prepared to accept the second half of this proposition. Of this there is, as yet, no sign at all. The theory of white settlement in central and southern Africa has always rested on the assumption that all Europeans shall be entitled, as of right, to the professional, administrative, technical and in general the more highly skilled professions and trades irrespective of talent. Moreover, to the extent to which immigration is exchanged the available opportunities for Africans must be restricted by reason of the need to provide for the newcomers. Is hypocrisy too harsh a word to use of this use of the word partnership?—Yours faithfully, IDRISS C. BELL
Swansea

A Streetcar Named Defunct

Sir,—Your article on the tram in your issue of July 5th lacks the logic that is a feature of the comments you make on a related form of transport, namely, railways, so I write suggesting possibly more appropriate criteria with which tramways should be judged.

You make the mere assertion "undoubtedly removal of trams helps to keep down congestion." Have you observed it, or did London Transport tell you so? Possibly an extra seventy-seven buses on the road seem to cause less congestion than the seventy-five trams they replace? But are those buses carrying as many passengers as the seventy-five trams? I suggest that nine buses anywhere on the road cause more congestion than the seven trams, constrained to single file, which carry closely the same number of passengers. "Trams cause congestion to other traffic" is the usual cry—but other traffic also causes

congestion to the trams. Is it not public transport in itself that causes road congestion? Is it not because trams rarely operate apart from buses, whereas buses are generally part of the traffic on any road, that the unthinking blame trams for traffic congestion, forgetting that, in the absence of seven trams, nine buses ought to be added to those on the road.

Your comparison of tram and bus speeds in Bristol is patently unfair. Bristol trams were the original ones of 1900 vintage, not modernised or renewed because of a tendency you mentioned, that the system was liable to be bought by the municipality every seven years. Comparison of the speeds of such trams with those of modern buses proves nothing. Birmingham trams, of 1925, average 12 m.p.h. on the largely reserved track routes to the Lickey Hills, whilst most modern trams (even the ex-London "Felthams" of 1932, now in Leeds) can attain speeds of 35 m.p.h.

It is true that London Transport has substituted buses for trams in the ratio of 77:75 rather than in the seating ratio of 77:56, but one cannot help asking whether the actual substitution ratio means that fewer peak-hour places are available to travellers? I submit that the total of seats available to peak-hour travellers should be the criterion for any substitution, lest a less satisfactory service be provided in the guise of progress. One wonders how many passengers in ex-tram areas have changed to railway travel now that they have the "benefit" of all-bus road services?

Whilst the above points are debatable, your comments on costs are not debatable, but rather, when viewed properly, give opposite conclusions from your own.

Tramway receipts during 1950 were only 65 per cent of expenditure. During that year trams still offered workmen's returns and other cheap fares such as 6d. maximum, 11d. return and 3d. mid-day (hence 6d. return, in effect, during off-peak hours) on ex-LCC routes. The single fare on many of the journeys covered by these facilities (nowadays generally designated "anomalies") is generally about 1s., so it seems that with equal patronage and present-day fares the tramway deficit would probably have become a surplus.

You comment that trams cost 31.2d. per car-mile compared with 24.9d. for the bus. Since trams have 73 seats and buses have 56 seats, this gives 0.428d. and 0.443d. as the costs per tram and bus seat-mile, with the tram about 4 per cent cheaper than the bus on the basis of its ability to carry people. Since London trams are more expensive to operate than need be because of the conduit current collection system, modernisation of the system and conversion to overhead wires would give an even more favourable comparison.

You also comment that new buses cost £3,500-£5,000 and new trams £8,000-£11,000, but do not relate this to the service expected of the vehicle;

without such considerations the most economical vehicle cannot be chosen. Since trams have 73 seats (for the sake of argument, though a large modern one such as would be suitable for London would seat about 80), and last about 25 years, and buses have 56 seats and are not expected to last more than 12 years, the seat-year of life costs should be determined. These are £6.03 and £7.45 (taking the higher of your prices quoted) so, on this basis, the tram is cheaper by 19 per cent.—Yours faithfully, B. JOHN PRIGMORE
Imperial College, London, S.W.7

Gains for the Dutch Labour Party

Sir,—In your issue of July 5th your correspondent comments on the results of the Dutch elections. With regard to the loss of two seats in Parliament sustained by the Catholic People's Party your correspondent remarks: "Part of this movement [i.e., this loss] was no doubt caused by an internal rift in the Catholic People's Party, where a junta of integralist theorists and reactionary businessmen had made a bid for party leadership." Your correspondent refers here to a group, formed by three former Cabinet Ministers, by some professors of the Catholic University at Nijmegen, and by a number of well-known Catholics. This group expresses widespread discontent with the policy of the Catholic People's Party. The group was invited by the party to a discussion which resulted in a covenant that has caused considerable trouble.

The group had no political aspirations whatsoever. It had nothing in common with a "junta," nor with an effort to capture party leadership. It maintained that government policy, for which the Catholic People's Party bears its share of responsibility, showed too many collectivist and levelling tendencies, and neglected the incentives necessary for a widespread formation of capital. It neglected the problem of securing a more highly qualified labour force. It also criticised the attitude of the Catholic People's Party in preferring a government with participation of the Dutch Labour Party.

I do not know what your correspondent means exactly by "integralism," but I was quite amazed at his description of some of my friends in the group. In some quarters it seems to be fashionable to treat as proof of a "reactionary mentality" any critical comment by businessmen on measures that are called progressive. These members of our group, who may be regarded as leading personalities among Catholic businessmen, think that social justice is incompatible with the enlightened despotism of bureaucratic managers and with a continuous concentration of human responsibilities. The tendencies towards a "managerial revolution" could easily be described as "reactionary."—Yours faithfully, F. DUYNSTEE

out of the mouths
of babes and office boys

They say around the office that I'm only good for spilling tea and losing parcels, but I've got me ambitions. One day I'll be an efficiency expert and — coo! — will I make 'em jump. I'll wear an Anfony Eden hat and carry a brief case with a secret compartment. Cool and very superior I'll sit at me chromium-plated desk, call up old Winterbottom (who is at present the boss) and say: "Winterbottom, must I do everythink meself? I've decided that there's a place in every office for portable typewriters. And it's been brought to me notice that there's nothing better than the Imperial Good Companion. Order half a doz. now. Oh, and by the way, Winterbottom, you're fired."

Books and Publications

Confidential Conversations

The Forrestal Diaries. Edited by Walter Millis. Cassell. 542 pages. 25s.

James Forrestal served continuously in the American government from May, 1940, until March, 1949; for the first three months as an administrative assistant to President Roosevelt, then successively as Under Secretary of the Navy, Secretary of the Navy and Secretary of Defence when that post was created in July, 1947. Less than two months after he resigned he jumped from the sixteenth floor of the Naval Hospital at Bethesda; but, before he went to hospital, he sent instructions that his diaries, which began in July, 1944, should be deposited at the White House. "This was an unusual request," remarks Mr Walter Millis, who has edited the diaries. "One can only infer that it reflected Forrestal's awareness of the confidential nature of much of this material and his desire to insure it, under any eventualities, against irresponsible publication."

It seems more likely that they were deposited at the White House to prevent any kind of publication at all, and it might have been better for many reputations had their appearance at least been delayed until all the protagonists were dead. For these are not diaries, in the ordinary sense of the word, but notes, usually dictated at the end of the day and uncorrected, designed to remind Mr Forrestal of what he might forget rather than of what he was certain to remember. The big events of history are, therefore, hardly mentioned at all, but luncheon conversations are reported in detail—to the probable discomfort of people who never expected their casual intellectual squibs to become a solemn part of the raw material of history.

It must be admitted that this book sets a doubtful precedent and one which, if widely followed, would render public men mute even at the dinner-table—or at least force them to have their private conversations as rigorously screened as their public speeches. Nevertheless it is possible to be grateful for this particular indiscretion as so much of what Mr Forrestal recorded is of absorbing interest. For the historian the most valuable series of entries will be that which describes the long and bitter negotiations which preceded the unification of the armed forces and the establishment of the National Security Council, without which body American diplomacy would still be operating regardless of available military power.

Mr Forrestal gives an example in his account of the time when the Jugoslavs shot down some American fliers. "Acheson," he says "was all for an immediate and aggressive use of American air fighter power over Jugoslavia. [General] Norstad at that time had to point out to him that such a demonstration would inevitably mean

war and we would be exposing green and untrained pilots to a superior and competent enemy." It was on such occasions, Forrestal said, that the National Security Council would be useful—"to make a careful examination . . . and avoid stumbling into war." This story of the patience with which Mr Forrestal fought, compromised or stuck in his heels to get what he thought vital for his country's security is evidence enough of why two Presidents promoted him to the highest post in his particular field and finally allowed him to work himself to death.

During most of his time in office he was one of the principal targets of American "liberals" because he was "prematurely anti-Communist"—"I find," he wrote in 1944,

that whenever any American suggests that we act in accordance with the needs of our own security he is apt to be called a god-damned Fascist or Imperialist, while if Uncle Joe suggests that he needs the Baltic Provinces, half of Poland, all of Bessarabia and access to the Mediterranean, all hands agree that he is a fine, frank, candid and generally delightful fellow who is very easy to deal with because he is so explicit in what he wants.

But he got a certain pleasure later from being able to remind people, as he reminded Mr James Byrnes in April, 1947, that they had chided him earlier for "being too extreme in my views about the Russians" when they started complaining that the Russians were "stubborn, obstinate and don't scare." Despite all the attacks on him as the prototype of Wall Street in government, however, Forrestal recognised the need to "have the support of public opinion in whatever policy we found it necessary to adopt," and he never bore any resemblance to the portrait painted of him by the Left.

Nor did he bear much resemblance to the ordinary Wall Street banker, though he had been one until he joined the administration. Unlike the other bankers in the government, he was the son of an Irish immigrant and had preferred to work his way through Princeton rather than Tammahy. Unlike other Irish-Americans, too, he devoted his official career to what he believed to be the best interests of the United States rather than Eire. And, since he understood the importance of Britain to the national security of his own country, he never allowed his Irish ancestry or his innate conservatism to colour his dealings with the Labour government.

Had he lived to write a book from these notes—and there is no evidence that he intended to do so—Mr Forrestal would no doubt have saved himself and his friends some embarrassing moments. His extreme preoccupation with his own

particular subject meant that his views on others often lacked depth. Since he reported his own unconsidered contributions to conversations along with those of other people, he therefore emerges from the book a lesser man, or a more superficial one, than he really was. But that is an unimportant defect in one of the most important additions to the books that add to our understanding of recent history.

Capitalism and Freedom

Religion and the Decline of Capitalism. By V. A. Demant. Faber. 204 pages. 12s. 6d.

Professor Demant's Holland Lectures deliberately invite comparison with Mr Tawney's famous lectures in the same series published under the title "Religion and the Rise of Capitalism." Partly because his pen is not so graceful as Mr Tawney's, and partly because he does not give the reader such sharp antitheses, Professor Demant's work will not rouse such a stir as Mr Tawney's, but a great deal of solid learning has gone into its making, and it deserves close study by economists and theologians alike.

Perhaps Professor Demant is not making so controversial an assumption as he supposes in locating "the nerve of capitalism" in "the predominance of market relationships over the greater part of the social field." He becomes a little more controversial when he sees the main problem set by the capitalist phase of history as the achievement of great economic advantages at the cost of colossal social dislocations. It is, of course, a fact that the assumptions of "the capitalist phase" are rejected today over a vast area of Asia and challenged even in Europe; and Professor Demant finds four main causes for the decline—"the hostility it brought on itself, the break-up of its own institutional framework and defeats of its demands for indefinite expansion, its parasitism on the non-economic foundation of society, and destruction of the dispositions which impelled it." But he never really faces the economic fact to which Bernard Shaw drew his attention just before his death, namely, that where capitalism is allowed to operate it is far from decaying but has been carried to unprecedented magnitudes.

More important still, from his own point of view as Regius Professor of Moral and Pastoral Theology at Oxford, is his failure to recognise fundamental moral facts. He is obsessed with the belief that capitalism claimed freedom for economic activities from ethical control; and in the sense that it sought to free economic life from the shackles imposed by obscurantist teachers he is right. But the claim made on behalf of the much-abused capitalist era is, not that it freed economic activities from moral considerations, but that, by greatly

extending the field of individual choice, it laid true foundations for the moral life. Only free men can be moral men. Capitalism may be in decline, but so is freedom; and perhaps this is no accident.

French Election Studies

Sociologie Electorale. By François Goguel and Georges Dupeux.

Geographie des Elections Francaises de 1870 à 1951. By François Goguel. (Cahiers nos. 26 and 27 of the Fondation Nationale des Sciences Politiques. Paris. 96 pages. 450 frs. 144 pages. 500 frs.)

Studies of general elections in this country have often been dominated by the national campaigns and by the view that elections are essentially plebiscites within a single great constituency in which the effect of the electoral system is to distort the difference between the total votes cast when they are translated into the number of seats won. In France, where there has been a tradition of such studies since M. André Siegfried's pioneer work in 1913, the present generation of students of general elections is busy giving new depth to the old outline of France's complicated political geography. Much more material is available in France, and most of the little handbook *Sociologie Electorale* is a guide to the sources; it is also a useful guide to the membership of successive chambers and shows how the votes went in crucial divisions.

In the first part, M. Goguel shows that even the subtle relationship between the tenurial system and politics that M. Siegfried established for western France does not hold good for all other parts of the country. It is true that in a country where rural matters are still dominant, the question of how the land is held is important. But the link with politics cannot be deduced automatically. To trace it one is sometimes driven back to the very roots of France's agrarian history. Similarly, although there is a correlation between religious observance and political behaviour, churchgoing and voting to the right are not in direct mathematical relationship in all regions.

To these cautions should be added the warning that investigations are much less advanced for urban than for rural populations. It is clear, in fact, that even in France the new approach to politics has still a long way to go, particularly as the influence of the political parties themselves has hitherto hardly begun to interest sociologists.

M. Goguel's "geography" is primarily a series of maps of French election results from 1871 to 1951; careful commentaries show the limitation of such a graphic presentation, particularly when so large a unit as the department is used. But even so, is he right to say that the maps are highly suggestive? M. Goguel believes that the final Socialist-Communist breach in 1946 marked the end of that dualism in French politics which he himself described as "the party of order" versus "the party of movement." There is reason now to believe that there is a division between the more forward-

looking parts of the country (in economic terms) with their Gaullist and Communist orientation, and the more backward areas which still remain within the conventional framework of the older groupings of the Third Republic. Because, he believes, the latter areas are still preponderant electorally speaking, the governments of the Fourth Republic are prevented from tackling realistically the grave social and economic problems they have inherited.

No one, least of all M. Goguel, would claim more than a hypothetical value for a suggestion based on relatively limited data; but the prospect that such suggestions open, both as a guide for understanding the France of today and as a stimulus to future studies, is certainly stimulating. Unfortunately, the rise in printing costs means that much of the work listed by M. Dupeux can be consulted only in typescript in the various university libraries. Nevertheless the existence of this series of *cahiers* and of the *Revue Française de Science Politique* makes it likely that at least the essential results of French studies of this kind will be made available fairly rapidly.

Diagnostic Historian

Avenues of History. By Sir Lewis Namier. Hamish Hamilton. 202 pages. 15s.

Anyone reading this book can understand why Sir Lewis Namier is generally regarded as one of the foremost of living British historians. The learning, insight and discrimination which characterise his work are becoming rare in an age when many historians are content to achieve no more than technical competence in their subject.

Here Sir Lewis has put together a number of his reviews and some occasional essays, but the work has far more unity and coherence than this formal description might suggest. This is because his view of the study of history, which is set forth in the first essay, not only shapes his own writing, but is the unvarying standard against which he measures the work of others. He compares the task of the historian to medical diagnosis; something which, although it demands experience and a scientific approach, is, in the last resort, intuitive. "Analytic insight into the tangle of human affairs coupled with a consciousness of his own limitations," he says, "is the mark of the real historian." That he himself possesses these qualities is shown in the remainder of his book.

With the exception of a generous, if critical, estimate of Dr Toynbee's synoptic vision of the whole sweep of human history, the rest of the volume is concerned with particular themes in modern British and European history. In British history the work ranges from an appreciative review of Professor Neale's book on Parliament under the first Elizabeth to an essay on the general elections of 1945 and 1950, together with three masterly sketches of Josiah Wedgwood, Wyndham Deedes and Orde Wingate. An edition of George III's letters to Bute moves Sir Lewis to further comment on a subject he has made peculiarly his own, while the publication of Henry Hobhouse's

diary is the occasion for some reflections on George IV and his ministers.

The seven essays in European history are all concerned in various ways with the century of German preponderance on the continent. They include an account of that curious but pathetic friendship between the Emperor Francis Joseph and Frau Schrott, together with a study of the relationship of nationality and liberty, which is perhaps the best thing in a distinguished book.

Evolution of a Humanitarian

The Memoirs of Herbert Hoover, 1874-1920. Hollis and Carter. 496 pages. 32s.

In 1919 John Maynard Keynes found only one man who emerged from the ordeal of the Paris Peace Conference with an enhanced reputation. "This complex personality," said Keynes, with his habitual air of weary Titan (or, as others might put it, of exhausted prize fighter), his eyes steadily fixed on the true and essential facts of the European situation, imported into the Councils of Paris, when he took part in them, precisely that atmosphere of reality, knowledge, magnanimity and disinterestedness which, if they had been found in other quarters, also, would have given us the Good Peace.

It is one of the ironies of history that this Aristides of Versailles should live to become the presidential Pangloss of 1929 and the exponent of Gibraltarism in 1952. If one could understand the evolution of Herbert Hoover one would understand much of the strange evolution of American conservatism. That is the main interest that attaches to his autobiography.

The book opens in characteristic style. It might almost be a parody of any successful Republican's reminiscences. Every cliché falls into place as neatly as the buttons on the business suit. The Iowa birthplace is straight Tom Sawyer—right down to Injun Joe. The best food in the Ritz does not compare with Aunt Millie's Sunday dinner; the most modern fishing tackle gives no such delight as was afforded by the "butcher-string-line and hooks ten for a dime" that did duty in the village stream. Then comes the story of "free-lance engineering" all over the world, with the Iowa Quaker's son winning every kind of success and barking his shins wherever he goes on the social conventions of the great effete world of Edwardian Imperialism.

It is with the collapse of that world in the ruins of 1914-18 that the opportunity comes to apply that same organising, constructive talent to a humanitarian end, and it is with the story of Belgian Relief that the autobiography first comes alive with a humanity which is neither imagined nor assumed. A certain largeness gets into the narrative, a certain passionate disinterestedness which makes the Keynesian tribute credible. Perhaps the humanitarianism never quite sees Europeans as fully human, but only as American *marqués*. Even so, it views them with a generous pity, and the story of the Hoover Relief is a story that does

its modest narrator great credit. If, here and there, one encounters hints of the Hoover that is to come, it is less in the facts than in the way the author has recorded them, writing isolationist history for the *Saturday Evening Post* in November, 1941. On the facts we leave him a Wilsonian and a League supporter; it remains for his second volume to explain the change that ensued.

Some Hard Words

An Explaining and Pronouncing Dictionary of Scientific and Technical Words. By W. E. Flood and Michael West. Longmans. 397 pages. 12s. 6d. net.

This dictionary is by "The New Method Dictionary" (author, Michael West) out of—the stud book is dubious on this point—either the well-known "Dictionary of Difficult Words" or the excellent "Chambers's Technical Dictionary," both of which devote much space to science, whether pure or applied. By this attribution of parentage, no slur is intended. Mr Michael West is a skilled and intelligent editor; along comes someone with a righteous desire and a marked ability to do something worthy in the cause of science, and to the marriage of congruent minds and parallel abilities let there be no impediment.

Illustrators, like translators, normally get a raw deal, especially the technical

and diagrammatic illustrators. Mr Charles A. Baker has supplied the public with 1,300 pictures and diagrams and the two authors with a most potent aid. Very, yet not too, small, these line drawings form, not an addition to, but an integral part of this useful book.

Smaller than "Chambers's Technical Dictionary" and more precise in scope than "A Dictionary of Difficult Words," this dictionary is neither forbiddingly technical nor difficult. (But why include *dyke*, which may sound technical to a civil engineer but which strikes the rest of us as an ordinary and very old English word?) It is intended both for the general reader and for the beginner in science or in technology; and it admirably fulfils this purpose. The definitions are terse, lucid, simple. The words used in the definitions fall within the vocabulary of every averagely educated person; here we see the practised and purposeful hand of Mr West. The book has yet another virtue: it will be very useful indeed to foreigners.

Geographical Compression

Ports and Harbours. By F. W. Morgan. Hutchinson's University Library. 176 pages. 8s. 6d.

Had he lived longer, the late F. W. Morgan would have provided us with greater works of original scholarship than this little book would pretend to be, but hardly one on which greater pains in compilation and selection had

obviously been lavished. The book begins with a description of the various types of harbour and of port installation. There follows a convincing classification and treatment of ports according to the trade for which they are used. Of the other chapters, all of considerable interest, one, that on port hinterlands, must stand as an example. This comments upon the struggle for traffic between the ports of continental Europe and elsewhere, as seen in national railway and waterway policies. Such a chapter makes the reader at once regretful at the compression inevitable in a book of only 176 pages of text; and amazed that it was possible to include—not necessarily superficially—so much.

Surprisingly in a book by a geographer, the maps are disappointing; it is sometimes difficult to distinguish land from sea, an unexpected fault. On the other hand, statistical material is interesting and recent.

As might be expected, considerable, but not disproportionate, attention is given to the relation between port growth and the physical nature of coasts, but the frequent mention of splendid natural harbours which have not developed into ports disprove any charges of geographical determinism. In fact, a nice balance is held between the various aspects of ports and harbours. An engineer, a port operator, an economist even, would have written otherwise. Perhaps because Mr Morgan wrote as a geographer, who is none of these, the book is an excellent general introduction to the subject.

Report on Southern AFRICA

Basil Davidson

A dangerous situation has arisen in Southern Africa because local racialism is in flagrant contrast with the great principle of multi-racial partnership which holds the Commonwealth together. Will there be an open conflict? The latest news is not re-assuring.

Basil Davidson's book is based upon personal study and recent experience. Detailed, factual and enlightened, explaining clearly what has happened, it is a most timely and useful guide to a crucial phase in African and Commonwealth History.

AMERICAN SURVEY

Back to Ohio

Chicago, Illinois

THE Republican Party has chosen a man who is the candidate of the liberal wing of the party, though nobody knows as yet how liberal he himself is, and has saddled him with a programme which is the product of the conservative wing. There is nothing new in this. Much the same thing has happened three times before, and each time the Democrats won the election. General Eisenhower may be a big enough man to overcome the handicaps under which he must start his campaign, but it cannot be assumed that he is. He has done nothing yet, since he came home, to show that he is the unbeatable man or that he has the kind of political intelligence which makes a candidate develop while running for office. Mufti killed much of the magic, and nothing has yet taken its place. But it must be remembered that the General has shown an amazing capacity for growth in difficult situations in the past, and he could do so again. He will start, however, still showing the deep scars which Senator Taft's tactics have inflicted on him and on the chances of the Republican elephant.

The Taft family has been the pet of the "regular" Republicans for forty years and, during that time, has done more to destroy them than a hundred Democratic leaders put together. In 1912 the *Chicago Tribune* attacked the "draggled and battered remnants of the old guard" and their "ruthless extremes of machine rule, trickery, bullying and fraud." Perhaps the only things that have changed since that time are that the *Chicago Tribune* has itself become one of the old guard, or has even travelled far to the right of it, and that President Taft's son has proved a far less efficient driver of the steamroller than his father.

"A modern Joshua" Senator Dirksen called the present Mr Taft, but he is a Joshua who has marched round the walls of Jericho four times so far, and each time it has been he who has fallen down. But his baleful influence on the party has been apparent ever since he was elected to the Senate in 1938. Though he was beaten himself at the nominating conventions in 1940, 1948 and 1952, and his understudy, Senator Bricker, was beaten in 1944, he has maintained control of the "real Republicans," who are so adequately represented in both Houses of Congress. And, though Mr Willkie and Mr Dewey deprived him of the nomination in 1940 and 1948—and it was really Mr Dewey

and not General Eisenhower who beat him again this year—he and his friends made it almost impossible for either of them to win the Presidency.

They were up to their old tricks again last week. Because the Senator came nearer to victory than ever before, the Eisenhower forces had to be even more ruthless in the latter stages of the convention than Mr Dewey had been in 1948. They had to work hard to counteract, because they could not prevent, the choice of speakers at the convention. Nobody can yet say how much harm those speakers did to the party because though it is accepted that nobody listens to speeches at a convention, this year there were many owners of tele-

vision sets who were privy to the proceedings for the first time and must have been surprised at what they discovered. They heard speech after speech, not only from General MacArthur and Mr Hoover or even Senator McCarthy, but also from Senators Bridges, Cain and Kem, Representatives Judd and Mrs St George and Mrs Church and General Hurley, which contained nothing but rancour and bitterness. The nearest to a positive policy to come out of any of them was Mr Judd's assertion that "most of the great forward steps of history were strictly negative"—not in itself a very stirring method of appealing for votes from a people enjoying a higher level of prosperity than ever before.

But, no doubt to their surprise, these owners of television sets discovered that they were not prosperous at all. They were, in fact, "being reduced to the tragedy of want" (Mr Hoover), "leaderless and floundering" (Mr Judd), "profoundly concerned as America flounders in uncertainty and indecision" (Governor Fine), "squandering their blood, wasting their resources and sacrificing their position while they cringed in the face of Communism" (Senator McCarthy). Never before had they "been in such jeopardy" (Governor McKeldin of Maryland); the American system of free enterprise was in danger from "wasteful, ruthless and corrupt policies" (General Hurley) and they were "desperate for a plan which will revive hope and restore faith" (General MacArthur). They must have envied those lucky people in other countries who are not bearing the burden of motor cars, deep freezes and air conditioning.

But they heard no mention of anything the Republican party was going to do to right these wrongs. They were

"And Now A Little Close Harmony"

Herblock in the Washington Post

The Changing South

[FROM A CORRESPONDENT IN VIRGINIA]

FIFTEEN years ago, the south reacted with the outraged pride of an under-developed country to the New Deal report that called it the nation's Number One Economic Problem. But no one denied that there was a wide gap between the material level of the south and that of the rest of the country. Today there is still a gap, but it is much narrower, thanks rather to the war than to the efforts of social reformers and economic planners. Average income in the south-eastern region, at \$882 a head, was in 1949 still well below the national average of \$1,330 a head. But it was 156 per cent higher than in 1929 and the rise had been faster than in any other region.

The agricultural cycle of one-crop cultivation of eroded acres, which could be summed up in two lines—poor land makes poor people, poor people make poor land—has been broken. This changed agricultural pattern is based on soil conservation and reforestation and on turning flood waters into sources of hydro-electric power. For this new agriculture is balanced by a developing industry; the whole southern environment has changed in the last fifteen years.

The eleven south-eastern states still have a higher proportion of their families living in rural areas than any other region, but agriculture no longer holds first place in providing income as it did in 1929. In 1949 manufacturing supplied about one-sixth, as against one-eighth from agriculture, of a total regional income which had grown from \$8,681,000 to \$27,084,000 in twenty years. This increase in income, even when divided among a population that had a net growth of 22 per cent over the two decades, means, when put into real rather than statistical terms, that the south-east has new things to do, more power with which to do them, and more to spend after they are done.

Everything that happened in Chicago last week, indeed, tended to show that the Senator and his old guard, though they may have lost the nomination, propose to keep control where they still have it—and it cannot even be challenged in Congress—regain it where they have lost it and, some think, even capture the candidate himself. There is, however, one serious weakness in their position which the Eisenhower forces could exploit if they wanted to, or if Mr Dewey were staying to run the campaign. Mr Taft has announced, and the fact is obvious in view of his age, that he will not try again for the Presidency. It is only necessary to look back to 1948 and the example of Senator Vandenberg to see what happens to the authority of anyone in Congress who cannot, when he cracks the whip, use the threat of excommunication if and when he becomes President. If General Eisenhower is elected in November it is probable that Mr Taft will have lost much of his power, though those Senators who will come back on the General's coat-tails are mostly incurable and will constitute a serious nuisance. But, until the Eisenhower managers have proved that they can elect their man—and it is an article of faith in the middle west that the "Wall Street New Deal Bankers" cannot win an election—the burden of Taftism will be a heavy one.

General Eisenhower has not yet evolved a policy of his own and even seems determined to avoid having one, at least until after he is elected. Up to now his silence has been justified by the need to get involved in what Governor Warren called the hectic scramble for the most conservative delegates. They have now been won and, when the campaign begins in earnest, something better is wanted than the platform's repeated "we charge . . ." against the Democrats or, in foreign affairs, its undocumented promises of cheap miracles.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The present president of the Alabama Farm Bureau Federation wears a ten-gallon hat. It symbolises the beef industry of the south-east—a new industry which brings with it permanent pasture and more fertile soil. Cattle have moved east while cotton has moved west. In the period 1928-30, meat animals provided 9 per cent, and cotton and cottonseed 41 per cent, of the region's cash receipts from farm marketings. In 1946-48, cotton and cottonseed had dropped to 25 per cent, and meat animals had risen to 17 per cent. Cross-breeding is making both beef and dairy cattle increasingly profitable: the enterprising South Carolinians who in the eighteenth century imported Sindhi bulls from India to get a breed more able to stand the hot weather, ticks and insects of the deep south must look down with approval on the experiments of today.

The new agriculture is being carried on with fewer people: for every thousand acres of farm land there were 57 workers in 1930 compared with 43 today. And the 43 have much better equipment to work with. In other parts of the country the recent trend has been away from horses and mules to

Source: US Department of Commerce

mechanical horse-power; but in the South, for many farmers, getting a draught animal was a big step up, and the number has increased from 98 to 117 for each hundred farm workers. At the same time, tractors and lorries have come too—a 300 per cent increase in the former, a 233 per cent increase in the latter, along with farm-to-market roads to run them on. In the Tennessee Valley, and many other areas, an electric pump now brings water to indoor baths and kitchens of farmsteads where previously the farm wife walked bucket-laden to and from the well. Even the cabins in the cotton proudly display the gleaming whiteness of a washing-machine on the front porch.

These improvements in farming have been paralleled by the increased use of forest products, from saw timber to pulp and paper plants. The region, with 20 per cent of the nation's commercial timber land, ranks second only to the far west. Mineral development has come on even faster. Coal mining is a traditional occupation in the south-east and output a man-day is still about one-sixth below the national average, largely because of lack of mechanisation. It is in other fuels, petroleum and natural gas, that the big change has taken place; the region's share of the nation's proved reserves came up from 5 per cent in 1935 to 11 per cent in 1948.

In the nineteen thirties the development of the Tennessee Valley was a major saga; improved navigation, flood control and electricity brought new industry, more productive farming, and increasing tourist trade. In the nineteen forties, the region became dotted with army and air force installa-

tions, rapidly set up to take advantage of an all-year-round climate for training and government payments became a growing factor in income. Oak Ridge was built in Tennessee as one of three major centres for the original atomic development; today further huge atomic plants are being built near Aiken, South Carolina, and Paducah, Kentucky. Industry in general was stimulated to go south during the war by acute shortages of labour in the traditional industrial areas and by a policy of dispersal as a safeguard against attack.

This southward movement had in fact started before the war. Then the migration of such industries as textiles and furniture-making, which left towns in New England and Michigan desolate in the depression years, was undertaken in order to be closer to supplies of raw materials—cotton and timber—and to hire cheaper, unorganised labour. But after the war, as a study by the National Planning Association has shown, industries moved south, or, more frequently, added to their total capacity by starting new units in the south, for two other reasons. Those making producers' goods were interested in the low land values which made the erection of modern, all-on-one-floor, assembly-line plants less expensive than in congested industrial areas. And those making consumers' goods or engaged in retail trade discovered that the south, with its new income, was a promising market.

As a result, manufacturers' outlays for new plant and equipment in the south-east in 1947 were above the average investment a worker for the same industry over the whole country in more than half of the major manufacturing groups. The industrial diversification which came with this new investment had a further effect: it increased the number of southern workers employed in industries where the value added by manufacture is in the higher range. Traditionally, the south's industrial employment has been centred in such occupations as textiles, tobacco and furniture, where the value added for each worker is low. As a consequence, earnings are now going up. In 1939, the average annual wage of production workers in manufacturing industries in the south-east was \$760; in 1947 it was \$1,908, and in 17 industrial groups it was over \$2,200.

This broadened base of family purchasing power was good news for the shopkeeper and the salesman. A generation ago the mail-order house catalogue, a gay companion to the family Bible on the tenant farmer's table, was wistfully known as "the wish-book." Today, that family is able to satisfy its wishes: between 1929 and 1948 the region increased its share of all goods sold at retail in the country by one-fourth, taking 15 instead of 12 per cent. Sales a head were still the lowest of all regions, but they nearly tripled over the two decades, and in 1948 were only 28 per cent below the national average, instead of 44 per cent as in 1929.

The new purchases have not been confined to goods: people are also in the market for health and education. A recent study of physicians' income shows that the southern doctor is doing better than his colleagues in the middle and north-eastern states: his \$11,159 mean income is above the national average. School building has been pushed also, in part through a general raising of the standard of facilities and in part as a result of legal decisions requiring equal facilities for Negroes and whites.

The south still has a long way to go. But over the last twenty years its economic characteristics have become much more like those of the rest of the country. The people and the resources have always been there. Today, the capital which for so many years was lacking is increasingly available to enable the people to make the resources produce.

American Notes

Watches to be Watched

President Truman, asking the Public Advisory Board for Mutual Security to make a comprehensive and independent survey of American foreign trade policy, has recognised the creeping protectionist tide which is undermining the country's efforts to encourage its allies to earn more dollars. So far little real damage has been done either by the amendments to the Defence Production Act—some of them defeated—designed to protect commodity producers, or by the endeavours of manufacturers to escape from foreign competition which they blame upon the Reciprocal Trade Agreements Act. But such attempts, especially when coupled with the Senate's failure to act on the Customs Simplification Bill, eat away at Europe's confidence in American understanding of what free trade really involves. That confidence had already been shaken last year by the Battle Act, designed to prevent countries receiving American aid from trading with the Soviet world, and one of the specific questions Mr Truman asked the advisory board to consider was whether the United States could not compensate in some way for insisting on trade restrictions of this particular kind.

The members of the board, representing business, labour, agriculture, education and so on, are well aware of the contradictions between recent developments in American trade policy and the purposes for which American money is being spent under the Mutual Security Programme. But it is the narrow-minded representatives of narrower interests who are responsible for those developments, the cheese producers and the manufacturers of glacé cherries, wooden screws and other minor products. They are keeping the Tariff Commission busy listening to their pleas for relief under the escape clause in the latest version of the Trade Agreements Act on the grounds that they are being unfairly injured by foreign competition.

The commission has recently reached decisions on what are probably the most important of these complaints—those brought by motor-cycle manufacturers and by watch makers. In refusing the application of the former, the majority of the commission in effect found that when foreign manufacturers have created a demand in the United States for a product that was not formerly available there, American manufacturers trying to steal this new market are not entitled to tariff protection. But the Swiss watches are taking an established market from the American products and, presumably for this reason, the commission is understood to have recommended an increase in duties on watches in a report to the President which has not yet been published.

Mr Truman must now either allow the increase or account to Congress for his failure to do so. If he does the latter, as seems likely, he may set the stage for the new Congress's first test on tariff policy. A more exhaustive trial will come

in the debates on the Trade Agreements Act, which must be renewed before the middle of next year. If the Republican platform is to be taken as a guide to what the party really intends to do, it seems that the Act will be further weakened in the event of a Republican victory.

* * *

Chicago Liked Ike

After he had won the preliminary struggles over the convention rules and the seating of delegates from Georgia and Texas, the nomination of General Eisenhower as Republican candidate seemed almost inevitable. What no one had expected was that it would come on the first ballot, the occasion when a number of states traditionally pay tribute to their favourite sons before settling down to a serious choice. But Governor Fine of Pennsylvania had already climbed down off the fence, bringing 53 of Pennsylvania's votes with him; the bulk of Michigan's votes were already in the bag. The first tally was so close—595 votes for the General, 500 for Senator Taft—that Minnesota's 19, originally pledged to Mr Stassen, were enough to carry the General over the top. It seems, however, to have been the Minnesota delegation, rather than Mr Stassen, to whom gratitude is due, and there may be no rewards such as that already presented to Mr Summerfield of Michigan, the new chairman of the National Committee. However, by that time there was a stampede to get on the bandwagon, and the first ballot, as revised, gave General Eisenhower 849 to Senator Taft's 280. Only California, of the states which might have exercised a great influence on the decision, stayed obstinately loyal to its favourite son, in the hope of a deadlock from which Governor Warren might profit.

Senator Taft's preliminary 500 was the highest number of votes ever rolled up for a Republican candidate who was not going to win. It was plain from the bitterness with which the Taft forces attacked "Two-timer" Dewey—a reference to the fact that he had twice led the party to defeat—and from the ovation given him by the Eisenhower supporters that much of the credit for the victory belongs to the Governor of New York. He was largely responsible for persuading the Republican Governors, who were meeting, by an odd coincidence, in Texas, to send their message demanding an amendment of the rules in the interest of fair play, and this made it possible for the Eisenhower forces to wring the last ounce of advantage out of the "stolen delegates" issue.

One of the most awkward minor problems facing the convention was the question of a civil rights plank. The Republicans enjoyed a monopoly of the Negro vote from the Civil War down to the New Deal, when Franklin Roosevelt managed to woo it away. In 1948 a strong civil rights plank was adopted, recommending federal compulsion to end discrimination. The Republicans, with no hope of

carrying any of the southern states, put all their emphasis on persuading the Negroes in the north to return to the fold. This year, however, both Senator Taft and General Eisenhower opposed federal compulsion; many Republicans hope that, under General Eisenhower, several southern states can be won away from their Democratic allegiance. The plank which was adopted, consequently, deplores appeals to racial prejudice, promises federal action to end lynching and the poll tax which is still used in some southern states to disfranchise Negroes, but declares that action to end discrimination is primarily a matter for the states and should only be supplemented, and never duplicated, by the federal government.

Television in Smoke-filled Rooms

There was a new look at the Republican convention this year: peepie-creepies, *alias* walkie-lookies, and periscope eyes brought the bands and banners and buttons, the celebrities and the common delegates, the agreed public speeches and the supposedly private arguments, into the nation's 18 million television homes, where 60 million viewers saw far more of the Republican rally than they would have done had they travelled to Chicago. The conventions had been televised in 1948, but then only about 400,000 television sets were in use; now half the population has access to them.

Three of the four television networks covered the convention, each under the sponsorship of a different manufacturer who advertised his products whenever a speaker sat down. However, the sight of a pretty girl showing off a refrigerator must have been more welcome than usual after the bombast of Senator McCarthy. Chicago's stockyard amphitheatre was chosen for the convention mainly because there was room for the tons of complicated equipment needed by the hundreds of television technicians. The amount paid by the sponsors for the honour of bringing the convention home to the American people is put at about \$7 million. The networks are nevertheless thought to have lost money, not so much because of the cost of providing the facilities as because they had to reimburse both sponsors and performers for programmes cancelled to leave the screen clear for hour after hour of convention coverage.

One of General Eisenhower's first experiences on his return to the United States was to have his bald head powdered before a television appearance and he made his acceptance speech dressed in "television blue"; other colours cannot be transmitted so satisfactorily. Television schools for political candidates have long been available and the Democratic convention managers have been grooming their cast for next week in the light of the mistakes made by the Republicans. Delegates have been reminded that the camera goes into every corner of the hall and that neither teeth nor shirt sleeves should be displayed unduly, since the public is supposed to expect dignity and discretion from those who are choosing the next President of the United States. The Democrats have realised, too, that not all political speakers are photogenic and they propose to relieve the viewers' eyes by illustrating the speeches with films of the party's achievements.

At the Republican convention, the cameras took the voters into the smoke-filled rooms as well as the convention hall. They could see whose free cigars—the Californians substituted orange juice—their state representatives were accepting and could guess at what promises were being given in return. They saw, and heard, Senator Taft's followers trying to keep the Eisenhower supporters from the disputed southern states from stating their case before the cameras, and the television interviewers striking blows for the freedom of the microphone.

The interviewers eventually won their battle and were admitted to the hearings of the credentials committee. In

fighting it, they brought the Taft Steamroller into America's living rooms and hastened the revulsion that put General Eisenhower on the road to victory.

Set Fair for Farmers?

If nature continues to smile, farmers will gather in a harvest this year second only to that of 1948. It is true that 2,000,000 acres less are being devoted to cotton this year than were last, but it may be assumed that the Department of Agriculture, after the scolding it received for its over-estimate in 1951, is erring on the conservative side. The final harvest may be near last year's 15.2 million bales. The Department believes that the maize crop will only be exceeded by that in the record year 1948, while the wheat crop is likely to be the third largest, at 1.2 billion bushels.

It does not seem that the farmer can lose, especially in a year when his harvest of votes is even more precious. Congress has hastily backed away from the idea of flexible price supports, which were designed to discourage over-production by lowering the loan rate to farmers in times of abundance. A Bill passed in the last days of the session takes away, until at least 1955, the right of the Secretary of Agriculture to set price supports of basic commodities at less than 90 per cent of parity, the artificial price which is supposed to provide the farmer with the same purchasing power that he enjoyed at an earlier period. And Congress has put off until 1956 the changeover from the old to the modernised method of calculating parity. The change, scheduled to take place in 1954, would have encouraged diversification by lowering the parity prices, and thus the supports, for such basic commodities as wheat, maize, cotton and tobacco.

There is no doubt that President Truman will sign the Bill. The Democrats are going into this election with 90 per cent blazoned on their banners, in the hope that the farm vote will reward them as it did in 1948. The Republicans in their platform have austere refused to outbid the Democrats, but they endorse the present system. The word of approval planned for Senator Aiken's flexible price scheme, which is important to dairy and poultry farmers who, like ordinary consumers, must pay inflated prices for grain, was hastily withdrawn when the action of Congress seemed to leave the Republicans in an exposed position. All the Republicans offer the farmer is more freedom from controls and administration, where possible, at local levels rather than in Washington. Their suggestion for a bi-partisan Farm Board, to review farm policies, would seem to be quite unnecessary. Nothing is so bi-partisan as farm policy, especially in election year.

Presumably neither party is looking beyond November. If they were, a year of bumper harvests at home and narrowing markets abroad would hardly be the time to set the scene once more for the piling up of costly surpluses. As much as 50 per cent of this year's wheat may find its way into the government's hands. But there is no way for the consumer or taxpayer to make his protest effective.

Passport for Divorce

Senator McCarran, who has sponsored so much mischievous and reactionary legislation, has one cause dear to his heart which is neither: a Bill to compel every state to recognise valid divorces granted by other states. Divorce is a state concern, and the laws governing it vary widely; it has been estimated that over 3 million men and women who have been divorced and have remarried are bigamists, in the eyes of some states, and open to criminal prosecution. Their children may be declared illegitimate. It would seem that,

"Ah yes - that's where I was!"

Place-finding is automatic on the Dictaphone Time-Master dictating machine

IMMEDIATELY a visitor has left your office, you can find instantly the place you had reached in your dictation before you were interrupted. For the Time-Master automatically backspaces to enable you to hear your last few words of dictation.

PERFECT CRYSTAL-CLEAR RECORDING

The Time-Master is a trim streamlined machine you can be proud of on your desk. It records on Dictabelts—little plastic belts, each one taking 15 full minutes of perfect crystal-clear dictation. The dictation too is more easily and clearly recorded, and therefore simplicity itself for your secretary to transcribe.

Small and pliable, Dictabelts fold flat for filing and may be mailed in an ordinary envelope, up to ten at a time for a 2½d. stamp.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine only 4½ inches high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform backspacing, immediate place-finding.
4. Simple, automatic operation.
5. Mailable, filable, expendable Dictabelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107, Kingsway, London, W.C.2, or ask for a demonstration at your local Dictaphone branch.

half an inch wide...

... 200,000 MILES LONG!

THEY CALL IT "SLIP"—a narrow ribbon of paper barely half an inch wide. As it flows out of a Cable & Wireless telegraph receiver it may be bringing a simple family greeting or a message that will change an industry. It is the visible sign of a great telegraph organisation that links the United Kingdom with the Commonwealth and the countries beyond.

Despite ever rising costs of labour and materials this vast network—the greatest of its kind in the world—is being constantly extended and strengthened to carry the traffic load. Last year Cable & Wireless offices used more than 200,000 miles of "slip", enough to put an eight-fold girdle round the world or to make a fluttering paper chain almost to the moon.

Such services are part of the Government despatch, of the press correspondent's report, of the businessman's order book—they are part of Britain's Business.

part of Britain's Business...

CABLE & WIRELESS LTD

ELECTRA HOUSE, VICTORIA EMBANKMENT, LONDON, W.C.2

as Justice Jackson of the Supreme Court argued in an opinion,

if there is one thing that people are entitled to expect from their lawmakers, it is rules of law that will enable individuals to tell whether they are married and if so to whom. Today the most learned lawyer cannot advise many people with any confidence.

The Senate adopted Senator McCarran's Bill unanimously, but unfortunately the House does not seem to have had time to complete action on it before adjourning. Although the Senator comes from Nevada, the measure does not necessarily benefit home industries. The standards set up for a valid decree require that the state granting it be the last in which the couple lived together or that the defendant be personally subject to the jurisdiction of the state or appear in the proceedings—requirements which Reno, which asks only a six-weeks residence by one party, does not satisfy at present. Neither would states be required to recognise the divorce mill over the border in Mexico, though film stars may not repair there so often now that a Cuernavaca divorce requires six months' residence. Other Mexican cities, however, remain more obliging, as Miss Ethel Mermah found when the Cuernavaca door was shut in her face. An out-of-state divorce could still be challenged on the score of fraud.

The present measure is based upon Article 4 of the Constitution which requires each state to give "full faith and credit" to the public acts and judicial proceedings of all the others. If the states have not done so in the past, it has not been simply the result of muddle and vindictiveness. If a man wins an out-of-state decree he may not be required to support his wife and family adequately and they may become public charges; property rights may also be called in question. Efforts have been made in the past to give the federal government power to regulate marriage and divorce. But legal opinion prefers the adoption of standards for recognition of out-of-state decrees, coupled with reform of the state laws to make them more uniform. The Roman Catholic church strongly opposes anything which will encourage divorce. But with 500,000 divorce cases a year, public opinion is changing; it even seems prepared to tolerate, for the first time, the presence in the White House of a divorced man—Governor Stevenson of Illinois.

* * *

Discord on the Federal Reserve

It is doubtful whether the average voter will be as impressed as the *New York Times* hopes he will be by the Republican platform's declaration of freedom for the Federal Reserve System from domination by either the Treasury or the White House. But the Republicans have an impressive array of expert opinion on their side in this matter, including that of such liberal, though unorthodox, Democrats as Senator Paul Douglas. In an outspoken minority dissent to the report on monetary policy and management of the public debt, just issued by a subcommittee of the Joint Congressional Committee on the Economic Report, Mr Douglas, with the support of Mr Wolcott, demands that Congress draw a sharp line between the functions of the Federal Reserve Board and those of the Treasury; between the responsibilities for the regulation of monetary and debt policies. At present the line is blurred by the requirement that the nominally independent FRB must co-ordinate its activities with the Treasury.

Senator Douglas's dissent was to be expected, but what was unexpected was that the so-called majority report, which had the full approval of only two of the three remaining members, did not come down on the side of the Treasury. For Representative Wright Patman, who over a year ago initiated this exhaustive investigation, is well known for his advocacy of the cheap money loved by the Treasury and for his distrust of the FRB's policy of restraining inflation by credit restriction and high interest rates. The differences between the two bodies led to open dissension early in 1951, which was

settled by an "accord" on the policies to be followed in financing the government's requirements which was widely held to be a victory for the FRB. Nevertheless, Mr Patman's report finds that this accord, which amounted only to an agreement to settle these matters by discussion, established a satisfactory method of dealing with debt management, for the present at least. But to Senator Douglas the accord had merely given rise to "admonishment, cajolery and heckling" between the two agencies.

The majority report, however, went on to tilt the balance in favour of the Treasury and the White House by recommending a number of technical and administrative changes in the Federal Reserve System, among them a decrease in both the number of governors and the length of their terms of office, which would have the effect of giving the President and Congress more immediate control over the FRB than they have at present. The report also proposed that the President should set up an advisory council on fiscal and monetary policy; this had been suggested by the Secretary of the Treasury and criticised by the FRB. This discordant report will be of little assistance to the new Congress should it wish to try to establish permanent harmony between the FRB and the Treasury, but in the absence of an open clash it may decide to leave things as they are.

Shorter Notes

The government, after years of what at the best can only be called undignified legal manoeuvres, has at last apparently recognised the weakness of its case in its dispute with Mr Stanley Dollar, former president of the trans-Pacific shipping line which used to bear his name. In 1938 the government took over his stock as security for a \$7,500,000 debt, repaid in 1943. Mr Dollar then began a series of suits for repossession of what is now known as the American President Lines and at last, when the case was going to the Supreme Court for the third time, the government announced that it would put up its holdings for sale in September and divide the proceeds with the Dollar interests. It is thought that Mr Dollar himself may be top bidder.

*

A child-loving philanthropist with \$300,000 to spare is wanted in Santa Claus, Indiana, for the present owners of the tiny village can no longer find time to manage its unusually seasonal business. The 100-year-old town, with its Reindeer Park and miniature railway, slumbers most of the year until Christmas approaches; then about 200 people are employed at the post office giving millions of letters and parcels the Santa Claus touch. Prospective buyers of Santa Claus must be fond of children and intend to continue the town's activities without commercialising them.

*

To rain or not to rain has been the question in the farm valleys of the State of Washington. While wheat farmers were anxiously scanning the sky for results of their rain-making with silver iodide, cherry growers were busy shooting cloud-dispersing chemicals into the air to stop rain from spoiling their harvest. Which faction will prevail has yet to be seen although the "drys" claim success.

*

Record exports in May, of \$1.485 billion, will widen still further America's trade gap, which for the first four months this year was almost 200 per cent greater than it was in the same period last year, when large quantities of strategic materials were being imported at high prices. No figures are available yet on imports for May, but from January to April they were \$3.6 billion, which in contrast with exports of \$5.3 billion left a balance of \$1.7 billion; last year's trade gap for the first four months was \$565 million.

ULSTER FARM

A PROGRESSIVE dairy farmer in Ulster who wanted to improve his grassland asked I.C.I. how modern methods of grassland management could best be applied to his farm. Accordingly the local representative of I.C.I.'s agricultural technical service visited the farm and a grassland development programme was planned and put into operation. Its object was to grow more grass — grass for grazing, and grass to make hay and silage for winter feeding. Over a period of 4 years the use of nitrogenous fertilisers was stepped up progressively from 5 cwt. per acre to 9 cwt. per acre, and from April to October grazing was carefully rationed by means of electrically charged fences moved twice a day. The effects of these methods were far reaching. The amount of silage made on the farm increased from 85 tons in 1947 to 450 tons in 1950; consumption of bought feeding-stuffs was halved, and the farmer was able to add to the numbers of his dairy herd every year. As a result, milk production rose steadily from 223 gallons per acre in 1946 to 344 gallons per acre in 1951. Dairy farms in many parts of the United Kingdom are now successfully applying similar methods.

THE ORGANISATION OF HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £1,800,000)

is associated with

The British Metal Corporation (Pakistan) Ltd.
The Cyprus Co., Ltd., Drew, Brown Ltd. (Canada),

Bury Felt is a remarkably versatile material. It can be hard enough to be diecut, chiselled or machined for industrial purposes — or soft enough to be made into ladies slippers. In the fashion salons for handbags, belts and accessories: in the engineering shop for gaskets, filters, buffing rollers and shock absorbers: in Britain's key industries as well as in Britain's loveliest homes — Bury Felts are hard at work.

THE WORLD OVERSEAS

Persia Seeks a Master

THE disease that besets Persian politics is a dislike of other people's leadership combined with an unwillingness to display it oneself. This has been lavishly illustrated during the last fortnight by the course of events in Teheran which has now culminated in the resignation of Dr Mossadegh for the second time because, it is reported, of the Shah's refusal to grant him all the powers he wants.

Dr Mossadegh returned from The Hague in low fettle. He had nothing to show for his trip. His reception fell short of expectations. His Finance Minister had in his absence informed the Press that the national finances were in a disastrous state, and that payment of salaries in June would be "a prodigious task." It was in this atmosphere that Dr Mossadegh first resigned, as is the practice of the Premier when a new Parliament has been elected. The new Majlis, when it met, displayed its feelings towards him by electing as its speaker the Imam Jume'h, the religious leader of an orthodox Islamic group among the mullahs, and the opponent of Dr Mossadegh's unorthodox cheer-leader, Mullah Kashani. It gave its support, therefore, to a man antipathetic to Mossadegh but without a party or constructive policy. Within a matter of days that same Majlis, having no other leader, was begging Dr Mossadegh to retain the Premiership. The Senate demurred. It felt that the Majlis should have consulted it before plumping for such a decision. The Shah also was known to be hesitant; the Imam Jume'h was pressing him to swallow his antipathy to the only other politician who is ready to try to retrieve the country from its economic plight — the aged but wily Qawan es Saltaneh. (It should be remembered that the Senate consists of 60 elder statesmen, half of them nominated by the Shah, and that it was brought into being, largely on the latter's initiative, in 1949, in order to serve as a brake upon the decisions of an irresponsible Majlis; it has never filled this role.) This time, however, the Senate refused to endorse the Majlis's decision. Some Senators expected the Shah to commend their attitude. To their astonishment the Shah limply exhorted them "to find a formula to the satisfaction of Dr Mossadegh before it is too late." Given only this negative lead, fourteen out of the thirty-six Senators attending the House voted for Dr Mossadegh. In the kingdom of the blind, the one-eyed is king.

Curious Financial Remedies

Whether the choice was right was soon a matter of doubt in Teheran. It was questioned in informed circles because of the curious set of financial remedies for the country's plight which Dr Mossadegh let it be known that he proposed to adopt: increase of the note issue from seven to eleven milliard rials; the raising of two further milliards by new taxation; the suspension of all pensions; the sale of the crown jewels for foreign exchange wherewith to build factories to serve as cover for the additional note issue. Each one of these projects is anathema to some important section of the population. But the choice of Mossadegh was also questioned by people without knowledge of public finance, for after it was made he imposed a new condition for continuing in office. He demanded six months' arbitrary authority in "financial and banking matters." He reinforced the demand by murmuring that he was inviting Dr Schacht to help him out. All Persian politicians have a pathological dislike of dictatorship; it calls to their minds visions of prison and the arbitrary whims of the last Reza

Shah. They therefore give undue reverence to a force that they call "the will of the people." What they have never recognised is that this force — ignorant, inconclusive and vacillating — cannot contribute to any nation's well-being unless it is steered by some man or group of men endowed with a grasp of public affairs. Dr Mossadegh challenged them to a choice between himself as arbitrary steersman and the production of some other hand that is prepared to steer.

How great is the need for such a hand is revealed by the figures available from both the National Bank and the Finance Ministry. Last March, Persia ended its financial year 1951-52 with a total ordinary expenditure of 8,700 million rials as against revenue of 6,530 million rials only. Additional extraordinary expenditure — incurred chiefly in order to pay the idle employees of the National Iranian Oil Company — brought total cash outgoings to the unprecedented figure of 10,870 million rials. The resultant deficit of over 4,000 million rials was met by devices several of which are unrepeatable: the conversion of £14 million held as a sterling reserve yielded 1,220 million rials; the raiding of pension and other special funds and of the sugar monopoly, 780 million; a national loan, to which response was disappointing, 450 million; and profits on the sale of foreign exchange, 550 million. All salaries and wage payments were therefore met, although government indebtedness to contractors increased. Since March, the deficit has grown at the rate of 250 to 300 million rials monthly. Revenue from customs dues has fallen; domestic oil sales are always lower in summer than in winter, which has increased the monthly deficit on the National Iranian Oil Company. It seems unlikely that more than half the salaries and wages due at the end of this month can be met; the lapse may not matter among civil servants, who are hardened to arrears, but might cause trouble at Abadan where former AIOC workers are accustomed to prompt payment on the due date.

The National Bank of Iran, which is a well-run organisation practising — in difficult circumstances — extreme orthodoxy in monetary policy, is therefore faced with the distasteful choice of seeing unpaid salaries and unemployment grow to menacing levels, or else launching inflation by making fresh direct advances to the government or agreeing to increase the note issue. Although there are few ways out of a financial crisis of these dimensions, practised orientals may be able to "juggle through" for further weeks or even months, though each of their raids upon reserves yields less than its predecessor.

As is only natural, a country in such straits turns constantly to thoughts of revenue from oil. Dr Mossadegh has undoubtedly derived some of his steady public backing from his contention that only British machinations stand between him and success. What he prefers not to see, and what no Persian therefore sees, is that oil sold without regard for old agreements, and without hint of compensation to the party to whom it was leased, undermines the whole fabric of international investment. It is useless to point out to an opportunist in financial straits that though sales of oil, the legality of which is open to question, may yield some immediate earnings they prejudice the whole future of investment in under-developed areas, Persia included.

The free world's attitude to making a questionable purchase is such that though inquiries about oil sold on the

Where Vickers can help

The preparation for the extension of a factory may be the first step to higher, more efficient production. The second step often rests with Vickers, for the Vickers Group is one of the great world-wide organizations which can do much to ensure the success of new developments. Companies within the Group manufacture plant for a great many industries. The design of their products, often embodying the experience of many lifetimes, goes a long way towards providing the efficiency that crowns a new industrial project with success.

Products of the Vickers Group include: INDUSTRIAL TRACTORS, SCRAPERS AND DOZERS • SURVEYING AND OPTICAL MEASURING INSTRUMENTS • CONSTRUCTIONAL STEEL WORK • CEMENT MACHINERY • RUBBER AND PLASTIC PRODUCTS

only that aid does not result in dollar imperialism or a materialising of Indian values: one of the greatest difficulties in furthering closer ties is the frequent misconception that all Americans bounce, and that, in their country all success is measured by the bank account. It is precisely because of these reservations that the form aid is now taking—the Community Development Projects—is a pure stroke of genius. There can be no strings in training Indians to develop their own agriculture by the use of fertiliser or better ploughs and no one, not even the Communist opposition, can object to increasing agricultural yields. Recently, too, as the help has come in, from the wheat loan to Point Four and the Ford Foundation grants—though it is still admittedly less than has been given to Formosa or the Philippines or Japan—people are beginning to contrast what the Americans are doing with what the Russians have failed to do. Russian wheat and Chinese rice have to be paid for at the full market price.

So there is again that feeling of friendship which there was in 1946 and 1947. India's ruling classes share with the Americans their lack of cynicism though they do not have the Americans' occasional ruthlessness; and their favourite colour is grey, not the American black-and-white. With all that Indians find to criticise in the United States and its policies, they do now accept that the Americans are free, friendly and doing their best.

German Communist Policy

THE five-hour survey given by Walter Ulbricht, secretary-general of the German Socialist Unity Party, at its second conference on July 9th underlined the fact that Soviet policy runs along lines which only change within narrow limits. It is not like a tram, but like a trolley bus. Sometimes it is expedient to talk about the peaceful coexistence of the two camps into which a world is divided, and sometimes it is not. Ulbricht, echoing some of the major Communist speeches of the last few years, explained the two hostile camps without mentioning peaceful coexistence. He stressed the orthodox line, that rivalry for markets inside the capitalist camp will lead to a common assault against the Socialist camp unless—to translate Communist jargon into plain terms—there is a revolution in Western Germany, and perhaps some other countries as well. The revolutions are, however, to be patriotic risings to overthrow pro-American governments, and Communists must sink their ideological aims in order to win allies among the middle classes, the professional military men and business circles. Communists must not imagine that the peace campaign has anything to do with pacifism, particularly in Soviet Germany, where a national army is to be set up.

Stalin has declared that war is inevitable unless "the people" take matters into their own hands and overthrow the pro-American governments. Ulbricht followed this thesis closely, adding the up-to-date point that the attempt to blockade China and the Soviet bloc had been responsible for speeding-up their efforts to become independent of the western world; this in turn reduced the available markets for the big capitalist countries and increased the internal contradictions in that camp—and so the danger of war. The chief "conflict," repeated Ulbricht, is between America and Britain.

Soviet policy for Germany has changed as little as this view of world developments; Ulbricht removed the faintest doubts on this score. The Communist aim is "a peace treaty and the restoration of German unity on a democratic basis." Apart from using this revealing word "democratic," Ulbricht underlined that in the new Germany the pro-western groups, and the "bankers, estate-owners and armaments millionaires" would be swept away. The social order would not

be exactly the same as in the Soviet German Republic, but neither would it resemble the Adenauer regime.

As to methods of achieving unity, Ulbricht indicated that the Russians will not accept the western governments' invitation to a conference on setting up an impartial commission, as a preliminary to free elections. The policy he outlined was the same as that laid down some months ago, when the Soviet Government apparently decided that its campaign for a peace treaty would not succeed as long as Dr Adenauer remained in power, and launched its national Germany army. Ulbricht still demands that the Adenauer government shall be overthrown by mass action outside parliament. The only change is in timing. Clearly it has been an infuriating disappointment to the Communists that the Western German trade union leader, Herr Fette, called off the strikes and demonstrations that were being held in May against the new works council laws. These actions were being used by the Communists and by some Social Democrats to protest against the treaties with the West, and it was evidently hoped that they might lead to the fall of Dr Adenauer. Now Herr Fette is branded, with Dr Schumacher, as a traitor. The overthrow of Bonn is, however, declared to be not only possible but inevitable, because a national liberation movement will arise against the "occupation regime."

Nevertheless, the date has been postponed, and the Communists have decided that active military backing may be needed to bring about the national revolution in Western Germany. Ulbricht made some very significant statements on these lines. He said:

This liberation struggle cannot proceed in one unbroken ascending curve. After an upswing there might be a temporary abatement, followed by another, yet more powerful advance. Hence the vanguard of the working class must aim at a gradual extension of the workers and the national liberation struggle. The Communists must look boldly ahead and prepare themselves and the masses—particularly the young people—for coming events.

The series of changes in the administration of the Soviet German Republic just announced by Ulbricht do not mean that Soviet aims have changed, only that the attempt of the last few months to speed up the timetable has been abandoned. The Soviet Republic, as he once more stressed, is simply to be turned into a more efficient base for securing all Germany. The Soviet Union's system is to be more closely adopted. The various *Laender* are being retained "in principle" for the day of reunion, but are in practice abolished. Instead, the country is being divided into administrative units based on economic areas. The form of government at the centre was already changed earlier this year to follow the Soviet model. Similarly, the Soviet system of justice is being adopted more faithfully than before, and the first steps towards collectivised farming are being taken. As Ulbricht said, the People's Republic is now to advance towards Socialism, and "State power is the main instrument" for this purpose. The State must therefore be strengthened together with the party that rules it.

All these measures are intended to help the campaign to secure Western Germany, as well as to prevent further undermining of the People's Republic from the West. The Eastern German army is intended to be the national army for all "liberated" Germany. It will be equipped with the weapons of modern warfare. The forces must be "filled with hatred of the US, British and French imperialists," and feel closely linked with the people's democracies and the "colonial peoples who are fighting wars of liberation." They must remember that wars against foreign rule are just. Herr Ulbricht, in a revealing declaration that was repeated in a telegram to Stalin, forecast that the resistance movement in the West would be encouraged by the knowledge that the national army stood ready to aid it. The only weakness in all this is the fact that, at present, despite all the opposition to rearmament, there is no resistance movement in Western Germany as understood by Stalin or Ulbricht.

Failure of the Chinese Air Force

[BY A CORRESPONDENT]

IN the past few weeks, United Nations bombers and fighter-bombers have made a series of attacks on power plants and other industrial targets in North Korea. Most attention has so far been focused on the political aspects of these raids, but the lack of Chinese reaction to the raids has surprised many air observers as well as political commentators. In spite of the prime importance of the defence of these targets for the Communist supply and industrial organisation in both Korea and Manchuria, the Chinese Air Force has failed signally to carry out a job of local defence which should have been well within its powers.

It was only last November that General Vandenberg, Chief of Staff of the United States Air Forces, stated that China had become a major air power. According to American intelligence estimates, the strength of the Chinese Air Force has increased from a figure of about 1,500 aircraft last autumn to a total of about 2,000 this summer. These figures have been repeated in responsible statements by British Ministers. It is known that about half the Chinese Air Force strength consists of MIG jets which are at least equal in performance to the Sabre, the best jet fighter that the United Nations can put into the air over Korea. The Chinese Air Force has received further supplies of radar equipment in the last few months. Moreover, by announcing the targets before the bombing in some cases, the United Nations have eased the tactical situation for the Chinese fighter squadrons. Not that their position is tactically difficult, for they know that raiding United Nations aircraft must always return to the same target areas. Moreover, Chinese MIGs still outnumber the escorting United Nations jet fighters and they have greater flexibility in their attacks on the bombers than the escorting fighters, which must be handicapped by the restricted manoeuvres imposed by their escort duties.

Despite all these advantages and the reported increase in operational strength, the Chinese Air Force has provided either very little effective opposition or no opposition at all. United Nations losses in these raids have been due mostly to battle casualties on take-off or when landing, or to the increased concentration of the Communist radar-controlled anti-aircraft fire in the target area. At a press conference in Washington last week, the American Air Under-Secretary, Mr Gilpatrick, revealed the puzzling fact that as the total number of jet aircraft in the Chinese Air Force has increased, the number of sightings of, and interceptions by, MIGs had decreased. When the MIGs do fight, however, they seem to be getting more aggressive and more experienced.

Lack of Trained Men

This can only mean that there is a serious lack of trained men in the Chinese Air Force which may be approaching the proportions of a crisis. A detailed study of combat reports from Korea over the last year or so has revealed clearly that the vast majority of Communist pilots have been inexperienced and hesitant. They have been ready to attack only when they had the advantage of height; and even then, they would only make a quick pass at the bombers and avoid anything in the nature of a dog-fight. But in the last year or so the Chinese Air Force has lost many of its élite pilots, including flying instructors, who have been the ones willing to engage in close combat and who have suffered heavy losses, especially against the Sabres flown by the more experienced United Nations airmen.

The Chinese Air Force has, moreover, been presented with a new operational problem. Many of the attacks on the power plants have been made by United Nations jet aircraft carrying bombs. These have presented a more difficult target

for the defending MIGs than the slower and larger American Superfortress bombers which were used in most of the bombing attacks of 1950 and 1951. There is also some evidence that the Chinese Air Force has been hampered by a supply problem. It is true that spare parts and replacement engines sometimes have to come from Soviet factories more than a thousand miles away. But this is a secondary problem compared with the major task of training an élite cadre of fighter pilots who can lead their air squadrons into effective air combat. War records so far have not sufficiently stressed how important this sort of air aristocracy was for victory in the Battle of Britain in 1940, nor how the lack of such an aristocracy was a basic reason for the air defeat of Germany in the spring and summer of 1944. The Communists must be better aware of this situation than we are. There is evidence that they are stepping up their operational training with MIGs in Manchuria and in the Maritime Provinces of the USSR and holding some back from premature front-line combat.

Colombia's Political Plight

[FROM OUR CORRESPONDENT RECENTLY IN BOGOTÁ]

SOME recent reports in the foreign press have given the impression that Colombia, the third biggest of the South American republics, was in the throes of an undeclared but full-scale civil war. These reports, as Mark Twain said of the premature announcements of his own death, have been somewhat exaggerated. Yet the sporadic violence which has cursed Colombia ever since the tragic outburst of riot and destruction in Bogotá in 1948 is still a serious reality. In recent months there has been less guerrilla activity by *bando-leros* in the remote western plains, where the disorders were originally most widespread; but there have also been more disturbances than before in the eastern provinces, where in one week in May over thirty persons were killed along the Magdalena valley. On June 29th nineteen soldiers were killed by an organised guerilla band in central Colombia. Not all of this violence is strictly political in character, for individuals and minor gangs have in some cases taken advantage of the disturbed situation to avenge private grudges or simply to rob. But until 1946 Colombia was one of the most law-abiding countries in Latin America, and the growth of lawlessness since then is admitted by all parties to spring primarily from political tensions. And it is to be feared that the new rift that has now appeared in the governing Conservative party may exacerbate these tensions.

The Conservatives came to power in the elections of 1946, when the Liberal party, which had long governed Colombia, was split by the left-wing demagogue Gaitán. Gaitán's rabble-rousing speeches during the following year heaped up fuel for the conflagration of 1948, in which he was killed, and after which the government clamped down firmly, and with much justification, on all political agitation that might lead to a second similar disaster. Moderate Liberals have since been in the unhappy position of having to avoid any appearance of condoning lawlessness, while at the same time deeply resenting the government's authoritarian methods. All responsible Colombians sincerely deplore the continuation of violence, but while the Conservatives claim that it would have ended long since if the constitutional Liberal opposition had not more or less passively condoned it, the Liberals in turn blame Conservative intransigence for most of the trouble. In such circumstances the tension between the two main political groups, always strong in a country where party affiliation is usually determined by birth, has become even stronger. A nation-wide "Campaign for Peace," launched with the blessings of the Church as an effort to end all internecine conflict, has hitherto failed to mend the breach, partly because, although Colombia is a strongly Catholic country, the Church is identified in many Liberal minds too closely with the Conservative tradition.

Recently, however, the Liberals have thought to see a ray of light in their darkness. Dr Gilberto Alzate, who was elected as President of the Senate last year, has broken sharply away from the official Conservative Party and carried many of its members with him. At the beginning of the year, indeed, it seemed that Dr Alzate, who had already openly declared war on several ministers and on Senator Alvaro Gómez, son of the ailing President and editor of *El Siglo*, the chief party newspaper, would capture the leadership of the party. Governmental leaders fought back bitterly, and gained some ground, but a Conservative convention which met in Bogotá at the end of May acclaimed Dr Alzate, and the party has found itself embarrassed by the existence of two rival directorates, each claiming the rightful leadership. The Liberal press naturally gave the split a prominent place in its pages until forbidden to do so by the government censorship, and some Liberals have expressed the hope that the Alzate crisis would compel the early holding of general elections, in which, they believe, they would easily defeat their divided opponents.

But it would seem that in their desperation the Liberals are playing with fire. Talk of any kind of co-operation between them and the *Alzatistas* ignores the hard facts about Dr Alzate's past and present record. In 1936 he was one of the founders of a short-lived near-fascist movement named *Nacionalismo*. To-day his big bald head and jowl still look like Mussolini's, and his demagogic attacks on "financial oligarchies" strongly recall those of Gaitán. Such a man would be a dangerous ally for a Liberal Party which, despite its bitterness, still holds fast to much that is truly liberal.

Colombia's political strife, moreover, seems all the more irrational in view of the country's present prosperity. With the market for its principal export, coffee, continuing strong, a sound balance of payments position, impressive developments in such crops for internal consumption as rice, and

the beginnings of a considerable heavy industry, Colombia is riding a real boom. Industry and the government have been able to finance such ambitious undertakings as the Neusa dam and hydro-electric plant, and the new pipeline which brings petroleum up from the Magdalena to Bogotá. Businessmen are optimistic and employees are drawing better pay than ever. Against such a background the country's bitter political feuds take on a tragically unreal air.

Critics of the Cameroons

[BY OUR CORRESPONDENT IN WEST AFRICA]

AT its meetings this summer the Trusteeship Council of the United Nations is to discuss reports from seven African territories, including the British Cameroons. This so-called "Cinderella" of West Africa consists of two long narrow ribbons of mountain and tropical scrub, lying alongside the Nigerian frontier. Its population of a million is fragmented into scores of different small tribes, and its economic life is rudimentary, apart from the former German plantation now run by the Cameroons Development Corporation. But these hardly enviable scraps of land provide splendid baiting material for use against imperial Britain at the Trusteeship Council. The name Cameroons comes from a Portuguese word meaning prawns or shrimps, found in abundance there. Hence the latest joke at Uno—*prawns in the game*.

The situation lends itself to such exploitation. Nineteenth of the old German colony of the Kamerun went to France, under League of Nations mandate, after the first world war; the remainder, while retaining its legal identity, was mandated to Britain and its two small parts were integrated administratively into Nigeria. The boundaries were, indeed, determined by ethnographic links with Nigeria in the north, and by geographical ones in the south. For all

Carefree Holiday Motoring with Dunlop—

the tyres with
the GOLD SEAL

Carefree holidays depend on trouble-free tyres. That's why so many motorists are starting the summer by fitting the latest and best Dunlop car tyre—and so should you. The Gold Seal on the sidewall means:

- Stronger and more flexible casing for greatest durability and maximum riding comfort.
- Non-Static properties for improved radio reception.
- Compounds which provide highest resistance to abrasion and wear.
- Patented Dunlop tread with thousands of 'teeth' to bite the road.
- Deep-pattern tread giving non-slip efficiency right to the end.
- Silent running throughout its long life.

practical purposes the two areas have been part of Nigeria for more than thirty years. They have no natural unity of any kind, being separated by part of Nigeria itself, and they are quite incapable, politically, economically, or culturally, of standing on their own feet; but the two together have become a Trust Territory, and the objectives of trusteeship under Article 76 of the Charter of the United Nations include "progressive development towards self-government or independence."

The only practicable version of this in the British Cameroons is self-government within the framework of a self-governing and independent Nigeria, until the tribes concerned are able to make a democratic choice of their own; but this policy can be represented as submerging a small Trust Territory into a British colony. So the Soviet delegate at last summer's meeting of the Trusteeship Council was colourful and apt in saying that "the policy of the administering authority with regard to the Trust Territory directly contradicts the Charter of the United Nations and violates its requirements." The contradiction, however, is not between British policy and the Charter, but between the principles of trusteeship taken neat and the facts of historical geography, although the United Nations, including Britain, Russia itself and everybody else, acquiesced in the illogicality. It is still possible to call Britain Perfidious Albion.

This year an alternative line of attack has been opened up for Britain's critics. The Trusteeship Council has received a petition from the Kamerun United National Congress (described by itself as "a virile and vociferous national organisation," founded in August, 1951) arguing that the territory is uncommonly backward, and that its poverty is due to the oddity of the international and administrative arrangements imposed by British sleight of hand. It presses for the early unification of the two sections of the Cameroons, French and British, preparatory to "the emergence of the Kamerun as a cohesive self-governing or independent Nation." Incidentally, the literary quality and intellectual niceness of the petition, signed by a Mr Jabea Dibonga, are

enough to prove that Britain has not denied education to the inhabitants of the Cameroons; for if Mr Dibonga did not write it, who did?

The political movement behind the petition is complicated in origin. It springs partly from pure frontier problems, such as customs, and in the last year or two the demand for unification has been heard increasingly from the French side. Nor have the tides of nationalism now sweeping West Africa altogether by-passed the Cameroons. Finally, there is the inspiration of the unification movement among the Ewe people in Togoland. The two cases are not parallel, for while in Togo there is the basic unity of the Ewe, there is no such unity in the Cameroons, and never has been. Before 1914 the area had scarcely been pacified by the Germans, certainly not unified, and it remains thoroughly heterogeneous. The British answer to the whole question is quite clear. All the arguments for separation put forward in 1919 have been reinforced by the passage of time and the moulding influence of two distinct colonial policies; the movement for unification is so far small and artificial; the British Cameroons would suffer, as the territory receives both direct and indirect subsidies from Nigeria, as well as other advantages, such as the marketing of exports through the Nigerian marketing boards; and its healthy

economic development, just beginning, would be interrupted by the separation from Nigeria.

There is another possible part-solution which is superficially more attractive. It was put forward when a United Nations visiting mission toured the country in 1949, reappears in the petition, and is sure to crop up when the next visiting mission arrives later this year. Briefly, the suggestion is that the two sections of the British Cameroons should be formed into a separate or fourth region, under the existing Nigerian constitution, with the same quite wide regional autonomy, and the same budgetary and administrative separateness, as the other three regions. In the future the region might elect to stay with Nigeria, or join the French Cameroons in a sort of federation; at any rate there would be some choice. Here again, though, the British answer is clear and definite. The Cameroons has been given greatly increased representation in the regional legislatures, under the new constitution, and there is even a special minister for the territory in the central council of ministers. The region could not compare with the other three in area, population, or economic strength, and has neither the money, the men, nor the experience to run its own regional legislature and administration.

It remains to be seen how far these arguments will carry in the Trusteeship Council, where Britain is once more on the defensive. The nationalist movement in the Cameroons is embryonic, though it is bound to develop; but for the moment its political importance lies mainly abroad.

More than half the income from Britain's exports is drained away in importing food from abroad. The price of foreign food is rising. Dearer food means dearer living and increased production costs. It becomes increasingly difficult, therefore, to sell goods abroad at a competitive price unless this trend can be reversed.

The quickest way to do this is to grow cheaper, more plentiful food for ourselves.

There are 17 million acres of rough grazing in this country where the fertility could be enormously increased with the proper treatment. So we have the land to grow more food.

But the £5 million in 3 years, which is all that has been allocated for this purpose, is inadequate.

What farmers need is more of the modern farming equipment that can bring to agriculture the efficiency, increased output and lower production costs that modern machinery and methods have brought to industry. Once this is understood this leak in the nation's economy can soon be plugged.

Harry Ferguson Ltd., Coventry.

GROW MORE FOOD IN BRITAIN

THE BUSINESS WORLD

The Banks' Investments

IN their mid-year statements of account issued this week four out of the "Big Five" banks have, as expected, made an important departure from traditional habits in bank accounting. Instead of writing down the book value of their investments in British Government securities to take account of the further depreciation that has occurred during the past six months, and thus to permit them to be shown "at or under market value," these banks have stated them "at or under cost and below redemption price" but above market value, which in each case is disclosed in a marginal note. The aggregate difference between the two sets of figures is just over £34 million, compared with an aggregate book value of £1,371 million.

This change may be open to misconception by people unfamiliar with the mechanics of banking. Therefore it should perhaps be said at the outset, before discussing the details of the change, that it is mainly of technical significance. In particular, the disclosure of this depreciation does not mean that the banks have lost the money it represents, or even that they have necessarily suffered any greater degree of depreciation than those banks that have adhered to the traditional accounting procedure and have not disclosed any depreciation at all. In conditions such as have obtained in the gilt-edged market in the past six months—and, indeed, over the past five years considered as a whole—no bank, and least of all the big ones, could have avoided depreciation on its investments, no matter how skilfully it operated.

The banks that have altered their practice in this fashion are the Midland, the Westminster, Barclays and Lloyds. The other six English clearing banks—the National Provincial, the three "northern" banks, and the two smaller institutions—have all followed the time-honoured practice, and they also show more clearly than is usually done at the mid-year what that practice is. They all specifically state that investments are shown at less than market value, but give no indication of the nature of the writing-down—except that it has not been at the expense of published reserve funds.

The procedure adopted by the tradition-breakers is not quite uniform. All four banks state that no transfers have been made from contingency account or from reserve fund, as existing at January 1st last, to write down British Government securities during the half-year; but the Midland and the Westminster banks state, in addition, that they have not made any provision for writing-down out of the profits of the half-year. The clear implication, on the one hand, is that the other two banks, Barclays and Lloyds, have written down their December 31st book valuations by undisclosed amounts; and, on the other hand, that the only changes in the book valuations of the Midland and Westminster over the half-year are those resulting from purchases and sales. Except to the extent that the end-December valuations

of these two latter banks still incorporated a hidden reserve, the difference now shown between book value and market value measures the actual net depreciation sustained during the half-year. It is not surprising, therefore, that these two banks disclose wider differences than the other two.

The comparison between the two valuations is shown in Table I, from which it will be seen that there is a marked similarity in the percentage depreciation within each pair of banks, and a notable contrast between the pairs. If the 3 per cent margin shown by the Midland and the Westminster does, indeed, reflect the greater part of the actual fall during the half-year, it represents a creditable achievement. Even such a short-dated security as 2½ per cent National War Bonds, 1954-56, dropped by 3.9 per cent during the period; 2½ per cent Funding Loan, 1956-61, dropped by 3.5 per cent; 3 per cent Savings Bonds, 1955-65, by 4.9 per cent, 3 per cent Funding, 1959-69, by 6.2 per cent. The "one-way-option" stocks, such as 2½ per cent Consols, slumped by

more than 9 per cent; while, at the other extreme of the scale, the 1952-54 War bonds fell by 1.7 per cent and the 1954 Serial Funding stock—the longest of the bonds foisted on to the banks last November in exchange for Treasury bills—fell by 2.4 per cent, to 3½ per cent below its issue price. A comparison of these movements with the disclosed depreciation of little more than 3 per cent makes it plain that the banks' efforts in recent years to reduce the average life of their portfolios (by no means an easy task to perform without severe penalties, in market conditions such as have obtained for a large part of the past quinquennium) have met with substantial success. The individual statements, as well as a joint "notice" issued from the Bankers' Clearing House, emphasise that none of the four banks holds any British Government security that has no fixed redemption date, and that the "majority" of each portfolio matures within ten years. It seems evident from the market experience

that "majority" must mean substantially more than half.

It is equally obvious, however, that the banks that have made this break with tradition have not done so merely with the object of demonstrating the success of their policies of shortening portfolios in order to keep the depreciation within moderate bounds. Nor, despite the indications that the new principles are likely to be followed in future, can it be pretended that the change has not been dictated by the exigencies of the moment. The driving force has been the huge strain put upon the traditional practice, a progressively increasing strain that has extended over the whole period since the collapse of the Daltonian monetary policy early in 1947. In these five-and-a-half years the ill-starred "Daltons" dropped by 46 per cent, and the average level of the whole gilt-edged market fell by almost one-third. At June 30th a two-year bond stood fully 5 per cent lower than a three-year bond (with equivalent coupon) stood in the Dalton heyday.

When this period is surveyed as a whole, it is, in fact a remarkable tribute to the conservatism and strength of British banking that the provisions from current profits and from previously accumulated inner reserves have sufficed to enable the banks to cover their investment depreciation internally for so long, for the average level of clearing bank investments over these years was £1,500 million, almost two and a half times its prewar level; it was increased by a further £500 million by the funding of Treasury bills last November. But inner reserves exist to provide for other contingencies, and more important ones, than book depreciation on the investment portfolio, notably provision for bad debts; and one of the reasons why the reserves have been able to stand the long-sustained strain of falling gilt-edged values is, no doubt, that calls upon them for bad debts have been unusually light. Indeed, in some recent years the accounting of bad and doubtful debts actually fortified the inner reserves, because the recoveries from debts written off early in the war exceeded the need for new provisions.

But now that the seller's market has ended and monetary discipline is creating more realistic business conditions, the banks' risks on loans and advances are rising. It is more important that ample inner reserves should be available for these contingencies, and other less definable ones, than that the accounting convention of investment valuation should be maintained. Hence, whether or not the banks that have dropped the convention could have met the whole of this half-year's depreciation of investments from their contingency reserves (a question to which the latest statements naturally give no answer), it is clear that such a procedure would at least have brought those reserves to a lower level than the banks concerned were prepared to countenance. In any case, there is no assurance that gilt-edged values may not fall still further.

Naturally, the point at which the balance of advantage seems to favour a break with tradition is a matter of judgment, and its position will accordingly differ from bank to bank. But, given the decision to protect inner reserves, there was, in principle, one alternative to the course actually adopted—to follow the precedent, set in 1931, of drawing on published reserves. But the situation now is very different from what it was then. Whereas the investment portfolios have expanded hugely since prewar days, the banks' capital and disclosed reserves have risen only slightly. Thus, although it is true that the depreciation now shown by the four banks is in

each case less than the published reserves, it represents a very substantial proportion of them—a proportion that in one case slightly exceeds the portion of these reserves not held on share premium account. The balances carried forward on profit and loss account are not, of course, disclosed in the half-yearly statements.

The banks have therefore made a virtue of necessity—or, if not literally of necessity, then at least of circumstances that they would have wished otherwise. The sea-change in the gilt-edged market has driven them to discover the unrealities that are unquestionably present in the traditional accounting practice (what the Clearing House "notice" calls the "old custom"); and some bankers are now flatly contradicting in private the very arguments that they used in public defence of the convention only a few months ago. The new arguments are certainly no less respectable than the old. It is contended that the market prices of the particular securities do not in fact afford a "true and fair" measure of the worth of the portfolios in question—first, because the portfolios never could be sold as a whole at such prices (or, indeed, at any prices, given their huge extent in relation to the size of the market) and, more particularly, because it is almost impossible to conceive circumstances in which more than a moderate proportion of them might have to be sold as a means of reducing their total.

TABLE II
CLEARING BANKS' GOVERNMENT SECURITIES: OLD BASIS
£ million

	Book Value*		Change over Half Year (+ or -)
	Dec. 31, 1951	June 30, 1952

TOTAL	469.14	453.66	— 15.48

* Valuations are in every case stated to be less than market value.
† Includes gilt-edged investments other than British Government Securities.

To the extent that the investments are sure to be retainable until the fixed redemption dates, the banks can reasonably regard their "true" value as the price they will secure on redemption; and meanwhile to ignore market depreciation entirely, on the ground that it will automatically disappear as redemption date approaches. On this basis, the existence of depreciation at a particular moment is of practical significance only to the extent that securities may have to be realised—for example, if the Government pursues a deflationary monetary policy that forces down the level of deposits, or if a credit discipline of the present kind makes it necessary to sell investments in order to make room for advances. Unless official monetary policy were extraordinarily misguided, the proportion of the investment portfolios that might have to be sold for such reasons is bound to be relatively small; but any sales compelled by monetary policy will almost inevitably be made at a loss—and the extent of any such realised loss is, of course, totally unaffected by the particular accounting techniques the banks may have chosen to adopt. A realised loss is no less real because

it has already been provided for out of inner reserves.

If this is to be the new theory of bank accounting, it may help to break down the doctrine of obscurantism in bank accounts. If a depreciation is disclosed, it will keep very firmly in the minds of bank managements their duty to maintain a high proportion of short-dated securities at such times, and may perhaps induce them to tell the public a little more about the disposition of the portfolios. In any case, if this mid-year precedent is followed, the extent of the depreciation from one half-year to the next will give a fair measure of the shape of the holdings—

A Commodity Price Indicator

ANY addition to the deluge of statistics that now floods the world requires, if not an apology, at least an explanation. The new commodity price indicator that this article introduces has the modest aim of illustrating general trends in world commodity prices. It might be thought that there are indices enough for this task. But, unfortunately, it is no longer true that British prices alone furnish a reliable guide to movements in world commodity prices. They are affected by subsidies and by the arbitrary pricing policies of the government trading departments, which are still responsible for buying one third of this country's imports. Some of the British markets for staple commodities have been closed for years, and American quotations are often the only guide to world price movements: American demand now dominates the commodity markets, and although many of the American markets are relatively insensitive to changes in supply and demand and are hampered by

frequent changes in import duties, for certain commodities—particularly copper, lead and zinc—only American quotations are available.

The sharp rise in commodity prices after the outbreak of the Korean war revealed certain limitations in the various American index numbers as indicators of the world price trends that affect the sterling economy; yet, hitherto, these index numbers have been the only ones available for this purpose. Between June, 1950, and March, 1951, most of the American indices showed a total rise in commodity prices of about 35 per cent, whereas the British price index of imported raw materials

and a very rough indication of the risk of losses that might be faced if the banks had to contract their portfolios. Unfortunately, the banks seem no more disposed than in the past to present informative profit and loss accounts. But, so far as the past half-year is concerned, there is no doubt that the trend of current earnings—that is, excluding the consideration of investment depreciation—has been more favourable. If there is no deterioration in the second half of the year, the banks at the year-end will certainly be making substantial transfers to reinforce their inner contingency accounts.

showed a maximum rise of 87 per cent. The relatively modest increase shown by the American indices is explained by the commodities chosen and the way their prices are weighted. An index number capable of indicating the general trends in world commodity markets must meet two requirements. It must show the general movement in prices of commodities important in international trade; secondly, it should be simple in scope and method. The new commodity price indicator outlined in this article will, it is hoped, satisfy both conditions.

The indicator uses the prices of seventeen commodities, listed in the statistical notes in this week's issue of the *Records and Statistics* supplement. They form a representative rather than a comprehensive group. For each of thirteen commodities a single representative quality has been taken; the other four (wheat, cotton, wool and copra) include more than one type, raising a problem that is discussed more fully in the statistical notes. Prices for each commodity are taken from the most representative market—for example, London for tin and rubber, New York for copper, lead and zinc, and Colombo for tea. Each price is converted, where necessary, into dollars or sterling, at the current rate of exchange and then into an individual index. The indicator is an average of these individual indices.

The choice therefore had to be made between different methods of averaging, in particular between an arithmetic mean and a geometric mean. Most statisticians argue in favour of a geometric mean for an unweighted average, but although the indicator had to be an unweighted average (for reasons discussed below), the arithmetic mean was chosen so as to achieve a better balance between the changes in the different commodity prices. The geometric mean tends to damp down the larger movements and to accentuate the smaller ones. To have used an elaborate system of weighting would have demanded the right selection of weights and the discovery of some recent period when the relations between different commodity prices could be regarded as normal. Since the war, there has been no such period; the outstanding feature of the commodity markets since 1946 has been the wide variation in relative prices.

The choice of an arithmetic average means that the indicator is in fact weighted by the number of commodities chosen. It includes six foods (wheat, maize, coffee, cocoa, tea and sugar), four fibres (cotton, wool, jute and sisal), four metals (copper, lead, zinc and tin) and three other raw materials (rubber, petroleum and copra). The number of commodities chosen in each group corresponds approximately to the relative values

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

of world trade in these groups before and after the war. Thus food—with six items out of seventeen—has an effective weight of 35 per cent in the indicator; this corresponds almost exactly to the proportion that food represents in the value of all basic commodities entering international trade. Perhaps fibres, on the same reckoning, are underweighted, but this could be corrected only by reducing the total number of commodities in the indicator, which would be undesirable on other grounds.

A major complication is the choice of a suitable base period. But for the war in Korea, 1950 might have been the first "normal" postwar year; the boom in commodities in the second half of the year rules it out as a base year. Both 1947 and 1948 were influenced by abnormal postwar demand and by the abolition of price controls in the United States. On the other hand, 1949 was a year of mild recession followed by devaluation. In the end it was decided to take the twelve months July, 1949, to June, 1950; and to calculate the index in both dollar and sterling values. The dollar version shows the trend of commodity prices in relation to the fixed price of gold. The sterling version shows the trend of prices as it affects those countries using sterling in their international transactions. As a result of the choice of base period, the graph of the sterling index is below the dollar index up to devaluation and above it after devaluation.

It has been emphasised throughout that the purpose of the new indicator is to show a general trend, not to provide an accurate measure of movement. If it is true that major movements in commodity prices are determined more by changes in demand than by changes in supply, and that demand reflects the prevailing monetary conditions, the price indicator should give a sensitive reaction to monetary influences throughout the world. But it has certain admitted limitations. It covers a limited number of commodities, chosen as being representative, but not claimed to be fully representative. The use of an arithmetic mean without any system of weighting gives any one of the seventeen commodities an individual weight of nearly 6 per cent. If the price of one commodity increased by 100 per cent and all the others remained the same, the indicator would rise by nearly 6 per cent. Nor does the indicator take into account "free market" prices of various commodities, where they exist. The difficulty here is to get a representative free market price at a given point each week and to know how much of the commodity changed hands at that price. Finally, seasonal trends in prices have not been eliminated. When the indicator is published each week in the *Records and Statistics* supplement and at intervals in *The Economist*, it will always be compared with its figure for twelve months before.

In the first of the three accompanying charts, the indicator (on both dollar and sterling base) is plotted against the Board of Trade index of import prices for raw materials and Moody's index of staple commodities. The dollar version of the indicator follows the Moody's index fairly closely until June, 1950, and then rises much more steeply, reaching a peak in March, 1951, when it was 68 per cent above its base (or 57 per cent above June, 1950). The Moody's index reached its peak in February, 1951, when it was 50 per cent above the 1949-50 base or 36 per cent above June, 1950. Both fell to a low point in September, 1951, recovered slightly and then

fell to a new low in the second quarter of this year. The indicator has shown little change since May, whereas Moody's index showed a rise in June.

The sterling version of the indicator is higher than the Board of Trade index in 1947 and the first half of 1948. This can be explained first by the fact that the Board of Trade index plotted here does not include food—and food prices were high during this period—and, secondly, by the tendency, under government trading, for prices to lag both on the upswing and on the downswing, a feature particularly noticeable in 1949 when commodity prices were falling. The indicator rose to a peak in March, 1951, when it was 82 per cent above the 1949-50 base and 57 per cent above June, 1950. The Board of Trade index, on the other hand, reached a peak in May, 1951, when it was 108 per cent above

the same base period and 87 per cent above June, 1950. This difference, too, can be explained by the fact that food prices are excluded from the Board of Trade index as shown—and they rose much more modestly than raw material prices—while throughout last year Britain was buying raw materials at premium prices.

The two other charts show the trends of the main groups of commodities included in the indicator—food, fibres, metals and other raw materials—in dollar and sterling terms. They reveal wide differences in the behaviour of commodity prices during the past twelve months. At the present time metals and other raw materials are rising, while food and fibres are still falling. The indicator for the last three months suggests that the fall in prices that persisted almost continuously since March of last year may be exhausted.

Business Notes

Market Rise Faltering?

The recovery that began in stock markets just over three weeks ago made further headway until last Thursday, when it was jolted into reverse by the unexpectedly alarmist tone of a statement from the Prime Minister. In the week to last Wednesday the gradient of the advance in gilt-edged was actually steepening, and spread right through the list, not excluding the shorts. On Wednesday, the gains ranged up to $\frac{3}{4}$ —for 3½ per cent War Loan, raising its week's movement to 1½ points, a rate of improvement that was paralleled by several other stocks, notably the longest of the Savings Bonds. At this point some quotations were as much as 3 points above the nadir reached on June 24th. In industrial equities the trend was similar, though less pronounced: in the week to last Wednesday, the ordinary share index of *The Financial Times* had gained another 2½ points, carrying it to 111.0, or appreciably more than half-way from the mid-summer low of 103.1 towards the peak of 114.1 touched at end-April. No new influences were discernible to account for this buoyancy—no influences, that is to say, beyond those noted in these columns last week. The dominant consideration, plainly, has been the sense of relief that the mid-year "hump" has been passed without disaster; and a further influence has been the evidence that the worst has been seen in the localised recession in textiles and certain other consumer goods.

These, however, are negative consolations that have little relevance to the fundamentals of Britain's economic problem. In the circumstances, though some recovery in markets was perhaps to be expected, its persistence and momentum have come as a surprise—especially as the institutional investors have throughout maintained an attitude of marked caution. On Thursday, therefore, the markets inevitably proved vulnerable to Mr Churchill's reference, on the previous day, to the "grave and far-reaching" measures "affecting every branch of our national life" that are to be explained in the coming two-day debate in Parliament on the economic situation as a whole. Not unnaturally, the markets took fright at such spectacular phrasing, characteristic though it was. There now seems considerable doubt whether the measures to be described are primarily those already in operation or measures still to be revealed. But if the markets were wrong on Thursday in supposing that there has been a sudden deterioration, and one requiring dramatic new measures, they were almost equally wrong before that in supposing that the passing of the first "hump" of danger meant that the period of the alert is nearing its end.

Exports Fall Again

The provisional figures for overseas trade in June show that exports are continuing their downward slide. Last month they fell sharply, to £185 million compared with £226 million in the previous month and £200 million in June, 1951. This was the lowest total since February, 1951. The monthly figures tend to exaggerate the seriousness of the decline because they do not allow for the differing number of working days; even so the daily rate of exports was 3 per cent lower than in May. Imports in June fell by £44 million to £277 million, and were thus £81 million less than in June of last year. After allowing for re-exports of more than £8 million, the excess of imports (valued c.i.f.) over total

exports (f.o.b.) was just under £8½ million, compared with £85 million in May and £149 million in June last year.

Exports in the first half of 1952 amounted to £1,346 million, which is more than £100 million above their total in the first half of 1951. The whole of this rise, however, was concentrated in the first three months of 1952, and it did not take place in exports to the most important markets; thanks largely to a fall in exports to Canada (a market that now shows some tentative signs of reviving), shipments to North America during the past six months have amounted to only £126 million or 10 per cent less than in the corresponding period last year. On the import side, there are signs that at long last the rise may have been stemmed. During the first

half of this year imports totalled £1,903 million, compared with £1,856 million in the same period last year and £2,058 million in the second half of 1951. The reduction in imports compared with the second half of last year was mainly due to a fall in volume.

It seems probable from the half yearly figures that Britain's overall deficit in the past six months was about (or perhaps rather over) £100 million, compared with £93 million in the first half of last year and £428 million in the second half. If an allowance of 12½ per cent is made for freight and insurance charges, the f.o.b. value of imports in the first half of 1952 appears to have been about £1,670 million; total exports (including re-exports) were £1,430 million, which would leave a visible deficit of about £240 million, compared with £336 million in the first half of last year and £453 million in the second half. It will be disappointing if net invisible receipts have not covered at least £120 million of the latest half-yearly deficit, and rather unexpectedly cheering if they have covered more than £150 million of it. In any case it is evident that there is still a long way to go if the overall deficit is to be removed this year, and the May and June trade returns do not show many signs of progress along it.

Transport Commission Report

The financial accounts of the British Transport Commission for 1951 were published a month ago; this fact, and the appearance of the Government's bill robs the commission's full report of some of its accustomed limelight. But many of the comments in the report have great significance in the present controversy on transport policy. They certainly put the commission's point of view fairly and squarely. At the very outset, the chairman, Lord Hurcomb, claims that

if the Commission were able to proceed with their plans for the integrated development of their services under a suitably revised organisation of their administration, and if they were permitted to adjust without undue delays the level of their charges to meet the costs of the various services provided, they would look forward with some confidence to the maintenance of the (financial) equilibrium achieved.

This statement begs a number of questions—including the best ways of revising the transport organisation (on which the commission is as silent as the Government) and the long-term implications of giving the commission an automatic warranty against increases in external costs. But it is ironical that at the very moment when the Government should be proposing the dispersal of the road haulage services operated by the Road Haulage Executive on behalf of the commission, the latter should be claiming noteworthy improvements in the efficiency of the road services.

Such improvements were to be expected after the first difficulties of acquiring the fleets had been overcome; the stage has at least been reached when a more satisfactory service is being provided for the trading community and when it would become possible—but for the Government's intentions—to talk intelligently about the real meaning of integration of road and rail services, and the principles on which their respective charges should be determined. The commission's report repudiates the notion that it may enforce "arbitrary selections of its services upon the public." It asks only that "the customer should pay the real cost of the services he selects, and that he should not receive one service at its bare cost if he insists at the same time on the maintenance of other services at less than cost." The application of these principles presents a number of practical difficulties, including accurate traffic costing; on this the commission has made some progress, though much more work remains to be done. The notes on traffic costing included in the report provide, indeed, the foundation of a study in transport economics, which are at least as important as the arguments about ownership and competition that now enjoy political currency.

The commission is not to be blamed for putting its case vigorously. It is in the business of integrating transport, and its report shows that it is forming reasoned lines of policy for carrying it out. Whether it could succeed, given the ambiguities of its present organisation and the marked lack of co-operation on the side of labour in making integration work is another matter. If the Transport Bill goes forward in its present form, it will not have the chance.

A Carrot from the IMF

One of the functions of the executive board of the International Monetary Fund is to compile an annual report on exchange restrictions in force in member countries, and to carry out consultations about means of lifting them. Last week the board issued its third annual report on this subject. It had a depressing tale to tell. At the beginning of 1951 some progress was being made towards the removal of these restrictions, but at the end of the year and at the beginning of 1952 the pendulum swung right back towards more stringent restriction. Apart from the United States, Canada and a handful of central American countries, nearly all members of the IMF now impose discriminatory restrictions of one sort or another. The Fund is therefore having to carry out "consultations" with no less than 44 of its 51 members. In the course of these consultations, the executive board reveals, it has felt able to declare that members that run into difficulties as a result of easing import and exchange restrictions could "reasonably expect" to be allowed to draw upon the fund's resources.

Since it began to receive American aid in 1948 Britain has been effectively barred from drawing dollars out of the fund; if this ban were removed Britain could, under the fund's articles of agreement, expect to be allowed to draw out about \$300 million in the course of the first twelve months. Independent members of the sterling area, who are also members of the fund, would have drawing rights on a further sum of over \$200 million in a twelve-month period. This is perhaps not, by itself, sufficient of a carrot to persuade the British authorities to make a real move towards convertibility—but it is one of several inducements that they must be eyeing as they stand on the edge of the water wondering if they dare to take some plunge. Needless to say, the executive board's present report, which is wholly concerned with exchange restrictions, does not have anything to say about the recent debate on the desirability of a move towards floating exchange rates; that is a subject on which some pronouncement may perhaps be expected when the fund's full annual report comes out in September.

Germany's Surplus in EPU

The complete figures relating to the operations of the European Payments Union in June are again dominated by the fact that Germany ranks as the main creditor, with a surplus of \$76.4 million compared with one of \$66.4 million in May. In accordance with the scale of credit and gold payments, Germany took one half of its surplus in gold and one half by increasing its balance with EPU. If the June rate of surplus is maintained, Germany will have exhausted its quota by September, a position that would call for special measures to decide how any surpluses in excess of the quota will be paid. It was little more than a year ago that Germany had exceeded its quota in the other direction and that special help had to be given to it by EPU. The violence of the swing that has occurred in the German balance of payments is a measure of the effectiveness of the remedial measures applied to the domestic economy following the investigation of the situation by EPU experts. It is also a measure of the volatility of the German balance of payments, free as it is from the burden of making provision for

A GREAT NEW TYRE BUILT TO CUT RUNNING COSTS

THE
de Luxe
All-Weather Tyre by
GOODYEAR

New all the way through!
New Carcass! New Tread!
New Shoulders! New Side-
walls! Tougher—Stronger—
Steadier—Safer—The
New de Luxe by Goodyear
is the greatest car-tyre value
obtainable at the Standard
Price Level.

It will save you money. The tread is thicker, tougher, wider, flatter, for longer mileage. The strong, resilient cord carcass combines reliable sidewall construction with comfortable riding. The smart, rugged shoulders protect the sidewalls. The famous diamond-tread design, still further improved,

ensures greatest grip on all surfaces and safer cornering. By all standards the new de Luxe is the right tyre for the times, at the right price, and obtainable now at your regular supplier.

When next you buy a tyre—insist on Goodyear

You can trust

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand gold-field alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

BARCLAYS BANK

external debts and for appropriate contributions to the common defence of western Europe. This dramatic change in the German position is a factor that, it is hoped, has not been overlooked in the course of the London conversations on German external debts.

The other main feature of the June returns of the EPU is the fact that France has become the second largest creditor, with a surplus of \$22 million, following a small deficit for the previous month. The French import cuts, together with the seasonal peak of tourist expenditure in France, are evidently making themselves felt. For France, as for a number of other countries, however, the June settlement has been considerably complicated by the results of the changes introduced in EPU at the end of its initial two-year life. Thus France received the benefit of the \$25 million allocated for future armament deliveries to Belgium. On the other hand, France was called upon to repay the exceptional credit of \$100 million granted by the Union last spring. As a result of these various cross-entries France was called upon to pay \$47.6 million in gold to the Union in respect of June operations. Third in the list of creditor countries is Belgium, with a surplus of \$21 million. The Belgian position with EPU has been completely transformed as a result of the new agreement made with Belgium. The increased quota and the substantial gold repayments made to Belgium have reduced Belgian credits to EPU from \$423.9 million to \$243.9 million.

The final figures for the June operations confirm that the United Kingdom had a net deficit in that month of £17,084,286 or \$47,836,000. No further use of existing sterling resources took place during the month. The accounting deficit was, however, reduced from July 1st by \$25 million following the new arrangement with Belgium. This reduced the amount of gold paid by the United Kingdom to the Union to £8,155,715. Up to date the total amount of gold paid by the United Kingdom to EPU amounts to £172,521,786, while the total overdraft run up with EPU by the United Kingdom is equivalent to £227,143,000.

Policy in the Air

The Government's aviation policy began to take more substantial shape during the course of Wednesday night's debate. It is becoming increasingly clear that the Government expects the two air corporations to keep within the boundaries of their existing networks, leaving private operators to develop any new routes that the traffic justifies. Mr Lennox Boyd also said in the course of the debate that, to help the private operators, the new Air Transport Advisory Council would not consider applications from the corporations to open up new freight services for one year. This should give the private operators time to get such services established. He repeated the assurance already given by the corporations that they would not keep aircraft specifically for charter work.

This is a fair and sensible policy so far as it goes, but it is still doubtful whether it goes far enough to give private operators a fighting chance of survival. Unless the Government is going to give the ATAC a specific directive to discriminate in favour of the private operators, it is conceivable that the corporation could drive them off any new route that they attempted to develop, whatever the Government's intentions on the matter. The competitive weakness of the private operators lies in their lack of capital and lack of aircraft. Capital to buy new aircraft will be hard to raise unless the company can show that it has a licence to operate a new route or service. But if a company asks the ATAC for a licence that it cannot start to operate for two or three years because it has still to buy the aircraft, the corporations with their expanding fleets can always make a counter-application for a service to be operated almost immediately on the same route. If the traffic justifies the new service at all, the ATAC can hardly avoid granting the licence to the

carrier who can develop it the most rapidly—and that will usually be one of the corporations.

There is no sign that the corporations intend to adopt destructive tactics, but it is reasonable to assume that by the time a new service begins to look economically attractive to the private operator, it will have looked equally attractive to the corporations. Because of these difficulties, the private operators are likely to ask the government for help in buying aircraft. Nothing that has been said suggests that they will get a sympathetic hearing, unless the Treasury, which has consistently vetoed the building up of a military transport fleet, can be persuaded that aircraft bought and leased to private operators will at least provide the framework of a strategic reserve.

Cars and Covenants

In deciding to lift the covenant on certain cars, the motor industry is taking the first step out of the morass of regulations and documents that has turned the once simple process of buying a car into a formidable legal undertaking. The tactics of retreat are quite different from those adopted when the restrictions were being introduced. This time, little or no information is being given to the public. No list of covenant-free cars has been issued; it is generally assumed that a model will be withdrawn from the covenant when the second-hand price for a car just out of covenant is lower than its list price when new, or in the industry's words when "it cannot now be the object of speculation," but there is no indication of the standards by which prices will be compared.

Such reticence may puzzle car owners who want to know which models are in or out of covenant. How does it happen that a Daimler may now change hands freely whereas the equally expensive Rolls-Royce remains subject to covenant? This fact is the more remarkable since it was only with difficulty that Rolls was persuaded to join the covenant scheme when it was introduced. The decision whether or not to withdraw has in fact been left in the hands of the individual manufacturers, some of whom may feel that escape from the covenant is, in present circumstances, a rather invidious freedom. The present arrangements are designed to provide them with a backdoor through which models can be withdrawn piecemeal without loss of face. Between 50 and 60 models have been withdrawn for a start, among them some of the more expensive cars, built by the "big six" manufacturers. More are likely to follow, for second-hand prices have been falling since the beginning of the year and the release of even a handful of 1951 and 1952 models on the market is bound to have a depressing effect on the second-hand prices of 1949 and 1950 cars just out of covenant. This change in values could conceivably recoil on the British Motor Trades Association, the body that has pursued covenant breakers with considerable vigour. Has the BMTA, by cancelling all outstanding covenants on cars withdrawn from the scheme, exposed itself to action? Certainly, the covenant has been annulled unilaterally in these cases without the consent of the purchasers of the cars that have been released from covenant, and some of them might argue that damage had resulted. It was always possible to argue that the covenant was a dubious expedient; it will be doubly dubious when applied to some cars and not to all, particularly when car prices may have seen their peak.

Strategic Supplies Improve

The International Materials Conference has now announced its allocations of copper, nickel, cobalt, tungsten and molybdenum for the third quarter of 1952. Without exception, they are at the highest rates since allocation began twelve months ago. The general improvement in supplies of strategic materials has also been reflected in recent changes

in the conference's functions. Zinc allocation was abandoned last month and the cotton and cotton linters committee is to be disbanded in September. The position of other commodity committees that are not concerned with allocation is to be reviewed shortly, and they too will probably be disbanded. At that stage the whole future of the IMC would presumably have to be reviewed.

Copper may be the next candidate for release from international rationing. The allocation for the third quarter has been fixed at 744,290 metric tons (including supplies for the United States stockpile), compared with 723,680 metric tons in the second quarter, but the Chilean Government is again left free to dispose of a limited amount of its copper outside the scheme. At the request of the United States a new clause has been added to the copper committee's recommendations; it provides that if some countries do not take up the whole of their copper entitlements, domestic users in the United States and other participating countries shall be given the opportunity of purchasing the balance. United States domestic consumers are also to be free to take up any surplus quotas of tungsten, cobalt and molybdenum. Since 1950 the production of tungsten in the free world has doubled and that of molybdenum has risen by 50 per cent. By contrast, nickel remains the scarcest of the strategic materials, though the allocation for this quarter has been increased from 35,195 tons to 36,580 tons. The allocation of cobalt has been restored to a quarterly basis and the distribution in the third quarter will amount to 2,475 tons compared with 4,413 tons in the first half of this year. Britain's share of these respective commodities will be 100,300 tons for copper (against 97,200 tons last quarter), 5,428 tons for nickel (against 5,326 tons last quarter), 360 tons for cobalt (against 648 tons in the first half of the year), 950 tons for tungsten (against 1,629 tons in the first half of the year) and 591 tons for molybdenum (against 1,067 tons in the first half of the year).

Iraq Stays in the Sterling Area

The sensible attitude taken up by the Iraq authorities in the negotiations leading to the recent oil agreement has clearly caused them to be regarded with careful favour by Whitehall. The more prosperous Iraq becomes—and in the near future it is likely to become very prosperous—the more pointed will the contrast be between the good fortune of its nationals and the plight of their unfortunate neighbours in Iran. It is presumably for this reason that the British Treasury has leant over backwards to be generous in the financial agreement that it concluded with Iraq last week. The whole of Iraq's blocked sterling balance of £23 million is to be released and the country is to remain a full member of the sterling area. This apparently means that it will be allowed to draw any dollars that it needs (after deciding on its own dollar import programme) from the sterling area central pool. Provided the oil boom lasts, however, Iraq is unlikely to impose any net strain on British resources, and its government has promised that it will act as a co-operative member of the sterling area and that it intends to regard the newly released sterling balance as part of the cover for its currency.

A New Tax Certificate

The Government is at last raising the rate of interest allowed on new Tax Reserve Certificates from the level to which Dr Dalton reduced it in 1946. He then introduced a second series, with a tax-free rate of $\frac{1}{4}$ per cent, compared with the 1 per cent offered by the wartime series. As from last Wednesday, the current issue was superseded by a third series, bearing interest at $1\frac{1}{4}$ per cent tax free, the interest being payable, as in the past, for a maximum period of two years. Since 1944, the period during which the certificates

may be tendered in payment of taxes has been limited to five years, but no such limit is fixed for the new certificates. Notably since the increase in Bank rate to 4 per cent, the $\frac{1}{4}$ per cent tax free rate had become hopelessly out of line with the realities of the market; for taxpayers subject only to income-tax at the standard rate, it was equivalent to less than three-quarters of the rate obtainable from balances on deposit account at the banks, and, more significant still, has ceased to be of interest to the institutional buyers that are mainly concerned.

In consequence, as noted in these columns a fortnight ago, the sales of certificates dropped steeply—to a level, indeed, that only just covered the rate of redemptions at a time when these are seasonably low. In this current fiscal year, sales up to July 12th amounted to only £41 million, compared with £112½ million in the similar period of 1951-52, while redemptions rose from £28½ million to nearly £33 million. The net borrowings, therefore, dropped from £84 million to only £8 million. If the new certificates attract accumulated tax reserves now held on bank accounts, they will help the Government to reduce its swollen borrowings from the banking system; but any resultant reduction of bank deposits will be of technical rather than fundamental significance. It may, however, tend to reduce the banks' liquidity ratios, and to that extent will act as a minor stiffener of monetary policy.

Stocking at the Pit-head?

The summer holiday season is already having an effect on coal production. Last week, when output of deep-mined coal fell from 4,076,000 tons to 3,840,400 tons, 371,500 tons are estimated to have been lost because men were away on holiday. In spite of this drop, distributed stocks of coal continued to rise; at 16,491,000 tons they are now coming close to the safety margin of 17 to 18 million tons with which the Coal Board hopes to start the winter. At this time last year stocks stood at the disturbingly low level of less than 13 million tons. The difference between the two years is partly due to increased output, but also to the far less predictable factor of falling consumption. In an address to the National Coal Board's summer school this week, Mr Schumacher, the Board's economic adviser, estimated that a variation of only one degree in the average temperature over the year affects inland consumption by 1,500,000 tons; in addition, of course, coal consumption is particularly sensitive to the level of industrial activity. For this reason Mr Schumacher believes that there is a strong case in favour of holding buffer stocks of coal. He estimated that pithead stocks of 5 to 10 million tons of coal, in addition to normal distributed stocks, would make it possible to meet incalculable fluctuations in consumption without dislocating supplies to consumers or, alternatively, upsetting production schedules in the mines.

There is no sign that the Coal Board is yet willing to follow Mr Schumacher in thinking along these lines. Under present conditions the Board would hardly be permitted to build up such stocks at the expense of either domestic or foreign consumers, even though both would eventually benefit. Moreover, stocks of the size contemplated would tie up £30 million of capital at present pithead prices, while the physical problem of storage, at one cubic yard of coal to a ton, is also a formidable one. These problems can be overcome; in the long run it might even prove cheaper to put capital into coal stocks than to pay guaranteed wages to miners on short-time because of a temporary recession in demand. The Board's real objection, however, is neither financial nor technical. It is simply that miners associate unsold heaps of coal at the pithead with short-time and unemployment, and will not keep up their present rate of production (including overtime and Saturday working) when they see such stocks accumulating. The Coal Board

may be unduly apprehensive about the miners' reactions, for when stocks began to accumulate recently in the Lancashire pits the miners showed no great sympathy for their apparently panic-stricken union leaders. They may need educating along the lines suggested by Mr Schumacher but they are surely not ineducatable.

Keener Demand for Wool

Prices at the London wool sales this week have endorsed the higher levels at the close of the Australian sales in June. Merino 64's were sold on Tuesday for 145d. a lb (clean) compared with 134d. a lb at the last London sales held in May; crossbreds reached 69d. a lb (clean) compared with 57d. a lb in May. As all overseas markets are now closed until the autumn, these "between season" sales in London provide a significant guide to the trend of prices. The fact that on the opening day the recovery that has been taking place during the past two months was fully maintained—and even perhaps slightly augmented—suggests that manufacturers are now more ready to add to commercial stocks, which had been allowed to run down to a very low level last April. Combing wools attracted the most attention in the London sales, a reflection of the fact that world production of tops has been slowly recovering for some months. The other main feature at the opening of the sales, the brisk demand for crossbred wools, can be explained by the long closed season in New Zealand, where the sales ended in April and will not begin again until November. Argentina holds large stocks of crossbred wool, but it is still not a very eager seller as it is hoping for much higher prices next season.

It is too early to give any reliable clip estimates for the new season. It seems, however, that the world clip may show a slight reduction on last year—perhaps to about 2,270 million lb (clean). The end-of-season stocks in producers' hands probably amounted to 130 million lb, which would suggest a total supply for 1952-53 of 2,400 million. If world consumption remains at its 1951 level of 2,250 million lb (clean), there would then be a surplus of 150 million lb, which does not seem an excessive allowance for stockpiling and for any further build-up in manufacturers' stocks. On this reckoning, the outlook for wool should not be too bleak.

The Trend of Production

Industrial production, which bounded up by 6½ per cent in 1949 and 8½ per cent in 1950, stopped rising after the last quarter of 1950, and in the autumn of 1951 showed a definite tendency to fall. By April and May of this year production was still some 2 per cent below its level in the same two months of 1951. The Treasury has now produced figures showing how this has been reflected in the performance of individual industries. The following tables show that the general level of industrial production has to a large extent been underpinned by increasing activity in the building industries, and in direct consumer goods industries such as those producing drinks, tobacco and paper or printed materials. These account for about one-fifth of the country's total production. In at least half the field of production, covering the bulk of the metal goods industries, food, mining and public utilities, production is still rising, but at a diminishing rate compared with last year. In some of the most important industries, production is now lower than it was a year ago. These include the vehicles, textiles, pottery and precision instrument industries, each of which has been an important exporter. The fall in production in the vehicle industries is, it is true, largely due to shortage of materials, but deliveries to the home market have not fallen sufficiently to maintain the same rate of exports from this reduced output—for passenger cars home deliveries are considerably higher than last year. The fact that vehicle exports

Consumers in Council

The Industrial Coal Consumers' Council encountered its first serious complaint last year, and to judge from its annual report, published last week, emerged somewhat shaken by the ordeal. During the year, the Coal Board introduced a new and highly complex price structure, the first rationalised pricing system attempted by the industry. The committee confessed that

our first reaction to the proposals was that the involved method of assessing the relative values of the various coals appeared to be unduly complicated. We were persuaded, finally, that the use of some such method was inescapable if there were ever to be a rational price structure.

Individual consumers were not so persuaded and the users of carbonising coal promptly lodged a complaint about the new prices with the Council. This appears to be the only serious objection raised to the new price structure; the Coal Board told the Council that talks had been held with the major consumers before its introduction and gave assurances that immediate steps would be taken to deal with the inevitable anomalies. The single complaint was based on the fact that the Coal Board had decided to charge the users of carbonising coal a hefty premium. This coal, found mainly in Durham, is scarce and therefore valuable; it is being rapidly exhausted and uneconomically mined in old-fashioned pits with narrow unmechanisable seams. The users complained that they were being exploited, because the Coal Board had reduced prices to domestic and other industrial consumers and made good the loss by putting up the price of carbonising coals. The gas industry is making the same case privately to the Coal Board. The Coal Board retorted that it had done what was possible to meet the case of the carbonisation industry before the price structure was introduced, and it still maintains that the Durham mines are losing about 1s. a ton by selling their carbonising coals even at the present high prices. "There was," reports the Council, "a strong difference of opinion among the members" about the justice of the case. The Coal Board made it clear that any alteration in the price of carbonising coal would put the whole of the new structure back in the melting pot, and this apparently swung the Council in favour of the Coal Board, for when the new prices were put to the vote, they were approved by a majority, the size of which is discreetly omitted from the report. The only other body to approach the Council during the year was the Institute of British Launderers, who were anxious that further rises in working costs in the pits should be met by increased efficiency, not by another rise in price.

Triplex Plays Safe

Since the advent of dearer money, necessity has proved to be the mother of innovation in the market for new industrial capital. The pioneer issue of a convertible loan stock by Distillers last May is now to be followed by a hardly less novel issue by Triplex Safety Glass. The company will break away, if only temporarily, from its single class capital structure by offering its equity shareholders 350,000 15 per cent 10s. cumulative preference shares; the exact price of the issue will be determined by market conditions when the offer is made, but it is expected to be around 20s. At this price the new shares would offer the high yield of 7½ per cent—a yield that is higher than the 7¼ per cent offered by the company's 10s. ordinary shares at the current price of 21s.

FACTS, FIGURES, AND OPINIONS

THE CASE OF THE FLYING PAY CLERK

Was his machine jet-propelled too?

PAY DAY in Royal Air Force establishments produces its own special problems. The great number of personnel to be paid, differing from man to man in rank, entitlements, allowances and deductions, makes speed in the accounts sections absolutely essential. The fact that personnel are liable to move from one station to another is just one more difficulty to be faced.

During World War II, the vast increase in man-power threw a heavy burden on accounting sections. Pay Clerks were hard-pressed to keep up with the amount of checking necessary, and individual airmen found, sometimes, that their full pay details lagged behind their postings from unit to unit.

Anxious to ease this situation, the R.A.F. consulted machine accounting specialists of Burroughs Adding Machine Limited.

In association with officers of the Air Ministry, Burroughs studied the problem, and it was decided to instal Electric Adding-Subtracting Machines to speed up the work.

Result? Using these Burroughs machines, accounting sections can check, quickly and smoothly, the exact financial status of the airmen they deal with. The new system makes it possible to supply each airman with a simple copy of his account every four months, and,

ON R.A.F. STATIONS a new streamlined machine is speeding the work of the accounting sections...

since duplicates of the figure information obtained are used as transfer documents, there are no delays in the dispatch of pay details.

WHAT ABOUT YOU? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line

of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment.

A Symbol
of Progress

Development work by Mond Nickel looks years ahead—to the time when new engineering projects, at present only in vague outline, will need improved materials to carry them out. The metallurgist aims always to anticipate these needs so that the designer, making his first drawings, may have confidence that the better properties he seeks will be available when design gives place to construction.

THE MOND NICKEL COMPANY LIMITED, Sunderland House, Curzon Street, London, W.1.

HOW MUCH STEEL

from
six
new
blast
furnaces?

ONE of the six new blast furnaces to be completed in this country in 1952 will be the largest in Europe. They will have been built by firms on the North-East Coast, in the Midlands, in South Wales, and near the North Welsh Border. When in full operation they will produce enough pig iron to increase Britain's annual output of steel by three-quarters of a million tons. These new blast furnaces are all part of the steel industry's first post-war development plan — the great £240,000,000 project begun in 1946, as part of which one of the world's largest steel works has been built.

"Don't forget me!" says JACK SCRAP
The steel industry still needs all the scrap which engineering firms and other steel users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

To sweeten the offer still further, the new shares have two special features. First, holders of the new preference shares will have the right to convert them into 10s. ordinary shares at par "between October 15 and November 20 in the years 1954 and 1955." Secondly, although the nominal value of the new preference shares is only 10s., the directors announce that they would be repaid at 21s. if the company were wound up. Any shares that are not converted into ordinary shares may be redeemed after June 30, 1962, at 21s. By incorporating this element of convertibility in the offer, Triplex is obtaining new money on better terms than it could have secured by a simple rights offer of ordinary shares, but, as with the Distillers' issue, the right of conversion appears to be attractive only if it can be assumed that in the next few years a growth in the company's business will ensure bounding profits and expanding equity dividends. Perhaps this is a bigger assumption to make about the motor industry, to whose fortunes Triplex is closely bound, than about the chemical industry, in which Distillers is taking an increasing interest.

Growing Tanker Fleets

During the first half of this year the active world tanker fleet has increased by 1,250,000 tons deadweight; excluding US Government-owned tankers, it now totals 30,763,997 tons d.w. This figure, prepared by Davies and Newman Ltd., London tanker brokers, compares with a world total of only 16,078,000 tons in July, 1939. The largest increase during the last six months has been in the British fleet, which expanded by 225,000 tons to a total of 7,056,538 tons, making it equal in size to the American fleet. But American tanker interests also own large blocks of tanker tonnage under the Panama and Liberia flags; the total tonnage under these flags amounts to 2,936,428 and 1,100,579 tons respectively.

The tonnage and the flags of tankers which await launching or have already been ordered, show that the future composition of the world tanker fleet will undergo significant alterations. The figures relating to the principal fleets are given in the following table:—

Flag	As at July 1, 1952	On Order as at July 1, 1952	Total in Existence and on Order
United States	7,061	1,136	8,197
British	7,057	3,463	10,520
Norwegian	4,617	3,659	8,276
Panamanian	2,936	1,899	4,831
French	1,266	609	1,875
Italian	1,125	325	1,450
Swedish	919	638	1,558

Despite the size of the existing tanker fleet, tonnage on order and still to be delivered amounts to a total of 13,692,170 tons d.w. The division of this tonnage among the principal flags is shown above. There remain 1,225,980 tons accredited to "other flags." Of these the majority will eventually be registered in Panama or Liberia by American owners; even so the high proportion of British and Norwegian tanker tonnage on order is remarkable.

These totals do not make any allowance for the scrapping of obsolete tonnage. Existing ships together with those now on order will bring the combined world total to more than 44 million tons d.w. by about 1957-58, ignoring subsequent orders and subsequent disposals. At present, however, there are over 6,000,000 tons in service built in 1934 or earlier, and practically all of this tonnage should be scrapped by 1958. This block of obsolete tanker tonnage includes 1,124,000 tons of British, 746,000 tons of Panamanian, 636,000 tons of Norwegian and 510,000 tons of United States tankers. If the figures are adjusted to allow for the scrapping of this tonnage, then by 1958 the British tanker fleet should total 9,396,000 tons, which is considerably larger than it is at present, while the American fleet, at 7,687,000 tons, will show little change.

The Norwegian fleet, at 7,640,000, will also be much larger, so will the Panamanian tonnage, at 4,085,000 tons. It is likely, therefore, that although by 1958 the world tanker fleet will be much bigger, the British and Norwegian share of the total will be even higher, and the American share lower, than at present.

Indecision in Wheat

The continued life of the international wheat agreement is still in the balance. The wheat council has told member governments that the formal recommendation required to extend the agreement beyond July, 1953, cannot be made in any case before the end of this season. It has also explained that renewal for a further period must depend upon whether member countries can agree upon maximum and minimum prices and, indeed, upon what constitutes a maximum or minimum price—that is, whether carrying charges are to be included or not. A special committee is considering these matters as well as the possibility of relating the agreed price schedule to a new or existing price index that would permit an automatic revision of the maximum and minimum prices at regular intervals. Until the committee has finished its study, the council feels it cannot take a decision. Hence it has postponed the discussion on the extension of the agreement until January 12, 1953.

It would seem from current opinion in both producing and consuming countries that the chances of an extension are slender. Neither side is particularly keen on fixing now either a maximum or minimum price for the next four or five years, and unless some method of an automatic revision can be devised, the wheat scheme may be allowed to lapse.

Shorter Notes

The active note circulation increased by another £19.4 million in the week to last Wednesday. This means that it had increased by £42.7 million in the three weeks since the fiduciary issue was raised to £1,500 million on June 24th; in the corresponding three weeks of 1951, it increased by only £18.4 million. The note reserve in the banking department of the Bank of England now stands at only £15.6 million; last year the active note circulation increased by a further £26 million in the last two weeks of July, so that another increase in the fiduciary issue seems inevitable in the course of the next few days, in preparation for the usual seasonal peak in demand for notes in August Bank Holiday week.

The awarding of an American Army contract, for nine power transformers, to Ferranti Ltd. is a victory of persistence. Ferranti's tender was £71,420 less than the lowest American tender. The Army considered this was sufficient justification to waive the Buy American act, which forbids the purchase of defence equipment outside the United States unless the difference in price is so great as to make this unreasonable; but two years ago an equally low Ferranti tender was rejected by the Seattle power authorities.

Two errors that occurred in Table IIa on page 133 of last week's issue of *The Economist* showing the percentage distribution of life, annuity and sinking fund assets of 41 insurance offices at the end of 1951 should be corrected. The proportion of the assets of 16 composite offices held in Home and Overseas Government and Municipal Securities should read 6.5 per cent (and not 8.5 per cent) and the proportion represented by Agents' Balances and Cash, should read 4.9 per cent (and not 14.9 per cent).

Company Notes

Renold and Coventry Chain.—In the year to March 30th Renold and Coventry Chain increased both output (by 6 per cent) and productive capacity, but unfortunately the shortage of steel prevented the fullest use being made of the new capacity and supply still lagged some way behind demand. Prices rose, but so did costs, so that while sales rose by £920,600 to £5,993,000, group trading profits rose by only £147,224, to £976,936. The directors' decision to maintain the distribution on the equity capital (as increased by the recent rights issue) must be regarded as a recognition of the steady growth in business rather than as a reflection of the very slight increase in net profits, after tax, from £280,356 to £281,672. An interim dividend of 3 per cent was paid on an ordinary capital of £1,131,310, and a final dividend of 9 per cent has been recommended on a capital of £2,413,464, as increased by a scrip bonus of 905,049 shares and a rights issue of 377,105 £1 shares at 30s. each.

The company has enjoyed an increase in sales in each year since the war and, as with many other skilled engineering concerns, the main task facing it this year is to secure a further increase in productive capacity. The group's outstanding capital commitments of £537,000 suggest that this programme of development is being quickly got under way. The programme will be partly financed out of the receipts of the cash issue of ordinary shares. At the end of the financial year these receipts had been used to pay off the parent

company's bank overdraft of £495,995 and to set up a cash balance of £317,983. At the moment, in the chairman's words, "demand continues at a high level in all the markets, and for the immediate future the distribution of the company's products will have to remain subject to systematic rationing."

Thomas De La Rue.—Since the war Thomas De La Rue has pressed forward with a policy of developing and diversifying its industrial manufactures. This policy has not met with unqualified success. The distribution on equity capital has remained unchanged since 1947, and it was not until the financial year 1950-51 that sales of the company's plastic products made any considerable contribution to earnings. They repeated—in fact increased—this contribution in the financial year to March 29th last; earnings from the industrial division of the company largely account for the advance in group trading profits from £761,463 to £880,403. Unfortunately there are already clear signs that these new ventures will not make such a satisfactory contribution to earnings this year. Restrictions imposed in certain overseas markets towards the end of the company's financial year and the falling off in demand for some of the company's products at home have already led to a reduction in sales, which—the directors declare—"must be expected to continue until trading conditions throughout the world improve."

Last year's trading results enabled the directors to maintain the ordinary dividend at a rate equivalent to 50 per cent on the old capital (before the 100 per cent scrip bonus), but the fact that British Industrial Plastics recently passed its interim dividend suggests that De La Rue's ordinary dividend may also be in danger.

The biggest danger is, of course, the recession in trade, but another factor, almost as potent in its effect on dividend payments, is

to be found in the group's balance sheet. In effect, the group possesses no liquid resources. Its cash holdings have been reduced from £124,713 to £49,428, while its bank borrowings have risen from £520,000 to £845,000. The repayment of a debenture stock a year ago may partly account for the growing stringency in liquid resources, but in the main it arises from the increase in stocks (from £1,467,122 to £2,197,932) and in debtors (from £1,196,352 to £1,474,248). Presumably the increase in stocks reflects the accumulation of goods and raw materials in the company's factories following the decline in sales. The possibility of losses on stocks this year cannot, therefore, be ignored.

Amalgamated Metal.—The Amalgamated Metal group sells a sizeable proportion of its stocks forward, and the chairman of the group, Mr. Walter Gardner, has therefore wisely laid emphasis on the somewhat exceptional nature of trading results in the year to December 31st last, when group trading profits soared from £403,509 to £1,919,439. In 1950 profits were adversely affected by the loss incurred by the subsidiary, Henry Gardner, through the incidence of commodity contracts maturing in that year. A year ago the directors pointed out that corresponding contracts maturing in 1951 would more than offset this loss; and in the event, the profits earned on these contracts account for £470,000 of the increase of over £1,500,000 in total profits. The exceptionally sharp advance in profits must also owe a good deal to the increase in the price of most of the commodities in which the group is interested, particularly at the beginning of 1951. At first sight the increase in the ordinary dividend from 7 to 8 per cent looks meagre when set beside the bound in net profits from £223,982 to £1,008,867. But this happy experience is hardly likely to be repeated and there is a need to retain the greater part of earnings in the business to finance increased investment in both working and fixed capital. The rise in stocks (from £1,821,568 to £2,918,910) and in debtors (from £4,019,329 to £5,182,642) has been accompanied by an increase in bank overdrafts from £687,740 to £1,610,924, while the company is extending its business in new fields, notably in the general import and export trade in Australia, Canada and Malaya. At the current price of 18s. 6d., the £1 ordinary shares yield £8 13s. per cent.

EXCHEQUER RETURNS

For the week ended July 12, 1952, total ordinary revenue was £57,327,000, against ordinary expenditure of £74,034,000 and issues to sinking funds £630,000. Thus, including sinking fund allocations of £7,507,000 the deficit accrued since April 1, 1952, was £213,074,000 compared with a surplus of £13,791,000 for the corresponding period of the previous year.

BOOKER BROTHERS, McCONNELL & COMPANY

(West India, African and general import and export merchants, sugar estate owners, rum blenders and importers, ship owners and shipping agents, and store owners)

INCREASED TRADING RESULTS

CONTRIBUTION TO COLONIAL ECONOMIC DEVELOPMENT

PROPOSED BONUS ISSUE

MR J. M. CAMPBELL'S REVIEW OF PROGRESS AND PROSPECTS

The fifty-second annual general meeting of Booker Brothers, McConnell & Company, Limited, will be held on August 7th at the registered office of the company, 37-41, Gracechurch Street, London, E.C.3.

The following is the statement of the chairman, Mr J. M. Campbell, circulated with the report and accounts:

DIRECTORATE

Since our last meeting Mr A. F. V. McConnell, who was chairman, has accepted the board's invitation to become president of the company. I have been appointed chairman in his stead. These changes were made because it was thought wise that the chair should be held by someone actively concerned and experienced in the everyday management and affairs of the company; and it was thought fitting that the family and name of McConnell, which have been so prominent in its history, should be identified with the company in this way, at its head. I would here refer, with deep regret, to the death on March 14, 1952, of Mr A. J. McConnell who served and directed the company most excellently during 35 years until his retirement in 1921.

For my part I feel particularly honoured at being made chairman because to me, as to all of us in the group, Bookers is not merely a business—it is a cause. Perhaps I may try to tell you briefly and, I fear, very inadequately what Bookers means to us.

In the world of men to-day there is a turbulent interaction of forces, good and evil, creative and destructive. Foremost among the creative forces is the British Commonwealth or Empire (I will not play politics by insisting on one designation or the other—it is the substance that matters, not the name); indeed the future of the British Commonwealth will certainly shape the future of mankind. Upon the triumph or ruin of the ideals which the Commonwealth represents, and which inspire it, depend whether civilisation—the ability of men to live in creative concert together—or chaos will prevail. Of vital concern to, and vitally concerned in, the future of the Commonwealth are those millions of colonial peoples whose lives are beset by a formidable host of problems, conflicts and difficulties—social, economic and political. These problems must be solved, these conflicts resolved and these difficulties overcome before the mighty influence of colonial peoples for progress and for good can, as we believe it will, decisively weigh the balance on the side of civilisation.

You may think it bathos that I should turn from world forces to Bookers, but in this organic structure—the world, the British Commonwealth, the Colonial territories, the individual men and women in them—Colonial companies such as Bookers form an essential part. Without them there could

have been, and there could be, no Colonial economic development—thus no social or political development. There could in fact be no Common Wealth. Thus we who serve Bookers—I hope I may speak for the shareholders who after all are Bookers—can feel that we are, in microcosm, with the peoples of the territories where we operate, serving the future of mankind. Without doubt our role is comparatively inconspicuous among the more significant, and the more portentous, forms of service, but nevertheless we are proud of it.

MANAGEMENT, STAFF AND LABOUR

As chairman my only hope of success lies in my being able to rely on the friendship, guidance and support of all my colleagues throughout the group. By my colleagues I mean every one of the men and women employed by Bookers in the British West Indies and British Guiana, in Central Africa and in this country; for the sum of their individual achievement is the measure of the achievement of the whole group. It is no use having shops and ships and sugar estates without the men and women to till the fields, to harvest the cane, to make the sugar and transport it, to sail the ships, to sell the goods, to keep the books—in short, to perform the hundred and one difficult tasks of management, staff and labour upon whose proper performance the success of Bookers rests. It is impossible to overstate the extent to which the success or failure of any unit or department does, in practice, depend upon the work of the individual—be he office boy or director, estate manager or shovel-man, cane-cutter or chemist, engineer or book-keeper, seaman or captain, typist or traveller, secretary or salesman. Some posts, of course, carry far heavier responsibilities than others—especially those concerned with the management of staff and labour and thus affecting the lives of others and their ability to give of their best; bad work usually spells bad management.

You probably realise that the recent reorganisation of Bookers was designed to the end that each individual may be in a position to know and to understand clearly what are his duties and responsibilities, how they are to be carried out and what their purpose is. I do not say that we have perfectly succeeded, but the first showing of our application to business organisation of these first principles of human relations is very encouraging. No doubt this is partly because in Bookers we fortunately started with a body of men and women of more than ordinary worth. I make no apology for introducing our management, staff and labour unusually early in my statement and I now thank them sincerely on your behalf for their work and loyalty in 1951.

FINANCE

Our accounts are in your hands nearly two months earlier than usual. Great credit

for this is due to Mr Tyrrell, our advisory group accountant, and the accounting staff throughout the group. We have again dealt in the directors' report with the main features of the accounts, but I must emphasise that the financial position of the group is even more liquid than examination of the balance sheet might suggest because unsold sugar is as good as cash. For instance, the value of this year's sugar crop, apart from rum and molasses, should be over £6 million, but the payment for it will inevitably be irregular owing to the vagaries of production and transport. It would be quite uneconomic for us to have so large a figure of cash at the bank that we could at all times finance our produce on hand. At some times we want large overdrafts, at others hardly any. Our bankers understand our needs and have always been ready to help us. Taking all in all I am sure that our present financial resources are sufficient, provided fresh inflation does not come upon us and provided we engage in no new development. Furthermore, deflation, even in moderate degree, would release to us substantial sums of cash—but he would be a brave man who would prophesy which of the three, inflation, deflation or steady money values will be experienced during the next twelve months. Indeed, any prophecy to-day about the future of business is most hazardous, but as you will infer from what I am going to tell you about the various undertakings of the group, your board are reasonably confident about future prospects. This does not mean to say that profits will be maintained at their present level, which seems unlikely. Taxation will be bearing even more heavily on the group in the coming years because some of our sugar companies will soon cease to benefit from a temporarily favourable basis of tax computation. Against that, however, your board are advised that the excess profits levy will probably not affect us because our overseas companies are not liable to this bad tax. Looming above all considerations such as these affecting the affairs of one group of companies is the grim struggle for the survival of the whole sterling area.

SUGAR

Our sugar undertakings did well in 1951, thanks to good autumn weather; admirable direction and management wholeheartedly supported by staff; fine work by our labourers; and improved efficiency in the field, and in the factories where our heavy capital expenditure so ably planned and executed by our engineers and chemists under the guidance of our technical director, Mr Eisner, is bearing rich fruit.

The outbreak of leaf scald disease which threatened cane cultivation towards the end of 1950 has been investigated by a number of experts. Their programme of control measures has been rigorously pursued with good evidence of success.

Our group of sugar estates produced

157,324 tons of sugar in 1951 as against 138,772 tons in 1950. I should here explain that of these totals only 81,939 tons and 76,757 tons have been dealt with in the Booker group accounts of the respective years. This is because the balance is produced by estates for which we act as agents or of which we own varying proportions of the share capital without their being subsidiary companies. We hope that output in 1952 will be still higher than in 1951, but we cannot tell what agricultural conditions in the autumn may be or what the weather will bring.

In the sphere of industrial relations, negotiations over such matters as wages and conditions of employment have been carried on with the established trades unions in a most constructive and friendly atmosphere. Their support of new incentive schemes and their sound advice to labour have done much towards industrial peace and increased output. I believe that there is a growing understanding among our labourers that it is they who gain most by higher output and they who lose most by strikes and stoppages of work. During the year a Union Provident Scheme was established, to which employers made a substantial contribution.

COMMONWEALTH SUGAR AGREEMENT

On December 21st last year the Commonwealth Sugar Agreement was signed. It has rightly been called a Charter for Commonwealth Sugar. Other than to remind you that it carries assurance, for eight years ahead, of "reasonably remunerative" prices for about two-thirds of our planned production of sugar, I need not expound the agreement as its very comprehensive details have been widely published. I need only add that the agreed method for determining each year this "reasonably remunerative" price is far from being a cost-plus method conducive to inefficiency. It will not protect the high-cost producer. On the contrary—it will by its very nature impose the need for the utmost efficiency and will only establish prices sufficient to stimulate the flow of sterling sugar which this country so urgently needs. Now that by this agreement the fears and anxieties which have in the past inhibited full production have been swept aside, our objective is to produce the greatest tonnage of sugar from the smallest acreage in the shortest time at the least cost. Only by reaching this objective can the future prosperity of the sugar industry of British Guiana, and thus of the Colony, be assured. With this clearly in mind, Mr Follett-Smith, the chairman of Bookers Sugar Estates Limited, has wisely decided to appoint, as agricultural director, Dr H. Evans, PhD, BSc, a leading member of the staff of the cocoa research scheme at the Imperial College of Tropical Agriculture in Trinidad. Dr Evans is a plant physiologist of international repute, who has, moreover, done valuable work on sugar cane in Mauritius. We have the highest hopes of what he may be able to achieve in British Guiana.

TRADING CONDITIONS BETWEEN CANADA AND BRITISH WEST INDIES

Against all these encouraging indications and events there is still one grave cause for anxiety—apart from all the hazards ever inherent in tropical agriculture. I mean the present condition of trade between Canada and the British West Indies. Mr McConnell mentioned this to you last year and I cannot now do better than repeat what I said recently in my chairman's speech at the annual general meeting of the West India Committee:—

"First, and of extreme importance, there is the fact that although Canada is not a party to the Commonwealth Sugar Agreement, the export quotas in the agree-

ment provide for the supply from Commonwealth sources of virtually the whole of Canada's sugar requirements; indeed the agreement is designed to give Canadian requirements overriding priority.

"Canada, traditionally, buys the bulk of her sugar supplies from the British West Indies; and in turn the British West Indies are, traditionally, an important export market for Canada—and indeed an expanding market in which the value of Imperial Preference should stand Canada in good stead. There is, moreover, a great fund of mutual goodwill between Canada and the British West Indies. In such conditions reciprocal trade between the two areas should flourish. But today, alas, currency restrictions, even with the new Trade Liberalisation Plan in being, severely limit British West Indian imports from Canada. This valuable reciprocal trade is thus threatened. As you know, Canada has turned to non-Commonwealth sources for some of her sugar supplies just because she has an opportunity to develop counterpart trade with the countries concerned. I can imagine no greater economic disaster to the British West Indies than the result of failure to appreciate the value of the Canadian market for sugar. There can be no certainty that this disaster will be averted until there is a real rather than a formal liberalisation of Canada-West Indian trade. Even from the point of view of dollar conservation one feels bound to question the wisdom of a policy which seeks to save a few million dollars at the direct risk of diverting Canada's sources of sugar supply and thus lose \$50 million dollars or more.

"I hope that everyone here and in the British West Indies—and in Canada—who can in any way influence policies and actions in this field will spare no effort to ensure that we do not lose the Canadian sugar market through negligence, shortsightedness or stupidity; moreover, that they will do all they can to create the most favourable possible conditions for the strengthening of the vital economic relationship between the British West Indies and Canada whose economic might grows stronger every day."

1953 will almost certainly have its full share of normal commercial problems for Bookers Sugar Estates; in particular we do not know what prices we shall receive for our free sugar, rum and molasses. We must expect the world price of sugar to be low, the demand for bulk rum to be less and there has already been an avalanche in the price of molasses which we shall begin to feel in the second half of this year. Nevertheless, and barring disasters, we are reasonably confident in the prospects of our sugar undertakings for the next two or three years.

During the last twelve months—partly because of the Commonwealth sugar negotiations—our relationship with officials of the Colonial Office and the Ministry of Food has been particularly close; and it has been, from our point of view, particularly happy. We are very grateful for their unfailing courtesy and for the help and advice which they always so readily give us.

Before leaving sugar and the part of the group concerned with primary production, I should tell you that we are undertaking a small pilot scheme to investigate the potentialities of sugar production in Nyasaland. This scheme is as yet in its infancy, and we shall not know until the end of 1953 whether a major scheme is possible, and if it is, in what way, if any, Bookers can participate in it. I am sure you will agree that your board must always be alive to new possibilities in keeping with the general nature of our business. For instance, we are also taking part in pilot schemes investigating the potentialities

of growing jute and bananas in British Guiana.

SHOPKEEPING

In 1951 our trading companies in Northern Rhodesia achieved an encouraging increase in their turnover and made a satisfactory return on capital employed. The position of copper, on which the economy of that territory is so largely based, gives reason to hope that its prosperity may be maintained, but in our businesses there we cannot count upon being insulated from slumps elsewhere.

In Nyasaland, too, our shops did remarkably well. The economy of Nyasaland, largely dependent as it is on tea and tobacco, is more vulnerable than that of Northern Rhodesia. As in Northern Rhodesia, we are still extending our activities in Nyasaland, and we can rely upon our board and management there to make money as long as there is no major slump in the territory. You should know that Mr Downs, the chairman and managing director of our company in Nyasaland (The London and Blantyre Supply Company, Limited), has, at his own request, retired from active management after serving the company magnificently for over 40 years. I am very glad to say that he has agreed to continue for the time being as chairman. We as shareholders of the London and Blantyre Supply Company owe a great debt of gratitude to Mr Downs, for it is no exaggeration to say that he made that company and for many years virtually was the company.

In Trinidad, Stephens, Limited, again did well, and their results compared very favourably with our Central African concerns. Mr Boon, for many years Stephens' successful chairman, has accepted appointment as managing director of Bookers Stores in British Guiana and took up his new post on January 1st this year. Mr Boon will remain chairman of Stephens for the time being.

In British Guiana the actual financial results did not show the improvement over 1950 that we had hoped for. Nevertheless, I can assure you that under the new organisation immense progress has, in fact, been made. The dynamic and efficiency of management has improved out of all recognition—although there are still many things to be put right and many problems to be solved. The standard and quality of our premises, stocks, salesmanship and display are now second to none in the British West Indies. We have much to be proud of today in our shops in British Guiana because through them we are not only supplying the needs of the people, but raising all standards throughout the Colony and indeed the Caribbean area.

In London, Campbell Booker Carter's business as an export, buying, shipping and confirming house flourished as never before, with a turnover of nearly seven million pounds sterling. Their staff deserve much praise for handling efficiently this considerable increase in the volume as well as in the value of orders and shipments. There can be little doubt that their business in 1952 will fall from this abnormally high level.

As you know, Campbell Booker Carter's activities fall into three categories. They are an independent export, buying, shipping and confirming house; they are the parent of our trading and shopkeeping companies in the British West Indies, British Guiana and Central Africa; and they act as buyers and shippers to their trading and shopkeeping subsidiaries. They have an extraordinarily good board and team of management, but at present they lack in London really up-to-date knowledge and experience of Colonial shopkeeping. For this reason we have asked Mr Leishman, the chairman of Campbell Booker Carter (Central Africa), Limited, to come to London in October this year to act,

with Mr Walker and Mr Robson, as a joint managing director of the Campbell Booker Carter Trading Group. Mr Leishman is a trader of quite outstanding ability, whose whole career has been in Central Africa and who, although a Scot by birth, has come to regard himself, I think, as a Rhodesian. It is his high sense of duty which has moved him to agree to come to London. He will be a great asset here.

SHIPPING

The long traditions of George Booker and Company handed on to Booker Brothers (Liverpool), Limited, under whose aegis the shipping section of the group operates, were well maintained during 1951 by its management and staff, United Kingdom, colonial and seagoing.

The Booker Line, which as you know provides British Guiana with a valuable freight and passenger service to and from Liverpool, like most British shipping companies carried good cargoes in 1951 at comparatively high freight rates. It was thus able to earn good profits. Throughout the year and since the beginning of this year, however, operating costs have continuously risen while freights are tending to fall. We cannot therefore count on a repetition of 1951 results. Moreover shipowners are penalised even more severely than other industrialists by present taxation practice. Depreciation allowances are of course quite insufficient to accumulate, over the life of a ship, enough money to replace it. Even in 1951 it was barely possible to find out of taxed profits a great enough sum of money to put to replacement reserve in order to augment the depreciation allowances to the necessary extent. In fact the experience of the Booker Line in 1951 admirably illustrates the justice of the submissions made by Steamship Owners' Representatives to the Royal Commission on Taxation. It is to be hoped that the major principles contained in these submissions will be accepted. Shipowning as a business is highly susceptible to world trading conditions, earnings are subject to wide fluctuations and competition can be very fierce. The Booker Line cannot detach itself from factors which affect the industry as a whole and it may be that in the future the sums requisite to be transferred annually to replacement reserve out of taxed profits will prove beyond those profits.

Bookers Shipping and Trading Company is progressing steadily in its shipping and forwarding work for outside shippers; and the passenger department earned good profits and, I believe, gave good service in 1951. The London branch of Bookers Shipping and Trading Company has now, deservedly, been promoted to its own offices at Ocean House, Little Trinity Lane, London, E.C.4.

In British Guiana our shipping interests had a rather better year than in 1950, but results were still disappointing. This is a sphere of our business which is still in the throes of reorganisation, and which is clearly suffering from the heritage of the past and of the war. Any modest profits which can be made at present must be ploughed back into the business in order that assets may be restored as quickly as possible. Given time and the right people in the right jobs in British Guiana, your board believe that our Demerara shipping interests can be made to show a good return on our investment in them. The prospects for coastal and small craft in the British West Indies are perhaps particularly promising.

RUM

Although United Rum Merchants, Limited, sold 50 per cent more rum during 1951 than they sold during 1950, their profits dropped owing to the continued steep rise in the costs

of production and distribution about which my predecessor warned you. To date this year we have, disappointingly, sold much less rum than in 1951, although more than to the same date in 1950. Reduction in sales, coupled with increasing costs, may produce very slender profits for United Rum Merchants in 1952. Encouraging features in an otherwise rather dismal situation are that during the last three years United Rum Merchants have opened several hundreds of new accounts for their brands in the United Kingdom; and that during the same period their share of the total rum consumed here has bounded up. Further, there is little evidence of a reduction in the demand for rum as against other spirits. Therefore, while shortage of money and strangling duty may bring about less demand for all spirits, there is every reason to believe that Lemon Hart and Lambs Navy Rum are actually swimming against the tide—if I may be allowed to mix my metaphor on the plea that it is at least nautical and therefore appropriate to rum! These facts speak highly for the salesmanship of the company. Sales to export markets were well maintained in 1951, but here again costs were overtaking profits. Mr Metcalfe and Mr Woolley were recently appointed joint managing directors of United Rum Merchants. You will see that the supplement to the 1951 accounts of the Booker group, which takes the form of the story of rum from the cane to the consumer, has been written by Mr Woolley, whose principal responsibility is the selling side of United Rum Merchants. Your board hope in future years to publish similar supplements describing the other main sections of the group—sugar, ships and shops—written by some of the men immediately responsible for them.

PROPERTIES, HOLDINGS AND SERVICES

The arrangements by which, under last year's reorganisation, our investments, properties and services in British Guiana were combined under one company has not worked. It was not possible for the one management to operate profit-making companies, to administer services and to look after properties all at the same time. We have accordingly split this company into three parts. Two of these parts become non-profit making companies to be called Bookers Central Properties and Bookers Central Services; the remaining part being called Industrial Holdings (BG), Limited. The last mentioned company, as its name suggests, will foster and operate our existing small companies and departments in British Guiana, such as our manufacturing drug company (with its retailing subsidiaries in Trinidad and Barbados), our lithographic company, balata company, petroleum marketing company and our produce, insurance and advertising departments. These companies and departments are, as I say, small, but they are none the less important. They, and the men who conceive and manage them, are important not only to the Booker Group to whose profits they can and should make appreciable contribution, but also to the development of British Guiana in which we are so vitally interested.

In conclusion I must tell you that my colleagues, on reading the draft of my statement to this point, told me that they thought I gave too discouraging an impression of the affairs of the group. We all live in difficult days and I have stated the position fairly and squarely as I see it. However, I agree with them that in reviewing the progress and the prospects of each section of our diverse group independently, I have, perhaps, failed to bring out the strength of the whole. I can only say that I am sure that in the knowledge of that great strength shareholders can be confident in their company—and proud of it.

THE BRITISH BANK OF IRAN AND THE MIDDLE EAST

CHANGE OF NAME

The sixty-third ordinary general meeting of this company was held on July 16th, in London, The Rt. Hon. Lord Kennet of the Dene, PC, GBE, DSO, DSC, the chairman, presiding.

The following are extracts from his circulated statement:—

Our accounts show a strong position. Cash and money at call exceed £29 million compared with £14 million a year ago. Deposits at £45 million compared with £34 million the previous year, are higher than ever before. A year ago deposits at Iranian branches were £13 million. By March 20, 1952, they had fallen to £6 million so that the net increase of £11 million in total deposits represents an increase of £18 million at branches outside Iran. It will be seen that we may expect no Iranian deposits to appear in the next balance sheet.

Investments at £6 million are £1 million more than last year. Bills discounted, loans, and advances, at £9 million, are £4 million less, because of preparations for winding up our Iranian business. Fixed assets at £100,000 are unchanged. This is the written-down value of our premises outside Iran.

It will be no surprise to learn that we are withdrawing from business in Iran. All our provincial branches there have been closed; and that at Teheran will close for new business on July 30th. Thereafter we shall maintain in Teheran only a small staff for long enough to finish the winding up of our Iranian business.

EFFECT OF RESTRICTIVE LEGISLATION

This is the inevitable and foreseen result of the adoption by Iran in recent years of legislation imposing on us as a foreign bank restrictive conditions under which we have been unable to carry on business save at a loss.

Your board has been actively extending the bank's business to other scenes more favourable for the employment of its capital, and of that invaluable asset, the services of an able and devoted staff qualified by special experience in the Middle East.

THE NEW CHARTER

The business of our bank as a whole is now widely based, and has gained in stability by its geographical extension. At the extraordinary general meeting, which will begin when this meeting ends, your approval will be sought for the adoption of a new charter and new statutes, to replace our old deed of settlement. Your approval of the resolutions will pave the way for further progress and expansion on lines we have had under continuous consideration.

The new charter provides for the completion of the change in our name from The Imperial Bank of Iran to The British Bank of the Middle East, and thus registers the history of the bank's development. It removes geographical limitations upon our business. The powers given us under our old charter were in many respects obsolete; the new charter brings them into relation with the business of a bank under modern conditions.

The report was adopted and at an extraordinary general meeting resolutions adopting the new charter and new regulations (to be known as statutes) were carried *nem. con.*

GOODLASS WALL AND LEAD INDUSTRIES

ALL-TIME RECORD RESULTS

NEED FOR ALLEVIATION OF TAXATION BURDEN

MR J. L. McCONNELL ON ABNORMAL TRADING CONDITIONS

The twenty-first annual general meeting of Goodlass Wall and Lead Industries, Limited, was held on July 10th in London, Mr J. L. McConnell, the chairman, presiding.

The following is an extract from his circulated statement:—

The group profits at £3,380,991 are an all-time record, being £833,411 greater than in 1950. After deducting taxation of £1,950,163 and minority shareholders' interests, the net consolidated profit becomes £1,355,811, or an increase over the previous year of £124,980 only. The profit before taxation is most satisfactory, but 1951 was once again a year of general inflation and rising prices, and it is my duty to point out to stockholders that our trading results for that reason are in excess of what we consider the earning capacity of the group under normal trading conditions. I must also draw attention to the fact that we have to pay tax on the increase in value of our base stocks of metals. These stocks are to all intents and purposes the equivalent of plant in that they must be kept up if the volume of trading is to be maintained, and no part of the increase in value, which is largely subject to taxation, is included in our profits. In consequence, the amount to be found for taxation is out of step with the earnings actually appearing in the accounts and for 1951 we have followed the same procedure as for the previous year and have written up the base stocks by £421,875, being the amount of taxation payable on their appreciation.

UNITED KINGDOM COMPANIES

Trading during the year fell into two well-defined categories. During the first six months raw materials, particularly lead and white pigments, were in short supply; consumers, by reason of the uncertainty surrounding the operations in Korea, stocked up heavily, and the United Kingdom official price of lead was generally lower than that prevailing elsewhere, with resulting advantage to our export trade. The period was, therefore, one of considerable activity and deliveries were limited only by the availability of raw materials. During the second six months the picture completely changed. Uncertainty regarding the future course of prices made our customers disinclined to book ahead, saddled as they were with heavy stocks, and the high prices of metals began to militate against sales. These and general all-round signs of financial stringency resulted in the year closing on a relatively quiet note. This has turned out to be the prelude to a recession in trade during the current year, but in 1951 the effect was not sufficient to outweigh the favourable influences during the earlier period. Our smelting and refining and antimony departments did exceptionally well; the Fry's Metal Foundries group improved on their 1950 results, which were themselves very good; and export results were highly satisfactory. The general level of trading was maintained as against the previous year except in sheet lead and lead pipe, where the high price of metal had some effect. Our business in lead oxides with the electrical battery industry was active, and our trade in lead compounds for use in the

ceramic and pottery industries continued to expand.

Goodlass Wall and Company Limited, Liverpool, our largest paint company, had a good year and, in spite of the shortage of certain raw materials and of tins and drums, improved upon their 1950 figures. Several newly developed products show promise. Our other paint companies at home did well.

OVERSEAS LEAD COMPANIES

The volume of trade done by the Calcutta companies showed little change in total from 1950 and the results were again excellent. The new company in Durban established itself more fully during the year.

OVERSEAS PAINT COMPANIES

Our companies in Australia, Eire, India and South Africa maintained their positions. Severe price control makes development difficult in Australia, and the exorbitant demands of labour in Bombay are making enterprise of all kinds unattractive. Inflation continues in the Argentine at a steadily increasing rate; the results of our company there were at a satisfactory level, but are once again omitted from our consolidated accounts on account of exchange restrictions.

TRADE INVESTMENTS

British Titan Products Company, Limited, have again gone ahead well and the completion of their latest unit at Grimsby in the autumn will involve an increase in our sizeable investment in that company. In spite of the difficulties in Australia, British Australian Lead Manufacturers Proprietary Limited continues to prosper. Our associated company in Johannesburg, Enthoven Fry, Limited, has had an excellent year.

RAW MATERIAL SUPPLIES

Except for a period in the early part of the year, lead has been in free supply, both in virgin and secondary form. The former is still under Government control. The official United Kingdom price varied during 1951 from £136 per ton at the commencement to £180 per ton in July and to £175 at the end of the year, while the price of lead on the Continent varied inversely from about £200 per ton at the beginning of the year to £175 in July and £150 at the end of the year. The effect upon our export activities is apparent. An advantage over Continental manufacturers of about £60 per ton in the early part of the year gradually changed to a disadvantage of about £25 at the end of the year. It is impossible to conduct a stable export trade under such conditions and the price policy of the authorities appears to have been governed by the appearance of their own trading account in metals rather than by the necessity to maintain the export trade of the country in lead manufactures at a high level.

FINANCIAL POLICY

For various reasons the financial position of the group has become less liquid. It is

illuminating, I think, to look at the changes which have taken place not in a single year, but over a rather longer period, so I have extracted the figures showing the changes over the three years from the end of 1948 to the end of 1951. During that period the increase in fixed assets and trade investments amounts, in round figures, to £1,800,000. Stocks and debtors, after deducting liabilities, including future taxation, have increased by £3,500,000, so that it has been necessary for us to find in all a sum of £5,300,000. This has been done by ploughing back into the business undistributed profits and depreciation of £3,700,000 (after charging for taxation no less a sum than £4,200,000) and the difference of £1,600,000 represent the extent by which our net liquid assets have been reduced during the period. We are indeed fortunate that a conservative financial policy in the past has so far enabled us to stand the strain imposed by present conditions.

The total stocks of the group at December 31st last were high. Since then, however, the fall in the prices of both lead and antimony has somewhat eased the position, but it will take some time to bring about the necessary improvements in our liquid position. We are experiencing a recession in trade; there are existing commitments which have to be worked off, and although we have come more or less to the end of the programme of expansion and rehabilitation envisaged some years ago, there are some developments still to be undertaken. The amount of United Kingdom taxation payable in respect of the last three years on the increase in value of our base stocks of metals has amounted to over £573,000. The prosperity of the country depends upon the prosperity of industry. I do, therefore, urge the Government, as the position of the country becomes stronger and its own economy measures become effective, to take steps to alleviate the excessive burden now resting upon industry.

In considering dividend policy on this occasion, your board has endeavoured to reconcile the stockholders' claim to a share in the substantial improvement in the company's earnings for 1951 with the need for continued conservation of the resources of the company, and has decided to recommend a final dividend of 64 per cent, less tax, making a total of 10 per cent, less tax, for the year (compared with 20 per cent, less tax, for the previous year upon the Ordinary stock then in issue) and that, in addition, a bonus of 2 per cent, less tax, be paid on the ordinary stock.

Our trading for the first five months of this year has been at lower than normal levels in most departments. The inability of our customers to obtain their full requirements of steel and other essential scarce materials has indirectly affected us, and in addition the instability of the prices of metals has not encouraged buying. Unless the position materially improves, we are bound to experience some reduction in our earnings. We are, however, interested in a large variety of industries and activities and with the first-class plant and organisation we have at our command we shall be able to take advantage of any change for the better.

The report and accounts were adopted.

BOVRIL, LIMITED

ALLIANCE OF INDUSTRY AND AGRICULTURE

LORD LUKE'S REVIEW

The fifty-fifth annual general meeting of Bovril, Limited, was held on July 11th.

The Rt. Hon. Lord Luke, the chairman, in his address to the shareholders, said that the production, distribution and consumption of beef today continued to be a matter of considerable concern, not only for this country but even for countries like the Argentine and Australia.

The Bovril group of companies had found, through long years of experience, that cattle breeding on a large scale had not been strikingly profitable. But that was probably due to their having chosen out-of-the-way parts of the world, which had required large sums of capital for development to offset the natural difficulties.

The factor, however, which had made their business as a whole successful, had been the alliance of the pastoral side of the business with the sale of the end-product, which had made the sources of capital available for ploughing back, and it was this alliance of industry with agriculture which in the chairman's mind was essential for the greater production of food in our Islands.

CAPITAL FOR FOOD PRODUCTION

The basic needs of agriculture in this country were the proper equipment of farms with machinery and housing and the re-development of marginal land, all of which would need a good deal of capital. The question arose, where was the capital to come from? It was doubtful whether agriculture itself was a payable enough proposition to enable it to provide sufficient capital from its own resources. Bank loans, though they had done much to help, were temporary and at the present moment restricted. The Treasury, which had taken as much money as possible off the landowners who formerly had been able to make capital improvements on their own land from their own resources, was unlikely to vote large sums for capital development unless it owned the land as well.

Industry (other than agriculture) should take a greatly increased interest and, indeed, action in solving this vital problem by investing capital in food production. Many industrialists had already made a contribution to our livestock improvement by the establishment of pedigree breeding herds of all kinds, and why should not this go a stage further into the fields of commercial production and re-unite urban and rural activities?

FORECASTS DIFFICULT

On an overall review of the results of the activities of the Bovril group of companies during the past year, figures could be considered satisfactory. Most enterprises had been successful, but there had been disappointments in the USA and Australia.

Whilst home sales had always provided most of the profit, the company had increasingly profited from the export trade. The nature of the business depended largely on the weather, and the seasons for cattle breeding in the southern hemisphere could be adversely affected one way or the other by the kind of winter we had to face. For instance, in the Argentine where droughts had been exceptionally severe during recent years in certain areas, this did not luckily affect their properties in any marked degree. But in the Northern Territory of Australia the recent severe drought would mean that

cattle losses in 1952 were likely to be extremely heavy. Again, in this country, the winter of 1950-51 was a hard period with a consequent epidemic of influenza which had greatly increased sales. This last winter had been rather mild and the country had been comparatively free from epidemics, but sales had been maintained at a satisfactory level.

With these things in mind it was always difficult to forecast future results with any degree of accuracy, but in the chairman's view the company was in as strong a position as possible to meet adverse circumstances.

OVERSEAS DEVELOPMENTS

Conditions in the Argentine were extremely difficult but it would be appropriate to pay tribute to the efforts that that country was now making to re-establish her export surpluses with meatless days, restricted use of flour and many other restrictions. The process would take time, especially where meat was concerned, but no one should underestimate her great recuperative powers.

Argentine Estates of Bovril Limited played its part by maintaining its estancias, breeding up cattle stocks and by giving employment to some 3,000 Argentines both on the land and in their factory at Santa Elena.

The effects of the drought in Australia would be shown in the current and future financial years, and not in the year under review. Their breeding cattle on Victoria River Downs, their movement to the Bovril station in Queensland and subsequent sale to meatworks on the east coast had continued to make progress.

The position concerning the projected meatworks at Katherine, about which he had spoken with some concern last year, had deteriorated. Lengthy consultations had failed to interest the Federal Government in assisting a great piece of the development work which had gone beyond the means of private enterprise and they had been reluctantly forced to take the decision of liquidating the whole venture. A sum of £100,000 had been written off as special depreciation to meet losses which might be incurred on realisation of assets.

STRONG SALES POSITION

Sales during the past year had been most satisfactory, in fact the best for some years. Satisfactory progress had been made at their factory in Northern Ireland and during the year they had placed on the market a new type of Baby Weaning Food in cube form which had been well received.

Exports in 1951 had shown an increase of more than 25 per cent over the previous year, and the figure achieved was the highest yet recorded in the history of the company. Bovril (Canada) Limited, had shown another good year and it was a pleasure to record the very steady progress that was maintained in that country. Much hard work was needed to build up and gradually develop the large potential market in the USA.

The group trading profit at £887,271 was nearly £400,000 more than last year. Taxation, however, accounted for £480,416 and the net profit of the group was £377,947 against £185,881. Payment of a final dividend on the deferred stock of 10 per cent was recommended, making 12½ per cent for the year and leaving an increase in the amount to be carried forward of £13,118 at £225,762.

AMALGAMATED METAL CORPORATION, LIMITED

EXCEPTIONAL TRADING RESULTS

The twenty-third annual general meeting of Amalgamated Metal Corporation, Limited, will be held on August 7th at Princes House, 93, Gresham Street, London, E.C.

The following is an extract from the statement by the chairman, Mr W. Gardner, issued with the accounts for the year ended December 31, 1951:

Group profit before providing for UK taxation is £2,096,891, compared with £592,877 for the previous year.

A year ago the directors reported that the group profits had been affected by the loss incurred by Henry Gardner and Company, Limited, through the incidence of commodity contracts maturing in 1950, and that there were corresponding contracts maturing in 1951 the profits of which would more than offset the 1950 loss. The contracts were duly implemented in 1951 and the profits on them, amounting to approximately £470,000 before tax, account for part of the increase of £1,504,014 in the profit before tax for 1951. In other respects, too, trading results have been exceptional.

USA AND COMMODITIES

The commodities in which we are interested have again been largely dominated by the course of action of the American authorities.

After a long abstention from the tin market on account of arguments over the price, the USA resumed purchases under an arrangement by which the British Government would supply 20,000 tons during 1952 at 118 cents per lb.

We had some hopes that the London Metal Exchange Market for lead might be reopened but this has not yet been found practicable.

In April the United States Government announced that the importation of natural rubber was to be handed back to commercial channels and, at the same time, abolished temporary end-use controls on the consumption of natural rubber. Any favourable effect from these announcements was offset by fixing a minimum usage of 450,000 tons for GRS which, together with Butyl and Neoprene, means that United States consumers must consume around 650,000 tons of synthetic rubber if they are to avoid the re-imposition of end-use controls.

These decisions, combined with the manner in which the transition was accomplished and the reduction in the price of synthetic, have proved more than the market could stand.

EXTENDED ACTIVITIES

Our new enterprises are making satisfactory progress. The British Metal Corporation has further expanded its overseas interests and has formed a company in Bulawayo, Southern Rhodesia, under the style of The British Metal Corporation (Central Africa) Limited. The British Metal Corporation (Canada) Limited has recently opened offices in Toronto and Vancouver. Drew, Brown Limited has also extended its activities to British Columbia.

It is a great pleasure to refer to the appointment of the British Metal Corporation Limited as the sales agents (with the exception of certain countries) for copper produced by Rhokana Corporation Limited and Nchanga Consolidated Copper Mines Limited. We particularly welcome the use to be made of the services of our constituent company by this important group.

DARWINS

SUCCESSFUL CONSOLIDATION

The twenty-third annual general meeting of Darwins Limited was held on July 11th at Sheffield, Mr F. Thompson-Schwab (the chairman) presiding.

The following is an extract from his circulated statement:

The accounts cover a period of nine months terminating on December 31, 1951. This period represents the fulfilment of a period of recuperation and consolidation which started in the autumn of 1949.

Turning now to the balance-sheet figures, it will be noted that the value of stocks has increased by £186,000 since March, 1951. This increase is largely due to a greater volume of work in progress. There has also been a reduction of £96,000 in our bank overdraft, making a total reduction in two years of approximately £225,000.

Fixed assets are valued at £541,000 after depreciation, but to replace them would require a sum several times in excess of that figure.

During the past two years nearly £300,000 has been spent on maintenance and replacements. In the nine months under review the figure is £127,000. After allowing for this, and after all charges except taxation, our profit figure amounts to £308,000 against a corresponding figure for the previous twelve months of £138,000.

DIVIDENDS AND RESERVES

Out of the profit figure of £308,000 we have to allow for preference dividend and the interim dividend already paid on the ordinary share capital. These two items together absorb just under £15,000 so we have to get together with the carry forward of £17,000 from last year £310,000 with which to deal. Our estimated provision for taxation is no less than £188,800 which reduces our available profit to £122,139. We propose to you the payment of a final ordinary dividend of 5 per cent, absorbing £13,496. We also propose to transfer to general reserve £100,000, bringing the figures up to £150,000 and to carry forward £8,643.

The years 1950 and 1951 have been decisive ones and I believe we may claim to have established a relationship with our work-people which is second to none.

The history of this company is well known in the critical years of 1947, 1948 and 1949. It has emerged from difficulties which were not of its own seeking, only to find that the increased profit which it is now able to make through the cutting out of inefficiency and waste, is subject to the excess profits levy—a levy resulting from a political promise to take a profit out of the rearmament programme. So far as this company is concerned it is nothing of the kind.

IMPROVED LIQUID POSITION

The liquid position of the company has improved in the nine months under review by about £190,000, and as a result of current trading there should be a further improvement during the year.

Results for the first quarter of the current year show a satisfactory increase over the corresponding period of last year. This rate of progress should not be expected to continue throughout the year, but I have solid reasons for believing that when we next meet we shall be able to show at least a modest increase in the profit figure before taxation.

The report was adopted.

TELEPHONE MANUFACTURING COMPANY

DIFFICULT TRADING CONDITIONS

The twenty-second annual general meeting of Telephone Manufacturing Company, Limited, was held on July 14th, in London, Mr Fred. T. Jackson, OBE, CMLIE, chairman and managing director, presiding.

The following is an extract from his circulated statement:

The net profit, after tax, of the parent company is £80,321 as compared with £86,413. The total of reserves and the unappropriated balance of profit and loss account of the parent company amounts to £534,040 and, therefore, exceeds the issued capital of the company.

As I forecast last year, the results of the parent company for 1951 are somewhat less favourable. Although the turnover was maintained there has been a further reduction in the rate of profit.

Direct export business accounted for 31 per cent of our sales for 1951 a smaller proportion than for 1950. Australia, our chief export market, has taken less, but the reduction has been offset partially by increased business in Canada and other countries.

After referring to the progress of the subsidiary companies, the statement continued:

You will expect me to refer to prospects for the current year. Altogether 1952 is likely to be a difficult year, and I do not think we can avoid some further reduction in the profits earned by your company.

The report was adopted and the dividend of 10 per cent approved.

WALKER CAIN, LIMITED

GRATIFYING RESULTS

The thirtieth ordinary annual general meeting of Walker Cain, Limited, was held on July 10th in London.

The Rt. Hon. Lord Brocket, the chairman, in the course of his speech, said: It is a matter of much satisfaction to your board to place before you such gratifying results in view of the heavy burden of increased taxation and the progressive increases in material costs and of wages.

The inexorable trend in manufacturing costs has been such that our chief benefit was derived from the retail side of the business in our managed houses.

The demand for bottled beers is inclined steadily to increase. Although there is a growing tendency for bottled beer our draught sales have been uniformly steady—a tribute to the excellence of our products.

The gross trading profit at £1,647,063 shows an increase of £183,866. Profits tax and income tax totals £923,407, an increase of £164,566. The net profit is £538,031, compared with £523,069.

Only 2.4 per cent of our revenue goes to the ordinary shareholders, the owners of the business. A further interesting fact is that during the financial year under review, we have paid the immense sum of £5½ million pounds in beer, wine and spirit duties, taxation and rates. This figure does not take into account the duty paid on other beers, wines, spirits and tobacco purchased duty paid, which would bring the total to approximately £6½ million.

I need hardly emphasise the position of strength which your accounts disclose. The

JACKSON THE TAILOR LIMITED

INCREASED TURNOVER

The twentieth annual general meeting of Jackson the Tailor Limited was held on July 15th at Newcastle. Mr Lionel Jacobson (chairman and joint managing director) presiding.

The following is an extract from the chairman's circulated statement:—

Last September good quality wool could be bought for approximately one-third of the price prevailing at Easter, 1951. So gigantic a fluctuation in the price of our basic raw material in the space of barely five months could not fail to have a marked effect on our position particularly as it coincided with a sharp recession in public demand. This falling-off in retail demand was general throughout the world and its immediate consequence was that goods, particularly worsted suitings, were in much freer supply, and delivery was speedier than had been anticipated. The acceleration of the rate of delivery of both cloth and linings resulted in the receipt of goods in excess of demand which was reflected by an increase in stock.

LOWER TRADING PROFIT

In such circumstances it was necessary for our board to take steps to stimulate demand and maintain turnover. We succeeded not only in maintaining full employment in our works during a difficult period but also we increased our turnover compared with the results of the previous year. Such a policy could not be effected without sacrifice and this is reflected in the trading profit of the group which is lower than that of last year but is similar to that for the year to January 31, 1950.

My belief is that the only sound policy which will yield lasting results is to offer to the public a well-constructed sound garment at a price well within their pocket. The fall in the price of wool has enabled us to extend and improve our range of suits at popular prices despite the continued rising tendency of our wages and distribution costs. We must master these problems for we are still faced with a measure of price resistance on the part of the public. I welcome the present level of wool prices. The consequent reduction in the price of cloth means that we can give our customers better value and will undoubtedly lead in due course to an expansion of retail trade. It is possible that this may involve a further reduction in profit margin, but we feel that some small contribution from the benefits of past expansion allocated to the maintenance of future goodwill must lead to the stability of the business of the group.

SOUND REPUTATION

So soundly is the reputation of the Jackson group established with the public that nothing which has happened during the past year has diminished the confidence which we have in its future prosperity.

Boom conditions prevailed in our industry during the first half of 1951. This year's retail sales show only a small reduction for that period. This is a considerable achievement by the sales section of the business when you bear in mind that there has been a substantial reduction in the average unit price which as a natural consequence entails a lower margin of gross profit.

I have previously drawn your attention to the support I have received from the other members of the board and the senior executive. The same spirit prevails in these changed times.

The report was adopted.

Total of net current assets exceed current liabilities by £3,356,468, so that we are in a good position to undertake the many schemes of improvements and redevelopments which are awaiting sanction.

The report was adopted and the dividend of 18 per cent approved.

THE METAL BOX COMPANY, LIMITED

REVIEW BY THE CHAIRMAN—
SIR ROBERT BARLOW

The thirty-first Annual General Meeting of The Metal Box Company, Limited, was held on July 16th at the May Fair Hotel, Berkeley Street, London, W.

Sir Robert Barlow, the Chairman, presided.

The following is an extract from his statement, which had been circulated with the reports and accounts for the year ended March 31, 1952:

Sales and income from investments have risen during the year—

At home ... From £21,037,000 to £26,529,000
Overseas ... From £7,272,000 to £9,894,000

£28,309,000 £36,423,000

The profits of the group have risen, after taxation, to £1,515,000, or 4.2 per cent on sales.

This greater activity has served to provide some 17,000 employees of the Company at home with an additional £668,000 in wages, salaries and other benefits, bringing the total to £5,612,000.

The state will take in additional taxation £571,000, bringing its share to £1,797,500.

The 8,500 stockholders of the Home Company will receive an additional £42,500, making their total £351,263.

Of the profits, £752,000 will be retained in the Home Company and £212,000 in the Overseas Group.

These sums, though substantial, are inadequate for the requirements of the business. Permission having been obtained from the Capital Issues Committee, an issue of a further 903,192 Ordinary Shares at £2 per share was made on June 14, 1952.

The issue will provide about £1,775,000 new money. The fact that this is almost the same as the amount paid out in taxation this year is merely coincidental—though it does emphasise the harmful effect on industry of taxation at its present level.

The position has now been reached where the more rapidly a business is developed, the harder it is hit by taxation. This is not the way to build up our industrial power in an increasingly competitive world.

TINPLATE

The supply of tinplate has not improved during the year and the restrictions on its use are still in operation, yet the growth of our business has continued. This has been due to the management making better use of what it could get, in adapting substitute materials and in spreading its activities.

It is true that since the turn of the year production has begun at the Trostre mill of the Steel Company of Wales, and is beginning to ease the position. But, as I pointed out in this review a year ago, this new mill cannot replace the production of the existing old type mills. These must be kept in opera-

tion, certainly until such time as other mills of the capacity of Trostre have been installed.

PRODUCTION

Improvements and additions to our means of production at home have been continued during the year at a cost of £1,350,000 and we are already committed to a further expenditure of £850,000.

SALES

The problems of production and material supply have loomed so large for so long that it is a relief and a stimulant to focus attention again on the prospect of selling our goods.

The report and accounts were adopted.

Complete copies are available on request from the Secretary, The Metal Box Company, Limited, The Langham, Portland Place, London, W.1.

RICHARD COSTAIN, LIMITED

VERY SATISFACTORY RESULTS

EXPANSION OF OVERSEAS BUSINESS

MR R. R. COSTAIN'S STATEMENT

The nineteenth annual general meeting of Richard Costain, Limited, was held on July 10th at Rodney House, Chichester Street, Dolphin Square, London, S.W.1, Mr R. R. Costain, CBE (chairman and joint managing director), presiding.

The secretary (Mr L. Richards, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:—

The accounts for the year ending December 31, 1951, again show a small increase in profits over the previous year, the greater part of which is absorbed by additional taxation. The net profits of the group, after providing for tax, amount to £103,033. The board recommends a dividend of 10 per cent, less tax, on the ordinary share capital, and, after placing £8,987 to capital redemption reserve fund, £25,000 to general reserve, the balance of profit and loss account carried forward is increased by £22,905.

The balance sheet of 1951 reflects the large volume of work in progress which has necessitated increased bank borrowings. In this connection the shareholders will be asked to approve an increase in the company's borrowing powers at the extraordinary general meeting to be held after the conclusion of the annual general meeting. These increased borrowing powers are desirable to simplify the co-ordination of financial resources with subsidiary companies, and are necessary in these days of decreased values of currencies to carry out the necessary work for the future progress and development of your company.

REPUTATION MAINTAINED

The work carried out by your company abroad continues to maintain a reputation for efficiency and speed of production, and shows every indication of expanding, in spite of development limitations imposed by capital restrictions. In conjunction with a South African firm, we have practically completed the large Hunyani Dam Scheme in Southern Rhodesia, and are in the process of carrying out works in many areas of the African Continent.

At home, one of the large reservoir contracts will be nearing completion at the end of this year, and a reduction in other types of building and civil engineering work must be anticipated. Your company is fortunate, however, in having two or three large contracts that will, I hope, show satisfactory results both for 1953 and 1954.

The factory side of your business continues to be very satisfactory, and the development of pre-cast concrete works in England, Wales and Scotland continues.

I am pleased to report that our association with Messrs John Brown and Company, Limited, is prospering in the joint company, Costain-John Brown, Limited, which has already acquired a reputation in the engineering and erection of chemical plant and oil refinery work. This company forms part of an American and English group which has jointly been awarded the contract of designing and erecting an oil refinery near Fremantle, Australia.

RIISING OPERATION COSTS

The properties owned by your company are still being maintained in a high standard of repair, but I regret to inform you that the revenue returns from these properties are deteriorating as operating costs continue to rise. I cannot hold out any hope of an improvement in this situation until proper appreciation is taken in Parliament of the difficulties that property owners suffer under the present legislation, and it is hoped that Parliament will rectify a situation which all reasonable men realise is imposing an unfair burden on a section of society in this country, and will undoubtedly, unless action is taken in the near future, affect the whole economic structure of the British Isles.

FUTURE PROSPECTS

From my earlier remarks you will appreciate the impossibility of making any prognostication as regards the future prospects of your company, and I can only say that all members of the board are fully conscious of the responsibility placed upon them, and are carrying out their duties to the best of their ability in these difficult days.

Finally, I think you will agree with me that the results of the year's business are very satisfactory. The year has not been an easy one, and your directors wish to record their high appreciation of the work of the staff, both at home and overseas.

The report and accounts were adopted and the dividend of 10 per cent was approved.

The retiring directors, Mr R. M. Wynne Edwards, DSO, OBE, MA, MICE, and Mr E. J. Cook, BSc, AMICE, were re-elected, and the remuneration of the joint auditors, Messrs James Worley and Sons and Messrs Peat Marwick Mitchell and Company, was fixed.

At the subsequent extraordinary general meeting and separate class meetings of the holders of Preference and "A" Preference shares, a resolution was passed amending the articles of association of the company.

The proceedings then terminated.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

Set Sterling Free?

THE "very serious measures" that the Government is taking to take "to enable us to pay our way" are not to be announced until next week. Usually, on these occasions, there are plenty of inspired forecasts of what is intended, which turn out to be reasonably well-founded. This time there are none; nobody professes to know what is coming. This may be because dramatic policies are being planned of such novelty that secrecy is essential. Or it may be, as has often happened before, that Ministers have found it easier to agree that something must be done than to decide what to do, and that, when Mr Churchill used such minatory language, he was speaking in the spirit of King Lear—

I will do such things—

What they are yet I know not—but they shall be
The terrors of the earth.

The urge, of course, will be to find something new to do. It is an understandable desire and, within the limits of reason, a wholly praiseworthy one, for it is a sickening and dispiriting business to meet each recurring alarm with nothing but fresh turns of the familiar screws; to cut imports and capital investment once again, when anybody can see that the only final cure is expansion. With every fresh instalment of restriction, the hope that it will be the last becomes more slender, and the public's willingness to endure it correspondingly less. If there is a new formula, it is badly needed.

In such an awkward fix, it seems natural to the present generation to seek a way out by doing something to the currency. The currency proposal that is on the agenda at present is one to "set sterling free" by allowing the rate of exchange to fluctuate in the market and by restoring a degree of convertibility to the pound. It should be said at once that there is no reason to suppose that these proposals have been accepted by the Government or that they will figure in next week's announcements. On the contrary, such signs as are visible to the outside observer suggest that no such decision has been taken. Nevertheless, "setting the pound free" has been authoritatively proposed and seriously discussed; there are many people who believe that it could cure the chronic anæmia of Britain's external finances; and it deserves some analysis, as a prelude to whatever measures the Government may have to announce next week. Moreover, the success that has been achieved in stopping—or almost stopping—the flux of reserves makes it possible to discuss such questions in a context of some freedom of choice and of timing. The possibility of the ultimate calamity arriving and of the reserves running out cannot yet be wholly excluded; and if it arrives the only remaining freedom of choice will be between desperately unpleasant alternatives. But it can now be hoped that this will be avoided.

"Setting the pound free," as currently proposed, does not mean what it says. In the first place, the freedom of the exchange rate to fluctuate in the market would be conditioned by the active intervention

of the authorities, who would be able, on any day, to determine what the rate should be. It is not a proposal that the reserves should not be used, but that instead of playing a passive and compulsory role, as they do with a fixed rate, they should be employed actively and at discretion. A fixed rate is, in a sense, a one-way option given by the Bank of England to those who hold pounds and are entitled to exchange them into other currencies; a fluctuating rate would enable the Bank to exact a price from those who wish to exchange. And in the second place, the convertibility that is now proposed would also fall a long way short of perfect freedom. It is not, for instance, proposed that residents in the United Kingdom or in the rest of the sterling area should have any more licence to convert their pounds into other currencies than they have at present; or that anyone, wherever resident, should be allowed to move capital funds that are now restricted; or that the sterling balances owing to other countries should be paid off in dollars or gold. What is proposed, it appears, is that from now on anyone residing outside the sterling area who comes into possession of pounds as a result of current trade (i.e., not capital transactions) should be allowed to convert them into gold or dollars.

This would not be full convertibility. But it would be a step towards full convertibility, and a step that the City of London would very much like to be able to take. The new factor that has emerged in recent months is that the City is, for the first time, willing to accept a fluctuating exchange rate for sterling as the price that has to be paid for this step towards convertibility. The argument is that the withdrawal of the obligation to peg the rate at \$2.80, and the freedom it would confer on the Bank to use the reserve as a *masse de manœuvre* on its own initiative, instead of keeping it passively at the disposal of the licensed holders of sterling, would make it possible to meet the demands to which convertibility would give rise; had there been a fluctuating rate in 1947, the attempt to provide convertibility would not then have failed. This is the proposal that requires examination.

Freedom the Obvious Goal

The great majority of informed opinion would accept convertibility as the obvious and desirable goal of British policy; it has been solemnly proclaimed often enough. It is true that one cannot help having some doubts whether sterling and most of the other European currencies will ever be freely convertible into dollars, in the full sense of the word, which would include freedom for capital transfers. But it is common ground with all but a small minority of opinion that, if Britain is to survive as a commercial nation, sterling will have to be much more freely convertible into other currencies than it is today. A country's currency cannot be convertible unless the country can earn its living in fair competition with other countries. This is the challenge that the British people must accept. The alternative notion of a ring-fenced high-cost partnership between the United Kingdom and some few members of the present sterling area is not only most unattractive, but impracticable; for fewer and fewer of them would play a game that promises them so little. Convertibility—if not in its complete form *vis-à-vis* the dollar area, then at least with the rest of the world—imposes itself as the objective of British policy.

There is something also to be said, in a long-term

context, for a floating exchange rate. The general argument between fixed and fluctuating rates is a familiar one, on which most people have long since taken sides. But there is also a special argument of application to sterling in the present phase of its history. The world economy is obviously still in a most abnormal state. Nobody can possibly make even a reasonable guess about the real value of sterling until the four major question marks of world economics are resolved. Can the dollar gap be closed, either by "natural" means or by forms of action by the American Government moderate and inexpensive enough to have a chance of being continued? How long will rearmament continue and what will it cost? Will there be another slump and if so how severe will it be? Will the relationship between the prices of primary products and the prices of manufactures remain so cruelly unfavourable to an industrial country that has lost its overseas investments? With all these major uncertainties, nobody can say at what rate of exchange—if at any—the accounts of the United Kingdom can be brought into a new permanent equilibrium. The one thing that is certain is that the eventual rate will not turn out to be one of \$2.80 to the pound. If a change in the rate is inevitable, and if nobody will ever be able to calculate *a priori* what it should be, it is at least arguable that opportunity should be taken to let the pressures of the market-place determine the answer. This may well be better than a series of attempts to think up a new permanent fixed rate, each of which ends in a crisis devaluation.

The Cost of Convertibility

A free pound—free to move on the exchanges and free to be converted—is thus, to put it at its lowest, an acceptable object of policy. But to say this is something quite different from asserting that a move in that direction at the present moment is either timely or possible. The present position is dominated by three facts: the terms of trade, though they have improved a little, are still strongly adverse; there is still a deficit in the balance of payments; and the reserves are critically low. The British economy is still sick; and though it may be true that plenty of exercise is a condition of good health, it does not follow that an invalid either could or should go in for a hurdle race just because he is tired of being in bed.

Convertibility for sterling is highly desirable; but none of the impressive arguments in its favour can really conceal the fact that it would cost something in terms of the reserves. There is a very subtle argument connected with the various special categories of restricted sterling which it is not easy to unravel but which it is important that the public should understand. When a foreigner comes into possession of sterling which he is not allowed to convert into the currency of his choice, it remains standing to his credit in a London bank. It is not practical to prohibit him from doing anything at all with it, and in practice various categories of foreigners are allowed to make various sorts of purchases with their restricted sterling. But once any such concession is made, the door is opened to methods—more or less roundabouts, more or less legal—by which the foreigner can get his money out. An exemplar of all these transactions (far too simple and obvious to be permitted, but it will serve to illustrate the principle) is this: the foreigner uses his sterling to buy some sterling area commodity for which there is a market in the United States (say Indian shellac); he sells it in America, perhaps underselling the regular suppliers;

and the dollars for which it sells, instead of coming into the Bank of England's reserves, stay in his pocket, with or without the knowledge of his own government. Rates are quoted in the markets of the world (other than London) for the different varieties of fancy sterling, and the discount that they show on the official rate of \$2.80 represents the price that has to be paid for grey-market conversion by those whose pounds are officially supposed to be blocked.

These fancy rates for sterling are very greatly disliked by the Bank of England. In part, this is the hatred that every controller has for what escapes from his control. But it is also true that the existence of grey-market convertibility costs this country reserves; the dollars paid for shellac in the simple example just quoted are lost to the national chest. But this simply illustrates the fact that, for a country in Britain's position, any restriction on convertibility saves some dollars and conversely any relaxation or evasion of the restriction costs some dollars. Grey-market convertibility must cost the country less than permitted convertibility at the official rate; firstly, because those who use the grey market convert their pounds at a lower rate; and secondly because there must be some holders of sterling who, through scruple or ignorance, do not use these methods. To try to stop the loss of reserves that comes from the existence of these fancy rates of granting the right of conversion at the official rate would be absurd; it would be like trying to stop the leaks in a ship's plates by opening the cocks.

This is a most summary treatment of a very complex subject. But it is perhaps enough to establish the fact that the technicalities of the exchange market do not disturb the general proposition that any extension of the area in which sterling is convertible would necessarily cost this country some of its reserves. How great the loss of reserves would be is a matter of judgment. It is easy to see that the grant of convertibility would lead to some people offering pounds for sale who would not otherwise do so—if it did not have that effect it would be meaningless. But would it lead to anybody buying pounds who would not otherwise do so? Much play is made with the increased confidence that would be felt in sterling. But what would be the cash value of confidence? There would be approving statements; but how much money? The maximum amount of freedom that can be contemplated at present is not very much; British currency policy has been very erratic in the past and might have sudden reversals in the future; and the Opposition could be counted on to undermine any appearance of permanence that it was sought to give to the new arrangements. In these circumstances, it is difficult to believe that there would be much additional demand for sterling as a result of convertibility; and if money were to come in, it would help the reserves only at the cost of also building up London's short-term debts to the world.

The City takes a more sanguine view than that set down here—which would be an impressive fact were it not for the memory that in 1947 the experts also thought that convertibility would not cost much. Much or little, it would cost something; and in the present state of the reserves anything that would bear upon them is dangerous. The inconvertibility of sterling is indeed a disgrace; the bankers are right to feel it keenly. But the only way to avoid the taint of bankruptcy is not to be bankrupt. Repugnant though it is, the conclusion must be that convertibility will have to wait until the reserves are larger, and going up.

The argument for and against abandoning a fixed rate for sterling is a little different. Convertibility, for a country in Britain's position, with heavy short-term debts, must always cost the reserves something; a flexible rate of exchange could, in certain circumstances, assist them. But hardly in the circumstances of today. So long as there is a deficit in the balance of payments, a floating rate would tend to be a sinking rate. But a sinking rate would turn the terms of trade still more unfavourably against Britain. For the present it is surely better to keep the pound up. The floating rate must wait until either the balance of payments is strong enough to prevent it from sinking or else a fall in the prices of primary products, and particularly of food, make a depreciation of sterling tolerable.

Third Parties

There is another set of considerations that has not yet been brought into the argument. This is the reaction upon other countries of a policy of "setting the pound free." The countries of the sterling area have a right to be consulted. The predictions of a collapse of the sterling area if the fixed rate for sterling were abandoned are grossly exaggerated; but the other sterling area countries could hardly be expected to like a policy that would leave the value of their currencies to the discretion of the managers in London—and would leave the managers in London at the mercy of the economic policies of the present and subsequent British governments. And though they all say they want convertibility, the sort of convertibility they want is the right to turn their own pounds into dollars, which is not at all what is proposed.

There is also Europe to be considered. Setting the pound free would almost certainly disrupt the European Payments Union. Its monthly clearing could hardly be worked if rates of exchange were moving hourly. EPU is a set of devices by which creditors in Europe agree to take something other than gold or dollars for their credits; if they can get gold or dollars through British convertibility why should they be content with less? Opinions differ about EPU between those who emphasise how inferior it is to complete convertibility of all European currencies and those who remember what an improvement it is on the bilateral payments agreements that preceded it. But this at least should be generally acceptable: that it would be a very great pity to disrupt EPU unless what was put in its place was a really large step towards something demonstrably better.

Moreover, if EPU went, the liberalisation of European trade that it has made possible would also go. Liberalisation has been seriously eaten into of recent months; but there is still a great deal of it left. It is doubtful whether the countries of Europe would be ready to maintain their open general licences for imports of each other's goods if the accompanying payments were forced back into bilateral channels. Furthermore, if the pound sterling were made convertible by unilateral action, there would be some tendency in Europe, as there was in 1947, to discriminate against British goods in order to have a favourable balance with Britain and thus secure precious dollars. Thus the effect on Europe of setting the pound free would almost certainly be, in some degree, to restrict trade. Yet it ought to be a standing rule of economic policy that any currency arrangement that restricts trade

is *ipso facto* suspect. It would seem sensible to conclude that there should be no British move towards either floating rates or convertibility without at least an attempt to concert action with some or all of the European nations, as well as with the members of the sterling area.

The Scope for New Policies

These currency proposals have been worth analysing at such length only because there appears to be a dangerous fascination in the manipulation of money. In the earlier postwar years the theorists of the left wing used to argue that it was possible to escape from the cruel necessities of Britain's place in the world by planning all trade and confining it within barter bargains. There is a corresponding tendency now on the Right to believe that there is a secret passage out of Britain's economic confinements that will be opened up by uttering the magic formula of free markets. But the inescapable fact is that no currency, planned or free, can be stronger than the economy on which it is based. All these arguments come back in the end to the same place: until Britain's domestic economy is put into such a state that it can earn its living in the world, the pound sterling will not be strong enough to be set free without sinking out of sight or to be made convertible without exhausting the reserves.

To come back to the old familiar problem is not, of course, to say that there is nothing new to be done about

it. But it is to assert that the field for useful action is at home and not in currency manipulations. The one bright feather in the present government's cap is that it brought back into use the weapon of credit control. The results to date have been excellent, and the policy has not yet had time to reach its full development. But though it is the essential basis for other actions, no one ever pretended that it could restore the efficiency of the British economy single-handed. The other actions must now follow. It is idle to expect any government with a narrow majority to do much by way of cutting the standard of popular consumption, and it is difficult to be much more optimistic about government expenditure. But the other side of the equation remains; a 5 per cent increase in output (for the same real incomes) would be as effective as a 5 per cent reduction in consumption, and much more satisfactory. Can nothing be done to reduce the monstrous impediments to initiative and effort? There was a moment when the Labour Government planned a great movement for incentive wage schemes, but it fizzled out. Does the EPL mean that the Government's mind is closed to any measures of rearranging taxation so as to bear less heavily on the qualities that are needed for economic efficiency? The popular conviction may have to be accepted that, in a welfare state, no stick may ever be applied to the economic donkey. But are carrots also taboo? Is that present-day Conservative doctrine? And if not, exactly what is it that prevents a Conservative Government from doing what it believes in?

When the Russians Bring Gifts

THERE is a feeling in the air that the growing strength and cohesion of the western allies in Europe are making an impact on Stalin's advisers. There is no striking recoil in Soviet policy to be recorded, and the small gestures of appeasement that are being made remain furtive; but the face that is turned towards the west bears something less of a scowl than it did, and in Korea the psychological conditions for a truce have been prepared with some care. Roughly speaking, the role that is played at the moment by Moscow and its allies is that of the manager with his team of heavy-weight and light-weight boxers. He pays them and trains them between fights, chooses their contests, and gives advice from the corner of the ring while the fight is on. If it is won he takes much of the credit; if it is lost he explains the reasons to the public; but he takes no part in the contests himself. Hence the contradictions in Soviet policy which are so puzzling to those who have not read their Lenin and find it hard to distinguish between the long-term strategy of Stalinism and its short-term tactics.

It happens, not altogether by accident, that the soft-speaking phase in Soviet policy coincides with growing pains in Nato. The military programmes agreed on in February at the Lisbon conference are behind schedule, for a variety of reasons; the tooling up has gone well but the divisions and weapons do not run off the assembly lines. And now that General Ridgway has twice the troops and aircraft that General Eisenhower had when he took over in April, 1951, there is a disposition to say that delays can be afforded, because the threat of scientific weapons is being and in creation supplies all that is needed to prevent world war breaking out in Europe. What value is to be set on such speculations will, perhaps,

be clearer when Mr Churchill has spoken next week in the House of Commons. For the moment it is more important to examine what is new and what is unchanged in Moscow's conduct of the cold war.

Clearly, if Stalin's object for the time being is to keep the Soviet Union out of trouble, the satellite governments and the national Communist parties become the main weapons of policy; and the problem of their use is to fight the right actions at the right times in the right places. Policy must be clear but it must be flexible. For instance, the peace campaign as conducted in 1950-51 failed to produce the protest and action by the "working masses" against the Korean war that was hoped; the campaign to sabotage deliveries of American weapons to France resulted in little more than a crane or two being thrown into the water. Such failures have to be forgotten and substitutes found. To do so is not difficult, for everywhere the Communist Party can be relied on to continue the struggle, infinitely adaptable, covering the retreat from one position by advance into another.

The last six months have produced two typical examples. It was necessary to distract public attention from the somersault performed by the Russians when they offered the Germans a national army. (It used to be a "crime against peace" to argue in favour of a German army; now it is a crime against peace—in Communist Europe quite literally a punishable offence—to argue against it.) So the manoeuvre has been covered by the world-wide germ warfare campaign against the Americans. Likewise, a complete change of tone in all that has been said about what China will do to the UN armies and what it demands of the Americans has been covered by the suggestion that western industrialists and

traders must get back to business as usual, cut loose from allied restrictions on trade with Communist countries, and enter the vast markets that they are reputed to offer.

Behind such tactics, and behind the reshuffle of Soviet ambassadors in Berlin, London, Peking and Washington, lies a political strategy which the instructions sent to the national Communist parties make no attempt to conceal. The main objective stands out clearly: it is to divide the Atlantic allies, in particular to divide Britain from the United States. Ultimately it is hoped to get American forces out of Europe, leaving Germany to become in course of time an ally of the Soviet Union. If the drive can be taken out of western rearmament and dissension sown in the ranks of Nato, then more time has been won to tighten the Soviet grip on eastern Europe, to mobilise German nationalism and to bring to the west the long-awaited, long-prophesied slump.

If this is the general plan, what are its particular features? Firstly, that blandishments and bullying go on side by side. Hints of expanded trade and peaceful co-existence come from Moscow while Ulbricht and Grotewohl preach from Eastern Germany the overthrow of Dr Adenauer by violence. Trade between Japan and Communist China is revived while Communist-led mobs demonstrate in Tokyo against the government and the Americans. Moscow can talk to Paris in friendlier tones while M. Duclos leads armed gangs against the Paris police.

Secondly, there is in action a new version of the tactics of the united front against imperialism laid down by Lenin. The Communist is to keep quiet about his ideology; his duty is to get allies, not to stand aloof. The common enemy is the American on the local airfield or in the local base; the emotion to be roused against him is national feeling; Europe, like Asia, is to be "liberated" from the foreign imperialist by its own efforts. If demonstrators get shot or battered by the police, so much the better; they make useful martyrs. Governments which co-operate with the United States must be attacked, if possible overthrown. If it can be done only with the help of Nazis and Fascists, then make allies of them.

Thirdly, liberation movements in Asia and Africa must go on, varying in intensity according to local circumstances. In some places—for example in Africa—all that is needed is to work with the momentum of events; in others, for example Indo-China and Malaya and Burma, there is not only a field for political exploitation but also a military situation in which China is directly interested. Lastly, it is important to note the timing of these tactics. Between now and 1954 the western alliance is due to reach the peak of its defence preparations, the peak from which it will look down on a future and lower level of peacetime readiness. Already there are complaints, second thoughts and recriminations about the burden of what is being done; and there is gloomy speculation about what will happen to the American and European economies when rearmament begins to sag. By next year many people will want to believe that the danger to the free world has been exaggerated, and it is the task of Communist propaganda to provide the evidence: peace in Korea if not in Malaya and Indo-China; temporary stabilisation in Europe while Soviet Germany struggles to win free Germany; offers of new markets to the West's consumer goods on condition that it offers raw materials and capital equipment in exchange.

Supposing, it may be asked, that these things do all happen, what does it matter? A drop in tension, less spent on rearmament, more trade with the East—these are all things to be welcomed. Why regard a Soviet effort to bring them about as a dangerous part of a cold war campaign? The answer is, of course, one that is constantly being forgotten: that the purpose of the West in building up strength is to negotiate on equal terms a fair settlement of the problems created by the last war. For without such a settlement the peaceful co-existence of Europe with the Russians is not possible. Now that this strength is in sight of achievement, it is naturally the Russians' purpose to put off negotiations which promise no benefits to themselves. Some of them may believe that the Atlantic front created by their hostility can now be destroyed by a little appeasement; others may be genuinely frightened of the West's manifest superiority in scientific weapons and industrial potential; others may still believe that Europe and Asia will be theirs for the asking if a slump follows rearmament.

Whatever the dominant opinion in the Kremlin—and there is no possibility of being certain what it is—the present directive for political warfare is clear: set German against German and Japanese against Japanese; exploit all disagreements between the United States and its allies; get the Americans out of Europe and, if possible, the British out of Asia; keep the colonial wars simmering but never let them boil over. The West will do well to fear the Russians when they bring in 1952 the gifts they could have offered so much more convincingly in 1947.

ADVERTISING

WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

Houses for All?

THE findings of the housing census have been awaited with some eagerness. For far too long housing policy has had to be judged by factual evidence which has been pitifully bare in many respects. The census does not provide all the information that is needed, but it helps considerably. Like the other preliminary results, the housing figures as yet available are based on a one per cent sample only. It will be surprising, however, if the final picture differs in any important respect. Only private households have been considered and the figures throughout exclude establishments like hotels or boarding-houses. Houses (throughout this article taken to mean "dwelling units") vacant on the night of the census have also been omitted.

It is changes in the number and size of families, rather than in the population, which primarily govern housing demands. In 1951, the number of households (a "household" is deemed to include any resident domestic servants or lodgers living with a family), was 27 per cent greater than in 1931, although the increase in the total population was only a third as large. There is nothing new about the number of households growing faster than the population—it has been going on throughout the century. Correspondingly, the average size of a household has been getting smaller; it is now 3.19 persons in England and Wales and 3.39 in Scotland, as compared with 3.72 and 3.99 in 1931.

A simple average has a dangerous way of hiding wide differences. On examining the sizes of households—which is possible in both years for only England and Wales—the surprising change is not that the number of households of eight or more persons has halved, but that the number of people living alone has doubled. One out of every ten households now consists of a single person. Households of two or three persons are still the most usual but it is the twos now, rather than the threes, that predominate.

1—HOUSEHOLDS AND THEIR SIZE
(England and Wales)

Size of Household (No. of Persons)	No. of Households (thousands)		Per cent Change from 1931 to 1951	No. of Households of each size out of every 1,000 Households	
	1931	1951		1931	1951
1	689	1,398	+103	67	107
2	2,240	3,642	+63	219	279
3	2,460	3,256	+32	241	250
4	1,981	2,485	+25	194	191
5	1,271	1,241	-2	124	95
6	747	568	-24	73	44
7	422	247	-42	41	19
8	214	109	-49	21	8
9	112	51	-54	11	4
10 and over	98	45	-54	9	3
All Sizes	10,233	13,043	+27	1,000	1,000

Many causes have been working together to bring about this shift from the larger to the smaller household—economic and social as well as what demographers call natural ones. The lower birth-rate and earlier marriages have helped. So has the welfare state by

making old people less dependent on their relatives and able to maintain a separate home. There are more elderly widows today increasing the number of people living alone. But young adults, too, will be more represented among the one-person households since their higher real earnings have enabled them to set up somewhere on their own. If the 1931 girl lived away from home it was in a hostel or as a resident domestic servant (adding to the size of a middle-class household in the census); her 1951 counterpart was installed in a "bed-sitter." All this has resulted in a redistribution of the population into smaller households.

To ask whether house-building has been keeping pace seems like begging the question. For, of course, a household cannot be formed unless it has somewhere to live. But by no means all households had a house or flat entirely to themselves in 1931—about one out of every five shared a dwelling. Has this side of the picture changed? On the contrary, it is almost exactly as it was twenty years ago. The count of structurally separate houses or flats made in April of last year showed that they had increased by some 30 per cent since 1931—slightly more than the households. Proportionately, rather fewer households are sharing today, but because the total number of households is so much larger, there are, in fact, some 80,000 more households without a dwelling entirely to themselves.

2—THE COUNT OF HOUSES AND HOUSEHOLDS
(Thousands)

	England and Wales	Scotland	Gt. Britain
Total households:—			
1931	10,233	1,172	11,405
1951	13,043	1,438	14,481
Per cent change	+27	+23	+27
Structurally separate dwellings:—			
1931	9,124	1,147	10,271
1951	11,934	1,378	13,312
Per cent change	+31	+20	+30
Households sharing a dwelling:—			
1931	1,949	48	1,997
1951	1,968	111	2,079
Shared dwellings:—			
1931	840	23	863
1951	859	50	909

The figure of over a million by which households outnumber separate dwellings is not a measure of the demand for additional homes. There will always be people who want to live in the same house as other people, although separately enough to count as a distinct household. The difference between the shared dwelling and a flat may be no more than a plywood partition on the landing with a door in it. Usually, however, occupants of shared dwellings are not entirely independent of each other and in some 70 per cent of cases at least the toilet arrangements are shared. Without doubt the majority of households who share a dwelling would rather not; but the census figures do not say how many. Nor, of course, can they answer such complex economic

questions as the relative preference for cheap shared accommodation and expensive new houses.

Just as the average household is smaller today, so too, of course, is the average house. Owing to the concentration of new building on smaller houses and to large old houses being divided into flats, there are now (in England and Wales) many more of all sizes of dwellings containing up to five living rooms (including kitchens but not

DISTRIBUTION OF HOUSEHOLDS BY SIZE
(England and Wales)

sculleries) than in 1931 and fewer of the larger sizes. The numbers of four-roomed and five-roomed houses have increased so much that 60 per cent of all houses in Britain are now of these two sizes.

3—AVERAGE NUMBER OF ROOMS OCCUPIED
(England and Wales)

Size of Household (Number of Persons)	Average number of rooms per household		Average number of rooms per person	
	1931	1951	1931	1951
1	3.0	3.3	2.99	3.31
2	4.1	4.1	2.07	2.06
3	4.5	4.4	1.49	1.46
4	4.7	4.6	1.18	1.16
5	4.9	4.9	0.98	0.97
6	5.0	5.0	0.83	0.84
7	5.1	5.2	0.73	0.74
8 and over	5.6	5.3	0.62	0.59
All Sizes	4.5	4.3	1.21	1.36

How does the new pattern of families fit into the new pattern of houses? At first sight, it looks as if the fit is much as it was twenty years ago. Table 3 shows that, in England and Wales, the same size of household occupied on the average just about as many rooms twenty years ago as today. At each census, for instance, the average household of two had about four rooms and the average household of five about five rooms, the number of rooms per person getting progressively less as the family size increases. It is the better housing standards for smaller families that allow a claim to be made for progress. For, since there are so many more smaller families, as a whole the population is rather more sparsely housed—statistically it works out at about one extra room for every seven persons. In Scotland, where housing densities compare unfavourably with England, the same sort of process has been going on and now, on the average, there is about one room for every person. Sharing households generally have less space per person than others.

4—DISTRIBUTION OF ROOMS AMONG HOUSEHOLDS
(Great Britain)

Number of Rooms Occupied	Percentage of Households of each size				
	1 person	2 persons	3 persons	4-5 persons	6+ persons
1	15.3	3.1	1.9	0.9	0.3
2	21.7	13.6	8.8	5.2	2.8
3	19.7	18.7	17.4	13.5	9.5
4	21.7	27.0	27.7	27.0	26.5
5	14.7	25.2	30.0	36.2	36.2
6 and over	6.9	12.5	14.2	17.1	24.7
	100.0	100.0	100.0	100.0	100.0

These neat statistical averages conceal, of course, the acute overcrowding at one end and the spacious living at the other. Both have become relatively smaller since 1931. Out of every thousand households of any one size, there are fewer living in a very small number of rooms and fewer living in a very large number of rooms. The averages are about the same but both ends of the scale have been telescoped. Thus, in spite of the great increase in one-person households, the number of one-room households is pretty much what it was twenty years ago. This is one of the most striking facts that

emerge. Another is that whatever the size of household, whether it contains one or ten persons, the most frequent size of house is either four or five rooms.

There are, however, still plenty of large families living in small homes and small families living in large ones. Of the one-room dwellings, for instance, nearly half are occupied by more than one person. There are nearly 600,000 households of four persons living in accommodation of less than four rooms. Table 5 shows, on the other hand, how many of the smaller households have rooms to spare even after allowing either two or three rooms to each person. There are, for instance, 674,000 households of one person with more than three rooms and—after allowing them their three rooms each—they have over a million rooms to spare.

5—SPARE ROOMS
(Great Britain)

Size of Household (Number of Persons)	Allowing 2 rooms per person		Allowing 3 rooms per person	
	Number of Households	Number of Spare Rooms	Number of Households	Number of Spare Rooms
	('000)	('000)	('000)	('000)
1.....	981	2,169	674	1,188
2.....	1,504	2,300	159	298
3.....	163	308	16	42
4.....	33	86	4	22

This calculation is not intended to encourage anyone to rush to the conclusion that small families have no right to live in large houses or that all families should be induced to live at a specified standard. If people can afford to pay the cost of housing themselves so spaciouly, and if they choose to spend their incomes in that way, to interfere with their preferences would seem to most people to be an indefensible attack on personal liberties. But something is surely wrong if, at a time of housing shortage, public policy positively encourages the wasteful use of housing space by housing subsidies and—particularly—by rent restriction. And the housing census leaves no room for doubt that many families, reduced in size by one cause or another, find it distinctly cheaper to stay where they are than to move to a smaller dwelling. In consequence larger families are forced to remain cramped.

There is a lot more to be learnt from the census. London housing is almost a separate story, for here there is the highest concentration of small households and comparatively few large ones. Half the larger houses with six or more rooms and one-fifth of all dwellings in Greater London are shared by two or more households. Outside London, the people of Wales and Merseyside share more houses than elsewhere. The largest households are to be found in Clydeside where there is most overcrowding. In England, Newcastle is one of the worst areas. It will come as a surprise to many people that 37 per cent of all dwellings in the country are still without a fixed bath.

But while the details of the housing census will repay careful study, its main value is in the two general lessons to be drawn from it. First, the standard three-bedroom house is not the only requirement for a population in which over a third of households consist of one or two people. And, secondly, rent restriction is undoubtedly preventing the best use of existing housing space.

The census, unfortunately, has still left untouched the money side of housing. How many people own and how many rent their houses? If they rent, how much do they pay? These are important questions to which no answers are given. The British people are only beginning to accept—as the Americans do much more readily—being questioned about their income and spending. Such questions, indeed, are not entirely suitable for a full-scale census. But, if the final results prove this sample trial to be as successful as is anticipated, there may be hope that some special inter-census inquiries will be made. If so, the object of filling the gaps that still remain in housing information deserves preference over that of merely bringing existing information up to date.

THE GROWTH OF SMALL HOUSEHOLDS
(England and Wales)

HOUSEHOLD ARRANGEMENTS 1951
(Great Britain)

NOTES OF THE WEEK

Egypt's Army Coup

"The whole of Egypt will welcome this news," says the proclamation issued by General Neguib Mohammed, organiser of Wednesday's army coup in Cairo. It announced that the army was purging the corrupt old guard that commanded it from safe seats in the rear during the Palestine war and was still in control until this week. The General is right if by "the whole of Egypt" he means the considerable group of town-bred, literate, middle-class Egyptians who have for years felt increasing resentment and frustration at the way personal fortunes were being amassed in high places.

This group has hitherto kept quiet in public on account of the traditional authority of pasha and palace; but this week it registers two notable victories. The first was scored for it by Sirry Pasha, when he resigned rather than appoint to the two important ministries of war and finance palace nominees whose reputations find no favour with any honest Egyptian. The second was won by General Neguib Mohammed when, with the support of the whole of the officer corps below his own rank, he secured from King Farouk acceptance of his claim to be commander-in-chief—the royal favourites at the top of the army having been already removed. It remains to be seen whether his energy will be sustained long enough also to purge the corruption ingrained in two other quarters: the Wafd party machine, and part of the entourage that depends on palace employment for a livelihood.

The chain of events that led to Sirry Pasha's fall, Hilaly Pasha's reinstatement, and then—within twenty-four hours—the army coup and the "emergency premiership" of Aly Maher is set out on page 234. Meantime a few conclusions can be drawn. The first is that King Farouk's popularity and prestige, for some years not high, have suffered a serious setback; he has had to accept dictation from a general whom he has lately opposed with marks of disfavour. The second is that the changes have to do with purely internal affairs. From habit, the army officers concerned in the coup gave, through the American Embassy, a warning against British intervention; but no foreigner even thinks of intervening in a matter so domestic. The only repercussion of these events upon Egypt's neighbours is likely to be in the Sudan, which can scarcely be tempted to ask just at present for a connection with the Egyptian crown. Lastly, a comparison with events in Persia is obvious but not apt; for in Cairo the changes have been dictated by a disciplined army, in Teheran by a mob; in the one by reason, and in the other by emotion. The only common feature is that both monarchs have had to bow to dictation by men they had tried to quell.

The Hague Court Verdict

By nine votes to five the International Court of Justice has ruled that it is not competent to deal with the merits of the Anglo-Persian oil dispute. It has therefore found for Dr Mossadegh's view that disagreement over a contract with a foreign company is not a dispute between states, and against the British Government's contention that this quarrel had become in the legal sense international, which means inter-governmental. The decision will give a boost to Persian self-confidence and will set back British chances of reaching a settlement that might recover some of the lost assets; but this demonstration of judicial impartiality reflects credit on the court.

Persians had for weeks been reckoning on their fingers the number of judges on whom they could count for political and "anti-imperialist" reasons. In fact, the British judge

voted for the verdict, the American (who might have been assumed to be less self-interested) against it, while the Brazilian and Chilean—who might have been super-sensitive on the score of a nation's claim to develop its own raw materials—also voted against it. But, as has often been pointed out in these pages, decisions in favour of defaulting sovereign debtors, however well founded they may be in law, have a deplorable effect on the mind of the large-scale investor overseas. What has happened in Persia will affect all under-developed countries' chances of attracting foreign investment.

Meantime, Persia has the oil and the Anglo-Iranian Oil Company must fight for its rights in a climate of opinion less favourable to its chances than hitherto. Three courses of action are open to it: either to get an arbitrator appointed under its concession agreement; or to fight for its concession rights in national courts, whenever the Persians try to sell oil from the concession area—a procedure which may succeed in some countries but certainly not in all; or to consider accepting the compensation for its assets which Professor Rolin, Persia's able Belgian advocate at The Hague, asserts that his client is ready to pay, though from what funds he does not say. All three choices are unattractive. The first, tried on its own, will lead nowhere so long as a mob which has canonised Dr Mossadegh has the last word in Teheran.

* * *

Two Cheers for Dr Mossadegh

By an accident of timing, Dr Mossadegh received two fillips on the same day. The verdict from The Hague was one; his acceptance once again as premier by an overwhelming majority of the Majlis was the other. This high-speed come-back followed four eventful days. The Shah forced Dr Mossadegh to resign, either because the latter insisted on becoming minister in charge of the army, or because he wanted to be an economic and financial dictator, or both. Then the Shah appointed in his place Qavam es Sultaneh, who prematurely announced that he would get the oil flowing again thanks to a "new policy." To his opponents this meant he would seek foreign help. Then the Mossadegh *claque* called into the streets of Teheran a crowd in which nationalist zealots, religious fanatics, and Communist wreckers shouting for a republic all played their part. Over thirty people were killed in the capital last Sunday. Qavam therefore resigned, and Dr Mossadegh was shouted back into office. The loss of prestige suffered by the Shah is obvious.

Dr Mossadegh is clearly a selfless person: anyone self-interested would have been content to retire while still an idol of the people and to leave someone else to put order into the chaos he has made of the state's finances. But he is also conceited, and his chief supporting newspaper claims that "now that the campaign against the foreigner has ended," he can put things right on the home front. Other observers persist in asking whether he can carry out unpopular economies when the mob that has put him into power may well be his master and whether he can sell crude oil fast enough to pay the workers at Abadan. A survey of the world's available tankers and refineries makes this doubtful. How, moreover, can he pay the army and the police?

While he is finding ways of getting some oil moving, there is a growing Tudeh party seizing its chances, an army getting more and more dissatisfied, and a national bank getting more and more alarmed. It seems doubtful whether Dr Mossadegh will be able to sell oil fast enough to keep pace with these mounting troubles.

The Guillotine for State Pubs

In one way or another the Government has lost a great many parliamentary points this session, and its latest recourse to the guillotine is another blunder. While this session will see only a White Paper instead of an iron and steel Bill and other major legislation is held up, while the debate on the economic situation must wait until next week, it looks bad to force through this session a Bill that merely repeals the state monopoly of public houses in new towns. Had the Tory whips pushed ahead with this Bill in standing committee soon after it had its second reading in February, it would have been safely on the statute book by now. But by leaving the committee stage to this late hour, they offered the Opposition a golden opportunity to filibuster—which Mr Ede and his colleagues promptly took. This in turn forced Mr Crookshank to choose between either losing the measure or using the ponderous weapon of the guillotine—and to waste a precious day in the process. As a result, the Labour party had a riotous day on Monday when the guillotine motion was debated. They filled the air with taunts that all this was being done at the brewers' behest. They claimed that on the committee which started to consider the Bill the president of the Band of Hope was "replaced" by a director of a large brewery—who, they went on to declare, had broken the rules of the House by voting in committee in spite of his pecuniary interest. They discovered with horror that the Brewers' Society had a parliamentary committee. Mr Bevan demanded to know which MPs were on it, declaring that if this information were not given, no one would dare speak for the Bill lest he be suspected of being in the pay of the brewers. The Opposition, in short, had a field day.

The Home Secretary had the impossible task of trying to show that the Bill was important and urgent enough to justify the stifling of parliamentary discussion. It was important to save the large sums that would otherwise have to be spent on acquiring existing houses, it would save setting up a new authority to run them in the widely scattered towns, and it would avoid taking action to which public opinion was opposed. It was urgent because plans for the new towns were meanwhile held up and because the three newly built houses could not otherwise be brought into use for some time. But the Tories have certainly lost both ways in this battle. They have lost in parliament by having had to use the guillotine, and in the country by allowing their opposition to state public houses—which the public almost certainly shared—to seem tainted by friendship for the brewers.

Preparations for Morecambe

The resolutions submitted by the constituency parties for the forthcoming Labour Party Conference were published this week. Only a fraction of them will survive the ballot and see the light of day at Morecambe. Nevertheless, these four hundred-odd statements, reflecting as they do the pre-occupation of the local party members, are of more interest than usual this year. Although the struggle for the party's leadership has been intensified while Labour has been out of office, its progress is only observable in the form of a conflict of personalities within the Parliamentary Labour party. But it remains an open question how far the Bevanites have succeeded in crystallising the discontents and frustrations of the rank and file so as to turn a conflict of personalities into an issue of policy in the eyes of the party's supporters. The resolutions for the annual conference are not an entirely reliable indicator of this. The fire-eating statements often come from branches whose candidates are never likely to reach Westminster and everywhere the wording of the resolutions tends to echo Labour enthusiasts rather than Labour voters.

But when allowance has been made for this inevitable bias the fact remains that between one-third and one-half of the resolutions concern rearmament and foreign policy compared

with less than one-fifth last year, and concessions to the need for the present level of rearmament (even "painless" rearmament) are hard to find. So much preoccupation with the issues on which Mr Bevan has taken his stand must have shocked the party leaders.

These debates on the party line may, however, be overshadowed by the voting on the opening day of the conference for the party leadership. The chief contest is for the seven constituency seats, which are elected on the votes of the delegates to the conference, each of whom has voting powers in proportion to the membership of his local party. The nominations will not be completed until mid-August, and the competition is intense. At first sight, the Bevanites, who last year won four of the seven places, go into the contest with strong advantages. They can count on the natural leftward bias of the constituencies. This is partly due to a desire to provide a counterpoise to the domination of the executive by the trade unions, which results from the fact that the unions have twelve seats of their own and have a decisive say in the five women's seats. It is also partly due to the system of indirect voting, as many delegates, particularly from areas held in Parliament by the Tories, are drawn from the left of the party. This has carried Mr Bevan to the head of the constituency poll every year since the war. It will be of interest, too, to see, when the nomination lists are published, whether the Bevanites have concentrated their attack by putting forward only a few candidates. No such co-ordination is likely among the other candidates, so that the orthodox votes may be spread widely—and ineffectively.

Yet with all these tendencies towards the left, it is hard to believe that the rank and file of the labour movement—if they really face the problem—will be prepared to sacrifice leaders of the calibre of Mr Morrison, Mr Griffiths, and even Dr Dalton, for further Bevanite representatives. What is at stake in these elections is not the party's policy, but the calibre of its leadership. To spurn its tried leaders at this stage would be an act of electoral folly as well as a breach of common sense.

The Shopworkers Wait

Much protest has greeted the Minister of Labour's refusal to accept automatically the wage increases proposed for some 1,500 workers in the distributive trades. His request to the 12 wages councils concerned that they should reconsider their recommendations in the light of the Chancellor's appeal for wage restraint is regarded by unions and Labour MPs alike as an unwarrantable interference with the machinery of wage negotiation; and Mr Bevan has made the more subtle point that by seeming to be opposed to wage increases the Minister has undermined his own influence as an arbitrator in industrial disputes.

Yet Sir Walter Monckton could hardly have acted otherwise. When recommendations are submitted to him by a wages council he must either issue orders to make them effective or refer them back for further consideration. The agreements in question were arrived at before May 15th, when the Chancellor appealed to the TUC for restraint in making wage claims, and they were submitted to the Minister in May and June. To have accepted them would therefore have been to encourage industry to ignore the Chancellor's appeal altogether. Sir Walter has done no more than Mr George Isaacs did as Minister of Labour in 1948. Shortly after the Labour Government issued its White Paper urging moderation in wage and salary increases, Mr Isaacs referred back the proposals of three wages councils for reconsideration in the light of that policy. When the same proposals were again submitted to him he made orders giving effect to them—as Sir Walter may do on the present occasion if the wages councils stand firm by their recommendations. He did not—indeed cannot—veto the increases they proposed.

He has, however, delayed them. At first sight it seems unfair that this one section of workers should have their hopes deferred just because their wages happen to be negotiated through wages councils. It seems doubly unfair because they are among the lower paid workers—indeed, that is precisely why the wages councils were set up. Much criticism has been directed to this point even by those most aware of the need for wage restraint. The injustice however, has been exaggerated. Large wage claims are being put forward in the basic and nationalised industries. But the electricity workers and the railwaymen have had their demands rejected, and now even the miners have met with a refusal of their demand for an extra 30s. a week. The only major award that has been agreed since the Chancellor made his appeal is the extra 5s. a week proposed by the Agricultural Wages Board. In the consumer trades wages are at a standstill; employers and workers are waiting to see the way trade is turning. The shopworkers are not alone in having to wait; and the delay, however infuriating for them, has the advantage of weakening the connection between wages and prices and so of checking their neck-and-neck race.

Saarbruecken versus Strasbourg

Mr Eden's proposals for linking the large and loose Council of Europe with the small and tight European defence community and industrial pool are now virtually discarded. Polite people in Paris say they are on ice; but there is normally no ice in a waste paper basket. The proposals are criticised as asking for representation without responsibility; they would allow the British and the Scandinavians to listen without talking.

So the plans for what is now called "Schumania" go ahead and it is more difficult than ever to see where this country fits in. What is aimed at is a small political authority for Europe with as much power as possible; the British seem to hanker after a large political authority with as little power as possible. People like M. Monnet think they can bring off a federal union; but their critics accuse them of building the first working model of a technocracy; Mr Eden's advisers seem to think the attempt will fail, but if it did not then Britain might become a western Cinderella.

The situation is highly confusing, especially as there is a Socialist view to take into account. British Socialists naturally tell European colleagues that they expect to come back to power; the Europeans therefore dream of Labour Britain keeping Catholic Germany in its place. They think this could be done by siting the Schuman Pool Authority in Strasbourg where British MPs could at least come and talk twice a year. Non-Socialists, on the other hand, who believe they can start Western Europe on the road to federation by setting up a political authority now, want to avoid Strasbourg at all costs. They would prefer a new start in Saarbruecken, a hideous town but really interested in heavy industry and Franco-German understanding.

Until Holland has found a government, no marked progress towards a political authority need be expected. But later this month M. Monnet comes to London and will want to discuss practical matters. How will the British take part on a permanent basis in some of the technical committees set up under the High Authority of the coal and steel pool? And how will British Ministers consult with the Ministers of the Pool? It is in the British interest, for the future if not for the present, to find answers. For the Ministers of "Schumania" have been meeting and getting down to detail.

Franco-German Steel Rivals

The High Authority of the coal and steel pool will start its operations in an atmosphere of keen rivalry between the French and German steel industries. Both sides have been

placing numerous projects before the steel committee of the OEEC. Though the committee is only advisory, weight is attached to its opinions. The French plan to increase their crude steel output to 21 million tons a year, while the Germans—though they talk of only 16½ million tons—have proposals for an output of flat products which will call for a crude steel output of about 21 million tons. Present German production is at the rate of 15½ million tons a year.

The Ruhr has been unable to secure the approval of the steel committee of the OEEC for its two largest projects—expansion of the Thyssen works and the former Hermann Goering works at Watenstedt. Various minor projects were approved at the committee's last meeting, but Britain and France held out against the two biggest. The French want to leave the question to be decided by the High Authority, knowing that in the meantime the moribund Military Security Board maintains its veto on the German projects. Furthermore, the OEEC committee found that the Germans have not realised the necessity of providing it with properly worked out plans, fitted into an assessment of the steel industry as a whole, including the likely markets. German industrialists have much to learn after decades of secret rearmament, war and unlimited demand, followed by an occupation regime.

Two facts dominate German thinking. One is that German steel output compared with 1913 shows nothing like the same increase as that of France and Britain. The other is that the Ruhr, since the last war, has been able to modernise its plant only in isolated instances, whereas France, taking advantage of Germany's handicaps and Marshall aid, has forged ahead with large, modern works. The Thyssen works at Hamborn are on the finest natural site for a combined steel plant and strip mill in Europe; but they have been rendered uneconomic by Allied dismantlement. Even if market research were to show that there was no future demand for the product of an expanded works at Hamborn, it would still be a national and political demand that they should be rebuilt to their prewar capacity of 2½ million tons of steel a year; and capital would not stand in the way.

The German steel industry looks forward with some confidence to a majority vote in favour of expanding the Thyssen and Watenstedt works when the matter comes up in the High Authority. The British will not be there and the Belgians have already voted in favour of the German projects at the recent OEEC committee meeting. But it is evident that initial harmony within the Schuman community will much depend on the extent to which France is prepared to acknowledge the Ruhr's claims. Recent statements by leaders of the French steel industry indicate that German expansion will be tolerated only if the Saar steelworks remain within the French economic orbit and if their own expansion plans are rapidly implemented. It is also evident that the French will insist upon a considerable expansion of German coking capacity before giving approval to large German steel increases. The approval of the High Authority will not be needed for self-financing, but will decide the all-important question where credits from the International Bank and other American sources are to be placed. Clearly it will help to save the Schuman pool experiment from failure over the issue of investments if the German industrialists approach the conference table with more frankness than they have shown in Paris.

Norway Stands Firm

Although in 1949 it was the Norwegians who led other European countries to join the five Brussels Treaty partners in the Atlantic Pact, they made it clear from the start that they would not allow foreign troops to be stationed on their soil unless and until they themselves felt that an attack was imminent. This question, virtually dormant since the birth of Nato, has recently come to life in connection with the

general welcome given in Denmark to the idea that allied bases should be created in that country.

To Denmark, exposed to immediate land attack, the essential point is that, as the Copenhagen *Social-Demokraten* puts it, "if we want aid in time and in sufficient strength, we must make sure that this aid can reach us." To Norway, traditionally more self-reliant and more sheltered from attack in spite of its common frontier with the Soviet Union, the problem is more complex. Account must be taken of the paranoid fears of its powerful neighbour, of the long time needed to prepare bases in difficult terrain, and above all of the maintenance of morale among a people accustomed to shoulder their own burdens. The fact that the Norwegians have felt it necessary to restate their distaste for allied bases reveals their continued sensitiveness on this point; but it does not imply any weakening of their loyalty to Nato.

That loyalty has, indeed, been staunchly reaffirmed in the Storting's recent approval of a record defence appropriation of 3,400 million kroner (£170 million) for the financial year that has just begun. Part of this total comes from Nato and United States funds, but Norway itself will find Kr. 2,750 million. Airfields and other installations account for Kr. 1,000 million, and will absorb about eight per cent of Norway's timber and ten per cent of its cement. For a country already suffering from a shortage of labour this is a remarkable effort; all the more so because Norway's foreign trade position is again disturbing. In the first half of 1952 imports totalled Kr. 2,883 million and exports only Kr. 1,994 million; in June the unbalance was exceptionally marked, and freight rates, on which Norway relies heavily as invisible exports, are falling sharply. Norwegians are entitled to remind their friends, as *Morgenbladet* did last week, that their policy regarding bases means paying a stiff price "rather than transferring this burden to our allies."

Motion on Liberty

The House of Lords, last week, continued its debate on the liberty of the subject. The previous occasion was in July, 1950, when Lord Samuel introduced his Bill for the preservation of the rights of the subject. That was given a second reading by 66 votes to 24 and forthwith disappeared. Last week's motion by Lord Samuel said very much the same things as his earlier Bill. Amended at the instance of Lord Salisbury to allow for the "progressive restoration of such liberties as and when the national situation allows," the motion was carried unanimously. So far, there is every prospect that the debate will again be resumed (it is to be hoped by Lord Samuel) in a year or so and on very much the same lines. The arguments on either side remain; the noble Lords who utter them change. Out of office, civil liberty is the cry. In office, there is always the proviso: "unfortunately, these are just the very liberties which it is quite impracticable, for administrative reasons, to restore at this moment"—just as, for six years, it was quite impossible, administratively, to abolish the identity card.

In sober truth, of course, it is not possible to make a clean sweep of every restriction on liberty as it was believed to exist last century; it would be foolish to suggest that all warrants allowing a public servant to inspect private premises should be abolished, which is one of the proposals sometimes put forward. Lord Jowitt was right when he said, in last week's debate, that a string of slogans do not make a parliamentary Bill. A general debate has value, in that it reminds civil servants of their duty to act judicially and to ask themselves if the powers they demand (or give themselves) are really necessary; but its effect wears off, and repetition hastens that process. Private members cannot hope to do very much. Even comparatively minor proposals, such as that to alter the burden of proof in the criminal prosecution of directors for offences committed by their companies, tend

to be argued on party lines, and the private member cannot call in the Whip in aid. Last year, the Government extended its emergency powers in bulk for another year, but it promised to think them out in detail in the time so given. Civil liberties are not at the moment in such danger that any super-priority can be claimed, but the promise remains to be redeemed, and a set of comprehensive proposals to restore some liberties (and a solid argument to defend those restrictions which are to be retained) would be a most encouraging response to this debate. It would also be a very fitting tribute to Lord Samuel himself.

Corporation Confined

One of the most interesting points raised in last week's debate in the House of Commons on colonial affairs was the future of the Colonial Development Corporation. The two reports for which Lord Reith has been responsible as chairman have both emphasised the anomalous position in which the corporation is placed. It is bound to act as a commercial concern—that is, over a period and over the whole range of its undertakings, it has to show a profit; yet it is subject to disadvantages that no ordinary commercial concern would tolerate. In the words of the latest report, the corporation is intended to "do economic good; just that; but to do it without losing money."

The attitude of the Labour and Conservative governments to the corporation's anomalous position is interesting. In a debate on the colonies in the House of Lords this week, Lord Ogmore, Minister of State for the Colonies in the Labour Government, said that

there is a complete difference of approach between the Government and the Opposition in the matter of the Colonial Development Corporation.

Perhaps that is going too far, but the difference of emphasis is certainly significant. The Labour Secretary of State tended, to begin with at least, to regard his ultimate responsibility for the corporation's activities as necessary for the protection of the colonial peoples—to prevent them from being submitted to development they did not like. He put more stress on the corporation's duty to do good, and was more willing to overlook Lord Reith's qualifying clause.

Even before the change of government, this optimistic view of the corporation's function was being modified. Now, under a Conservative Secretary of State, the change of emphasis has been underlined. It is the protection of the taxpayer's money that is given priority, not doing good to the colonies. Last week, Mr Lyttelton laid down four criteria, at least one of which must be satisfied before sanction is given to a scheme put up by the corporation. First, is the colonial government concerned willing to share in the scheme if it has the money? Second, are local experts being mobilised and is local advice being taken? Third, has local capital been offered a stake and has it accepted? Fourth, has private enterprise in this country, carrying on the same kind of business, been asked to participate? Few people who have the interests of both the colonies and the taxpayer at heart will disagree with these criteria. What remains to be seen is whether they leave the corporation enough scope to justify its present organisation.

Improving Farm Layout

The unsatisfactory layout of many farms is a well-known obstacle to the improvement of farming efficiency in Britain. The Agriculture Act empowered the Agricultural Land Commission to prepare schemes for the adjustment of farm boundaries and a scheme has been drawn up for the Yetminster area in Dorset.* This is an area where fragmentation of holdings is especially bad. Of the 35 farmers

in the area, 27 occupy between them no less than 93 separate parcels of land. One farm is in nineteen scattered pieces. The farms are not especially large. There are also 47 separate owners in the area, and some farms have three or four landlords.

The Commission is sure that bad layouts are a principal cause of the poor standard of farming in the area. Difficulties of access impede a balanced rotation of crops, since the nearer fields tend to be overworked while the more isolated parts of the farm are neglected. In the same way, difficulties over the movement of stock prevent the building up of attested herds. Fencing and ditching are unnecessarily costly, and improvement schemes necessitate a higher degree of co-operation than can usually be obtained. Both the quantity and the quality of farm production suffer. The reorganisation of farm units is, however, complex and difficult. The best way would be to consolidate the disjointed pattern of ownership, but this is not effectively within the Commission's powers. Its scheme provides instead for a limited exchange and transfer of farm tenancies—in itself, a hard enough matter to arrange equitably. Its proposals have been modified in the light of strong local opposition, but even so it seems doubtful whether they command the "substantial degree of support among interests affected" which, in the Commission's own view, is necessary to the success of a scheme of this sort.

The Government's action in dropping the scheme is not surprising. Presumably no more schemes will be prepared under the Act, since the same difficulties would arise elsewhere. But the problem, which relates in some measure to the greater part of the country, is too important to be shelved. Since existing owners in any area will not agree to pool their rights, it might be best to empower the Commission itself to acquire an appropriate area of land and reorganise the layouts of the individual farms within it. An experiment on these lines, besides its direct benefits, would make it easier to weigh the gains and drawbacks of action on a larger scale.

A Command for the Straits

Frankness should not be out of place among Atlantic allies; so it may as well be said bluntly that a way has now been found of placing the armies of Greece and Turkey under Nato command, without assigning them to the Italian General Frattini. The latter will continue to command

allied land forces in Southern Europe, and an American general will command the Greek and Turkish forces from a south-eastern headquarters. He will have an international staff and the support of a tactical air force. The chain of command extends upwards from this headquarters to General Ridgway via Admiral Carney, whose empire as allied com-

mander-in-chief in Southern Europe is now established as far as the shores of the Caspian Sea.

The change draws attention to the way in which Nato, since Greece and Turkey joined it, has moved steadily closer to the Middle East. Indeed, the revised North Atlantic Treaty could be read as giving General Ridgway responsibility for defending the islands of the Eastern Mediterranean; and the statement that the defence of Thrace is the special task of the new headquarters does not alter the fact that Nato is now concerned with protecting the eastern as well as the western shore of the Straits. Clearly, if this flank of the Middle East is to be regarded henceforth as part of southern Europe, the Arabs will have to think again about their refusal to take collaboration with Nato seriously.

Deadlock on Admirals

On the sea command in the Mediterranean the deadlock between American and British views remains. Hitherto it has been easy to say that if either side gave way there would be uproar either in the American Navy or in the House of Commons—and some people think the former more important. Now it looks as if a substantial part of the British case has been conceded. The Americans, by agreeing to the new south-eastern headquarters, have admitted that Mediterranean defence east of Italy cannot be directly controlled from Paris and Naples; and it was argued by the British that strategy in the Mediterranean involved the Middle East and Commonwealth as much as it concerned Western Europe. They suggested quite reasonably that Admiral Carney, General Ridgway's commander-in-chief in Southern Europe, had too much on his plate to give proper attention to the multiple naval problems of Mediterranean strategy.

Now, however, Admiral Carney's plate is less amply covered. He will push much on to the new south-eastern headquarters; although he still commands American naval forces in the Mediterranean, he has lost the Sixth Fleet to General Ridgway. The time has come to reconsider the British position. Now that Nato has accepted responsibility for the Eastern Mediterranean, there is no logical reason why the Commander-in-Chief Mediterranean Fleet should not accept Nato responsibility under an American Commander-in-Chief Allied Forces if it were offered. If Admiral Mountbatten became commander of allied naval forces, Southern Europe, Mr Churchill would be accepting with good grace the obvious fact—that Southern Europe wants an American at the top. The Americans' *quid pro quo* would be to admit that from time to time their ships might come, as part of allied forces, under a British officer—or rather under an international commander who is British. It has happened in Korea and it will happen in forthcoming manoeuvres.

Crops Across the Curtain

So far this summer Nature seems to be on the side of the West. While reports come in of a bumper crop in France and Italy, of good harvests in the United States and Canada, there are indications that conditions in the Soviet Union have been unfavourable. Because of a cold spring, sowing started late and had to be done rapidly. The first half of May was then dry over most of the country, and in central Russia there was a lack of moisture up to the end of June. Heavy rains in the Ukraine are now reported, but excessive rainfall has apparently damaged crops in parts of that republic.

The Soviet authorities say that improved techniques, deep sowing and quick gathering with the aid of combine-harvesters will make up for the bad weather; but it does not seem rash to assume that this year's yield will be not much greater than that of last year, when drought in Siberia and the Volga region reduced the crop. In 1951 grain

* Yetminster Farm Boundary Report. HMSO. 10s. 6d.

production (on a standing crop basis) was about 120 million tons, or over 4 million tons less than in the two previous years. By 1949, production had recovered from the great ravages of war, but since then the vagaries of Nature—among other factors—have prevented further expansion. Grain production has failed to reach the goal of 127 million tons set for 1950 in the Five-Year Plan; and it is still some 12 million tons short of the figure set for 1942 in the last prewar plan. Indeed, it is scarcely greater than the actual crops gathered in the years immediately before the war.

In the latest issue of *News*, the English-language magazine produced in Moscow, *The Economist* is taken to task for pointing out the striking fact that there is a vast gap between the great achievement of Soviet industry and the lag in its farm production. A certain Professor V. Kovda quotes figures to show that grain output is now about 60 per cent greater than before the revolution. True enough; but during those 35 years population has increased by about half, the output of coal rose tenfold, of steel sevenfold, of electricity fiftyfold. Can Mr Kovda really be a professor of economics?

Malan versus Parliament

There can seldom have been a more tragic farce in a land with a tradition of British democratic procedure than the first meeting this week of the Judicial Committee of the new South Africa High Court of Parliament. Set up by Dr Malan's Nationalist government in the session of the Union Parliament which is just over, this organ of the new "High Court" has been hearing the prime minister's application for a review of the unanimous verdict, given by the properly constituted Appeal Court, that the Separate Representation of Voters' Act is invalid. All independent observers outside the influence of South African politics maintain that if the Appeal Court rules the Act invalid, then it is invalid. It seems equally clear that the establishment of a High Court of Parliament by less than a two-thirds parliamentary majority is *ultra vires* and, therefore, also invalid.

Only the six Nationalist members of the ten-man committee took their seats. Even the government can hardly have expected the four members of the opposition whom it appointed to join in advising parliament to overrule their own support of the Appeal Court. Although this is at present still a constitutional fight, it is no mere battle of words. The opposition in South Africa feels that it is fighting for its own future existence.

The bitterness of the struggle over the coming months and its effect on other parts of Africa, raise the question of what can be done by those outside the Union who understand what is at stake. Dr Malan and his followers should be persistently reminded of how strongly his policies are resented and opposed in the rest of the world; but nothing but harm can come from outsiders claiming that there is a right to interfere officially. The protest organised in London last week, for instance, by the Union of Democratic Control and signed by 115 members of the British Parliament, was provocative and ill-advised. Dr Malan will use it to prove his thesis that the South African opposition is a tool of the British and to rally support for the government against outside interference.

Censorship for Comics?

The addiction of British schoolchildren to American-style "comics" is, in the opinion of Sir Hugh Lucas-Tooth, Parliamentary Under-Secretary at the Home Office, a matter to be dealt with by parents and not by official intervention. Answering a question in Parliament last week, he explained that any action by the Government would effectively amount to censorship, which would be "unacceptable" to public opinion in this country. The argument is a powerful one,

though it is hard to draw a firm logical line between a crudely printed series of "stills" and a moving picture, censorship of which is accepted virtually without cavil. Certainly few of these "comics," translated into terms of celluloid, would rate a "U" certificate; and a good many would undoubtedly qualify for an "H."

It is indeed just possible for a particularly alert, conscientious and persuasive parent effectively to follow Sir Hugh's naïvely confident advice to "discourage children from reading these magazines and direct their attention to more suitable reading matter." Most, however, give up the unequal struggle—leaving the occasional nonconformist to suffer all the odium attaching to priggishness and tyranny. How much harm is in fact done to the minds and morals of children by continuous exposure to this mephitic tripe is at present a matter of conjecture, though teachers, juvenile court magistrates and, incidentally, the governments of Canada, New Zealand and Sweden have their own ideas. Certainly there is a wide difference between the traditional British comics, which are merely trivial, and the juvenile No Orchids imported from, or modelled on, those sources of which America has the unenviable monopoly. The former, like their blameless counterparts in book form, resemble the cheap sweets and sherbets whose main drawback is that they kill the appetite for real food; the latter can better be compared to actively noxious drugs.

Or can they? There is scope for objective inquiry. Were it established that their effect is in fact serious, legal action should (again on the film analogy) be possible short of illiberality; it should not be beyond the ingenuity of legislators to provide that certain classes of illustrated literature, like tobacco, alcohol, and the privilege of seeing certain classes of film, should be saleable only to customers over a minimum age. Parents could then safely be left with the more manageable task of stopping leaks at their own discretion.

Webster's Dictionary

A Dictionary of the English Language, &c. By Noah Webster, LL.D. Revised and Enlarged by Chauncey A. Goderich. Office of the Illustrated London Library, Strand.

Though Noah Webster is very fiercely attacked by some English philologists, his dictionary, improved by the introduction of all kinds of modern words, scientific, technical, and popular, and abridged by the Professor at Yale college, is so much superior to Walker's, or any common pronouncing English dictionary, that this edition of it must be most acceptable to the English public. There is no permanent dictionary maker now amongst us (except some gentlemen who have compiled technical dictionaries, or dictionaries of particular subjects), and accordingly our general dictionaries, almost unimproved for more than half a century, remain much behind the wants of the age. It is probable that in this half century as many words have been added to the language as before existed in it; and though the greater part of these may not be common to all, there are no readers who do not occasionally get puzzled by an unknown or a hard word, of which they would like to have, but cannot get, the meaning explained. Than a good English dictionary, including all words now in use, we know of no book more generally wanted. As the present work, in addition to other improvements, contains a vocabulary of modern geographical names, with their pronunciation, and as it has served the American public, it is very likely to serve the English public, at least till our great publishers and lexicographers provide us a better.

Proud Inheritance

History has measured his genius with accuracy....

Of the private life of Henry Maudslay only a little is known, but of his engineering genius historians can tell us much—since his passion for accuracy and perfection of finish led him to introduce many developments in manufacturing technique which have since become common-places of precision engineering. The first slide-rest and the screw-cutting lathe were his inventions, as were the punching and shearing machines and the table type of steam engine; and in 1805 his constant search for accuracy led him to produce the earliest micrometer, nicknamed by him "the Lord Chancellor". Now preserved in the Science Museum, South Kensington, it was officially tested in 1918 and found to possess a quite extraordinary degree of

accuracy considering the date of its construction. Maudslay knew that without the machine real accuracy was impossible... but he also knew that fine machines were useless without fine craftsmanship. Were he alive today he would have thrilled to see the combination of both in the modern Maudslay plant in Warwickshire which bears his name: and the engineering precision and finish of the heavy commercial vehicles produced there would satisfy even his meticulous standards.

Which year's model?

EVER SINCE 1769 (when a certain French artilleryman fell out of a self-propelled three wheeler) the automobile industry has been planning ahead. What will it offer us in 1962? Gas-turbines seem a probable. Gas-discharge lighting? . . . regenerative braking? . . . stepless transmission? . . . When the next decade's new model rolls off the assembly line, TI technicians will share in the achievement. For then, as now, TI will be ready with many of the parts to make the whole, from the components of the axles and steering columns to the seats of today — or their unheard-of equivalents to come. Ready with the bicycle of 1962, which you might not recognise. Ready with the road signs, which you certainly will.

TI'S FIFTY-ONE FACTORIES SERVE THE WORLD*

Painted 1926— repainted 1951

The brick and stucco of the Chadacre Agricultural Institute were painted with white lead in 1926. For a quarter of a century it was not touched. Then, last winter, the accumulated dirt was washed off before repainting — and that was all that was needed to be done: the original paint had worn thin, of course, but the film was smooth and unbroken; it formed a perfect foundation for the three coats of white lead. Although we do not pretend that 25 years between paintings usually gives the most economical maintenance, this building is a very good example of what we mean when we say white lead paint lasts.

Letters to the Editor

Canada's New Horizons

Sir,—Your article in your issue of July 5th had a note of sadness that this country was not participating more in the Canadian boom. Yet there is one way in which it might gain, and that is by sending more of its young people to get their share of the engineering and other technical jobs that are going to be increasingly available. Largely with this in mind, the Canadian British Education Committee was founded in London to try to smooth the path for those boys and girls from this country who wished to enter Canadian life via a Canadian university. This is the best and surest way of preparing for a successful career in Canadian industry.

We have removed the currency and other obstacles thanks largely to the great understanding and sympathy of the British Government who 15 months ago granted us a quota of 100 students per year. These would be allowed to exchange sufficient pounds into Canadian dollars to pay for their Canadian expenses. The Canadian universities also agreed to keep sufficient places available in spite of overcrowding and in spite of the fact that a student pays only a minor portion of the cost of his education, the rest being met by Canadian provincial government aid or through university endowments. No restrictions were made by either side about the future residence of the students, they could either stay in Canada or return home. In either case they are almost certain to be a factor in improving the economic and other relations between Canada and this country.

Yet so far our results have been most disappointing. Last year only 22 students took advantage of the scheme and this year there will be about 26. I wonder if parents in this country realise Canada's wonderful opportunities.

More disappointing still has been my experience with a small bursary scheme. The president of one of the largest Canadian mining groups and I founded at our own expense what we termed "Self-Help" bursaries for 10 students in mining and geology. The first year we propose to give money and after that to guarantee the student summer work in a gold or base metal mine or a job with a field geological party. Not merely should he be able to clear at least \$500 towards his winter's university expenses but he will get practical experience and make valuable contacts which might result in a good position after graduation. We had, however, great difficulty in bringing this scheme to the notice of potential candidates. Perhaps the title "Self-Help" frightened them, although self-help is the basis of Canada's prosperity in which they are being offered a share.—Yours faithfully,

H. H. HEMMING

Coercing the Farmers

Sir,—May I, on behalf of this association, wholeheartedly support your concern that the threats to the traditional liberties of person and property implicit in our present agricultural policy should arouse so little anger? The Government's policy derives from a fundamentally false premise which is at the root of many of our economic problems today.

We have not yet succeeded in throwing off the memory of our wartime economy. In wartime we have to produce as much food as possible from our own soil, whatever it may cost, because it is physically impossible to get it from elsewhere. But when war is over we must, if we are to compete in world markets, grow as much food as it pays us to grow and not one ounce more. It is absurd to imagine that we can permanently compete with other industrial countries if their people have access to the cheapest food supplies while we have not.

Capital and labour are limited. If more of each is devoted to food growing, less is available for the production of other things, such as exports. Furthermore, the greater the amount of capital and labour that require to be applied to land in order to produce food, the dearer that food will be. Then everything else will be dearer than it need be because the cost of food is by far the greatest part of the cost of everything else. If our exports are dearer than they need be, we shall earn less foreign currency with which to buy food and raw materials from abroad. We shall then have to produce more at home, and the whole vicious but diminishing circle will start again. The truth of this paradox is that the more food we grow at home, the less we have to eat.

Many people are disturbed at the way farm land is being taken from farmers and used for other purposes. But hundreds of times more food is produced by the earnings of Lord Nuffield's factories than any farmer could grow out of the land he occupies. The speed at which the use of land has changed has been the measurement of the growth of our wealth and power, not of our decline. A far more insidious danger is the taking of farm land from one farmer in order to give it to another. That is the result of agricultural policies which are based on the fallacy that we have to produce as much food as possible at home. Under the Agriculture Act, 1947, the Minister has the arbitrary right, under Sections 84 and 85, for instance, to deprive a farmer or smallholder of his right to occupy his own land on the grounds that for one reason or another he is not, in the opinion of the Minister, making "full and efficient use of it for agriculture." The dispossessed man has no right of appeal to any court of law. Needless to say, the tendency is for the little men to be

dispossessed and for their land to be given to bigger men. It is for the purpose of protecting small farmers and smallholders against the arbitrary decisions of Ministers that this association has been formed.—Yours faithfully,

OLIVER SMEDLEY

Farmholders and Smallholders

Gains for the Dutch Labour Party

Sir,—Professor Duynstee of Nijmegen clarifies a few points about a group in the Dutch Catholic People's Party, led by himself. While grateful for the clarifications, one may, however, doubt a few of his points. Professor Duynstee says his group had "no political aspirations whatsoever." I presume he means to say no aspirations for office or parliamentary representation; the latter, however, is not strictly true, as one of his group got a seat in the first chamber, presumably not unconnected with the group's action. Whether this activity will not bring one of them a place in the cabinet remains to be seen. But political aspirations may mean influence, power in the general sense of the word, as well as "jobs for the boys." All the activity of Professor Duynstees group was intended to get more influence in the Catholic People's Party, and the negotiations he refers to were mainly about that point.

Professor Duynstee says he does not know what "integralist" means. I will not embarrass readers of *The Economist* with theological abstractions, but for those eager to know a glance at the dictionary will be sufficient.

It is entirely up to Professor Duynstee to give his business friends (or former business friends) other names than "reactionary," but it is evident from their demands, and from the violent reaction they inspired in the Catholic trade union leaders, which way their sympathies went.—Yours faithfully,

YOUR CORRESPONDENT

The Hague

Europe in a Hurry

Sir,—Those of us who publicly advocate support of federation in Europe are often met with opposition which seems grounded in emotion rather than objective reasoning. It is well to remember how the opponents of federation think, and perhaps I may take two examples. (1) It is alleged that the federal idea would not work and that the Continent should be discouraged from adopting it. This piece of gratuitous advice is contrary to the evidence of history, and it is hard to see how federation could be worse than the present system of international "co-operation" which has failed to prevent us spending 20 per cent of the first half of this century in world war.

(2) Seldom explicit, but often behind arguments against federation, whether including Britain or not, is the postwar "little Englander" defeatist isolationism, coupled with the fear that, keeping ourselves out of European "entanglements," we may find ourselves dwarfed not only by the United States but also by a united Western Europe. We are apt to talk of continentals as defeatists and of the Americans as isolationists, but we have our own share of both; it looks as if it is our own small-mindedness which led us to what appears to have been the official belief, namely that the Europeans would never accept the temporary sacrifices necessary to establish a federation and secure the long-term benefits springing from it. Incidentally, contrary to what you imply in your article in your issue of July 12th, a reduction in the parliamentary authority of the people will not be among these sacrifices; certain functions, at present nominally controlled through national parliaments but in reality in the hands of international committees whose democratic responsibility is hard to trace, will be transferred to a supra-national parliament—the people will lose nothing of their sovereignty, though the authority of the national governments will be curtailed.

Finally, let us be frank in admitting that the argument in the last resort against federation, that we must be free to do as we choose in the case of a conflict of interest with our international partners, exalts to the status of a national creed what is, in this interdependent

world, nothing better than piracy. Not until the pirates accept or are subject to law shall we be sure of peace.—Yours faithfully, MARTIN MADDAN

West Malling

On the Atlantic Community

Sir,—You infer that the terms of reference of existing organisations have prevented them, and still prevent them, from pursuing the objects of the Friends of Atlantic Union. But in fact Federal Union—within the limits of its finances—has advocated the development of the Atlantic-Commonwealth community since its inception in 1938. In 1951, and again this year, it passed resolutions stating that it would "welcome the formation of a federation embracing a federated Europe, the United States of America and those countries of the British Commonwealth willing and eligible to join." The resolution continued, "Such a federation so formed must be open to all nations to join as soon as they can conform to the requirements of the federation."

Secondly, you infer that Federal Union is among the voluntary bodies which have "objected" to the setting up of the Friends of Atlantic Union. Presumably this is a reference to our letter which appeared in *The Times* on July 17th. But in fact we welcomed the debut of the Friends of Atlantic Union; you misinterpret our letter.

The Friends of Atlantic Union have

a particular field of study, which we consider will be in the forefront of international affairs for some years to come. If, as we believe, they are to be an organisation concerned largely with research, then their efforts should receive every encouragement. But in the meantime there is, as witnessed by the letter of the United Nations Association to *The Times*, a real need for a meeting between members of that association's executive and of our own, of the Friends of Atlantic Union and the United Europe Movement, in order to secure a better understanding and sense of perspective in the relations of the four bodies. It was the idea of such a meeting that inspired our letter to *The Times* and not, as you would appear to suggest, a desire to "object" to the setting up of a new organisation.—Yours faithfully,

E. DOUGLAS ROBINSON

Federal Union, W.C.2

Cheaper Jute

Sir,—I think the concluding three words of your note of July 5, 1952, "an unhealthy surplus," are somewhat misleading. The surplus can be regarded as "unhealthy" only from the Pakistan Government's point of view, whilst for the world at large it can only be welcomed as a means of bringing about lower prices for this essential packing material, to the benefit of all concerned. Yours faithfully,

WILLIAM G. CLASEN

Atomic Aristocrats

The Traitors: The Double Life of Fuchs, Pontecorvo and Nunn May. By Alan Moorehead. Hamish Hamilton. 222 pages. 12s. 6d.

To understand everything about these unhappy men is not to pardon everything, even though Mr Moorehead seems at times to be pleading that it was the state of Europe in the thirties that led each of them into the sin of pride. On the contrary, as one comes to the end of this sordid and puzzling story of deceit and arrogance, it is the remarks of the British judges that stick in the memory. "I think you acted with degradation," said Mr Justice Oliver to Nunn May. "You betrayed the hospitality and protection given to you by the grossest treachery," said Lord Goddard to Fuchs. The young German Communist who arrived in a Quaker household in 1933, "white-faced, half-starved, with a bundle of dirty linen" was earning fifteen years later £1,800 a year as one of Harwell's most trusted physicists. A strange character in any age: mighty drinker, chain smoker, good mountaineer, "paragon of thoughtfulness," first-class chairman of a dull committee. When he boasts that he had achieved "a controlled schizophrenia," he is being very German and very modern. One feels he sometimes said

to himself, "I am crooked in a very interesting sort of way." Pontecorvo, on the other hand, seems to have been merely restless; it is not certain he was a spy.

This is a book of great interest because it gives the fullest available account of Fuchs—the only character of the three that really matters—and because it throws some light on the security problems created by refugees. When men like Fuchs came to England, Germany was the enemy and Russia the ally. In September, 1945, when Nunn May was returning to England with a line established to the Soviet Director of Intelligence, when Fuchs was handing over details of the bomb to the Russians, and when Pontecorvo was working at Chalk River—then the Russians were already the enemy. That fact, so reluctantly admitted in Downing Street, was first made perfectly clear by the Gouzenko disclosures in Canada.

For security to switch the emphasis was not easy; and on the evidence in this book they were very unlucky over Fuchs. Three years before he was

caught he was watched carefully for weeks; but they happened to be the weeks when he was "dormant." The eventual clue came from America and from the strain of the deceit on the deceiver. How Mr Skardon decontrolled the schizophrenia is a fascinating episode. By 1949 Fuchs had become a keen Harwellian. "Had there been Harwell colours and a school tie," writes Mr Moorehead, "Fuchs would have worn them."

The author does not sound too comfortable in his job of interpreting the minds of these atomic aristocrats. Sometimes he has an honest-to-God way of calling them rascals; sometimes psychology and the *Zeitgeist* play their part in some rather jejune judgments. The crack about the new ethics getting joined up with the new physics does not quite come off. The physics are new in the sense that they give enormous power to individuals in laboratories; but the ethics are not new, nor are the temptations facing the atomic physicist. There were during the war many hundreds of people who could have lost it by thinking it their duty to pass on official information. It will be a pity if discussion of this provocative book makes people lose sight of one simple fact: that those who

promise not to give away secrets and then do so are dishonourable. If the secrets are big enough the offence will be called treason; and it is right that Mr Moorehead should have called his book "The Traitors." There are those who would have called it "Victims of Hitler" or "They Lied for Humanity."

Slandorous Pinpricks

Ordeal by Slander. By Owen Lattimore. MacGibbon and Kee. 236 pages. 13s. 6d.

This book was written in a hurry by a bewildered and angry man, but it is none the worse for that. It is the account of what happened to Professor Owen Lattimore and his family during the few weeks between March 13, 1950—the day on which Senator McCarthy first called him a "pro-Communist" adviser to the State Department—and May 2nd of the same year, when the Senate Subcommittee under the chairmanship of Senator Tydings heard Mr Lattimore's last testimony and questioned him for the last time. And it concludes with two chapters in which the victim discusses his ordeal and tries to warn his fellow-countrymen that "it might be you." Had he known what was in store for him, he might have said "It might be me again."

Indeed, in view of what has happened to him since the book was written, Mr Lattimore would have been better advised to call it "Slandorous Pinpricks" and reserved the word "ordeal" for the next instalment of his persecution. In the last few months he has learned that even the State Department, to which he was supposed to be a "pro-Communist" adviser, is prepared to sacrifice him, and, on the flimsiest evidence, put his name on a list of people not allowed to leave the country. And he has also discovered that Senator McCarran is a far more subtle, experienced and dangerous—because more "respectable"—inquisitor than the barbarian McCarthy.

Nobody knows yet whether he will escape from his encounter with the McCarran Committee unscathed. It has recently recommended that the Department of Justice should submit to a grand jury the question of whether he "testified falsely . . . with reference to at least five separate matters." To anyone who has watched the manner in which this committee conducts its business, it is a tribute to any witness to admit that he has only been tricked into five errors, but it is also an unfortunate fact that nobody who is tried in the United States—and it is by no means certain that Mr Lattimore will ever come to trial—on any charge which suggests, however remotely, disloyalty can expect at this moment to have a fair trial.

Mr Lattimore was in Afghanistan on a mission for the United Nations when Senator McCarthy made his first accusation. And, as he took no notice of the cables he got about it, but went on with his work, he was also there a few days later when the charge was changed to "top espionage agent in this country."

His wife, therefore, had to bear the brunt of the early publicity alone, and she contributes one chapter to fill the gap in the story before her husband got back to the United States. In that chapter she puts her finger on one of the most curious aspects of the case. It is unlike Mr McCarthy to begin with a comparatively mild accusation if he is going to proceed to a more serious one. His technique calls for hitting with everything at once. So she admits that she never connected the advance publicity on the second charge—in which the Senator described his anonymous "top espionage agent" as the "former boss of Alger Hiss" in a spy ring in the State Department—with her husband, partly because the description did not fit him.

She was probably perfectly right not to do so. The best evidence is that Mr Lattimore was, in fact, a last minute substitute, which would account for his earlier mention in a minor role. The "former boss of Alger Hiss"—and that is something Mr Lattimore never was—was going to be an entirely new, and much more sensational, name. It has never been clear why the Senator switched victims at the last moment. It may have been because the China Lobby moved in to run his campaign at that moment and persuaded him to turn his guns on their favourite target.

This short book only tells the beginning of the story, but its account of the hearings before the Senate Committee, and of the discomfiture of the comic villain, Senator Hickenlooper, is excellent. At the end there is a suggestion that virtue is triumphant, but Mr Lattimore was not to know that his victorious spring campaign in 1950 was not the end but rather the first instalment of a serial—and a serial which has made many Americans wonder where their country is heading to. There is something ironical in the situation of a country which has fought to rid itself of the privileges of a king and finds itself saddled instead with the unlimited immunity of 531 princelings.

Artistic Empire

Duveen. By S. N. Behrman. Hamish Hamilton. 210 pages. 12s. 6d.

The basis of Joseph Duveen's imperial career as an art dealer was a simple one. He convinced American millionaires that the ideal "buy" for a man of wealth was a work of art. His favourite sales argument to a prospective client was: "Do you realise that the only thing you can spend a hundred thousand dollars on without incurring an obligation to spend a great deal more for its upkeep is a picture? Once you've bought it, it costs you only a few hundred dollars every 15 years for cleaning." Although they paid through the nose for their acquisitions, the millionaires were nevertheless persuaded that by accepting the Duveen doctrine, they were economising on the running costs of their possessions. The other allurements which Duveen spread before them was, of course, that each

great picture he sold represented a monopoly which a wealthy man could vaunt before his rivals. And, finally, since many of his customers were ageing men in poor health, Duveen gave them the reassuring hope that, through their great collections, their names would survive their deaths.

Whatever one may think of the morality of these motives, they have secured for America a high proportion of Europe's best pictures, and created such celebrated institutions as the National Gallery in Washington. How much Duveen really knew about pictures is doubtful, but he had the wisdom to enrol as his adviser, Bernard Berenson, the most authoritative and scrupulous of art experts. Thus fortified, so to speak, on his lines of communication, Duveen practised a wide variety of tactical manoeuvres on his clients. Sometimes he stormed them, sometimes he stalked them, but in the end he sold them the world's great pictures at unheard-of prices. Moreover, if a "Duveen" came back on the market he bought it (at a higher figure, if necessary) for the crux of his business was to maintain the fantastic commercial values he had created for the Old Masters.

The Duveen epoch is over, and the conditions for the further exploitation of its economic doctrine no longer exist. While it lasted it filled America with many of the world's best treasures, muddled up artistic with commercial values, and produced, in Duveen himself, one of the most vivid personalities of this century. Mr Behrman's ebullient biography of this legendary figure is also, although it was not intended as such, a social document of great significance.

Seed Without Fruit

Essai sur la Nature du Commerce en général. By Richard Cantillon. Institut National D'Etudes Demographiques. 192 pages. 750 frs. (950 frs. bound).

Richard Cantillon died in 1734 at the age of thirty-seven, victim of a burglar who, after murdering him in his bed, set his house on fire. Of his works, the by-product of a brilliant if somewhat scandalous career in the speculation-crazy Paris of John Law, there survived only the "*Essai sur la Nature du Commerce en général*," which remained unpublished for some thirty years and was at first only uncertainly attributed to its author. Overshadowed first by the Physiocrats and then by the British classics, it has roused ever since only an intermittent interest as a curiosity of the history of economics; it has left no descendants and no perceptible mark on the advance of economic science.

Reading it today in this beautifully edited and attractively produced volume, one is astonished at this lack of repercussions. For the "*Essai*" is unique. It is the work of a man who, accepting without question the political assumptions of mercantilism, of the permanent cold war between all nations, nevertheless fully recognises the power of purely economic forces, of the interaction of basic physical data and the self-interest

of individuals to override and nullify the efforts of politicians. His theory is, indeed, primitive; all is white and black; as one of his editors acutely remarks, one no more looks in the "*Essai*" for a recognition of the marginal principle than for perspective in a masterpiece of Giotto. His basic economic entity is an awkward intrinsic value made up of land-and-labour, which debar him from the heroic simplifications of the classics and imposes on his argument all the disadvantages of a sort of intellectual bimetalism. Like Quesnay, he is obsessed with the notion of economic circuits, with the tracing of particular flows of money and goods—a task which even the econometrists of today, with all the tools of modern statistics and method ready to hand, are only beginning to find practicable. Occasionally, too, he commits actual and glaring faults of logic.

The "*Essai*" is, however, full of acute observation and of highly seminal ideas. There are passages, dealing with the relation between the balance of payments, the quantity of money, the volume of unemployment and the standard of living, which might be applied almost unchanged to the world of today; here, a lifelike theoretical description of the Australian crisis, there, a sage critique of cheap money policy as pursued by a Central Bank in collaboration with a Chancellor, elsewhere again an emphasis on the necessity—and difficulty—of deciding whether the state of the economy calls for more or for less effective purchasing power. Cantillon no more believed in the beneficence of the Hidden Hand than in the mutual benefits of international trade. He was an interventionist in principle. He did, however, realise what intervention was up against. But for the accident of his early death, he might, like Ricardo, have turned entirely from business to theory; he might have corresponded with and met Adam Smith; he might have influenced the whole development of classical economics and hence the intellectual climate to the nineteenth century. Or again, of course, he might not; but one cannot read the "*Essai*" without such vain but fascinating speculations.

Emigrants From India

Indians Overseas, 1838-1949. By C. Kondapi. Oxford University Press for the Indian Council of World Affairs. 558 pages. 35s.

This bulky work collects much information of value and interest to all concerned with the prosperity of the Commonwealth in the east. After an introduction sketching the history and nature of Indian emigration, Mr Kondapi considers in detail the conditions which have greeted the emigrants in the countries of reception. Chapters are devoted to educational facilities, labour legislation and welfare, and the peculiar problems of wartime. (Some may raise an eyebrow at the statements on page 178 about the Indian National Army.) Then follows the longest chapter (over 200 pages) significantly entitled "Disabilities." It reviews, occa-

sionally in rather tiresome and petulant language, the restrictions on entry and residence, the occupation of land, the right to trade and work, and social intercourse which face the Indian immigrant in varying degrees throughout the world, but particularly in Africa. It is a melancholy story, but the author preserves on the whole a detached viewpoint, though he clearly has great difficulty in understanding the reasons moving any community to hasty measures of self-protection when faced with an influx of cheap labour of a different race.

After chapters on the political status of Indians overseas and the machinery available for their protection, there are suggestions for the future. Although a menacing tone is noticeable in places ("The colour bar has today become an economic weapon in the hands of the whites and their governments") the recommendations are in general sane and practicable. Mixed marriages are approved because they are a unifying factor and prevent Indians becoming a separate entity in their new community.

Shorter Notices

Schumpeter: Social Scientist. Edited by Seymour Harris. Harvard University Press. (London: Geoffrey Cumberlege.) 124 pages. 25s.

Wesley Clair Mitchell, The Economic Scientist. Edited by A. F. Burns. National Bureau of Economic Research. 387 pages. \$4.00.

The predominantly transatlantic habit of inviting the colleagues and relations of eminent men, lately deceased, to contribute matter to a memorial volume is a pleasant one and, moreover, likely to make easier the task of future historians anxious to assess the quality and human background of another generation's leading minds. It does not, however, result in the production of books susceptible to the ordinary processes of reviewing. The critic is disarmed by the atmosphere of piety; the mere commentator is baffled by the multiplicity of authorship and the inevitable overlapping of "aspects" as tribute succeeds tribute; the fellow-disciple finds that someone has said it all already. Both the symposia under review fulfil the primary purpose of presenting their respective heroes in relation to the thought and the events of their day. That on Wesley Mitchell, biographically the more comprehensive, is of especial interest to those aware of the peculiarly uneasy tension subsisting, within the general discipline of economics, between the empirical and the deductive elements of thought; that on Schumpeter, briefer and from time to time refreshingly astringent, reminds the reader that this pioneer of dynamic analysis was not only a highly original thinker but second only to Keynes as a cause of original thought in others.

Mr President. By William Hillman. Hutchinson. 196 pages. 21s.

The English edition of President Truman's diaries and private papers, collected by Mr Hillman, has now been published. A review of the American edition, published by Messrs Farrar, Straus and Young, New York, appeared in our issue of April 5, 1952.

In Agricultural Disputes
or Heavy Duty Cooking

WAT TYLER was dead. The howling mob of revolting peasants were about to avenge their murdered leader by massacring the entire royal party.

Hearing a querulous serf enquire "Who will lead us now?" the 14-year-old Richard II leaped to their front and cried "I will be your leader," promising them the reforms they demanded.

Struck by the young monarch's brave demeanour, the peasants dispersed and went their ways in peace.

Just as indecision could have cost the king his life, so it can cost you a great deal of money. For instance, if you order Falkirk Cooking Equipment now, then you will get it now—and at the very reasonable current price. If you delay the opportunity may not wait.

VITAL FACTS ABOUT FALKIRK

Equipment for Gas, Electricity, Oil, Steam and Solid Fuel.

Really tough cast-iron construction—will last for years.

Efficient modern equipment means less work for small staffs.

No weak links, a complete and balanced range of equipment.

Specially designed installation and plans for each customer.

Price most competitive.

If you need new kitchen equipment, now is the time to buy.

AMERICAN SURVEY

Democratic Discipline

Chicago, July 23.

THE Democrats came to Chicago full of good intentions and determined not to make the same mistakes as the Republicans. They managed to avoid some of them but they also invented new ones of their own, and by the end of the third day of the Democratic convention there seemed to be more than a superficial resemblance between this week's proceedings and those at the Republican convention two weeks ago. There was certainly not much difference between the habits, behaviour and arguments of the disputed delegations from Texas and Mississippi in either party, or between those of either faction within each party, and it was soon clear in the bright northern light of Illinois that all Southerners, except perhaps Maverick Texans, whatever party label they wear, believe themselves eternally persecuted by the North.

The quarrels of this week have been worse organised and the cases of both sides less well presented than in the fight between the Taft and Eisenhower forces. Two weeks ago the struggle was between two wings for control of the party; this week it was an attempt on the part of an undoubted majority of the party to discipline, without losing, a small minority. The actual contest between the two factions in Texas and Mississippi was therefore only incidental; this was proved by the decision of the North to allow the States' Rights Democrats, or Dixiecrats, to be seated, although it could have refused to seat them had it wanted to do so. What was at stake was more important than the factional dispute this year. It was the question of party discipline in the future—or, since the word discipline is unpopular, what was called in Senator Blair Moody's resolution "the great American principle of majority rule."

Nobody has any objection to the Dixiecrats starting their own party if they want to. But there is considerable, and legitimate, objection to their calling their own candidate, whether he is one of their own backs as in 1948 or the official Republican candidate as is threatened this year, the "Democratic" candidate and not permitting the people of their states to have a chance to vote for the choice of the Democratic convention. It was only in those states where the Dixiecrat was on the ballot as the official Democratic candidate that he won four years ago and the Moody resolution is designed to stop this happening in future. And it is at the future that it is aimed more than at this year.

This resolution will become part of the permanent rules of Democratic National Conventions and when the southern delegations arrive in 1956 they will know that, before being allowed to take their seats, they must give an assurance that they will "exert every honourable means available . . . to provide that the nominees of this convention for President and Vice-President . . . appear on the election ballot under the heading, name or designation of the Democratic party." They have been permitted to sign this year with the proviso that they are not required to do anything which contravenes the laws of their state or the instructions of the party organisation in their state. But next time there will be no such proviso and then no southern state which is not prepared to put the official candidate of the national party on

the ballot as a Democrat will be allowed to come to the convention, to try to get its own candidate nominated and then betray the party by refusing to accept the decision of the majority.

Those Northerners who started the move for this resolution were not all, however, motivated by thoughts of the future or by the ideal of party unity. Some at least were hoping to drive the Southerners out of the convention, to make the Democratic party homogeneous and militantly liberal and, incidentally, to make it unnecessary for the convention to turn to Governor Adlai Stevenson of Illinois in order to keep the party together. Had Mr Stevenson not addressed the first session and displayed his quality before their strategy began to work, they might have succeeded. But Monday's speech from a reluctant candidate convinced so many in the North that they had a chance to bind the party instead of splitting it that the militant liberals could not muster enough votes to unseat the Texas and Mississippi delegations. They found themselves driven, probably with prodding by telephone from the White House in Washington, to try to find a compromise which would allow those who maintained they could not sign the assurance to do so.

★

In its present form the resolution has splintered the South and only three states have failed to give the assurance. Alabama, which put the Dixiecrats on the ballot in 1948, has since passed a law making it obligatory to put the official party candidates on it; Florida found it had such a law after one of its Senators had made a vigorous denunciation of the resolution, and Tennessee and North Carolina are no longer sufficiently affected by the southern neurosis to worry. Only Virginia, South Carolina and Louisiana refused to sign, and each has its reasons. That of South Carolina is the corrosive bitterness of Governor Byrnes against President Truman, and his evident desire to hurt the party at all costs, even if it means hurting Mr Stevenson, for whom Mr Byrnes had such admiration when he was with him in the State Department. In the case of Virginia, it is probable that Senator Byrd, the nominally Democratic owner of the state, is trying to find some good excuse for taking it overtly into the Republican ranks where he himself would feel at home.

The position would have been very different had either Mr Averell Harriman or Senator Kefauver appeared likely to win the nomination, and would change again should either do so. In that case the three lone southern states might well be joined by others and there is still no guarantee that even Mr Stevenson would be the official Democratic candidate in the states which have given this year's limited version of the assurance. But if, as began to be accepted even before he had finished his speech, Mr Stevenson is nominated and takes, as expected, a Southerner as the Vice-Presidential

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

candidate, the South would have everything to lose and nothing to gain by forcing a split this year. The Southerners will have four years to think over the future and decide whether the Democratic party is too hot—or too tactless—to hold them.

Tact has much to do with it. Franklin Roosevelt was never popular in the South, and even now the appearance of Mrs Roosevelt on the platform was greeted with southern silence, but he took good care not to go as far as the hot-heads of the North are now prepared to go and he never lost the southern states. Everything known about Mr Stevenson suggests that he would be at least as successful in keeping the party together, and possibly more successful in making the South think that someone loves it. But it may be too late to do anything about the two burrs under the saddle of the Democratic donkey except to let them go anywhere they please. There does not seem to be anywhere much for Governor Byrnes to go, but elephants have thicker hides than donkeys and, since Senator McCarthy causes the Republican elephant no discomfort, it could easily bear Senator Byrd.

Hoppy's Millions

[FROM AN AMERICAN CORRESPONDENT]

AMERICAN advertising and merchandising experts shake their heads in pity and wonderment at the failure of the late Prince Consort to capitalise on his name. Had he charged five per cent of the manufacturer's price for every Prince Albert coat—and better still, had he seen to it that there were also Prince Albert top hats, cravats, gaiters, waistcoats and walking sticks on which to levy an exaction—there is no telling what a tidy fortune might have been built up. Naturally, no one in the United States would miss an opportunity like that today. A good example of how a name is exploited and of what the rewards can be is the case of the western film star, Hopalong Cassidy. Thanks to television, he is a popular hero and therefore a merchandising sensation; his is a name to conjure with, and therefore to sell goods with.

Several million Americans between the ages of three and eleven glue themselves to the family television set once a week to watch Hopalong's inevitable triumph over evil. It follows that they constitute an eager market for about 150 different products used by that age group, ranging from such obvious cowboy accoutrements as boots, shirts, toy pistols and sombreros to such unlikely and un-ranch-like equipment as wallpaper, bicycle horns and bedspreads, all bearing the Hopalong Cassidy name and picture. About a hundred manufacturers are licensed to use the label, on payment of five per cent of the factory price of each item sold. The business amounts to \$20 million a year at wholesale, twice that much at retail, and thus brings the Hopalong Cassidy Enterprises about \$1 million a year.

The roots of this commercial triumph go back to 1935 when, after a successful career of heart-throbbing roles in silent films, an actor, Mr William Boyd, was beset by a run of bad luck. Penniless and jobless, he jumped at a chance to play in a series of western, or horse opera, films, even though he could stay on the back of a horse only with great difficulty. The central character of some 66 of these films produced in the following eight years was Hopalong Cassidy, portrayed by Mr Boyd as a figure of western sartorial elegance and as clean-living as the schoolmarm or rancher's daughter whom he saved from peril after peril.

After the war, with rare foresight and the expenditure of

nearly \$400,000, Mr Boyd bought up all of the old Hopalong pictures to use on television. When that medium came into its own, his films were an instant success. Youthful devotees of westerns found it much handier and less expensive to view one on a television set than to wheedle 25 cents out of their parents for admission to a neighbourhood cinema.

The popularity of the old films with a new audience was such that at one point last year they were being shown simultaneously in 62 of the 63 cities with television stations. This year they are telecast over 49 stations, and negotiations are under way for the filming of a new series, designed exclusively for television. If for any reason these fail, it will not matter; some Hoppy films have already been shown three or four times in the same city and, in Hollywood parlance, audience acceptance remained undiminished. This is not strange because, except for the personal appeal of the actors, one western film is almost indistinguishable from another.

Exposure to Hoppy produced mass adoration, from which it was only a small step to mass emulation. A sales organisation was set up and the boom was on. A measure of the efficacy of Hoppy's cachet in moving goods can be found in the experience of the Rollfast Company, makers of roller skates. It may be argued that a bare minimum of cow-punchers have traversed the Texas plains and the Montana Rockies on skates, but young admirers of Hoppy did not hesitate to buy Rollfast's product, particularly since it was embellished with jewelled ankle-straps and spurs. Rollfast's spring season in 1950 established a new record; an extra shift had to be employed to meet the demand. The company moved at once to make the Hopalong Cassidy bicycle equipped with built-in gun holsters on each side, the saddle trimmed with leather fringe and nailhead studs, and the handlebars shaped like steer horns.

Increases of from 25 to 2,000 per cent in sales were reported by retailers of children's clothing—hats, shirts, boots, trousers, socks, gloves, belts, underwear, pyjamas, cravats, and even cowgirl skirts. Some imitate the western styles; others are simply an ordinary product with a Hopalong Cassidy picture or emblem stamped, printed or embroidered on the cloth. As would have been expected, sales of shooting irons, spurs and pint-size ten-gallon hats boomed; it is more surprising that sales also soared for biscuits, ice cream, candy bars, soap, toothpaste, hair-ribbons and penny banks, provided they carried the Hoppy name. In the past year, the biggest innovation has been the licensing of dairy companies in 14 of the largest metropolitan markets, and two of the world's largest baking companies. The dairies, using the name and picture on milk cartons, report that business has increased from 15 to 20 per cent.

The latest catalogue of the Hopalong Cassidy Enterprises, listing all products using the name, shows such diverse and unexpected items as Hoppy ear muffs, rain sets (hat, coat and gun), bow ties, polo shirts, dressing gowns, bedside lamps, lunch pails, bathroom rugs, fountain pens, greeting cards, games of all varieties, colouring sets, television chairs (to sit in while viewing the Master), window shades, clothes hampers, linoleum, laundry bags, and the Hopalong Cassidy Bath Roundup which "contains a sculptured cake of Topper, Hoppy's famous horse, in pure castile soap, and two large cylinders of Hoppy's favourite bubble bath, pine scented (\$1 retail)."

To calculate Mr Boyd's gross income is difficult, but it is obvious that it runs into a large sum. Besides the estimated \$1 million a year from royalties on sales, he gets \$5,000 a

Shell Chemicals

Shell research has brought a new, improved technique to the laundry. The modern detergents are kind to all fabrics; their efficiency is unaffected by the hardness of water and they deposit no lime scum—a major cause of greying in white materials. Outstanding among these Shell products from petroleum is LENSEX—an all-classification detergent now being used on an ever-increasing

scale in many laundries. Its versatility ranges from the safe washing of delicate fabrics to powerful grease-removing action on mechanics' overalls. LENSEX is also playing an important part in laundry economics, because with all types of laundering—light, heavy, white, coloured—it gives a cleaner wash on less fuel and water, and in less time.

SHELL CHEMICALS LIMITED, Norman House, 105-109 Strand, London, W.C.2

week from a nationwide radio programme, \$1,000 weekly for each film televised in each large city, and an undisclosed amount from the sales of two million comic books every month and from comic strips running in 200 daily newspapers. Much of this, of course, is absorbed by expenses and by royalties paid to the writer of western novels who created the character of Hopalong many years ago. But even more of it goes for taxes, since no depreciation can be charged on the original assets. Mr Boyd's public relations office declares that, despite his large gross income, he has been unable, so far, to recoup his initial outlay of about \$400,000.

Lest British readers smugly believe that their own young are immune to the Hoppy craze and that such a thing could happen only in America, it should be noted that in recent months one-third of all Hoppy's fan mail has come from the United Kingdom, where "penetration" has been confined entirely to theatre showing of the films.

There is some ugly talk that Hoppy is slipping in the United States, giving way to rivals in the shape of Captain Video and other television pioneers of interplanetary travel. Takers of the merchandising pulse report growing sales of toddlers' anti-gravity suits, as well as space helmets for the under twelves. Even lay observers are struck by the fact that when children are seen moving forward in a half-crouch, their fists gripping either a facsimile or imaginary pistol, fewer and fewer say "Bang," and more and more say something resembling the sound which Paris hoardings aver is made by Perrier water. Hoppy's six-shooter, bubble-bathed and pine-scented though it may be, seems to be giving way to the Space Cadet's Atomic Disintegration Ray Gun. This is progress, and a new generation of merchant princes is racing to keep abreast of it.

American Notes

Soothing Defence Fears

The Department of Commerce and the Committee for Economic Development, a private organisation, are trying to repeat an earlier success with their joint study of the potential markets for America's expanded industrial output that will exist when defence spending begins to fall off. In 1943, at a time when fear of a postwar depression was general, they forecast a coming world-wide demand for American goods which, when the war ended, turned out to be even greater than they had predicted. They hope that this similar study will allay the similar fears that exist today. But, in his mid-year economic report, the President struck at different fears, those of the many people who contend that the defence effort, at home and abroad, is exhausting the economic strength of the United States. Mr Truman, prophesying that by 1960 the country's gross national product will be nearing \$440 billion a year, pointed out that it had risen by \$40 billion, at 1951 prices, during the past two years, while the increase in all national security expenditures during the same period had been only about \$30 billion. This meant that the country's standard of living had been maintained in spite of foreign aid and the defence programme.

Spending for that programme, now at an annual rate of over \$30 billion, should be running at about \$42 billion sometime next year. The latest quarterly report of the Acting Director of Defence Mobilisation, Mr Steelman, showed that, although some manufacturers were still behind schedule, deliveries on military contracts were at last rising fast, particularly in the most tardy category, that of "hard goods," the tanks, aircraft, electronic equipment and so on, which require a long tooling-up period before they can come off the assembly lines. Mr Steelman's report was largely devoted to soothing the fears of yet a third group of critics

of the defence programme, led by Mr Bernard Baruch, who argue that this year's "stretch-out," which has delayed the period of maximum deliveries until well into 1953, is endangering the safety of the United States. To this Mr Steelman gives the standard reply, that the delay means that

in the end the United States will have the best weapons and that this is preferable to having inferior ones more quickly. The final answer to this argument depends on the Russians.

Both Mr Steelman and the President emphasise two points: first, that their plans for security and prosperity are already threatened by the steel strike and will be completely disrupted if it is not settled quickly; and secondly, that in spite of the uneven state of the economy at present, soft in some spots, hard in others, there is a real risk of renewed inflation during the coming winter. And they insist that both dangers have been accentuated by Congress's refusal to give the President what he wants: authority to seize the steel plants was denied to him and his powers of controlling prices, rents, wages and credit have all been weakened.

Cartels on the Carpet

As has happened before, the heat of the summer and of the coming election has gone to the heads of Senators left behind in Washington to hunt for publicity that will commend their party to the voters; furthermore, Democrats never have any difficulty in finding reasons for attacks on monopoly and big business. But Senator Lyndon Johnson and his Preparedness Sub-committee have perhaps some excuse for patting themselves on the back for having saved the United States from the "gouging" of the tin cartel by encouraging their government to force down the price of tin. The committee's report at least puts a case for its assertion that the price of \$1.12 a pound, on which the negotiations with Bolivia stuck, was a fair one; however, its failure to publish the results of its special investigation into Malayan conditions suggests that they may have been less favourable to the committee's argument.

Senator Johnson, somewhat irresponsibly for a man who belongs to the Armed Services Committee, has always regarded it as outside his field to consider the implications for the foreign policy of the United States of his strictures on the tin cartel. But Senator Hennings, of Missouri, maintains that he is thinking chiefly of that foreign policy when he charges the world's seven leading oil firms—the five major American companies, the Royal Dutch-Shell group and the Anglo-Iranian Oil Company—with controlling the oil market, exploiting oil consumers and dominating American policy in the Middle East, Indonesia and Venezuela, by means of an oil cartel. Mr Hennings alleges that these firms are using their monopoly to fix prices and to make "excessive" profits by

overcharging not American consumers, who would be likely to "seek corrective government action" if they did, but America's allies, who do not like to criticise American firms when they depend on gifts of American dollars. Some weight has been given to Mr Hennings's accusations by the Mutual Security Agency's recent suspension of dollar grants for oil purchased from three American firms in the Middle East, on the ground that discriminatory prices had been charged.

Mr Hennings had to do without the help of the famous study made for the Federal Trade Commission, which is supposed to establish the existence of this international oil cartel, but which has never been published for reasons of national security. This report was, however, available to the Senate Small Business Committee led by Senator Long of Louisiana, a State where the independent oil companies, always ready to harass the large integrated ones, have much influence. Mr Long's committee is now holding hearings on the oil cartel and its effect on domestic oil supplies. Meanwhile the Department of Justice, needled by Mr Hennings, is also about to begin a civil anti-trust suit and to seek a criminal indictment from a grand jury against these seven oil companies. Mr McGranery, the new Attorney-General, is probably as anxious to divert attention from his lack of energy in clearing the Department of corruption as he is to present the Democrats with a good advertisement. The prosecution has been put in charge of Mr Leonard Emmerglick, who has been responsible for such gigantic and successful anti-trust cases as that against the Aluminum Company of America, and there is every prospect that these latest anti-trust proceedings may dwarf even those to which the oil industry has been subjected in the past.

Fair Trade Comes Back

Contrary to all expectations, and to the advice he received from most of the departments concerned, President Truman has changed his mind and signed the McGuire-Keogh Bill which replaces the teeth of the state fair trade laws knocked out over a year ago by the Supreme Court. "Fair trade" is the euphemism for resale price maintenance preferred by those who are trying to educate the public to regard price-cutting as an economic crime. Until the Supreme Court decision in the Schwegmann case last May, it was believed that a manufacturer who signed a price agreement with a single retailer in one of the 45 fair trade states could, under the Miller-Tydings Act, force all other retailers in the state to charge that price. It was these "non-signers" who were freed by the Court and whom the new Bill brings back into line.

Mr Truman approved it without enthusiasm. Perhaps he was impressed, in an election year, by the squadrons of indignant small businessmen who whipped up substantial Congressional majorities for the measure. The consumer, as usual, put his case less vividly. The President admitted that fair trade suppresses certain valuable elements of competition, but he felt that its restraints on cut-throat competition would be the salvation of many small businesses—and Mr Truman was once a small businessman himself. He suggested that Congress, at its leisure, might profitably review the whole vexed question of public price policy.

Legally, fair traders are almost back where they were last May, with one exception. In the opinion of the Fair Trade Council, the Bill does not really wipe out a lower court's decision, in the Wentling case, which permits mail order houses in one state to conduct raiding operations over the border. As a practical matter, fair trade may revive only slowly, especially in the appliance field. Manufacturers have to do the policing under the Act, and those with heavy inventories may respond cautiously to the demands of

orthodox retailers for protection against price-cutters, such as the discount houses, who at least can move substantial quantities of goods. Price-cutting has become almost a habit. In the past year brokers have sprung up who make a speciality of buying appliances from distressed retailers and reselling them at cut-rates. In New Jersey there has been so much of this that it is now a crime to remove the serial numbers from appliances and machinery, something which is done to make it impossible for the manufacturer to trace the leak. The mail-order houses are ready to push their own brands if the prices of others go up. It may be that fair trade only works when the economic sun shines and, though the retailers' clouds are lightening, they have not all rolled away.

Whisky Galore

The distilling industry fears it is about to drown in oceans of whisky, legitimate and bootleg, while taxes leave the ordinary customer with hardly a drop to drink. Last November the federal excise tax was raised to \$10.50 a gallon from \$9; with state levies, taxation takes about \$13 on a gallon which costs \$1.50 to produce. One result has been to lower the sales of legitimate whisky; pints are sold where fifths used to be even though prices have been cut, and hostesses are serving California sherry instead of rye. Another has been to encourage moonshine—untaxed whisky—to move out of the southern hills and invade the north, from which it was driven when Prohibition was repealed almost twenty years ago. Today's bootlegger is thoroughly up to date; he uses chlorophyll to disguise the aroma of his still. Sometimes he is a displaced person, a gambler run out of his normal occupation by the new federal tax on gambling.

The federal alcohol tax unit suspects the industry, and probably with some cause, of exaggerating the bootleg bogey when it estimates that illegal capacity is greater than that of the licensed distillers, and talks about "prohibition by taxation." But the unit itself, though it has less than 900 agents, seized stills last year with a capacity of 120 million gallons of alcohol a year. The total licensed production of whisky and neutral spirits was 302 million gallons in 1951, and this spring half the legitimate distillers in Kentucky—traditional centre of the industry—were idle.

What the industry would like, and it is said that bartenders are dispensing propaganda with their cocktails, is for the federal tax to be cut to \$6 a gallon, the level at which it stood in 1944. This, no doubt, is expecting too much, but the industry takes pleasure in pointing out that federal revenues, instead of increasing with last year's new tax, actually fell by \$126 million in the first six months it was in force. Last year the federal government drew \$2.5 billion from taxes on beer, liquor, and wines. The state governments, which depend on alcohol taxes for 5 per cent of their revenues, are also feeling the pinch and are likely to lobby for a reduction in the federal tax.

What adds mightily to the distillers' worries is the 768 million gallons of whisky in warehouses, a nine years' supply at the present rate of consumption. Production was increased after the war in Korea broke out, in the fear that the government might ban it, and in the hopes that people, deprived of other things to spend their money on, might buy more spirits. Both proved wrong. But the federal tax on stocks from 1946 and 1947 must be paid, at the end of eight years, whether they are sold or not. Representative Eberharter would put off this day of reckoning by granting the distillers four more years of grace. But on this the industry is sharply split. Those with heavy inventories support him, but those without suspect that his Bill represents a conspiracy to give strong companies the chance of offering the public twelve-year-old whiskies, when the usual age is only four to eight years.

Shareholders Profile

The decision of the New York Stock Exchange to stay open half an hour longer, until 3.30 p.m., five days a week, is the first fruit of the study of share ownership prepared by the Brookings Institution at the request of the exchange. Other exchanges had already extended their hours, in the hope of attracting more western business, for when it is 3 p.m. in New York it is only noon on the west coast. Those who believed the "Big Board" should follow suit found decisive ammunition in the study's report that the proportion of share-owning families to the whole population is higher in the far west than anywhere else, and that the largest number of share-owning families is concentrated in the twelve north-central states—often more loosely described as the middle west. Saturday closing will mean that the exchange will be open only half an hour longer each week, and in addition to recognising the westward movement of population and wealth, the change should make it easier to attract staff and save money.

The Brookings study provides the first comprehensive reliable information about shareholders and shareholding. After eliminating all duplication, it concludes that only 6,490,000 Americans own shares in public companies. This unquestionably is a shock and a challenge to those who believe that wide ownership of industry is the chief safeguard of the present economic system. Many others have an indirect interest through ownership of insurance or participation in pension schemes, but previous estimates of direct holders had run as high as 15 million. About one out of every sixteen adults owns one or more shares. There is some indication that the trend is upward; a quarter of the present number only became shareholders in the past three years. Share buying seems to be influenced much more by hopes than by fears of inflation. Only 1 per cent of the purchasers bought shares as a hedge against inflation; 28 per cent hoped for capital gains.

Out of the survey's accumulation of facts the profile of the average stockholder emerges. He is slightly more likely to be a man than a woman and, if a man, his holdings are larger, contrary to the belief that women, by living longer, are inheriting the earth. He is most probably between 50 and 60 years old; a home-owner; and a member of a small, rather than a large, family. The more education an individual has, the more likely he is to own shares. The table below shows the distribution of share ownership according to the income of the family to which the owner belongs:

Reported Combined Family Income a Year	Total Population		Individual Share Owners		
	Per cent	Number	Per cent of Group	Estimated Number	Per cent of Total
Less than \$2,000...	16.5	(000) 25,660	1.1	(000) 280	4.3
\$2,000—\$3,000...	15.7	24,460	1.4	350	5.4
\$3,000—\$4,000...	23.1	35,900	1.6	590	9.1
\$4,000—\$5,000...	17.6	27,370	3.0	830	12.8
\$5,000—\$10,000...	23.0	35,820	8.0	2,880	44.4
Over \$10,000.....	4.1	6,310	24.7	1,560	24.0
Total Individuals...	100.0	155,520	4.2	6,490	100.0

The fact that 76 per cent of all shareholders fall in the group with incomes of under \$10,000 a year has been widely welcomed in some quarters as a proof of economic democracy. It would have been even more illuminating if the survey had been able to estimate the value of shares held by each income group—but this, apparently, was more than it was felt the long-suffering sample should be asked to submit to.

The survey unquestionably will provide much useful guidance, both to those whose business is dealing in securities and to the organisations interested in creating a wider com-

munity stake in industry. Manufacturing companies, for example, may note with some dismay how far they fall behind the public utilities and oil companies in securing employee ownership of their shares. Further studies at regular intervals, either under private auspices or those of the government, would make the present survey even more valuable than it is, by indicating the trends in share ownership.

Entertainment by Americans Only

The exception that proves the rule that there are more people at work in the United States than ever before can be found in the entertainment industry. Mr Petrillo estimates that only 5 per cent of the members of his American Federation of Musicians are adequately employed, Broadway has had another of the poor theatrical seasons that are becoming a habit and in Hollywood the film skies are as dark as ever. As a result there has been an outburst of attempts to restrict employment in entertainment to Americans only.

Mr Petrillo began it, as he has many other make-work expedients, by notifying conductors and musical performers some months ago that, if they made gramophone records abroad with foreign orchestras, they would risk losing their membership in his union, which would mean that they could not play with any important American orchestra. Both Mr Artie Shaw and Mr Andre Kostelanetz changed their plans for recording in London as a result, but Mr Artur Rodzinski was apparently forgiven for ignoring the ban in Vienna, when he confessed that the record in question had been a failure. Mr Petrillo has now followed up this initial effort by warning gramophone companies that they are breaking their contracts with his union if they record abroad.

Mr Petrillo's moves must be intended chiefly to show his members how active he is on their behalf, for he can hardly expect to get much more recording-work for them by this nationalistic approach. Only a high tariff could prevent the importation of records as long as Americans continue to want to hear foreign orchestras. And the reason why American companies have been making records abroad is that the wages of foreign musicians are lower than those that Mr Petrillo insists on in the United States—although they are not high even there—and so it costs less to record abroad. If Mr Petrillo prevents these records from being made in Europe, few of them will be made at all.

In Hollywood, too, trade unionists have been protesting against the growing tendency to make films abroad, both for cinema and television showing, simply because it is cheaper; the union is, however, prepared to accept the practice where it is for the purpose of using frozen dollars or of finding authentic scenery. And in New York the Actors' Equity Association, partly in order to bring pressure on British Equity to permit the employment of more young Americans on the London stage, has decreed that no alien may be engaged at a salary of less than \$500 a week and that 60 per cent of the cast of each company must be resident in the United States. The first casualty under this rule is likely to be the London production of "The Trial of Mr Pickwick," for which an all-British cast is said to be essential; even once-British actors now resident and naturalised in the United States are not considered to be adequate substitutes.

Shorter Note

The Civil Aeronautics Board has extended for seven years the permits already held by Pan American Airways and Trans World Airlines to operate passenger flights across the Atlantic. These are now the only two American airlines serving these routes, and the board's ruling confirms that it wishes to encourage competition on them, rather than to pick one "chosen instrument" to represent the United States on transatlantic flights.

WHEN THE HOOK catches in the line, a fisherman is annoyed. But there is one kind of fishing where it is an accomplishment. It is the highly specialised art of bringing up a cable from the depths of the sea practised regularly by the crews of the cable ships belonging to Cable & Wireless Ltd. They fish with a grapnel.

Delicate instruments have brought the ship over the cable. The grapnel swings at the end of a hawser. Its four foot length sinks down to the ocean bed, maybe to 3,000 fathoms—about 3½ miles—where the pressure is 3½ tons per square inch. The grapnel must be guided until it catches the cable, sometimes a tedious business. Hauling in is tricky and often dangerous when a cable

is badly entangled and the weather is rough. The ships, for all their elegant appearance, are floating factories, manned by experienced resourceful technicians ready to effect a repair of 50 feet or put in a 100 mile extension.

There are 155,000 nautical miles of cable in the great submarine network of Cable & Wireless Ltd. Despite ever rising world costs of material and labour constant maintenance keeps the traffic load moving quickly and securely. The Company has eight cable ships patrolling the world's waters—they are a vital part of this vast integration of cable and wireless communication, which serves the whole Commonwealth, earns money for Britain in foreign countries and is truly part of Britain's business.

ELECTRA HOUSE, VICTORIA EMBANKMENT, LONDON, W.C.2

THE WORLD OVERSEAS

The Events in Egypt

THERE have been rumblings of discontent in the officer corps of the Egyptian army ever since last December when King Farouk tried and failed to get a nominee of his own elected as president of the Officers Club in Cairo. Some observers were, therefore, surprised when the army turned out to quell the riots of Black Saturday, January 26th. The double explanation of the role it played on that evening is that tradition is strong and that the officer corps is not subversive of law and order, whereas the rioters were. Yet the discontent of the officer class continued to prevail and came to a head, as will be seen, during the recent three-week premiership of Sirry Pasha.

Nevertheless, no one foresaw the whirlwind onset of the events of the past week. The weather is hot. The palace and the pashas have left Cairo either for the summer seat of government at Alexandria, or for holidays abroad. The two Wafdists who were likely to be the chief workers for change—Nahas Pasha and Serag-ed-Din Pasha—were both on board ships *en route* for European spas. Everyone calculated that Sirry, whose honesty is widely recognised though the process by which he came to power is deplored, had at least the summer months in which to start trying to straighten the country's disordered economy.

Then it became known that he was having difficulty in filling one unenviable post—the ministry of finance. The Palace had a nominee from its own ranks, but one unwelcome to Sirry. The rumours of army discontent had at the same time been substantiated. At a meeting of the Officers Club, General Neguib Mohammed, who has been its president since the December affair, freely voiced the club's feelings on the way in which Egypt was being run. By royal order, the club was thereupon closed. Sirry, who well saw the dangers of army antagonism at such a juncture, tried to meet the situation by proposing General Neguib Mohammed as his Minister for War. The King refused a candidate so antipathetic to him personally, and proposed a counter-nominee whom Sirry knew would be *persona non grata* with most army officers. Rather than accept either of the palace candidates for two key portfolios, Sirry resigned.

Hilaly Returns—For 24 Hours

Hilaly's cabinet had been popular with the officer class because it was thought to be bent on carrying through a purge under the recent "Origin of Fortunes" law, which is designed to root out the corrupt practices and illegal gains of the last ten years. Influenced, it seems, by the common-sense of his then Chief of the Royal Cabinet, Hafez Afifi Pasha, the King realised the importance of heeding army unrest, and recalled Hilaly. Hilaly therefore resumed office last Tuesday; he must have been able to set some conditions for return to a job out of which he had been jostled in the unsavoury circumstances described in *The Economist* of July 12th, for he put back into office the two brooms whose resolute sweeping had made certain Egyptians in high places feel uncomfortable—Ahmed Mortada el Maraghy Pasha at the Ministry of the Interior and Zaki Abdel Motaal Bey at the Ministry of Finance.

The one significant change in the new Hilaly cabinet may have helped to cause its demise within twenty-four hours of its birth. By appointing Ismail Cherin Bey as Minister for War he was in fact supporting King Farouk in an effort to show the army who was master; this young man, though

respected, is entirely without experience of office and is the King's brother-in-law.

During last Tuesday night General Neguib Mohammed read the signs of the times. He was an object of royal disfavour, and banishment to some desert outpost was likely to be his fate. He therefore acted swiftly upon a plan that must have been held ready, for it ran on oiled wheels. By dawn the army was in control of key points in Cairo including its radio station, though it made no attempt to take over the civil administration. The General thereupon sent his ultimatum to the Palace at Alexandria. He must be made commander-in-chief and the ranks above him must be purged; King Farouk concurred.

The basic reasons for army disaffection cannot be fully understood without going back to the story of the Palestine war. In that campaign many Egyptian units at the front fought well, but did so in adverse circumstances, for their supply position was most inadequate. They were sabotaged from the rear by an old guard that, either through inefficiency or graft, or both, sent them old and faulty ammunition out of which fortunes had been made *en route*, and never despatched across the Canal the comforts for which funds were being collected in Cairo. A public inquiry made since that date has revealed a degree of callousness and corruption at the top that has shocked all honest men. General Neguib, commander of a division and wounded three times in the Palestine campaign, has never made any secret of the fact that this is his view, and he is the symbol of army resentment at what happened. Hence his statement in his proclamation that "people who received bribes contributed to our defeat during the Palestine war." (The word defeat in connection with that war has never so far been publicly pronounced in Egypt.) Hence the purpose of his *coup* which was, according to the same proclamation, to put an end to "a period of gross corruption and government instability."

Cleaning up the Top Brass

Since General Neguib's aim to clean up corruption inside the army was so much akin to that of Hilaly Pasha in politics, it could be well imagined that they would work in harness. Maraghy Pasha, the Minister of the Interior, on Wednesday morning travelled by air from a cabinet meeting in Alexandria to confer with the new master of Cairo, and was said to have fallen in with all the latter's demands. But General Neguib would not parley and by Wednesday afternoon the Hilaly cabinet had resigned. Maybe its relations with General Neguib broke on the question of its appointment of the royal nominee as minister for war. But it is more likely that General Neguib was already in collaboration with a different and equally honest potentiality for the premiership, Aly Maher Pasha.

Whatever the reason for the change, Aly Maher is, as *The Economist* goes to press, trying to form a cabinet. It will be remembered that he was the patriot who, after the riots of January 26th, had the honesty and moral courage to take over the management of the country. If the palace is still going to count now that it has had to cede points to a disaffected officer corps, it is worth noting that Aly Maher has, for family reasons, more influence with the King than has Hilaly. His first efforts were said to be directed towards forming a cabinet that includes the Moslem Brotherhood, which in a somewhat unconstructive way, also stands for a fight against corruption.

No Truce on the Radio Front

Six months ago British broadcasting across the Iron Curtain seemed to be on the verge of a repulse that might develop into a rout. On the one hand, the Soviet Union had just extended its jamming operations to blanket not only BBC programmes in Russian but also those in Polish and Finnish; on the other, the BBC, already outstripped in scale both by Soviet and by American broadcasting to Europe, faced rigorous cuts in its output owing to the limits imposed on its grant-in-aid from the Treasury. To the prospect of further Soviet jamming was added that of growing competition among other broadcasters for positions on the crowded short-wave bands.

Most of these fears proved justified. Since the beginning of the year, Communist jamming stations have gone into action against first one and then another of the BBC's transmissions to eastern Europe. Jammers, deployed not so much in batteries as in whole field regiments, have opened up against broadcasts in Czech, Slovak, Hungarian, Rumanian, Bulgarian and even Albanian. Eastern Germany is now the only part of the Soviet half of Europe that can listen without interruption to BBC programmes; and there the Communists appear to be adopting the technique of drowning-out rather than jamming, for they have brought into play a newly completed and exceptionally powerful transmitter at Koepenick, near Berlin, and have stepped up the power of three other East German stations.

Yet the threatened rout has not taken place. With a touch of drama, the Government announced in the nick of time that the extra costs involved in countering the jammers would be borne on a separate account. Without this concession, the BBC would have had to amputate its programmes even more drastically than rising costs had already forced it to do. With it, the Corporation has been able to maintain most of its services to the free world and to bring additional transmitters into play to get jammed programmes through. As in the case of broadcasts in Russian, there is evidence that listeners in what have been christened the "new jamocracies" are still able to hear London if they have good sets and the patience to search the wavebands.

Rush Hours on the Air

The front is being held; but the reserves behind it are now very small. British broadcasters are looking ahead anxiously to the coming winter, when the seven-year sunspot cycle will produce a peak of interference. In purely technical terms, broadcasts from London could, of course, be pushed through to eastern Europe more strongly if large groups of transmitters were concentrated on them at midday hours when the transmitters are not otherwise employed. But as few people in Communist countries are able to listen during working hours, it is questionable whether a concentrated effort at such times is as effective as even a weak output at dawn or in the evening.

Short-wave broadcasting in evening hours is, however, increasingly subject only to the law of the jungle. The number of rival transmissions is still multiplying, and in the continued absence of any international agreement covering this field the BBC has to contend not only with Communist but with new American and other western stations. Its long-established frequencies are being "cuddled" more and more tightly as the official Voice of America, the independent Radio Free Europe, and the networks of continental countries increase their activities. If a frequency is abandoned even for a short time it is automatically occupied by a hungry rival; and if a powerful station chooses to take up a position at the very elbow of a more modest one, the latter is practically off the air from then on. The prospects

of a general international agreement to relieve this pressure are clearly remote. But there seems no reason why the western governments, which are already acting together on many sectors of the radio front, should not agree among themselves finally to end this internecine strife. It might well be a suitable question for Britain's permanent representative in Nato to take up with his colleagues.

Eddies Round Dr Adenauer

It now appears that October will be the earliest month for the second and third readings of the European defence treaty and the Bonn conventions in the *Bundestag*. The Constitutional Court is not likely to give its verdict before then on the all-important issue that will decide whether Dr Adenauer must secure a two-thirds majority in the Lower House for the EDC treaty. The Chancellor has not much backing for his efforts to push the treaties through quickly. The nearer the moment comes for taking this crucial step the more nervous the Germans become. Many would like the French Assembly to lead the way and others suggest that the American President should be elected before the *Bundestag* takes the final vote.

Reports from Paris stressing French determination to keep the economic wealth of the Saar, and from Berlin on steps to set up an East German army, have encouraged the search for an alternative to present plans for defence. Both Dr. Adenauer and Herr Ulbricht, it has been noted, are declaring that their armed forces have to be built up in order to make the other side ready to talk on German unity. Where is this to end? Are Germans to be moved against each other as pawns in a deadly game between America and Russia? Since the signing of the new conventions that are to end the occupation regime Germans feel renewed national self-confidence. It is time, they say, that Germany produced a foreign policy of its own. There are few who feel that Germans are prone to show disastrous incompetence in this field. The general view is that the present international trouble is due to President Roosevelt's deals with Stalin at Yalta. History for the Germans begins in 1944. And in 1952, as one leading politician said the other day, Germany is an equal partner of the western powers, and must use its rights to make them "think German."

Alternatives to European Army

Some of the various alternatives to the European army that are being discussed might be described as "neutralism plus" or "rearmament minus." They are based on the axiom that Germany must not be involved in a war which would inevitably destroy it. Dr W. W. Schuetz, a very intelligent and ardent champion of German unity, has written a book* in which he warns Americans that their new German allies have no confidence in US strategy, and that, in turn, a dangerous lack of confidence in the Germans will arise in America if the alliance has only a weak backing in the Federal Republic. Germans must be convinced that they will achieve unity and that America means to press Russia back without war. In a closely reasoned argument Dr Schuetz proposes that Germany should rearm in the framework of the European army, but that the number of its divisions should be strictly limited, and that American forces should retire to the Rhine. The Soviet Union, in other words, should not be threatened with an ultimatum arising out of actual strength, but only with the potential that the West could develop if Stalin chose to challenge it.

Dr Schuetz is connected with the Christian-Democrat Minister of All-German Affairs, Herr Jakob Kaiser. Another politician, this time from the ranks of the Free Democratic

* *Deutschland Am Rande Zweier Welten*. Europa Verlag.

party, Herr Pfeleiderer, has found some support for a proposal that the non-German forces should retire to the corners of the country, leaving a German government in command of the rest. This has been criticised as a plan for dividing Germany into four instead of three. The "Austrian solution" has also been tentatively put forward, but has been generally condemned. And there always remain the Social-Democrats, implacably opposed to the EDC, and the new conventions. If they are, nevertheless, ratified, Dr Schumacher's party will demand revision.

One or two popular writers have recently openly expressed a thought that is in the minds of many—that the European army must develop into a German-American alliance, in which France would willingly accept Germany's role as defender of Western Europe. Major (Retd.) Adalbert Weinstein, who is in touch with professional military opinion, suggests in the *Frankfurter Allgemeine Zeitung* that, as the psychological basis for a European army is evidently lacking in France, a possible alternative to the EDC might well be the "integration" of West German and American armies. These are straws in the wind. Many German military men believe that America will eventually find that it is cheaper and more efficient to rearm Germany direct than through an international bureaucracy. Their ideas, it may be said, are regarded with horror by the same German circles who found the Nazi regime repugnant.

Dr Adenauer's increasingly difficult coalition partners, the Free Democrats, are trying to become the party of the army. In the north this party tends very much to the right. It championed the generals' demand that the so-called war criminals, notably Field-Marshal Kesselring and Manstein, shall be released. This demand is insistently made, usually on the understanding that the men shall not be freed as an act of mercy—many of them are already being released after much reduced terms of imprisonment—but as atonement by the Allies for a miscarriage of justice. The FDP Congress has declared that the solution found in the Bonn Treaty is not satisfactory; the present "intolerable situation" must be ended by an amnesty. The Germans, they say, have shown their magnanimity for the sake of Europe, by their readiness to forget their resentment, provided the Allies do belated justice to honourable soldiers.

The Nazis Come Back

The Free Democrat Congress has also demanded that any discrimination imposed by de-nazification tribunals against former Nazis must be rescinded. This is part of a campaign to win the votes of those former Nazis who have accepted democracy as "fate." It is backed by other, more extreme right-wing parties, and by the professional military men, who feel bound to champion the *Waffen SS*. The trend towards rehabilitation of the Nazis is strong. Former Nazi party officials are rapidly coming back to jobs in business and local administrations. The popular illustrated weeklies, which have very large circulations, abound in articles chosen to foster nationalism, anti-Semitism and anti-Americanism. Dr Adenauer has his following, but its voice is drowned.

The Chancellor has also been steering a hard course between the employers and trade unions on the question of joint direction of private and public enterprises. Last week, he met with the first large-scale and successful revolt among his coalition partners on this issue. The works constitution bill was passed, although the Chancellor had pressed for it to be postponed while the trade unions' objections were further examined. It is very much to the credit of the trade union federation's leader, Herr Fette, that instead of resuming strikes against the law he has announced that he will fight it in the next elections. Communist hopes have thus been frustrated and parliamentary democracy has been saved. The outcome of this crisis gives grounds for confidence in the strength of the best elements in Germany.

Change in Australia's Tax System

[FROM OUR MELBOURNE CORRESPONDENT]

THE decision of the Commonwealth Government to return to the six States their former taxing powers is more than a political gesture. It is a decision which when translated into action will alter profoundly the financial and the political relationship between the Federal and State Governments. No other single act in the history of Australian federalism has done more to strengthen and consolidate the centralisation of power in Canberra than the adoption of uniform income taxation in 1942. Its abandonment must similarly cause just as profound a change, but it will not mean a plain reversion to the state of affairs which obtained previously.

Since federation in 1901, there has been a gradual increase in the powers and authority of the central government. This process was inevitably accelerated during time of war, when the Commonwealth was responsible for the defence of the nation. The adoption of uniform income tax in 1942 was necessary to enable war finance to be obtained in the most efficient manner possible. It was never intended that it should be a permanent arrangement. It was a High Court decision which established that the Federal Government possessed priority of income taxation not only in war, but also in peace, and the Chifley Labour Government continued uniform income tax into the peace.

Federal Stranglehold

In theory, a uniform tax possessed all the virtues. It simplified administration and at a stroke eliminated the necessity for a multiplicity of returns from taxpayers residing in and deriving income from different States. With two separate taxing authorities in the field, the lot of the taxpayer was unenviable. But the implications of uniform tax go much further than the mere simplification of tax administration. With the Federal Government possessing absolute priority in the field, it naturally became tax master, and as tax master it was in a position to exercise a strangle-neck control over the States, if it wished. For under uniform tax, the States are dependent upon Canberra for the bulk of their revenue by a reimbursement of taxes collected by it.

In essence, the States, since 1942, have spent large sums of revenue without having the responsibility of raising it. Every year Canberra witnesses the unedifying spectacle of the six State Premiers importuning, pleading and cajoling with the Prime Minister for more and more money for their States. When they are refused further instalments of money they are able to make political capital of the fact that progress and development is being stifled through the parsimony of the wealthy and autocratic Commonwealth.

After the July meeting of the Loan Council, five of the six State Premiers left Canberra bitterly disgruntled about the refusal of the Commonwealth to meet their demands for more money to balance their budgets and carry on essential public works. They wanted increased tax reimbursements and they wanted the Commonwealth to increase the amount it was prepared to underwrite for works programmes. The South Australian Premier (Mr Playford), who leads a Liberal-Country Party administration, accused Mr Menzies of being "guilty of sharp practice to help only some States." The acrimony which is so much part and parcel of Australian political life was here prominently displayed.

It is therefore not surprising that the present financial relations between the Federal Government and the States have reached breaking point. For the last ten years the States have always regarded the Federal Government as an authority upon which they could fall back for funds. Now,

Some of us will be breathing a sigh of relief now that to its close draws High Summer. What a month it has been for all of us. Dutiful at Lord's, wise at the Horse Show, and surprised, once again, in the Stewards' Enclosure, at the mad rush of Henley, belying the leafy peacefulness of the River—Death in the Afternoon! One longs now, to relax in the friendlier, impromptu atmosphere of Goodwood and breathe the air, fresher of the sea, at Cowes. Yet how English it all is, how English we all are.

Deb's Diary

I arrived bright and early at the opening of the Schweppereilli show. Among men—yes, men—present, were my friend Jock "Bingle" Bog-Boggs, and Tony Schwepp-Schweppingham, with whom I chatted.

the decision to throw the right of taxation back to the individual States means that there will at least be some relation between spending and the taxable capacity of the people most directly affected. States will no longer have the right to go cap in hand to Canberra to plead for funds to maintain their current services. This will be a responsibility of the individual State Governments, which will presumably have to trim their coats according to the available cloth. For their funds for development works, the States will continue to use the mechanism of the Loan Council, an authority consisting of Federal and State Treasurers designed to regulate the amount of public borrowing both in Australia and abroad. In the current financial year, which began on July 1st, the Commonwealth Government has undertaken to underwrite the cost of public works in the States by £180 million, which is considerably less than the £247.5 million put forward by the States as their minimum requirements. As the amount raised by public borrowings is not, on the most optimistic estimates, expected to exceed £50 million, it is clear that the Commonwealth is committed to find £125 million either from revenue or from expansion of credit. In the year just ended, the Commonwealth found £160 million for State works, of which £45 million was found by the issue of Treasury Bills.

The abandonment of uniform taxation will not automatically be followed by a magical betterment of Federal-State relations. And in the case of some States—Queensland and New South Wales for example—there could well be a sharp increase in total taxation on the basis of current spending. Victoria, which was the lowest-taxed State before 1942, and which accordingly suffered by the formula for reimbursement, is likely to benefit.

It will not be as simple to return the taxing powers to the States as it was to put uniform taxing into operation. That is well realised by the Commonwealth and States Governments which have appointed a committee of Treasury experts to report on the implications of making so fundamental a change in the financial and political structure of Australia. It is easy to say that financial responsibility must be returned to State Governments, but whatever happens, the Commonwealth, still with priority of income tax and enjoying customs, excise and sales tax revenue, must still dominate the financial scene of the Commonwealth.

Maturing Mexico

[FROM A CORRESPONDENT IN MEXICO CITY]

THE surprising thing about Mexico's presidential election on July 6th was neither the result nor the sporadic rioting that broke out the next day, but rather the utter calm and orderliness of the voting itself. Mexicans are used to shutting themselves up and keeping the children safely indoors on election day, leaving the streets to the rashly adventure-some and the determinedly partisan. To everyone's amazement, over 4 million of the country's 5 million voters (bachelors over 21 and married men over 18) queued docilely for hours outside the polls, submitted good-naturedly to repeated searches for weapons, marked their ballots and went quietly home. It was a landmark in Mexican politics.

To be sure, all but one of the four opposition candidates immediately shouted "fraud," finding it no more necessary to await official returns, still trickling in, to realise their defeat than did the ruling party's candidate, Señor Adolfo Ruiz Cortines, need formal assurance of his victory. In fact, after a few days of counting votes, representatives of the opposition parties gave up in boredom and left only the representatives of the governing *Partido Revolucionario Institucional* (PRI) to watch the final tabulation. Mexicans, by long experience, have developed a deep cynicism about election results so that in the end no one ever feels quite certain about what really happened, but there is every reason

to believe that Señor Ruiz Cortines actually obtained a substantial majority.

Furthermore, it became fully evident in the days just after the election that Mexico has passed the period where voting is simply an excuse or a signal for rebellion. No one would commit the folly of supposing that this outward digestion of the democratic forms means that the country has reached the stage where an opposition candidate might come to power through the polls. Rather, it marks the beginning of the transition to an epoch marked by stability, formality, and a slow broadening of the base of government.

President Miguel Alemán's government took immense precautions, yet the efforts of General Miguel Henríquez Guzmán, the foremost opposition candidate, to launch an uprising clearly owed their failure far more to lack of popular support than to any administrative repression. Even the Communist party publicly dropped its friend Señor Lombardo Toledano when it realised what a bad showing he had made, and offered in thinly veiled terms to back any Henríquez bid for power through revolt. The reaction was nil. In private talk, Mexicans of all classes kept repeating, "We'd like a change of government, but fighting for it has gone out of fashion. Better the imposition (as the administration's candidates are widely called) than a revolution."

Voters Wake Up

It is not only weariness of violence that has brought about this feeling, but also the fact that Mexico has entered a period of moderation and consolidation. The change most Mexicans yearn for is no longer a basic change of politics but an improvement in the standards of government and, primarily, an absolute, undeniable proof that the electorate can have its way. Such proof could only come through the conceded victory of an anti-administration candidate at the polls, and that is still a long way off. Still, the desire for it reflects a feeling of participation in national life, and of the citizen's responsibility for, as well as to, his government, that is new in Mexico.

Sensing the awakening interest, all the candidates made unusually vigorous campaigns and probably succeeded in extending the boundaries of political life. To begin with, the government did a commendable job in encouraging a record number of voters to register. Then each aspirant, no matter how small his chances, penetrated far into the countryside and did his best to rouse the apathetic peons as well as deluging the more alert townsmen with his propaganda.

Issues and personalities, not energy, were the two most glaring deficiencies in the whole electoral show. The scarcity of issues, however, was due to the fact that the government's programme is basically satisfactory. Stressing broad projects for economic development—electrification, land-reclamation, capital investment in industry, education and, to a lesser extent, housing—the PRI advocated what Mexicans feel their country needs, and no opponent would have found it worth while to argue differently. Foreign policy was considered irrelevant. The left tried to drag in anti-Yankeeism but failed to arouse interest. Corruption and "millionairization" of officials might well have been an issue, but the politicians chose to skirt it. While Señor Ruiz Cortines's backers made much of his personal reputation for honesty, no party to the campaign made much effort to dig elsewhere in the rewarding field of exposure.

Señor Ruiz Cortines's own pallid personality was a notable factor. A tired and colourless civil servant who has worked himself up through the ranks and into President Alemán's footsteps as Governor of the State of Vera Cruz and then Minister of the Interior, he is not made of the stuff for hero-worship. His followers were *PRistas*, not *Ruiz-Cortinistas*. This shift in emphasis from the man to the party is a healthy one, a proper step to follow the shift from soldier to civilian that marked Señor Alemán's campaign in 1946.

General Henriquez, the strongest opposition candidate, may be said to have formed his party for the occasion—an amalgamation of right, left, army and assorted discontent—and he did campaign on personality. But even in the areas of his greatest popularity, people were *Henriquistas* mainly as the most convenient way of opposing the PRI, not by positive choice. When the election tumult finally dies, the name of Henriquez will be forgotten. Señor Lombardo, once an imposing figure on the national scene and an internationally known labour leader, suffered badly from the label of “Moscow agent” and demonstrated conclusively that he has lost his once firm hold on the Mexican labour movement. By the official count, he appears to have won only between two and three per cent of the vote. The fourth candidate, Señor Efraín González Luna, also cut a small figure although he showed up somewhat better at the balloting. He was the nominee of the Catholic Party. Mexico, however devout in religion, is all but anti-clerical in politics, and the Church now has a sort of gentleman’s agreement with the government that neither will go out of its way to embarrass or interfere with the other. The campaign of the quiet, conservative González was by no means a breach of the agreement.

As President Alemán said conversationally this week, “It wasn’t a perfect election. Perfection and politics don’t go together. But it was peaceful and genuinely popular. That is a milestone in Mexican history.”

The British in India

[FROM A CORRESPONDENT IN CALCUTTA]

In a recent parliamentary reply to Communist criticism of alleged British influence in India, Mr T. Krishnamachari, Indian Minister of Commerce, retorted that British industrialists set a standard for India: they treated labour better; they automatically adjusted their dearness allowances to the Calcutta Chamber of Commerce price index; they did not keep a double set of books in order to avoid taxes; they were readier to keep their mills going when profits began to fall off; they provided a *levée en masse* which the country wanted. The publicity given to these remarks has led to the wide expression of the view that British stock has never stood higher in India than today. This is true, but like all generalisations, it needs to be seen in perspective.

In 1947, Indians had contradictory feelings towards the British. There was jubilation over independence, but resentment over the partition of the sub-continent, for which Hindus held the British to blame. The termination of the political struggle eased tensions and led to an upsurge of friendliness towards the British, but all politicians and many business men looked forward to the rapid Indianisation of industry and the virtual elimination of the British from India.

Time has now softened the initial resentment against partition and, for a variety of reasons, feeling towards British business men has gradually begun to change for the better. The British themselves made an important contribution towards this shift. They underwent a subtle psychological change. The “corruption of absolute power” ceased to work upon them; they shed their arrogance; they ceased to patronise; they showed greater consideration; although they did not fraternise, they made efforts to unbend. Moreover, by and large, and with many notable exceptions, the calibre of British business men in education, technical knowledge, and experience of the world, was greater than that of the Indians. In 1946-48 a number of prominent British businesses sold out to Indians, and the way in which a number of these concerns were subsequently managed aroused such dismay among Indian investors that rumours of a change in management is now apt to cause nervousness on the stock exchange. British ability to state a reasoned case came to be increasingly appreciated as the Government intervened more and more in economic matters; both Indian

officials and industrialists began to insist on the inclusion of a Briton or two in delegations to New Delhi. And the comparative ease with which the British stood up to the Government’s successful nation-wide drive against tax-evaders did not pass unnoticed.

In international relations—diplomatic and economic—ministers have gradually come to realise that the Commonwealth not only imposes no impediments to freedom but brings advantages with it. The first manifestation of this realisation took the form of defending membership of the Commonwealth by minimising its importance. Critics were assured that it “meant nothing really.” But since the Communists became the chief parliamentary opposition after this year’s elections, their daily attacks on the British connection have had the unforeseen effect of forcing India’s leaders, political and industrial, to think out their ideas more carefully. Where but a few months ago everyone from Pandit Nehru down, allowed themselves only non-committal references to the Soviet Union, the Communists have now goaded them to a point where they feel no embarrassment in explaining the utility of the Commonwealth connection, and in pointing to Soviet weaknesses.

Return of Self-Confidence

The result of all these developments has been that whereas, in 1947, most British business men felt that it was only a question of time before they would be compelled to sell out to Indians, today their self-confidence has returned. The rise in British prestige is a matter for congratulation, not for complacency. The British benefit by a system of education and administration, since vanished, which gave the generation of Indians now in power a bias towards Britain (all the stronger for being frequently unconscious). The British will be increasingly reminded as the years pass that they are in the somewhat uncertain position that foreigners must always occupy in any country. They would be wise to continue the process of increasingly associating Indian capital and personnel with their firms.

Relations between British and Indians in the same firm are uniformly pleasant; equality of treatment in access to confidential information, and in matters of leave and salary is absolute. Social mixing outside office hours, however, depends on whether the Indians are “westernised.” If they are, they are apt to belong to an older generation, and they are not representative of Indian business men as a whole. Westernisation will doubtless continue among those whose parents were thus brought up but the degree is likely to decrease as the teaching of English is now begun at a later stage and is allotted less space in school time-tables. The British business man of tomorrow will have to be as ready to learn an Indian language as his colleague in France is to learn French; with each passing year more official pronouncements will be made solely in Indian languages. On the other hand, it is not entirely the fault of the British if there is still little mixing with the average orthodox Hindu, whose social customs would anyway gravely hinder it.

Henceforth, British business men and technicians will experience increasing competition from Indians. Hitherto, in return for their virtual monopoly of experience and technique, the British have been able to command good salaries, generous provident funds, houses at nominal rents, free cars, leave passages and medical attention. But Indians have been learning all the time and large numbers have caught up. They are both willing and able to undertake high responsibilities for substantially less than British salaries and amenities. Some Britons seem to assume that the British must be more efficient simply because they are more highly paid. There have, however, been outstanding examples of a change in company management from British to Indian followed by remarkable increases in profits. The British retort that this is due to black marketeering may be true in some cases, but not in all.

He fights among the trees. It is on the constant war waged in the forests by entomologists like Walter Griswold; that world output of paper is greatly dependent. His enemies are the pests and parasites which attack the trees from which the wood pulp for newsprint is obtained. Thirty-two year old Griswold graduated in Forestry at the University of New Brunswick and had already carried out research in the forests before joining Bowaters’ staff. He is officer in charge of the Newfoundland field workers who pry into the cracks in the bark and beat the boughs over extended sheets to collect specimens of the pests threatening the growing trees. Once these pests have been identified in the Dominion Entomological Laboratory it is Griswold’s job, in co-operation with Canadian Government experts, to plan the appropriate counter-attack. One successful method is the introduction of species of parasites and virus disease as allies to prey on those already in possession. It is largely upon the success or failure of this silent struggle to protect the forests that the supply of paper to keep pace with the world-wide spread of literacy depends in the years to come.

The whole wealth of Bowaters’ craftsmanship, experience and research in the art of making paper—the ‘know-how’ in short—is freely at your service.

These facts are published to show what British enterprise can achieve in spite of difficulties.

It can be done

On the 18th May 1952, Benghazi's new power station was opened by His Majesty King Idris of Libya. This was the first project carried out by a British contractor in Cyrenaica. The consulting engineers were Mackness and Shipley.

When the work began, the province was still suffering from the effects of war. Plant and materials—other than sand, of which there was more than enough—were carried from Britain and transhipped at

Tripoli, for Benghazi harbour was badly damaged. Local labour was not yet trained in modern construction methods. There were dock strikes and shortages in Britain, drought in Cyrenaica. But the work was completed on time.

The organisation which carried this job through is also engaged in construction works in Syria, Mauritius, Northern and Southern Rhodesia and the Union of South Africa, besides its activities in Britain.

THE BUSINESS WORLD

The Drain on Industry

IT is in the spring and early summer that the voice of the British company chairman is most frequently heard in the land. Between April 1st and June 30th last the accounts of 840 public companies were issued; they represented about 35 per cent by number, and over 45 per cent by total income, of the accounts published in the year to end-June as a whole. Excluding the rubber companies, whose accounting dates sprawl untidily across a wide period, the financial years of just over half this sample of companies coincided very closely with the calendar year 1951; most of the rest ended at some date up to and including March 31st. It is therefore fair to say that the quarter's accounts broadly mirror trading experience in 1951, although the sample is perhaps unduly weighted by the experience of large companies with worldwide (as distinct from purely British) interests.

The tables accompanying this article, and the fuller tables in the current issue of the *Records and Statistics* supplement, show that the total income of these 840 companies rose by £49 million, or some 6 per cent, in their latest year; if the exceptional experience of nine oil companies is excluded, the total income of 831 companies rose by £105 million, or just over 17 per cent. This compares with an increase of 16 per cent in the total income of the 475 companies that published accounts in the first quarter of 1952, of 32 per cent in the total income of 564 companies (excluding the oil companies) that published accounts in the last quarter of 1951, and of 24 per cent in the 515 accounts published in the quarter before that. In the year to June, 1952 as a whole, 2,397 public companies showed an increase of £292 million, or 19 per cent, in total income; they raised their ordinary dividend payments by just over £8 million or 5½ per cent, the percentage increase declared by companies that published accounts in the second quarter of 1952 being the same as that for the twelve months as a whole. By comparison, according to the preliminary national income estimates, wages and salaries rose by £765 million in 1951, or 11 per cent.

Most industries—certainly most of those in direct contact with consumers—experienced a downturn in their fortunes after the late summer or early autumn of 1951. In the accounts published last quarter, however, only six of the thirty-three groups (under the classification adopted in *Records and Statistics*) showed that this downturn had wiped out the effects of the previous improvement in trading receipts. The groups showing a fall in gross trading profits were oil (from £174.3 million to £116.3 million, owing mainly to the fall of £44 million in the profits of Anglo-Iranian), wool (from £4,413,000 to £2,542,000), clothing and footwear, shops and stores, tea, and iron and steel. The largest proportional increases in gross trading profits were shown by newspapers, paper and printing (38 per cent), shipping (32 per cent), tobacco (29 per cent) and chemicals (25 per cent). Most other groups showed very stable profits, and it is significant, as a sign of the recognition by directors of shadows ahead,

that in one-third of the thirty-three groups ordinary dividend payments fell.

All these figures, of course, refer to profits as the tax collector defines them; they are therefore misleading in economic terms—which is very useful for those who like to be misled. When subjected to closer analysis, the figures reveal yet again the harm done to the fabric of the economy by the present Inland Revenue system of assessment of depreciation allowances and inventory gains. It will be seen from the accompanying table that the 840 companies in last quarter's sample earned a total income of just over £844 million, of which more than £355 million was paid out in tax. Of the rest, various administrative and other charges (including pensions and directors' emoluments) took just under £43 million, debenture interest and preference dividends took over £27 million, ordinary dividends (up by just over £3,500,000) took less than £70 million, and more than £71 million represented either the minority share in profits or profits retained by subsidiaries.

This left just over £277 million, of which rather less than £129 million represented the depreciation allowances (including the now defunct initial allowances) granted by the tax authorities, rather less than £78 million was needed for various contingency and other specific reserves (including those for the replacement of assets, both fixed and current), and rather less than £71 million could be added to general revenue reserves and accumulated profits. These additions to reserves were necessarily insufficient to finance the increase of just under £142 million shown in the book value of the companies' assets (after allowing for a book depreciation of just under £88 million) and the increase of over £345 million shown in the book value of their stocks (an increase due mostly to higher prices). In consequence, even while the boom remained on the boil, British industry was again obliged either to live off its capital or to run further into debt.

*

From where did the necessary funds come? The composite balance sheet of these 840 companies, set out in the second of the accompanying tables, shows—at first sight surprisingly—that their holdings of marketable securities and cash ran up by £17 million in the year; this, however, was wholly due to an increase in the gilt-edged holdings of the iron and steel, engineering and shipbuilding groups (as an aftermath of steel nationalisation). On the other side of the composite balance sheet, borrowing from the banks increased by over £76 million, creditors and accrued charges by over £217 million (or by some £98 million more than current debtors) and other current liabilities and provisions by £22 million. The rest of the necessary finance had to be raised on the long-term capital market. The table shows that these companies raised just under £40 million on new debentures and preference shares, and increased

their ordinary capital by just over £41 million in the year.

Although part of the latter no doubt represented capitalisation of reserves, there is already some sign in these figures of one of the most notable features of the capital market since the inauguration of dearer money—the switch from borrowing on debentures to the raising of capital by rights issues of equities. This is in some ways a welcome development, for the piling up of prior charges had previously gone on at a rate that sent a shudder down the spine of all those who paused to consider what it might mean if ever a slump returned. But, under present circumstances, the rights issue tends to be simply a device for mulcting the ordinary shareholder of part of the capital value of his existing shares and wringing new funds out of him at pistol point—and this, all too often, merely to ensure that the real value of his company's assets can be maintained intact. The student of current trends must therefore make one of three assumptions about the future finances of British industry. Either he must assume that this "stand and deliver" technique can go on for ever; or he must assume that the productive assets of British industry will be irreparably eroded (ultimately to vanishing point); or he must assume that the system of assessment of industrial profits for tax purposes will eventually be amended. Since the first of these assumptions is absurd and the second will some day be recognised as unpleasant, the third assumption must in the end surely carry the day.

In recent weeks a series of expert witnesses has appeared before the Royal Commission on Taxation urging, in effect, that the day should be hastened. There are two major points at issue. The first is that profit and loss accounts are misleading documents unless they are drawn up in terms of reasonably standard units of account. At the moment they are not so drawn up, for part of the costs written into them—namely the costs involved in the wearing out of a fixed asset—is measured in pounds of the 1930's (or whenever the asset in question was originally acquired) while other entries in the accounts are measured in pounds of the 1950's. In France and some other countries depreciation allowances are now calculated after multiplying the cost of a fixed asset by an officially computed index number that expresses the fall in the value of money since the date of its acquisition. The evidence recently given to the Royal Commission by Lord Runciman and others has made it clear that some such system will have to be adopted in Britain if British shipping (to mention only one hard-hit industry) is not to fall gravely behind its foreign competitors when existing ships wear out. It is true that this view is not accepted by all British accountants, to some of whom a 1930 pound apparently is still the same as a 1952 pound because it bears the same label. But it is notable how far even the most conservative sectors of accounting opinion have moved in the last year. In evidence before the Commission last week, spokesmen for the Institute of Chartered Accountants in England and Wales suggested guardedly that the Inland Revenue's statutory rules governing the compilation of accounts for tax purposes should be abandoned and replaced by accountancy principles "subject to some solution of the problem of replacement costs."

The second major point at issue concerns the method of stock valuation that should be used when assessing profits and liability to tax upon them. The Royal Commission last week received a detailed memorandum from

the British Bankers' Association, which examined and praised United States income tax regulations on this subject. The bankers believe that "a trader should always be allowed to regard himself as disposing first of those items in his stock which have cost him most." This would be likely to involve use of the first-in-first-out (FIFO) method of stock valuation at a time of falling

prices and the last-in-first-out (LIFO) method at a time of rising prices. The bankers provided a statistical example which showed that a company selling 200,000 tons of a given material at £15 per ton in a year in which the cost of that material rose from £10 to £15 a ton and its stock from 100,000 tons to 110,000 tons, might equally well be said

to show a profit of £910,000, or £664,800, or £410,000 or £370,000—according to which of four methods of stock valuation was used (with the FIFO basis in this case showing the largest profit and the LIFO basis the smallest one). The bankers then transposed the figures to illustrate what would happen in a year when cost prices fell from £15 to £10, stocks fell from 110,000 tons to 100,000 tons and average selling price was £13; they concluded that the company could be variously assessed as showing a loss of £410,000, a loss of £154,800, a loss of £10,000 or a profit of £30,000 (with LIFO on this occasion showing the only profit and FIFO the largest loss).

There may be some who will object that this is a proposal that industry should be allowed to play a game of "heads we win, tails you lose," with the revenue, and who will therefore prefer the present system under which

Electrical Entente

ELECTRICAL interconnections crossing international boundaries have been commonplace in the European power economy for over 30 years. The recent decision by the British and French nationalised electricity supply authorities to instal a cable across the English Channel, therefore, may be considered as no more than an additional—and inevitable—extension of a pattern that already covers most of Western Europe. The theoretical advantages of the scheme have never been in dispute, but the technical feat of laying a more powerful submarine cable than has ever been laid hitherto needed much expert thought. A committee, drawn from the staffs of the British Electricity Authority and *Electricité de France*, has been considering the technical aspects of the problem for over two years; and has now decided that it is a practicable proposition—though the necessary development work may take another two years.

The operating advantages of any international link are, in effect, merely an extension of the benefits to be gained from the national interconnection of power plants into a "grid system." These are the reduction of idle capital in the form of standby-plant, since one standby unit can serve many stations; the need for less total plant, since diversity of demand spreads the peak loads; a reduction in total production costs of electricity, since the most efficient stations can be used to generate the greatest amount of current; and increased security of supply.

These advantages of grid operation have been realised to a great extent both in Britain and in France. The Electricity Act establishing the British grid system was first passed by Parliament in 1927. In the 10-year period between 1926 and 1936 (by which time the grid was in full operation) the linking of this country's generating resources on grid principles resulted in a reduction of the proportion of plant that had to be held spare from 70 per cent of the total capacity in 1926 to 26 per cent in 1936; the average cost of generation (including capital charges) was reduced from 0.4d. per unit to 0.19d. per unit over the same period. Moreover, the war demonstrated that major enemy attacks, with consequent damage to generating and transmission equipment, could not succeed in bringing about a breakdown of the country's electricity supply.

In France the development of hydro-electric power capacity in the Alps, the *Massif Central* and the Pyrenees,

the tax authorities tend to gain most of the time. But this is a short-sighted view. There is room for debate whether the French system of depreciation allowances and the LIFO-FIFO method of stock valuation are the best cures available for two grave economic ills—the wasting sickness that is preventing industry from keeping its productive assets in proper shape without running into debt, and the inflammation of wage demands that is inevitable when published "profits" look so high even though true profits are so low. But only those who are blind to the wasting sickness, or those who find the inflammation useful for the furtherance of their political ideals, will deny that a cure of some sort is needed. It is greatly to be hoped that the majority, at least, of the Commission will seek to propound such a cure; otherwise another Commission will some day have to be set up to conduct a post-mortem.

together with the location of large coal deposits in the north, has introduced greater benefits from complete interconnection than in Britain. The ability to share load—through the medium of long-distance links connecting the hydro regions with the industrial load areas and their thermal power plants in the north—has meant that each method of generation could be operated more efficiently than in a country with either all-thermal or all-hydro generation. The possibility of storing energy in reservoirs to drive hydro-electric plants, is of great advantage to the operators of interconnected power networks. Such benefits of co-ordinated power production apply equally to international power exchanges. In addition, the diversity of peak load is greater as the grid networks become wider in extent. The French peak is generally about one hour in advance of the British peak. And as Europe becomes more closely linked electrically, the peak period becomes even more widely spread—as, for example, when a link extends from southern Italy to industrial Scotland.

Both Britain and France face a shortage of generating plant to meet growing demand. Lord Citrine, chairman of BEA, repeated at the British Electrical Power Convention in June his familiar argument that the present Government limitation of 1,500,000 kilowatts of new plant each year needed to be raised in order to cover the expected increase in demand and the replacement of coal-wasting, obsolete plant. The cost of new generating plant is now of the order of £64 per kW, and has increased by about one third since 1948. In France, the large programme of hydro-electric development undertaken since the war has now, to a considerable extent, been accomplished; but the prospective increase in demand is such that a further plan will have to be set in motion without delay, if severe electricity shortages are to be avoided in four or five years' time. So far, the French Government have not authorised the capital expenditure for certain concluding stages of the first post-war plan, and further major developments have had to be postponed. The two power systems are roughly similar in size. In Britain, at the end of March, 1952, steam plant with a maximum capacity of 14,214,000 kW was available, together with 185,000 kW of water power from Scotland. France, at the end of 1951, had 5,843,000 kW of installed thermal capacity, and

6,784,000 kW of hydro plant, making a total of 12,627,000 kW. The average price received per unit in Great Britain as shown in the last available BEA report (1950-51) was 1.181 pence for 46,500 million units. In France, 38,279 million units were sold in 1951, for an average price of 1.16 pence per unit.

The broad lines of operation for a cross-Channel link are also clear. Britain would export energy to France in the summer period, thus utilising thermal generating plants in this country at greater efficiency and at a higher load factor and saving water at times of drought in some of the hydro-electric plants in France. In winter, the electrical tide would be likely to run the other way. When water supplies in the hydro plants are plentiful, power could be imported to help to meet the peak load in Great Britain and to save coal by ensuring greater efficiency, and by bringing in energy that did not require coal. An increase of thermal efficiency of 0.01 per cent in the average British national figures would save 160,000 tons of coal a year. Interconnection, bringing an improved load factor and better utilisation of plant, could thus contribute significantly to more economic power production. On the slight price differential between French and British unit prices, the transfer of 54,000 million units—about one year's consumption for Great Britain—would save the whole cost, about £4,500,000, of the present pilot project. In practice, such a transfer would take several years.

But considerable advantages to both national power systems can be obtained without any large net export of power in either direction. The 1951 balance sheet of French operation with interconnections to Belgium, Luxembourg, Germany, Switzerland, Italy and Spain, shows a net result of only 3 million units exported, though 638 million units passed at various times in and out across the country's frontiers, giving considerable advantages to the operating engineers both in France and in the other countries concerned. Thus, any misconception that interconnection by means of a Channel cable might involve the electrical "dependence" of Britain upon a foreign power is disproved. Moreover, the low figures of net transfer, in comparison with the large amounts of power actually transferred in both directions at different times of the day and year, show that in terms of finance the two power authorities could render each other valuable assistance with a negligible effect upon the balance of payments between the two countries. The initial cost of £4,500,000—and presumably the actual construction by cable companies—will be shared between the two countries. But since the project remains in the future, no agreements upon charges, methods of operation, maintenance and security of supply appear yet to have been reached.

Considering its potential advantages, it seems disappointing that the initial Channel cable project envisages an interconnector with a capacity of only 100,000 kW, no more than the output of one large modern power station; thus it will be no more than a pilot link. It is understood that the interconnector will take the form of four single-core cables, operating at 132,000 volts, insulated with pre-impregnated paper and covered with lead, with gas used under pressure to maintain the insulation in good electrical condition at all times. The three-phase alternating current system, operating at 50 cycles a second, is used both in Britain and France, and the

laying of four cables, physically separated by about 500 yards, will provide a spare conductor to preserve continuity of supply in the event of fault or fouling.

Technical problems in projects for transmitting alternating current over lengthy cable systems arise from the heavy charging current that such cables require; for example, a 25-mile cable of the type proposed might well need 50,000 kVA simply to charge it up. This fact presents operating difficulties; before a swing of power in one direction or the other can take place, much of the energy provoking the power swing must be stored in the cable insulation. As a consequence, relatively costly compensating equipment has to be provided.

An alternative to the standard alternating current system would be the use of high voltage direct current, and a scheme operating on this principle is now being constructed for what will be the world's longest submarine power cable link—the supply of energy to the island of Gotland, 62 miles off the east coast of Sweden. The conversion of alternating current into direct current by means of large mercury arc valves, and its reconversion at the remote end into alternating current, has been pioneered by Swedish engineers, who are convinced of its practicability. High voltage direct current transmission avoids any difficulty over charging current; it needs only two cables instead of the three required for three-phase alternating current transmission (and in emergency it can be operated at half the power using a single cable and a seawater return, as in the Gotland scheme); it requires smaller cables for a given capacity; and it affords better control of load flow. On the other hand, the terminal equipment is more expensive and complicated than for an AC system. However, the proposed Channel cable is likely to be suitable for future operation on the direct current system, and the transmission capacity would be trebled if this change were made. Further interconnections might well be of the direct current type. This first 100,000 kW link will enable valuable operating experience to be gained. But significant economies, by the more efficient use of plant, cannot be achieved until a substantial link, which might transfer perhaps a million kilowatts, at a capital cost of about £15 million, comes in its train.

Price Indices of Capital Equipment

The Economist Intelligence Unit, in conjunction with the Association of Certified and Corporate Accountants, has compiled a series of indices showing changes in the cost of replacing industrial and other assets. Indices available are

Plant: chemical, electrical, food processing, machine tools, mechanical handling, printing, tanning, textile, foundry.

Also agricultural machinery, factory buildings, commercial vehicles, and office equipment.

Special Investigations can also be undertaken.

For further particulars, apply to:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1

Business Notes

Leap in Bank Deposits

The credit trends shown in the latest statement from the clearing banks make a striking contrast with the intentions of the Government's disinflationary policy—though this contrast is, of course, only another facet of that shown in the Exchequer return, discussed in these columns three weeks ago. In the 5½ weeks to June 30th net bank deposits leaped by £120 million, which is easily the biggest increase since the wholly abnormal movement of October, 1950, and, except for one or two wartime years, is in fact the largest June movement ever experienced. In 1946, during the height of the Daltonian frenzy, the movement was £112 million. At June 30th, after the latest increase, the total of net bank deposits, at £5,817 million, was still £134 million less than at the corresponding date last year; but in April the fall shown on the year was £203 million. This striking movement does not mean that there has been any apparent softening of the impact of the new monetary discipline on the private sector of the economy. It is true that bank advances to this sector seem to have been increased during the month, but the amount of this increase was almost certainly less than the movement of the advances total might seem to imply; this total dropped by £30 million, or by £15 million less than the month's call on the BEA loan, the proceeds of which may be presumed to have been applied in repayment of outstanding electricity advances. Other forms of bank finance for the private sector of the economy were, moreover, sharply contracted. Bank portfolios of commercial bills dropped by another £18 million, reducing them to only £83½ million, or more than £100 million below the peak of last February, while aggregate investment holdings declined by another £15 million (partly, no doubt, in consequence of writing-down).

The £64 million fall in these three items, taken in conjunction with the £120 million increase in net deposits, implies that governmental demands for bank finance expanded during the 5½ weeks by no less than £184 million. There has thus been a sharp accentuation of the tendency noticeable in May, when the presumed amount of government borrowing was just over £70 million; in June last year, it may be noted, the Government was apparently able to reduce its indebtedness to the banking system. These borrowings are, of course, readily explicable by the trends shown in the Exchequer return. During the period most nearly comparable to that covered by the banks' statement, there was an above-line Exchequer deficit of nearly £150 million and, in addition, there were large expenditures below the line—£15 notably, £57 million for advances to local authorities, £15 million apparently absorbed in working capital by trading controls and £7 million by war damage. If, for the reasons given here three weeks ago, the strongly adverse trend shown in the above-line account during the first quarter of the fiscal year may be expected to be partly corrected later in the year, the Government should eventually be able to repay part, at least, of these excessive borrowings. But, until this hoped-for change becomes fully apparent, the credit trend will be watched with some anxiety. One inevitable consequence of the scale of Government borrowing has been a sharp expansion of the banks' liquid assets; despite the contraction of commercial paper, the banks' total bill portfolios rose during the month by no less than £129 million, raising the ratios of total liquid assets to deposits to 34.7 per cent, easily its highest point since the special exchange of Treasury bills into Serial Funding Stocks took place last November. Clearly, the need for a funding operation grows steadily.

Competition in Transport

"Even the most fearsome critics of the present Government's new Transport Bill—the independent critics, that is—all unite in saying that drastic transformation of the 1947 Act is absolutely necessary." With this challenge to the Opposition, the Minister of Transport on Tuesday steered the debate on the 1951 report of the Transport Commission towards a debate on the new Bill itself. Mr Lennox-Boyd praised the report, and accepted without protest that it had been written "with the Government's Transport Bill in mind"; this might have helped those responsible for the report "to clear their minds and to clarify certain issues." Clarification on the Bill then followed. The Commission's achievements—which the Minister acknowledged—were not the fruits of integration; they were the achievements of the separate parts of the Commission's businesses. "The absolute failure in the realm of integration" forced upon the Government the obligation to introduce a new Transport Bill.

It is true that integration of transport has not been a spectacular success; five years would in any case be a short time for any material progress towards integration, and the past five years have not been among the most placid in the country's economic history. The recipe that the Minister propounded was decentralisation—and the best way to deal with decentralisation was "through private enterprise and competition." The traveller and trader should be allowed to choose the form of transport they prefer; but they should pay "not only in the ordinary cost of transport that they use, but also the cost of any other transport services which it is in their own interest should also be preserved." Hence, in the Minister's view, the justification for payments from the road levy to assist the railways.

Mr Lennox-Boyd went on to claim that the charging powers contemplated for the railways in the new Bill would give them headroom to meet increases in costs, and competitive power to quote rates below the new maximum rates. There are, however, limitations to these new liberties. The power to increase rates by up to 10 per cent to meet increased costs is subject to retrospective sanction of the Transport Tribunal—as is proper. The power to quote less than maximum rates is subject to publication, equality of charges and prohibition of undue preference, together, in the last resort, with power for aggrieved carriers to appeal under certain conditions to the Transport Tribunal against competitive charges below maximum rates. This is dipping the toe in the cold water of competition. It is odd that the railways are to be supported by a levy because of their competitive weakness, and at the same time to be denied the exercise of free competition because of their "huge resources."

Action on Monopolies

The work of the Monopolies Commission on cases submitted by the President of the Board of Trade has been meticulous, comprehensive and fair. It has also been slow, though sufficient experience has now been gained to justify the hope of at least some speeding up of its output. Wednesday's debate on the Commission's work was a very calm affair. Dr Dalton asked the expected questions. "Deeply disappointed" with the working out of the Act of 1948, for which he shared responsibility, he suggested the use of Section 15 which empowers the Board of Trade to refer for investigation the general effects throughout industry of any particular restrictive practice, such as the use of the collective boycott, exclusive dealing arrangements or restricted entry into an industry.

To this suggestion, Mr Thorneycroft (who admitted to a prejudice against monopoly, and one that did not distinguish too carefully between public and private monopoly) gave a measured welcome. The Commission's four reports (on dental goods, rainwater goods, electric lamps, and electric cables) have disclosed strong family resemblances among the various restrictive devices that the Commission found to exist in these industries. Only one of the four industries has been brought under the sanction of a Statutory order, and this has seemed to many to put the one in an invidious position when there are other industries (whether under enquiry or not) that are free. Clearly, the banning in any particular industry of practices generally pursued quite legally elsewhere is neither just nor expeditious. Mr Thorneycroft's proposal, therefore, to make use of the procedure under Section 15, and to ask the Monopolies Commission to make "a general study of some practices based on their original reports" offers a chance of greater expedition. Exclusive dealing and the collective boycott, the President suggested, would together be "a very strong candidate" for early examination.

Dollar Exports Improve

Exports in the first half of this year reached £1,347 million and were £107 million higher than those of the first half of 1951. These figures alone might suggest that the export drive is going well; unfortunately, they conceal a disturbing decline in trade during the second quarter of the year. Exports in the June quarter, indeed, were 13 per cent lower than those of the previous quarter, and of this fall about 5 per cent can be attributed to the fact that the second quarter included fewer working days, since it included both Easter and Whitsun. The net loss reflects, in part, the damage to British exports caused by the tightening of import restrictions by sterling area countries. Thus the general trend in exports is discouraging, though fortunately there is comfort to be derived from a recovery in exports to the dollar area.

The metal using industries carrying the treble burden of demands for exports, defence, and home investment, have been succeeding quite well in meeting their export responsibilities. In the first half of this year, the value of metal goods exports reached £655 million, no less than £80 million above

Wool manufactures	95,962	61,606	11,331	9,804	9,303	8,531
Cars	50,873	60,738	10,948	9,255	10,446	8,181
Domestic pottery (incl. china)	7,642	9,127	1,678	1,628	1,348	1,118

the total for the first half of 1951. Even here, however, import cuts in sterling countries are being significantly felt. Machinery exports, which amounted to £219 million in the first half of the year compared with £170 million in the same period last year, were slightly smaller in the second quarter of this year than in the first—the value of shipments to Australia and New Zealand alone declined by 50 per cent. Exports of vehicles show a similar trend. For the first half of the year they reached £262 million, £32 million above the corresponding figure for last year; but they dropped from £139 million in the first quarter of this year to £125 million in the second. Only 74,000 cars were shipped abroad in the second quarter, compared with 87,000 between January and March; exports to Australia in the second quarter totalled less than 4,000, compared with 22,500 in the pre-

ceding three months, when there was presumably some hasty shipment of cars before the barrier was lowered. Given the depressed state of textile trade throughout the world, the severe reduction of textile exports was plainly inevitable. In the first half of this year exports of cotton goods were £86 million, against £104 million in the first half of 1951; exports of wool manufactures fell from £96 million to £62 million, and of silk goods from £31 million to £23 million. Second quarter exports were lower than those of the first quarter. It is heartening that coal exports are recovering rapidly this year.

The rise in exports to the dollar area is a welcome contrast to the recent decline in total exports. In the second quarter exports to the United States reached £36 million, some £1½ million more than in the first quarter. Exports of textiles and of tin increased and the number of cars shipped in the second quarter—8,937—was double that of the first quarter. The recovery in exports to Canada continues; car shipments, in particular, are doing much better. Nearly 8,000 cars were exported in the second quarter compared with 548 in the first quarter, but the rate of shipment is still far below that of the first half of 1951.

Import Cuts in Effect

The policy of cutting imports, on which the first phase of the Chancellor's measures of last November was so largely constructed, is now becoming visible in the trade figures. The import bill for the first half of the year amounted to £1,901 million—some £46 million higher, in fact, than that of the first half of last year. But the import figures for May and June showed a significant fall. Imports in June totalled £276 million and were £81 million lower than those of June, 1951. Not all of this fall can be attributed to the Chancellor's cuts of November and February but imports of several items affected by the cuts are now falling. These include a number of foodstuffs—among them fruit and vegetables, cocoa preparations and tinned ham—from Europe, which have been lower this year than in the first half of 1951. On the other hand, although there is to be a severe cut in the allocation of dollars for tobacco this year, the cut did

THE TREND OF SELECTED IMPORTS
(£'000s)

	Totals		Monthly Average	Monthly Totals		
	First half 1951	First half 1952	First quarter 1952	April	May	June
Food:—

Machine tools	5,061	25,058	4,035	3,926	5,059	3,986
Lead	7,686	15,418	3,530	1,773	1,454	1,383
Zinc	8,338	20,450	3,328	3,636	4,495	2,562
Tin	3,258	2,283	630	180	158	59

not apply to purchases from last year's crop. Large quantities of tobacco continued to arrive in the first quarter of this year and imports for the half year were higher than in the same period last year. Grain imports were not subject to any reduction; they amounted to £153 million, costing £33½ million more than in the first half of 1951 because of larger and more expensive arrivals of wheat and maize.

Few raw materials came under the Chancellor's axe; smaller quantities of paper making materials, leather and paper (except newsprint) have been imported this year than in the same period last year. Lower import prices have also played their part in reducing the value of raw material

TRADE and TRAVEL Australia and New Zealand

Whether your activities entail long distance travelling or concentrated investigations, we can assist you in AUSTRALIA and NEW ZEALAND

Our TRADE INTRODUCTION SERVICE and TRAVEL DEPARTMENTS will gladly:

1. Make a SURVEY to meet your trade requirements.
2. Prepare a suitable ITINERARY.
3. Book TRANSPORT by air, rail, road or sea.
4. Secure Hotel ACCOMMODATION.
5. Arrange business INTRODUCTIONS.
6. Issue TRAVELLERS CHEQUES and TRAVELLERS LETTERS OF CREDIT.

Inquiries welcomed either through your own Bankers or direct.

A short time ago we had a phone call from a manufacturer of woollen goods. He was concerned about the heavy increases in customs duties recently imposed in Venezuela on textiles. Was this likely to kill his export trade to that country?

We told him that, although the general opinion appeared to be that this increase had virtually closed the market, we were referring the matter to our Caracas Branch.

Within a few days we were able to quote him a report from this branch stating that there was still a market in Venezuela for high quality textiles of British manufacture, and that the demand was likely to continue.

Thus, thanks to our on-the-spot representation, we were able to obtain first hand, independent comment and clarify for the exporter, in a matter of days, a situation that might otherwise have remained obscure for weeks.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

private debts has apparently been raised to a figure of between 300 million and 340 million Deutsche marks. There has been no fresh news this week about the way in which this sum might be distributed—except that the sterling and other soft-currency bondholders may have made some concessions to American opposition to the enforcement of dollar clauses. At any rate, the representatives of American bondholders, who returned to New York in a "huff" on this subject a few weeks ago, have now announced that they have rejoined the conference as "a new basis for discussions with respect to the Dawes and Young loans has been developed which appears to present a reasonable prospect of equitable settlement."

It also remains to be seen whether the apparent generosity of Germany's second thoughts may not be due to its hopes that there will be some curtailment of the payments that it will have to make to the Allied governments in respect of postwar credits. The next stage in the debt discussions will be the negotiation of bilateral agreements between Germany and the three creditor governments—the United States, Britain and France—for settlement of these postwar credits. Only when these agreements have been signed will the stage have been prepared for the official ratification of the agreements that now seem about to be signed between Germany and the private creditors. There is thus still some room for possible slips between the cup and the lip. The same judgment, of course, applies to Japanese debts, the conference on which began in New York last Monday, after a statement by the Japanese ambassador-at-large that his country is considering a "very generous settlement." In the circumstances, it is hardly surprising that on the Stock Exchange this week, movements of both German and Japanese bonds have been wide and erratic.

One early consequence of the effective understanding on Germany's standstill debts should be the reappearance of German bills and other forms of credit on the London market. About £32 million of such credits (including some £12 million in respect of arrears of interest) should re-appear as a result of the proposed "re-commercialisation" of the standstill debts. Some of these credits will take the form of cash advances, on which a rate of 4 per cent will be paid, while the remainder will appear as German bills, for which a discount rate of 3½ per cent has provisionally been fixed. These facilities will henceforth be extended exclusively against *bona fide* imports into Germany.

Trade With China

Some interesting repercussions of the Moscow Economic Conference and of the talks which were begun there for developing trade between Britain and Communist China, have recently become apparent. The vague plans and expressions of hope which were expressed at that conference have since been followed up by more precise conversations between Lord Boyd Orr and other members of the British delegation at the Moscow Economic Conference and the Chinese Export and Import Agency which, for the time being, is domiciled in East Berlin. These discussions have now induced the British interests concerned to form a company by name of International Trade Association Limited to act as a channel through which the established Far Eastern merchants may find a sympathetic approach to the Chinese market. This new company is administered by persons who attended the Moscow Economic Conference. Its chairman is Mr W. D. Lorimer, managing director of North British Locomotives, and other directors include Mr J. Perry and Mr G. B. Drayson, MP. This company is intended to act as a co-ordinating and introductory channel. It has neither the organisation nor the finance to handle trade on its own account. It may, however, be in a position to render certain services to already established merchants in the Far East. Some of the contracts which were discussed in general terms

at the Moscow Economic Conference are now beginning to crystallise. During the past three weeks the Board of Trade have issued licences for the export of some £1,000,000 of non-strategic chemicals to China. Some of these shipments can trace their origin to the initiative taken in the course of the Moscow talks.

Japan and Gatt

The Japanese Government has notified the executive secretary of the General Agreement on Tariffs and Trade of its desire to accede to that agreement and to enter into tariff negotiations with 28 contracting parties. This request has been communicated to all the contracting parties of Gatt. They have been asked if they have any objection to Japan entering negotiations under the new procedure worked out in 1951, which allows individual countries to become contracting parties without holding a full-scale multilateral tariff conference. They have also been asked whether, in the event of negotiations taking place, they want to participate. The Japanese demand for accession to Gatt follows logically from the coming into force of the Japanese Peace Treaty. The probable entry of Japan among the contracting parties is likely to be a major event for Gatt. It will also set a difficult problem for the United Kingdom Government, whose attitude to Japanese imports into Britain and the dependent territories remains decidedly equivocal. It was about a year ago that the President of the Board of Trade in the Labour government announced that the United Kingdom had decided to withhold from Japan the most-favoured nation treatment "bearing in mind the prewar record of Japanese competition, especially in the textile trades." This remains the attitude and policy of the Conservative Government. It can, however, no longer be adhered to if Japan becomes a contracting party of Gatt. As a contracting party Japan would have the automatic right to claim most-favoured nation treatment from Britain and all other members. This issue may help to crystallise the British Government's attitude to Gatt, an issue on which profound differences of opinion appear to obtain within ministerial circles.

More Sulphur

A gradual increase in world supplies of sulphur has enabled the International Materials Conference to raise its allocations for the second half of this year. The IMC announced this week that 3,200,260 tons will be distributed to consumer countries in the current six months compared with 2,951,400 tons in the preceding half year. The United Kingdom share will be increased by 1,000 tons to 195,000 tons.

The Sulphur Committee of the IMC reports that world stocks of sulphur, which had been falling throughout 1950 and the early part of 1951, have ceased to decline since international allocations began last July. A shortage of sulphur persists but the efforts of the IMC have at least succeeded in bringing world consumption down to virtually the same level as production. Its task has been made a little easier by a perceptible increase in output, which in the second half of this year is expected to reach 3,200,000 tons compared with 3,070,000 tons in the second half of 1951. Even with this rise, however, production still lags far behind requirements, which are put at 3,830,000 tons for the current half year.

World requirements of sulphur are likely to continue to increase rapidly over the next few years. The setback suffered by the rayon industry has undoubtedly reduced its need for sulphuric acid for the time being, but this factor will probably result in nothing more than a slight kink in the upward trend of world demand for sulphur. On the

other hand, it is not certain that production will for ever lag behind the growth of demand. In the last year or two, sulphur has come to be regarded as a commodity threatened with perpetual and absolute shortage. The United States produces more than 90 per cent of the world's sulphur and although its production (largely from rich natural deposits) is being expanded, its reserves of sulphur in this natural form are known to be limited. But in the United States and elsewhere in the world, there are large deposits of other sulphur bearing materials which were not profitable to exploit while natural sulphur deposits were ample for the world's needs. These alternative sources of sulphur are being increasingly exploited. Sulphur is also being recovered from petroleum and natural gas. In this country Shell have one recovery plant in operation and another is being set up at the Esso refinery at Fawley. An anhydrite plant is being constructed by ICI and the principal consumers of sulphuric acid in this country. The largest use of sulphur is in the production of sulphuric acid and both here and in the United States many acid plants are now being converted to use pyrites. The development of these alternative sources of sulphur make it arguable whether sulphur will for all time be afflicted by shortage.

Fiduciary Issue Raised Again

As expected, the Treasury has had to authorise a second "summer holiday increase" in the fiduciary issue, by £50 million to £1,550 million. By last Wednesday the active note circulation had already risen to £1,502.6 million, compared with £1,380.9 million a year ago. It will inevitably rise again during the current week, before turning down from its customary August Bank Holiday peak. In the nine weeks since May 21st the active note circulation has risen by nearly £97 million, or almost exactly double its increase in the corres-

ponding nine weeks of 1951. Part of the explanation of this very large increase may be that people are preferring to hold more of their purchasing power in the form of notes and less in bank deposits, in consequence of the rising trend of bank charges; while the active note circulation at the end of June was some £93 million higher than a year before, the level of gross bank deposits was some £102 million lower. But it would be wise to draw consolation from this approximate stabilisation of the total volume of money, especially as the trend of deposits is at present sharply upwards. The main determinants of the size of the note issue relative to the size of bank deposits are the proportions of current income going to those who do not usually have bank accounts and, above all, the level of prices (and thus of weekly needs for ready cash).

Steel and Shipbuilding

The principal feature of Lloyd's Register shipbuilding returns for the second quarter of the year is the marked drop in the tonnage on which work was begun in British yards. This amounted to no more than 205,641 tons, the lowest figure for any quarter since the war, and compares with 324,831; 361,259 and 423,602 tons respectively for the three previous quarters. Work started in the last twelve months has totalled 1,315,000 tons gross, compared with 1,476,000 tons in the previous twelve months. Foreign shipyards, on the other hand, have been increasing their activity, and in the last quarter Japan alone began nearly as much tonnage as the United Kingdom. In 1951 Britain was responsible for 40 per cent of the tonnage laid down in the world; but in the last quarter the British share was lower than 20 per cent. This is some indication of the effects of the steel allocation measures of which the shipbuilders have been so critical recently. They complain that the total quantity of

100,000 MILK PAILS WARWICK

The large-scale introduction of strong, light hygienic aluminium to the food industries has been the main preoccupation of the WARWICK PRODUCTION COMPANY since 1945. One hundred thousand milk pails for the dairy industry is a typical effort.

ENTERPRISE IN ALUMINIUM

Warwick Production Co. Ltd., of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP; a sister company to SMD Engineers of Slough, who recently built the Aluminium Structure of the Dome of Discovery and the world's first All-Aluminium Aircraft Hangars at London Airport.

"If it's Aluminium - it's Almin!"

ALMIN LTD • FARNHAM ROYAL • BUCKS • Telephone: FARNHAM COMMON 595

steel allocated to the yards is well below normal requirements, that deliveries are lower than allocations, and that the specifications and sequence of delivery frequently interfere with the regular flow of work.

Such delays can have a far-reaching effect, increasing the cost of shipbuilding and upsetting promised delivery dates. The order book of the British shipbuilding industry stands at about 7 million tons, with an estimated value of about £670 million; one-third of which is for direct export. This total includes orders for some 850,000 tons which have been received since the beginning of the year; if the industry could get all the steel it requires, of the right specifications and at the right time, this latest batch of orders would represent about six months' output capacity. Any impediment to the smooth operation of the shipbuilding industry is particularly unwelcome at a time when foreign competition is becoming noticeably stronger.

Hire Purchase and Price Control

The hire purchase regulations that Mr Butler introduced last January, in order to restrict demand for goods that might be exportable, were bundled in on top of earlier hire purchase regulations meant to serve a very different purpose—that of preventing abuse of the price control system. Last week, the Board of Trade discontinued one of these earlier regulations, which had in effect made it impossible for non-price-controlled goods (except non-utility furniture and bedding) to be included in the same hire purchase or credit sale agreement as price-controlled goods. This regulation had caused great administrative inconvenience to traders since the recent freeing from price control of carpets and certain other household textiles and goods—a process of de-control, incidentally, which is being gradually extended and which last week reached out to all forms of push chairs, in a new perambulation to freedom. There is still considerable controversy about whether the new style hire purchase measures (including the recent request to the banks to reduce their lending against hire purchase proper) are having much real effect on consumption, but it is certainly important that they should be thoroughly disentwined from price control orders, which were not desired to cut back consumers' demand but to cosset it.

New Bottle for Old Wine

Thursday's successful new issue by George G. Sandeman, the well-known port and sherry exporters, was the first direct offer of new equities to the public for some months. The background to the issue was the familiar one of erosion of private capital under the relentless pressure of death duties. For 162 years George G. Sandeman has traded either as a partnership or as a limited private company; the present scale of death duties has now forced its owners to seek a market quotation for the whole of the company's issued capital of £432,016 5 per cent £1 preference shares and £1,000,000 £1 ordinary shares—and to offer 500,000 of these ordinary shares to the public at a price of 22s. 6d. each. The company's directors will still own or control nearly 344,000 of the ordinary shares and will remain responsible for the management of the company.

In the last ten years the company has shown a progressive profit record, with quite a sharp expansion in earnings in the last two years. As there has been a fall in sales in the first six months of this year, the directors do not expect profits in 1952 to equal those earned last year, but they estimate them conservatively at £275,000; after tax and preference dividend payments this would cover the contemplated dividend of 9 per cent more than twice. At the offer price of 22s. 6d. the new shares, which have no precise counterpart in the market, yield a full 8 per cent—a yield

that appears to be well in line with shares of a similar status in the consumption trades. As total net assets (excluding any allowance for goodwill) amount to £2,248,000, of which net current assets (largely representing stocks of maturing wine) account for about £1,869,000, a relatively low capitalisation appears to have been put upon the business. The over-subscription of this issue made by a reluctant pioneer may tempt others to break away from the long tradition of the family business in the wine trade.

Prospects on the St Lawrence

The sudden surge of interest in the St Lawrence seaway has taken the Canadian authorities somewhat by surprise, for the scheme has not yet been approved and no body responsible for its administration has yet been appointed. In outline, the object is to provide a 2,600-mile waterway through Canada from the Atlantic to the Great Lakes, and at the same time to dam the St Lawrence river in order to construct three hydro-electric power plants, totalling 3,500,000 horse-power, along its course. It was always hoped that the United States would share the cost and the work of this scheme with Canada, but American railway companies and other transport interests have maintained their effective lobby against the project. In these circumstances Congress has not yet approved the scheme, and Canada has therefore decided to go ahead alone. Before it can do so, however, certain aspects of the scheme still have to be approved by the Joint International Commission, which arbitrates on questions involving any change in the water frontier between the United States and Canada. No opposition is expected from the commission, but the formalities of hearings and approval cannot be completed before the autumn and until then the Canadian government cannot take any active steps to put life into what is still a paper scheme.

Until the project takes concrete shape, it is impossible to assess what the requirements will be and how well fitted British manufacturers would be to supply them. It seems possible that British companies will have opportunities of providing construction materials as well as tendering for power plants and machinery. British, and presumably most European, prices for power plant and similar custom-built machinery tend to be comfortably below American, and their delivery dates may also be better. But it will present a major challenge to such companies to provide spares and servicing facilities from a distance of 4,000 miles to compare with those provided by American manufacturers just across the border.

The Cost of Synthetic Rubber

A special committee is to meet in London at the end of next week to study the proposal for an international agreement to prevent "burdensome surpluses or serious shortages of rubber." The committee, which consists of representatives of the main consuming and producing countries, has been set up on the recommendation of the Ottawa Conference of the International Rubber Study Group last May. At that time the price of rubber was only 2s. 1d. a lb, and many producers claimed that their costs of production were far above this level. In the last two months there has been a slight recovery (to 2s. 2½d. a lb last Wednesday), but the plight of the natural rubber industry is still serious enough for Sir Gerald Templer and others to draw anxious attention to its possible political repercussions in South-East Asia.

Rubber growers have long maintained that the American Government's pricing policy for synthetic rubber constitutes one of the chief obstacles to the prosperity of natural rubber, and the American reclaim rubber industry is now echoing this complaint. A member of the Rubber Reclaimers' Asso-

ciation has recently told a Senate Committee that if the synthetic industry were in private hands, the prices "would have to be 28 to 31 US cents a lb to reflect a profit after taxes." This price would be equivalent to between 2s. and 2s. 2½d. a lb, and would be sufficient to enable the natural rubber industry to compete; it compares with the 23 cents a lb at present fixed by the United States Reconstruction Finance Corporation, which controls the synthetic industry.

Tungsten Price Confusion

Following the recent reduction in the official United Kingdom buying price for tungsten ore from 445s. to 425s. a unit (of 22.4 lb), the selling price has been reduced from 467s. 6d. to 447s. 6d. a unit. The buying price is purely nominal, for little ore is being offered to Britain at this level. The recent weakness of tungsten has been caused

not so much by a decline in demand as by the significant increase in output during the past six months, particularly in Burma, Siam and Korea. Britain is anxious to see this larger supply reflected in a sharp decline in the price; although this has already fallen by a third from its peak of last year, it is still some three and a half times the level of June, 1950. Britain, therefore, is not an eager buyer.

Producers expect the price to recover, despite the fact that output is now running at about double the rate

Company Notes

Distillers.—The market's disappointment with the mere maintenance of Distillers' ordinary dividend at 22½ per cent was immediately reflected in a fall of 9d., to 17s. 6d., in the 4s. ordinary shares; as the recently issued loan stock is ultimately convertible into ordinary shares, it also fell—by 1½ points to 104. Some investors had apparently been encouraged to expect a 25 per cent dividend by the directors' statement at the time of the loan stock issue that the results for the year to March 31st would show a further substantial rise in trading profits, and had not given sufficient heed to the current warning that taxation would absorb a large proportion of this increase. Both the forecasts of increased profits and higher taxation are confirmed in the company's preliminary statement. Group trading profits have advanced from £17,947,229 to £21,265,450, but, thanks to the increase in the provision for taxation from £9,515,576 to £11,816,737, group net profits have risen by only £311,525 to £7,170,450.

	Years to Mar. 31, 1951	1952
Trading profit	17,947,229	21,265,450
Total income	18,411,095	21,729,345
Depreciation	1,103,627	1,395,730
Taxation	9,515,576	11,816,737
Net profit	6,858,925	7,170,450
Ordinary dividends	2,701,960	2,668,416
Ordinary dividends (per cent)	22½	22½
Retained by subsidiaries	2,977,137	2,651,373
General reserve	685,527	1,000,000
Stock contingencies reserve		400,000
Added to carry forward	423,351	143,109

4s. ordinary stock at 17s. 6d. yields 15 8s. per cent.

The increase in gross profits in the last few years has obviously owed a good deal to the world-wide inflation of prices, but it has also reflected a steady expansion and development of business—not only in the

dollar-earning trade in potable spirits, but also in the company's participation in the chemical and plastics industries. These developments imply increased investment in both fixed and working capital, and require the continual support of ploughed back profits, as well as of the new money raised by the loan stock; in the latest year the group's general reserves have been reinforced by the appropriation from profits of £1,679,824 (against £3,188,013), and its stock contingencies reserves by the appropriation of £1,561,274 (against £439,190). In the next few years the company's dividend policy must also be geared to the consideration that a speedy conversion of the loan stock (which would be encouraged by an increase in equity distributions) would mean a rapid increase in equity capital. The directors may, therefore, feel under a double incentive not to raise the coupon rate until the development programme has fully matured.

W. H. Smith and Son.—The problems faced by W. H. Smith and Son may differ more in size than in kind from those faced by the newspaper agent "round the corner," but it will be surprising if many of the smaller newspaper and stationery retailers can echo the report made by the group's chairman, Mr. D. J. Smith, that a substantial increase in the value of sales (due almost entirely to last year's all round increases in prices, particularly of the national daily newspapers) was achieved without the loss of any customers. On the other hand, almost all retailers will endorse the chairman's remark that expenses have continued to rise. The main components have been a bigger wage bill, now accompanied by claims for further wage increases, on the retail side of the trade, and a rise in cartage and carriage

costs on the wholesale side. Rising costs have not, however, altogether absorbed the increase in the group's income from its sales (including a continuing expansion in its export trade), so that it has been able to report a further increase in trading profits, from £1,629,094 to £2,154,674.

	Years to Mar. 29, 1951	1952
Consolidated earnings:—		
Trading profit	1,629,094	2,154,674
Total income	1,645,289	2,180,744
Depreciation	160,646	194,543
Taxation	819,567	1,185,622
Net profit	527,789	570,837

Ordinary capital	1,000,600	1,000,600

£1 "A" ordinary stock at 39s. 4½d. yields 16 2s. per cent.

Taxation at £1,185,622 (against £819,567) has eaten into earnings, but group net profits still show an increase, from £527,789 to £570,837. The company has therefore had no difficulty in maintaining the year's distribution on the "A" and "B" ordinary shares at 12 per cent and in increasing its appropriations to revenue reserves from £240,000 to £294,000. Unlike many other retail concerns the group has been able to strengthen its liquid resources, and there should, therefore, be no difficulty in again maintaining dividend payments this year. Shareholders should not hope for much more than this, for Mr D. J. Smith warns them that there is no real prospect of a further large increase in sales this year, especially "as it is hoped that the rise in

Shorter Notes

The Capital Issues Committee, which in the past few months has notably liberalised its attitude towards the capitalisation of company reserves, has now granted permission to Imperial Tobacco to capitalise £22,537,830 from its capital and revenue reserves. The company is therefore to issue 22,537,830 new £1 ordinary shares at par to equity stockholders in the ratio of three new shares for every £5 of stock held. More decisively than many boards, the directors of Imperial Tobacco emphasise that the capitalisation of reserves does not mean bigger dividends. Eschewing the more customary phrases, the directors point out that "the proposed issue contains no element of bonus and carries no implication as to the rate of dividend beyond the fact that whatever the amount to be distributed the rate of dividend will be five-eighths of what it would have been had this capitalisation of reserves not been made."

The Ministry of Materials has announced that control over the purchase and use of teak ended on July 22nd. An import licence will still be necessary when importing teak from outside the sterling area.

prices has been halted." And there is a danger that while sales are being stabilised, costs will continue to rise.

Bleachers' Association.—The slump in the textile trade came too late to be fully reflected in Bleachers' accounts drawn up at the end of last March, so that the group's trading profits show a further increase, from £1,244,211 to £1,423,298, though profits as well as sales must have been tapering off before the end of the financial year. As taxation has increased from £523,518 to £674,817, group net profits have fallen from £433,023 to £419,291. The decision to cut the ordinary dividend from 8 to 6 per cent does not appear to spring directly from this decline. It should be regarded rather as a deliberate attempt to build up the group's reserves in preparation for the effect that the slump in sales will have upon the accounts for the current year. In all, the group has ploughed back £280,000 (against £200,000) to reserves from net profits.

Consolidated earnings:—	Years to March 31, 1951	1952
Trading profit	1,244,211	1,423,298
Total income	1,332,348	1,502,717
Depreciation	150,592	151,856
Taxation	523,518	674,817
Net profit	433,023	419,291
Ordinary dividends	80,193	60,145
General reserve	100,000	100,000
Fixed assets replacement reserves	100,000	100,000
Other specific reserves	79,294	7,320
Added to group carry forward	79,294	7,320
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	5,709,294	5,673,097
Net current assets	1,935,567	2,531,819
Stocks	1,374,206	1,821,653
Cash	338,574	155,844
Reserves	1,850,549	2,175,941
Ordinary capital	1,909,368	1,909,368

10s. ordinary stock at 7s. yields 18 11s. per cent.

The need to make these appropriations is all too apparent from the consolidated balance sheet. Further sums have been locked away in working capital so that cash balances have been reduced from £338,574 to £155,844 and quoted investments from £781,744 to £639,833. The increase in the book value of stocks, from £1,374,206 to £1,821,653, may largely reflect the piling up of unsold stocks in the association's warehouses; the appropriation of £30,000 in a subsidiary company's stock depreciation reserve is a sign that losses on these stocks may be feared. Similarly the transfer of £50,000 to an investments contingency fund indicates a threat of other losses if the group is forced (by the dearth of cash balances) to realise part of its investment holdings. Some measure of the dangers that may lie in store for the association is to be found in the yield of over 8½ per cent offered by the 10s. ordinary stock units at the current price of 7s.

Lewis Berger.—The dividend policy of the directors of Lewis Berger is in sharp contrast to that of the directors of Bleachers. Faced with a similar, if less severe, slump in sales, they have taken the surprising step of increasing the ordinary dividend from 15 to 18 per cent. The advance in group trading profits, from £905,766 to £1,001,748, and the even smaller increase in net profits, from £362,316 to £368,844, might be regarded as providing the justification for this policy, yet it is accompanied by the chairman's insistent warnings about current trading prospects. Having pointed out that profits earned by the group overseas now exceed those earned by its home companies, Mr T. Lilley indicates that sales of the group's paint and related products, particularly in export markets, have been affected since the beginning of the year by credit and import restrictions. Furthermore, in the year to March 31st last, profits of certain overseas companies had already been reduced as stocks had had to be revalued at lower market prices. Mr Lilley also refers to "critical

trading problems" and suggests that the outlook for the group in 1952 is not encouraging.

An examination of the consolidated balance sheet makes the directors' decision to increase the equity distribution no less intriguing. Cash balances have been drawn down from £471,293 to £64,209, and the group has had to borrow £744,677 from the banks. These changes appear to be the direct outcome of further investment in working capital; the

Consolidated earnings:—	Years to March 31, 1951	1952
Trading profit	905,766	1,001,748
Total income	919,019	1,049,250
Depreciation	108,965	119,240
Taxation	398,000	510,000
Net profit	362,316	368,844
Ordinary dividends	126,019	149,482
Retained by subsidiaries	15*	18
General reserve	227,275	207,324
Added to carry forward	Dr 47,794	Dr 2,662
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	2,697,597	3,007,616
Net current assets	2,929,638	2,701,054
Stocks	2,536,452	3,790,638
Cash	471,293	64,209
Bank overdraft	744,677	—
Reserves	3,112,915	2,759,660
Ordinary capital	1,054,550	1,581,825

As ordinary share at 10s. Od. yields 17 4s. per cent.

* Equivalent rate on new capital of £1,581,825.

book value of stocks, for example, has risen by over 50 per cent from £2,536,452 to £3,790,638. This leap can be attributed in part to heavy buying of raw materials by the Australian subsidiary towards the end of the financial year, in an attempt to forestall the import restrictions. In the current financial year the group's liquid resources will be temporarily reinforced by the cash receipts from the sale of the company's leasehold interest in Berger House. But Mr Lilley explains that this sale has been made "in order to arrange that the capital funds expended are reimbursed for use in the production and sale of paint products"—an admission that does not seem to hold out much promise that the company's requirements for working capital will decrease. All this suggests that the very best that can be expected in the current year is that the ordinary dividend will be maintained.

Salts (Saltaire).—In the last few months holders of wool textile shares have grown accustomed to hard knocks; that now administered by Salts (Saltaire) is a pile-driver. In the year to March 31st last, group profits tumbled by over 70 per cent, from £1,960,712 to £527,053. The fact that the "golden fleece" profits of 1950-51 largely represented inventory gains and were in no sense "true" profits does nothing to soften this blow. Indeed the full effect of the recession in trade has not been reflected in the latest preliminary statement, for in the accounts drawn up at the end of last March no provision has been made for the difference of £243,000 between the value of forward purchase contracts for materials and the market replacement value of those materials (or the estimated net realisable value when this is lower). Presumably this loss will have to be written off the current year's profits or made good by writing back part of the stock and contingencies reserve of £1,000,000. Although the provision for taxation has been sharply reduced, from £1,011,365 to £266,172, net profits have fallen from £871,127 to £166,401. The dividend on the ordinary shares has, therefore, been cut from 75 to 50 per cent and the dividend on the preferred ordinary shares from 150 to 125 per cent. These dividend payments, which together amount to £161,175, absorb almost the whole of net profits, so that the transfer of £40,000 (against £580,000) to revenue reserves has been made possible only by drawing down the carry forward from £203,261 to £168,487. After the announcement of the cut in dividends the 1s. ordinary shares were marked down 9d. to 5s., to give a yield of 10 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 19, 1952, total ordinary revenue was £55,568,000, against ordinary expenditure of £73,363,000 and issues to sinking funds £1,050,000. Thus, including sinking fund allocations of £8,557,000 the deficit accrued since April 1, 1952, was £231,919,000 compared with a surplus of £34,405,000 for the corresponding period of the previous year.

CONSUMER RESISTANCE AND WOOL PRICES

MR PHILIP A. WRIGHT ON THE OUTLOOK

The annual general meeting of Patons & Baldwins, Limited, will be held on August 26th at Darlington.

The following is the statement by the chairman, Mr Philip A. Wright, which has been circulated to shareholders with the report and accounts for the year ended May 3, 1952:—

GROUP ACCOUNTS

I reported to you in my statement which accompanied the accounts for the year to April 28, 1951, that a subsidiary company, Patons & Baldwins (Australia), Limited, had been incorporated in Australia for the purpose of taking over the company's business in the Commonwealth and that small subsidiaries had also been formed in France and the Union of South Africa. The statement of accounts circulated to stockholders this year therefore comprises a consolidated profit and loss account (showing the trading results of the company and of the newly formed subsidiary companies as well as the results of Stitchcraft, Limited, a wholly owned subsidiary of your company which has been in existence for a number of years), the balance sheet of Patons & Baldwins, Limited, and a consolidated balance sheet showing the affairs of the group as a whole. In the consolidated statements the interest of outside stockholders in Patons & Baldwins (Australia), Limited, arising from the public issue of preference and ordinary stock in that company, has been shown separately.

THE TRADING LOSS FOR THE YEAR

At the conclusion of my statement last year in attempting to venture an opinion as to the prospects of the company for 1951/52 I stated that the continued rise in the price of raw wool had brought consumer resistance to a head. I further stated that the heavy and continuous fall in wool values which had occurred since March, 1951, coupled with consumer resistance, were likely to make the present year a very difficult one. Events have fully justified the forecast I made. 64's Tops have fallen during the year under review from 290d. to 133d. per lb. and severe consumer resistance has brought the wool textile industry to an unprecedented low level of production. While your company has not suffered as severely as some in this respect, it will be seen from the consolidated profit and loss account that the impact of these changes on the trading results of the year ended May 3, 1952, has been considerable and the group deficit incurred after crediting a surplus on sale of property of £184,457, a profit on exchange of £69,472 and such relief as will be afforded from repayments of British and Dominion taxation is £482,660.

Your company, whilst being a large spinner of yarns for hosiery and other manufacturing purposes, is principally engaged in the production of yarns for hand knitting. The company's raw material is directly purchased in the primary wool markets of the world, processed from the raw state to finished yarn in the company's factories and sold principally on non contract terms. To give efficient service this entails substantial stocks both of raw wool and finished yarns

and it follows, therefore, that when the market value of raw wool collapses in the manner indicated during the past financial year your company is particularly vulnerable. The diminishing spot market in wool in London, the scheme of marketing English wools sponsored by the Government which compels the company to buy its requirements in large lots at a limited number of sales rather than as and when required from merchants, and so far as Australian wools are concerned, the shipping delays in bringing our supplies to this country have all caused the company to carry heavier stocks at certain times of the year and have added to the market risks. During the period of steady and continuous fall in wool values the United Kingdom selling prices of the company's hand knitting yarns were controlled by the Central Prices Regulation Committee upon a basis designed to control prices in an inflationary market and which in a falling raw material market did not permit the recovery of more than a small portion of the cost of materials purchased at higher prices. In these circumstances it is not surprising that the company's results as shown in the attached accounts show such a major reversal from those of the previous year.

THE CONSOLIDATED PROFIT AND LOSS ACCOUNT

The deficit on trading brought into Section I of the consolidated profit and loss account, after valuing all stocks of wool tops and yarns on the basis of the market values of raw wool on May 3, 1952, is £293,492 compared with a surplus for the previous year of £3,834,696. I emphasised last year that this substantial figure could not be looked upon as a normal trading profit as it included moneys recovered from the sale in a rising market of cheaply bought stocks—in 1951-52, as I have already explained, the converse has been the case, and the company has suffered as a result of the sale in a falling market of comparatively dearly bought stocks.

After crediting the non-recurring items of £184,457 surplus arising from the sale of the remaining portions of the company's factory at Melton Mowbray and the major part of Clark Bridge Mills, Halifax, the £69,472 profit on exchange arising as a result of the movement during the year of the Canadian dollar and the consequent revaluation in terms of sterling of the net floating assets of the company's Canadian branch and making such other charges as are shown in Section I of the profit and loss account the deficit carried to Section II is £634,794 compared with a corresponding surplus last year of £3,289,658.

In Section II of the profit and loss account are set out the credits and charge occasioned by British and Dominion taxation. The trading loss of the period will result in due course in repayments of British and Dominion income tax amounting to £252,396. In addition, we have ascertained during the year, for reasons unconnected with the trading loss, that provisions made in earlier years for Dominion and Foreign taxation amounting to £25,112 are no longer required. These sums go therefore in re-

duction of the loss brought in at the head of this section of the profit and loss account. Section II also contains a charge of £97,597 to cover the net British taxation due to profits tax on the payment of the fixed dividends on the company's 6½ per cent and 4 per cent preference stocks, the interim dividend on the ordinary stock of 4 per cent and the final ordinary dividend of 6 per cent which the directors will recommend for your approval at the company's annual general meeting. This charge, anomalous as it may seem in a year in which the company has not earned a profit, arises as a result of the forfeiture of non-distribution relief for profits tax purposes received in earlier years when the past profits out of which the dividend distributions are paid were earned and put to reserve. Since the company is legally bound to pay its preference dividends at the agreed fixed rate the whole of the charge for distributed profits tax falls upon the ordinary stockholder, who in receiving a modest return on his investment out of profits foregone in the past has to bear this onerous sum.

CONTINGENCIES RESERVE

After the debits and credits for taxation the net deficit attributable to Patons & Baldwins, Limited, is £482,660. This figure is struck after including the profits of all subsidiary companies less the proportion of the profits of Patons & Baldwins (Australia), Limited, belonging to the £A750,000 5 per cent preference stock and £A500,000 ordinary stock held principally by Australian investors. The share of the Australian company's profits attributable to these interests is £27,777. Profits, less in the case of one subsidiary a loss, amounting to £4,722 (net) have been retained in the profit and loss accounts of subsidiary companies.

Over the years 1948-1951 the company has built up a contingencies reserve which stood in the 1951 balance sheet at £2,800,000 after deducting the book value of the company's assets in Shanghai. This contingencies reserve was built up out of profits principally for the contingency of a fall in wool value just such as occurred during the past trading year. The directors propose therefore to bring back to profit and loss account a sum of £700,000 from contingencies reserve. This sum of £700,000 is considerably less than the sum of £804,648 which was appropriated to contingencies last year, when I said that in recommending such a large appropriation the directors had in mind the downward trend of wool values and the consequences that must ensue should that trend continue.

DIVIDEND TEN PER CENT

After bringing back the £700,000 mentioned and including £294,313 left in the profit and loss account after deducting from last year's carry forward of £459,120 the preference dividends and the interim ordinary dividend, all of which have already been paid totalling £164,807, the directors have for disposal a credit balance of £511,653. Out of this sum the directors recommend for your approval the payment of a final ordinary dividend of 6 per cent, making a total of 10 per cent for the year, which will involve, less

income tax, £83,123, leaving the carry forward at £428,530. The uncertain outlook has influenced the directors in deciding to recommend a final ordinary dividend of only 6 per cent. The need to conserve the resources of the company is obvious, particularly in view of the substantial amounts required for taxation liabilities early next year. These heavy liabilities are a further example of the drain on industry generally of the present penal taxation which, if persisted in, must inevitably not only restrict expansion but make it difficult or even impossible to maintain existing levels of production.

I consider that in a year which has seen such a major reversal of conditions in the textile industry generally, it is not unsatisfactory that your company has been able to cover its trading deficit, pay the fixed dividends on its preference capital, 10 per cent on its ordinary capital together with the profits tax which this involves by drawing on its contingencies reserve to the extent of £700,000 that is considerably less than its 1951 appropriation of £804,648 and reducing the carry forward on profit and loss account by £30,590.

THE CONSOLIDATED BALANCE SHEET OF THE COMPANY AND ITS SUBSIDIARIES

It will be observed that the balance sheet of the company and that of the group as a whole have this year been presented in columnar form which I think is an improvement.

Taking the group as a whole net assets after deducting the interest of outside shareholders have fallen from £14,850,272 to £14,080,059—a decrease of £770,213. The net value of fixed assets shows an increase from £8,092,157 to £8,532,444. This increase is principally covered by final payments in respect of constructional work at the company's factory at Darlington and the installation there of further machinery. There have been sales during the year of the remaining portions of the company's factory at Melton Mowbray and the major part of the Halifax properties.

Total current assets at £12,885,677 show a decrease compared with last year of £3,394,984. Taking the categories of assets in this group individually the value of stocks has fallen by £3,485,652, sundry debtors and bills receivable by £256,546 and bank balances and cash have increased by £347,214. Looking at the group as a whole the overall weight of raw wool and top stocks is approximately the same as at the end of the 1950-51 year. In the United Kingdom stocks of wool and tops show a substantial increase in weight held. As mentioned previously, the company has valued its stocks at May 3, 1952, including wool, tops, yarns in process and finished yarns on the basis of wool values ruling on the balance sheet date.

Total current liabilities have fallen from £5,342,546 to £3,322,776 principally due to a decrease of £1,516,084 in borrowings from the bank and on acceptance credits. If the reserve for future taxation of £1,180,000 shown in the 1951 figures is taken into account the fall in the liabilities of the group as a whole is correspondingly greater.

EXPORTS

In the export markets as in the United Kingdom consumer resistance to high prices caused the volume of business done by the company in overseas markets to contract in 1951/52 compared with the previous year. In recent months the urgent necessity to bring international indebtedness under control has resulted in further severe restrictions in imports with the resultant counter restrictions of one form or another by the countries affected. While these restrictions may be a vital necessity at the present time it is

difficult to see in them any long-term solution of the immediate trade problems confronting the world. Surely the only sound solution is, as soon as practicable, to free the currencies from control and allow the balance of trade between countries to find its own level.

SHANGHAI

The note to the balance sheet fully sets out the treatment afforded in the accounts to the trading results of the company's former branch in Shanghai, China, and to the assets and liabilities of Patons and Baldwins (Far East) Limited, which, during the year, took over the former branch. You will have seen the statements in the Press concerning the withdrawal of British business interests from China. Your subsidiary company, Patons and Baldwins (Far East) Limited, has associated itself with the other major British interests in China in approaching the Central People's Government with this in view.

PERSONNEL

The board are very relieved that your company has been able to get through this very difficult year with little or no short time working and are hopeful that the same conditions can be maintained during the coming year. I greatly regret that the results of the year's trading do not justify, this year, the payment of a bonus to employees and I hope before long it will be possible for them again to share in the prosperity of the company. We are grateful to all of them for their efforts

and for their loyalty to the company's interests and would again specially mention those few gallant men who have upheld our interests in Shanghai under the most trying conditions.

THE FUTURE

It is customary in a chairman's statement to venture an opinion as to the prospect for the future. I find upon looking back that I, and my predecessor in office, Mr Alexander Forrester-Paton, whilst being reasonably optimistic as to the company's capacity to manufacture and sell a product of high repute have been guarded as to our prospect for the future because we have felt over recent years that the steadily increasing level of wool prices could, in the end, only lead to difficulties for us as a company. Whilst in the circumstances it is no consolation to be proved right by events, I think we can be considered fortunate to have come through the past twelve months no worse than has proved to be the case. Though wool values have recovered somewhat since the date of the balance sheet their future course is still very much in doubt but it is clear that the past year has seen the major portion of the recession which so obviously had to be faced when one considered the peak prices to which wool had risen by March, 1951.

The coming year is likely to be again a difficult one but I am hopeful that it will also see the commencement of a recovery in the wool textile trade, but whatever there is in store I am confident of the company's ability to meet the future.

RHODESIAN CORPORATION

REVIEW OF PROGRESS AND PROSPECTS

The twenty-sixth annual general meeting of Rhodesian Corporation, Ltd., was held on July 22nd at the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.

Mr L. C. Walker, FSAA, chairman of the company, presided.

The Chairman said: You have had the accounts of the corporation for the fourteen months ended September 30, 1951, in your hands for the past six weeks, and with your permission I am going to ask you to take them as read, but before moving their adoption I feel it is my duty to bring you up to date with the corporation's activities, as it is over nine months since the close of these accounts.

The first matter I wish to bring to your attention is the fact that we have arrived at the position whereby the corporation has been enabled to declare an interim dividend of 5 per cent in respect of the current year, which was paid on July 21st, thus fulfilling the endeavours aimed at by your directors.

INVESTMENTS

Your corporation holds a substantial interest in the Bulawayo Board of Executor and Trust Company, one of the oldest and most important trust companies in the country. Their business is being rapidly extended, with the result that steady and increasing dividends are being paid. Among other investments of your corporation we have large holdings in Falcon Mines, Rhodesian Brick and Pottery, Northern Rhodesian Copper shares, Wankie Colliery, the Chartered Company, and in the main all our investments are in companies with Rhodesian interests.

Falcon Mines has continued to make satisfactory profits, and the commissioning of the Dalny Mine main reduction works during the June quarter, as forecast by the chairman of that company, will enable increased profits to

be earned. The capital expenditure programme at the Dalny Mine has now been largely completed.

RHODESIAN BRICK AND POTTERIES COMPANY, LIMITED

Good progress is being made with the erection of the Salisbury plant, and it is anticipated that the plant will be completed and in production by the end of the year. The plant is of the very latest design.

The Bulawayo works are making steady monthly profits with an increasing demand.

TOBACCO

A further factor enabling us to look ahead in respect of our profits for the current year is the excellent returns we have obtained from our tobacco crop (only half of which so far has been realised) at prices well up to our expectations and yielding in the aggregate a good profit.

I must warn you, however, that while we have every intention of extending our tobacco acreage, the situation arising from the present labour shortage must not be lost sight of.

Our Trelawney Estate, on which we concentrate most of our tobacco cultivation, has been greatly improved by the building of a dam, which has solved the problem of irrigation.

ESTATES

I would like to draw your attention to the Southern Rhodesia Government's scheme for the development of a satellite town known as Norton, in the area adjacent to the Hunyani Dam, and in close proximity to our Kent Estate of approximately 20,000 acres—which is only 20 miles from Salisbury. This should lead to the early development of this estate,

and your directors are hopeful that a portion of this estate may be required for industrial and residential development.

With regard to the agricultural and ranching side of the estate, improvements have been made in the production of maize and other commodities for feeding purposes, but unfortunately setbacks in the way of cattle diseases continue which affect the production of the best type of our ranching herd.

Regarding our other estates which adjoin the Salisbury and Bulawayo townships, consisting of approximately 16,000 acres, restrictive legislation in force at present prevents any development. However, in the interests of the country, we are prepared to lay out these estates as residential areas as soon as permissible.

Mining

As shareholders are aware, the Redwing mine is the only mining venture which the corporation has retained, and development is concentrated on sinking the shaft, which has now reached a depth of 775 ft. As soon as the work of sinking to the 8th level is completed development on the various levels on a larger scale will proceed.

Finance

At the present time our actual cash resources, after payment of the dividend, remain at upwards of £66,000; our quoted investments have a market value of £494,200, and our unquoted assets, some of which yield good dividends, are, in the opinion of your directors, fully worth the book valuation. In addition, we have fully secured loans, also balances due in respect of land sales, and our current assets are valued at approximately £750,000.

As a safeguard against depreciation of investments, we have created an investment depreciation reserve of £60,000.

In conclusion, I would like to express the appreciation of the directors to the staff, and in particular to the secretary, in London, for the estimable services they have rendered, also to the staff in Bulawayo and Johannesburg.

The report and accounts were adopted.

THE TRUSTEES CORPORATION, LIMITED

A SUCCESSFUL YEAR

The sixty-fourth annual general meeting of The Trustees Corporation, Limited, was held on July 23rd at Winchester House, E.C.2. Mr L. A. Stride, the chairman, in the course of his speech said:—

Once again we are able to present to you accounts which are satisfactory.

Gross revenue from interest and dividends at £380,429 shows an increase of £46,607 over last year. From Winchester House, in spite of increased running costs we report a profit of £29,320. The total revenue for the year amounts to £418,262, compared with £368,173, an increase of £50,089.

Our net revenue amounts to £247,877. We now recommend a final dividend of 11 per cent with a bonus of 2 per cent, both less income tax, on the ordinary stock (making a total of 20 per cent for the year).

Balance Sheet: The total of our revenue reserves is now over £898,000, compared with our issued ordinary capital of £875,000.

In my personal opinion the present standard of living cannot be maintained much longer. If, however, the people of this country will only spend less individually, refrain from demanding 500 or 600 million pounds increase in wages and salaries for a

year, then we shall find the paper £ buying more and more instead of less and less. In that event we shall be able to regain and probably improve upon our recent standard of living. For the current year I expect the revenue to remain buoyant, although it will probably not reach the peak achieved during the past year.

The report was adopted.

LONSDALE INVESTMENT TRUST

ANOTHER SUCCESSFUL YEAR

MRT. L. McC. LONSDALE'S STATEMENT

The fifth annual general meeting of Lonsdale Investment Trust Limited was held on July 23rd at 22 Old Broad Street, London, E.C.

The following is the statement by the chairman, Mr T. L. McC. Lonsdale, which had been circulated to stockholders with the report and accounts for the year ended February 29, 1952:—

The group has had another satisfactory year. There was a further improvement in the Trust's gross revenue from £176,263 in the previous year to £197,100. Dividends from general investments increased by £20,645; dividends from subsidiary companies remained unchanged, including 7½ per cent from Robert Benson, Lonsdale and Co. Limited, but there was an increase of £42,198 in the revenue reserves carried forward in that company and its subsidiaries. After charging profits tax and income tax, which were larger by £13,026, the net profit of the Trust increased by £6,723. After paying the preference dividend and the proposed dividend of 10 per cent on the ordinary stock, the carry forward is increased by £20,322. The total taxed revenue reserves of the group have therefore increased by £62,520 to £285,233 during the year.

The rise in the book figure for investments quoted in Great Britain is mainly due to the inclusion under this heading of the Trust's holding in certain companies previously unquoted for which a quotation was obtained during the year. The fall in values on the London Stock Exchange is reflected in the reduction in the market value of quoted investments.

The profits of Robert Benson, Lonsdale and Co. Limited, were well maintained although the last six months of the company's year coincided with the waiting period between the election and the Budget, a material change in the financial climate and a marked recession in the textile industry. The current year has been satisfactory to date and several projects for new capital issues are under consideration. I need hardly emphasise, however, the difficulty of making predictions regarding future results.

EROSION OF CAPITAL

I must stress again what I have said in each of the last two years—for it is not only of the utmost importance for an issuing house, but of vital concern to the national well-being—that inflation and the incidence of high rates of taxation, based on profits which are arrived at before taking into consideration replacement values of stock and plant, are forcing companies to seek fresh capital not only for developing their businesses, but also for maintaining them at the present level.

This erosion of capital is aggravated by the imposition of the Excess Profits Levy as a further tier of taxation on companies, in addition to income tax, distributed and undistributed profits, which cannot but deter

progressive businesses and greatly complicate the already difficult work of an issuing house.

INDUSTRY'S PROBLEM

If British industry is to re-equip itself and develop, as it must, for the nation to support its present population in the standard of life which we wish to maintain, there must be real savings by companies and by individuals. The problem is twofold; firstly, to create an atmosphere conducive to savings by companies and individuals alike; secondly, to give to the potential investor an inducement to make his funds available for the development of industry. The first requires a reduction in taxation; the second a feeling of confidence that Government taxation policy will not be operated in a manner deliberately to destroy the rewards appropriate to the investment made. Industry has inherent hazards of its own; potential investors must be encouraged to take those risks and not, as at present, be discouraged by the special selection of industry as a victim for differentially higher taxation with a variety of taxes whose rates are unpredictable from year to year.

If such an attitude prevails it is difficult to see how industry will get the capital it requires. I earnestly hope that the Royal Commission for Taxation will use the weight of its impartial authority to show how dangerous the present tendencies are.

The report and accounts were adopted.

HENRY HOPE & SONS, LIMITED

SATISFACTORY TRADING

The fifty-fourth annual general meeting of Henry Hope & Sons, Limited, was held on July 23rd at Halford Works, Smethwick, Mr H. Donald Hope, chairman of the company, presiding.

The following is an extract from the chairman's statement for the year to March 29, 1952:—

You will observe that the total net profit after taxation, including dividends from subsidiaries, is £186,393 against a total of £232,129 for the previous year.

Wages and prices continued to rise throughout the financial year, and we have been compelled to increase our selling prices to keep pace with this inflationary spiral. Unfortunately, the Government department which controls the selling price of much of our output has been erratic and sometimes dilatory in dealing with our claims for legitimate price increases. The low profit on our home trading is again largely due to the Government's insistence on pegging prices at too low a level.

Taxation.—Last year British and foreign taxation took just over half our gross profit. This year it has risen to two-thirds, and we have reached the position both in this country and the United States, where companies—like individual surtax payers—have no encouragement to increase profits or turnover.

Hope's Heating and Engineering Limited.—This subsidiary has brought its share to the trading results and it is noteworthy that the success of this division is largely due to the efficiency of their oil burners and coal stokers as well as to their dust and fume removal and ventilating plant.

Important Contracts.—While the reduction in profit is disappointing, the stockholders can take satisfaction in the remarkable strength of the business. Trading on the whole has been satisfactory and has included many notable contracts.

The report and accounts were adopted.

ROLLS-ROYCE, LIMITED

ANOTHER SUCCESSFUL YEAR

RECORD TRADING RESULTS

LORD HIVES ON LARGEST SINGLE DOLLAR ORDER

The forty-fifth annual general meeting of Rolls-Royce, Ltd., was held on July 22nd at the Midland Hotel, Derby, The Right Hon. Lord Hives, CH, MBE, LLW, DSc (the chairman), presiding.

The following is an extract from his circulated statement:—

I am very glad to be able to report another successful year's trading. The profits are a record for the company.

The chief source of additional revenue was the increased and more up-to-date production facilities provided by your company. Altogether over four million pounds of the company's money has been spent since the end of the war, with considerable commitments still outstanding. In the majority of cases the decision to order this new equipment was taken by your company quite irrespective of the present rearmament programme.

It is a complete justification of the policy which has been pursued by your company for a number of years of keeping its factories and plant up to date. This expenditure was only possible because profits had been retained in the business in past years.

Last year your directors felt justified in recommending that the dividend distribution should be restored to the 1938 level. This year we think it is reasonable that the stockholders see a modest increase. Your directors therefore recommend a final dividend of 10 per cent, making 15 per cent for the year.

We accept that the excess profits made on purely rearmament work may be subjected to special tax. We do submit, however, that it should not be overlooked that the present rearmament programme, which is planned to a terrifying extent throughout all the free nations of the world, can only be regarded as a gigantic stockpiling operation in any circumstances short of war. We all hope and pray that it will remain so.

Your company has a national responsibility in the defence programme, and we have an obligation to carry out the wishes of the Government, even to the extent of sacrifice of commercial enterprise. For future business we shall have to rely more than ever on the superior quality of Rolls-Royce engines.

The essential task at the moment is the re-equipment of the Royal Air Force, but in this it is to be sadly regretted that orders were not placed in time for various types of British aircraft, with the result that the Royal Air Force is being supplied with American equipment. This is not only a matter which concerns the pride of the British industry: it is only to be expected that our allies will adopt equipment similar to the Royal Air Force.

AERO DIVISION

On the military side, the Canberra fitted with the Rolls-Royce Avon engines is now being delivered in quantities to the Royal Air Force.

The production of Dart engines for the Vickers Viscount has now started. During the past year additional orders have been received by Vickers from overseas.

Delivery of Avon engines from Glasgow has now started. The plans for the manufacture of our engines by the Bristol Aeroplane Company, Limited, D. Napier and Sons,

Limited, and the Standard Motor Company, Limited, have gone ahead, and we continue to give them every assistance.

We welcome the scheme of "super priorities" which was announced only this year. It is of particular interest to us because most of the aircraft on the list use our engines.

We have this year obtained, against American competition, an order for a very considerable number of Nene engines for training aircraft to be built in Canada. This order probably represents the largest single dollar order ever secured by the British aircraft industry.

Our existing arrangements in Australia have continued to operate satisfactorily. Commonwealth Aircraft Corporation are in production on the Nene engine and are well under way towards producing Avon engines.

Merlin engines have continued to give a good account of themselves in civil operation, and we have built up experience which will be of great value to us as our commitments increase with the operation of the Dart/Viscount and the Avon/Comet. We fully realise the obligations to stand behind these engines and provide service and spares on a world-wide basis.

MOTOR CAR DIVISION

During the year our Rolls-Royce and Bentley cars continued to meet with approval from a growing body of owners, but import and other restrictions abroad have still further narrowed the markets to which we can export freely. At home it is unfortunate that controls and material shortages prevent us, on the production side, from achieving the output and efficiency which we desire.

It has unfortunately been necessary once again to increase our prices to cope with the considerable rise in cost of materials during the year, and also a further national wage award. The effect of these increases in manufacturing costs is, of course, greatly inflated by the 6½ per cent Purchase Tax which the motor car trade has to bear. It is vital that the Government should keep this tax under constant review, so that it can be adjusted at the proper time, and before irreparable damage is done to the industry.

Production and development of the "B" range of military and commercial petrol engines are proceeding actively, and the motor car division is also carrying out other development work in connection with the military side of the rearmament programme.

Manufacturing conditions at home and marketing conditions throughout the world have made the year a very perplexing one. We have endeavoured to tackle the many shortages at home as they have revealed themselves. We have had to adapt our policy at home and abroad to the market conditions, which are often complicated by political considerations.

It is as well to remember that the unique reputation which your company has built up and held for so many years, with widely varying products, is the result of the unequalled skill and experience of your executive officers; to the profound knowledge and enthusiasm of the staff, and eventually to the pride and loyalty of all the Rolls-Royce workers.

The report and accounts were adopted.

WILLIAM HANCOCK AND CO.

The sixty-fifth annual general meeting of William Hancock and Company, Limited, was held on July 24th in Cardiff, Colonel J. Gerald Gaskell, CB, TD, DL (chairman and managing director), presiding.

The following is an extract from his circulated statement:—

The profit on trading has increased from £253,379 to £314,000. The net profit of the company has increased this year from last year's figure of £71,977 to a figure of £79,774, which I think you can consider as being reasonably satisfactory.

Most departments—namely, brewing, bottling, wine and spirit and minerals—have helped to obtain this year's result, with the exception of the catering department, where the results are very disappointing compared with previous years.

The proposed rate of interest on the ordinary stock remains at 14 per cent for the year.

During the year we have had to meet many increased costs for materials that are required in our industry—casks, bottles and cases, etc.—but they have not been so severe as in the past, with the one exception of brewing materials—namely, malt and hops. I have no doubt that the new season's malt will show a considerable reduction for the reason that more barley is being grown this year than last.

There is one satisfactory feature of the year's working and that is that we have maintained our sales, in fact slightly increased them as far as our beer sales are concerned, and this in spite of the most intensive competition.

The report was adopted.

THOMAS BROWN & SONS, LIMITED

The fifty-fifth annual general meeting of Thomas Brown & Sons, Limited, was held on July 15th in London, Mr John M. Lawrence (the chairman) presiding.

The following is an extract from his circulated statement:—

Your company has had another successful year of trading. The net profit of the company and its subsidiaries amounted to £113,470, compared with £84,652.

Your directors propose that a final dividend of 2s. per stock unit and a bonus of 1s. per stock unit on the ordinary stock should be paid, making a total of 4s. per stock unit (or 20 per cent) for the year.

From June to December almost unprecedented drought conditions prevailed in Queensland. This affected very adversely the sugar, dairying and farming industries. Rain fell in January and February over a greater portion of Queensland and relieved the position, but it was not until late March that the heavy rains that are generally expected early in the year eventuated.

On March 7th this year the Australian Government made a most drastic reduction in the goods that can be imported in Australia. If the regulations be not modified, our imports during the current financial year will be considerably less than during the year under review, and this will have serious repercussions on our trade in imported goods.

It is impossible to forecast the future with any degree of accuracy. The activities of your company are, however, widely spread and soundly controlled under the present management.

The report was adopted.

JOHN THOMPSON LIMITED

(Steam Power Plant and General Engineers)

INCREASED OUTPUT

£33 MILLION WORK ON HAND

MR EDWARD W. THOMPSON'S REVIEW

The seventeenth ordinary general meeting of John Thompson Limited was held on July 23rd at Ettingsall, Wolverhampton.

In the temporary absence, through indisposition, of the chairman, Mr Edward W. Thompson, MA, the deputy-chairman, Mr J. H. N. Thompson, MC, MA, AMIMEchE, presided.

The following is an extract from the chairman's circulated statement:—

Our net profits after paying £600,007 for taxation and providing £203,491 for depreciation are £393,880; this compares with £402,400 for the year 1950 and £312,174 for the year 1949.

The gross trading profits of the group for the year 1951 at £1,251,991 show an increase of £50,786 over the corresponding figure for the year 1950 and an increase of £375,504 over that for the year 1949.

The output for the past year is more than two and a half times that for the year 1946, indicating the development and progress made by your company since the war.

The output for 1951 in money values again increased by £2 million from £9 million to £11 million as mentioned above; our gross trading profit before taxation, depreciation, etc., increased by only approximately £50,000, and due to higher taxation and depreciation the net profits were slightly lower.

The total taxation charged in the accounts this year at £600,007 is again an increase of £29,495 over the previous year. During the current year we have to contemplate paying the new Excess Profits Levy, which will almost certainly involve us in additional taxation. Your board are in entire agreement that excessive profits should not be made out of rearmament contracts. As far as we are concerned, however, we are only directly commencing our rearmament work during the present year 1952, and the greatly increased gross profit figures for 1951 and 1950 as compared with the previous years were not the result of direct rearmament work, but were due to the development and expansion of our normal business both for home and export in the years since the war, and were, as previously mentioned, a direct result of the capital expenditure incurred during that period.

The original proposal for the Excess Profits Levy standard was to base it on the average of the years 1947, 1948 and 1949, and was most unfair to our company, since in 1947 we had not recovered from the changeover to normal work after the war. Subsequent alterations to the proposed standard substituting the average of the years 1948 and 1949 will be less penalising to our company, but, undoubtedly, no standard period could be fair that does not include the year 1950—a year which, as stated and as far as we are concerned, does not include any direct rearmament work whatsoever.

DIVIDENDS AND CAPITAL

Your directors have again decided to recommend the repetition of the same total dividend in respect of the year 1951 as in the previous year, namely, a final dividend of 12½ per cent which with the interim

dividend of 10 per cent already paid will make a total of 22½ per cent for the year. The total amount paid out in dividends, therefore, will be exactly the same as in the previous year.

You are, of course, fully conversant with the recent increase in capital which it has been found essential to secure, and it is only necessary, therefore, to restate the position very briefly. The capital of the company was increased by £150,000, and new shares in the ratio of one new share unit for each four units already held were offered to existing ordinary shareholders at a price of 14s. 6d. per share. The amount realised by this issue was just under £500,000, and as explained in the various circular letters at the time, the issue was necessitated by the increase of £875,000 in the stock and work-in-progress as at the end of 1951 compared with the corresponding figures at the beginning of that year, and the obvious need to finance the increased, and increasing amount of work on hand.

Even with this new increase in capital the company's issued and paid-up capital is only £1,341,065 consisting of £481,116 preference capital and £859,949 ordinary capital, whereas the capital actually employed in the business is now almost £3,750,000. This large sum is a result of the conservative financial policy which your board has pursued during past years.

FUTURE PROSPECTS

We have experienced considerable difficulties in the early part of this year due to the shortage of steel and other materials, but in spite of this the average output of our subsidiary companies shows a reasonable increase as compared with the same period of 1951, and as far as the home companies at the end of March, 1952, were concerned showed a total increase of over 18 per cent. If this output can be maintained and material supplies do seem a little easier, there is no reason why the gross trading balance for 1952 should not be as equally satisfactory as last year.

The work in hand of our various companies has again increased, and is now approximately £33 million; again, to some extent, the result of long-term contracts.

The home trade of our companies is mainly devoted to essential requirements. Important contracts have been completed and others are on hand for power stations for the British Electricity Authority. Essential boiler plant is being supplied to various types of industry, and I am gratified to say that our Motor Pressings Company is maintaining its good service to the motor industry.

We are maintaining our efforts to increase our export trade, and direct and indirect exports of our companies during 1951 were approximately £3 million. Foreign competition, however, in exports even for our type of business, is increasingly severe, but our subsidiary companies in the Commonwealth and our agents throughout the world are meeting the challenge most successfully.

The report and accounts were adopted.

F. H. LLOYD AND COMPANY

FURTHER IMPROVEMENT

MR F. N. LLOYD'S STATEMENT

The sixty-fifth annual general meeting of F. H. Lloyd and Company, Limited, was held on July 18th at the registered office, James Bridge Steel Works, near Wednesbury, Mr F. N. Lloyd, chairman and managing director, presiding.

The secretary, Mr E. Allison, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:—

Ladies and Gentlemen,—I am glad to be able to report a further improvement in the accounts for the year ended March 31, 1952. There was an increase of 16 per cent in the tonnage of castings dispatched, and their value was further enhanced by an increased proportion of alloy heat treated work and also an increased proportion of castings sent out in the machined condition or as finished machinery.

There has also been an increase in earnings per employee of 16 per cent by comparison with the previous year. This has come about partly as an outcome of the national wage advances during the year, and partly due to increased piece-work earnings. Bearing in mind the very substantial amount of increased machinery put to work by the company during the year, it cannot be said that our employees, who have not increased in number, have not benefited in proportion to the increased amount of work that they have turned out.

FURTHER PLANT NEEDED

The additional equipment, without which the improved results now shown would not have been possible, was financed by the proceeds of the issue of capital that we made early in 1951. The need for still further re-equipment is as great as ever, and will undoubtedly fully tax the financial resources of the company in the future. The cost of new plant and equipment is increasing steadily, and there is also a tendency for delivery dates to become longer rather than shorter.

Both our subsidiary companies, Lloyds (Burton), Limited, and Parker Foundry (1929), Limited, have shown record productions and earnings during the year. Neither of these companies has since the date of their establishment made any contribution towards the earnings of the parent company, all profits earned having been retained in the subsidiary companies and devoted towards their development and improvement.

Since the beginning of 1952 there has been some slackening in the demand for castings for ordinary commercial purposes, and owing to the present difficulties of international trade, the future outlook for our ordinary business is somewhat uncertain. We are, however, kept fully employed as requirements of national defence have more than taken up any slack that has developed in other directions, and we do not anticipate much difficulty in maintaining a full order book during the current financial year.

NET PROFIT AND DIVIDENDS

The net profit, after providing for depreciation £82,055 and taxation £400,000, amounts to £316,036, as shown in the consolidated profit and loss account. To this is added £3,703, over-provision for taxation by subsidiary companies in the previous year.

During the year interim dividends were paid of 2½ per cent, less tax, on the 5 per cent cumulative preference shares and 5 per cent, less tax, on the ordinary shares. We are now recommending an increase in the plant replacement reserve of £168,000, making the total reserves £325,000, and an allocation of £81,000 to general revenue reserve, which then stands at £483,000. Our recommendation regarding the plant replacement reserve arises from the necessity to provide for the likely rising cost of the additions and improvements to plant mentioned earlier.

We also recommend the payment of final dividends on the share capital of 2½ per cent, less tax, on the cumulative preference shares and 12½ per cent, less tax, on the ordinary shares, which in total will absorb £42,788. The balance on the consolidated appropriations account to be carried forward to next year is increased to £65,851 compared with £57,456. In recommending that the ordinary dividend be increased by 2½ per cent over last year, your directors have done their best to meet a situation brought about by the company's improved trading, coupled with the Chancellor's appeal for restraint in dividend distribution.

Finally, I would like to join with my colleagues on the board in expressing our appreciation of the efforts of everyone connected with this company's activities. The will to work, coupled with that sense of responsibility so essential to progress has, throughout the year, been apparent in all that they have done.

The report and accounts were adopted; the proposed dividends were approved; retiring director, Mr E. S. Everitt, was re-elected, and Messrs Agar Bates Neal and Company were appointed auditors.

BRITISH BORNEO TIMBER COMPANY, LIMITED

A BONUS ISSUE

The thirty-second annual general meeting of this company was held on July 24th in London, Mr H. W. Horner, chairman, presiding.

The following is an extract from his circulated statement:—

From July 1st this company starts a new phase of its life. The proposals approved at the extraordinary general meeting of members held on March 22, 1951, have been carried into effect by formal agreement with the Colonial Office.

Permission has been granted for the company to capitalise £120,000 of the amount at credit of general reserve; this will be issued as a bonus to members, in the proportion of two new stock units for every three now held.

It is proposed to hold the meeting in September to give them effect.

We are proceeding as rapidly as practicable with the extensive programme of re-equipment, on which, and on labour saving mechanisation of logging operations and transport, the board have undertaken expenditure totalling £276,000.

The balance on working for the year, in the production of a rather smaller volume of timber, was nearly £50,000 better than for the previous year, the results for which were then helped by bringing in excess provisions of previous years of approximately £40,000. The board have transferred £40,000 to general reserve, and propose to repeat last year's dividend at 20 per cent.

The report was adopted.

THE A.P.V. COMPANY

CONSISTENT AND SATISFACTORY PROGRESS

The forty-second ordinary general meeting of The A.P.V. Company, Limited, was held on July 23rd in London.

The following is an extract from the chairman's circulated statement:—

The group trading profit for the year amounted to £719,030, of which £565,654 was earned by the company and £153,376 by the subsidiaries.

The results are evidence of consistent and satisfactory progress, but your directors have felt it desirable to resist the temptation to make a more generous distribution to shareholders, because of the continuing need to retain profits in the business for development purposes. The provision for group taxation amounted to £334,433.

During 1951 there was no relaxation of the strain put upon your factories by the great volume of turnover needed to cope with the demand for the company's products. Indeed, the reverse was the case and the strain was greatly increased, both by the additional turnover called for and by the difficulty of obtaining some raw materials. Orders on the company's books at January 1, 1952, exceeded those in hand on January 1, 1951, by nearly 10 per cent. Your company's efforts to assist in the drive for exports were maintained and even extended during the year. The export orders received by your company were higher than in 1950 and represented 42 per cent of all the orders received.

I mentioned last year the great demand of industry for what I called stainless steel secondary equipment. This demand reached totally unexpected levels during 1951 and rapid development of your company's productive capacity for such equipment was necessary. These developments have now been in great measure effected and we are in a position to meet almost all the reasonable demands put upon us.

FUTURE PROSPECTS

In considering the future when I addressed you last year, my chief anxiety was the prospect of severe and, in some cases, total restriction of the supply of raw materials essential to the manufacture of the company's chief products. I am glad to say that these restrictions have not taken the extreme form which all anticipated and that although there have been and are serious difficulties with some raw and some semi-manufactured materials required, on the whole it appears that, unless new restrictions are imposed, your company will not be prevented on this account from completing its manufacturing programme this year. What lies beyond this year no one can tell.

The first stage of the building of your new factory and foundry in Crawley, Sussex, is now nearing completion and limited production should begin there within a matter of weeks. With the completion of stage 1 now in sight, attention is being devoted to the initiation of stage 2 of the move to Crawley. The economies arising from this move should be considerable.

It will be clear to you from the brief summary I have given you that an immense burden has fallen upon the shoulders of all your employees from the directors downwards. If only the same willingness to work, the same enterprise and initiative can be maintained in the future, your company should emerge successfully from the difficulties and trials which undoubtedly face the engineering industry today.

The report was adopted.

NCHANGA CONSOLIDATED COPPER MINES LIMITED

RECORD RESULTS

The fifteenth annual general meeting of Nchanga Consolidated Copper Mines Limited will be held on August 14th, at Kitwe, Northern Rhodesia.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, circulated with the report and accounts:—

It is just over 18 months since the management and control of your company were removed to Northern Rhodesia. The course of events during that period has demonstrated that the decision to make this change was completely justified. The location of the head office enables policy determinations to be made locally in the light of first-hand knowledge and with the benefit of consultation with Government and other authorities. This is particularly desirable, in view of the increasingly complex political situation, since the views and policies of the copper mining companies on all major questions, particularly those concerned with European and African labour problems, must necessarily carry considerable weight in the territory. The results for the year to March 31st last show new records for production, sales and profits.

In my statement accompanying the 1951 report I said that it was the intention to provide finance for the capital expenditure programme, comprising mainly that on the third stage extensions, chiefly by raising capital and partly out of profits. Last year £700,000 was appropriated out of profits and in view of the continued prosperity the board has appropriated from this year's profits the sum of £2 million. The question of how the balance should be provided is receiving active consideration.

SUPPLY OF POWER

Of prime concern to this and the other copper mining companies in Northern Rhodesia is that of power supply. I mentioned to members last year that the Power Interconnection Scheme on the copperbelt—a local "Grid" system—was likely to be commissioned towards the end of 1951. Owing to delays in deliveries of essential equipment, commissioning has had to be postponed, but is now imminent. An integral part of the scheme is the installation of further steam power plant.

I would like to say something about copper prices. It is common knowledge that other base metals have reflected a downward trend since the beginning of 1952. However, copper has not only maintained its price during this period, but has recently advanced. The abrogation by Chile of the agreement with America to supply that country with electrolytic copper at 27.50 cents per pound, and the reduction in American domestic production caused by strikes have not only led to further releases of copper to industry from the American domestic stockpile, but have also resulted in the American authorities permitting consumers in that country to purchase foreign copper at any price. This has resulted in an increase in the American export price, which in turn has been reflected by an increase in the price paid to your company by the British Ministry of Materials.

Copies of the annual report and accounts may be obtained from the Head Office, Kitwe, Northern Rhodesia, or from the Transfer Offices at 44, Main Street, Johannesburg, and 11, Old Jewry, London, E.C.2.

E. K. COLE, LIMITED

CONTINUED EXPANSION

The annual general meeting of E. K. Cole, Limited, was held on July 24th, at Southend-on-Sea.

Mr E. K. Cole (chairman and managing director), who presided, in the course of his speech said:—

We have had another successful year. The trading profit amounts to £536,282 and the net profit, after providing for all expenses, including depreciation, but before deducting taxation, is £463,215, an increase of £38,163 over the previous 12 months.

The taxation liability in respect of the profits for the year under review has been provided for by the transfer of £304,000 to taxation reserve, leaving a net balance of £159,215, to which is added £50,000 provided for taxation in previous years not now required.

RADIO AND TELEVISION

We were able to take full advantage of the good trading conditions which prevailed in the industry during the year. The opening of the North of England and Scottish Television transmitters led to a further expansion of the television market and our receivers commanded gratifying support by the public. Our policy of producing television receivers with the largest possible screen consistent with moderate prices continued to be successful.

Last year I made reference to the onerous increase of 33½ per cent in the Purchase Tax rate on television and radio receivers since when the present Chancellor has imposed restrictions on hire purchase transactions which require not less than 33½ per cent of the price to be paid down and limit the maximum period during which the balance may be repaid to eighteen months. It will be appreciated that these two factors must have and are having a detrimental effect on the industry. It is realised, of course, that to improve present national economic conditions strong measures are necessary but, at the same time, it is acknowledged that to hold one's own in the export markets of the world it is essential to have a flourishing home market. Our volume of home television production has enabled us to quote competitive prices in Canada and South America with the result that we are already in production on one order for television receivers worth more than 1,500,000 dollars and await final confirmation of another amounting to over 650,000 dollars. We can only enlarge on this important new export outlet by low costs and competitive prices which in turn can only be maintained by a big volume of home production.

ELECTRONICS

The expansion of this division in the production of radar, communications and nucleonic equipment for Government services and commercial use continues and a satisfactory contribution toward the trading results of the company was made.

PLASTICS

In spite of difficult conditions towards the latter part of the year this division increased its turnover and operated profitably and this was due in no small measure to the success of efforts made to secure the utmost efficiency.

EXPORTS

Our turnover with overseas countries has again reached a new record. Our export department is to be commended on this result, and we shall endeavour to maintain and expand our overseas business.

The report was adopted and a total distribution of 25 per cent was approved.

WHITBREAD & COMPANY

COL. WHITBREAD'S STATEMENT

The annual general meeting of Whitbread Company, Limited, was held on July 18th, in London, Colonel W. H. Whitbread (chairman and managing director), presiding.

The following is an extract from his circulated statement:—

The profits of the parent company for the year, before providing for taxation, amounted to £1,572,097, which shows an increase of £282,459 over the previous year. The taxation charge, however, is £967,731, compared with £743,753 for the previous year; an increase of £223,978. The consolidated accounts give a similar picture. The profit for the year before providing for taxation is £1,780,536, which is an increase of £309,782. Again, the taxation charge is higher, at £1,123,272, compared with that of the previous year of £860,082, an increase of £263,190. You will observe that taxation dominates the whole of the results. After all the year's hard work the group net profit shows an increase of only £46,592, all the rest of the increased profit, amounting to £263,190, being taken by the Chancellor for distribution to the Welfare State.

Although taxable profit is four times as much as in 1938, the burden of taxation has increased by nearly six times during the same period.

DESTRUCTIVE TAXATION

Out of a group trading profit of £1,780,536, the taxation charge absorbs £1,123,272. Of this taxation figure, £522,244 is in respect of profits tax—this is £211,000 more than last year. Furthermore, after studying the effects of the recent budget, we believe that the tax on our profits for the current year will be at least as high as for the year under review. It is obvious that taxation at this rate makes it financially irresponsible to take what in earlier years would have been considered reasonable commercial risks in order to develop the business both at home and abroad. Indeed, the merchant adventurer has small encouragement as, owing to the present incidence of taxation, he has very little to gain from the success of his energy and enterprise but still bears the full responsibilities of failure and financial loss.

I am aware that circumstances are changing and that we must adjust our outlook to the conditions and opinions of the time, but the present method of the central Government of seizing by far the largest portion of the rewards of enterprise and distributing them among the unenterprising, surely must have gone too far and will defeat its own purpose.

Although there is little incentive to your directors to develop our export business, we will continue our efforts in order to help the country in the struggle to balance its external payments.

THE FUTURE

Your board look to the immediate future with confidence, subject to unpredictable changes in trading conditions and to adverse legislation. This is demonstrated by their recommendation of a final dividend of 17 per cent, making a total of 23 per cent for the full year. It should be noted that this distribution represents only 2.2 per cent of the gross revenue and 44 per cent of the total amount available for appropriation excluding the amount brought in from the previous year.

The report and accounts were adopted.

ELLAMS DUPLICATOR COMPANY, LIMITED

RECORD RESULTS

The annual general meeting of this company was held on July 24th in London, Mr Frederick Ellam (chairman of the company) presiding.

The following are extracts from his circulated statement:—

For the year ending December 31, 1951, the trading results have created a record, both as regards sales and profits achieved both by our home and overseas organisations. The various commodities produced and marketed by your company have been maintained at their usual high standard of quality and various new projects are developing satisfactorily.

Last year the rising costs of raw materials was causing anxiety, whereas recently the tendency is for the cost of some of the commodities we purchase to decrease, and having regard to the substantial stocks held at the end of 1951, your directors have deemed it advisable to pursue a conservative policy, and the general and the stock reserves have been increased by £25,000 each.

Among the difficulties that we have to contend with are the restrictions imposed on the import of our products into certain countries, notably Australia.

There have been in the past few months signs of a trade recession, but in view of present conditions your directors do not consider it advisable to recommend a further increase in the dividend, which, you will remember, was raised last year to 33½ per cent.

The report was adopted.

MILLARS' TIMBER AND TRADING COMPANY, LIMITED

INCREASED TURNOVER

The annual general meeting of this company was held on July 24th in London, Col. Clive E. Temperley, OBE, MC, BSc, presiding.

The following is an extract from the directors' circulated statement for 1951:—

The consolidated profit and loss account shows a trading profit of £563,279—an improvement of some 20 per cent over last year. This improvement resulted from a substantial increase in turnover, which, in turn, largely accounts for the marked expansion in the group's current assets and liabilities. Your directors recommend a dividend of 20 per cent on the ordinary shares.

Our production of Jarrah and Karri in Australia again increased.

In the United Kingdom, merchandising of general hardwoods and softwoods expanded considerably and reached record proportions both in volume and value and in the profits earned. In South Africa the operations of our subsidiary company are still limited by import restrictions, especially from countries with hard currency. Nevertheless, this subsidiary was able to show a satisfactory increase in turnover and profits.

Millars' Machinery Company achieved record figures in the volume and value of its products sold and earned satisfactory profits.

Taking our group as a whole on the facts as we know them at present, we should have another satisfactory year.

The report was adopted.

Two Best Men

"ONCE MORE," the special correspondent of the Times cabled from Chicago on Sunday, "those who have confidence in the United States have the laugh on those who believe the worst of it." The American political system, so revered in its own country, has never lacked critics on this side of the Atlantic. Dedicated to the purpose of avoiding tyranny, it has too often seemed to produce only sectional irresponsibility. The free-for-all of an American election, designed to enable the people to choose whomsoever they will, has many times seemed only to put clowns, and worse than clowns, in high places. Of the system's day-to-day working these criticisms may well be justified. But on the great occasions, on the supreme issues, it has the habit of doing the right thing; and if it does the right thing only at the eleventh hour, after many prophecies of disaster, it does the right thing handsomely. Chicago (of all places) has within the month of July provided the stage for an impressive double demonstration of political sagacity. Europeans, viewing the clumsy chaos of the nominating conventions, meeting almost within the stockyards, and yet resulting in the nomination of two such admirable teams as General Eisenhower and Senator Nixon, Governor Stevenson and Senator Sparkman, will be moved once more to reflect that God moves in a mysterious way His wonders to perform.

There is indeed much to be grateful for. Many people, both within the United States and throughout the free world of which the United States is the keystone, had looked forward to the election of 1952 with foreboding. On the one side, there seemed to be the Democratic Party, wearied and soiled by twenty years of uninterrupted office, with hardly even the spirit left to defend its own admirable record in foreign policy. On the other side, there was the Republican Party, seemingly led by men who had spent twenty unrelieved years in the frustration and irresponsibility of opposition and were, in their own way, as exhausted by it as their opponents. With the country so aboundingly prosperous, their chances of an all-out attack on Democratic domestic policies were clearly not high; so they have for months been attacking American foreign policy with an irresponsibility and a carelessness of the consequences that cannot be explained except by the desperation of a generation-long exclusion from power. The friendly European observer hardly knew which to hope for: another four years of a Roosevelt-Truman Democrat, which would promise continuity of policy, but also continuity of the national divisions; or the election of a regular Republican, which would release many frustrations, but would bring to positions of influence and power many men who have committed themselves to pernicious nonsense.

Most European political systems, confronted with a position of spiritual stalemate like this, could do little about it; preferment in politics is a matter of climbing the ladder, and when there is a vacancy at the top, the choice is limited to two or three familiar—possibly far too familiar—figures. The great strength of the American system,

for all its turbulence, is that the long arm of the people's choice can go deep into the barrel and pull out the best men available—in the present case, a man who has never played a part in Federal politics, and a man who has never held elective office at all. Both the Presidential candidates are the very opposite of "party regulars." Governor Stevenson is, indeed, a professional politician, and his nomination was the work of the central mass of moderate professionals within the party convention. But he is uncommitted to any section; and if he is elected, his administration will not be machine-made. Paradoxically, it is possible to feel more sure of this in his case than in General Eisenhower's. For the General, as a politician, is still an unknown quantity, and a great deal depends on how much he would leave to his friends and on who, in the event, they would turn out to be (for there was motley in his pre-Convention entourage). But if Governor Stevenson is elected, there will be no doubt who is President.

The greatest gain of the last few weeks, as seen from this side of the water, is that European anxieties need no longer be engaged. There is more interest in Europe in this election than ever before and most Europeans who follow public affairs are forming their judgments and their preferences. But they can now keep them to themselves; for, although one or the other of the two candidates might make the better President—better for America and better for Europe—neither would be a misfortune. For the first time for many years, not one of the four candidates for the Presidency and the Vice-Presidency has roots in any of the States that front upon the Atlantic Ocean. The Presidential candidates are

Midwesterners (General Eisenhower's residence in New York is a technicality); and the Vice-Presidential candidates come from the other two coasts, the Gulf and the Pacific. And yet both parties have aligned themselves in support of an "Atlantic" policy.

The explanation is that "Atlantic," in this context, was only in its origin a geographical term; to say that an "Atlantic" policy has been confirmed is to say that the United States proposes to continue the alliance with those nations whose structure, whose ideals and whose purposes are most like its own—not all of which are to be found on either side of the Atlantic ocean. Under President Roosevelt, events formed that alliance. Under President Truman, it has been given permanent content. Whichever candidate wins in November, it will be continued. General Eisenhower has been its most effective executant. Governor Stevenson, in his acceptance speech, gave much the best description that has yet been heard of the qualities that will be needed for its final success—"sacrifice, patience, understanding and implacable purpose."

In either of these hands, the leadership of the free world is safe. Those of us who have no votes, but whose lives and liberties yet depend upon the policies of the United States, can settle back to watch the show with the comfortable knowledge that we shall be able to cheer the winner in all sincerity, whoever he may be. It will be a fine show; for the result is in real doubt and the rivals are well matched. General Eisenhower is a world figure of rare personal charm; Governor Stevenson an orator and an intellect of Wilsonian force. May the best man win.

July Masquerade

FOR some reason, the postwar governments of Britain always seem to be taken with the desire to make statements on economic policy—or rather, to make confessions of their lack of economic policy—in the closing days of July. The Socialists were very indignant with Mr Butler and Mr Churchill this week for saying so little, after so much had been so portentously promised; but the present Government was only faithfully following the precedents set for it by its opponents. The course of events seems every year to be about the same. The Government lays down the lines of its economic and financial policy for the year at Budget-time in the spring, with a full apparatus of estimates, surveys and white papers. The fiscal parts of the plan are embodied in a Finance Bill, which takes until some time in June to get through Parliament. The plan decided on in March is not on the statute book until three months later.

But by about the time the Chancellor of the Exchequer is relaxing after getting his Bill through, it begins to be apparent that the estimates were too optimistic; things are not going according to plan. The Treasury has shown a steady bias every spring: it always underestimates the inflationary forces at work in the economy, and it no less persistently exaggerates the unemployment to which a properly severe Budget might give rise. Accordingly, by early July, the alarm signals are going up. Inflation is appearing at home; and the balance of payments is not behaving as it was told to. (Nobody nowadays even tries to pretend that these two phenomena are independent of each other.) The word goes round Whitehall that some-

thing will have to be done. The parliamentary session is approaching its end, and, if only to protect the position of the Government against the autumn, a warning must be given. Inspired paragraphs begin to appear in the papers; an atmosphere of apprehension is built up and the country braces itself to hear the worst.

But then it turns out that there is really very little to be done. The time since the budget is too short for anybody to have thought out a whole new policy. Midsummer is almost as bad a time technically as it is temperamentally for making radical revisions of programmes—the ink is hardly dry on the commitments made in execution of the last programme, and since government departments will soon be beginning work on the estimates that they will submit in November, they can hardly be asked to produce a new set now. After all, disaster has not arrived; it is only pending. So the substance of the promised measures evaporates and has to be replaced by admonitory platitudes. There may perhaps be a cut or two in imports for the sake of appearance, or a ceremonial obeisance to doctrine, such as Mr Gaitskell's misconceived limitation of dividends a year ago. (Whether the "new pattern" of defence expenditure is more than a gesture, the vagueness of the references to it does not permit one to guess.) The net effect is that the country feels it has been led up the garden path. Ministers are always shocked and surprised when their solemn, but disembodied, warnings are met with hollow laughter.

What should they have done? The practical politician

will answer that if in fact they had nothing to announce, they should have made no announcement. But the position is truly disquieting, and something should indeed be done about it. The balance of payments is not righting itself as quickly as was expected. At home, bank deposits are ominously rising again; and anybody who wants to know why should look first at the Exchequer returns. In the first 17 weeks of the financial year, the figures "above the line" (that is, the current revenue and expenditure) show a deficit of £216 million, compared with a surplus at this time last year of £56 million. Moreover, the government's capital expenditure "below the line" is booming; the total deficit, above and below the line together, is £436 million, or three-and-a-half times as large as it was a year ago. Too much should not be read into financial returns at any particular moment; they can be distorted by accidents of timing. But there cannot be much doubt that the Treasury itself is beginning once again to lead the inflationary procession. The more it restricts other people's borrowings from the banks, the more it borrows from them, directly or indirectly, itself.

There is, therefore, plenty of ground for new steps in economic policy. But what should they be? Hitherto, with the important exception of its abandonment of cheap money, the Conservative Government has simply taken over the Cripps policy. Yet the Cripps policy, so valuable in its day, is now obviously very close to its terminus. Import cuts are no longer effective; and the country cannot stand any more of them.

Is there, then, a Tory alternative to the policy of restriction and austerity? At the beginning, when Mr Butler smashed the Bank Rate taboo, there seemed to be. Credit restriction has achieved a great deal in the past nine months and it should certainly not be nibbled away by the Government's own capital expenditures. But few even of its most passionate partisans ever believed that monetary policy could do the trick on its own. To make credit scarce and dear, and do nothing else, is simply another form of restriction. The object of monetary discipline should be to make it possible to pursue a policy of boldness and expansion elsewhere without starting an inflationary spiral. It does no more than provide a firm fulcrum on which other measures will have to do the levering.

What other measures? A Conservative government might refresh its memory of its own principles. It believes in a capitalist economy—that is, not necessarily an economy owned by rich men, but one whose progress is dependent on the steady investment of savings in productive capital equipment. Today, in Britain, both the total of savings, and the fraction of it that industry is allowed to use for productive purposes, are dangerously too small. A sincere Tory government would move to increase both, which it could best do by repealing its own and its predecessor's discriminatory taxation on the ploughing back of company profits, and by making all forms of non-productive capital expenditure take a back seat, even if that meant fewer houses, fewer government offices, and the housing of generators in prefabs instead of in brick cathedrals. Conservatives also believe in initiative and enterprise—Mr Butler twice said so on Tuesday: the increase of exports depends on "the energy, initiative and ingenuity of industry itself"; we

must strive "with that resolution, that skill and inventiveness in new design and production which we still have in our ranks . . . to preserve and fortify our proud position," and so on and so forth. Everybody says these things; they are so true as to have become truisms. But if any government were ever to act as if it believed them, the result might be electrifying.

This week's debate was evidently intended to serve as a warning by the Government to the country. In the event, the warning has been the other way round, as even their own back-benchers pointed out. The debate, in fact, maintained the form that has been shown from the first days of this Parliament. When the subject is foreign policy, or rearmament in its strategic aspects, the Government has never failed to wipe the floor with the Opposition. On economic matters (with the sole exception of Budget Day itself), ministers are lucky if they escape with their shirts intact. The reason for the contrast is obvious. In foreign affairs, the Conservatives have a policy that they understand and believe in. In economic affairs, they have no policy of their own, and the policy they adopted from the Socialists is worn out. But they need a policy; and they will have to get one very quickly if they are not to get from the country at large the derision to which they were treated this week by the Opposition.

The Hope of the Liberals

It is abundantly evident . . . that in the approaching struggle the Liberal party will need all its energy, all its wisdom, all its tactical skill, to ensure a decisive victory over Protection, and to reach a safe and quiet haven for Free Trade. . . . There is no margin for vagaries, blunders, or dissensions. A false move may postpone, if it does not endanger, the hope of the Liberals. An untimely or malicious motion may awaken discord among allies whose closest union is essential to secure their common triumph. The Ministerialists are a compact host who will manoeuvre under strict discipline and act as one man. . . . The Opposition, on the other hand, consists of four very imperfectly amalgamated sections, whose discrepancies are many, whose idiosyncrasies are obstinate and strongly marked, and whose notions of Parliamentary discipline have always been notoriously lax. Of these sections the Whig party is at once the most numerous, the most dense, the most experienced, and will form the nucleus round which the others must rally. Then comes the division of the Peelites, strong in individual talent, strong in popular esteem and confidence, and prepared to carry out unflinchingly the policy which originally made their bond of union, and which for the time can be the only true bond of the whole Liberal party. But their numbers are not formidable, and the sympathies of many of them are perplexingly divided. The extreme *gauche*, the Radicals, or as they are now termed, the Manchester School, are energetic, influential, and indefatigably active, but often inconsiderate in their proceedings. . . . Lastly comes the Irish Brigade, whose course is meteoric and incalculable—to be counted on for hostility to Lord Derby's Ministry, but scarcely with confidence for any other course of sustained action. On the side of the Ministers, therefore, is a well-trained and regular army, entrenched in the strongholds of office: on the side of the Liberal Opposition is a force, numerically larger, and individually far abler, but divided into several bands, marching under different leaders, regarding themselves as patriotic volunteers, enlisted on no certain terms, and bound by no military oath of fidelity or obedience.

The Economist

Egypt and the West

NOTHING succeeds like success, especially in the Orient. If General Neguib Mohammed meant what he said in his first proclamation, his feats this week have far exceeded his original intention. He set out merely to purge the higher ranks of the army and to reprove King Farouk for the royal whims which have lately produced government instability; but he had no intention of playing a permanent role in politics. Then the applause with which these first moves were greeted led him to make further demands: dismissal of the entourage of Levantine parasites whom it had recently been the King's fancy to push for high office, followed by reduction of the royal powers under the constitution. By Saturday evening last King Farouk had sailed away to exile—the maker of his own undoing by his unaccountable taste in friends, wayward, greedy and unlamented. There followed a scramble to shake the General's hand. Certain honest and independent men were already on his side, notably Abdel Gelil el Emary, the young and highly able financier who has become Finance Minister; also with him were a few of the less fanatical members of the general council of the Moslem Brotherhood—men who joined it chiefly for its "clean hands" doctrine. This group placed itself under the respected umbrella of Aly Maher, now prime minister. The army is not at present for or against any party; members of all, from the Liberals to the Moslem Brotherhood, are to be found in its ranks; it does not hate the Wafd, for the Wafd (being out of office) was not implicated in the Palestine arms scandals. No party leader was therefore likely to be backward in offering his congratulations; each has simply been told to trust Aly Maher. Nahas and Serag ed Din, the two principal Wafdists, both on holiday in Europe, tumbled into aeroplanes in order to proclaim that the General's movement was their movement, too. Neguib received the former, but not the latter; presumably he thus marked his view that the habit of amassing wealth at the taxpayer's cost must disappear from Egypt with the royal yacht.

These events give cause for wonder whether General Neguib can, as their sequel, retire into the background as he says he means to do. Once a keystone is removed it requires replacement, or else collapse ensues. Who is going to replace, both constitutionally and in politics, the important element hitherto represented by "the Palace"? Who is to have the last word in summoning a premier, dismissing parliament or declaring war? There are three candidates for the job. One is the army, working perhaps—on account of its lack of political experience—with such politicians as are ready to fall in with its wish for clean hands and stability. Another is the Regency Council of three which, under the constitution, King Farouk has named in a sealed envelope to be opened when parliament meets. The third is "the people," which, while the present parliament lives, means the Wafd, and which would probably continue to mean the Wafd were there a general election. The Regency Council will be impotent unless composed of the other two or allied with one of them. A period of manoeuvre for position by the army plus the "clean hands" group of independents on the one hand, and by the Wafd on the other, for control of the nation's affairs seems probable.

Struggle spells instability, and Egypt would probably be better off if one group or the other were to win an outright supremacy. Which would be the more to its advantage? Neither, of course, can drop the claim to Egypt's two "national aspirations"—sovereignty over the Sudan and evacuation of the Canal Zone. To do so would be to court assassination. But General Neguib has, by the very initiative of his coup, somewhat altered the emphasis which politicians seeking public favour have been wont to place upon these aspirations in contrast to aims at home. The brain of Egypt—and, for that matter, also of Persia—suffers from a disease that amounts to abnormal development of one part, with consequent arrested growth in another. Both nations have lately concentrated so exclusively upon developing anti-foreign emotions that they have stunted their capacity for dealing with ordinary domestic concerns. The prime virtue of General Neguib's coup is that it makes a start in righting this damaging unbalance; it has earned its public backing on the strength of its determination to provide a new deal at home. The prime weakness of the simultaneous coup that restored Dr Mossadegh to power in Persia is that it was still based on the negative and warped theme of foreign interference. In Egypt it may be that the mob is now to be controlled by men with a grasp of essentials. If so, there is more hope for Egypt than for Mossadegh's Persia.

If Aly Maher, General Neguib and the men around them are to fulfil that hope they will require to be vouchsafed two blessings. The first is the gift of time. Only the passage of months and years can restore to the Egyptian public its lost sense of proportion about the need for decency and efficiency at home. The second is public backing from the largish group of literate town-bred Egyptians—a growing bourgeoisie—that longs for stability and honest dealing in public affairs but has hitherto never dared to say so except behind closed doors. Probably the best way to bring this group to a flowering is by enabling it to acquiesce in a benevolent dictatorship. There are precedents for such a route to stability. One was in Kemal's Turkey. In Iraq, also, fear of a lapse into the chaos that is beggaring Persia has lately led to widespread acquiescence in a virtual dictatorship by that pillar of stability, General Nuri Pasha es Said.

Naturally, the western powers who take an interest in the defence of the Middle East view with alarm and despondency any prospect of instability inside Egypt. Therefore if the leaders of the army and the Wafd cannot agree, the western world, as well as Egypt, would be better off if one or other were to be supreme. As far as can be foreseen in these early days, only by attaining such supremacy could either group secure the leisure in which to adjust the many distorted impressions that have lately fuddled Egyptian minds. Only when a period of stability has led to adjustment of these misconceptions can the west treat with Egypt on the straightforward basis upon which it deals with, for instance, Turkey. For the present it must bide its time.

In the constitutional tangle with which Aly Maher is faced—with a king in a perambulator, without a regency Council and without a parliament other than a prorogued

which he sought to dissolve in March and of which the Wafd is master—the supremacy of either of the two main groups now on the stage is unlikely to be attained without a contest. That contest is for Egyptian participants only; these will, no doubt, as is their wont, try to sound the British and American embassies for backing, but it would be inappropriate if either were to show preferences. Any such gesture would court misinterpretation. There is warning of this fact in the recent benevolent but clumsy and imprudent attempts at

A "New Pattern" of Defence

IT is not at all easy to discover from the Prime Minister's speech in the House of Commons on Wednesday exactly what is happening to the defence programme. One can sympathise with Mr Churchill's unwillingness to be drawn into precise figures at this stage, or to give away information which could be useful to hostile powers. But the British public has been asked to sacrifice so much for rearmament and has, on the whole, responded to the demands that successive governments have made upon it with such loyalty and confidence, that it deserves something better by way of an explanation than vague generalised phrases.

The only thing that is reasonably clear is that the level of expenditure—especially that part that bears upon the engineering industry—is to be reduced. What is obscure is why this is being done. Mr Churchill offered two sets of explanations. On the one hand, he maintained that it was being done under the pressure of economic necessity:

There can be no assurance of lasting military strength without a firm economic foundation, and no defence programme can stand without the economic resources to carry it through. The defence programme must be kept within the limits of our economic strength. . . . This diversion of resources from defence to the export drive is just as necessary for our military strength as for our daily life; not to make it would mean a plunge into bankruptcy.

But he also said that it was due to technical changes in weapons and war, the strides made in atomic weapons by the Americans, the development of new aircraft "which profoundly affect the tactics of air warfare and air defence," and the progress made in this country in guided missiles and rockets. These improvements he said will have enabled many practical economies and reductions to be made in the original programme, with a positive increase in war power. . . . Even if we had not been called upon at this time to make new efforts to stimulate exports and reduce the investment programme and social expenditure at home, it would have been necessary to review the whole position [of the defence programme].

These two explanations are not necessarily inconsistent with each other. But are quite distinct; and it matters a great deal which is the one that has chiefly influenced the Government to cut the programme.

From the strictly economic point of view, of course, any reduction in defence expenditure is doubly and trebly welcome. There is no doubt at all that the present level of expenditure on arms is doing great damage to the national economy. Mr Bevan has been quite right about that, as was always acknowledged in these columns. But the justification for armaments is not an economic one at all. Arms are not something of which a nation wants to have as much as it can afford, like health services or houses or pensions or education. They are something of which, on economic grounds, a nation

mediation over the royal title to the Sudan by the American Ambassador, Mr Jefferson Caffery, which have—instead of fulfilling their purpose—left with Egyptians the false impression that a wedge can be driven between British and American policy. The western powers must refrain from taking a hand in the game or their own ends will be defeated. But they are entitled to think that unconstitutional acts carried out with honest intentions are better than chaos and corruption promulgated in the name of the constitution.

should have as little as possible. The argument for rearmament has not been that it can be afforded, but that it is necessary for safety, and it is his total failure to deal with this (except by a little wishful thinking about the Kremlin's intentions) that has disqualified Mr Bevan's arguments from serious consideration. It is true, of course, that economic factors cannot be entirely excluded; there is a limit somewhere. But if it is true that a defence programme will be useless without a firm economic foundation, it is at least equally true that a strong economy is not worth having unless it can be defended. And if the nation's back is breaking, why does it have to be assumed that a necessary degree of defence is the last straw? The great majority of the British public have accepted the argument that the existing programme is the minimum that is required as the British contribution to the prevention of another war. Both successive governments have said this, and have been believed. It follows that any cuts in this programme that are made for purely economic reasons would be the falsest of false economies, since they would increase the danger of war, than which nothing could be more disastrous to the British welfare state or to its possibility of paying its way in the world. If it is still true that cuts in the defence programme increase the risk of war, then they do not avert national bankruptcy, they make it inevitable, and true economies must be sought elsewhere.

There are many people in this country who in response to this logic have put a painful curb on their natural desires and have not lent themselves to agitation for reduced taxation or increased social expenditure because they accepted their share of responsibility for the decision to seek safety in strength. Those of them who are in public life have exposed themselves to unpopularity. The Government owes a great deal to this willingness of public opinion to be convinced, against its desires and interests, by a logical argument, and if, in the present amendment of the programme, there is any element of sacrificing safety to political expediency, that would amount to a betrayal of those who have stood firm against temptation.

It is, therefore, essential that the strategic argument for a revision of defence plans should be fully expounded. If it is convincing, if it really is true that Britain can play as effective a part as before in preventing the outbreak of war, and in defending itself if attacked, at a lower real cost, then there will be no doubters and no dissentients. But it is far too late in the day for any surrender to Bevanism to be permissible, however attractive the economic relaxations that it would permit or the political rewards that would be reaped by those who propose it.

The Reward of Greed

A Ballad for Bank Holiday

(By a Correspondent)

One Robert Ignatius Algernon Park
Began his career as the junior clerk.
He added up figures and got them all right,
And thirty years later they made him a knight.

Sir Robert Ignatius Algernon Park
Went into the City and soon made his mark.
He floated new firms and new ventures galore,
And factories sprouted where never before.
He kept to three courses; he never grew sleek.
He paid forty thousand in wages a week.
He kept off tobacco; he kept off the beer;
And twenty years later they made him a peer.

Now clothed in the ermine his turnover grew
Till at length he was worth quite a million or two,
When he said, "It's high time I was looking around.
"For an heir to this lot when I'm under the ground."

He hadn't a son and he hadn't a daughter,
And his half-sister Joan was—no better than she oughter.
He hadn't a nephew, he hadn't a brother;
He hadn't a niece, and he hadn't a mother.
He hadn't a wife, and he hadn't a father,
And he swore by the beard of the Prophet that rather
Than let Mr Butler make such a fine killing
He'd die a poor man without leaving a shilling.
For he thought, "Till I'm gone neither Butler nor Joan
"Can stop me from blowing what still is my own."

He'd been bothered of late by a pain in the tum
Which had caused him to feel most unusually glum.
And he felt so distressed after eating a bun
That he hastened to Harley Street, W.1,
Where lived that select if expensive magician,
Sir Bluster Below, London's leading physician,

Who prodded and pummelled and slapped him and said:
"Say 'R' if you can, and then stand on your head."
Then he looked at our hero, he looked at him sadly:
"You've got *stomachicus intoxicica* badly.
"For 99 guineas I'll tell you the worst;
"You'll die at 6.30 on April the 1st."

"Go summon my broker, my man of affairs.
"Bid them sell all my stocks, bid them sell all my shares.
"Go fetch Mr Hammer, my stout auctioneer;
"Fetch bankers, accountants; go fetch them all here.

"Go sell all my pictures, go sell all my suits;
"Go sell all my guns and my syndicate shoots;
"Go sell all my rods and my stretch on the Test;
"Go sell my debentures, go sell them at best.
"Go call in my mortgages, call in my bills;
"Go sell all my farms and go sell all my mills;

"My horses, my cattle, my sheep and my goats,
"And turn the whole lot into ten shilling notes!"

With a fortnight to go, and not feeling so grand,
He took a small flat overlooking the Strand,
Where he caused to be built an elaborate chute,
With gadgets and pressure releases to boot.
A really Heath Robinson sort of affair;
The neighbours leaned out of their windows to stare.

There were pulleys and ropes and a very strong spring,
And it took half a dozen to manage the thing.
And he wrote to the Chancellor, "Come and have tea
"Upon April the first; there'll be something to see
"Which you just mustn't miss; it's a real proper do.
"And bring the chief Lords of the Treasury, too."

When his last day had dawned he was steadfast but pale,
And he saw with delight it was blowing a gale.
He swallowed two packets of Pinkerton's Pills;
He went through his papers; he settled his bills.
And being a man who left nothing to chance,
He ordered his coffin—and paid in advance.

He rang up his lawyer to come in alone
(He looked like a dog who'd been robbed of its bone).
"Just fill up your pockets from out of those sacks:
"If it's less than your fees, it's at least free of tax!"
He gave a last briefing and drill to his squad,
Who had long thought him mad, or at least very odd.
At five he sat down with his mystified guests.
He fed them on vodka and ptarmigan breasts.

Then at 5.45 when he'd finished his tea
He pushed back his chair and said, "Listen to me:
"Though I've worked like a slave—as you'll give me my
due—

"For some 60 odd years, it's been mostly for you!
"For I reckon you've had while you've lived on the
backs
"Of the firms I have floated ten million in tax.
"On top of all that there's a thousand and ten
"(I'm still talking in millions) from taxing my men.
"Then add on to that all the millions untold
"From the duties you've netted from things I have sold."

"And another thing, too—though it's hardly my rôle—
"I have saved you a nice little fortune in dole.
"And what is the cream of a very bad joke,
"You've had all this oof without doing a stroke!
"You've taken the ha'pence, but none of the kicks.
"From each pound of my own you get nineteen and six!
"Are you really assuming that after you've bled
"Me alive for so long you can rob me when dead?
"Well, you may get away with this ramp as a rule,
"But to-day it is my turn to say—'April Fool'!"

Then he cried to his men: "Man the chute; load 'em in!
"Fire! Yoicks! Tallyho!" and "Let battle begin!"
Then a crack from the chute and a yell from its crew,
And the first 50,000 went into the blue.
And a blonde leaving work cried with rapturous squeals:
"Ere Elsie, 'ere Madge! If it ain't raining Beales!"

And over the City was heard a great fluttering,
And then came a puzzled incredulous muttering.
Then screaming and shouts, then a general roar,
Like the tide coming in on a rock-broken shore.

And from bearded old men to the smallest of mites
They grabbed and they pushed and they started free
fights,

(That is, all except some of the real 'clever dicks'
Who said, "We're too old to be caught by such tricks").
And two or three skulls were soon cracking like eggs,
And a hundred or so broke their arms and their legs
In trying to climb where these lovely brown leaves
Had fallen on roof tops and gutters and eaves.

NOTES OF THE WEEK

Cautionary Tale from Persia

In a famous English cautionary tale, the boy who slipped his hand and ran away from nurse met "something worse" and was eaten by a lion. In Persia this week there have occurred the first signs that nationalists in high places realise that they have escaped from one foreign menace merely to run into the jaws of another—Soviet Russia. Dr Mossadegh's director of the national police has broadcast a warning that Communists are "using the guise of nationalism" to "carry out their sinister purpose, which is to sell the country to the foreigner." General Sheibani was referring merely to the obvious Communist participation in the riots which carried Dr Mossadegh back to power; he probably did not know that the Tass Agency, broadcasting in Russian and English but not in Persian, was simultaneously making publicity for reducing the Shah's powers. Within a week Dr Mossadegh had pressed for and secured the departure from Teheran of the Shah's mother, his twin sister and his chief supporter in the army. The Shah now retains little beyond the actual peacock throne on which he sits.

Hitherto, when any caller has suggested to Dr Mossadegh that his policy helps the Russians he has replied, with the chuckle that his friends think cunning and his enemies find senile, that he knows this but can be relied upon to cope with the Russians in due course. The Economist has hitherto been loth to refer to any connection between his policy and that of the Soviet Union because nearly all his fears of the past fifteen months have been inspired by purely Persian motives; that they have helped Soviet policy has been incidental. Now, he is willy nilly so much the tool of that policy that a link that is being coupled up from the Russian end demands emphasis.

Meantime, he is going through the motions of normal

And the traffic all came to a stop willy-nilly
From the top of the Strand right along Piccadilly.

And every three minutes to keep up the fun
Six hot sweating workmen reloaded their gun.
And the Chancellor gasped and he said "What the
deuce!"

And the Chancellor's face went a horrible puce,
And the head of the whole Metropolitan police
Shouted, "This is a scandalous breach of the peace!"
And waving a warrant and drawing his sword
He ran up the steps to the flat of m'lord.

But he got there a moment too late in the day,
As the foreman reported, "Bombs gone! Notes away!"
M'lord looked at his watch; it was 6.29.
And he chuckled, "Sir Bluster is cutting it fine."
Then he looked at his guests and he saw their long faces,
And he laughed such a lot that he broke his new braces.
And he laughed and he laughed and he laughed till he
cried.
Then he cried and he laughed and he laughed—till he
died.

government. He has got the Majlis to approve a new programme of reforms for which there is no money to pay. He has spoken with the British Ambassador of arbitration and, within a day or two, withdrawn the suggestion. He has spoken with the American Ambassador of letting the World Bank run the oil industry so long as it refrains from employing Britons. To pin hope on these suggestions is useless, for he will make offers only on his own terms. No reliance can be placed upon a man who fumbles while his country slips further and further towards bankruptcy and disturbance. The one cold comfort to be drawn from the plight of Mossadegh's Persia is that it furnishes a cautionary tale, which is coming to be regarded as an object lesson by at least one sensible neighbour.

Closer Liaison in Korea

General Van Fleet's statement that a truce in Korea is less likely than at any previous time is surprising. It is difficult not to suspect that this is what the Communists want the United Nations commanders to think. If there is eventually to be a truce, this is the moment when both sides are being put to the last test of will. The Communists are trying to wring further concessions on the one remaining issue of the prisoners of war, and the allies are trying to show the Communists that, although they gave way at crucial deadlocks in the past, their last word has now been said. Until the Communists understand this, there is not likely to be a truce. The apparent hopes of a fortnight ago look like being dashed, but the allies have no alternative to maintaining their previous attitude at Panmunjom, and in the field to stick to their guns.

To help in the conduct of purely military operations, the UN Supreme Commander, General Mark Clark, now has

a British officer. The new post of Deputy Chief of Staff has been filled this week by Major General S. N. Shoosmith, who has had experience as head of the British Joint Services' Mission in Washington. His appointment in no way alters the chain of responsibility in Korea. As Lord Alexander emphasised in Parliament, General Shoosmith will in all respects be an ordinary member of General Clark's staff and responsible solely to him. No other relationship would be possible, and there is no doubt that a senior British officer at headquarters should be able to help his commander by bringing a special point of view to bear on the common problems of the headquarters. It is fitting that this appointment should be made on the anniversary of the formation of what General Van Fleet called in an order of the day "the great and gallant" British Commonwealth Division.

—But No Political Adviser

The problem of political consultation between Americans and British in Korea remains unsolved. There are several reasons why it is more difficult than the improvement of military consultation. While supreme command has been properly and willingly entrusted to the Americans because they bear the brunt of the campaign, basic differences between Americans and British on policy towards China prevent a similar approach to political questions. General Mark Clark feels strongly that Washington is the place for political consultation, and certainly any political adviser on the staff of such a general's general would be in a difficult position. If a British official attempted to play such a role there would have to be an American adviser as well; but now that the MacArthur autocracy is regarded by all concerned as a thing of the past, Washington is content to handle political matters with the Supreme Commander direct. Lastly, if there is a case for a British adviser, why should the claims of other nations engaged in the fighting be ignored?

These are strong reasons for doing nothing; but there is also a strong case for doing something. Since the Japanese peace treaty came into force in April the British position has got worse. Until then, the senior British representative in Tokio was accredited to the Supreme Commander, though Sir Alvary Gascoigne in practice saw little of General MacArthur. Now he is accredited to the Japanese Emperor and has nothing to do with Korea. Secondly, the deep and potentially serious misunderstanding that arose over the Yalu bombing must not be forgotten. If there is to be no truce and the war goes on, there is a risk of its being resumed on a wider and politically more dangerous scale. The demand for political advice on the spot might become stronger and more urgent.

These are some of the problems of fighting a war ten thousand miles from the nerve centre in Washington. As seen from still further away in Britain, there is a strong case for effective and official relationship between the British Ambassador in Tokio, Sir Esler Denning, and General Mark Clark. The American Ambassador to Japan, Mr Robert Murphy, is consulted by General Clark; why should his British colleague not also be consulted?

Recovery in Steel

The economic debate has wiped out the slight recovery in the Government's prestige as a result of the White Paper on the denationalisation of steel. This was not produced thus hurriedly at the end of the session solely to allow time for constructive criticism before the Bill was introduced. It was also designed to soothe Conservative impatience at the Government's failure to carry out its election pledges. It has succeeded in that purpose very well—or had done so until Mr Butler's speech revived the dissatisfaction on the back benches. The Conservatives are pleased at the way

the White Paper has been received, and pleased to see some progress at last towards one of the milestones of their legislative programme. But if the Steel Bill is to be introduced at the beginning of the autumn session and got on to the statute book by Easter, it is hard to see how this can be done without postponing the Transport Bill—unless the guillotine is freely used when both Bills are in committee.

Another cause for Conservative pleasure is the dilemma in which the White Paper has placed the Opposition. The Labour party's reaction is complicated by the attitude of the TUC and of the steelworkers' leaders. The White Paper was discussed with the TUC, which said that it wished to reserve its position. But it must give the unions some satisfaction that under the Government's scheme their representatives would sit on the supervisory board, and so would recover a say in policy at the highest level that they have not had since the wartime Iron and Steel Board was replaced by the nationalised corporation. It was a clever touch to make the proposed holding company separate from the supervisory board, so that trade union members will not have to preside over the disposal of the shares.

The White Paper, moreover, robs the Opposition's plan to renationalise the industry of any sense at all by providing for adequate public control; indeed, the area of public control would be extended, for the board would be responsible for the whole industry and not merely for the nationalised part of it. It is similar to the scheme that some Labour ministers themselves were understood to have favoured in 1948, until they were forced to bow to left-wing opinion; and it would probably give a Labour Government as much power as it would need. Mr Lincoln Evans, the steel workers' leader, is known to think that it is the control rather than the ownership of industry that matters, and he would probably prefer to make the White Paper workable rather than to have another upheaval. On the other hand, it is difficult for the Labour party to go back on Mr Strauss's declaration, in the debate on the Address, that it would renationalise the industry when it next came to power. The Opposition, therefore, when it breaks its silence, will probably feel obliged to utter its greatest piece of folly once again—and, again, without really believing in it.

Revolt on Labour's Right

This week has plunged the Labour party in as much discomfiture as the economic debate has put the Conservatives. It has had to face a new type of revolt—from its right wing. On Thursday and Friday the House of Commons was asked to approve the contractual agreements with the German Federal Republic. The party leaders had drafted an amendment to the Government's motion in terms wide enough and vague enough to cover up the differences between the Bevanites and the rest of the party. This was no mean feat of draftsmanship, for the Government's motion linked the present policy with the Washington declaration on German rearmament signed by Mr Morrison, as Foreign Secretary, in September of last year. The essence of the amendment was to accept "the principle, subject to proper safeguards and conditions, of a German armed contribution to an international system of collective security," but to insist that its application at this time was "inopportune."

But the amendment proved too much for some on the right-centre of the party, who were shocked at this retreat, for reasons of parliamentary expediency, from the policy initiated by the party when in office last year. Ten members voted against the amendment when it was put to the meeting and two or three members threatened either to abstain or even to vote for the Government in support of the principle of German rearmament. Embarrassing as this further airing of differences is, it is preferable to victory of the other faction and the outright repudiation of the very policies that Labour helped to shape.

How Many Bevanites?

The stand taken by the right wing of the Labour party this week on the subject of German rearmament obtains added interest in the light of the results of the Gallup Poll on the popularity of the left wing, as personified by Mr Bevan, with the rank and file of Labour voters. The dwindling support for him and his policies contrasts sharply with the mass of Bevanite and near-Bevanite resolutions on the agenda of the Morecambe conference.

The contrast is at first sight surprising and paradoxical. It is really, however, only one more instance of a general rule of political life; that all political parties tend to generate, by their own internal processes, more militancy than the general public will accept. In the cosy atmosphere of mutual encouragement, mutual admiration and mutual sympathy for grievance, the more extreme path always has an attraction which more moderate proposals lack. To the great mass of voters, however, it is generally moderation which exerts the most reliable appeal; and the nemesis of the militant group is apt to be its propensity to mistake the enthusiasm of its own members, and the attractive power which it finds itself exerting on sympathisers in its immediate vicinity, for the public support in that full sense required for electoral victory. Wise political leaders know this well, restrain themselves and their lieutenants, and get called trimmers (or, at best, "good committee men") for their pains. The unwise and the conceited—these two classes are apt to coincide—do not.

Castles in the Backward Countries

One conclusion to be drawn from the Gallup Poll is that support for Mr Bevan is strongest among members of trade unions. It is natural that his demand for cuts in defence expenditure should find favour with those whose first concern is to maintain living standards; and there must be many who share his point of view without wanting him as leader.

Those who are not Communist usually rationalise their opposition to rearmament by saying that there is a more effective way to fight Communism. This is to raise the standard of life of the backward peoples, so that they are no longer a prey to any doctrine that seems to promise them a better life. It was the argument used in the Bevanite manifesto "One Way Only"; and it has played a part in changing Labour thinking from the view that the white man's burden was nothing but the swag to a quite unrealistic notion of his responsibilities towards the rest of the world. Recently a group of Labour MPs, under the chairmanship of Mr Harold Wilson, advocated overseas investment on a colossal scale; and now the executive of the Labour party has issued for presentation to the Morecambe conference a policy statement* on similar lines—except that the demand for investment overseas is not coupled with a demand for a reduction of rearmament. That makes it less pernicious than "One Way Only," but even less realistic.

The problem that is stated in the pamphlet is all too real and all too familiar. No one will dispute that the advanced countries ought to invest in the agriculture and industry of undeveloped countries if the further growth of want and misery is to be prevented. The pamphlet estimates that, merely to hold living standards where they are, the present rate of world investment in undeveloped countries should be multiplied sevenfold. The Labour party executive does not say what Britain's contribution should be to the international agency it would set up to administer the funds. Still less does it say how the money would be found.

There is no hint in this pamphlet that before a country can export capital on a large scale it must have a large surplus in its external payments. There is only a hint that, as resources are limited, more can be devoted to develop-

* "Towards World Plenty." The Labour Party.

ment abroad only by curtailing consumption at home. Would those who have opposed every step towards solvency that threatens living standards accept the much larger sacrifices that would be needed for heavy investment overseas? That is the question that should be put to the conference.

The Schuman Pool

After their formal ratification of the Schuman Plan treaty last week, the Foreign Ministers of the six member nations have agreed that both the Court and the High Authority will begin operations on August 10th. The temporary headquarters of both institutions will be at Luxembourg, while the Schuman Assembly will hold its first meeting in Strasbourg.

The one immediate consequence of the pool's existence is the abolition of most of the Allied controls over West German coal and steel except for supervision of the break-up of the Ruhr trusts. The Allied Governments had agreed to remove these unilateral controls once the Schuman pool was functioning and the High Authority had assumed the wide powers assigned to it as the international body for directing the coal and steel industries of all six members. Accordingly, the Allied High Commission has announced the "progressive liquidation" of the International Ruhr Authority and the end of theoretical restrictions on West German steel capacity. In practice the most important gain for the Germans is the elimination of the Ruhr Authority's power to fix the quantity of German coal exports.

The appointees to the High Authority have now been named with the exception of the representative from Belgium. When he is chosen the eight members will select a ninth man to represent European labour on the High Authority. The most likely candidate for this job is the Belgian trade union leader, M. Finet.

A Solution for the Saar?

The big surprise for M. Schuman's colleagues at the Paris meeting of Ministers last week was his proposal that Saarbrücken be made the permanent site of the pool as part of a plan to "Europeanise" the Saar. The French appear to have in mind an autonomous Saar placed under the new political authority which has yet to be created. Some have suggested that an apt analogy is the District of Columbia in the United States. M. Schuman strongly feels that real co-operation and amity between France and Germany depend on a solution of the problem that will satisfy both peoples, and it is for this reason that he immediately brought the question to the forefront. In French eyes he has made a generous and handsome gesture. Outright political annexation of the Saar could have been regarded by the French as no more than reasonable compensation for the damage done to their economy by a third German invasion and four years of extortionate occupation which finally turned France into a battlefield.

The Germans, however, including Dr Adenauer, naturally look on the proposal with suspicion. They regard it as a betrayal of the new European spirit. They point out that France shows every sign of holding on to its leases of the Saar's steel and coal plants, and has as yet given no firm undertaking to permit the re-emergence of German political parties in the Saar and the holding of free elections. If the French are in earnest about their ideals, it is asked, why do they not internationalise a piece of French territory as well?

Disinterested third parties note that the Saarlanders, if they run true to form, would in free elections simply vote for the side which at the moment promises them greater prosperity. Thus immediately after the defeat of Germany in 1945, Saarland passports were much sought after. Now that the West Germans are making such a rapid economic recovery, a majority in the Saar might opt for a pro-German government. This, of course, would put the Bonn Government in a strong position to urge that the French leases be handed back and that the territory return to Germany.

The truth is that sentimental nationalist considerations are not uppermost in the minds of the Saar populace. Crudely stated the basic issue is, therefore, who shall own the Saar's resources—the industrialists of the Ruhr or the industrialists of Lorraine? M. Schuman hopes that European federation will push ahead so quickly that power politics of this kind will be irrelevant in the near future. He will urge this view on Dr Hallstein, West German Secretary for Foreign Affairs, when the two men resume negotiations over the Saar.

Blow to French Rearmament

The French Government has received a shock on learning that its request for greater financial help from the United States has been turned down. Statements by American delegates to the Lisbon Conference last February were ambiguous about the prospect for more aid and apparently left the French unjustifiably optimistic. As a result, modifications of the French rearmament programme which might have been made at Lisbon with a minimum of bad feeling may now have to be made in an atmosphere of maximum resentment.

The French asked for two kinds of aid: additional assistance in order to balance next year's ordinary budget; and a much larger sum spread over the next three years, both to balance the arms budget and to enable France to build up a large and permanent export industry in arms. Altogether, the amount requested is over \$600 million. The French have realised that there are really two kinds of American offshore purchases: those made under foreign aid grants through the Mutual Security Agency, and those made by the US Services from their own appropriations for the supply of American troops. It is on this latter, and more dependable, stream of dollars that the French have their eye.

American officials give three reasons for rejecting French demands. They say that Congressional cuts have reduced the foreign aid funds available; that the United States is opposed to making foreign aid commitments for more than a year ahead; and that technicians from US Services have little use for some of France's military equipment.

The French are most unwilling to take the easy way out and cut their rearmament programme, for they are anxious not to fall behind Western Germany in military potential over the next few years. The motive is the same as that which lies behind their desire to hold on to the steel of the Saar. This sentiment may strike observers as conflicting directly with avowed French ideals for the coal-steel pool and the European Defence Community; but France is convinced that a true European community can be based only on parity of power between itself and Germany.

Chairman of the BBC

The announcement that Sir Alexander Cadogan is to succeed Lord Simon of Wythenshawe as chairman of the BBC has been given a mixed reception and questions have been asked in the House of Commons concerning his qualifications for the post and the criteria used by the Prime Minister in making the selection. No one questions Sir Alexander Cadogan's long experience as a diplomat. As Permanent Under-Secretary at the Foreign Office and in many missions abroad, he gained the widest possible experience in representing and interpreting the policies of the successive governments he served. The question arises simply because, at this juncture, it is difficult to see how a chairman with the training and—inevitably—the outlook of a civil servant can be expected to deal comfortably with the kind of difficulties the BBC is certain to meet in the next five years.

It will be a time of intense pressure on the Government from the outside interests which seek to break the BBC's monopoly. That pressure will certainly be passed on. Yet a cardinal principle of the BBC as an autonomous public institution must be to resist government pressure and preserve its own independence with jealous concern. In the two most effective periods of the BBC, this independence was guarded by remarkable Director-Generals, Lord Reith and Sir William Haley. Yet Sir Alexander Cadogan joins the Board when there is no Director-General at all. The desirability seems therefore all the more apparent of appointing a chairman able to resist the Government's wishes, when it is necessary to resist them, not one trained to accept and interpret them.

Stemming the Wage Flood

Among the platitudes of Tuesday's debate was the Chancellor's plea that wage increases should be linked to productivity. His own plan for realising that hope had already been turned down by the unions. Last week the union members on the National Joint Advisory Council finally rejected Mr Butler's proposal for a committee, representing both sides of industry and the government, to consider how to relate wage increases to productivity. The unions are strongly opposed to allowing the government any say in determining wages, the more so since the Minister of Labour referred back the increases recommended by the wages councils in the distributive trades. What will probably prove to be no more than a formal gesture of respect for the Chancellor's appeal was seen as a dangerous departure in Tory policy. The deputation from the TUC which met the Prime Minister last week had much to say about government interference in collective bargaining, but their fears were allayed by the Minister of Labour's protestations on Thursday.

The General Council of the TUC has not yet returned any answer to the appeal for wage restraint that the Chancellor made in May, but it has now considered a report on the subject from the Economic Committee—a document which, if accepted, will be presented to the Trade Union Congress at Margate in September. The council's reputation for responsibility demands that it should not publicly sanction general increases of wages in accordance with the cost of living index, and it will no doubt repeat its principles about wage increases for lower paid workers and a share for the workers in the proceeds of higher productivity. In practice it is the better paid workers, like miners and engineering workers, who have made the largest claims and the resolutions to be submitted at the Congress leave their attitude to wage restraint in no doubt. The Association of Engineering and Shipbuilding Draughtsmen, for example, will ask "Congress to declare its support for the effort of the unions to defend the living standards of members by the submission of wage claims" and to reject "any policy of so-called restraint." The National Union of Tailors and Garment Workers adds the persuasive point that wage restraint should be resisted to the utmost "until adequate price controls and food subsidies have been restored."

The chances of obtaining the co-operation of the unions in restraining wages were never very good, and they are certainly not improved by the Government's failure to impose "very serious measures" on other sections of the community. With the cost of living three points higher in June, the dam built up by the recent rejections of wage claims cannot last for long.

Federation Delayed

Two important statements were made by Mr Lyttelton in last week's debate on Central African federation. The first was that the next and final conference, which was to have been held in October, has been postponed until January, partly because of what Mr Lyttelton called the logistical difficulties of moving Ministers in the autumn, and partly because of the need to study the reports of the three technical commissions, which will not be ready before the end of September. Mr Lyttelton's second statement was that another debate would be held in the House of Commons before the British Government took an irrevocable step towards federation. He did not, as Mr Clement Davies assumed, give an unqualified assurance that the government would not impose

federation if the Africans persisted in their opposition to it.

On this opposition he made the interesting comment that he had evidence that it was weakening, that the Africans were showing more willingness to discuss the scheme than they had previously, largely because the district commissioners had now been instructed to explain it to them. The government is evidently pinning its hopes on persuading the Africans to agree to the scheme; it would thus avoid the dilemma of either forcing it on them—and running the risk of losing the goodwill of Africans everywhere—or dropping the scheme—and perhaps seeing Southern Rhodesia with its two million Africans become a fifth province of the Union.

The spokesmen of the Labour party in the debate showed themselves as well aware of this dilemma as the government. Their main criticism of the new proposals for the federal constitution was directed, ironically enough, to the safeguards that will prevent it from being amended against the wishes of the territorial governments or the African Affairs Board. These safeguards provide that an amendment of the constitution must be passed by a two-thirds majority of the federal assembly and must then be reserved for the assent of the Secretary of State and be subject to a parliamentary resolution if objections are raised to it. But, it is pointed out, they also freeze the constitution and will prevent Africans from having any more seats in the federal assembly than they are allotted at the start. Designed to protect Africans, the safeguards will, it is argued, block their further advance. Here is another dilemma, which Mr Lyttelton admitted. But he was probably justified in claiming that if the political progress of the Africans in the northern territories reaches a point where they can insist on better representation in the federal assembly, it will be hard for the European majority in the assembly to deny it for long.

Moscow on Chicago

"A plague on both your houses" has been the unwritten comment of the Soviet press on the conventions in the United States. There is no official view on the candidates and the American presidential battle is considered by *Pravda* and *Izvestia* as less important than the opening of the Volga-Don Canal. But to be non-committal on important issues is characteristic of the Moscow press at the moment.

Since Russians are told that Wall Street magnates direct both parties and hold the threads of what is known as "bi-partisan policy," they might be expected to feel no serious

The Saving on the Food Subsidies

concern about the outcome of the campaign. Yet beneath the apparent indifference it is possible to detect preferences, or rather degrees of dislike. For some time Senator Taft was the least disliked. He received no praise, but the former stalwart of isolationism was believed to have a chance of defeating the Russians' bogey-man, ex-General Eisenhower. So long as he seemed to have some chance, the Russians seemed to favour a Republican victory, but once the verdict had gone to Mr Eisenhower there was a barely perceptible change of attitude. The Democratic convention was spared no abuse: the direction of financial magnates, the similarity in aims of foreign policy, the "purchase of delegates," all came in for notice; but the Republicans got the palm for bribery. Mr Stevenson is being described as a self-confessed partisan of cold war and "total diplomacy"; but Mr Eisenhower is credited with the solid backing of the "financial sharks" and "millionnaires."

Whatever the result of the campaign, the nominations have clearly deprived the Soviet rulers of any faint hope they may have had that a change of President would bring a relaxation in American foreign policy. Indeed, they fear that it will be pursued with even greater vigour if Mr Eisenhower wins. It is only for propaganda purposes that they speak of the importance of the Progressive Party's convention and of the vital struggle of American "progressive forces."

Red Cross and Red Star

Firing on the Red Cross has long been an abomination to civilised peoples and a pastime for the uncivilised. The Communists have now frankly joined the ranks of the latter, but as mud-slingers rather than sharpshooters. Their motives are all too easily perceived. For years Communist policy towards the Red Cross has been akin to their policy towards other international humanitarian bodies; they have taken advantage of its services when it suited them, cold-shouldered it when it did not, and rigidly forbidden it to carry its activities across their frontiers. In the last war Japan and Russia were the only major combatants that refused the Red Cross access to prisoner of war camps. The Chinese and Korean Communists have likewise obstructed all efforts by the Red Cross to reach their prison camps, but they have accepted, and made propaganda use of, its list of prisoners in United Nations hands.

The transition from this indifferent attitude to the present campaign of abuse was abrupt. As soon as it was suggested that the Red Cross should investigate their "germ warfare" charges, the Communists discovered that it was, in the words of the Moscow *New Times*, "composed of accomplices of the imperialist aggressors." To substantiate this proved difficult. Although the organisation was condemned in April, not until late July could the Communist press assemble the damning evidence. This proved to consist of the suggestion that the Red Cross's inability to penetrate Nazi concentration camps was due to its "interest in covering up for war criminals" rather than to any obstacle placed in its way by the Nazis. (No similar explanation was given for its failure to reach Soviet camps.) And this week the *Daily Worker* has subjected every member of the International Committee of the Red Cross to the closest scrutiny without finding anything worse than that two of the sixteen had once been termed by Goebbels "personalities of European standing and international reputation."

The Communists have shown a certain ingenuity in focusing their abuse on the International Committee. The direct descendant of the original committee formed by Henri Dunant in 1863, from which the whole world movement sprang, has always consisted of Swiss citizens, and is thus easily decried as "the so-called international committee." The fact that their traditional neutrality has always made the Swiss ideal people to deal with belligerents can be ignored, as can the fact that all the national Red Cross Societies, including

the Russian, have until now found the committee a very convenient instrument. But, far from being "not answerable to any truly international body," the committee is governed by the decisions of the periodic International Conferences of the Red Cross, at whose current session in Toronto the Chinese and Korean Communists and the Russians are fully represented, the last by a general. It is a little difficult to square their presence at Toronto with their simultaneous attacks on the very heart of the Red Cross, except on the assumption that they have come to try to disrupt one of the few entirely non-political bodies left in the world.

Olympic Oddities

The Olympic Games seem to have passed without any serious breach of the spirit of international harmony. True, Moscow radio this week quoted charges by the leader of the Soviet team that the judges had been unfair to Russian, Polish and Czech athletes, and alleged that at the 1948 Games the Americans had "carried out various dark machinations in order to win." But a little muttering was to be expected after such incidents as the well-meant American offer of ammunition to a Russian marksman whose Soviet-made rounds failed to explode, and the Russian footballers' defeat by the Yugoslavs, who had been written off in advance by the Communist radio as "humble and servile." It was a pity that the Communists had to isolate their athletes in a separate camp as well as prevent their own nationals from coming to watch the Games; but at least this was better than the original Soviet plan that their team should fly back to Leningrad every night.

No doubt efforts were made to convince individual western athletes of the iniquities of their governments' policies; but after local press publicity had been given to the way in which members of the Argentine team were tricked into signing the Communist "peace petition," under the impression that they were merely giving autographs to admirers this technique seemed to lose its effectiveness. The Finnish Communists may have hoped much from the non-political youths whom they attracted to their low-price youth camp, yet there is little evidence that they carried their propagandist activities in this direction far; and it was quickly established that the German girl in angelic robes who burst so dramatically into the opening ceremonies was acting on her own initiative rather than for Moscow's "peace" campaign. But this incident illustrated a sad characteristic of the contemporary world. To such an extent has Communist propaganda debased the word "peace," that today the most apparently innocent activity under that banner has to be examined to see if it is not just another cynical manoeuvre. Only when "peace committees" in Communist China, Eastern Germany and elsewhere cease to act as military recruiting agencies and propagandists for war production will the word regain its reverend meaning.

Rebuilding Hadrian's Wall

Lord Catto's committee had to decide whether it was possible to determine Scotland's contribution to the fiscal and foreign trade totals of the United Kingdom. Briefly, it finds that while the fiscal totals can be divided (as indeed they were on several occasions before the war) foreign trade is impossible to disentangle without rebuilding Hadrian's Wall. The Government has accepted this report, and appointed a Royal Commission to review "the economic, financial, administrative and other considerations" involved in Scottish government.

For those who take only a cursory interest in Scottish affairs, it may be illuminating to contrast briefly the views taken of these events by Scottish Nationalists and by more

The hind-legs propel him up. The fore-legs are tucked in, clear of the bar. The rider leans forward, shifting his weight over the neck. His thighs grip the saddle. His toe is light in the stirrup. The reins are firm in the grasp of a master. It all adds up to a faultless round.

WELL GATHERED

The companies which are gathered together to form Associated Electrical Industries have names which are household words. In Britain alone, thirty factories in twenty different towns produce between them over £60,000,000-worth of equipment in a year. The companies of A.E.I., working separately and together, are a fine example of co-ordinated effort for the public good.

MARCONI serves mankind

In 1896 it was said, with prophetic brevity, "Signor Marconi has produced . . . a new system of telegraphy which will reach places hitherto inaccessible." And even today the future of wireless cannot be finally foreseen. The first television broadcast from overseas (featuring Calais Town Hall) and the first television programme from the air were both made with Marconi cameras. Such developments are but the latest steps on the road which Marconi was the first to tread.

MARCONI'S WIRELESS TELEGRAPH COMPANY LTD · MARCONI HOUSE · CHELMSFORD · ESSEX

moderate opinion. The Nationalists feel that Lord Catto's committee was appointed by the Labour Government as a time-wasting expedient, since the figures of Scottish overseas trade are irrelevant to the issue of home rule, whereas its share of government revenue and expenditure could usefully have been reported on long ago. The Royal Commission meets with their approval even less, since they see in its terms of reference yet another red herring to draw attention from the central issue of political independence. The Conservatives, they say, promised a Royal Commission on "the whole question"; and the practical issues involved in various degrees of legislative devolution do in fact need to be impartially examined before the subject can usefully be discussed in Parliament.

The answer to all this is that home rule agitation turns upon the question whether Scotland is the milk-cow or the poor relation, and if the figures to answer the question could have been obtained, discontent might have been allayed. In default of this, a broad investigation into the possibilities of administrative devolution is now being offered. It should satisfy those with legitimate misgivings about Whitehall domination, while reserving the issue of legislative devolution to be examined on a purely political level.

Spotlight on Prisons

For years official and private reports have emphasised the evils resulting from the growing prison population combined with the shortage of prison staff, and now the Select Committee on Estimates has added its warning (HMSO, 9s.), declaring that some of the evidence it heard was alarming. In 1950 the daily average population of prisons and borstals in England and Wales was nearly back to the level of 1910. In 1951 it continued to rise steeply, and in February of this year it exceeded 23,000. In terms of physical overcrowding this means that 4,500 male prisoners were sleeping three together in cells designed for one person. In Wandsworth prison alone more than 500 prisoners were sleeping three in a cell.

Those who assert that prison life today is too soft and no deterrent to crime should reflect on these figures. They should also ponder the fact that because of the shortage of staff prisoners have to be locked in their cells from 5.30 p.m.

to 7 a.m. Brutality has certainly been taken out of prison life; but in these conditions it can hardly fail to be brutalising. At the same time it is becoming more demoralising. Before the war the prison staffs worked a three-shift system, which enabled the prisoners to have a working day of 7-8 hours. Owing to the shortage of staff during and after the war an average working week of no more than 22 hours could be provided. In recent years better recruitment enabled a full working week to be provided at various specialised prisons; but in 1951 the Government imposed a standstill on the further increase of prison staffs, and a general reintroduction of a proper working week has had to be postponed. At Parkhurst, where long prison sentences of up to 14 years are served, the working week averages less than 18 hours.

The Select Committee agrees with the Prison Commissioners that in fact a financial saving could be achieved if enough additional staff could be recruited to enable all prisoners to spend a 40-hour working week. This, how-

ever, assumes that government departments will co-operate in providing work for prison labour. The Select Committee points out that at present this co-operation is singularly lacking. New prisons and the relief of overcrowding may have to wait for a change in economic conditions; but there is no excuse for allowing prisoners to spend most of their days in idleness simply because of departmental inertia.

Closed Shop Closed

The board of arbitration on the closed shop dispute did not have to decide whether Durham County Council could insist that its employees should be members of a trade union or professional organisation. The council had already, in earlier tussles with its professional employees, agreed on the principle of voluntary membership of such organisations. What the board had to decide was whether it was in conflict with that principle to demand that applications for extended sick leave should be made through a trade union or professional organisation, or whether, as the council claimed, it could make such regulations at its discretion, not being obliged to grant any extended sick leave at all. The board's decision was that the regulation was in conflict with the principle of voluntary membership of trade unions and professional organisations and should, therefore, be withdrawn.

The victory is shared by the professional organisations of doctors, dentists, midwives, nurses, teachers and engineers, who had joined to form an emergency committee. It was a disinterested victory, for they are, of course, in favour of the membership of professional organisations. It is also final—unless the council thinks of a subtle new way of closing the shop.

New Towns' Problems

Lord Beveridge, who is chairman of a development corporation of one of the new towns, has written a little book* drawing attention to their economic difficulties. These spring primarily, in his view, from the low productivity and high costs of the building industry, which not only slow up the production of houses but prevent new social opportunities from being realised.

At Newton Aycliffe we hoped to make a smokeless town with district heating, but we found the cost so high that we could not make it a compulsory addition to the rent of every person in the town. We wanted to build a good theatre but the cost was frightening. We thought of a first-rate hotel, but we find ourselves reduced to a public house with no rooms for anything but drinking.

Similar complaints have been voiced from the corporations of other new towns. Rents in new towns have also to be considerably higher than for local authority housing, because there is no general rate fund available to help pay for the houses, roads, open spaces, and other services provided by the development corporation. Moreover, a corporation, although it receives the full statutory housing subsidy, has no stock of old houses available to help equalise rents while, unlike a local authority, it is bound by the Rent Restriction Acts not to raise rents.

Nevertheless, Lord Beveridge notes that the corporations have no difficulty in letting their houses and have not experienced any considerable protests against the rents. Here is suggestive evidence that it is council houses which are subsidised too much, not new town houses that are subsidised too little—though it is true that the new town residents are at present drawn mainly from the better-paid, skilled workers. New towns would in fact benefit from the overdue reform of rent legislation, as well as from the rise in building productivity on which Lord Beveridge pins his faith. Meanwhile, they deserve fairer and more imaginative treatment by the government and local authorities.

* New Towns and the Case for Them. By Lord Beveridge. University of London Press. 2s.

Letters to the Editor

Tools for the Land

Sir,—The article in your issue of July 12th contains several points which call for comment. First, you refer to British tractor production of 137,144 last year and remark that it has been possible for manufacturers to put down production lines capable of turning out 200 to 300 tractors a week. This is evidently a slip of the pen. In the case of the Ferguson tractor the Standard Motor Co., Ltd.'s production line has for some time been turning out 300 a day.

Secondly, you say that of the 137,144 tractors produced last year 112,577 were sold abroad. The first of these figures relates to three- or four-wheeled agricultural tractors and the second to all tractors, including horticultural tractors of ten horsepower or less and track layers. Production last year in Britain of three- or four-wheeled agricultural tractors was 137,475, of which 107,945 were exported. Production of all types was 181,070, of which 112,577 were sold overseas. So the British farmers last year received 29,530 agricultural wheeled tractors.

Thirdly, you write that "Ferguson designed a method of coupling implements directly on to the tractor, with a hydraulic system to lift the tools out of the ground." This is by no means the most important feature of the Ferguson System, which, above all, enables the work done by the implement to give to the tractor the necessary adhesion and traction without massive weight and expensive power. The next most important features of the system are the automatic control of the implement's working depth and the safety of operation.

Fourthly, you refer to the Ferguson-Ford lawsuit as having "dragged on wearily until last summer, by which time the principles of the disputed patents were in general use." In fact, the lawsuit was settled in April this year by Ford paying Ferguson £3,300,000 and agreeing to discontinue making the tractor incorporating the patents concerned by the end of this year. No other tractor has incorporated these patents.

Fifthly, you observe that farmers "are not over-anxious to pay an additional £90 for a tractor's hydraulic system." In the case of the Ferguson, which represents by far the greatest number of tractors with hydraulic system, this is a standard fitting and the price of the tractor is considerably below that of any other medium-powered tractor with or without hydraulic system. Of the 137,000 three- or four-wheeled agricultural tractors produced in Britain last year 74,000 (Fergusons) had the hydraulic system, and, of the remainder, the big majority were Fordson, David Browns and Nuffields, most of them probably sold with hydraulic systems.

Finally, you remark that the farm machinery industry does not respond easily to changes and warn it that unless it puts new ideas into practice, a second Harry Ferguson will. Why a second Harry Ferguson? I can assure you that the original is "aggravating" enough not to share your doubts as to the response of farmers to innovations and, indeed, has every possible reason not to do so.—Yours faithfully,

NÖEL NEWSOME

Harry Ferguson, Ltd., Coventry

Sir,—The article in your issue of July 12th has fallen into the not uncommon error of assuming that progress in tractor and farm machinery development stemmed mainly from the efforts of one man. The tractor was far from being an "iron horse" when Harry Ferguson first introduced his principles; most of the spade-work in modern tractor design was completed some 25-odd years ago. By that time, hydraulic control of mounted implements was incorporated in models already in quantity production; the row-crop tractor had revolutionised farming methods; and equipment driven from the tractor power take-off was being used in increasing numbers. Subsequent development was in the reduction of transmission losses, the increase in engine speeds, and greater ease of attachment.

In 1918, International Harvester Company demonstrated at Savanna, Illinois, a full line of farm implements mounted on and operated through the power take-off shaft of a self-contained row-crop cultivator-tractor. On this "super power unit" was developed a variety of mounted implements of three-fifths of the weight of similar horse drawn machines. This scheme was abandoned because it was decided that the farmer would not invest in the new equipment and discard his perfectly good horse-drawn equipment. For this reason, the row-crop tractor went on ahead by itself, provision being made to use horse-drawn equipment with it. The change to power take-off driven machines was gradual and, in the meantime, a variety of implements tailored to the tractor were developed.

It still appears that a farmer can be best served by a tractor which not only operates its own specially "tailored" equipment but can also be applied to getting the best work out of other makes of farm machinery and implements already in use on farms. Although some self-propelled machines have been successful, it is more than likely that, in the future, we can look to the larger and more expensive machines being built to fit on to the tractor, as is already being done with cotton-pickers, corn-pickers and beet-harvesters fitted to Farmall tractors. This method would have the

effect of reducing the threat of over-capitalisation to which you referred.—Yours faithfully,

H. E. NORRIS

International Harvester Company,
London, E.C.1

When the Russians Bring Gifts

Sir,—The warning implicit in your article is timely. You will have to keep on sounding it at regular intervals. There is, however, one sentence which requires revision. You write that the purpose of western rearmament "is to negotiate on equal terms a fair settlement of the problems created by the last war." Does not this imply that the Soviet Union will abandon communism? or, as your next sentence suggests, does *The Economist* believe that "peaceful co-existence" is possible between democratic states and a state controlled by persons devoted to a creed whose plainly stated object is the destruction of what we understand by democracy?

I agree with your diagnosis that there may be reasons for supposing that the long-term policy of the Soviet Union is to destroy us by "peaceful" aggression—meaning everything short of full-scale military operations—but if we are to be honest with ourselves must we not admit that peaceful co-existence between communism and democracy is a contradiction in terms? Genuine peace will only come about when the basic principles of the free way of life are universally accepted—or at any rate accepted by all states strong enough to menace the security of others. The most we can hope for with communists is to create an armistice, and in the time thus gained work in a variety of ways to make the world safe for democracy by making democracy universal. How this can and shall be done might be a suitable subject for a sequel to your warning, "When the Russians bring gifts."—Yours faithfully,

STEPHEN KING-HALL

London, S.W.1

Malan versus Parliament

Sir,—Your note aptly describes the proceedings of the Judicial Committee of the new High Court of Parliament as "a tragic farce." It is going too far, however, to say that it is "clear" that the establishment of this Court by ordinary legislative procedure was invalid. The arguments against the validity of the High Court of Parliament Act are, to put the matter conservatively, less compelling than those which prevailed in the case of the Separate Representation of Voters Act. Dr Malan may well have succeeded in doing indirectly what he could not lawfully have done directly. A decision by the Appeal Court, in the forthcoming litigation, that the High Court of Parliament Act did not fall within the ambit of the

entrenched sections would cause little surprise among constitutional lawyers. Such a decision would not, of course, in any way strengthen the moral foundations of the Government's case.—Yours faithfully,

S. A. DE SMITH

University of London

An Alternative Vote

Sir,—For the past thirty years Parliaments, and consequently governments, have controlled our destinies through members elected by minorities (sometimes by little over one-third of the votes cast in their constituencies) and by parliamentary majorities which have only once or twice reflected party majorities of the electorate. I am disinclined to accept all the debatable arguments advanced in your timely article, but it may interest your readers to know that at one of the customary meetings of the Liberal parliamentary party, during the session of 1924, when the Liberal party was 159 strong, I distinctly recollect Mr Lloyd George and Mr Asquith (as they then were) informing their colleagues that though, in the earlier days of their political careers, they had neither of them been impressed by proportional representation theories, they had for some time past both become convinced, since adult suffrage had come to pass, that P.R. or the alternative vote had become an absolute necessity for the maintenance of democratic government.—Yours faithfully,

E. A. LESSING

London, S.W.1

National Parks in Dispute

Sir,—The Hobhouse Committee laid particular stress on the critical nature of the limits of the size and number of national parks they recommended for establishment. If, as you suggest in your issue of July 19th, only two or three national parks were established (and in fact there are already six designated) it would concentrate holiday traffic in them and seriously threaten their peace and beauty. Considering the nature of the country affected, which is often mountainous and invariably agricultural, there will not be any serious economic difficulties arising by applying the principle that amenity and access considerations in these areas should be paramount.

You make the point that the country covered by national parks is severed from local planning authorities. The provisions of the National Parks Act, Section 8, make it perfectly clear that nothing of the sort happens. The local planning authorities retain control of the national park administration whether it be by joint board, planning committee or sub-committee. Two-thirds of the members of the local planning authorities previously administering the areas have seats on the new national park bodies, and in practice it has worked out that the clerks and planning officers have continued their previous functions if somewhat differently distributed.—Yours faithfully,

GERALD HAYTHORNTHWAIT

Sheffield.

Books and Publications

Chronicling the Cold War

Survey of International Affairs, 1947-48. By Peter Calvocoressi. Oxford University Press for the Royal Institute of International Affairs. 581 pages. 45s.

Documents on International Affairs, 1947-48. Edited by Margaret Carlyle. Oxford University Press for the Royal Institute of International Affairs. 877 pages. 70s.

Halfway through this latest volume of the Chatham House Annual Survey, Mr Calvocoressi remarks with a sigh of resignation,

The historian might at this point succumb to the temptation to pass quickly over the ephemeral and repetitive disputes which occupied the whole time and attention of the four Foreign Ministers during the next seven weeks, but the chronicler may not take such a stride.

It is first and foremost as a chronicler that the author of the survey must regard himself, and it is by undertaking such publications as the survey and its companion volume of documents that Chatham House is laying the solid foundations on which alone the serious study of contemporary history can be based. Both the present volumes admirably fulfil this purpose and compare favourably with the best of the prewar series. The confusion of conferences, the constant exchange of notes and protests, the names half-remembered and the dates half-forgotten, all the contents of the bulging packets of news-cuttings stored in St. James's Square are here reduced to order, provided with footnotes and arranged in sequence with a patient and resourceful scholarship. This is the indispensable groundwork upon which the more speculative art of divination is dependent.

But Mr Calvocoressi obviously possesses the gifts of the historian as well as the patient virtues of the chronicler.

The more general portions of the survey, which provide the framework for the detailed narrative, exhibit judgment and penetration, while the most pedestrian footnote is often enlivened by an unexpected turn of phrase. The reader who pursues his history to the end will have a far clearer picture of these critical years than he can ever have possessed at the time.

The period covered in these two volumes is bounded at one end by President Truman's announcement of American support for Greece and Turkey, followed by General Marshall's famous offer to Europe, and at the other by the Berlin blockade and the early stages in the creation of a West German government at Bonn. Its theme is the Cold War, Act I, Scenes I and II.

The recounting of this unhappy history leaves certain sharp impressions on the mind of the reader. The first is the extent to which even at this early stage the conflict between the western powers and the Communist bloc was worldwide in character. The course of events in China and South East Asia is traced immediately after those in Eastern Europe and Germany, with the result that the underlying unity of the Cold War is sharply illuminated. The second effect is to make one realise that it is American power alone, and the willingness to use it, which has blocked the Communists' path to success, both in

THE COLUMBIA LIPPINCOTT GAZETTEER OF THE WORLD

edited by LEON E. SELTZER

2,100 pages, printed in three columns—130,000 articles
5,500,000 words — Thumb Index — £16. net

The publication of this great work is the result of five years of the most exacting scholarship by a staff of 150 experts, who have produced the most complete, accurate and up-to-date gazetteer in existence.

It lists, in alphabetical order, political divisions such as provinces, counties, towns and villages, and geographical entities such as islands, lakes, canals, dams, etc. The entry for each place gives essential facts relating to population, industry, agriculture, mining, and a guide to the pronunciation of the place-names. The system of cross references and the single alphabetical arrangement ensure that the volume is particularly easy to refer to.

The book will be indispensable to exporters, importers, Government officials and travellers, who can all find in compact, easily available form, the detailed information which they need. No Company library can afford to be without it.

Europe and in Asia. For those inclined to gird at American shortcomings, this volume of the Annual Survey should be recommended reading.

It would be even more profitably read by those who fondly believe that if only the representatives of the western powers and the Russians—or Chinese—were to sit down round a conference table, a great many of our troubles would disappear. The history of 1947 and 1948 lends no colour to such a belief. The inner course of Russian policy, as Mr Calvocoressi is the first to admit, is often difficult to follow, but the distrust, bad faith and casuistry which characterise its outward expression are repeated so monotonously in these years that they should impress even the most credulous. The two volumes are indeed a monument to the futility of the western powers' good intentions and the unrelenting hostility of the Communists. Mr Calvocoressi offers no indictment; he is content to stick to the facts—but the facts in this case are eloquent enough to need no commentary.

The Right to be Apathetic

The Government of British Trade Unions. By Joseph Goldstein. Allen and Unwin. 300 pages. 25s.

The well-deserved attention which this book has received has been concentrated on the facts it discloses. These facts—of apathy, oligarchy, election-rigging, and breakdown of communications in Britain's largest union—have not been challenged; nor has it been claimed that, whatever the special disabilities of that monstrous conglomeration the Transport and General Workers' Union, it is in these respects unique. It is trade unionism in its day of supremacy which is described, criticised, and by implication damned. Only, Dr Goldstein does not see the implication. The world, to him, is in transition from capitalism to social democracy; social democracy will supersede the profit motive by an undefined "socialist motive" (expressed in terms suggesting a starry-eyed trust in government by exhortation); choice of job, hours of work, rates of pay, must be determined by democratic political process; and the all-inclusive trade union, sizzling from top to bottom with conscious public spirit, is the obvious instrument both for developing the necessary social skills and for harnessing them to the needs of the planned economy.

On this hypothesis it is indeed urgently necessary to find out why monster unions do not in fact fizzle with public spirit and to apply remedies; to make active participation the done thing; to overcome the majority's apathetic preference for less dreary activities. On any other, a different solution may seem better. Dr Goldstein makes many sensible suggestions about the breaking down of obstacles to participation and the improvement of communication; but he refuses to face the basic fact that the average man simply is not a sufficiently political animal for his purposes. Even the least political will indeed unite in solidarity and self-sacrifice for a sufficiently urgent and valued cause; but no

such cause is available today. Full employment and the welfare state between them have left to trade unionism only a fragment, essential indeed but tiny, of its original function; to expect the spirit of Tolpuddle in the year 1952 is like expecting in a prosperous modern city the spirit of a band of pioneers beset by savages and starvation.

This may be regrettable; but most people have a strictly limited appetite for ardour, endurance, and long dull meetings in damp ugly rooms. A permanent atmosphere of conscientious communal fervour is no more natural than a permanent flow of adrenalin at the rate appropriate to life-and-death struggle. The price of liberty is eternal vigilance; but the penalty of insomnia is neurosis and collapse. The more comprehensive the role of government, whether based on Westminster or Transport House, the more universal its impact on individual life, the greater the need of vigilance, the more exacting its burden, and the more widespread the ordinary man's refusal, in the name of self-preservation, to stand his share of guard duty.

No doubt much could be done, in the light of Dr Goldstein's study, to revivify the trade union dinosaurs. But from the propositions that oligarchy is an evil and a danger, and democracy a strain and a bore, it may eventually be deduced that less complex and powerful organisations would at once offer fewer opportunities to oligarchs and impose less strain on the limited stock of public spirit.

The Great Achievement

The Root of Europe. Edited by Michael Huxley. The Geographical Magazine. 112 pages. 15s.

This book would have been improved by the omission of the editor's preface. In this Mr Huxley, starting from the ideas of Mackinder, seeks to show that "the so-called 'Western' and 'Eastern' Groups" in present day politics "are co-heirs of one testator," namely Greek culture. But though he ranges widely in a highly coloured style it is difficult to see how this kind of John Gilpin's ride through the world and the centuries in five pages can be regarded as proving any thesis, let alone one so difficult to reduce to concrete terms. Fortunately, however, as Mr Huxley states at the beginning, the individual essays in the book "were written independently, not so as to lead to any common conclusion."

If therefore the various contributions are taken as a series of separate studies of certain aspects of Greek civilisation at work in different countries at different times, then the collection is both interesting and attractive. One essay, that by Dr Sutherland on "Greece in Rome," is, indeed, brilliant. Not only is it a perfect example of balanced compression, but individual sections start whole trains of thought—that, for example, on Roman religion, or the remark that "Rome was born rather to the connoisseurship of a fully developed art than to any creative elaboration of her own." Dr Tarn, Professor Dvornik and Steven Runciman also succeed in presenting in judicious and readable form

much unfamiliar material on Greek influences in the East and in Eastern Europe. Only the essay on the Renaissance, which resurrects some long buried fallacies, falls below the generally high standard of the whole.

The publishers and authors are also to be congratulated on the relevance and standard of production of the illustrations. Even the most familiar, such as the San Vitale mosaics, gain by being closely linked with the text; whilst the lovely detail from the Sopochani deserves notice by all interested in the history of western art.

Attention must, however, be drawn to one astonishing omission. Six years ago the greatest living English Byzantine scholar posed the question: "has any other part of the Greek achievement exercised a greater influence upon European history than [the] late flowering of the Greek intellect in the Christian Creeds?" The reader of this book would search in vain, not only for an answer to this, but even for an indication that the question existed at all.

Irish Agriculture

Irish Agriculture in Transition. By Joseph Johnston. Hodges, Figgis and Company, Dublin and Basil Blackwell. 185 pages. 15s.

Professor Johnston has written a number of interesting essays about the endemic problems of Irish agriculture. Two main questions engage his attention, one being the system of land tenure. He shows how Irish farming, rescued from the evils of a profligate and absentee landlordism, has in recent years been weakened by the policy of land subdivision pursued for social and religious reasons which (though the author's language is more mild) make economic nonsense. He is critical of the Land Commission's powers to acquire, at the taxpayer's expense, what large farms remain and parcel them out into small unrelated holdings, a procedure more apt to create "a kind of agricultural slum and in no sense a rural community." His solution for rural poverty and overpopulation lies in a great extension of the system of co-operative farming first developed by Sir Horace Plunkett, which should be based where possible on the old landed estates.

The second main question is how to improve Anglo-Irish trading relations, on which the prosperity of Irish agriculture still largely turns despite the legacy of political conflict. In fact, Irish and British agriculture are mutually complementary, and the development of Irish food production is very much in the interests of both parties; but the highly preferential treatment of British agriculture acts as a magnet to Irish labour while leaving the agricultural possibilities of Eire unrealised.

Professor Johnston skillfully traces the strange effects of Ministry of Food policy on the Irish fat cattle trade, and has some useful suggestions for the development of a mutually advantageous trading policy.

Unofficial Ambassador

The Road to Safety: A Study in Anglo-American Relations. By Sir Arthur Willert, Derek Verschoyle. 184 pages. 15s.

In preparing this book, Sir Arthur Willert has drawn most usefully upon his own recollections of Washington and New York during the first world war, upon the as yet unpublished papers of Sir William Wiseman, and upon much of the published material dealing with Anglo-American diplomatic affairs between 1913 and 1919. His book should certainly achieve its primary purpose: in his own words to "give to Sir William Wiseman, a young British officer who played upon the American political front a role not less precocious though much less advertised than that of T. E. Lawrence upon the Eastern fighting front, the niche which he deserves in diplomatic history." Sir Arthur largely proves his point that Sir William Wiseman, quite apart from the intelligence work which was his primary responsibility at that time—and to which Sir Arthur gives little attention—became "the key man in the British organisation in the United States, virtually supplanting one Ambassador and invaluable supplementing another."

It is a fascinating story how, when relations between President Wilson and the then British Ambassador, Sir Cecil Spring Rice, were not as intimate as was necessary for winning the full co-operation of the United States, a young and hitherto unknown Intelligence Officer should have won the complete confidence of the President, and of his intimate adviser and aide, Colonel House, and been used by them more than they used the Ambassador for liaison with the British Government.

Whilst concentrating upon the unusual and important role played at that time by Sir William Wiseman, Sir Arthur Willert also throws some new light upon the Balfour, Northcliffe and Reading missions. He also, in his references to the establishment of a small British information office in America under the late Sir Geoffrey Butler, shows how unfounded were the allegations spread abroad by anti-British elements in the United States that a vast, unscrupulous network of British propagandists hoodwinked America into entering the war.

Apart from its value to diplomatic historians, Sir Arthur Willert's book should interest all students of contemporary Commonwealth-American relations. It should serve to remind all who are concerned with British representation in America that personalities matter much more than rank, and that with each new President it is vital to know who is the House or Hopkins of the moment, and to have as Ambassador, or at the Ambassador's right hand, someone able to establish a relationship of full and intimate confidence with those on whom the President relies privately as well as with those (who may not be the same) by whom he is advised formally.

ACCOUNTING FOR INFLATION

A Research Study of the
Taxation & Research Committee
of the
Association of Certified &
Corporate Accountants

This study is an examination of some of the problems arising from a period of prolonged inflation and, in particular, of those touching provision for the replacement of fixed assets and the assessment of true profit.

It does not purport to provide a complete, far less an ultimate, solution to these problems, but it does suggest a new approach to them, which it elaborates at sufficient length to form a basis for the discussion and constructive criticism which it is hoped the book will evoke.

A 47-page appendix gives details of the steps taken in other countries to meet the same difficulties.

AMERICAN SURVEY

General and Governor

Chicago, Illinois

AS General Eisenhower followed the Democratic Convention, he must have felt a pang of jealousy for the man who will be his opponent in November. Mr Adlai Stevenson's path to the Democratic nomination was so exactly the path the General had expected to follow and had been promised that he would be able to follow to the Republican nomination. But, instead of sitting quietly at Shape and waiting to be summoned to office as the symbol of the unity of the Republican party and of the country, he found that he had to come back to the United States, make more and more campaign speeches and, finally, involve himself in the old political business of meeting droves of delegates and trying to woo them by being all things to all men. And, at the end of it all, he emerged from the convention the candidate, not of the country, not even of what Mr Stevenson called "both Republican parties," but only of one wing of the minority party.

The Governor of Illinois, on the other hand, emerged triumphant from his long period of reluctance. Right up to the end he never wavered from the position that he had taken months ago—that he would do nothing to get the nomination, but that he could not refuse it if it came his way. And, at the end, he won without lifting a finger on his own behalf, without making a deal with anyone and with the last-ditch supporters of the two main candidates still holding out, despite the rather ludicrous efforts of Senator Kefauver to jump on a bandwagon which no longer had any room for him. Governor Stevenson will be able to start his campaign without having had to give any hostages to embittered opponents and, if he wins, he will be able to form his administration without any unfortunate commitments.

That two "reluctant" men should have behaved so differently can only be explained in one way. Mr Stevenson genuinely did not want to be President, while General Eisenhower most certainly did. American political reporters have learned to be cynical and few of them ever doubted the General's ambitions, though they agreed that he had no desire to work for the nomination. There is nothing extraordinary in that. But it was extraordinary that, except for those whose political attitudes made it necessary to pretend that the Governor was inherently dishonest, nobody believed that he was playing a devious game or that he meant anything but what he said. Many newspapers—the *Chicago Sun-Times* in particular, and probably the *New York Times* as well—who were "prematurely pro-Eisenhower" must, as they contemplate the respective merits of the Eisenhower-Nixon and Stevenson-Sparkman teams, be wishing that they had thought a little longer before they rushed into print.

It is so long since the Democrats had to pick a candidate rather than confirm the automatic renomination of an incumbent President that many people remembered with apprehension how expert they have proved in the past at rubbing their linen in the mud and then washing it in public. Mr Stevenson himself must have had some excruciating moments as he watched the proceedings on Thursday and

into the early hours of Friday morning. The party which was preparing to thrust an unwanted task upon him seemed to be industriously engaged in making that task as hard as possible. But in the end, and thanks to the good sense of the large middle group in the convention, all came out well. The hotheaded young men on the left got a lesson and the bitter old southern bosses on the right got a warning. Neither won; it was the party itself that came out victorious.

The importance of the party's victory over its own enthusiasts only became fully apparent after the result was certain. The speeches of the two defeated Senators, Mr Kefauver and Mr Russell, when the third ballot had brought Mr Stevenson within 2½ votes of a majority, gave a much more genuine impression of real unity than anything Senator Taft said during the rather forced reconciliation scene when General Eisenhower walked across the road to the Blackstone Hotel to see him. And on Saturday morning care was taken that seconding speeches for Senator Sparkman were made by men from every part of the country. The Democratic party has, in the view of most people, come out of this convention, after teetering for two days on the edge of an abyss, more united than it has been for twenty years. And fears that General Eisenhower can win many southern states have now been dismissed. It seems unlikely at the moment that he can win any, except Texas, which hardly belongs to the South any more. It is becoming increasingly Republican and this year regards the question of whether oil under the sea belongs to the federal or to the state governments concerned as a more important issue than Negro rights. Mr Stevenson's view that it belongs to the nation is unacceptable to Texas; General Eisenhower supports the states.

The Republicans, on the other hand, are perhaps even less united than they were after other narrow victories of their left, or conservative, wing over their right, or counter-revolutionary, one. The *Chicago Tribune* is set apart from other Republican newspapers by its extreme views, so the fact that it has received thousands of letters from Republicans who maintain they would rather stay at home than vote for General Eisenhower probably does not have much significance. But the *Chicago Daily News*, which has been a consistent supporter of the General, printed a letter which began:

Let me emphasise that we have a deep, sincere feeling of almost reverence for Senator Taft, uninfluenced by propaganda of any kind. It is deep within us. We don't know just when we acquired it—no doubt over a long period of time—but it has deepened and deepened until now it is a definite, powerful, subconscious influence which is a part of us.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

However pathetic this statement may seem to those in Washington who have watched the devious workings of the Senator's conscience, it represents the emotions of many people and those emotions are not likely to be appeased by appeals to unity or exhortations to ensure a Republican victory in November.

Those who had hoped for something more inspiring from General Eisenhower, once he was nominated, than immediate meetings with Senator McCarthy and ex-Senator Brooks of Illinois, a notorious isolationist, were heartened by his decision to appoint Governor Adams of New Hampshire, one of the best of the Republican Governors, as his "Chief of Staff" for the campaign. The Democrats' choice of Mr Stevenson has ensured that the General's campaign will be hard. It will not be easy to persuade the electorate that Mr Stevenson, a more conservative candidate than either Mr Roosevelt or Mr Truman, is going to plunge the country into socialism at a moment when his party is ripe for a little conservatism in the true sense of the word. And, even had the General any personal inclination, which he presumably has not, to outflank the Governor on the left, he would not be allowed to do so by those members of the reactionary wing of the Republican party who have joined his bodyguard.

★

The party as a whole, regardless of its choice of candidate, seems to be in a counter-revolutionary, rather than a conservative, mood. There was a whole section of the Republican platform, and one of which little notice was taken at the time, though Mr Truman mentioned it when he introduced Mr Stevenson, devoted to a defence of the achievements of the Eightieth Congress, the only one since the Roosevelt revolution in which the Republicans had a majority. As it was largely by attacking this Congress that Mr Truman won in 1948, it might have been more tactful to let sleeping dogs lie and not awaken memories of its established reputation—regardless of whether this is justified or not—by such an enthusiastic endorsement. And for the edification of those who do not bother to read platforms, Representative Martin, with the whole country watching on television, referred to that Congress as the greatest in modern history when he introduced the General to the convention. Mr Martin went even further and, as the prospective Speaker of the House of Representatives after a Republican victory, promised to undo the New Deal. The diehards seem determined to keep the party clean—and unsullied by success.

The Democrats, who had arrived in Chicago full of confidence after discovering that the unbeatable General had an Achilles' tongue, left in a mood of exaltation. They had heard Mr Stevenson's speech of welcome and his acceptance speech—it was instructive to watch the face of Governor Dever, a typical machine politician, as he realised what a campaign asset, even in his own terms, he had helped to nominate—and they had no fears that the inarticulate General would be able to stand up to such a literate and acute speaker. The Alsop brothers even thought it tactful to warn the Democrats against the dangers of overconfidence, to remind them of "the great popular strength and potent personality" of General Eisenhower and to tell them not to "count on him to spend the entire election campaign with his foot in his mouth talking through his toes." But, until the General has proved that he can stand up against a man who is probably the best orator of his generation, the Democrats will remain confident.

From Colorado to Cape Cod

[FROM A CORRESPONDENT ON HOLIDAY]

GENERAL EISENHOWER'S choice of Colorado as a holiday retreat, between the successful end of his campaign for the nomination and the beginning of his campaign for election, strikes a deep chord in many Americans. Colorado is part of the authentic West, home of the tall mountain and the deep lake, the grizzly bear and the bighorn sheep, the silver mine and Pike's Peak. As a place for a holiday it represents one of the three great summer dreams: if they could choose, most Americans would either go West, go abroad or go to New England.

That the Republican candidate, General Eisenhower, should choose to go West is an overdue swing away from the attention which political holiday-makers have lavished on the east coast for more than two decades. Even Mr Herbert Hoover, Californian by education, had his summer camp in Virginia, Franklin Roosevelt was an eastern seaboard man who preferred to spend his holidays on the north-east coast. President Truman turned his back on his native Middle West to idle on the southern tip of Florida. Not since the exuberant days of Theodore Roosevelt has a candidate chosen to fry pancakes in Colorado, and done it with reasonable skill. The Colorado tourist industry already owes the General a solid silver token of appreciation.

Since Theodore Roosevelt's day the West has been subdivided and civilised, but many of the features which delighted him are still there. To be sure the bighorns are protected from greedy hunters, the buffalo are mostly in national parks, and certain bits of famous scenery have succumbed to the economic pressure of tourist cabins and neon signs. But solitude is still to be found and mountains that rise thousands of feet above the surrounding plain have heavy snows and sudden rock slides to overwhelm man's worst tourist whimsies.

★

The one constant in the American holiday pattern is the desire to go somewhere, whether it is east or west. The tourists may marvel over immensities, or coo over charm and quaintness: the important thing is that they leave home and there is profit to be made from them both coming and going. The paid vacation is now a national institution, a mass movement; out of 44 million wage and salary earners studied in 1950, some 37 million received holidays with pay. These holidays vary from a week to a month, or more in the academic world, and most of the 37 million take their places somewhere in the cross-country tourist tide.

As a rule they go in the family car, the easiest way and usually the cheapest. People are now beginning to complain that the high-speed toll roads, such as the New Jersey and Pennsylvania turnpikes, have raised the cost of motor travel until it is almost cheaper to go by train, but the word "almost" still governs, and the complaint does not apply if the car is filled with children, dogs, clothes and camping equipment. So strong is this urge to travel that it has become a highway game to check the licence plates on passing cars against a list of the forty-eight states that issue them. In New England the best hunting grounds are the long motor speedway reaching out of New York almost to the Massachusetts border, and the smaller roads along Cape Cod.

Worship of Cape Cod is a cult far removed from love of Colorado. Geographically the cape is a flat spit of sand shaped like a fish-hook curving into the Atlantic off the south-

east corner of Massachusetts. Hallowed by history as the spot where the first English settlers touched land in 1620, it has more sand, more sun, more beaches, more cranberries, more blueberry scrub, more antique shops and more exclamatory tourists than any other section of its size in the United States. In the summer it is entirely given over to the tourist industry, and it serves people on all economic levels from the old families whose forefathers built big houses there to the new ones who seek lodging with a Portuguese fisherman. In the winter the tourists vanish, the roads clear, the antique dealers move their stock to Florida, and the residual natives who in earlier days lived mostly on fish and root vegetables now turn to unemployment relief as their best cash crop.

This two-cycle economy is not unknown in other tourist regions, but like everything else on Cape Cod it is more sharply defined there. It is not that the natives feel any less independent and self-respecting because they accept government aid in the dull season. The Cape Coddier is a man to whom cash has always come the hard way. He

must make his year's profits in four months of summer, and of those only July and August give him peak loads. Competition is stiff, and tourists unpredictable. If the government gives help, it also takes taxes.

New England was publicly reproved last year by the Council of Economic Advisers because it was not more enterprising about asking for government funds from Washington for various public projects. New Englanders still stubbornly insist on managing their own affairs, but this does not mean that they are always successful at it. Their tourist industry is for the most part made up of thousands of independent establishments. There are famous hotels along the shore and in the mountains, but a far greater number of cars stop at the thousands of houses where a spare room is set aside in June as a source of summer money. The tourist business brings New England some \$800 million a year, but the risks are great and the business mortality high. In the words of the Economic Advisers: "It requires

more than a small amount of capital and an advanced age to run a vacation business successfully."

Yet New England keeps at it. Recently it has added to its attractions by restoring historic towns which have fallen apart with time. This move, which owes its vigour to the work which the Rockefellers did in reclaiming and refurbishing Williamsburg, the early capital of Virginia, has recently been extended to Salem, Massachusetts, famous for witch-burning and as a sailing port. Not only have the fine old eighteenth-century houses of Salem been opened to the public on visiting days, but Pioneer Village, said to be an exact reproduction of the Salem of 1630, has now grown into the landscape, so that it seems an authentic reminder of a hard past. Houses are of rough wood, roofs covered with rush matting, floors of dirt covered with rushes, and there is not a bathroom to be found. The late President Coolidge thought, when the place was first opened in 1930, that visiting it would "reduce complaint and increase contentment," but there is no evidence that he was right.

Reporters who penetrated to General Eisenhower's Colorado retreat found log fires blazing on the hearth at a time when New Yorkers were living through the worst heat wave in eighty years—and even a cool summer in New York would be hot in most other places. Yet there are still people who choose to come to the metropolis for their holidays. But residents who can afford it move out at least as far as the coasts of Long Island and Connecticut for the summer, and come in to work every day. On city streets a decent care for the dress conventions still rules in spite of the heat, but it relaxes towards the suburbs. The wives and daughters who bring the family car to meet the commuters' trains at the shore towns look newly risen from the sands, with long bare legs sprouting from shorts concealed by one of father's old shirts, now an established seaside fashion; they put the tired business man into holiday mood every evening.

American Notes

Steel Goes Back

The longest steel strike in American history has at last been brought to an end, after nearly 20 million tons of steel had been lost. Precisely what Mr Truman had in mind when he told the trade union and the industry that they must settle their differences within twenty-four hours "or else" is uncertain. But the damage done to the defence programme during the last weeks of the strike clearly afforded good grounds for invoking the seizure powers in the Selective Service Act. The Secretary of Defence, listing the casualties, could point to the closing of the Army's largest shell plant, the drop in the production of certain types of ammunition to a rate below that at which they were being used up in Korea, and the crippling of aircraft production. What Mr Lovett found particularly heartbreaking was that the defence programme had been tripped up just as it was getting into its stride. In all, he estimated that more than 20 per cent of the military equipment scheduled to be delivered this year has been lost.

The US Steel Corporation expected to be operating at 80 per cent of normal production by the end of the week, but despite the co-operation of the union, some damage to the furnaces has been unavoidable, and it may be a month before the industry is back to the over-capacity rate at which it was operating in May just before the shut-down. The pipe-lines will take longer to fill. The types of steel needed for the defence programme will remain tight until sometime next year.

None of the three participants—the government, the in-

dustry, or the union—can take any pride is such a result. Mr Truman's only consolation must be that he avoided using the Taft-Hartley Act. The union may be pleased with its cash victory; it has won an increase of about 21 cents an hour (including the value of certain non-monetary concessions), compared with 26.5 cents recommended by the Wage Board last spring. But it has lost about \$350 million in wages. The companies congratulate themselves on having fought off "compulsory unionism" and having won for their employees a new "escape clause" from the union shop. But in its main outlines the agreement is very much like the one the union made with the Bethlehem Steel Corporation, on which the other big five turned thumbs down a month ago. And a price increase close to the \$5.20 a ton now granted could have been had long ago—even though the economic stabilisers are still not reconciled to it; they know how hard it will be to keep it from spreading to other industries. Of the \$5.20, \$2.84 is justified as covering cost increases up to July last year, 70 cents is for a rise in freight rates, and the rest is to help the companies meet the present wage rise. It thus remains a mystery why the final settlement was so long delayed. Part of the answer lies in the industry's embittered labour relations, and Mr Murray, the union chief, and Mr Fairless, the president of US Steel, plan a tour of the corporation's plants, in an unprecedented double billing, for a public burying of the hatchet. This may mean that both realise that another such stoppage might involve a serious curtailment in the freedom both of the industry and of its workers.

Appeasing the South

It was the votes of the Utah delegates that technically gave Governor Stevenson the Democratic presidential nomination, but it was the withdrawal of Mr Averell Harriman, the liberals' candidate, that swung the convention decisively in the Governor's direction. Mr Harriman's supporters hoped that they might be rewarded, for saving the party from what threatened to become a deadlock, by the selection of a progressive Vice-Presidential candidate. At first sight that is what Senator Sparkman of Alabama seems to be, for he has supported Mr Truman on almost every issue, both at home and abroad. But he has the inevitable southern flaw in his record: he is unable to accept any interference from federal authorities in what he regards as a matter entirely for state governments, the guaranteeing of civil and employment rights for Negroes. Mr Sparkman's nomination was the final knot that seems to have tied the South back into the Democratic party, for this election, at least.

The repair work was begun when the convention decided to allow all state delegations to vote, even those from Virginia, South Carolina and Louisiana which had been unable to swallow the loyalty pledge. The repairs were continued by the acceptance of a compromise on civil rights, without argument—not that the chairman, Mr Rayburn, was prepared to allow any argument at that stage of the convention. This civil rights section was the only controversial plank in the long Democratic statement of policy, consisting otherwise of praise for the party's accomplishments and promises to do even better next time. On civil rights, however, it was impossible to be self-satisfied, and the liberals had hoped for an even more militant guarantee of federal action than that which drove the Dixiecrats to secede in 1948, and for an undertaking to change the Senate's rule of unlimited debate which permits Southerners to talk civil rights legislation to death. Both the guarantee and the undertaking were included in the final version, but in modified form; the guarantee was no longer precise enough to be unacceptable to the South, in its present conciliatory mood, and there was little danger in the undertaking, for any attempt to change the Senate rules can always be talked out in its turn.

In appeasing the South, however, the Democrats have risked alienating two important groups of supporters in the North, the trade unions and the Negroes; the latter have been particularly offended by Mr Sparkman's nomination. The Negro vote is important, not because of its size, but because much of it is now concentrated in key northern states, where it might decide the result if the election were close. In so far as Negroes vote as a group, they have been voting steadily for the Democrats in recent years, won from their traditional Republican allegiance by the Administration's social welfare measures as much as by its civil rights' promises. But the watering-down of those promises in the latest Democratic platform, and the failure to keep the promises made in 1948, give the Republicans an opportunity of recapturing Negro votes this year. Unfortunately for them, it is an opportunity which they have made it difficult for themselves to take. In the elusive hope of seducing at least a few southern states, the Republican platform builders produced a civil rights plank much weaker than the Democratic one—and it is not certain that General Eisenhower will be willing to strengthen it.

* * *

Slump Inside the Boom

President Truman's theme in his Mid-year Economic Report was one which Democratic campaigners will be whistling all the autumn: that despite the burdens of the defence programme, Americans have never been so well off; that inflation may be unfortunate, but deflation would be worse. Production, sales and employment have been running at a high level for a year, yet, during the last six months, the cost of living has remained steady. But as the chart shows, this economic stability, at a time when government spending for security has been rising, has been purchased at the cost

NEW YORK . . . 70 Broadway

of substantial declines in the production of consumer goods. (The decline in steel simply reflects the strike.) The gross national product for the first half of this year, in 1951 prices, and at an annual rate, was 3 per cent larger than in the first half of last year; industrial production was down by 3 per cent, partly because of strikes. Disposable personal income, on an annual basis, was put at \$11 billion higher, but only \$7 billion of this was spent. What made room for the defence programme, without overweighting the economy toward inflation, was the continued high rate of saving and the shrinking of private inventories.

This slump inside the boom has given rise to fears, most vigorously expressed by the Congress of Industrial Organisations, that a recession is just around the corner. By June, however, the pendulum had begun to swing back. The sales of most consumers' durable goods are looking up. Retail trade is about 1 per cent higher than it was a year ago. The rate at which inventory accumulation has been falling has slowed down. The relaxation of credit controls has helped those who are beginning to think that now is the time to buy, though they are still in a minority. The Council of Economic Advisers, taking into account the probable level of government and private investment expenditures, as well as the possibility that consumers may spend slightly more and save slightly less of their incomes, concludes there are no grounds for expecting any general recession in the next twelve months.

What is more likely is continued stability or a return of mild inflationary pressures. The fact that the consumers' price index has just edged up to a new high fortifies this estimate, while the piling up of demand caused by the steel strike suggests that, even if a recession cannot be avoided, it has been pushed further off, perhaps to the middle of next year.

What is more controversial is the Council's belief that a recession can be avoided when defence spending drops off in two or three years, through the existence of "built-in stabilisers" such as social security benefits, and through intelligent private and governmental action. The Council believes that a recession after the war, which was so widely expected, was avoided, not so much because of the accumulation of war-deferred demand, but because of a vast expansion of the internal market, due to more even distribution of high incomes, a higher standard of living, the introduction of new products, and the rapid rise in the population. All these should continue to give business confidence to expand. Less optimistic economists feel this analysis underestimates the role played seven years ago by deferred demand and exaggerates the rate at which the economy can go on expanding.

Freedom to Travel

The State Department is being prodded by the courts into keeping its promise to revise its passport procedures. A special three-man Federal Court, convened to decide on the constitutionality of the law giving the Secretary of State power to grant passports under regulations prescribed by the President, ruled that the law itself was constitutional, but that the way it had been applied in the particular case under consideration was not. The Department had arbitrarily revoked the passport of Miss Anne Bauer, a naturalised American working as a journalist in France, on the usual vague grounds that her activities were contrary to the best interests of the United States. No details were given and Miss Bauer had no opportunity of stating her case. The judges declared that she had been deprived of her right to travel, a personal freedom on which her livelihood also depended, without due process of law. They held that

like other curtailments of personal liberties for the public good, the regulation of passports must be administered, not arbitrarily and capriciously, but fairly, applying the law equally to all citizens without discrimination, and with due process adapted to the exigencies of the situation.

Unless this decision is reversed—it can be appealed directly to the Supreme Court—the State Department will probably have to be prepared to hold a hearing every time it withdraws, or even denies an application for, a passport. It has not waited for this before granting a passport, on his second application, to Dr Linus Pauling, the internationally known and respected chemist from the California Institute of Technology; he was refused a passport to enable him to visit Britain earlier this year, apparently, although no reason was given in this case either, on unsubstantiated suspicions that he had Communist connections. But even now Dr Pauling is free to travel only to France and Britain and he has had to sign an affidavit that he has never been a Communist. This is a safeguard necessitated by the McCarran Act, which forbids the issue of passports to members of "Communist-action organisations."

The unfortunate results of this prohibition have just been illustrated by the refusal of a passport to the New York *Daily Worker* sports editor, who wanted to attend the Olympic Games but could naturally not sign such an affidavit. The Communists have thus been made a free gift of an unnecessary martyr, although it is unlikely that world opinion will be so widely and adversely affected by this refusal as it was by the way Dr Pauling was treated.

Shorter Notes

Nations exporting to the United States, particularly Switzerland, found comfort in President Truman's refusal last week to restrict imports of garlic in spite of a Tariff Commission recommendation that he do so. Not only Swiss watch makers, but also that part of the American industry which depends on Swiss watch movements, are hopeful that the same reasoning the President followed in the garlic case—that restrictions would benefit only a few American producers and would hurt United States relations abroad—will lead to a similar rejection by the President of the Commission's recommendation for what the Swiss have called a "tariff curtain" on imports of watches.

The Federal District Court in New York has rejected an appeal for a new trial for Mr Alger Hiss, the State Department official now serving a five year sentence for perjury for denying that he gave department documents to Mr Whittaker Chambers, a confessed Communist spy. The appeal was based in part on alleged forgery by typewriter; Mr Hiss's counsel said it could be proved that the key exhibit in the trial, an old Woodstock typewriter once owned by Mr Hiss, could have been duplicated by Mr Chambers.

THE WORLD OVERSEAS

Argentina Without Evita

THE early and tragic death of Señora Eva Perón has provoked widespread and unquestionably sincere mourning throughout Argentina. The hundreds of thousands who flocked to pay a last tribute to her testified to the remarkable way in which the young radio actress who in 1945 became the then Colonel Perón's second wife had genuinely captured the imagination of vast numbers of Argentinians. The immediate consequence of her death will be an access of sympathy for the President, and a temporary stilling of criticism of his policies. But when all the monuments have been erected and all the eulogies pronounced, it will be surprising if the Peronista regime does not rapidly realise what a grave political blow the death of "Evita" has dealt it.

Many political figures have proved after their death to be both more potent, and less embarrassing to their colleagues, than they were in life. To some extent this applies to Señora Perón, whose arbitrary manner often disturbed the solidarity of the Peronista movement, and whose posthumous influence will undoubtedly be invoked with fair success in support of its future actions. But nothing can now replace the almost hypnotic effect which her personality exercised on the Argentine masses, and particularly on organised labour. Her intervention had staved off several strikes in recent years; her displeasure had been enough to oust more than one secretary-general of the CGT, the centralised trade union organisation; and she had increasingly won the reputation of being the workers' intermediary with the President.

In this respect, her disappearance from the political scene could hardly have come at a more unfortunate moment. After last year's abortive military revolt, General Perón came to lean more heavily than ever on the support of organised labour; but the subsequent rapid deterioration of the economic position has provoked unusual disquiet among both the leaders and the rank and file of the trade unions. The harsh facts of Argentina's economic plight are at last being brought home to the urban proletariat, from whom they had long been hidden by successive wage increases, "strength through joy" festivities, and lavish doles from Señora Perón's unaudited funds. Today the very bread reflects them. Its colour and quality are now so bad that General Perón himself was forced to argue recently that at least it was equally unpleasant for rich and poor alike. Yet this, until last year, was one of the great wheat-exporting countries.

No Relief in Sight

No early break in the economic clouds seems likely. Prices of food and other essentials are still rising. Almost every industry is passing through a difficult period, partly due to the restriction of credit, and partly to consumer resistance to high price levels. The textile and footwear industries have been particularly hard hit by a drop in sales. Although the droughts of the past two years were finally broken by heavy rains this spring (autumn in Argentina), the earliest of these rains probably reduced the harvest of maize, which is now of vital interest to Argentina in view of the lack of other export crops; indeed, it is now proposed to barter maize in exchange for imports of wheat. If present trends continue, things are likely to get still worse before the arrival of the new crops at the end of the year.

Meanwhile the President has found it easier to reshuffle his government than to reorientate his policies. General Perón took advantage of his inauguration for a second presidential

term in June to replace his Ministers of Agriculture and Livestock, Finance, Industry and Commerce, Public Works, and the Treasury, and to convert the Ministry of Economy into a Ministry of Foreign Trade. After the spendthrift years in which nobody thought of economising, there has been some ironic comment in Buenos Aires at the decision to abandon the very word in favour of "foreign trade" at a time when the latter has nearly vanished. But there has also been created a new Ministry of Economic Affairs, headed by Dr Gómez Morales, the former Finance Minister, who is expected to co-ordinate the other economic departments and to become the President's chief economic adviser, somewhat in the manner of Dr Miranda. It looks as if his guiding hand will be badly needed in coming months. Most of the new ministers are young and little known. Dr Antonio Cafiero, the new Foreign Trade Minister, is only 30, and his lack of experience was revealed in his very first statements to the press. Dr Miguel Revestido has taken over the Ministry of Finance at the age of 34, after managing one of the now State-owned railways. The Treasury goes to Dr Pedro Bonanni, whose career has been in the post office savings bank, but who may well prove more capable than his predecessor, Dr Cereijo, who distinguished himself shortly before his removal by announcing that the prevailing trend in Argentina was "one of prosperity." Señor Rafael Amundarain, the new Minister of Industry and Commerce, is 41 and a former departmental head in the Ministry of Transport.

Ready to Go into Reverse

The composition of the new cabinet, together with General Perón's earlier announcement that 1952 was to be a year of transition and consolidation between five-year plans, suggests that the President has been shaken badly enough to lose his confidence in the economic policy he has pursued so recklessly in the past. The new ministers look suspiciously like a docile team well suited to carry out a reversal of the policies with which their predecessors had been associated.

A certain amount of back-peddalling is already visible. The President has again announced higher prices for grain crops, and the general manager of IAPI, the official Trade Promotion Institute, through which the farmer has long been deprived of most of the value of his crops, has resigned. General Perón has also assured farmers that prices will again be raised if their costs increase during the year, and that the CGT will help them to obtain extra labour at harvest time; but it remains to be seen if the urban worker will relish being mobilised for farm work. And the President's promise to mechanise agriculture depends on his success in finding exports with which to pay for urgently needed machinery and fuel.

To revive exports is, indeed, the crux of the government's problem. In the first quarter of 1952 Argentina had an unfavourable trading balance of 1,947 million pesos, more than twice the 1951 rate. But exports mean primarily meat and grain, and this in turn means more meatless days and dingy bread for the masses, while the simultaneous suspension of imports will tighten their belts even further. "Evita" might have got them through to the end of the year without serious trouble. Whether her husband, who may now drift away from the trade union section of the Peronista movement and nearer to the army officers who hated his wife, can perform the same miracle will largely depend on his ability to invoke her memory.

The Folly of a King

[FROM A SPECIAL CORRESPONDENT]

KING Farouk the First of Egypt sailed from his country on July 26th unwept by a people who had greeted his kingship fifteen years earlier with ecstatic reverence and had remained through many disillusioning years innately royalist in sentiment. He returned from his studies in England on his father's death in 1936 and entered into his constitutional powers on July 29, 1937. He was then a handsome, gracious youth of seventeen and when in the following year he married the equally beautiful daughter of Youssef Zulficar Pasha, their subjects were extraordinarily happy. He was only 32 when he abdicated, but his physical beauty was gone; he looked a fat and lumbering man in his late forties as he made his way up the ladder to board his yacht.

The Egyptian people feel they have seen only a mirage of promise and beauty in the reign of Farouk. The newspapers recall the early impressions of the reign as "a dream which the people caressed through the years until it faded and decayed." The people "kissed the air the young king breathed." But now, this young man "who never learnt from experience," "was ungrateful to the nation . . . unjust to the people . . . broke every law of morals . . . trespassed the limits of dignified deportment . . . transformed a constitutional monarchy into an unjust autocracy . . . exploited his country . . . humiliated his nation, in fact has not missed a single chance of humiliating and dishonouring his country." He was "absorbed in his vices," among which must be included "an excessive cupidity for material things."

Intrigues of Court Favourites

How did it happen that a man of acknowledged intelligence was so prodigal of a people's affection that such verdicts should be pronounced upon him? Although historical analysis may eventually elaborate in detail the causes of his failure, it will be difficult for it to avoid the broad conclusion that, like Stavrogin, he was a man who could understand but not believe; that he preferred the evil to the good. It is true that, coming in youth to the throne, he had no experience whereby to judge people or events, but it seems clear that he quickly learnt to prefer that advice which indulged his weaknesses and which taught him more and more to see the throne as given by God to his service. At the outset of his reign there were hints that he was conscious of the opportunity which his kingship gave him, but increasing physical and moral flabbiness left him no stamina for the effort. To this was added towards the end an increasing cynicism as the threat to his throne developed, so that, instead of making the effort to save it and his people, he relied on the intrigues of court favourites. Never was this more obvious than in the last few months when he waged within the army itself a struggle to replace Lewa Mohammed Neguib, a man against whom there is no breath of scandal and who served with distinction in the Palestine war, by a favoured officer, Lewa Hussein Sirry Amer, suspected of a part in the arms scandal and even of complicity in the murder of another officer. Again, as the result of an intrigue, he compelled the resignation of Hilaly Pasha's honest administration to replace it by one in which Kerim Tabet Pasha, a man deeply suspect to the country, had the post of Minister of State.

It is difficult to hold bad advisers more responsible than the King himself. He chose them, raised them from humble positions, honoured them and at the same time drove from his side those honest statesmen who saw the dangers of his course and tried to save him. In October, 1950, a petition from anti-Wafdist leaders begged him to leave aside the advice of his favourites, some of whom, it plainly said, were suspected of corruption in the Palestine arms scandal; but the signatories were rewarded with increased enmity from the King. In the end King Farouk was isolated from almost all but his favourites. Only Hafez Afifi Pasha, animated by a

sense of duty, kept himself, with difficulty and against many affronts, Chief of the Royal Cabinet. Even in that position he could not deflect the King from the final fatal steps which led Lewa Mohammed Neguib and the army to drive the King from his throne.

As the King's reputation declined, the people's awareness of corruption in high places increased. It was the common gossip in streets and coffee houses and even in clubs which the King himself frequented. The result was to develop in Egypt a broadly based movement of reform which, from extreme left to extreme right, had this in common with all honest men, that it desired the country cleansed of social injustice and corruption. The extreme movements include many of Egypt's best elements who have been driven to extremes by the apparent hopelessness of attempting to correct the evils of the country. (Indeed, assassination in the Middle East is in itself frequently the outburst of people whose minds have been exasperated to madness and this has often given rise to public tolerance of the crime.) The trend towards nihilism was strengthened by the sense of hopelessness among people who, at the outset, were intent only for national betterment, so that it became almost impossible to decide what was good and bad in movements which were often in themselves dangerous. The army had the strength to break through and, because it felt itself dishonoured in Palestine by the very corruption of which the people complained, it became the instrument of what is intended to be a benevolent revolution. Had the army not done so in disciplined fashion it seems highly probable that other forces would ultimately have done so more explosively.

There is much yet to do in Egypt, but at least one thing has been done which could only with difficulty be undone: the hidden forces which from the King's footstool did so much to pervert government in Egypt have been destroyed. It remains to be seen where the unleashed passion for virtue will lead a country for so long inured to social sin.

The Japanese Constitution Under Fire

[FROM OUR CORRESPONDENT IN TOKIO]

IN 1946 it was the fashion for intelligent Japanese, when asked what they thought of the new Japanese Constitution, to reply politely, "I'm afraid I don't know: I can't read English." That has always been the fatal defect of the MacArthurian Constitution—in general, a sound and, at times, eloquent declaration of human rights and freedom. It was blatantly a product of alien influence, imposed in a time of surrender and military occupation by a victor on a beaten foe. It had no Japanese sanctions. That it would be altered and reshaped when the alien influence was withdrawn was certain. Already, only three months after the peace treaty, organised and growing pressure is discernible for important revisions of the Constitution.

No one should be surprised that the Emperor's status has been one of the first issues to be raised. The technical point is blandly made that, while Article I describes him as "the symbol of the State . . . deriving his position from the will of the people with whom resides sovereign power," Article 7 invests him with powers and responsibilities which are far superior to the orthodox functions of a symbol. The proposal in influential quarters is that this undemocratic paradox should be corrected and that the Constitution should vest sovereignty jointly in the Emperor and in his people.

Actually, the powers granted in Article 7 are essentially nominal, and the real purpose of the revision is to begin the restoration of the Emperor to a status comparable with prewar days. This does not necessarily imply the return of the divine halo which the militarists found so useful. But it does mean the constitutional reconstruction of the old

Tenno system, in which the Emperor, venerated as the mystical father of his people, will shake off presumptuous western fetters and eventually resume the Japanese attributes of full sovereignty.

The overwhelming mass of the Japanese people can be expected to support this revision of the Constitution, if the issue is intelligently presented. Because of his role during the Occupation, the Emperor is closer than ever before to the hearts of his people, who feel that he has devotedly suffered humiliation on their behalf. A most interesting, although unpublicised, passage in the debate in the Diet on the controversial Anti-Subversive Activities Bill was the assertion of the Director of the Special Investigation Branch of the Attorney-General's Office (Mr Mitsusada Yoshikawa) that, under the Bill, which is now law, advocacy of the abolition of the Emperor system would constitute sedition.

The article over which most open dispute has already occurred is the celebrated war-renunciation provision that MacArthur reputedly wrote himself:

Art. 9.—Aspiring sincerely to an international place based on justice and order, the Japanese people forever renounce war as a sovereign right of the nation and the threat or use of force as means of settling international disputes.

In order to accomplish the aim of the preceding paragraph, land, sea and air forces, as well as other war potential, will never be maintained. The right of belligerency of the State will not be recognised.

MacArthur boldly disavowed this pious affirmation before he was recalled, calling on Japan to rearm and, in fact, ordering the actual resumption of rearmament with the establishment of the so-called National Police Reserve, which is now being expanded to 110,000 men, equipped with howitzers, bazookas and aircraft and stiffened with a cadre of tough former officers of the Imperial Japanese Army.

To sidestep the hazard of attempting to alter this article of the Constitution, Prime Minister Yoshida has sturdily adhered to the fantasy that the National Police Reserve is only a local police force, presumably proposing to use howitzers as an experiment in rigorous traffic control, and that its establishment was in no sense a violation of the letter or spirit of Article 9. He is supported by numerous legal authorities like Dr Soichi Sasaki who argues that the article does not proscribe "possession of war potential as a means of self-defence." The issue has now been carried to the High Court by the legal minds of the sundered Socialist Party. Mr Yoshida, it is generally agreed, has been politically wise in so far as delaying a showdown on this question, especially when it could be submitted that he was acting under United States pressure.

"Excessively Democratic"

Proposals for the revision of the articles relating to the government's right to dissolve parliament, membership of the House of Councillors and election of prefectural governors are all directed towards a return to prewar Japanese practice. There are many conservative critics of the new method of electing members of the Upper House and prefectural governors. They say it is "excessively democratic," and want to return to the old method of selecting, which they say is "more in harmony with the Japanese tradition." In addition, other groups wish to insert in the two articles guaranteeing freedom of speech and assembly and the right of labour to organise, some such "safeguard" as the proviso "insofar as public welfare is not thereby subverted or threatened."

That there would be substantial opposition to these last proposals is certain. There was surprisingly wide and laudably liberal opposition to Mr Yoshida's Anti-Subversive Bill and only the excesses of the Reds themselves ensured its eventual passage in less modified form. But revisions of the Constitution are clearly inevitable and—like so many developments in independent Japan—nearer than anyone had anticipated.

Belgian Army Disturbances

[BY A CORRESPONDENT]

ONE night last week troops in different parts of Belgium who had just completed 18 months' service, demonstrated noisily and with varying degrees of violence against the two-year term of conscription. About 10 p.m. on July 25th, several hundred troops of the 12th Engineer Regiment, stationed at Namur, assembled noisily in the parade ground of their barracks. They tried to make for the streets by the main entrance, and when turned back by the Military Police, scrambled over the walls into the street. After smashing the windows of the quartermaster's stores and the Military Police motor pool, they marched off in regular formations to the barracks of another regiment. The Military Police tried to stop them but were overwhelmed. Then the gendarmerie moved in, charging the troops with truncheons and firing bursts of sub-machine-gun fire in the air by way of intimidation. Amidst scenes of great confusion they made some sixty arrests there and then. When the rest of the column reached the Marie Henriette barracks, some three dozen soldiers forced their way in, roused the inmates and freed a private who had been locked up for indiscipline. Once again, however, the gendarmerie caught up with the mutineers, and after more arrests had been made, order was eventually restored.

Similar incidents took place in other parts of the country, in particular in several Brussels barracks. It is plain that the morale of some units is disturbed and tempers frayed. There is a clause in the new conscription law which "allows the authorities to release National Servicemen after 18 months if no immediate danger threatens the peace." Successive statements by ministers had led most National Servicemen to believe that this "early release" clause was going to be applied in their own cases. There was naturally, therefore, much resentment and disappointment when, about ten days ago, the Foreign Minister let it be known that this clause would not in fact be invoked.

2-Years Service Unpopular

The two-year period of military service has always been very unpopular in Belgium ever since it was decreed in 1950. The Socialists argued at length, both in Parliament and in the press, against the measure. They said it was unnecessary and the "outcome of a moment of government panic." They pointed out that until Greece and Turkey came into Nato, Britain was the only other member country with as long a period of military service. It has been further argued that because Britain had adopted a two-year period, it did not necessarily follow that it was right for Belgium to do the same. In Britain, it was said, exemption and prolonged deferments cut down the conscripts to only 62 per cent of the male population of service age, whereas in Belgium the comparable figure is 76 per cent. It would therefore, it is argued, be possible for Belgium to shorten the period of service and still maintain a manpower effort comparable to the British.

The Government has, without doubt, been worried about the situation. It has repeatedly stated that Belgium would not maintain the two-year period if the other countries of the EDC did not take similar action. The hints dropped by various ministers that, as an intermediate measure, the Government might use the "early release" clause of the conscription law, undoubtedly had a serious foundation. The Cabinet did contemplate this possibility, especially after Mr Shinwell, last June, deplored the Atlantic partners' refusal to follow the lead of Britain and Belgium, and hinted that if they maintained their present course, Britain might have to cut down its own period of service. But after the Belgian Cabinet found that the British Government had no intention of taking up Mr Shinwell's suggestion it decided—for the time being—to stick to the two-year period.

Germany Comes First in Yugoslav Trade

ONE result of Stalin's quarrel with Marshal Tito has been that, in the first half of this year, the Federal German Republic became Yugoslavia's biggest trade partner, ousting the United States as exporter and Britain as importer. According to statements made to the *Frankfurter Rundschau* by their trade counsellor in Germany, the Yugoslavs expect to double their foreign trade this year, compared with 1951, and imports from Germany will probably amount to a third of the total.

For political reasons the Germans were encouraged to grant a credit to Yugoslavia in 1950. Now, on their own account, they are taking a gamble on its future as a valuable supplier of grain and metals, and as a market for machinery. The Germans have found that Yugoslavia has not been able to meet its delivery obligations, and is unlikely to repay DM407 million at the due date in 1952. This fact has been accepted, in view of the Yugoslavs' progress with their production and exports. The unused balance of the credit has been enlarged in the latest trade and payments agreement, and it will be used to import machinery. The Yugoslavs hope to make additional purchases in the Ruhr with part of the credits extended to them by the International Bank and Britain. Altogether they want \$44 million of German engineering products during the period of the current agreement.

German-Yugoslav trade is still small—only \$60 million each way in the current trade year—and it is not being established on identically the prewar pattern. The days are gone when the Yugoslavs had an embarrassing quantity of surplus wheat and Germany provided the only market for it.

They are, indeed, now Germany's largest supplier of maize, and hope to rebuild their exports of pigs; but both sides attach a new importance to the development of Yugoslavia's mines and metal industries, which British and other western firms are helping to build up. Under the new agreement, Germany will deliver rolled steel and 200,000 tons of coke, as well as some consumer goods. The Germans were swayed in their decision to extend further credit by Belgrade's estimates of increased output. Iron ore production, for example, is estimated to rise to 2½ million tons in 1953 and 1954.

The Germans will help to adjust Yugoslavia's deficit by giving an extra allowance to their tourists visiting that country, but this will, of course, make little difference. The main development is expected to be an increase in the Yugoslav exports as well as imports. Belgrade's representative in Germany has pointed out that, in the course of whittling away state monopolies, foreign trade licensing has been completely abandoned as from July 1st. Moreover, exporters can keep 35

per cent of their foreign exchange proceeds to dispose of as they will. Even the German champions of liberalisation have not yet gone as far as this.

Pyrenean Petroleum

[FROM OUR PARIS CORRESPONDENT]

As its industry expands France needs more and more industrial fuel. Since the war great strides have been made in electrification, and the output of coal, which was disastrously low after the liberation, has been raised to a reasonable if not a spectacular level. Hydroelectric power, developed with the aid of Marshall plan credits, has hitherto contributed most to industrial expansion. Now there is also a chance that France may eventually be able to produce on its own soil a fair proportion of its petroleum requirements. Such is the significance of recent achievements in the Pyrenean region.

With Great Britain, Holland and the United States, France owns a large proportion of Middle Eastern oil. Since 1920 the *Compagnie Française des Pétroles* has held one-quarter of the shares of the Iraq Petroleum Company, which supplies 20 per cent of French imports of crude oil. At the same time France has developed an extensive refining industry on its own territory. Its refineries were ruined during the last war and have since been reconstructed with a throughput of 22 million tons per annum. They have come in very useful, both to France and Great Britain, since Abadan closed down.

Even before the war it was realised that, in order to increase the security of the national supplies, prospecting must be carried out in France itself and wherever possible in the African territories, both colonies and protectorates. To this end the *Centre de Recherches de Pétrole du Midi* was formed in 1937. This organisation had its first lucky strike just before the war when a large bed of gas was discovered at Saint Marcet, south-east of Pau. During the war the French were careful to go slow with prospecting lest the Germans, who were growing increasingly short of oil as they retreated westwards, should benefit from further finds. (The chairman of the *Régie Autonome des Pétroles*, M. Pierre Angot, was deported on account of his go-slow policy and died in captivity.) After the war funds were provided under the Monnet plan and prospecting was resumed in the Pyrenean region.

Pipeline to Bordeaux

The field at Saint Marcet, administered by a state-aided company, has gone from strength to strength, producing 285 million cubic metres of gas in 1951. Reserves are estimated at 5 billion cubic metres (about a billion has already been extracted) and the wells, with a potential flow of 1 million metres per day, are as productive as those in the United States. This natural gas contains various condensable elements which are recovered at the nearby factory at Bousens, the most modern of its kind in Europe. In 1951 14,800 tons of petrol were produced there, about 7,700 tons of butane and nearly 4,000 tons of propane. Gas treated in this way becomes almost pure methane with a very high heating-

power. A system of pipelines carries it to Pau, Toulouse and Bordeaux where it is put to domestic or industrial use either as fuel for heating or as petrol or as a raw material to make ammonia and fertilisers. It is calculated that the bed of natural gas at Saint Marcet produces as much heat as a coal-basin producing six or seven hundred thousand tons per year.

In 1949 another company, the *Société Nationale des Pétroles d'Aquitaine*, struck oil at Lacq, a few miles from Pau. This bed now produces 300,000 tons of oil per year at a depth of 650 metres; 15 wells, all of them flowing, are at present being exploited. The bed at Lacq is of the water-drive type and should take ten years to exhaust. The oil is taken away by trainloads from an immediately adjacent station and refined either at Pauillac near Bordeaux or La Mède near Marseilles.

It is known that a much deeper bed exists at Lacq. Last year gas was struck, after drilling to a depth of 3,550 metres. Owing, however, to the great pressure, the large flow and the poisonous character of the gas, the company decided that the well must be abandoned. In order to "kill" the flow Mr. Myron Kinley, an expert known as the "flying fireman," had to be summoned from Texas. He arrived within 48 hours and spent the next two months leading the company's efforts to seal off the well. He finally succeeded, thereby much endearing himself to the inhabitants of Béarn. Further attempts are now being made to drill into the deep-lying bed.

Bigger Funds Needed

What proportion of French metropolitan consumption is provided from this Pyrenean region and from other metropolitan and North African sources? France itself uses about 12 million tons of refined oil per year. Excluding gas, current production in France now amounts to 375,000 tons per annum, from Lacq and from Pechelbronn, in Alsace, an old source now in decline which has produced three million tons during the last two centuries. In addition, French North Africa (Algeria and Morocco) produces 180,000 tons, which bring the French-produced total to 550,000 or about 4 per cent of the metropolitan consumption. France exports some 5 million tons of refined oil to its African dependencies and to foreign countries of which 1,500,000 go to North Africa. North African refineries are now being built to ensure that all the local crude oil may be consumed on the spot.

In France and the French Union prospecting is largely financed from the budget (French mining legislation gives absolutely no encouragement to landowners, who have no proprietary rights over what may lie beneath the surface of their holdings). Funds are also provided by the prosperous companies already extracting such as the RAP and the SNPA. The authority co-ordinating investment is the *Bureau de Recherches de Pétrole* which has been working since 1945 on the basis of two five-year plans and spending 100 billion francs voted by Parliament. This is too small a sum for really extensive prospecting. In order to encourage private capital special tax-exemptions based on American and Canadian practice may be offered to investors. Foreign capital has already been admitted by the French government. In 1950 the Shell and Gulf Oil groups, controlling two North African companies, were given permission to prospect in Tunisia, and a year later an affiliate of Standard Oil acquired the same right in the Bordeaux region. All further development in fact depends on the supply of capital. Meanwhile Pyrenean production continues discreetly, and with scarcely a blemish to the magnificent landscape.

*

Correction.—The publisher of "Deutschland Am Rande Zweier Welten," by Dr W. W. Schuetz, mentioned in *The Economist* of last week, is the Deutsche Verlags-Anstalt, Stuttgart, and not the Europa-Verlag.

Has nobody told you, Mr. Grigson?

Most drivers take the underneath of a car for granted, but industry cannot leave protection from rust to chance. Among the most effective methods of rust removal and rust prevention are those calling for phosphoric acid. Albright and Wilson's phosphate products in many different ways, often anonymously, are giving manufacturers what they want—to provide the better goods which the public needs.

Steel and Free Enterprise

ON its technical merits, as well as the intrinsic importance of its subject, the measure to restore steel to supervised private ownership that the Government has outlined this week deserves priority over the Transport Bill. In contrast to that Bill, the White Paper on the iron and steel industry propounds a reasoned, even an astute, Parliamentary exercise, to be followed by a financial operation that is at any rate plausible. It offers a reasonable chance of returning a considerable shareholding in the steelmaking industry to private investors; and the degree of public supervision that it would permit—though not guarantee—might well make it difficult for a subsequent Labour Government to find any but the most doctrinaire excuse for another wholesale reversal. It is, moreover, tactfully constructed to appeal to the trades unions, whose co-operation would be required. Whether it promises truly competitive private enterprise in the steel industry is distinctly doubtful. But there is no evidence that the Government ever intended it to do so. The Conservative commitment was “to provide for the reorganisation of the iron and steel industry under free enterprise with an adequate measure of public supervision.” That much, this measure may well do; amended, it might do more.

Selling the steel companies back, under this scheme, will be a job for the Treasury, which will have an entirely free hand. The forthcoming Bill will abolish the Iron and Steel Corporation; its ownership of the nationalised companies will pass to a holding and realisation agency appointed by the Treasury, whose duty will be “to secure the return of these companies to private ownership and meanwhile to ensure their efficient direction.” Since the White Paper can hardly admit the possibility of anything less than successful outright sales, the other possibility of leasing plants to operating companies is not mentioned. Perhaps there is a chance that it might slip into the Bill. Little is said about methods of sale, though use of the ordinary market channels is presumably envisaged; most of the provisions listed under “Transfer of Ownership” are designed to remove any considerations that might hamper the agency—or its master, the Treasury—in arranging resale. Regroupings of companies or capital reorganisations will be permitted; Iron and Steel stock will become part of the National Debt and lose its distinguishing name, thus freeing the agency from preoccupation with the £240 million that the last Government paid for the industry; that stock, and most other gilt-edged stock, will be accepted in payment for steel securities—at their then current market values. The prices to be asked will have regard to

... all relevant factors at the time of sale ... the important changes which have taken place since nationalisation in the physical assets, capital structure, reserves and trading prospects of many of the iron and steel companies, together with other considerations such as the monetary and market conditions prevailing at the time.

The terms and timing of sales by the agency must be

approved by the Treasury; priority will be given where practicable to applications from former shareholders.

The Government recognises that sales may take some years to complete. Meanwhile, the agency will act as the most passive of shareholders. All that it receives from sales and dividends will be paid to the Treasury, which will in turn provide for the agency's outgoings. These may include finance for the development of the companies it still owns. To be dependent upon the Treasury for the money to carry out capital investment running into millions a year does not sound an enviable position for any board of directors, but if the development schemes are approved by the proposed Iron and Steel Board, it is to be presumed that the necessary finance would not be withheld.

Some sections of the steel industry profess to be entirely sanguine about these plans for resale. They are even thinking in terms of a rough timetable. If the Bill is introduced late this year, it may become law by March, though the concentration of Budget business would mean that any delay could put it back to June. That is the case for priority over transport—even a month to spare would make the timetable safer. But if the Bill becomes law by Easter, unscrambling could and should begin forthwith. Out of the £240 million book value of the nationalised companies, perhaps £60 million is represented by ex-subsidiary companies that it is hoped their former owners—notably Vickers and Guest, Keen and Nettlefolds—would buy back straight away. It is argued that the equity capital of most of the major steel companies—perhaps 30 per cent of the remaining £180 million—could be sold back in six to nine months for some £50 or £60 million. This would leave some £100 million or more, mainly in the form of preference and debenture capital—with the Treasury's realisation agency. The earnings prospects of the industry, it is pointed out, are better than in 1948, as Mr Hardie argued before his departure in February, and as the forthcoming report of the nationalised corporation will presumably demonstrate.

Such forecasts, it must be emphasised, are entirely unofficial. They may also be too optimistic. The Treasury and its agency are given complete freedom about what they may sell and when they sell it; but that may not necessarily hasten the process. There is no timetable, so this will not be a forced sale, though the Treasury will naturally be under political pressure to sell. As for prospective buyers, it is by no means certain that the original interests in the major subsidiary companies will be bought again. The two companies principally concerned have recently sounded lukewarm on the question—though it would obviously be in their interests to take this line until the actual sales came to be negotiated.

For the private and institutional investor in the City, many questions remain unanswered. It will not be easy to get a clear picture of all the separate companies offered for sale until the Iron and Steel Corporation's report and accounts appear in a few weeks' time; under the ægis of the Corporation, several important steel companies have carried out considerable reorganisations of their capital, and have thus radically altered the balance between their equity capital and prior charge obligations. Their individual operating results will also be awaited with interest. Some steelmaking units will obviously be easier to sell than others and the rate of return upon the book value paid in compensation may vary considerably. Perhaps the greatest question mark in the process of denationalisation concerns the latest and largest plant, built by the Steel Company of Wales at Margam. Constructed at postwar capital costs, and completed only since denationalisation, this has no proved earnings record, and it provides in any case a sad reminder that the last time the public was asked to participate in a major new steel project the response was dismal. The City is also aware that the industry it is being asked to purchase has already committed itself to further development at the rate of £60 million a year for the next five years or more, which implies large further instalments of new money and continued low rates of dividend as profits are ploughed back.

One question that remains unanswerable and must bulk large is Mr Strauss's threat to renationalise at no more than the original compensation terms. The Government is confident that another Labour Government would never carry out that threat; the investor must form his own opinion. Among other points of doubt, there is one that the Government might have answered, but has not. What is an investor buying when he buys a given steel share? The system of levies and subsidies within the industry, operated to adjust the advantages of making steel from various combinations of raw materials, makes it hard for a prospective investor to judge the earnings records of particular companies with any confidence for the future. The White Paper provides for that system to continue.

The Iron and Steel Board that the Government proposes to set up to supervise the industry will possess powers far exceeding those of any similar body in a privately-owned British industry—though it need not wield all these powers directly. Its scope will be wider than the Labour Government gave to Mr Hardie's Corporation for the Board will have power to supervise the whole of the steelmaking industry, plus the steel-founding and ironfounding industries (of which only limited parts were nationalised). The Board will draw its members from employers, labour, and consumers, but it will have an independent chairman and other independent members. It will have two main responsibilities: development and prices. It will have to consider and approve the major development plans submitted by steel companies, and may restrain companies from development of which it disapproves. It will have power—in normal times—to fix maximum prices for sales in Britain by producers in the industries it supervises. Its permissive powers, however, are much wider. It will review raw material supplies, control their distribution in times of shortage, and may—at its discretion—take steps itself to import raw materials, iron and steel. It

may sell imported materials below cost and may impose levies on the industry to meet losses incurred in so doing. It will “arrange for” the periodical publication of statistics relating to the industry; it will be consulted regarding any changes in import duties on iron and steel.

The Minister of Supply will appoint this board; his formal powers of control over its main operations, as set out in the White Paper, are not extensive, but may be strong in practice. The powers of allocation and price control under emergency powers and Defence Regulations now being exercised in respect of steel will remain with the Minister, though the Government may delegate them to the board. Enforcement is therefore a Ministerial responsibility; the development and price controls exercised by the board in normal times will be secured only by contractual obligations, enforceable by civil proceedings, between the iron and steel producers and the board. The Ministry, not the board, will exercise the much-discussed “positive power” of setting up or operating iron and steel works that no company feels able to undertake. That, so far as it goes, is the right formula; but the point has never seemed to possess any major importance. The Minister must approve any sales of imported materials below cost by the board, and will consider representations by companies about any levies it may impose. Finally, the board will make an annual report to the Minister, who will lay it before Parliament.

Is this the *status quo ante* Hardie in steel? In practice, it appears that the Government intends that it should be. The obvious question that this array of powers and responsibilities poses is that of the relations between the new Board and the British Iron and Steel Federation, which until now, with some show of co-operation from the nationalised central body, has operated all the functions which the White Paper would entrust to the

SCOPE OF THE PROPOSED IRON AND STEEL BOARD

Process to be supervised by Board	Total 1951 output in UK (tons)	Per cent of total output produced by nationalized companies
Iron ore	14,647,000	97.4
Pig iron, etc.	10,000,000	94.7
Ingot steel	15,155,000	98.2
Iron castings	3,753,000	23.0
Steel castings	270,000	19.3
Rolled products	11,386,000	91.5
Forgings (excluding drop forgings and smiths' hand forgings)	388,000	73.8
Hot finished tubes and pipes	1,174,000	70.2
Bright steel bars	384,000	10.7
Tinplate, terneplate and blackplate ..	757,000	87.8

board. The board's schedule of duties, powers and responsibilities, indeed, reads like an amalgam of the general duties laid on the corporation by the 1949 Act with the main functions of the federation. It seems that the Government intends that these functions should continue to be exercised, in the main, by the federation. Moreover, whatever the powers upon which it could call, a committee of twelve people representing diverse interests may not necessarily behave as a strong independent body; much will depend upon the chairman. Nevertheless, the provisions of the White Paper give the board power to take over every significant function of the

federation; from the time that the Bill becomes law, the federation will exist and work only on sufferance of the board and of the Minister. The Government's intention may be to return the industry to its pre-1951 condition; but this measure would place in the hands of a Labour Minister of Supply power to control the industry effectively and almost entirely without worrying about renationalisation. Even in private ownership, the industry could overnight be converted into a state-managed cartel from which constituent companies would not have power to resign, as they have from the federation.

The only hint on policy for the board that emerges from this White Paper is not reassuring. If the present voluntary system of spreading costs and earnings across the industry operated by the federation should prove unsatisfactory, the board will have power to take it over and enforce it upon all the companies within its orbit. This official blessing for the most questionable practice of the industry since the war largely precludes the full benefits of competition. Indeed, the White Paper would thus enable the board to manipulate costs in a way that in other privately-owned industries might well attract the attention of the Monopoly Commission. It would appear that the Government shares with the postwar Labour Governments the conception that the steel industry is in some way a natural monopoly. The 1949 Act was Labour's way of dealing with such a monopoly; this

White Paper agrees on the nature of the animal, but suggests a Conservative way to supervise it. There is a good deal that can be said for such an argument, and it is consciously accepted in certain sections of the industry; but the question has not recently been publicly examined, let alone demonstrated. The next few years in steel will be years of major change. How much of the industry can be genuinely sold back to the private and institutional investor? Must some rump of high-cost plant always remain in state hands? Where will the money be found for the industry's costly plans of continued development? Can some *modus vivendi* be found between privately-owned re-rollers and ironfounders, ex-nationalised steel makers (perhaps still part-owned by the state), a residue of nationalised companies, and conceivably some uneconomic plants owned by the Ministry of Supply? All these questions have to be answered.

But one thing is clear. The Government should adopt the principle, and instruct the board, that prices of materials and products should in general reflect economic costs. The prospective investor is entitled to know the effects of the levy and subsidy arrangements upon the profitability of the companies in which he is invited to take an interest. Such admissions of principle and frankness would immensely improve the Bill, and the Government's standing as a proponent of free enterprise. In the long run, they would improve the competitive strength of the British steel industry.

Business Notes

Anticlimax Again

With the unhappy air of a man setting off a very small squib before an audience that had been primed to expect really big bangs, Mr Butler announced this week that there is to be no major change in the policy laid down in his budget. Indeed, if the forecasts that he made in the debate are fulfilled, the Commonwealth countries that convene in London on November 25th—to discuss a wide range of subjects “including imperial preference”—will find themselves already bumped back on a course not very different from that adumbrated by their Finance Ministers last January. “Provided no new adverse factors arise,” the Chancellor still believes that the United Kingdom's deficit with the non-sterling world in the second half of 1952 should be approximately covered by receipts of American aid (which are expected to amount to £115 million); in addition, Britain will presumably continue to run at least some small surplus with the overseas sterling area. The hope that the overseas sterling area would be able to offset this expected deficit with Britain by a surplus in its accounts with the non-sterling world has apparently been abandoned, but—despite the recent fall in the prices of rubber, jute and other commodities—Mr Butler believes that these accounts will be “just about in balance” in the current half-year. Unless this conjectural balance with all non-sterling countries masks a prospective deficit with those countries that have to be paid in dollars, the implication seems to be that the government expects little net movement in the gold reserve during the next six months. Unfortunately, the Chancellor had to announce that the sterling area's deficit with one area that does now demand payment in dollars—Western Europe—widened considerably in July. He dismissed this, however, as a manifestation of a familiar seasonal tendency (the one that causes so many sterling area crises to come to a head in September). By the end of the year, the Chancellor hopes, the sterling area should be in balance with EPU.

If Britain is to fulfil its share in this programme it will have to cut its deficit with the non-sterling world by at least £160 million—from £275 million (according to the Chancellor's provisional estimate) in the first half of 1952 to £115 million in the second. Part of this improvement may be sought at the expense of a narrowing of Britain's customary surplus with the sterling area, which—as far as can be gathered from Mr Butler's very garbled comments on this point—was well over £125 million in the first half of this year. The rest is intended to be covered partly at the expense of the defence programme, partly by running down stocks of imported food and raw materials to (but not below) their end-1951 levels, and partly by an increase in production.

Export Potential and Import Cuts

On the respective contributions anticipated from these three sources, Mr Butler was surprisingly uninformative. He announced that the new pattern of the defence programme will make it “possible to limit the demands made by defence on the engineering industries in the near future,” and that “a certain amount more foreign exchange” should be earned in the second half of this year as a result of the arrangements now being made for selling British defence equipment abroad; it should be emphasised, however, that neither the £25 million of orders already placed in this country under the United States off-shore procurement programme nor the £10 million of extra armament sales recently negotiated with other non-sterling countries will necessarily be completed and paid for in 1952—and nor, of course, will the “substantial” other United States purchases still under discussion. Mr Butler also declared that the level of British imports, which fell—at an annual rate and on a c.i.f. basis—from £4,250 million in the third quarter of 1951 to £3,700 million in the second quarter of 1952, “will continue to fall

even more sharply in the next few months;” indeed figures provided by the President of the Board of Trade in a later speech suggest that the annual rate in the second half of the year should be somewhere between £3,200 and £3,400 million. As a result, imports of unrationed foodstuffs (apart from wheat and flour) will be about 25 per cent less in the second half of 1952 than they were in the second half of 1951, imports of dollar tobacco about 56 per cent less, imports of paper and pulp more than 50 per cent less, and imports of manufactured goods (other than machinery and defence supplies) about 40 per cent less. The Chancellor did not make it clear how far these substantial cuts are the direct consequence of the decisions announced last November, January and March, or how far they are due to a new tightening of the screw; since the previous announcements related the level of cuts to a notional and never very precisely defined import programme, however, the distinction is not important. The Board of Trade has now turned its hand to the task of cutting down the notional import programme for 1953.

The main danger that springs from these decisions, of course, is that the damming-up of the flow of imports by this crude weapon of physical controls will impede production by creating shortages of particular materials and components, and will cause consumers' purchasing power to be diverted towards goods that ought to be exported. On this, Mr Butler had few crumbs of comfort to offer. He agreed that industrial output in the first two months of the present financial year was slightly lower than in the same period of 1951-52, but he ascribed this chiefly to the shortage of steel (which he expects to be very significantly eased in the second half of this year). He also looked for an increase in production of coal and chemicals, and announced that the housing programme is to remain sacrosanct (but with new economies in the use of imported materials). For the rest, export industries (and particularly dollar earners) will continue to receive a preferential allocation of raw materials; some of those that successfully claim to belong to this very vague category will be elevated in the queue above those in the equally vague category of rearmament industries. The facilities provided under the Export Credit Guarantees Act are to be widened and exchange control over credit terms will be modified, presumably in order to extend longer credit to exporters of capital goods. Provided that costs are kept in check by “moderation” in wage demands, these measures may make an increase in exports financially possible; since no new steps have been taken to check pre-emption by the home market, however, it does not follow that the possible will be achieved.

Coal Tributes—and Targets?

Mr Butler's hope that this year Britain may export twice as much coal as it did last year is in its way a return to the days when politicians set coal targets and asked the industry to hit them. In fact, to export about 15½ million tons by the end of this year would put some strain on the Coal Board. It would mean exporting almost another eight million tons of good quality coal in the remaining five months of the year: up to mid-July, about six million tons had gone overseas, and the balance will be made up in low-grade coals and slurries, of which 1½ million is scheduled for export during 1952. Will the Coal Board be able to dig this coal, and sell it?

A month ago Lord Leathers, in an OEEC report, put British coal output this year at 225.8 million tons; this week he seemed hopeful that it might reach 226 million tons. Even the Coal Board, which is at present blushing somewhat uneasily beneath the politicians' bouquets and wondering whether the National Union of Mineworkers may hurl a brickbat, is cautiously talking in the same terms. If inland consumption does not surpass last year's—so far it is nearly 2 million tons lower, so that this would give room for a

reasonable recovery in industrial consumption—that would again take 208 million tons. Stocks at the end of last year were 15½ million tons, and on the NCB's “safety” estimates they should be 1½ million tons higher at the end of 1952. Bunkering normally takes about 3½ million tons. Therefore, the industry can probably export all the coal it produces in excess of about 213 million tons—probably 13 million tons, plus the lowgrade fuels which are outside the statistical picture.

If the coal can be produced, it can probably be sold. But the three changes already made this year in the coal export programme naturally do not make sales any easier. Some of Britain's possible customers have already made arrangements to buy all their coal for 1952; and the estimates of consumption in Western Europe this year now seem less likely to be realised.

* * *

Government Borrowing and the Banks

In the first sixteen days of July net deposits at the London clearing banks rose again, by over £27 million. Once again the whole reason for the rise lay in voracious demands for bank finance by the Government. The clearing banks' holdings of Treasury bills rose by just under £77 million; after allowing for small falls in cash and call loans, net Government borrowing from the banking system appears to have risen by just under £67 million. Meanwhile the banks' advances fell by another £38 million and their commercial bill holdings by over £2 million, while their investment portfolios were little changed. It is true that an increase in Government borrowing and a fall in bank advances are customary features of the clearing banks' statement for July; in the first eighteen days of July, 1951, for example, bank holdings of cash and money market assets (including commercial bills) rose by over £79 million and advances fell by over £34 million—a pattern not very different from that shown this year. But this does not alter the alarming fact that heavy short-term borrowing by the Government has now swollen the ratio between the banks' liquid assets and their deposits to 35.9 per cent, compared with 32.0 per cent last November and 31.6 per cent just after the end of the 1951-52 financial year.

If the banks are to remain under persistent and positive pressure to restrict their advances, it is imperative that this liquidity ratio should not continue to expand. There is some reason to hope that the scale of net Government borrowing from the banking system should now run down from its peak—thanks partly to the fact that the “departments” will no longer be switching out of floating debt to meet successive calls on their subscription to the now completed BEA loan, and partly to the recent decision to increase the attractiveness to investors of both defence bonds and tax reserve certificates. On the other hand, provided Mr Butler's hopes are fulfilled, the Government should receive less finance from the sterling counterpart of the external deficit in the fourth quarter of this year than it did in the first two, while the shortest-dated of the serial funding stocks (which matures in November) is now rapidly becoming a liquid asset in bank portfolios. In these circumstances, there seem to be two factors on which the future course of the banks' liquidity ratios—and with them the effectiveness of credit restraint—will largely depend. The first factor will be the Government's ability to keep in check the rate of Exchequer deficit—and particularly the scale of lending to local authorities. The second factor will be the Government's willingness, if the Exchequer's cash deficit continues, to borrow on long term from the market instead of on short term from the banks.

* * *

Automata in the Air

The guarded statement about guided missile development made by the Minister of Supply last weekend gives a

partial answer to critics of the security silence that has been imposed on the development of these weapons. This silence, in contrast to widespread publicity in the United States, had created an impression that British rocket research was not yielding very positive results. This was certainly not justified. Yet, despite the Minister's confident forecasts, the replacement of the piloted interceptor fighter by the guided rocket here or in any other country seems likely to take longer than was hoped. The delta-wing G.A.5, for example, represents a stage somewhere between the two methods; the aircraft flies with a pilot but electronic mechanisms relieve him of much of the responsibility for sighting and aiming at his target. At the heights and speeds of modern bombers and fighters, this is in any case a feat almost beyond human ability. But only recently have electronics developed to a point where scientists are within "measurable distance" of taking over all the functions of the human pilot and it is still possible that a further intermediate stage of piloted rocket-powered interceptor fighter will be needed before they do so.

Neither the rocket motor nor the aerodynamics of rocket design present exceptional difficulties. The major problem is to design guiding mechanisms that cannot be easily diverted from their target by interference devices carried by the enemy aircraft. The most satisfactory method of doing this is to make the missile guide itself independently of any control from the ground. This, Mr Sandys implied, has now been done for some but not all of the missiles under development.

By talking about the creation of a new industry with a nucleus of 100 companies the Minister gave only limited acknowledgment of the work carried out by the much smaller number of companies involved in the development of these and other forms of rockets. Much of the work is being done by the big aircraft and engine manufacturers, few of whom feel strong enough to remain aloof from the developments of weapons that will almost certainly restrict the market for piloted military aircraft. The electronics industry which already holds the key to the efficiency of modern aircraft, will in future assume a large degree of responsibility for the performance of these new weapons. Progress in this industry will also decide the scale on which they can be produced. The rocket casing and motor are simpler to build than the modern jet fighter or its engine, but the production and assembly of the electronic heart of the missile will be difficult to mechanise. At one time it seemed that rocket development might create a new chemical fuel industry, but the difficulty of producing such chemical fuels in the quantities needed means that the oil companies, whose military market for high octane aviation spirit has been replaced by one for wide-cut distillates, will probably also provide petroleum-based rocket fuels.

Integrating Backwards in Steel

In 1939 John Summers and Son installed a new American-type continuous strip mill at its works at Shotton, Cheshire. Its plans to modernise and increase its steel melting capacity to feed the mill were held up by the war; but since 1945 it has developed one stage further backward. In a fortnight's time its new melting shop, with eight 150-ton openhearth furnaces installed, will begin pouring steel; the shop will have a full capacity of 15,000 tons a week, half as much again as the two obsolete melting shops it will replace. In October, two batteries of 44 coke ovens each will begin to make coke and supply coke-oven gas to help to heat the openhearth furnaces. In December a new blast furnace—with a hearth diameter of 27 ft, the largest outside the United States—will be blown in. Its full output of 8,000 tons of pig iron a week will provide about half of the steelmaking materials for the melting shop. From a "pure steel" works, drawing its pig iron from the Shelton iron works at Stoke-on-Trent, therefore, Shotton will have developed backwards into an integrated steel plant. Foundations already exist

for a second blast furnace; when this, two further coke-oven batteries and possibly two extra openhearth furnaces are completed in some years' time, the total plant will have a capacity of more than a million ingot tons of steel, in the finished form of sheet and strip, a year.

Even in 1937, when Summers first decided to lay down the strip mill, Shotton seemed to the Import Duties Advisory Committee only "so planned, as to location and production, as to involve the minimum possible disturbance to employment"; and in 1946 the British Iron and Steel Federation recognised that it was "not situated in so favourable a position for the assembly of the raw materials, coking coal and ore, as some of the other coastal plants." The imported ore that will form part of the blast furnaces burden will have to be hauled about 14 miles from navigable water at Birkenhead. If steel plans could be made upon a clean new slate, it is fairly certain that the Shotton mill would not be where it is; or that this exact location would not be chosen for an integrated steel works—though the spaciousness of the site, which has allowed a magnificent layout, and the advantages of largely fresh water supply from the Dee, would come into the other side of the balance.

Steel planning, in British reality, is not like that. Moreover, Shotton now demonstrates bluntly the financial vulnerability of new projects upon suitable, if not perfect, sites. The original 1939 strip mill cost £5 million. By the time the current development is completed, it will have cost another £17 million. The additional coke, iron and steel furnace capacity will cost another £5 million on top of that. For £27 million, that is, Summers will have an integrated steelworks producing rather more than a million ingot tons of steel. The industry's only major new plant since the war, the Steel Company of Wales's works at Margam, will turn out about 1½ million tons of similar rolled steel products a year when its extensions are completed; but it will have cost probably £80 million or more. Given such capital charges, its costs can hardly be comparable. Shotton and Margam provide distinct examples of "patching" and practically new development in British steel since the war; as it now stands, the argument for patching is not easy to overthrow.

Textile Convalescence

The promised review of rayon prospects which the chairman of Courtaulds gave on Wednesday to the company's annual general meeting gave shareholders some slight encouragement. Sir John Hanbury-Williams said some weeks ago that without a rapid improvement in sales, the dividend might not be maintained; in his statement this week he made it clear that what the industry now faced was not rapid recovery but a period of protracted convalescence. He explained that in the second quarter of the year, demand for rayon yarn and cloth "reached the lowest level for many years." Rayon plants cannot be operated so flexibly as cotton mills, and are difficult to adapt to short time working. By the middle of May, stocks had been built up to a level that made it necessary to close down the greater part of the company's plants for four weeks. The result of this was shown in the disturbingly low level of production in June, when output of staple fibre dropped to only 2.4 million lb compared with 15.6 million lb in January, and filament output was 9.3 million lb against 18.5 million lb in January. Total rayon yarn output (including nearly a million pounds of nylon) was less than 12 million pounds, one-third of the figure at which the plants were running last winter. During June, however, sales showed a "small increase which has enabled us to effect a slight reduction in our finished stocks." Sir John added that there has been a "modest rise" in export orders, so that some of the closed plants have started production again, but on a "very reduced scale."

The outlook for textiles may not be so deeply grey as Sir

asks for a Credit

It is a simple matter for the Westminster Bank to establish local credits anywhere in the world, for there is no town of commercial importance in which it is not represented. Equally, the collection of funds due to you from foreign buyers presents no difficulties. The comprehensive service of information and advice which the Bank provides for those who trade abroad is fully described in a booklet called 'The Foreign Business Service of the Westminster Bank'. We shall be glad to send you a copy on request.

WESTMINSTER BANK LIMITED

Foreign Branch Office: 41 Lothbury, London, E.C.2

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

John's choice of words might suggest. The great embarrassment of the rayon producers is, of course, the high level of stocks. In Lancashire production was cut back at an earlier date, and the weight of stocks carried was made less oppressive by being scattered down the production chain. The subdued revival that has been taking place in Lancashire in the past weeks is not visible in the accompanying chart because the holiday season is just getting under way. The extra week's holiday, granted for the first time this year, is likely to have an even more drastic effect on yarn output in the coming months than short-time working early in the

year. The recent fall in output can be attributed to the first of the Oldham holiday weeks, and a further sharper fall can be expected when the second week in Oldham coincides with the first of the Bolton holiday weeks. Stocks that have not been sold at recent cut prices may be disposed of during the long holidays. Many traders believe that seasonal trading came back with the buyers' market so Lancashire should be in a reasonably healthy position to face the winter buying season. A further reason for hope lies in the cotton industry's price policy. Yarn prices have been reduced quite sharply, while the rayon producers' prices have remained unchanged, and spun staple prices have hesitated between the two opposing policies. Stable prices have their virtues, but it is difficult not to feel that better discretion in this instance is being shown by the cotton industry.

Car Prices Out of Covenant

The secondhand car market has not taken kindly to the partial lifting of the covenant against resale. Prices have been slipping for several months; they have now reached a level where no two-year-old car just out of covenant is likely to fetch much more than the current list price for the same model new, though that will still leave owners of some models with opportunities of profit. Cars delivered in 1950, before the purchase tax was raised from 33½ per cent to 66½ per cent, are coming out of covenant. The owner of a covenant-free Austin A.40 would have paid £541 for it in 1950. Today's list price is £717, and by the time the car reaches the customer, it will probably cost him close to £750—which is the listed secondhand price for a 1950 A.40. Similar margins between first cost and current secondhand values exist for other small 1950 cars such as the Ford Prefect, Morris Minor and Hillman. But certain other 1950 medium-priced cars are changing hands at £200 or more below the listed secondhand price, and this itself is not always as close to the current list price for new models as in the case of, say, the A.40. Secondhand prices might be even lower but for the absence of any secondhand Ford Consuls or re-designed Vauxhalls. If the two-year covenant persists, there will be no secondhand Consuls or Zephyrs before 1953, and few Vauxhalls before 1954, and so long as the manufacturers cling to the covenant, new anomalies will occur with the appearance of each new model.

The dealers themselves would have liked to see all cars above a certain price removed from the covenant. The difficulty about fixing an exemption level at, say, £1,200, was the considerable premium still commanded by Jaguars and Rover saloons, cars selling new at between £1,400 and £1,700. The industry, which has not shown itself particularly sensitive to public opinion on the covenant, has compromised by allowing each maker to withdraw individual cars from the scheme whenever he feels satisfied that they are no longer "objects of speculation." Some of the cars still under covenant are patently not objects of speculation—a fact suggesting that the list does not provide dealers and their customers with a logical guide about the chances of withdrawing any particular make of car from covenant. No doubt some manufacturers are reluctant to attract attention to sales difficulties by withdrawing cars from the scheme, but there are already signs that keeping such cars under covenant creates fresh troubles for dealers. Some who have new models in their showrooms cannot sell them because customers are not prepared to sign a covenant and face the prospect of large losses when the time comes to trade in the car. If the industry does not have second thoughts about the present half-in half-out covenant, the market itself is likely to kill the scheme through general disregard. The time has surely come for the industry to let the market take its course.

Dearer Money in Australia and South Africa

Interest rates have been raised this week in both Australia and South Africa. The Australian authorities, in accordance with traditional political misunderstandings about the significance of "bankers' profits" in that country, have long hamstrung their sporadic attempts at enforcing a disinflationary policy by keeping down the rate that may be charged on bank advances. The maximum rate on the commercial banks' overdrafts was lowered by statutory order to 4½ per cent at the beginning of 1947; this order has now at last been revoked, in return for an understanding that the maximum rate will not be raised above 5 per cent. Simultaneously the various forms of savings deposit and fixed deposit rates have been raised by ¼ or ½ per cent, and the Treasury bill discount rate has gone up by ¼ per cent to 1 per cent.

The South African authorities have never hampered themselves with as many inhibitions about the use of monetary policy as have their Australian counterparts. Mr Havenga announced this week that the Union Government was in full accord with the Reserve Bank's recent decision to loosen the peg on long-term Government bonds to allow a redemption yield of 4½ per cent. Rates for six months' Treasury bills are also being raised, from 1½ to 1¾ per cent, and those for twelve months' Treasury bills from 1¾ to 2 per cent. In his review of the general economic situation in the Union at the annual meeting of the Reserve Bank this week, the Governor, Dr de Kock, felt able to strike a relatively cheerful note. Although he emphasised that this was a time for consolidation rather than further expansion, and declared that the Union could not expect any appreciable inflow of capital for some time, he believed that South Africa's phenomenal industrial development in recent years had put it into a better position to meet any recession that might now set in in world trade. Last year the Union's external current account deteriorated from approximate balance to a deficit of £109 million, but the net capital inflow of £71 million was much the same as in 1950.

South American Sterling

After a long delay commercial negotiations have begun between Argentina and the British Government representatives in Buenos Aires. Progress is expected to be rather more rapid than in previous discussions between the two

THE RUGBY PORTLAND CEMENT COMPANY LIMITED

A Circular Letter was despatched on Tuesday, 29th July, to the Ordinary Shareholders of the Company announcing that the Directors have decided to issue forthwith £1,000,000 4½ per cent. Unsecured Loan Stock 1957/62 and, towards the end of 1953, 1,000,000 Ordinary Shares of 5s. each.

This Loan Stock will be offered to Ordinary Shareholders at par on the basis of £1 of Loan Stock for every two Ordinary Shares held at the close of business on 25th July, 1952, rights to less than £1 of Loan Stock being disregarded: and each £1 of this Loan Stock will carry an option to subscribe between 1st November, 1953 and 15th December, 1953, for one new Ordinary Share of 5s. at 10s. 6d. Option Certificates will be issued and will be transferable independently of the Loan Stock. Application is being made to the Council of The Stock Exchange, London, for permission to deal in and for a quotation for the Loan Stock and the Option Certificates.

The new Ordinary Shares to be issued pursuant to the Option Certificates will rank for dividend as from 1st January, 1954, and in all other respects *pari passu* with the existing Ordinary Shares.

The consent of H.M. Treasury has been given to the proposed issues.

A Letter of Rights, together with a Form of Application for Additional Loan Stock, will be posted to Ordinary Shareholders in the course of the next few days.

FACTS ABOUT AUSTRALIA

Over 3,000,000 bales of wool exported yearly

Australia is the world's largest wool exporter and is one of the chief primary producing countries of the world. Her secondary industries are growing in importance and are well represented in her exports. The Bank of New South Wales welcomes enquiries about trade and business opportunities and the establishment of new enterprises in Australia and New Zealand.

In selecting desirable trade relations for exports and imports with Pakistan, Habib Bank Ltd., with 45 branches spread over West and East Pakistan, can prove to be most helpful and you are invited to use our services.

The Bank is fully competent to handle all foreign exchange business, including opening and advising of commercial letters of credit, collection of documentary bills, remittances, etc.

FOREIGN BRANCHES: Bombay, Calcutta and Colombo.

CORRESPONDENTS & AGENTS at all important cities of the world.

I.C.I. TECHNICAL SERVICE

THE chemical industry's ability to satisfy the needs of its customers at home and to succeed against competition abroad is determined largely by the efficiency of its technical service—that is, the expert advice and assistance it gives to those industries that use its products. The man who buys heavy chemicals is not persuaded to do so by high-pressure salesmanship or intensive advertising. He buys them because they are the necessary raw materials of his business, and he tends to go to a concern which not only enjoys a high reputation for quality but supports its products with technical service.

Technical service works in two ways. It confers obvious and direct advantages on the consumer, and the chemical industry also benefits. Out of the experience of its technical service are born new products, and new techniques, to improve efficiency in many trades. I.C.I. employs hundreds of qualified men in this specialist organisation, which covers nearly every branch of Industry and Agriculture at home and abroad and costs over £1,000,000 a year. Such an organisation can only be maintained by a large scale enterprise. This series of announcements, citing examples from I.C.I.'s casebook, is intended to show the importance of its technical service to the efficiency of British industry and, therefore, to the wellbeing of the community.

Adventure Story!

To change from manual, or any of the more conventional mechanized methods of keeping accounts, to Hollerith Electrical Punched Card Accounting is an adventure rich in possibilities. It opens a door on uncharted territories ripe for exploration. To promote the better understanding of Hollerith techniques and methods, we have written a guide book called "In business, too..." As this book is planned for business executives, may we ask you to use your business or professional noteheading in applying for a copy?

countries. The last shipment of meat at the price agreed in the 1951 negotiations has already been made, and any further shipments will be made at a provisional price which will be adjusted later to whatever new price is agreed. This, incidentally, is also to be the basis on which Uruguay will continue its meat shipments to Britain. Whatever terms are agreed with Argentina will, if precedent is followed, automatically apply to the British meat contract with Uruguay. The negotiations with Argentina should be stimulated and hastened by the chronic shortage of sterling from which Argentina is now suffering. The various guaranteed sterling accounts which Argentina set up as a result of previous financial arrangements with Great Britain are virtually empty. The current account has of late had to be replenished by special sales of sterling to Argentina against dollars. Argentina has need of many essential materials including oil from the sterling area. The desire for sterling should, therefore, provide a good lubricant to the negotiations on the meat contract. On this particular issue Argentina has made its usual opening gambit by suggesting that it will be content with nothing less than the world price for meat. Fortunately for the British tactical position in these discussions, there are at present abundant supplies of meat in Britain.

A shortage of sterling is also seriously affecting Brazil. The Brazilian number one account has been deprived of one of its main sources of sterling as a result of considerable reductions in British purchases of Brazilian cotton and of the fall in the price of this commodity. Not only is the number one account virtually exhausted, but substantial arrears of remittances to Britain and the rest of the sterling area have accumulated. There is a balance left in the blocked account, but this is earmarked for capital transactions, including the repatriation of Bahia South Western, San Paulo and Northern Utilities. The amount in this account will be barely sufficient to meet the claims that will ultimately be made upon it.

Iraq Petroleum Progress

In 1949, oil production in Iraq barely reached 4 million tons; by 1955, it is expected that output will be no less than 30 million tons. Last year's production from the Kirkuk field was 8 million tons. To double output in two years and quadruple it in the following three years gives the proper impression of the scale and speed of development that is being undertaken by the Iraq Petroleum group. So, equally, does the record of capital expenditure—£21½ million spent last year for further construction of the 30-inch pipeline from the Kirkuk oilfield to Banias on the Syrian coast; £18 million and six years of work to develop the Zubair field, from which oil is now flowing through the 12-inch pipeline to Fao, soon to be paralleled by a 24-inch pipeline, at a cost of nearly £1 million; £14½ million spent on the Mosul concession, where plans are well advanced for the linking of new production with the existing pipelines from Kirkuk.

Last year, which brought its disastrous losses in Persia for Anglo-Iranian, was marked by the conclusion of a new relationship between the IPC and its associates and the Government of Iraq. The companies have together undertaken to produce not less than 30 million tons a year—the Iraq and Mosul companies producing not less than 22 million tons from 1954 and Basrah not less than 8 million tons from the end of 1955. In this vastly increased output, the Iraq government will enjoy a 50-50 participation; in a foreword to an impressively produced report on an impressive year, Mr H. S. Gibson, managing director of the IPC companies, records that on the basis of present prices and costs, the Iraq government's revenues from oil should rise from £15 million in 1951 to £59 million in 1955. By Iraq law, the government is pledged to devote 70 per cent of their oil revenues to capital schemes "to enrich the productivity of the soil and enrich the lives of the people."

These are wise lines of development for both partners to the agreement. Yet the production of crude oil and its transport to the seaboard is only the first part of the achievement of the IPC group and the companies participating in it. The latter increased their refinery capacity in Europe last year by 24 million tons, and had 11 million tons of additional capacity under construction. They also increased their tanker fleets last year by 483,000 tons and had a further 2,100,000 tons under construction or on order.

"Imps" and its Capital

The capitalisation of £22,537,830 from Imperial Tobacco's reserves rectifies a long standing anomaly. With each increase in duty and with every rise in costs, especially in the cost of leaf tobacco, the disparity between the company's issued capital of £50,420,986 and the real capital employed in the business has grown wider. The greater part of the company's reserves, which totalled £44,917,746 (excluding future tax reserves) at the end of last October, have therefore been permanently locked away in financing its ever-growing commitments in working capital. As they believe that there is "no likelihood of any appreciable permanent reduction in the working capital needed by the company," the directors have therefore decided that the time is ripe for broadening the base of the company's financial structure. They have carefully refrained, however, from capitalising any part of the reserves that were built up in the past from fortuitous profits; the leaf replacement reserves have been left intact and, while £5.4 million has been capitalised from a contingencies reserve, the £9.5 million left in this reserve more than covers the net amount of the exceptional profit that arose from the increase in tobacco duty in 1947.

To provide a margin over and above the requirements of this free issue the authorised capital of the company is to be raised to £85 million. The directors, rather ambiguously, declare that they consider this margin desirable "so that an issue of shares for cash could be made if and when conditions in their view warrant such a course—which is not the case at present." This statement should not, of course, be taken to mean that the only obstacles to making an immediate cash issue are the "conditions" now ruling in the stock markets. In view of the cut in imports of dollar tobacco, the company seems likely to run down its stocks considerably this year, and its need for new finance is presumably less likely to be pressing.

Committees for Purchase Tax

The terms of reference of the two new committees on purchase tax, published last week, are sufficiently comprehensive to give the committees a fair chance of finding a solution to the twin problems of rebate and "uplift." These two aspects of purchase tax administration have been a bone of contention between traders and the Customs and Excise for several years. The first committee, under the chairmanship of Sir Maurice Hutton, will deal with the problems of traders' losses which arise when the rate of purchase tax is reduced. In a buyers' market, each reduction means that the retailer has to stand the loss caused by writing down the price of stocks on which he has paid tax at the old, higher rate, to the price of new stock bearing the lower rate of tax. The committee is to consider how far there is a case, "in principle" for paying compensation to these retailers when the rates of purchase tax "or other duties of Customs and Excise" are altered and if so, how this could be done. The inclusion of all Customs duties within the committee's terms of reference was not fore-shadowed at the time when the proposal was first made to set up these committees. But now that tax is collected from such a wide range of consumer goods, and at such heavy rates, there is much to be said for finding a means of ending the

pre-budget gamble that such traders have to face each year. If it does not, the interruption in wholesale orders created this year by textile and clothing retailers' efforts to clear stocks before the Budget is likely to be repeated annually in many trades.

The second committee, under the chairmanship of Mr Frederick Grant, QC, is faced with the highly technical dispute over "uplift." By law, purchase tax is assessed on the wholesale price of the article. The committee is, in the first place, to examine whether this is the right method of assessment. The dispute over "uplift" arises in the innumerable special cases where manufacturers sell direct to retailers and not through a wholesaler. The Customs and Excise have always insisted on adding a theoretical wholesale mark-up to the price asked of the retailer in order to arrive at the correct amount of tax to be paid. Thus, if the wholesale price of an article is 107s., a manufacturer selling to a retailer at 100s. must add a notional 7s. to his price to calculate the amount of tax to be paid. Manufacturers have consistently argued that their price to the retailer in fact includes a proportion of wholesaling expenses, and that "uplift" is therefore unnecessary. The clothing manufacturers recently reached an agreement on this question with the Customs, where "uplift" is wholly or partially waived if the sale complies with certain conditions. Hosiery manufacturers have now joined this scheme and it is probable that piece goods manufacturers will do the same. Unless the committee recommends a change in the point at which the tax is assessed, it would appear that some of its work has already been done.

New Style in New Issues

A Bank rate of 4 per cent has put a premium on ingenuity in the new issue market. Rugby Portland Cement has now followed the fashion set by Distillers and Triplex Safety Glass, but with its own ingenious trimmings. It is making a "rights" issue of £1 million 4½ per cent unsecured loan stock, 1957-62, complete with an option to subscribe to an issue of £1 million ordinary shares next year at a price that is less than half the current market price of the company's existing equities. Ordinary shareholders are to be offered the right to take up the new loan stock at par, in the ratio of £1 loan stock for every two 5s. ordinary shares held. Each £1 of new loan stock will carry with it the option to subscribe for one new 5s. ordinary share, at 10s. 6d. each, at the end of 1953. Once the loan stock is allotted the option certificates will be given a separate quotation in the market; dealings in such option certificates are familiar enough in the mining market, but they have not been seen in the industrial share market for many years.

Without the alternatives of taking up the option on the ordinary shares at 10s. 6d. (which compares with a current market price of 22s. 3d.), or of selling these options on the open market, a straightforward offer of a 4½ per cent unsecured loan stock would have been doomed to certain failure; the option certificates should now ensure that dealings in the loan stock *cum* option begin at a premium. By a piece of arithmetic almost as ingenious as the issue itself, the chairman, Mr Halford Reddish, was able to show this week that, under the present regime of profits tax and EPL, borrowing on such a loan stock will not have an adverse effect upon the amount of profits available for equity distribution; in fact, it will actually increase them—so long as the average amount of borrowed money in any one chargeable period exceeds that outstanding during the standard EPL years. In comparison with the novel details of the offer the purpose of the issue is almost mundane. The new money is required to pay off a short-term loan of £500,000, arranged last year to finance plant extensions at home, and to finance the building of new cement plants in Trinidad and Western Australia.

German Debts Near Agreement?

The international conference on German prewar debts has this week been moving rapidly towards a successful conclusion. A plenary session of the conference is due to take place at the end of this week. It will probably set its seal on agreement on all points except a remaining difference on the dollar clause in Young Bonds which may have to be smoothed out between the American and other bondholders after the London conference has closed. Subject to this gap, the agreement by the four sub-committees should be completed by the end of this week and details should be published in the very near future. The trustees and paying agents of Potash Bonds have this week announced that with the approval of the international bondholders committee, they have withdrawn proposals which were submitted to the tripartite commission on German debts, with the agreement of the potash producers. After discussions with the producers it has been decided to await the outcome of the conference on German external debts before considering whether further proposals can be formulated for approval of the bondholders' committee and the bondholders.

Cable and Wireless Costs Increase

The nationalised Cable and Wireless operating company will benefit indirectly, but perhaps only in a modest degree, from the increases in overseas telegraph rates between Britain and the Dominions announced by the GPO this week. But unless it conducts successful negotiations for higher charges with its most important customers, the Crown Colonies, it may be unable to report a net profit next year. In the year to March 31st last, the inflation of costs throughout the world had already cut so deeply into receipts that the earned surplus fell from £2,232,743 to £1,481,649 and the net balance after tax from £833,340 to £464,660. This balance was insufficient to cover the £630,000 needed to meet the customary dividend of 6 per cent (which, since nationalisation, has been payable to the Treasury). Rather than draw on the carry forward, the directors have therefore decided "in view of the company's general financial position and the present trends of revenue and expenditure" to cut the dividend to 2½ per cent; this will absorb £393,750, and leave £70,910 to be added to the carry forward.

Last year the company's total receipts rose very slightly, from £10,203,653 to £10,229,914 (with telephone and message receipts virtually unchanged); meanwhile working expenses, including higher wage and salary payments, rose from £4,457,961 to £5,247,444, and total expenses (including provisions for depreciation and renewals that make some allowance—except on cables—for present-day replacement costs) from £8,531,615 to £9,404,838. Total telegraph traffic increased by six million words to 492 million words last year, but the calls handled by the radio telephone circuits declined from 3,000,000 to 2,750,000 paid minutes, in spite of the opening of new services. This decline was largely due to the general trade recession in Hongkong, especially with the mainland of China.

Open Trade in Lead

This week's decision to restore an open market for lead is welcome. It is hoped that private dealing in lead can begin on October 1st, broadly on the same lines as for dealing in tin. The market will be free to deal in lead whether it comes from non-dollar or dollar sources (subject to exchange control to prevent currency evasion) and full arbitrage facilities will be afforded with the New York market. In taking this step, the authorities accept the risk of losing some dollars but since the United States is now a net importer of lead—at the rate of about 200,000 tons a year—the risk is hardly great. And

some initial loss of dollars, if it occurred, might be regarded as a minor matter compared with the larger benefits, both direct and indirect, that should follow the re-establishment of London as an international lead market. Moreover, if there is any dollar loss, it is likely to be offset by gains in EPU currencies, and these are at present equivalent to gold.

Almost all the lead used in this country is imported, and Australia is the largest source of supply. In the twelve months since June, 1951, United Kingdom imports of lead amounted to 210,000 tons, of which 116,000 tons came from Australia and 28,000 tons from Canada. During this period unusually large imports totalling 54,000 tons came from Mexico and Peru under contracts made by the Ministry of Materials last year, but shipments from these sources have now ceased. Smaller quantities are also being imported from Belgium, Germany and various other countries. Since last autumn lead consumption in this country has declined rapidly; monthly consumption of lead is running no higher than 6,000 tons of virgin metal compared with 13,500 tons a month in 1951. Stocks have increased sharply; by the end of May they had reached over 120,000 tons compared with a mere 27,000 tons a year ago. This increase has occurred despite the sale to the United States of 53,000 tons from government-owned stocks earlier this year. It is reported that further sales have taken place recently but details have not been given.

Lead has never been as short as zinc and copper. Although for a time last year it seemed that a serious shortage might be developing, lead was never allocated by the International Materials Conference. The rapid improvement in supplies makes nonsense of Mr Bevan's assertion that there is an international shortage of lead. As supplies have increased so prices have fallen and the continual changes in official prices in this country and the United States during the last few months have made the need for a world market price plain beyond dispute. The British price which was around £175 a ton at the beginning of this year is now down to about £131 a ton, delivered consumers' works, and is about £3 a ton above the current American level of 16 cents a lb., spot New York. The world price that will emerge when the London Metal Exchange reopens may be near the American level, but lead is now being offered on continental markets for as little as £115-£120 a ton.

New Season in Hudson's Bay

This year's shipping season on the once dangerous Hudson Bay route opened on July 23rd, three days earlier than in 1951 and thirteen days earlier than in 1949. The marine insurance market has agreed that minimum additional premiums for voyages to Port Churchill between July 23rd and October 10th will be reduced to 7s. 6d. per cent for vessels carrying a gyro compass, compared with 10s. per cent in 1950 (when the rates were last altered) and with 40s. per cent twenty years ago; for ships not carrying a gyro compass additional premiums remain at 40s. per cent, compared with 50s. per cent twenty years ago. These concessions by insurers follow upon the eleventh report by the Commonwealth Shipping Committee on Hudson Bay insurance rates, which reveals that there were no major casualties on the route last year. Most of the vessels going to Port Churchill, of course, now carry all the modern aids to navigation—including radar, which is very valuable in ice-infested waters even though it is only of limited service in finding leads out of pack ice. In addition, important additional aids in the Strait and Bay have recently been provided by the Canadian Government. Two new charts have been published and RCAF airplanes flying over the area report the positions of ice fields and ice packs; these reports are relayed through land-based radio stations and by the patrol ice-breaking vessel N.B. McLean, which is equipped with towing gear, a searchlight and salvage plant. Another armed ice breaker is now building for the Canadian Navy.

Last year 7½ million bushels of wheat were shipped to Europe from Port Churchill in 21 vessels and the Commonwealth Shipping Committee argues that up to 5 more vessels carrying an additional 2½ million bushels could comfortably have been handled. Hitherto vessels have been forced to clear Port Churchill by October 10th, but the Committee points out that in only one year in the last quarter century has ice come down the Churchill River as early as this; in any event the river freezes first, and freezing-up thereafter extends gradually to the Bay and then to the Strait, so that vessels can normally safely remain at Port Churchill for several days after the first appearance of up-river ice in the harbour. The insurance market has partly conceded this point, and will allow vessels to remain at Port Churchill until October 15th this year, subject to the payment of additional premiums at 25 per cent above the scale for the normal season ending on October 10th.

Shorter Notes

The administrators of Rumanian, Hungarian and Bulgarian property in the United Kingdom will shortly be directed to distribute these assets to British creditors of these ex-enemy countries. It is expected that about £7 million will be available for creditors of Rumania, £600,000 for creditors of Hungary and £110,000 for creditors of Bulgaria. This news led to a rise in East European bonds in the Stock Exchange this week, with Rumanian bonds showing particular strength.

The Standard Motor Company has set up, with its Australian distributor a new company, Standard Motor Products, Ltd., which will start the assembly and "progressive manufacture" of the company's cars and also of the Ferguson tractor in Australia. Several leading British manufacturers already have assembly plants in Australia, as they have in the other major export markets. By starting production proper, as distinct from putting together knocked-down cars imported from Britain, Standard may get some of the advantages that General Motors is already reaping from its Australian factories; that is, of producing a car that may be in principle a foreign design but which has been tailored locally to fit Australian conditions.

Princes Investments, Ltd., has withdrawn its intended offer of 6s. for each 5s. ordinary stock unit of Grosvenor House (Park Lane), Ltd., following a recommendation by the directors of the latter company to its shareholders that the offer should be rejected. In a circular to shareholders in Grosvenor House the directors pointed out that a recent valuation of the company's properties would support a value of 12s. each for the 5s. ordinary stock units of the company on a going concern basis; this compares with the market price just before the announcement of the offer by Princes Investments of 3s. 6d.

THE ECONOMIST,
22 RYDER STREET, LONDON, S.W.1

Company Notes

General Electric.—Demand—and therefore ultimately investment—in the electrical industry appears to be flowing in the right direction, towards capital goods and away from consumer goods. In a report accompanying the full accounts of GEC for the year to March 31st, the chairman, Sir Harry Railing, reveals that orders for consumer goods began to fall towards the end of the financial year, and have continued to do so both at home and abroad throughout the spring and early summer. This decline, however, has been more than offset by the increased demand for capital goods, and Sir Harry is therefore able to report fresh records in production, sales, exports and outstanding orders on GEC's books. The expansion in turnover was achieved in spite of shortages of materials and labour early in the financial year, and it has been reflected in the increase in group trading profits from £7,424,716 to £8,617,275. A further increase in taxation, from £3,640,848 to £4,455,066, has whittled down the advance in net profits to a mere £113,075, but the net balance of £2,091,114 still comfortably covers the interim dividend of 7½ per cent (paid on the ordinary capital of £4,198,372) and the final dividend of 15 per

Consolidated earnings:—

	1951	1952

£1 ordinary stock at 79s. 6d. yields £5 13s. per cent.
* Interim dividend of 7½ per cent on £4,198,372 capital and a final dividend of 15 per cent on £5,877,720 capital.

cent (paid on the capital of £5,877,720 as increased by the "rights" issue in the spring).

This successful "rights" issue provided the base for further expansion. A good deal of the new money was quickly absorbed in financing increased investment in stocks and work in progress; the increase in the book value of stocks from £25,247,010 to £33,541,257 was the natural outcome of a higher volume of production and of the rises in material costs and labour rates. In recognition of the growth in the group's business and stature, the directors have decided to capitalise £5,887,720 from the share premium account in order to issue a 100 per cent scrip bonus to equity shareholders. On present prospects dividend disbursements in the coming year certainly seem more likely to go up than go down.

Patons and Baldwins.—The statement made by Mr P. A. Wright, the chairman of Patons and Baldwins, adds the greys and half tones to the sombre picture revealed by the company's preliminary statement, which was discussed in these columns on July 5th. After revaluing all stocks of wool tops and yarns at market prices on May 3rd, the group's deficit on trading amounted to £293,492, compared with a surplus of £3,334,696 in 1950-51, a year in which profits were swollen by heavy inventory gains. Mr Wright does not explicitly disclose the extent of stock losses in the latest year, but his statement confirms the impression that these losses were far heavier than the withdrawal of only £700,000 from the contingencies reserve might at first suggest. He reveals that the overall weight of raw

wool and top stocks held by the group on May 3rd was approximately the same as at the end of the previous financial year, although the consolidated balance sheet shows a fall in the value of stocks from £13,396,641 to £9,910,989. In the parent company's balance sheet the value of stocks has fallen even more sharply, from £13,391,677 to £7,887,151, although the weight of stocks held in Britain has actually risen.

The fall in stock values has been accompanied by a decline in bank overdrafts and acceptance credits, from £2,361,207 to £845,123, and by a rise in cash balances from £200,250 to £547,464. These changes and the payment of a 10 per cent ordinary dividend for the year are the only welcome features of the accounts themselves, but the chairman's statement does throw a more

Cons. balance sheet analysis:—

	1951	1952
Fixed assets, less depreciation	8,092,157	8,532,444
Net current assets	10,938,115	9,562,901
Stocks	13,396,641	9,910,989
Cash	200,250	547,464
Bank overdrafts and acceptance credits	2,361,207	845,123
Reserves	7,851,996	7,081,783
Ordinary capital	2,638,829	2,638,829
£1 ordinary stock at 49s. 6d. yields £4 2s. per cent.		

encouraging light on future prospects. Mr Wright hopes that the coming year will "see the commencement of a recovery in the wool trade." Lower prices have not, as yet, brought any marked resurgence in sales, but if the current recovery in wool prices is maintained the industry should be relieved of its biggest headache—the threat of further stock losses. Mr Wright gives due weight to this factor in pointing out that "the past year has seen the major portion of the recession which so obviously had to be faced when one considered the peak prices to which wool prices had risen by March, 1951."

John Brown.—As accounting records were damaged by fire at the Coventry works of Wickman, Ltd., last March, the accounts of the Wickman group of companies have been omitted from the consolidated accounts of John Brown. Following the necessary adjustments in the accounts, the preliminary statement for the year to March 31st last shows that the group's profits before tax have advanced from just over £1,464,000 to nearly £1,720,000. There has obviously been no slackening in demand for the group's products, and this increase in gross profits suggests that the group, though possibly handicapped by shortages of steel, has been able to increase its output by the utilisation of additional capacity. Unfortunately for shareholders taxation, at £1,132,612 (against £874,814), has eaten so deeply into gross earnings that the consolidated net profit has actually fallen slightly from £589,583 to £587,361. It is not surprising, therefore, that the directors have been content, in effect—once allowance is made for last year's 100 per cent scrip bonus—to maintain the tax free ordinary dividend for the year at 7½ per cent. As in the previous year, this dividend absorbs £323,083, and the balance carried forward by the group has been increased from £1,253,827 to £1,361,027. At the current price of 42s. 3d. the £1 ordinary stock units offer a gross yield of 6½ per cent—a yield that suggests that investors are not expecting much more than the maintenance of a tax free rate of 7½ per cent in the current year. With its widespread interests in the shipbuilding and engineering industries, the group should certainly not suffer from any lack of orders this year, although there may be a temporary check to production if capacity has to be switched from rearmament to exports.

EXCHEQUER RETURNS

For the week ended July 26, 1952, total ordinary revenue was £60,645,000, against ordinary expenditure of £44,812,000 and issues to sinking funds £260,000. Thus, including sinking fund allocations of £8,817,000 the deficit accrued since April 1, 1952, was £216,346,000 compared with a surplus of £55,862,000 for the corresponding period of the previous year.

After decreasing Exchequer balances by £287,215 to £2,751,393 the other operations for the week increased the National Debt by £6,423,795 to £25,978 million.

COMPANY MEETINGS

THE BRITISH PLASTER BOARD LIMITED

CONTINUED STRONG DEMAND FOR GYPSUM PLASTERS

• TURNOVER CONSIDERABLY INCREASED

LORD BELPER ON INJURIOUS EFFECT OF EXISTING TAXATION LEVEL

The thirty-fifth annual general meeting of The British Plaster Board Limited was held on July 24th at 20, St. James's Square, London, S.W.1, The Rt. Hon. Lord Belper, PC, DL, JP (the chairman), presiding.

The following is the chairman's statement, which had been circulated with the report and accounts for the year ended March 31, 1952:—

It is with deep regret that I record the death on September 7, 1951, of Mr C. Macfarlane Cullen. Mr Cullen had given distinguished service to our subsidiary, D. Anderson and Son, Limited, over a period of 40 years, latterly as chairman and joint managing director. He was appointed to the board of The British Plaster Board Limited, on February 6, 1947, and his counsel was much sought after throughout our company. His passing is a real loss.

Mr F. W. Anthony, who has attained the age of 70, is retiring from the board of The British Plaster Board Limited. We are fortunate, however, in that he has agreed to remain in an advisory capacity on the boards of a few of our subsidiary companies, including The Gotham Company, Limited, which he joined some 49 years ago, becoming chairman of that company in 1939. The amalgamation of The Gotham Company, Limited, and The British Plaster Board Limited, in 1935 was one of the first of the series by which this group was formed, and it was then that Mr Anthony joined the board of the parent company. His long and highly efficient service to the company has been a material factor in the success achieved, and his colleagues join with me in wishing him a prolonged and happy period of retirement from his executive duties.

CONSOLIDATED BALANCE-SHEET

As foreshadowed in my statement a year ago, after expert advice the company's fixed assets have been revalued, and they are now shown at figures which are more realistic in terms of the postwar value of the pound sterling. I should, however, emphasise that your directors have been conscious of the possibilities of a fall over the next few years in the cost of plant and buildings, and that, while the object has been to arrive at a reasonable value of the unexpired life of the fixed assets based on the possible replacement cost, a conservative view has been taken. Nevertheless, you will observe from a study of the consolidated balance-sheet that the surplus arising from this revaluation is the very substantial amount of £4,220,612, shown under capital reserves. The fixed assets now stand at £6,298,163.

The value of shares in associated companies has been increased by £75,794, which is mainly accounted for by the investment in Placoplatre, a plaster board manufacturing company in France.

The marked increase in stocks and debtors is in line with the common experience of industry today, and emphasises the toll taken of cash resources in a period of rapid inflation. This increase is offset to some extent by the greater amounts due to trade creditors.

Contracts for future capital expenditure, noted at the foot of the balance-sheet, show a substantial increase at £621,750. This largely reflects the putting in hand of the project for the supply of anhydrite for the manufacture of sulphuric acid, which I mentioned a year ago. We have now entered into a contract with the United Sulphuric Acid Corporation, Limited, for quantities of approximately 250,000 tons per annum, which will be mined in the North of England where the necessary reserves have been proved. Your company's organisation is well equipped to undertake to supply this indigenous material to any other such nationally important projects which may materialise. The country's economic position points to the necessity of using its indigenous materials wherever possible, especially, perhaps, when it effects a saving of hard currency.

We are now deep-mining upwards of one and a half million tons per annum of gypsum and anhydrite and our current and potential capacity is such that we can readily arrange to meet all demands likely to be made upon us.

It is interesting to record, at this point, that during the last three years our own deep boring plants have covered wide areas in the proving of appreciably greater reserves of both gypsum and anhydrite.

As you will have observed from the balance-sheet, the market value of our investments is lower than cost, less reserve as at March 31, 1951. This is due to the severe fall which has occurred in Government securities and an appropriation of £50,000 has been made out of this year's profits to investment reserve to cover this reduction in value. Fortunately, these particular securities are redeemable at par in 1964-67.

TURNOVER

Turnover again increased considerably—by nearly one-third over the previous year—in spite of difficulties for the first eight months in securing adequate supplies of paper for the manufacture of plaster board and felt, and shortages of metals which continued throughout the year and prevented higher outputs of hot brass stampings and drop steel forgings by our Birmingham and Stourbridge companies.

The availability of adequate supplies of paper in the latter part of the financial year unfortunately coincided with the effects of the recession experienced by some sections of the building material industries, and sales of plaster board were somewhat restricted towards the end of the period through falling demand. Reduced demand for this particular product still continues, and there are now less orders for roofing felt. There are, however, signs that the absorption of unusually large stocks built up by merchants and builders will bring increased orders before very long.

I am glad to state that demand for plasters and other gypsum products continues to be strong and sales in the group as a whole are satisfactory.

PROFITS

The method of writing off depreciation has been amended by reassessing the unexpired life of the assets. It is significant of the need for a change in the attitude of the taxation authorities to this subject that, ignoring initial allowances—which, in any case, are now withdrawn—the Revenue are, in effect, only prepared to take into account rather less than 12s. in every £1 deemed necessary by your directors to be set aside as depreciation for the year under review.

Consolidated trading profits at £1,259,077 show an increase of £204,470, or nearly one-fifth more than last year, and this can, I think, be taken as a satisfactory result of the increased sales if due allowance is made for the heavy increase in costs beyond our control. Taxation has absorbed the majority of this increase in profit, so that the amount of £418,883 left over is only £42,157 more than the previous year's figure.

I know that you are conscious of the injurious effect of existing levels of taxation and the consequent withdrawal from industry of cash required to maintain adequate working capital, quite apart from the necessity of making provision for replacement of fixed assets from time to time.

Unless the peak of taxation has been reached and a gradual fall is to take place from now on, it is difficult to envisage how industry generally will be able to provide sufficient funds out of profits to take care of the replacement of fixed assets, and failure to do so is bound seriously to jeopardise efficiency in the future.

PRICES

You will be pleased to know that since my statement to you last year, there has been a satisfactory settlement over the control of the prices of our gypsum products. The previous Government had referred the whole matter to the Palmer Committee, whose interim and final reports were both favourable to our case. After due consideration by the Minister of Works, the three Statutory Orders controlling the prices of gypsum products were rescinded on December 27, 1951, and a new voluntary control agreement was entered into with the Ministry. In March of this year the Minister freed the gypsum industry from control altogether, in common with other building material industries, including the bitumen felt manufacturers.

ASSOCIATED COMPANIES ABROAD

Our associate companies in South Africa and Eire have both made good progress and increased profits have been earned, while in France our new associate company, Placoplatre, is also showing improved results, with its products already becoming a factor in the French building trade.

Your directors have thought for some time that the British Plaster Board Limited should interest itself in the manufacture and sale of some of its products in the Rhodesias. Recently, therefore, it was decided to take a substantial interest—relative to the size of the small-scale plants required—in Southern Rhodesia, in association with one of our sup-

pliers of paper in the United Kingdom and others.

PERSONNEL RELATIONS

The satisfactory results of the past year could not have been achieved without the sustained efforts of all our employees, no matter of what degree. It is fitting that I should record this acknowledgment of their vital contribution to the year's results. Both they and the company have again benefited by the friendly relations with the trade unions which have continued over many years.

DIVIDEND

The directors have decided to recommend a final dividend of 10 per cent, making, with the interim dividend, a total of 17½ per cent for the year. This compares with the total of 16½ per cent paid for the previous year, and provides a small increase for the stockholders.

The report and accounts were adopted and the final dividend of 10 per cent, making 17½ per cent for the year, was approved.

The retiring directors, Mr T. S. Durham, Mr R. G. Forsyth, Mr H. Leigh Newton and Mr J. H. Sheppard, were re-elected, and the remuneration of the auditors, Messrs Bretherton Hurst and Company, having been fixed, the proceedings terminated.

GRAYSON, ROLLO & CLOVER DOCKS LIMITED

A PROFITABLE YEAR

SIR DENYS GRAYSON ON TRADING CONDITIONS

The thirty-first annual general meeting of Grayson, Rollo & Clover Docks Limited, was held at Clover Docks, Birkenhead, on July 24th, the chairman, Sir Denys Grayson, Bt., presiding.

The secretary read the notice convening the meeting.

The following is the chairman's statement circulated with the report and accounts for the year ended March 31, 1952:—

In commenting on the affairs of the company since our last meeting, I must first of all record with great regret the death, on October 27, 1951, of my father, Sir Henry M. Grayson, Bt., KBE. His long association and his work with the company as chairman is well known, and I am sure you will agree that the standing and prosperity of the company which has been attained under his leadership is a fitting memorial to him.

You will observe from the accounts for the year ended March 31, 1952, that again the company has had a profitable year, and your directors consider that the results are quite satisfactory.

THE DIVIDEND

When we met last year, I made reference to the provision of a special dividend reserve account as, following the statement made by the then Chancellor of the Exchequer, the dividend on the ordinary shares was restricted to 10 per cent. It had been the intention of the board to recommend an ordinary dividend for last year of 15 per cent and from the directors' report now before you, it will be seen that this intention was implemented on December 11, 1951, when a special dividend of 5 per cent was paid. Between the date of our thirtieth annual general meeting and the payment of this special dividend the issued capital of the company

had been increased by the issue of 382,564 ordinary shares as a bonus, and the special dividend was paid on the full amount of the ordinary shares as existing at the date of payment of this dividend.

Shareholders will no doubt be interested to know that from each pound of the profit the Government will take in taxation 47.7 per cent. Reserves, replacements and developments, about 43.3 per cent, and the shareholders, preference and ordinary combined, 9 per cent.

APPROPRIATIONS

With regard to the appropriations from our trading profit, your directors recommend that £50,000 be transferred to the general reserve. It will be remembered that last year, the sum of £100,000 was transferred to this reserve, but £50,000 had been brought from taxation reserve being a provision no longer required, and the general reserve now stands at the total of £352,885. The expenses of the bonus issue made in October last year have been written off, and £70,000 is again recommended to be placed to the replacements and development account.

Arrangements to provide pensions for the executive and general staffs have now been made with an insurance company, and you will see that a small balance of £3,907 remains from the amount previously set aside. The directors have deemed it advisable to increase the balance of this account to £5,000 as a reserve for future contingencies.

The valuation of the property, plant and machinery of the Company has been completed, and a note of the figure arrived at by our valuers, viz., £1,590,584, appears on the balance sheet. You will appreciate that this valuation is made on a going concern basis at a time when the industry is well employed.

Investments this year show an increase of £12,100, and this is due to the company taking up further shares in British Wheeler Process Limited. That company has added a further vessel to the fleet of tank cleaning craft and, I am happy to say, continues to progress and extend its activities.

THE OUTLOOK

Trading conditions in our industry always make it difficult to attempt to foretell future prospects. At present we have a very good volume of work in hand and in prospect including a considerable amount of Admiralty and Merchant shipping work. The present year has commenced favourably as we have been well employed with drydockings and special surveys as well as the usual voyage repairs entrusted to us by our ship-owning friends. Whilst timber supplies have improved, the steel and general metal position causes considerable concern, and it is understood that the expected increased steel allocation for period III of the current year will not be made, and in fact the tonnage available will be less than the allocation figures.

Our new 20-ton travelling crane will not be available for some months, as production has been slowed down by the shortage of steel, but the ground work is proceeding so that the installation of the crane will be made without any avoidable delay.

In concluding this report, I am glad to say that during the year under review, the company has been free of any major labour troubles, although the supply of skilled labour is still below the demand in the industry.

I am sure that it will be your desire that on your behalf I should express our appreciation of, and grateful thanks to, all our employees for their good work and loyal support.

The report and accounts were unanimously adopted.

TRUST HOUSES

EFFECTS OF TAXATION ON HOTEL INDUSTRY

The forty-ninth annual general meeting of Trust Houses, Limited, was held on July 25th, in London.

Captain A. R. S. Nutting, OBE, MC, the chairman, who presided, in the course of his speech, said:—

Our trading profit shows a small increase from £389,583 to £410,569. Taxation, which I need hardly remind you is far too high and far more than industry can reasonably be asked to bear, takes £269,402 and we are left after all our hard work with a net profit for the year of £122,486.

It may interest you to know that our turnover last year was the highest in the history of the company and I have had taken out a break-up of £1 of takings. Cost of food, liquor, and tobacco represented 51 per cent, wages and salaries at head office and houses 21.7 per cent, overhead expenses 13.7 per cent, repairs and renewals 7.1 per cent, direct taxation 4.8 per cent, dividends 1.7 per cent. This break-up shows the proportion of our turnover paid out in direct taxation. If I were to extract the sum of indirect taxation, including the purchase tax which we have to pay on our furniture and equipment and the large sum of excise duty in respect of which we are tax-collectors for the Government, the percentage figure would be not 4.8 per cent but 28 per cent. In other words out of every £100 we take just over £28 goes to the Government in direct and indirect taxation. We were fortunate in having good results during our standard years, we therefore do not anticipate that the company will be liable for EPL in the immediate future.

Captain K. C. McCallum, MC, managing director, seconding the resolution, said:—

This industry is now our best earner of United States dollars, as is clearly indicated in the last report of the British Travel and Holidays Association. The Government spends large sums of money in efforts to expand the tourist industry.

GOVERNMENT'S CONFLICTING POLICIES

Unfortunately there is a lack of suitable accommodation in the country. Before the war there was a steady development and improvement of hotels and inns which prudent proprietors paid for by ploughing back part of their profits. Such improvements, although they are within the four walls of the premises and not extensions, are treated by the revenue authorities as capital expenditure and attract income and undistributed profits tax at the rate of 10s. in the £. Before the war there was no profits tax and income tax was at a comparatively low level and was not a very great deterrent to progress. But today the position is totally different and the cost of modernisation and development out of revenue has become prohibitive.

The Government is paying out with one hand to attract tourists and with the other is giving little encouragement to provide for or retain them when they arrive. It is obvious that only half this policy is right.

Governments of Continental countries do everything in their power to assist the hotel industry to earn foreign currency. We should do likewise and I strongly advocate that existing country hotels and inns should be given every assistance and encouragement. This could be best done by:—

1. Permitting the cost of improvements within existing buildings to be treated as a revenue charge.

2. Remitting purchase tax on furnishings and equipment.

The report and accounts were adopted.

THE STANDARD BANK OF SOUTH AFRICA

CONTINUED BUSINESS ACTIVITY

MR JOHN NICHOLSON HOGG'S STATEMENT

The one hundred and thirty-ninth ordinary meeting (being the annual general meeting for the year 1952) of The Standard Bank of South Africa, Limited, was held on July 30th, in London, Mr John Nicholson Hogg, presiding.

The following is an extract from his circulated statement:—

I feel that I should draw your attention to certain proposed changes in the capital structure of the company. Resolutions will be laid before you at the annual general meeting which, if passed, will increase the authorised capital of the company by £5 million and will also make changes in the nominal amount of the present shares and in the liabilities attaching thereto.

In comparing the balance-sheet now before you with that of last year, you will note that the principal movement is in the figure for advances which at £114 million is almost £30 million higher than a year ago. The items "bills of exchange purchased" and "customers' bills for collection" have also increased, by £1 million and £2 million, respectively. These increases resulted from a relaxation in 1951 of the restrictions on imports into the Union of South Africa, which led merchants and traders to build up their stocks. We have been at pains to try to ensure that these increased facilities were used for genuine trading transactions and not for speculative or long-term capital purposes. It is perhaps worthy of note that even before the end of our financial year there was a modest falling off in our advance figures, and since March this tendency has been maintained.

The other movements in our assets, partly due, of course, to the increase in advances, have been a reduction of £17 million in our investments, and of £8 million and £10 million in our cash items and bills discounted respectively.

On the liabilities side the one movement of importance is a small drop in the total of current deposit and other accounts. This is £4½ million less than the previous year.

PROFIT AND LOSS ACCOUNT

You will note from the profit and loss account that after providing for taxation and after making a transfer to the credit of reserve for contingencies, out of which reserve provision has been made for diminution in the value of assets, the profit amounted to £911,999, that is to say, £102,775 more than last year. Adding in the balance brought forward, there is a total of £1,082,872 with which we have to deal. Out of this an interim dividend of 7s. per share was paid on January 27, 1951. From the balance remaining, £990,997, there has been allocated £200,000 to bank premises, leaving £790,997 to be appropriated. It is recommended that £400,000, the same as last year, be transferred to the officers' pension fund and that a final dividend of 9s. per share, together with a bonus of 4s. per share be paid, leaving £220,372 to be carried forward to next year's accounts. Together with the interim dividend, this final dividend and bonus will amount to 20s. per share, thus repeating the distribution made for 1950-51.

With the balance sheet of the bank there are also presented the accounts of our wholly-owned subsidiary the Standard Bank Finance and Development Corporation, Ltd. From these it will be seen that after deduction of

taxation a net profit of £11,454 remains. There was brought forward from last year a sum of £15,751, and this, together with the profit for the current year, amounting in all to £27,204, is carried forward to the next accounts. The corporation continues, we believe, to serve a useful purpose, and the results disclosed are, I think, satisfactory.

SOUTH AFRICA

In the Union of South Africa the year 1951 saw continued business activity and industrial expansion. The principal changes in the economic conditions in the country during the year arose from the adverse balance of external payments, which followed a relaxation of controls, and the inflationary pressures which made themselves felt with increasing force. In terms of values, there was a very substantial increase in imports during the year. Exports were higher by a smaller figure and the visible trade deficit was much larger than in 1950. Although the flow of investment funds from overseas continued at about the same rate as in 1950, the present difficulties of other countries may well result in a lessening of the flow of capital funds to the Union. The decline in the price of wool will have an important effect on external earnings during the current year.

Internal trading during 1951 was stimulated by the increase in the volume and range of stocks, both imported and home produced, and by high earnings in farming, mining and the secondary industries.

Conditions of prosperity existed in the farming industry last year following good weather and favourable prices for farm products, particularly for wool. Widespread droughts occurred, however, in the summer of 1951-52 and the current maize harvest is likely to be the smallest for many years. Even with reserve stores from the two previous good harvests it is estimated that supplies of maize will be insufficient to meet normal consumption.

SOUTHERN AND NORTHERN RHODESIA

Retail trade in Southern Rhodesia during the past year was well sustained and turnover generally was much above 1950. The steady expansion of trade naturally followed the increase in the population of the Colony.

While trading conditions were buoyant generally in Northern Rhodesia they were particularly active in the mining areas where demand was sustained at a high level by the increased earnings of the mine workers and the larger numbers employed.

Although trading activity in South-West Africa was maintained during 1951 there is appearing a caution in demand attributed to the high cost of imported goods.

The East African Territories have passed through another year during which business activity has been maintained at a high level, but as the year drew to a close it became evident that prices of many of the natural products, so important to the economy of this part of Africa, were inclined to fall. As was natural the market in piece-goods reacted unfavourably and some merchants in the larger centres became overstocked.

The report and accounts were adopted. Resolutions altering the articles of association and increasing the capital of the company to £15 million by the creation of 5 million new shares of £1 each were approved.

G. R. A. TRUST

MR F. S. GENTLE ON TAXATION

Mr F. S. Gentle, chairman and managing director, presiding at the twenty-fourth annual meeting, said that the group's trading profit had risen from £213,000 to £268,000, in a year when trading conditions had not been easy.

An ordinary dividend of 12½ per cent was recommended against 10 per cent last year. Current assets exceeded current liabilities by £590,000; a strong liquid position.

Average attendances had fallen about 4 per cent, but compared with the general reduction in the balance of money available for entertainment, after meeting the ever-rising cost of essentials, this said a great deal for the continued popularity of greyhound racing.

As from March 30, 1952, the Government had reduced the rate of Entertainments Duty on racing to bring all sports into line. Part of the benefit had been passed on to patrons by reducing admission prices.

Last year G.R.A. tracks produced direct taxes for the Exchequer totalling £2 million, whilst all they could distribute to ordinary stockholders was £26,000. The discriminatory 10 per cent pool betting duty had reduced G.R.A. income by hundreds of thousands of pounds a year.

He thought it too much to expect the abolition of the pool betting duty, but it should be reduced and all forms of betting should be equally subject to taxation.

In the meantime they would have their difficulties, particularly if the spending power of the public continued to grow less, but he thought they could face the future with confidence.

The report was adopted.

EX-LANDS NIGERIA

The fortieth annual general meeting of Ex-Lands Nigeria, Limited, was held on July 29th in London.

Major General W. W. Richards, CB, CBE, MC, chairman of the company, presided.

The following is an extract from the statement of the chairman, which was circulated with the report and accounts:—

The operations carried out during the year to December 31, 1951, gave gratifying results, and we are able to maintain the dividend distribution at a shilling per unit of stock.

The output for the year was 610 tons of tin, assaying approximately 74 per cent metal. This is 102 tons less than the previous year. The decrease was almost entirely due to the gradual falling off of the tin content of the ground worked.

Revenue from tin produced £426,626, this is almost £70,000 less than the amount received for the previous year's production.

Costs showed an increase of approximately £47 per ton. The tax liability has been estimated at £96,000, leaving a profit for the year of £59,527.

With regard to current operations, the output for the first five months of the year totalled 250 tons of tin, which is 13 tons less than the corresponding period of last year.

We are at present in negotiation for the purchase of additional tin and columbite-bearing areas, and if the negotiations are successful it is probable that we will seek Treasury permission to make a new issue of capital, which will be offered to members for subscription.

The report and accounts were adopted.

BROADCAST RELAY SERVICE

GROWING POPULARITY OF REDIFFUSION FACILITIES

RAPID OVERSEAS DEVELOPMENT

MR J. S. WILLS ON PROPOSED CAPITAL ISSUE

The twenty-fourth annual general meeting of Broadcast Relay Service Limited was held on July 25th in London.

Mr J. S. Wills, chairman and managing director, presided and in the course of his speech said:

With regard to our operations at home, I am pleased to record that once again we showed an increase in the number of our Rediffusion subscribers.

FIFTEEN-YEAR LICENCE

On many previous occasions, reference has been made to the Post Office licence under which we operate. The present Government has received the approval of the House of Commons to a proposal to grant a 15-year licence to relay operators.

In our manufacturing sphere, the output of electronic equipment by our subsidiary, Redifon Limited, has once again increased, largely as a result of greater exports, which currently represent more than one-half of that company's total output. We have also carried out a considerable amount of work for national rearmament purposes, so that only about one-quarter of the output of Redifon Limited is now available for normal commercial home requirements. In recent weeks we have been successful in obtaining in Canada, by tender, an order for the manufacture of several flight simulators for the Royal Canadian Air Force. The value of this contract is nearly \$3 million.

RAPID OVERSEAS GROWTH

In overseas areas the growth of our Rediffusion and broadcasting business has again been extremely rapid. All our subsidiaries operating abroad have substantially increased the number of their subscribers during the year.

In the island of Malta, GC, the Rediffusion service now serves over 28,000 subscribers. Our company in Trinidad operates Rediffusion services in the main urban areas and also broadcasting stations giving complete coverage throughout the whole territory. In Hongkong, although the Rediffusion service started as recently as March, 1949, more than 50,000 loudspeakers are now connected to the service. In Singapore, 23,500 subscribers are connected to the Rediffusion service in the island. In Kuala Lumpur, in the Malayan Federation, the number of subscribers has passed the 10,000 mark. In Barbados the company operates a Rediffusion service with 5,600 subscribers.

In Ceylon a start was made in August, 1951, to provide a Rediffusion service in the city of Colombo and already there are 6,500 subscribers to this service. In Jamaica, until recently, we operated a radio station alone but we have now also opened a Rediffusion service. In Bermuda and British Guiana radio stations only are operated. In Montreal, the Rediffusion service started just over 18 months ago and is showing promising signs of progress with 4,500 subscribers.

The provision of television programmes by wire, of a quality much higher than can be obtained by any other means, has been undertaken experimentally in Montreal for over a year and this service will be ready for operation in September, 1952, when the Canadian Broadcasting Corporation's television station is opened in Montreal. Nearer home, we have some 2,000 subscribers

to our rediffusion service in Jersey. We have also carried out important television experimental work in Jersey and it is hoped very shortly to introduce a wired television service there.

In all, overseas, more than 80,000 hours of programmes are originated each year in our own studios.

I told you last year of our decision to introduce a wired television service in Margate. We have been progressing with this development. We have also proceeded to erect, during the year, television networks in other areas, such as Eccles, Birkenhead and Nottingham, and we are proposing to introduce similar networks in Holloway (North London) and in Kingston-upon-Hull.

HOME AND OVERSEAS OUTLOOK

Turning now to the future: At home, in certain towns, we provide only a two-programme service and one of our primary objects, when the new licence is granted, must be to replace those wires or supply the additional wiring so as to provide more programmes in those towns. Our second purpose, at home, must be to erect a wired television system in our existing towns as soon as we are satisfied that our system is appropriate to the needs of television for several years ahead, particularly in relation to the possibility of alternative television programmes. As to our manufacturing activities, in view of the importance of our export and Government contracts and the expected further increase in the demands from these sources, it will be necessary to extend our factory accommodation and to increase our output yet again.

In overseas areas, our opportunities are immense. Developments in Montreal are now getting well under way. We are examining the prospects of operating a similar service in other towns in Canada, but this will depend on the results achieved in Montreal.

We are expanding our area of operations in Jamaica and Ceylon. In Malaya, we are on the point of extending our rediffusion service to Penang. Shareholders will appreciate that a considerable and sustained task is continuously being undertaken by the Overseas Company in investigating prospects and negotiating for licences in many countries, and that there is necessarily a time lag between the cost of this effort and the financial reward.

All the current operations overseas were based on earlier negotiations, and I am glad to be able to report now that, as a result of more recent endeavours, we have secured the necessary agreements to start operations in Nigeria and in Orlando, the largest native township in South Africa. We are also planning developments in Tanganyika and, subject to the grant of the requisite licences, in Portugal.

PROPOSED NEW ISSUE

You will be aware of the policy of the Government to restrict credit and new permanent capital to essential purposes and, in particular, to ensure the highest priority for exports and for the defence programme. It will be clear, from this policy, which of the several items in the programme I have detailed, take priority, and your directors propose to proceed with those developments with the maximum speed possible. With this

in view, therefore, application has been made to the capital issues committee for the issue of new capital amounting to some £2½ million in Debenture Stock and Ordinary shares which will be utilised for such developments and for repayment of the related bank borrowings.

I will not give details of our proposals, as their implementation must depend upon the sanction of the Treasury, and they are, therefore, still subject to variation. I will say, however, that so far, at least, as it consists of an issue of Ordinary shares, it is intended that such issue shall be made to Ordinary Stockholders of Broadcast Relay Service, Limited, and that the terms of issue shall be attractive to Ordinary Stockholders.

The report and accounts were adopted, and the proposed Ordinary Stock dividend was approved.

BANK LEUMI LE-ISRAEL BM

MR S. HOOFIEN ON MONETARY INFLATION

The first annual general meeting of the Bank Leumi le-Israel BM was held at the offices of the Bank in Tel-Aviv on Thursday, July 10, 1952.

Mr S. Hoofien, the chairman, referred in his introductory remarks to the taking over of the business of The Anglo-Palestine Bank, Ltd., by the bank on May 1, 1951. The profits of The Anglo-Palestine Bank, Ltd., during the first four months of the year have been incorporated in the bank's profit and loss account, the figures of which can, therefore, be compared with last year's figures of the bank's predecessor. The balance of net profit in the amount of I£374,975 compares with a balance of I£316,538 in last year's accounts of The Anglo-Palestine Bank, Ltd. Out of this balance an amount of I£120,000 has been appropriated to the payment of a dividend of 10 per cent, subject to tax to stockholders, out of which 5 per cent was distributed as an interim dividend in October, 1951. An amount of I£250,000 has been allocated to the contingencies reserve. In respect of the payment of the final dividend of 5 per cent, a difficulty had arisen in that in February of the present year the rate of exchange of sterling for the purpose, *inter alia*, of the payment of dividends was altered from I£1 per 1 pound sterling to I£2.80. In order to make up for the difference in proceeds a special distribution of I£0.0675 per stock unit of I£1, free of Israel income tax, is being proposed which, if the deduction of 25 per cent for Israel income tax is taken into account, brings up the dividend for non-resident stockholders to an actual 10 per cent. Deposits stand at I£92,552,035 (1950: 80,213,768) and loans at I£49,886,371 (1950: 34,465,670).

It is probable that the issue department will be taken over on January 1, 1953, by the Bank of Israel, which it is the government's intention to set up.

GENERAL ECONOMIC SITUATION

Mr Hoofien then dwelt on the general economic situation and showed that, contrary to a generally held opinion, the monetary inflation is practically at an end. During the last six months (end-October, 1951, to end-April, 1952) the net circulation (net bank notes plus net sight deposits) has risen by not more than 4 per cent. The rise in prices, caused partly by the February change in the exchange rates and partly by the government's wage policy, has, however, continued. The government has taken a courageous and

wise step by drastically cutting its import programme, but will have to revise its wage policy, which causes a continued expansion of buying power, if it wishes to bring about a satisfactory return to normal conditions.

The accounts were unanimously approved and the proposed dividend and special distribution were likewise approved.

MENDARIS (SUMATRA) RUBBER AND PRODUCE ESTATES, LIMITED

CONDITIONS IN INDONESIA

SIR ERIC MILLER'S SPEECH

The forty-first annual general meeting of Mendaris (Sumatra) Rubber and Produce Estates, Limited, was held on July 30th in London.

Sir Eric Miller, the chairman, who presided, in the course of his speech, said: In my address last year I explained that the crop for the first seven months of 1951 was nearly 100,000 lb lower than that for the corresponding period of 1950, due to go-slow tactics, full-scale strikes and perhaps the most insidious of all, the stealing of latex. Fortunately conditions improved from August onwards and although stealing still continued the final crop of 1,585,266 lb exceeded the 1950 harvest by 235,000 lb.

THE ACCOUNTS

Turning now to the accounts, it is noticeable that although the balance from trading account increased by £8,500 over the previous year, the balance left, after taxation, to carry to the appropriation account is only £1,000 more than in 1950. This is due to heavier UK taxation. We have had to pay or provide for Indonesian export duties and through their exchange certificate system, a levy amounting to 33½ per cent of the proceeds of all export sales which, with taxation on profits in the East and at home, makes an overall total of £150,000, leaving us with only £30,597 for appropriation. We have written down our holding in Indonesian Government Loan by £2,269. On the other hand we have been able to bring back £20,250 which represents a provision made in the 1948 accounts and which is no longer required. We are left with a balance of £67,495 and out of this a dividend will be considered by the directors immediately the equivalent of the Rupiah profit for 1951 has been received in sterling.

If conditions in Indonesia had been sufficiently encouraging we should in the ordinary course of prudent management have been replanting some part of our older areas each year with modern high-yielding material, but, as things are, that is out of the question. Whether the Government there will have the wisdom and the capacity to re-establish the economy of the East Coast of Sumatra on a foundation secure enough to justify the investment of further capital by estate enterprises in long-term cultures, such as rubber, remains yet to be proved.

NEED FOR EXPERIENCED PLANTERS

Having played a considerable part in the past half century in developing there what were some of the finest plantations in the East and having shown tenacity in our efforts to re-establish them despite grave and continuing handicaps, we have so far refrained from concluding that their future prospects are irrevocably bleak and discouraging. Time is running out, however, all too fast. Our older planters are nearing the age when they are entitled to look for peaceful and well-earned retirement at home. We are having the greatest difficulty in getting entry permits

for younger men who are willing to seek a planter's career in Sumatra.

Indonesia for the Indonesians may be a good political slogan for internal consumption, but it is short-sighted in the extreme to apply it where expert talent of the right kind is not available on the spot. Managerial responsibility is only attained by long and conscientious apprenticeship, and the Indonesian Government should welcome with open arms men of talent from overseas who are willing to come in to help run the agricultural and industrial concerns and by their example and precept help to educate Indonesians for gradually increasing responsibility.

CURRENT YEAR'S IMPROVED CROP

The current year's crop shows a noticeable improvement at 1,064,822 lb for the first six months to June 30th, compared with 599,651 lb harvested during the same period last year, which included the strike period. The price of rubber is, however, much lower and it is as well that we are participating in group forward contracts for ordinary rubber and for sole crepe, although the precise allocations will not be known until the date of shipment.

Whereas the long-term outlook for natural rubber appears reasonably encouraging, it is impossible for me to predict the way in which many conflicting factors are going to affect the market in the near future. One thing is clear, however, that there is not too much No. 1 rubber available, whether smoked sheet or crepe, and those grades can only be obtained from properly equipped estates. We make a certain amount of sole crepe, but unfortunately the factory labourers, in their present mood, are unwilling to give the close attention to detail which is necessary in the preparation of this high-grade product.

The report was adopted.

LONDON COUNTY FREEHOLD AND LEASEHOLD PROPERTIES HANDICAP OF PRESENT RENT ACTS

The annual general meeting of the London County Freehold and Leasehold Properties, Limited, was held on July 28th, in London.

Mr Thomas J. Cullen (chairman and managing director), who presided, in the course of his speech, said:—

After providing for all property and management outgoings, the revenue balance was £767,358, against £720,855 last year.

It is important to realise that the net income from investments made since 1939 far more than covers the increased dividend of 1.2 pence per 10s. unit.

The income from those investments has been growing each year, but has hitherto been required to replace the income lost by reason of war-damaged properties and then by the de-requisitioning of properties and the unavoidable delay in reconditioning or reconstructing them.

We are still sorely handicapped by the Rent Acts in their present form.

Property owners are not asking for any disproportionate increase in rent. All they ask at the moment is that the amount available for repairs, maintenance and management should be increased sufficiently to enable them to meet the increased costs over 1939 prices.

It is astounding to me to learn from statements in Parliament and in the Press that the Government do not propose to amend the Rent Acts this year and possibly not even next year. What justification is there for this attitude?

The report was adopted and the total dividend of 1s. per 10s. unit of ordinary stock was approved.

HICK, HARGREAVES AND COMPANY, LIMITED

RESULTS AGAIN SATISFACTORY

MR W. D'ARCY MADDEN'S SPEECH

The sixty-first annual ordinary general meeting of Hick, Hargreaves and Company, Limited, was held on July 30th, at Bolton.

Mr W. D'Arcy Madden, chairman and managing director, who presided, said:—

The accounts, which you have before you, again show satisfactory results for the past year and the strong financial position of the company.

The profit earned before taxation is £305,796, a moderate increase of seven per cent over the previous year. Of this profit, tax requirements are £162,007, or fifty-three per cent of the profits earned, and the final net profit, after taxation, is £143,789, against £140,051 for the previous year.

After the appropriation in this year's accounts, the revenue reserve, together with the balance carried forward, exceeds £500,000, against the share capital of £288,000 and the excess of current assets over current liabilities is £875,975.

DIVIDEND 20 PER CENT

The final dividend recommended by your directors is fifteen per cent, making twenty per cent for the year, and this, I think you will agree, is fully justified by the year's results and the financial position of the company.

The sum of £15,000 has been set aside for a bonus to our staff and workpeople, and also £5,000 to a new pension supplementary reserve which is being formed in order that pensions which may be found inadequate owing to the higher cost of living, can be augmented. We shall hope to increase this fund in the future as may be found desirable.

The works have continued in full production throughout the year and they are fully occupied with a heavy order book, the larger proportion of which consists of work of the highest priority for the British Electricity Authority and the Ministry of Supply.

OVERSEAS VISITS

At the beginning of the year I paid a short visit to the Union of South Africa with the object of visiting our agents and discussing with them, and other business concerns, the possibility of improving our South African trade. I am satisfied that valuable contacts were made during this visit, and I am pleased to say that we have recently secured an important order from the City Council of Johannesburg, for condensing plants for their new "Kelvin" power station.

Mr Davies will be visiting Canada this autumn, on behalf of the company, as your directors have very much in mind the importance of extending our business overseas.

The extensions to the works to which I referred last year have now been authorised, the principal contracts have been placed and work will shortly commence.

The relations between the management and the employees of the company continued to be very satisfactory, and I want once more to thank our staff and workpeople for their work and co-operation, which has contributed so much to the success of our undertaking.

The report and accounts were adopted.

TAYLOR WOODROW

INCLEMENT WEATHER AFFECTS RESULTS

The annual general meeting of Taylor Woodrow Limited, was held on July 25th in London, Mr Francis Taylor (chairman and managing director) presiding.

The following is an extract from his circulated review:—

The annual statement for the year ending December 31, 1951, shows a diminution in our trading profit, which has been brought about by various causes, but in the main by exceptionally bad weather experienced in 1950-51 when record rainfalls were recorded, coupled with the devaluation of the pound sterling and a spiral of rising cost which particularly affected many items not covered by the rise and fall clauses in our contracts.

TRADING OUTCOME

It is gratifying to note that the disappointing result was not brought about by any marked recession in trade. This year the credit on profit and loss account before taxation, depreciation, etc., is £291,805, compared with £375,629 in 1950. The profit and loss account includes the results of all subsidiary companies. It does not, however, include any profits from associated companies. I am pleased to report that these associated companies, in which your company has important interests, have earned substantial profits.

During the year our construction company secured several important new contracts, and these are proceeding satisfactorily. Our reputation in the building and civil engineering world continues to grow.

The company's ballast pits have operated to capacity during the year, and in spite of intensified competition have maintained their position in this field of our activities.

The joinery manufacturing business continued to expand as compared with the previous three years; actual turnover for 1951 was approximately 50 per cent greater than for 1950, but this was to some extent due to higher timber and wages costs.

The range of products has been very wide indeed, embracing various requirements for the building and civil engineering activities of the group and in addition a greater variety of woodwork was successfully supplied to customers under strictly competitive terms. Some setback has been experienced in connection with our activities in plastic materials entirely due to the greatly increased cost of raw materials.

Our house building company is engaged upon contracts for Housing Associations and so soon as the supply of materials permits we shall lose no opportunity in engaging upon estate development.

After reviewing the widespread overseas activities, the statement continues: Notwithstanding the difficult conditions governing international trade, our export company was able to maintain and increase its sale of Arcon structures. An important contract for the Government of Pakistan is nearing completion, whilst among the many orders secured from different parts of the world, may be mentioned a substantial dollar contract for the United States Defence Forces, and numerous buildings for the Fremantle Harbour Trust. We continue to obtain substantial inquiries for our Arcon structures, but with contraction in international credit, and the barrier on imports maintained by a number of countries, we, in common with other exporters, may have to face a diminution of trade.

The report was adopted and authority given to the directors' proposals for increased borrowing powers.

THOMAS DE LA RUE AND COMPANY, LIMITED

CONTINUED PROGRESS

MR B. C. WESTALL'S SPEECH

The fifty-fifth annual general meeting of Thomas de la Rue and Company, Limited, was held on July 30th in London.

Mr Bernard Clement Westall, CBE (chairman and joint managing director), who presided, in the course of his speech said:—

The net profit for the year, before providing for taxation, was £659,281. This compares with a profit of £600,113 for the year ended March 31, 1951, for the profit of £623,103 included a provision of £22,990 no longer required. Under the heading of Appropriations you will note that we have to provide, approximately, £14,000 less for taxation than was required for the previous year. This is due to the fact that although home taxation is up by some £47,000, we do not have to allow for £61,578 Foreign and Dominion tax, as was the case last year.

Turning to the balance sheet, the bank loan, as you will see, had increased from £520,000 to £845,000, and since the close of the year there has been a further increase. This continuing inroad on working capital has been brought about by the considerable expansion that has taken place over the past few years, necessitating capital outlay on manufacturing capacity, the carrying of larger stocks and work in progress and the financing of a larger volume of trade. It is clear that additional permanent working capital is required and the board are giving serious consideration to the amount of such additional capital required and to the form this should take. Stockholders will be informed of the board's decision in due course.

SECTIONAL ACTIVITIES

Last year I stated that, in my opinion, the major part of the profits would derive from the industrial division. This forecast has proved accurate, for more than half the profits are attributable to this source.

The plastics section showed a substantial increase in turnover. "Formica," our well-known laminated material, made a marked advance, particularly in the export field. The gas section has also shown a marked improvement, the sales of our cookers being limited only by our capacity.

The stationery section trading profit has been used this year to write down the value of certain stocks and materials, a course which the board considered prudent to take in the light of current trading trends.

During the past year satisfactory profits were made by the security division.

As far as the current year is concerned, trading conditions at home and abroad are much too fluid for me to give any prophecy. There has been a falling off of demand, both abroad and at home, since the end of the financial year, but since we issued that report there are some signs of an improvement in sales, both in the export and the home market. In the home market we have arranged for a campaign to increase the use of "Formica" into the home.

With the knowledge that the quality of our products is first-rate, that our prices are right, and with the support of an enthusiastic staff, I am confident of the long-term future of our company.

The report and accounts were adopted and a final dividend of 15 per cent, less tax, making 35 per cent, less tax, for the year, was approved.

TRUMAN, HANBURY, BUXTON AND COMPANY, LIMITED

SALES WELL MAINTAINED

The sixty-fourth annual ordinary general meeting of this company was held on July 31st in London.

Mr G. Dent (chairman), in the course of his speech, said:—

We have had a satisfactory year's trading.

Our barrelage went up by 3.2 per cent, which compares with an increase reported for the country of 1.05 per cent. This increase is rather remarkable in view of the fact that beer prices went up by 1d. per pint as from May, 1951.

There has been a great increase in the sale of bottled beers, especially in Trubrown Ale, while our Burton-brewed Ben Truman continues to meet an ever-increasing demand.

The sale of draught beers, especially in our London houses, has been well maintained, and they undoubtedly benefit very much from being able to offer the public a real Burton brewed draught bitter, the palate of which is unmistakable. In spite of the general swing to bottled beers our sales of this bitter continued to rise.

The cost of materials has risen very steeply. Last year's harvest was one of the worst in living memory, and sound barley was very scarce. As a result, prices rocketed, and the average cost per quarter of malt made last season was 65s. higher than in the previous year.

The average price of last year's hop crop, as fixed by the Hops Marketing Board, was £5 2s. 6d. higher than for the previous year's crop.

The report was adopted.

FORSTER'S GLASS

REASONS FOR FALL IN TRADING PROFIT

The thirty-third annual general meeting of this company was held on July 30th in London, Col. Charles E. Ponsonby, TD, DL, the chairman, presiding.

The following is an extract from his circulated statement:—

The profit for the year amounted to £63,826, before charging taxation but after charging £37,962 for depreciation (as against £33,459 last year). After deducting the net charge for taxation and the net amount of preference dividend paid, the profit is £21,227. Out of this the directors recommended a dividend on the ordinary shares of 10 per cent (less income tax), which will absorb £9,023, leaving £12,204 to be added to the undistributed profits, making that figure £61,640.

The fall in trading profit is disappointing. Nationalised industries such as coal, gas, electricity and transport continue to increase their charges, and the frequency with which advances in these and other charges, have been notified throughout the year, coupled with advances in labour costs, has reduced the margin of profit considerably, there having been no compensating adjustment in our selling prices. The increase in costs has been accompanied by a sharp fall in demand beginning last November. It would be difficult to define the exact nature of this decline, but it is definite. At the moment the falling off in demand appears to have steadied, but as long as it persists earnings are bound to be seriously affected.

The report was adopted.

ALLIED IRONFOUNDERS LIMITED

YEAR OF GOOD PROGRESS

MR JAMES SHAW ON COMPANY'S ENHANCED REPUTATION

The twenty-third annual general meeting of Allied Ironfounders Limited, was held on July 24th, in London, Mr James Shaw (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The trading profit of the group, as shown by the consolidated profit and loss account, amounted to £2,077,989 (last year £1,926,276). Taxation takes £1,078,618 (last year £1,018,003), and the balance of £722,759 (last year £842,700) is available for reserves and dividends.

The consolidated balance sheet shows clearly the strong financial position of the group. Against current liabilities of £1,642,227 and income tax of £769,293 due on January 1, 1953, we have current assets of £5,936,775. Fixed assets stand at £2,204,317. Our buildings and plant are in excellent condition, but to provide for the extra cost of replacement we have brought our replacement reserve up to the considerable figure of £1,250,000. Our total reserves exceed £3 million. I hope you will agree with me that this is a most satisfactory state of affairs to report to you.

REVIEW OF THE YEAR

These results, which surpass all previous years in volume of turnover and profit, are evidence that the resources of your company have been efficiently employed. Progress was restricted to some extent by limitations in supplies of essential materials and shortage of labour, but these adverse factors were countered by improved methods, new processes in production and good labour relations throughout the period. A record of service and quality, supported by extensive national advertising, has established many of our products as household names, thus enhancing the reputation of your company at home and abroad.

The statement reviews the company's trade in rainwater and soil goods, baths, cooking and heating appliances, heavy cooking equipment and agricultural products. Exports for the year constituted a record for the company.

OUTLOOK

The foregoing review deals with the period ending March 31st last. Since then there has been a decline in the demand for certain of our goods, primarily those sold in the replacement trade. Along with other industries we are now experiencing the change of climate from a sellers' to a buyers' market.

In the export field, however, we are faced with more adverse conditions. With the violent change in the economic policy of the Australian Government, unhappily forced upon them, we must suffer a serious loss of trade to that great Commonwealth country. Restrictions have also been imposed upon our exports to New Zealand. We aim at re-

gaining our trade and expanding our activities in these two countries.

In South Africa we own a substantial share in the largest foundry of its kind in the Union.

At no time in its history has your company had at its command such strength of finance, physical assets and qualified personnel. The efficient employment of these resources is the responsibility of your board of directors, but one which is not easily discharged in these days when industry is groping its way between the conflicting policies of free enterprise and state ownership. Your directors are looking confidently to the future, knowing that we have the capacity and the will to make your company prosper.

The report and accounts were adopted and a final dividend of 10 per cent, making 17½ per cent for the year, was approved.

ASSOCIATED BRITISH PICTURE CORPORATION

VALUE OF THE "EADY" FUND

The twenty-fifth annual general meeting of Associated British Picture Corporation, Ltd., was held on July 31st in London, Sir Philip Warter (the chairman) presiding.

The following is an extract from his circulated statement:—

The trading profits of the group are £2,340,775.

The net profit of the group is £529,341 as against £663,609, and there remains a balance of £506,084, being the net profit of the corporation for the year, which compares with £624,393 last year.

With the balance brought forward of £176,558 the total amount available is £682,642, and after meeting the fixed preferential dividends, the total distribution of 20 per cent on the ordinary stock and transferring £100,000 to general reserve, the balance to be carried forward amounts to £191,517.

The total box-office receipts of the group amounted to £19,960,394—an increase of £1,059,280 over the previous year. Out of this total £7,941,415 was paid in the form of entertainments duty and Eady levy, which together absorb approximately 40 per cent of the amount paid by the public at the box-office. Thus the result of the provisions of last year's Finance Act, coupled with the Eady levy, has been that while gross takings increased by £1,059,000, entertainments duty and levy also increased by no less than £932,000.

Despite all the efforts that have been made during the year to impress upon the Treasury the need for some amelioration in the rate of entertainments duty, we have not as yet been successful in obtaining any worthwhile concessions. It is, in my opinion, absolutely essential that the industry should receive substantial relief from the burden of entertainments duty if it is to continue with any measure of success.

PRODUCTION

The net result on the production side of the business, due partly to the operation of

the Eady Fund, shows an improvement, but, in my opinion, unless this fund is put on a more permanent basis the outlook for British film production is not encouraging.

The sum collected through our cinemas and paid over to the Eady Fund is greatly in excess of any benefits we have received or can hope to receive on the films which we have produced ourselves. In fact, out of 20 British first feature films played over the circuit last year 14 were produced and financed by sources entirely independent of the corporation, as were similarly all the British second features played.

Nevertheless, we realise the value of the Eady Fund to independent film producers and, through them, to the industry as a whole. Consequently I believe it would be in the best interests of all concerned if the Eady Fund were put on a permanent and statutory basis.

The attendances in the current year to date have been adversely affected by the exceptionally fine weather and other causes, and having regard to the continual rise in operating costs, mainly wages, the results in the first quarter of the current financial year do not compare favourably with the corresponding period of last year. It is, of course, too early to form any reliable estimate as to the probable outcome of the year's trading.

The report was adopted.

OHLSSON'S CAPE BREWERIES

TRADE WELL MAINTAINED

The sixty-third annual general meeting of Ohlsson's Cape Breweries, Limited, was held on July 30th, in London, Mr Geoffrey Dent, the chairman, presiding.

In the course of his speech the chairman said:—

I am pleased to say that our trade generally has been well maintained and has shown a satisfactory increase, especially in Natal and in the Transvaal. An improved trading profit has resulted from all branches, with the exception of Rhodesia. Here severe new competition and a cut in beer prices had an adverse effect on our sales and profits. Prices have now been restored to a more economic level and increasing sales so far this year are encouraging.

Profit margins on sales for 1951-52 have dropped by 30 per cent, as compared with 1938-39, and it is only by increased turnover that profits have been maintained.

The profit on trading and rentals of the company and its subsidiaries for the year amounted to £582,683. The balance of net profits of the Holding Company amounted to £200,832, which, with the balance brought forward, gave an available balance of £323,403. After various allocations it was proposed to pay a final dividend of 17½ per cent on the ordinary shares, less income tax, making a total distribution of 22½ per cent for the year, leaving £125,113 to be carried forward.

With regard to the future, I can only say that so far sales have been well maintained.

The report was adopted.

One Shilling

After One Session

THE Parliament elected last October has all but finished its first session. By the time that the holidays and the party conferences are over, Mr Churchill's Government will be a year old. It would be pleasant to think that before then the leaders of both parties will have reflected dispassionately on the lessons of the session. There have been important achievements. It is no small thing that economic disaster has been staved off. British foreign policy has been made coherent and firm again, and has been expounded in Parliament with wisdom and skill. But neither side can feel on balance any satisfaction with what it has done; and neither, if it were dispassionate, would have any difficulty in identifying the things that have done it discredit. Foreign affairs apart, the Government has been, to an unexpected degree, indecisive in policy and at times incompetent in Parliamentary tactics, in debate and in administration. The Opposition has shown a degree of political immorality that, if not altogether unexpected, certainly comes near to being unprecedented.

There are things to be said in defence of the politicians. They are not yet used to the close division of power shown at the last two elections. The resulting tension and uncertainty are obviously bad for both Government and Opposition. To believe that the unhappiness of the session had no deeper cause than this would be comforting, but it is unrealistic. The Government has never had any difficulty in mustering its supporters for the division lobbies and, on all appearances, is as little likely to fall by defeat in Parliament as any of its predecessors with more impressive majorities. It is despite their Parliamentary voting that the Tories have little faith in themselves and have failed in this session to dispose of any major item of their legislative programme. Four measures were promised in the King's Speech—to denationalise road haulage and steel, to strengthen the Monopolies Commission, and to embody the surviving emergency regulations in an Act requiring annual renewal. None of these has even begun its Parliamentary career. The volume of its legislation is, of course, no measure of a Government's worth, but the fact remains that the Conservatives chose to embark on four major measures and after nine months have got nowhere with them. If it does nothing else, that failure certainly saps their self-confidence.

There are more important symptoms of the Government's weakness. The first is purely political. One would have expected that through last winter and spring, at least, Ministers could escape blame for rising prices and similar discontents; responsibility could fairly be pinned on their predecessors. Yet this the Government has entirely failed to do—as it showed in its ill-judged intervention over transport fares. The breakdown is in the simpler arts of political persuasion, and its consequence is a sense of growing unpopularity that has helped to make most Ministers less rather than more confident as they have become accustomed to their offices.

This, however, is only the superficial cause. If Ministers have let themselves be condemned for not doing the impossible—for failing

THE ECONOMIST, 22 Ryder Street, St. James's, London, S.W.1. Telephone: Whitehall 1511.
ANNUAL POSTAL SUBSCRIPTION £3
Registered as a Newspaper. Entered as Second Class Mail Matter at the New York, N.Y., Post Office. Authorised as Second Class Mail, Post Office Dept., Ottawa.

CHIEF ACCOUNTANT required by Group of Companies, with Head Office in London. Wide commercial and/or professional experience is necessary. Business is progressive and offers scope for a qualified man who is keen and energetic. Age 40/45. Salary from £1,500, according to qualifications.—Applicants should send full particulars to Box 999.

GENERAL MANAGER or Sales/Advertising Manager. Unrivalled experience of large-scale marketing consumer goods (foodstuffs and chemical lines) as top level executive with famous firms. Highest qualifications (including F.S.M.A.) and integrity. Resident London. Exceptional personality.—Box 24.

LAST-MINUTE Continental Holidays not arranged for the masses but individually for you. Ten days in Spain from £26 19s. 6d.; Italy £25 19s. 6d.; France £18 10s. 6d.; seven days in Paris from £13 15s.—Write or phone: Business & Holiday Travel Ltd., Grand Buildings, Trafalgar Square, W.C.2. Whitehall 4114/5.

GRADUATE, 34, with considerable organisational and sales experience both home and export, at present sales manager manufacturers/merchants group, seeks new post with scope for hard work, loyalty and intelligence.—Box 32.
P.E.O., versatile, prolific writer. Good organiser. Lecturer. Publicity background. Seeks London appointment.—Box 31.

to reduce prices or provide more meat—that is largely because they have not, either before or since the election, offered the public any more realistic standards of judgment. They have emphasised, of course, how difficult the country's problems are; they have not made anyone feel that the problems are now being tackled in a new and more imaginative spirit. The one distinctive Tory measure that has reached the stage of a published Bill—for transport—is the one on which the Government has made the poorest showing. In most other matters, Ministers have been content to make it their strongest argument that Labour did much the same. There could be no plainer confession of weakness. For the end result of Labour policy was, on the Tories' own argument, to leave this country insolvent and insecure.

The tighter credit policy is new, it is true, and is doing much good, but their unsureness whether they were tackling inflation or deflation has hopelessly confused Ministers' presentation of the case. They can claim, in immediate economic affairs, to have saved the country from imminent disaster, but that has been done—with American aid—before, and it does not lead to any conviction that the economy is being put permanently on a sounder footing. If Tory navigation has helped the ship to ride out one storm—and even that is not yet certain—it does not look in any better shape to face the next. The Government has had to ask the public to accept some sacrifices but has not shown them to be the necessary and sufficient price of solvency and security in the longer run. The fact that the sacrifices are small therefore does not make them any less irritating.

*

If the Government had had to face a united and competent Opposition all this would already have been disastrous, at least for its morale. In fact, it has had to cope with nothing worse than an Opposition trying to conceal its own differences by rowdiness. The arrogant and empty clamour from the Labour benches in this session must be deeply distasteful to those—Mr Attlee, no doubt, and Mr Morrison—who understand and value Parliamentary government. No more excusable are the techniques of pure obstruction, of wasting time over some measures, like the Army Act, that are not really controversial. In themselves, perhaps, these things should not be taken too seriously. They may be dismissed as the mob inanities that frustrated backbenchers, cooped up in Parliament by the Whips, will always drift into if they are not held in check by firm leadership. That may be an excuse for many members, but the danger for the future lies precisely in the effective collapse of Mr Attlee's leadership. No doubt the Labour party is sound enough in the limbs; the question is what is happening to the nerve-centres.

Her Majesty's Opposition may normally be taken to have two purposes. One is to improve, by its criticism, the current conduct of the country's affairs; and the other is to get as much party advantage as possible out of doing so. It is difficult to see that the Labour party's conduct, especially in the past few weeks, has much relation to either purpose. It is solely concerned with the struggle for power inside the party. That is why, for example, the solemn procedure of the vote of censure is misused in order to register what are, in fact, quite small differences with the Government. The censure as such pleases the militants, while the moderates console themselves by the relative mildness of its phrasing. The

general formula is devastatingly simple. It is to find the lowest common factor: if Labour members cannot agree on any new ideas, they can keep in step by forgetting, in practice, the ideas some of them had when they were in office. They can oppose by setting aside all the requirements for solvency and security that Sir Stafford Cripps and Mr Bevin used to preach about.

The change was made easiest, and was made first, in economic policy. As early as the first economic debate of 1952, Mr Attlee was arguing that inflation does not matter; to check inflation by cuts in the social services "is, surely, utterly fantastic." The world is, surely, flat, for who can see round it from Westminster? It has long been plain that the Labour party could have a realistic financial policy only if its leaders ignored the wishes of most of their followers. But that, it now appears, was too charitable an interpretation. Labour will in truth accept a realistic policy only if its leaders are so awed by having a crisis on their hands that they will surrender policy-making to one man who has kept his head. And the leaders, like the backbenchers, will forget as soon as they can. This is the only basis for most Labour criticism of Mr Butler's policy.

In foreign affairs and defence the retreat from realism had to be slower: the policy of the Conservative Government was so plainly a continuation, in all essentials, of its predecessor's. But the retreat is now complete. Whatever the original rights and wrongs of German rearmament, the effective choice now plainly lies between pushing ahead with it and abandoning it. Yet, in order to avoid splitting itself (much) in the division lobbies, the Labour party was willing last week to oppose by quibbling about timing—and to go on to register, on this narrow ground, a vote against the Government that will necessarily be interpreted abroad as opposition to the principle of German rearmament. Bipartisanship in foreign policy has been ended not because the leaders of the Labour party have changed their minds but because they no longer dare to stand up for what they think.

There was never any doubt that in opposition Labour policy would move some way to the Left. Criticism is not of the movement but of the incoherent and irresponsible form that it is being allowed to take. The reason why it takes that form is not, though it often appears so, that the party has suddenly lost all common sense. The reason is that its leaders, feeling insecure, have chosen not to exercise leadership but just to hang on. Yet while that is the major cause, the Government certainly must bear some responsibility for the behaviour of its opponents. It provides the Socialists with every reason for believing that they can win the next election on the Tories' mistakes; they can probably gain votes without being sensible and moderate themselves, and Mr Morrison's strongest argument within the party is correspondingly weakened. On the other side of the account, Labour's irresponsibility and unrealism increase the Government's difficulties in both economic and foreign policy. And the Government's weakness in turn further encourages Labour's reckless arrogance.

This is the vicious spiral that has begun to turn after one session of Conservative government. If it is allowed to go unchecked the outlook for British politics and the British people is deeply and unnecessarily disturbing. To stop the spiral before it is too late is equally the interest of the majority of moderate men among the leaders of both parties. Is it really too much to ask that both sides should think afresh what they can do to stop it?

Debtors and Creditors

THERE is probably a greater chance now than at any time since the conference at Bretton Woods that the baffling problems of international trade, payments and investment within the free world will be considered and dealt with jointly by the whole western world. For one thing, the risk has faded that an isolationist might be the next President of the United States. For another, eight years of paying lip service to the Bretton Woods ideals and pursuing an almost exactly contrary policy have convinced most people that the principles themselves had better be re-examined. Never before has there been so much talk on both sides of the Atlantic of the need for a common system of economics and for long-term plans of economic co-operation to underpin the political and strategic unity of the Atlantic community. Never before has it been said with quite so much emphasis that, in this new system, creditors and debtors alike have their contribution to make and that the new arrangement will entail duties on both sides.

Unhappily, the creditors tend to speak more of the duties of the debtors and the debtors to stress the responsibilities of the creditors. Yet it is only creditors who can take action on the credit side; and if the debtors are to make the efforts necessary to right their position, they will have to do so willingly. The remaining months of 1952 are likely to be a period of preparation and discussion; action must in any case await the election of a new President and a new Congress. It is fortunate that, to serve as an agenda for discussion, an objective document should exist, prepared by an international panel of experts, which brings much light—and no heat—to a study of the behaviour of nations whose balances of payments are out of equilibrium.

The working party which has presented its conclusions upon the "internal financial situation" of member countries to the Council of the Organisation for European Economic Co-operation studied only four case histories—of two creditors, the United States and Belgium, and of two debtors, Britain and France. But the points it emphasises and the conclusions it draws apply over a much wider field. The starting point is the state of affairs in 1951. Admittedly it was an abnormal year; the violent upheaval in world prices after the start of the Korean war was still in progress and the programmes of large-scale rearmament in the West were just beginning. Nevertheless, all the member states of OEEC, the countries of the sterling area and of North America were

exposed in varying measure to these general upheavals and the fact remains that in some the response was to hold a balance in their economies, in others it was a plunge into renewed inflation, and thence into trouble with the balance of payments. When all differing factors are allowed for, it is at least likely that the deficit nations had some policy in common and that the creditors achieved success by some of the same means.

*

The report of the OEEC working party leaves very little doubt about what this common factor was—it was credit policy. It is, indeed, a striking fact that every country whose position improved between 1950 and 1951, or remained on the credit side, practised some degree of credit restraint, while all those whose position deteriorated did not. This cannot be merely coincidence. To say that this was the common factor does not, of course, in any way exclude other elements of the problem. It cannot, for instance, be denied that Britain suffered cruelly in 1951 from the sharp unfavourable movement of the terms of trade. But Belgium and Germany are also countries that import raw materials and sell manufactures, and they were not driven into deficit. It is true also that a given degree of internal inflation affects different countries differently. To judge by the figures of price rises alone, there was no more internal inflation in Britain in 1951 than in the United States, and though there were some moves towards credit restriction in America, they were not very drastic. But the answer is that a given degree of inflation can hurt a country in Britain's position much more than one in America's—just as the consumption of whipped cream and fried potatoes can do much more to the weight of some people than others. Only creditors can afford cheap money.

Perhaps the clearest object lesson is given by Germany. The Germans in 1951 had some advantages that have nothing to do with credit policy. They are prepared to work very hard and, either by good luck or good management, they contrived to build up their stocks of raw materials at the right moment—not at the wrong moment, as the British Government did. Nevertheless, the main reason for the contrast between Germany's deficit in 1950 and surplus in 1951 lies, beyond much doubt, in the conservative financial policy that was followed, on the advice of an OEEC mission. Financial

policy alone can, perhaps, achieve very little; but without it other methods designed to right the balance of payments can achieve nothing.

The evidence is far too strong to make it any longer possible to deny the close link between an internal financial policy which averts inflation by adjusting the flow of demand to the flow of supply and a nation's ability to secure balance in its international payments. If the evidence from the creditors were not already strong, the evidence from the debtors would be overwhelming. In Britain, during the crucial year of 1951, inflation was, it is true, no worse than in earlier years. But the degree of suppressed inflation made it impossible to counteract the general adverse conditions of the year and such particular disasters as the loss of revenue from Abadan. Control over the extension of credit was too lax, the "degree of flaccidity" in the credit system too pronounced for financial policy to play its part in checking internal demand and making sufficient resources available for export. The result was sensational. A creditor by some £244 millions in 1950, Britain fell into debt to the extent of £521 million in the following year and even today after rigorous cuts in the import programme and some relaxation in armament, balance has not yet been restored.

It is in France that inflation had the most devastating consequences as a result of the unfavourable conditions of 1951. The rise in prices there was higher than in any other OEEC country save Austria and Iceland and the increase in the cost of living was 50 per cent higher than in the United States. The deficit in the balance of payments reached a figure—at £377 millions—four times higher than in 1950 and almost level with the phenomenal deficit of 1947. Admittedly, the internal inflation was accelerated by the traditional French distrust of a devaluing franc and the tendency of real savings to vanish into stockings at home and into bank accounts abroad. It is also true that wages were considerably increased in that period. But the distrust could not have had so devastating an effect if demand and consumption had not been sustained all the time by the ease with which private interests and the government could resort to inflationary borrowing.

*

The decisive character of lax financial policy in France's case is, moreover, confirmed from the experience of another state—Australia—in which such special features as French psychology were entirely absent. The Australians are by tradition a people that neither distrust their currency nor hoard their savings. Yet in 1950 and 1951, as the general inflationary pressures gathered strength, accentuated by high earnings from wool and from the automatic linking of wage increases to the rise in the cost of living, uncontrolled credit expansion, both in basic capital expenditure and in a mass of inessential industrial activity, stoked the inflationary fires, blew up internal demand and produced by the end of 1951 a soaring deficit in the balance of payments. The resemblance between the deterioration in the two economies is further underlined by both governments grasping at the same remedy—a flat 50 per cent cut in their import programmes.

It is at this point that the connection between internal financial stability and the duty of the debtor in international trade becomes obvious enough. Internal inflation leads to unbalance in international payments,

for demand rising without a corresponding rise in internal supply goes hungrily out to eat up the supplies of other people, or the supplies that ought to be sold to other people. Checked in its early manifestations by adequate restraints on credit, it will not run a nation catastrophically into debt. Left to itself, it runs up deficits so alarming that only panic action with a hatchet can stave off bankruptcy—hence the scale of the French and Australian cuts.

Yet such sudden curtailments of trade are disastrous to steady international commerce. A year ago, the liberalisation of trade in Europe gave grounds for hope that a more rational and efficient division of labour might one day emerge. Virtually all members of OEEC, with the exception of Turkey and three countries—Greece, Austria and Iceland—which are recognised to be in special difficulties, had freed 70 per cent and more of their private intra-European trade from licensing (Germany has liberalised 82 per cent, Belgium 88 per cent, Italy 99 per cent). But now Britain's degree of liberalisation has fallen below 46 per cent and that of France to zero. To secure the 50 per cent cut in French purchases, all imports are now subject again to licensing. Quite apart from the disruption which such wholesale cuts impose, the policy itself can only lead at last to a general reduction in trade.

*

There can, in the light of 1951's experience, be very little doubt about the first two items on the list of commandments for countries running into deficit in their international accounts. The first is to take corrective action promptly, before the deficit has reached crisis proportions. The second is that corrective action, whatever else it may consist of, should include action to remove any excess of domestic credit that may exist.

It is, of course, perfectly true that the debtors alone cannot guarantee an expanding world economy. World trade cannot grow if the creditor nations do not accept the need for expansion and prefer to make hard money and balanced books their only aim. The criticism can perhaps be levelled with some justice at Belgium, a persistent creditor since the war. It is also true that the maintenance of high tariffs and relatively low foreign lending in the United States is incompatible with the role of the greatest creditor nation.

Yet the debtors would perhaps be well advised at this stage to concentrate upon their own responsibilities. The United States has after all maintained so far a consistently high and expanding level of employment and for some time to come, as the OEEC experts point out, armament production alone is likely to ensure a continuance of steady activity. The debtors must therefore ask themselves what degree of world expansion they demand as a condition for their own solvency. May it not be that, spoilt by so much free giving from other nations, solvency has ceased to seem to them either a necessary or even a moral choice?

So long as national shortcomings in work or competitiveness or efficiency are tolerated and even encouraged by inflation and import cutting, the first contribution to the restoration of national solvency cannot come from the creditors. It must come from the deficit nations themselves. The debtors' duties may be only half the story, but, in the conditions of 1952, they make up the first chapters of the book.

New Patterns in the Pacific

THIS week an historic meeting has been taking place at Honolulu in the middle of the Pacific. Mr Acheson, the American Secretary of State, flew there to meet the Ministers for External Affairs of Australia and New Zealand, Mr Casey and Mr Webb, for the first session of the Pacific Defence Council. It is natural to see in this conference the beginnings of what might eventually become a defence organisation for the Pacific which would bear comparison with the North Atlantic Treaty Organisation. If that hope were to be fulfilled, the free world would indeed have reason to feel prepared for the worst that the two great Communist powers, Russia and China, could throw against it.

For the moment, however, this hope is still a long way from realisation, and it can do little good to exaggerate

either the scope or degree of preparedness and organisation that the Pacific Defence Council so far represents. Its official name is the ANZUS Council—for Australia, New Zealand and the United States—and a feature of its present session is that the Council has been deliberately limited to the ministers and officials of three of the sovereign, English-speaking powers in the Pacific; there is not even an observer present from the United Kingdom. These limits are a source of strength as well as of weakness: of strength because the unity of purpose and determination of the three powers cannot be questioned; of weakness because any defence organisation which is to operate effectively in the western Pacific must sooner or later include, not only the United Kingdom, but perhaps France and certainly Asian members too.

The prime task of the present session was to agree upon the machinery of the Council. It is true that Mr Casey spoke in his opening address of an exchange of views on "situations in the Pacific affecting the security of all." The three statesmen, backed by their experts, could hardly come together without discussing the general problems with which their new organisation is designed to deal. But the origins and purpose of the Council demand that the session should not end without taking administrative decisions which are bound to have required most of the time available for discussion. Establishment of the Pacific Defence Council was agreed upon by the United States as a method of implementing the guarantee of security which it gave, to the Australians and New Zealanders last year, in return for

their acceptance of the Japanese peace treaty. The aim therefore must be to set up permanent committees which can keep a constant watch on all developments in the Pacific—strategic, political, military and economic—that may affect the new alliance. It is announced that one committee will deal primarily with the military aspect: it will be established somewhere in the Pacific itself, perhaps at Honolulu. The other, or others, should clearly be based in Washington.

Although the mainspring of the Pacific Defence Council lies in Australian fears of a revival of aggressive Japanese militarism, this does not fully explain the reasons for its present limited membership. Nor does it quite account for the fact that the Council represents the nucleus of a Pacific defence structure which is more

likely to have to oppose Communist than Japanese aggression. During the period in which negotiations took place last year three factors gave the Pacific Defence Council its present size and form. There was, first, a need for haste in drawing up the American guarantee to Australia and New Zealand, if the Japanese peace treaty was not to be delayed any longer than it had been already. This prevented the inclusion of the United Kingdom in the treaty, since to bring it in would have raised complex issues in regard to British Pacific territories such as Malaya and Hong-

kong, and these would have taken a good deal of time and negotiation to solve. Secondly, it was perfectly clear that an American guarantee in no way weakened Britain's recognised obligation to come to the assistance of Australia and New Zealand in time of war. If these members of the Commonwealth were attacked, the rest of the Commonwealth would be in the battle anyway. An American guarantee merely transformed the chances of fighting effectively in the Pacific from the outset.

*

Now that the first practical steps have been taken to set up the Pacific Defence Council, the next should be to hammer out answers to the problems for which there was too little time last year. It may be that the Americans, who face an increasing risk of formal commitments to defend far too many distant territories, cannot in an election year be expected to bind themselves over Malaya or Hongkong. But in time it should not be impossible to devise a formula which would recognise

the two undeniable facts: that Britain is committed to fighting if Australia and New Zealand are attacked, and that the United States could not in fact be indifferent to an attack upon Hongkong or an invasion of Malaya.

The third factor which has limited the present size of the Council is simply the difficulty of making a cap to fit such a wide variety of heads as are to be found in the western Pacific. From the American point of view, it might have been best to try to combine in a single agreement all those territories to the defence of which the United States is already formally bound. They are Japan, the Formosa of Chiang Kai-shek, and the Philippines, as well as the two Commonwealth nations. But there are many obvious reasons why that was impossible at this stage, among them the fact that Australian public opinion would not accept it. To the Australians, the rise of a new Japan inspires a fear similar to that which the French feel about Germany. Moreover, neither the Japanese nor the Chinese Nationalists are in a position to undertake the reciprocal commitments towards the United States which have been written into the treaties with Australia and New Zealand.

Although the conditions and problems in the Pacific and South East Asia are quite different from those which existed in Europe between the end of the war and the signing of the North Atlantic Treaty in 1949, it is reasonable to compare the stages by which defence arrangements have developed, since the ultimate object is the same. In Europe, the first step was the Treaty of Dunkirk in 1947, by which Britain and France aimed to protect themselves against Germany. As the menace of Russia grew, this alignment was extended the next year into the Brussels Treaty, which included the Benelux powers. Then, with American and Canadian support, the defence structure under the North Atlantic Treaty became wider in scope, stronger and far more elaborate. Today, the Pacific Defence Council represents, perhaps, a streamlined version of the Dunkirk Treaty period—

The Uneasy Triangle

IN one respect, and one only, the Conservative Government has by its own actions altered the economic climate. In spite of the widely expressed fears of a slump, it has been faced, like its predecessors, with an urgent need to prevent personal incomes from outrunning real national production. Labour relied chiefly on cutting inflated incomes down to size by taxation; Conservative policy, reviving the monetary weapon, is rather to prevent them from rising in the first place. This shift of emphasis is for many reasons a good thing. But it sharpens an incompatibility which in one way or another has bedevilled Britain's economic affairs ever since the war: the three-cornered incompatibility between a stable price level, full employment, and the free collective bargaining by which the size of so many incomes is determined.

Theoretically, at least, one can have any two of these desirable things. Neither theoretically nor in practice is it possible to have all three. A community can have stability of prices and full employment if it can bring itself to do without free collective bargaining. A really effective control of wages would require an all-powerful central authority not only holding down aggregate wage increases to whatever sum was genuinely justified by real

streamlined because with America already an ally and with the experience gained in Europe, the stage is already set for an expansion of the Council into a general Pacific Pact when the moment is ripe. The fact, however, that almost none of the Asian states is yet both willing and able to join must mean that the moment is some way off. Even though the Atlantic experience is a guide, the special problems of the Far East are likely to make Pacific integration slower than that of the West.

The immediate issue before the Pacific Defence Council is, therefore, consolidation rather than expansion. In practice this means ensuring that the alliance of Australia, New Zealand and the United States in the Pacific becomes as strong as possible as quickly as possible. That is largely a task of liaison with the main defence organisation of the western world, Nato. It is a question of seeing that Australia and New Zealand receive a proper share of the arms of the free world, and that they themselves use their own resources to the maximum economic and military effect.

When Mr Menzies, the Australian Prime Minister, was in Washington and London earlier in the summer, he asked if Australia might join Nato. Although his request was rightly enough refused, on the grounds that it would make Nato unwieldy and destroy its original concept, the problem of the Australians and New Zealanders is real. They feel not only that they run the risk of being a long way down in the arms queue but also that they stand committed to the consequences of policies in which they have little say. If the Pacific Defence Council can help to bridge this gap between the two ends of the free world by working, in close contact with the Standing Group of Nato in Washington, it will fully justify the time and effort which have been put into its construction this week at Honolulu.

national productivity but also sorting out relative wages according to some sound objective standard. If the two sides of industry were willing to accept such an iron control, employment could be kept as near to 100 per cent as the sheer physical immobility of labour would allow, without any pressure on prices resulting. This is the way in which efficient dictatorships solve the problem.

Alternatively, full employment can be combined with free collective bargaining, but only by paying the penalty of an incessant upward spiral of costs and prices. Full employment means high bargaining power for the workers, high bargaining power means wage increases which, in greater or less degree, outrun the growth of productivity; these high wages not only raise costs but, by swelling demand, pull up prices and generate high profits; high prices and profits whet employers' eagerness to obtain more labour; and so *da capo*. The disadvantages of this state of affairs are obvious; but if the community is willing to pay this price, then full employment and free collective bargaining could at least theoretically coexist.

Or, as a third possibility, an economy can have stability of the value of money and free collective bargaining if it is willing to sacrifice full employment. The central

monetary authority, with its control over purchasing power and credit, can make it hopelessly unprofitable for employers in general to meet demands for higher wages. Since there is no answer to the argument that you cannot get blood from a stone, a sufficiently tough monetary policy makes it safe to leave wage bargains to settle themselves; but when wages are thus settled, the workers whom it does not pay to employ, to supply a market where there is not much money about, will simply remain out of work.

Full employment, stability of prices, or the free wage bargain—some concession, some abasement of the ideally desirable, must be made on at least one of the three. But on which one? And to what extent? The more uncompromisingly public opinion insists on keeping all three unimpaired, the sharper in fact is their mutual opposition. Something must give way in any case; if the sacrifice is not made deliberately it happens by default. What has been seen in Great Britain over the last six years is an adamant insistence on full employment; freedom of collective bargaining tempered only by the (at times considerable) moderation of the trade union leaders; and prices which have never stopped rising. Of the three desirable things, the British community has had a full dose of one, a fairly large dose of the second, and very little of the third. This has not been a deliberate choice; stability of values has been, as it were, the neglected residuary victim. It may be, nevertheless, that even if the choice had been fully conscious and deliberate, it would have gone the same way. So passionate is the devotion of the present generation to full employment, so strong is the position of the trade unions and their attachment to free collective bargaining, that the British people might, with open eyes, abandon the stability of their money rather than endanger the other two. One cannot be sure; the rising cost of living is not to be underrated as a bogey. But a deliberate policy of securing full employment and freedom of collective bargaining at the cost of permanently rising prices is perhaps sufficiently plausible to serve as a hypothesis. Let us, therefore, assume that it is what the British people would desire, and enquire whether it is a practicable choice.

It is less so, probably, in this country than in any other in the world. If the United States chose to put itself on an express price escalator, it could do so, not indeed with impunity but with far less immediate prospects of disaster. Even in the United States, there would be some immediate penalty price to be paid. A lot of injustice and waste will be tolerated when the alternative is the collapse of a boom, but will they be tolerated indefinitely? The whole beauty of inflation as a stimulus to activity and a guarantee of full employment is that it widens the margin between business costs and business returns. It does this only because costs are relatively fixed; and costs are fixed precisely because some people and some types of income are not on the escalator. So long as enough suckers are available to accept fixed returns in funny money, it will be possible to postpone the final turn of inflation—the savers' strike, the flight from the currency into any and every alternative asset, the collapse of investment and of employment itself, and a general chaos fatal to free society. But the more unmistakably the climate of inflation is established, the more it is taken for granted, the faster and more inevitably the essential supply of suckers will run out.

Even in the most favourable circumstances, therefore, the ideal of an accepted and permanent inflation, sufficient to guarantee full employment in the face of the steadily rising wage levels that free collective bargaining, even if used with restraint, will infallibly bring about, is an illusion. The trick may work for a time, but it is unlikely to work for very long. This is true for a closed or nearly self-sufficient economy; it is doubly true for Great Britain. Britain's ability to maintain full employment, let alone the national standard of living, depends on Britain's capacity to offer foreign buyers good value for money. That capacity certainly cannot be combined with a permanent and accelerating inflation. Long before reaching the stage of collapse from its own internal contradictions, a full employment policy which destroys all stability of monetary values is bound, in a country situated as is Great Britain, to destroy itself. It has already come perilously near to doing so.

Still, one must not speak in absolute terms. Stability of values, it has been argued, cannot be jettisoned for the sake of full employment and free collective bargaining; but one need not identify stability with an absolutely fixed and sacrosanct price level. Few economists believe that a rigid ceiling on prices is either necessary or even a particularly good thing for economic health. Indeed, the general consensus of economic opinion is that a slowly rising price level is more conducive to "stability" in every sense that matters. In the absence of deliberate policy (or of the special pressures of war and cold war) well-developed free economies do tend to pull over to one side—the side of over-thriftiness, of falling prices and deflation. The simplest and most effective means of counteracting that tendency is to lower the effective rate of interest a point or two by permitting, or encouraging, prices to rise.

But to do good, and to avoid doing grave harm, the rise of prices needs to be slow and gradual. A rough and ready test would be to say that the rise should not be so fast that an individual suffers acute injustice or disappointment during his lifetime; the savings that a man makes in his prime should retain at least most of their value in his old age. This means an average rate of rise in prices of something like 1 per cent, or at the most 1½ per cent, a year. Anything beyond this will sooner or later prove to be intolerable and disastrous.

A rate of fall in the value of money as slow as this, however, is something quite different in character from the upward rush of prices in recent years. It could hardly be achieved with employment as overfull and with the unions' bargaining power as freely exploited as they have both been since the end of the war. If, from the side of stability of values, the concession can be made that it need not mean absolute rigidity, are there perhaps similar concessions that can be made from the other two corners of this uneasy triangle? And are the concessions that it is reasonable, within the bounds of practical politics, to ask for sufficient to enable a satisfactory compromise policy to emerge? If it is not possible to combine overfull employment, completely free bargaining and absolute stability of values, is it nevertheless possible to mix together sufficient of each to make the compound acceptable and workable? These are the questions that subsequent articles will attempt to discuss.

(To be continued).

NOTES OF THE WEEK

Mossadegh versus Tudeh

Inside Persia, the events of Bloody Monday, July 28th—the day of rioting that ousted Qavam es Saltaneh and restored Dr Mossadegh to power—have considerably altered the scene. Their principal effect has been to alter the importance of the roles played by the chief actors in the drama. All but two of these have been shorn of their former significance; the two players whose importance is enhanced are Dr Mossadegh himself and his fanatical right-wing accomplice, Mullah Kashani. July 28th has shown the Shah to be undependable and the prisoner of the national front. It has taken the stuffing out of all other politicians. It has left the army leaderless and a prey to differences within the officer corps which Dr Mossadegh is fomenting in order to ensure his own supremacy. In short, two ageing fanatics, possessed of power founded almost entirely on mass emotion and both of them in delicate health, are the nation's only remaining bulwark against anarchy.

The other factor in the situation is the Tudeh party, which gained in strength by its share in the riots. Yet its demeanour since they ended suggests that it still lacks leadership. It has plenty of support, and possesses considerable powers of destruction, but it is not ready to assume a constructive role. It is therefore content to let elderly muddlers assume dictatorial powers and take full responsibility for allowing the national economy to sink from bad to worse. Hence its acquiescence in the arrangement whereby Mullah Kashani summoned it to action on July 27th ("We accept sincerely any groups which co-operate in the campaign") yet three days later returned it to a back seat. ("Those who agitate against the will of the nation and the law will be punished.")

From these facts one firm conclusion can be drawn: the combination founded on Dr Mossadegh and Mullah Kashani will retain its capacity for keeping order so long as it can go on paying the army and the police. Now that it has been voted full dictatorial powers it can probably do this for weeks, if not months, to come. It intends to reduce the cover for the currency, which is ample. The notes for the purpose are printed and only await distribution. For a time, they can be made to serve for meeting the payments in question.

Appeasement Without End?

The western powers, therefore, have a few weeks of grace in which to reflect upon what they want to happen in Persia and whether, by any means, they can help to shape events to their taste. All possible eventualities are disagreeable. One is that the Mossadegh-Kashani front should drift on with a dubious economic programme, and so complete the ruin of Persia's economy; only Tudeh would be pleased. Another is that death or some less natural agency should remove two elderly leaders; but no desirable replacement for them is any longer discernible. A third is that the front should keep its head above water by continuing to pay the security forces and the oil workers. This they may manage to do for a matter of weeks or months by using the new notes, but ultimately payment will be possible only if Mossadegh is helped with outright money gifts, or if he sells crude oil.

The policy-makers of London and Washington therefore face a distasteful choice; even if they keep Mossadegh afloat with gifts or with purchases of his oil, they must recognise that he never heeds advice and is unlikely to be strong or efficient enough to reorganise Persia's shaky economy and administration. They will become victims of everlasting blackmail, which may not even succeed in its purpose of arresting the rise of Tudeh, and that will afford a disastrous example

to the other oil-rich states of the Middle East. If on the other hand they sit by while Dr Mossadegh drifts towards bankruptcy, they concede Tudeh and its Russian sponsors a victory by default. Washington is known to favour the former alternative. But, as seen from London, Washington's policy for the whole Middle East seems to be nothing but appeasement without end—and without alternative if the appeasement of Dr Mossadegh should in the end fail to stop the Tudeh advance towards power.

For London to yield to Washington and to buy some of the oil from Mossadegh would involve swallowing a great deal of pride. That is not in itself an objection; so much pride has been swallowed already that some more could be got down, however much disgust the long-suffering British public might feel. It is the inability to see how such a policy conceivably leads to a satisfactory result that causes resistance. If, then, London is to yield to Washington's view of the best way of warding off the immediate danger of a Communist government in Persia, it must only be in return for specific commitments from Washington for the future. There must be no abandonment of the legal rights of the Anglo-Iranian Company; if any oil is bought, some of the price must be for compensation. And, most particularly, there must be agreement between London and Washington on what they will jointly do if, after all, the experiment fails and a Communist government comes to power in Teheran.

Cabinet Confidences

Mr Attlee and Mr Bevan were engaged last week in a dispute concerned ostensibly with the doctrine of collective responsibility in the cabinet. In fact, its constitutional significance was slight; but it may be important in the struggle for power within the Labour party. The upshot is to suggest how difficult it would be for Mr Attlee, if he were again Prime Minister, to work with Mr Bevan as a colleague.

The sequence of events was this. On Wednesday, in the economic debate, Mr Bevan declared that in January, 1951, he insisted on putting into the last Government's statement of the defence programme cautionary words emphasising that its fulfilment depended on adequate supplies of materials, components and machine tools. On Thursday Mr Attlee explained that he did not feel free to comment on Mr Bevan's statement because, "no doubt through inadvertence," it broke the "well-established rule inhibiting members of a government from revealing what passes in cabinet or in confidential discussions"; without this rule, "confidence between colleagues is impossible." On Friday, Mr Bevan denied in effect that he had spoken inadvertently and claimed that if collective responsibility broke down—because a member of the cabinet resigned—the ex-minister was entitled to draw on confidential discussions in order to explain why he resigned.

On the constitutional issue, two things seem to be plain. First, Mr Bevan's defence has the *post facto* air of an excuse. When he resigned he explained his action fully enough without making any such categorical declaration about his discussions with his colleagues; he cannot plead the necessity for self-justification fifteen months later. In any event, the precedents plainly do not give a resigning minister an automatic right to disclose the relevant cabinet discussions; he needs the permission of the Sovereign through the Prime Minister.

On the other hand, Mr Attlee applied the doctrine of collective responsibility too widely; he seemed to think that the discussions of a cabinet must remain as secret as they

are while it is in office. In fact, of course, most ex-ministers do eventually give their versions of history in some form or other. Nothing will stop old men from reminiscing and indeed history would be a poor thing if they were stopped. The question is at what point reminiscence becomes legitimate. Collective responsibility would mean nothing if ministers were free to talk about a cabinet the moment it went out of office. There is no rigid constitutional rule; there is, surely, a practical working test. An ex-minister ought not to say things that will make it harder for his colleagues to work together—whether it be with him or not—when they are next in office. And Mr Attlee is certainly entitled to consider that Mr Bevan has transgressed this rule.

Slim Line in Statutes

The session of Parliament that virtually ended last week—there will be only a fortnight or so for tidying up odds and ends in the autumn—must surely be the first for many years in which the most important item of legislation was provided by a private member. Mr Harold Lever's Defamation Bill has earned that distinction. Some last-minute amendments proposed by the Lords remain to be dealt with, but the Bill is sure to find its place on the Statute Book. It will make several important improvements in the law relating to libel and slander, but it is nevertheless a minor measure; its prominence measures the meagreness of the Government's own legislation in this first session. The main Bills promised in the speech from the Throne last November have not been produced, and nothing else of importance took their place. Most of the fifty or more measures reaching the Statute Book are simply the legislative reflection of administrative action, such as the Agriculture (Ploughing Grants) Act, the Family Allowances and National Insurance Act, and the Home Guard Act. The rest of the Government measures—apart, of course, from the Finance Act—are very small beer.

On the other hand, private members have steered a number of useful Acts through Parliament. The changes in the law embodied in the Acts on affiliation orders, corneal grafting, the disposal of uncollected goods, cremation, the care of young children, and hypnotism—all these are useful. They indicate, too, that back benchers have at last found some other source for legislative projects than the Royal Society for the Prevention of Cruelty to Animals. Laws about animal welfare are a good thing, but they have taken up more than their share of Parliamentary time since the war.

The slimness of the session's legislation means that the great Parliamentary question about Mr Churchill's Government will remain unanswered for a year after its formation. Has the Government a sufficient majority to push through controversial legislation? The issue has not been put to the test. The reason why the denationalisation Bills have not reached the Statute Book is not that the Opposition blocked them but that the Government made no real effort to bring them forward. No doubt the Opposition will try in the autumn to do all the blocking it can, but there is no reason why—with clear-headedness and resolution—the Conservatives should not carry through any of the measures they included in their election programme. If, however, they allow the Opposition to retain the Parliamentary initiative that Labour seized and held throughout this session, then indeed the Tories are lost.

Soviet Germany Takes Shape

Events of the last few days in Soviet Germany remove any doubts about Communist intentions there. Indeed, opponents of German rearmament have now no excuse for not recognising that the familiar arguments about prospects of agreement with the Russians are out of date. Soviet aims

remain the same but the sights have been raised; the tactics, too, have been changed because previous methods were unsuccessful. The aim is still to secure a peace treaty which would get the American forces out of Germany and an all-German Government into power that would be, in the Communist sense of the word, democratic. But priority now goes to setting up a strong, armed Soviet state east of the Elbe. The Pieck Republic is being sealed off from the West and transformed into a model people's democracy.

In this new centralised state obedient *Land* parliaments have voted themselves out of existence and set about forming local councils, directly subordinate to a central government that has been reorganised on the Soviet model. Compulsory labour service for young people has been introduced in order to provide pre-military training and free labour. Terrorism is the order of the day. Long sentences have been given to men accused of giving information to the League of Free Jurists—or merely of asking the League's advice. While an international conference of free lawyers was being held in the free end of Berlin, the broken voices of the convicted men were being broadcast from the enslaved sectors. Nothing could illustrate better how West Berlin is an island in a world of tyranny.

The more the Russians try to seal off their zone, the more intolerable to them the existence of this island becomes. Thousands of refugees are passing over to it, among them young men fleeing from conscription. Last week General Chuikov accused the Western powers in a note of breaking the agreement that ended the blockade of Berlin. This might be the prelude to a new attempt to starve the city out; but it may also be intended to warn the Americans not to stop strategic materials passing from Western Germany to the Soviet area. Russian determination to keep this trade going is shared by many Western Germans, and a new interzonal trade agreement has just been signed which calls for a fair

ADVERTISING

WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.

In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

SAMSON CLARK'S

exchange of steel products from the Ruhr against Soviet German coal supplies to West Berlin. Illegal trade has lately been greatly reduced and it would not be surprising if General Chuikov has been instructed to see to it that the Americans do not restrict the legal exchanges as well. That, at least, is the most optimistic interpretation that can be put on his note.

One Wise Man?

So persistent is Mr Churchill's reputation in matters of strategy that few questions have been asked about the assumptions underlying his speech last week on the revision of the British defence programme. Two at least suggest themselves, in view of the fact that the Atlantic allies are supposed to be carrying out a programme for the defence of Western Europe which was agreed at Lisbon in February. This programme is established in detail for 1952, in rough draft for 1953 and in outline for 1954; and it was known that its execution was falling behind schedule even before the delays in American arms deliveries and the relaxation of British and French efforts were officially admitted.

First it may be asked whether Mr Churchill's view that the danger of world war in the immediate future has receded is shared by the American, British and French chiefs of staff in the Standing Group which directs the strategy of Nato. If it is not, then there is an important conflict in intelligence and appreciation which Nato exists to resolve; and if word gets round that Mr Churchill favours a view which permits a relaxation of effort during the two or three years ahead, then all the weaker brethren of the Atlantic alliance will follow him rather than Nato, with risky consequences to Europe's readiness. Is one man wiser now than were the three wise men earlier this year?

Secondly, it may be asked whether it was necessary for the Prime Minister to be quite so disparaging in his references to Nato. He seemed to imply that in December the Atlantic Council of Foreign Ministers would be presented with the *fait accompli* of a new British programme. This must affect, among other things, the British contribution to Europe's air defences; and it is difficult to understand why the measures proposed cannot be discussed with Nato now. Everything is now laid on (as an article on page 343 points out) in the headquarters directed by Lord Ismay for continuous political and economic consultation on defence matters from which Britain has as much to gain in burden-sharing as any other member. It would be deplorable if Britain were to repeat in the Atlantic partnership the errors of behaviour that have done so much harm in the European company.

The Party and the Spy

The two Notes which the Swedish Foreign Minister handed to the Soviet ambassador in Stockholm on Tuesday both deserve attention. The first dealt with the recent Russian attacks on unarmed Swedish aircraft. It recalled with regret that the Soviet government had refused to help clear up the mystery which at first surrounded the disappearance of a Dakota passenger plane in June, and had later rejected the idea that the case should come before the International Court. The Note reserved for Sweden the right to raise the matter again at a suitable opportunity, and this is interpreted as implying an appeal to the United Nations Assembly this autumn. If Hr Uden means what he says, his country may therefore play at the next Assembly a very different role from the one it assumed at the last.

This change of atmosphere is partly accounted for by the subject of the other Note, which frankly requested that Soviet diplomats in Sweden should cease to act as spies. The Swedish government pointed out that several of these diplomats and a *Tass* correspondent had been identified, in the

Stockholm spy trial which ended last week, as having given both instructions and payment to Fritjof Enbom and his associates. In ten years of activity the Enbom ring obtained for the Russians a mass of highly important information about land defences in northern Sweden. Moreover, it organised and trained groups of Communists in the defence zones for both espionage and sabotage work in the event of a Russian invasion. But the unique feature of the case was the extent to which the Swedish Communist Party was directly involved. Six of the seven accused belonged to the party or its youth organisations; three worked for Communist newspapers, and the group held meetings in those newspapers' offices; and a Communist member of the Riksdag was identified as having promised to find an operator for a secret transmitter, and having advised Hugo Gjersvold, one of the leaders of the ring, to deny everything if questioned. No Communist party in the West has ever been so deeply compromised by a public revelation. The Swedes can be expected to show their response to these revelations in the approaching elections; but of more interest will be the reaction of those Communists in other western countries who have hitherto thought that party membership could be combined with patriotism.

Measuring Subsistence

It has long been apparent that the main purpose of the Beveridge plan for social security has not been achieved. Poverty has been greatly diminished by the absence of unemployment. But the minimum income provided by the national insurance scheme for people who cannot work or who have retired has fallen well below the amount necessary to prevent poverty, even with the increases which recently came into force.

This does not mean that these people are necessarily living in poverty. Through the Assistance Board they—and others in similar circumstances without insurance benefits—can have their income brought up to what the board considers an amount adequate to provide subsistence. But this raises the question whether the board's standard of subsistence is acceptable. If it allows for no more than the purchase of bare necessities—food, shelter, clothing and fuel—there are far more people living in poverty than are officially deemed to be. On the other hand, if more than bare necessities are included in the subsistence standard, where should the line be drawn? The purpose of PEP's latest broadsheet* is to show how widely varying poverty standards can be and to suggest ways of compiling one that could be used for fixing the level of social security payments.

Unfortunately, as the broadsheet points out, there is no prospect of the Ministry of Labour's new inquiry into family budgets being completed in time for the first quinquennial review of the national insurance scheme. There is all the more reason, therefore, for adopting PEP's suggestion of smaller inquiries into the actual spending of special groups such as the aged, people living on national assistance and so on. The results would not, of course, be a conclusive measure of the cost of genuine "subsistence." People do not spend their money as the experts and planners would like them to. They may prefer, even when living on the poverty standard, to spend more on entertainment and tobacco and less on food. Must they then, since their consumption of food is less than the amount deemed essential for health, be considered as living below the poverty margin? At present, the Assistance Board's practice seems to be to exclude unessential but conventionally accepted items of expenditure like tobacco from its subsistence standard. On the other hand, its "disregarding" of assisted people's other resources when assessing their means is generous enough for most of them to have some margin for extras. If, therefore,

* Poverty Ten Years After Beveridge. PEP, 16 Queen Anne's Gate, SW1.

EARLY IN THE 1890's, Commander Henry Bradwardine Jackson — knowing nothing of the work of Marconi — first conceived the idea that torpedo boats might announce their approach to a capital ship by the use of wireless waves. In 1895, in the torpedo-school ship 'Defiance' at Devonport, he began secret experiments on Admiralty Instructions. Before the end of the year he had succeeded in transmitting, from one end of the ship, signals of sufficient intensity to ring an electric bell in the receiving circuit at the other. After meeting Marconi, who first visited England the following summer, he went rapidly ahead with the evolution of naval wireless telegraphy, making vital contributions to the development of world communications. The tempo of modern life has certainly quickened since 1895, when Albert E. Reed first developed the production of super-calendered newsprint. In the reclaimed straw paper mill he had acquired the previous year, his first machines produced but six cwt. of paper an hour. Compare with this the six tons an hour reeled off the modern high-speed machines in the great Aylesford mills of the Reed Paper Group — their continually-expanding production including newsprint, kraft and tissue papers. For to-day the Reed Paper Group with its great resources and technical experience is one of the largest paper-making organisations in the world.

The George Inn, Penrith

LAKELAND has some of the most attractive coaching inns in the country. During the holiday season they draw many visitors to whom the romantic conception of bygone years still strongly appeals.

At home, the most convenient method whereby customers may provide for their cash requirements on holiday is to have their cheques cashed at a convenient branch or bank by arrangement. If touring, Travellers' Cheques are more convenient.

Abroad, you will find it better to take Travellers' Cheques, or Letters of Credit, issued by the Bank, encashable on demand by its correspondents throughout the world. In either case your Bank Manager will be glad to advise and assist.

a decision is taken—and there is no reason for assuming that it ought to be—to widen and raise the subsistence standard, the corollary would appear to be a stricter means test. Is this what most assisted people would prefer?

Grievance at Merthyr Tydfil

Merthyr Tydfil's unofficial coal strike, now a fortnight old, is a comparatively small affair in itself, involving 1,600 men and a daily loss of about 1,000 tons of coal. It is, however, of some importance as an example of a new type of strike; its cause is quite unconnected with the strikers' contract of employment. The issue is an increase, now suspended during negotiations, in the Merthyr Tydfil Corporation's concessionary bus fares—fares which had been frozen in 1942 and which, in spite of a Coal Board subsidy, were imposing a loss of £50,000 a year. Why the miners of Merthyr Tydfil, any more than anyone else, should be entitled to permanent insulation from the effect of rising costs (to which their own higher wages have contributed) is a question which no spokesman has tried to answer.

Such answer as could be given would probably have to be couched in terms of the miner's peculiar psychology and unique imperviousness to uncongenial fact and argument—a matter sympathetically discussed in the latest of the Acton Society's research pamphlets, "The Worker's Point of View."* Industrial relations within the coal industry and relations between the mining community and the outside world appear to be alike bedevilled, beyond what anyone had previously supposed, by suspicion and resentment and by a kind of selective credulity that they encourage. "When the miner receives information he fits it into the pattern of his existing prejudices." (So, indeed, do most people; but most people are lucky enough to have escaped circumstances as conducive as the miner's to a pattern so cast iron and so irrational.)

Fear of unemployment, hatred of authority, and a gnawing conviction of being undervalued are the three main ingredients of that pattern. The first may be quite irrelevant to the Merthyr Tydfil dispute, the second hardly less so; but the third one may reasonably suspect to be actively concerned. A privilege hitherto enjoyed by miners is being whittled away; which equals a discrimination against miners, which equals further evidence that miners are regarded as inferior. Thus a deep-rooted emotional conviction reinforces the mere economic calculus, justifying resort to that one traditional expression of resentment The Strike—though it is quite irrelevant to the concrete grievance concerned. All this is, of course, no reason for yielding to an unreasonable demand pressed by indefensible means; but it underlines the importance of finding some means of penetrating the psychological barriers behind which suspicion and resentment still destructively ferment.

London's Poor Scholars

The education committee of the London County Council has decided that it cannot afford to pay the larger grants to university students recommended by the Minister of Education in June. Most education authorities appear to be accepting the recommendations, although at the cost of giving rather fewer awards. The LCC's policy, however, is to set no limit to the number of its awards, but to give them to all who can reach the required standard. In the circumstances, the education committee finds it impossible to reconcile the increases proposed by the Minister with her earlier demand that education estimates as a whole should be reduced. Its revised estimates did not provide for increased grants of this size. The committee therefore recommends for the coming academic year a scale of increases that would cost in the

aggregate only £30,450, compared with £98,850 if it adopted the scale recommended by the Minister. It means, for example, that the LCC's maximum grants to students at Oxford and Cambridge will be worth some £20 less than state scholarships.

The scales recommended by the Minister were already too low to meet the increase in the cost of living that has taken place since 1949. The LCC's still smaller awards would therefore mean hardship for many, were it not for the practice of giving additional grants where home circumstances make them necessary, and special grants from a hardship fund of £5,000 a year established in 1950. For those authorities which make no such provision it is certainly better to reduce the number of scholars rather than to keep all in penury.

In the patchwork of the British educational system the amount of assistance that a student gets is often a matter of geography; but local authority awards are on the average worth less than state scholarships in money, and certainly in prestige. They always involve some financial assistance, but do not necessarily carry the honorarium of £30 which is paid to state scholars whatever their parents' income. In view of some misunderstanding arising from an article in *The Economist* of December 22, 1951, it should be made clear, however, that neither for state nor for county scholars is there any automatic payment of fees.

Japan and East-West Trade

Fitting Japan into the western trading community may prove to be an even more lengthy and disturbing process than were the negotiations for the Peace Treaty itself. In American eyes at least, it is urgently necessary to keep effective controls over Japanese strategic exports to the Communist sphere, especially to China. Talks on this subject have just been concluded at a conference in Washington between representatives from the United States, Britain, France, Canada and Japan. The communique they have issued is unrevealing, presumably because the Americans are highly sensitive about these export controls. But there are reports that the other participants won reluctant American agreement to include Japan in the Paris committee, an informal group that co-ordinates western policy for strategic exports to the Soviet sphere. Hitherto it has dealt only with east-west trade in Europe.

American officials are said to favour bringing Japan into a new Far East control group which would concentrate on trade in that area and would tighten the embargo against strategic goods for Communist China, whose troops are fighting the United Nations in Korea. Although the UN Assembly over a year ago passed a resolution banning strategic exports to China, goods of military importance are still getting there through loopholes.

Washington apparently fears that to include Japan in the European group would encourage deals inimical to its east-west trade policy. If the Japanese move to increase trade with China, they may be cheered on both by Europeans—for example, the Germans, who are half-hearted about their own export bans—and by countries like Britain which would welcome means of relieving Japanese pressure on their own markets in South East Asia.

If tensions of this kind are to be avoided, surely it is time for the free world to accept certain facts and to put east-west trade into perspective. Both Germany and Japan have almost restored their prewar productive capacity; they cannot be restrained from pursuing the markets and sources of supply they need to live, let alone to prosper. The Russian sphere—even if all western strategic controls were lifted—could not provide more than a fraction of the solution. There are strong indications that Soviet development is committed to industrial autarky. So far from providing the industrialised countries with supplies of raw materials, the

Russian sphere is turning into a competitive buyer. The food surpluses of the area show signs of declining. Instead of offering the industrialised nations a stable, long-term market for their manufactured goods, the Soviet intention is to import, as a transitional measure only, sufficient capital equipment to achieve industrial self-sufficiency. It would be premature to say that the same is true of China; but if Mao Tse-tung follows Stalinist orthodoxy China, too, will be anxious to pursue a similar policy.

In the short run, the policy of strategic export controls undoubtedly entails some sacrifice of markets and non-dollar supplies. But, in the long run, east-west trade will not answer the problem that faces the free world. If it is to keep Japan and Germany in its camp, some other trading outlet must be found for them. The only visible hope is to make them partners in efforts to develop the backward areas of the free world and to encourage the production of food and raw materials.

American Rights in Morocco

Last month, the judges of the International Court at The Hague heard the United States defend against French attack the extra-territorial rights in French Morocco granted in 1836 by the Sultan to President Jackson. In particular, these rights give Americans in Morocco the right to be tried before their own consular courts and forbid the application of any French Moroccan legislation to Americans without the prior consent of the United States Government. They were confirmed by the Treaty of Algeiras of 1906 and, although the other powers have renounced their capitulatory rights in Morocco, the Americans have never done so. Legally, therefore, the American case is not a bad one, but the United States can hardly be proud of its role as the last of the old capitulatory powers.

The present dispute arose out of the activities of some 37 Americans who stayed behind in Morocco when they were demobilised after the war, and took advantage of their special privileges as American citizens to conduct highly profitable export businesses. The French Government eventually decided that their activities, which included evasion of currency controls through transactions on the Tangier free market, were a threat to the economic and financial stability of the protectorate. After protracted negotiations the State Department in December, 1949, while carefully reserving American treaty rights, agreed that as part of a temporary compromise measure, Americans in Morocco should be subject to dollar import controls. The thirty-seven Americans did not take this lying down. Their efforts, and those of powerful friends in the lobbies of Congress, led to an amendment to a 1950 Appropriations Act which has since lapsed, which withheld American aid from any country with dependent territories in which American treaty rights were being violated. It was to prevent the application of this amendment that the French laid the dispute before The Hague Court in October, 1950.

Even if the Court does arrive at a satisfactory settlement, the consequences of washing publicly this piece of dirty linen will be unfortunate. Both parties are closely interested in the stability of Morocco (the United States has five big bomber bases there), and both, no doubt, had made good resolutions to stick to legal arguments; but they could not keep them. The American counsel declared that the real issue was whether the territory should be integrated in the French economy or allowed to develop freely; and the French counsel accused the United States of trying to impose its own "quasi protectorate." Both statements must have delighted the Moroccan Nationalists—and the Russians. This dispute between friends should have been settled out of court long ago.

More Crime

Hopes that the wartime increase in crime had spent itself by 1948 have not been fulfilled. The number of indictable offences known to the police dropped sharply in 1949, and the lower level was maintained in 1950. But the criminal statistics for England and Wales for 1951 (Cmd. 8616) show that this decline was only temporary. Last year, as can be seen in the accompanying chart, the total jumped up again to 524,506, nearly 2,000 higher than the 1948 total.

For the last three years the proportion of indictable offences "cleared up" has been 47 per cent, compared with 50 per cent in 1938. This is not the same thing as the number of convictions. In 1951, the number of persons found guilty at all courts of indictable offences was 132,817, of whom 117,004 were males. The chart also shows the number of male offenders in the different age groups. The methods of disposing of these offenders are of some interest. In every age group, the proportion of offenders put on probation was smaller than it was before the war. There was

consequently a much greater use of fines; but one would like to know whether the amount of the fines imposed reflected the fall in the value of money since 1938—a fine that does not hurt is of little use. More people were also sent to prison by the higher courts in 1951 compared with 1938. Of particular interest here is the proportion of youths aged 17-21 sentenced to imprisonment. The Criminal Justice Act of 1948 provides that offenders under 21 should not be sent to prison unless the court considers that no other way of dealing with them is appropriate. But the proportion of youths so sentenced by the higher courts last year was 13 per cent compared with 7 per cent in 1938.

The published criminal statistics provide only a general outline of the amount and nature of crime. Supplementary statistics, distributing the offences and offenders by police districts, are available for research workers; and, for the first time, last year's supplementary statistics include material of use in the study of recidivism.

No Room

In the past fortnight the holiday traffic has reached its height, and the queues and discomforts of last weekend should commend to many people the proposal that the Government recently turned down; the August bank holiday should be moved to the last Monday in the month, so that the weekend traffic does not coincide with the peak

* "The Worker's Point of View." No. 11. Acton Society Trust, 32 pages. 2 shillings.

period for annual holidays. As it is, the congestion threatens to get worse. In spite of the textile slump more people than ever seem to be going away for their holidays this year. During the past twelve months over 4 million workers have been granted a second week's holiday with pay, which most of them will take in July and August; and now that the allowance for foreign travel is reduced, people who would otherwise have spent all their holidays abroad are spending part of them at British resorts. The last half of July and the first half of August, moreover, is the period when the influx of foreign tourists reaches its maximum; for them the problem of finding accommodation is becoming acute.

The mass of British holiday makers do not, it is true, compete with the foreign visitor for hotel accommodation. He does not want to visit seaside resorts, nor does he stay at boarding houses and holiday camps. It is, in any case, not this type of accommodation that is most scarce. But the shortage of hotels suitable for the well-to-do visitor—especially in London and Edinburgh—is so acute that it now threatens to stop the great postwar expansion of the tourist trade. The British Travel and Holidays Association had estimated that some 750,000 foreign tourists would visit

Source: Annual Report of the British Travel and Holidays Association.

Britain this year, compared with nearly 700,000 last year; they were expected to spend, if fares paid to British companies are included, some £125 million compared with £100 million last year. These forecasts may prove to have been modest. There has been some decline in the traffic from Europe, but a big increase in the number of tourists from the United States. June brought 26,500 of them—nearly half as many again as in June of Festival year. But this rate of increase can hardly be continued. Already many foreign visitors are being turned away.

The shortage of first-class hotels is not the only reason for this. Another is that British hoteliers, with a few exceptions, remain uninterested in foreign guests, and are often unwilling even to answer letters from abroad. It is all too evident that in Coronation year many opportunities of earning foreign currency are to be thrown away.

Grimmer Fairy Tales

The German Communists have recently turned their attention to fairy tales—not, that is to say, to the modern Canterbury tales about germ warfare or the monstrous crimes of Gomulka and Slansky, but the old-fashioned sort about fairy godmothers and magic rings. There are worthy people everywhere who disapprove of offering this imaginative dream-world to children born into an age of science and reason. It might hastily be assumed that Communists would be among those who would like to preserve young minds from the influence of the fairy tale. It is, therefore, for fairy-tale addicts as pleasant as it is surprising to find Herr Oskar Hoffmann of the Office of Literature and Publishing in East

Germany declaring the idea held by some teachers that fairy tales are outmoded to be “a wrong and harmful conception hostile to culture.” But it must not be thought that the little peace fighters and totalitarian tiny tots growing up inside the Pieck Enclosure are to be allowed to learn fairy tales as they were taught to their parents. The *Kinderbuchverlag*, with the skilled assistance of Professor Hans Siebert, has published a new edition of Grimm's Fairy Tales, “not in the old form, but with critical editing and selection.”

Children, of course, must be edified as well as entertained, and what may pass unrebuked in a bourgeois society cannot be permitted in a country that is building socialism. The good Professor Siebert is determined to protect them. The little ones may be led into a Right-nationalist deviation by a kindergarten game; they may contract cosmopolitanism from a nursery rhyme; Titoism may lurk in a top. But children can learn from fairy tale heroes and heroines, according to the Professor, to “respect the value of human labour, overcome difficulties, be courageous, and fight and make sacrifices for a good cause.”

Unfortunately many of the old tales are far from suitable for this purpose. There is often a deplorable attitude towards the virtues of hard work. Not only do fairy tale characters wander about in the most anti-social way without party directives or official permits; they succeed by luck, magic, supernatural assistance, cunning or by almost any means but working at a job. To correct this tendency, Professor Siebert makes a fairy tale in which a family gets its food with the aid of a magic table end with their returning to their trades and “working better than ever before.” No doubt Cinderella, too, will now have to go back to her kitchen and “fulfil her norm.”

Penalising Smokers?

Amongst some of our correspondents, and perhaps generally, there prevails an opinion, that because a habit is unpleasant or injurious, like smoking tobacco, that it is proper to subject it to taxation. Of course, they believe that the tax will prevent the formation of the unpleasant habit. Tobacco, however, is enormously taxed here and in almost every European country, and the tax certainly does not impede, if it do not promote, the habit. Everybody now almost is a smoker. The cigar meets you on the steam-ship and in the public streets; fumes of tobacco are puffed into your face as you walk and as you ride. You encounter it in parlours and gardens, in shops and in libraries, in coffee-houses, and public carriages. There is scarcely a place sacred from its invasion. We know no more offensive habit for those who, like ourselves, are not smokers than the present almost universal practice of smoking, which has certainly not been checked by the exorbitant duties imposed on tobacco. A correspondent who advocates the high duties admits that the prohibition to do a thing induces the desire to do it. If of itself it have certain soothing charms, like smoking tobacco or inhaling the fumes of opium, the prohibition is, in fact, a declaration by the highest authority that the recreation is very delightful, since it is necessary to counteract it by high duties; and thus the *quasi* prohibition, we know from the history of opium-eaters in China as well as tobacco-smokers in all Europe, really stimulates the habit it is intended to repress. It is by no means the only example to be found in history of hasty, passionate legislators failing, even more than other men, to accomplish their designs. . . . It is very unwise . . . to bring taxation, without which the State cannot exist, into disrepute by using it to punish some of our fellow-creatures for what we do not approve of, and thus making it a portion of the penal code.

Letters to the Editor

When Russians Bring Gifts

Sir,—The article in your issue of July 26th contained this sentence: "A drop in tension, less spent on rearmament, more trade with the East—these are all things to be welcomed." Such words invite a few reflections.

Most thinking people have now a fairly good impression of the reliability and the morality of the men in the Kremlin. They know how the Communist fifth column works in friendly countries while the official representatives of the Soviet Union pay lip service to the "peaceful co-existence" of the East and the West. With this in mind, is it wise of the West to hope for "a drop in tension" which can hardly be more than apparent? And is it really advisable for the Western powers to restrict rearmament in the belief that these quite amoral people in the Kremlin have suddenly changed character?

It is a fact that there is opposition to the regime within the Soviet Union. Broadcasts from the West are a contribution to this opposition; a ban on all trade with the East would be far more efficient. Admittedly, the West itself would suffer by such a restriction, but absence of trade and the lack of certain commodities may well accelerate the stagnation of the Soviet economy which, being socialist, is bureaucratic and inefficient anyway. Disintegration from within is the likely end of the Soviet Union, and the sooner this totalitarian regime disappears, the better for the peace and the prosperity of the world. Let us therefore hope that the tyrants in the Kremlin will get no further commercial support from the West. The West should look farther ahead than to its immediate advantage.—Yours faithfully,
M. MADSEN

Bergen, Norway

Jews Behind the Curtain

Sir,—An article in your issue of June 21st fails to give a single fact in support of the statement that "Jews once more find themselves a discredited and even threatened minority."

Where is there discrimination? Perhaps among the 20 per cent of Stalin prize winners, who are Jews? Is there discrimination, for example, in the editorial board of the Diplomatic Dictionary published by the Soviet Foreign Office? Out of the eleven members of the editorial board four are Jews and nearly half the contributors are Jews. One needs only to look through the file of the recent issues of the *Voprosi Ekonomiki*, the leading Soviet economic journal to see the high number of Jewish contributors. The same applies to Soviet literature, to *Voprosi Istori*, *Pravda* and *Izvestia*. Criticism of the Israeli Government has nothing whatsoever to do with criticism of Jews. The Soviet Government and Communist Party have always

maintained a critical attitude to the Zionist movement and particularly to its Right-Wing leadership. Whether certain Jews wish to emigrate from Russia to Israel no one knows, except your correspondent.

With regard to Yiddish publications in Russia the facts are plain. As a result of the war the former compact Jewish communities in the Western parts of the Soviet Union have largely disappeared; many Jews have migrated into the interior of the Soviet Union and the more they become integrated in the economic life of the country the less they had recourse to Yiddish as a language. A similar process is taking place in Britain and America, and last year the only Yiddish daily paper in Britain, the *Jewish Times*, ceased publication for lack of support.

It seems that, at the moment, in the campaign of the West against the Soviet Union anything is justified even if the statements made are founded on fiction or plain nonsense.—Yours faithfully,
CHIMEN ABRAMSKY

London, N.6

Federation Moves On

Sir,—The logic of the argument of your correspondent, Mr Bell, in your issue of July 19th—that ultimately "members of both races will be found performing all the various economic functions proper to a modern society"—will not be questioned by men of good will. He is wrong, however, to suggest that those who advocate federation and racial partnership are opposed to the objective of equal opportunity between Africans and Europeans. This objective is implicit in the term "partnership" as defined by the Prime Minister of Southern Rhodesia and by the Governor of Northern Rhodesia as well as other Central African leaders. Certainly the test must be skill and mental capacity and not race or colour, and Mr Bell will no doubt agree that the benefit derived from any partnership must bear some relation to the contribution put into it.

In the recent debate in the Northern Rhodesia Legislative Council on the draft federal scheme Mr Welensky reaffirmed his belief in Cecil Rhodes's dictum of equal rights for civilised people, and declared that the aim of his country must be "to produce a system . . . which will permit both races to live and contribute to the development of this country. That system has to recognise the aspirations of both races."

Far from restricting opportunities for Africans increased immigration of Europeans should provide even greater scope for them, for it is a vital necessity for the continued development of British Central Africa.—Yours faithfully,
J. P. McDONAGH

London, S.W.19

Sir,—The boggy of Colonial Office control is one of great moment to all thinking Rhodesians. The White Paper

carefully leaves the identity of the Secretary of State open. You state that this means: "the Secretary of State for Commonwealth Relations acting in consultation with the Secretary of State for the Colonies." Sir Godfrey Huggins tells us that it is the Secretary of State for Commonwealth Relations. If so, why avoid the issue in the White Paper? Thus is the present air of secrecy and suspicion perpetuated. Unless the matter is cleared up by an official announcement at an early date it will become increasingly difficult to organise European opinion in favour of closer association, and the proposals may well be defeated when the referendum is held.

One other matter. Many are perturbed at the almost universal opposition to the proposals among Africans. Instead of trying to steamroller federation through in spite of this, it is surely far better to meet it, and intimate forthwith that it is Government policy, in both Rhodesias, to implement the findings of the Dalglish Commission and permit Africans to advance in industry. At this stage only a few could take advantage of such a gesture. It is all very well to pay lip-service to educational as opposed to colour standards. Nevertheless it is sheer hypocrisy to aver such an attitude, and ignore the Dalglish Commission's findings.—Yours faithfully,
J. G. PAIN

Bulawayo

Transport Travesty

Sir,—The most controversial measure introduced in this session of Parliament has undoubtedly been that dealing with the denationalisation of road transport. You regard the Bill as "virtually devoid of principles." Yet unless the unions concerned resort to "industrial action," it appears unlikely that the Government will be disposed to think again. Surely the country's biggest industry deserves further exploration of alternative measures which would pay due regard to the economic issues and also appeal to moderate opinion in both parties.

Serious consideration should be given to the possibility of separating the function of ownership of vehicles, etc., from that of their operation. The Road Haulage Executive or an entirely new organisation could under such a system retain the ownership of depots and vehicles which would be leased on a time basis to private operators. At the same time, existing depots could perform the function of freight exchanges or clearing houses for road transport, thus obtaining as many return loads as possible.

This system would combine the advantages of a large- and small-scale organisation. The raising of new capital and the standardisation of plant are best left in the hands of a large organisation whereas the comparatively small operator is better able to cater for the individual needs of road transport users.—Yours faithfully,
S. A. SUMMERFIELD
