ACCORDING to orthodox election theory, middle western farmers vote Republican when they are prosperous, Democratic when they are worried. The truth of the theory is tested every four years, but this year the prophets hesitate to interpret it in practical terms of votes, not only because it led them seriously astray in 1948, when the middle western farm states surprisingly supported Mr Truman, but also because this year farmers are both worried and prosperous at the same time.

This has been a good year for them. Production of both crops and livestock has been greater than ever before and demand will almost certainly be maintained during the

coming season. Farm prices have admittedly fallen a little since midsummer. The price of wheat, at its seasonal low, has dropped nearly to the level at which the government is obliged to support it, and maize, with a record-breaking crop in prospect, may fall below this level at the height of the harvest. Beef prices are down a little, as a four-year build-up of stock nears its peak; the annual count next January is expected to show a rise of six to seven million head in beef cattle. The related price of hogs is down even more noticeably. Nevertheless, on the whole prices are above parity, the level at which they are supposed to ensure the farmer a fair return in terms of what he must buy, and cash income from farm marketings is expected to be a little higher in 1952 than in 1951.

At the same time, however, the farmer's costs are rising. Prices received by farmers for the things they sell were off three points on the index in mid-September compared with a year earlier and prices paid for the things they need were

up two points. The rise was not in the commodity part of the index; it came from increases in tax and interest rates and in wages paid to hired help. The last index was up by 6½ per cent and the 2 per cent rise in interest rates reminded farmers that their mortgage indebtedness has been growing these last two years in a way that recalls the short-lived joy-ride of 1920. As a result farmers feel squeezed; moreover, they foresee something more painful than a squeeze before long. Demand for their products is high because of the prosperity engendered by heavy defence expenditures. When these level off, or begin to drop, as is planned for the second half of 1953, farm prices are likely to take their historic place as leaders of the economic down-swing. And when the agricultural boom recedes, the mountains of costs accumulated in the postwar years will be uncovered.

So, because present prosperity is not an election issue, and because agricultural policy can only provide a partial answer to worries about future swings in demand, the farm programmes of the two parties will probably not influence the farmers so much as some other factors, when they go to the polls in ten days' time. In any case, the difference between the position of the two candidates is not very marked. At the National Ploughing Contest at Kasson, Minnesota, early in September, both Governor Stevenson

and General Eisenhower, as one farmer put it, "promised Heaven with a white fence around it." Mr Stevenson announced that he favoured price supports at 90 per cent of parity, the level now on the books. So did General Eisenhower. However, contrary to the impression given by the press, the General did not actually advocate a farm programme providing for 100 per cent of parity. He only said:

All I know of farmers convinces me that they would rather earn their fair share than have it as a government hand-out. And a fair share is not merely 90 per cent of parity—it is full parity.

Since then Governor Stevenson has not gone much further, though he devoted considerable space to farm objectives in his San Francisco speech and has declared his opposition to the controversial Brannan Plan, originally devised by Mr Truman's Secretary of Agriculture as a way of supporting the prices of perishable commodities. General Eisenhower, meanwhile, has been caught between the factional differences in the Republican party. His Kasson speech, supporting the present farm programme, represents the influence of Republicans like Representative Clifford Hope, of Kansas. He was responsible for that part of the Hope-Aiken Act of 1949 which provided for the continuation of the existing system of farm price supports for a period, now extended to 1954, before the application of the Aiken part of the Act, which inaugurated a new method of calculating parity and provided for flexible rather than rigid price supports.

As soon as the Kasson speech was given, the agricultural pressures that are behind the Aiken position were applied to the General. Chief among these was that exerted by the American Farm Bureau Federation, which has persistently and consistently advocated flexible price supports. Another influence was Mr Milton Eisenhower, the General's brother, whom he regards as the brains of the family and who is president of Pennsylvania's State Agricultural College. General Eisenhower's speech at Memphis, Tennessee, was the result. Introduced by the Farm Bureau's past president, Mr Ed O'Neal, the General reaffirmed his support of the present law for the two years it had to run. But, after noting that "the mandatory price support of 90 per cent of parity will expire at the end of 1954" which "means that we have just two years—beginning next January—to plan ahead," he inferred he was for something different thereafter, and proposed a bipartisan commission to canvass possibilities.

General Eisenhower is perhaps afraid that if farmers base their choice on specifically agricultural questions they will be guided by memories of what Democratic Administrations have done for them and of what they suffered under the last Republican Administration. Certainly he has constantly emphasised the bipartisan character of recent farm policy and in his wooing of the midwestern farm vote, which has been more concentrated than has that of Governor Stevenson, he has made the Korean conflict the main issue. Farmers resent this war even more than do other groups in the population, because conscription has taken boys away from the land where labour is now permanently scarce, and where the absence of a man is felt much more acutely than in a factory.

The Korean war will certainly be one of the farmers' chief considerations should they vote this year, as seems likely, not on the particular issues that concern them as agricultural producers, but on the general ones that concern them as citizens. Other general issues will be "the mess in Washington," Communism in government, big bureaucracy, federal expenditure and deficits and so perhaps back to the special issue of prices again. And on this basis, as far as can be judged in mid-October—and it must be remembered that farmers are always extremely reticent about their voting intentions—it looks as though the advantage lies with General Eisenhower, not only in those midwestern farm states, such as Kansas and Nebraska, that are always considered safely Republican, but in others, such as Iowa and Minnesota, that were so unexpectedly Democratic in 1948.

American Notes

Strike Against Stabilisation

Mr John L. Lewis has always refused to recognise the government's right to interfere in negotiations between himself and the coal companies. The official reason why his 350,000 miners have stayed away from work this week, without any direct instructions from Mr Lewis, is that they are protesting against the companies' refusal to pay the full \$1.90 a day increase in wages which was agreed in September, rather than against the decision of the Wage Stabilisation Board which made the companies liable to penalties should they pay more than \$1.50. But no one doubts that this is in reality an attempt by Mr Lewis himself to destroy the whole policy of economic stabilisation in order to demonstrate his own power and independence.

The coal case was the first major test of the new board, which was reconstituted by Congress after its predecessor had capitulated to the steel workers. Another capitulation had been forecast and the labour members of the twelve-man board were indeed prepared to give Mr Lewis all he asked. However, the industry and public members insisted that

a wage stabilisation programme under which an excuse was found for approving every increase requested by a powerful group would be a fraud.

They refused to go above the 18 cents an hour which they found to be justified by the rise in the cost of living and by the board's duty to maintain a fair relationship between coal wages and those in other industries. This would bring the basic daily wage in the mines to \$17.85 instead of the \$18.25 which had been agreed between Mr Lewis and the coal owners.

The decision was as unexpected as it was courageous, since the board might have sheltered behind the excuse that the rest of the anti-inflation programme was already mori-

bund. The announcement was delayed, whether by luck or good management, until after Mr Lewis had endorsed Governor Stevenson for the Presidency, the first time this life-long Republican has supported a Democrat since 1936. It remains to be seen whether Mr Lewis will now change his mind; his miners, more independent in political than in economic matters, have usually voted Democratic, but their decisions this year are likely to be influenced by their feeling that the government has forced them to strike. President Truman, however, can hardly interfere in the dispute on the miners' behalf without making a laughing stock of his contention that the Republicans are to blame for weakening the controls on inflation. With plentiful stocks of coal above ground, it will be the end of the year, with the election well over, before the effects of the strike become serious and there is no urgency about a settlement. When one does come, it may save the faces of both Mr Lewis and the board, by providing the disputed 40 cents a day in the form not of higher wages but of "fringe" benefits, such as holiday pay and increased night shift differentials, in which the miners have lagged behind some other industries.

Campaigners Go East

This week, the penultimate of the election campaign, both presidential candidates, and General Eisenhower's "other opponent," President Truman, have come to the east coast. The General has followed the President into New England, while the President has been touring Pennsylvania, and Governor Stevenson is in New York, where Governor Dewey is at last taking an active part in the campaign on the General's behalf. These are the heavily populated industrial areas where electoral votes are most thickly concentrated. So are the racial and religious minorities, the Poles and Italians, the Jews and the Negroes, who can decide the vote of a closely contested state. This was therefore naturally the moment chosen by Mr Truman, who has never shown any signs of squeamishness in this campaign, to suggest that General Eisenhower is anti-Semitic and anti-Catholic and has identified himself with the "master race" idea, from which he freed Europe, by embracing such Republican Senators as Mr Nixon and Mr Jenner, who had voted for the McCarran Immigration Act. This Act, sponsored by a Democrat, although one whom Mr Truman repudiates, perpetuated the discrimination, first authorised by a Republican Congress in 1924, against immigrants from southern and eastern Europe in favour of those from the Anglo-Saxon countries.

As Mr Truman's accusation was released, the General was making a declaration of faith in a liberal immigration policy, and a promise to seek revision of the McCarran Act, in terms as inspiring as those in Mr Truman's original veto of the Bill. It seems as if Mr Truman, in this attack on a man so closely associated in the public mind with the liberation of Europe's oppressed peoples, has perhaps gone beyond the limits not only of good taste but of political advantage. That the Republicans are by no means sure that this is so is, however, shown by their hasty efforts to secure testimonials for General Eisenhower from such prominent Jewish leaders as Rabbi Silver and Mr Bernard Baruch. Mr Truman himself maintains that the press distorted his remarks.

Whether or not the Republicans are the party of Nordic supremacy in the eastern cities, there is no doubt that the Democrats in the South are the party of white supremacy. These words actually appeared on the Democratic ballot in Alabama on which Mr Sparkman, now the Democratic vice-presidential candidate, was elected to the Senate, and the Republicans are using this evidence against him to the full in their final assault on the vital Negro vote. But General Eisenhower touched the same pitch when he accepted the support of Governor Byrnes of South Carolina, a firm believer in Negro segregation. And the most sensational desertion

to the opposite camp this week was the General's loss, not his gain. Senator Morse of Oregon, one of his earliest supporters in the Republican party but always something of a lone liberal ranger, has decided to vote for Governor Stevenson, in disgust at the General's "surrender" to the Republican "reactionaries."

Trouble Ahead for Traders

The decline in American exports, which has now persisted long enough to indicate a trend, is causing serious concern. Exports in June, July and August were below the average for the earlier part of the year, below comparable months of 1951, and well below the 1951 average. If it were not for military aid shipments, which have been 31 per cent higher for the first eight months of 1952 than for the same period of 1951, the export total for the entire eight months reported this year would be lower than for the comparable time in 1951. Slower sales are particularly noticeable in farm commodities, textiles and machinery, all of which find an important part of their market abroad.

American imports, however, have suffered an even sharper drop, as the rest of the world knows only too well. From January to August other nations sold \$732 million less to the United States than they did in the same period last

Source: US Department of Commerce.

can get along without them if it must, an indifference that particularly affects Europe.

American purchases from Europe now represent only 18 per cent of US imports compared to the prewar figure of 30 per cent. This illustrates the shift in America's trade from Europe to the western hemisphere, which is also seen in US exports to Europe; they fell from 45 per cent of all exports before the war to 30 per cent last year. On the other hand, imports from North and South America have risen from a prewar average of 38 per cent to a postwar figure of 57 per cent of the total. The rise in US sales to these countries, from 35 per cent to 46 per cent of all exports, although smaller, still gives a favourable balance to the United States because of the greater value of its total exports. While the United States is financing the Canadian and Latin American deficit by private investments in primary production, financing Europe's deficit with the United States through foreign aid programmes may well be reduced still further, if not halted altogether, by the new Congress. Should this happen, the consequent losses of sales by farmers and by armament and machinery manufacturers in America may bring pressure from these special interests for reductions in American tariffs and other import restrictions. They will probably try to show their countrymen the urgency of enabling Europe to earn more dollars so that it can continue to buy from American farms and factories.

Money Talks Politics

It may set an unhealthy precedent for political candidates to have to reveal their private resources, as General Eisenhower has, rather grudgingly, after Governor Stevenson's implicit challenge. But there is wide agreement that it would be healthy to have much more publicity about the money that is spent on campaigning. The limits of \$3 million for a national committee and \$25,000 for a Senatorial candidate set in 1939 by Congress have long been ludicrously inadequate and are openly, and legally, disregarded by both major parties. Candidates, however virtuous, find they have to turn a blind eye to money spent in their behalf. Senator Douglas estimates, for example, that \$200,000 is needed to conduct a Senate campaign in a big state, and the total spent this year on all the campaigns may run as high as \$80 million. Nothing like this will be reported, however. In 1944, spending of \$20 million was reported, but the actual total is believed to have been twice that. Television, which costs \$30,000 or more for a good half hour, is partly responsible for the higher price of a political career, but the cost of travel, literature, even confetti, and everything else has risen too. Much more is commonly spent on a contest for a seat than the victor can ever hope to receive in salary, and it is hard to refuse contributions from questionable or interested sources.

This year the Democrats are having to make a virtue of necessity. They never can rely on as many big contributors as the Republicans can, and Governor Stevenson's high-mindedness has discouraged the professional touch in party finance. Mr Beardsley Ruml, the fertile originator of the "pay as you earn" tax scheme, has come to the rescue with a plan for a million \$5 contributions, an amount which, it is considered, will make the giver feel he has a stake in a Stevenson victory, but is not so large as to make him think twice. Each contributor will receive a certificate, with a graceful word of thanks from Governor Stevenson printed on the back, and the assurance that \$3 will go directly to the national Stevenson-Sparkman campaign. The rest goes to local war chests.

The immediate aim is to keep Governor Stevenson on the air and the television screens, where he is so effective, and where he needs to be kept if he is to become as well known as General Eisenhower. The Democrats complain that poverty has brought them "within an eyelash of having to cancel some of the Governor's broadcasts." Their anxiety has been increased by news of a Republican plan for a television and radio blitz in the last fortnight of the campaign in twelve of the doubtful states. General Eisenhower made a number of two-minute films and recordings some time ago. The head of "Volunteers for Stevenson" got no satisfaction from the Federal Communications Commission when he protested that this "circumvents the principle of equal television and radio time for rival candidates." The FCC would interfere only if Democratic money was turned down. But the complaint that the advertising agencies are being called in to sell the Republican candidate "like soap or bubble-gum" may moderate the Republicans' enthusiasm for swamping the air waves. If they do, the question of how loudly money should talk in politics may have to be answered after the election.

Before the Supreme Court

With the exception of the steel seizure case, which set a constitutional limitation upon the President's powers, the Supreme Court last year managed to avoid any profoundly controversial issues. Most of the cases which the Court has agreed so far to review this year—it normally turns down about three-quarters of those filed—are equally unlikely to become *causes célèbres*. They are varied enough, however, to preserve the nine Justices from boredom.

The Court will rule, for example, on feather-bedding; whether it is legal, under the Taft-Hartley Act, for printers to insist on setting advertisements in "bogus type," type, that is, that will never be used because the advertisers send matrices prepared elsewhere to the newspapers. About 5 per cent of printers' time is spent "setting bogus." Similarly, may the Musicians' Union force a theatre to hire a local band, which will never take its instruments out of their cases, when a better-known one is engaged? The Court will hear contentions that, when a company gives seniority credit to all its workers for time spent in the services, it discriminates against ex-servicemen who worked for it before they joined up. Discrimination of another kind is involved in the argument of the Federal Trade Commission that a buyer is responsible for making certain that any discounts he may manage to secure are not unfair to other buyers. A more colourful case, with a broader sweep, is Arizona's old complaint that thirsty and growing California is soaking up more than its fair share of the life-giving waters of the Colorado River.

But the decision that may well prove a landmark will come on three cases concerning segregation in the southern schools. One, involving South Carolina, was sent back to the lower court at the last session, though two justices protested that any new information would be irrelevant; at least this manoeuvre gained time and postponed an explosive issue until after the election. Indeed, hearings are not scheduled to begin until December, and the decision probably will not come until next spring. The question is whether segregation, of itself, involves a denial of the "equal protection under the law" guaranteed to everyone under the Fourteenth Amendment of the Constitution. For many years the doctrine has been that facilities for the two races might be separate, but they must be equal.

Segregation is enforced in the schools of seventeen states, although in 1950 the Court ordered Negroes to be admitted to university courses. In the three present cases, involving schools in Kansas, South Carolina, and Virginia, the Court may find some way of postponing a decision on the constitutionality of the "separate but equal" theory. A finding that segregation is unconstitutional would apply, at first, only to the school systems concerned, though eventually it would affect all southern states. But South Carolina's Governor is Mr Byrnes who, with Governor Talmadge of Georgia, has announced that he will turn all the schools over to private groups rather than mix white and Negro children. Similar tactics failed when the Supreme Court ruled that Negroes must be allowed to vote in party elections. But this is a much more emotional issue.

Shorter Notes

Five major oil companies which are the subjects of a special grand jury investigation into their alleged international cartel practices will probably go to the Supreme Court in an effort to have the case transferred from Washington, D.C., to New York. A lower court has already rejected their appeal, which was based on the fact that 14 of the 23 members of the jury are government employees; the oil firms maintain that this constitutes a "packed jury" already biased in favour of the government.

Gardeners in America are no longer to be told that chemical soil conditioners will do most of their work for them, for the Federal Trade Commission has begun a campaign to halt the "false and misleading" advertising used by some of these firms. A formal complaint has been made against the makers of "Fluffium" for such "gross exaggerations" as saying that one gallon of their product will condition as much soil as 15 bales of peat moss for one-eighth the cost, and that the gardener has only to spray the mixture on his soil once for conditioning that will last indefinitely.

THE WORLD OVERSEAS

"The Europe of Charlemagne"?

(From Our Paris Correspondent)

LAST week-end the treaty for a European Defence Community was hauled out of the boat-house and pushed gingerly down the slips into the turbulent lake of French politics. Nobody at all broke a champagne bottle on it and the splash made by the boat when it hit the water for a moment looked big enough to swamp it. But these first reactions must be interpreted with some caution. For by Wednesday M. Pinay had weathered the crisis; his Radical and right-wing Ministers were prevented from jumping overboard and M. Schuman is still punting steadily ahead.

It was M. Edouard Herriot, President of the National Assembly, who addressed his fellow Radicals at Bordeaux with the first lapidary words: "The treaty contravenes the French constitution since it entails an abandonment of national sovereignty without reciprocity. Certain advantages accrue to Germany, but none to France." Since M. Vincent Auriol had already signed the EDC treaty on behalf of the French Republic, M. Herriot's remarks were rather startling. They referred to the preamble of the 1946 constitution which runs: "On condition of reciprocity France agrees to such limitations of sovereignty as may be necessary for the organisation and defence of peace. . . ." (Apart from the question of German reciprocity opponents of the treaty urge that the clauses whereunder the European Defence Commission appoints generals of higher than divisional rank and the EDC's Assembly may increase or reduce budgetary expenditure and receipts are exorbitantly at variance with the French constitution.)

Sour Grapes and Spilt Milk

But the octogenarian Radical did not limit himself to legal criticisms. He viewed the whole prospect of German rearmament with horror—all the more so, he said, because Great Britain had no place in the undertaking. M. Edouard Daladier, who has something less than the dignity of M. Herriot, took pleasure in squeezing a good many sour grapes over the spilt milk:

We are turning the Potsdam agreement upside down and, as a start, we give Germany back its army and armament. Because we are afraid of Russia we are rebuilding the Europe of Charlemagne. But Russia is merely applying the Potsdam and Yalta agreements and it was nobody but the architects of those treaties who placed Russia a few hundred kilometres from our frontiers and a few score kilometres from German key-positions.

After the orations had died down it was the turn of the younger generation; of MM. René Mayer, a seasoned European "integrationist," and Edgar Faure, who is something of a dark horse in foreign policy. Both men disagreed with their senior colleagues and as Ministers naturally accepted the treaty as it had been negotiated. M. Mayer said, however, that ratification should not be attempted before the United States had a new President and the Saar a new statute satisfactory to both France and Germany. M. Faure, for his part, set two conditions external to the treaty. France must no longer fight alone in Indochina and the European Army should be covered by a European political authority.

Meanwhile the UDSR (a small, modernised Radical party) was holding its congress at Clermont-Ferrand. The Minister of Defence, who is a sound but unexhilarating

speaker, reaffirmed his conviction not only that there must be an EDC, but that France must be its pioneer and the pioneer of the European political authority. M. Paul Reynaud also supported the EDC from outside the government. "We must take care lest the German tree blinds us to the Russian wood." This sentiment was a far cry from MM. Herriot and Daladier.

While Radicals and UDSR were deliberating, M. Pinay was at his home town, Saint Chamond. During a small ceremony at which the Prime Minister was pinning medals on some nuns, a journalist asked him his views on the European Army. In a message which ran through France like wildfire, M. Pinay was misreported as saying something to the effect that it would be all right if there were no Germans anywhere near its General Staff. This misrepresentation naturally thickened the pall of anxiety.

The general impression of the debate is simply one of prematurity. Somebody said in Paris a month ago: "Every official says the EDC will be ratified, but find me a deputy who sees himself voting for it!" The remark still holds. The time is by no means ripe for the Assembly to debate the treaty. Early next year things may be quite different. The Saar dispute may have subsided: the President of the United States may have clarified French prospects in Indochina and North Africa. There are indeed several distinct snags to the EDC in the minds of many Frenchmen. Most of the politicians—except the Communists and a few others who believe implicitly in Soviet non-aggression—recognise the need for a German defence contribution in men and money during the next two or three years. But they are most unwilling that the EDC—for them the sole acceptable mode of German rearmament—should start off in circumstances highly unfavourable to France. About 150,000 French Union (non-Vietnamese) troops are engaged in the East until further notice, including a large fraction of French NCOs. The Indochinese diversion drastically reduces France's European availabilities. So, potentially, does the steadily deteriorating situation in North Africa.

Doubts about Germany

Can the United States, and to a lesser extent Great Britain, by an act of high policy in these areas take some of the pressure off France and so increase the French military forces and financial resources available in Europe? At present the drain is increasing in spite of American aid. At the same time many Frenchmen feel doubts about the future behaviour of a Germany entirely out of allied control, vaguely encouraged by the United States, divided and crammed with displaced persons. They are therefore reluctant to hasten rearmament, which under the Treaties of Germany, is to be synchronised with the end of the occupation: or rather, they feel that France should somehow be rewarded for permitting the handcuffs to be unlocked. All seem agreed that the reward should be confirmation of French pre-eminence in the Western Mediterranean; for without the African link France is not only no longer a world power but not even complete as a European country. No other country in Europe controls quasi-metropolitan areas comparable to Morocco, Algeria and Tunisia.

So much for considerations of power extraneous to the treaty

proper. But there are also points of internal structure which French politicians find worrying. The articles in the treaty which are causing most concern are 12 and 13. Article 12 allows the immediate detachment of European forces from the European army to quell disorders within a member's own state. Article 13, on the other hand, postulates that a withdrawal for use overseas must be specifically sanctioned by the EDC command. The French, with their North African and Indochinese worries, feel that this puts them at a marked disadvantage. But a similar objection could be raised against Nato and whereas France can maintain an army outside Europe, Germany is prevented from doing so by the contractual agreements with the allied powers. To the French rejoinder, based on Article 11, that Germany can build up a militia at home, it should be pointed out that any credits voted for such a purpose in the Bundestag would be public and subject to foreign scrutiny. The French are also worried about the weighted voting system within the Ministers' Council of EDC, but other Germans have declared themselves willing to agree that their own and French voting power should always be equal irrespective of financial contributions to the common budget.

Finally, in the field of pure national feeling and in detachment from questions of Germany and Russia, there is a real repugnance against liquidating the French army. This current of feeling—particularly strong in the *Rassemblement* of General de Gaulle but extending also far over to the Left—is not much affected by the fact of present French military weakness. One might rather say that French military patriotism is even made the keener by it, so that the one desire of many is to revive the ancient institution of the French army; it is, after all, the oldest army in Europe and its virtual absence is in French eyes quite abnormal. Against the old die-hard nationalist military conception, one political party, the "Integrationist" M.R.P. is pitting the ideal of a European force to be forged by the French. Several generals, especially Général de Larminat, head of the French military delegation at the EDC negotiations, fully support the pioneering Plevin plan against "le képi." It is worth noting, moreover, that the Socialists, however anti-German, did not attack EDC, and seem reconciled to it as a lesser evil. There is little doubt that, all things considered, the European army is the road to salvation. But it is probable that French hearts and heads will speak against it for a while longer until events justify the whole conception further and until perhaps certain changes have been made in the treaty itself. Last Sunday's hearty expostulations were, indeed, not nearly so unpromising as they looked.

Declining World Production

If Stalin is fully briefed on United Nations statistics, he must be rubbing his hands with glee, because the latest data for the April-June period of this year show world industrial output falling for the second successive quarter. The trend is so general throughout the free world, that observers must undoubtedly begin to wonder whether the long awaited post-war recession has not already begun. The decline in production, moreover, has occurred at a time when most countries are engaged on rearmament and when domestic inflation is still a major issue for many of them. Admittedly the defence programmes have been retarded or stretched out, but these decisions are more likely to affect output in the second half of the year than in the first.

The decline in world production (excluding the Soviet Union) was almost three per cent during the first six months of this year. In Western Europe it amounted to almost four per cent and the rate of decline tended to increase in the second quarter. In Britain industrial production continued to rise in the first three months and then fell quite suddenly by eight per cent between March and June. American peak output was reached in the second quarter of 1951 but the

decline in the second half of that year, apart from seasonal movements, was modest. This year output has continued to fall and at a more rapid rate; between April and June it was some four per cent smaller than in the last quarter of 1951. The countries least affected are the "inner six"—the members of the European coal and steel community. Their industrial production in the second quarter of this year showed a slight rise on the first three months, but it was still one per cent below the peak of the last quarter of 1951 and the monthly figures suggest that the declining trend is continuing even for this group.

The data for the Communist world are not reliable. It would, however, seem from United Nations statistics that production in these countries is either being maintained or declining at a less rapid rate than that of the free world. This would not be surprising, for in a fully controlled economy there is no reason for production to decline so long as the supply of raw materials is adequate.

But statistics cannot be taken at their face value. They show what has happened without indicating the causes. And it is the causes that are important in any discussion about the possibility of a world wide slump. An accurate analysis would require a division in the figures between goods produced on government account and goods produced for the civilian sector. Unfortunately such a division is not available. But from a knowledge of what has happened over the

past eighteen months it would seem that between June, 1951, and June, 1952, defence production was more or less maintained or declined slightly, while civilian output fell quite sharply. The decline in retail sales after the first quarter of last year occurred in both Europe and the United States. In the nine months following the outbreak of hostilities in Korea, people rushed to the shops and built up private stocks, and they were able to live on those stocks during the following twelve months. It is only recently that retail sales have again started to recover.

If this analysis is correct it would seem that during the second half of 1952, civilian production should expand once more while defence production declines or at least does not increase—in which case total industrial output might not show any marked recovery during the current six months period.* Output in the third quarter is always seasonally low because of the annual holidays, so that the testing period will be the last three months of this year. If output then is still falling at an appreciable rate, those who forecast an imminent slump might well be proved correct.

At the present time it would be fair to say that the world is in a state of precarious balance. That, indeed, is an achievement after the tremendous disturbance created by the Korean commodity bubble. But the vital question is which way will it swing? And here the United States will play a dominant role. If it is true that America is entering another phase of modest inflation, the world economy might be kept on an even keel for the next nine or twelve months. But as soon as the rate of American government expenditure and of American domestic investment declines—and it seems almost bound to in the second half of next year—the precarious balance is likely to be converted into a downturn. For Europe even a "prosperous recession" in the United States could spell trouble, as 1949 showed only too vividly.

100,000 MILKER PAILS by WARWICK

The large-scale introduction of strong, light hygienic aluminium to the food industries has been the main preoccupation of the WARWICK PRODUCTION COMPANY since 1945. One hundred thousand milker pails for the dairy industry is a typical effort.

ENTERPRISE IN ALUMINIUM

Warwick Production Co. Ltd., of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP: a sister company to SMD Engineers of Slough, who recently built the Aluminium Structure of the Dome of Discovery and the world's first All-Aluminium Aircraft Hangars at London Airport.

To Business men only

KEEP your business eye peeled for this poster and ask your secretary to get you tickets now for the Business Efficiency Exhibition, Kelvin Hall, Glasgow, Nov. 4-14. With rising business costs scaring the daylight out of most of us this

Business Exhibition will show you a hundred and one practical ways in which you too can save money, time, labour and effort in your own business. Remember, Business Efficiency Exhibition, Kelvin Hall, Glasgow, Nov. 4-14.

your competitors will be at the
BUSINESS EFFICIENCY EXHIBITION
Kelvin Hall NOV. 4-14

House Warming for Uno

[FROM OUR UNITED NATIONS CORRESPONDENT]

THE storm warnings which were flying when the General Assembly convened in its new Manhattan home have by no means been taken down, but the first gusts of wind have been lighter than expected. Mr Acheson, whose angry polemic at the Paris meeting last winter disturbed the British and the French, showed himself mild, grave and shrewdly diplomatic, as befitted a man whose government must shortly face a national election. Mr Vyshinsky produced his usual diatribe and attracted a full house even though it was Saturday morning, but his variety is far from infinite, and custom has staled it. The castigating adjectives and the scorn were there, but the old fire was gone; the white-haired warrior seemed an aged and shrunken figure trying to pretend to lost vigour. The fact that he had ceded to the Poles the right to present the main Communist proposals may have fostered this impression, and it is always possible that a hint of failing powers is merely one more weapon in an ample armoury; but intentional or not, the hint was there, and the corridors felt it.

Old Assembly hands tended to dismiss the Vyshinsky speech as merely a repetition of things said too often to command attention, but certain elements deserve comment. The speech lasted an hour and fifteen minutes; with the exception of a short gibe at the Secretary-General and his economic report, the first forty minutes were devoted to the charge that the United States was keeping the Korean war going to make money out of it, and to a plea that the war be ended in accordance with the latest Communist proposals. In this sustained castigation the United Nations as an avenging force was tacitly dismissed. The United Kingdom and France were mentioned in parentheses, but the chief target of abuse was the United States, guilty in the Russian mind of all possible crimes including that of waging germ warfare. It was apparent in the language Vyshinsky used that Russia now wishes its charges of germ warfare to be accepted as proven facts. No mention was made of the American effort to get an impartial body such as the International Red Cross to examine them for the Security Council. That the Soviet Union had blocked this effort was something which the Assembly was not supposed to know. Thus far the Americans have been so thoroughly convinced of their own innocence that they are said not to have planned to assert it before the Assembly. Mr Vyshinsky's attack on this point may cause them to change their minds and take effective advantage, for once, of the world forum which he uses with such consummate skill.

Home for Christmas?

There is now little doubt that the Korean war will receive ample, not to say acrimonious, attention during the nine weeks of discussion on which the Assembly has embarked. It is not, however, the only point of anguish. On the agenda are 71 items, and at least six potential storm centres have already appeared—the six items which countries concerned tried to have excluded from the agenda. The protestants included South Africa, the Ukraine, the Czechs and the Russians, with France giving notice that it would not try to exclude the items on Morocco and Tunisia, but registering protest at their inclusion and declaring that it would not discuss them. Item 22, the question of Indians in South Africa, raised such a storm in the Assembly that at one point the delegates refused to accept the President's ruling on a point of procedure.

Whether the Assembly can get through its 71 items in the nine weeks allotted is highly doubtful. Thus far it has lost one day, attributed in the corridors to Mr Acheson's difficulty in framing a speech that would express the American point of view no matter which party comes to power on November

4th. Other nations, however, have also shown an unprecedented reluctance to speak their minds in the general debate, and unless the committees can by an act of will banish the American election from their minds and work as well before it as they expect to afterwards, the chance of adjourning by December 20th seems remote.

It is still too early to know whether the United Nations' new quarters will make for speed or leisure. Physically they are far more comfortable than were the temporary quarters at Flushing Meadow, and tardy delegates will no longer have the excuse afforded by distance from lodgings or from pertinent documents. The new Assembly chamber is, for all its size, an easier place for discussion than some of the smaller council chambers, and it has about it a flattering air of brilliance and importance which should discourage dullness. Whether it can evoke wisdom remains to be seen.

Southern Rhodesia and its Neighbours

[FROM A CORRESPONDENT IN SOUTHERN RHODESIA]

WITHIN the next six months we shall know whether the draft federal scheme for British Central Africa is to be translated into reality. The Prime Minister of Southern Rhodesia, Sir Godfrey Huggins, has very properly committed his government to a referendum on this issue and the day of decision is likely to fall in March next year. Thirty years ago a similar referendum was held in Southern Rhodesia to decide whether this dependent territory, three times the size of England, should be incorporated as a fifth province in the Union of South Africa or become a self-governing unit of the Colonial Empire. By a majority of 2,785 votes the electorate chose responsible government. That they decided wisely is obvious from the economic progress of the past 30 years.

Since no British Government would now agree to give Northern Rhodesia responsible government, Mr Roy Welensky and his elected colleagues in the Northern Rhodesia Legislative Council see in the proposed federation their only hope of achieving a greater measure of control over the administration of their territory. So highly do they value such a constitutional advance, with the added security it implies, that a majority of the Europeans in Northern Rhodesia are quite ready to see a big slice of their buoyant revenue paid into the Federal Treasury to ease the burden Southern Rhodesia now carries, and to subsidise the development of the poor relation of the proposed federation—Nyasaland.

For the people of Southern Rhodesia, who have it in their power to thwart the plan by opposing it at the forthcoming referendum, the issue is not nearly so clear-cut. They already enjoy a large measure of self-government. Notwithstanding the reservations that remain in their constitution, they are treated for all practical purposes as a full member of the Commonwealth. Their Parliament is wholly elected and its proceedings are more akin to those of the House of Commons than the proceedings of any colonial legislature, where the government benches are occupied by civil servants and the power is conveniently balanced by the inclusion of members nominated by the governor.

Furthermore, Southern Rhodesia's economy is broadly based. Tobacco, gold, asbestos, textiles, cattle hides, chrome ore, coal and coke and fifty other commodities are regularly exported. Its general development—especially in the fields of public utilities, social services and local government—is at least a generation ahead of that of the two northern territories with whom it is now asked to pool its destiny. Apart from the possibility of enjoying a greater share of the prosperity generated by Northern Rhodesian copper, Southern

Rhodesia appears to have little to gain on the economic front by federation. It is, however, being argued that a bigger economic unit would attract more development capital, particularly from North America. If that contention is correct, the gain will be somewhat bigger.

On the political front, there is certainly no gain and possibly some loss. To the extent that powers are surrendered, the Legislative Assembly in Salisbury will be reduced in status. Fundamental matters such as external affairs, defence, immigration, transport and communications will be controlled by a federal assembly in which the Southern Rhodesian representatives will be in a minority and where some members will be elected or nominated to represent specific racial interests. Such a concept is as foreign to Southern Rhodesia as it is to the United Kingdom. In these circumstances, it is not surprising that opinion south of the Zambezi is sharply divided on the federal proposals. The publication next week of the reports of the three commissions set up to examine various aspects of the federal plan—fiscal, judicial and civil service—may help to crystallise opinion more definitely; but meanwhile the bulk of the electorate is strictly neutral.

At present there are three groups. The first believes that any form of closer union is better than none. This group forms the hard core of the United Central Africa Association, of which the Prime Minister of Southern Rhodesia, Sir Godfrey Huggins, is president. The second group, epitomised by the White Rhodesia Council but by no means confined to its members, opposes any form of closer union with the "Black North," before Southern Rhodesia has itself attained full dominion status. The third and now by far the largest group—which may shortly find expression in the establishment of its own organised platform—favours closer union, but fears that the present terms are unworkable. Inevitably, the UCAA has attracted many place-seekers who see in the achievement of Central African Federation the fulfilment of their dreams of personal advancement. Equally inevitably, the WRC has attracted the "little Rhodesians" who, with a conservatism matched only by that of the Africans (with whom, nevertheless, they have no wish to associate themselves), prefer the safety of things as they are to the dangers of the unknown.

Far more interesting, because their votes will decide the issue, are the members of the neutral group. These include several distinguished leaders of opinion and many of the Prime Minister's political supporters. They have studied the White Paper more carefully than most and, though they may be mistaken, their conclusions will have to be rebutted convincingly if the referendum is to go in favour of federation. Of course, they object to the proposed African Affairs Board. Their objection is not to the provision of safeguards for African interests, but to the new principle involved—the principle of an independent body, answerable to no electorate whose members are, in effect, nominees of the Secretary of State, to sit in judgment on what the elected government proposes to do. They would prefer an Upper House, where African interests could be specifically, directly and strongly represented, to apply the necessary check without infringing the traditional right of the "Commons" to be answerable only to the electorate.

This neutral group also objects to Southern Rhodesia having only a minority of seats in the Federal Assembly (even when the three members specifically elected to represent African interests are included). They are conscious that the territory has a long experience of self-government, has three times as many Europeans as the other territories combined, and has far outstripped the other territories in economic progress. Finally, and most important of all, they object to the introduction of racial discrimination into the legislature. They argue that the Europeans will never outnumber the Africans and, if politics are thus encouraged to develop on racial lines, the white man can have no secure future in

Central Africa, whatever the importance of the contribution he has made to its economic and social development. They favour the maintenance and extension to Central Africa as a whole of Southern Rhodesia's common voters' roll, to which Africans, Asiatics and people of mixed blood are admitted on equal terms with Europeans as they achieve an accepted standard of civilisation. They argue that such voters will place country above race and give concrete and effective form to the theory of political partnership on which the hopes of the federalists are so firmly based.

Whatever the division of opinion, which, on this particular issue, cuts right across normal party affiliations in Southern Rhodesia, all three groups have one aim in common. They wish to see Central Africa as a unit under the British flag, steadily growing in strength and influence, owing undivided allegiance to the Crown and making the best use of the resources with which Nature has endowed these half-million square miles of the African continent. If the issue to be decided at the referendum were merely the principle of closer union, there can be no doubt that, in the Rhodes tradition, a large majority would plump for federation. But the imperfections, as Southern Rhodesians see them, of the federal plan as it stands at present have occasioned many doubts and fears, which the final conference in London next January must acknowledge—and assuage as best it can.

New Stage in Finland

[FROM OUR SCANDINAVIAN CORRESPONDENT]

THE fall of the Finnish coalition government last week may mark the end of a short but significant epoch in Finland's political development. It was the third regime in succession which Mr Kekkonen had headed. It had lasted from September last year not without both internal and external strains and stresses. The main difficulty has been the obstinate self-seeking parochialism of Mr Kekkonen's own Agrarian party. Last March, after disagreements with his own supporters, he handed in his resignation as a means of bringing them to order. This time he has had to dissolve his government in face of his party's stubbornness, or, more accurately, in face of the opposition of the powerful Agricultural Producers' Central Association (LCP) which, as such, has no parliamentary representation.

The trouble arose when it was proposed to raise considerably the ruinously low controlled rents for houses as from October 1st. The Social Democrats agreed to a 20 per cent increase in rents provided that the prices which a proposed law was to guarantee for agricultural produce should be based on the autumn 1951 level. The Agrarians and Social Democrats, who were the backbone of the coalition (which also contained two Swedish ministers and an independent foreign minister) agreed on this. But powerful pressure groups outside Parliament, the LCP and the primarily Socialist Trades Union Congress (LO) refused to support the decision.

A paradoxical situation has thus arisen in which parties which have many good reasons for disagreement have agreed on a major matter, but are forced by the extra-parliamentary differences of their main supporting bodies to break up their coalition. Perhaps, as conditions have become more difficult for Finnish trade and, recently, for Finland's farmers, who are contending with record rains and a lost harvest, the coalition was doomed to eventual breakdown. But it has a good record: it has been encouraging to see the growing toleration and increasing statesmanship of several of its leading members, whose earlier attitude had caused some foreboding. What comes now is difficult to say. Both Mr Kekkonen and Mr Fagerholm, the Social Democrat leader, have publicly stated that the coalition is the best basis of any new government. To recreate it, however, they will have to discipline their powerful supporters, and that may take a long time and even new elections.

Belgrave Square, 1825

Which generation did they build for?

In the age of gracious living the achievements of Thomas and William Cubitt reflected the national mood. They built fine squares and broad streets to replace the wastelands surrounding the City of London, and stately mansions to dignify the new prosperity of the countryside.

The tempo of life has changed, and functional simplicity has supplanted ornate magnificence in the design and construction of our homes. Today Cubitts are meeting the national need by

the construction of flats and housing estates in many parts of Great Britain and the Empire overseas, but the homes they built more than a century ago still stand solid and enduring—a welcome heritage of the past and a sound assurance for the future.

CHAGAS DISEASE

IN large areas of South America, up to half of the population suffer from the effects of Chagas disease—an illness that causes acute debility, fever, and often idiocy, paralysis and death. There is no known cure for Chagas disease, and, until recently, there was no effective method of preventing its spread, for the large, bloodsucking bugs that carry it are immune to most insecticides. In 1948 I.C.I. undertook experimental work in the control of the Chagas disease carrier when a technical service man from I.C.I. General Chemicals Division visited South America in connection with the use of "Gammexane" insecticides. Laboratory tests carried out in Chile, Argentina, Brazil and Uruguay gave such promising results that a full scale field-trial was arranged. This took place at an up-country village in Uruguay where the interior of every infested building was sprayed with a "Gammexane" preparation. The trial was an outstanding success. A single application of this powerful insecticide wiped out the entire bug population of the village. As a result of this technical service work by I.C.I., campaigns to eliminate Chagas disease are now being undertaken in a number of South American republics.

THE BUSINESS WORLD

Shipping in Rough Waters

JUST over two years ago, ships were being laid up because freight rates had fallen so low as to make some of the voyages on offer unprofitable. The Chamber of Shipping index of tramp freight rates was in the region of 25 per cent lower than in 1948. In recent months ships have been laid up again, though there has been a slight improvement in rates in recent weeks. For four months freight rates have been lower than the 1948 average; considering that operating costs have increased in the last two years, the margins that recent rates have offered have been about as low as in mid-1950. In the interim, however, shipping—of which international industry British shipping is only one sector—experienced almost unprecedented prosperity, as demonstrated by the behaviour of the freight index. The average in 1951 was 173.7 (1948=100), more than double the average for the two previous years.

The reasons for this unexpected boom in the demand for shipping space are common knowledge. They sprang indirectly from the outbreak of hostilities in Korea; but the war in Korea was not directly responsible for the shipping boom. Several months elapsed after that outbreak before freight rates began to rise; the war is still going on, although at a slower pace, but freight rates are back to the pre-Korea level. When the demand for basic commodities and raw materials causes a rise in their prices, the rates paid for the ships that are needed to carry them also rise; and the reverse naturally follows. Several extraneous factors also added their weight to the demand for shipping. The coal crisis in Europe, for example, could not have come at a more unfortunate time—from the charterers' point of view—and the liner companies' demand for extra tonnage to cope with the increased exports of British manufactured goods pushed the price up further.

While freight rates were skyhigh the more responsible shipowners were not so complacent as might have been expected during one fat year among so many lean. In the first place, the high earnings of almost every type of vessel hardly disguised the steady increase in operating costs of every kind. Seafarers' wages were increased in March, 1951, and again in January, 1952, in accordance with demands based not on higher freight rates, but on the increased cost of living, and the last increase alone added well over 10 per cent to the wage bill. While shipowners' earnings have dropped, the cost of living has not, and the reasons that justified the wage increases still apply. The circumstances have not yet arisen, although they might, when the shipowners must go to their employees and ask them to accept a reduction in wages. That has happened before—and, incredible as it may sound in these days, the seamen agreed.

Industrial relations in shipping, however, are something of a model for other industries: the recognition of common interest is perhaps easier in so free an international market. Few shipowners, therefore, are yet

heard complaining about the wage element in their increased costs. Port charges, however, are a different matter; and costs in port since the war have increased by leaps and bounds. At the height of the boom the very pressure of traffic caused congestion in many ports, thereby delaying ships, increasing their operating costs and in turn cutting down the amount of tonnage available on the charter markets. Now that the volume of traffic passing through the ports has declined, this aggravated congestion has been relieved for the most part; but port tariffs have not been lowered. Moreover, the deficiencies in operating equipment that make ports unable to absorb any extra pressure of traffic still remain.

Another major element in operating costs is the price of coal and oil bunkering. Both fuels rose in price with freight rates; it is the cost of oil fuel that principally affects the modern ship. The higher that freight rates rose, the higher the oil fuel prices became, and at one time a physical shortage of oil stocks occurred. That situation has passed, and oil prices have been reduced (as again last week) since freight rates began to reflect the fall

in demand for ships. The oil companies, in announcing recent changes in their prices, have attributed them in part to rises or falls in the level of freights. For a shipowner to reply that the price of oil bunkers has affected the trend of freight rates would be to start an argument as unprofitable as one about hens and eggs.

A chain reaction, nevertheless, is set off in a period of inflated demand for commodities and for ships. It sets off demands for increased prices throughout industry, and increased wages all round. Shipowners have not been able to find the way out of the spiral any more than others. The materials they use have gone up in price, and with them the general costs of maintenance and repair—heavy items on a piece of capital equipment that has a definitely limited life. Insurance premiums, too, have responded in the usual way to the increased costs of maintaining ships in a seaworthy condition.

During the period of high freight rates, shipowners were fully capable of absorbing such increases in operating costs in their stride; but they were aware of the difficulties that would arise when rates became less remunerative. That was only one of the reasons why many of them called the freight boom "unhealthy." During the boom inefficient ships were as able to secure business as the efficient. Anything that would carry a cargo could find one, and an old ship in being would fetch a better price than a new one on the stocks. Furthermore, hundreds of ships from the United States "mothball" fleet were dusted and put back to work. It would have been folly in the circumstances not to have made use of this strategic reserve; but inevitably it aroused fears that it would be used by a governmental authority to depress commercial freight rates. That fear will remain so long as the mothball fleet remains afloat, although in fact the ships released were withdrawn from service without undue reluctance when it was apparent that the peak of demand had passed.

Last year's boom brought out the significance of this government-owned reserve of ships. To meet allied military requirements, the American Government was able to draw upon only a fortuitous "buffer stock" of shipping. This might have been interpreted to suggest that a strategic necessity existed for a permanent and self-replenishing supply of merchant tonnage. In fact, the use of these ships had the practical effect, once the immediate strategic dangers had receded, of reducing the opportunities for commercial shipowners to earn the funds necessary to replace their fleets. Sooner or later the issue must be faced by the United States and its allies together. If a strategic reserve of merchant ships is necessary, and the events of 1951 went far to suggest that it may be, how is the existence of that reserve of ships to be ensured? Is the reserve fleet that now exists under the American flag, as a result of wartime exigencies, to be replaced in due time *en masse*, as it was built? And is this to be done at the expense of the taxpayer, regardless of economic considerations? Moreover, if it is decided to maintain such a reserve to meet the special needs of war, ought it to be employed to stabilise rates in a peacetime boom, thus depriving the main allied merchant fleet of the earnings out of which it must draw the funds for its normal replacement?

For the Americans this is a painful dilemma. Aware as they are of the vital importance of a plentiful supply of merchant shipping in time of war, they cannot themselves operate a sizeable merchant fleet efficiently enough to compete with the other maritime nations. They do their best to hold what they have by means of shipbuilding and operating subsidies, reservation of coastal trade, protection and discrimination of one form or another, and the operation of the so-called "50-50 clauses" in the various dollar aid agreements. The other maritime nations, and particularly those of Western Europe, have a different tradition. In the past they have always succeeded in maintaining their merchant fleets and keeping them at work earning foreign exchange. Their success, it is true, has not by any means been a result of deliberate Governmental policy; but in the event their shipping services have become a principal source of strength in their national economies. Since the Second World War the Americans have been exhorting their poor relations in Europe to increase their industrial productivity, lower their prices and boost their exports to the dollar area. If there is one industry in

which the European maritime nations can beat the Americans hollow on a purely competitive basis it is shipping—and shipbuilding, too. But this particular form of competition is apparently unacceptable in the United States, and too often the requirements of defence are pleaded as the excuse for the various protectionist devices that are employed to vitiate it.

This is in the realm of international politics, where shipowners sometimes fear to tread. In the domestic sphere, however, British shipowners are complaining that the politicians have little real understanding of the situation. In Parliament and outside, from time to time, politicians take pleasure in congratulating the shipping industry upon having replaced its war losses to such an extent that the strength of the Merchant Navy, ton for ton, is what it was in 1939. Shipowners reply in vain, it seems, that the amount of dry-cargo tonnage is not only much less than it was before the war but even less than it was last year, and that its average age is ever increasing. So far the politicians have not suggested that this decline is the result of lack of enterprise on the part of shipowners.

Shipowners, for their part, lay the blame primarily on the high rate of taxation and secondly on the method of arriving at tax liabilities and assessing depreciation allowances, in the special circumstances of their industry. Their arguments are familiar enough by now. The capital assets of shipping are of high value and short life; they must be replaced in entirety, not piecemeal, and in present conditions the cost of replacement is three or four times the cost of the original ship. And shipping, like other industries has to pay income tax, profits tax and perhaps excess profits levy before provision can be set aside to cover the additional cost of replacements.

The exceptional period of high profits, through which the shipping industry has just passed, is not a favourable background to any proposal that suggests special concessions for the industry. On the other hand, now that profits of any kind are problematical, any alleviation of the tax burden will have less effect. Meanwhile, as time passes and Royal Commissions deliberate, the competition for the carriage of the diminishing volume of international seaborne trade increases, and the Germans and the Japanese, with the benevolent approval of their governments, are beginning to throw the weight of their new-found and highly efficient modern fleets into the arena. The new Elizabethan merchant adventurers are not going to have the advantages of their forebears.

The Motor Industry

A survey of the technical and economic problems facing the British Motor Industry in the period of intense competition ahead

PAGE 265

Development Areas Revisited—II

Rearguard Action or Offensive?

THE movement of industry to the development areas is commonly discussed almost exclusively in terms of branch factories. But branch factories are a modern innovation and exercise only a limited influence on the location of industry. The big changes in location have usually resulted more from the rapid growth of firms on the spot than from the opening of branches by firms established elsewhere. It is surely to the firms that are already operating in the area that one ought to look first for its industrial salvation. If they are helpless, can a dribble of branch factories coming from outside alter the long-term trend? As for the short-run, is it not a snare and a delusion to think of combating unemployment by means that are most unlikely to add to total employment faster than about one per cent per annum? Location policy can never be what so many people imagine it to be—a simple device for plugging holes in the good ship "Full Employment" wherever they develop.

If location policy is looked at from the point of view of the firms already in the development areas, rather than of branch factories, some interesting questions arise. Why can these firms not themselves expand, occupy additional premises and make new products? Are they succeeding in doing so or are the development areas being spoonfed with enterprise from without? There can be no harm in the government's going into the factory-building business, and erecting nearly as high a proportion of the smaller factories as local authorities are erecting of new private houses. But is it necessary to try to fill them by imposing discriminatory restrictions on factory-building elsewhere? Might not more be done to induce firms already in the district to take on new responsibilities, to consider whether they might not develop new products or supply new markets? If the real danger before the areas is renewed industrial decay, the only real prophylactic is renewed industrial growth, and preferably growth from the parent stem unless the existing complex of industries is incapable of sprouting.

The government is by no means oblivious to this line of reasoning. Apart from the direct aid that it offers to some industries—not necessarily concentrated in the development areas—its control over industrial location is not exerted solely over branch factories. It also tries, for example, to smooth the path of local firms by the offer of suitable factory premises in these areas at low rents. It is doubtful how important this is. Messrs Hague and Newman, whose study of costs in setting up clothing branch factories* was mentioned in a previous article, insist that rent and rates are a small item in costs and that the difference between London and South Wales in this respect is insignificant. On the other hand, many firms that lack the resources to build a new factory for themselves are prepared to move to an industrial estate where at least the fixed capital is found for them. Although the unit cost in clothing manufacture attributed to rent and rates may be about the same in London and South Wales, the lay-out of a modern Welsh factory may in fact pay a high dividend in relation to the cramped if not tumble-

down accommodation in which clothing factories are often housed elsewhere.

Whatever could be done to put new life into the firms already in the development areas and graft new activities on old, there is a clear danger that insistence on shunting the growing industries of the country into the areas with high unemployment rates may enfeeble the whole industrial structure. This danger has perhaps been lost sight of in the talk over "footloose" industries. It is perhaps natural to conclude, when all the locational factors on which stress is usually laid by economists have been shown to be unimportant (as in the clothing trade) or to be swamped by the organisational problems involved in setting up a branch (as in shoes), that the choice of location must be largely a matter of indifference to most industries—the manager's convenience apart. This is a very dubious conclusion. But even if it were accepted, what would follow? That the manager's convenience should be ignored? Some might conclude just the opposite. In Puerto Rico, for example, the first moves to bring in new industry have been to build a modern \$9 million hotel, to finance a number of good restaurants and to project a series of small mountain resorts for weekends and holidays. These manoeuvres have been highly successful, measured both as profit-making ventures and in terms of the number of new factories attributable to them. No doubt circumstances are different in Britain; but even here a rather more indirect approach to control of location might yield useful results. Or is the conclusion that no harm can result from pushing an industry like clothing into the development areas? This too is highly doubtful. As Messrs Hague and Newman point out, we do not know how many firms decided not to expand at all when they were not allowed to expand *in situ*.

The crucial issue, however, is whether, even if all the rest is granted, the development areas have a special claim on the industries of this type. If clothing factories can go almost anywhere without loss of competitive power, ought they to be dumped in those areas that happen at the time to be suffering from unemployment to a slightly greater extent than elsewhere? Is it not equally arguable that they should go to the areas that in the long run are most worthy of development? Should they, for example, be put down alongside coalmines that are in course of being closed or alongside coalmines that are just being sunk?

This is no academic issue. However mobile some industries are, the major industries of the country are not easy to move about. No one thinks it a matter of indifference where coalmines are sunk, land is farmed, oil refineries are erected, steelworks are expanded, soda ash is manufactured, or ships are built. Even the aircraft industry could not be re-located without a damaging loss of efficiency. Yet it is these industries, far more than boots and shoes, textiles, radio valves and the like, that control the eventual distribution of the population. The government is consulted by most of the basic industries on matters of location, and consultation may even involve

* Costs in Alternative Locations, by D. C. Hague and P. K. Newman. Cambridge University Press, 12s. 6d.

reference to the cabinet ; but the decisions must generally be made on commercial or strategic rather than social grounds. From time to time, therefore, one or other of the basic industries is bound to begin tugging at the existing pattern and making the distribution of population lurch this way or that. Is the right policy in such circumstances to make the lighter industries lurch the other way ?

The answer to this must be to some extent tied up with housing policy. If housing sets a limit to the pace of development in an expanding area, it sets a limit simultaneously to the rate of labour transfer. There is then a strong case for preventing an aggravation of the shortage of labour, by limiting the competition of the more mobile industries for labour, and diverting those industries to areas where workers are idle. If the expanding area is a single large town such as London, whose growth feeds on itself and does not derive primarily from natural resources or acquired skill, there is a case, as the Barlow

* New factories and extensions to existing factories completed and/or occupied in Great Britain during the postwar years up to June, 1952 (excluding schemes with less than 5,000 square feet of covered floor space and excluding war-damage replacements). Source: Board of Trade.

Committee argued, for making a determined effort to restore a new balance with the rest of the country and putting a continuing brake on development in it, not merely a temporary one. But if there are a number of smaller expanding areas, scattered over the country—as may now be true—there is no reason why they should not be allowed to grow at a time when little or no waste either of labour or of “social capital” is involved. So long as houses, schools, and other services are being provided in every part of the country, it does not make much sense to talk of social costs of movement when a limited migration takes place from one area to another (unless, indeed, one is thinking solely of the loss of community

life in the one area and allowing no gain in the other).

In the catechism of the politicians, migration from declining areas is still anathema. Yet it has not only continued on a large scale but is actively supported in a most unexpected quarter—by the town planners. There has been plenty of wild talk about “decanting” the “surplus” population of the larger towns into other areas to which industry is simultaneously to be relegated by some sleight-of-hand vaguely described as “planning.” In the development areas this line of thought only makes sense if it implies that location policy should actively promote a movement both of industry and of population out of the areas altogether.

*

It will be obvious that, however many new facts about costs in branch factories have been added to our knowledge, there is still a great deal to clear up before a final assessment of development area policy can be made. In the accompanying table postwar factory development in the development areas and other parts of Britain is compared with the distribution of the insured population (since no accurate figures of existing factory space exist as a base) and a rough index of “relative development” is calculated. But this inevitably leaves other questions unanswered. On what scale are people still leaving those areas ? Where are they going and how do they succeed in finding houseroom ? It is perhaps significant that the Scottish development area has been losing population at a rate not much below that of the twenties. Do the new industries represent a net addition to industrial employment in these areas, or are other industries being pushed out at about the same rate as the new industries come in ? Again, there is evidence that at least some offset must be allowed for. The idea that it is easier to recruit labour in the development areas than elsewhere is not always well founded. Moreover, the new industries seem to have contributed more towards bringing women into industrial employment than towards overcoming unemployment amongst men. Finally, where are the boom-towns of modern Britain, and what thought is being given to their problems in comparison with the energy lavished on the towns that are in decline ? Is there not a danger of fighting an everlasting rearguard action without ever leaping to the offensive, by selecting the towns and districts that are destined to grow, and making sure that their growth, instead of being marred by hasty improvisation, is eased by the constructive intervention of central government agencies ?

Sooner or later the issue is bound to be raised, whether the present development areas are to be regarded as permanencies, whether their boundaries are ever to be redrawn or some are to be de-scheduled. It is a fair guess that although additions to the list may be made, deletions are most unlikely. Is it necessary, then, to contemplate a steady expansion until nearly the whole country is included under the act ? This would seem a fantastic outcome. The more feasible line of advance, as has recently been proposed, would seem to be to extend some of the powers enjoyed by the Board of Trade in relation to the development areas so as to allow them to be applied to the country as a whole. The government would then be able to take a more comprehensive view of their responsibilities, instead of feeling under a constant compulsion to shepherd new or expanding enterprises in the direction of the development areas.

The reduction in the supply of bills has led the discount houses to reverse the tactics they followed at the tenders while the issue was rapidly rising. The pressure upon them in financing a steadily mounting intake of bills—involving a

bigger risk that they might be forced to meet marginal needs for cash by expensive borrowings at the Bank of England—was reflected in a rise in the average allotment rate of discount from under 47s. per cent in early May to a peak of nearly 49s. 9d. per cent last month. Twice this month, however, the discount market has raised its bid price for the bills—on each occasion by 2d. per cent. At last week's tender this adjustment produced a fall in the average allotment rate by 7½d. per cent. Hence this average rate, at 48s. 4d., is now fully 1/16 per cent below its peak. Unfortunately, however, the Treasury's continuing deficit and the impending repayment of the £105 million of unconverted Funding stock will cause a re-expansion of the bill issue before the phase of big tax collections opens—which may explain why the banks, in their market operations, have not been very responsive to the fall in the tender rate.

Export Subsidies Again

The British delegation at the Gatt meeting in Geneva has now served notice that it will propose that stricter provisions against export subsidies should be written into Gatt when the terms of that agreement are reviewed. Mr John Leckie, the British delegate, was speaking in support of the Greek complaint against the United States export subsidy on raisins; the United States delegate replied that this subsidy was merely aimed at keeping American exports of raisins at their pre-war level and to counteract some countries' restrictions on dollar imports.

This disagreement about the morality of direct export subsidies shows how difficult is the problem that confronts the IMF committee that has been asked to look into—and presumably to find ways of stamping out—hidden export subsidies in the form of dollar retention schemes and tax rebates. The article in *The Economist* of September 27th, which discussed these hidden subsidies, has drawn a stream of comment—and not a few protests—from the European countries concerned. One of the main complaints has been that there is a beam in Britain's own eye, in the fact that British purchase tax is levied on goods at the moment of their sale in the domestic market so that export production is spared. Another point made by Continental sponsors of dollar retention schemes is that they have the thoroughly desirable effect of allowing dollar exporting industries to re-equip with dollar capital equipment; many of the "free dollars" earned by Dutch and German exporters are used in this way. Finally, the Dutch authorities argue that their dollar retention scheme cannot possibly lead to increased spending on foreign goods; the 10 per cent retention is allowed only on the dollar proceeds of direct Dutch exports (not re-exports) and these dollars are not transferable to commodity shunters (in fact, they are not transferable to anybody at all—although the goods that can be bought with them are). It is true that Dutch transit traders are allowed to buy goods in soft currency countries, and to keep—or, if they wish, freely to transfer—all but 10 per cent of the dollar proceeds from the resale of these goods in the United States; but this, it is argued, is not a reflection of hidden Dutch export subsidies, but of its normal exchange control system. Quite clearly, the dollar retention schemes and other export subsidies now in operation in Europe are firmly entrenched and popular with both the governments and the traders of the countries concerned; so long as sterling and other major world currencies remain inconvertible, any effects by international bodies such as Gatt and the IMF are not likely to do much to stamp them out.

Forecasts Wear Thin

The most important item on the agenda of this year's Cotton Board conference at Harrogate last weekend—a report on the recent Buxton international cotton textile industry conference—was kept back until the last session of the last

day. What a thousand Lancashiremen, representing all sections of the cotton industry, most wanted to hear was the Cotton Board's explanation of its high estimate of the industry's likely exports next year—1,350 million square yards for 1953, compared with actual exports of 850 million square yards in 1951 and estimated exports of only 746 million this year. Their eagerness for an explanation had certainly not been lessened by the opening speech of the conference, in which Mr Thorneycroft, President of the Board of Trade, made it cruelly clear the industry must not look to Whitehall for extra assistance. Delegates waited with some impatience for the report on the Buxton conference. But this turned out to be devoted mainly to the stale news that, first at smaller international meetings at home and abroad, beginning in 1947, and finally at Buxton, the Cotton Board had induced millowners in other textile exporting countries to admit that the world's existing productive capacity is in excess of the ability of markets to absorb cotton textiles. As was already known, the Buxton conference made no plans to prevent the building of more mills. But having laboriously implanted the idea of surplus capacity, the Cotton Board clearly places some hope on restriction by auto-suggestion.

When it finally came to the 1,350 million square yards export estimate, spokesmen of the Board formally explained that it was a reasonable expectation of the trade lost only on account of the war and postwar conditions that could now be regained. This did not satisfy Mr Naesmith, general secretary of the Amalgamated Weavers Association, and himself a member of the Cotton Board, who pressed for further elucidation. The Board maintained that a defeatist target was at all costs to be avoided and that an optimistic one was infinitely preferable, and that if Lancashire had set itself a lower target and then exceeded it, other exporting nations would charge it with flooding the market—the very thing the Buxton conference had been called to avoid. No outsider would wish to criticise unfairly Lancashire's own attempts to propel itself out of the doldrums of the world trade in textiles: and the international contacts achieved at Buxton were almost certainly worthwhile. But forecasts admittedly inflated by wishful thinking may be worse than none at all: next time the textile manufacturers meet perhaps they will be able to stand a little realism in British—and other—forecasts.

British Deals in Dollar Stocks

Some market analysts in New York have put part of the blame for the recent unsettlement in Wall Street on sales of dollar securities by the British Treasury. Although these reports are grossly exaggerated, there may be an element of truth in them. After the final repayment in 1951 of the British Government's wartime loan from the Reconstruction Finance Corporation, the underlying collateral securities were freed; those that had been merely borrowed from their British owners were returned to them, but a portfolio of securities (probably worth about \$500 million) remained in the undisputed ownership of the British Government and was held in the Exchange Equalisation Account. It seems probable that some switching has recently been taking place in this portfolio, and that the British Government has been taking its profit on certain common stocks (including, reputedly, some 100,000 Amerasia Oil Corporation shares) and reinvesting the proceeds in other securities. It should be emphasised, however, that these operations have not added up to any sudden dumping of securities on the market; in particular it should not be assumed that the British Government has been selling its dollar securities and turning the cash into its reserves.

Good News in Rubber

American consumption of natural rubber may increase by some 120,000 tons a year because of the reported decision

of American manufacturers to use more natural rubber and less synthetic. During the first eight months of this year American consumption totalled about 800,000 tons, of which 282,500 tons, or 35 per cent, was natural and the rest synthetic. From the beginning of October the proportions are being adjusted to 45 per cent natural and 55 per cent synthetic rubber. It is believed that natural rubber may eventually reach 50 per cent of the total consumed in the United States—provided there is no change in relative prices of synthetic and natural rubber in the meantime. The main reason for the present changeover is that the current price of No. 3 RSS rubber, the grade chiefly used by the American industry, is slightly lower than 23 cents a lb, at which price general purpose synthetic is sold. But butyl synthetic is an exception; this type is largely used in the manufacture of inner tubes and is still considerably cheaper than No. 1 RSS, the only grade of natural rubber suitable for this purpose.

World production of natural rubber was expected to exceed consumption by 300,000 tons this year, but in fact the stockpile has probably absorbed the whole of this potential surplus. But the rubber market will not be wise to rely on similar purchases to absorb next year's surplus. World production of natural rubber is falling, but unfortunately consumption has been lower this year than last. If American consumption of all types of rubber does not fall much below 1.2 million tons next year, the consumption of natural rubber in the United States should increase to about 550,000 tons. This would still leave the consumption of synthetic rubber at nearly 700,000 tons, although it could sink to 510,000 tons before controls on the use of natural rubber would be reimposed.

The rubber market has given a cautious welcome to the news of the change in United States policy. Spot prices of rubber in London rose by ½d. to 22½d. a lb on Wednesday, but they are unlikely to increase much further, because if that happened natural rubber would cease to be competitive

OF COURSE we safeguard money and cash cheques. But we go further. We maintain specialist departments whose functions, although not 'banking' in the usual sense, can nevertheless be used to very good purpose. These departments will, for example, act as an Executor, help with a customer's Income Tax problems, obtain currency for foreign travel. They will do many more things besides. But the moral of this multiplicity of functions is simply this: if you have any problem of finance or business, the chances are that we can help you deal with it. And that is what we mean by 'banking'.

WESTMINSTER BANK LIMITED

with the synthetic product. From the point of view of Britain's dollar earnings, the probable rise in American consumption is particularly welcome. Dollar earnings from Malayan rubber have fallen sharply this year, not only because of the reduction in price but also because a much smaller quantity has been shipped to the United States than in 1951.

Changes in EPU

The United Kingdom has now duly received the gold that it earned from EPU in September; its surplus—and thus its gold receipt—in that month has now been officially confirmed at £13,242,857; this is the first surplus the United Kingdom has earned with Europe since May, 1951, and it remains to be seen whether it represents the start of a new chapter in the story of EPU. The recent meeting of the Managing Board of EPU did not, however, suggest that any such new chapter will have to be worked through under very different rules from those that have obtained hitherto. The Managing Board's main tasks were to study the questions of an increase in the German and the Dutch quotas. Each of these countries has now an accounting surplus in excess of 75 per cent of its initial quota. The Board has recommended an increase in the Dutch quota from \$355 million to \$455 million, but no recommendation has yet been made about the German quota. The Managing Board has also been analysing the suggestion made in its last report that Latin-American countries might be included in the membership of EPU. A detailed statistical exercise has been started to measure the precise effect of such an inclusion—an exercise that might with advantage have been made before the suggestion was ventilated in the report. On the basis of this study, it now seems unlikely that Latin-American countries will be asked to become fully fledged members

A short time ago we had a phone call from a manufacturer of woollen goods. He was concerned about the heavy increases in customs duties recently imposed in Venezuela on textiles. Was this likely to kill his export trade to that country?

We told him that, although the general opinion appeared to be that this increase had virtually closed the market, we were referring the matter to our Caracas Branch.

Within a few days we were able to quote him a report from this branch stating that there was still a market in Venezuela for high quality textiles of British manufacture, and that the demand was likely to continue.

Thus, thanks to our on-the-spot representation, we were able to obtain first hand, independent comment and clarify for the exporter, in a matter of days, a situation that might otherwise have remained obscure for weeks.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

The Film Producer's Share

Two years ago, few people in British film production would have said that in this country "the proportion of [net] box-office receipts flowing to the producer [is] less illiberal than in other countries of the world." Even today, many technicians would deny it. But the British Film Producers' Association has said so, in its annual report this week. It is clear that, in the view of the producers at any rate, the increased "Eady levy"—by which producers of British films receive a farthing or three-farthings on every seat sold in British cinemas, over and above their ordinary commercial earnings from film hire—has been enough to make film production here once again a reasonable proposition.

The levy was one of those convenient makeshifts, common in British practice, that serve a purpose without tying the Government to a specific policy, and become by degrees part of the customary order of things. But it may not pass into established custom so easily. The people who pay it, the cinema exhibitors, are themselves encountering hard times, even apart from the heavy burden of Entertainments Duty; and the levy is one item in their expenditure that is entirely voluntary. As a result of agreeing to pay it, they did obtain some concessions in duty in 1950 and 1951—though these may not have been as large as were expected. Nevertheless, they are required to pay the levy by nothing more binding than the word of their trade association. Only a few exhibitors are refusing to pay, and the fraction of the total levy that their contributions would represent is even more insignificant. But many other exhibitors would probably hesitate to renew the undertaking to pay it for longer than the present term, which ends in August, 1954, however much the producers may feel that this is "money which Parliament intended that they should pay over to British production." The cinema business still hopes for more relief from duty; and some exhibitors feel an "Eady extension" should be retained as a bargaining counter. They are not, as a body, worried by the fact that given the present term of the levy producers can hardly enter into commitments for making films after about March next year; though the major circuits, which have links with production, support extension now.

Therefore the future of British film production, despite its present comparative health, remains unsure. Urged to extend the levy system as a statutory regulation, the Government has blandly replied that it is the industry's business. It seems likely that the system will be extended eventually, even if less soon than the producers hope. But even the last government, which devised various forms of support for film production, never quite committed itself "not only to protect the industry indefinitely, but also to aid it financially for as far ahead as can be seen." Nor is this Government very likely to commit itself; though it is perhaps equally fair to guess that it will continue to follow that policy without saying so.

Imports Fall Faster

The decline in imports gathered speed in the third quarter. Most of the reduction again fell on raw materials, but the value of food imports declined more steeply than it did earlier this year. During the first half of the year declines in price were mainly responsible for the fall in the value of imports of raw materials, but in the third quarter the expiry of old contracts enabled larger cuts to be made in volume. In all, foreign raw materials cost Britain £305 million in the third quarter, compared with £367 million in the second quarter. For example, imports of paper-making materials, which were among the few raw materials

affected by the Butler cuts, declined in the second quarter mainly because of a fall in woodpulp prices; but the spectacular fall in the third quarter reflected a sharp reduction in volume as well. The fall in the value of imports of textile materials continued in the third quarter when there was a seasonal falling off in arrivals of raw wool.

Prices of foodstuffs have generally been higher this year than in 1951, and the slight reduction in the value of their imports conceals a larger cut in volume. However, in the third quarter a seasonal fall in the price of food imports helped to reduce the amount spent on food by £50 million, compared with the second quarter. Grain and flour imports were sharply down, following exceptionally heavy imports

A fall in the terms of trade indicates a movement favourable to this country.

in the first half of the year. The import category "Other Food" showed a sharp fall in the third quarter; this was partly due to a decline in the quantity of sugar imported but mostly to cuts in the import of a number of unrationed foodstuffs. And the reduction in the dollar allocation for tobacco is now beginning to tell: imports rose in the third quarter, but not to the same degree as during the same period last year. Supplies for the rearmament drive continue to form an excep-

tion to the general downward trend of imports. Imports of non-ferrous metals remained at the high rate of the first two quarters and so did imports of machinery, which for the first nine months of the year have amounted to nearly double their value in the same period last year. Much of the sting has been taken out of the reduction in imports by the fall in prices, which are now some 8 per cent lower than they were a year ago. This movement is still continuing. In September import prices fell by two points owing mainly to a further sharp fall in raw material prices, but also to the seasonal fall in the price of foods. Export prices fell by one point in September; prices of textiles renewed their downward drift and for the first time since the end of 1950 the price of metal and engineering exports also declined. However, the terms of trade were still moving in this country's favour; they have improved by no less than 14 per cent since the middle of 1951.

* * *

Textile Exports on the Mend?

This year, unexpectedly, textile exports have provided the exception to the rule. They were declining steeply in the first quarter of the year when most other exports were reaching record heights. But now that almost all this country's major exports are falling, textiles seem to be pulling out of the dive. In the third quarter they totalled £82 million compared with £88 million in the second and £119 million in the first quarter. Admittedly, the second quarter contained rather fewer working days than usual, but on a daily rate basis the fall in textile exports between the second and third quarters was little more than half the corresponding decline between the first and second quarters. Wool textiles are in the van of the recovery. In spite of a slight fall in September, they rose to £30.2 million in the third quarter, an increase of £2.6 on the quarter; there had been a fall of £6.4 million between the first and second quarters. Exports of cotton goods, on the other hand, continued to fall sharply in the

Surely, it was later than that, Doctor?

Sir Alexander Fleming discovered penicillin in 1928, but it was many years before the benefits of this anti-biotic could be widely applied. In the large-scale production of penicillin, phosphoric acid is used to maintain correct conditions in certain stages of the process. This is yet another example of the ways in which Albright & Wilson's phosphorus compounds are applied in manufacturing processes of the most diverse kinds, sometimes playing a major, sometimes a minor, but almost always a significant part.

Chemicals for Industry

ALBRIGHT & WILSON LTD

49 PARK LANE · LONDON · W.1

raw107

third quarter, though the September figure showed a slight improvement. In the quarter they totalled £28.8 million, or little more than half the amount for the third quarter of 1951. Silk and rayon exports in the third quarter amounted to £8.3 million, which was only slightly less than the second quarter figure, partly in consequence of a recovery in the South African market.

Although exports of metal-using industries remain higher than a year ago, the trend in recent months is not encouraging. Exports of metals and metal products, which had risen slightly in the second quarter compared with the first, fell in the third by no less than 19 per cent, on a daily rate

THE TREND OF SELECTED BRITISH EXPORTS
(£ million)

	1951				1952		
	1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	1st Qtr.	2nd Qtr.	3rd Qtr.
Coal	5.5	6.4	7.7	9.7	10.9	13.7	15.8
Iron & steel man...	37.3	41.8	38.2	42.3	47.7	48.5	41.8
Machinery	78.5	91.6	93.4	99.6	112.9	105.9	97.6
Cotton goods	46.8	56.8	54.5	51.3	49.8	36.2	28.8

basis. On the same basis, engineering exports declined by 15 per cent in the third quarter compared with a fall of 3 per cent in the second quarter. Within the group, exports of machinery followed this general drift downwards, though shipments of machine tools remained remarkably steady. Exports of textile machinery fell only slightly, in spite of the much vaunted world wide recession: the third quarter's figure was indeed a little higher than that for the second. Exports of vehicles have fallen more steeply than those of machinery; though there was a sharp increase in exports of cars to North America during the third quarter, it was not sufficient to offset the continued decline in the major sterling area markets. Coal exports this year present a marked contrast to the general trend; they have increased steadily, and in the third quarter they reached a level more than double that of the same period last year.

Oliver Twist Airlines

In spite of a highly successful year, in which fortune has favoured them both politically and economically, the independent air transport operators still labour under a sense of grievance. Since the Government threw open the development of new routes to all operators, more than 60 applications have been made for licences to operate new services, ranging from short-range domestic to transatlantic routes. In the twelve months ending June 30, 1952, members of the British Independent Air Transport Association, to which most of the independent companies belong, have doubled the freight that they carried: they flew more than 6.5 million ton miles and the number of passenger miles flown increased by 40 per cent to 154 million. The capacity of their combined fleets increased by a million pounds to a total of three million pounds, only 800,000 pounds smaller than that of British European Airways. This suggests that the industry must be in a far healthier condition than it was a year ago—when, admittedly, it looked so sick that the future of some of its members hung in the balance.

Having staked their claim to their due share in expanding air traffic the independents are now asking for Government assistance to buy aircraft in which to carry it. The association's report says that one of the "major questions of policy" that remains to be settled by the Government is "how the independent operators are to find new aircraft

with which to operate new services." In view of the difficulty of getting private capital, the association argues that the "Government will have to prime the pump either by giving a guarantee to private capital loans or themselves ordering the aircraft for hire-purchase by operators." Even though, as the association suggests, the trooping operations of the independents give them a measure of strategic importance, any proposal that the Government should put up money for operations too risky for the City calls for stronger justification than this. Nor is it wholly true that the difficulty the companies have had in their search for the funds with which to buy aircraft (in particular, Bristol Britannias at £600,000 apiece) is due to the lack of serious study given by "financial interests" to the air transport industry. One of the most successful of the independents was backed by one of the big insurance companies and is proving a profitable investment. Moreover, many of the aircraft manufacturers are themselves prepared to offer hire-purchase terms to their customers. If British companies prove that they can take advantage of the opportunities offered with existing facilities, however limited, they will not have to wait long for capital to finance further expansion.

Tin and Cheap Sterling

The committee of the London Metal Exchange has recently called the attention of its members to the "deep concern" of the Bank of England at the loss of hard currency that has been suffered as a result of the use of cheap sterling in financing purchases of tin in the London and Singapore markets. Very large quantities of tin purchased in this way have recently been re-sold in dollar countries—to the detriment of direct exports from the sterling area. The members of the Metal Exchange have, therefore, been asked to ensure that any tin purchased from them "is solely for industrial use in the stated country of destination." This is the latest indication of the continuance—indeed the growth—of cheap sterling operations in the commodity markets. Transferable sterling has recently hardened to over \$2.69-70, a figure at which the discount on the official rate is no more than 3 per cent; it says much for the perfection of the technique of commodity shunting that at this level Continental merchants should still find it profitable to engage in transactions of this character. London metal traders will no doubt strive earnestly to comply with the new request, but it is difficult to believe that they will really be able to plug all the leaks. In fact, the authorities' latest method of trying to check these deals seems unlikely to be any more successful than its previous method of relying on gentleman's agreements with the central banks of the countries concerned. It has become clear recently that these central banks are not giving their co-operation to the British Exchange Control as fully as had been hoped; it would be expecting a great deal of them to act as policemen for a mechanism in which they themselves have no faith.

Shipyards' Output Declines

The doubts that have been felt about the complaints of shipbuilders that they have been starved of steel seem to be dispelled by the latest shipbuilding returns compiled by Lloyd's Register of Shipping. They show that in the third quarter of the year work in progress in British shipyards declined, against the rising trend in the rest of the world. While the tonnage of ships under construction abroad rose by 264,449 tons gross to a total of 3,802,391 tons, the total here dropped by 13,759 tons to a total of 2,062,482 tons. This compares with a total of 2,270,621 tons only six months ago. Even more revealing figures show the tonnage of vessels on which work has begun but which have not reached the launching stage. This amounted to 1,745,292 tons twelve months ago, but has now declined to 1,534,025 tons. There is no question of any lack of orders, since the tonnage for which plans have been approved or material ordered has risen from 1,989,706 tons to 2,684,263 tons in the same period; and even though the rate of new orders received so far this year has been less than last, new contracts booked exceed the tonnage of ships completed, which is 939,366 tons gross.

Another disturbing feature of the returns is the rate at which the work in the yards of foreign competitors is increasing. Work in progress in Japan during the quarter increased by 603,500 tons, in Germany by 67,165 tons, in Sweden by 43,965 tons and in Italy by 36,523 tons. In Britain work was begun on less tonnage than was launched, but the reverse was true of most other countries, particularly Germany and Japan, whose speed of delivery is putting them at a distinct advantage in the competition for new orders. Apart possibly from craftsmanship, the only advantage that British shipbuilders now have over Germany and Japan is the lower cost of steel. Steel in these countries is more expensive, but labour costs are lower, and are likely to be much lower if the British shipbuilding trade unions get their way; and much earlier delivery dates can be guaranteed.

The British advantage of cheaper steel, however, is entirely lost if adequate supplies are not available. The industry's allocation for the third quarter was lower than in the second, and for some shipbuilding areas amounted to only about 60-65

per cent of their demands for merchant vessel building. In the fourth quarter the allocation was raised by 8 per cent, and it has been announced this week that it will go up again by 9 per cent: which suggests that supplies early next year may still be some 30 per cent below what the industry is asking for.

Shorter Notes

The Export Credits Guarantee Department is to extend to exporters to dollar account countries in Latin America the special facilities that it already affords to exporters to the United States and Canada.

The boom in the Rhodesian copper belt has led to another batch of excellent trading results, this time from the "Rhoango" group. Rhokana has raised its ordinary dividend from 200 to 225 per cent, following an increase in its "normal profits" from £10.5 to £11.5 million. The controlling company, Rhodesian Anglo American, has raised its ordinary dividend from 55 to 62½ per cent, in line with the expansion in its "normal profits" from £14.8 to £19.5 million. As far as British shareholders are concerned, however, dividends will be taxed at a rate that is reduced by an allowance for double taxation relief. Half of last year's dividends were treated as tax-free distributions, as these dividends were partly payable out of profits earned before the companies emigrated to Rhodesia.

The International Materials Conference has made a supplementary distribution of 29,800 tons of crude sulphur for the last six months of 1952, additional to the distribution announced in July of 3,200,260 tons.

The return of premier grade motor spirit from February next has focused some attention upon the fact that one of the major companies, Regent Oil, has no catalytic cracking unit for the production of such spirit in this country. Regent, which is controlled jointly by Trinidad Leaseholds and Caltex, is anxious to make clear that Trinidad Leaseholds has recently completed in Trinidad a modern "cat cracker" costing between £4 and £5 million; the motoring public will be able to obtain the premier grade of Regent motor spirit as well as of other brands.

Company Notes

Thomas W. Ward.—Although the value of total sales by the Thomas W. Ward group increased from £26,624,000 to £29,077,000 in the year to June 30th, the group's trading profits remained practically unchanged, at £2,026,077. The increase in the value of turnover appears to have been due almost entirely to an increase in prices, which has clearly been matched by an equivalent increase in costs; in fact, since the figure of £2,026,077 for trading profits includes an element of "windfall profits" following the increase of £2 a ton in the price of scrap iron and steel in August, 1951, it is probable that the group's margins of profits upon sales were reduced in the last financial year. Thanks to a reduction in the charge for taxation, net profits have risen fractionally, from £753,287 to £761,134. But as this increase was so slight, the directors could not do more than maintain the ordinary dividend at 20 per cent, and repeat the appropriation of £200,000 to the general reserve.

There have been almost as few changes in the consolidated balance sheet as in the

	Years to June 30, 1951	1952
Consolidated earnings:		
Turnover	26,624,000	29,077,000
Trading profit	2,026,244	2,026,077
Total income	2,139,736	2,138,765
Depreciation	208,975	243,654
Taxation	1,092,866	1,076,564
Net profit	753,287	761,134
Ordinary dividends	116,875	115,500
Ordinary dividends (per cent)	20	20
Retained by subsidiaries	203,099	186,179
Contingencies provision	200,000	200,000
General reserve	200,000	200,000
Added to carry forward	Dr. 38,773	Dr. 22,226
Cons. balance sheet analysis:		
Fixed assets, less depreciation	2,505,257	2,831,817
Net current assets	4,060,874	4,330,111
Stocks	2,614,851	3,309,759
Cash	1,366,558	1,135,749
Reserves	3,438,259	3,801,009
Ordinary capital	1,100,000	1,100,000
£1 ordinary share at 75s. 1½d. yields £5 9s. per cent.		

profit and loss account. The group's investment in stocks has increased in line with the increase in turnover, but the increase in the book value of stocks from £2,614,851 to £3,309,759 has taken place without making any serious calls upon the group's liquid balances. In effect, Thomas W. Ward has marked time, but in the current year it may suffer some reverse in its fortunes. Orders that the group has received are being worked off more quickly than new orders—particularly from overseas buyers—are being obtained. Moreover, it seems likely that a further rise in costs may eat into profits, and the chairman warns shareholders that "it would not be wise to count on results remaining as good as over the last two years."

Broken Hill Proprietary.—The full accounts of Broken Hill Proprietary for the year to May 31st last, which are drawn up in Australian pounds, show that the group's trading balance increased from £7,645,466 to £8,132,290, but that net profits made a somewhat smaller advance from £1,876,053 to £1,915,233. The rise in profits reflected increases in both output and prices. An improvement in coal supplies supported the increase in production of pig iron and steel in the company's works at Newcastle; the production of pig iron increased from 738,877 to 843,712 tons and of steel from 757,064 to 822,715 tons. Work from the end of the financial year a further increase in prices has taken place and this is now to be followed by a third dose. This third increase will have to be made at a time when the demand for pig iron in Australia is declining; the company's output of pig iron is already in excess of Australia's current requirements, but arrangements have been made to export the surplus.

The increase in output has been made

possible by a further extension of the group's productive capacity. In the last financial year the net book value of the machinery, plant and equipment owned by the group rose from £24,915,992 to £30,890,792; at the same time the book value of stocks increased from £10,593,218 to £14,341,154. Both these increases are a reflection of the inflation of prices as well as of the company's growth. Taken together, they have made a serious call upon the group's liquid resources despite the issue of new shares in 1951. In the consolidated balance sheet, cash balances (net of the unsecured overdrafts owed by the group) are shown to have fallen very sharply, from £3,963,430 to £435,637.

In estimating what ordinary dividends are likely to be paid by Broken Hill, investors should give considerable weight to this decline in liquid resources. In 1951-52 the company maintained the ordinary dividend at 8½ per cent, but the final dividend of 4½ per cent was paid in May on the increased ordinary capital of £24,944,196. The company has already paid an interim dividend of 4½ per cent on the new capital for the current year. This suggests the directors will decide to do no more than to maintain a full year's dividend rate of 8½ per cent. The sterling equivalent of this dividend rate is 6½ per cent, so that on this basis the £1 ordinary shares at the current price of 31s. 10½d. yield 4.2 per cent.

Fairey Aviation.—The boom that the aircraft industry is enjoying is not fully reflected in the accounts of Fairey Aviation for the year to March 31st last. Group trading profits have risen by £148,817 to £804,832, but—as taxation has risen by £167,025 to £417,501—net profits have actually fallen. It is not possible, however, for aircraft manufacturers to link profits earned in any particular financial year to the deliveries of aircraft actually made in that year. In consequence, no less than £525,000 of the profits of £804,832 reported in the last financial year represented profits arising from contract settlements reached during the year, but from deliveries actually made in earlier years; similarly in 1950-51 a sum of £420,000 was credited to the trading profit of £656,615. In the latest accounts no credit has been taken for goods delivered in the year, but still awaiting price settlement at the end of last March; nor, as in the past, has any credit been taken for profits accruing on work in progress. For this reason the provision for British taxation does not cover income tax, profits tax and EPL arising on such profits.

The tax provision has, however, risen so sharply (from £250,476 to £417,501), that the group's net profits have been reduced from £404,493 to £382,994. This figure amply covers the maintained ordinary dividend of 25 per cent, which absorbs £134,892. The directors have reduced the appropriation to the general reserve from £150,000 to £100,000, but this has been balanced by an increase in the profits retained by subsidiaries, from £57,202 to £124,361. The expansion of the group's productive capacity to meet the demands of the rearmament programme has put a considerable strain upon the group's financial resources. An increase in the net book value of fixed assets (from £787,517 to £1,040,451) and in the book value of "stock, work in progress and goods delivered awaiting price settlement" (from £2,508,673 to £5,035,682) has been accompanied by a decline in cash balances from £1,325,784 to £360,979 and by an increase in bank overdrafts from £89,400 to £919,990. At the moment the directors believe that the best way of financing the increase in working capital is by borrowing from the banks, but, in order to be able to tap the other source of new money—the capital market—if this is necessary, the directors are proposing that the company's existing borrowing powers should be doubled. At the current price of 31s. 6d. the 10s. ordinary shares yield just over 7.9 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended October 18, 1952, total ordinary revenue was £52,653,000, against ordinary expenditure of £103,693,000 and issues to sinking funds £409,000. Thus, including sinking fund allocations of £17,852,000 the deficit accrued since April 1, 1952, was £382,125,000 compared with a deficit of £92,837,000 for the corresponding period of the previous year.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

	Estimate, 1952-53 £'000	April 1, 1951 to Oct. 20, 1951	April 1, 1952 to Oct. 18, 1952	Week ended Oct. 20, 1951	Week ended Oct. 18, 1952

COMPANY MEETINGS

ALLEN HARVEY & ROSS, LIMITED

EVENTFUL YEAR FOR DISCOUNT MARKET

MR G. M. B. PORTMAN'S STATEMENT

The ninth annual general meeting of Allen Harvey & Ross, Limited, will be held on November 13th at the company's offices, 52, Cornhill, London, E.C.

The following is the statement of the chairman and joint managing director, Mr G. M. B. Portman, which has been circulated with the report and accounts for the year to September 30, 1952:

The company's balance sheet as at September 30, 1952, and the profit and loss account are now before you for your consideration and adoption.

The year has been, almost from its start, very eventful for the London Discount Market, which has experienced some return to the realistic practices of more than 20 years ago.

BANK RATE

The first six months of trading by your company saw two rises in the bank rate causing heavy depreciation in the investment and Bill holdings: the resultant loss, however, was far less serious than might have been expected upon a sudden change from long years of cheap money, as your company had been able to set aside from past profits a contingency fund more than sufficient to provide for depreciation, and although the net profit for the year is lower, the second half of our year has shown a satisfactory margin of profit. The surplus shown in the balance sheet under capital and revenue reserves has increased by £24,000 as compared with last year and the directors again recommend a transfer to general reserve of £25,000, bringing the reserve up to £150,000, and leaving the amount carried forward to the credit of the profit and loss account at almost exactly the same figure as a year ago.

Our liability for profits tax is of course reduced and this is reflected in a lower figure at which sundry creditors account stands. Of the investments held on September 30th the maximum life was 2½ years and the average life was 9 months.

PURCHASES OF BILLS

The company's purchase by tender of Treasury Bills over the whole year fell from £342 million to £305 million, and purchases of Commercial Bills increased very slightly during the year, from £43,419,000 to £43,981,000. In analysing these figures for the whole year we see that although there was an increase of 27 per cent over the first six months of the previous year, since April purchases of Commercial Bills have fallen by 25 per cent below the figure for the corresponding period in 1951. Such is probably a common experience owing to the fall in the market values of raw materials and the higher cost of this type of finance.

The changes in bank rate have produced at least one very welcome consequence: Discount Houses have at last a reasonable margin of running profit on their holdings of Treasury Bills so that they have less need to seek a substantial running income from short bonds.

Your directors desire to express complete satisfaction with the work of the company's staff, for which all concerned are very grateful.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

A BONUS ISSUE

The forty-first annual general meeting of the Olympic Portland Cement Company, Limited, was held on October 17th, in London.

The Hon. Gerald H. G. Williamson, the chairman, in the course of his speech, said: The trading profit, before charging depreciation and depletion, has again increased from £172,757 in 1950/51—itsself a record—to £236,404 in the year under review. The net profit, £83,461, shows an increase of £28,456. An interim dividend of 7 per cent was paid on February 9th last and the board now recommend a final dividend of 8 per cent and a bonus of 5 per cent.

The general reserve now stands at £314,067. Over recent years it has been built up more rapidly with the object in view of augmenting the company's issued capital, which the board consider has been completely out of line with the true underlying value of the assets. A capital of £250,000 is comparatively small and could restrict the company's credit facilities on the Pacific Coast.

The board decided a few months ago to make application to HM Treasury for permission to issue the balance of the authorised capital to members as a capital bonus in the ratio of one new share for each old share held, and, for the purpose, to capitalise £250,000 of the balance on general reserve.

The report was adopted and the board's capital proposals were approved.

LEWIS BERGER & SONS, LIMITED

MR THOMAS LILLEY'S REVIEW

The seventy-third annual general meeting of this company was held on August 7th in London, Mr Thomas Lilley, the chairman, presiding.

The following is an extract from his circulated statement for the year to March 31, 1952:

The profit before taxation was £930,010, compared with £810,054 in the previous year. The paint trade and the Berger group have passed through times of extravagant customer demand and raw material shortages with the consequent sellers' market conditions. Then the policy of the group was to concentrate on tailor-made specialist products. During that period the new range of products based

VITAMINS LIMITED

INCREASED TURNOVER

At the annual meeting held recently, Mr H. C. H. Graves, chairman, said that in 1951 226,000 fewer men and 248,000 fewer women died than would have done so if death rates had still been at the 1901 rates. Whose was the credit?

Some credit was due to improved sanitation and hygiene; even more to great advances in surgical and medical methods. But with what *weapons* had doctors and others effected this revolution? Primarily, (a) with the newer knowledge of nutrition and, (b), with the products of the pharmaceutical industry—insulin, the sulphonamides, the antibiotics, the vitamins and other wonders. Their company was proud to have played a part under both heads.

It was objected that these *weapons* cost money. Of course they cost money!

All agreed that the NHS must be efficiently and economically administered. Their Board, faced at the latter part of 1951 with almost daily rising costs, had decided against any increases in prices of their pharmaceutical products. This had an adverse effect on trading margin, but they had gained in esteem, and justly enough in turnover!

Their world-known product Bemax was part of "the newer knowledge of nutrition." Their pharmaceutical products, primarily in the vitamin field, held an honourable place with the medical profession.

On the agricultural side, sales of their Vitamealo products for cattle, pigs and poultry continued to grow. The "newer knowledge of nutrition" applied to animal husbandry produced marginal economic effects—favourable effects—which the farmer could appreciate more readily perhaps than the rest of the community—because the quicker maturity of his livestock, the better conversion ratios of food into flesh or milk or eggs produced for him a marginal effect where he could feel it, in his pocket book. Once again, Vitamealo-reared pigs had won 4 of the 6 Pig Championships at Smithfield and 88 per cent of all carcass awards.

Trading profit at £41,518 should be compared not only with the last year's record figure of £63,755, but with the previous figure of £10,870. The recession was due to the decision not to increase selling prices in 1951—a decision abundantly justified by the effects on turnover.

"Current assets £621,643," comparing with £226,065 only three years ago, was a fair measure of their business increase. They were now in a "buyers market" for raw materials and on their increased turnover were benefiting accordingly. They planned to meet the capital commitment of their new Crawley factory, if necessary, without recourse to the capital market; although a funding operation might later be desirable.

Their Company was now well placed and organised to take advantage of the intense activity and development begun in 1940 and which had continued unabated. There were remarkable opportunities which planned research had put in their way. Adverse national or world events apart, the directors, management and staff of Vitamins Limited and of their main subsidiary, Agricultural Food Products, Limited, as a united team confidently faced the future.

The Report and Accounts were adopted.

SIAMESE TIN SYNDICATE, LIMITED

RECORD PROFIT

The forty-fifth annual general meeting of this company was held on October 23rd in London, Mr Kenneth O. Hunter, chairman, presiding.

The following is an extract from his circulated statement for the year 1951:

The output of tin during the year from dredging operations (including those of the wholly owned subsidiary) amounted to 1,564 tons as compared with 1,525 tons in 1950. In addition a further 61 tons were produced from the re-treatment of tin shed tailings, giving a total production of 1,625 tons which is slightly less than the 1,658 tons which were mined last year. Total yardage at 7,469,100 cubic yards was approximately 1 million cubic yards below the previous year's output, due almost entirely to the fact of the subsidiary company's dredge being out of action for the greater part of the year, but the production so lost was approximately offset by the increase achieved by the Peck dredge, and, to a lesser extent, by the Ngow dredges in working richer ground.

The average price realised on the sale of our product was approximately £721 per ton ore, a rise of about £150 a ton on 1950. This increase accounts for an expansion in revenue of nearly £223,000 which is, however, to

some extent offset by a parallel rise in mining costs of about £103,000.

The net profit before taxation at £489,335 is an increase of more than £139,000 on 1950 and is in fact the highest which has been recorded in your company's long history. It has, however, been necessary to provide no less than £311,800 in respect of United Kingdom taxation. We are proposing a final dividend of 25 per cent (making 150 per cent for the year).

The report was adopted.

BANGRIN TIN DREDGING

INCREASED TONNAGE

The thirty-second annual general meeting of this company was held on October 23rd, in London, Mr Kenneth O. Hunter, chairman, presiding.

The following is an extract from his circulated statement for the year 1951:

The output of tin ore from dredging was maintained at 1,098 tons, as compared with 1,101 tons last year. In addition, a further 34 tons was obtained from the re-treating of tin shed tailings, making a total of 1,132 tons of ore recovered, which is the highest tonnage in the company's history apart from the peak year of 1937 when 1,164 tons were mined. This result has been achieved despite the fact that No. 2 dredge ceased operations on September 29, 1951, on completion of the treatment of the dredgeable ground in the old Bangrin area.

The main reason for the increase is the higher average value of the ground worked which was 0.72 lb per cubic yard, as opposed to 0.67 lb per cubic yard in 1950; both these values are well above the average for the remainder of our leases.

The substantial increase in the world price of tin at the end of 1950 and during the first months of 1951 was not fully maintained, but the satisfactory average of £711 per ton ore was nevertheless realised on the year's production, resulting in a net revenue of £803,783. The profit figure of £405,633 shows an increase of £86,625 on the previous year, and is a record in the company's history. Unfortunately at £272,730 the amount of taxation also reaches a peak and the net available surplus amounts to no more than £173,524 as against £140,139 in 1950.

The report was adopted and the proposed final dividend of 10 per cent, making 70 per cent for the year, was approved.

The Motor Industry

BRITISH CARS IN WORLD COMPETITION

A CONSPECTUS OF CARS

THE RIGHT ROADS FOR BRITAIN

Over-Square Engines Higher Compression

British Cars in World Competition

IN the first half of 1950, 262,507 motor cars were made in this country, a rate of 10,150 units a week; France produced 122,799 cars in the same period, and Germany produced 92,416, giving a joint weekly output of 8,300 units. In the second quarter of 1952, British output was running at a rate of 8,800 a week, but the joint French and German output had reached 13,000 a week. In 1950, British car output was nearly one-quarter above the production rate of Germany and France put together; by the middle of 1952, Germany and France had established a lead of nearly one half over this country. This dramatic change gives cause for hard thinking.

So long as shortage of dollars restricts the sale of American cars in the major export markets of the world, and so long as British car exports to their principal markets enjoy a tariff preference, the incursion of competition from European car manufacturers may not seem a matter of grave concern. But already in some neutral markets, such as Holland and Switzerland, the German and French factories, with the advantage of lower transport costs, have established a clear lead in sales. If this lead were to enable them to secure the greater share of all neutral markets, a major section of Britain's export trade would be menaced.

An article on a later page argues that certain French and German cars offer accommodation and performance, relatively to their weight and cost, superior to those of British lightweight vehicles and comparable to British models in the cruiser-weight class. The German and French automobile industries, taken together, are probably concentrated to a greater degree than the British car industry. Two leading Continental models, the 750 c.c. Renault and the Volkswagen, are each produced at rates of 2,000 a week, which is higher than the output of any single British model. Labour costs per man hour are lower; machine equipment is probably, as up to date at the Renault works as at any British factory; utilisation of machinery and tools is higher than the British rate. In the long run, the British car industry will maintain its exports at a high level only by matching the value of German and French models.

Industrialists often assert that a flourishing export trade can be based only on a thriving home market. Although the postwar experience of the British motor industry may seem to contradict this assertion, the classical pattern of the motor car industry throughout the world has been that manufacturers have sold the bulk of their outputs in their home markets at prices making a more than proportionate contribution to overhead costs, so that they could sell for export at ex works prices closer to their marginal costs of production. As a result, export prices, despite transport costs and import duties, have tempted the foreign customer. During the postwar years, the export demand for British cars has been intense. The Government and the industry, in a combined operation, have taken advantage of this opportunity by severely restricting sales of cars at home. The industry has sold the bulk of its output abroad at prices which have covered a full share of overhead expenses and yielded a reasonable profit. British manufacturers as a whole have sold motor cars, commercial vehicles, components and spare parts, to the value of more than £1,000 million in the five years to the middle of 1952. Meanwhile, the shortage of cars in the home market has maintained used new cars at a big premium above list prices; the more popular models after two years' use have commanded, at least until recently, a considerable premium above their retail price plus purchase tax, and more than twice their list price, ex tax.

But in the last two years, this happy state of affairs has changed considerably and cars are no longer easy to sell. Many importing countries until recently were purchasing cars and other goods in excess of their means; these countries have taken remedial measures and their own purchasing power has proved inadequate to absorb imports on the old scale. Smaller markets which had formerly received modest allocations of the more popular cars have stepped into the gap, but it may not be long before they begin to show signs of saturation. Increasing continental competition implies that the present volume of British car exports will be maintained only if prices are reduced significantly. Export prices can no doubt be reduced and still leave some profit over marginal pro-

MECHANICAL DEVELOPMENT ENGINEER required for Modern Manufacturing Engineering firm in the South West. To be responsible to Company's Chief Engineer for Research and Development in connection with present and projected products in the Lubrication and Hydraulic equipment field. Candidates must have B.Sc. Engineering as minimum standard followed by ten years' experience in the design and direction of Mechanical Engineering work. A knowledge of modern manufacturing methods an advantage, but inventiveness and ability to think objectively is essential. Pension Scheme. Age and full particulars of education, training and details of positions held and responsibilities to Box 94.

MARKET RESEARCH.—A vacancy exists in the Market Research Department of a well-known manufacturing company in the Home Counties for a young honours graduate in economic subjects, with some experience of Industry or Commerce. The post, that of Assistant to the Consumer Research Manager, offers exceptional opportunity for gaining a wide experience in the planning and operation of Market Research enquiries. The initial salary will not be less than £550 p.a., plus non-contributory pension and life assurance benefits.—Applicants are invited to write in confidence, giving full details of their age, qualifications and experience, to Box 93.

COMPANY Secretary/Accountant, qualified, aged 37, present remuneration £1,200, desires appointment which will allow full scope for a keen executive brain.—Box 96.

PRINTING Executive, possessing all essential connections for complete production of special brochures and books, offers services to principals contemplating same.—Box 67.

SENIOR Export Executive, world-wide experience, fluent French, German, Spanish seeks appointment commerce/industry.—Box 93.

YOUNG MAN, 24, junior director London export house, six years' experience international commerce, world travelled, languages, seeks position at home or abroad, preferably Canada or Mexico, where ideas, initiative and hard work count.—Box 95.

duction costs. But if export prices are to be reduced, the industry will look to the home market for a greater contribution to overheads and profits. The only effective way of securing this result in the long run is to reduce retail prices and expand the home market.

What is the scope for a major expansion of home sales? The first step towards the answer is to compare the number of cars in use with the distribution of personal incomes in this country:—

MOTOR CARS IN USE				
		(000)		
1920	1925	1930	1935	1938
186	590	1,075	1,505	1,944
1947	1948	1949	1950	1951
1,944	1,961	2,131	2,258	2,380

The next table gives the Inland Revenue's return of incomes (before tax) for 1949-50:—

Income	No. of Incomes	Cumulative	No. in receipt of family allowances	Cumulative
Over £1,000	654	654	116	116
£1,000-£900	121	775	22	138
£900-£800	184	959	37	175
£800-£700	313	1,272	63	241
£700-£600	592	1,864	137	378
£600-£500	1,262	3,126	315	693
£500-£450	1,075	4,201	275	968
£450-£400	1,523	5,725	377	1,245

In comparing the number of cars in use with incomes at the different levels, allowance must be made for cars used exclusively for business purposes and the (much larger) number used partly for business and partly for pleasure. A considerable number of private cars must be chargeable against Schedule D assessments of business

General Motors CHEVROLET

profits and this fact alone makes any conclusion from a comparison of cars in use and the distribution of incomes rather tentative. On the face of the figures, there seems to be a substantial number of people with incomes below £600 a year who are running cars.

Some evidence in support of this conclusion emerges from a regional analysis of new registrations in recent years. This suggests that the smallest proportionate increase in vehicles registered from 1938 to 1950 was in county boroughs and the urban counties of London, Middlesex and Surrey, and the largest increase among the counties, and particularly in counties of a rural character where incomes generally run lower.

If it is true that families of modest income can afford a car despite high prices of new and second-hand cars and high running costs, the large number of families in the £600-£500 a year bracket and in the £500-£450 bracket represent a potential market which might be developed at a lower level of costs. The largest element in the cost of car ownership is taxation. A car with a retail price, excluding purchase tax, of £500, run for 7,000 miles a year at 30 miles per gallon, and written off over eight years costs about £125; to this taxes add £80

—more than 60 per cent. A similar sum for a car costing £315 and doing 38 miles per gallon shows a cost of £90 a year plus £57½ per cent for taxes. These are reasonable estimates of the cost of motoring in a new car. In normal times, when second-hand prices are in sensible relation with prices of new cars, the less affluent can

Vauxhall WYVERN

obtain their motoring by buying second-hand cars, to suit their requirements; by such means, and by motoring less than 7,000 miles a year, those with marginal incomes can become motorists.

If the number of owners of cars is to be increased, the present heavy burden of taxation will have to be reduced. Taxation now adds about 60 per cent to the cost of motoring; and yields about £335 million a year—ten times the Exchequer's contribution towards the roads. If all forms of taxation on motoring were cut by three-quarters, reducing the burden to no more than 15 per cent, the motorist would still be contributing a full share to the upkeep and improvement of the roads. If, in addition, the motor industry provided a vehicle that would give the most modest motor car at the lowest cost, a further reduction of 10 or 20 per cent could be expected in the cost of motoring. The total cost of ownership might be brought down, both for the new car buyer (if he bought the cheapest car offered) and for the second-hand buyer, to little more than half of the present cost. A really ultra-economical car produced on a scale comparable with American practice would make economical motoring possible to millions, in this country and abroad, to whom the idea of owning a motor car is now utterly remote. In that event, the potential volume of motor car exports would far outstrip the present figures.

For fifty years, motoring has been over taxed. Motor cars have been treated as if they were "visible symbols of the selfishness of arrogant wealth." That attitude largely explains the wasted years between the wars, when the development of the motor industry and of roads was strangled by taxation. If, instead, automobile develop-

Ford ZEPHYR

ment had been encouraged, some millions of man years wasted in unemployment might have been used to good account, and by 1939 this country would have been equipped with a greater engineering industry, a fine road system, a stronger balance of payments, and a significantly higher standard of living. A policy of encouragement could enable the industry over the next thirty years to play a part in the affairs of the nation comparable to the contribution of the automobile industry to American life.

When the artist's vision — the craftsman's touch —
are thus united, the already broad field of human experience
is both extended and enriched.

ROLLS-ROYCE

THE BEST CAR IN THE WORLD

ROLLS-ROYCE LTD., 14-15 CONDUIT STREET, LONDON, W.1

This study of Sarah Siddons, most celebrated actress of her time, shows the touch of Gainsborough at its most masterly. Reproduced by permission of the Trustees of the National Gallery, London.

Announcing important new developments

on the **BENTLEY** sports saloon

The Bentley Sports Saloon now presented incorporates many improvements and additional features. A lengthened chassis enhances the appearance already improved by re-styled body work; luggage space has been increased to double the capacity of previous models; modifications to rear suspension add to comfort and the recently introduced 4½ litre engine still further improves performance. These modifications and the introduction of hot and cold air de-misting equipment are only a few of the additional features now incorporated in the Bentley.

BENTLEY MOTORS (1931) LIMITED, 14-15 CONDUIT STREET, LONDON, W.1

A Conspectus of Cars

VISITORS to the motor show which opened at Earls Court this week will find a cosmopolitan range of cars. German cars are not represented, but this exception apart, the leading motor manufacturers are showing cars from Canada, the United States, France, Italy and Spain. Earls Court provides an opportunity for measuring the British products against those of their overseas rivals—not in terms of sales achieved, for these are governed by currency regulations and import restrictions as much as by competitive efficiency, but in terms of price, performance and style. The twin tables on page 272 of this article sets down the leading characteristics of the more important British cars, and of a representative selection of American and European cars. Most of the figures in this table are derived from the reports on road tests published by *The Motor*, by whose courtesy they are used here.

Size as a Factor

When the European makers base their plans on attracting a mass market for their cars, they must allow for one most important element—that of size. American motorists want, and commonly manage to afford, cars as big as they can conveniently use. The standard car, whether cheap or dear, will carry six persons and a lot of luggage smoothly and almost silently. For the ordinary motorist in the United States, bigger size or better performance, even if it cost nothing, would add scarcely anything to the convenience and utility of owning a car. He can, at some increase in cost, get a larger car of even more splendid appearance, with fiercer acceleration and greater power. Alternatively, at a similar or very slightly lower price (and facing a bigger loss on resale) he can obtain a rather smaller car, which will probably be easier to handle provided that the driver is prepared to shift the gears himself instead of relying on an automaton in the gear box. But for the ordinary motorist any deviation from standard is likely to mean less good value for his money.

It is possible to predict with some confidence the probable line of development of the American standard car. Automatic transmission is at present an optional extra; in spite of the enormous investment of money and brains in the development of low-cost automatic systems, they still add about 10 per cent to the selling price and inevitably increase fuel consumption. But the strong preference of the American public for automatic transmission is most tangibly shown by readiness to pay for it; such systems seem bound to become standard equipment within the next three or four years. This week's announcement that Rolls-Royce have decided to instal the General Motors' automatic transmission as an option for overseas customers suggests that British developments in this field are much less far advanced. Power-assisted steering is now being offered as an extra on the heavier and more expensive cars, and power-assisted brakes, too, may in time become common for the standard saloon car. In respect of size, however, the American manufacturer seeking major markets has to forgo nothing of the ideal in order to keep the price of his product within the reach of his customers' pockets. This is one of the most important elements in the enormous strength of the American automobile industry.

But only the North American market has that character. Car makers outside the United States have a far more complex problem: How large a vehicle can the largest possible number of customers afford? The tables show the diversity of answers to this question.

The Cruiser Weight Answer

Immediately after the war, when the archaic horsepower tax was abandoned, opinion in Britain favoured a car to seat up to six persons, but with smaller power and weight than the standard American car. By concentration on a cruiser weight vehicle of this size—with corresponding uniformity of components—manufacturing costs, it was argued, would be brought so low that the cruiser weight vehicle would earn the leading place in the world's markets outside the United States. The *Standard Vanguard*, the *Ford Zephyr* and *Consul*, and the *Vauxhall Velox* and *Wyvern*, are the natural expressions of postwar thinking.

The *Standard Vanguard* was the first to appear, with a four cylinder 2.1 litre engine and a kerb weight of 24½ cwt. Ford and Vauxhall re-equipped their plants more extensively and although their new models were thus delayed, they may have gained valuable savings in the weight and in the man-hour cost per vehicle. These two companies have produced answers of extraordinarily close similarity. Both have overhead valve engines of 3½ inch bore and 3 inch stroke, a six-cylinder version for the more expensive, a

VOLKSWAGEN

four-cylinder version for the more economical. In each case the six-cylinder version is about one cwt. heavier than the four cylinder; and it may be guessed that the additional cost is less than £20. The Ford cars weigh each about one cwt. more than the corresponding Vauxhalls; the interior dimensions of the Vauxhall are very slightly more generous and the economy slightly greater; the Ford engines develop rather more power, at all events at full engine speed, than the Vauxhall, and thus give a slightly better performance at higher road speeds.

Vauxhall, which in prewar days never produced an 8 h.p. car when four of the "Big Six" probably found that this was the size in greatest demand, can hardly contemplate a major effort in this range. This company's facilities at Luton have been severely limited by Government policy; and it has opposed any suggestion of setting up plants elsewhere—in notable contrast to the policy of its parent, General Motors, which has tended to favour dispersed and smaller manufacturing units. The Luton plant also builds a considerable, and highly successful, range of commercial vehicles; Vauxhall's output may account for 40 per cent of the total.

**THIS YEAR
 OF GRACE
 SPACE
 PACE**

Enhancing British prestige by yet another year of success in international motoring events, Jaguar Cars are meeting with ever increasing acclaim in the World's markets. In the past year 83% of all Jaguar models were sold overseas, bringing to Britain no less than 10 million dollars as part of their great export earnings.

THE FINEST CAR OF ITS CLASS IN THE WORLD

See the actual record-breaking Jaguar which exceeded 100 m.p.h. for 7 days and nights, on the JAGUAR STAND 168 Earls Court.

Five-Star cars are Exciting

CONSUL

* The Motor says...

PERFORMANCE

ZEPHYR-SIX—“Outstanding performance... the engine turns with really electric motor smoothness... will out-accelerate any car in its class.”

CONSUL—“Good all round acceleration... very smooth... conforms to an acceptable standard of silence.”

COMFORT

ZEPHYR-SIX—“Will carry six people in comfort—with room to spare.”

CONSUL—“The Front suspension is unique... an extremely comfortable ride... good bump absorption... an entire absence of pitch or float.”

SAFETY

ZEPHYR-SIX—“Accurate and sensitive steering... potent braking system... very safe.”

CONSUL—“Tenacious road holding... on corners... ease of control... the steering is notable for lightness.”

STYLE

ZEPHYR-SIX—“Clean attractive lines... fine styling... sensible lack of ostentatious decoration.”

CONSUL—“That rare vehicle — an everyman's car that is basically good by any standard.”

CONSUL: £470 plus P.T. £262. 12. 3

* The Autocar says...

PERFORMANCE

ZEPHYR-SIX—“A genuine speed of over 80 m.p.h. — will cruise all day between 60 and 70 m.p.h.”

CONSUL—“Full advantage has been taken of modern ideas in design. A quick no-fuss getaway from cold.”

COMFORT

ZEPHYR-SIX—“Roomy without being cumbersome... the interior — neat yet business like.”

CONSUL—“The suspension permits very little roll... riding is level on average surfaces—severe shock is absorbed.”

SAFETY

ZEPHYR-SIX—“The steering — light and very positive... the brakes — powerful yet progressive... visibility is extremely good.”

CONSUL—“The car rides extremely well and has powerful brakes... steering is fingerlight yet definite.”

STYLE

ZEPHYR-SIX—“A very satisfactory car... has a clean external appearance with balance of line.”

CONSUL—“A smart car entirely in the modern style... clean lines and a smooth appearance... one of the outstanding cars produced since the war in the popular class — has handling qualities that would be acceptable on a car of any price.”

ZEPHYR-SIX: £532 plus P.T. £297. 1. 1

Greater Value than ever since price reductions

Ford
★★★★★
MOTORING
THE BEST AT LOWEST COST

Ford, whose products include Fordson tractors and commercial vehicles, have continued to produce their 8 and 10 h.p. cars, which have many common components. The Ford Consul and Zephyr showed—for example, in their completely novel front suspension—that the company was not afraid to depart from established practice where it found advantage in so doing; and when the small Ford appears, it may be hoped that it will be a car of notable overall economy.

When the Standard company decided to devote itself to the cruiserweight car (made with the same engine as that of the Ferguson tractor) it gave up the 8 h.p. Standard, which many good judges held to be the best of the prewar small cars. A “bored-out” version of its engine was, however, embodied in the Triumph Mayflower, which was obviously aimed at a market above the lowest. It is expected that Standard will shortly be producing a car in the smallest class, and aiming at the highest degree of economy. If so, this car will be a very different article from the new Triumph sports car which has been unveiled this week.

Among the Eclectics

The Nuffield Organisation is in a position to get a share of many markets. The two Wolseley models give it a stake in the dearer market; the Riley and M.G., which must have paid off their tooling costs long ago, provide a stake in the sports car market. The M.G. Midget is probably the only British vehicle selling in America at a price that earns a full margin of profit; with deliveries there of the order of 100 a week, it is selling at a rate probably as high as that of any other imported make. In the cruiserweight range, the Morris Six and Morris Oxford provide slightly less ample accommodation than the Fords, Vauxhalls and Vanguard of this class. The performance and economy of the Morris Six is reasonably comparable with that of the Zephyr and Velox though its weight is 3 cwt. or so greater. The Morris Oxford compares similarly with the Consul or Wyvern. The Morris Minor is generally regarded as one of the best current examples of British design and is now much improved by the fitting of the Austin 800 c.c. overhead valve engine.

The principal cars in the Austin range are the A.125, comparable in accommodation with the full size American saloons, the A.70 with a kerb weight of 25½ cwt, the A.40 (19½ cwt) and the A.30 (13½ cwt). The three last-named cover the range of popular British sizes in rather closer steps than some other manufacturers judge to be fully economic. The Austin A.30 has the distinction of being the lightest car made by any of the major organisations. With a weight of 13½ cwt, however, it is still not a car to satisfy the utmost demand for economy. Its weight is almost as great as that of the classic Model T Ford, which had an engine of almost three litres capacity, and more than twice that of the first Austin Seven which at its introduction weighed 6½ cwt. It is 10 per cent heavier than the 4 c.v. Renault; the latter with an engine developing 19 h.p. against the Austin's 30 h.p. gives almost the same performance, and a fuel consumption which shows a 20 per cent economy. It seems likely that the Renault engine, with its modest output, is conservatively loaded and should give a longer trouble-free life than a more heavily stressed power plant. The Renault's low weight evidently follows a ruthless scrutiny of every item, and the use of components specifically designed for

this vehicle without regard to any other. But the mounting of the engine at the rear is an important factor in its lighter weight. The Renault gives passengers as much space as the A.30; but, since the engine occupies the space between the rear wheels, and the lock of the front wheels limits the width of accommodation in front, luggage which the A.30 would take in the boot has to go on the roof of the Renault.

Price reductions recently announced for the Humber Pullman and a new Super Snipe result in a lower price-weight ratio than might be expected in their class; to produce the Super Snipe at a profit for 50 pence per lb must call for notable manufacturing efficiency. The Humber Hawk is a sound example of a cruiserweight vehicle, though at 26 cwt somewhat heavy, and therefore more expensive to build, than the Vauxhall and Ford six cylinder cars giving similar accommodation and disposing of greater power. The Hillman Minx is the Rootes Group's leading contribution among the smaller vehicles. Its good looks must help its sale considerably, and it is not surprising that sales of the Minx in the American market have been nearly as large as those of any other British car. It is noteworthy that none of the principal Rootes pro-

RENAULT 760 c.c.

ducts had overhead valve engines until the announcement last week of the new engine for the Super Snipe; but presumably the substantial investment in machinery and works reorganisation for such a change are under consideration for the smaller engines.

The Top Class

Of the vehicles made by British manufacturers other than the Big Six, the most notable are the Bentley and the Rolls-Royce, and the Jaguar. The two former are designed to appeal to those who are prepared to pay a high price for distinction and for refinement. The recently announced Continental Bentley, with a body by Mulliners, offers a saving of some 3 cwt. on the standard saloon, and a top speed of 115 miles per hour.

The Jaguar Mark VII is the only British car which, at its price in the home market, offers value for money comparable with corresponding cars in the United States. The accommodation is about as spacious as in the standard American saloon car, though the front seats are designed for two people in utmost comfort rather than for three on a bench seat. The performance is a little better than that of the larger American cars selling at a higher price. Its lack of an automatic transmission may well be accounted a virtue by many owners abroad to whom it appeals. In handling qualities and in road holding and braking, on any but the straightest of roads, the enthusiastic driver must find it a better car than any American product. To produce this car, in quantities which by American standards are very small, at a price which enables it to sell on its genuine transportation merits in the American market, is an outstanding achievement of design and manufacture. The new Armstrong Siddeley and Humber Snipe may be regarded as a bid for a share of this market.

European Competitors

In Italy, Fiat accounts for almost 90 per cent of total production and only Lancia and Alfa Romeo are significant among other producers. In the cruiser weight class, Fiat offer two models, the 1900 c.c. and the 1400 c.c., with similar bodies—a policy parallel to that of Ford and Vauxhall. Both versions, however, have four-cylinder engines—the 1900 having a longer stroke, while the 1400 has a stroke/bore ratio even smaller than the present tendency of technical thought would demand. Both engines, however, seem to be inflexible in character, yielding a reasonable output only at a high rate of revolutions—though, as a corollary, they are no doubt able to stand up to continuous fast driving on the autostrade which English engines of comparable size would find punitive.

The Fiat 500 c.c. is a modification of a vehicle first produced some twenty years ago, but it cannot yet be considered an outmoded solution of the problem of a "minimum" motor car. Its weight is comparable to that of the Renault, but the accommodation it gives is much smaller. With an engine of two-thirds of the capacity of the Renault, it gives almost the same power at full speed, but performance at moderate engine or road-speed is definitely less good, and the petrol consumption higher.

New Ideas from France

Among the French cars of medium size, Citroen is an established and yet still revolutionary concept in design. When first introduced nearly twenty years ago, the design was a most notable departure from current practice, with front-wheel drive and a body which took full advantage of the absence of a fore and aft propeller shaft to give a flat floor and ample accommodation. No other private manufacturer in the last forty years has ventured an investment on the heavy scale needed for quantity production on a model so different from what the public had learned to accept. Yet success has kept the design going for twenty years and it is now incorporated in two models. The most notable French competition to the British cruiser weights is the Renault Frigate. This has a four cylinder, 2 litre engine and a body offering fully as much space as the Fords and Vauxhalls. Independent suspension on all four wheels—which no other cruiser weight car in large production has adopted—should give notable road holding. The fuel economy claimed by its makers is surprisingly high, as also is the kerb weight at 24.9 cwt. Current production is said to be at the rate of 130 a day, working up to 250 a day—at which figure the potential output of 60,000 a year might well be higher than that of any British cruiser weight car. It is indeed surprising to find that its price in the French market is lower in relation to weight

What is an Over-square Engine?

A NUMBER of car manufacturers are changing the characteristics of their engines from the conventional narrow bore, long stroke unit shown on the left to one in which the stroke is shortened and the bore widened until both stroke and bore are of equal dimension or, as in some cases, until the bore is in fact wider than the stroke is long—hence the name "over-square." British manu-

facturers for many years concentrated on the use of a narrower cylinder bore and a longer piston stroke—not, indeed, on calculations of technical advantage, but because the old system of motor taxation based on horse-power rating forced them to adopt such dimensions in order to keep the notional horse-power of the engine down to the minimum; the actual horse-power developed from such engines

depended on the engine revolutions, which had to be correspondingly high to secure a given performance. The change to a flat rate of tax has released engine designers from such artificial restrictions. The superiority of the "over-square" over the alternative type of engine is not universally accepted, but it does seem to have certain advantages which make for rather longer engine

life. The piston itself can travel more slowly since it has a shorter distance to move in a given time (1). The diagram shows that the valves can be made larger (2), and the wider bore of the cylinder leaves space for water cooling between the valves that could not previously be contrived (3). The shorter piston stroke reduces the height of the entire engine (4) making for a more compact unit. As a result, it becomes possible to stiffen the components and to lengthen both the main bearings and those on the connecting rod (5 and 6), making for sturdier construction all round.

Over-square designs cannot be introduced without complete re-tooling of existing engine plants when major changes in models are being made, such as those that have recently taken place in the Ford and Vauxhall factories. Apart from these instances in which over-square engines have been adopted, there is a general tendency among other manufacturers to reduce the length of the piston stroke short of adopting a "square" engine.

To some extent, this investment in road transport arises from changes in industrial location. Dispersion from the older industrial areas has meant that for part of British industry there is no alternative to road transport, unless an inordinate amount of packing and handling is accepted. But a second advantage—perhaps greater—lies in its flexibility. Road transport permits saving in packing materials and containers, since the risk of damage is smaller than it is with the multiple handling necessary on the railways. This increase in the cost of packing materials and containers has contributed to the growth of road transport; so has the need for rapid transport to keep factories working smoothly in a period beset by shortages and delays in obtaining materials. Vehicles have also often been required, in this period of full-employment, to bring factory workers from a wider radius, particularly in the newer industrial areas.

*

Road transport since the war has become integrated into the varying methods of production and distribution

of an increasingly large number of firms. For many businesses, purely on the basis of cost, investment in road vehicles pays. It would be even more economic if the road system were brought up-to-date. An example of the benefits that may result from a good road scheme is to be found in the Liverpool-East Lancashire trunk road, completed at a cost of £2½ millions. Half of the traffic on the old roads has been absorbed by this road; it is estimated to save £600,000 a year in vehicle operating costs. According to the British Road Federation, tests have shown that such modern roads allow vehicles to run on 40 per cent less fuel, and in some cases to halve the running time, cut tyre wear by 15 per cent, and reduce expenditure on repairs and maintenance by 10 per cent; and it is argued that, with the right type of roads, operating costs per ton-mile for the heavier type of goods vehicles could be cut by almost one-third. One of the most direct handicaps that poor roads impose is on the motor industry's power to compete in export markets. Manufacturers are producing vehicles that are sold abroad to run at speeds of 50 m.p.h. and upwards; but

Higher Compression and Premium Petrol

The compression ratio of an engine measures the relation between the combined volume of the combustion chamber and cylinder when the piston is at the top, and at the bottom, of its stroke. The smaller the space that remains when the piston is at the top of its stroke, the greater will be the pressure set up in the combustion chamber and the higher the thermal efficiency secured from the engine. The power output of an engine for a given fuel consumption can therefore be improved by raising the compression ratio.

The diagrams, reading from left to right, show what happens when the compression ratio is raised from 6.5 to 1, which was the standard prewar figure, to 8 to 1, which is the present maximum, and then to a theoretical figure of 10 to 1 which represents the probable limits to which a reciprocating petrol engine could

go. Compression ratios can be raised only if suitable fuel is available. Petrol of around 80 octane, which seems likely to become the standard "premium" grade gives its best results at ratios of up to 8 to 1; higher ratios demand higher octanes, and only a change from premium grade 80 octane to aviation grade 100 octane would make it possible to go much above an 8 to 1 ratio. It seems unlikely that petrol of such high octane value would ever be freely available at the pump, and hence that manufacturers would embark on the production of cars with compression ratios beyond 8 to 1.

British manufacturers, however, will now have considerable room for improving the compression ratios of their engines. The majority of cars are designed with compression ratios between 6.8 and 7 to 1 and a few go as high as

7½ to 1. The principal reason why these figures are so low stems from the limitation of pool petrol to 72 octane; and those few manufacturers who designed postwar engines with ratios a little below 8 to 1 had to reduce them when 80 octane petrol was not available. Manufacturers across the Channel have not suffered so long from this limitation of unsuitable fuel, and a number of their cars have been rated up to 8 to 1.

To raise the compression ratio of an existing car is a comparatively simple operation involving the machining of a fraction from the base of the combustion chamber, so lowering it and immediately increasing the compression ratio. Some British manufacturers are about to take this step, but it is a change that imposes greater stresses on the engine, and therefore one that is easier to make on the short-stroke square engines which are sturdier than the long-stroke engines unless, the latter have been specially designed for working at high compression.

Shell X-100 Motor Oil provides the greatest protection against engine wear

When the Jaguar XK120 made history recently by covering 16,800 miles in 7 days and nights at over 100 m.p.h., it gave proof of the supremacy of Shell X-100 Motor Oil. The condition of the engine when stripped down was a remarkable tribute to the protective properties of this great oil.

Whatever the make of your car you can have the same protection from acid-action—main cause of engine wear, that enabled Jaguar to compress over two years' normal motoring into one week.

Ask your garage to drain out your old oil and refill with the correct grade of Shell X-100. If your car has covered a high mileage and the engine has not recently been completely stripped, the oil should be changed again after the first few hundred miles and the filters checked. Winter protection. Acid Action does most damage during

the cold, damp winter months. Shell X-100 neutralises this Acid Action and keeps engine surfaces constantly covered with a tenacious protective oil film.

CHOOSE THE RIGHT GRADE
It is important to get the correct grade of Shell X-100 Motor Oil for your car. Here are the four grades:—

Shell X-100 Grade 20/20W
Shell X-100 Grade 30
Shell X-100 Grade 40
Shell X-100 Grade 50

For worn engines it is usually an advantage to use a grade heavier than that originally recommended when the car was new. Your garage will advise which grade your car should have.

You can be sure of SHELL

**NOW! In 20 minutes...
COMPLETE WINTER
PROTECTION**

Positively no rubbing!

WITH Car-Plate complete winter protection is so easy! Just spread Car-Plate on a clean* car, let dry—then wipe lightly. That's all! No rubbing with Car-Plate! 5/- from all garages and accessory dealers.

Prove it yourself with the 'Raindrop Test'!

Prove for yourself how Car-Plate protects against rain and snow by making this simple test. Just wipe off any surface dirt or dust from your Car-Plated car and see how the raindrops 'bead up' on the clean waxed surface. Water cannot begin to soak into the finish to do its hazing, dulling work.

★The easy way to prepare the finish of your car for a Car-Plate waxing is to clean it super-clean with Johnson's Carme—the quick safe cleaner for all car finishes and for chromium.

— MADE BY THE MAKERS OF JOHNSON'S WAX —

they cannot balance their production with a home demand for the same types so long as the larger commercial vehicles here have to conform with a speed limit of 20 m.p.h.—which in practice means schedules based on 16 m.p.h. and may require 15 per cent more vehicles to be used on the transport system.

No postwar government has lent to the advocates of investment in roads as willing an ear as for example, other public utilities have been able to command. Mr Brunner indeed pointed out last week that electricity since the war has been allowed to spend about 50 per cent more than has been spent on the roads since the

whatever improvements are carried out need to constitute, in themselves, a complete scheme; isolated stretches of first-class road will achieve little more than the present policy of mending and patching. It would certainly be possible to finance the construction of a series of major new road works on the toll principle. Many roads and bridges have been built in the United States on this principle, the most recent being the Pennsylvania Turnpike. The tendency in the United States seems to be to extend this method of road finance in order to supplement the general road building programme undertaken by the Federal or State governments.

★

It may be argued that road users already contribute enough in taxation, both on their vehicles and on their fuel, to provide sufficient funds for any scheme, however ambitious, of new and improved roads. From the economic point of view, moreover, road development requires the same consumption of materials, manpower and other resources, however the finance is found. Private finance of toll roads, therefore, may seem only a rather desperate solution for a problem that clearly should be a public responsibility. Even so, do not the crippling disadvantages from which British road transport now suffers justify radical solutions? Under the present taxation system in Britain, the road user has no influence whatever upon the provider of the track, despite the heavy burden of road taxation that he pays. There seems little ground for hoping, therefore, that in the reasonably near future trade and industry are likely to receive any help in cutting down their transport costs by an improvement of the road system. In these circumstances, it may well be that road users themselves would find it a worthwhile investment to build a network of modern roads, even without government finance.

The case for improvement of Britain's road system, is essentially simple. Much of the effort that industry is making to modernise equipment within the factory and to increase productivity in manufacture is being frustrated by the inefficiency with which its product, at all stages of manufacture, is being transported to and from the works and into consumption. Without a commensurate invest-

beginning of this century. In 1946 the Labour Government approved a comprehensive 10-year plan for modernising the road system, divided into three stages. The first, covering two years, was to catch up with arrears of maintenance accumulated during the war, to improve "blackspots" for accidents and to begin reconstruction in blitzed areas. The second, to last three years, was to complete the work of the first phase and start certain big new construction schemes. Bridges were to be strengthened and congestion in London and other cities was to be relieved. In the last five years of the programme there was to be a thoroughgoing reconstruction of the principal national routes, including a large mileage of motorways. No action whatever has yet resulted from this plan. Even the bare maintenance of the roads has been cut to a dangerous extent, while some £3,500,000 has been spent on roadworks that cannot yet be used because they have been left unfinished.

Even given the apparently unyielding reluctance of the Government to allocate funds for new road work, there may exist an alternative method of providing at least the framework of a system of modern roads. This alternative is the more practicable because of the fact that

Based on a survey made by the British Road Federation in 1949.

ment in roads upon which modern motor vehicles can operate efficiently the whole production process—which ends only when the goods reach the consumer and not before—cannot reap the full benefits of the efforts now being made here and there along the line.

Labour after Battle

THE opening of the new session of Parliament next week will coincide with a new phase in the thinking and conduct of the Labour party. It may not be on balance an improvement, but at least it will be different from the intrigues and indecisions of the past eighteen months. The "Bevanite" struggle, in the form in which it has dominated British politics during that period, is over. This is the implicit admission of the statement published on Thursday in Mr Bevan's own organ, *Tribune*. He has bowed to the orders of the majority of the Parliamentary Labour party; his friends will no longer act as an organised group in open opposition to the decided policies of Mr Attlee and the other members of Labour's front bench.

Mr Bevan's retreat does not mean that the contest for the future leadership of the Labour party has been irretrievably decided against him; still less does it mean that the debate on Labour policy, which underlies the personal struggle for power, is exhausted. But there is a decisive change. The policy debate will now be conducted in different terms and by different methods. The struggle for power will be renewed, but it is unlikely again to take the form of a regular minority protest against Mr Attlee's authority.

This is welcome, if only because it should make Labour politics rather less undignified than they have been since Mr Bevan's friends were freed from such restraints that his presence in the cabinet imposed between 1945 and 1951. But the outsider is concerned with Labour's battles less for their dignity and charity than for their bearing on the party's future policy, whether in opposition or in office. And here the significance of Mr Bevan's retreat is unusually difficult to assess. The controversy has turned almost entirely on personalities and party organisation, not on policy. Both sides have appealed primarily to the party's loyalty: on one hand, loyalty to its present leaders; on the other hand, loyalty to the older enthusiasms and prejudices of socialism. Neither side has ever challenged the other by producing a coherent policy.

The effect of recent events on future policy is likely, nevertheless, to be profound. It follows from the nature of Mr Bevan's work during the past eighteen months. The essence of his achievement is summed up in two facts which are now indisputable: Mr Bevan gained the sympathy of the majority of the rank and file of active Labour party members; he quite failed to gain the confidence of the party's oligarchy, of the trade union leaders, the Labour MPs, the officials at Transport House—the oligarchy of those who bear practical industrial and political responsibilities.

The sympathy of the rank and file was put beyond doubt at the Morecambe conference, by the success of all the six Bevanites who competed for the seven places on Labour's executive committee that are at the disposal of the party's constituency associations. This was the easy reward for eighteen months of propaganda appealing to all the stock emotions and familiar ideas of the party zealots—their desperate

reluctance to believe that an arms race could have anything to do with a socialist foreign policy; their determination to believe that present discontents must have the same cause as the evils they had fought in the thirties; their faith that nationalisation and planning are disappointing only because they have not gone far enough; their hope that profits can always be squeezed more and social services can always be extended a little farther. The one coherent principle in Bevanism has been the attempt to tell the faithful Socialist that the world is still what he believed it to be, with only the very minimum of concessions to postwar experience. For the party workers in the constituencies, the formula has proved to be as successful as it is simple.

On the long view, this may be the depressing lesson of the past eighteen months. In the short run, it is the demagogic nature of Bevanism that has made its retreat this week unavoidable. The doctrine that went down so well in the constituencies was just too simple for Westminster and Transport House. In spite of his evident popularity with their followers, no Labour leaders of any significance climbed on to Mr Bevan's wagon. Even those on the Left who might have been expected to be his natural allies have in fact stood uneasily aside. Mr Bevan as a leader failed to win the trust of any experienced politician. When, therefore, the Right wing of the party decided that his success with the constituencies made a counter-attack essential, it had the support not only of the trade union leaders but also of a large majority of Labour MPs. At the party meeting last week the Bevanites were in effect declared to be guilty of conspiracy, and while denying the justice of the verdict they have felt compelled to recognise its force. For the time being, their activities as a party within a party are over. And if they were resumed, Mr Attlee would now have a recognised code of "loyal" behaviour by which to appeal to the party in the country for their condemnation. It would be foolish to assume that Bevanism is dead, but certainly its renewal in anything like the old form would meet with far stronger opposition than did its inception. Mr Bevan's position may not be hopeless, but it is weaker now than at any time since the general election.

*

Such is the present state of the Labour party. Its obvious advantages, compared with what went before, unfortunately have to be weighed against the two heavy costs that have been incurred. In the first place, Mr Bevan has been weakened only by imposing on Labour MPs a far more rigid discipline than has ever before been experienced in British politics. In this matter freedom should not be confused with democracy. It is not objectionable that within the Labour party the oligarchy has triumphed over the zealous rank-and-file. The case for decision by counting heads applies to the community as a whole, not to a political party. The function of the parties in a parliamentary democracy is to present on the issues of the day a point of view acceptable to about 50 per cent of the electors. That can never be the view of the active ranks of party workers; it must be worked out by the full-time politicians who combine party principles with a lively appreciation of national circumstances and political possibilities. In this sense, a good party in a democracy is necessarily itself an oligarchy. But if it is a healthy party it is an oligarchy with freedom of discussion and respect for the individual conscience.

In fighting Bevanism the Labour party has adopted rules that could be exploited, if power once fell into illiberal hands, on dangerous authoritarian lines.

No doubt this extreme danger is remote, and the party's present leaders intend to use their power as liberally as possible. But the new rigidity and discipline are unhealthy enough even if they prove to be only a slight brake on the new thinking and discussion that Labour so obviously needs. The brake is made more regrettable by the second cost of the battle against Bevanism—the unthinking move to the Left that has occurred in many departments of Labour policy. The orthodox leaders have not ignored the popularity of Bevanism in the constituencies. They have resisted, at least in part and temporarily, its influence on foreign policy—though even there the concession they made on German rearmament was considerable, and there can be no certainty that it is the last. Immediately, the whole party has gone a long way towards Bevanism in its gropings towards a domestic policy. Here the leaders have truly truckled to the rank and file. What Mr Morrison and others had fought against since 1948 slipped into the policy resolutions at Morecambe without protest. The Labour party has expressed its intention of carrying out more "major" acts of nationalisation when it is next in office.

A general declaration of this kind is not, of course, decisive. What happens between now and the next election—in particular, the recurrence or otherwise of crisis conditions—will do far more to determine the Labour programme than any words that have been spoken yet. But a sharp bias towards the Left has unquestionably been introduced. It has been fashioned in the heat of battle with Mr Bevan. It is not based on the fresh thinking that the Fabians and others have set for themselves but have as yet hardly begun. It is not the movement to the Left that in one sense is bound to come as Labour turns to fill the vacuum that had developed before its defeat with some positive ideas. On the contrary, the leftward view that has now gained strength is still that of twenty years ago, of the class war and the omnipotent state. The experience of the postwar years remains undigested.

No one can deny Labour the right to become a doctrinaire Socialist party if it wants to be. But it is not entitled to hold up the processes of government, or in the meantime to abuse the duties of opposition, because it has no clear policy. That is still the chief danger. The generalities about policy to which the party's leaders are now committing themselves are dangerous chiefly because they are to a large extent insincere. It is no secret that many of the men who have for the present defeated Mr Bevan do not want to undertake more nationalisation. They are fully aware that the real task of Labour policy is to find the roads to the expanding national income, to the more rigorous economy, that it cannot yet promise to the country. These are the things that have so far been the real casualties of Bevanism. For a year Labour has been squabbling instead of thinking, and in the upshot it has vastly strengthened the inhibitions against honest thought. It may not be too late to break down the inhibitions again, but men like Mr Morrison and Mr Gaitskell should feel very sure of success before they take any pleasure in the resistance to Bevanism or set any store by its permanence. And it is hard to see any basis for such confidence.

Shades of Himmler

THERE is some reason for gratitude that Hitler's former paratroop commander, General Ramcke, should have chosen to be indiscreet in public. Had he not called the western allies war criminals, had he not boasted that it was an honour to be on the blacklist of civilised opinion, the meeting at which he spoke last weekend might have attracted no attention. That would have been a pity. For the reappearance of 5,000 men of the Waffen SS, marching through the beflagged streets of Verden, enjoying the hospitality of their old, notoriously Nazi garrison town, was an event not to be missed. There had been hopes that Himmler's élite corps would not be heard of again, that the death's head symbol would never show itself again on the streets of Germany. But now, suddenly and subtly, the challenge has been made: to the authority of the allied occupation, to the conscience of the German public and to the moral courage of its government and administrators. It is the first whisper of a question that has barely been asked outside Germany itself: shall men of the SS take part in the defence of Europe?

The incident is of symbolic rather than legal importance; it is only the thin end of the Nazi wedge which the decision to rearm has brought into view. Neither General Ramcke nor the organisers of the rally appear to have offended against German law; the shock troops of the SS, which was branded at Nuremberg as a criminal organisation, have taken care to reappear under cover of a "welfare organisation." Among the men gathered at Verden there were doubtless some who genuinely failed to understand why those initials still stunk in the nostrils of Europe and Russia. Likewise, it is true, there were some decent and deluded men conscripted into the Waffen SS when war had taken its toll of the specially indoctrinated, systematically brutalised guardsmen of the earlier days. And some, at least, of those present at Verden have disavowed all sympathy with General Ramcke's speech and preferred, like Generals Gille and Hausser, devotion to democracy. Yet, when every allowance has been made, there remains the fact that most former SS men find it safe to be proud of belonging to that organisation, for the grave reason that German public opinion has never faced the truth about it. It insists on forgetting the loathsome career of Heydrich, the dreadful "liquidation units" of the SD, the "hardening" of young men by the brutal guard duties of Buchenwald, the systematic extermination of "inferior races," the dedication of these guards to Himmler's vision of a Germanised Europe ruled by a warrior caste.

It is this forgetfulness, this turning aside from the shameful truth that can still corrupt and wreck democracy in the Federal Republic, when it is about to take an ally's place beside its former enemies in Europe. Public opinion, confronted with the ideas and personalities of the past, is still either timorous or cynical. In Bonn itself, in Dr Adenauer's cabinet, permeating a thin layer of enlightened men and women in public life, there is to be found an admirable Christian courage. It has expressed itself in small things and big: in the justice done to the memory of those who conspired against Hitler in 1944; in the compensation—inadequate though it is—to Israel; in the suppression of the fanatical SRP; and in the Chancellor's stubborn and skilful labours to

find a new relationship with France through a united Europe. But it is a stripling spirit, as good German democrats know; and the danger they fear most, as they nurse its strength, is that military revival will bring with it the stealthy growth of a state within a state. It is this spectre that looms up behind the Verden incident. What General Ramcke said matters less than the circumstances in which he said it. Every German is watching to see whether the incipient defiance passes unrebutted.

A spokesman of the Federal Government has expressed regret about the matter. He could hardly do less and Dr Adenauer could hardly do more—for the law has not been broken. The question is now whether the Allied High Commissioners can intervene. They undoubtedly have the power to treat the speech of General Ramcke as incitement to disorder; when the Conventions with Germany are ratified they will retain only the right to protect the security of their forces and to assist the German government against "subversion of the liberal-democratic basic order, a serious disturbance of public order or a grave threat of any of these events." It would be difficult to bring the Verden incident into any of these categories, and it would be unwise to do anything at this time which would turn insolent generals into patriotic heroes and so strengthen the hands of those chauvinistic elements which charge Dr Adenauer with acting as a tool of the Allies. So far as possible German parliamentary democracy must be allowed to assert its own authority against its enemies, and the occasion for doing so must be carefully chosen by the German government.

On the other hand, there are dangers in doing nothing. Most Germans respect authority only when it is backed by force. Some of them will now be saying that it takes a paratrooper to put the foreigner in his place. And the decent democratic minority will watch anxiously to see whether these boasts are true. They have seen a steady flow of war criminals released; they have seen Field Marshal Kesselring, set free by an act of clemency because he is a sick man, accepting—as if nothing had changed in 25 years—the presidency of the Stahlhelm. These events are all warnings to the new German state that freedom may be abused and generosity treated as weakness.

*

There is, probably, little more to be done about this incident than to treat it as a warning. If graver incidents occur London should get its information and decide on its action more quickly. But there are things that can be usefully said, even after some pause for thought. In the first place, British public opinion will not tolerate the revival in any form of the SS organisation. Criticism, even insult, may have to be tolerated; but the reappearance of that "desperate sworn fellowship," as Dr Kogon has called it, must be prevented. How that is to be done is a matter for discussion between the Allied High Commissioners and Dr Adenauer; but that it must be done should be declared publicly. Secondly, no officer or man who volunteered for the SS should be allowed to take any part in the recruitment, organisation and training of the German contingents for the European defence community. It is the prospect that their services

may be needed "against Bolshevism" that has encouraged its members to re-form their fellowship.

It seems to have been overlooked outside Germany that 18 months ago the German Soldiers' League let it be known that its members would not assist in rearmament unless all discrimination ceased against the Waffen SS and all war criminals were released. So far the Verein Deutscher Soldaten has not been called on to make good its words, but the time may not be far off, and it is necessary to face the issue now. It is unthinkable that France and other members of the EDC would allow their serving soldiers—even if they were willing—to work with former members of Himmler's special and shock troops. If no stipulation to this effect exists in the secret military protocols of the defence treaty, the Americans, British and French should consider a joint declaration to the German government that volunteers to any branch of the SS should be excluded from the European Army and that conscript members should be employed only after the most careful investigation.

Such a step would cause a storm of indignation; it would probably cause a political crisis that would delay German rearmament and ratification of the conventions. But it is a crisis better faced now than later. Many Germans who would feel bound to protest publicly would be secretly grateful that they had been relieved of the responsibility of making the first stand against the Nazi implacables. Men and women would be obliged to choose in their minds between solidarity with the past and an honourable determination to make a fresh start. On the allied side, concentration on this single issue would clear the confusion that surrounds the debate on

German rearmament and the treatment of war criminals. About some cases and some trials there have been doubt and controversy; about the condemnation of the SS there has been no doubt at all. If it could be shown that the German Government and the Allies insist on drawing the line somewhere, in maintaining one principle among the compromises that Europe's danger has made necessary, then public opinion would rally more confidently behind the plans to let Germans play a part in the Atlantic community's defence.

Every German who takes seriously the effort to make democratic institutions work in his country knows that the real test will come when his civil authority is called on to control the military. The European Defence Community will provide some safeguards—that is one reason why a number of Germans support it—but the final responsibility will rest with the men in power in Bonn. If the agitation to release and rehabilitate war criminals is allowed to go to the point where the SS re-emerges as a select brotherhood among the cadres of the new German divisions, irretrievable harm will occur to Germany and to the West. The arguments for restoring sovereignty to the Western Germans and for rearming them within freely negotiated limits are still strong; and it is equally clear that a German government cannot be strong if it is dependent on the former enemy. But there must be a policy for dealing with the risks of military revival, which are as apparent to Dr Adenauer and his advisers as they are to Germany's western allies. The Verden incident may not be the occasion for action now, but it is certainly an occasion for thought and consultation about action later.

Comment and Defamation

MR HAROLD LEVER'S Bill to amend the law of defamation received the Royal Assent this week. In its career, which began last December when Mr Lever won first place in the ballot for private members' Bills, it has experienced almost as many escapes from disaster as the heroine of an early film serial. In committee, it sometimes failed to find a quorum; when it did, it was deluged with amendments. On its third reading in the House of Commons, it beat the clock by no more than four minutes. In the last week of the Session, the House of Commons refused to accept all the Lords' amendments, and the Bill passed its final stages only because the Lords did not insist. But in the end virtue has triumphed; and in the case of this Act, the virtues are considerable.

In general, its effect is to relieve the British Press from the burden of anomalies and inconsistencies that have developed since the law of libel was last amended some sixty years ago; it also clarifies the liabilities of those responsible for broadcasting. At the same time it makes other useful but comparatively minor changes in the general law of defamation. The Bill as introduced was based on the report of the Porter Committee, published four years ago, and its substance has not seriously changed during its hazardous ten months before Parliament. The changes made by the Act can be grouped under four heads: the protection given to newspapers when reporting what is said on occasions of public interest; "unintentional" libel; the defences of justification and fair comment; and broadcasting.

Newspapers have an absolute privilege in reporting

what is said in Parliament and in the Courts of this country, however defamatory of an individual those statements may be. They also have a qualified privilege in reporting what is said at some public meetings; the qualification is that the report, besides being accurate, must be made in the public interest and published without any wrong motive or malice. These privileges are essential if a newspaper is to keep the public informed of what is said and done by public bodies of every kind, but the list of public meetings to which this qualified privilege applies was drawn up in 1888 and there have been some remarkable changes in the shape of public administration since then. The new Act makes two important changes. It leaves the occasions of absolute privilege untouched, but it splits up those where a qualified privilege exists into two groups. In the first are all proceedings in Dominion legislatures and courts and in international organisations of which this country is a member. Qualified privilege applies to reports of these, as now. In the second group are the public meetings of most domestic bodies in this country, including the general meetings of public companies (the full list is given in the schedule to the Act). A qualified privilege is given to such reports, but the privilege will be lost if the newspaper fails to publish such "reasonable" letter or statement in explanation or contradiction on being required to do so by any person who claims that he has been defamed in the report. This right to reply, and to secure the publication of the reply, is new.

The next two changes in the law, over the pleas of

"fair comment" and "justification" in reply to what is said to be a libel, give additional protection to newspapers—on the face of it, from their own mistakes. Comment is as much the business of a newspaper as news and, just as news should be fact, comment should be based on fact. But no human organisation can escape making some factual mistakes. The press has always claimed that provided a newspaper proved that the substance of the statement complained of was true, it should be entitled to the verdict. The Courts became unfair to the press when they ruled that one untrue statement in an article containing comment could destroy the efficacy of a defence of fair comment. Sections 5 and 6 of the new Act restore the balance. If the comment is fair on the basis of what facts are proved to be true, the defendant's plea will be accepted. Similarly, where a defence of "justification" is made, inaccuracy in some facts will not invalidate the defence if what is proved to be true is enough to do substantial damage to the claimant's reputation.

★

An "unintentional" libel as defined by the new Act is the publication of allegedly defamatory words "innocently in relation to" the person who claims that he has been defamed. The phrase is clumsy, but it is hard to define the situation in any other way. The most celebrated instance of an unintentional libel is the case of Mr Artemas Jones. A newspaper published a slightly scandalous account of the goings on of a fictitious character, who was given the name of Artemas Jones. The Court's ruling was that, even if the newspaper did not know that a Mr Artemas Jones existed, the article was libellous of the real Mr Jones. Ever since this case, newspapers have been in danger of being penalised for excusable ignorance as well as for carelessness or error. Under the new Act, anyone who publishes what he claims is an innocent defamation may offer to "make amends," which involves publishing a correction and apology, and he must be prepared to put on record in a sworn statement all the facts which, he says, establish his "innocence." If he has offered the amends and is successful in proving his innocence, he has a defence to an action for damages based on the defamatory words. The section of the Act creating this new defence is one of the most involved in it, and the Courts may well be called upon to interpret its meaning; but at least newspapers now have some defence against the purely gold-digging action—and, even more important, against the threat of it.

The fourth group of sections deals with broadcasting. Section 1 makes defamation in a broadcast a libel, not a slander. Section 9 gives the news broadcaster transmitting from a station in this country the same protection that a newspaper has, and Section 16 limits that protection to broadcasts for general reception.

The Act makes a number of other amendments to the general law of defamation. A person slandered in respect of his office, profession or business need not prove that he has suffered actual monetary loss before he can recover damages. A parliamentary or local government election candidate no longer has a qualified privilege over what he says about his opponents, and a defendant in a defamation action may reduce his own liability by showing that the claimant has already recovered damages for the same words from someone else.

Much of Parliament's discussion of the Bill concerned

points that do not appear in the completed Act. One was whether the Court of Appeal should be given the power to cut down excessive damages awarded by a jury to a successful claimant; this was pressed by Lord Jowitt in the House of Lords. It was argued in reply that juries give excessive damages in cases other than libel actions, and that the powers of the Court of Appeal ought to be considered separately in another Bill. This is a fair answer provided that Parliament finds time for such another Bill. Its record over the Porter report itself is not encouraging. Another debatable subject was the "group" libel. The civil action of libel is an action by an individual to recover damages for the loss he has suffered. A prosecution for criminal libel is based on the belief that the person libelled will be provoked by the libel into a breach of the peace and that the libeller should be punished for his provocative words. Neither quite meets the case of a defamation of racial or religious groups. The group libel clause for this Bill, as originally moved by two Labour MPs, would have created a new criminal offence—that of publishing anything calculated to bring any body of persons, distinguishable as such by race, creed or colour, into hatred, ridicule or contempt. An amendment moved by Lord Silkin would have given each member of the group defamed a personal civil right of action, but exercisable only with the consent of the Attorney-General. Both proposals failed to win majority support, partly because a criminal libel prosecution is still something of a safeguard, partly because of the extreme difficulty of finding any set of words which would not limit freedom of speech far more seriously than anyone wished.

★

The Act does not make any revolutionary change in the law of defamation, save possibly to establish that a newspaper in some cases may—and in other cases must—offer space for reply or correction to an individual it has chosen to write about. The Attorney-General claimed for the Act, in the opening debates in Parliament, that it restored the balance between the writer and the publisher and the person written about. That is its real value. Freedom of speech is always a matter of balance, of taste and responsibility as well as of law, and if any one ingredient gets out of balance it is the public that suffers. The press may muck-rake, but so did Florence Nightingale and Elizabeth Fry. The press may make money for its proprietors but, then, so did John Wilkes, for himself. If the press could have written more freely about the activities of Mr Stanley before the Lynskey Tribunal began its hearings, many people, including some of those who suffered most in the investigation, would have had every reason to be grateful. There is nothing in the Act which weakens the duty of the press to take care. What the Act does do is to minimise some of the consequences of the disability the press shares with the rest of the community—its inability to be omniscient.

The Defamation Act, 1952, joins the small group of private members' measures that have brought about some definite improvement in some specific section of the country's laws. It joins Sir Alan Herbert's Matrimonial Causes Act, 1937, and the late Miss Ellen Wilkinson's Hire Purchase Act, 1938. If it is not risking serious embarrassment to say so to a Labour MP at the present time, Mr Harold Lever has certainly earned the gratitude of the press of this country.

Western Stakes in North Africa

THANKS to a vote in the United Nations Assembly last week, two complaints against French policy in Tunisia and Morocco launched by the Arab-Asian bloc are rated as urgent and are to be discussed directly after the debate on the war in Korea. All that need be said about their high place on the agenda is that it implies that there is in North Africa a threat to peace, which there is not. The votes in favour of urgency were inspired by extraneous motives in every case save that of the Arab-Asian plaintiffs, who feel a duty to keep needling the one major colonial power that survives in Moslem territory. The Soviet bloc voted in order to make trouble for a western power. The United States also voted for it; it has since officially explained to France that the American delegate, Mr Gross, made a mistake. But Mr Gross is a diplomat of experience; he may have conceived the order of the agenda as unimportant compared with the tactical advantage of lining up alongside the Asian members in the hope of influencing their votes on the Korean war.

If this was American reasoning, it left out of account a major interest of the United States to which attention is only now being drawn. French North Africa constitutes half of the south coast of the Mediterranean. Its tranquillity is vital to the security of the area. Its air

bases, some of them already manned by Americans, are the lifeline to Nato's south-eastern outposts in Greece and Turkey. To stimulate its nationalists into unpromising attitudes by giving their case against France such high priority is to reduce the chances of bringing them to amicable agreement. His vote, of course, incensed France, which is easily able to prove that its men and money have brought immense material benefits to the Tunisians and Moroccans. France can also prove, both by statistics and by evidence for the eye, that it has done more to improve the lot of the poorer classes than has any independent state of the Middle East. No North African Moslem believes this, but it is immediately apparent to any dispassionate person who walks through the slums of Cairo and Baghdad and then through those of Tunis and Algiers. France's current reward for its efforts is the complaint by Tunisians that the posts for which they have been educated have been usurped by Frenchmen, and the complaint by the Moroccans that a policy of leaving their institutions intact has channelled the whole modern development of their country into French hands.

There is substance in these African grievances, but they are not topics on which other tutelary powers, who themselves have created similar grievances elsewhere, are entitled to indict French policy. In the last year, however, French decisions in both Tunisia and Morocco have caused justified exasperation in the western world, a feeling that has been reflected in both American and Turkish voting at Uno. A year ago both these Governments—allies of France in Nato—acceded to M. Schuman's plea that the Moroccan question did not warrant discussion by the Assembly, since it was in process of solution by direct negotiation with the Sultan. Six months ago both of them deprived the Arab-Asian bloc of the support that it needed for lodging the Tunisian complaint before the Security Council. But, this October, both voted to place the two issues on the Seventh Assembly's agenda. The change is significant.

The tale of events in Tunisia and Morocco that caused them to change their decision has been told in these pages. The main conclusion it shows is that the perennial conflict between the claims of North African nationalist and European settler, which are championed in Paris respectively by the Socialists and the Radicals, has a particularly damaging effect whenever a coalition cabinet in Paris needs the support of both parties. French policy in both Morocco and Tunisia has wavered for over a year, either oscillating between concessions first to one faction and then to the other, or else postponing necessary decisions. This failing has produced some disastrous results. It has given latitude to the men on the spot in North Africa to frame policy according to personal taste—sometimes violent and near-Nazi, sometimes would-be seductive but flabby. A Paris policy that is itself short-sighted has never directed the settlers to look ahead. It has made friendly Africans despair of France's ability to grasp that they have grown up and need a different relationship; it has united all sectors of African opinion—rulers, nascent bourgeoisie, proletariat—as never before.

A majority of the settlers, and many people in France also, do not accept these facts. They still believe that it

is possible to divide the Tunisians and Moroccans into a ruling class that needs to lean on France for survival, and a proletariat that obeys a few ringleaders but is good at heart. They still believe that French policemen have only to manhandle and deport these ringleaders, and all will go on as before. Two notorious incidents confirm this analysis of their attitude: one was last year's "March on Fez and Rabat" (whereby the Resident General in Morocco, then Marshal Juin, tried to remind the Sultan that without France his throne was still vulnerable to Berber animosities); the other, this year's arrest by the Resident General in Tunisia, M. de Hautecloque, of the whole of a Tunisian cabinet because the Bey refused to dismiss it for sending an emissary to Uno. Both events are proof of French failure to assess the strength of an emotion that now suffuses the whole free world of Asia and Africa.

Frenchmen full of good will towards the Tunisians and Moroccans are also handicapped by the rather different political position prevailing in Algeria. The three northern provinces which form its hard core are run as an integral part of France; they contain over a million French settlers, some of whom are Algerian to the fifth generation. Algeria's Moslems have since 1947 been French nationals and, subject to an educational qualification, have a vote for the French Parliament. Both in outlook and in management, Algeria is different from the protectorates, and France has natural misgivings lest alterations in the status of the latter should cause domestic upheaval in Algiers. Yet, if these considerations are allowed continuously to delay the internal autonomy promised to Tunisia and Morocco, their peoples will seek other champions.

There are only two ways out of this dilemma. One is to do what Marshal Juin seems to wish: to proclaim that Nato security in North Africa is assured so long as sufficient forces are kept there and no notice is taken of nationalist grievances, whether voiced locally or before the United Nations. The other is to remind the settlers that France keeps its promises, that autonomy for Tunisia and Morocco is therefore inevitable, and that Frenchmen who wish to go on living and earning there must either propose a system whereby they are represented in purely Tunisian and purely Moroccan institutions—for instance, by means of some device giving them double citizenship—or else must reconcile themselves to living there as foreigners. Any half-measures, such as attempts to hang on to privilege, harm not only France, but also Nato, because they diminish security by forcing the Moroccan and Tunisian nationalists into an eastern

as opposed to a western connection. The objective both of France and of the Nato powers ought to be to vest these people with the dignity of an African and Islamic identity and to enlist them as active and willing allies.

The tragedy in the sequence of events that has brought the two topics before Uno is that the French cause will not benefit if a debate is held in which its case goes by default, because M. Pinay's government regards the matter as one of domestic jurisdiction. Indeed, the chances of compromise will be reduced, for the North Africans will increasingly feel that their best friends lie eastward, and will also feel more inclined to strike attitudes from which it is difficult to retreat. The

only way to stop this unhappy train of events would make great demands on French statesmanship. It would mean renouncing the case for domestic jurisdiction, which is in any case thin in protectorates which have sovereign rulers; it would mean allowing those members of the Cabinet who think the time has come for major treaty revision in both Tunis and Morocco to prevail over those who cling to outdated forms; and it would mean using Uno as a forum for expounding France's past work and present intentions, including the time-table (never yet laid down) whereby the promised autonomy is to be secured. Such a step would ask a very great deal of a cabinet and Parliament which are raw from experiences in Indo China, and hyper-sensitive about pressure from Washington. It may be asking too much; but there is now no other discernible way of securing a vote that will align a majority of Tunisians and Moroccans where, if treated with understanding, they want to be—in alliance with France and the West.

Labour's Greater Share

Though labourers may have been to the present period redundant, it has been our duty, nevertheless, for a considerable time past, to record, quarter after quarter and year after year, with rare exceptions, an increasing number of marriages as well as an increasing number of births. At the same time great attention has been paid to the improvement of the public health; and though our faith in the success of the Sanitary Association, the Board of Health, and the Sewers commissioners is not very strong, they can hardly have made their great clatter for several years, stirring up parish authorities to abate nuisances and whitewash houses, without having effected some trifling improvement in the sanitary condition of our towns. What they have been attempting to accomplish, has, at the same time, been more certainly promoted by that freedom of trade which has allowed the people . . . to get a more abundant supply of food than formerly. . . . Far, therefore, from entertaining any apprehension of a want of people from the present emigration, we are inclined to regard it as a relief. . . . When it is said that wages are rising, and that the cost of railways and of agriculture will be increased, it is not meant that there will be increased difficulty in making and maintaining railways and cultivating the ground than at present—it is not implied that labour will become less efficient or less intelligent. What is meant is simply that the labouring classes will get a much larger share than hitherto of the produce of labour. . . . It is not supposed either that less work will be done or less wealth produced; on the contrary, emigration implies, in the end, a more profitable employment of labour, greater enterprise, and greater production. All these things imply a great coming change in the relations of different classes, which will gradually affect the distribution of property, make many present arrangements of little use, and some it will altogether extinguish.

NOTES OF THE WEEK

Peace and Honour

In the twenty-eight long months since the first Communist invasion of South Korea, the reason why the United Nations went to that country's help has become blurred in many people's memories. In an able speech at the UN Assembly last week, Mr Acheson wiped off the blurs and left a clear picture. He reminded the representatives of sixty nations how, ever since 1946, the Russians had rejected every move towards the reunification of Korea on the grounds that it violated "the absolute authority of the Soviet Union in the northern zone"; how they repelled the UN commission sent to Korea by the Assembly under a decision taken by 43 votes to none; how 53 nations had supported the Security Council's decision to help defend Korea, while only the Soviet bloc opposed it. He recalled that at the time of the invasion there was still a UN commission in Korea, and that it had reported unanimously that South Korea could not possibly have been the aggressor. He contrasted the small and lightly armed forces that South Korea had in June, 1950, with the aggressors' large conscript armies, equipped with tanks, aircraft and heavy guns, with Soviet advisers down to battalion level, and backed by universal military training.

The Secretary of State was equally lucid about the truce negotiations. He cited the United Nations Command's aims in these talks: to stop the fighting once the aggressor had been repelled; to guard, as far as possible, against further fighting; and to bring about a fair exchange of prisoners. The Command had successively agreed to let the Communists repair airfields during the truce, to accept Poles and Czechs as members of the supervision group, to let Communist teams verify prisoners' refusal to be sent north, and to deliver all prisoners to a neutral area where they could freely choose whether to go north or south. But it could not use force to hand unwilling prisoners back: "We cannot buy peace at the price of honour."

Mr Acheson's dispassionate review made a strong impression on the Assembly, and Asian delegates were particularly interested in his point that the UN Command, although opposed by Communist forces operating from China, had limited the conflict to Korea and intended to continue that limitation. Mr Acheson is to be congratulated on telling the naked truth about Korea. His speech has been criticised as too uncompromising and likely to frustrate unofficial attempts to shift negotiations from Korea to a suitable capital. He was, on the contrary, fully justified in surrendering no part of the substance of a strong case for the shadow that has been flitting around the UN corridors.

Khartoum, Cairo and London

For the first time for very many years an Egyptian statesman has publicly given Great Britain the benefit of the doubt. General Neguib has had the broadmindedness to agree with certain notable Sudanese, whom he has been entertaining in Cairo, that a proposition which has British blessing—the Sudan Government Statute—is a disinterested and forward looking piece of policy. He agrees to work it, subject to some amendments on which he and his Sudanese visitors have agreed.

The constitutional position regarding the Statute was described in *The Economist* of September 27th. Each of the two co-domini had the right to comment on it before November 9, 1952. It provided for the period between the inauguration of self-government and the exercise of self-determination, and laid down that, during that time, the British Governor General should be head of the state.

General Neguib agrees; but he lays down two limiting conditions. The Governor General must be "advised in the exercise of his functions" by a commission of five—one British, one Egyptian, two Sudanese and one Indian or Pakistani. If any decision of theirs were to "conflict with his responsibilities," he must refer the matter to both co-domini, as he must also do in matters of foreign affairs.

Great Britain has never recognised the act whereby the Wafd unilaterally denounced the condominium agreement, and Egypt therefore has a right to a say in the Sudan's future. During the steps towards self-government which have taken place since 1948, it has hitherto consistently refused to play its part as joint ruler, because its king proclaimed sovereignty in the Sudan; meanwhile its leaders accused Britain of going ahead with plans for Sudanese independence out of imperialist motives. General Neguib has had the moral courage to drop this futile attitude and to work for better relations not only with Khartoum but with London.

The agreement was reached only on Wednesday night. First comments from Khartoum, coming in as *The Economist* goes to press, suggest that it may not find universal favour there. Some Sudanese factions feel that the chief Sudanese signatory, Sir Abdel Rahman el Mahdi Pasha, has no right to speak for the country as a whole. They would be foolish to let this emotion stand in the way of a proposal that is so much to their national advantage. Some of the British citizens on the spot are said to be nervous for a different reason—lest the loophole for reference of so many of the Governor General's duties to both co-domini means a return to a familiar stalemate. Their trouble is that over the years of Egyptian boycott they have let themselves forget that the Sudan is a condominium. The proposals now made may not work with the smoothness of a one-man show, but at least they are workable, and it is General Neguib's turn to be given some credit—credit for the intention to work them well.

Conservatives Gain Favour

The voters of the Cleveland division of Yorkshire have earned more attention than has been given to them. They have made it possible to question the stock assumption that Mr Churchill's Government is unpopular; they may even have indicated that the assumption is out of date.

As by-elections go, the polling at Cleveland last week was fairly high—71.3 per cent of the electorate, compared with 85.1 per cent a year ago. It is therefore surprising that the Labour majority was reduced by as much as 1,560. Indeed, the Conservative candidate gained a slightly higher percentage of the votes cast than was given to him at the general election—45.9 per cent instead of 45.2 per cent. Technically, therefore, the evidence of Cleveland is that in the past twelve months there has been a swing of 0.7 per cent of the electors from the Labour to the Tory side. It is not, of course, evidence that can be accepted in itself. By-elections are never a safe indication of the way people will vote when the next government is at issue; at Cleveland the Labour organisation may well have been over-confident; while the Labour candidate was new to the district, the Conservative had fought before—in short, one straw certainly does not establish the direction of the prevailing wind.

But when all these allowances have been made, it remains fair to say that a few months ago most people would have judged it to be inconceivable that the Tories should do as well as they have done at Cleveland. A more reliable indication of the general opinion of the country will be provided

next week by the marginal constituency of High Wycombe, which the Conservatives gained narrowly from Labour last year and where the by-election will be nearer than usual to the mood of a general election. But unless Labour regains this seat by a sweeping majority, it is reasonable to conclude from Cleveland that people are at any rate a little happier about the Government than they were—though it may be only because they have had their summer holidays.

Engineers Are Polite

The executive committees of the shipbuilding and engineering unions, which met again on Wednesday, voted by a majority of ten to one that the employers' offer of 7s. 4d. a week (7s. 6d. in shipbuilding) was "inadequate;" they asked for a renewal of discussions. After all their fire-eating and threats, it was hardly to be expected that they should joyfully accept the employers' offer; and sponsored as it was by the Amalgamated Engineering Union, on whose initiative the claim for £2 a week was first put forward, the resolution was almost mild in tone. The Communist-inclined unions—the Electrical Trades Union and the foundry workers—put forward a resolution demanding that the long-threatened ban on overtime and piece-work should be imposed immediately; but this was rejected by a substantial majority. On a resolution urging acceptance of the offer, almost one third of the votes were cast in favour. It is fair to guess that the confederation would be glad to settle for another halfpenny an hour added to the present offer of 2d.—that is, for 9s. 2d. a week. If the employers will not offer that, the ban on overtime may yet be enforced. But it is clear that the unions have sobered down a great deal.

The change of heart has two causes. The engineers are bound to be influenced by what is happening in other industries. All three railway unions have now accepted the railway tribunal's award of 7s. a week; and this week the miners' demand for an increase of 30s. a week was turned down by the industry's arbitration tribunal without any award at all. An even more important influence for moderation has been the fall in exports. The returns published last week must have been sobering enough. The announcement on Monday that more cars are to be released for the home market, coupled with talk by the chairman of the Austin Motor Company about the "horrible spectacle of unemployment," may also have promoted caution. The engineers can no longer persuade themselves that because rearmament is in their hands they can get all their own way.

Kenya Crossroads

There are signs that the Kenya emergency is being treated by some people as a test case of British colonial policy. On the one hand are those whose attitude may be summed up as follows: this is what comes of giving political advancement to people who are not ready for it; stop talking about constitutional reform and racial parity on the Legislative Council, and get on with plans for economic and social development. On the other hand are those who are anxious lest the repressive measures that the Kenya Government has been obliged to take will be maintained by pressure from the European settlers when the emergency is over; lest, in the meantime, they have the effect of driving the mass of Africans to the extremists' side and of losing the Government the support of the moderate African leaders.

Both points of view were clearly represented in the House of Lords debate on Wednesday. To some extent the first is the view of the Conservatives and the second of the Labour party. To some extent they merely pose in another form the old issue of good government or self-government; and to some extent they are both perfectly right. Whether or not

economic grievances are a major factor in Mau Mau's campaign of violence, the growth of a landless, homeless, workless African class must be a continual source of danger. The Governor's programme of economic and social measures, which he announced in the Legislative Council this week, is therefore to be welcomed. Among short-term measures he laid special emphasis on African housing and on bringing new industries into production.

But those who urge what may be called the political solution are equally right in protesting that all these measures, however vigorously pursued, will be of little avail if Mau Mau terrorism leaves behind it a sullen and resentful African population, denied political expression for its leaders. The announcement of the formation of a provisional executive committee of the Kenya African Union, most of whose former leaders have been arrested for Mau Mau activities, is significant, for it shows what great store the moderate African leaders set by political organisation. The Kenya Government's difficult task is to win their co-operation without giving the Europeans the impression that it is not dealing firmly enough with the terrorists.

France's Open Wound

Whether or not one agrees with everything President Auriol said in his speech of patriotic pride at Donzère-Mondragon, there is no doubt that his remarks on Indo-China deserve careful attention. He emphasised a fact that is often forgotten: in monetary terms the defence of Indo-China has already cost France more than twice the amount received under the entire Marshall Plan. In human terms the losses have been appalling; before the start of the most recent campaigns, well over 30,000 French soldiers and some 1,500 officers had died. This latter figure means that the

ADVERTISING

WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.

In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

SAMSON CLARKS

graduating classes of France's military academy at St. Cyr are sent directly to Indo-China, and that few survive to grow into future staff officers and generals.

As long as France is compelled to carry on alone, it cannot be expected to play a fully effective part in European defence or to see German rearmament with dispassionate clarity. As President Auriol clearly stated, France conceives its commitment in Indo-China to be of concern to the entire free world. In terms of the defence of free Asia it ranks with, or above, the action in Korea and the defence of Malaya. Legitimate grievances over this issue, moreover, give a ready motive for national sensitivity and shortsightedness over such questions as North Africa and the Defence Community.

The fact that the war has remained a kind of colonial action removed from UN interest and participation has created an explosive situation in French opinion. Bitter opposition against campaigns in which every gain is nullified by climate and time is no longer the prerogative of the Communists. Yet in defiance of a long tradition of individual freedom, the French government is jailing Communists for "demoralising the army" by their frank criticism of the war. The possibility has to be faced that it will become a condition of M. Schuman's success with his European policy that the simultaneous emergence of Vietnam as a fully-fledged state and the withdrawal of French forces should be covered by international action. What this could be it is extremely difficult to determine. Direct American intervention would merely provide the excuse for more conspicuous Chinese intervention on the side of Vietminh. It is, perhaps, for those governments of free Asia which are members of the United Nations to think about ways in which that organisation could be seized of the matter; but it must not be done in such a way as to create yet another North African issue. And if that is to be avoided the initiative must come from the French Government.

Mao Over Malaya

A captured document published this week shows that the Communist leaders in Malaya have ordered their gunmen to give less time to attacking and intimidating civilians, and in general to confine their activities to the more important military objectives. This directive was apparently issued nearly a year ago; but it has not been put into effect with any great haste. It is curious that it should come to light so soon after the Asia "peace conference" in Peking, for it fits in neatly with the resolutions of that motley assembly. There much was said of the ease with which different political systems could co-exist, and it was unanimously declared that Asia could successfully defeat the forces of war through "the co-operation of all persons of goodwill." The Malayan

Communists would not secure such co-operation if they continued their insensate attacks on Asian, as well as European, civilians of both sexes and all ages.

During the Peking conference there were few references to the Soviet Union and fewer still to Communism. This is no new tactic for "peace" movements in the West, but it must have produced a rather hollow sensation in the Chinese capital, where propaganda is franker and less disciplined. The new line for Asia is clearly that of the united front, with all manner of cultural contacts—including cynical exploitation of the Eastern religions—to back it up, but based primarily on nationalist and anti-western sentiment. Malaya, however, sets the new Communist regional command in Peking some special problems, which were clearly indicated in the references made to it. Malaya was equated with Korea and Indo-China as a major battle-front; the standard formula was "the wars of aggression in Korea, Vietnam, Malaya and other countries," and there were endless appeals for the removal of foreign troops from all three countries. The fact that all this could be said without a single opprobrious reference to Britain, while the United States was deluged with abuse, will seem strange only to those who are unfamiliar with Communist methods. But the organisers of the conference must have regretted that the only Malayan delegate they could lure to Peking was apparently a Chinese—a fact that probably explains why no place could be found for Malaya among the eleven vice-chairmen of the new "peace" liaison committee.

Bidding for the Overseas Chinese

Whoever is going to be the next President of the United States, there is no indication that American policy is likely to be so modified in the near future as to allow a Communist conquest of Formosa. The confidence now felt, both in the island itself and among anti-Communist Chinese abroad, in the stability of American support for Nationalist resistance has had the effect of making the Nationalists a less ghostly factor in Far Eastern affairs than they were a year ago. When Chiang's remnant retreated to Formosa after the collapse on the mainland the ten million or so "Overseas" Chinese, including the well-to-do business and commercial classes, hastened to line up on the side of the Communists, who were credited with the intention of pursuing moderate policies. But the wholesale massacres of "counter-revolutionaries," the ruthless extortions from the urban middle classes, and the tactics of obtaining foreign exchange by imposing heavy fines on families with relatives abroad so that they must appeal to the latter to pay them, have caused alarm and disgust.

A result of this gradual change in the situation is the Overseas Chinese Conference now being held in Taipei, with 262 delegates from 28 Chinese communities in foreign countries, mostly from South-east Asia. It has resolved to set up an association, organised in seven regions, to cover Chinese residents all over the world and support the Nationalist Government's "policy for reconquering the mainland." This is the first organised challenge to the grip of the Communists on the Overseas Chinese, which has so far been strong, not so much because of widespread conviction as because of the apparent lack of any political alternative. The struggle for their allegiance is of great importance for South-east Asia, if not immediately for China itself; for these numerous and wealthy communities cannot be directly coerced by Peking. They would have freely adhered to the new regime in China if it had lived up to its early promises, but as it manifests more and more its real character, they are tending increasingly to oppose it.

Chiang Kai-shek's recent appeal to the United States for an end to the "neutralisation" of Formosa, so that Nationalist forces may be free to attack the mainland, need not be taken too seriously at this stage; but there is now a prospect of a

PAGE 341

Scene reconstructed by Roy Carnon

IN LANCASTER, some eighty years ago, young Samuel Fawcett started work as an engraver of copper rollers for printing designs on oilcloth. A keen photographer, he quickly devised a way of saving time and labour. Using the natural sunlight in his conservatory-like exposing room, he prepared the rollers photographically and etched them by an acid process. Later he began to seek a means of reproducing fine gradations of light and shade. In 1890, when he had developed the system of ink control still used today, he met Karl Klic, an inventor from Austria. In collaboration they set out to apply Samuel Fawcett's methods to the printing of paper, and by 1895 they had evolved the photogravure process—now known throughout the world for the fineness and fidelity of its results. In achieving this quality, an important contribution has been made by the development through the years of the specialised gravure papers produced by the Reed Paper Group. For this is an organisation which has inherited from its founder, Albert E. Reed, a vigorous tradition of paper pioneering. As with gravure printings, so too with kraft, newsprint and other papers, the changing needs of trade and times are constantly anticipated. In this way the Reed Paper Group, with its five mills, has acquired technological experience and technical resources unequalled today in the many-sided service it can offer.

PIONEERS IN MODERN PAPER TECHNOLOGY

—so advertisers get more circulation than they buy

IN 1949, The Reader's Digest had a 300,000 circulation. This year—it has a guaranteed 700,000 average net sale. And sales are still piling up.

Advertisers gain handsomely from this rapid rise. This autumn, for instance, they are getting about 100,000 circulation per month free.

They've had a bonus, in fact, each year since The Reader's Digest accepted advertising—for the page rate is based on a conservative guaranteed sale which has always been exceeded.

READ IN THE HOME

Research shows that The Reader's Digest is read at home by 90 per cent of its readers. They're people of above-average purchasing power, too. The Reader's Digest is skilfully edited to carry your message to both men and women, and page rates for advertising space compare very favourably indeed with rates for other magazines.

COLOUR VALUES

Full colour pages in The Reader's Digest are extra good value, for the colour rates are less than 30% above black-and-white. For consumer goods from cars to clothes, groceries to gas cookers, colour has proved its power to sell.

The proportion of advertising space in the magazine is strictly limited, so space should be reserved without delay.

The Reader's Digest

The Advertisement Director, 1 Albemarle St., London, W.1. Grosvenor 4738

prolonged coexistence of two rival Chinese governments, both based in Chinese territory and bidding against each other for support among ten million Chinese who are still free to choose. This is a situation which has no parallel in other countries captured by Communist revolutions.

Ownership or Control?

Last week's parliamentary debate on the iron and steel White Paper gave little hope of sufficient agreement to make the iron and steel industry safe from fresh upheavals. Yet it also showed that the objective conditions for agreement exist. The area of common ground is much greater than in many measures that have remained undisturbed on the Statute Book after the Government which produced them has departed. It is agreed that iron and steel needs a special measure of public control. It is agreed that because the industry's products and markets are varied, and because of the goodwill and prestige of its constituent firms, management should be decentralised rather than monolithic. It is agreed that control, however exercised, should be general and indirect. It is agreed that the practical problem is to reconcile responsiveness to national needs, long-term as well as immediate, with the initiative and commercial aggressiveness needed to make costs and techniques competitive.

Is this reconciliation best effected by national ownership, as under the nationalisation statute, or by the agency of an outside organ of regulation as proposed in the White Paper? What, if the second alternative is preferred, should be the nature of such an organ's powers? Through what machinery should the powers be exercised? And over how wide a field? These are strictly practical questions to which ideologies are relevant only as fog is relevant to navigation. There are, it is true, few observable facts to form the basis of rational decision. But there was sense in Mr Sandys's point that public ownership, whatever its original statutory form, is inevitably a powerful centralising force and thus a threat to flexibility and initiative. Against this may be set another argument, well established from the history of statutory commissions: that outside agencies, however admirably suited to supervision, are clumsy and frustrating instruments of active control. Mr Morrison hit this nail on the head with his warning of "a state of bureaucratic interference—checks, balances, starts and stops" which could be worse than nationalisation.

The proposed extension of control—from a comparatively narrow basis of ownership to a basis of supervisory power affecting nearly ten times as many firms—may accordingly be seen either as an advantage or as a danger. It certainly shows the Government to be as much alive as the Opposition to the need for regulation, while a number of Labour speakers showed themselves to be quite as much alive as the Government to the need for initiative. Where so much common ground demonstrably exists, it is a depressing commentary on the Labour party's morale that the "Strauss threat" should remain its last word on the future of iron and steel.

Planning Unplanned

While it is willing to hold a public inquiry if one is demanded, the Government has this week made plain its intention to develop Gatwick as the alternate airport for London. Recent controversy on this proposal, inside and outside the House of Commons, has raised questions wider than its particular merits and demerits. The scheme is expensive, and its total cost cannot, at this stage, be accurately forecast. But this does not necessarily mean that it is ill-considered or reckless. There must always be an element of speculation in the finance of long-term capital projects, whether of nineteenth-century railways or of

twentieth-century airports; and if optimism in estimating costs has in the past been a besetting sin of government departments in general, and of the Ministry of Civil Aviation in particular, there are indications that in this matter at all events the planners are willing to profit by the lessons of experience.

A much more serious matter is the want of liaison, foresight, or both, which has produced a head-on clash between the interests of the airlines and those of the new town of Crawley. Once it is granted that Britain must have an efficient and expanding civil aviation service, the provision of proper airports becomes an unquestionable necessity. Wherever these are placed, they will constitute a nuisance more ruthlessly pervasive than any sardine factory, pottery bank or cement works. It is the boast of town planners, and particularly of new town planners, that their wisdom and foresight produce (or will produce) incomparably better results than the blind greed of nineteenth-century private enterprise with its jumble of factories and houses; and so indeed they should. The new town of Crawley, with all its heavy cost both in money and in local upheaval, was supposed to present in prospect a fine flower of that wisdom and foresight. It may now be doomed to form a sort of Station Approach to what has been enthusiastically described as a "Clapham Junction of the air."

This is obviously regrettable, but have the town planners anyone but themselves to blame? The Gatwick scheme has been talked about for the last ten years; and, since, for obvious technical reasons, the choice of sites for a major airport must always be narrow, the Government's decision to overrule the interests of the town seems to be justified. However the blame may be apportioned, the upshot is a lamentable failure in that very co-ordinating and harmonising of economic activity which it is the object of planners to achieve. As guardians of the public interest, they have laid themselves wide open to the old question—*quis custodiet ipsos custodes*?

Federation Technicalities

Hitherto, most of the discussion on the plan for Central African federation has centred on the attitude of the various communities and the extent to which their wishes and fears are met by the constitutional proposals. In the last few months, however, three commissions have been studying the main technical questions involved in federation—the public service, finance and justice—and their reports were published this week (Cmd. 8671-3).

At this stage, when the fate of the federation proposals is still in the balance, detailed discussion of the technicalities of federation seems a little premature, although all the proposals contained in these reports are obviously of great importance if federation is actually put into force. The fiscal commission, for instance, had to decide such questions as the shares of the federation and the three territories in the total revenue. It proposes that the proceeds of the basic income tax should be allocated in the proportions of 60 per cent to the federation, 17 per cent each to Southern and Northern Rhodesia, and 6 per cent to Nyasaland; and it recommends that these proportions should be written into the constitution, subject to a review by an independent commission after three years. On expenditure, the fiscal commission provides for nearly £6 million a year for development in addition to the cost of existing projects and those to be financed from loans. At this point, the commission touches on what may be called the politics of federation. It states that the federal government will have to pay special attention to development in Northern Rhodesia and Nyasaland to bring them up to Southern Rhodesia's level—an emphasis on the federal government's functions regarding development that will not be lost on the opponents of federation.

The politics of federation are also reached in the report of the civil service preparatory commission. Thus, it assumes that the African Affairs Board would have the right to intervene if it considered that the avenues of advancement open to Africans in the federal service were not being safeguarded by the proposed Public Services Commission. The rights of the African Affairs Board are, indeed, a constitutional matter, and the determination of constitutional issues is dealt with by the judicial commission. It recommends that the jurisdiction of the proposed federal supreme court over such issues should be prescribed in the constitution, and that there should be no appeal from the court's decision except by leave to the Privy Council. But since the constitution can be amended, the ultimate safeguard for African interests is political, not judicial. It will depend on whether the Government and Parliament in this country agree to allow the amendment.

Europe's Search for Dollars

Despite the success of the Marshall Plan in bringing European production back to or above its prewar level, the dollar gap is still the most serious of Europe's many economic problems. The struggle to achieve internal financial stability has not been entirely successful; although the threat of inflation continues, production is tending to decline, or to rise only very slowly. But overshadowing all this is the persistent deficit in many countries' balance of payments and an even greater deficit in their balance with the dollar area. In consequence the move towards liberalisation of trade has been reversed. In this setting the Council of Ministers of the Organisation for European Economic Co-operation has been discussing what it should do in the year ahead.

A permanent solution involves adjustments in the production and employment structures of most European countries and also of the United States; but countries are still unwilling, for political reasons, to make or even permit such adjustments. Europe has, therefore, once more sought a palliative not a cure. It has accepted the Butler principle of "trade not aid." That at least is a step in the right direction, for it makes the United States a partner instead of a patron. But the suggestions that the United States must adopt a more liberal commercial policy and that it must invest on a substantial scale in underdeveloped areas are at this stage purely academic. It is doubtful whether the complete abolition of the American tariff would enable Western Europe to earn sufficient extra dollars to balance its dollar accounts. What is more important is to give a guarantee to European exporters that no additional obstacles in the American market will be placed in their way for a period ahead. This would encourage new exporters to try their luck there, because at present the initial cost of entering the American market is very high and has to be amortized within a very short period.

American investment in underdeveloped territories, with the proviso that the dollar capital could be spent on buying European goods, could help towards a solution. But it would involve transferring productive resources in Europe from consumer goods industries to capital goods industries. These dollars would be spent in Europe only if European prices and delivery dates were fully competitive. For certain types of capital goods British and German prices are certainly competitive with American; but delivery dates are another matter. All the underdeveloped areas want to develop rapidly; they are not willing to wait three or five years for delivery of equipment. And it is here that the size of American industry plays an important part. The requirements of these areas would represent a significant proportion of Europe's current output but only an insignificant part of America's. In these circumstances the United States is always likely to be able to give quicker delivery.

M. Pinay's Hidden Strength

It is now eight months since M. Pinay took office. From the early days both his friends and critics have regularly predicted his imminent fall on economic policy. They were convinced that he would be unable to master France's inflationary problems, that in spite of his exhortations prices would continue their rise, and that in their wake would follow the usual sequence of industrial disputes, wage increases and further political bitterness. In fact, current prices are only a little above the March level and M. Pinay is still there.

People in France are now saying that his master stroke was the decision to tie wages to the cost of living. The necessary legislation was passed in July and its first critical test came late in August, when the official cost of living index threatened to reach the point at which a wage increase was automatic. Faced with this disaster French businessmen, farmers and speculators managed between them to muster sufficient restraint to hold prices below the danger mark. To economists it has been something of a surprise to realise that, in an economy where everyone is inflation-conscious and where most prices are fixed by private collective agreements, the introduction of a sliding scale wage policy can act as a check to inflation. A policy of this kind puts the whole population on notice that once they allow prices to push beyond a very clearly marked point, the entire economy will once more be thrown out of control.

The recipe, of course, is not for general application. It would probably fail in countries like Britain where peoples' experience of price movements is limited to comparatively small fluctuations in the value of money. In other cases and at other times, moreover, a sliding wage scale would be a positive disadvantage, since it would severely handicap any government that wished to pursue a policy of reducing consumption and increasing investment. It would also be naïve to believe that the restraint of French monopolists is the whole story. M. Pinay has been greatly helped by the fact that, ever since he took office, world prices of raw materials have continued to fall and estimates of world crops have been consistently high.

Socialists and European Union

It has always been obvious that European federation, even the partial and limited version now being considered by the six nation *ad hoc* assembly, is a difficult undertaking; but its prospects are being made even more uncertain by the growing opposition of many European Socialists to an organisation in which they will be outnumbered by a Conservative-Catholic majority. In the assembly of the coal and steel community the Socialist membership, including the German Social Democrats, amounts to 21 out of 78, or less than one third of the total. In the assembly that is planning a European political authority the abstention of the German Left reduces the Socialist group to only 15; and there is no sign that the Germans who outweigh all the other "little Europe" Socialist parties put together, will undergo a change of heart towards a defence community which, in their view denies Germany complete equality and abandons the struggle for national unity.

In the eyes of their Continental comrades the real villains of the piece are the British and Scandinavians, who could greatly swell the Socialist ranks in any representative federal assembly but feel unable to join any exclusively European body. Their total membership (excluding the Finnish party) is over 7 million, while the "little Europe" Socialist parties (leaving out the Saar) can muster only 610,000 members between them. Lengthy and arduous debates at the recent

a picture of health

A doctor would recognise this as a picture of a healthy human liver. Any similarity it may have to the root system of a plant is intentional. It illustrates a point basic in the grammar of biology... that animal and vegetable share many of their principles of life. The taproot of Fisons business has been, for more than a hundred years, chemical fertilizers for the soil of farm and garden. Today Fisons have roots in the field of chemicals, for medicine and industry. Fisons contribute to the harvest, health and wealth of Britain.

meeting of the Socialist International in Milan did nothing practical to bridge this division. All the European parties, however, were agreed that Britain and Scandinavia must at any rate be closely associated with the six-power Community. Indeed, the French Socialists have made this a condition of their support of the Community in which they fear German predominance.

This is not a realistic attitude. The associated British would be able to talk but not vote, which means causing the maximum of trouble with the minimum of result. Few of them would understand, or care deeply about, the issues that divide the Christian Democrat from the Continental Socialist; British, French and German men of the Left could bitterly disagree about policies affecting the planning of economic life and the standard of living that would come before a European assembly. The pretence that there is, or could be, a solid European Socialist front except in stark and frustrating hostility to the Centre and the Right is one that the British Labour Party should examine carefully.

Guarding British Treasures

A committee under the chairmanship of Lord Waverley has been considering how best to prevent the steady depletion by export of Britain's works of art. A measure of control over such exports is exercised already, through export licensing. The Board of Trade has a panel of artistic advisers, who are consulted before an export licence for a suspected work of art is granted. This arrangement is far from satisfactory. It makes use of a system that was devised for a

completely different purpose—to ensure that British exports showed a fair return in foreign exchange. It works badly for everyone: it imposes an impossible task on the expert, overwhelmed, perhaps, with requests for his advice, supplied with inadequate descriptions, and unable to see the proposed export without a journey, sometimes to the quayside. It is disappointing—it may even be disastrous—for the seller, who is unlikely to get such a good offer in the comparatively impoverished home market. It is infuriating for the buyer, whose purchase is thus torn from his grasp. And it has not even been completely effective in preventing the sale of important works.

Lord Waverley's committee can see no way of preventing this arbitrary interference altogether, but thinks that it should be limited to articles worth more than £1,000 and more than 100 years old, the value of more modern articles being hard to establish. An owner who is prevented from selling abroad would have to be offered a fair price at home. This should not necessarily be as much as he would have got by exporting, but it should be the international market value as assessed by an expert committee. It is hoped that normally the national collections will make these purchases, and for this purpose the committee suggests that the grants-in-aid to them should be increased. If, nevertheless, no purchaser, public or private, makes a suitable offer, the committee thinks that the money must be found by special parliamentary grants.

Any suggestion for larger grants-in-aid for anything must be viewed with great suspicion. But there is no doubt that the purchase grants now made to the national collections are small. And here, as with Britain's neglected historic houses, is an item of expenditure that unfortunately cannot be put off until better days. Losses cannot be made good another time.

Letters to the Editor

Refugees from Reality

Sir,—The leading article in your last issue seems to us both superficial and cynical. Leaving aside the last sentence, which in effect dismisses as blind or dishonest all those who are working for children, better health, better food and similar aims, we would particularly contest your statement that the "central cause" for the United Nations is "defending peace." First, the prevention of war is negative and sterile in itself and cannot, therefore, be a sufficient or worthy overriding aim for such an organisation as the United Nations. Of course, one can do nothing to make a better world if there is war. But its prevention is a means to an end—a vital means, the primary and perhaps the most important means, but still not the end. Secondly, to "defend" or "maintain" peace is in the long run impossible. We have so often been truly told (but have largely disregarded the truth) that peace, to mean anything, has to be positively created; or, to put the obverse of this, that we must work to remove the causes of war. The work of WHO, UNICEF, FAO, ILO, and many other agencies, is directed to just this object—to eliminate ills and to satisfy basic wants, to make mankind happier and in so doing to lessen many, at least, of the causes of international tension and enmity, by lessening human resentment and bitterness.

To make it at all possible to prosecute these great, constructive, creative projects the ring must at the same time be held, the flood waters retained by strong dykes. But to argue that this must take exclusive priority is to be guilty of equal blindness or dishonesty in not admitting the supreme importance of fighting hunger, disease and poverty as the basic evils; while to dismiss as impractical or dishonest idealists those who are trying to persuade nations to accept the vision and duty of mutual help in adversity is to encourage those who would merely preserve their own skins and to make it far more difficult to attack the fundamental causes of the war which you, and we too, so desperately wish to prevent.—Yours faithfully,

L. O. LYNE
MICHAEL LUBBOCK

London, W.1

[The article did not condemn all who work for children, health, or better food, nor those who call for mutual help in adversity. It criticised those who placed particular projects, ranging from five-power pacts to an international criminal court, above the central cause of defending peace. It did not claim for the latter "exclusive priority," but argued that to turn aside from it was both tempting and fatal.—EDITOR.]

Correspondence Colleges

Sir,—The suggestion that the ideal curriculum for part-time vocational training made up of a combination of

intensive, disciplined fact-learning and writing practice, followed by discussion classes for ventilating and maturing the information so gained, is dismissed in your article as utopian. This gloomy view is not altogether well founded. While discussion classes provided by education authorities are only practicable in the subjects of sufficient general interest to attract a reasonable attendance, the professional bodies themselves provide the equivalent of discussion classes in their specialised subjects. The Institute of Cost and Works Accountants, for example, holds meetings at over fifty centres throughout the country where members and students listen to lectures and join in discussion. In the larger centres approximately sixteen lectures are held each winter, approximately one half of these being arranged by the students' own organisations. At Coventry special series of lectures and discussion groups have been held on Saturday mornings as a joint arrangement by the Coventry Technical College and the local branch of the institute. At all meetings opportunity is afforded to students to discuss informally with fellow students any matter outside the subject of the meeting, and qualified members are pleased to draw upon their greater experience to help students with their problems.

This is not to suggest that all is well with vocational training for the professions, in some of which at least there is

also a necessity for some form of post-graduate education if the mass of qualified members are to take an interest and part in the development of new ideas.—Yours faithfully,

Kenilworth

J. P. WILSON

Sir,—May an accountant who completed his professional training with the aid of a correspondence course add his comments to your two articles?

First of all, unless one lives in a large urban area, this is virtually the only way to acquire the extensive technical knowledge now required for professional qualifications. Even then, studying at home is more economical of time than attending evening classes, by reason of the travelling involved. Secondly, as far as accountancy students are concerned, membership of a students' society is encouraged. These meetings provide a very useful forum for discussion at a level which I would say is higher than is to be found at evening classes.

Correspondence courses are not without their disadvantages, of which, in my opinion, the striving for a "model solution" is the worst. To most of the problems one meets in professional life there is no such thing as a "model solution." One applies certain principles to a situation where personal and business considerations also require to be taken into account and the resulting solution is generally a compromise. Secondly the answering of list papers, although it may be good practice for the answering of examination questions and the only way by which a tutor can assess a student's progress, does rob the student of valuable reading time. One tends, therefore, to attempt to assimilate the reading in the given text book, work through the lesson supplement, answer the test paper and heave a sigh of relief at the thought that that is one more stage completed.—Yours faithfully,

Birmingham DONOVAN MOORE

Inflation in Australia

Sir,—I read the article in your issue of October 25th with full agreement until I came to its last sentence, suggesting that "many Australian observers have come to believe that only a severe economic crisis can convince the Australian people of the need for more workers on the land, for more pioneering

**AUTUMN
BOOKS**

1952

PAGE 341

in the 'outback' and for harder and longer effort at the work bench in the cities."

Are you sure that these "many observers" are right? It seems to me that other parts of your article argue against them. You point out that before the war "capital and labour were already withdrawing from primary production and the land," and that "the war simply reinforced much that was already potentially out of balance." If the depression of the 1930s failed to arrest the trends which you deplore (and in fact it accelerated them), a "severe economic crisis" in the 1950s would not be likely to do so. It would come about, presumably, through a decline in Australia's overseas earnings, leading to unemployment and reduced imports. I suggest that Australian farmers would then insist on the urban community subsidising their incomes, thus obviating the need to expand export production sufficiently to make up the loss in their own, and the country's external, earnings. In the prevailing temper of Australian politics, such a demand would be humbly acceded to. So also would a parallel demand from the manufacturers for tariffs, bounties and import prohibitions to enable them to make, inefficiently but at a profit, the goods which the country could no longer afford to import, and so provide jobs for the unemployed. The general result would be a further intensification of the kind of trend which you, in company with the British economic mission of 1929, feel so strongly about. Its strictures and recommendations were ignored by Australian producers bent on autarky, and I am afraid yours will be too.—Yours faithfully,

London, W.1

J. D. B. MILLER

The Strange Case of Mr Zukas

Sir,—I should like to comment briefly on your references to Mr Zukas in your issue of October 4th. It is misleading to describe Mr Zukas as having arrived in Northern Rhodesia from Cape Town last year. He was brought as a child by his immigrant parents to Northern Rhodesia, has lived there ever since, and the only sense in which he arrived from Cape Town is that the Northern Rhodesian Government gave him a scholarship to Cape Town University.

I should also like to correct your unfounded suggestion that Mr Zukas's friends have left him in the lurch in custody in Northern Rhodesia in order to embarrass the Northern Rhodesian Government. It is a fact that very many people in Africa and in Europe have subscribed money to support Mr Zukas in his fight; and it was the pure misfortune that the short time limit allowed by the Appeal Court ran out before enough money was obtained that led to the revocation of the leave to appeal. All friends of Mr Zukas regard this as a most unfortunate development.—Yours faithfully,

BASIL DAVIDSON

Braintree

Commodity Price Indicator

Sir,—In your article of July 19, 1952, you launch your new Commodity Price Indicator with sufficient explanation as to its construction. But it is impossible for me, or for anyone, to determine the best price indicator strictly by its performance. I must disagree very strongly with your indicator, and, in particular, with its weights. I cannot understand your choice of an arithmetic weighting scheme. The commodities you have selected have vastly different effects upon world trade; you cannot give equal weight to tea and to wheat. The value of wheat trading is far greater than that of tea trading. A system of representative weights must be used. Your system of arithmetic weights leads to an indicator of the price movement of one unit of wheat, one unit of maize, one unit of coffee, etc. Your indicator as such does not represent world trade.

Further, I cannot understand why the choice of a base period should have afforded so much trouble. The base period does not imply "normality." Any base period would suffice. The base period is but the point from which you measure your readings. No implication of a normal period is inherent in its selection. Base periods are generally chosen, by custom to agree with the base periods of other indexes.—Yours faithfully,

VICTOR R. FARHI

New York

[The commodity price indicator is not intended to measure changes, but merely to indicate changes. Hence a system of weighting is not only unnecessary; it would also be misleading, since any weighting system would have to be based on a unique pattern of expenditure. And relative prices of commodities change considerably even over a period of a year or two. It is true that any year could have been taken as a base period. But since the indicator is in fact an indicator, it was designed to show changes from a period to which people would normally refer—such as the twelve months immediately before the outbreak of hostilities in Korea.—EDITOR.]

Development Areas Revisited

Sir,—In the article in your issue of October 18th it is stated that Mr. Newman and I showed that, in the clothing firms we studied, "transport costs . . . varied from 0.3 per cent of turnover below, to 0.8 per cent of turnover above, costs at a London location." This is incorrect. In no case did we find that transport costs in the Development Area branch were lower than they would have been in London; the additional costs ranged from about 0.1 per cent in one firm to 0.8 per cent in another.

May I also be permitted to explain that, while the National Institute of Economic and Social Research has very kindly allowed our report to appear as one of its Occasional Papers, Mr Newman and I were both on the staff of University College, London, when the inquiry was carried out?—Yours faithfully,

DOUGLAS C. HAGUE

Orpington

How did it happen?

HERE IS A MYSTERY. How is it that a newspaper of modest circulation, not even coming from Fleet Street, should be so influential throughout the world? By what magic has the Manchester Guardian become so famous a newspaper?

The answer sounds odd in these days of big battalions and screaming headlines. The Manchester Guardian has made its way by fine reporting; good writing; an eye for truth; and a tongue not afraid to tell it. There are no tricks or stunts in the Manchester Guardian. It relies upon intelligence, integrity, wit.

The Manchester Guardian will never appeal to the millions. But more and more intelligent citizens, in London and in other big cities, are turning with deep respect to this unassuming and outspoken newspaper, the Manchester Guardian.

If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.

DRY FLY SHERRY—the best appetizer—makes a most acceptable Christmas gift and provides a gracious welcome to your guests. Order early from your Wine Merchant to avoid disappointment.

AMERICAN SURVEY

Clouded Crystals

Washington, DC

THE proposition upon which there is the largest measure of agreement in the United States in this final full week before polling day is that the election has gone on too long. The fruits of sheer fatigue are evident—in the faces and voices and in many of the words of the candidates, in the laboured restatements of old positions on old issues and in the repetitive talk in the bars and railway carriages.

The platitudes of the moment hang in the air like stale smoke:

Two months ago—a month ago—I'd have said Eisenhower . . . I think Stevenson has a very good chance . . . Ike's lost the independent vote. . . . Just the same, there's this It's-time-for-a-change thing, and it goes very deep. . . . They talk Republican but when they get into that polling booth . . . People don't vote on issues and personalities, they vote on what's going to be good for them in their own back yard. . . .

Among those who have been moved and inspired by Governor Stevenson's eloquent liberalism there is a feeling that the United States will somehow be shamed in the eyes of the intelligent free world if it now fails to elect this Wilsonian symbol of the new America. Among those who have been and remain wedded to General Eisenhower there is an almost angry determination to stand by him and to claim that nothing has happened to alter the original argument that he is big enough, wise enough and good enough to hold together and lead a nation with a very tough four years in front of it.

There is no good reason to doubt that when, in the embittered concluding stages of the campaign, each side accuses the other of the worst sort of demagoguery each is believing what it says. When President Truman declared that the Republicans who secured the passage of the McCarran Act and of other legislation affecting displaced persons and would-be immigrants to the United States betrayed an anti-Catholic and anti-Jewish trend of thought, and that by embracing such Republicans General Eisenhower had underwritten such a trend, Mr Truman appeared to be speaking with conviction. But at the same time he provided General Eisenhower with a conviction which led him in turn to say that the Democrats were now "creating distrust, disunity and bigotry by falsely accusing others, including myself, of these evil things."

There are many Republicans who find themselves convinced that the Democrats have "appeased" or been "soft" about the Communists, even if they do not accept what

Senator McCarthy and his imitators say and do not like the way they say it. And there are as many Democrats who believe that the charges of the McCarthy school have been uttered, as Governor Stevenson said in his Cleveland speech last week, by "those who would beguile the voters by lies or half-truths, or corrupt them by fear and falsehood" and in consequence are "committing spiritual treason against our institutions (by) doing the work of their enemies." The Governor went on to tell his big audience:

I said to you in my Acceptance Speech, accepting a nomination that I did not seek, that I would rather lose the election than mislead the people. I meant it. . . . Whether this sort of campaign can be used in a great American election in the year of grace 1952 to defeat the candidate of one of the major parties . . . is not just an issue of today but it must be settled today or it will affect not only American elections but American life for years—perhaps for generations . . .

In Buffalo at about that moment General Eisenhower was saying, also with great earnestness:

"Feel Anything Yet?"

Herb Block in the Washington Post

I would rather look at the record than call names. . . . My only aim is to get the facts and nothing but the facts to every voting American. . . . Our discredited national leadership has been sapping the moral foundation of America.

This assumption of righteousness by each of the parties is no brand new phenomenon, but there have not been many occasions when the independent, free-thinking voter has been confronted by such irreconcilable claims. Some of the tongue-tied prophets suggest that this is why the polls have been indicating an abnormally large "undecided" group. This can also be explained, and has been explained, laboriously and repeatedly, in other ways: the voters do not feel sure whether or not the sacrifice in Korea is justified as the Democrats say it is, or a "bungle" as the Republicans say it is; the voters have been shocked by the evidence of corruption in government, or have recognised that the talk about corruption is nothing but a political ramp. But there is more statistical evidence behind the rather different contention that the undecided group will decide, quite late in the game, to vote, not for the most moral party or for the party which has stated the issues in the most compelling language, but for the party which the individual independent voter has individually concluded offers the best insurance of his individual future.

The Gallup Poll has been showing that the voters divide most narrowly, but slightly on the Republican side, when asked which party they prefer. They have been more noticeably

pro-Eisenhower when asked which candidate they prefer. But when asked which party they believe will do more for them as individuals they have come down heavily on the Democratic side. Those who are inclined to predict a Republican victory are those who believe that the magic of the Eisenhower name and a general "throw-the-rascals-out" sentiment (based on frustration over the Korean war and disgust with the less attractive fruits of twenty years of Democratic rule) will count for most. Those who expect the Democrats to win think that the "don't-let-them-take-it-away" sentiment will prevail when the chips are down. They believe that a lot of people may vote Democratic because they like Governor Stevenson's way and because they have grown disillusioned about General Eisenhower, but they think the election will be clinched by a greater number of people who will vote Democratic because they and their families are, and want to go on, living well.

Neither body of crystal-gazers, however, sounds very sure; for a lack of faith in all polls, a suspicion of all statistics and a most uncomfortable sense of the inscrutability of the voters in the mass prevail in the land this week. How many people have been talking Republican and wearing Ike buttons because it seemed to be socially or commercially safer to do so? How many such men and women have already decided that when the time comes they will pull the curtain across the entrance to the polling booth and secretly vote for Mr Stevenson? Whether this shadowy company is fact or fiction nobody knows. Still less does anybody know with any certainty what will be done by the millions who genuinely do not yet know how they are going to vote and who may put off the final decision until a day or two or even an hour or two before they commit themselves.

A shared experience, a trend strong enough to produce a pattern, could set off a landslide in either direction. With an Eisenhower landslide the Republicans could take complete control of the House of Representatives and they could win the Senate by holding all the 21 Republican seats involved this year and winning two of the 14 Democratic seats at stake. A Stevenson landslide, or even a fairly definite Stevenson victory, might provide a securely Democratic House and a Democratic Senate at least as firmly held as the one President Truman has lately been working with. A narrowly won Eisenhower victory might, on the other hand, install a Republican President with a Democratic Senate.

The new occupant of the White House will be whichever of the candidates wins 266 or more votes in the electoral college where each state votes as a block for the candidate who receives a majority, however narrow, of popular votes in the state. If it can be assumed, as most of the uncertain prophets do assume, that the Republican revolt in the South will not be powerful enough to lose him any southern or near-southern state, Mr Stevenson seems on paper to have a good chance of landing about 196 electoral votes. He would be over the top if he could carry New York (45 electoral votes) and California (32), or New York and Pennsylvania (32). But these three key states are widely thought to be doubtful. Ohio (25) and Michigan (20) are as widely awarded to General Eisenhower. In the lists which some do and some do not call doubtful there also appear Illinois (27) and Minnesota (11). But it is more than possible that states which both sides have written down as sure can go the other way. There is, in short, no list of states adding up to 266 electoral votes in which the reputable crystal-gazers have full confidence. Before the end of next week everyone will know where he went wrong and by then it will seem to have been faint-hearted and foolish ever to have wondered.

According to Dr Gallup

THE American Institute of Public Opinion blames its failure to predict the outcome of the 1948 presidential election accurately on two mistakes. Surveys were stopped too early to allow for last-minute shifts of opinion and Dr Gallup allotted the undecided votes equally between the two candidates, while post-election surveys showed that the majority of such voters finally cast their ballots for Mr Truman. This year in his latest poll, of which the results were published on October 24th, Dr Gallup gave the Democrats a generous two-thirds of these votes. This had the non-committal result of dividing those polled equally on the question: "If the election were being held today, which party would you like to see win?" But when applied to the question "Which candidate would you prefer?" this allocation gave General Eisenhower a majority of popular votes.

There is so far little indication in the accompanying charts of the growth in Governor Stevenson's popularity which had been expected as he became better known. But Dr Gallup

attaches great importance to the additional question, "Which party do you think is best for people like yourself?" According to the October 24th poll, 50 per cent thought the Democratic party the best for them personally and only 30 per cent the Republican. There is still time for 1948's last-minute swing to the Democrats to be repeated and, as Dr Gallup carefully points out, American presidential elections are frequently "too close to be divined by any known research procedures."

New England's Favours

[FROM A CORRESPONDENT IN CONNECTICUT]

THE attention which the presidential candidates are paying to southern New England suggests that even the homes of the bean and the cod may not be proof against last-minute blandishments. Time was when they were as safely in the Republican pocket as the South was in that of the Democrats, but both certainties have disappeared. Even in this old and thickly settled section, where mill workers and farmers all have their radios, and many have television sets, candidates dare not rely on these mechanical devices. No one can ignore the lesson which President Truman taught in 1948—that it is the whistle stop and the personal appearance which win the votes.

Maine, Vermont and New Hampshire, the three states of northern New England, possess twelve electoral votes, and the chances are excellent that all twelve will be cast for the Republican candidate. Southern New England is less solid in its convictions, and there is reason to believe that at least some of its twenty-eight electoral votes can be had for the

counteract Idaho. This is not a time for neglecting small favours. Moreover, the question marks which hang in the political skies of all three states involve the fate of Governors and the control of Congress. The political composition of the Senate, now so closely divided, may depend on what happens in Connecticut. The death this year of Senator Brien McMahon means that his state must fill not one Senatorial seat but two.

★

The three southern New England states are linked by economic and political similarities. All three contain large numbers of foreign voters imperfectly absorbed into the older population; all three are heavily industrialised in certain sections and rural in others; all three were staunchly Republican in earlier days and have recently been showing strong Democratic sympathies. All these circumstances sharpen political conflict.

In Massachusetts that conflict rages between the early settler and the immigrant, the farmer and the factory hand, the Protestant and the Catholic, the Irish and the world. It has been said before that both Boston and New York have, in their political life, paid heavily for Britain's ineptness in Irish matters. Boston, at least, is still paying, though since one of its mayors spent part of his term in a federal jail there has been a concerted effort on the part of other citizens to check Irish control of office and patronage. In the present election the Irish-American Governor, Mr Dever, is being challenged by a Republican, Mr Christian Herter, whose ancestors came from Germany in 1848; by this time Mr Herter, who has several terms in Congress to his credit, ranks almost as a Mayflower Yankee. The Senatorial contest is between Senator Henry Cabot Lodge, Jr, seeking re-election behind a name that wakes august echoes, and Mr John Kennedy, whose wealthy Irish father was Ambassador to the Court of St James in the early years of the last war. Both contests are in doubt.

The Irish influence penetrates south into Rhode Island, where the late US Attorney-General, Mr McGrath, whose reputation is now somewhat tarnished, began his political career. This is the smallest of states, a ragged oblong of picturesque coast with 674 persons for every rocky square mile. This dense population is composed mostly of skilled factory workers who give Rhode Island the highest industrial output a head of any state in the union. How all this can be crowded into 1,250 square miles, and leave room for farms, a major naval base and two fashionable summer resorts is a mystery.

In local matters the state's political masters are the Italians, who cast a solid 30 per cent of the vote, and the Portuguese. It was the need to make sure that such groups do not desert their traditional Democratic allegiance this year which tempted President Truman to inject the issue of racial and religious discrimination into the campaign. The more secure of Rhode Island's two Senatorial seats is not at stake; it is occupied by Mr Theodore Green, a Democrat. The other is held less surely by another Democrat, Senator John O. Pastore, Italian by origin, Roman Catholic by faith, who is hopeful of re-election despite the best efforts of his Republican challenger, Mr Bayard Ewing. The Democratic Governor, Mr Dennis J. Robert, also counts on being returned. His

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

asking—if the asking is done in the right way. The puzzle is to find a way which will appeal to the mill hand, the farmer, the new immigrant, the old Yankee and the escapist from New York, who, together, make these states a trio of political crazy quilts.

Massachusetts used to be solidly Republican, but in 1928 its Italian and Irish Catholic voters ranged the state behind the unsuccessful Democratic candidate, Al Smith of New York. Massachusetts has been counted in the Democratic column ever since, but this year its voters show no eagerness to make up their minds. Little Rhode Island, which has also voted for a Democratic President since 1928, expects to give its four electoral votes to Governor Stevenson, but is not a certainty. Connecticut, whose eight electoral votes went to the Republicans by a slender majority in 1948, will probably repeat that choice this year, but the balance between rural Republicans and city Democrats is uncomfortably even.

To make certain of these twenty-eight electoral votes takes more effort than they would be worth in a less hotly contested race. But if all twenty-eight can be won by the Democrats, they would more than offset those of Senator Taft's Ohio. Individually, Rhode Island with four can

Republican opponent is Mr Raoul Archambault, a name supposed to appeal to the numerous French Canadians in this polyglot state. The Democrats expect to carry the state for Governor Stevenson, but the Republican promise of a change is attractive during an industry-wide depression in the textile mills.

Connecticut, south of Massachusetts and west of Rhode Island, is still in a state of rebellion against changes which have been accepted, however grudgingly, by its sister states. Its population is almost equally divided between the older stock and the foreign born or first generation American, with the natives on the short side of the division. Four-fifths of the vote is normally cast along party lines, and so evenly split between the parties that heavy pressure must be focussed on the other fifth to swing any election. From 1936 to 1944 Connecticut gave its eight electoral votes to Franklin Roosevelt, but in 1948 it swung back to what used to be its traditional Republican orbit.

The chance to name two Senators this year has spurred the parties to more than customary exertions. So far the Republican candidates, a New York banker who makes his home in the state's expensive western fringe, and a West Hartford manufacturer, have failed to arouse much popular interest. The real campaigning centres are among the industrial population of the coast and the Connecticut River valley towns. The ladies of Greenwich and Westport may shine at political teas, but in Stamford, Bridgeport and New Haven the parties rely on loud speakers. There, where the Democratic vote is normally heavy, Republicans have brought every weapon into play, even enlisting Senator McCarthy's brand of demagogic appeal to capture the resentful and fanatic.

Two years ago the state leaders would have none of Senator McCarthy, but his much publicised quarrel with Senator Benton, who must now seek re-election, has made him seem so useful that they have recently invited him to sit on platforms with them. It is not impossible that, in spite of devoted attention to the state's many small businessmen, Senator Benton may lose his seat. Not only must he fend off Republican attackers from other states, but he also faces trouble from the old mayor of industrial Bridgeport, who would like to go to Washington. Mayor McLevy, running for the Senate on the Socialist ticket, has no chance of victory, but he may drain off enough votes to defeat Mr Benton. Perhaps this is why he has been enabled to wage a hopeless campaign. On the other hand, Representative Ribicoff, the other Democratic candidate for the Senate, may succeed.

American Notes

White House via Korea?

With so many voters still undecided, both parties are sensitive to anything which may start a landslide. General Eisenhower's promise, if he is elected, to go himself to Korea to seek a speedy and honourable peace is a heavier eleventh-hour blow to the Democrats than Senator McCarthy's much-touted "exposure" of Governor Stevenson, put on the air by a group of old America-firsters. The Governor was prepared for the Senator's attempt to exploit his deposition on Mr Alger Hiss in 1949. He had already told an audience in Cleveland that General Eisenhower and Mr John Foster Dulles, as colleagues of Mr Hiss on the board of the Carnegie Foundation in 1949, were equally endangered by the doctrine of guilt by association. Most thoughtful Americans feel that Mr Stevenson's statement that Mr Hiss bore a good reputation—as he obviously did—should never have been raised in the campaign. There are signs that

Senator McCarthy watered down his text after General Eisenhower denounced "smear by innuendo," though the General named no names and can hardly return any votes the Senator's tactics may have won for him.

General Eisenhower's Korean offer is evidently the "solution" it has long been hinted he had up his sleeve and which President Truman, who rushes in where other Democrats fear to tread, last week demanded should be put on the table. It has attractions for the voters—particularly women, who now outnumber men voters by 2 million—who resent the Korean casualty lists, the conscription of sons and husbands, and high prices. How the negotiators at Panmunjom would be helped by the presence of General Eisenhower—who walked so innocently into Senator Taft's trap—is not easy to see. The high premium he puts on an immediate settlement may even make their task harder, endangering, as Governor Stevenson said, "the unshakable determination to stand firm, the only background against which an honourable and final settlement can be reached." The Governor's reply, delivered after a day of conferences on how to meet the General's latest offensive, was that the root of the trouble was in Moscow, not Korea. This was truer, though probably less effective, than the following hint that the General might be contemplating a widening of the war, a charge designed to smoke the General out.

★

If the protest against Korea is the Republicans' ace, prosperity under New Deal measures is the Democrats', and Mr Truman and Mr Stevenson have been playing it for all it is worth. General Eisenhower, in his last swing through the industrial east, has been trying to trump it by belated assurances that he favours high wages and, at the first sign of a depression would bring all the resources of the government into play. Some observers wonder, however, whether Korea is not a much more vivid election issue to the 7,500,000 voters coming to the polls for the first time this year than the rigours of a depression they never experienced. Nearly 75 million voters have now registered and are thus qualified to vote, a 12 per cent increase on the number who registered in 1948, although the voting population has only risen by 3.5 per cent. In New York, at least, the Republican areas seem to have done the best. But it is thought that only about 55 million will actually vote, a smaller percentage of the electorate than the 59 per cent who took sides in 1940. If these estimates are accurate, they hardly point to a massive protest vote.

★ ★ ★

Pushing Down the Communists

Two years after the passage of the McCarran Internal Security Act, over the President's veto, the first step has been taken along the road leading to a test of the Act's doubtful constitutionality. The Subversive Activities Control Board has been advised, by a panel which has conducted full hearings, that the Communist party should be forced to register as a "Communist-action organisation," because it is a revolutionary movement dominated by a foreign country. The party is sure to appeal against this ruling, if it is accepted, as it almost certainly will be, by the full board, and it is likely to be another two years before the Supreme Court reaches a decision. Even if the decision goes against the Communists, the party will not be outlawed, any more than it was by the Court's earlier decision in favour of the Smith Act, under which the party's leaders are being sent to prison. But if the Communist party is finally forced to register under the Internal Security Act, its members will be subjected to various special requirements and prohibitions which, in the opinion of the critics of the Act, will merely have the effect of pushing the party still further underground, not of smothering it altogether.

The panel's report appeared, very conveniently for the Administration, just two weeks before the election. Further-

Fly **TWA** to the USA and back for only £146.4s.

TWA's new Thrift Season fares offer you the greatest air-travel bargains ever

By taking advantage of TWA's new thrift season Sky Tourist fares you can save £101 on the standard return to Boston, or £105 to New York.

And TWA's Sky Tourist fares to the major cities in America give you further savings of up to 37 per cent.

NEW YORK. TWA Thrift Season fares are available on 9 flights weekly, including TWA's luxurious "Ambassador" all-sleeper service, TWA's part-sleeper flights and the low-fare Sky Tourist services. (Tasty meals available at reasonable prices on Sky Tourist flights.)

Only TWA offers this "Double Saving"—for business or holiday travel—one ticket—one airline—all the way. Enjoy the comfort, service and dependability of TWA's world-proved Constellations.

more, the Attorney-General; as evidence that he is not "soft" on Communism, is pressing for the deportation of a number of foreign-born Communists, including several of the leaders now in jail. In some of these cases denaturalisation proceedings will first be required. They will also be necessary if the Attorney-General is to prove, as he is trying to do, that he is not "soft" on crime either, by the deportation of Mr Frank Costello, the New York gambler now in prison for contempt of the Senate Crime Investigating Committee.

However, the Republicans, with the help of Democrats such as Senator McCarran and Senator O'Connor who seldom hesitate to harass the Administration, are also making a last pre-election attack on Communism in government with deeds as well as words. And there is a strong suspicion that, to some of them at least, the deeds are particularly welcome because they involve incidentally an attack on the internationalist activities of the United States. Mr Paul R. Porter is being summoned home from his important post with the Mutual Security Agency in Paris, to explain why he appears never to have repudiated views expressed nearly twenty years ago when he was a young Socialist. And Mr Whittaker Chambers has once more been brought back from his farm to strengthen the case against those American employees of the United Nations who have refused to tell the Senate Judiciary Committee whether or not they are or have been Communists. To the disgust of the committee, Mr Trygve Lie has refused to stop their salaries, although he has sent them on leave, until the question has been fully considered by a special international panel of "eminent jurists."

Metals—Too Little and Too Much

The new British loan of 20,000 tons of aluminium to the United States and the delay in the repayment of the earlier loan will probably save the American authorities from having to reduce allocations of aluminium for non-essential uses. Manufacturers are already restive at the postponement of the removal of controls on the metal, which had been expected early next year, and are complaining that they are being restricted more severely than their competitors in allied countries. The latest shortage of aluminium is partly the result of the steel strike, which held up the completion of new facilities, but mainly of droughts in the Pacific north-west and the Tennessee Valley, which have meant a drastic reduction in supplies of hydro-electricity in the two chief aluminium producing districts. The shortage has made it impossible to find aluminium for the strategic reserve; furthermore, estimates of the amount of aluminium needed in the event of all-out mobilisation have recently been substantially increased. As a result at the beginning of October the Defence Production Administration announced a third round of aluminium expansion, an addition of 200,000 tons a year, which would bring total domestic capacity to 1,746,000 tons a year by 1955, an increase of over 1,000,000 tons since 1950.

It is expected that private enterprise will be ready to undertake this aluminium expansion, but the DPA has suggested, probably more as a threat than anything else, that the government may itself be forced to make up deficiencies in the output of the six "Band One" heat-resisting metals, needed in large quantities for jet aircraft and other new weapons. Nickel is probably one of the six; the others may be tungsten, cobalt, beryllium, tantalum and columbium. The DPA has instructed the various government agencies concerned to intensify their efforts to save these "Band One" metals wherever possible, in both military and civilian uses, and to do all they can—and there are many means available—to increase output from both domestic and foreign sources, in order that greater supplies may be available for the stockpile.

The stockpile is understood to contain most, if not all, of the lead and zinc that is required as a wartime reserve,

and for this reason metal traders were suspicious of the attempts to steady the market for these metals, made during the late summer by the stockpile buyers. If these attempts were repeated they would almost certainly be assailed as unjustified government interference with free competition. It is therefore unlikely, especially as the expansion in lead and zinc mining appears to have been overdone, that the government will do anything to check the recent fall in prices of these metals, which followed the reopening of the London Metal Exchange, even though a number of marginal mines have already been forced to close. There is, however, beginning to be pressure for government assistance for the smaller mines and for an increased tariff on imported lead and zinc.

Gadgets for Candidates

This has been a "television campaign" and candidates have submitted to the strains and the indignities involved—the lights, the make-up and the hustle—to bring their cases and their faces into the living-rooms of the nation. One invention, designed to mitigate the ordeal, is the teleprompter, an electronic device that slowly unrolls the speaker's text, in large print, outside the audience's sight. The teleprompter, had its first national debut when Mr Herbert Hoover fell out of step with it at the Republican Convention. Further publicity attended General Eisenhower's failure to synchronise with the technicians. But this must have been due to inexperience. For, almost a year before, the device had proved a discreet and invaluable assistant to grateful professionals on television and on the films. With three or four scattered around the room, it is possible to be completely natural. Owners of the device take elections in their stride; they count on a bigger, steadier market from businessmen called on to address a convention or their workers.

A more fantastic brain-child is the talkathon, a patented scheme for placing a candidate on the air for twenty-five hours, prepared to answer all questions telephoned to him and to demand support and contributions he has surely earned. Governor Dewey used a modified talkathon with great success in 1950, but the device did not really catch on until this year as a way of attracting attention to a relatively unknown candidate. Its most triumphant exponent was an obscure Judge Cherry, in Arkansas, who ousted the Governor by talkathon. Regrettably, even its attractions did not enable Mr Len Schmitt to defeat Senator McCarthy in Wisconsin. But Mr Di Salle, who is running for Senator in Ohio, is using it to overcome the lead of his well-established opponent, Senator Bricker.

As seems only fair, the voter will also have the services of science at his disposal when he sits down on Tuesday night to hear the results. The Columbia Broadcasting System is using Univac, the "Giant Brain," an electronic automatic computer, at Philadelphia to compare the returns, hour by hour, with the results in 1944 and 1948. The machine was given about a fortnight to "memorise" these earlier statistics. The National Broadcasting Company, not to be outdone, will rely on the similar but smaller Monrobot to pick out significant trends and help mere humans to predict the result as early as possible.

War Between the Textile States

A government proposal to review the minimum wage which must be paid by mills with government contracts worth \$10,000 or more has provided a new battlefield for the long war between the textile interests still left in New England and those which have established themselves in the lower-paid South. During the past six months workers in the northern mills have had to accept the first general wage cuts since the nineteen-thirties to enable their employers to survive a recession made more bitter by southern competition. The

southern mill-owners refused last year to grant the increases in wages won in the North. As it now has 80 per cent of all cotton and rayon capacity, it is the South which calls the economic tune and the North which must dance. It has political power, too. Southern legislators this year have managed to prevent government contracts from being placed wholly in New England, arguing that whatever distress was relieved there would merely be transferred below the Mason-Dixon line. The formula adopted was so complicated that virtually no contracts were placed until the worst of recession was past.

Northern mill-owners hope, however, that a review of the 87 cents an hour minimum established in 1948, in the light of wages now prevailing, may reduce the wage advantage of 20 to 25 cents an hour which the South enjoys. The Walsh-Healey Act was passed in 1936, at the height of the New Deal, to make sure that government purchases did not encourage sweat-shop conditions or substandard wages. Under the Act the Wages and Hours Division of the Department of Labour (whose Secretary today is Mr Tobin, a Massachusetts man) has three times set minimum wages for textile firms with government contracts. These tend to become the minimum for the whole industry. Each time the industry has been considered as a unit, on the ground that a single market exists for textiles, but the wage set in 1948 was that prevailing in mills in the South-East. It is the contention of New England that a single minimum should continue to be set, but that it should represent wages paid throughout the industry. The Southerners are demanding that there should be a dual standard, as there is in some other industries. Most of the government witnesses appeared to favour the contention of the North, but the southern spokesmen are determined, if they are worsted, to take their case to the courts.

A Kettle of Frozen Fish

To the satisfaction of local Senators, the Pacific tuna fishing industry is being closely studied from all sides by two government agencies—the Tariff Commission and the Fish and Wildlife Service of the Department of the Interior. The first, which held hearings early this year on the desirability of raising the duty on tinned tuna, is now to decide whether imports of fresh and frozen tuna should be caught in the tariff net from which they were saved by the Senate last summer, while the second is considering whether the industry needs the help of price supports or perhaps of a subsidy. From a canning point of view, tuna has become the leading American fish, largely as the result of the efforts of fish packers to create a mass market. All branches of the tuna industry are concentrated on the Pacific coast, mainly around the Southern Californian ports, but packers elsewhere are beginning to tin frozen tuna. This partly explains why many Californian canners favour a tariff which would put up the price of their raw material.

Last year shoals of the frozen fish from Peru and Japan swamped the American market, and there was also a temporary increase in imports of tinned tuna, but over-expansion of the American tuna industry in all its branches also seems to have something to do with the fact that by the end of 1951 the tuna fishing fleet was unable to sell its catches. This has been very pleasant for the consumers of tuna sandwiches, one of the few foods which have fallen steadily in price. Protests against the proposed duty on tuna have also come from the owners of the refrigerated ships which have made the importation of fresh tuna possible and from those in the State Department and elsewhere who are concerned at the contradiction between such a duty and the country's declared policy of building up both the Peruvian and the Japanese economies.

The Tariff Commission has recently refused to help the New England fishing fleet by raising the tariff on frozen fillets of fish such as cod and haddock. The scarcity of meat

during the war and its high price since has meant a greatly increased demand for these fish, especially since they can now be sent all over the country in the frozen form. But New English fishermen are being squeezed out of this expanding market by the more up-to-date Canadian industry, which also has the advantage of prolific fishing grounds nearer to its ports. As a result the leading American packers of these types of frozen fish are moving to Canada and another traditional New England industry is dying of inanition.

But in the State of Washington the fish, with the help of the local opponents of interference from Washington, D.C. have routed another federal agency, for the moment at least. The local courts have refused to allow the City of Tacoma, which had the backing of the Federal Power Commission, to build a dam on the Cowlitz River as part of its hydro-electric development, on the grounds that it would disturb a fish sanctuary.

Shorter Notes

As the result of President Truman's personal intervention in the coal dispute, the faces of all concerned have been temporarily saved and next Tuesday the Democratic candidate should be able to count on the support of the coal-miners, whose votes are especially important in such key states as Pennsylvania and Illinois. The coal owners, who were no more satisfied than was Mr Lewis with the Wage Stabilisation Board's refusal to permit an increase of more than \$1.50 a day in miners' wages, are now going to pay the extra 40 cents in their agreement with the union into a special fund. This will be set aside until some way has been found of getting round the board's objection to it. Meanwhile Mr Lewis has sent the miners back to work for only the permitted rise of \$1.50.

The investors' dream, a bond whose dollar value increases as the cost of living goes up, but cannot fall below the face value of the bond, has come true for workers in a magnesium company. Under the terms of their new union contract, in place of back wages they will be given the bonds, which will be revalued every half-year; interest payments will also be flexible. A new contract entered into by another firm gives every worker an individual paid holiday on his birthday.

Television viewers may not be entertained by future Congressional hearings, as they were during the Kefauver crime investigation, if Congress takes to heart a recent court decision. Two gambling figures, claiming their constitutional rights were infringed by television and radio broadcasts of the sessions, refused to testify. They have been upheld by a federal judge. The conflict between Congressional procedure and constitutional rights was also shown when, in another recent case, the publicity resulting from Congressional hearings was held to have been prejudicial to the fair trial of the accused, an Internal Revenue Collector, whose conviction for corruption has been set aside by the Appeals Court.

Integrating air service with the needs of the communities it serves is the goal of an airport programme ordered by President Truman on the basis of a special study by the Airport Commission, which was set up in February, after several serious accidents. The Commission recommends that cities be protected against disasters by special zoning of airport areas, that stricter traffic control include the separation of military from civilian craft at busy airfields, that more money be spent on new airports and on improving present ones and that helicopter service be developed for postal and freight traffic as well as for bringing passengers from metropolitan centres to outlying airports.

THE WORLD OVERSEAS

Italian Balance Sheet

IN a speech made this week, Italy's Minister of the Treasury, Signor Pella, made it plain that its financial resources were strained to the utmost and that no further rearmament burden could be envisaged. At every stage, over the past few years, Italy has found itself faced with a clear and inexorable choice between monetary chaos on the one hand and unemployment on the other. It has courageously chosen the latter (the latest figures give 2,243,938 unemployed) and has placed the stability of the lira at the top of its programme. Nevertheless, the Government has to undertake a \$160 million a year social welfare programme. With the expansion of exports, the dilemma took on a particularly cruel form. Yet Italy's survival depends on this expansion because of the limited capacity of domestic consumption and the increasing need for imported raw materials. As Italy's credit balance with EPU increased, so did the danger of inflation. A decrease in exports, on the other hand, meant even greater unemployment. Signor de Gasperi's Cabinet acted with great courage. In the autumn of 1951, in order to maintain tight control over domestic credit and bring its EPU account into balance, the Government let down the import barriers and adopted a policy of extreme liberalisation. As a result, Italy's balance of trade has appreciably deteriorated and unemployment has been created in numerous industries.

Comparing the first six months of 1951 and 1952, imports have risen by 10 per cent and exports have declined by 9 per cent. More wheat, raw cotton, iron, and crude oil have been imported, whereas there have been sharp cuts in the export of dried fruit, wines, textiles and non-metallic ores. French import restrictions have led to a decrease in Italian exports to France from a monthly average of \$15 million in the fourth quarter of 1951 to about \$8 million a month for the first half of this year. Imports, however, have remained at an average monthly level of about \$7 million. Imports from the United States average some \$47 million a month, whereas exports rarely exceed \$10 million. With the countries of eastern Europe, however, Italy maintains a favourable balance, exporting some \$14 million worth of goods during the first six months of 1952, as compared with \$10 million worth of imports. Taken all in all, Italy's adverse balance of trade results in a deficit of some 300 billion lire, a figure 60 per cent above that of last year. None the less, its EPU surplus in September still came to 7.7 million units.

This export crisis (as it can be legitimately called) has provoked widespread criticism of the Government's inflexible monetary policy. Arguments are often heard for a partial relaxation of credit and for a somewhat more restrictive tariff policy. Up to now, however, the Government shows little intention of modifying its primarily anti-inflationary stand. The note circulation, moreover, continues to increase. The by 9.1 billion lire, for example, from July to August. The Government will prefer to rely on off-shore purchases and an export credit guarantee which is at present being worked out. Exporters obviously face two risks: that of not being able to sell their goods and that of not getting paid once they have sold them. The Italian Government seems prepared to assume some 75 per cent of the latter risk (as compared with the 85 per cent coverage extended by the British Government). This may indicate that Italian exporters will concentrate increasingly on the "people's democracies" and Latin America, in both of which foreign currencies are scarce and a seller's risks correspondingly great.

In the last few months, there have been signs of recovery. There has been an expansion in investment and consumer goods industries. There has been an increase in the building trades and an important and steady upswing in the tourist trade (in 1951 there were 5.5 million tourists to Italy). The increase in aggregate national income continues even when foreign aid and the growth in population are excluded. Despite floods, moreover, the prospects for a good harvest are excellent and should allow a cut in the grain imports, which reached 940,000 tons in the first seven months of this year. The level of industrial production has, on the whole, been maintained and the sharp decrease in the number of strikes has permitted an increase of 0.7 per cent over the first half of last year.

Life Blood from Abroad

This is largely due, however, to the constant stream of American aid with which the Italian economy has been rebuilt. Allotments to Italy by the Economic Co-operation Administration and the Mutual Security Agency alone totalled \$1,470,700,000 between April, 1948 and May, 1952. Of these \$135,900,000 are as yet unassigned. Life blood from foreign sources is being constantly pumped into the Italian economic system, the latest being in the form of off-shore purchases by the United States which will amount to \$142 million in the first year and will benefit more than 130 separate firms. The notion that the Italian economy is in a state of sound health must therefore admit of rather special qualifications.

With regard to prices, Signor de Gasperi finds himself in a position not altogether different from that of M. Pinay. Although he has obtained definite decreases in wholesale prices, the retail price index continues to cause alarm. After a 12 per cent increase, which reached its climax in January, 1951, wholesale prices are roughly back to a pre-Korean level. Retail prices (depending mostly on food stuffs) on the other hand, have been climbing constantly. If 1938 is taken as unity, prices stood at 58 in January, 1950, at 64 in July, 1951, and at 66 in July of this year, a rise which is not catastrophic but none the less subject to close watching. Wage increases and transportation costs are the main factors involved.

What conclusions can be drawn from this whole picture? It is clear that Italy has done remarkably well in the face of great postwar difficulties. Its monetary policy is a model of classical restraint, albeit suffering from a certain rigidity. So far, the Communist threat has been defeated on the vital industrial front. The constant threat of unemployment has created the paradoxical sight of Communist workers busily manufacturing \$90 million worth of high explosives under American contracts. By imposing considerable hardships on its own population, the Italian Government has succeeded in gaining the respect and confidence of its allies. As a New York bank recently put it, "Italy is a good risk." But it would be foolish to underestimate the elements of stress and instability latent in Italy's economic life. Solutions have still to be worked out for the problems of unemployment and for the backwardness of the South. Whether, for instance, this could be done at the moment without a significant relaxation in the Government's attitude towards credit restrictions must remain an open question. Italy, moreover, will soon be facing increased German and Japanese competition. Its liberal import policies will make the country extremely vulnerable in the race for world markets. The problem of

overpopulation remains unsolved and its permanence seems unhappily assured by immigration barriers on the one hand and Catholic doctrine on the other. But, above all, Italy has a totally dependent economy and every step forward has to be taken with the aid of a foreign crutch. As long as the cold war remains at high tension, the skeleton of American isolationism will remain in the closet and Italy can count on a stream of dollars. If the Communists should launch a real peace offensive, however, or if Republicanism should have a chance to disclose some of its more authentic atavisms, Italy's dependence may prove mortal.

At Coal-Steel Headquarters

[FROM OUR SPECIAL CORRESPONDENT]

ONE day last week a Luxemburg paper devoted several columns to the phenomenon that has recently appeared in the heart of this small European capital: the High Authority of the European Coal-Steel Community. The article conveyed very accurately the blend of pride, curiosity and concern with which most Luxemburgers view the experiment now unfolding in their midst. It was lavishly illustrated, mostly with pictures of the tin-type variety: M. Monnet, Chairman of the Authority, in spirited discussion with Sir Cecil Weir, chief of the British delegation; the six beaming children of M. Coppé, Belgian representative on the High Authority; three cheerful policemen on guard at the Court of Justice; and the first engaged couple, Signor Giaccherio, Italian member of the Authority, and his secretary.

Running through this homely account of the new Community, however, were two contrasting themes. On the one hand, the paper expressed a nostalgia for the old days, more or less insisting that not one millimetre be shorn from the stature of the sovereign Duchy of Luxemburg; and on the other hand it carried a note of anxious hope that the new supra-national authority will in some way help to create a revitalised Western Europe.

These sentiments are not confined to Luxemburg. Much the same thoughts go through the minds of the nine men on the High Authority who, after only three months on the job, are profoundly conscious that their hardest task is how to strike a balance between the pressure of political interests at home and the drive for integration. Above all, everyone is concerned that integration shall be a partnership of equals and that the Community shall become neither the creature of one dominant power nor a Franco-German diarchy.

It is too early to say how these conflicts will be resolved and what shape the organisation will assume. Like all international bodies it will sooner or later acquire a personality of its own; at the moment its outstanding traits seem to be a quiet sense of mission without any fanaticism and an abundance of plunging energy which sometimes creates the appearance of chaos. Until very recently the Authority had little to show for its effort, partly because energies were

diverted to the question of political relations with the Council of Europe at Strasbourg and partly because the technical problems before them are both vast and novel.

Now, however, things are beginning to move. Last week the first communiqué announced the formation of a joint committee to work out in definite form the future association between Great Britain and the Community. This has been a welcome surprise to those who had expected that the Authority might postpone placing relations on a working basis until it had got into its stride and crystallised its own policy. If the Authority has its way, Britain will eventually "muddle through" to a point where it both retains its identity as leader of the Commonwealth and acquires a new identity as an important *de facto* partner of the new Community. The intention is to work gradually towards this end by such means as concerting investment programmes and commercial policies.

The Authority's second communiqué announced the imminent arrival in Luxemburg of some 150 experts. Drawn from governments, trade unions and business, they represent the best and most experienced minds in the coal and steel industries of the six nations. Until the end of the month the Authority will concentrate on picking their brains for the purpose of drafting its first report, due for presentation to the Community's Assembly in January. Their views will be sought on five main topics: the long-term outlook for markets; the general investment programme, including provision for workers' housing; short-term supplies and needs, such as the questions of coal allocation and supplies of iron ore and scrap; the levy, or in other words the special taxation powers of the High Authority; and transport, particularly the removal of discriminatory freight rates.

Free Trading Plans Delayed

With such a report the danger is, of course, that Europe will be presented with yet another compilation of individual national statistics and plans. What is needed and expected from the High Authority is an assessment of total productive capacity among the six, an evaluation of the markets available to them and suggested plans whereby the six, working as a unit, can seize market opportunities in the most efficient manner. If the Authority is to command the respect and co-operation of its subjects, it will have to engage not in the filing of figures but in operational research and planning.

While these discussions proceed, the Authority is also in the throes of devising its own organisational structure. The position is still fluid, but at present it looks as if nine major divisions will be set up: production, investment, marketing, transport, legal, financial, social welfare, progress control and economic (this, perhaps the most important department, would be concerned with the impact of the coal and steel industries on the total economy of the six powers).

It is not intended that any of these divisions should become empires. Current thinking is that no more than two or three officials for each department will be maintained at headquarters. They can be envisaged almost as the management directorate of a business corporation who will call on the advice of outside experts whenever needed.

The common market itself, which the Authority is supposed to establish and then supervise, is still some way off. The original plan called for the coal trade among the six nations to be freed by February and the steel trade by April, but it is now clear that a longer period of study and preparation is required. Among the problems that must first be solved is the question of high-cost Belgian coal production. Under the Schuman treaty the Belgians were to receive financial help from more economic producers in the area to enable them to modernise or shut down coal mines. Now the Belgian coal industry is pleading with the Authority not to make maximum use of the treaty provision that permits it to reduce Belgian coal production by three per cent annually.

Battle Act and Boycott

MR HARRIMAN, the United States Mutual Security Administrator, has now published his first report on operations under the Battle Act. This much-criticised Act, which came into effect last January, requires that the United States should stop aid to any country that refuses to co-operate in restricting exports of strategically important goods to the Soviet bloc. It divides the commodities with which it deals into three main groups. Arms, ammunition, military equipment and atomic energy materials make up the first. If a country knowingly permits these to be exported to the Soviet bloc, all American aid must automatically be withheld from it; but as yet no such case has arisen. The second category includes petroleum products, railway equipment, most non-ferrous metals, and certain types of aircraft, vessels, synthetic rubber, tyres, chemicals, steel alloys, and electrical, metal-working, and other industrial equipment. The general intention is that export of these, too, should be wholly prohibited; but the President is authorised to continue aid to a country sending such goods to the Soviet bloc, if circumstances justify it.

In the six months covered by the report, three known cases of this kind occurred. Denmark supplied the Soviet Union with a 13,000 ton tanker; the Netherlands sent \$240,000 worth of oil exploration gear to Poland; and a grinding machine valued at \$11,000 was shipped from Italy to Rumania. In each instance, Mr Truman directed that aid should continue. In letters to committees of Congress, he pointed out that these exports had been promised before the Battle Act was passed; that the three exporting countries were actively co-operating in the joint defence of the West; that, in the case of Italy, administrative errors were largely responsible for the fact that the machinery was allowed to leave the country; and that, if US aid was stopped, the three countries would have to trade with the Soviet bloc on a scale which would be to its benefit and to the detriment of the free world. The President's views were supported by all the expert departments concerned.

Communist Trade—If it Pays

As regards the third and largest class of goods which it covers, the Battle Act does not envisage a complete embargo, but only a restriction of exports. The premise is that no risk is involved if exports of these commodities to the Soviet bloc are kept at a reasonable level, or that any such risk will be offset by the value of the goods received in exchange. In short, the aim is to ensure that the net advantage of trade in these less strategic goods shall fall to the free nations. The lists of controlled goods are long, and they are frequently amended in view of changing conditions; but the major items are certain raw materials, machine tools, and mining, construction, transport and electrical equipment. This task of control is much more complex than that of handling the embargoed commodities, and the Battle Act does not authorise the ending of American aid to any country that commits a single breach of its agreements in this respect. The President is merely required to stop aid if he finds that a country is not effectively co-operating in the general plan. To date, no such action has been taken.

The delicate nature of this system of joint control emerges clearly from this summary of the Act's provisions. As the report points out, the effectiveness of the controls depends on the extent to which the co-operating nations can agree both on action and on definition. Long before the Battle Act came before Congress, this agreement was a reality. The main industrial nations of the free world had agreed to deny strategic goods to the Communists before the Korean war began, and had set up consultative machinery for that purpose. Since then, they have developed many techniques to defeat the ingenious tricks used by the Communists to

smuggle in military supplies by way of as many as five intermediate countries. There is no better evidence of the value of the control system than the fact that Soviet agents have offered ten times the normal price for some of the contraband that they sought to acquire.

All, of course, is not perfect. There is room for genuine differences of opinion as to what exports are "strategic," and in which category they fall; the wall of secrecy that surrounds the Communist economy makes it difficult to establish the facts. But the Administrator's report is remarkable for the depth of understanding of European and Asian problems that it shows. Although it rightly discusses the possibility of developing new sources of supply in the free world, it repeatedly emphasises that many free nations need some degree of trade with the Soviet bloc. It cites British and Dutch dependence on east European timber, Scandinavian need for eastern markets for fish, the importance of entrepot trade for Hongkong, and the political problems that might arise if a limited amount of rubber from Malaya could not be sold to Russia. (It is noted that, since the United Nations called for an embargo on strategic exports to China, the only rubber shipped there has come from Ceylon, which neither belongs to Uno nor receives American aid.) Throughout, the report is concerned to point out that any total embargo would injure the free world more than the Soviet bloc, and that the Battle Act itself recognises that the control system must be selective. Such a selective system cannot be emotionally satisfying, either to the American who suspects his European partners of backsliding, or to the European who resents forgoing any chance of getting new markets or non-dollar supplies. In the words of the report,

The destruction of free world unity, through the exploitation and distortion of legitimate differences of opinion among the free nations, is a primary goal of the Kremlin's political and propaganda warfare. It is therefore particularly important, here and abroad, to foster the fullest public understanding of the need for effective controls over strategic exports. At the same time, the public must be alert to the dangers of arbitrary or intemperate action.

The report itself will do much to increase this public understanding. As well as expounding the whole case for the controls, it shows how the Communist propaganda machine has tried to exploit the east-west trade issue, not only through the Moscow conference held in April, but by planting rumours about fat eastern contracts obtained by one European country in order to rouse the suspicion of others, and even inventing stories of strategic goods being sent to Russia from Europe in hopes of leading to criticism in the United States. It is precisely such tactics that might lead to "arbitrary or intemperate action," and public opinion in the free world will need to be constantly on guard against them.

The New Rhone Barrage

[FROM OUR PARIS CORRESPONDENT]

FRANCE has made a major and spectacular step forward in the utilisation of its natural resources. The hydroelectric power station opened by the President of the French Republic last Saturday is the largest in Western Europe with a mean annual production of 2,000 million kWh. The world-champion barrage is in Columbia, U.S.A. (13,000 million kWh) and the longest one, at Dneprostoi in the Soviet Union produces 3,500 kWh. Donzère-Mondragon will be the most important of twenty power stations, with a total annual production of 13,000 million kWh, projected by the *Compagnie Nationale du Rhone*.

The CNR is a prosperous state-aided corporation a quarter of whose shares are owned by the state railways, which need as much electricity as they can get. Up to date the corporation, which operates a triple programme of hydroelectricity,

ECONOMIC CONDITIONS ABROAD

The Economist Intelligence Unit provides quarterly reports on economic and business conditions in

Argentina, Australia, Belgium, Borneo, Brazil, Burma, Canada, Chile, China, Colombia, Cuba, Denmark, Egypt, Finland, France, India, Indo-China, Indonesia, Israel, Italy, Japan, Yugoslavia, Kenya, Malaya, Mexico, Netherlands, New Zealand, Norway, Pakistan, Persia, Philippines, Portugal, Siam, Southern Rhodesia, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Uruguay, U.S.A., Venezuela, Western Germany.

These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1.

inland navigation and irrigation, has harnessed the Génissiat falls south of Geneva, with a compensating dam below. It has also built an industrial port downstream of Lyons, and brought water to much farming land and constructed electrical transmission lines to the Paris region. Since French consumption of electricity rose from 23,605 million kWh in 1946 to 36,021 million in 1951 and will be well over 40 million by 1956, the hydroelectrical aspect of the CNR's works is naturally the most immediately significant and the one paramount to the Monnet Plan. But the eventual construction of an easily navigable inland waterway from Marseilles to Geneva would profoundly affect established trade routes—probably to the detriment of Genoa. The Donzère-Mondragon system comprises a reservoir dam producing an increase in water level of over 16 feet and a diversion canal 17 miles long—a smooth waterway broader than the Suez Canal, which short-circuits some turbulent reaches of the Rhone. The "André Blondel" power station at Bollène is equipped with six Kaplan turbines of 70,000 hp, each driving an alternator of 50,000 kW capacity, generating at 10,500 volts. Three turbines are already turning and all six will be in action by 1954. A few hundred yards off the current is transformed to different voltages for connection to the French supergrid and for use on the Lyons-Marseilles railway when it is electrified. Beside the power station is a lock with a drop of 85.3 feet and with power to raise or lower the water-level at a rate of 5½ feet per minute.

As President Auriol proudly pointed out in his speech at Mondragon, this dam is not only a giant step in France's realisation of the Monnet Plan, it is also a first rate example of France's reconstruction and resurgence.

Soviet Central Asia—I

Islam Under Stalin

[BY A CORRESPONDENT]

It is difficult to assess how the Central Asian Republics of the USSR (Kazakhstan, Uzbekistan, Tadzhikistan, Turkmenistan and Kirghizia) have fared within the Soviet Union. Up to 1940 the Soviet press, including that of these Asian Republics, yielded a considerable measure of information and statistics, but even then there were few original or dispassionate analyses. In the postwar period, the press has confined itself to generalities. First-hand evidence of the few refugees from these territories is in some cases vivid and circumstantial but can fill only a few gaps. The following observations, therefore, are offered with a full awareness of the limitations imposed on any outside observer.

Soviet writers on constitutional matters echo Stalin when claiming that the Soviet multi-national state has solved what has come to be called the problem of a "plural society." They claim that "socialist federation" guarantees the harmonious co-operation of diverse nationalities within the framework of a multi-national state, within which both the component entities and the union itself remain truly sovereign. This harmony exists because both strive towards the same end—the creation of a socialist society.

From the very start there was no question that the non-Russian nationalities should be left to evolve whatever type of state they might wish to build for themselves; rather they were to be helped and guided along the road to socialism in exactly the same way as the RSFSR itself. The doctrine of the right of secession, granted in the Soviet constitution, has always been coupled with the proviso that recognition of the "right" does not imply that it need, or should, be used. The criterion of whether or not to exercise it was, in fact, its effect on the advancement of socialism, and only the proletariat of a nation could determine this.

The Bolshevik view of national development has been well

illustrated since 1948 in the Soviet attitude towards the emergence of India, Pakistan and Ceylon. These are not greeted as great nations which have liberated themselves from the imperial yoke to acquire the dignity of statehood. On the contrary, both Gandhi and Nehru are, in their different ways, described as betraying the cause of the masses because the pattern they brought about was not that of Marxism.

The constitution of the USSR contains some of the accepted safeguards of federalism (i.e., legislatures in the constituent republics, and a bicameral legislature for the Union with a Soviet of Nationalities as its second house). But it also contains three features, which are both the result and the instruments of the theory outlined above and which, in effect, tip the balance in favour of a "monolithic" state. Civil and criminal law fall within the jurisdiction of the Union; so do the state economic plans, the over-all budget and the banking system; thirdly, article 126 of the constitution records the fact of government by the single All-Union Communist Party.

The substitution of Soviet law for Moslem law and of peoples' courts for Koran courts in the Central Asian territories was virtually completed by the end of the first five-year plan, and with it disappeared one of the characteristic features of Islamic society. The emancipation of Moslem

women, and the first steps in their education, were coupled with these reforms and won a good deal of popular support. Conversely, in districts where opposition was strong against emancipation of women it was as a rule equally strong against peoples' courts and the innovations of western law. No serious attempt was made by the Bolsheviks, except as a temporary expedient, to foster or tolerate reform within Moslem practice or customary law itself, such as was achieved in Moslem parts of India; neither did they make the kind of concession represented by the *statut personnel* in French Islamic possessions. The break with the old social order (which, except for blood feuds and slave raids, had been maintained pretty nearly intact under the Imperial regime) was officially completed in something under fifteen years.

The disestablishment of religion and the separation of church from school were brought about in Moslem Central Asia in exactly the same way as in the RSFSR and elsewhere in the Union. In this sphere, perhaps more than in that of law and custom, what might have been fruitful developments within Islam itself were swept away in the uniform pattern of secular reform. The young Bokhara movement in the early 1900s and the introduction of Russian language classes in the Koran schools were each in their way potentially progressive beginnings. But after a laudable and promising start on national lines, Soviet education in Central Asia has developed into a system of compelled russification. Experience in the dependent territories of other contemporary empires shows, however, that, to a lesser or greater extent,

Hercules's Second Labour was to kill the Lernean Hydra, a nine-headed water-snake. For every head he cut off, two new ones grew, so he set to work to burn them off and finally succeeded.

Another task that grows apace is to supply industry with all the nickel it requires. No sooner have the needs of existing users been satisfied, than fresh users are found in other quarters. To meet the demand, the Nickel Organisation is constantly proving new ore bodies, and extending its underground excavations. So successfully has the task been carried out that the total amount of nickel ore proved and available for mining is now growing greater year by year.

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3

Why this badge means even more today

DID YOU KNOW...?

- 1 The TA was in the past the second line of our Army. It is now a vital part of the first line.
- 2 The TA includes some of the oldest, most famous regiments of the British Army. It uses the most modern equipment, as issued to the Regular Army.
- 3 The British Army could not mobilise today without the TA.

Already thousands of men and women are giving up a slice of their spare time to the TA—because they know that, as able-bodied citizens, they couldn't offer their country a more useful service. They find companionship, skill in working with first-class men and equipment, a

true sense of responsibility for their families and countryside. But they'll tell you themselves that they need more willing help—and quickly. Their enthusiasm for the Territorial Army is matched by pride in their unit and in the job they are doing for their country.

**Spare time for Britain in the
TERRITORIAL ARMY**

Call at your Local Unit for further information

this tends to be a feature common to all such societies. In Central Asia primary education is at present in the indigenous tongue; Russian, first as a spoken and then as a written language, is introduced in the last three years of primary school; secondary education in the majority of cases has Russian as its medium of instruction, with the indigenous language and literature as compulsory subjects for all children attending the school. At the university or technical college stage, Russian is the sole language. This is not startlingly different from educational practice elsewhere in non-metropolitan territories. What vitiates the Soviet system is not the language in which the education is imparted, but the fact that education itself is one of the acknowledged tools of the Communist Party. For the nationalities of Central Asia this means that the vital force in forging a people's destiny is taken out of its own hands.

Finally, there is the Party. Here again, the two most far-reaching decisions were taken at the outset of the Bolshevik revolution: the Party was to remain a single unit and not launch independent affiliated parties in the peripheral territories, and it was to be rooted in the people, recruiting its members from indigenous groups. The Bolshevik leaders hoped that this would ensure that the local party organisation could never become a force making for particularism, and that it would gain the confidence and acceptance of the local population. That this theory has not worked out flawlessly in practice is shown by the periodic party purges, whose victims in Central Asian territories have been almost always Central Asians, accused of "nationalism."

But it cannot be denied that the Party is the most potent force against national initiative and divergence. The revised Party Statute clearly states the position of the Republican parties within the Union party hierarchy:—

The highest organ of the Republican party organisation is... the Central Committee of the Communist party of the Union Republic. In (its) work (it is) directed by the decrees of the Communist party of the Soviet Union and of its directing organ. (Section V, Clause 40.)

When to this is added the fact that all Party members are liable at any time to be transferred, with little or no notice, to any part of the Union, it is clear that the climate is not favourable to the emergence of a Tito or a Mao Tse-tung.

(To be concluded)

Free World and Eastern Europe—II

American Propaganda for "Liberation"

[FROM A NEW YORK CORRESPONDENT]

SUCH sabotage and subversion as the United States Government sees fit to encourage in the Soviet Union and in the satellite countries of eastern Europe must, perforce, remain cloaked in secrecy. Propaganda, however, is constantly in the limelight. It is conducted by the Government chiefly through the Voice of America, which is now transmitting programmes in Russian from Munich, and it has been criticised on two counts: that it devotes too much attention to the advantages of the American way of life and not enough to the hardships and cruelties of life behind the iron curtain; and that it is unduly hampered by the diplomatic cautiousness inherent in the State Department. It is often, therefore, suggested that government propaganda should be taken out of the jurisdiction of the Secretary of State and entrusted to an independent agency which could talk back at the Russians with no holds barred.

Propaganda under various private auspices, however, is not subject to the qualifications imposed by diplomacy. The

two most important organisations engaged in privately financed and controlled propaganda in the iron curtain countries are the American Committee for the Liberation of the Peoples of Russia, Inc., and the Crusade for Freedom.

Last February the American Committee, representing both Russian and non-Russian peoples of the Soviet Union, elected as its chairman Admiral Alan G. Kirk, former American Ambassador in Moscow. Admiral Kirk, succeeding where others had failed before, unified ten organisations of Russian exiles for joint propaganda against the Stalin regime. At a conference in Munich at the end of June, these organisations formed a committee to sponsor Radio Liberation, a 10,000 watt transmitter under construction at Lampertheim, near Munich. This station, financed and managed by the American Committee, will broadcast to the Soviet Union in Russian, Ukrainian and other languages of the Soviet peoples.

The co-operating organisations include representatives of four groups primarily Great Russian in composition, as well as representatives of organisations of exiles from Armenia, Georgia, Byelorussia, North Caucasia, Turkestan and Azerbaijan. The only important group of exiles from the Soviet Union whom Admiral Kirk did not succeed in bringing into the committee is that of the Ukrainians, who hold aloof from other Russian exiles because the latter oppose the cherished Ukrainian objective of separation from Russia and the formation of an independent Ukrainian state. The Russian exiles other than the Ukrainians want liberation from the Stalin dictatorship but oppose the territorial breakup of the Russian state.

The key role of Admiral Kirk in anti-Russian propaganda work was underlined in August, when President Truman appointed him director of the Psychological Strategy Board. This board, working under the supervision of the National Security Council formulates and co-ordinates United States policy in the field of psychological strategy against Soviet and other Communist propaganda throughout the world. Admiral Kirk was succeeded as chairman of the American Committee by Vice-Admiral Leslie G. Stevens, naval attaché in Moscow from 1947 to 1949, and a close student of Russian affairs. While serving as chairman of the American Committee, Admiral Kirk said that he could not hold out immediate hope for a rebellion within the Soviet Union, but declared that "our best potential allies" are the Russian people, whom he described as the first and oldest victims of Communism.

Crusade for Freedom

The second important private organisation conducting propaganda against Communism is the Crusade for Freedom, which was formed in 1950. Its president is Rear Admiral H. B. Miller. The first chairman of the group was General Lucius D. Clay, who in August was succeeded by Mr Henry Ford 2nd, president of the Ford Motor Company. During two years Crusade for Freedom has raised over \$3 million from 25 million Americans to support its two radio outlets—Radio Free Europe and Radio Free Asia. The latter is operated under the auspices of the Committee for a Free Asia, in San Francisco; the former has transmitters in Munich and Frankfurt in Germany and at Gloria, near Lisbon. Crusade for Freedom plans to raise more money in 1952 to finance additional transmitters in its Europe and Asia networks. In 1951 the organisation also released 13,000 gas-filled balloons which, carried by the wind, took millions of messages of freedom into Communist territory.

Those engaged in government and private propaganda hope that the peoples of iron curtain countries, knowing they are not forgotten by the outside world, will be encouraged to oppose their present Communist regimes, and, if not to overthrow them by force, at least to undermine them by passive resistance and non-co-operation. If and when Communist regimes disappear from the scene in eastern Europe, what

kind of institutions do the exile groups expect to emerge? On June 12th, in the "Williamsburg Declaration of 1952," the exile leaders of Albania, Bulgaria, Czechoslovakia, Estonia, Hungary, Latvia, Lithuania, Poland, Rumania and Yugoslavia, gave a blueprint of the changes they would make in their countries after liberation.

After declaring that secret police, concentration camps, forced labour, trial by torture and intimidation, extortion, arrest, genocide and deportation would be immediately abolished, and that stakhanovism and punitive laws on the discipline of labour would be ended, they stated that "the peasants shall be liberated from forced collectivisation and kolkhozes." The right of private ownership of land shall be restored, and land and other property taken from the peasants for collectivisation shall be given back to those who till the land. Free and independent voluntary trade unions and labour organisations shall be the guardians of workers' rights and interests. The rights and dignity of the worker shall be protected, and his opportunities for social and economic progress, including the right to ownership of property, shall be inviolate. The free peoples of Eastern Europe would form a regional group, and through this group would join in the formation of a United States of Europe.

This programme and others like it announced by exile groups in the United States make no reference to the possibility of restoring the reactionary elements which played a significant, in some cases a controlling, role in the countries of eastern Europe during the inter-war years. The far-reaching, and not always progressive, influence formerly wielded by the Catholic Church in several of the eastern European countries is also passed over in silence. Nor is there any mention of the problems that would arise if and when a liberated Eastern Germany, reunited with West Germany, sought to recover the German lands lost to Poland and the Soviet Union. It is apparently assumed that, once the Russians have retreated within their borders, eastern Europe will have nothing more to fear either from its own former reactionary elements or from a resurgent Germany.

(To be concluded)

Independent India's Civil Service

[BY A CORRESPONDENT IN INDIA]

THE frequently heard *obiter dicta* that the efficiency of the Indian civil service has fallen disastrously since independence implies comparisons that cannot be made. The duties of the prewar ICS and of the post-independence Indian Administrative Service differ in scope, kind, and objective.

The ICS was basically concerned with law and order. While it is true that many District Officers led selfless lives devoted to bettering the lot of the millions in their charge, consciously or unconsciously they were confined within certain limits by the knowledge that they were foreign rulers whose dominion would be upheld with increasing difficulty if it ran counter to the varied beliefs and customs of the ruled. While reforms were initiated and nation-building activities undertaken, the rate of progress in certain directions was set by the need for caution. The ideals of the old Government of India included incorruptibility, justice, and a steady but unspectacular rate of economic progress. If the conception of the welfare state had then existed, the old government would have shrunk from it as the opposite of that for which it stood—a sound but unobtrusive administration that did not impinge on the lives of the people more than necessary. It is no reflection on a fine body of men to say that in their circumstances, with the imperial authority always behind them, a high degree of efficiency was to be expected.

The ideals of the independent Government of India, on the other hand, are those of a welfare state, with which is synonymous an eager readiness to intervene in every form of activity existing, or even imaginable. Before the war, for all practical purposes, the only contact that business men had with the civil services was as channels of communication to, and pressure on, the Government to adopt or refrain from adopting some broad commercial policy. There was not much to be inefficient about. Today, the Government undertakes not merely the general direction of the economy but reaches down into its smallest details. We have internal food procurement and rationing, and state importation of grains running from three to six million tons a year, frequently combined with barter deals in jute or other exports. We have rationing, controls, or direct government intervention in one form or another, in the affairs of the steel, cement, cotton, cloth, sugar, coal, electricity, insurance, banking, civil aviation, and jute industries—a list incomplete but staggering enough when the volumes and quantities involved and the size of the population and of the country are visualised. As if this were not enough, the civil services have also been required to struggle with the partition of the sub-continent, with a *de facto* civil war in 1946-47, with the biggest two-way refugee movement known to history, and with the subsequent relief and rehabilitation of some 8 million people.

Chaos or Democracy?

The Indian Administrative Training Service School was launched in March, 1947, and the first batch of trainees, selected from war service candidates, had hardly been enrolled when they had to be drafted out on special duty to cope with every kind of emergency. Nor did the restoration of peace allow a pause for consolidation. Sardar Patel's ambitious and successful policy of absorbing the princely states covering no less than 645,000 square miles (or more than half of the total area of the whole Union) imposed fresh burdens on the higher personnel of the civil service. Simultaneously, India began to open embassies and legations all over the world and a diplomatic service was created.

Above all, there has been a profound change in the spirit of the administration. In the old days, the District Officer was a benevolent autocrat. Today, his administration must be sensitive to public opinion, otherwise the people may complain about his methods, deeds, or misdeeds, to their local member of parliament, and he may be moved elsewhere with varying results on his career. Critics of the régime hail the effect of this as "chaos"; sympathisers acclaim it as the working of democracy. District Officers are as overwhelmed with new duties as their colleagues in the capitals. Partition has led to large-scale international smuggling between India and Pakistan, and food, cloth, and other controls, as well as to internal smuggling between states. Nor are labour problems as smoothly handled as they could be when a mill manager, faced with trouble, telephoned the police and had a squad restoring order with old-fashioned efficiency within the hour. Labour tribunals are slow and less sure on which side lies the right.

Examples of the enormously complicated tasks of India's overworked post-Independence civil servants could be multiplied, but enough has been said to suggest that comparisons with the efficiency of the ICS are unrealistic. The wholly different problems of the IAS arise from the all-embracing aims of the welfare state, from the itch of inexperienced politicians to interfere in administrative matters, and from the innumerable opportunities for corruption that rationing and licensing offer to politicians as to civil servants. Whether these weaknesses will gradually be eliminated, time will show. But that independent India has survived the shocks attendant upon its birth is in large measure due to the ideals of discipline, duty, and integrity that the handful of remaining ICS officers, now manning key posts in the IAS, are instilling by precept and example in the new service.

WHEN IT'S A QUESTION OF TIME...

folk finders . . . !

Are they on your pay roll, these people who waste time looking for other people, interrupting those who want to be getting on with the job? They are unless your premises are properly equipped with a thoroughly up-to-date Internal Telephone and Staff Location system. Another thing that saps efficiency, if you are not so equipped, is your switchboard operator having to 'phone all over the building for people when she should be dealing promptly with outside calls. T.R. Service saves time and temper by making everyone on the premises easy to find instantly.

TR SERVICE
speeds production

Today's need for maximum output has so increased demand for T.R. Service—Internal Telephones, Staff Location, Internal Broadcasting and Time Control—that new installations can now be undertaken only in organisations engaged upon work of National Importance.

JOSÉ JOURNEYED SOUTH

José is a cigar expert from Havana. His skill he inherited from Manuel, his father, who was a pupil of the greatly respected Juan. Today, José is in Jamaica producing Larra* cigars for Por Larranaga. Thus he carries on the tradition of craftsmanship of which he is so proud, happy that the wrapper leaf which he has always known is sent regularly from Havana. José is pleased, too, that he is still with his old Por Larranaga colleagues. Truly, he feels, Larra cannot help but be very fine cigars indeed.

WHO WILL ENVY NOAH? He had to cater for an ark-full of hungry passengers.

Consider for one moment the tonnage of meat for the carnivores, and vegetables for the vegetarians. Noah would have appreciated the balanced range of equipment that the Falkirk Iron Company now provides. Falkirk's policy of designing each installation for the individual customer would have found especial favour in his eyes.

The burden of feeding his fabulous menagerie — with a crew of only seven — would have been greatly lightened by the many labour-saving qualities of Falkirk equipment.

With such heavy-footed passengers as the hippopotamus, the African rhinoceros and the mighty aurochs, the advantages of tough cast-iron construction are obvious.

As he staggered down the companion-way with a bucket of broth for an ailing Aardvark, Noah must have yearned for efficient Heavy Duty Cooking Equipment that could be made for gas, electricity, oil, steam and solid fuel and sold at a competitive price.

Alas poor Noah! His lot was very hard. The large-scale caterer of today, however, enjoys all the advantages denied the patriarch, by merely asking the Falkirk people for a quote.

Thousands of rusty mountings which carried Oerlikon guns on merchant ships in World War II have been cleaned and reconditioned by two Simon companies, Metal Laundries and Thomas Adshead. This has been done at a tenth of replacement cost, owing mainly to the special de-rusting process operated by Metal Laundries. Similar work has been carried out on thousands of large bomb casings. These, like all aspects of rearmament, are melancholy tasks, but as they have got to be done they must be done as efficiently and cheaply as possible.

Profits off the Boil

THAT ominous word "recession" was first discussed in the board rooms of British companies over a year ago; but only in the past few months has it become the commonplace of the general meeting. An analysis of the trading experience of the 564 companies whose accounts were published between July 1st and September 30th goes some way towards explaining why. When these 564 companies are sorted into thirty-one industrial groups (under the classification used in this week's issue of *Records and Statistics*) it can be seen that in ten of these groups profits earned in the latest year of trading were smaller than in the previous year. This is a startling contrast to the experience between 1950 and 1951. When the 515 British companies that published accounts between July 1st and September 30, 1951, were classified into the same thirty-one groups, trading profits were shown to have risen in all cases.

Moreover, last quarter's figures naturally do not show the full effect of the recent decline in sales. The financial years of nearly half the 564 companies concerned ended on March 31st last. In most cases, therefore—the main exceptions were companies in the woollen industry—bumper profits were earned for about six months before sales and profits began to taper off. Because of this time-lag, and because of the continuance of the boom in building and most sectors of the engineering industry, the aggregate of the published profits still shows an increase on the comparable aggregate for the previous year, though the rate of increase is smaller than that shown by companies whose accounts were published earlier in the year.

The tables accompanying this article, and in *Records and Statistics*, show that the total income of the 564 companies rose by £26 million, or 10 per cent. This 10 per cent increase shown in accounts published in the third quarter of 1952 compares with an increase of 17 per cent in the total income of 831 companies (excluding the exceptional results of nine oil companies) that published accounts in the second quarter of this year, and with an increase of 24 per cent in the total income of the 515 companies (whose financial years spanned much of the boom resulting from the Korean war) that published accounts in the third quarter of 1951. It can also be compared with an increase of 18 per cent (or £271 million) in the total income of the 2,446 companies that issued accounts in the year to September 30th as a whole; these 2,446 companies raised their ordinary dividend payments by £6 million, or 4 per cent. The percentage increase in equity dividend payments declared by companies that published accounts in the third quarter of 1952 was even smaller, at 2½ per cent; in fact, equity shareholders in these companies actually received a smaller rate of return on issued ordinary capital—and, of course, a much smaller return on the capital resources employed in the business—than in the previous year.

The ten groups that reported a fall in trading profits

last quarter were three textile groups (wool, cotton, clothing and footwear), two commodity groups (tea and rubber) and—showing a much smaller fall—five miscellaneous industries (chemicals and paints, warehousing, shipbuilding, oil, and finance and land). The dividing line between those groups that suffered a fairly heavy fall in profits and those that reported only a slight fall (or showed a small increase) seems to be drawn between those that had to write down stocks and those that did not. The stock figures are, in fact, perhaps the most revealing feature of the latest accounts; they suggest that several industries that managed to show an increase in profits on the year did so only because they had not, at the balance sheet date, yet felt it necessary to cut their selling prices—despite the accumulation of unsold goods in their warehouses.

The most significant falls in published profits occurred in the textile trades. In the clothing and footwear group trading profits fell by 35 per cent, in the cotton group by 51 per cent, and in the wool group by 86 per cent—the biggest decline of all. In all three cases these declines were accompanied by a definite slowing down in the rate of increase in stock values, and in the case of companies in the wool group by an actual reduction in these values of 28 per cent. Woollen manufacturers were, of course, faced with the steepest decline in raw material prices during the year, so that profits earned by these companies had to bear the heaviest burden of stock losses. This experience should be contrasted with that of the silk and

rayon group. Profits reported by silk and rayon companies last quarter still showed a slight increase on the year (of 3 per cent, compared with one of 70 per cent

reported in the third quarter of 1951), while the book value of their stocks increased by 58 per cent (compared with one of 11 per cent). This increase almost certainly represented the piling up of unsold stocks, and more particularly of unused raw material stocks, in the warehouses and factories; at the time these balance sheets were struck, the need for the unpleasant decision to write down stocks had apparently not yet arisen.

The experience of shops and stores straddled somewhere between that of the silk and rayon industry and of the woollen industry. The shops and stores group as a whole reported a further increase in profits and stock values, though on nothing like the scale of increases reported a year or so ago. This result, however, was distorted by the experience of a single company, Great Universal Stores, whose hire-purchase sales continued to increase against the tide of falling sales elsewhere in the retail trades. Some decline in profits and in stock values would probably be revealed if the results of GUS were excluded from the stores group.

*

Three other important industrial groups closely in contact with the consumer (chemicals and paints, motors, and electrical manufacturing) reported a slowing down of the rate of climb in profits, accompanied by a very marked increase in stock values. Here, as in the case of the rayon industry, this increase appears to have represented the accumulation of unsold stocks. In the chemical and paints group, where trading results have been affected by the recession in the plastics industries, there was a very slight fall in profits while stock values increased by 37 per cent. In the motor group and the electrical manufacturing group (where the decline in the sales of radio and television sets and of other consumer goods has played an important role) profits showed a further increase, but at a much slower rate than that reported by similar companies a year ago; this was accompanied by an increase in the value of stocks held by the motor companies of 34 per cent (compared with an increase of only 1 per cent a year earlier) and an increase of 35 per cent (compared with an increase of 3 per cent) in the value of stocks held by the electrical manufacturers.

The close parallel between changes in stock investment and movements in profits can also be discerned in those industries where the recession in trade came too late to be caught in the analysis of accounts published in the third quarter of this year, and in those industries that are not yet likely to be feeling the effects of a serious recession in trade at all. In the first category the most notable example is provided by the sixteen companies in the newspapers, paper and printing group. Profits earned by these companies were still swollen by windfall stock gains; profits therefore jumped by about 42 per cent, while the value of stocks rose by some 71 per cent. This trend will almost certainly be reversed when paper companies whose financial years ended later in the year report their results. Such a reversal in trends need not, however, yet be expected in two other important groups (building and engineering) where profits and stock values have continued to rise quite rapidly. Profits earned by the 48 engineering companies that published accounts in the third quarter rose by about 27 per cent, while the book value of stocks—presumably as a reflection both of bigger sales and higher prices—rose by 29 per cent. Although some of the products of the engineering industry are not now as easy to sell as they were a few

months ago, there is no real reason to suppose that stocks of unsold goods are piling up—certainly they were not doing so when these accounts were struck. An even more spectacular increase in stock values (of 43 per cent) was reported by the 25 companies in the building group; as the housing programme was just getting into its stride when the financial years of many of these companies

ended, this increase was to be expected—as was the 21 per cent increase in profits.

To sum up: in the year covered by this latest sample of company accounts, the capital goods industries could still see a rather flickering green light ahead of them and only the textile and some other consumer goods industries could definitely see a red one. But for a wide range

of industries that straddled between the investment and the consumer goods sectors the light had very definitely turned to amber. It remains to be seen what effect will be wrought on the finances of industry—and of the country—if this amber light does turn to red. All through the boom, increases in equity dividend payments and in reserve appropriations lagged well behind any advances in trading profits—thanks to the remorseless attentions of the tax collector. But it is these Cinderellas that have also suffered most harshly at the first whiff of trade recession. Equity dividends were sharply reduced—and reserve appropriations even more sharply—by all three of the important textile groups last quarter, and only in the engineering and paper industries was there any notable further increase in dividend payments and in the

amount of profits ploughed back into the business. The recession to date, however, must not be exaggerated. There is no evidence yet that the dividend cuts made by the textile companies this year will be the general lot of industrial investors next year. And, in the field of public finance, the figures so far available suggest that taxes paid by companies for 1952-53 (levied on profits earned in the year to March 31st last) may bring in all that the Chancellor expected when he drew up his budget—although they also suggest that income and profits taxes on company earnings will not be such a fruitful source of revenue in 1953-54. But the general impression remains that these over-milked kine have not emerged from the seven fat postwar years in any fit shape to ride out seven lean years—if the lean years follow.

Cheaper Life Assurance

LAST year the boom in new life business reached what may be a temporary peak. According to figures just published by the life offices' associations the total new business of 75 leading offices (which account for at least 98 per cent of all business transacted in this country) rose by £135.7 million to £728.8 million in 1951; within these totals, new business under group life and group endowment assurances rose by £60.1 million to £135.5 million and that under individual pensions schemes—including "top hat" pension schemes for higher executives—reached £78.2 million. In all, over one and three-quarter million people in this country now participate in schemes with pension benefits (usually, but not always, associated with life assurance benefits); and the premiums attributable to pension and "scheme" business account for some 31½ per cent of the total annual premium income of British life offices. Thanks largely to the buoyancy of this total annual premium income (which rose by just over £26 million to £226.7 million in 1951)—and despite further increases in payments to policy holders, management expenses and taxation—the life and annuity funds of these 75 offices rose by £116 million to £1,895 million last year; in 1950 they had risen by £104.5 million to £1,779 million.

Such, in brief, is the course and anatomy of the latest phase of the boom. There is evidence, however, that the boom is now flattening out, and that the figures for 1952 will not be significantly better than the very good ones for 1951; indeed, sales of individual life assurance policies at home will almost certainly be lower. At first sight this may seem surprising, for total personal savings in 1952 are generally expected to be somewhat higher than in 1951. How far does this indicate that recent reductions in the rates of life assurance premiums have not been sufficient to offset the increased attractiveness of other media for personal savings—as a result of the all-round rise in interest rates?

Broadly speaking, the answer seems to be that the flattening of the boom cannot be attributed to this factor at all. The table on the following page shows the reductions that have been made since May, 1950, in the cost of certain types of life assurance policies and annuities by 43 leading offices. It will be seen that nearly all the offices have reduced their non-profit premium rates in this period; in fact more than a third of the offices in the

table have made reductions in the last three months, while another third did so earlier this year—and many have changed their rates more than once since the war. The base date (May, 1950) in the table and the 43 offices concerned have been chosen to facilitate comparison with the detailed figures set out in the article "What a Life Premium Buys" in *The Economist* of November 18, 1950.

*

There are three important qualifications that need to be borne in mind when analysing the changes shown in the table. First, the figures refer only to annuities and to life assurance policies that do not entitle the holder to participate in profits. Rates of bonus as well as of premium enter into the relative attractiveness of the with-profit contracts of the different offices; and changes in circumstances, such as a rise in the rate of interest, are normally allowed to work themselves out in the rate of bonus. Although a few offices have recently reduced their premium rates for with-profit, as well as for non-profit, life assurances, this is not the normal practice.

Secondly, it is not really possible to work out from the table the relative "cheapness" of the rate of premium of a given office, because of the complexity of the underlying assumptions. To cite only one example: two of the offices in the table offer specially favourable rates to total abstainers. Even if these complications could be allowed for, the comparisons in the table would show which is now the cheapest office only for policies of the type and size and at the age indicated, and only for immediate or split annuities for one sex at one age. It is now almost universal practice to allow reductions in the rate of premium for large whole life and endowment assurances; such reductions are usually on an increasing scale, and some offices quote a particularly attractive rate where the sum assured is above £5,000. Again, some offices are now believed to quote especially low rates for endowment assurance policies effected under "top hat" pension schemes, while some deliberately quote uncompetitive premium rates for all non-profit business—because they prefer to transact most, or even the whole, of their new business on a with-profits basis.

Thirdly, a change in the rate of interest is not the only factor that can affect the cost of life assurance and

annuity contracts. There are at least three other major factors—taxation, mortality and expenses of management—that have to be considered as well. It so happens, however, that recent fluctuations in these three factors have not been nearly as important as fluctuations in interest rates. Income tax on the interest earnings from life assurance funds has been stable for twelve years—at 7s. 6d. in the £; this concessionary rate was granted by the Finance (No. 2) Act, 1940, has been continued ever since, and seems unlikely to be withdrawn. The trend of mortality is in favour of the offices in life assurance business, but against them in annuity business—including staff pension schemes. Expenses of management have risen greatly since the war and are still rising, but so far at any rate the volume of new business (and, with the help of a relatively small wastage from lapses and surrenders, of the total business in force) has been sufficient to absorb rising costs. After making adjustments for the distorting effect of annuity and single premium life assurance business, the percentage of premium income absorbed by expenses in the leading offices averaged 14.3 per cent in 1949, 14.0 per cent in 1950 and 14.1 per cent in 1951.

It is, therefore, largely by reference to the change in interest rates that the recent reductions in premium rates should be measured—and the prospect, if any, for further reductions judged. The second and fourth columns of the accompanying table show the sums that can now be assured under non-profit whole life and twenty-five year term endowment assurances respectively, by a premium of £25 paid by a healthy person aged 30 years next birthday (who is not exposed to any exceptional hazard through occupation, residence or travel). It will be seen that whole life assurance sums now offered by these offices for this premium range from £1,523 to £1,313, a difference of 14 per cent; twenty-five year term endowment assurance sums assured vary from £746 to £683, a difference of 8 per cent. The average whole life sum assured for this premium is £1,410, compared with £1,332 in 1950, an increase of 5.9 per cent; the corresponding averages for endowment assurances are £719 and £697, the increase here being 3.2 per cent. It can be calculated from these figures that the average improvement in terms since May, 1950, corresponds to an increase of approximately $\frac{1}{4}$ per cent in the future net rate of interest assumed in calculating the premiums for whole life assurances, and about $\frac{1}{4}$ per cent for

twenty-five year endowment assurances. In the same period, the net yield (allowing for income tax at 7s. 6d. in the £) on $2\frac{1}{2}$ per cent Consols has risen by $\frac{1}{4}$ per cent, and the net yield to redemption on 3 per cent Savings Bonds 1965/75 has risen by $\frac{1}{4}$ per cent.

It must be remembered that the fact that premiums now being received can be invested more profitably than premiums received in 1950 does not mean that premiums received in future years will also be invested at a relatively high rate of interest. It is no answer to this problem to say that, in theory, it is possible to change the rates of premium for new business whenever the current rate of interest changes. The life offices can never, in practice, prepare the way for exact compensation in this way by matching the maturity dates of their investments precisely and appropriately to the mean term of their liabilities. They must also carry in the back of their minds the thought that—in the long run—a fall of, say one to one-and-a-half per cent in the rate of interest is now rather more likely than a rise of the same magnitude; incidentally, such a fall would also have a more dangerous effect on existing business. When these considerations are borne in mind, it seems reasonable to judge that most offices have now reduced their premium rates as far as they safely can.

In "immediate" annuity business, since the whole consideration is received at once, the complications mentioned in the last paragraph need not enter into the calculation of costs. The cost of ordinary immediate annuities and of split annuities can safely be adjusted in step with changes in the rate of interest. The sixth column of the table shows that the cost of a split annuity of £100 per annum granted by the 43 offices now ranges from

£1,340 to £1,668, a spread of 24 per cent; the average cost is £1,482 compared with £1,566 in May, 1950, a reduction of 5.4 per cent. The purchase price of an immediate annuity of £100 per annum varies from £1,134 to £1,316, or by 16 per cent; the average cost has fallen from £1,260 in May, 1950, to £1,208 now, a reduction of 4.1 per cent. Both types of annuity have thus become cheaper since May, 1950, by the equivalent of an increase in the yield on the purchase price of approximately $\frac{1}{2}$ per cent. Since the mean terms of the liability under both types of immediate annuity contracts are relatively short, this change can fairly be compared with the $\frac{1}{2}$ per cent and $\frac{3}{4}$ per cent increase in the gross redemption yields of War Loan 1955-59 and Savings Bonds 1965-75 respectively. It appears, therefore, that here again the benefit of most of the increase in gilt-edged yields has been passed on to the holders of these annuities.

To sum up: Although the figures in the table accompanying this article need to be interpreted with caution, most offices now seem to have passed on to the public the benefit of the rise in their interest earnings. If the new business figures for 1952 tell a story of less buoyant advance than those for recent years—and the indications are that they will—then the explanation should not be sought in the reduced attractiveness of life assurance policies relative to other savings media. One of the main explanations may be that the recent boom has absorbed a large part of the natural market—and, in this connection, it should not be forgotten that the growth of group pensions business in recent years must have embraced many people who would otherwise now have been taking up individual policies. In life assurance, as in other businesses, the sellers' market may be near its end.

TRADE with SWEDEN

Business Notes

Trade and the President

Among the many major responsibilities that will devolve upon the next American President, whoever he may be, will be that of deciding which way world trade should go. Both Mr Stevenson and General Eisenhower have proclaimed on the hustings that a long-term solution for the problem of the dollar gap must be sought, whereby world trade might be progressively freed without vast and continuing American grants-in-aid to the Commonwealth and Western Europe. And, behind the scenes, advisers of the present administration have been studying the various ways in which substance might be given to this pious hope.

European and Commonwealth observers would do well to suspend judgment upon any specific proposals that may be canvassed—until after next week's election. In matters financial, only fools rush in when the identity of the possible angel—and therefore the sort of scheme he might be willing to back—is unknown. In the past week, however, considerable publicity has been given to a working document that is known to have been drawn up by the Mutual Security Agency and to have been discussed—though certainly not agreed with—President Truman's Treasury. This MSA scheme is believed to have three main features. First, it recognises that there cannot be any genuine advance to free world trade unless there is a substantial once-for-all increase in world currency reserves; the MSA therefore suggests that sterling and other Nato currencies should be aided along the road to convertibility by supra-national backing, in the form of a reserve fund of several thousand million dollars to which the United States should contribute at least four-fifths and European countries one-fifth. Secondly, the MSA recognises that such a scheme might impose a continuous drain on United States resources unless other members of the new reserve system kept their internal economies under stern control; it therefore suggests that an Atlantic Economic Board should be set up to attempt "co-ordination" of members' economic and trade policies. Thirdly, the MSA recognises that any new world trading system could be overwhelmed by a sharp fall in raw material prices, such as would at present occur at the onset of any American recession; it therefore suggests that an Atlantic Commodity Board should be set up to stabilise raw material prices and production through long-term agreements with leading producer countries. In the next few months a great deal of hard thought is going to have to be devoted to these matters. If any practical new scheme is to emerge, Commonwealth and European countries must not content themselves with speculating on how many American dollars they can hope to get; they must decide—coolly and with an eye on the advantages to be gained—how much delegation of economic sovereignty to a supra-national body they will be willing to offer.

Production Still Depressed

There are no measurable indications yet of the renewed increase in industrial production upon which the Government has been basing some of its hopes for the economy. In August the official index of industrial production showed 99 (1948 average = 100), compared with 102 in July and with 104 in August last year. And on the basis of information received so far, the figure for September seems likely to be 115-116—against 121 in September, 1951. In the first eight months of this year, industrial production was 3½ per cent lower than in the same period of 1951, and the estimate for September would make the comparison slightly worse (though not so bad as July and August appeared in comparison with the corresponding months of 1951).

The indices of output for particular sections of the economy are recorded much more in arrear. In the first six months of the year, production seems to have been higher than a year earlier in building materials, food, metals and engineering; roughly unchanged in vehicles, building and contracting, the public utilities, and mining and quarrying; down in most consumer goods. Coal and steel production are at present both higher than in 1951; and there has been some revival in the cotton industry.

Employment has not increased as much as usual this year, and there has been a sharp fall in the number of vacancies notified to the labour exchanges (which is now a more precise indicator of industry's power to absorb labour than it used to be). Vacancies in September have been fewer than the numbers of unemployed for the first time in any September since the war. At the same time, labour has been shifting towards the defence industries, and more slowly towards engineering as a whole—the shortage of steel, presumably, has limited the capacity of many sections of engineering to take on more workers.

Sterling Ascendant

Sterling has this week been showing every sign of resurgent strength. In the official market it has once again crossed the parity with the dollar, to close at \$2.80½ on Thursday. In the forward market the premium on three months dollars, which at the beginning of this month was around 2½ cents, has narrowed to 1½ cents. This represents an interest rate of about 1½ per cent per annum, and is very little more than the appropriate forward exchange parity indicated by the differential between short-term market rates of interest in London and in New York. The recent demand for sterling against dollars is due to a variety of factors. This is the time of the year when the seasonal demand for certain sterling area products makes its effect on the exchange market. The market is also benefiting from the cessation of the exceptional demand for dollars that followed the short-lived concession for commodity arbitrage between dollar and European countries. But for this relaxation, the sterling rate in New York would probably have continued the recovery that was well under way in the first part of August. The latest recovery in the rate does little more than correct the subsequent dip, which by the middle of September had brought the rate down to its "lower gold point" of \$2.78. The most important factor in the market, however, and one that is reflected in the forward rates, is the covering of semi-speculative, semi-commercial bear positions. With the modest rise in the gold reserve and the prospect of further rises in the coming months, the normal tendency on the part of overseas traders is to cover sterling requirements and not to delay purchases in the hope of later depreciation. The tendency over the summer months was to delay sterling purchases in the expectation that the floating rate, of which there was then much talk, would lead to a lower value of sterling. No such expectations are now entertained and a fair volume of semi-commercial speculation against sterling is being covered.

The other main feature in the foreign exchange market this week has been the strength of the guilder. This is also a somewhat delayed phenomenon, reflecting the improvement in the Dutch balance of payments that has been apparent for some months past in the European Payments Union settlements. The guilder's underlying strength would have become apparent earlier but for the dollar-EPU arbitrage scheme, which created a considerable demand for

sterling on Dutch account. This demand for sterling led to a weakening of the guilder from Fl. 10.56 at the beginning of September to Fl. 10.71½ in mid-October. From that point, however, the rate has moved against sterling, to Fl. 10.66½. The market reports some important purchases of guilders on behalf of oil companies. Another factor is that with transferable sterling now at \$2.70 (representing a discount of only about 3½ per cent on the official rate) commodity shunting is losing a great deal of its attraction; consequently, Dutch demand for sterling is losing one of its main elements. Security sterling has also continued its upward trend this week, and has strengthened from \$2.58½ to over \$2.60.

Deposits Rise, Despite the Loan

The October statement from the clearing banks will come as a disappointment to anyone who hoped that any perceptible degree of funding of bank deposits would have resulted from the Treasury's recent loan operations. Although sales of the new Serial Funding Stocks ostensibly produced £317 million of cash early last month, net bank deposits rose by £15 million in the four weeks to mid-October. Two factors account for this seeming paradox. The first is that most of the so-called "cash" subscriptions for the new issues came from the banking system, which, of course, had to finance itself by selling bills to the authorities to a more or less equivalent amount. The clearing banks' participation, on the evidence of the October statement, appears to have amounted to about £221 million, for that is the extent of the rise in the aggregate investment portfolio during the month—a rise that, incidentally, raises both the total portfolio (£2,142 million, against £1,555 million in October, 1951) and the ratio to deposits (34.7 per cent) to the highest level ever recorded. Further "cash" subscriptions also came from other banking institutions, including the discount market, that may be presumed to have mainly financed themselves in much the same way, by operations that had their eventual counterpart in purchases of bills by the Treasury itself. The only portion of the nominal £317 million of cash subscriptions that could produce a reduction in bank deposits was that furnished by non-bank subscribers other than the "departments" themselves.

This residual and "genuine" portion of the cash subscriptions—the portion not financed, in effect, by the banks or by the authorities themselves—might have been expected to amount to some tens of millions. If no other influences had been at work, bank deposits would have fallen correspondingly. The fact that they actually rose by £15 million instead is explained by the second distorting factor—the financing of the Treasury's current deficit. The domestic deficit amounted to rather more than £100 million in the four weeks most nearly corresponding to the dates of the banking statements, before allowing for finance secured from tax certificates and small savings. While the loan operation enabled the Treasury to redeem floating debt, its current need for cash has been compelling it to re-borrow. It would be rash to try to guess the relative strengths of these conflicting factors. On the one hand, it is clear that the extent of the Treasury's reliance on the banks for current finance has been appreciably understated by the smallness of the month's rise in deposits; on the other hand, this need for finance has completely obscured the small margin of "genuine" cash subscribed for the new loans.

Liquidity Ratios Now

In consequence of these re-borrowings by the Treasury, the month's net decline in the banks' liquid assets fell appreciably short of the £221 million that was in effect converted into investments. Holdings of Treasury bills dropped by £170 million and total liquid assets by £207

million (including a further small decline in commercial bills), so that the total, at £2,120 million, has not even been restored to its level of end-June last, and is still roughly £140 million above the low point reached after last year's funding. In conjunction, however, with the month's rise of £41 million in gross deposits, the contraction suffices to cut liquidity ratios to roughly the extent envisaged when the conversion was announced. For the clearing banks as a group, the ratio has fallen from 38.0 to 34.4 per cent, its lowest since May. This still comfortable level is likely to be reinforced in a fortnight's time, when the Treasury re-borrows for the redemption of the £105 million of 1952 Serial Funding stock that remains unconverted; and, until the big tax-gathering season opens in the New Year, it will be fortified still further by the financing of the current Exchequer deficit.

A scrutiny of the figures of the individual banks throws interesting light on the technique of the conversion, and incidentally substantiates the claim that the formula suggested by the authorities to the banks was more flexible than that adopted last year. The range of liquidity ratios shown by the "Big Seven" banks individually is still as much as 3½ points (from 33.1 per cent for Lloyds Bank to 36.6 per cent for the two northern banks), but among the "Big Five" it is less than 2 points, compared with over 3 points in September. To achieve this closer approach to uniformity required "cash" subscriptions to the loans related to the previous level of liquidity ratios rather than to the size of the bank. Thus it happens that the largest bank (the Midland) subscribed the smallest proportion of deposits (less than 2 per cent), whereas three banks put up over 5 per cent.

Steel Shortage Fades

One of the first specific indications by which the Government's decision to re-adjust the rearmament programme "so as to lighten the burden on engineering" may be judged is the easing of the shortage of alloy steels. Both supply and demand have changed this summer. The alloying materials have become considerably less scarce, and have allowed an increase in the production of alloy steels to about a million tons a year, compared with a rate of about 850,000 tons a year ago. On the other side, defence demands do not seem to have risen as much as total output has done—and presumably much less than they would have been expected to increase in the original paper plans for rearmament. In these circumstances, the Government has taken the opportunity to simplify its steel allocation system by giving consumers using alloy steel for approved purposes a single authorisation of all types of steel, within which they may acquire carbon or alloy qualities according to their needs and the producers' power to satisfy them. This reduces paper and administrative costs; and it will allow some flexibility in the exercise of demand. The current allocation system can make little allowance for changes in a consumers' demand for different qualities of steel; as supply becomes a little easier the paper authorisations tend to pile up in the wrong places.

This weakness is not confined to the allocation of alloy steels; and perhaps the most encouraging sign of this week's decision is that it suggests that an end to steel allocation as a whole may not be far off. The uses of alloy steel are still restricted by "end-use prohibitions" which specify the grades of alloy content allowed for various kinds of alloy steel product; and the Alloy Steel Directorate supplied by the industry to the Ministry of Supply will still remain formally in being, to administer these regulations. Nevertheless, this relaxation is one indication of the general fading in the steel shortage that has been expected for months. There remain certain products that are still tight—plates, small billets for engineering, small bars, and drop forging qualities of steel are examples—but in the main supply is not far out of balance with demand. Once supplies of these particular products

improve, there will remain no excuse for maintaining the clumsy allocation system; and it should not be retained too long to cover such special cases.

More Cars and Less Exports

The Minister of Supply admitted this week that releases of cars to the home market are substantially exceeding the number originally intended; and his admission was followed—actually within a few hours—by an appeal from Mr L. P. Lord, the chairman of the Austin Motor Co., for a freeing of cars from purchase tax, in order to save the motor industry from imminent unemployment. These two statements together constitute a remarkable confession of failure on the part of both the industry and the Ministry to implement the policy laid down at the beginning of the year. It was intended then to restrict deliveries of cars to the home market to a maximum of 60,000; all the rest of the industry's output of cars was to be sold abroad. But since the early months of the year exports have been falling consistently below their 1951

levels—not so much because British cars were ceasing to be competitive, but because overseas import restrictions were shutting them out of markets in which, so it is believed, there is still a considerable measure of unsatisfied demand.

Had Government policy been consistent, the logical consequence of this loss of export business would have been a reduction of output by the industry; but, in fact, this has never happened, and is never likely to happen. Within the Ministry of

Supply, home quota figures have always been regarded as notional, whatever interpretation the central planning bodies have put upon them. This year there have been two retreats from the supposed policy. A face-saving manoeuvre was carried out during the summer, when the fixed home quota of 60,000 cars was replaced by an understanding that the industry would export 80 per cent of its output, which implied a home quota of 90,000 cars. Yet by the end of August, more than 84,000 cars had been sold at home, and in the past month or so the industry has been selling only between 50 and 60 per cent of its output abroad. In spite of this, the allocation of steel to the industry has been increased considerably for the fourth quarter of the year. This would be sufficient to raise the rate of production during that period up to, if not above, last year's total of 476,000 cars, whereas output during the first eight months has been at the rate of only 420,000 cars a year. This expected rise in output has created the situation that prompted Mr Sandys to say "we recognise that in the immediate future the industry will probably not be able fully to achieve its export target and, therefore, for the time being, will have to sell more on the home market." It seems probable that some 150,000 cars will be sold at home this year, compared with 109,000 last year. On this indication, deliveries in 1952 will be even higher, for it is difficult to believe that the circumstances that led to the imposition of import restrictions on British cars are so transient as the Minister's words might seem to suggest. Although the motor industry claims to have the best export record among the metal-using industries, it is not so obvious that the production of more cars for sale at home is the best use to which the extra steel could be put.

Confusion in the Second-hand Market

Meanwhile, the prospect of increased releases of new cars is one that may deal a body blow to the highly organised trade in ex-covenant cars. The prices of these cars have been falling throughout the year, but during the summer it was still possible, as the accompanying table shows, for the owner of an ex-covenant car of popular make to get more for that car than he paid for it when new. This possibility arose mainly from the fact that the rate of purchase tax had risen from 33½ to 66½ per cent within the period between his purchase and sale, and there had also been a rise in manufacturers' basic prices. There are no ruling second-hand prices for either of the new cars produced by Ford or Vauxhall because none of the models is yet "ex-covenant."

Between the early summer and autumn, prices had fallen by as much as £100 a car and Mr Lord's action in suggesting the possibility of a reduction in purchase tax may already have cut them by, say, a further 20 per cent. On the day after his speech dealers were at a total loss to know what prices either to ask or to offer, and the salesmen of new cars were in an even less enviable position. With some 250,000 of home orders still on its books, the motor industry has no reason to believe that it cannot find buyers for all the cars that are likely to reach the home market in the months before the Budget—even though the rate at which new cars are being turned down when offered to "buyers" on the lists is

causing consternation. For this reason, distributors have been at some pains to avoid actually exhibiting cars for immediate delivery in their showrooms; instead, they tend to dispose of their surplus to other dealers who still have effective buyers on their lists. These tactics have the secondary effect of underpinning second-hand prices, which are governed by the relative scarcity of new cars. Nevertheless, the figures for second-hand prices ruling in October are probably on the generous side.

But the industry has not yet made a convincing case for reduction in purchase tax. It is important for it to maintain a high volume of output in order to keep down costs, and the incidence of purchase tax does weigh heavily on cars at all price levels. On the other hand, a deterrent of this kind may be the only means of encouraging the industry to make the maximum effort to hold its ground in the export markets. It will need a considerable volume of unemployment (of which, for all Mr Lord's fears, there seems little immediate prospect) to justify any measures that are likely to swell still further the volume of cars sold at home.

Experiment with Zinc

On January 1st private dealings in zinc are to be resumed on the London Metal Exchange, and so another step will be taken along the road of freedom. But if zinc, why not copper? For zinc, to Britain, is much more a dollar commodity than copper. The Government doubtless regards

this as an experiment that if successful could be soon extended to copper. What are the chances of success with zinc? Demand for the metal has recently been weak in all countries, and this week the Ministry of Materials reduced its price from £118 a ton to £110, following a decline of one cent per lb in the New York price.

Whether the experiment will cost Britain dollars is another matter. Nearly half of Britain's requirements come from the dollar area—Canada and the United States. The rest comes from Australia, Rhodesia and Europe. Canadian supplies will continue to come to Britain, because British users like the Canadian quality and because of the traditional trade links between the two countries. The United States, which is a net importer of zinc, is a marginal supplier from which Britain buys (apart from making use of its refining capacity) only when supplies are scarce. In fact less American zinc is likely to come into this country under private trade than under government trade. American exporters are unlikely to accept the lower price that may well rule in a free London market; the British Government bought from the United States because it wanted large quantities, particularly for its stockpile, and America was a convenient supplier for this purpose.

Another possibility that might cost dollars is that Europe might buy dollar zinc through the London market. This is considered unlikely, because on balance Europe is a net exporter. The chances of success, therefore, would seem to be high, particularly as larger quantities of Rhodesian zinc are expected to come to London in future.

Rayon Recovery

The sharp rise in rayon production during September, rather than the actual total achieved, suggests the industry has recovered from the worst of the slump. The quantity of yarn produced, 22.4 million pounds, was still far below the industry's capacity, but it represented a rise of 46 per cent on the total for the previous month. The improvement was, moreover, most marked in rayon staple, which has borne the brunt of rayon's troubles. Last winter, staple fibre production was running at a rate not much below 17 million pounds a month, but in June it dropped as low as 2.4 million pounds. Production in September recovered to 11.5 million

pounds following a minor famine in the mills where stocks of staple had been allowed to run down so low that they were quite inadequate to support the revival in demand for rayon cloth. Shortages of this kind are being revealed in all stages of textile production, because, for months past orders have been placed on a day-to-day basis. Thus the normal autumn improvement in trading has found all sections of the industry, from the mills to the retailer, without an adequate reserve of new stocks.

The rise in staple consumption is confirmed by the fact that production of spun rayon yarn from staple fibre in the first two weeks of October regained the level of twelve months ago. In the week ended October 11th Lancashire produced 1.8 million pounds of spun rayon yarn and 580,000 pounds of cotton and rayon mixtures; these figures compare with a total of 1.8 million pounds of spun rayon and only 320,000 pounds of mixtures in the corresponding week last year. These figures are hopeful. Whether demand will recover sufficiently to employ the total capacity of the industry is not yet certain. Producers are not yet intending to bring all their closed plants back into commission.

Steel Arguments and Realities

Only a few sentences in the Commons debate upon steel last week contributed much that was fresh in the way of information or argument about the practical problems of the industry. Mr Sandys revealed that pending re-sale of the nationalised steel companies he proposed to make them subject to the powers of the Monopoly Commission. When asked if the Commission might investigate the setting of steel prices he answered that its attention might, rather, be aroused "if these companies individually engage in anything in the nature of restrictive practices," though a Conservative back-bencher later hazarded the view that "it will probably be illegal in a relatively short time in this country to try to get collective agreement to fix prices." Mr Sandys spoke moderately about the industry's system of adjusting steelmaking costs by levies and subsidies upon steel and raw materials, which the White Paper on denationalisation proposed that the new Steel Board should be given statutory power to continue:

It has undoubtedly helped to maintain stable and relatively low prices of steel. Nevertheless, it possesses all the disadvantages of any system of price averaging in that it masks real costs and interferes with the healthy operation of normal economic forces. But it would be quite impossible to end that system overnight without very serious disturbance to both consumers and producers. On the other hand, I am sure that that is the direction in which we must try to move.

The Minister can fairly argue that the last change he authorised in the price of pig iron did move in that direction. It is to be hoped, as various Liberal and Conservative spokesmen suggested, that when the Steel Bill is published it will embody broad instructions to the proposed board to promote genuine competition in the industry.

Perhaps the only other important practical issue that was touched upon was steel development. Various Opposition speakers trailed new estimates of what the industry ought to have done since the war—Mr Edelman had measured the current demand of the steel-consuming industries and found it to be 19 million tons (of crude or finished steel?)—and doubted whether the money would be found from private sources or the Treasury for the further developments that the industry has envisaged. Mr Robson Brown spoke of a feeling "in some quarters"—apparently industrial rather than political—that such further development should aim at a capacity of perhaps 18 million ingot tons, rather than the 20-21 million tons to which the industry has informally committed itself. Such feelings are hardly surprising in an industry where development seems fated to remain shadowed by political uncertainties; they may also be based upon less sanguine estimates of demand for steel than some of the planners are pleased to venture.

An Option on Wool

A futures market for wool is to be opened in London early in the New Year. This announcement, made by the London Produce Clearing House Limited (a subsidiary of

United Dominions Trust Limited), took Bradford and the London woolbrokers by surprise this week. Earlier this year the whole question of a wool futures market was studied by a sub-committee of the Wool Textile Delegation, which decided that such a market could offer no immediate practical advantages. But the sub-committee added that there were many occasions when the facility to cover transactions by hedging in a futures market would be of great benefit to individual firms. There was obviously a minority opinion in Bradford in favour of setting up such a market.

Although wool is a sterling commodity, the only futures markets dealing in it are located in New York, Antwerp and Roubaix. The London wool market deals in spot supplies, whilst the primary markets (those situated in the producing countries) are regarded by manufacturers as forward delivery markets, in that wool bought there is available only some three to eight weeks after purchase. The essence of the futures market is the facility to deal in "options"—to buy and sell futures contracts rather than bales of wool. The initial standard contract on the new London market will probably be for merino 64's tops; only later, when the market has gained experience, will a standard contract for raw wool be introduced.

Bradford's objections to a futures market are partly psychological (or almost ethical), partly technical and partly economic. Many Yorkshire manufacturers think it "wrong" to deal in options rather than in the commodity, in that this permits speculation by people not primarily concerned with handling or processing the wool. Before the war, the Liverpool cotton futures market showed on occasion that outside speculation may exaggerate price-swings, instead of damping them down as a futures market can normally be expected to do. But if a futures market operates properly, it can offer an important service to the trade, by providing facilities for insurance against future price fluctuations.

The technical objection is the difficulty of establishing differentials for grades both below and above the standard contract. Although it is true that wool prices generally vary together, there is no fixed relation between the prices of the different types, nor do the prices differ in accordance with any calculable mathematical formula—or at least they have not done so in the past. Bradford's economic objection is that manufacturers like to balance their own books in their own way, and therefore require a futures market only in exceptional periods such as last year. Further, if the market is not successful, Bradford claims, it can have serious repercussions on the wool market.

Bradford Reserves Judgment

The value of a futures market to any trade is that it reduces the risk of holding stocks of raw material and semi-manufactures, a risk that can be great in a period of uncertain prices. In recent weeks, Bradford could have made good use of hedging facilities, for the modest recovery in textiles caught it without stocks, and both combers and spinners are now having to quote the first quarter of next year as their earliest delivery date. In a sellers' market, that hardly seems to be the way to do business, particularly as continental manufacturers, who have used a futures market for years, can offer earlier delivery.

But the need for a market is not sufficient to make it work, and a futures market, like an insurance scheme, can work properly only if it gathers together a large enough volume of trade. The promoters of the scheme are satisfied that the market will be used by American merchants and manufacturers, because in New York they can only hedge on a duty-paid price. Moreover, those British and foreign merchants who have recently been hedging in New York and Antwerp would no doubt switch to London. But it remains to be seen whether these groups can supply an

adequate volume of business. It will take some time to convince Yorkshire that this is a valuable addition to existing trading facilities. The market will have to enable the fastidious wool manufacturers to get the particular types they want; and it will have to demonstrate its power of reducing price fluctuations and not accentuating them. It can do this only by working closely with the existing London wool exchange, not independently of it.

Britain Lends More Aluminium

Once again Britain is to release to the United States aluminium produced in Canada under contract to this country. Production capacity for aluminium in the United States, now the world's largest producer of the metal, has been greatly increased during this year; but drought has caused serious power shortages in the Pacific North-West and Tennessee Valley and brought about a considerable fall in output. To meet the resulting shortage Britain has agreed to the diversion of another 20,000 tons of the metal from Canada—10,000 tons in December and the remainder during the first quarter of next year. In addition, this country has agreed to postpone its right to the replacement next year of the 15,000 tons of aluminium diverted to the United States earlier this year. The earlier loans last winter amounted to 25,000 tons, so that over about fourteen months Britain will have lent America 45,000 tons of aluminium, none of which now needs to be replaced before 1954.

Meanwhile, the Ministry of Materials, the sole importer of the metal, has raised its price to consumers in Britain. The Ministry described this increase, by £9 to £166 a ton, as due partly to a rise in production costs and partly to the appreciation of the Canadian dollar. While the United States has run into this unexpected shortage, supplies of aluminium in Britain have increased so steadily that the metal appeared likely to become relatively plentiful. Imports, which were at the average monthly rate of 14,786 tons during 1951, rose to a monthly rate of 18,574 tons during the first half of 1952 and still higher, to more than 22,600 tons, in July and August. Production of virgin aluminium here has been maintained at about 2,500 tons monthly, a little higher than last year, though there was a slight fall in the production of secondary aluminium in the summer. Consumption of virgin aluminium has been rising steadily; it reached 23,000 tons in June, compared with 16,000 tons in June 1951. Although a voluntary distribution system operates for aluminium in this country, there is little difficulty in meeting existing industrial and defence requirements. In recent weeks there has been a slight falling off in demand though this has had no effect upon the world price. Though the new loan to the United States will necessarily limit British imports for some months, the Ministry is confident that it will be bringing in enough to satisfy requirements here.

Fuel without Policy

In the Commons this week, Mr Lloyd managed to outline the Government's views on fuel policy—and on the Ridley Report—while mentioning fuel tariffs once, in half a sentence. Most other speakers followed his example of omission, with some honourable (and some pathetic) exceptions; but hardly a politician present could steel himself to agree with the Ridley Committee that if a scarce fuel was being sold below cost its price should be put up.

From the committee's 40 recommendations the Government has selected a few, mainly uncontroversial, for acceptance. It believes that industry should be invited to set up and finance (with the assistance of the National Coal Board) an independent advisory service on fuel efficiency;

Look out to sea

or up the river

...you see **DURALUMIN**

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

Have you considered the advantages light alloys can bring to your business? You may perhaps not have heard all the latest developments. A request to us to call upon you would place you under no obligation whatsoever.

when this is functioning properly the Minister (against the committee's advice) proposes to cut down the work of his own advisory service. Broadly, it accepts the committee's advocacy of improved solid fuel appliances for domestic heating. It will encourage their manufacture, and may award a "hallmark" for those reaching a given standard (though it hesitates to mark each type with the actual "room efficiency" attained under test conditions); but it will not give financial incentives to put in such appliances, either to consumers or to local authorities building housing estates. Nor is it yet prepared to give industrialists any incentive through tax concessions or low interest rates to install fuel-saving rather than other capital equipment. And it has turned down both of the central bodies proposed by the Ridley committee; the joint planning board to deal with the issues on which the nationalised fuel industries may have to work together, and the tariffs advisory committee to examine the pricing policies that these industries adopt.

The Minister has a good case for caution on some of the committee's proposals; and on joint fuel production projects, at any rate, co-ordination hardly needs any new planning board, providing he does his own job properly. But it seemed rather disingenuous to quote the committee's verdict that consumers' choice could be relied on to bring about the best use of fuels without its essential rider—"provided that fuel prices closely correspond to the relevant costs of supplying the different fuels." The committee found that fuel prices today do not closely reflect costs, and suggested measures that might make them do so. So far, at any rate, the Minister has shirked this issue. Public attention to the whole question has slackened during a year in which sagging industrial output, rather than higher coal production, has banished the immediate coal shortage. But if industrial production is to begin rising once again, the shortage is certain to recur; in the last few weeks, indeed, fuel consumption has begun to rise.

Encyclopædia of Gilt-edged

For the last seven years many serious students of gilt-edged have leant, to a degree that needs to be gratefully acknowledged, on that ever-expanding encyclopædia of the Funds, *British Government Securities in the Twentieth Century*. This major work of reference—which is issued, for limited private circulation only, by a leading firm of investment brokers—grew from what now seem relatively modest beginnings in November, 1945, to a 600-page second edition in June, 1950. It has now been further expanded by a 217-page supplement, covering the period from 1950 to October, 1952. There are times when the stern Stock Exchange code of anonymity, which forbids public ascription of authorship to an individual Stock Exchange firm, can be positively embarrassing to a grateful public press.

The new supplement, from which the accompanying chart has been abstracted (as one straw from a valuable haystack), brings up to date the authors' analysis of the structure of the gilt-edged market, the history of each individual gilt-edged issue, the published holdings of the national debt commissioners and a wide range of miscellaneous information. It is prefaced by a penetrating survey of events in the market since the mid-summer of 1950. The investment habits of three main characters play a part in this survey. First, the authors believe that private investors no longer regard their investments in gilt-edged as semi-permanent, but are now showing a new sensitivity to changes in the internal and external economic prospect; the concentration of their relatively small transactions "has a greater effect on prices than fewer institutional deals representing far more stock in the aggregate." Secondly, the activity of institutional investors in the last two years is described in some detail; the authors declare, *inter alia*, that the rapidly growing pension funds are now "a factor in the markets second

only in importance to the banks and insurance companies," and they reveal that the persistent appetite for shorter medium-dated stocks—in particular Defence 3 per cent and War 3 per cent—"is generally supposed to derive from Colonial or Dominion sources." Finally, this survey includes some interesting allusions to known or suspected

BRITISH GOVERNMENT SECURITIES— NOMINAL AND MARKET VALUES.

official intervention in the market in the last two years. The authors state regretfully that a full examination of official transactions is impossible, and suggest that any attempt at this might "savour a little of *lèse-majesté*." If so, *The Economist* has clearly been guilty in the past of high treason; and it must gratefully acknowledge that exhaustive statistical surveys such as this major one have helped it to do so.

OFS and Anglo-American

Small private investors have long been chary of risking their funds directly in the development of the new gold mines in the Orange Free State, and the danger that the political powder keg in South Africa may explode has lately made them more chary still. It is not surprising to find, therefore, that in the latest major financing to be publicly announced, the finance house concerned is itself playing a very large part. Of the £12½ million required by three mines in the Anglo-American group—President Brand Gold, President Steyn Gold, and Welkom Gold—only £5½ million is to be raised by a direct offer of shares to investors. President Brand Gold is offering its shareholders 2,500,000 5s. shares at 17s. 6d. each (compared with a current price of 19s., in the ratio of one new share for every three held; the Anglo-American Corporation is to subscribe for a further 250,000 shares at the same price. Each of these shares gives subscribers the option to take up a further share at 22s. 6d. each at the end of April, 1954. The corporation has underwritten the first issue, and has given a guarantee that it will either subscribe for any shares not taken up by option holders or will fill in the gap by a loan. Until the date at which the options can be exercised, the corporation will lend any money President Brand Gold may require at 6 per cent.

The corporation is also granting loan facilities to President Steyn and Welkom at the same rate of interest. The whole of the £4,000,000 required by President Steyn Gold may be provided by direct loans from the corporation, although the corporation has an option to provide up to £2,000,000 permanently by taking up 2,000,000 President Steyn 5s.

shares at 20s. each (compared with a current price of 17s. 3d.) before the end of June, 1955. Half of the £3,000,000 required by Welkom Gold is to be met by the sale of its holdings of 800,000 shares apiece in President Brand and President Steyn to the Anglo-American Corporation. The remaining £1,500,000 may be lent directly by the corporation—or, alternatively, the corporation may exercise an option (in full or in part) to take up 1,000,000 Welkom ss. shares at 30s. each (compared with a current price of 20s. 6d.). Any loans made by the corporation to President Steyn and Welkom will be repayable between 1957 and 1962.

Insulin without Exploitation

The Monopolies Commission was asked to investigate the supply and distribution of insulin because one company, Burroughs Wellcome Limited was responsible for more than a third of the supplies (the company in fact produces about half the total output) and because membership of British Insulin Manufacturers, the association to which the producers belong, restricts competition between them.

The Commission's report published this week, shows that there are no grounds for fearing that the close association between the four producers, Burroughs Wellcome, Boots, British Drug Houses and Allen and Hanburys, will in any way "operate against the public interest." Since the beginning of the war, they have pooled their knowledge of the delicate process of extracting insulin from animal pancreas. They use techniques that cannot be protected by patents and are therefore closely guarded as trade secrets. The outcome of their collaboration, which still obtains, has been a spectacular increase in yields of insulin and, in the opinion of the Ministry of Health, the raising of the quality of British insulin to a standard equalled only by that obtained in Scandinavia. The companies sell at the same price, with the Health Service as the principal customer but each is free to lower its prices. The Commission finds that the producers neither fix prices nor operate a stop list.

They are, in short, following a practice common throughout the pharmaceutical industry where production of a standard drug is often carried out by a few companies on behalf of the whole industry. Research and investment costs are frequently so high in relation to the quantities produced that this may often be the only economic method of supply. Hence it follows that a preparation sold under a variety of trade names may be predominantly the product of a few manufacturers. Burroughs Wellcome is the dominant producer in the field of insulin; in penicillin production Glaxo and the Distillers Company are the leaders. The reason why insulin was chosen for special investigation may, perhaps, be found in a paragraph in the report that refers to incidents in the thirties when an import duty was imposed on foreign insulin. The investigations of the Commission show that the industry has developed considerably since then.

The Size of Coal

Domestic consumers this week have been offered a special inducement to take smaller coals: "untreated smalls" are to be sold cheaply and off the ration. Ampler coal stocks today have enabled the Ministry to offer the inducement; but the request would have had to be made in any case. The more coal that is cut by machine, the smaller it gets—by present mechanical cutting methods. That is to say, less of the coal that reaches the pithead is in large lumps, much more in the smaller sizes, and a growing proportion in "untreated smalls." This has held good for years, with increasing mechanisation and less favourable seams, and may continue for many more; but its effect is felt with varying weight by the ordinary consumer. This year, with

output not increasing much and considerably larger exports being planned, the National Coal Board and private exporters have begun to find some discrimination in the kinds of coal that the overseas consumer will buy. In its annual report in May, the board said "if exports increase again, smaller sizes

GRADES OF COAL SOLD, 1946 AND 1951

	1946		1951		Difference (Million Tons)
	Million Tons	%	Million Tons	%	
Large	61.2	35.0	64.4	31.3	3.2
Unscreened	15.5	8.9	15.9	7.7	0.4
Graded	34.0	19.5	41.9	20.5	7.9
Treated Smallsm...	21.9	12.6	34.1	16.5	12.2
Untreated Smallsm...	32.0	18.4	39.2	19.0	7.2
Other coal & slurry	5.6	3.2	6.2	3.0	0.6
Anthracite	4.2	2.4	4.1	2.0	0.1

will have to be supplied to the house coal market"; and now they are to be. As yet, the consumer will not be obliged to take them simply because coal is being put into stock all along the distribution chain. If industrial demand recovers, the domestic consumer might not be offered the choice for long.

At the same time, the favourite small coals of the domestic consumer—anthracite and the best briquettes—remain scarce. The board still has only one—now considerably enlarged—plant making "phurnacite," which is an excellent but expensive carbonised briquette, and is planning another, which should eventually bring the total output—225,000 tons in 1951—to about 350,000 tons. Dr Bronowski, the board's director of research, expects to be able to make such fuels from a much wider range of coals in future—and not "the old-fashioned shepherd's pie of coal remnants which has given the briquette its horrible reputation." But this is well in the future; in the meantime, the householder may have to do what he can with much smaller ordinary coals.

Shorter Notes

Almost all the Persian lamskins from Russia and South West Africa offered at the London auctions this week were sold. Prices at the London sales were well maintained, though at the New York auctions a week before prices had dropped from 12½ to 15 per cent compared with those at the September sales. Prices in London were at most only about 7½ per cent lower than in September, and at the last auction unchanged or even slightly higher. The comparative strength of the market came largely from Continental buying, mainly from Germany and France.

I. G. Farben, the German Dye Trust, intends to settle its obligations to foreign creditors. The proposed settlement will be subject to the final results of the London conference on German debts. The proposals apply to claims in Reichsmarks for debts that were incurred before May 9, 1945, and to claims in foreign currencies for debts that were incurred before September 1, 1939, and were still due to the same creditor on June 15, 1950. Under the present foreign exchange regulations, payments to creditors in settlement of such claims can only be made in blocked D-marks.

Two tobacco companies, Gallaher and Cope Brothers, have announced their intention to amalgamate. Holders of the £437,500 of ordinary stock in Cope Brothers will be offered an equivalent amount of Gallaher ordinary stock; the amalgamation will only become effective if holders of not less than 90 per cent of the ordinary capital of Cope (or such lower proportion as Gallaher may accept) take up the offer.

Company Notes

Calico Printers.—The full accounts of Calico Printers for the year to June 30th show in only the barest outline the effects of the trade recession upon the company's fortunes. Once account is taken of the transfers to and from reserves against stocks and debtors, the group's trading profits are shown to have fallen from £5,214,216 to £1,475,686; but there is no indication of how much (if at all) a depreciation in stock values has been responsible for this decline in earnings. It seems probable that an EPT refund of £248,574 has influenced the directors in their decision to maintain the ordinary dividend at 12½ per cent, at a net cost of about £132,000. This can bring only cold comfort to share

	Years to June 30, 1951	1952
Consolidated earnings:—		
Trading profit	5,214,216	1,475,686
Total income	5,383,108	1,861,658
Depreciation, etc.	1,004,549	1,065,888
Taxation	2,320,867	348,564
Net profit	1,053,029	289,545
Ordinary dividends	131,955	131,955

Reserves	9,784,344	9,114,298
Ordinary capital	2,010,736	2,010,736

£1 ordinary stock at 32s. 3d. x d. yields £7 15s. per cent.

holders—as, indeed, does the balance sheet. Nearly £8.3 million, compared with £7.8 million the year before, remains locked away in stocks, while the group's holdings of quoted investments have been reduced from £2.8 million to £2 million. At the same time the group's cash balances have been run down from £1.2 million to £467,000 and its bank overdrafts have increased from £321,000 to £870,000. As yet equity shareholders have been sheltered from the chill winds of the slump, but the high level of stock investment and the decline in liquid balances suggest that their shelter may not be a very snug one.

Horlicks.—The annual address of the chairman of Horlicks is a model of uninformative caution, and shareholders will find it difficult to trace in detail the course of their company's fortunes in the year to March 31st. They can only surmise that—as with other companies in close contact with consumers—it was a rise in costs throughout the financial year, and a fall in sales in the last quarter of the year that caused the group's trading profits

	Years to March 31, 1951	1952
Consolidated earnings:—		
Trading profit	711,665	659,138
Total income	723,042	717,735
Depreciation	81,666	90,400
Taxation	356,273	332,265

Cash	471,393	469,384
Reserves	1,910,307	2,336,592
Ordinary capital	500,000	625,000

£5. ordinary stock at 24s. x d. yields £6 5s. per cent.

to fall from £711,665 to £659,138. Thanks to a reduction in the charge for taxation, the fall in net profits was even smaller (from £198,554 to £194,957), so that the directors were able to maintain a dividend rate of 30 per cent on the increased ordinary capital of £625,000.

The directors have concentrated on reinforcing the reserves of subsidiaries rather than those of the parent company; this may not be unconnected with the labour problems and consumer resistance that the American subsidiary has been experiencing.

The new money that the group received from the issue of ordinary shares and a debenture stock last year has been quickly absorbed by an increase in investment in both fixed and working capital. The most notable increase has taken place in stock values, which have risen from £784,017 to £1,243,043; this in itself suggests that stocks were beginning to pile up at the end of March. The chairman is as reticent about the future outlook as he is about the company's past experience, but clearly no increase in dividends is in prospect.

Hawthorn Leslie.—The accounts of Hawthorn Leslie for the year to June 30th continue the tale of prosperity in the shipbuilding industry. The company's profits advanced from £563,975 to £783,543, and—in spite of an increase in taxation from £281,852 to £442,397—net profits rose from £205,689 to £272,507. The directors were therefore able to increase the appropriation to the general reserve from £140,000 to £180,000, and to raise the ordinary dividend from 12 to 15 per cent. This increase in equity payments was certainly justified by the company's profit record and by the strength of the balance sheet. Like most other shipbuilding concerns, Hawthorn Leslie receives considerable sums from its customers on account of work in progress, and thus does not suffer from acute working capital problems. In the latest year the book value of stocks and work in progress increased from £507,574 to £796,558, but the company received £1,118,167 (against £1,322,697) "on account in excess of work in progress." The company's liquid balances are therefore undeniably strong. Cash balances have been reduced from £1,590,994 to £803,645, but this has been offset largely by an increase in the book value of quoted investments from £1,388,936 to £2,076,107. The company's interests in the building of tankers should ensure a full order book and good profits in the current year. A high level of profits and a high degree of liquidity could mean faster dividend warrants. At the current price of 23s. 6d. x d. the 10s. ordinary stock units yield 6½ per cent.

John I. Thornycroft.—At first sight the very sharp decline in Thornycroft's trading surplus, from £1,047,000 to £612,000 in the year to July 31st, seems to afford an odd contrast to the bumper profits shown by Hawthorn Leslie and some other shipbuilders. But shareholders will remember that Thornycroft—unlike Hawthorn Leslie—has substantial interests in commercial vehicle production as well as in shipbuilding. In any case the completion of contracts—and thus the profits—of shipbuilding and marine engineering concerns fluctuate very sharply from year to year. In 1951-52 the company's trading surplus included only £66,000 in respect of delayed settlements, while the 1950-51 figures included a similar credit of £475,000. If these figures are excluded from the reckoning, the surplus is shown to have fallen only from £572,000 to £546,000. The directors have decided in effect to maintain the ordinary dividend at 15 per cent, but the appropriation to a general reserve has been reduced from £225,000 to £94,330. At the current price of 51s. 3d. the £1 ordinary shares yield £5 17s. per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended October 25, 1952, total ordinary revenue was £56,964,000, against ordinary expenditure of £56,070,000, and issues to sinking funds £640,000. Thus, including sinking fund allocations of £18,492,000 the deficit accrued since April 1, 1952, was £381,871,000 compared with a deficit of £82,089,000 for the corresponding period of the previous year.

TRADING

The total sales for the year showed an increase of 21 per cent over last year and represented an all-time record both in value and volume in the history of the company. This very gratifying result was largely due to the orders in hand at the beginning of our financial year, together with those obtained during the ensuing nine months. Since March, however, we have experienced—common with many other commercial concerns—a recession in demand which still exists. Stockholders must, therefore, not expect the record sales of last year to be repeated this year, although, thanks to our efficient manufacturing operations and energetic selling methods, we are confident of our continued ability to obtain our full share of any available business in our comprehensive lines of office equipment. In short, profits are certain to be lower during the current year, although not sufficient to prevent stockholders from receiving a satisfactory dividend on their investment.

MACHINES AND SUPPLIES

Our list of new machine users continues to grow satisfactorily, and it is particularly

RONEO LIMITED

TOTAL SALES AN ALL-TIME RECORD

GROWING LIST OF NEW MACHINE USERS

SIR GREVILLE MAGINNESS'S SPEECH

The forty-fifth annual general meeting of Roneo Limited was held on October 29th at the Holborn Restaurant, London, Sir Greville S. Maginness (chairman of the company) presiding.

The chairman said:

Ladies and gentlemen:

The directors' report and accounts for the year ended June 30, 1952, have been in your hands for the prescribed period and, in accordance with our usual practice, I presume I may take them as read.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The net profit for the year is £213,524 after providing £457,768 for taxation and £130,640 for depreciation and amounts written off.

It is proposed to transfer £40,000 to general reserve, £80,000 to Plant Replacement Reserve, and £10,000 to investment reserve, thus bringing the total of these three reserves to £710,000. Your board consider it essential to continue the policy of ploughing back profits in view of the greatly increased costs of replacing capital assets, financing stocks at ever-rising levels, and expanding the business of the company as and when circumstances permit.

Dividends, less tax, on the 6 per cent and 10 per cent preference stocks have been paid for the year. An interim dividend of 5 per cent, less tax, on the ordinary stock has already been paid, and it is now proposed that a final dividend of 12½ per cent, less tax, be distributed, making 17½ per cent, less tax, for the year. After providing for these reserves and dividends there remains a balance of £34,515 to be added to the sum of £241,410 brought forward from last year, thus making the total amount to be carried forward £275,925.

STEEL EQUIPMENT

The continued shortage of steel sheets has again militated against maximum sales in this section of our business. I sincerely hope that this state of affairs will change in the near future, and that we shall once more be able to offer the full range of standard lines to our customers, both at home and overseas.

I am pleased to be able to report continued progress in the supply of banking equipment both in this country and abroad. This is a specialised job to meet exacting requirements and covers everything from a detailed survey to the design, construction and installation of not only standard lines, such as desks, filing units, systems, etc., but also counters, posting and sorting racks, public writing tables, board-room tables, and other special equipment. This specialised service is equally available for any offices where modern steel equipment is required, and the success which has marked our efforts following these comprehensive surveys only serves to prove that it still pays "to call in Roneo."

EXPORTS

Our sales abroad increased by 34 per cent compared with the previous year, thus reaching a further landmark in the history of the company and representing a valuable contribution to one of the most vital problems which this country has to face. They were, in fact, over three times the figure for 1947—a notable achievement upon which we can congratulate ourselves. Here again, the best results accrued during the first half of the past financial year, and I am sorry to say that since then further restrictions of one sort or another have begun to operate. Such important markets as Australia, New Zealand, India and South Africa have all either prohibited or curtailed imports. The political situation in Egypt and in the Middle East generally has also had its effect in those markets. Needless to say we can only sell our goods in those countries where imports are possible and it is sincerely to be hoped that these controls and restrictions will prove to be of a temporary nature and will be lifted at no distant date.

NATIONAL SITUATION

It has been my practice in recent years to review what appeared to me to be the leading facts in the general situation of this

country by way of background to the consideration of the results and future prospects of our own company, and I should like again to review the position as it exists today.

During the past year the situation has been dominated by the grave deterioration which occurred in the latter half of 1951 in our international balance of payments and the consequent running down of our gold and dollar reserves, and the threat to the future position of the £ sterling.

Since the war this country has passed through a succession of crises in its economic life, and on two previous occasions in the postwar period we have been faced with similar though not such serious threats to the £ sterling. On the first occasion we were saved by the grant of Marshall-Aid and, on the second occasion, we had to seek a remedy through a 30 per cent devaluation of the £ sterling. During the whole period, however, we have seldom been in a position when we could view our current balance of payments with satisfaction, although towards the end of 1950 we were accumulating gold and dollars at a rate which, at that time, appeared to justify the suspension of Marshall Aid to this country.

GOLD AND DOLLAR RESERVES

That situation did not long continue and, as I pointed out last year, in the third quarter of 1951 we lost the equivalent of £210 million of our gold and dollar reserves and, as a consequence, those gold and dollar reserves at September 30th stood at some £1,160 million. The position in the ensuing weeks—during the General Election campaign—deteriorated very rapidly and, although the new Government took steps to reduce our imports, nevertheless by March, 1952, our gold and dollar reserves had fallen to the equivalent of a little over £600 million, and if the rate of loss between September and March had continued we should by now have exhausted those reserves.

Since March there has been a considerable slackening in that rate of loss and we may derive some encouragement from the announcement made by the Treasury on October 2nd that there was a small increase in the reserves during the month of September, and also from the White Paper issued on October 6th which showed that this country had achieved during the first half of 1952 a surplus of £24 million in its balance of payments on current account with the rest of the world. Nevertheless the present position far from giving any ground for solid satisfaction must continue to cause serious concern to us all. The significance of our gold and dollar reserves is only fully appreciated when it is borne in mind that about half the world's trade is today conducted in sterling, and these reserves may be called upon to meet deficits with non-sterling countries in the current balance of payments not only of this country but of all the countries in the sterling area. It is essential that this country and the rest of the sterling area should not only achieve a balance of payments with the rest of the world, but that a substantial surplus should be earned so that the reserves can be built up again to a sufficient level to avoid any further repetition of

the crises which we have experienced in recent years.

THE ALTERNATIVES

It is clear that there are only two ways of achieving this: either by a further reduction of imports or by a considerable expansion of our exports.

In my view, we should if possible avoid any further reduction in our imports, not only because such reduction can only result in a lowering of our standard of living and the danger of widespread unemployment through the restriction of supplies of raw materials which we must import from overseas, but also because in the long run the expansion of world trade must be our objective. In fact, even in the short run, the cutting of imports frequently produces retaliatory action by other countries and, by reducing our opportunities for export, makes our problem all the more difficult.

The expansion of exports today presents us with greater difficulties than at any time since the war. The sellers' market which exporters enjoyed has now disappeared everywhere. We are faced with intense competition from all quarters, and the rapid recovery of the industrial power of Germany and Japan is now a major factor in international trade. Moreover, many of our competitors are able to quote firm prices and in this respect the British exporter is, at the present time, at a serious disadvantage.

DOWNWARD TREND OF EXPORTS

Our difficulties in expanding exports are brought out clearly by the downward trend in the volume of exports which has taken place since the first quarter of this year, and it is clear that the reversal of that trend will depend upon a reduction in our costs, not only in the export industries themselves but also in those basic industries—such as fuel and power and transport—whose costs are reflected in the costs of all other industries. It is essential that the country should realise that the current upward movement in wages will undoubtedly add an additional handicap to British exporters, and may well defeat their efforts to maintain—let alone increase—their trade in overseas markets.

In speaking of exports we must not lose sight of the considerable contribution to the solution of our balance of payments problem which invisible exports can make. Our shipping and the banking, insurance and merchanting services, which this country with its long experience and unrivalled techniques can provide, do not for their current earnings require the importation of any appreciable volume of raw materials into this country. For such services as banking and insurance, however, to make their maximum contribution, it is essential that the confidence of people overseas should be re-established in the stability of the £ sterling.

INTEREST ON OVERSEAS INVESTMENTS

Until the last war this country was able to pay for some 20 per cent of its imports by the interest on its overseas investments—investments which it had been possible for our fathers and grandfathers to build up in the period when this country still enjoyed the lead in industrial development which it owed to the Industrial Revolution having occurred earlier in these islands than in other countries. As a result of the war, we have lost a substantial part of those investments and, as the Chancellor of the Exchequer himself recently pointed out, we have been transformed from the world's biggest creditor with a surplus of about £3,500 million to a debtor position of about £2,500 million. Perhaps we were too ready before the war to take for granted the advantages which the foresight and the industry of earlier generations had secured for us, and it is somewhat

difficult for people in this country to accustom themselves to the idea that as a nation we no longer enjoy the benefits of an unearned income.

In contrast to our prewar position, we have since the war been dependent, first, on loans and later on Marshall Aid provided to us by the generosity of the American people. We cannot, however, expect to receive further assistance of this character and, as a people, we must get out of our minds the idea that the world owes us a living. As the Chancellor has further pointed out, over and above all this the change in the terms of trade has added up to £1,000 million a year to our import bill as compared with prewar, which is equivalent to another three hours' work per week by every worker in this country to get the same amount from abroad as we got before.

A CALL FOR MAXIMUM EFFORT

In such a situation as I have described, everyone in this country must recognise that we shall only be able to avoid reductions in our standard of living and widespread unemployment if we all put forth our maximum effort and apply ourselves conscientiously to our job, whatever it may be.

While we recognise the vital necessity of the defence programme, I think that there are many of us who are not convinced that the Government has yet tackled the question of reducing government expenditure in other directions with nearly sufficient vigour and determination. A situation in which some 40 per cent of our national income is absorbed by taxation is one which, even in the most favourable circumstances, could not be healthy. In present circumstances, its effect is to frustrate that initiative and enterprise by which alone our industrial and commercial position in the world was built up, and by which alone it can be restored. I would not wish to enter into the controversial question as to where economies can most readily be achieved, but just as the Government is calling on industry to do what is clearly its duty so industry is entitled to ask that the Government should tackle this question of government expenditure and taxation with a will and an energy which we have not yet seen applied to it.

In conclusion, I should once more desire to pay a sincere tribute to the staff and all employees, both at home and abroad, who by their loyal services have contributed effectively to the satisfactory results shown in the accounts before you.

The report and accounts were adopted.

NATIONAL CANNING COMPANY

RECORD TRADING RESULTS

STRONG FINANCIAL POSITION

MR S. W. SMEDLEY ON THE CONTINUED PROGRESS

The twenty-first annual general meeting of the National Canning Company Limited was held on October 28th at St. Ermin's Hotel, Caxton Street, London, S.W.1, Mr S. W. Smedley (chairman and managing director) presiding.

The secretary (Mr F. G. Pickett) read the notice convening the meeting.

The following is an extract from the address by the chairman which had been circulated with the report and accounts for the year ended May 31, 1952:

Ladies and gentlemen,—It is now 21 years since this company was formed to take over the shares of Wisbech Produce Cannery, Limited, which name has since been changed to Smedley, Limited. The business was commenced in 1924 and owned factories at Wisbech and Evesham. Since that time we have acquired the following assets:

In 1931 a large factory at Dundee was purchased and equipped; in 1932 we erected a factory at Spalding and equipped and opened a factory at Paddock Wood, Kent; in 1935 all the shares of British Fruit, Limited, owning a factory at Faversham, were acquired; in 1936 Angus Fruit Farms, Limited, was formed to purchase six farms in Scotland; in 1938 all the shares of Baird Wolton and May, Limited, owning a cannery at Barming, Kent, were purchased and 1,200 acres of farm land at Evesham were bought; in 1940 the shares of Strathmore Fruit, Limited, with a small cannery at Blairgowrie were purchased—this factory has since been sold; in 1941, 266 acres were added to the farmland already owned in Scotland; in 1946 a controlling interest in Jersey Canning Company, Limited, was acquired, and a factory at Blairgowrie was bought and converted. In 1949 a factory at Coupar Angus, not far from Blairgowrie, was purchased and equipped and commenced operations in

1950; in 1950 we extended our farming interests in the Wisbech area and purchased a further 200 acres.

In addition to the foregoing, during the past 15 years we have expended substantial sums in equipping five of the factories for the processing of frozen foods.

With the exception of an issue of £100,000 in Preference shares in 1933 and £75,000 in Ordinary shares in 1939, which together realised £201,250, all the above purchases have been financed entirely out of the company's own resources.

I have been directly interested in fruit growing and buying for over 50 years, and in canning in this country for the past 30 years. The last 21 years of my life have been entirely devoted to your company and its subsidiaries and I am proud of the way in which it has grown and of the fact that I am at the head of executives and work-people who have contributed to the growth of the company and to the results for the past year which, for the first time, show trading profits of over £1 million.

THE YEAR'S RESULTS

From the consolidated profit and loss account you will see that the group profit, before taxation, amounted to £1,149,492 as compared with £937,942 in the previous year. £630,679 is required for taxation, against £516,759 for the year to May 31, 1951, and, after the net retention in the subsidiary companies of sums amounting to £225,562, against £298,000 last year, the net profits attributable to the National Canning Company amounted to £274,220 compared with £99,429 in the previous year.

The profit and loss account of the National Canning Company itself shows a surplus for the year of £156,252 to which should be added £174,676 brought forward from the previous year and £117,968 adjustment for

prior years' taxation, mainly the charging out to subsidiaries of profits tax previously borne by the holding company, making £448,896 available for distribution. Your directors have transferred £200,000 of this sum to the general reserve, bringing that fund up to £500,000 and, after payment of the dividend on the Preference shares, they recommend for your approval the payment of a dividend on the Ordinary shares at the rate of 20 per cent, subject to tax, which will leave us with the sum of £197,183 to carry forward into the current year's trading. Your board also recommend that £46,750 of the general reserve be capitalised and issued in fully paid Ordinary shares to Ordinary shareholders in the ratio of one new share for every ten held.

EVER-GROWING MARKET

The quick frozen food department is being developed on sound lines and is contributing steadily to our earnings and, in this connection, we have under consideration plans for a considerable extension of our facilities for quick freezing. We began to develop this side of the company's business some years before the war and there has now been sufficient time to establish the fact that quick frozen foods are here to stay and that there is an ever-growing market for such products alongside our canned goods.

I would particularly like to draw your attention to deals we have put through with American and Canadian firms this summer—perhaps some of you may have seen mention of it in the press. They were for 250 tons of fresh frozen raspberries in bulk to New York and large quantities to Canada, all grown on our Scottish farmlands. Scottish-grown raspberries are the best in the world and we hope these orders, which this year amounted to many thousand dollars, may be the forerunner of others which will not only benefit your company but will also help our country's export trade.

Since I last addressed you the supplies of tins have so improved that we are hoping for a record pack. We are carefully watching our costs with a view to keeping our prices as low as possible consistent with maintaining the high quality of our products.

THE OUTLOOK

Ever since the end of World War II in 1945 I have been looking for signs of recession in our business, but I am bound to admit that so far, since that date, we have gone from strength to strength. We have a good EPL standard and, over the years, we have built up a position of considerable financial strength, which will stand us in good stead if and when difficult times come along.

So far as the year to May, 1953, is concerned, our pack to date has shown a further increase, and the majority of crops have been good. In view of this, unless anything unforeseen occurs, it is reasonable to infer that we should have another satisfactory year's trading.

Last, but not least, I am always glad to take the opportunity which this occasion provides to thank all the executives and employees of the group for their loyal co-operation and work towards the progress of our company, and I am sure I can call upon the shareholders to support me in this sentiment.

The report and accounts were adopted and the dividend of 20 per cent was approved.

The retiring directors, Mr E. Ronald Crammond, Mr G. W. Osborne, Mr G. P. Smedley, Mr David Lowe, CBE, and Mr H. J. Browning were re-elected, and the remuneration of the auditors, Messrs Price Waterhouse and Company, having been duly fixed, the proceedings terminated.

BERALT TIN AND WOLFRAM

MR F. GATES ON THE OUTLOOK

The twenty-fourth annual general meeting of Beral Tin and Wolfram, Limited, was held on October 30th at Winchester House, Old Broad Street, London, E.C.

Mr F. Gates, chairman of the company, presided.

The chairman, in the course of his speech, said:

The accounts for the year ended March 31, 1952, now presented, tell a clear story of an exceptionally prosperous year, which leaves the company in a strong financial position. I see little in the figures on which I can usefully comment, but it is interesting to note that out of each £100 realised from mineral extracted and sold nearly £50 was retained in Portugal by way of wages, purchases of stores, power, etc., and taxation, and that out of the remaining £50 nearly £30 had to be paid in UK tax. Out of the surplus of sales proceeds over working costs, over 75 per cent was taken in taxes by the two countries, and this percentage may be even greater during the current year, since Excess Profits Levy was only applicable for the last quarter of the year under review.

PRODUCTION AND ORE RESERVES

Production of wolfram and tin concentrates during the year averaged a little over 200 tons per month, and a substantial proportion of the wolfram was sold to the US Government in compliance with a request from the Portuguese authorities for sales against dollars.

The rate of production has been maintained since the end of March last at about the same figure, but the contribution made by the block of ground immediately above main adit level, the richer areas of which were worked out during the war years, is falling off. Every effort is being made to secure production from lower-grade ground in various parts of the mine which can only be worked profitably while the wolfram price is high and thus to avoid prejudicing the future of the mine by undue encroachment into the high-grade areas in the heart of mineralisation on No. 1 level (200 feet below main adit).

Work on No. 1 level has disclosed a granite-greisen intrusion, the shape and extent of which have not yet been fully determined, and the behaviour of the veins running close to and through this intrusion is being studied. It is certain that mineralised veins persist far below No. 1 level and I am glad to say that Professor W. R. Jones, who carried out a geological examination in May last, has reported most encouragingly on the probability of mineralisation continuing in depth.

WOLFRAM SALE CONTRACTS

The Ministry of Materials' buying price for wolfram, which stood at 485s. per unit at March 31st last, has since fallen to 410s., so that the fixed price contracts with the US Government and the Ministry of Materials, of which I spoke to you at our last meeting, for about 40 and 50 long tons per month respectively at prices substantially higher than the current prices, now stand the company in good stead. These contracts expire at end-June and end-September, 1953, respectively.

In an endeavour to secure the company's position still further ahead the board have concluded further contracts with the US Government and the Ministry of Materials.

The contract with the US Government, to which reference was made in an announcement in the press on September 12 last, arose out of the considerable interest which the

representatives of the Government have shown in the potentialities of the Vale da Ermida area after an inspection of the area by one of their engineers.

Under the contract the US Government undertakes to purchase up to about 2,500 long tons of wolfram over a period of five years beginning October 1, 1952, at fixed prices for deliveries during each of those years. The prices for each of the first two years are both well above the current market price and the price fixed for the subsequent three years is not too far below it. The company undertakes to deliver under this contract all wolfram produced from the Vale da Ermida area but it is important to note that it has the right to make up any deficiency from other sources, and the contract terms as regards quantities and times of delivery are very flexible.

More recently still, a contract has been made with the Ministry of Materials for the sale of 100 tons of wolfram per month from October, 1953, to September, 1955, inclusive at the market price current from time to time with "floor" and "ceiling" prices which the board think reasonable. The company has the right to terminate the contract should circumstances change so that profitable working at the "floor" price becomes impossible, and the Ministry reserves the right to terminate it not earlier than September 30, 1954, should they cease to control wolfram in this country.

MONTHLY DELIVERY FIGURES

In order to give the clearest possible summary of the outstanding contracts I would explain that the company is entitled thereunder to make monthly deliveries of wolfram concentrates as follows:

Until end June, 1953	150 tons at fixed prices and 50 tons at the market price current from time to time.
From July 1 to Sept. 30, 1953	90 tons at fixed prices and 50 tons at the market price.
From Oct. 1, 1953, to Sept. 30, 1954	40 tons at a fixed price and 100 tons at the market price subject to agreed "floor" and "ceiling" prices.
From Oct. 1, 1954, to Sept. 30, 1955	The same as for the previous year, subject to the Ministry's right to terminate the contract for 100 tons per month.
From Oct. 1, 1955, to Sept. 30, 1957	40 tons at a fixed price.

NEW AREA

The conclusion of this new contract with the US Government justified the board in pressing on vigorously with the preparations for bulk testing of the Vale da Ermida area and with the reconditioning of the old mill at Panasqueira. It is expected that bulk tests on ore extracted from the area will be commenced early in 1953; future plans will, of course, depend upon the results disclosed by these tests. If the recovery of mineral is such as to permit profitable operation at normal tin and wolfram prices, the large tonnage of mineralised ground in the area will constitute an important addition to the company's ore reserves and our production of tin concentrates will be appreciably increased. The opportunity is being taken to reopen some of the old wolfram stopes at the top of Panasqueira hill, ore from which can conveniently be treated in the Panasqueira mill.

The report and accounts were adopted.

THE KAMUNING (PERAK) RUBBER AND TIN COMPANY, LIMITED

SIR JOHN HAY'S STATEMENT

The forty-third annual general meeting of The Kamuning (Perak) Rubber and Tin Company, Limited will be held on November 19th at 52-54, Gracechurch Street, E.C.3.

In his statement circulated to stockholders the chairman, Sir John Hay, said:

Although we gladly acknowledge and fully appreciate the greater energy and resourcefulness which are being employed under General Templer's leadership to combat violence and disorder in Malaya, the satisfaction which may be derived from evidence of improvement must be tempered by a loss which I am about to record here and by the recollection of the fact that this is the fifth year in succession in which I have had to report to you that danger to life and destruction of property still remain a continuing threat. We have to deplore the death by murder in April last of one of our assistants, Mr J. C. Ward, a young man of twenty-three who had hardly completed a year's service with us, but in that short time had given promise of developing into a valuable member of our staff, and who by the manner of his death gave an example of outstanding courage.

After reviewing the company's domestic affairs, with particular reference to the excessive taxation borne by the rubber industry, Sir John went on to say:

It is perhaps natural that catchwords used in this country to foster political prejudice should become current in a land like Malaya, which has only recently reached political consciousness. Consequently, at times we find rubber companies domiciled in this country referred to with opprobrium as capitalist. Capitalist in that context is no doubt meant to conjure up a picture of a man exercising oppressively excessive financial power. This is a highly imaginary figure, remote from realities. The average holding of stock in this company is no more than £59 and the average net dividend paid to the average stockholder during the last twenty years is equivalent to slightly less than £3 per annum, a sum sufficient to provide him with one cigarette a day or a weekly pint at the "local" of what is known in some quarters as "wallop." The rubber-producing industry is largely financed by the savings of the little man and it is his money which has helped to establish and develop an industry which has proved to be the mainstay of Malaya's economy and has become the biggest dollar-earner in the Empire. But the reward he receives for so investing his savings is quite inadequate as an incentive for continuing providence. Unless, therefore, the investor is to be given fairer treatment and a bigger share of the profits of the enterprise he has financed, the sources of capital will dry up, enterprise and development will languish and the talk now current about developing Colonial countries will become only an empty dream.

NEED FOR FAIRER TREATMENT

The price of rubber has now reached a level which leaves little profit, even to a company so relatively favourably placed as ours. Our net revenue for the current year is likely to be only a fraction of what we earned during the period now under review. With the end of purchasing for stockpile in sight, the natural rubber industry is about to enter into sharp competition with synthetic, with its powers of competition seriously impaired by heavy taxation, which in the case of United Kingdom companies is equivalent to nearly 70 per cent of their profit, and by

conditions which militate against industrial efficiency and require heavy expenditure on security measures, much of which has to be met by the producer. Perversely, the present has been chosen by state governments to increase land rents. In some cases they have been multiplied several times over. This company, happily, is exempt from this latest impost.

In striking contrast with this is the fostering care with which the United States Government tends and protects its synthetic rubber. It is largely exempted from the taxation to which other enterprises are subject, it is guaranteed a market; it is financed by the virtually inexhaustible resources of its governments, it is officially encouraged, sustained and helped in all its operations.

The forbidding prospect of competition on such unequal terms, with all that it may imply in its impact upon the material well-being of the people of Malaya, on efforts now being made to restore law and order, and its possible effect upon the industry's sorely needed dollar earnings, has led in some quarters to a mood of escapism and a dangerous eagerness to seek relief by some dramatic stroke. It is this mood which is productive of proposals which have little foundation except in abstract reason and which offer promises which on closer examination are found to be illusory. The present situation requires a strong injection of economic realism, expressed in sound and practical measures. We should seek again and with all necessary skill and determination to convince the United States authorities of the great importance on economic and political grounds of their removing all discrimination against natural rubber. Our slogan should be "Not money aid, but fair trade."

On our own side, the heavy burden of taxation so precariously poised on an unstable rubber industry should be lightened and spread more evenly on a wider and firmer basis. Given these conditions—to regard them as unattainable would surely be defeatist—and a general appreciation of the need for economic and efficient production of natural rubber, need we be so fearful of competition that we must seek doubtful refuge in dubious schemes?

FINNEYS SEEDS

The sixth annual general meeting of Finneys Seeds Limited was held on October 27th in London, Mr Ernest Cornwall (the chairman) presiding.

The following is an extract from his circulated address:

I have much pleasure in presenting the report of the directors and the accounts for the year which ended on June 30th last. They reveal a very satisfactory year's trading.

Net profits have increased despite increased taxation. After appropriating £10,000 to investment reserve, we are able to repeat a final dividend of 7½ per cent, making 12½ per cent for the year, and to carry forward rather more than we brought in.

The gratifying improvement in our earnings is a reflection of our greatly increased turnover. This was mostly in the agricultural seed and seed grain departments, due in no small measure to our policy of keen selection and careful roguing of strains and stocks and the handling of the highest possible quality from the very best growers.

In his first year as sole managing director, Mr Boustead has more than justified our confident expectations and has merited our warmest commendation.

To all our officers and staff, travellers and agents, our sincere thanks are due for efficient and devoted service.

Regarding the forward position, the harvest having been good and early, we have been able to commence the autumn grain season a fortnight earlier than usual, with orders in hand in excess of the corresponding period last year.

Although we suffer with others the vagaries of the weather, the demands of the Exchequer, and many restrictive trading measures due to the unfortunate balance of payments position, we have a very live business in a live industry and no effort will be spared to maintain and improve the position we hold in this, the most essential of our country's basic industries.

The report was adopted.

STRATFORD-ON-AVON PRODUCE CANNERS, LIMITED

INCREASED TRADING AND NET PROFITS

The twentieth ordinary general meeting of Stratford-on-Avon Produce Canners, Limited, was held on October 27th at the Welcombe Hotel, Stratford-on-Avon, Colonel N. C. Joseph, the chairman, presiding.

The secretary (Mr G. E. Smith) read the notice convening the meeting and the report of the auditors.

The following is the directors' statement, which had been circulated with the report and accounts for the year ended May 31, 1952:

Your directors are pleased to report the trading profit for the year amounts to £95,080, compared with £81,155 last year. The profit and loss account shows the net profits amount to £42,280, compared with £37,836 for the previous year. The increased profits of the year, coupled with heavier taxation now operating and including Excess Profits Levy for five months of the company's year, have increased the tax charge from £39,313 to £48,149. The proposed dividends to the ordinary shareholders for the year amount to £9,774, or 23 per cent of the available net profits, and after writing £10,000 off the investment of 2½ per cent Treasury stock, the amount transferred to reserves is £21,097, which is 50 per cent of the net profits.

At the last annual general meeting it was agreed to set aside the sum of £5,000 to commence a pension and gratuity scheme for our employees. Since that date your directors have adopted a pension scheme with an insurance company and will in future make payment of an annual premium, the sum of £5,000 will not therefore be required.

SUBSTANTIAL CONTRACTS

With anticipated easing in tinplate supplies it is reasonable to expect an increase in competition. Your company is favourably placed to meet whatever conditions may arise. The past fruit season has been very satisfactory and the prospects for sales of canned vegetables are excellent, the company already holding forward contracts running into substantial figures. The jam department output continues to develop substantially.

In accordance with the articles of association Mr G. E. Smith and Mrs D. Edkins retire from the board and, being eligible, offer themselves for re-election. We take this opportunity of thanking our employees for their continued loyal services during the year. The auditors, Messrs James, Stanley and Company, have intimated their willingness to continue in office.

The report and accounts were adopted; the proposed dividends were approved and the retiring directors were re-elected.

THE FINANCIAL NEWS LIMITED

DIVIDEND MAINTAINED

VISCOUNT BRACKEN'S SPEECH

The fifty-fifth annual general meeting of The Financial News Limited was held on October 28th at Winchester House, Old Broad Street, London, E.C.2, the Right Hon. Viscount Bracken, PC (chairman of the company), presiding.

The secretary (Mr A. E. Knock) having read the notice convening the meeting and the report of the auditors, the chairman said: Though nine months have passed since the death of General Dawnay, our sense of loss has not diminished. We cannot over-estimate the shining services he rendered to us or how much we owe to that willing, able, gay and gallant gentleman. In his place as our vice-chairman we have elected Colonel Crosthwaite-Eyre.

Our consolidated profit before tax for the year ended June 30, 1952, amounted to £112,536. After provision for taxation, the amount available for dividends is £50,047, and if you approve the payment of a final dividend of 35 per cent, making 60 per cent for the year, the rate which we have paid for the past six years, the carry forward of the company and its subsidiaries will be increased by £6,721. This does not, of course, take into account the proportion of the undistributed profit of The Financial Times, Limited, which is attributable to our shareholding in that company.

There have been no important changes in the balance sheet figures. In the consolidated balance sheet, current assets exceed current liabilities by £163,558.

PROGRESS OF PUBLICATIONS

Let me now say something about the affairs of the various publications in which we are interested.

The Financial Times: The Financial Times made good profits in 1951, and maintained its dividend at the rate of 25 per cent. There has been a considerable improvement in newsprint supplies and The Financial Times is now able to satisfy public demand for the paper and to broaden its services to readers.

The Investors' Chronicle: The circulation and advertisement revenue of The Investors' Chronicle showed a satisfactory improvement. Now that the cost of paper has diminished we may hope for an increase in profits during the next financial year.

The Banker: The Banker had a profitable year. Increased advertisement and sales revenues more than offset increased costs, and good profits were earned.

The Practitioner: The circulation and advertisement revenues have steadily increased, and we believe that its earning power should show a considerable improvement during the present financial year.

The Economist: As you know, your company holds a half interest in The Economist. Here again circulation and advertisement revenues are at record levels.

I have given you a report of the affairs of our subsidiary companies and I am not going to deal with the economic problems of the world. They are the constant concern of our newspapers. All that is left for me to do is to say how grateful we are to the staff that serves The Financial Times, Limited, and to the staffs of our subsidiary companies.

The report and accounts were unanimously adopted.

TRAWLERS GRIMSBY, LIMITED

LARGER TRADING PROFITS

The thirty-second annual general meeting of Trawlers Grimsby, Limited, will be held on November 19th in London.

The following is an extract from the statement by the chairman, Mr J. Carl Ross, circulated with the report and accounts for the year to March 31, 1952:

The total of our trading profits is £276,957, inclusive of net income of a non-recurring nature amounting to £19,500. This is an increase of £4,642 on the year to March, 1951, after due allowance has been made for income of a non-recurring nature in both years.

The net profit is £52,466, which compares with £51,828 in 1951. This in some respects may be considered to be a satisfactory result during a difficult year of trading. However, it is an exceedingly small return upon the value of the assets employed by your company and also upon the turnover which this year totalled almost £5 million, an increase of 20 per cent upon last year's figure. It is proposed that a final dividend of 10 per cent, less tax, be paid, making 15 per cent, less tax, for the year, and to transfer to general reserve £10,000.

Reserves are considerably higher and consist of an increase of £83,175 in the reserves of subsidiaries; in the parent company Excess Profits Tax refund is increased by £6,312, and a sum of £35,681 has been released from reconditioning of vessels account. The overall increase in reserves and profit and loss balances is £134,837—a not inconsiderable sum.

The price of oil is of material importance, 20,000 tons being our approximate annual consumption. From a pre-devaluation price of £4 14s. per ton it had risen to £9 11s., but at the present time it is £8 8s. It is hoped that the reductions in cost will continue along with the price of wire, sisal and manilla ropes.

Fishing conditions have not been easy—average catches tend to be less, and during 1952 to date the average price of fish has also been less, compared with the same period of 1951. This is due in some part to unrestricted importations of foreign caught fish—mostly Icelandic and German.

TRAWLING COSTS

A breakdown of our trawling costs may be of interest—for each 20s. received at a sale of our fish by auction there was spent on: Fuel (coal or oil), stores, ice and fishing gear, 7s. 11d.; crew's wages, 5s. 5d.; depreciation of vessels, 1s. 9d.; dock expenses, 1s. 7d.; repairs, 1s. 7d.; other shore expenses, 10d.; insurance, 7d.; tax, 7d.; transfer to reserve (replacement), 4d.; profits (distributed to shareholders), 2d.

The trading companies operate in all the major ports and in many of the larger cities and towns. It is pleasing to report increased business in almost every department, but increased costs of operations are adding materially to the price of fish to the housewife. There cannot be cheaper fish than at the present time until the costs entailed by trawlers and the costs of distribution are reduced.

Since March 31st and up to September 30, 1952, trading conditions in our industry have deteriorated and the results of your company for this period cannot be regarded altogether as satisfactory. However, it is hoped that the position will improve to some extent by March 31, 1953, and that the results for the current year will not be regarded as unreasonable in the circumstances.

THE OLD BLEACH LINEN COMPANY, LIMITED

TRADE RECESSION REDUCES PROFIT

The nineteenth annual general meeting of The Old Bleach Linen Company, Limited, was held on October 29th at Randalstown, Mr Norman F. Webb, the chairman, presiding.

The following is a résumé of the chairman's annual report for the year ending June 1, 1952:

After recording the loss the company had sustained in the death of Mr A. H. Johnson, OBE, last May, the chairman referred to the recession of trade which all markets had experienced, and the disappointment of the hopes of a revival in the spring.

Turning to the accounts, the profit on trading at £89,006 showed a decline of £82,133 in comparison with the figure for May, 1951. After adding the balance forward from last year and allowing for depreciation (£25,874) on their customary basis, and deducting other usual expenses, including provision for taxation, interest on Bank accommodation and unsecured notes, etc., there was a sum of £141,150 available for appropriation compared with £159,068 in 1951.

From that, after providing for the year's dividend on the 6 per cent cumulative preference shares to June 30, 1952, less tax (£12,600), and the interim dividend of 5 per cent on the ordinary shares representing £3,938 net, there was left £124,612, out of which the directors recommended a final dividend of 2½ per cent, making 7½ per cent for the year on the ordinary share capital. With that provision absorbing £1,969 and the transfer of £8,000 to the trustees of the staff and executive directors' pension funds, there remained a balance of £114,643 to be carried forward.

RECORD EXPORTS

The company's plant expansion programme was now practically complete. With the object of consolidating all fixed assets in the parent company, the buildings and plant, etc., originally allocated to the Furnishing Company at the time of its formation, had now been returned to The Old Bleach Linen Company Limited.

In line with that policy had been the board's decision not to proceed with the transfer of the fixed assets represented by the carpet factory and machinery to Old Bleach Carpets, Limited; consequently, the entire holdings of all subsidiaries now rested in the hands of the parent company.

Liquid assets stand at £1,086,568 against current liabilities of £641,722. Total stocks valued on the customary conservative basis of cost or market value, at £897,145, may look high, but with a comprehensive line such as Old Bleach, going to the retailer, who expects quick delivery, this is inevitable.

The drop in trading and profit figures was regrettable, but under the conditions prevailing in the textile trade generally, the results were not to be considered altogether unsatisfactory. Export figures for the period were up on last year, which had been a record for the company.

After one of the slackest summer seasons' trading in memory, autumn buying was showing a considerable improvement, and looms in certain sections were working overtime, and, in some cases, on two shifts.

The report and accounts were adopted.

THE ELY BREWERY COMPANY

MR L. NIDDITCH ON SUCCESSFUL YEAR'S TRADING

The fifty-sixth annual general meeting of The Ely Brewery Company, Limited, was held on October 23rd at Pontypridd, Mr L. Nidditch, FFS (Eng.), FVI (chairman, managing and financial director), presiding.

The following is an extract from the chairman's circulated statement:

Ladies and gentlemen,—It is with much satisfaction that I present to shareholders the fifth accounts since my election as chairman and after approval of the reconstruction scheme I evolved early in 1947, with the result that no shareholder was deprived of any capital loss or dividend arrears. I am pleased to report that we have more than maintained trade and profits in spite of money tightness.

Last year I concluded my review with the following sentence: "The outlook is clearly open to a cheerful interpretation on the part of all shareholders." The same outlook applies to the future.

We have continued to increase our patronage to some extent in about 60 per cent of our houses, which I am sure you will agree augurs well for the future. In the current financial year our trade again shows a slight increase in barrelage sales. Our strategic planning of the last two or three years is now bearing fruit, with prospects of still better results to come. Our trade last Easter, Whit-sun, and August Bank Holiday weeks were records.

Those of the employees of the company whom we selected for promotion to executive office during the last three or four years are all showing excellent promise, and I can assure you that we are a very happy, courteous, and co-operative team. With the help of all other employees, we have made Ely Brewery a respected and successful company. Furthermore, all employees now approach their work with a buoyant and eager outlook towards continued prosperity.

NEW PRODUCT

Last Easter we marketed a new light ale in nip-size bottles to retail at the round and convenient figure of 6d. This we have

named "Druids Ale," and I am pleased to say it has taken most satisfactorily and achieved its intended purpose, including that of being an easy drink for ladies to enjoy in the company of their husbands or friends in a congenial atmosphere when to spend a greater sum on a larger bottle of beer or spirits might perhaps be somewhat inconvenient.

The increased bottled sales over the whole country for the last four years is about 10 per cent over 1948. Our bottled beer sales have increased by 125 per cent.

Quite a goodly number of shareholders, I am pleased to note, increased their holdings during the year. In all, your directors signed almost 700 share certificates since our last annual meeting, and in giving a warm welcome to these new shareholders I again also thank all old shareholders for their continued confidence in your board, and for the many kind letters I have personally received.

TRADING RESULTS

The profit and loss account of £348,257 shows that we earned £40,000 more than the previous year after a greater expenditure of £7,000 on repairs to houses and £2,000 more to employees' bonus at £5,700: £2,069 as depreciation on casks, and £5,000 amortisation on brewery plant is being applied. Although the future outlook shows promise we have deemed it prudent to provide for uncertainties resulting from official policies and create a contingencies reserve of £10,000. We are also placing £15,000 to reserve fund. Taxation requires £118,000, and so configures liquid resources at an oppressive rate. The present party in official control was voluble as a critic when profits tax was raised to 30 per cent—and later to 50 per cent—and then finds solace and self-persuasion at fixing 45 per cent (less income tax) when reaching power. It is difficult to assess promises and courage with wisdom when out of or in power.

We have already declared an interim dividend of 3½ per cent, less tax, on the ordinary capital, and now propose and recommend a final of 3½ per cent, less tax, making

in all 7½ per cent for the year. We also recommend a further tax free distribution of 1½ per cent in cash out of realised capital gains account. In addition, we also recommend a 5 per cent, tax free, accretion bonus in cumulative preference shares to the extent of one £1 5 per cent cumulative preference share for every 80 ordinary 5s. units held as at December 8, 1952. I must point out that the several share bonus issues made in the last four years about equal the undistributed profits of the last six years, and, as yet, takes no account of the general vastly improved capital position and rise in assets values.

CAPITAL ACCOUNT

Briefly reviewing the capital account, our cash acquisitions and transfers from leasehold account since 1947 amount to the satisfactory increase of £355,000, of which £20,094 was incurred for this financial year in cash. In all since 1947, £149,000 was paid from cash resources. Our plant and machinery has been added to by £26,000 this year. Motor vehicles, which mostly comprised aged vehicles with heavy, worrying maintenance, now stand at £20,300, after depreciation of £17,000, and are all in excellent condition.

THE COMPANY'S DEBENTURES

It is of interest to note that this company's debentures have been and still are being quoted at around 94 per cent—being approximately 15 per cent higher than the average market price of 4 per cent debenture stock. This is the highest price compared even with the first dozen strongest and most successful "blue chip" companies in the country, and, I believe, higher than any other brewery company's debentures. Since last July little of this stock has come on the market.

I conclude by expressing my personal thanks, together with those of my board, to all employees and tenants for their continued enthusiastic co-operation and loyalty, which has played no small part in achieving the most satisfactory year's results.

The report and accounts were adopted, and at a subsequent extraordinary general meeting a resolution was passed capitalising £31,420 of the undivided profits of the company and authorising a bonus issue of one 5 per cent cumulative preference share of £1 for every 80 ordinary stock units of 5s. each at present held.

THE ROYAL BANK OF CANADA

BONUS DECLARATION

The Royal Bank of Canada has declared a bonus of twenty-five cents per share for the year ending November 29, 1952—payable December 15, 1952, to shareholders of record at close of business on November 15, 1952.

By Order of the Board,
T. H. ATKINSON, General Manager.

October 30, 1952.

PROPRIETORS AND DIRECTORS with controlling interest in Private Companies manufacturing and selling proprietary lines through Grocery and/or Ironmongery Trades are invited to communicate with large London Manufacturing and Selling Concern, with a view to discussing working arrangements and eventual sale of shares, thus avoiding possible difficulties at retirement or death. Write in confidence, Box 101.

AGRICULTURAL CO-OPERATIVE ASSOCIATION, LIMITED, requires Education Officer. Experience of agriculture or rural living, preferably interested in agricultural co-operation. Graduate in agriculture or economics with agricultural economics desirable. Ability to write and speak especially to rural audiences. Experience in editorial work, the organisation of Courses, lecture tours, and use of visual aids desirable. Salary £500 x £26 to £850. Superannuation scheme. Application forms from Secretary, 14, Portman Square, London, W.1, to be returned by November 15, 1952.

ACCOUNTANT (Chartered or Incorporated) required as Assistant Secretary to a large public company in the textile trade in Manchester. Age 30 to 40 years. Commercial experience desirable. Write, stating age, experience and present salary, to Box 288, Wheelers Advertising Agency, Manchester, 2.

EXECUTIVE, early thirties, seeking fresh fields, would welcome opening, not necessarily commercial, in progressive and interesting work. Considerable administrative ability, overseas experience, languages, drive, used to responsibility. Salary not first consideration.—Box 99.

OTHER NOTICES APPEAR ON PAGE 34 OF COVER.

1952

The Public Duty of Economists

TO ask whether economists are doing their duty by the public may seem the expression of an unworthy doubt. Never has the professional economist been more active in public concerns, never have the economics departments of universities been bigger and busier, than in the years since the war. Nevertheless the question needs asking. For the primary social job of economists, arising out of the very nature of economics, is neither to legislate nor to administer; nor is it completely performed by concentration on even so right and noble a pursuit as the disinterested search for abstract truth. Economics is essentially a study of human action, of rational choice between alternatives and of the circumstances in which choice is made. If it is to have any aim or value otherwise than as an arena for intellectual athleticism, its aim must be to make choice more rational, that is, more self-consistent, and its value must lie in the illumination which it provides for those making the choice.

In a dictatorship or oligarchy it suffices if a *corps d'élite* is capable of confronting the situation "either—or." In a *laissez faire* society, grossly irrational choosers gravitate to a position where their irrationality hurts only themselves. But in a social democracy, where a large part of economic decision is genuinely though indirectly collective, both the quality of initial choice and the process of putting it into effect depend on the capacity for rational choice of the Common Man, the Average Voter. This capacity is not a natural and universal characteristic; it is a capacity of the fully adult mind. Few if any individuals entirely and reliably outgrow the small child's propensity to demand incompatibles, to howl because the same threepence will not buy an ice cream cornet and a chocolate bar; which is why one is always hearing that it is "politically impossible" to act on any other assumption than that one can have one's cake and eat it too. Moreover, willingness to be rational is not enough; not only planners and legislators, but those on whose votes and whose co-operation, in a free society, they depend, must have the data on which to use such rational powers as they possess. Hence the special importance, in Britain today, of the economist's role as general educator; as illuminator and clarifier of the alternatives between which choices are made.

How far does the economist impact on public opinion fulfil this role? One indispensable index to their success can be found in their writings for the lay public—a public, that is, excluding both their present colleagues and the already specialised aspirants to that status. One must, of course, classify further. The economists' "lay public" include high-level administrators; City men and others familiar with large-scale business problems and procedures, laymen only in the sense that they have never followed or have not kept

abreast of a particular academic discipline; the professional classes or intelligentsia; ordinary Home Service and Light Programme citizens in all walks of life; and school children. How have these, in fact, been served?

The first two classes, one may conclude on a survey of the economists' recent output, have been reasonably well provided for. They are comparatively well equipped, by practical experience and interests as well as by probable intellectual calibre, to listen in on the professional economists' mutual debate. The mere "intelligent layman," too, if willing to take a good deal of trouble and apply himself really hard, can hitch an intellectual ride on a number of excellent up-to-date general textbooks for undergraduates—the names of Benham, Boulding, Cairncross, Eastham, Phelps Brown and, from across the Atlantic, Samuelson, all spring to mind. Or he may turn, justly confident of finding matter within his range, to the relevant volumes of the Home University Library or Hutchinson's University Library, or to the Cambridge Economics Handbooks on special subjects. But the proviso is important. He must be willing to become, for the time being, a serious student; which means not merely exerting a student's conscientious application but exerting it on acquiring a mastery of the economist's analytical tools. If his curiosity and perseverance give out, it is hardly surprising.

The economists do serve him better with comment on current and particular problems than with basic texts. But when, as often happens, these comments are markedly polemical, he remains painfully aware of inability to use his judgment on them and to disentangle from the argument of, say, Professor Cole, Dr Balogh or Mr Harrod, the element of light from that of heat. Even when the writer's intention is most purely expository or his personal angle most clearly stated and accordingly easy to discount, a reader lacking knowledge of background and principle misses the full benefit of information and argument. One can indeed cite books to which this criticism does not apply. Professor McCord Wright's "Capitalism" provides the finest postwar example; Professor Lerner's "Economics of Employment" provides another. Both, it must be noted, are American; no British economist has similarly catered, except by the essay or lecture, for the most willing and conscientious general reader.

The comparatively lowbrow Average Man—who makes up the greater part of the voting collectivity—is even less well served. It was, indeed, for the Average Man that Mrs Gertrude Williams wrote that superlative Penguin, "The Economics of Everyday Life"; a gallant and, within limits, brilliantly successful attempt at filling the most obvious gap in the citizen's bibliography. But this is the exception that proves the rule. Had its author been (with all due respect) a

OXFORD
UNIVERSITY PRESS

top-flight academic, the book might never have been written. And between her necessarily very sketchy, though admirable, outline and the over-academic Introductions and Elements designed primarily for university students there lies a horrible void where pullulate the school textbooks written by parrots for parrots, *biblia abiblia* relevant neither to the development of rationality nor to the understanding of the economic scene but only to a once-for-all regurgitation on examination paper.

Why this deficiency? There is the natural aversion of scholarly minds from those crude first approximations, oversimplifications, and sketchy descriptions, called for in really elementary writing for non-intellectuals whether in schools or elsewhere. There is the bent, characterising just that intellectual type most frequently attracted to economics, towards abstraction and *a priori* reasoning; a bent unpropitious for the ordinary reader's preferred approach, which is from real-life description to underlying principle, from diversity to unity, from concrete to abstract. There is also the preoccupation of so many of the best economic minds with administration, either of university affairs or in public service, and with politics. There is, perhaps, discouragement in face of the public's preference for just those confident snap answers which it is not the business of economics to proffer.

The ideal "Economics for Laymen" is easier to specify than to write. It should be predominantly factual, setting its matter in a solid framework of statistical magnitudes—beginning perhaps with the aggregate national income and its distribution between different income types and between individuals; instilling, in fact, that sense of proportions so essential to economic realism. (It is unlikely to surpass in this respect Professor Hicks's invaluable "Social Framework," which, however, is not comprehensive enough to fill the whole bill.) It should give a picture, vividly recognisable in terms of the reader's personal experience and knowledge of current events, of the processes of getting and spending, of the organisation and manning of different kinds of business, of the public controls within which it works, of its common procedures. It

should move smoothly from What to How and from How to Why, every generalisation making its impact on a mind already equipped with recognisably relevant evidence. It should hammer home in every context the universal fact and essential nature of economic choice; at the same time it should not outrage the reader's sense of reality by assigning to economic motives, explicitly or implicitly, a primacy which he knows in his bones that they do not always possess. It should indeed make clear, reporting rather than arguing, the political and ethical judgments which impinge on economic decision. It should demonstrate the economic process as a matter of dynamic unfolding, part of the march of history; an endless film, not a still nor a repeating reel. It should—but this is idealism indeed—lightly but genuinely hint the way on towards the heights and the frontiers of knowledge, raising speculations, indicating controversies. Ideally once more, it should be not one book but many; a whole class of economic literature, ranging from the secondary school primer to a new "Wealth of Nations."

Exacting as the specification may be, it is hard to believe that there exists no economist capable of filling it; no one combining the highest theoretical expertise with knowledge of cities and men, and literary gifts with ability to lay his mind alongside the muddled blunt-edged mind of the Common Man; no one having these qualifications and, at the same time, public spirit and energy enough to do this most essential job—which, incidentally, would be a highly remunerative one. Virtue, in this instance, need not be its own reward.

Tyranny Dissected

Hitler: A Study in Tyranny. By Alan Bullock. Odhams. 776 pages. 25s.

It is an excellent thing that this estimate of Hitler's character and achievement should have been made by a liberal historian of the war generation, while the Führer's offences still smell to Heaven, while personal memories of him are vivid and before his rehabilitation is attempted. Here is a cool, readable and acute dissection of how the man from the Vienna doss-house gained and exercised political power. It is not a biography, although the materials for biography are all here; it is, as the author insists, a study in tyranny—such a superior word to "totalitarianism." Mr Bullock has left the way open—and this is not an important criticism—for studies of Himmler, Schacht, Speer and Goebbels

which will explain the extraordinary manner in which Germany gathered and maintained strength between 1933 and 1944.

Unlike many previous writers, Mr Bullock does not underestimate Hitler's ability, nor his quality as a revolutionary. The man who ruled Germany from 1933 to 1945 was, indeed, a political genius; he was a master of the irrational forces in modern society, a brilliant judge of opponents' weaknesses—whether it was the statesmen of the West, the generals of the General Staff or his rivals within the party. Because his judgments were unhampered by any scruples of religion, conscience or simple kindness, his sense of timing was superb, his calculation of

risks bold and subtle. He took the German people with him because he offered them the prospect of power and heroic recovery; and, as Mr Bullock points out, his policy and creed were "the *reductio ad absurdum* of the most powerful political tradition in Germany since the unification" carried to its logical conclusion. As ardently as any Communist, he loathed and set out to destroy the "liberal bourgeois system" in which he had been unable either to earn a living or find happiness.

Hitler's decline began from the moment that he exercised supreme power in war over Germany's forces. Here he overreached himself, and Mr Bullock's account of his struggles with his advisers and his treatment of commanders in the field is of fascinating interest. It provides the climax of the

Presidential Profiles

America's Man of Destiny. By Kevin McCann. Heinemann. 201 pages. 12s. 6d.

Adlai E. Stevenson. By Noel F. Busch. W. H. Allen. 240 pages. 15s.

Adlai Stevenson: The Man and the Statesman. By John Bartlow Martin. Gollancz. 175 pages. 12s. 6d.

No man is expected to be a hero to his personal assistant. But to Mr McCann, who served General Eisenhower from 1946 to 1951, the General is a hero without a flaw. This is reassuring, but it makes for dull reading. "Man of Destiny" is not the intimate biography the publisher's blurb so winningly suggests. Neither is it an illuminating account of the General's services to his country and the free world. It is not only completely uncritical, giving no hint of the disillusionment which was to come when the General entered politics. It is also too scanty and superficial to give the reader any real understanding of the problems General Eisenhower faced and surmounted as head of the Allied Expeditionary Force, as Army Chief of Staff, and as Supreme Commander of the Atlantic Pact forces. The book includes, it is true, a number of unpublished letters and memoranda, which show the General to have been conscientious, patriotic and hard-working. They also suggest, with one or two exceptions, that the General's reputation was won as a man of action rather than of thought, that he is mightier with the sword than with the pen.

The trouble with Mr. Stevenson's biographers is exactly the opposite. They reveal that the Governor belongs to one of America's minor political dynasties, that he is thrifty as only a rich man dares to be, what time he gets up, and what jobs he has done. But those who have read any of the Governor's campaign speeches, will turn to these books, and turn in vain, for the witty, eloquent, courageous texts that have made Governor Stevenson a hero to millions who have never met him. The campaigner has left the campaign biographers far behind. Nevertheless, these short biographies have their uses. Six months ago, the Governor was known, outside Illinois, only for his curious reluctance to run for President. Four years ago, even in Illinois, he was only a forlorn Democratic candidate for

trilogy into which this long book is divided: Party Leader, Chancellor, War-Lord. Almost exactly half way through the story Mr Bullock pauses (in chapter VII) to examine in detail the character of this odious hero, and it is here that those who have time only to taste one course in a rich menu should pause. It is a model of careful, moderate yet critical appraisal. There is one passage of distinction which might do for Hitler's epitaph—though it would be more effective written by a German:

Indifferent towards the suffering of others, he lacked all feeling of sympathy, was brutal, intolerant and callous, and filled with contempt for the common run of humanity. Pity and mercy he regarded as humanitarian clap-trap and signs of weakness. The only virtue was to be hard, and ruthlessness was the distinctive mark of superiority.

the Governorship in a state which had had only three Democratic governors in its history. A wave of disgust with the Green administration swept him into office with 570,000 votes to spare.

Both biographies sketch the difficulties on which Mr Stevenson cut his political teeth and built his reputation. He refused bad deals even to accomplish ends close to his heart; he could have had a badly needed new state constitution if he had been willing to veto a Bill for a crime investigation. He refused to be stampeded into witch-hunting. Mr Busch, who gives up half his book to the Governor's veto messages and speeches and articles written before the convention, includes in full the masterly veto of the Broyles loyalty oath bill. This is proof that long before he was compelled to take on Senator McCarthy, Governor Stevenson had thought long and hard about the problem of domestic Communists and the bigger problem of the Communist hunters. He is a conservative, in the true sense, on civil liberties, and on finance, more interested in improving hospitals and roads and schools than in social innovations.

The article on "Korea in Perspective," written in 1951 and also reproduced in full by Mr Busch, is a reminder that foreign affairs was Mr Stevenson's first love, long before he became enamoured of good state government. He helped to bring the United Nations to life, and the Korean article is a remarkable analysis of what was gained when America decided to stand firm in 1950.

Of these two sketches, Mr Martin's is the slighter and more impressionistic, but he has the gift of making his subject seem to breathe. Mr Busch is more solid. Neither attempts a considered judgment, for which it is certainly too early. Neither book can claim to be more than an introduction to a remarkable man who is only beginning to make his mark on the American and world scene, and will be worthy of much more serious study before he is finished.

A Mind in Anguish

Lord Acton: A Study in Conscience and Politics.

By Gertrude Himmelfarb

Routledge and Kegan Paul, 260 pages, 21s.

A good deal has been written about Acton since the war, and the reason for this renewed interest is not difficult to see. As Miss Himmelfarb says in her introduction,

Acton is of this age more than of his. He is indeed one of our great contemporaries. Acton was a pessimist and a moralist, a combination hardly likely to endear him to a world that was at the same time expansively optimistic and narrowly materialistic. When the spiritual climate changed, however, Acton found his home . . . Because Acton was never taken in by history, he can speak with authority when history runs amok.

Acton was a bundle of contradictions, and it is no good trying to explain away his inconsistencies. Like his friend Gladstone, he boxed the compass in his political beliefs between his early and later writings, and throughout a great part of his life attempted to maintain simultaneously positions which to more ordinary people appeared plainly incompatible.

The most familiar of these incompatibilities is Acton's combination of devout Catholicism with a doctrinaire liberalism, which led him, while remaining a faithful son of the Church, to attack the crimes of the Papacy more bitterly than a professed anti-clerical. But there were also others. No man ever proclaimed more persistently the duty of the historian to pass judgment, yet, as Miss Himmelfarb points out, many passages in his notes and correspondence show that his imaginative sympathies and sense of mixed motives constantly "frustrated his will for moral indignation." A similar conflict appears in his Liberalism. Proclaiming the revolutionary effect of Liberal ideas, which he declared, constituted a "revolution in permanence," he refused to admit the element of violence which is an essential part of most revolutions. Attempting to preserve the doctrinaire purity of political ideals, he nevertheless found himself driven to condemn a Robespierre and to prefer the tolerant and fruitful compromises of English to the dogmatic and barren rigidity of Continental Liberalism.

These contradictions, far from detracting from the power of Acton's thought, add immeasurably to it. It is the anguish of a mind, striving and failing to reconcile irreconcilable values, which attracts us to him far more than the legendary range of his learning that so much impressed his contemporaries. Miss Himmelfarb's book does full justice to this dominant theme of unresolved moral tension which in the end crippled his creative powers. She traces the conflict in his mind from the early days of *The Rambler* and *The Home and Foreign Review*, through the storms of the Vatican Council and the later breach with Dollinger to the Cambridge Inaugural and the Lectures on the

French Revolution. Her mastery of Acton's writings and of the mass of unpublished material in the Cambridge University Library is impressive without being obtrusive. The wide reading that has given her so convincing a grasp of the intellectual background of the times is employed most economically and compressed into a book of such modest length without detracting at all from the ease and pleasure with which it is read.

This is not a definitive work. So long as the correspondence and notes at Cambridge, into the riches of which Miss Himmelfarb gives us tantalising glimpses, remain unpublished, this can scarcely be undertaken. For the probability is that judgments based on Acton's hitherto published work will have to be drastically revised in the light of this new material. But for the first time, without fuss or unnecessary display, we are here provided with an account which reveals something of the true stature of a thinker whose insight into the problems of morality and politics preoccupying our own time was deeper and more prophetic than that of any of his nineteenth century contemporaries.

Tale of the Sea

One of Our Submarines. By Edward Young. Rupert Hart-Davis, 317 pages, 18s.

Anti-submarine operations are the first concern of the British Navy in wartime, and the hunting of U-Boats has rightly been the subject of many postwar books. But the enemy's activities at sea also gave Britain's small, but intensely keen, submarine branch a chance to carry the war into enemy waters.

From north of the North Cape to south of the Celebes, in the treacherous mists of the North Sea and the unpleasantly clear waters of the Mediterranean, Commander Young served for five years in this hazardous trade. Others may have more war patrols to their credit; other submarine captains may have made larger bags by gun or torpedo, but few could combine the qualities required to be the first RNVR officer accepted for service in submarines, and the first to be given command, with the ability to write such a stirring tale as this.

Here are all the ingredients for an adventure story: the stealthy approach for a torpedo attack; the decision to surface and fight the enemy with the gun; the secret agent landed on the enemy coast; the escape from the sunken submarine. Although it is not always easy to connect the incidents with the main course of the war, because of the almost complete omission of the year when dates are given, the adventure story is well told.

There is, however, more to the book than this. It is also the story of an amateur sailor, with none of the technical background of the normal member of a submarine training class, learning the essentials of an extremely complicated war machine. He can only grasp essentials in the short time at his disposal, so he realises that he must rely more heavily than usual on the knowledge of his fellow officers and men. Gradually he gains skill and confidence and, as he advances

from Navigator to First Lieutenant and from First Lieutenant to Captain, gradually others gain confidence in him.

While the layman need not fear that his enjoyment will be spoilt by too much technical jargon, the expert will not have his feelings outraged by one breath of journalese. All submariners will be glad that their activities have been so ably recorded by one of their own number and in a book which stands on its own merits as a great tale of the sea.

Hackneyed Subject

Atlantic Impact, 1861. By Evan John. Heinemann, 296 pages, 15s.

On an early page of his book Mr John refers to "a politician called Everett." This was the distinguished statesman and scholar who was four times Governor of Massachusetts, President of Harvard College, Minister to the Court of St. James's and Secretary of State of the United States. At a later stage Mr John identifies Edward Everett somewhat more fully as a liar whose "love for Humanity was not accompanied by any love for Truth." This attack upon Everett suggests something of that peculiar combination of innocence and brashness which characterises this book throughout, innocence of familiarity with American history and brashness in judgment upon it.

It is a familiar, almost a hackneyed subject to which Mr John here addresses himself: the Trent affair and the reaction of Britain to the American Civil War and of America to the British reaction. A generation ago E. D. Adams covered the ground pretty thoroughly in two volumes, and a number of monographs have been devoted to it since. None of these is mentioned by Mr John, who approaches his subject with the enthusiasm of a novice and abandons it in the same state. Yet we must be grateful to him for clearing up, in a few swift sentences, some of the problems that have engaged the anxious attention of American historians for many years. Thus we are told that "it is difficult to dispute the constitutional legality of secession" and that disposes of a good many statesmen and scholars who have in fact disputed it. We are assured that South Carolina rebelled against the "grinding modern tyranny" of economic exploitation, a fact which South Carolinians somewhat oddly left out of their Declaration of the causes of secession. We are reminded that the Yankee politicians "rigged the tariff" to the injury of the South, though it was in fact the South that wrote the tariff of 1857. Most remarkable of all, we are solemnly informed that for many Southerners, and even for Jefferson Davis, "slavery was a side issue"—a consideration he failed to make clear in that inaugural address which emphasised the attack on slavery as the chief cause of secession; a fact which the Vice-President, Stephens, failed to make clear in his famous speech calling slavery the

"cornerstone" of the Confederacy.

But it would be futile to list the errors of fact and of judgment that jostle each other on every page of this curious book. Mr John uses the Trent affair as a peg—a pretty long one—on which to hang his reflections on British-American relations at the beginning of the American war; he fails to carry his story on to include the escape of the *Alabama* and the Laird rams and thus gives the impression that it was only the Union government that could be charged with violating international law. His argument is that Americans were wrong on the Trent affair, and that British resentment against the violation of the somewhat obscure law of the time was perfectly understandable. His larger argument is that Britain could not properly be expected to sympathise with the North or to forgo sympathy with the South as long as the Union government failed to make clear that it was fighting to destroy slavery.

Two observations are relevant. First, it was, from the beginning, clear to all that a Confederate victory would greatly strengthen slavery and that a Union victory would weaken or destroy it, and this regardless of official "war aims." If British statesmen failed to see this they were obtuse, and that is not a charge that can be made against Palmerston or Gladstone or Russell. Secondly, the crisis of Gladstone's Newcastle speech—that speech which he later called "the most singular and palpable error" of his career—and of the Laird rams came well after the Emancipation Proclamation. That proclamation was called by the *Edinburgh Magazine* "monstrous, reckless, devilish," and elicited from *The Times* the observation that "impotent malignity is apt to be a very contemptible spectacle." It was not, in fact, the clarification of the slavery issue that silenced the loudest roars of the British lion, but the clarification of the military issue.

As a lively narrative of some of the minor events of this two-year period, as a re-creation of such individuals as the Prince Consort or "Bull Run" Russell, "Atlantic Impact" is entertaining enough, but it is not a serious contribution to history.

One Who Counted

Fear God and Dread Nought. The Correspondence of Admiral of the Fleet Lord Fisher of Kilverstone. Selected and edited by A. J. Marder. Jonathan Cape. 377 pages. 30s.

Professor Marder has used much the same technique in presenting this collection of Lord Fisher's letters as he used with Admiral Richmond's diaries in "Portrait of an Admiral," also recently reviewed in these columns. But the result is infinitely more successful in the present case. A true portrait of Richmond could not be gained from his diaries; but "Jacky" Fisher was a profuse letter writer, and this selection enables us to form a remarkably clear idea of what sort of a man he really was. Moreover, it is not only the naval student or historian who will benefit from this book. Fisher's interests and activities ranged over a very wide field. He was an acute observer of international affairs at several critical periods; he was mixed up with most of the statesmen and politicians of the early 1900s, and was on intimate terms with Edward VII and the Prince of Wales.

Fisher's outward truculence, his vehemence in speech and writing, his unflinching persistence and his "ruthless, relentless and remorseless" methods inspired many lesser men with awe and earned him bitter criticism from the strongholds of naval conservatism. Yet, after reading these letters, one feels that he was, *au fond*, a humble and lovable man, who deliberately made himself out to be harsh and ruthless in order to achieve his object of tearing the service he loved out of the ruts into which it had fallen during the long years of Pax Britannica. For he was a great patriot, and saw very early what the rise of the new German Navy really meant. Of course he was ambitious, but his ambition was never merely selfish, for we see him, again and again, prepared and even expecting to sacrifice himself in the causes he believed in. His accomplishments, which ranged from revolutionising fleet organisation and tactics to starting Osborne and Dartmouth Colleges and the change from coal to oil fuel, were tremendous. And, in the background from quite early days, we can see the germ of the ideas which culminated in the design of the *Dreadnought*.

While still a boy Fisher wrote that he "could not bear to read [his letters] over twice," and they all have a breathless directness, as if struck white hot from the fiery metal of his mind. It is impossible for anyone to read them without feeling that he has been living on intimate terms with a very great man. "Remember," wrote Lord Esher in 1904, when he and Fisher were sitting on the committee for the reform of the War Office, "not more than a dozen people in England count for anything, and you happen to be one of them." Mr Marder's biographical introductions to each chapter give exactly the right amount of background to the letters which follow. We can look forward greatly to the appearance of the second volume.

Hanging Historian

In the Nazi Era. By Sir Lewis Namier. Macmillan. 204 pages. 12s. 6d.

This is the third volume of studies which Sir Lewis Namier has published on the diplomacy and statesmen of the later 1930s. Like "Europe in Decay," it is composed almost entirely of reviews contributed to the weekly or monthly journals, and at his best—for instance, in the essay on "The German Army and Hitler"—Sir Lewis displays a power of insight which, added to his equipment as a scholar and the distinction of his style, stamps even his book reviews with an unmistakable hallmark.

In his Inaugural Lecture Lord Acton compared the historian to a "hanging judge." It is a description which Sir Lewis might well make his own. He takes no pains to conceal the scorn he feels for many of the transactions and actors he describes. Yet underlying the scorn, and giving to these occasional pieces a unity of conception, there is a serious purpose: to challenge the historical myths that are already growing up about the origins and course of the Second World War.

This is far from being a popular purpose. The unexpected twists of postwar politics, which have led to the rehabilitation of Germany as an ally against Russia, have also given a powerful impetus to a revisionist rewriting of recent history. Thus von Papen, in his recently published Memoirs, has been quick to take advantage of the present situation to represent himself as one of the earliest defenders of Western civilisation against the barbarian hordes from the East, while it has become a commonplace to lay the blame for the presence of the Russians on the Elbe at the door, not of Hitler, but of the Allies who enforced the policy of unconditional surrender.

Such facile assumptions need to be critically examined in the light of the records. But while sympathising with Sir Lewis Namier's purpose, it is possible to feel that he has set about his task in the wrong way. This feeling is due to the literary form in which he has chosen to work. As he himself remarks in his introductory essay, few of the memoirs here dissected have much value in themselves. It is the assumptions they reveal, the historical myth to which they contribute, that it is important to lay bare and examine, but in his concern with the personal shortcomings of authors and politicians and with the minutiae of their detailed narratives, Sir Lewis tends to lose sight of his main objective.

What we are offered is a series of preparatory studies for a major work which, it appears from the preface, the author is now unlikely to write. This is sad news and few readers will be able to put down the present volume without a feeling of disappointment, and even irritation, that the learning and insight which are displayed in so many scattered comments should not have found a more adequate vehicle for their expression than a collection of reviews.

HOLLIS AND CARTER

Ideal Chairman

A Man of Law's Tale. By Lord Macmillan. Macmillan. 379 pages. 21s.

Lord Macmillan did not live to see the publication of his autobiography, and those who read the tributes to his memory on the occasion of his death a few months ago must have been struck by the profound respect and affection with which he was regarded. His autobiography evokes the same feelings in one who had not the privilege of knowing him. He was obviously a wise and a good man. It is, of course, a success story, starting in the best possible place for such stories, a Scottish manse, and the author very naturally and rightly looks back over his nearly eighty well-spent and, one would gather, uniformly happy years with quiet satisfaction. But the record speaks for itself. He was trusted by all and sundry for sound judgment and fair dealing, and there is not a single ill-natured or unkind remark in the book.

While still a young law apprentice in Glasgow he was asked to record his life's ambition in one of the Books of "Confessions" then popular, and he wrote: "To be a Lord of Appeal." In due course he became one, though he had never been a member of the English Bar. But it was as a chairman of Royal Commissions and Committees of Enquiry that he achieved his peculiar eminence. After completing his labours as chairman of a Royal Commission to investigate and report on Banking and Currency in Canada, the Canadian prime minister presented him with a book inscribed to "Lord Macmillan, Incomparable Chairman, Eminent Jurist, Typical Scot and Beloved Friend." There was indeed hardly any subject meet for enquiry during the interwar period for which Lord Macmillan was not felt to be the ideal chairman:—high finance (though he told Keynes that he did not understand it and Keynes did not seem to think that mattered), the conferring of party political honours, the preservation of works of art, sexual misbehaviour in the London parks, a wages dispute in the textile industry—one could double the length of the list. He was chairman of the Pilgrim Trust and of the authority responsible for the new London University buildings.

Twice he approached the fringe of party politics. In 1924, though a Conservative, he accepted with Baldwin's approval the office of Lord Advocate in the first Labour government and in 1939 he became Minister of Information, resigning when it became apparent that the Minister ought to be in the House of Commons; but democratic politics were not in his line, and with his usual wisdom he kept clear of them.

Although author and publisher bear the same name they are not discoverably related; but the professional contact of the two families extends back to 1861 when Macmillan and Co. published Footnotes from the "Page of Nature, or First Forms of Vegetation," by Lord Macmillan's father.

Witness of Chaos

Arrow in the Blue. By Arthur Koestler.
Collins and Hamish Hamilton. 310 pages.
18s.

In this first volume of his autobiography, Mr Koestler has achieved something which is, in his case, unusual: he has written a disappointing book. The clue to it is, perhaps, his admission that "in England and the United States, the majority of the people I know have consulted psychiatrists on one occasion or another." For every paragraph of narration in Mr Koestler's account there is a corresponding lesson drawn from the gospel according to Freud. What makes this so irritating is the fact that much of Mr Koestler's psychiatry is second-hand. It leads him to a pretentious use of symbolism (as in the title) and to an extensive treatment of erotic themes. His chapter on Parisian brothels reads like the diary of an adolescent hoping to be found out by his bourgeois parents.

This would be less of a disappointment if Mr Koestler's life were not so fascinating and if his avowed challenge to St Augustine and Rousseau had been less justifiable. In fact, Mr Koestler is among the most brilliant witnesses of chaos and much of his individual experience is a parable for the age. Little of this emerges even in the account of his conversion to Communism. We are told that "oversensitivity to social injustice and obsessive cravings for Utopia are signs of a neurotic disposition," and find Alger Hiss, Donald Maclean and Joliot Curie happily lumped together on the psycho-analyst's couch. The actual circumstances which led to Mr Koestler's entrance into the Communist Party are grotesquely trivial—a bad loss at poker, the fact that the engine-block on his newly repaired car had burst, and a night spent in uninspiring company. Nor is Mr Koestler's wider analysis of the spell of Marxism devoid of this trivial and haphazard character.

"Arrow in the Blue" raises a disquieting question. Why is it that the intellectual buoyancy and literary craft in so many ex-Communist writers are flawed in some subtle but decisive way after they leave the Party? Silone is an important exception, but in many cases an element of confusion has entered into much of the work of many others. The "god that failed" seems to exact a heavy price from those who desert him. Mr Koestler's new book is part of this ransom. Nevertheless, it would be wrong to overlook its brilliant journalistic qualities and the sense of sustained nervousness and irony with which he so often comments on the age of anxiety. The chapters on the author's adventures in Palestine in 1926-1927, with their treatise on hunger, and the narrative of the Russo-German Zeppelin expedition to the Arctic in 1931 are superb examples of his art.

Love and Indignation

First and Last Loves. By John Betjeman.
John Murray. 244 pages. 20s.

There are certain qualities which Mr Betjeman shares with an earlier and more famous critic of architecture—John Ruskin. He is a poet; so, it will hardly be denied, was Ruskin, though his only actual verses were unpublishable juvenilia. He is in every sense of the word a Protestant. And, refusing like Ruskin to regard architecture as a mere matter of comely or uncomely three-dimensional shapes, he is a critic not only of buildings but of mores and manners. Writing of towns or of churches, of railway stations, chapels, or country houses, he implicitly or explicitly states a personal and civic creed. Finally, he is not only a lover but a hater. As Ruskin hated industrialism, so he hates commercialism and bureaucracy; as Ruskin hated steam power, so he hates the internal combustion engine. He also hates chromium plating, neon lighting, black glass, and all "the noise of antiquarian prejudice shouting at its bastard, jazz-modernism." His opening essay, "Love is Dead," is a condemnation only incidentally concerned with buildings; a denunciation of Suburban Man, the Lowest Common Multiple, "too bored to think, too proud to pray, too timid to leave what we are used to doing," living in a "right little tight little clinic," finding it unnecessary ever "to feel or think or see again." "All our doings," he quotes from the Prayer-Book, "without charity are nothing worth."

His own charity embraces, with an enthusiasm bordering on perversity (so, perhaps under the influence of Ghastly Good Taste, one occasionally feels) Non-conformist chapels, the Charing Cross Hotel, and Cannon Street Station. His essays on seaside resorts, on obscure parish churches, on the pleasures of a wet winter evening, breathe a lyric fervour beneath which there comes and goes an engaging whisper of self-mockery. His nostalgia has the quality of freshness, for he is nostalgic about things for which most people's affection is—Ghastly Good Taste again—unacknowledged or shamefacedly concealed: chintz and family photographs and Aunt's watercolours in a Surrey drawing-room; "beautiful button-nosed blondes" with tennis rackets, all the leisurely middle-class Philistinism now collapsing into the Lowest Common Multiple.

Enchanting and provocative, "First and Last Loves" is also shamelessly bitty and scrappy, an *olla podrida* of essays, articles, broadcast talks, lectures, some explicitly dated, some self-dating, some unidentified and unidentifiable; but it draws a unity of feeling from its opening declaration of faith and of war. By way of bonus, the essay on Non-conformist Architecture is abundantly, wittily and affectionately illustrated by Mr John Piper, who also designed the enigmatically symbolic book-jacket; and a series of often astonishing drawings and photographs supplements the text of the Notes to Victorian Architecture.

Unfortunate Testament

The Dilemma of Our Times. By Harold J. Laski. Allen and Unwin. 272 pages. 18s.

This is a regrettable book. Harold Laski was an inspiring teacher, an adventurous thinker, a most lovable man; and the posthumous publication of his last, unfinished work is an understandable piece of piety. Originally conceived as a mere appendix to "Faith, Reason and Civilisation," his wartime analysis of the contemporary conflict of ideas, it grew in the writing till it roughly equalled the original work. Whether Laski meant to use it as a quarry from which to draw material for a more proportionate intellectual edifice, or to enlarge it into a definitive structure superseding its predecessor, remains unknown. One can in any case charitably suppose that he was "writing himself in," regardless for the moment of repetitions to be pruned, of omissions to be made good, of weaknesses to be strengthened, of exaggerations to be toned down, and of a style which, however closely it fitted the original shape of his thought, is an agonising outrage on the genius of the English language. But even when every conceivable allowance has been made, "The Dilemma of Our Times" can only detract from his reputation. It is virtually a self-caricature. The old brilliance is there, the infinitely stimulating capacity to see from new angles, to establish new connections between ideas and events, to point historical parallels and analogies, to marshal and manoeuvre the resources of great learning. But there is also something for which it is hard to find a kinder name than dishonesty.

The "dilemma" is posed by the mutual antagonism of bourgeois America (which is fundamentally in the wrong) and Communist Russia (which is fundamentally in the right). The dispossessed majority rightly demand equality; equality necessarily demands collectivism; collectivism inevitably demands revolution; fear of revolution begets repression and in particular a cold war on Communism at home and abroad;

and Communism reacts to persecution by a defensive aggression; the stage is set for World War III as it was for World War II. Now if one is going to build today on such essentially Marxist postulates as those initiating this sequence, it really will not do to ignore the entire literature of liberalism over the last twenty years and more. It is necessary to answer such writers as Professor Röpke, Mr Walter Lippmann, Bertrand de Jouvenal, not to mention Laski's own colleagues, Professor Robbins, Professor Popper and Professor Hayek. It is necessary to meet the market socialists themselves. Not one of these, or of the many others who could be named, is so much as mentioned; no "unperson" of 1984 could be more completely expunged from living controversy.

The uninstructed reader, dazzled and bludgeoned by an apparently all-comprehending display of erudition, is given the impression that the only serious intellectual opposition to Marxist Socialism today comes from Mr T. S. Eliot; that the entire case for the dispersion of decision, and hence for private property, rests on a romantic traditionalism. That Laski keeps his eyes tightly closed against that new stratification of society in Russia which, even more than low standards and cold war oppression, cuts at the root of his thesis that Socialist revolution brings liberation; that, having disclaimed any intention of equating Russian and American behaviour to political non-conformists, he repeatedly proceeds to do that very thing; that he never confronts the sheer arithmetic of equality, so damaging to anyone arguing that poverty equals unfreedom; all these criticisms, while important, are comparatively minor counts. In the great debate of our time Harold Laski was one of the most brilliant and influential of advocates. This last of his contributions to the debate reveals him—not to mince words—as a shyster.

Middle Eastern Common Man

Caravan: The Story of the Middle East. By Carleton S. Coon. Jonathan Cape. 376 pages. 28s.

The other day, a bulletin published by a British Chamber of Commerce in the Middle East exhorted firms to teach their western employees and travellers a better appreciation of the peoples among whom they work. When possible, it said, they should attend courses on the subject, but not everyone can afford the time or money to do this. All, however, are in a position to read about it. All should include this very good work even on the shortest of short book lists.

Professor Carleton Coon is professor of anthropology at the University of Pennsylvania. Still under 50, he has used the most mobile years of life to advantage. He has lived a great deal in Morocco but travelled much farther

east; armed with calipers, a camera, a working knowledge of oriental languages and a human interest in the heads he was measuring, he has eaten food and slept in villages all the way from the Atlantic to Afghanistan. He has learnt not only from the questions he put but from those he was asked in return. His book is the better because he so obviously enjoyed the social side of the profession he has chosen.

What he describes is the origin and nature of the ordinary lives that people lead, and his problem of selection and arrangement was therefore formidable. On the ground that there are plenty of books about the modern Middle East, he starts by limiting his field to "the

Two important books to be published shortly

**Great Britain,
The Sterling Area and Europe**
F. V. MEYER

This survey deals first with Britain's present economic position, with special reference to problems of the balance of payments and of overseas indebtedness. The section which follows gives a history of the sterling area, and the main emphasis is placed on an analysis of the economic benefits which Britain derives from this monetary union with economies that are largely complementary to her own. This chapter provides tables showing the sterling area's balance of payments and the contributions of the United Kingdom, the overseas sterling area and non-sterling countries to the Sterling Area Gold and Dollar Pool in post-war years.

The section dealing with Europe shows the economic effects of an economic alliance with competitive economies, demonstrating how such a union strengthens the member economies, and special consideration is given to the problem how a European tariff union would affect present British commitments.

BOWES & BOWES, CAMBRIDGE

civilisation of these lands before they felt the impact of the industrial revolution and the west"—that is before Egypt turned west under Mehemet Ali. But to put down the book on the assumption that it therefore lacks application to today would be a sad mistake. Analogies drawn from experiences on his travels, and points to current events as illustrations of ancient truths, keep tumbling into his story. Why do traders of a kind always huddle into the same section of the bazaar? Why, when met with a mounting of temper, does a Turk get angrier and a Persian more studiously polite? Why is wisdom still graded by age? Why are Turks better than Arabs at shouldering responsibility? Mr Coon is all the time accounting for the scenes and habits which any visitor notices on first impact although, to residents, they are taken so much for granted that they are seldom analysed.

When a book gives so much informa-

tion on so vast a subject it is difficult, in the course of reading, to detach any general impressions. The steady stream of differences between localities, races, religions, and ways of life almost annihilates capacity to see the wood for the trees. Yet the reader who, having regretfully finished the last word, flips back through the pages can evolve some conclusions. Of these perhaps the most important is that he must judge the Middle East less in the light of its failure to keep up with the technical inventions of the last four hundred years and more in that of its resilience in inventing over the centuries the only suitable way of life and livelihood for dwellers in a desert that is also a crossroads. Mr Coon has the two great qualities of sympathy and tolerance, and if he provokes them in the reader he will have made a considerable contribution to east-west relations by writing this scholarly and human book.

Commoditie, Firmnesse and Delight

The Smaller English House, 1500-1939. By Reginald Turnor. Batsford. 216 pages. 42s.

This delightful book is concerned, not with the more familiar story of the great houses of Britain, but with the evolution of the middle-class house. Mr Turnor traces this evolution through four phases of influence—craftsmanship, art, scholarship and science. The earliest houses were the product of craftsmanship—built by unknown local builders according to vague plans and without anything that could be called architectural supervision. Gabled, mullion-windowed and asymmetrical, they appealed, thinks the author, to the romantic in man—to something he calls "basic taste"—which has nothing to do with intellectual appreciation.

Intellectual appreciation began with the early Renaissance period, which owed much to Dutch and Flemish influence. As Mr Turnor says, the flamboyance of these designs suited the exuberance and virility of the Elizabethans, while trade and political sympathies strengthened the link. At this period the development occurred which, according to Mr Turnor's convincing thesis, marked the transition of building from a craft to an art. This was the introduction of symmetry into design—the conception of balanced planning and elevation. It was derived, via Italy, the Low Countries and France, from the architecture of ancient Rome. But the full force of Italian influence was slow to reach Britain, which was largely insulated from it by anti-papist sentiment. At a time when the English house was rambling and half-timbered, the orderly classicism of Palladio was in full swing in Italy. Not until Inigo Jones built austere elegant houses such as the Queen's House at Greenwich was classical influence fully seen; and the style did not take root until half a century later—until the age of the Palladians in the early eighteenth century.

The latter end of the classical move-

ment was the Greek revival, seen in the columns and pilasters of the Regency villa. Mr Turnor thinks that this was the moment when architecture took the wrong turning. The more sensible products of the modern movement, he says, have much in common with the Regency house, and there could have been a logical and unbroken descent. But the romantics threw over their predecessors so completely that "after a hundred and twenty years of wondering where to go, architecture seems still to be in a mood of defiance and rebellion." The first reaction from classicism was the age of scholarship, the minute study of Gothic architecture and its reproduction in a way that was nevertheless unmistakably Victorian. Then came the violent revolution of the modern movement, when architecture became a science, a house "a machine for living in," and designs could show "the anti-septic deathliness of the hospital mortuary."

Mr Turnor pleads for a return to the idea that "architecture is at least half an art; that it is something capable of giving pleasure and exaltation even to those people who have no knowledge of its construction." Modern architecture must certainly be adapted to modern materials and modern ways of living, and reproductions, even of the best products of the past, are unsatisfactory. But the author is surely right in thinking that it is by returning to humanism, by embracing the past instead of frenziedly rejecting it that architecture can again find its way and provide the "commoditie, firmnesse and delight" that Sir Henry Wotton considered to be its essential attributes. Mr Turnor's interesting and balanced views are expressed in very readable prose. His book, illustrated with many excellent photographs, is of the sort that will get little chance to gather dust in the bookcase.

Writer and Clubman

A. E. W. Mason: *The Adventure of a Story-Teller*. By Roger Lancelyn Green. Max Parrish. 272 pages. 21s.

Few people can resist the fascination of a success story. Mr Green's A.E.W. is the character most people would all like to play—the enchanting and exhilarating friend, the brilliant talker, stimulating listener and good mixer—and it is heartening to know that such a Laughing Cavalier of letters could develop from the misunderstood and lonely Dulwich boy, driven into himself by a narrow-minded and domineering mother; stealing from his bed at night to wander for hours about the lonely roads around his unhappy home.

Believing, with Shaw, that the essential information about a writer is to be found in his books, Mr Green displays Mason through the characters who reflect him, and shows how the episodes of his life were progressively woven into the novels. It is undoubtedly interesting to place Mason in his circle of friends and acquaintances—which included most of the literary and theatrical lions of the period—but a connecting list of cricket, croquet, golf and charade parties grows tedious, and the snippets of conversations, which were no doubt brilliantly witty in their time and place, are apt to fall flat. Again, it is instructive to know how the plot of "The Four Feathers" germinated, and the authentic travel experiences which the author incorporated, but tiresome that every scene should be paired with its counterpart in the various houses and gardens of his distinguished friends. This has the unfortunate outcome that the charming, handsome, debonair, elegant Mr Mason, "loved all over the place" and "as big a swell as ever," becomes faintly reminiscent of "intelligent Mr Toad"; and surely the "laugh that was famous in two hemispheres" would ring out in ghostly derision at the suggestion that its owner could ever have provided a "new and matchless jewel to set in the diadem of literature."

Writing was, for him, the means to a good income, and by personal experience, trial and error, and much honest work, he finally evolved the recipe that exactly suited the taste of the intelligent general reader of his day. His very considerable contribution to contemporary fiction is that he was the pioneer of the thriller that was also a novel of distinction, both in style and characterisation. Mr Green's analysis of the various stories from "The Courtship of Morice Buckler" to "The House in Lordship Lane" will therefore be of great interest to all readers who enjoy the Sayers-Allingham-Marsh succession.

The most satisfactory part of the actual biography deals with Mason's passion for mountaineering and his secret service experience. These were his own chosen antidote to a life which he knew to be too easy and stereotyped, and through them we find the fundamental character beneath the versatile and flamboyant "ideal clubman."

Man of Matang

A Pattern of Islands. By Arthur Grimble. John Murray. 250 pages. 18s.

This book is wholly delightful—difficult to put down, laugh-provoking and finished with regret. Those who cherish the thought of an earthly paradise in the coral islands may hitherto have had a sneaking suspicion that actuality would spell disillusion. Here is Sir Arthur Grimble, who went to the Gilbert islands in 1914 as a colonial service recruit, full of romance and Robert Louis Stevenson and empty of leadership, making the best of their dreams come true. His fluent vivid writing needs no photographs to bolster up his descriptions of the islands, for which Mr Pomfret's drawings are an excellent accompaniment. As for the Gilbertese themselves, in writing of them Sir Arthur has at least two major qualities: a deep understanding and an amazing memory for conversation—or at least a gift for recreating it. He lets the people speak for themselves, and incident after incident thus combines the truth of autobiography and travel tale with the excitement of fiction.

And how courteously and wisely the Gilbertese can talk. "Know the roots," said Sir Arthur Grimble's adoptive father to him on his initiation into a clan.

Know the roots and thou shalt know the tree. Know the tree and behold! it shall answer to thy cultivation.

Could the value of anthropology to indirect rule be more pithily and graphically summed up?

Life on the coral islands was, however, certainly not all romance for this Man of Matang (the Gilbertese name for a European) and his wife. A ruined dinner—how ruined it would spoil the reader's enjoyment to disclose—prevented him from finishing a sonnet about the "false values of civilisation" and the "big simplicities" of life with the Gilbertese. One of the refreshing things about this book is Sir Arthur's ability to laugh at his own discomfiture, whether he is battling with officialdom, sharks or the Gilbertese language.

District officers and their wives are certainly better treated by the colonial service today than they were—in the South Seas at least—in the first world war. How different, too, in many respects was Sir Arthur Grimble's job than that of his modern counterpart in, say, Africa: the district officer of today is not even expected to be a leader but has to co-operate with native politicians. Yet how often does Sir Arthur Grimble's account of his life as a colonial servant strike familiar chords: the merry, gentle Gilbertese, "princes in laughter and friendship, poetry and love," suddenly transformed by a self-seeking fanatic into savages destroying their own villages and killing their own race; the courageous native magistrate standing alone against the rioters; the loyal chief *kaubure*, threatened with death, going alone to quell an angry hostile village afraid for its land. Sir Arthur Grimble's book is not all romance and excitement and entertainment; it is instructive as well.

BATSFORD**Straw for Politicians' Bricks**

The Future of American Politics. By Samuel Lubell. Hamish Hamilton. 285 pages. 15s.

This book, which appeared in the United States early this year, is largely responsible for the widely-held belief that the Democrats can hardly fail to win next Tuesday's presidential election, because they are now supported, permanently for all practical purposes, by a majority of the voters. This belief is based on Mr Lubell's discovery that the Republicans are "on the wrong side of the birth-rate," that it was the children of the prolific immigrants from southern and eastern Europe, coming of political age in the nineteen-thirties, who gave Franklin Roosevelt his victories. In return he—and world events—gave them a prosperity which turned these traditionless voters into traditional Democrats, and lifted them into the conservative class where people vote for the party which has made them what they are provided it can be trusted to keep them so. The Democrats are, therefore, no longer the revolutionary party and the Republicans have so far not gathered enough courage to pick up the torch, although their 1952 slogan—"It's time for a change"—perhaps shows that they are beginning to see where their future lies.

For Mr Lubell does not regard the Republican future as hopeless, although he warns the party that a victory for General Eisenhower would be only a single swallow and that it would need a great deal of consolidation to become a Republican spring. But Mr Lubell does find that the economic strains of inflation and heavy taxation and the emotional strains of the cold and Korean wars have

combined to pull many voters to the edge of, if not right out of, the Democratic orbit. They feel that within it they can no longer be sure of the steadily growing prosperity they have come to expect; and they have reached the economic level where the New Deal sometimes hurts.

Mr Lubell is not, however, much concerned with straws in this year's political wind. What he provides is a whole stack of straw out of which American political prophets will make bricks for years to come. For Mr Lubell has not conjured up his book in the forcing house of a Washington newspaper office or a university political science department. He has dug for it in the individual voting returns of every district in the United States during the last thirty years and he has harvested it by thousands of personal interviews with voters in what he found were the key wards and the key counties. His book contains a fine and easily assimilated crop of surprising facts about why Mr Truman won in 1948, who the isolationists really are, how the farmers and the Negroes really vote, where the South is going politically and about the other basic questions in American politics, many of which were regarded as certainties, not questions at all, until Mr Lubell examined them. There is no need to rush through this book in order to guess what is going to happen in the United States on November 4, 1952, but it is required reading for anyone who wants to understand afterwards what has happened or to guess what is going to happen in 1956 or even 1960.

Judgment Revised

The Forsaken Idea: A Study of Viscount Milner. By Edward Crankshaw. Longmans. 178 pages. 15s.

This short account of Lord Milner's political ideas shows that its hero had a valuable method of considering problems in politics, logically and without prejudice—whatever one may think of his conclusions. Meditation and material have been combined to produce an original study. The "accepted" view of Milner shows a narrow, persecuting imperialist, a bigoted Tory. Mr Crankshaw accepts nothing without evidence; and he can find no evidence for this. He finds him rather a man with an intellect sharp enough to discern what had got to be done to preserve his country as a great power, and a character bold enough to go and do it, as best he could, without regard either for party or for popularity. Because he was genuinely radical, one who looked to the root causes of evils and prescribed drastic remedies, Milner was never wholly accepted by Bonar Law's Conservative party; he was too bellicose for the Little Englander liberals; thus cut off from party, he never rose to the political supremacy his abilities entitled him to. Yet he thought hard about statecraft, all his life; and this book helps to show how well he did it.

Mr Crankshaw is almost oppressed by recent and contemporary problems; he sees Lord Milner as a figure born before his time, who wrestled in South Africa

with a conflict of irreconcilable ambitions of a type that has since become more familiar. He praises Milner for refusing to appease Kruger. Yet his main defence of the war of 1899-1902 is constructed on a more surprising, a more ingenious, and a more tenable position: he succeeds in showing that Milner's main preoccupation was to protect the native peoples of South Africa from Afrikaner dominion. Unfortunately, having cleared Milner from the charge of engineering the South African war for base motives, he tries to clear him from an equally damaging charge, that of having approved Chinese labour for the Rand under grossly inhuman conditions, much more summarily. On the evidence here adduced, it would take a sympathetic jury even to find a verdict of "not proven."

"The Forsaken Idea" does not by any means confine itself to South Africa; there is illuminating new material, for instance, on the fall of Lord Randolph Churchill, and a tirade of Milner's against the system that he once called "the great Downing Street Jelly-Fish!". This is the sort of book that needs to be written and needs to be read, a book that challenges preconceived ideas; a refreshing book, provocative of clearer political thinking.

Palace Quarrel

Lord Hervey's Memoirs. Edited by Romney Sedgwick. William Kimber. 370 pages. 25s.

Politics in the eighteenth century resemble the contemporary comedy of manners, purged of high principles and nakedly materialistic. The tragedies of the seventeenth century conflict were played out and politics were largely reduced to manoeuvres for spoils and rewards. Conventions assigned the leading role to the Crown, which controlled the patronage on which the majority of a Minister in Parliament chiefly depended. There was no conception of party government unconnected with the King. Opposition was equated with disloyalty and faction. Discontented politicians therefore sheltered behind the Prince of Wales, who for his part tasted some of the delights of anticipated power by issuing, as Sir Robert Walpole said, promissory notes. Embittered relations between the King and the heir to the throne were thus a constant factor in politics. If high drama was no longer played on the stage of the House of Commons, melodrama, descending at times to bedroom farce, was enacted in the theatre of the Court.

Lord Hervey's memoirs expose with the utmost candour the effects of this constitutional convention upon the relations of George II and Frederick, Prince of Wales. The memoirs were first published in 1848, but were then censored to exclude "any expression positively offensive to a delicate mind."

In 1931 Mr Sedgwick discovered a full manuscript version, which was published in a limited three volume edition at a prohibitive price. The present volume consists of the memoirs purged, not of their indelicacy, but of the "dead matter" of Parliamentary debates and foreign policy. The result is a highly amusing book, containing all the stories for which the memoirs are famous and at the same time preserving the dramatic unity of the palace quarrel with all its political implications.

Hervey complained that he spent his best years with nothing to do but "carry candles and place chairs," but, like St. Simon, he had an unrivalled observation post. He originally belonged to the household of the Prince of Wales. But his quarrel with Frederick helped to gain for him the favour of the Queen, who poured into his sympathetic and retentive ears her frenzied hatred for her son. In return Hervey wrote a comparison of Frederick with Nero which provided the Queen with many an enjoyable evening. The King emerges from the memoirs as ill-tempered and selfish, despising culture and longing for his Hanoverian parade ground and mistresses. Forced to stay in this island where "he was obliged to enrich people for being rascals and buy them not to cut his throat," he vented his spleen on his family. The Queen's only solace lay

in cultivating her political influence over the King, comforting herself with the reality of power while she publicly submitted to insults and abuse. For this she endured the intense boredom of her husband's company, forced, says Hervey, "like a spider to spin out of her own bowels all the conversation with which the fly was taken."

Lord Hervey, spiteful, effeminate and undisguisedly partisan, was so good a reporter that this book only whets the appetite for a new edition of the memoirs in full at a reasonable price. Politics, even when of purely historical interest, are not, as Mr Sedgwick seems to suggest, necessarily tedious, and certainly not in the hands of Lord Hervey.

Witness of Modern Spain

Unamuno. By Arturo Barea. Bowes and Bowes. 61 pages. 6s.

Bowes and Bowes have added as another monograph to their excellent series of "Studies in Modern European Literature and Thought" this succinct and sympathetic introduction to the work of Miguel de Unamuno and its place in the evolution of modern Spain.

This philosopher, whom Señor de Madariaga calls "the greatest Basque of all times, with the exception of Ignatius Loyola," was obsessed by the incurable split in the Spanish mind—conservative

"What in the hell have 80% of the people in the U.S. to live for? . . ."

Thus a taxi-driver in a letter to the President in which he mentions that his income is \$180 and his expenses \$179.43 for the month, exclusive of clothing, school expenses, doctor's bills, etc. (The president of Bethlehem Steel has an income of \$464,321 per annum.)

THE WORLD THE DOLLAR BUILT (12s. 6d.), by Gunther Stein, quoting from Congressional committees, leading newspapers and magazines and other reliable sources, projects a picture of the U.S. which is round, true and sometimes terrifying. Here are the real issues behind the Presidential elections and many of the reasons for present world tensions.

The chairman of the President's Council of Economic Advisers replied to the taxi-driver. We quote:

"In these times Americans must preserve their faith and courage."

LONGMANS

against progressive, orthodox against agnostic, isolationist against cosmopolitan—which he interpreted in the Hegelian manner as thesis and anti-thesis; and the whole of his work, whether as essayist, novelist, or poet, is a search for the synthesis that he believed to be inevitable, however remote and elusive. He identified this dilemma with his own inner conflict between reason which denied immortality, and the vital sense which desperately demanded it. He felt it to be his mission to overcome the personal inertia induced by schism and to transmute the victory into a general incentive against resignation, whether in Catholic, rationalist or agnostic:

Let us so act that the Nothing becomes an injustice. Let us battle against destiny even if there is no hope of victory. Let us battle against it quixotically.

He approached the problem of Spain's position as a modern state from the standpoint of social ethics, not of political technique, and his affirmation that the existence of a nation depends on the depth and strength of its roots, rather than on its external power and prestige, brought him into conflict with contemporary statesmen. The essay *En torno al casticismo*, written when he was thirty, contains the nucleus of all his ideas about Spain and the relation between individual and nation, between nation and humanity. It opened a new approach to the war of ideas which then raged between the reactionary traditionalists and the liberal, anti-clerical "europeanisers." Unamuno maintained that there was no contradiction between the genuinely Spanish and the European, since in their roots they were identical: "The eternal Spanish tradition is human rather than Spanish and must be sought in the living present, not in the dead past." He felt that contemporary society, which had sunk into stagnation through rigid seclusion, could be revitalised by the challenge of foreign ideas, but not by slavishly imitating them. His views were apathetically received at first, but later had an enormous influence on the thought of the younger generation.

If it is "impossible to discuss modern Spain without turning to Unamuno as one of the main witnesses," it is equally necessary to consider Ortega Y Gasset. Arturo Barea gives little weight to the intellectual antagonism that existed between these two philosophers who shared the spiritual leadership of their country for half a century, and epitomises the subjective and objective facets of the national character and the two trends of thought that divided the "generation of 1898." Unamuno believed in the salvation of Spain through its own essential substance, which would contribute an ingredient to the wider development of Europe; Ortega is the voice of European Spain, rescued from supineness by the invigorating experience of continental thought. Together they fostered the period of intense intellectual awakening that followed the debacle of the Spanish-American War, and each owed a part of his stature to the fruitful opposition of the other.

Amazonia Through a Magnifying Glass

The Amazing Amazon. By Willard Price. Heinemann. 220 pages. 18s.

This book divides itself naturally into three parts. The first is a pep talk on the potentiality of the Amazon basin, where diamonds are harder and brighter and can be scooped up for the stooping, and gold so abundant that negro slave women used to powder their hair with its dust to give a blond tint; where there are the largest deposits of high grade iron ore in the world, fabulous riches of manganese upon which—according to Governor Dewey—the very existence of America and the free world depends, and oil, which also spells "the difference between a free and a slave world." This Aladdin's Cave is serviced by the largest waterway in the world; "the river that affects Americans more than their own Mississippi; Englishmen more than their own Thames." It is a moving sea, rather than a river, with eleven hundred tributaries, ten of them larger than the Rhine, seven of them a thousand miles long, one of them three thousand miles long with ninety tributaries of its own, the whole draining three million square miles of territory with thirty thousand navigable miles of waterway for ocean going vessels—in short, one can sail twice the distance round the earth without leaving Amazonia.

Bludgeoned by statistical eulogy we concede that it is a big place, and gladly explore it with Mr Price in the second, and by far the most fascinating part of the book, which is a personally conducted tour of jungle, waterway and prairie, in the past, present and future. The author is an experienced traveller

in the wilds, observant, vital, with an appreciative sense of humour and, better still, a sense of human values; he is therefore extremely good company, whether shooting nightmare rapids, trapping a jaguar with birdlime, grappling with a thirty-two foot anaconda, or gossiping about the magical drugs of medicine men, or communal life in a maloca and the charm of Amazon menus. He is never vainglorious.

The final chapters, dedicated to progress, are a saga of the benefits of American development—"trains, planes, automobiles, trucks, steamers, barges, docks, derricks, factories and agricultural machinery for the conquest of the world's last frontier." The Brazilians like this, and one of their Foreign Officers is reported as saying "We are taught three things in school; to believe in mother, God, and the U.S."

These packed pages are full of useful, bizarre or entertaining information, but—are the traveller's tales sometimes rather tall? Some who have dwelt in Amazonia or on its fringe may boggle at oranges as big as footballs, and leaf-cutter ants which demolish a whole plantation in a single night; and marvel that a man could spend two hours with his legs dangling in piranha-infested water and escape with nothing worse than life-long scars. It is unkind to cavil at a certain amount of picturesque exaggeration in so diverting and colourful a whole, but perhaps one could mention that Queen Elizabeth did not have Raleigh beheaded for failing to find Eldorado.

Ducal Ditty Box

My Ditty Box. By the Duke of Montrose. Jonathan Cape. 232 pages. 21s.

Having lived a long and varied life, the Duke of Montrose might well have felt justified in inflicting upon the public a proportionately large volume of memoirs. In fact he has been more considerate and, indeed, has gone rather too far in the other direction. His book is short and is divided into so many chapters on so many subjects that the result is inevitably scrappy—often irritatingly so. To this extent the title "My Ditty Box" is accurate enough, for in his ditty box a sailor keeps an assortment of small personal belongings, some valuable and some not.

The Duke went to school at Eton, which he describes—with a modesty that his fellow Old Etonians may find it a little difficult to accept—as having been made famous by the Duke of Wellington's apocryphal remark about the winning of Waterloo. After only two years, however, he was forced to leave through an accident that left him totally deaf in one ear and very deaf in the other. It is difficult to realise that the rest of the Duke's life has been spent under this considerable handicap. To have spent many years at sea, worked his passage home from Australia in a windjammer, and gained his certificate as a Master Mariner (Square Rig); to have taken an active and highly unorthodox part in

that most unorthodox of all campaigns, the Boer War; to have gone on to become a highly successful company director and chairman, and a leading figure in Scottish public life—these are not inconsiderable achievements. But the Duke's principal claims to the gratitude of his fellow citizens arise from his deep and enduring love of the sea. He was inspired by an early meeting with Lord Brassey to carry on the latter's work of fighting for better conditions for British seamen—an interest which he has kept up throughout his life. And to the Duke also goes the credit both for inventing and designing the first naval aircraft carrier and for reviving the Royal Naval Volunteer Reserve.

For this modest book the author makes very modest claims. It contains, he assures us, no great literature nor anything of political importance. It is intended mainly to give pleasure to his friends; and this it will certainly do. If others feel at times that the book deals rather disjointedly with rather too many of the Duke's multifarious activities, they will nevertheless put it down feeling that they would like to know more of the Duke himself. Perhaps for the unskilled autobiographer this is the path of wisdom.

The Voice of Experience

The Art of Being a Parent. By Amabel Williams-Ellis. *The Bodley Head.* 192 pages. 8s. 6d.

Si jeunesse savait. . . . The trouble with parenthood, a good many parents would agree, is that it is only by the time one has finished raising a family that one has become really competent to do so. If only one had realised this, or this, or this; if only one had heard, or read, the views of Expert A, and dropped Expert B into the wastepaper basket; if one had had a clearer insight, instead of merely a depressing hindsight, into one's own motives and shortcomings; if one had known where to look ahead and where to take the moment as it comes; if one had had a detached and objective view of conventions; how much more enjoyable family life would have been and how much more reason one's children would have to rise up and call one blessed.

This admirably wise, warm-hearted and lively little vade-mecum of parenthood cannot, it is true, be a substitute for first-hand personal experience; but it stands out from the ruck of its rivals, of the innumerable guides to mothercraft, child psychology, education, and so forth, as a work of art stands out among blueprints. The comparison is, on second thoughts, unfair to such a writer as Susan Isaacs—to whom Mrs Williams-Ellis enthusiastically refers her readers for further guidance; but no one, not even Mrs Isaacs, has previously put the art of parenthood in perspective as part of the art of life. That one is unlikely to be a satisfactory parent if one is an unsatisfactory person in general, and that one is unlikely to be a satisfactory person in general if one is either nothing but a parent or nothing but a provider; this is the unifying theme which threads through the deceptively lightly-written and easy-running chapters on tiny babies, toddlers, school-children of different ages, young things on the verge—or over the verge—of full independence, and on special questions such as play, moral and religious teaching, aptitudes and ideals. (Quotation is almost invidious where so much is so eminently quotable; but it is impossible to resist the temptation, apropos of this last topic, to quote the young person who, when asked about her inclinations, said "I like sitting in a tree and screaming, as well as anything.")

This sense of perspective, this recognition of the fact that parents are human, is both refreshing and illuminating. "The Art of Being a Parent" is not a profound sociological study any more than it is an exhaustive treatise on paediatrics or education. But because Mrs Williams-Ellis sees parenthood, family life, human life in general, steadily and whole, with the unsentimental kindness of experience, parents whether of one day's or twenty years' standing will find in her book more practically profitable reading than a whole specialist library could afford. Two final words must not be left unsaid; first, that "The Art of Being a Parent" is no less entertaining than wise; second, that it is emphatically addressed to husbands as well as to wives.

The Arab League

The Arabs and the West. By Clare Hollingworth. *Methuen.* 273 pages. 21s.

The Arabs in question are the nationals of the states composing the Arab League, though the author writes briefly about Libya and the Gulf protectorates too. There is a long section on Palestine, and chapters on the Arab armies, oil, industrialisation, and Communism.

This is not a book for the scholar, but the information given by the writer, who has considerable experience of the Middle East as a journalist, will appeal to the ordinary reader; he will learn a good deal about the major questions listed above and at the same time entertaining details about, say, the creation and abandonment of Umm Qasr, the smuggling into Palestine through Amman during the war, and the hashish racket in the Lebanon. The description of notabilities, though at times open to question, fills out a vigorous picture.

Some of the judgments are somewhat superficial. To say that "a few more Persians in senior jobs . . . and a few Persian directors, and the Abadan refineries would be working full blast today" is to ignore deep-seated causes which Dr Mossadegh is gradually admitting; and to suggest that we could have eradicated the idea of corruption from the Egyptian character and somehow got rid of the immensely wealthy upper class is to follow shallow Egyptian critics who accuse the British of having interfered in the internal affairs of Egypt and at the same time of having omitted to do things which could only have been done, if at all, by violent and sustained interference at all levels. On the other hand, the writer's uninhibited method results in criticisms which it is healthy to consider: for instance, that among the many thousands of British in the Middle East during the war there were some whose conduct lowered considerably the British reputation for personal honesty; that some Britons condescend to Americans and some Americans are far from helpful to the British; and that if the French were unwise in their Syrian policy, the British were at the last too harsh to the French.

In a sad picture of the closing stages of the Palestine conflict the author represents the British as hesitant and at last as improperly abandoning responsibility, the Jews as incredibly skilful in imposing their version of events on the world, and the Arabs as obstinate, stupid and shortsighted in the management and presentation of their case. She rightly warns her readers that the question of Israel is far from being settled, and that it is the chief element in the suspicion and scepticism with which the Arabs regard the West. She paints again the now well-known picture of the huge gap between rich and poor and the callousness of the ruling classes. But she also emphasises the threat to stability and even to world security which this constitutes, exacerbated as it is by the ceaseless efforts of the Communists, who take advantage of every grievance, general or local, to stir up hatred not only against the statesmen responsible but against the West and in particular Great Britain.

President above Party

THE American people have once again surprised themselves and the world. There is no doubt about their choice of their next President: Americans from every part of the country and from every walk of life want General Eisenhower. It is a measure of his personal magnetism that he was able to overwhelm such an intelligent and inspiring opponent as Governor Stevenson. But there is equally no doubt that in choosing the man the voters have not chosen the party: the wind of popular enthusiasm that has blown the General into the White House has not swept through the Capitol. In the new Congress the Republican majority will be of the narrowest, both in the Senate, where such a result was not entirely unexpected, and in the House of Representatives, which usually reflects the popular majority of the presidential candidate. General Eisenhower has been elected as a national leader and he will be a successful President to the extent that he seizes the opportunity.

When he left Europe in June there were few, either there or in the United States, who doubted that he could, and would, seize such an opportunity. But as the General has campaigned up and down the United States there have been ominous signs that the qualities which have made him respected and beloved as a military leader all over the free world were failing him in the political field at home. It is to be hoped that these disquieting indications are simply the result of his political inexperience, and of the natural pressure to reconcile himself with the dissident wing of his own party and to differentiate himself as sharply as possible from President Truman. If this is so, and from the later course of his campaign it seems justifiable to think that it is, the General should now be able to resume his mission of re-uniting the nation.

He certainly cannot do this by making sharp changes in either economic or foreign policies. If he tried to do so, the facts of today would defeat him. Now that the Republicans at last have the responsibility of office they must recognise this as well. As long as the party was in opposition it could reject, or at least pretend to reject, everything Rooseveltian, but the only way for it to build a positive policy is to admit that two major elements in the Roosevelt revolution are irreversible—close co-operation with other free nations and the American version of the welfare state, which is called the New Deal.

General Eisenhower has made his reputation as an exponent of the first and will surely not jettison it now. The second is a matter of which he has no experience, but it is of almost as much importance abroad as it is at home. For it involves a readiness and an ability to take steps, at the first signs of an economic recession, to prevent it becoming the depression which would drag down the rest of the world even deeper than it would the United States. This may present the Eisenhower Administration with its real test, particularly if by any chance the General should achieve something approaching peace. For even without that the rearmament programme will be levelling off

in the second half of next year and the American economy is already apprehensive at the prospect.

General Eisenhower's first, and perhaps his last, chance of allaying these apprehensions will come when he chooses the members of his Cabinet and his personal staff, especially since he is a man who is known for his habit of selecting good advisers and of relying on them. He comes out of the campaign uncommitted in this respect and he can, if he will, take his pick of good men, who recognise that the Roosevelt revolution has come to stay, but who will bring to it business ability and a conservative approach. They can improve its execution both abroad,

by working out permanent policies, especially on the economic side, and at home, by reconciling the need for maintaining economic stability with fair treatment for capital.

The American voters have put General Eisenhower above his party. If he can pull that party up to his level by making it accept the basic continuity of American policy, he will earn both the gratitude of the world and a place in its political history. It will be a difficult task, requiring clear sight and a strong will, but the alternative is to try to put the clock back. That means inevitable failure and a Democratic victory in 1956.

Government Without Enterprise

THE Queen on Tuesday opened her first Parliament with all the youthful graciousness and sense of dignified ceremony that she has made her own. Yet the brilliance of this state occasion was in sharp contrast to the political content of the speech from the throne. No government programme has conformed more thoroughly to the obvious expectations. It has established beyond doubt that five years in the neutrality of the wartime coalition and six years in opposition were not enough to stimulate British Conservatism to fresh ideas except those that Labour shared. There is apparently no constructive legislation that the Conservatives want and at the same time believe to be practical politics.

Their first programme a year ago contained four major measures. They proposed to undo the nationalisation of steel and of road haulage, to make the Monopolies Commission a more powerful scourge of restraints on trade, and to give the status of permanent legislation to wartime emergency regulations that still cannot be weeded out of British government. Not one of these measures in fact made any progress in the last session, and the Government's reaction is now to shelve the more constructive half of them. Ambitions have certainly shrunk. The two years' stint is to include only one important measure in addition to the denationalisation of steel and road haulage. This—the reform of the Town and Country Planning Acts—will presumably be concerned chiefly with development charges and compensation, and it represents a financial and administrative necessity rather than a deliberate political choice.

If in this session the Government manages to do what it intends, its legislative achievement after two years in office—effectively, after half its probable life—will amount to little more than the undoing of one of its predecessor's measures, the Steel Act, and of parts of two others, the Transport Act and the Planning Act. Such a programme should not be condemned merely because it is slight—the volume of legislation is not the main measure of a government's worth. The reason for disappointment is the content of the legislation the Tories do propose. If legislation is to be slight, it is the more important that the bills should be well chosen.

The test to be applied is simple. What is the contribution of the proposed measures to the main needs of 1953, and in particular to the task, as defined in the Queen's speech, of "placing the national economy on a sound foundation"? The financial proposals for town and country planning are as yet unknown, but they are bound to be of subsidiary importance. The two denationalisa-

tion measures merit some welcome. The Transport Bill has been considerably rewritten, and it is now reasonable to hope that, when this Parliament has finished with them, both the steel industry and the transport industry will have greater opportunity for efficient operation than they have at present. But denationalisation is still open to the same charge that was made against nationalisation. To say that it is irrelevant to the country's immediate problems is an exaggeration, but a pardonable exaggeration. The Conservative proposals for steel and transport should on balance do good, but they are of less than first importance.

A year ago it was possible to take a kinder view. The two measures of denationalisation could be seen as part of a general programme for restoring some competition and vigorous enterprise to the British economy. The third, and much more important, item in this programme was the promised bill to strengthen the attack on monopoly. Without that general reform, the two particular measures for steel and transport are of much less weight. There is a case for them. The Government's anxiety to include denationalisation among its first accomplishments is good politics; after the disappointments of the last session, and in face of the bitterness of Labour opposition, its decision to undertake no more than two major economic measures this year is probably wise. But it is unwise in these circumstances to choose both the denationalisation bills and to postpone or perhaps abandon the general measure against monopoly.

That is regrettable in itself. The Conservatives are leaving aside one of the few forms of legislation that could give effective impetus to efficiency and enterprise. They are suggesting once again that they do not really believe in competition, that the most substantial of their modern concessions to liberalism is still little more than lip-service. And, secondly, the dropping of the monopoly bill makes denationalisation far less convincing. If the programme for this session consisted of either the Steel Bill or the Transport Bill in combination with a general measure against monopoly, ministers could hope to persuade the public that in denationalisation they are genuinely concerned about efficiency as well as about private ownership. By that means they would go a long way towards undermining the main obstacle in their path, the Opposition's threat to renationalise steel and road transport at the first opportunity. If the Conservatives had convinced independent opinion that

there is some connection between the Steel and Transport Bills and the needs of economic efficiency, they would have robbed this threat of most of its sting. Instead, they have drifted into a programme that elevates denationalisation to a place of primary importance in their legislation. It plainly does not deserve such prominence.

The British Conservative party is not, in fact, the prisoner of mysterious "vested interests," but it has a peculiar genius for providing its opponents with plenty of opportunity for asserting that it is. By sticking to denationalisation while it abandons action against private monopoly, it exposes itself to the charge of acting from purely party motives. It is this suspicion that provides some sort of justification for the purely party reply that Labour makes; if the suspicion were less strong the Opposition could get nothing but discredit from its threat to retaliate by nationalising steel and transport again.

★

This is the Government's mistake in political strategy. It is considerably multiplying its difficulties in Parliament, and weakening its chances of making private enterprise in steel and road transport permanent, by trying to carry out both these measures in one session at the sacrifice of a more general and more important purpose such as the strengthening of the Monopolies Commission. The error in strategy is important because it reflects the deeper weaknesses that still trouble the Government. A year in office has done no more than six years in opposition to clear the Conservatives' minds about what they want to do. They are still being chased by events—such as the necessity of doing something about leaseholds—rather than working to a plan. They find themselves now in a happier political situation, and the country in a more favourable economic position, than they could have hoped six months ago. From the by-election at High Wycombe (which is discussed on a later page) it appears that, thanks perhaps to Mr Bevan rather than to their own virtues, the Conservatives have fully regained the popularity they lost last winter. And thanks partly to Mr Butler's policies and partly to good fortune, the British economy has not only been snatched from disaster, but can look forward with some confidence to at least some months of comparative ease in paying its way abroad.

There is no reason to think of this as more than another breathing-space, and it plainly ought to be taken as an opportunity for framing bolder policies. In fact, ministers seem to be treating it rather as a chance to sit and wait. Admittedly the tasks in economic policy call as much for administrative as for legislative action. There will be necessary discussions with the Commonwealth countries and perhaps afterwards with the United States and with Britain's partners in the European Payments Union. Mr Butler will try to prepare a Budget at once tough and invigorating. But while these things are important, they are not enough. All that Mr Butler is likely to achieve by cutting Government expenditure will be fully offset if Mr Macmillan succeeds in building more houses, as the Queen's Speech promised. The measure that could now make the biggest single contribution to "the task of placing the national economy on a sounder footing" is not a simple matter of administration. It is in some way to allow rents to rise—to reform or at least to relax a control that has become entirely unrealistic—and it requires legislation of a peculiarly difficult kind.

One of the lessons of High Wycombe, as of the by-election at Cleveland a fortnight ago, is that such measures of economic realism as cutting the food subsidies do not provoke the bitter opposition that Labour propaganda had frightened the Tories into fearing. They ought to take heart and tackle the strangleholds of rent control and the housing subsidies. But no such legislation is proposed. This omission is as great a weakness in the Government's programme as the dropping of the Monopolies Bill.

Mr Churchill's Government has done rather better, and indeed promises rather better, than seemed at all likely after the failures and hesitations of its first six months. It will now be under strong pressure to pause and see how things turn out—if not to curry favour by relaxing its policies against inflation, at least to abstain from any new economic discipline. Yet the first duty of ministers is constantly to remind themselves and their followers of one hard fact: There is no reason to assume that the trend of political opinion and of improvement in the balance of payments is permanent. When the difficulties of the export trades are growing sharply, the policies that saved Britain from the crisis of last winter—above all, restriction of imports—cannot be expected to remain sufficient. The first year of Conservative Government has to its credit a fairly successful rescue operation. But almost nothing has been done to restore enterprise and initiative, to create the incentives to efficiency, or to stimulate a massive increase in productivity. Those are the real foundations on which a solvent and secure economy—and an alternative to Socialism—can be built.

'Clydella' lasts longer

Sizes 38 to 44 inches chest. Price 59/6d.

IN EVERY CLASS of goods there is one that sets the standard for the remainder, one that a man is proud to possess.

In men's pyjamas that one is 'Clydella'—it wears for years, never loses its softness, warmth or colour.

There's nothing to equal

How Important is Korea?

OUTSIDE the United States a good deal of disquiet has been aroused by the prominence given to the question of Korea in the presidential election campaign. There has, undoubtedly, been some cause for this disquiet. Whenever a country's foreign policy is made a punchball for partisan buffets, whenever contenders appear to have committed themselves to future action of a vaguely defined kind, its allies must await the issue with some anxiety; and the anxiety is bound to be considerable when the country is the strongest member of the partnership, the most energetic, and the bearer of the greatest burdens. Britain, France, and the other countries that have joined the United States in going to the help of South Korea could not but wonder, while the election fever raged, whether the American Administration that is shortly to take office would not emerge from the battle of ballots committed to some arbitrary course. There is, in fact, no commitment, save that the President-elect has undertaken to visit Korea.

But this focusing of attention on Korea has been both justifiable and necessary. It is still doubtful whether public opinion in Britain and in Europe has grasped the true significance of the fighting in Korea. It is taking place on the opposite side of the world and in one of the few areas where British and European interests are not immediately affected; it is all too easily pigeon-holed in European minds as remote and essentially an affair for Americans. On this side of the Atlantic, people are well aware of the dangers that an extension of the Korean conflict would involve, but they are not easily persuaded to look closely at the conflict itself. This is a most dangerous attitude. The war in Korea is much closer to the world situation than is usually understood in this country. Not only is it the first genuine attempt to make a reality of the dream of collective resistance; it is also a struggle in which the greatest of the powers are deeply involved. Indeed, the most extraordinary feature of this extraordinary war is that for over two years it has been successfully prevented from spreading. The essence of the present world conflict has been compressed into a microcosm within the fragile geographic framework of one country. This restriction of the war has avoided infinite hurt to the world; but it has had the effect of veiling its universal significance.

Yet, if America's allies have too often thought of this as an American war, so, too, have many Americans. Even Mr Eisenhower, that veteran of the grand alliance, has allowed himself to discuss the issue in terms of purely national politics. True, the United States has borne and is still bearing a greater share of the burden than all of the other nations that have come to the aid of the Koreans. But the contribution of the other allies has not been negligible; and the moral authority given to the campaign by the United Nations has been of even greater importance. The fact that this is a United Nations war should be foremost among the thoughts of the President-elect when he seeks the way out of it that he seems to have promised.

What will his first approach be? During the election campaign, Mr Eisenhower undertook to visit Korea in person if he was the victor. Mr Stevenson's answer was that the key to the problem lay in Moscow,

not in Korea itself. There was some justification for both attitudes. Certainly, neither Moscow nor Peking has ever entrusted the Communist spokesmen at the Panmunjom truce negotiations with any power to adjust themselves to the United Nations' terms. Although the gap between the opposing sides at Panmunjom has been finally narrowed down to the single issue of the Communist demand for forcible repatriation of all prisoners, there is no indication of an early truce. It is tempting, therefore, to conclude that the only hope of progress lies in transferring the negotiations from the Korean paddyfields to some more august meeting place, where a broader view can be taken and the question of the prisoners seen in proper perspective.

It must be asked, however, if the full implications of such a move have been taken into account. If a major political conference were now convened to seek a solution to the wider problems connected with the Korean war, its agenda would not be easily restricted. It would have to discuss the political future of a Korea on the hazardous path towards eventual unification. Guarantees against a new Communist coup would have to be secured before the question of free elections could even be discussed. It would also have to deal with Communist China's demands both for wider recognition and for a seat in the United Nations—not an ordinary seat but one equipped with the power of veto. The question of Japan, with which the Communist powers have not yet concluded a peace treaty, and whose incorporation into the Pacific defence system they have bitterly opposed, could hardly be sidestepped; nor could that of Formosa and the future of Chiang Kai-shek and his army. Even this would not exhaust the catalogue. The United Nations embargo on the export of strategic goods to Communist China might presumably be lifted if that country ceased to attack UN forces, but there would remain the issue of the general system by which the free nations control strategic exports to the bloc of Communist states, a system that vitally affects trade between China and Japan. And no settlement in the Far East would offer much hope of finality unless it comprised some means of securing Indo-China and other threatened areas in South East Asia against the expansionist aims of their great neighbour to the north.

Before embarking on, or even considering, any discussions of this wide scope, the non-Communist countries should recall their bitter experiences last year. Then, encouraged by indications that the Soviet government was willing to discuss the main causes of European tension, Britain, France and the United States sent representatives to meet Mr Gromyko in Paris in the hope of working out the agenda for a conference of foreign ministers. For fifteen weeks talks dragged on at the Palais Rose without result; between the first meeting and the seventy-fourth Mr Gromyko sounded new depths of invective; and when, at one point, the western delegates found a formula to which even he could not object, he dragged in new and unacceptable conditions. This sterile affair carries a salutary lesson. It should suffice to warn the free nations against entering upon a similar

marathon in the Far East. No purpose will be served by transferring the debate from Panmunjom to pandemonium.

This is not to say that a general Far Eastern settlement is altogether impossible—if Stalin is so disposed, which is most doubtful. But three essentials for successful negotiation must be noted. First, there must be no oriental version of the events at the Palais Rose; if the Communists are not disposed to be reasonable over an agenda, they are hardly likely to come to terms when matters of substance are reached. Secondly, the principal allied nations must be fully agreed in advance not only on their first moves, but also on the line of conduct they would adopt if, as is almost inevitable, their first proposals were rejected. If any differences were allowed to appear between the United States, Britain and France—to say nothing of their other partners—the Communists would certainly do their utmost, in accordance with Marshal Stalin's latest directive, to widen these rifts. Mr Eisenhower and Mr Dewey may already have raised the Communist price by showing such eagerness to end the war. And it must be questioned whether, in the light of the present situation in the Far East, the major allies are yet prepared to submit themselves to such a searching test.

Finally, the most dangerous enterprise of all would be to enter into a general conference on Far Eastern issues

without first achieving at least an armistice in Korea. Given the apparent deadlock at Panmunjom, the temptation to do so is strong. There is undoubtedly something to be said for removing the problem from the jaded and embittered truce team and handing it over to fresher negotiators in some less frustrating setting. But, whatever is done in this direction, there should be no embarking on a general debate until the guns have first been silenced. To discuss the fate of the whole Far East against a background of killing would indeed be negotiation under duress. In addition to giving the Communists a chance to continue the war—a course from which they have shown themselves not at all averse—such a widening of the discussions would place them in exactly the right position to use their favourite and familiar tactics of threats and of division. Each of the allied negotiators would be under strong pressure from its own people to halt the bloodshed by accepting terms that the others might find unacceptable; while their antagonists, to whom life is cheap, could haggle indefinitely.

The Korean issue is, indeed, not only more important but a great deal more complex than is generally supposed. The entire civilised world most earnestly desires the earliest possible end to the fighting; but if it is bought at the price of betrayal of the Koreans, of disunity between their allies, and of maladroit entanglement in a dozen other Far Eastern issues, it will be bought dearly.

Third Try for Transport

AN interval for reflection and consultation has produced some improvement in the Government's Transport Bill. It does not call for the castigation that was accorded, in these columns and elsewhere, to the White Paper proposals last May and to the first draft of the Bill in July. But that does not mean that the new Bill is a perfect piece of draft legislation, or that it goes to the roots of the problems of public transport in this country. It is still based primarily on the need, in the Government's view, to return the Transport Commission's road haulage services to private enterprise, in order to secure better service to those who send their goods by road. This act of disposal remains the predominant purpose of the Bill. But the Government has at least listened to those who asserted that "freedom" for the roads should go hand in hand with at least some degree of greater "freedom" for the railways. The main virtue of the Bill is to be found in the steps—tentative though they undoubtedly are—towards this end.

In substance, the methods proposed for selling the Commission's road services to private bidders remain very much as they were. At the same time, the Commission will have to discharge the task of selling its road haulage assets, under the watchful eye of a disposals board and the Minister, and also provide a public service "without avoidable disturbance to the transport system of the country"—as unrewarding a task as ever faced a public body. It is still permissible to doubt whether bidders will come forward for more than a part—and perhaps only a relatively small part—of the Commission's road haulage fleets, even when allowance is made for the automatic granting to the purchasers of the right to a five-year "A" licence free of any mileage restrictions. The Bill, after all, promises greater latitude in the granting of both "A" and "B" licences in future, and

the repeal of the 25-mile limit at the end of 1954. Those who purchase vehicles from the Commission will thus have a comparatively short special advantage. There will no doubt be attractions in acquiring some of the trunk services now operated by the Commission, but unless private operators can expect to secure much greater economy than the Road Haulage Executive (which has made considerable progress towards greater efficiency despite the disappointing financial results that have come from its operations) they are likely to confine their bidding for the more remunerative services, and leave the Commission to continue to operate the less desirable ones.

Thus the political gesture of "freedom" for road haulage may, or may not, decisively change the structure of the road haulage industry as it has developed during the last five years. A publicly owned operating body is likely to remain in existence at least for some considerable time to come; perhaps the Government, in drafting the Bill, have kept this in mind, not merely as a possibility but as something that is positively desirable. If the auction of road vehicles were to go badly—and there is nothing in the elaborate disposals machinery that guarantees that it will go well—a road haulage service in being will still exist to continue to meet the public need. It would be the greatest irony of all if private buyers proved insufficiently enterprising to take more than a modest proportion of the Commission's vehicles; certainly, in framing their bids they will have to take into account many changes in road haulage costs that have occurred since private enterprise enjoyed its heyday in the industry.

But these considerations are in no sense new; they go back at least to the Conservatives' election manifesto

and to the spelling out of the Government's transport proposals in the White Paper last May. The really new feature in the revised Bill is the attempt to pay some attention to the economic problems of the railways. The Government has at last come round to seeing that greater freedom on the roads should imply some relaxations for the railways. The idea that a liberated road haulage industry should pay a perpetual levy to bolster the still-restricted railways has mercifully been dropped; it was as loudly opposed by the one as it was bitterly resented by the other. In its place there is a new principle which is important so far as it goes. The railways are to be freed from at least part of the traditional restraints—which date from days when they were effective monopolists—on the charges that they are allowed to make for their services. The Bill provides that the railways shall no longer have to charge all customers the same rates for the same service; they will have to publish their maximum charges, but they will be free to seek business at lower rates without any of the old prohibitions against undue preference or inequality of charges.

This is clearly a step forward. The question to be asked is whether it goes nearly far enough. A careful reading of the Bill suggests that this greater degree of commercial freedom will not begin to be effective until a "charges scheme" is in existence and has been approved by the Transport Tribunal. Five years have passed since the Labour Government's Transport Act contemplated a two-year period for the formulation of charges schemes; there is still no charges scheme for freight traffic. It is difficult to see how any more or less rational scheme can be devised until the disturbance arising from the severing of road haulage from the Commission is over. Are the railways, then, to wait, conceivably for several years, before they are allowed to take this first relatively modest step towards commercial freedom? Why is it left for traders who assert that they are bound to railway transport to seek redress against "unreasonable or unfair" charges and for road hauliers to complain against "uneconomic charges made with a view to eliminating competition" when the railways are to have no similar opportunities of protest against the actions of their suppliers and competitors? The essence of this greater freedom—and it is only a modest gain, at the most—is to ensure that it works. The Bill appears to take especial care that it will work only under the most inhibiting circumstances. The idea of greater freedom for the railways has at last got its toe in the door at Berkeley Square House. But it will have to push a lot harder at old fears of monopoly power before the railways can enjoy a real access of competitive freedom.

*

Something of the same inhibition is to be seen in the proposals for reorganising the railways. The 1947 Act already provides considerable power to change the character of the managerial forms under which public transport has operated; decentralisation and the revision of the functions now carried out by the Railway Executive—which the Government intends—could be secured with comparatively little trouble under existing powers. But the Government's view appears to be that the future organisation of the railways will require much detailed consideration and a corresponding amount of time. The

Commission has to prepare a scheme and submit it to the Minister; it is then open to the public (including specifically among "the public" the National Coal Board) to make representations. The final shape of the organisation will then be embodied in a formal scheme approved by Parliament and unalterable except by the consent of Parliament.

This method is laborious, time-consuming, and wrong. The organisation of the railways is undoubtedly a matter of public interest, but it is not for that reason a matter on which public intervention is likely to be useful. Nor is it wise to enshrine in quasi-permanent form the organisation of the railway industry at the outset of what ought to be a new phase of commercial opportunity. The basic needs of an efficient railway organisation are, at bottom, relatively simple. There must be an effective dispersing of commercial and operating decisions by a process of decentralisation; there must be some retention of central management power on matters concerned with wages, charges and technical standards; and there must be, above all this, a body that concerns itself, not with management, but with the direction of broad policy. What the Bill apparently proposes, instead, is to let everyone with the remotest concern in railway transport have their endless say about the management and direction of the industry. This is a question not for bargaining or plebiscite among railway users, but for the Minister himself.

In some important respects, the new Bill is a considerable advance on its unfortunate predecessor. But it still fails to provide the conditions under which rail and road transport can compete on more or less equal terms. The crux of the matter is to be found in the degree of public obligation that will repose on the two forms of transport. The railways are to provide public freight services, with some useful but limited easing of old obligations about publication of rates and equality of treatment. The road haulage industry is to be left untrammelled by public obligation, free to carry whatever loads on whatever terms it chooses. Such obligations may not in practice put the two forms of transport in competitive parity—as witness the sharp differences in fares and services on long-distance passenger working by rail and road. Any form of transport loaded with the public obligation to provide service when many people want to travel, or when few people want to travel, is bound to incur wastes and increased costs that are avoidable only by turning traffic away at the peaks, or by refusing to provide a service when there is little demand. Regulation of the passenger services has not removed the anomalies between the obligations of rail and road; regulation of road haulage services would be as unlikely to provide equal conditions between rail and road for handling freight.

If, therefore, there is logic in a new experiment towards greater freedom for the different forms of transport, let it be freedom that is conferred equally upon the railways. The public may not care for all the implications of such freedom, particularly because it would have to pay more when the services it demanded cost more; the railways would no doubt argue that in hard practical fact they can never vary their charges to accord closely with differences in the costs of the different services that they provide. But, in the end, that is what "freedom" and "competition" really imply, and it is a signal defect of the Government's new Bill that it leaves out of consideration the terms on which road and rail can best serve the country in competitive and efficient rivalry.

Stalin's Moslem Empire

IN a world dominated, but by no means fully controlled, by two giant powers, one of the most important of the secondary forces that appreciably affects the balance of power is Moslem nationalism. Today this force is exerted effectively against the West alone. In Persia, Egypt, Tunisia and Morocco hatred of Britain, France or the United States assumes violent forms. In the rest of the Arab world and in Pakistan it is latent. Only Turkey is a friend of the West, because Turks recognise the real source of danger to their independence, their freedom and their Moslem civilisation. Persian and Arab nationalists, though themselves no friends of Communism, gladly repeat every Moscow-made rhetorical phrase about "western imperialism" without asking themselves whether there are not imperialisms other than "western" which rule over Moslems, or other systems to which such words as "oppression" and "exploitation" are more applicable. Not only Arabs and Persians, but Europeans and Americans, show little interest in the thirty million Moslems ruled from Moscow. The iron curtain is especially thick around Baku and Tashkent; yet enough is known to give some picture of what Moslems can expect from an extension to their lands of the benefits of Stalinism.

The great majority of the Soviet Union's Moslems are akin to the Turks; about two million are of Iranian origin, while the smaller nations of the North Caucasus are ethnical curiosities, unrelated to any nation of the outside world. The Soviet Moslems occupy an honourable place in the history of Islam. For long periods in the Middle Ages Turkestan was a centre of splendid civilisation. In more modern times, the Tatars of the Volga valley were pioneers of modernism and democracy in the Moslem world, exponents of Turkish nationalism forty years before Kemal Atatürk. In the days of "reactionary Tsardom" they were able to maintain contact with their fellow-Moslems in the rest of the world. Since the triumph of "liberating anti-imperialist Bolshevism," and more especially since the consolidation of Stalin's autocracy, they have been denied access to the Islamic world; and now the Islamic world seems to have forgotten them.

*

The successive twists of the party curve in Moscow have brought no relief to its Moslem subjects. The first years of Bolshevik rule were marked by the great famines in the Volga basin and Turkestan, in which some millions of Tatars, Bashkirs and Central Asians perished. In the twenties, though Moscow's official policy of resistance to "Great Russian chauvinism" was to some extent applied in the Ukraine and Transcaucasia, this was not the case in the Tatar lands or in Turkestan. In the thirties even the official doctrine changed; thenceforth "local bourgeois nationalism" was pronounced a more dangerous "deviation" than "Great Russian chauvinism." Since then Moscow has made no genuine attempt to stop Russian officials of the Communist party in Moslem lands from using their powers to promote russification. At least a million Kazakhs, over one-third of the total number in the world, starved when collec-

tivisation was imposed. The purge of 1937-1938 fell more heavily on Moslem Communists than on Russian Communists resident in Moslem lands. Almost without exception, the leading Central Asian Communists were "liquidated." Tens of thousands of Tartars and Caucasians, both in and outside the party, were swept away to prison or labour camp.

The war brought a certain relaxation of totalitarian pressure on the Russian people: they suffered and died, but at least they were allowed, and even encouraged, to show pride and love for their country. But not the Moslem subjects: the NKVD, no doubt with good reason, regarded them as potentially or actually disloyal. Various reprisals were taken against them. The climax was the crime of genocide committed against the Chechen people of the north Caucasus. Because Chechen guerrillas had continued to fight the Soviet forces during the war (the rebellion had started before Hitler invaded, and was neither organised nor inspired by him), the whole Chechen nation was held collectively guilty of treason. Early in 1944 men, women and children were rounded up by the special troops of the NKVD, some were shot and the rest deported in railway trucks to an unknown destination, in the Russian winter.

*

Soviet propagandists make much of the economic modernisation of Central Asia under Soviet rule, an account of which is given in an article on page 394. Many Persians and Arabs have fallen for the Stalinist *mystique* of breakneck industrialisation, and compare this "progress" with the "stagnation" under western rule. They do not inquire how it was effected. The skilled workers and engineers were brought from Russia and the Ukraine. The unskilled labour force consisted of uprooted Uzbeks and Kazakhs. The industrial wealth produced in Tashkent or Alma Ata goes not to enrich its people but to swell the resources of the totalitarian state machine with its centre in Moscow. Colonisation is not confined to the importation of technicians and skilled workers. Russian and Ukrainian peasants have been settled on the Kazakh lands, whose former inhabitants perished, together with their livestock, in the famine of the early 1930s. The Uzbeks and Tadjiks have been forced to cultivate cotton in place of grain. There was much to be said in favour of this course, for climate and soil are ideally suited to it. But Soviet policy had two unattractive features. First, it pushed cotton production to the point at which Central Asia was deprived of its own cereal supply; food had to be imported from Siberia, and Moscow thus held the weapon of famine to cower the people of Turkestan. Secondly, the income from the cotton crop went not to the growers but to Moscow. The kolхозes of Turkestan, like the kolхозes of Russia, had to pay their tribute to the government grain agencies and to the machine tractor stations. The proceeds of what was left sufficed to keep the peasants alive, but little more.

It is possible that the Central Asian peasant is not worse off than the peasant in the more remote country districts of European Russia. It is possible that the

citizens of Tashkent are better clad than those of Minsk. But the lion's share of what the peasant and townsman of Central Asia produce goes to Moscow. Egyptian nationalists have often inveighed against the excessive devotion of their nation's agriculture to cotton, which was furthered under British rule; but no one has suggested that Britain forced Egypt into submission by the threat of famine, or that Egyptian cotton did not fetch a good price. (That Egyptian peasants have too little land is another matter, and is not a result of British rule.) And whereas Egyptian politicians and farmers could and did curse the British before and after Egypt became independent, Uzbeks know from long experience that those who criticise Moscow's cotton policy thereby unmask themselves as bourgeois nationalists, with all the consequences that follow.

*

Soviet propaganda also makes much of the advance of education among the Union's Moslems. That there has been an advance cannot be denied; but the nature of the advance is not so well understood. Illiteracy is still widespread among Central Asian peasants. In the towns the great majority can read and write; but secondary and higher education, of which the statistics are at first sight impressive, are largely designed for the local Russian population. That instruction is given in Russian is not unreasonable. An Uzbek who aspires to be a doctor, or an engineer, or a scientist must clearly know Russian; and it would not be easy to arrange lectures on atomic physics in Kara-Kalpak. But the fact that in 1938 at the University of Alma Ata, in the Kazakh SSR, only a quarter of the students were Kazakhs is

revealing. Since the war educational facilities have increased; so also has Russian colonisation. As for the content of education, it is the same in Stalinabad as in Stalingrad, Stalino or Stalinsk: it is neither Kirgiz nor Ossetin nor Russian, but Stalinian. Especially in recent past, falsification of history has been the main feature of Soviet education in the Moslem territories. The north Caucasian hero Shamil, who for many years resisted Russian invasion in the 19th century, has been posthumously unmasked as an Anglo-Turkish agent. The revolts of the Kazakhs and Kirgiz against Russian conquest were not struggles for freedom, but reactionary rebellions, led by obscurantist beys and mullahs, against the progressive and civilising mission of Russia. Surely in Egyptian and Algerian ears this phrase has a familiar ring?

The leaders of Arab and Persian nationalism are the young intelligentsia, the product of western economic and cultural influence. This Moslem intelligentsia, like the Russian or Balkan intelligentsia of fifty or twenty years ago, is both attracted and repelled by the West, eagerly accepts its cultural benefits yet rejects its political domination. The contrast between his own twentieth century life and the medieval squalor in which his people lives impels the Moslem intellectual to revolutionary protest against an unjust society; and since this society is, or seems to him to be, created or maintained by western power, it impels him to fight against the West.

*

Similar forces may well be at work in Soviet Central Asia, too. The Russian connection has brought modernisation to Turkestan, but it has also brought oppression. The contrast between the commissar in Tashkent—be he Russian or Uzbek—and the peasant in the cotton-growing kolhoz beyond the city precincts is different from, but not less profound than, the contrast between the Cairo bourgeois and the fellah in the Delta village. It is precisely the educated Uzbek, who owes most to Soviet society, who is most likely to be aware of the conflict between the interests of the Uzbek people and those of Moscow. Some Uzbek intellectuals will no doubt be completely assimilated, becoming *homines sovietici* and ceasing to be Uzbeks; but the experience of other empires—for example, of Austria-Hungary and British India and French Indochina—suggests that these will be exceptions. Most Uzbek intellectuals, even if they are members of the Communist party, will not cease to be and to feel Uzbeks. The ever-recurring purges in the party and in the administration of Central Asia, and the attempt to deprive the Soviet Moslems of their history, provide strong indirect evidence that this is so. Soviet industrialisation and education in the Moslem territories create explosive forces that are dangerous in the long term. No one is better aware of this than the Soviet leaders.

Meanwhile, the secret police are powerful and the Soviet Moslems are cowed. Meanwhile, the Persian and Arab nationalists will pursue their struggle against the West. It will have to be decided according to the merits of the case and the relative strength of the antagonists. But one would like to hope that the students and lawyers of the Middle East sometimes remember their brothers in distant Samarkand, who have no access to the tribune of the United Nations.

NOTES OF THE WEEK

Tory Triumph

It is now unquestionable that a remarkable change in political opinion has taken place during the summer. At High Wycombe this week the conditions of a general election were as nearly reproduced as is ever possible in a by-election. Both sides treated this marginal constituency as if the life of the Government were at stake—as, indeed, it might have been: a heavy defeat at Wycombe would certainly have exposed the Conservatives to the risk that a few more by-elections might destroy their slender majority. The electors on both sides responded nobly; 84 per cent went to the polls, only 2 per cent fewer than at the general election last year. And the Conservatives did not merely hold a seat that they had failed to win in the close contest of 1950, and then gained by only 1,750 votes last year. They increased the majority by 350. As a percentage of the votes cast, the Conservative majority increased from 3.34 per cent a year ago to 4.08 per cent this week. That is to say, the net result is equivalent to 0.37 per cent of the voters changing sides.

This slight swing of opinion in the Government's favour occurred also in the Cleveland and South Belfast by-elections. Although in themselves these are less significant than Wycombe, they make it impossible to attribute the result there to particular circumstances, such as the quality of the candidates. It appears that ministers have at last regained their popularity of a year ago, and after the difficulties they have encountered they are entitled to be greatly gratified.

What has offset the almost inevitable tendency for opinion to move against the party in office? Among the various explanations that have gained currency, two have a ring of reality. First, it seems likely that Labour propaganda, at the general election and since, was over-played. After all the charges that the Tories would bring mass unemployment, misery and war, there are now people who are pleasantly surprised to find that in fact the welfare state goes on much the same under Mr Churchill as under Mr Attlee. Secondly, the public has perhaps taken rather more note of Labour's internal quarrels than that party's optimists had supposed. It seems a reasonable guess at the mood of the floating voter to say that if in the past twelve months he has not developed any fresh liking for the Tories, he has found even less reason for renewing any confidence in Labour. The Government's success is relative to the Opposition's failure, but the margin is real enough.

*

Nye Fawkes Day

Mr Aneurin Bevan could hardly have had a worse day than November 5th on which to come forward as the challenger of Mr Morrison for the deputy leadership of the Parliamentary Labour party. He thus advertised the struggle for power within the Labour party on the very day when the swing of opinion against Labour in the Wycombe by-election was recorded. Fairly or unfairly, that is bound to draw upon Mr Bevan's head many reproaches for his part in weakening the unity of the party. This is unlikely, however, to affect the outcome of the ballot for the deputy leadership. Mr Bevan would in any case have got the support only of his ex-groupers; and they can be counted on to rally to him despite Wycombe. But the coincidence of his advertising of the party split and the failure in the by-election may well do some damage, at any rate for the time being, to his standing in the Labour party at large. Even the Bevanites in the constituencies are reported to be concerned at the electoral damage which the party controversy is causing.

Mr Bevan's reasons for opposing Mr Morrison at this stage

are not clear. He could have fully satisfied his supporters by standing for one of the twelve places on the party's Parliamentary Committee—which he intends to do in any event, once he has been defeated in the contest for the deputy leadership. The most probable reason for his challenge to Mr Morrison seems to be that he is preparing the ground for future contests. If he comes forward as a candidate for this very important post year after year he may hope to stake a claim, if not to become Mr Attlee's successor, at least to be Mr Morrison's successor. He is apparently relying, despite the High Wycombe result, on the belief that the tide of opinion in the party will run his way. And whatever disabilities Mr Bevan may have, a reluctance to aim too high is not among them.

Meanwhile, the leftward drift in Labour policy certainly continues. At the party's first meeting in the new session Mr Shinwell obtained his colleagues' support for the demand that there should be an inquiry into the length of National Service. There are also signs that more and more Labour backbenchers are preparing to challenge the Government's actions in Kenya. It may be that Mr Attlee will eventually feel strong enough to keep his followers from irresponsibility, but he is a long way from that point as yet.

*

New Deadlines for Nato

Some of the missing links in the North Atlantic Treaty Organisation began to take shape last week when, for the first time, the three members of the military Standing Group came over from Washington to Paris to confer with the fourteen Permanent Representatives. For some time, the civilian heads of Nato, including Lord Ismay and the chairman of the Atlantic Council, Hr Ole Bjoern Kraft, have been concerned over the tenuous liaison between the political and the military wings of the organisation. Although the Standing Group have taken part in full-dress meetings of the Council, co-ordination between such events has been poor. Matters came to a head during Operation Mainbrace, the recent naval exercise in Scandinavian waters, when it was found that the governments concerned had not been adequately consulted. Assurances have now been given that nothing of this kind will occur again, and some of Nato's smaller members have also been heartened by the repetition of the pledge that the general strategic plan aims at defending the territory of all fourteen. But a good deal of ground remains to be covered before Lord Ismay's thesis that the Council's relationship with the military authorities should be that of any government with its generals, becomes a reality.

Nor will Nato have much time to consider these matters in the coming months. Events are pressing in upon it. The next plenary session of the Atlantic Council will begin on December 15th, and the Standing Group will return to Paris before that date to examine the military aspects of the organisation's annual review. But, in spite of great efforts by the secretariat, it is still doubtful how complete the review will be by December. Most member nations were late in replying to the annual Nato questionnaire and some, including Britain, have still not provided their contributions for the review. This is a direct consequence of the drastic revision of rearmament schedules decided upon during the summer. In view of the scale of that revision, the Nato planners will be left in a position of great embarrassment if the information is not forthcoming by the middle of December. In this unhappy conjuncture of events, the one encouraging factor for the heads of the organisation is that the new President of the United States will not be a man whom it is necessary to educate and indoctrinate in the aims and methods of the Atlantic alliance.

Air Subscription Rates for 1953

Owing to increased costs, some increases in air subscription rates to *The Economist* will have to be introduced from January 1st, 1953. The countries affected are:

Australia : £8 5s. (sterling)	Malaya : £6 15s.
Hongkong : £7.	New Zealand : £9.
Japan : £9.	S. America and W. Indies : £7 15s.

The substitution of an airfreight for an air mail service to Egypt makes it possible to reduce the air subscription rate to £5 5s. Rates to all other destinations remain unchanged:

Anglo-Egyptian Sudan : £5 5s.	India, Ceylon : £6.
Canada : \$21.50 or £7 14s.	Iran : £6.
East Africa : £5 5s.	Iraq : £6.
Europe (except Poland) : £4 15s.	Pakistan : £6.
Gibraltar, Malta : £3 15s.	Union of S. Africa : £5 10s.
Gold Coast & Nigeria : £5 5s.	U.S.A., \$21.50 or £7 14s.

Dollars for Europe's Arms

Figures published last week by the Mutual Security Agency afford a closer look at the way in which American off-shore purchases have been operating over the fiscal year 1951-52. Although original estimates had suggested a figure of about \$680 million, the actual value of off-shore procurement came to \$729 million. The total was devoted to arms for Nato countries and the figures do not include orders placed directly on behalf of the United States forces. The lion's share of \$350 million went to France, and this would suggest that American dissatisfaction with certain features of the French armament industry had not then crystallised. What is more disturbing is the fact that \$46.6 million of \$65 million allocated to aviation industries were earmarked for France. Why one should concentrate on developing French alternatives to extant British prototypes, or why the weight of expectation should bear on the Mystère IV when the Swift will have a far better performance it is difficult to explain. Questions of national pride and the general wish to give work to French aircraft factories seem to have influenced MSA's decisions.

Over the period 1951-52 Italy received \$140 million worth of off-shore orders and the United Kingdom came third with \$75 million. It is interesting to note that Swiss industries benefited to the extent of \$34 million, whereas the share of Western Germany did not exceed some \$10 million. The bulk of off-shore purchases was made up of munitions and high explosives and a major fraction was allocated to shipping and harbour installations. The fact that only \$7 million were devoted to small-arms suggests the extent of the disorder and indecision which have prevailed in that whole domain, especially in plans for standardisation.

The latest programme for off-shore procurement, which will cover 1952-53, has not yet been issued in detail, but there seem to be a number of shifts of emphasis. The six EDC countries may receive more than \$620 million worth of orders, and it is expected that greater attention will be paid to defence production in Belgium and Western Germany. Nor have the details of the aircraft section of the programme been as yet worked out; but it appears that the problem of incorporating British engines in airframes developed and produced on the Continent is one of the main points under study. If the Ottawa conference on armament were to provide a solution to the riddle of standardisation, moreover, the effect on the allocation of off-shore purchases would not be long delayed.

Marshal Tito's Straight Left

At the sixth congress of the Yugoslav Communist Party, held in Zagreb this week, the impression of cautious confidence and muted self-satisfaction has been in marked contrast to the atmosphere of fear and uncertainty at the last congress, held just after the break with the Cominform in 1948. In the past four years Yugoslavia has changed a great deal, and in ways which to an orthodox Communist must seem startling and sometimes hard to stomach. Marshal Tito, Mr Kardelj, Mr Djilas and others have this week tried to explain these changes to the Party. It would have been more clearly and easily done if they had not chosen to justify them in terms of Marxist ideology rather than on the obvious grounds of Yugoslavia's needs.

Since the Communist Party is the only potential source of effective opposition to the Marshal, it is essential that he should carry it with him in all the new developments the country is undergoing. It was, of course, a foregone conclusion that the congress would officially endorse the leader's policy; a' the same, it would seem that the Marshal's lead is accepted willingly by the majority of party members. How many, like Neskovic, who was recently expelled from the Politburo, belong to the small minority who do not, is

anybody's guess. But the repeated insistence in this week's speeches on Yugoslavia's independence of both east and west, on aid without strings, and on Socialism as a prelude to Communism, reflects perhaps not only the Yugoslav leaders' own principles, but also their desire to outrage their comrades' feelings as little as possible. At the other extreme, Marshal Tito complained about "some obsolete ideas from the west" which had been introduced into the party because of mistaken interpretations of the newly granted freedom. It is hard to see how he can expect his followers to be exposed to western influences—even carefully selected ones—without being affected by them.

The virulence of this week's attacks on Soviet policy, on the Soviet system, and on Stalinism and all its works, seems to dispose effectively of rumours that still crop up that Marshal Tito might accept a compromise with the Soviet Union. For the first time he spoke openly of the Party's task "of waging a struggle against Cominform Soviet revision of Marxist theory and practice on an international level." What exactly he means by this in practice is hard to say—perhaps a determined attempt to split the western Communist parties. But it is a significant sign of the strength of his belief that for him and his supporters there is no way back to the Soviet fold.

The Fall in Production

In 1947 Dr Dalton publicly wondered at the contrast between Britain's internal prosperity and buoyant public finances, on the one hand, and the chronic weakness, on the other hand, of the external balance. In 1952 the welcome, if precarious, return of external stability contrasts with an ominous budget deficit and with a sharp decline in industrial production. This decline, which now amounts to close on 10 per cent compared with last year, dramatically reverses the whole postwar trend. The Opposition has not been slow to point what it sees as the moral; Mr Gaitskell demanded last week that the Government "take steps to arrest the decline and to restore the increasing production which took place continuously under a Labour Government." More and more is likely to be heard of the argument that tighter credit is responsible for reduced production, and therefore that this and other measures against inflation ought to be relaxed.

No one can be complacent about a decline in production. Even apart from the particular hardships of actual unemployment (which, however, remains by any standards extremely low), the physical need for higher output is so obvious that even a slackening of the rate of progress, let alone an actual reverse, would be cause for distress. It is still necessary, however, to draw some distinctions. As Mr Butler said last week, "What we need is not just production irrespective of what we produce . . . but production of those things that the world's markets will buy and our industry's growth and progress at home require." One of the penalties of long-continued inflationary pressure is precisely that its indiscriminating stimulus to production results in an assortment of products, and a corresponding assortment of workers and resources in general, that is increasingly inappropriate to the real needs of both home and foreign markets. It therefore calls sooner or later for just that kind of halt, back-tracking and redeployment which is so unpleasantly apparent today.

Many of Britain's export difficulties can, indeed, be traced to precisely the same readjustment in other countries. To speed and to smooth the necessary redeployment, both here and in the rest of the sterling area, is the way to restore the rising trend of production, and to put it this time on the surer foundation of genuine demand and realistically ascertained costs which only stable money can provide. If this urgent task of economic statesmanship is not accomplished, the respite in Britain's international economic troubles, and

How much horse power in a raincloud?

There is more energy in a raincloud than in an atomic bomb
—and one day we may know how to tap it: there is
inexhaustible power in the tides, and people have
envisaged a time when

we may use so much
of it as to alter the orbit of the moon. . . Perhaps the windmill will stage a comeback, lifted on an aluminium
tower to a height of a thousand feet or more. And what of solar radiation? . . . Or will cheap power from
atomic fuels outdistance all the rest? Who knows? . . . But one thing is certain—whether the power station of
tomorrow be a forest of steel masts or an atomic reactor buried in a concrete hill, it will owe something to TI.
Not in components alone, but in the practical devices that take shape when TI specialists are called in.

Progress In Electronics

RESEARCH The great variety of subjects under continual investigation in the Mullard laboratories include some that are truly revolutionary. Ultrasonics is an example. This science, involving the use of sound waves far beyond the range of human hearing, is likely to find increasing applications in numerous industrial processes. Its development is typical of Mullard initiative in research.

PRODUCTION Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

those of the Commonwealth, will prove to be short. But this is the very reverse of a case for returning to the inflationary conditions that made the present decline in production inevitable. Even were the British Government sufficiently foolish, it could not count on the same convenient folly simultaneously afflicting those nations with which Britain trades. Mr Gaitskell, at all events, should know better.

* * *

Wage Claims Under Deflation

A return to realism in wage claims is reflected in the miners' quiet acceptance of the decision of the Porter Tribunal to award them no increase at all. It is true that the findings of their own arbitration tribunal are binding on both sides of the industry, and that the union's next step will no doubt be to formulate a new claim. But it is nevertheless remarkable that, apart from the protests of a few pits and some refusal to work the voluntary shift, there has been none of the aggressive bravado that prompted the original claim for an all-round rise of 30s. a week.

The tribunal's case for making no award is that although, since the last wage increase in November, 1951, there has been a 6 per cent rise in the cost of living, it would be wrong to allow wages to be controlled by minor movements of the index. In any case, the miners were over-compensated in November for the rise in prices; and as compared with 1947, when the industry was nationalised, their earnings have far outstripped the cost of living. From October, 1947, until August of this year, the cost-of-living index rose from 101 to 137; but the average weekly earnings of mineworkers rose from 100 to 162, or from £7 10s. a week to £12 3s. The miner is highly paid in relation to the rest of the industrial community—as indeed, he should be, in view of the unpleasantness and hazards of his occupation. Output per manshift has risen from 1.07 tons in 1947 to 1.19 tons in 1952, and this is not all due to increased mechanisation. But the tribunal pointed out that the miner's share in this increase had already been recognised in the award that was made last November. Finally, it was opposed to any interference with the existing wage agreement at a time when the whole wages structure of the industry is under review.

Arguments about the "fairness" of a wage increase can rarely, however, be decisive. The case for paying the miners more in the national interest has become less strong as the shortage of miners has become less acute. The Coal Board's original target of 750,000 has not yet been reached; there were 720,661 miners in August. But for many months past more men have been entering than leaving the industry, and the rate of recruitment is as great as the industry can at present absorb. Moreover, while the shrinkage of Britain's export markets makes it essential to avoid a general rise in industrial costs, the miners' claim could be met only by raising the price of coal by 5s. a ton, and it is doubtful whether any of it could be recouped by charging more to foreign importers of coal. At home and abroad the shortage of coal has been eased by a fall in industrial activity. In deciding their next step, the miners, like the engineers and shipbuilders, thus have to face the fact that they are no longer in a position to enforce extravagant claims.

* * *

Eggs Going to Town?

It is strongly rumoured that the Minister of Food is going to abolish next spring the egg allocation scheme that has worked so badly in recent years. Nearly half the eggs produced in Britain are failing to pass through the Ministry's hands—that is, something like 4,000 million eggs a year, or three times as many as Britain imported in 1951. The Ministry's distribution has broken down so completely that

the public no longer thinks it wrong to organise a private pipe line direct from farm to breakfast table, and to try to go back to enforcing the scheme now would therefore require a whole army of inspectors.

But decontrol will not be simple. First, it will mean removing the subsidy, now paid on a dozen eggs. Secondly, the special allocation of eggs to young children will have to be discontinued; but there will be no need for this welfare service once adequate supplies are available in the shops. Thirdly, price control will have to be abandoned if demand and supply are to be equated. The Treasury is unlikely to allow eggs to be imported freely to satisfy all demands. But to free prices would eventually raise difficulties with the farmers. Eggs are one of the foods governed by the Agriculture Act of 1947, which, although carefully and vaguely worded on the question of prices, stated that a market must be provided for home producers, and that they must receive a reasonable return. These two conditions have been interpreted as implying that an annual price should be agreed between the Government and the National Farmers' Union, and farmers will be loth to abandon this procedure.

It is to be hoped that the Government will not be intimidated by these difficulties. The townsman has endured long enough a system which, under the pretence of securing fair shares, restricts him to one stale egg a week.

* * *

Persia and Communism

The last convoy of cars from the British Embassy has crossed the Persian frontier, and with it there has disappeared the serviceable counter-weight that successive Persian governments have used for the last 150 years to offset pressure from Russia. Dr Mossadegh still retains some substitutes for it, chief among them the United States Embassy, which is far more sensitive than its British counterpart to talk of an imminent Tudeh menace. Another is the Shah, who is being pushed this way and that while his family and friends are exiled and while a Senate that was largely his creation is shorn of dignity and power; his position is now meaningless except as a symbol that Dr Mossadegh does not actually intend to pave the way for Soviet puppets. A third is M. Camille Gutt of Belgium.

Two months ago Dr Mossadegh informed the mission of UN experts, now in Iran under the technical assistance programme, that he wanted them to engage an eminent financier to advise him. M. Gutt is a financier in a different category from Dr Schacht, who was already being consulted. He was lately head of the International Monetary Fund, and before that an adroit finance minister in his own country. He agreed to accept the Persian invitation as a piece of international service; he will spend two months in Teheran and has equipped himself with a team of four experts: two Belgians, one of whom is an expert on taxation, one American professor and one financier from Salvador. Both of the latter worked for him in the Fund. This team is subject to the general regulations which govern service to member

states by UN officials and has no executive power. It will merely make a report on which action could later be based.

It therefore joins the long, long trail of advisers—the Millsaughes, the Morrison-Knudsens and the Overseas Consultants Incorporated—whom Teheran has employed but never used because to carry out their advice would have unpleasant consequences. Yet, by its very presence in Teheran, it adds one more layer to the paper-thin rampart that now stands between the Mossadegh government and the pressure which Moscow is building up through the Tudeh party.

* * *

The Arabs and Germany

The Arab League is this week urgently summoned to meet and discuss Germany's payment of reparations to Israel. Some members have already exercised pressure on Bonn to get the process stopped before the Bundestag ratifies the agreement. The protests range from letters from the Mufti to a diplomatic Note handed over last week by General Neguib in person; and official objections have been lodged by an Arab League delegation at present in Germany. Arab reasoning is as usual simple: Israel's economy is shaky and all Arabs hope that it will not only pine but die; anyone who injects it with the elixir of life is, therefore, their enemy; fourteen annual instalments of German goods, delivered free, constitute just such an injection. In any case, the Arabs add, why should one government take payment of a debt that is owed to world Jewry, and why should not Israel's share be paid to the Arab refugees, who are Israel's victims?

This protest puts the Germans in something of a predicament, for they are in any case divided on the merits of the reparations agreement. One school of thought, firmly led by Dr Adenauer, is for pressing it through in order to expiate Hitler's crime towards Jewry; and certain industrial circles support it because it promises big orders unhampered by payment difficulties. Its opponents hold that Germany cannot afford to make such a payment; and their ranks are now swelled by a group that corresponds to the one-time Baghdad railway enthusiasts, men who see a bright future for German trade and influence in the Arab countries. The accompanying table shows that effort along these lines has already produced results:

	\$000		
German exports to	1950	1951	1952 Jan.-June
Egypt	19,143	29,712	18,734
Syria	7,104	7,659	4,902
Lebanon	...	3,947	2,117
Iraq	335	2,261	2,038
Persia	9,272	19,945	11,091

Though the credit requirements, particularly of Egypt, have hampered the process of expansion, there is an obvious market for an efficient deliverer of heavy equipment which Germans would be loth to lose.

The Federal Government is rightly angered at the way the Arabs have abused German hospitality by lobbying business circles against the agreement. But, as a result of the Arab pressure, the Federal Government has now submitted a counter-proposal to the Arabs. The content is secret, but it presumably offers to review the list of goods to be supplied, in the light of the Arab fear that it includes war potential. The biggest items in it are, for the first instalment, machinery, manufacturing and electrical equipment, rolled steel, iron and ferrous metals; next year, oil deliveries will be added to the list. The Arabs have actually threatened retaliation by the boycott of German goods, but Dr Adenauer need not take this too seriously. For the Arabs need Germany just as badly as Germany needs them: they like to be in a position to equip themselves (or to threaten customary suppliers that they will do so) from a source that is free from the taint of "western imperialism."

* * *

The Cost of Dockers' Security

One of the effects of the fall in imports and exports is the mounting expense of the dock labour scheme, by which dockers on the register are able to draw a wage whether or not there is work for them to do. On November 1st the levy paid by employers to finance this scheme was raised from 16½ per cent of dayworkers' wages to 22½ per cent. This is the highest levy since the National Dock Labour Board was established; it compares with a rate of 11 per cent during 1951 when full employment was at its height. It is also getting very near the limit of 25 per cent beyond which the Board cannot raise the levy without permission from the Minister of Labour; and it is long past the point where the Board has had to consider whether it should declare some dockers redundant. The number of men drawing pay without working varies widely from day to day, but it is now seldom less than 9,000 and sometimes reaches 20,000.

The demand for dock workers can change very suddenly, and the Board is therefore reluctant to disperse labour until it seems certain that trade will not return to the level of 1951. It is also unwilling to shake confidence in the security of a job that it was brought into being to "decasualise." It had hoped to hold the fort by stopping recruitment and by not replacing dockers who left. But at 78,000, the labour force is only fractionally smaller than it was in the third quarter of last year, although considerably below the peak of 81,000 reached at the turn of the year. The men are reluctant to leave an occupation which in good times can bring in as much as £20 a week. Other work is not always easy to get—

least of all in Liverpool, which like other ports receiving much general cargo, is particularly badly hit.

It is, however, in the interests of neither the dockers nor the country that the present situation should continue. The docker's minimum wage of £4 8s. a week was intended merely to tide him over short-term fluctuations, not as a more or less permanent dole. It is not enough to support a family; yet the docker is unable to draw national assistance because technically he is not out of a job. The national aspect is equally unsatisfactory. The higher levy adds to the cost of imports and so raises the cost of living; but, far worse, it adds to the cost of exports just when it is most important to keep them competitive. The board may be right to delay as long as it can, but if by the end of the year there is no reason to foresee a revival in trade it will be time to reduce the labour force in the docks.

* * *

Americans in Britain

The Visiting Forces Bill went through its final stages last week and Great Britain has now followed Canada in completing its obligation under the North Atlantic Treaty to give member countries jurisdiction over their own forces wherever those forces may happen to be stationed in the treaty area. The principle of the Act is not new. Corresponding rights were given to Commonwealth countries over their own troops here in 1933, and to Allied countries as a temporary measure in 1942. But this Act is intended to be permanent, the forces covered by it are mainly those from the United States, and the debates last week did not escape completely from some air of anti-Americanism.

The Act is less drastic than the wartime measure; visiting forces are not given anything in the nature of practical diplomatic immunity. The service authorities and courts of visiting Nato countries have exclusive jurisdiction over their own men for anything done by them while they are on duty, and for any offence solely against their own property or against another member of their own forces. To the extent to which any man is tried by his own service court, the jurisdiction of British courts is excluded, for he cannot be tried again for the same offence by a British court. Subject to that, British courts have the same jurisdiction as they have over other foreigners, and the normal police powers of arrest remain in force, although the man arrested may have to be handed over to his own authorities. A separate section of the new Act gives the Ministry of Defence responsibility for settling all civil claims that arise as well, and the Home Secretary promised to make this as widely known as possible.

The Opposition sought to amend the Act in order to exclude from its scope the visiting forces of any country that did not give reciprocal treatment to British forces stationed there. The debate thus became very much a demand that the Government should not apply the Act to United States forces here until the Senate has ratified the Nato agreement on which it is based and Congress has passed an equivalent measure. The Home Secretary replied that there was no constitutional difficulty in the way of corresponding American legislation, that the President had asked the Senate to ratify the agreement last June and that the necessary legislation for Congress was in preparation. The amendment was defeated on a division. It would be unfair to suggest that all MPs who voted for the amendment were anti-American, even on that occasion—as Mr Chuter Ede rightly said, it is possible to be pro-British without being anti-American—but there is something unreal, and petty, in the suggestion that Congress in the United States is likely to act more quickly if it is told that the threat of a British gaol hangs over American servicemen here until it does. Is this country likely to pass a sharp sentence of imprisonment on, say, two American sailors were they foolish enough to steal a taxi-cab and rob the driver of thirty shillings? Not at the moment, anyhow.

The French in India

It would seem odd if there were a sovereign Indian community embedded, say, on the French Atlantic coast—odd, because it is the Europeans who have spread into Asia, not the Asians into Europe. But there would be no automatic reason for Paris to demand that Delhi must now give it up, particularly if the Indian position in such a territory dated back for nearly three hundred years. Although Mr Nehru's complaints to the United Nations about the little French possessions on the Indian coast and his direct protest to the Portuguese about the continued existence of Goa have the trend of modern opinion on their side, they do not have the backing of any form of international law.

The dispute, nevertheless, is one which the French should approach more open-mindedly. They may be under no obligation to give up their traditional little enclaves in India; they are certainly not obliged to evacuate them just because the British have left. And Mr Nehru, for his part, is undoubtedly piling Pelion on Ossa by bringing this dispute before the United Nations so soon after doing his best to help queer the French pitch in Tunisia. But is it always wise to stick too rigidly to one's lesser rights in a fast changing world?

There is an emotional and geographical simplicity in the Indian claim. The Indians may have spoilt their case by rejecting the idea of holding plebiscites, but there is impartial evidence that the terroristic methods employed by vested smuggling interests in the French territories would probably invalidate the verdict of any plebiscite. What really matters to Paris, however, is the wider question of relations with India as they affect Indo-China and Tunisia. If France gave up its Indian territories, it would have taken a step towards encouraging Mr Nehru to recognise Bao Dai, with all the added prestige which that would bring to the Vietnamese administration. In the bitter struggle over dependent territories as a whole, M. Schuman can ill afford any policy which helps unnecessarily to consolidate the African-Asian bloc against France.

* * *

Thorez Tarries Awhile

Despite fervent expectations to the contrary, it now looks as if M. Thorez may yet winter in Moscow. The welcoming posters and floral wreaths on Paris walls may wilt before the return of "France's beloved son and leader, Maurice." In some quarters it is being argued that his health is not as yet entirely restored; but, as the anti-Communist group "Paix et Liberté" has put it: "Thorez se trouve beaucoup plus résistant qu'en 1940." It may be that he does not wish to return before a solution has been found for the Marty-Tillon affair. He could then return as the leader of a united and purged Party without having to interfere in an internecine struggle which has profoundly bewildered numerous Communists. A man with M. Thorez's military record might feel embarrassed about expelling heroes of the Black Sea mutiny and the Resistance. On the other hand, would he enjoy seeing M. Duclos take all of the credit for solving a sticky situation? A third possibility is that Stalin does not wish to risk the imprisonment of M. Thorez should the French Government abrogate the parliamentary immunity of leading Communist deputies.

This delay is causing acute embarrassment to the leader's French disciples. Everything had been prepared for a rousing welcome and, although the giant rally scheduled for November 7th in the Velodrome d'Hiver has not as yet been cancelled, the faithful will have to be satisfied with a mere speech by M. Duclos. Nevertheless, party loyalty to the leader is unshaken—"our Maurice is always with us, even when away." M. Lecœur, the conscience of the party, has been preparing for his continued absence by developing the thesis that great leaders have a sacred duty to stay away from danger in order to be around on the day of ultimate triumph.

The Queen's Speech

Nothing will be more easy than for the Government to frame a speech for the Queen, in which they shall evade the real question at issue. They may congratulate the country upon its great prosperity—the agriculturist upon his improved condition; they may refer with approval to the great relief from taxation which the country has obtained during the late Parliament; and they may ask the faithful Commons of the New Parliament to revise the taxation of the country with a view to the best interests of all classes. They may do all this, and Free Trade may be as far as ever from being safe in their keeping. Many opinions may be held as to what constitutes the "best interests of all classes." There are many reasons why such an issue should not be taken upon the Address. In the first place, there is naturally a strong desire on the part of the House to be unanimous in addressing the Queen. In the next place, the speech is by custom so general and vague that it may mean anything or nothing with reference to a special policy; and it would be difficult to frame an amendment with such precision as would meet the requirements of the case. Nothing short of a direct attack upon Free Trade, or of a professed adherence to Protection, would appear to render an amendment upon the Address desirable. But if not in that form, we entirely agree that it is necessary as soon as possible, in some other, to have this question for ever set at rest. If Ministers will do it voluntarily themselves—if they will frankly renounce their former views as erroneous, and espouse Free Trade as a wise and beneficent policy, which they will not only maintain but extend, so much the better. The object of the extra session will be gained, and the country may fairly wait the production of their measures. . . . This is, in truth, the great practical object to be gained by the meeting of Parliament at so unusual a time. Our commercial and financial policy must no longer be left in doubt or suspense.

The Economist

November 6, 1952

Whether the five Communist deputies will have their immunity raised will not be decided for two or three weeks. Meanwhile, by jailing opponents of the Indo-China war, such as Le Léap, the trade union leader, and by allowing the police to ransack the homes and offices of Communists (including deputies to the National Assembly) the government has seemed to be losing its head under criticism. By its growing tolerance of brutality and disregard for due process of law, the government is playing directly into Communist hands. There is nothing as effective as a dose of martyrdom for transforming the embarrassed and ridiculous position of the French Communist Party into the cornerstone of a united front.

Chemists Against Gambling

The majority of chemists will have nothing to do with the Ministry of Health's scheme for paying them a little faster. The Ministry has fallen nine months behind in its pricing of prescriptions; it had, therefore, asked all chemists whether, for prescriptions issued between February and May inclusive, they would accept payment on the basis of the average cost, as calculated by the Ministry, of the prescriptions issued by them during the preceding four months. By this means the Ministry calculates that it could pay the chemists about five weeks earlier than would otherwise be possible. It also estimates that the chemists would stand rather more than a fifty-fifty chance of gaining on the gamble, and most of those who lost would lose less than 2d. on each prescription.

Tuppences, however, multiply into substantial sums, and chemists who lost on the deal would hardly find consolation in global averages. Sixty-five per cent of them have therefore rejected the scheme, including two of the largest firms—Messrs Boots and Timothy Whites. Only 18 per cent accepted, and 17 per cent did not reply—their silence, not very justifiably, being taken as consent. With so few acceptances the Ministry is hardly likely to go ahead with its scheme. The chemists evidently feel that, having waited nine months for their money, they may as well wait five weeks longer; that the Ministry has got itself into this mess by greatly underestimating the number of prescriptions in the first year of the national health service; and that no individual chemist should suffer in consequence.

All this seems reasonable enough. The Ministry may slightly reduce its arrears of work when it deals with prescriptions from June onwards. Since the charge of 1s. came into force, the number of prescriptions has been much lower than it was in the same months of last year. But the saving may be partly illusory; patients have been getting their doctors to write everything they need on one prescription form, and compendia of medical supplies and flagons of medicine may mean just as much work for the Ministry's pricing bureau. The bureau can now keep pace with current work. But it looks as if there will have to be some new thinking about the problem of arrears.

Party Split in Nigeria

Nigerian political parties have been notoriously fissiparous in the past, and they are still kaleidoscopic in their tendency to group and regroup. At present a series of parallel developments is taking place both within and without the two major parties, Mr Awolowo's Action Group and Dr Azikiwe's National Council for Nigeria and the Cameroons. So far, the Action Group is monolithic in the Western Region, and is even making an assault on the North where it is attaching to itself some of the minor political

groupings. Much more interesting, however, is the report that the leadership of the National Council may be in dispute. There have been rumours of a split behind closed doors, which may have far-reaching personal and political implications. At its annual conference held early in October, the party formally agreed, in private session, to give the Macpherson constitution a trial; but great opposition has been reported to this decision, and a campaign to reverse it was begun by the national secretary of the party, who is said to be hand in glove with Dr Azikiwe.

The split, if there is one, may be symptomatic of a cleavage between the "parliamentary" leadership, that is, the National Council ministers in the Nigerian Government (of whom Zik is not one) and the party organisation. If this cleavage becomes more pronounced, it may well increase the insecurity of the ministers and therefore of the Government. In African politics, it is only too easy to earn the label of collaborationist or "Uncle Tom," and huge drafts on the political courage of the National Council ministers would be required if it came to an open break with Zik and, even more, with the Zik press.

The question for Nigeria is whether, if the main parties split and change, anything resembling "western" politics will emerge from them or in their stead. In this context, it is interesting to note the growing attempt of the "intellectuals" to get together in a radical Socialist (but not Communist) party. This is the first attempt in Nigeria to base a party on Right or Left.

No More Viking Divisions

The incident of General Ramcke's outburst against the western powers at the recent rally of the Waffen SS is closed as far as the British Government is concerned. But it would be a mistake to conclude that the British disposition to let bygones be bygones is reciprocated on the German side or that the Verden episode was either the first or the last of its kind. The Waffen SS and other Nazi organisations that were condemned wholesale in 1945 are not content to let matters rest now that the western powers require German help. They demand that their national and personal grievances against the Allies and Dr Adenauer's government shall be redressed, with what amounts to an acknowledgment of "guilt" from their former enemies. It is somewhat as if the police were sued for damages by everyone they had arrested, whether criminals themselves or unwilling accomplices; they could not afford to submit but would have to bring up the facts of the case and take a firm line. This at some time will have to be done by the British Government as well as by the German authorities. The issues of the past will have to be fought out again, as the moment comes for deciding the form of the future German army.

Some former leaders of the Waffen SS, it should be noted, are not only demanding pensions and the release of imprisoned comrades, but claim a special place of honour as the foremost fighters against Russia. The Viking Division, formed out of the Fascist and German volunteers from the occupied territories, is being held up in some quarters as the prototype of the European army. It is well to recall once more that the Waffen SS was the military arm of the Nazi party, dedicated to the religion of Germanic racial domination. Its mission was not so much to destroy Communists as the "subhuman" races of Eastern Europe and, above all, the Jews, in order that Germans might settle on their territory. The SS commander, Hönmler, made no secret of his orders that German predominance must be ensured by killing, say, all Polish professors and taking away all children that showed signs of Germanic blood. This, like the liquidation of Jews in the west as well as the east, was regarded as an honourable task by the Waffen SS and the special *Einsatz-Kommandos* in those demented days.

Somewhere a company

(we aren't sure which)

is about to start a job

(we can't guess what)

which will need close control

(we're not clear how)

of its source of power . . .

(we wonder which)

Compressed air might help

(we're **POSITIVELY** able to deal with that A)

If you need a piece of equipment which doesn't exist to do a job which does — put your problem to Hymatic. Among the practical solutions our development unit has evolved are the Hymatic anti-G valve, hot air controls on jet engines and diesel engine starting. You will find us especially keen about valves, controls and actuating mechanisms for air, at high pressure and low pressure, hot or cold. We like taking on a difficult problem — and, if air holds the answer, we will find it. Write Hymatic, Dept. DU. 4.

Letters to the Editor

British Motor Industry

Sir,—In your review of the motor industry, you draw attention to the fact that the 750 cc Renault (and the Volkswagen) is produced at a greater rate than any British car, while the machine equipment is probably as up-to-date at the Renault works as at any British factory. During a recent visit to the Renault factory I collected a remarkable broadsheet issued to all their workers describing their 1951 results in relation to world competition; one of the figures given is that the average age of their 21,780 machine tools in 1951 was 15.7, by comparison with 20 in 1944. This figure is not, of course, directly applicable to the 750 cc, but I wonder how many managements here know the average age of their tools?

Incidentally, the Renault leaflet about their "cruiser-weight" Frégate gives details similar to those in your tables, comparing its accommodation and performance with those of their domestic and foreign rivals in this field: this is a practice I believe no British manufacturer has so far adopted, presumably on the grounds that they do not yet believe world competition strong enough to make dog eat dog if it can.—Yours faithfully,

BOSWORTH MONCK

London, N.1

*

Sir,—The article in your survey of the motor industry under the title "The right roads for Britain" seems to beg a few questions. It may be asked whether the projected motorways would in fact prove to be an economic proposition. You have referred to the savings, partly of course attributable to fuel and other taxes, in running costs which result from a good road-building scheme—and indeed more such may be highly desirable; but no one would suggest that the savings on a national system of motorways would be on anything like this scale. Against these savings must be put the effects on other sections of the nation's economy.

On 1949-50 figures a simple calculation will show that the direct loss of agricultural production due to the construction of a new motorway would be at the rate of about £350 per mile per year. The consequential loss due to severance cannot easily be estimated, but would certainly be substantial. Is our balance of payments position so favourable that we can lightly disregard an annual loss of agricultural production of the order of half a million pounds?

The effect of the motorways plan on the railways should also be taken into account. Lower traffic receipts on British Railways might have a serious effect. As a possible alternative to the motorways scheme might it not be asked whether the use of modern methods of handling could not give to the railways sufficient flexibility to attract traffic back from the roads. This

at least could be done without depleting the nation's resources in other directions.—Yours faithfully,

H. JOHN TOOBY

Bramford, Nr. Worcester

*

Sir,—It is unfortunate that the survey in your issue of October 25th fails to recognise the real difficulty facing British exporters in the European markets. It is not that they cannot produce a cheap and efficient car, but just the fact that the Dutch, Belgian and Swiss peoples would rather buy a German car than one of British manufacture. They did so before the war and do so now. By comparing the Volkswagen, the car constituting the greatest competitive danger, with one or two English models, we find that not only are the English models cheaper, but also that they are more efficient mechanically and of superior appearance, not to mention comfort which is entirely non-existent in the Volkswagen.

For example, the Austin A 30 which costs £355, the Ford Prefect which costs £370, and the Ford Anglia which costs only £313, are all superior in many respects to the Volkswagen which costs £382. In other words, the problem of the motor industry is not to produce a cheap and efficient car, which it already does, but to demonstrate the quality of British cars to European buyers.—Yours faithfully,

H. MEYER

Chandler's Ford, Hants

Ultrasonics in Industry

Sir,—Non-destructive testing is particularly vital to industry at a time when raw materials are in short supply and competition on the increase. You rightly point out the potentialities of ultrasonic flaw detection, but it is necessary to stress that it does not replace or even compete with other forms of non-destructive testing.

To some extent the use of radiographic, magnetic and ultrasonic testing overlap but each method has its particular limitations as well as its applications—and the choice of the most suitable method will depend on the form and material of the article to be tested and on the nature of the testing problem. Anyone who is considering buying non-destructive testing equipment would be well advised to consider all the methods that are possible.

As far as ultrasonic flaw detectors are concerned I have found that equipment using a single-probe scanning technique is more economical in use, more reliable in its findings and easier in operation than the double-probe units previously available, but even this great advance in design does not enable ultrasonic equipment to test satisfactorily those problems where other methods are called for.—Yours faithfully,

J. D. HISLOP

Harrow

Development Areas Revisited

Sir,—May I add some footnotes to the articles in your issues of October 18th and 25th?

First, as regards the excess costs in the early years of a branch factory, the figures you quote from "The Cost of Industrial Movement" refer to operating costs, exclusive of productive materials. The excess cost on turnover is naturally lower, and for some purposes this aspect may be more important to the manufacturer. In a rather worse-than-average shoe case, the excess per unit in the third year at the branch was 13 per cent on operating costs, against 5 per cent on the turnover attributable to it.

Secondly, the differences between the findings in our study at the National Institute and that of Messrs Hague and Newman are, in the main, not differences between the shoe and clothing industries, but are due to our having measured different things. We compared the manufacturing costs per unit at the branch, in each of its early years, with the actual unit cost at the parent factory; they compared the cost effect on turnover, in various categories, of manufacturing at an established branch in a development area and at a (hypothetical) branch in the district of the parent factory. Further studies seem to show that while some clothing branch factories are easier to set up than shoe factories, the problems are similar both in these and in a good many other industries.

Thirdly, wide variations in cost experience at branch factories have been found. While some are more costly than the shoe factories you refer to, others have done substantially better than their parent factories after a short time. These variations have been found within a single industry and even in a single firm with more than one branch. In a final report which the National Institute intends to publish, it is hoped to show the causes of these differences.

The changing pattern of economic activity is always leading to geographical movements of industry and of people; branch factories are only one part of this movement, but under any government policy they would be an important part. The problem you pose, of deciding on the "areas that in the long run are most worthy of development," is perhaps thornier than you imply, and the means of solving it have not yet been worked out. Local planning authorities stake their claims, but cannot easily assess future industrial trends and have little influence over them. Meanwhile industrial decisions, both private and public, have to be made, and they are often based on rather short-term considerations.—Yours faithfully,

W. F. LUTTRELL

National Institute of Economic and Social Research.

Books and Publications

Right Honourable Ernie

Ernest Bevin. Portrait of a Great Englishman. By Francis Williams. Hutchinson. 288 pages. 21s.

Although Mr Williams has dipped his pen in honey to write this well-flavoured book, one closes it hoping that Ernest Bevin will have no imitators. They might try to be autocrats without remaining, as he did, one of the rank and file; they might, indeed, be bosses without having a title so humorously affectionate as "Ernie"; they might be great strike-leaders and fierce fighters of the class war without being negotiators so skilled that they grew to prefer conciliation to strife. Bevin could regard trade union democracy as something different from, and perhaps more important than, parliamentary democracy without treading too heavily on his countrymen's liberties; but another man might go in the direction of Stalin and make the exercise of power through organisation the whole purpose of his career. Indeed, there were moments during the war when the Minister of Labour was in fact a generalissimo.

The story is told here of how, in 1940, he jotted down the main points of the Emergency Powers (Defence) Bill in the train and had the legislation drafted and agreed by Parliament eight days later. His power was enormous and it was exercised in a grand manner to which Mr Williams's expert descriptive style does

full justice. Here it was, from the Ministry of Labour, that the foundations of the social revolution were laid and the Labour victory of 1945 prepared. To say this is not for a moment to question Bevin's patriotism; he was as stubborn a war leader as the Prime Minister himself. But he took to the full the chance to transform the relations between capital and labour under pressure of war. Whether, on a long view, any harm was done in the process Mr Williams does not pause to think or say. In more than one chapter he is too devoutly absorbed in his worship of the proletarian who made good. And what a story it is! As one watches the resolute, rolling progress from the Bristol mineral-water round to the door of the Foreign Office, interest in the man eclipses memories of the bitterness he aroused. One is forced to chuckle admiringly at a vanity that later became tiresome. Mr Williams quotes him as saying "They say Gladstone was at the Treasury from 1860 to 1930. I'm going to be Minister of Labour from 1940 to 1990." And only he could have said publicly to the left-wingers: "I am broad-minded. . . . The reason why I am so unprejudiced is that Dalton and Laski have never got hold of me."

This portrait is varied in quality, but it will certainly set many people thinking afresh about Ernest Bevin's conduct of foreign policy. It is possible to see now why he specialised in organising Britain's friends abroad into Western Union and Nato, and why he believed so fervently—against Continental opinion—in functional co-operation. He had achieved power for himself and "for my people" by organisation; he had learned "to combine a sense of the possible with a regard for the visionary objective." He distrusted the intellectuals with whom he had to deal in politics because they tended, in his experience, to betray organisation by being vain and to confuse negotiation by being dogmatic. The Foreign Office must have quivered with delight when he was heard to say "What we must do is not to create a situation"; that the professional diplomat from his public school and university should have such a maxim confirmed by the professional organiser who left school at eleven must have been something of a revelation. And it was a thousand pities that demagoguery in the White House helped to produce in Palestine just the kind of situation he was trying to avoid.

This book is most readable and in parts brilliant. Page 178, with its long description of Bevin's impact on Labour Party conferences is a good place to take the apéritif.

When he was done, having spoken, as like as not, well beyond the time allowed, for he treated rules with contempt, regarding them as without any possible application to himself, he would look around the hall with obvious satisfaction and then with great deliberation climb

slowly down from the rostrum and march back to his seat, each solid step seeming to say with due emphasis, "Well, that's settled that."

There is a tendency to overwrite and spoil one piece of description with another. In one place Bevin's sentences are described as "rough-hewn from the tough, intractable rock of language"; in another there is a reference to "peculiar trade union English born out of wedlock somewhere between Smith Square and Whitehall." And in the thrill of recording Somerset toughness Mr Williams sometimes forgets those who were crushed and bruised—for example, Ben Tillett and Lansbury.

Abdication or Fulfilment

Documents on British Foreign Policy, 1919-1939. Edited by E. L. Woodward and Rohan Butler. HMSO. First Series, Vol. IV. 1278 pages. 75s. Third Series, Vol. V. 818 pages. 52s. 6d.

The latest volume in the Third Series of the Foreign Office documents devotes more than 800 pages to only nine weeks of European diplomacy. The period dealt with is from April to June, 1939, from the British decision to guarantee Poland to the British decision to send Sir William Strang to Moscow. Every one of these pages is informed by the mounting tension which was obvious to all after Hitler's seizure of Prague and Mussolini's seizure of Albania. Only less noticeable is the extent to which, while they record a revolution in British foreign policy—the guarantees to Rumania and Greece, the Anglo-Turkish Declaration and the beginning of serious negotiations with Russia, all following quickly on the heels of the guarantee to Poland—they confirm the helplessness of the British Government to affect developments or control events.

It has long been debated whether this helplessness was due to a failure of British policy or whether it constitutes the British Government's chief defence. The main value of these documents is to show that the revolution in British foreign policy came much too late. They deal with many important episodes—with Hitler's denunciation of the Anglo-German and German-Polish Agreements, the dismissal of Litvinov, the conclusion of the German-Italian Alliance—not one of which, as the editors claim, appeared or could appear decisive to British observers. They show that the reason for this was that all the initiative and the power of decision that remained lay in Moscow and Berlin. In this sense, they leave little doubt, the die was already cast by April, 1939. And, given that the British Government did not act before it did, they defy the honest reader to claim that it could have acted otherwise.

If there was a failure of British foreign policy—and governments should be held guilty until proved innocent—we must seek for it earlier than 1939; and we must reach our conclusion after studying

more than the European evidence. Many students of the problem have already reached a verdict along these lines. But, although this collection of British documents contains some of the indispensable evidence, any definitive conclusion must still be delayed. Several volumes of the Third Series are still outstanding, and they will deal with such vital questions as the culmination of the Anglo-French-Soviet negotiations and the situation in the Far East between the summer of 1938 and the outbreak of war. The First and Second Series are even less complete, though they proceed steadily; Volume IV of the First Series, on British policy in the Adriatic and the Middle East in the second half of 1919, is another recent addition.

On the other hand, the collection has now proceeded far enough to suggest that its value will lie in confirming our existing knowledge, and not in making substantial alterations or sensational additions to it. And if this is true of the subsequent volumes, as of those which have appeared, it seems likely that the final verdict will not differ much from the opinion already widely held. There was a failure in British foreign policy. It took place in the late 1920s and the early thirties. It was one that was most difficult to avoid, though its chief intrinsic source was an almost congenital lack of anticipation. In 1939, and not for the first time, Great Britain was forced to realise that the responsibilities of a world position must be abdicated or fulfilled and that, if they are not to be abdicated, they cannot go unfulfilled for long.

More Readings

Readings in Monetary Theory. Selected by a Committee of the American Economic Association. Allen and Unwin. 514 pages. 30s.

It was perhaps inevitable that the editors of the later volumes of the American Economic Association's series of "Readings" should have to face the choice between selecting articles already published in a previous volume, and hunting far afield for suitable material. The present volume takes the latter course, and in consequence conveys the impression of a rather spotty mixture of the old and outmoded and the very recent and untested contributions.

Nevertheless, the book includes enough articles of lasting importance to make it a worthy addition to the series. Particularly useful republications are Professor Hicks's "A Suggestion for Simplifying the Theory of Money," Mr Franco Modigliani's "Liquidity Preference and the Theory of Interest and Money," Professor Pigou's "Economic Progress in a Stable Environment," and Mr Roland McKean's "Liquidity and a National Balance Sheet." Also interesting to the English reader are Mr Henry Simons's "Rules versus Authorities in Monetary Policy"—a challenging statement of the liberal view of monetary policy—and Mr Lester Chandler's lucid discussion of "Federal Reserve Policy and the Federal Debt."

While the merit of the other items selected is more open to question, it is difficult, given the editor's determination to minimise overlapping with other collections of articles, to suggest more eligible alternatives. Probably the weakest section is that on monetary policy, which leans rather too heavily on the Chicago school and provides little explanation of the growth of qualitative credit controls; here the editors might well have included Mr Henry Wallich's "The Changing Significance of the Interest Rate" or Professor Sayers's "Central Banking in the Light of Recent British and American Experience." It is also surprising that Professor Robertson's delightful essay "What Has Happened to the Rate of Interest?" does not even appear in the extensive bibliography which completes the volume.

It is an interesting reflection on the trend of English economics that, with the exception of the article by Professor Pigou already mentioned, the latest English contribution to the volume is dated 1935. Perhaps the resuscitation of Bank rate will revive interest in this important field.

New Light on the Classical Economists

The Works and Correspondence of David Ricardo: Vols. VI-IX: Letters. Edited by Piero Sraffa. Cambridge University Press. 353 pages. 387 pages. 403 pages. 401 pages. 24s. each.

With the publication of four substantial volumes of David Ricardo's letters the main structure of this majestic enterprise now stands completed, the fruit of over twenty years' research and editorial activity. A "Biographical Miscellany," and general index are to follow. The "Letters" are, from the point of view of the biographer and of the historian of economic thought, the most interesting and valuable part of the whole project. Of the 555 letters, written or received by Ricardo in the course of his correspondence with Mill, Malthus, Trower, McCulloch and others, no less than 320 are now published for the first time, and these the most important and significant. This new matter includes the whole body of the "Mill-Ricardo papers," discovered, by pure good fortune, after thirteen years of patient detective work had failed to trace them; letters which—besides incidentally casting an engaging light on the characters of both parties—explain certain obscurities, in the development of Ricardo's ideas of value, which misled even so acute an analyst as Edwin Cannan.

Study of these letters, and still more of the correspondence with Malthus, raises indeed some rather uncomfortable questions not only relevant to the ideas of Ricardo. A great proportion—though not, in the then state of economic thought, a proportion in any way excessive—of these long-drawn-out epistolary debates is concerned with the content of basic concepts and terminology; and the distressing fact is that all the acute intellectual power and mutual good will of the correspondents was insufficient to

bring them wholly, in the most literal sense, to terms. This same unsuccessful preoccupation with terminology has, to varying degrees, continued to characterise economic science to this day—inevitably so, perhaps. But when one finds a debate of the most crucial practical importance—that between Ricardo and Malthus on the nature and causes of a "glut"—petering out and abandoned in favour of the vain search for an invariable standard of value, one begins to feel a new sympathy for the econometric school, with its insistence that the tools of abstract analysis should be strictly operational. The inside history of economic thought as here revealed is, in fact, matter not only for economists but also for philosophers.

From Union to Famine

Public Opinion and Government Policy in Ireland, 1801-1846. By R. B. McDowell. Faber. 303 pages. 35s.

Dr McDowell has rendered a service to students of Irish history by extending his research on Irish public opinion to the period after the Union. In his new volume he has shifted the emphasis

THE BOOK THAT YOU CAN'T BUY

It is LANCELOT AND GUINEVERE—immortal tale of a guilty love—now about to be issued by the FOLIO SOCIETY in Malory's incomparable version. Bound in silver embossed in scarlet, with gay illustrations in heraldic array, this new edition is taken from recently discovered manuscripts. Not for sale, it is being produced as a free Presentation Volume for all members.

The Society publishes special editions of the world's greatest books, illustrated by distinguished artists, individually designed and craftsman-made. And, because the demand is guaranteed by members, these beautiful volumes often cost no more than ordinary editions. Membership is limited, but a few vacancies now exist for the new series. Here is your opportunity to join. For 20pp illustrated booklet hand coupon to your bookseller: in difficulty post to—

Wines of France

by ALEXIS LICHINE

This is a book for everyone who likes to drink wine—whether it be a fine bottle from his own cellar, or a glass with his meal in a restaurant. Mr. Lichine, himself owner of two vineyards in Bordeaux and one in Burgundy, and an exporter of repute, does not spend time on old and rare vintages, which are extremely costly if not completely unobtainable, but deals at length with all the wines of France which the wine-lover can both obtain and, as is so important nowadays, afford. He describes the wine districts vineyard by vineyard, the quality of their wines and vintages, and the variety of methods of viniculture and wine-making. The book is already circulating in France, and has produced high tributes such as this from *Comte Hubert de Beaumont, proprietor of Chateau Latour*: "I have lent this volume to many of my friends, who enjoyed it as much as I did. And being the head of a first Grand Cru as well as being closely related to the firm 'Moët et Chandon', I am very hard to please indeed."

328 pp., Demy 8vo. 21s. net

CASSELL

from public opinion to government policy and has thus sacrificed some of the originality of treatment that made his earlier study so valuable. In the forty-six years that divided the Union from the Famine, great political controversies raged almost incessantly in Ireland. The victory of Catholic emancipation was followed by the campaign for the repeal of the Union. Both movements were led by O'Connell, who emerges as the dominating figure of his time. O'Connell combined an unusual collection of religious, patriotic and social principles which gave him an immense power of appeal to the masses of the Irish people. But there were important groups in Ireland, among both Catholics and Protestants, who resisted O'Connell's demagogic attraction. Dr McDowell traces the evaluation of opinion in these minority groups, and shows the gradual withdrawal of Protestants from the national movement which they had supported so strongly in the previous century. The development of a separate political consciousness by north-east Ulster can also be observed.

Irish affairs occupied a considerable amount of parliamentary time, though not so much as they were to occupy in the eighties. English ministers must often have regretted the passing of the Union that made them responsible for the government of a country so different from their own. As the Industrial Revolution progressed, British and Irish conditions diverged more widely. Well-meant but ill-advised measures failed to secure economic prosperity for Ireland, which drifted slowly to the catastrophe of the Famine. The Irish spectre was never long absent from the British political scene. Lord John Russell asserted that almost every major political crisis since the beginning of the century had been caused or complicated by Irish affairs. Happily there were some constructive achievements during these depressing years. The foundations of the modern Irish civil service, municipal government, police, poor law and primary education were successfully laid. On all these subjects, Dr McDowell, armed with his accustomed impeccable scholarship, provides light and guidance.

Ancient Empire

The Hittites. By O. R. Gurney. Penguin Books. 240 pages. 3s. 6d.

This little volume derives much of its fascination from being a report of work in progress. The secret of the Hittite hieroglyphic script is as yet unbroken, but bilingual inscriptions found at Karatepe, in the foothills of the Taurus mountains, promise results in the very near future. As it stands, Mr O. R. Gurney's book is a summary of all the knowledge so far gathered about this powerful empire, which ruled the Anatolian plains from 1700 to 1200 B.C. It is an admirably lucid account, illustrating time and again how the structure of the remote past can be conjured out of mere fragments and dim memories. The process of analysis resembles that of astrophysicists, who determine the structure of dead stars

from the content of a few meteorites. The chapters devoted to Hittite law and social institutions are especially well documented, whereas that on languages is more of a catalogue of unsolved problems.

The interest of the general public in archaeology is well served by the Pelican series, and Sir Leonard Woolley's new book on "a forgotten kingdom" in Asia Minor is to be published early next year. But the very fact that this series is meant for the general reader prompts two criticisms. One small map, on which most names mentioned in the text are either missing or given in a different form, is not enough, and certain highly technical sections (such as a fascinating discussion of the possible relationship between the Hittites and Homer's Troy) would be better as appendices. The illustrations, on the other hand, are remarkable, especially when one considers the price of the book.

Galaxy of Dickens Characters

The Humour of Dickens. Chosen by R. J. Cruikshank. News Chronicle Publications Department. 145 pages. 3s. 6d.

This anthology does in book form what Mr Emlyn Williams is doing on the stage. It presents some of the richest and rarest of Dickens's characters, in passages selected by Mr R. J. Cruikshank and illustrated by distinguished modern cartoonists—Messrs Ronald Searle, Osbert Lancaster, Joss, Illingworth, Low, Giles, Michael Cummings, Vicky, Horner, and Ardizzone. All these have given their work as a labour of love, and the profits are to go to the Dickens Fellowship, on the occasion of its jubilee, for the Dickens House Endowment Fund, the income from which will be devoted to the upkeep of the Dickens House.

In his introduction Mr Cruikshank points out that the modern world is apt to forget that Dickens was perhaps at his greatest as a humorist and to think of him primarily as a pioneer of social reform. "Our Russian friends, for example, delight in the Eatanswill Election scenes in *Pickwick* as devastating exposures of our bourgeois parliamentary system." A pioneer of social reform Dickens certainly was, but, as Mr Cruikshank says, his genius is seen in its true splendour in his comic inventiveness. It is a warm humour that ennobles, not degrades mankind. "He transforms the shoddiest of humanity into shining immortals." Among the shining immortals whose acquaintance the reader can renew in this book are Podsnap, Pecksniff, the Mantalins, Mr Chadband, Mr Micawber—and many more.

The artists have obviously enjoyed themselves illustrating Dickens. Mr Ardizzone in particular seems very much at home with him—his drawings are in the tradition of Phiz, but wittier and more significant; and there is a superb Mr Bumble by Ronald Searle. Altogether, this is an ideal bedside book, or (at its modest price) a perfect Christmas token.

For which Period did they build?

AMERICAN SURVEY

The General's Victory

Washington, D.C., November 5th

THE breadth and depth of General Eisenhower's victory has made the professional Republicans who managed and master-minded his campaign look very small. They expected nothing like this; they had never had on their hands a candidate who had come within miles of producing these results. There is no way of knowing the private thoughts of Senator Taft as he heard the election results come in and saw the response of the country to the man he and his followers were battling to deprive of the Republican nomination only four months ago. But they must have been tinged with amazed envy.

The Republican professionals on November 5th had the air of hard-working chorus girls watching a prima ballerina. Never in their lifetime could any of them expect to put on the performance that was being given by a man who had been saying at intervals throughout the campaign, "I am not a politician, and I suppose I never shall be." Not a man among the professionals could have seen himself turning Texas, Florida, and Virginia into Republican states, while simultaneously carrying New York by 830,000 votes, Illinois by 400,000 and California by what appears to be over 500,000. The experience might be called chastening, if it were not for the fact that men who have spent a lifetime in politics do not chasten easily or permanently.

No great exhibition of deference and humility is to be expected from the Republican professionals during the coming months. But it will probably not be easy for them to ignore the central truth that General Eisenhower owes his election very largely to liberals and other non-isolationists in both parties from coast to coast. By a simple, if ironical, corollary, many Republican conservatives and near-isolationists owe their Senate and House seats and the party certainly owes its Congressional majorities to the confidence General Eisenhower, at the head of the Republican ticket, inspired in these same groups. Even so, several of the worst Republican isolationists have been defeated in the Senate races.

In theory, at least, this should relieve President Eisenhower from the necessity of making, in the White House, the sort of compromises with the paladins of the Republican right

wing that he accepted in the name of unity during the campaign. But theories do not always work out and it will be necessary to wait and see whether a new coalition of Congressional liberals and middle-of-the-roaders will be wooed and won by the new President. Certainly the old coalition which served, if it sometimes failed to satisfy, two Democratic Presidents during the last twenty years has fallen apart throughout the nation.

Republican newspapers are congratulating the South on having struck off its chains and entered the company of the two-party states. It may take another election or more than one to show whether the Democratic solidity of the South has been permanently dissolved. But there is every present sign of satisfaction below the Mason-Dixon line with the South's iconoclastic venture. The trade union leaders, with

the possible exception of Mr John L. Lewis, most of whose loyal miners in West Virginia seem to have been armed even against General Eisenhower, have no testimonials to their political influence to offer anyone any more. It did no good for the leaders of the American Federation of Labour to break tradition so boldly with so resounding an endorsement of Governor Stevenson. The Congress of Industrial Organisations might as well have "stood in bed", as the Americans say.

Every one agrees that women and the new young voters liked Ike and helped to put him in. But the revolution has gone further and deeper than that. The Democrats, who were the majority party—the entrenched party in control of the huge federal machine—have been swept out of office although they had provided the nation with the most prosperous times in its history and although they presented a candidate with the stamp of greatness upon him. There existed, after all, the shared experience which alone can produce a landslide of these proportions. Enough Republicans, Democrats, and independents felt alike about the stalemate in Korea, about the "mess in Washington," about high prices and high taxes, and about the new hope which the good rugged soldier seemed to offer.

Of all the factors which contributed to the remarkable popular vote General Eisenhower has received, the most easily discerned is the dissatisfaction with the indecisive war in Korea. This is going to be the first more than man-sized job

the President-elect will have to tackle. His promised flight across the Pacific to Tokyo and to the remote peninsula where the world's most dangerous local war is in progress is now being planned. This is a dramatic enterprise and it is a dangerous one, not only in terms of its physical hazards, but also because of its possible political and international effects. The nervousness it will undoubtedly occasion among a number of the members of the United Nations participating in the war may be allayed. But as things stand now, it looks as though it will not be easy to reassure America's allies and, at the same time, satisfy the millions of Americans who elected General Eisenhower in the belief that some new way out of the impasse can be found.

If the results of a public opinion poll published during the final stages of the campaign are to be believed, there is a two to one majority in the United States which has lost patience with the negotiations at Panmunjom. It is persuaded—or at any rate is ready to offer the opinion—that it would be better to enlarge the war as a means of winning it and getting it over than to continue the present stalemate indefinitely; or, if that is impracticable, to pull out and leave the South Koreans to do the fighting.

General Eisenhower's aim may well be to speed up the training and equipment of new South Korean divisions for front line duty. But if that is to be the sole positive outcome of his trip to Korea and if the length of time it will take to retire American divisions to reserve positions—and thus substantially to reduce the American casualty lists which have been issued for so many months by the Defence Department—should come as an unpleasant surprise to most of the voters, it is conceivable that the honeymoon period of the new President may be shorter than it should be.

The posts of Secretary of State and Secretary of Defence in the new Administration are being eagerly but inconclusively offered by the newspaper columnists to Senator Lodge, who was defeated in Massachusetts, to Governor Dewey, to Mr Paul Hoffman and to Mr John Foster Dulles. No matter who are chosen, the new President and his Secretaries of State and Defence will at once find themselves under pressures to take action on Korea which would be much better deferred. They may be able to resist, but at best the campaign and its results have left a big and immediate problem at the door to the White House.

College Invasion

[FROM A UNIVERSITY CORRESPONDENT]

UNDER the postwar programme of educational exchanges, over 30,000 graduate and undergraduate students are now coming each year to some 1,300 American institutions of higher education, to the small ones as well as to the large; in addition a mass of trainees is being brought to the United States by the foreign aid authorities, to learn American techniques in industry and agriculture. These university students from abroad only make up about one per cent of the total enrolment in American colleges, although in the Massachusetts Institute of Technology a tenth of the students are foreigners and the proportion is about five per cent in several other colleges, notably Columbia and the University of California, each of which has nearly 1,500 foreigners in its student body of around 30,000.

The foreign students come from more than a hundred countries, led by Canada and China (the Chinese students are no longer able to return home). Next come Germany and Japan, as a result of the schemes for re-educating ex-enemies; Mexico and the United Kingdom also each had over 1,000 students in the United States during the last academic year. Every state in the Union has its share of these students, depending mainly upon the number of its colleges. Two-thirds of them are in their twenties, nearly one-third of them are women and they study more than fifty subjects. Most of those from Asia and the Middle East take engineering, while the Europeans prefer social science and arts courses; religion is also a popular subject.

It is estimated that the average cost, including travel, tuition and board and lodging, is about \$2,500 a year for each student. Over half of them have some sort of scholarship, from their own or the United States government, from some private agency at home or in the United States, or most frequently, from the American college itself. The US government helps, chiefly with travel grants, under the Fulbright and Smith-Mundt Acts, passed in 1946 and 1948 respectively. They are largely responsible for the present welcome invasion of foreign students. Under the Fulbright Act, named after a Senator who was himself a Rhodes scholar, only foreign currencies are available, derived from the sale of surplus American war property abroad. This money can be used to enable Americans to study in foreign countries—well over 3,000 of them have taken advantage of the opportunity—and to cover the travelling expenses of foreigners who wish to study in the United States.

In Great Britain, for instance, sterling to the value of \$1 million is being made available for this programme every year for twenty years. Some 700 grants, about one in ten of those requested, are being made annually under the Fulbright arrangement. Congressional appropriations pay for the American end of the scheme.

Educational commissions have been set up by the US government in over twenty countries to deal with these exchanges. In the United States they are handled officially by the State Department's International Information Administration and unofficially, and very effectively, by the Institute of International Education in New York, which manages scholarship funds for private groups and advises American

FOREIGN STUDENTS IN THE UNITED STATES

"Type these fifteen letters please"

The Dictabelt has revolutionized office dictation!

FIFTEEN LETTERS or even more on a little plastic belt! That is only one of the amazing developments in office dictation made possible by the Dictabelt, the revolutionary new recording medium of the Dictaphone Time-Master.

More dictation. Fifteen minutes of solid dictation goes on to each Dictabelt; fifteen minutes of notes, letters or memoranda for your secretary to type when it is most convenient. Dictabelts fold flat for compact filing and up to ten can be posted for a 2½d. stamp.

Easier dictation. The Time-Master is extremely simple to operate—there are no time-wasting controls to set or adjustments to make. It is designed to achieve the maximum efficiency with the minimum of effort both when you dictate and when your secretary transcribes.

Better recording and reproduction. Time-Master recording on plastic Dictabelts is crystal-clear from beginning to end. The sensitive microphone catches every word you say—even a whisper: this makes transcription both easy and accurate for secretaries.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform backspacing, immediate place finding.
4. Simple automatic operation.
5. Mailable, filable, expendable Dictabelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107 Kingsway, London, W.C.2.

students going abroad as well as foreigners coming to the United States. It has been suggested that the latter have not always been wisely selected, especially when the choice has been that of public or private groups in their own country rather than of some American organisation. Another source of trouble has been the difficulty of arranging adequate "orientation" courses, to give foreign students some idea of how America lives in general before plunging them into the specific ordeal of a college existence, especially trying if it also means living in a huge city such as New York or Chicago. Such programmes are particularly necessary for the many students who speak little English and for those who come from areas with an entirely different cultural background, such as Asia or the Middle East. Many of these students also meet racial discrimination, although every effort is made to place them in communities where this problem is not serious.

Nevertheless a number of foreign students leave the United States embittered by race and class discrimination (particularly after hearing some of the exaggerated claims that it is non-existent), shocked at the political apathy of Americans and their ignorance of other cultures, governments and economies and with contempt for the country's superiority complex and for what seems to be a sacrifice of the spiritual for the material. The foreign student is likely to be older, more mature, more intelligent and more serious than his American counterpart and some apparently never adjust themselves to the informal manners of Americans, their superficial friendliness and lack of restraint in public, their care-free neglect of their studies or even their different eating habits.

Undoubtedly, however, the vast majority of foreign students return home pleased with what they have found and with a balanced appreciation of American democracy, free enterprise and foreign policy. For example, the student exchange programme, which began in 1939 as far as Latin America was concerned, must be given a share of the credit for the improvement in relations with the southern half of the hemisphere during the past decade. But there has been a tendency to take the benefits of the exchange programme, which are obvious even to the most cynical, too much for granted. It is sheer nonsense to believe that the mere presence of foreigners in the United States will ensure good fellowship and friendly relations, that it is enough to hope that, if all doors are thrown open to visitors, they will reach the considered judgment that the country's good points outweigh its bad.

But on the American side the overwhelming evidence is that the presence of foreign students has become a challenge to the colleges and will have real significance for them. Even though the exchange programme is so far only "something pasted on to our institutions," not an integral part of them, it has helped to give new reality to college teaching. For American studies have always centred to a great extent round the cultural heritage from western Europe, Italy, Greece and the Near East. Personal contacts have made American students more aware of the need for a real understanding of the demand in other countries for independence, opportunity and education, and have helped to awaken them to the obligations of world leadership. Moreover, the educational exchange programme has done something to counteract the recent tendency to anti-intellectualism in the United States, the suspicion of the unorthodox, and has strengthened the colleges in their stand for open-mindedness.

These ambassadors from abroad are going into every type

of American home and community. More and more are coming to the United States through the generosity of local organisations; when the women's club of Greenwood, Mississippi, brings a French girl to college, the whole region is likely to feel the repercussions. Thousands of these students are constantly giving talks on their home lands and discussing their ideas with eager audiences in sections of the country which in the past have seldom seen a foreigner.

This impact on local communities may be of even greater significance than the influence on the colleges. If continued, it will surely help to break down some of the provincial prejudices and nationalistic exuberance of which many foreign students have complained and to build up that respect and confidence between individuals which provides the only firm basis for friendship and co-operation between governments. The firm belief of the enthusiasts who have inspired this programme is that it is, or at least can become, "the most effective and hopeful" of all the efforts now being made to strengthen the free world.

American Notes

The Verdict

General Eisenhower has been swept into the Presidency by a popular majority which, at the time *The Economist* went to press, had reached 6 million on a total poll of over 57 million. In the electoral college, which always exaggerates both a victory and a defeat, the General seems certain of 431 votes from 38 states to Governor Stevenson's 100 from 10 states. The Democrats have been driven back on their crumbling ancestral stronghold in the South; Governor Stevenson did not carry a single state which was not either a southern or a border one. Even in the Democratic debacle of 1928—the last time a Democrat lost—Al Smith carried Massachusetts and Rhode Island. It is a tragic irony that so enlightened and intelligent a campaigner as Governor Stevenson should be indebted for his few crumbs of electoral comfort to a cluster of backward states where the proportion of voting to population is so low.

It would be disturbing if the Democratic politicians were to conclude that Governor Stevenson's high-minded campaign—and Senator McCarthy's low-level one—contributed to the collapse. In fact Governor Stevenson probably did better, in terms of popular votes, than any other candidate available for the Democratic nomination last July would have done. His popular vote, at 25.7 million, is greater than President Truman's was in 1948. General Eisenhower's majority is overwhelming compared with those by which President Roosevelt and President Truman won in 1944 and 1948, but unless it widens rapidly as the rest of the poll comes in, it will not compare with the majorities of 7 million and 11 million won by Roosevelt from a smaller electorate in 1932 and 1936.

* * *

A Close Shave for Congress

The voters who turned out for General Eisenhower were clearly much less enamoured of the rest of the Republican candidates. This can be most clearly seen in the House, where all the seats were at stake this year and which normally gives an incoming President a substantial majority. Instead, the Republicans seem likely, with eleven votes still in doubt, to have a majority of only ten or twelve, compared with a Democratic majority of thirty in the last House. The final composition of the Senate is now expected to be 48 Republicans, 47 Democrats, and Senator Wayne Morse. The Republicans have just managed to avoid giving Senator Morse—who walked out of the Republican

party in protest against General Eisenhower's campaign—a deciding vote he would have enjoyed using. On the present results, the Republicans will organise the Senate, and enjoy, for the first time since 1948, the power involved in holding the committee chairmanships in both houses. Senator Nixon, presiding over the Senate as Vice-President, will cast a deciding vote in any tie. The prospects are that the youngest Vice-President may have a stormy session, though party lines count for less in the Senate than in the House or most other elected-legislative bodies.

Though the Republican Congressional majorities are so narrow, there is cause to be thankful that they exist at all. It would be hard on the first Republican President in twenty years to be harassed by an opposition Congress, and to have the Democrats able to reject his appointments. The voters have put a brake on the freedom of a Republican Administration by refusing to give it big Congressional majorities. But the power—and the responsibility—are both clearly Republican.

The voters' discrimination between the presidential and congressional races is evident in some of the Senate results. Senator McCarthy seems certain to be a thorn in General Eisenhower's flesh as a committee chairman, but he has apparently not done as well as the rest of the Republican ticket in Wisconsin. Though Senators Malone, Watkins, and Jenner, three of the poorest Republican candidates, have been swept back to Washington by the Eisenhower tide, Senator Cain has gone down in Washington, Senator Kem has been defeated by Mr Stuart Symington in Missouri, and Senator Ecton seems likely to give way to Mr Mansfield in Montana. In Kentucky, a first-rate Republican, Mr John Cooper, has been preferred. Senator Langer has been returned from North Dakota to take over the chairmanship of the Judiciary Committee from the intolerant Democrat, Senator McCarran. There are Senators on both sides, however, who will be missed. General Eisenhower was unable to save Senator Lodge in Massachusetts, and both Democratic candidates in Connecticut, one of them the internationally-minded Senator Benton, who had incurred Senator McCarthy's enmity, were defeated.

The General Inherits Prosperity

The rejection of the party in power at a peak of peace-time prosperity is one of the most conspicuous ways in which the election results broke the political rules. "Save the boom" measures from Washington did not save Governor Stevenson, while the voters clearly turned a deaf ear to the Democrats' warning that a vote for the General was a vote for hard times. In some business quarters there is, indeed, a suspicion that a Republican victory may exert a deflationary influence, because of General Eisenhower's vehement promise to cut government spending next year by 10 per cent or more. But the more sophisticated Wall Street view has been that the General would not find it easy to carry out his promise to cut government spending substantially, at least not for two or three years. By the end of his campaign General Eisenhower had pledged himself to continue all the New Deal measures which his party has criticised for so long as extravagant, supports for farm prices, soil conservation, irrigation projects, and electricity development. He repudiated with indignation the suggestion that he would not bring all the resources of government into play at the first sign of a depression.

Present prosperity may be "phony" as the General alleged, and balanced precariously on defence spending, but it is very widespread. The Federal Reserve Board expects that industrial production, which in September reached a postwar record, will be shown to have inched upward a trifle further in October. Steel production rose steeply in September, after the strike, and is now running at 106 per

cent of the industry's capacity at the beginning of the year. The automobile assembly lines are humming. Sales at all kinds of retail stores in September were 7 per cent above those a year earlier; department stores sales were up in October, and even in New York City, where they have had a depressing year, department stores' last month drew even with their 1951 figures. Consumer credit outstanding reached a new peak in September. Makers of textiles, shoes, television sets, and washing machines are at last getting the benefit of the pick-up in the shops. Manufacturers have unfilled orders worth more than \$70 billion on their books—\$10 billion more than they had a year ago. Earnings (after taxes) in the third quarter are 3 per cent higher than they were in the second, and 2 per cent higher than they were in the third quarter last year, for the 525 companies whose reports are tabulated by the National City Bank of New York. For two-thirds of them, however, the first nine months, as a whole, was less profitable this year than last: sales are up, but so are costs.

Politically, it may well be less advantageous, and much more risky, for a new Administration to assume office at the top of a boom rather than at the bottom of the trough, as Franklin Roosevelt did in 1932. The business men who confidently expect sympathy and understanding from the Eisenhower government and who will provide many of the new President's advisers will have a chance to prove their gratitude and show how much they have learned in the past twenty years about avoiding a slump.

Green Book in the Air

Officials concerned with foreign economic policy have for some time been floating trial balloons filled with various new approaches to the problem of aid for America's allies. Already some of these balloons have been shot down and the air has thus been slightly cleared, although probably only temporarily, for President Eisenhower. It was already obvious that the new President and the new Congress, whatever their political complexion, would be unwilling to continue pouring dollar aid, which in all its forms has cost the country about \$40 billion since 1945, into the Atlantic Pact bucket without some assurance that the often-promised end to economic assistance was really in sight. And the European recipients of this aid are equally anxious to be free of the embarrassment of being dependent on the bounty of the United States, especially since the new Administration and the new Congress are expected to scrutinise the use made of American funds even more critically than did their predecessors.

This idea that a permanent solution must be found is common to all the trial balloons, but there is as yet no means of telling whether any of them, or any combination of them, will be acceptable to President Eisenhower as a way of putting the idea into practice. Most of the balloons do, however, contain another idea that is very close to his heart, that of pushing Europe into unification. One of the schemes proposes that in future military aid, in the form both of actual equipment and of dollars for off-shore buying, should be directed to the European Defence Community, not to individual countries, in order to encourage centralised procurement. Another scheme is for two Atlantic Boards, one to be responsible for a dollar pool to make currency convertibility a practical proposition and thus to facilitate an expansion in foreign trade, the other to co-ordinate trade policies and to steady commodity prices.

This is the Mutual Security Agency's now-famous "green book," which had been flying around Washington for some time, being sniped at by the Treasury. It was finally brought down to earth last week when the press began to discuss it as if it were the agency's official plan, instead of only a discussion paper produced by a few members of the staff and already out of date. The only proposal that is at all firm is much less revolutionary, but none the less desirable

GROW MORE FOOD IN BRITAIN

Ferguson tractors are manufactured for Harry Ferguson Ltd., Coventry, by The Standard Motor Company Ltd.

"...has decided on a scheme
to modernize the docks
at a cost of..."

**Where Vickers
can help**

With the brief news announcement that an important scheme of works is to be put in hand, there begins a period of intense activity for those who are to carry out the task. Frequently Vickers are called in, for they have been supplying equipment for docks, harbours, railways and other large-scale projects since before the memory of this generation. These are not by any means their only activities, for the engineering skill and resources of the Vickers Group also contribute to progress in many secondary industries, including soap, paint, brewing, printing, and plastics.

Among the products and services of the Vickers Group are: SHIPS
SHIP REPAIR SERVICE • MARINE ENGINES • DOCK GATES AND
MACHINERY • AIRCRAFT • RAILWAY ROLLING STOCK •
INDUSTRIAL, MINING AND POWER STATION EQUIPMENT

Revolts Behind Bars

Serious riots in the state prisons of Ohio and Illinois have brought the national total this year to twenty. The attention of an indifferent public is once more being directed forcibly to the fact that the American prison system is on trial. It was a trifle hard that Governor Stevenson should have had to abandon his campaign to quell a riot in Illinois, for he is a believer in modern methods of correction and considers that a prison term should be spent preparing the offender to return to the community. But in practice, small prison budgets, inflation, and overcrowding in ancient buildings—that in Illinois is over 75 years old and that in Ohio even older—often defeat the most ardent reformer.

Both in Illinois and Ohio the riots were suppressed without the bargaining, the bonhomie, or the steak and ice-cream dinner which are so disturbing an aspect of the peace with the Michigan rioters last spring. But in Ohio the more docile prisoners are already being transferred elsewhere, a recognition that overcrowding and a failure to segregate the most hardened cases was partly to blame. In this respect, as in others, the federal prisons provide a model, though admittedly they house only 17,000 compared with the 150,000 detained in state institutions. Some of the states now differentiate between offenders, but too often all are herded into gloomy fortresses designed to provide a degree of security from escape which is required in only a fraction of the cases. Federal prison construction in the past fifteen years has been devoted entirely to medium and minimum security institutions; work and rehabilitation are provided for all. Two-thirds of the federal prisoners enjoy this relatively mild form of detention. There have been no organised outbreaks in federal gaols in the last two years. Young offenders will be given even more individual attention, both in sentencing and treatment, under the Youth Correction Act, recently signed by President Truman.

Modern penal methods are based on the fact that 95 per cent of all prisoners eventually are released. Better classification of prisoners is needed, however, if individual corrective treatment is to be possible. This would end the confinement of young offenders with hardened old ones, psychopaths, dope addicts, and sexual degenerates which a daring reporter recently found in New York when he committed a sham crime to obtain a prison scoop. It would make it possible to suit the punishment to the criminal—and to choose, more successfully, those who are eligible for parole or probation. Many more prisoners may have to be placed on parole or probation if, as some observers fear, the cost of rehabilitating them in modern prisons proves prohibitive. But this would require better parole agents and probation officers and many more of them, if new crimes committed by men on parole are not to harden the community against the whole parole system. Today parole officers are often political appointees and they are not paid much more than unskilled labourers.

* * *

Whip-hand Over Credit

The Federal Reserve authorities appear well satisfied with the results of the accord reached with the Treasury eighteen months ago, which relieved them of the obligation to support government bond prices at par. This requirement had previously had the effect of forcing the Federal Reserve to supply fresh reserves to the banks, and thus create new money, whenever the banks chose to sell govern-

ment bonds. It is not conclusive proof of the effectiveness of the new monetary policy that wholesale prices have fallen and that the rise in the cost of living has been slowed down, if not actually brought to a halt. The monetary accord was concluded just after wage and price controls were imposed, and at a time when the scare-buying which followed the Korean attack was about to slacken. But as the charts show, the FRB is now in a position to make the banks respond to orthodox monetary weapons.

On balance, as seasonal demands for credit appear, member banks' borrowing tend to exceed their excess reserves—the reserves they hold in addition to the minimum that they are required to keep. The member banks' reluctance to remain in debt to the Federal Reserve means that they scrutinise all

new loans with increasing care. The net rise in business loans of leading banks in 94 cities was \$732 million from June to September; this shows little change compared with the corresponding months of last year, but it is a long way below the total of nearly \$2 billion in the corresponding period of 1950. The FRB today can see that there is adequate credit for business without contributing to inflation.

The central bank has used its new authority with discretion. As it was consulted on the terms which the Treasury should offer in its \$10.7 billion refinancing in September, the FRB eased the way of the new issue by buying \$600 million of it. But open market operations over the whole year have tightened the money market and made the banks dependent upon rediscounting in times of stringency. The consequent rise in interest rates, in turn, has made government securities more attractive to private investors, particularly corporations.

The real test of the new relationship between the FRB and the Treasury is yet to come. The cash deficit this fiscal year—which comes after two years of near balance in the federal cash accounts—has been largely covered by borrowing. Even if General Eisenhower can avoid further deficits, his new Secretary of the Treasury, in his first year of office, will be faced with \$47 billion of refunding, of which over half is in one-year certificates. Should he attempt to lessen the present dependence on short-term financing, which is cheap, but makes the Treasury vulnerable to changes in money-rates and leads it to demand support from the central bank? He must also consider whether to ask Congress for authority to make savings bonds more attractive. Interest on these bonds was raised to the legal limit—3 per cent—last May, but the Treasury is still paying out more than it takes in.

THE WORLD OVERSEAS

Building Up Indian Industry

(From Our Correspondent in India)

MANY people in India regret that industrialisation has had to take a back seat in the country's Five-Year Plan. But this decision, taken for statesmanlike reasons, is one of priority only: the emphasis on industry has been deferred rather than laid aside. Indeed, nothing produces more optimism about the future of Indian industrialisation than to glance at its past, for there one can see not only how formidable are the obstacles, but also how certain it is that they will be surmounted.

Before 1914 India provided the classical case of a colonial economy. It exported food and raw materials; it imported, mainly from the mother country, industrial products, largely consumer goods, including three-quarters of the clothes of its people and the majority of their brass pots. Its only major industry was the making of jute goods. This position was the inevitable result of the free trade principles of the Indian Government. The elements of truth which lay behind this attitude are still of importance in governing the pace and direction of future industrialisation. India is still very lacking in the external economies that make new development relatively cheap. Outside a few main towns a new factory must not only import all its skilled labour, and train all the semi-skilled, it has also to build houses for all its management and many of its workers. Even in the great cities the employer has to accept responsibilities for training and medical facilities and often also for housing, which in other countries are the responsibility of municipality or state. The initial capital the entrepreneur requires is, moreover, considerably greater than elsewhere. He can usually not buy or lease a factory; he must build it, as well as the services that go with it. He thus not only needs more money, but he also gets no return during the whole period while the land is acquired—never a very rapid process—and the building is constructed.

Shortage of Trained Men

Even when he has his factory, he still has to face difficulties unknown to his western confrère. India is very short of good managers, good foremen, good artisans. A new works must either import foreigners or train its own staff. The railways were importing express drivers until not many years before the war, and most of the Ordnance Factory foremen, like the assistant weaving masters in many cotton mills, were English in 1939. Today the importation of foreigners at any level below the top is crushingly expensive, while the training of local cadres—obviously, in the long run, the better solution—takes time and money and the capacity to bear disappointments.

The labour, too, though apparently cheap—the Indian unskilled rate is about 30s. a week—is often not so in fact. It is usually raw from the village, with all that means in absenteeism, low norms, and high maintenance costs; and its naturally low productivity is made lower by the conditions under which it lives. One cannot expect really hard work from a man who gets a ration of 12 oz. of cereals a day, whose family is in his home village while he lives in one tenement room with half-a-dozen of his fellows, and who comes to work on a train carrying four times its proper complement.

These are the Indian entrepreneur's major difficulties. He has to face also a whole series of minor ones. There is a

lack of good workshops, so that he has to do much of his own engineering work. Despite the improvement in the last few years, railway wagons are often difficult to get, and line capacity and marshalling yards, inadequate even around Bombay and Calcutta, are hopelessly so in the main steel and coal areas, while distribution into the countryside and collection of raw materials are severely handicapped by lack of roads. Because of the protection, often necessary, given to other industries, he has to pay more for the raw materials and components he buys. High grade textiles, for example, are rendered more expensive by the import duty on cotton.

When all these difficulties have been overcome the Indian entrepreneur still has to face the problem of finance. A few of the bigger foreign houses and managing agencies can always obtain the money they need for a really profitable proposition; but the vast majority find themselves caught between the upper millstone of banks and the nether millstone of share market. The former like to be liquid, and therefore, while they will make advances on stocks reasonably freely, are normally willing neither to make advances of fixed assets nor to put much of their resources into industrial securities; in the latter, which is narrow and speculative, even the best firms cannot always raise money on reasonable terms.

Some Unhelpful Policies

In addition there is always the Government to deal with, over foreign exchange, import licences and permissions to get steel or to raise capital, labour disputes, and the location of industry. The Government's understanding of industry has improved greatly over the last five years, and expansion is no longer sterilised by threats of nationalisation; but at the very best controls mean delay, expense and visits to Delhi; and some of the Government's policies are still positively unhelpful. The duty on palm oil, which protects no one, makes soap unnecessarily expensive. Expansion of modern industry is sometimes held up to protect high cost cottage producers whose methods, particularly of marketing, are too primitive for them ever to be able to expand the market themselves. Above all, high rates of taxation, especially combined with depreciation allowances based on historical cost, greatly reduce the capacity of a business to build itself up from its own retained profits.

The list of difficulties is formidable and it explains both the high protectionism of the Indian Government and its difficulty in choosing exactly those industries which are truly infant to which to give its patronage. Both for the cotton textile and for the steel industry India has great natural advantages; but each required some 30 years of heavy protection before it could compete on equal terms with imports. Doubtful though one may be of, for example, the protection given to some of the basic chemical industries, for which the distance between salt and coal is a permanent handicap, it is often not possible to say that the present burden will not be justified by future advantages.

India has now completed the first stage of industrialisation. It has created a light consumer goods industry. By 1939 nearly all the Indian villagers' clothes and brass pots, soap and matches, were home made. The Indian cotton

What 'TOP HAT' retirement means to a senior executive

An Export Director, salary £5,000, aged 49, married, with no children, has a Top Hat policy taken out for him this year by his employer.

Annual premium, a business expense, is ... **£ 1,602**

He has life cover until retirement of ... **£ 27,820**

Then a pension for life of ... **£ 2,564**

OR, he may have a tax-free cash payment on retirement of ... **£ 6,955**

In which case he will still have a pension for life of ... **£ 1,923**

BUT to pay that £1,602 premium himself
he would have to set aside from his
earned income each year not less than ... **£ 3,209**

Senior men find it difficult to make provision for retirement in these days and staff pension schemes are not always suited to their needs. Many employers are using the Top Hat retirement scheme to help such men. Robt. Bradford (Pensions) Ltd., who are specialists in pension arrangements, will be glad to discuss cases and possibilities with you.

*Painted 1926—
repainted 1951*

The brick and stucco of the Chadacre Agricultural Institute were painted with white lead in 1926. For a quarter of a century it was not touched. Then, last winter, the accumulated dirt was washed off before repainting—and that was all that was needed to be done: the original paint had worn thin, of course, but the film was smooth and unbroken; it formed a perfect foundation for the three coats of white lead. Although we do not pretend that 25 years between paintings usually gives the most economical maintenance, this building is a very good example of what we mean when we say white lead paint lasts.

NEWS FROM THE FISHING INDUSTRY

Bringing the gales home to you!

This map shows you the various gale-warning areas made so familiar by the B.B.C. The figures below each name indicate the average number of days a year on which a gale is blowing.

When it is considered that most of these gales occur during December, January, February and March and that fishing is impossible under gale or near-gale conditions, it is not surprising that fish is sometimes scarce in winter.

British trawlers know their job!

Issued by the British Trawlers' Federation Limited

The Golden Talbot Inn, Liverpool

UNTIL the middle of the eighteenth century Liverpool was almost cut off from the rest of the country by the lack of a main road. In 1760 the road through Warrington was completed, and in 1766 a coach which did the journey to London in three days set out from the Talbot Inn. On this site the Bank of Liverpool conducted its business for a century until the opening of the new Head Office on the opposite side of the street in 1932.

Martins Bank Limited now operates nearly six hundred branches throughout England and Wales, the Isle of Man and Jersey.

MARTINS BANK

Limited

LONDON DISTRICT OFFICE: 68, Lombard St., E.C.3

HEAD OFFICE: WATER STREET, LIVERPOOL 2

Total Assets (as at 30th June, 1952), £339,517,017

textile industry was amongst the world's biggest. But there was still very little heavy industry. Production of steel was only 750,000 tons a year and, although India could by 1939 produce, for example, most of its own railway wagons and carriages, it still had to import its locomotives and machinery.

War in 1939-45 once again acted as a forcing house. The actual quantity of industrialisation was quite limited, but the Indian Government was finally converted to the need for an indigenous heavy as well as light industry. The difficulties in the way of all Indian industrialisation weigh particularly on heavy industry whose need of managers, skill, capital, and transport, are all much greater than those of light industry. In the long run, however, India has all the requirements; it has one of the world's largest reserves of high grade iron ore, enormous quantities of coal (though the quantities of coking-coal are limited) and a very large hydro-electric potential. A very large percentage of these resources is clustered together within quite a small area. Nowhere in the world is good quality iron-ore nearer to coking-coal, a large labour supply, existing transport facilities and a major port. Indian steel, today, is among the world's cheapest and should continue so, while Indian coal, of reasonable quality, costs only 30s. a ton at the pithead.

Development has been fairly slow over the last few years, largely for lack of steel and cement, and because of the long delivery dates of foreign machinery makers. Nevertheless, the direction in which future development will go is already clear; the growth which has occurred since 1946, has been, above all, in engineering and chemicals. Now the pace should speed up. The money has been found for an expansion of steel production by 500,000 tons; cement production has grown from 1,400,000 tons in 1938 to 3,200,000 tons in 1952; the first of the new electricity generating stations under the plan, at Bokaro, will come into operation in 1953; an agreement has been made for the production of steel tubes in India; several new factories for the manufacture of bicycles are nearly ready, a government factory for the production of machine tools is under construction; there has just been opened a works which can already produce 25 per cent of India's requirements of ring-spindles; refineries for over 3 million tons of oil are to be constructed; and the production of such accessories as paper, board and tin cans expands from year to year.

One development gives birth to another. Every new factory means a wider market and greater external economies for other would-be entrepreneurs. As steel and cement come into freer supply, as India draws more of its machinery from its iron resources, as the number of managers and artisans and foremen increases—perhaps also, as foreign aid increases—so the pace will quicken.

Shaping Up at Uno

[FROM OUR UNITED NATIONS CORRESPONDENT]

LAMENTS over the United Nations tendency to mark time until the American elections should be over have been exaggerated. It is true that the general debate has lagged, and that a small number of committee meetings have been cancelled for lack of ready speakers. But enough has been said in plenary and in committee sessions to show how the main lines of the debate will shape themselves. The groundwork for Mr Eden's speech has been laid; and if no one yet knows just what M. Schuman will say about Tunisia and Morocco, it is not for lack of firmness on the part of the French delegation.

Thus far an air of conciliation has been quite as apparent as the better publicised air of aggression. This has been true even in the Korean debate, where Messrs Acheson, Selwyn Lloyd and Casey surrounded themselves with olive

branches and even Mr Vyshinsky was less violent than he might have been. No fruit has yet appeared, but there has been so much optimism around that the United States felt called on to tell correspondents that current peace rumours were totally unfounded. Other sores, too, seem less inflamed this year than at earlier sessions. During the debate on the plight of Arab refugees occasional voices rose to their old levels, and the wailing wall note was struck. But afterwards the committee passed a resolution calling for a \$23 million refugee fund; the vote was fifty to nothing, with only the Soviet bloc abstaining.

Apart from Korea, the most acrimonious discussion is taking shape around Article 2, paragraph 7 of the Charter, which reads, "Nothing contained in the present Charter shall authorise the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state, or shall require the Members to submit such matters to settlement under the present Charter. . . ." France will probably attempt to stop debate by invoking that paragraph with regard to Tunisia and Morocco. South Africa sought refuge in the same tent when the Ad Hoc Committee came to deal with the treatment of Indians, and will stay there to try to ward off discussion of *apartheid*. Even the Yugoslav attack on the Soviet Union, made during the Fourth Committee's debate on non-self-governing territories, felt the effect of that paragraph, which acted as a block over which the Russians and satellites kept stumbling. Their unhandiness with it may work to the advantage of other colonial powers.

A Rest for the West

Western observers, numbed by long battering under Marxist invective, found the Yugoslav-Soviet fight strangely restful. For once they could watch without having to dodge, and even the brickbats which came their way glanced off without damage. Thus, when a Byelorussian sentence began "For a Titoist to lie and slander is not only a habit" and concluded "it is the duty of a paid agent of American imperialism," no American was seen to flick an eyebrow. This sense of irresponsibility was heightened by the fact that the fight was chaired by an Argentine, a follower of General Perón and therefore schooled in a not dissimilar type of street fighting. His difficulties in calling opponents to order seemed a kind of poetic justice which too seldom falls in the lap of the western powers.

At other times, the discussion of dependent territories showed a tendency to become involved with that of underdeveloped countries. The Pakistani delegate, indeed, observed at one point that "backwardness is not the monopoly of non-self-governing territories," thus putting the debate squarely into Looking Glass Land. Eventually the Fourth Committee will arrive at its own version of "Who takes care of the caretaker's daughter when the caretaker's busy taking care?" In the language of the agenda, this reads: "Factors which should be taken into account in deciding whether a territory is or is not a territory whose people have not yet attained a full measure of self-government."

Farcical as the phrasing may be the problem is real, and the differences of opinion acute. Britain is convinced that it is papa who decides when sonny is grown up, and who confers on him latchkey and lecture at the appropriate moment. The United States used to be sure that sonny knew best, as exhibited in 1776, but that certainty has been shaken by recent American experience as a colonial power. Pakistan and India, recently emerged from colonial status, tend to sympathise with those eager to get out from under the guardianship of an older power. Russia plays one game at home and another in the Assembly, a contradiction which formed the theme of the recent Yugoslav attack. But the attempt to make a check list of ways of measuring maturity promises to be at least an interesting intellectual exercise. Whether it will aid decision or postpone it remains to be seen.

Statesmanship and the Sudan

GENERAL NEGUIB'S Note to London on the future of the Sudan is, by any standard, a piece of statesmanship; compared with that set by his predecessors in Egypt—the Palace and the Wafd—it is a striking one, and heightens Egypt's prestige in international politics. For years the British have been saying to Cairo: "Come! you also are a Co-dominus in the Sudan. Join with us in plans for its future"; but they have been met with rebuff and boycott. For the last six months the Sudan Government had been asking for Egyptian as well as British comment on its draft Statute by today, November 8th.

General Neguib has snapped up both invitations in his Note on the Statute, sent this week to London. At a stroke, therefore, he has recovered the initiative lost by his predecessors, and has rubbed the slate clean of the foolish claims to kingship and dictation of a constitution for Khartoum that had been advanced by Farouk and Nahas; he has also recovered a status in Sudanese opinion that they had lost. For his Note contains more than just his own ideas; it has been framed after consultation with all parties in the Sudan, and drafted in agreement with the large Umma (independence) party, hitherto opposed to Egypt. If General Neguib can also obtain for it the support of the obstructive quarters usually known as "public opinion in Cairo" he will indeed have brought off a master stroke.

His Note communicates to London the amendments to the Sudan Government Statute on which he and some Umma leaders have, after considerable debate, agreed. Naturally these are not 100 per cent acceptable to all Sudanese, nor in every way identical with the draft that London had approved, just as the text that had British approval is not 100 per cent acceptable to Egypt. The key to the Egyptian Note is anxiety to ensure that self-determination shall take place in "the requisite free and neutral atmosphere."

Persuading the Parties

Neguib's great advantage in framing it was that, unlike most Egyptian politicians, he knows the Sudan. He has served there and inherits Sudanese blood from his mother. He understands, as few Egyptians do, the antagonism between its religious sects and its political parties. In Cairo over the last fortnight, he has seen leaders of the parties opposed to Umma; these include the Sudan Party, which would like to plan for a future within the British Commonwealth, the Socialist Republican party, which claims to speak especially for the Southern Sudan, and the quarrelsome posse of rival pro-Egyptian parties whom he has perplexed by his readiness to negotiate with Britain, but whom he is now pressing to sink their differences and form a single National Union party; he believes that the existence of a counterweight to Umma is bound to make things work better in the future. He has told all parties that he wants his draft to meet their conflicting views (which seems to mean that he is ready to amend it so as to get the maximum degree of consent); he has also told all that they must participate in the forthcoming elections as nothing is gained by sulkily boycotts.

The Sudan Government Statute as drafted in Khartoum and approved in London was described in *The Economist* of September 27th. The amendments General Neguib now proposes are as follows: first, he wishes to lengthen the transitional period between now and self-determination, extending it at least till 1955. The purpose of this change is to give time for Sudanisation—i.e., the transfer of administration, police and defence to indigenous hands. He proposes that all British and Egyptian troops shall leave one year before the vote on self-determination. (It can be argued that if the British were ready to contemplate a free and unfettered vote on self-determination in 1953 as they had offered to do, they are no worse off by this proposition.) His second main proposal is to retain the clause in the statute that renders the

British Governor-General the supreme constitutional authority during the interregnum, but considerably to limit his discretionary powers. These were always subject only to the consent of the two Co-Domini in matters of foreign affairs and amendments to the Statute, and in Neguib's draft they remain so. But in the exercise of all the Governor-General's other discretionary powers—the chief of which had to do with control in times of emergency and with protecting the special interests of the Southern Sudan—the Note wishes him to work in concert with the international commission of five that was described in *The Economist* last week. The main powers proposed for this commission are that in the event of disagreement with the Governor-General, its say shall be final unless both Co-Domini agree with the Governor-General. Contrary to first rumours from Cairo, the Note proposes deletion from the Statute of the Governor-General's special responsibilities for the Southern Sudan—a deletion that will gravely worry some Sudanese who think Cairo ignorant of the problems of non-Moslem areas.

One passage in the Egyptian Note is somewhat undemocratic. It lays down that, when self-determination takes place, the Sudan must choose between a link with Egypt and complete independence. No one in Britain seriously thinks that a majority in the Sudan would want to make a choice other than one of these two—for instance, would want to join the British Commonwealth—but if a decision is to be "free and unfettered," it seems queer to limit it to two choices.

The immediate practical problem raised by the Note is: how soon can elections take place and bring in the self-government period? Britain had promised them by the end of this year. Now the Note proposes direct elections in a greatly increased number of constituencies, and their supervision by a seven-man international commission which is in its turn to be appointed by the Governor-General's five-man international commission—that is, it proposes two time-consuming processes. Since most representative Sudanese agree with this part of the Note, it seems to absolve the present Sudan Government, and Britain, from their undertakings to complete elections by the end of 1952. Perhaps elections can begin before then, but they will, if held under the proposed arrangements, take weeks or even months to complete.

The immediate task ahead is to hold up the promulgation of the original statute—which was due to take place today—while differences are ironed out and the support of a maximum of Sudanese parties is retained. Quick decisions will have virtue, for in the Middle East, with its infinite capacity for producing reasons why not, time never increases the prospects of compromise. Meanwhile the British should feel thankful that the Egyptian negotiator will be so relatively open-minded a man. They need to be equally open-minded, remembering always that, so long as no minority in the Sudan is unduly caused to suffer, an imperfect agreement is far preferable to a quarrel conducted from respective high horses, and poisonous to the whole of western relations in the Middle East.

Soviet Central Asia—II

Economic Planning in the Steppes

[BY A CORRESPONDENT]

WHEN discussing the economic development of Soviet Central Asia, one is tempted to think in terms of Malaya or Nigeria, that is in terms of an autonomous economy, connected to a greater or a lesser extent with that of the metropolitan country, but distinct from it. Such an economy has independent relations with the outside world and has its own problems of investment and balance of payments. This, how-

ever, is by no means the case for Soviet Central Asia, both because of its geographical relationship to Russia, and because of the unitary planning of a socialist economy in general, and of the Soviet Union in particular. Central Asia is being developed as a vital and powerful region but strictly within the Soviet economy as a whole.

Economic regionalism has been a feature of the postwar years throughout the Union. The planners have made special efforts to avoid long hauls; to find and adapt local building materials; and to diversify local agriculture without reducing the main cash crop in each region. In Central Asia this has meant unslackening attention to cotton; continued heavy investment in oil installations; and development of the non-ferrous metal and chemical industries (particularly in Central Kazakhstan). The production of agricultural machinery, already established in Tashkent in the first five-year plan, has been expanded to include machinery for cotton cultivation, though it is difficult to ascertain whether, for instance, six, twenty, or eighty cotton packing machines have been delivered from the Tashkent plant. Heavy industry in Central Kazakhstan, based on the Karaganda coking field and ore deposits, is also of recent origin. Railway construction has been focused on internal communications—the linking of new industrial centres to the trunk lines and to each other, the replacement of a narrow gauge by a permanent way, and the doubling of tracks. Timber remains the outstanding lacuna in Central Asia, and judging by the repeated instructions to collective farms to establish their own brick kilns, building materials of all types are still a bottleneck.

Some new ways of preserving a balance between the claims of cash crops and of industrial development on the one hand and the growth of food on the other, have been tried out in the postwar years. The campaign for large units in agriculture, prominent in 1950-51, took the form in the cotton areas of new irrigation techniques, which made possible larger fields suitable for mechanical cultivation. These presupposed

modern machinery; how far they have been economically justified in the conditions of Central Asia there is as yet no firm evidence. On the side of food production, there have been intensive experiments with "dry" agriculture, designed to leave the bulk of the irrigated lands to cotton growing. The exceptional variety of climates and contours within the region is a great asset, provided that rain and snow water are wisely utilised.

Increasing Local Food Production

To feed the new industrial towns, state farms (*sovkhozy*) have been established in their neighbourhood, for instance in the arid, sparsely populated districts of Central Kazakhstan, where the local collective farms were inadequate to carry the influx of population. Where the labour for these *sovkhozy* came from and how it was recruited remains unknown. Another device to increase local food production has been the attempt at the partial reintroduction of seasonal pasturage in parts of Kazakhstan and Northern Uzbekistan.

The project for the Kara Kum canal is on a larger scale than those previously carried out in Central Asia. Of the latter, the Vaksht schemes in the plateaux of Kirghizia, though less famous than the much publicised Stalin canal in the Ferghana, represent a considerable achievement and have added new areas for the cultivation of Egyptian cotton. In comparing figures for irrigated areas, the upkeep and drainage of existing irrigated lands must be borne in mind: in the statistics of the 1930's, areas were several times classed as "additional" when they were in fact areas where drainage had been neglected and which had again been brought into use. Apart from irrigation schemes, considerable work has been done in the conservation and distribution of sub-soil water, in the building of wells, and in the constant struggle against evaporation. It is these measures which have made possible the creation of industrial centres in the grey plain of Central Kazakhstan.

The Economist Diary

The Christmas present for the man who seems to have everything.	A memorandum book, an appointments register, and a complete reference book.	A diary lay-out specially designed to meet the needs of the busy man.
A week's appointments at an opening; a book that lies open flat on the desk.	Facts and figures covering the world always available when required.	All information easily found by means of handy thumb-indexes.
Bound throughout in red leather; title blocked in gold.	Price (U.K. only) 42/- (including postage and purchase tax)	Prices to overseas addresses vary widely; a schedule will be sent on request.

ILLUSTRATED PAMPHLET AVAILABLE FROM

DIARY DEPT., THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1

How far are the developments undertaken by the GosPlan during the successive five-year plans in the peripheral territories economically viable and, indeed, how far do considerations of economic viability determine Soviet planning? These questions go beyond the scope of this article. An estimate in regard to the five Central Asian Republics was made by Mr and Mrs W. Warren and published by them in *Foreign Policy Report*, XXV, "Soviet Central Asia: Development of a Backward Area." Their broad conclusion is that by freeing the Soviet Union from dependence on imported cotton, Central Asia pays the way for its own development. This, however, is not the kind of argument which ever appears in Soviet discussions of economic policy. Exponents of the Soviet financial system invariably lay their emphasis on the role of the Union budget as a channel for the redistribution of the national income in the directions, both territorial and functional, dictated by political considerations.

To what extent, then, one finally asks, have the Kazakhs, Uzbeks and Tadjiks accepted the Soviet system, prospered under it, or made it to any degree their own? A German expert on Central Asia, Dr Plaetschke, writing on the results of the 1939 census, came to the conclusion that the Tadjiks and particularly the Uzbeks were holding their own, assimilating technical development, and keeping alive to some degree the traditions of Islam. The Kazakhs, on the other hand, have lost ground. A comparison of the census of 1939 with that of 1926, which should have shown a natural increase in the number of Kazakhs, actually showed a decline of more than 80,000. This catastrophic "disappearance" of almost one-third of the Kazakh nation (3,100,000 in 1939), was principally due to starvation and disease during the collectivisation years, but its effects were reinforced both by the systematic colonisation by Russians in Kazakhstan and by the inability of uprooted Kazakh nomads to adapt themselves to life in the new industrial centres.

Dependence on Moscow

That the Soviet system, while successfully breaking pan-Turki and pan-Islamic movements in the Central Asian territories, has not succeeded in altogether converting national and religious loyalties to itself, is indicated both by internal and by external evidence. Instances of the former are the recent sharp criticism of nationalist writers, particularly historians, and the purges in republican Party organisations. As external evidence there is the fact that a Moslem Turki unit was the first to be formed among the prisoners of war taken by the Germans to fight on the Axis side in 1941. The absence of a delegate from any of the five Republics at the Karachi Moslem congress in 1951 is also a sign that Islam has not come to terms with Communism in any constructive sense.

Yet it is easy to read into these facts something that is not there. True, the press and periodicals of the Republics refer again and again to the difficulties of working with women and girls, to the lack of indigenous teachers and leaders, to deficiencies not only of technical but of political education, to the persistent influence of recalcitrant mullahs and to the maintenance of old traditions and prejudices. But the dilemma of Soviet Central Asia lies precisely in this—that industrial progress, the benefits of contemporary social services, the emancipation of education, come to it through its membership of the Soviet Union and therefore, in effect, at the hands of Communism. The peoples of the Republics have no wish to remain as an isolated kind of anthropological museum: it is not easy to see at present how progress can come to them in other, more acceptable, ways.

(Concluded)

Jugoslav Economic Crisis

THE Yugoslavs are putting a brave face on last summer's drought, but it is now plain that it is a serious blow and that the reserves built up after last year's excellent harvest will not be enough to cushion the economy from the consequences. The damage sustained is heavier than after the disastrous drought of 1950. Mr Kidric, the President of the Economic Council, has put it at over 100 billion dinars. The yield of wheat and rye is 25 per cent less than last year; maize is down by 64 per cent, sugar beet by 75 per cent, potatoes by 38 per cent and beans by 77 per cent. For Marshal Tito the disaster could hardly have come at a more unfortunate juncture; it jeopardises—or at any rate retards—the series of bold policies which the Yugoslav planners have launched in an effort to secure economic stability and prosperity without doing too great violence to their Marxist beliefs. For the Yugoslav man-in-the-street it probably means another heavy dose of austerity just when he was beginning to find life easier than for some time past.

The repercussions of the poor harvest have been spreading through the economy for some time. In particular the efforts made to solve the balance of payments problem have received a sharp setback. The Yugoslavs were counting on stepping up their agricultural exports to help pay for their heavy import programme. According to the original "Social Plan" for 1952, agricultural exports should rise by 27 per cent compared with last year. During the first seven months of the year, they did in fact account for 54 per cent of Yugoslav exports. But in August the Government took the inevitable step of banning the export of grain and other farm produce. As a result, according to one estimate, agricultural exports will be over 70 per cent less than in the last fiscal year (when they were worth 39 billion dinars) and if the latest estimates from Belgrade are correct, it will be necessary to import about 1,200,000 tons of foodstuffs.

The Government has abolished the ordinary foreign exchange allowance for private individuals and is doing what else it can to protect the balance of payments; but it can only do so at the cost of temporarily and partially nipping in the bud the measures for liberalising foreign trade that were introduced last summer. Import and export licences were abolished on July 1st, but on October 1st a six-month ban was placed on the import of a wide selection of about 100 articles. Moreover the freedom which export firms gained last July to spend 45 per cent of their foreign exchange as they thought fit, has been drastically curtailed. In order to make sure that it is used to the best advantage, the Government has decreed that all except 20 per cent of each firm's earnings shall be sold to the National Bank.

Building up Food Stocks

Fortunately the protracted negotiations on the 1952-53 instalment of tripartite aid ended in agreement in the middle of last month, and the Yugoslav Government has lost no time in making use of some of it to buy food. Having received an immediate instalment of \$30 million of the American share, it is already asking for a second instalment of \$20 million. Tripartite aid was originally designed principally to supply the Yugoslav economy with industrial raw materials, but it is possible that over half of this year's allotment of \$99 million will have to be spent on food. The Government is anxious to build up stocks in local depots as soon as possible, partly because later on bad weather may hold up distribution and partly because the knowledge that the local stocks exist will be a valuable psychological aid in preventing panic buying and hoarding.

At the moment the situation on the home front is not too bad. Prices have risen, but not steeply—as yet. All the same, the public is showing a tendency to hoard and the measures recently announced by Mr Kidric show that the Government feels it necessary to take steps against

We've solved some problems in our time!

IN 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would pre-heat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity inside a diameter of 1½ inches and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and

Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

*nulli secundus and
hats off to no one*

Enough of this modesty, this cult of the understatement, this hiding of our lights under bushels, this unwillingness to come right out with it and say that we are good. So here goes. We are good. And the reason for this unwonted effusion of self-pride? We have produced a thoroughly good portable typewriter, cleanly made, precise in working, strong yet light enough for you to run for a train while carrying it. It's called the Good Companion and it's a peach of a machine. But it's not simply the goodness of the machine itself that makes us so proud; it's the fact that we can produce such an unreasonably good portable typewriter for such a reasonable price.

IMPERIAL TYPEWRITER COMPANY LIMITED • LEICESTER

inflationary pressures. House rents, which at present are disproportionately low, are to be raised by 100 per cent; a further effort is to be made to cut down drastically on state expenditure; and the country's total wage roll will not be allowed to go up.

Many processing industries have, indeed, already been thrown into great difficulties because the delay in settling the new tripartite aid agreement has deprived them of essential raw materials; and now they find themselves getting less than they had hoped through foreign aid. In the processing industries as a whole, production in the first eight months of this year dropped to 94 per cent of last year's level; in the textile and rubber industries it dropped by 14 per cent, and in the leather industry by 26 per cent. It will be surprising if it does not drop still further in the months ahead.

Production in the basic industries, however, has been slowly but steadily rising, and it is by increasing exports of ores, metals, chemicals and construction materials that the Yugoslavs stand the best chance of paying their way, although no effort is being spared to get the textile and other industries to lend a hand. The Government has already made considerable cuts in its capital investment programme, but it is determined to press on with the completion of various key projects designed to secure more hydro-electric power, iron and steel and other basic resources. To obtain the necessary capital equipment, it is pinning great hopes on another loan from the International Bank. Since the three western powers have now agreed to support Yugoslavia's request for a loan, there is a better chance that the protracted negotiations with the Bank's representatives which began in Belgrade last July, will be brought to a successful conclusion.

Indonesia Without Allies

[FROM A CORRESPONDENT]

Now that the Anzus, or Pacific, Council has been in effective existence for several weeks, neighbouring Asian countries have had time to digest its implications. The nearest and one of the most important is Indonesia, where, ever since the handing over of power by the Dutch in 1949 each successive government has followed, in foreign affairs, the so-called neutral policy, gazing neither to left nor right, nor to east nor west. Any attempt to carry out a firmer policy on one side or the other has been liable to create a cabinet crisis. In February the Sukiman cabinet resigned. The causes were various but the occasion was the signing of the Mutual Security Agreement by Mr Achmed Subardjo, the Foreign Minister, and Mr Merle Cochran, the United States' Ambassador. Parliament refused to ratify the agreement.

There are a number of arguments put forward over the actual definition of a "neutral policy." Supposing, for example, it were to the advantage of Indonesia to make certain political arrangements with the western powers one school of thought says that this would contravene the neutral policy. Another group replies that to neglect an arrangement advantageous to the state because of fear of offending Russia and the satellites, is itself not a neutral attitude. Such discussions have never been fully resolved and there is no sign of Indonesia committing itself one way or another to either of the contending powers. This is the controlling factor in Indonesia's attitude to the Anzus agreement between Australia, New Zealand and the United States.

It may be thought that the pursuance of this rather colourless foreign policy is purely opportunist, the desire to be the middleman in both markets. However, although there is undoubtedly some truth in this, there are deeper historical and political reasons. In the 1920's many of the present and political leaders of the country were students in Holland. There, like most young people with their background and aspirations,

they dabbled in Communism which seemed not only to provide hope for the future but proclaimed success as a scientific certainty. A few of the Indonesians, Dr Hatta for example, were among the shining lights of the League against Imperialism. After the first heady enjoyment of Marxist doctrine and the belief in world revolution had passed off, the majority of the Indonesian leaders turned away from Communism. On the other hand, many do not wish, largely for emotional reasons, to become involved with countries, which they learned in their young days to look upon as the bulwarks of capitalist imperialism.

Recent years have seen India, Pakistan, Burma, the Philippines and other former non-self-governing territories achieve independence. In all these cases the handing over of power involved no bloodshed between the former colonial power and the newly created state. These events undoubtedly created a strong and favourable impression. On the other hand, Indonesia's independence, although politically the result of action taken in the United Nations, involved a number of years of destructive warfare. The Indonesians feel little affection for the Dutch and a certain amount of this distrust is carried over to those countries which Indonesia sees to be allied with Holland in various security and economic organisations.

Oceans of Political Prejudice

A neutral policy is also the easiest way out for any cabinet faced with a parliament constituted on the Indonesian pattern. There are many political parties, nearly all of them extremely flexible at making and breaking alliances with other political parties. A reshuffled cabinet, a government post vacant, and immediately the bargaining begins, the large parties offering the bait and the small parties manoeuvring to swallow as much of it as possible. The two main parties in parliament are the *Masjumi* (the Muslim Party) and the PNI (National Party of Indonesia). These are of about equal strength and neither has anything approaching a majority in the House. Each one has to rely on the support of a number of smaller parties to be able to carry on the government. In practice the *Masjumi* and the PNI take part together in a coalition government—but not without having to give seats in the cabinet to members of other parties as well. Every political party has its own pet likes and dislikes and the only way to steer a cabinet through these oceans of political prejudice is to find some policy which represents the lowest common multiple of party opinion. When one considers that there are some 18 political parties ranging from the religious *Nahdatul Ulama* section of the *Masjumi*, on the one hand, to the lunatic left *Partai Murba* on the other, it is not surprising that, to English eyes, the policy of the Indonesian Government sometimes appears rather indeterminate.

The Anzus agreement is designed to provide security for the Pacific area but since it is an entirely "western" and non-Asiatic organisation it will not appeal to Indonesia. During the discussions in the General Assembly of the United Nations Indonesia has shown from time to time an inclination to join with other Asiatic or Muslim countries in creating a "Third Bloc." If an Asiatic security organisation was started under the guidance of, for example, Mr Nehru, then Indonesia might be attracted. However, such an Asian scheme involves many difficulties. Does Australia, because of its geographical position, enter into it? If so, then this is a tie-up with the western powers. Does Viet Nam join in? Indonesia looks upon Viet Nam as a colonial country. Where will the money and the armaments come from? It is difficult to foresee that, under existing conditions, the country will commit itself even so far as an Asian security alliance. Economic and cultural treaties present no difficulty but it is not to be expected that any agreement which commits Indonesia to the possibility of military action will be looked upon with favour.

THE BUSINESS WORLD

After Monte Bello

THE conspicuous success of the explosion of Britain's first atomic weapon at Monte Bello last month has given a fresh urgency to the long-standing controversy over the organisation of what will become a new industry based on nuclear physics. The production of atomic bombs is the first and most pressing objective of any atomic energy organisation, but eventually the production of atomic piles for submarines and aircraft and for civil use will at least equal them in importance. The size and complexity of the production units that had to be brought into operation to provide the necessary materials for a single bomb are not widely appreciated, nor, possibly, is the fact that resources several times as large as these would be needed to provide the foundation for a nuclear physics industry, even if its purpose were wholly military. There have been misgivings, both within and without the several establishments and committees that make up Britain's atomic energy organisation, about the wisdom of placing this new project, even in its earliest and most secret stages, under the direct day-to-day control of a government department; and such arguments must carry even more weight now that an eventual expansion of the organisation is seen to be inevitable.

The control of atomic energy rests in the hands of the Ministry of Supply under the direction of a Controller-General—at present, Lieutenant-General Sir Frederick Morgan. There are several inter-departmental councils and committees, one with scientific representatives from the universities, but their responsibilities are nebulous and it is unquestionably the Ministry of Supply that plans and runs the organisation. Sir John Cockcroft, who, with the exception of Dr Penney, is the only easily recognised personality in the organisation, is the director of the Harwell Research Establishment (as well as chairman of the Defence Research Policy Committee), and his responsibilities do not extend to the other atomic plants. The staff of the establishments are considered as civil servants and their recruitment and pay are governed by the same rules as other government-run scientific establishments. This is the basis on which the scheme has been run since it was started in 1945; the only innovation introduced by the present government has been the appointment of Lord Cherwell as personal adviser on atomic energy to the Prime Minister. In this role, Lord Cherwell has no specific responsibilities towards the Ministry of Supply; there are indications that the two sides are not, even after twelve months, finding it easy to evolve a satisfactory formula for working in harness.

The essential preliminary to building a bomb was the establishment of six separate stations. It was upon the design, construction and day-to-day running costs of these stations that the Labour Government, over the years 1945-51, quietly expended the sum of £100 million

that so surprised Mr Churchill; a further considerable sum has since been spent on the completion of the bomb itself and the necessary arrangements for testing. The first of these stations, at Harwell, is nothing more than an establishment equipped for pure research, and for the development of projects to a stage at which they are suitable for full-scale design studies. Thus, Harwell is responsible for the design and construction of the two low energy piles operating at that station, and for the work now being carried out on larger piles for power generation. A second small establishment at Risley functions as a drawing office.

The next three plants are production units. The first, at Springfields, refines uranium metal from imported crude ores. The second plant, at Capenhurst, carries out the intricate process of separating the fissile uranium 235 from this metal, which consists chiefly of non-fissile uranium 238. Both types, or isotopes, of uranium are chemically identical; the only discernible difference between them is in their weight, indicated by the numbers by which they are identified. The sorting of the light from the heavy atoms is a slow and tricky business that depends for its success on devising techniques for causing the light atoms of U235 to rise while the heavier atoms sink. The fissile uranium so extracted is used as fuel in a pile operated at Sellafield. Here a proportion of the particles released by the continuous fission of the U235 are used to convert the non-fissile portion of the uranium (which outweighs that of the fissionable atoms by a ratio of 140:1) into plutonium, an artificial element that is not found in nature. Plutonium, which is fissionable, is used for the explosive charge of atomic bombs, and is expected to be one of the principal fuels of atomic power plants. The function of the sixth plant, at Aldermaston, has never been announced; it is generally assumed to be the headquarters of Dr Penney's team working on armaments.

Construction of the bomb had to wait until enough plutonium had been produced at Sellafield, atom by atom, to provide an explosive charge, probably in the region of three to four kilograms. The Sellafield plant has been working now for about 18 months, and the greater part of the plutonium produced during that period went up at Monte Bello, so that the slow process of accumulating plutonium has to start all over again. Britain has, in short, a pilot organisation capable of providing over a period of years sufficient fissile material for a small stockpile of bombs, but unlikely to have much to spare for developing other civil and military aspects of nuclear energy. If the preliminary work on power plants for the generation of electricity is successful, further facilities will have to be provided for the production of fissile materials, either for other military purposes or for the generation of power for civil use.

At this stage it is worth examining the procedure

adopted in the United States to meet a similar situation. The Atomic Energy Commission came into being in 1946, a year after the Harwell organisation had been set up by the Ministry of Supply. The AEC is a semi-autonomous government organisation, the members of which are appointed by the President with the approval of the Senate, and its annual budget is voted by Congress. The Commission owns and finances several atomic piles producing fissile materials, as well as a number of research centres dealing with all aspects of nuclear physics including the design of reactors; and it designs and produces atomic weapons. But these plants and stations are operated by about six different private companies on an agency basis; the design and construction are shared by a far larger number, including many small businesses. The Commission has not, like the Ministry of Supply in this country, made itself responsible for designing, building, staffing and supervising the atomic energy project at every stage of its development.

In the United States, therefore, industry has been given the opportunity to take part in the acquisition of knowledge of a completely new technology where materials are measured in atoms and particles of atoms. The chemical aspect of this work—the handling of radioactive materials, the separating of one from another and the disposing of effluent—is a far more critical factor in the nuclear physics industry than the simple engineering of atomic piles and the marrying of reactors with power generators, and there are signs that a new chemical industry based on radiation may develop from it. British companies have been prevented from acquiring this experience, and their exclusion from the atomic piles at the early stage of their development may in part explain the apparent lack of interest shown by British industry in atomic energy and even in its by-products.

Meanwhile, the Atomic Energy Commission in the United States is broadening its policy in order to encourage industry to assume more direct responsibility for certain aspects of the work. A new contract has recently been completed with one company for the supply of zirconium, whereby the company itself finances the necessary works, invests capital in the requisite plant and sells the zirconium to the Commission at a price that is intended to provide a normal commercial return on this investment. The Commission has also made it known that it would consider buying plutonium from companies operating their own nuclear reactors. There is, in theory, no reason why a reactor generating electricity should not at the same time produce plutonium, and the possibility of investing in dual-purpose plants has attracted the interest of four leading American companies that for one reason or another require electricity in regions that are remote from normal sources of power. British companies are not formally debarred from the possibility of making arrangements of this kind with the Ministry of Supply; but even the most sanguine observers think it unlikely that, under the present system, any such facilities would in fact be extended. Moreover, any such facilities would in fact be extended. Moreover, another party that at present has no link with the organisation, but is likely to be intimately affected in the long run, is the British Electricity Authority, which has a formal monopoly of electricity generation, in Britain, and is investing in coal power stations each year more than has so far been spent on the whole atomic energy programme. The development of nuclear reactors may eventually raise fundamental questions regarding investment in all other forms of fuel and power.

The weakness within the British system is not in its central direction, or even in its financing; the scientists have been given a generously free hand in both spheres. It lies, rather, in regulation of the establishments by dictates laid down for the administration of the civil service. If the problem of atomic development were purely one of research, this might not be of serious consequence. But the atomic energy project, as has been shown, is not a research programme in the accepted sense, since it involves the establishment of considerable production facilities before it can begin to yield results. In all other fields of military endeavour, the Ministry of Supply gives design contracts, or hands over its own designs to private companies to prepare and put into production. There is, on the face of it, no formal or technical reason why this same policy could not have been followed in this particular case.

But the fact that it has not been followed involves an important disadvantage quite apart from that of the exclusion of industry from knowledge of the evolving techniques. The scales of civil service salaries, and even the leisurely machinery for recruiting and confirming appointments, may threaten the quality of the development itself. Although something has been done to improve the salaries by appointing men to a higher grade than they strictly merit, the fact remains that there is a steady leakage of good and promising men at all levels from the atomic energy establishments into industry, where their salaries are higher, into the universities where they have academic freedom of speech, and to other countries where both industry and the universities offer golden prospects. Such leakages are less likely to occur when such men are privately employed and paid their market value. In its early stages, the success of the British programme owes so much to the near-genius of one or two individuals that this drain of talent may not matter. Its effects may, however, begin to be felt when the time comes to expand the service or to replace the normal wastage of the men at the top.

★

In July a year ago, Lord Cherwell made an eloquent plea for a change in the system of organisation—either towards the American method, or by the setting up of a public corporation. But the hopes of a change that followed his appointment as adviser to the Prime Minister have been fading as the months pass. Sir John Cockcroft, when he gave evidence to the select committee on estimates this spring, said that approach had been made to industry, in particular to Imperial Chemical Industries Limited. It appears that ICI was asked whether it would build a plant for the Ministry, and refused on the grounds that it was already preoccupied with export business. The company's version of the negotiations has never been published but, bearing in mind ICI's need to keep abreast of any radical development in the field of chemistry and physics (and also the fact that Mr Michael Perrin, one of ICI's directors, was until 1951 second in command to the controller-general at the Ministry of Supply), the explanation given to the Select Committee is probably an over-simplification. The exclusion of the big chemical companies from applied nuclear physics means that in any work they may be asked to undertake in this field they will have to learn the job from scratch. It is not easy for a company such as ICI, already involved in a heavy and complicated expansion programme of its own, to jump into the breach

at short notice. Yet, with the possible exception of the British Monsanto company—which might be able to call on its American parent for technical assistance, were the American law governing the exchange of atomic information to be modified—there hardly seems another company in the industry with the experience for such a venture.

This is a real difficulty and one that time alone cannot solve. But Sir John revealed also in his evidence the unconscious bias of the true scientist against industry when he said, "There is no chance, at the moment, as I see it, of industry making a profit by coming into this business, and without making their profit I do not see why they should come in." He perhaps overlooked the fact that the immense volume of work done in the United States has been on an agency basis whereby industry got its "profit," and the Atomic Energy Commission got its plants built and run on its behalf on a commercial footing. Even in the United States, the possibility of private financing of the construction of the plants is still no more than an object of study by industry; it may be many years before it becomes a fact.

There is perhaps more to be said for keeping atomic energy under the control of the Ministry of Supply than for putting the responsibility upon a separate public corporation established for the purpose. Such corporations are not too well fitted to deal with a rapidly expanding technology, and there is no reason to believe that the Ministry has not encouraged the scientists to press ahead as rapidly as possible and has provided them

with every facility to do so. Early this year, the Prime Minister said that the question of reorganising the atomic energy project would be shelved until after the Monte Bello tests. Had the explosion not been a success, more plutonium for a second bomb would have had to be made and a second explosion attempted before there could have been any serious question of expanding the service. But since the test has been a success, it can reasonably be presumed that a number of bombs will be made for the stockpile. It is also known that work is proceeding rapidly on the construction of pilot power generators and new types of material-producing piles. Although additional supplies of fissile materials may not be needed for some years, the plants to make them take almost as long as this to build. The question is whether the Ministry of Supply is to begin expanding its staff in order to increase its already large investment in atomic plants or whether it is to employ industry as its agent both in the construction and in the running of them; there are many wartime precedents for joint working on these lines.

An answer to this question must be given shortly one way or another, regardless of whether the Ministry, a public corporation, or even industry itself is the eventual owner of the plants. The Ministry's past experience in getting the plants built, particularly the Sellafield pile, has not been too fortunate, but there have been signs during the past months that it finds it as difficult as any other government department to relinquish one iota of its authority and responsibilities. The choice ought not, therefore, to be left to the Minister of Supply alone.

The Gold Surplus

THE gold and dollar reserves increased by \$82 million in October; concurrently the sterling area's surplus with Western Europe rose sharply to over £34 million, and Britain will therefore receive another \$96 million of gold from the European Payments Union in mid-November. The net inflow of gold and dollars in October was the biggest since early 1951, and the surplus with Europe was the biggest since the halcyon autumn of 1950. It may therefore seem curmudgeonly to complain that the figures published this week have disappointed the country's best hopes.

But that is the fact. The increase of \$82 million in the reserves in October was due to three factors, of which two prove to have been flowing less strongly in Britain's favour than had at one time been hoped. The first of these factors was the receipt of \$35 million of defence-support aid from America. It will be remembered that Mr Butler estimated last July that Britain would receive some \$322 million of American aid in the second half of 1952—that is, an average of nearly \$54 million a month; between the end of June and the end of October, however, only \$168 million has been received—which makes an average of \$42 million a month. There is no reason to suppose that there has been any serious hold-up in allotments of aid to Britain or in British imports of the "defence-supporting" materials that qualify for reimbursement by the Mutual Security authorities; the delay in receipts is believed to have been wholly due to the technicalities of the accounting procedure used—and it is still possible that the remaining \$154 million needed to fulfil Mr Butler's forecast will

in fact be received in November and December. But, on the whole, this now seems unlikely.

The second factor behind the increase in the reserves in October was a receipt of \$37 million of gold from EPU, in settlement for the sterling area's surplus with Europe in September. It will be remembered that \$24 million of this surplus was due to a special debt repayment to this country by France; the sudden jump in this surplus—to \$96 million in October—is therefore the most cheering feature of this week's news. It is probable, however, that the October figures reflect the first main fruits of the recent short-lived experiment in commodity arbitrage, whereby some \$150 million worth of dollar commodities were bought from North America by British merchants for re-sale to EPU countries. In addition, October customarily marks the beginning of the flush period of sterling area surpluses with Europe; for one thing, the first impact of the wool sales makes itself felt in that month. This season of surpluses tends to mount to its peak in the early months of the New Year, so that the immediate prospect for continuing gold receipts from Europe may be reasonably bright. But since Britain is still sheltered behind a rickety barricade of import restrictions, and is still in default on its obligations under the EPU liberalisation programme, this return to seasonal surplus falls some way short of a return to true solvency with Western Europe.

The third factor behind the increase in the reserves in October was a net gold and dollar surplus of \$10 million with non-European countries. The small size of this surplus was the most disappointing feature

TRINIDAD

PORT OF SPAIN
SANGRE GRANDE
LA BREA
SAN FERNANDO
RIO CLARO

ASPHALT: A local legend at La Brea, Trinidad, describes how the famous pitch lake was once the site of an Indian village. The villagers offended the local deity by their persecution of the humming birds (which were animated by the souls of dead Indians) and as a punishment they were engulfed in the pitch lake with all their belongings.

In 1595 when on his ill-starred expedition to South America in search of El Dorado, Sir Walter Raleigh called at Trinidad. He made use of the pitch for caulking his ships and reported that he found it 'most excellent good'—an opinion which has since been endorsed by road makers in Great Britain and in many other parts of the world.

Full and up-to-date information from our branches in Trinidad on market conditions and industrial trends in the island is readily obtainable on request. Please write to our Intelligence Department at the address given below.

HOW MUCH STEEL

from
six
new
blast
furnaces?

ONE of the six new blast furnaces to be completed in this country in 1952 will be the largest in Europe. They will have been built by firms on the North-East Coast, in the Midlands, in South Wales, and near the North Welsh Border. When in full operation they will produce enough pig iron to increase Britain's annual output of steel by three-quarters of a million tons. These new blast furnaces are all part of the 'steel industry's first post-war development plan—the great £240,000,000 project begun in 1946, as part of which one of the world's largest steel works has been built.

"Don't forget me!" says JACK SCRAP
The steel industry still needs all the scrap which engineering firms and other steel users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

STEEL HOUSE, TOTHILL STREET, LONDON, S.W.1

*In the tradition
of things well done*

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

Where
on earth is
Mackay?

Probably you are not quite sure. It is one of many prosperous sugar towns in Queensland—and it has a branch of the Commonwealth Bank. Like most of the communities that together form the Australian market, Mackay has its own social and economic conditions. These conditions are first-hand knowledge to the Commonwealth Bank which, by means of its nationwide network of branches, can give accurate details on any town or state, or the whole continent. British exporters viewing the Australian market 12,000 miles away will find this knowledge indispensable. It is readily available from our Financial Information Service at Australia House in the Strand.

of last month's returns. As the accompanying table shows, the sterling area's accounts with these countries have hovered between a deficit of \$9 million and a surplus of \$10 million in each of the last four months. It had previously been supposed that the accounts with this area for August and September had borne the whole brunt of the special payments of \$150 million for dollar commodities under the arbitrage scheme. It now seems that this burden was not, after all, fully shouldered in those months; indeed, there may still be some payments to be made in November. It will be disappointing if the impact of the wool and cocoa sales, and of certain other seasonal factors, does not soon begin to show up in the accounts with non-European countries, as in those with Europe; and, in fact, the trend of the rate for spot sterling, which stood at \$2.80½ last Wednesday compared with \$2.78½ at the beginning of October (and \$2.80½ at the end of it), suggests that this trend may already be in progress. But the North American market is not in a robust enough condition for such chickens to be counted one moment before they hatch.

There are two other factors that need to be taken into account in any assessment of the prospect for the gold reserves. First, at the end of December some \$196 million will have to be withdrawn from the reserves for interest and capital payments on the postwar loans from the United States and Canada. Some market observers in America have recently suggested that the British Government may intend to meet part of these payments by liquidating some of the portfolio of dollar securities by which came into its hands last year, when Britain made its final payment on—and thus set free the original collateral

against—its wartime loan from the Reconstruction Finance Corporation. There is no reason to suppose that any such operation is in prospect; the significance of any recent switching within this portfolio of dollar securities has almost certainly been exaggerated in Wall Street.

It is unfortunate, however, that the fate and function of this official portfolio of dollar securities should be so deeply shrouded in mystery. Nothing is known about its market value—recent unofficial guesses, which have assessed it at about \$500 million, are subject to a wide margin of error. The securities concerned, although held by the Exchange Equalisation Account, are not included in the published total of the gold and dollar reserve; that total, at \$1,767 million on October 31st, includes only holdings of gold and dollar balances,

together with some short-term obligations of the United States Government. Moreover, it was revealed this week that even dividend and interest receipts on the ex-RFC securities are not credited to the central reserve; they are apparently re-invested on Wall Street instead. There is no reason, in principle, why the authorities should not keep back these dividend receipts for what is, in effect, a (no doubt staid) flutter in equity investment. But the EEA would certainly be wise to give more account of its stewardship over this not inconsiderable hidden reserve; a fair rule of thumb is that it should give out no less information about its operations than any other investment trust.

Another problem that looms ahead for Britain is the threat of a decline in gold receipts from EPU. If the sterling area's surplus with Europe in November exceeds \$30 million, then 30 per cent of the excess will have to be devoted to repaying Britain's substantial overdraft with the Union; if surpluses continue thereafter, Britain will find itself gradually propelled along the EPU's "sliding scale"—so that a steadily growing proportion

* Gold payments to EPU in each month are the consequence of deficits incurred in the preceding month.

of any surplus will have to be devoted to repaying the overdraft while a steadily diminishing proportion will earn reimbursement of gold. Moreover, if these surpluses swell far and fast enough to entitle Britain to claim early reimbursement of all the \$511 million of gold that it paid to EPU in 1951 and early 1952, the Union itself may be placed in considerable difficulties; at the moment it has not got that much gold on hand. This, however, is merely another reflection of a familiar world problem—of the insufficiency of gold and dollar reserves outside North America, and the check that it imposes on any continued expansion of trade. It is this general problem that should be one of the main issues before the Commonwealth Conference in London later this month; and also one of the main issues that lies in wait for President Eisenhower after his inauguration.

A SURVEY OF INTERNATIONAL BANKING

1952

will appear in next week's issue

Business Notes

Ike and the Markets

The stock markets this week have had a surfeit of bewildering food for thought, and every excuse for indigestion. The first news of Mr Eisenhower's sweeping victory sent a flurry of conflicting movements through stock and commodity prices all over the world; but within a few hours it had become apparent that there was a waiting body of professionals prepared to take advantage of—and thereby to correct—the most unsophisticated of these initial reactions. On Wall Street the first reaction was to mark up the main body of industrial stocks by \$2 or more; the London market had expected that American investors would welcome the swing to the right in this way, and the premium on dollar stocks here increased from 7 to 8 per cent on Wednesday. By Wednesday afternoon (New York time), however, Wall Street had exhausted its initial phase of enthusiasm and run into a bout of short term profit-taking; by the close of business the various industrial share indexes in New York were up by less than $\frac{1}{2}$ per cent on the day, and dollar stocks in London were accordingly marked down again on Thursday. By Thursday morning, too, British investors had begun to digest the implications of the return to power in the United States of a party with a traditional bias towards protectionism—and a bias against the swift sort of Government action that might be needed if ever recession returned. But, to date, the net movement in prices has been surprisingly small. In the week to Wednesday's close—a week that brought the news of the transport issue, the Queen's speech, the gold reserves announcement, and High Wycombe as well as the American election—the *Financial Times* index of industrial ordinary shares fell by only 0.3 of a point, to 114.0, and old Consols rose by only one point to 60 $\frac{1}{2}$.

Immediately after the announcement of Mr Eisenhower's victory, cotton futures broke by between \$2 and \$3 a bale in New Orleans, while wheat dropped by about a cent a bushel at Chicago; there are evident fears in the regions that should know best that the Republicans' farm policy may not be quite as inflationary as that of the Democrats. In Singapore rubber rose by $\frac{1}{4}$ of a cent per pound (and the London market followed suit) in the—probably incorrect—thesis that the Republicans' attitude towards natural rubber cannot very well be more unfavourable than that of the Democrats. The same hopes were kindled by gold producers, and gold prices rose sharply on the volatile Paris market, while Kaffirs were initially marked up in London; the rather jejune argument here was that Mr Snyder had said that the dollar price of gold would not be raised "so long as he remained at the United States Treasury"—and now he was not going to remain. Amid this welter of speculation only one point stands out clearly: The fact that the American people have decided that it is time for a change in the complexion of their administration means that this must also be a time for some changes in the world economic outlook; but only Mr Eisenhower's untested powers of resistance to his own right wing—together with Europe's ability and willingness to orientate itself with the new tide—can decide what these changes will be.

The Steel Bill

Finding a formula for steel denationalisation has not imposed upon the Government the embarrassing display of second and third thoughts that transport did. The transaction, in all probability, will be more difficult as well as more important; but the way of going about it has always looked, on paper at least, a more plausible proposition. The

text of the Iron and Steel Bill, which was published just before *The Economist* went to press, deserves full examination: but from first impressions it appears to contain some improvements upon the workmanlike proposals already set out in the Government's White Paper during the summer. The real difficulties of selling back steel will not arise at Westminster; but these changes may meet certain of the political objections that are not purely doctrinaire.

The changes include concessions to criticism inside and outside the steel industry. The main duty of the Iron and Steel Board that is to be set up is defined as the exercise of general supervision "with a view to promoting the efficient, economic, and adequate supply under competitive conditions of iron and steel"; no reference to competition appeared in the White Paper. Again, arrangements by the board for the sale of imported materials at lower than cost prices are now mentioned only negatively, as being prohibited except with the consent of the Minister of Supply; and no reference appears to arrangements "for the loss to be recovered from appropriate sectors of industry, as is done at present." Moreover, the Board's powers to raise levies from iron and steel producers appear to have been slightly circumscribed.

The process of resale is still sketched only broadly in the bill, in order to give the holding and realisation agency that will take over the assets of the present Iron and Steel Corporation of Great Britain considerable latitude in "securing the return to private ownership" of the steel companies now publicly owned. This agency, in the meantime, will "so exercise [its] powers as a holding company as to promote the efficient direction of [its] subsidiaries." Any surpluses from its consolidated trading may be paid into an Iron and Steel Realisation Account controlled by the Treasury, from which the Treasury may allow the agency moneys required for its functions such as the provision of finance for development; the Treasury will be empowered to issue up to £150 million from the Consolidated Fund into this account, and to cover this issue by borrowings. It has been obvious that the development programmes upon which the publicly owned companies are embarked could not be held down to the limit of the surplus funds arising within the nationalised industry; this measure will provide money for the development to go on while the companies remain unsold. The original sum paid in compensation will not affect the re-sale; British Iron and Steel stock will become an ordinary gilt-edged security, with the Treasury accepting full liability. There will be no question of matching the resale price with the price paid; nor is there any question of a levy upon all private iron and steel manufacturers to offset the loss that might be made in selling to new private steelowners, as in transport. And as and when the Treasury considers that the duty of the realisation agency has been "substantially discharged," it may dissolve it and transfer any remaining assets to some other official nominee. That day, probably, is a long way off. But the way back is begun.

New Money for Transport

The expected Transport issue made its appearance this week, for the expected amount of £120 million, and took the form of British Transport 4 per cent Guaranteed Stock, 1972-77, offered at 95 $\frac{1}{2}$. The prospect of an early issue had emerged not merely from indications that the Commission would need finance for its 1953 capital programme but also from the knowledge that it had to refinance the £60 million of one-year 1 $\frac{1}{2}$ per cent stock placed privately with the National Debt Commissioners last December. Surprisingly, the whole of this refinancing is being arranged with the Commissioners, who are accepting an equivalent block of

the new stock in exchange for their maturing holdings. The effective amount of the public offering was therefore only £60 million, admittedly a substantial issue, but a much smaller one than the market had reason to expect.

The choice of a 4 per cent stock, instead of the 4 $\frac{1}{2}$ per cent selected for the Electricity issue (of two years longer life) last spring, required the offer of an unusually wide discount, and thus gave the stock some novel features of particular interest to investors concerned with the net redemption yield. By this device, the authorities were enabled to adhere to their recent policy of pitching their issue terms strictly in line with the market level, while still offering a minor bait. The gross yield allowing for redemption at the latest date was £4 5s. 11d. per cent, or virtually the same as that offered, before the terms were known, by the 4 $\frac{1}{2}$ per cent Electricity stock; but the net redemption yield, based on tax at 7s. 6d., afforded an advantage of $\frac{1}{8}$ per cent, at 2 $\frac{1}{2}$ per cent. Once again, therefore, the authorities have shown technical ingenuity; but this technical skill is being directed towards very modest objectives. This loan, because it makes an appeal to the public on medium-long stock, was at first greeted by some as an instalment—though an unspectacular one—of the genuine funding that is now widely regarded as necessary, and that was so noticeably lacking in the refinancing issues of last month. But in fact this Transport operation confirms the attitude of timidity and of solicitude for the market that was deduced from the previous operations.

It had been suggested then that a genuine funding might be attempted by the Government itself when the needs of other public borrowers had been met. But the maturing of the yearling issue to the National Debt Commissioners presented an immediate opportunity—through a real effort to refinance it by sale of stock to the public. Instead, that chance has been ignored, and the public offer is limited to the minimum objective—the Transport Commission's need for new money. It is true that the whole £120 million could not have been absorbed by the public forthwith in any case; and it is true, too, that the Debt Commissioners now have a stock that may be saleable to the public in due course—after the "departments" have unloaded their share of the stock issued for cash. But the terms of the issue were not calculated to induce a rapid clearance; and the decision to make a specific allotment to the Commissioners, instead of leaving them to act as underwriters for the whole amount (as distinct from half of it) does not suggest that there will be any pressure behind the tap that will presumably now start to flow.

Higher Prices for the Transport User

The new issue will raise the capital charges of the Transport Commission by some £3 $\frac{1}{2}$ million in interest each year. Last year capital charges for interest and redemption required £44.8 million from the Commission's working surplus of £49.1 million, and the surplus expected this year, according to the prospectus, will be "of approximately the same order." On a full year, such a surplus would be barely enough to cover increases in capital charges since 1951, and the prospectus recalls the Commission's statutory duty to secure sufficient revenue to meet charges properly chargeable to revenue account, taking one year with another. Without some growth in the volume of traffic, therefore, the cost of the Commission's new money alone might necessitate increases in transport rates and fares, even assuming that operating costs had remained stable.

But operating costs have not. The day after the new issue was announced news came that the Commission had asked the Minister of Transport to authorise a rise of 5 per cent in rail freight rates, dock and canal charges, and road haulage rates, and that it proposes to bring the whole question of passenger fares under review. Since it last sought an increase,

transport costs have continued to rise steadily. In a full year the increased bill would be:

January—Increase in coal prices	5.0
February—Increase in steel prices	2.5
March—Increase in fuel duty	5.5
October—Increase in National Insurance	1.3
October/November—Estimated cost of new wage increases	18.0
	32.3

Added to this, the Commission has to bear the loss of about £2 million a year from the changes in its fares scheme ordered by the Government. Against this £34 million of increased costs, such economies as it has been able to make, and its increases in provincial bus fares, must weigh light in the balance.

The increases in freight rates now asked for would raise £15 million a year, but the Commission's financial prospects may be worse than this request would imply. The amendment, dictated from above, of fare increases that the Transport Tribunal had approved must have cost London Transport dear; and even last year this section of the Commission's transport system was alone in showing a net revenue deficit. If London Transport is lurching further into the red, increases in fares are inevitable; and it is to be hoped that in the coming review of fares London's burden will not be shifted on to the shoulders of railway travellers elsewhere by flat rate increases spread across the country. Some co-ordination of fares cannot be avoided where main line trains serve the same suburban areas that London Transport does; but this system of equalisation, which has political attractions but runs entirely counter to any principles of efficiency in transport, should be pared to the minimum.

* * *

Freedom for Local Borrowings?

Local authorities will no longer be prohibited from borrowing otherwise than from the Public Works Loan Board. This prohibition, which could be relaxed only by dispensation from the Treasury, derives from Section 1 of the Local Authorities Loans Act, 1945, and has been renewed annually since 1950. The Expiring Laws Continuance Bill, published this week, omits to renew this section, which therefore lapses at the year-end. But the Public Works Loans Bill, published simultaneously, increases the limit upon advances from the PWLB from £950 million to £1,050 million (and permits new issues to the PWLB up to a maximum of £500 million). This suggests that there is no intention, for the present at least, to induce local authorities to seek their finance through market or banking channels—if only for the reason that their present needs largely derive from programmes and commitments arranged some time ago.

* * *

Barter with Brazil

There are still some loose ends to be tied up in the three-cornered deal between the Brazilian Government, the Gloster Aircraft Company and the Raw Cotton Commission. But the main outline of the proposed transaction is clear—and not a little disturbing. It raises some important issues for British commercial policy. The background to the deal—and it is a background that needs to be stressed—is that Brazil is grossly in arrears with its commercial remittances to Britain and other countries. At the end of September its arrears in sterling amounted to £38 million and in convertible currencies to \$338 million; Brazil also owed considerable sums to private Belgian and Swedish exporters, and had accumulated substantial debit balances in its payments agreements with Germany, Italy, Holland and Norway. There are, in fact, still some British exports that Brazil received

last November that it has not paid for, and its obligations for pensions seem to have been in arrear since March at least.

Temporary default by Brazil is not a new phenomenon. It has happened in several winters since the war. On previous occasions, however, Brazil has always been able to clear these arrears in the spring and summer, when it has received payment for its cotton crop. This year, however, its sales of raw cotton have flagged—solely because it has asked too high a price for its crop. The prices that the Brazilian Government has quoted average about 50.5 US cents per pound, compared with the 38.5 cents a pound asked by American growers, who, in effect, set the ruling world prices for this particular grade of cotton. In consequence, the British Raw Cotton Commission has imported less than 10,000 tons of cotton from Brazil in the first nine months of 1952, and in September it imported none at all. In the first nine months of each of the previous two years, the Commission imported more than 1 million pounds from Brazil.

* * *

Meteors for Cotton

In these circumstances it is clear what ought to happen. The Brazilian Government ought to cut its price, sell its cotton and use the proceeds for clearing its arrears. Any transaction that encourages Brazil to evade this obligation is gravely detrimental to British interests, and to the interests of other major trading countries. Earlier this year, however, it became clear that the Brazilian Government had set its face against any reduction in the quoted price of its cotton; this seems to have become partly an issue of face and partly a prop to its bargaining position in the complicated series of bilateral deals that it has negotiated with continental and other countries. It has therefore gravitated towards a solution that Señor Miranda of Argentina perfected in the early post-war years; it is trying to arrange bilateral deals with foreign countries, whereby it can sell its cotton to them at grossly inflated prices, but in turn will pay artificially inflated prices for the manufactured goods that it buys from them. It is believed—and it is certainly to be hoped—that the Board of Trade has refused to agree to any such official deal between Britain and Brazil. But Mr Thorneycroft has also apparently decided that, under existing currency regulations, he can do nothing to stop a private transaction of this sort, even one that involves a quasi-Governmental body such as the Raw Cotton Commission.

It is a private transaction that now seems to have been tentatively arranged. The arrangement is that the Gloster Company will sell up to 70 Meteor aircraft to the Brazilian Government for between £4.5 and £5 million; of this, £3.5 million will cover the aircraft themselves, while the balance will meet the expense of sending technicians and training crews to Brazil. The average price that the Brazilians are paying is therefore about £50,000 per aircraft, which is nearly double the standard market price. At the same time, the Raw Cotton Commission is to buy some (probably about 15,000 tons) of Brazil's cotton at Brazilian prices. As the cotton arrives, the RCC will pay the price that Brazil has demanded into a blocked sterling account in this country. Gloster will draw on this account for the purchase price of the aircraft, and will deliver machines only as and if the necessary sums accumulate. It is possible, therefore, that less than 70 aircraft will eventually be sold; this depends mainly on how much cotton the RCC decides to buy. Although Gloster will draw a gross sum equivalent to £50,000 an aircraft, the company will retain only enough to cover the normal market price of its aircraft. The balance will be returned to the RCC to compensate for the loss that it will incur when it sells on the home market (at world prices) the Brazilian cotton that it is to buy at Brazilian prices. If the transaction does go through on these lines, those who are owed commercial arrears by Brazil have every reason to complain of it.

IMF's New Drawing Accounts

The International Monetary Fund has let it be known that it is willing to open "stand-by" accounts, on which members can draw if and when they run into balance of payments difficulties. These accounts will only be opened for members whose applications are considered to be credit-worthy and to comply with the IMF's rules and requirements; the main objective is apparently that members who have not yet been forced to draw on the Fund—but who feel that they may soon wish to do so—should be able to make sure that any application made in a moment of dire need would not be summarily rejected. It is proposed that these drawing accounts should be opened for six months in the first instance, and renewable for similar six-monthly periods thereafter. They would be charged with interest at $\frac{1}{4}$ per cent per annum.

This is undoubtedly a step in the right direction, but it will not—by itself—restore the Fund to the status that it was originally intended to assume as a major instrument in the finance of international trade. Members' annual drawing rights remain restricted to 25 per cent of their original quotas (which at present price levels are far too small); it has been suggested recently that the Fund might waive this 25 per cent rule for very small countries with very small quotas, but no major move in this direction is yet in the wind. Under the present rules Britain's maximum initial drawing right on the Fund in any one year would be some \$325 million and that of other sterling area countries nearly \$200 million. So long as the Marshall Plan lasted, countries in receipt of Marshall Aid were precluded from drawing upon the Fund. Since ECA gave way to MSA European countries have held back from knocking on the Fund's door—partly because they were afraid that their applications would be rejected (a fear that the new "stand-by" accounts system could help to resolve), but also partly because they have come to regard their drawing rights on the Fund as a last-ditch reserve.

* * *

Coal for the Winter

Britain is fairly certain not to suffer a fuel crisis this winter—partly because it has suffered a slackening in industrial output this year, and partly because economy measures and mild weather saved coal last winter. This is the not altogether comforting prospect with which the fuel winter began this year; distributed stocks of coal in consumer's hands are at record levels, and for some months the amount that is being held in stock at collieries has been tactfully described as "not available." So far has the balance swung that among the most cheering figures that the Ministry's weekly statistical summary can include nowadays are any showing an increase in inland consumption of coal, particularly industrial consumption—which may suggest, weather apart, some quickening of industrial production.

Consumption of coal in Britain in the first 43 weeks of 1952 was 3,300,000 tons lower than in the same period of 1951. Production from the mines has not been able to match the increase achieved last year, so that the increase in stocks—plus an increase in exports, which are already 50 per cent higher than by this time last year—has come about largely through lower consumption in Britain. It may well be that production per manshift for workers really engaged on getting coal is somewhat better than current figures would suggest, since the manpower figures used in these calculations include many more newcomers being trained and more men engaged on development than last year. But the increase in productivity that has confidently been expected for months past—"as soon as the new men reach the coal face," and as soon as face are made ready for them, in some mines—has not yet shown itself.

COMPETITORS' OFFERS TO STAFF ARE NOW LESS ATTRACTIVE

One value of a pension scheme

A TEXTILE MANUFACTURER had been losing trained staff to two competitors in his area, despite the fact that he paid equally high wages and provided better canteen, social and sports facilities. The competitors' strength lay in their pension schemes and the drift of staff ceased as soon as he put in similar arrangements.

Robt. Bradford (Pensions) Ltd., handled the scheme for him. They are specialists in designing pension schemes and have unrestricted choice of the entire insurance market because they are independent of all insurance companies. Their impartial advice and wide experience costs you nothing. One of the directors will be pleased to discuss cases and possibilities with you.

Spotlight on Australia

To meet the requirements of those contemplating business or manufacture in Australia, two booklets have been issued by the Australia and New Zealand Bank Limited.

"Industrial Australia"—containing authoritative information on industrial resources, markets, labour and finance.

"Company Formation in Australia"—a general guide to Company Law, with notes on current taxation.

Copies of these booklets will gladly be sent on request.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

THE LONDON OMNIBUS

A Vehicle of Information

Home Fires

Fires are quite all right in their proper place. When they break out elsewhere, within the house or out-buildings, they can quickly run through the property. Though nothing can put back what has been lost, our Fire Policy can make good your losses.

Better Terms

When school fees come in, some fathers find themselves wrestling with sums. Others have discovered however, that the right answer to this particular problem is to take out an Education Policy with us well before schooling begins. It's just a matter of good arithmetic.

Future Outlook Settled

However promising the present, the future safeguard is all-important for you and your dependants. The prob-

lem demands a careful consideration of a Life Policy, and our booklet 'How to be Well Assured' gives a variety of choices to suit your need. You'd be well-advised to read it.

For Your Panes

The bigger the windows, the more natural targets they become for sticks, stones and elbows. When they are broken, our Plate Glass Policy makes sure you are fairly compensated for the damage.

And finally . . .

If you would know more about any of the policies outlined here, if we can provide any information about any particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Dept. P6, London, E.C.4.

D-Day for Furniture

If the standards now drafted by the British Standards Institution for certain pieces of furniture are accepted by the industry, there is no longer any reason for retaining the furniture utility scheme. This is a moment that the industry has been dreading ever since the budget, when, with this one exception, the utility schemes were swept away in favour of the "D" plan. Under this scheme purchase tax becomes payable only on the amount by which wholesale prices exceed a given datum line and not, as previously, on the whole price of any article sold at more than the maximum utility price. The furniture utility scheme had this temporary reprieve because the Government felt that it still provided some guarantee of a minimum standard of quality, a function that other utility schemes had long ceased to perform. Therefore, the Government asked for the authority to introduce a "D" scheme for furniture, but decided not to enforce it until some alternative method of safeguarding quality had been devised.

The Furniture Development Council has now succeeded in devising a series of comparatively objective performance tests to assess whether a given piece of furniture will stand up to the strains and stresses of normal use. These tests are being used as the basis for the British standards now presented to the industry for its consideration. If these are accepted, manufacturers will still be free to decide whether or not to submit their products to the BSI for testing, and the fact that their furniture may meet the standard will have no bearing whatsoever on its liability to purchase tax.

In practice, however, it is difficult to separate the two concepts. The "D" scheme brings considerable relief to manufacturers of non-utility goods, at the cost of taxing some products that were previously tax-free. But more than 95 per cent of the furniture sold today is utility. The industry fears that if the datum line of the "D" scheme is fixed in such a way that 50 per cent of the industry's output is tax-free and the balance taxed on a portion of its selling price, as in other industries, much more of the furniture produced is going to attract tax. The industry has repeatedly asked the Treasury for an assurance that the datum line will be fixed at a level not lower than the present maximum utility prices. There seems little prospect that this will be done and little reason why it should. Furniture has no stronger a case than any other form of consumer goods for tax concessions. The recession of the past twelve months was as much due to persistent over-production as to a fall in retail sales, and today it is a thing of the past. In September, unemployment in the industry was down to 3,061, the lowest figure recorded this year, after having touched heights of 6,000 and 7,000 in previous months. On the other hand, the industry has a strong case for demanding that the Government should state its policy now, while manufacturers are tooling up for the new designs to be shown at the trade shows in the new year. However unpalatable the official verdict may be, it will do far less harm to the trade than a prolonged period of uncertainty.

* * *

Recovery in Textiles

Textile trade at home can no longer be called sub-normal, however slack it continues to be abroad. The index of wholesale textile sales at home (1947 = 100) shot up from 83 in August to 154 in September, while stocks (on the same basis) dropped from 163 to 151. In other words, after a long period of disturbance, sales and stocks stand in the same relationship to each other that they bore in 1947—which is probably as near equilibrium as they are ever likely to get. The value of wholesale sales in September was three points higher than in September last year, when sales had risen far less dramatically from an August level of 110. Since prices have fallen sharply in the last twelve months, the real volume of business done must have risen considerably on the year.

As the accompanying chart shows, the domestic textile recession of late 1951 and early 1952 had its root in excess buying during the post-Korean boom. At the beginning of 1951, after a prosperous Christmas, sales, instead of showing the seasonal New Year decline that precedes the arrival of spring stocks, continued at a high level. The result was that stocks were depleted at a fast enough rate to cause a real danger of shortages. But the retail boom came to an end before this could happen; and then, as a mild winter followed a cold summer, retailers cut back their purchases

from wholesalers, so that wholesale stocks began to rise as rapidly and as alarmingly as they were falling a short while before. It has taken the greater part of this year to bring wholesale and retail stocks and sales back into balance. Preliminary reports of October trade suggest that the improvement that began in September has continued unchecked, but there are still some abnormal features about the business done. Confidence is returning very gradually, and buyers prefer to work on a hand-to-mouth basis rather than risk a repetition of last year's accumulation of unsaleable stocks. They are, therefore, still placing orders for winter stock, when they might normally be expected to be concentrating on goods for the spring. The mills, which cannot work on such a short time basis, and which are themselves somewhat understocked, are not finding it easy to meet the trade's demands for immediate delivery.

* * *

Selling the Government's Lead

London lead prices showed little initial reaction to the announcement by the Ministry of Materials on Tuesday that arrangements had been completed for the sale to Commonwealth producers of most of the Ministry's remaining commercial stocks. The sale will take place over the next fourteen months and the price will be calculated on the basis of the monthly average London Metal Exchange quotations for the period. How much lead is involved in the deal the Ministry did not say and the market can only guess. In August the Ministry agreed with the trade that, after providing for the strategic stockpile, it would release small quantities from its holdings of lead to meet consumer and market needs for spot metal during the initial period of private trading. In the Ministry's opinion this transitional phase is now coming to an end. Within the next few weeks it will cease to guarantee to sell lead for prompt delivery through the Government broker, as sufficient metal should by then have reached this country through normal trade channels. In the meantime requirements for current consumption—which are not expected to be large—will be met from the 9,000 tons of metal that will remain in the Ministry's commercial stock after the bulk has been sold to the producers.

The Government had always intended, once the transitional period was over, to dispose of its remaining commercial stocks with as little disturbance to the market as possible. The latest announcement reflects no change in this policy although, as the volume of trade since the reopening of the market has been larger than was expected, the Ministry say that they have been able to reach agreement with the producers more quickly than was anticipated. On October 1st the Ministry was believed to be holding stocks of not less than 103,000 tons. Since then it is understood to have sold 3,000 tons through the Government broker. According to the statement, a residue of only 9,000 tons remains still to be disposed. At this point the arithmetic of stock disposals breaks down, for it is not known how much of the 90,000 tons that remain unaccounted for has gone to the strategic stockpile, whether any has been sold to the United States Government, or how much is being sold to the producers. At least the Ministry seems to be spacing the sales to consumers over a reasonable period of time. Obviously, it has a common interest with the producers in not wishing to depress prices any further.

Stock Exchange Referendum

The unofficial referendum organised by eleven leading stock exchange firms seems to have given the Stock Exchange Council a mandate to go ahead with its proposals to increase brokerage commissions and to reduce rebates to agents. Just over 60 per cent of the 3,719 members who received the circular letter issued by the eleven firms have given a definite answer to it. In all, 2,301 members answered the question about commission rates, and of these, 1,563 (or 68 per cent) agreed with the Council's policy; similarly, 2,266 members gave their opinion about the Council's proposals to reduce rebates to agents, and 1,463 (or 63 per cent of them) were in favour. Much of the opposition to the proposed changes came from the larger firms that do a great deal of institutional business—and from the jobbers. Of the brokers who answered the circular, 77 per cent were in favour of an increase in commissions and 70 per cent in favour of a reduction in agents' rebates; among the jobbers who answered the questions, however, 59 per cent opposed the increase in commissions and 55 per cent opposed the reduction in rebates. Clearly the jobbers gave more weight than the brokers to the argument that the proposed changes would reduce the volume of business in the "House." Tactically the Council has won another round; strategically its victory might prove a Pyrrhic one.

Stability for Wool

The fifth meeting of the International Wool Study Group took place in London this week and the member countries agreed that there was no urgent problem to be solved. During the past season (1951-52) a virtual balance was achieved between available supplies and world consumption, because Argentina and Uruguay held back a large part of their clips in the hope of getting higher prices. Only recently has Argentina modified its exchange rate for wool and thereby encouraged a sizeable export. This season's world clip is forecast at 2,325 million lb (clean). World consumption, which a year ago was running at an annual rate of 2,050 million lb (clean), has recovered to 2,260 million lb in the third quarter of this year. Thus only a modest further increase is needed to maintain the balance between production and consumption.

This is perhaps significant for the stability of the wool market in the medium term, but in the short run its behaviour will be determined by the rate of liquidation of the South American stocks. Argentina and Uruguay together are believed to hold some 200 million lb (clean) of wool in

excess of their normal carry-over, so that total available supplies this season could amount to over 2,500 million lb. And unless the wool textile industry experiences another panic boom, world consumption is unlikely to rise much above 2,350 million lb. Admittedly, the British Government intends to buy some 50-60 million lb for its stockpile. But this quantity cannot bridge the gap between maximum world consumption and maximum world supplies, including the South American excess stocks.

Stocks in consuming countries have declined during the past twelve months and are now equivalent to only about 4 months' supply at the present higher rate of consumption. They could be increased by 50 million lb. Thus if only half the Argentine stock were marketed, stability in the market could still be maintained. Argentina in the past has not been prone to force its sales; indeed, its accumulation last season arose from the unwillingness of the government to issue export licences for raw wool at the prevailing prices, which it considered too low. The recent adjustment in the exchange-rate applies only to dollar and sterling countries. If Argentina wanted to sell its wool at any price, it could have marketed its supplies last season or made the new exchange rate applicable to all countries. It would therefore seem that on present trends wool prices are unlikely either to fall sharply or to rise sharply during the current season.

Softwood and Hard Currency

Timber merchants, who recently scrambled to take up import licences for the first 500,000 standards of softwood that the Government will allow to be imported during 1953, are now impatiently waiting to learn when the next instalment of licences will be made available. The Government has promised that there will be another instalment for 1953, of not less than another 500,000 standards. But the ministries concerned are anxious that there should not be a repetition of the wild rush that so quickly exhausted the first batch of licences—and of the pressure of buying that so delighted the exporters.

The timber trade, which is now allowed to use its licences for imports from any country, suffers from two major disadvantages. First, timber is primarily an import commodity, and only a relatively small proportion of the products made up from it are re-exported—in the form of packing cases, for example. Secondly, by the perversity of nature or economics, softwood grows mainly in hard currency countries. The British Commonwealth produces vast quantities of hardwood; unfortunately, however, the only Commonwealth country that grows softwood abundantly is Canada. Nevertheless British timber merchants still believe that import licensing could safely be removed, provided that consumer licensing of softwood were maintained. In these circumstances, it is argued, merchants would buy where and when they thought fit (and accordingly at the cheapest prices); in their own interests they would never buy more than the controlled consumable amount. The Ministry of Materials may not be altogether unsympathetic to this view, but the Treasury probably is. Since softwood imports, even under present restrictions, cost £70 million (mostly in hard currency) in the first nine months of this year, the Treasury's caution is not surprising. But it is clear that some announcement about arrangements for importing the remaining supplies needed for 1953 will soon have to be made. Meanwhile, as the Government gradually increases importing freedom, it becomes more anxious about observance of permitted consumer use of this hard currency commodity. With the ending of Government buying, the Timber Control of the Ministry of Materials will be wound up at the end of this year and a smaller Directorate of Timber will take over the remaining duties. In making this announcement the Ministry is at pains to stress that consumer licensing and acquisition will be strictly enforced.

I.C.I. TECHNICAL SERVICE

THE chemical industry's ability to satisfy the needs of its customers at home and to succeed against competition abroad is determined largely by the efficiency of its technical service—that is, the expert advice and assistance it gives to those industries that use its products. The man who buys heavy chemicals is not persuaded to do so by high-pressure salesmanship or intensive advertising. He buys them because they are the necessary raw materials of his business, and he tends to go to a concern which not only enjoys a high reputation for quality but supports its products with technical service.

Technical service works in two ways. It confers obvious and direct advantages on the consumer, and the chemical industry also benefits. Out of the experience of its technical service are born new products, and new techniques, to improve efficiency in many trades. I.C.I. employs hundreds of qualified men in this specialist organisation, which covers nearly every branch of Industry and Agriculture at home and abroad and costs over £1,000,000 a year. Such an organisation can only be maintained by a large scale enterprise. This series of announcements, citing examples from I.C.I.'s casebook, is intended to show the importance of its technical service to the efficiency of British industry and, therefore, to the wellbeing of the community.

Copper Strike Continues

The strike in the Rhodesian copper mines was less than a fortnight old when the Ministry of Materials announced last week that for the time being purchases of copper for delivery to consumers during December would be limited to three-quarters of the November allocation. This is probably no more than a precautionary measure, for although the continuation of the strike means a loss to Britain of some 25,000-30,000 tons of copper a month, stocks in this country are probably sufficient to cushion the effect of the stoppage for some time, and activity in the copper fabricating industry is known to have been falling off lately. At first sight it might seem that Britain is being a little unwise in leaning so heavily on one source for almost the whole of its supplies of an important metal such as copper. But Rhodesia is the only country in the sterling area that has an exportable surplus—most of the world's copper comes from the American hemisphere—and the need to save dollars has forced this country to place all its eggs in one basket.

During the first nine months of this year imports of copper have amounted to 290,000 tons, of which Rhodesia has supplied 120,000 tons of blister copper (for the fire refineries in this country) and nearly 60,000 tons of electrolytic copper. The balance of 110,000 tons also consisted mainly of Rhodesian metal, which owing to insufficient refining capacity is sent to the United States, Belgium and Germany to be electrolytically refined before reaching this country. Copper is still under government purchase and precisely because almost the whole of the Rhodesian output reaches this country under Ministry of Materials contracts and is subsequently distributed at fixed prices, the effect of the strike on world copper markets is likely to be small. There are already signs that the world shortage of copper is at last beginning to ease. Although Chilean copper is still being sold at high prices in the American markets, substantial quantities of European copper have recently been exported to the United States.

The Promise of Titanium

Since last year Imperial Chemicals Industries has been producing small quantities of titanium from an experimental plant at its general chemicals division at Billingham, and studying the melting, casting, and fabrication of the metal in its metals division. This week it has announced that it is starting to erect pilot plants that will form "a British source of supply for the development of prototype applications of wrought titanium and its alloys in the engineering and aero-engineering fields." British engineers will then be in much the same position as their American counterparts—able to examine possible uses of this potentially important metal, though still unable to get it in quantities that would make large-scale production practicable.

The development of titanium as a metal—the dioxide is already widely used as a pigment—has been rapid in its early stages, but expansion towards large-scale output is hanging fire, despite the increase in output of ilmenite, the ore most generally used. Before 1946, production was measured in tens of pounds; this year it may reach 2,000 tons in the United States, the only country producing significant quantities as yet. But the several companies that have gained some experience of producing the metal, and the many others that are studying it, are hesitating to tie up large investments in the present expensive processes—they feel that some much cheaper production method, or more than one, is only just round the corner. The Kroll process most widely used, involves thermal-chemical reduction in molten magnesium and purification in an inert gas. This refines the ore in small batches of no more than about 200 lb at a time, owing to the great amount of heat generated in the reaction and the

readiness of hot titanium metal to combine chemically with the side of the iron vessel. American chemical engineers have fairly cheap helium available for the inert atmosphere, but British producers would generally have to use argon. The amount of power needed in the actual process and in producing the magnesium required for titanium refining makes the process tremendously expensive in energy. In America today, titanium costs \$5-15 a pound.

Several other processes are known, and various adaptations of the Kroll process to render it continuous are being studied by American and British firms. But the difficulties are intense; a method of refining with hydrogen studied by the National Physical Laboratory, for example, has had to be abandoned because of the difficulty of finding suitable refractory materials. Nevertheless, the supply of even small experimental quantities of this metal to British engineers will be valuable, if only for the opportunities that its technical qualities promise. Titanium is as resistant to corrosion as stainless steel and 40 per cent lighter; it is harder and more corrosion-resistant than aluminium; and in certain applications its toughness stands mechanical shock and abrasion better than alloy steels.

Shopping Efficiency and Costs

Distribution costs in America may take rather more of the consumer's dollar than they do of the British consumer's pound. This impression is not verifiable, mainly because hardly any reliable figures are available for British distribution. But it is often elevated into a boast by champions of American-style marketing; and the retailers' productivity team that has just reported upon American shopping holds that gross retail margins are certainly no lower in America for food, and are considerably higher for "non-food" goods sold—estimates that would support the general impression as far as they go. Costs of distribution, of course, are no less necessary to the productive process than costs of production, and to the extent that "mass distribution makes mass production possible," the final price to the consumer may be reduced however the costs are apportioned. Nevertheless, the fact that retailing in America is probably more expensive than in Britain—despite the fact that much of the conventional service of the shop is being shifted on to the customer to do for herself—is a necessary background for discussion of the "efficiency" of distribution in the two countries.

Self-service, inevitably, is the development in retailing that has caught the imagination of the retailers who made up this team sponsored by the Anglo-American Productivity Council. In the selling of groceries, the transformation of American shops in the last decade has been startling:

	1940	1950
Percentage of private traders:		
Complete self-service	15	68
Semi-self-service	53	26
Counter, delivery, and credit service	32	6

In selling goods other than food, self-service has been introduced to an extent that few British shopkeepers would have believed possible. In all types of shops, such services as delivery, when they are offered, tend to be carried out by independent contractors. Perhaps the key to the rapid growth of self-service has been the fact that the American customer, who is usually driving a car, provides her own delivery service for the goods that she sets out to buy or can be tempted to buy "on impulse."

As a result, it appears fairly clear that American retailing is economical in labour. The United States, with about three times the British population, employs rather fewer than twice as many food shops and rather more than twice as many workers in them as Britain does, and handles a relatively greater volume of purchases. Though far more part-time workers are employed, these are used mainly in peak hours

From one Employer to another

The other day I was talking to one of my own company's employees, when he remarked, "of course, I don't suppose I'd save a bean if it wasn't for the Works Savings Group." He was just one of those millions who are doing themselves a bit of good by saving regularly through an Industrial Group. He's investing in Britain because it's made easy for him by someone in the firm taking a little extra trouble.

This made me realise how much we, as employers of labour large and small, can do and are doing, for the welfare of our workers and in the national interest, by encouraging Savings Groups within our organizations. There are today over fifty thousand Industrial Savings Groups whose organizers are devoting much time and enthusiasm to the task of encouraging thrift amongst workers at all levels.

I need not reiterate the appeal of the Chancellor of the Exchequer when he emphasised the urgent need for thrift. Never have savings been more vital than now. Let us, therefore, make a special drive between October and March to increase the number of Savings Groups and the number of Group Savers in places of employment. Ensure that our staffs have full facilities for National Savings; take a special and personal interest in our Savings Groups; encourage our employees to save in every way possible. We shall be doing a good thing for the country, a good thing for the business, but most of all—a good thing for our own work people.

May I send you any further particulars, or ask one of our National Savings representatives to call and discuss the available facilities with you?

There go a few thousand customers

Not my class of trade, old boy.

That's what I thought until I started advertising to them. But believe me, what with overtime, some of them are making pretty big money. In a lot of cases there are two or three wage earners in a family, too. Their incidental expenses are low and most of them live in subsidised houses.

How do you reach them?

Well, I'm doing it through the Daily Mirror.

The Mirror, eh? I can't say it's a paper I'm very fond of. I don't read it very often either, but over four million, four hundred thousand other people do — every day.

Quite a potential market!

It certainly is. And, speaking for myself, I couldn't care less what paper they read. All I'm interested in is selling them my products.

So am I. Is space in the Daily Mirror expensive?

On a square inch per thousand basis it's the lowest of all national dailies.

Are you certain?

Absolutely. You ask your advertising agent.

or to supplement shopping hours. Much greater capital investment is put into shopping facilities—business tends to be concentrated into a smaller number of larger shops—and considerably more effort seems to be expended upon pre-packing where goods are not already branded. This represents a pattern of retailing fairly sharply removed in various ways from the British; and the team's recommendation to British shopkeepers to study and develop self-service, or methods that similarly engage the customer's initiative in buying, may wait upon or hasten considerable changes in the whole structure of retailing here. It is perhaps significant that in food retailing in the United States a considerable decline is noted in the number of shops specialising in different foods such as meat, fish, and greengrocery; and that there are already very few small sweet shops.

Growth of "Scheme" Assurances

The statistics recently published by the Life Offices Association and the Scottish Life Offices—and briefly discussed in *The Economist* last week—throw some valuable new light on the growth of "scheme" assurances in this country. These statistics are based on returns from 64 of the 76 United Kingdom registered offices and 11 of the 13 Commonwealth registered offices; they are believed to cover 98 per cent of the new ordinary life assurance business transacted in this country. At the end of last year, as the accompanying table shows, some 901,000 people in this country were covered by both group pension schemes and group life assurance policies, while another 200,000 were covered by group pension schemes alone and 378,000 by group life assurance policies alone. These figures relate only to what may be called "staff" schemes; they exclude certain group

* Excluding sums assured and premiums covering 6 million lives at the end of both 1950 and 1951, since these are believed to relate to group business of a special kind.

† Approximately 790,000 lives in 1950 and 901,000 lives in 1951 were covered under both group life assurance policies and group pension schemes. There is a similar duplication in the two sets of new business figures, amounting to 94,000 lives duplicated in 1950 and 119,500 in 1951.

life assurance policies that covered 6,000,000 lives at the end of both 1950 and 1951, but related to "group" business of a special kind. In addition to group business proper, 311,000 people were covered by "schemes" operated through individual—instead of collective—policies; the figures for this type of business for 1950 (as shown in the table) may be incomplete, owing to statistical difficulties in assessing the number of "top hat" contracts for higher executives. In all, "scheme" business accounted for some £200 million of the

£627 million of new sums assured with these offices last year. It also accounted for 31.5 per cent (or £71.4 million out of £226.7 million) of the offices' total annual premium income; in 1950 the corresponding figure had been 27.6 per cent (£55.3 million out of £200.6 million) and in 1949 25.9 per cent (£47.3 million out of £182.5 million). Two other features of the life assurance boom illustrated by the new figures are the continued growth of net sums assured and bonuses in force under individual policies (from £4,120 million at the end of 1950 to £4,478 million at the end of 1951) and the rapid rate of increase of new life assurance business overseas (mostly in Commonwealth countries). According to the Board of Trade, British registered offices wrote £65 million of new life assurance business overseas in 1949 and £75.6 million in 1950; the life offices associations' figures now record £95.2 million of overseas new business in 1951.

Butter Output Falls

The upward trend in the world output of milk and dairy produce ceased in 1951. Milk production declined last year, mainly because of the particularly cold spring and the reduction in the dairy herds of Europe and North America. Even so, the year's output of milk throughout the world was still some 5 per cent above the 1938 level, according to the Commonwealth Economic Committee.* The growth of milk output since the war is due to a higher yield per cow, for the world's dairy herd in 1951 was no bigger than before the war and it is believed to have declined this year.

There has been a sharp change in the pattern of milk utilisation since prewar days. The expansion in milk production has been reflected in higher consumption of liquid milk and in larger production of cheese and processed milk. On the other hand the output of butter has declined because of a falling off in supplies of manufacturing milk. Even in 1950, when butter production reached its postwar peak, it was still 11 per cent below the 1938 level. Moreover, the fall in milk production in 1951 was almost entirely reflected in lower output of butter. Because of a rise in consumption in the exporting countries, trade in butter has declined even more sharply than output since the war, and in 1951 butter exports were some 30 per cent lower than in 1938, owing chiefly to lower shipments from Australia and Denmark. In New Zealand—which is now the world's largest exporter of butter and cheese—the expansion in output last year was, however, sufficient to allow both for larger home consumption and larger exports. World consumption of butter, which had reached a postwar peak in 1950, declined last year and in most countries was considerably below the prewar level.

WORLD DAIRY PRODUCTION (Million cwt.)

Product	1938	1949	1950	1951
Butter (24 countries)	56.9	47.7	50.3	48.4
Cheese (21 countries)	29.8	38.3	38.9	39.3
Condensed and evaporated milk (11 countries)	35.0	45.7	51.1	51.7
Milk powder (13 countries)	7.2	16.1	15.8	14.2

Source: Commonwealth Economic Committee.

Consumption per head varies sharply. In New Zealand and the Irish Republic it exceeds 40 lb a year, but in the Netherlands it is only a little over 6 lb a year. In spite of rationing, more butter is consumed per head in this country than in the United States; in 1951 the comparative figures were 14.6 lb per head for this country and only 9.7 lb for the United States. In both countries consumption last year was little more than half its prewar level.

* Dairy Produce. Commonwealth Economic Committee. 1952. 5s.

Output of two other principal dairy products, cheese and condensed milk, did not decline in 1951 although it ceased to rise. The fall in cheese production in the Commonwealth countries and North America last year was offset by higher output in continental countries; world output remained 30 per cent above the 1938 level. Production of milk powder is more than double the prewar level, mainly because of the large expansion in the United States. There has, however, been a slight downward trend in production since 1949, because of a falling off in the manufacture of skimmed milk powder, but this appears to be recovering this year.

Looking at Work

Three years ago a joint committee of cost accountants and production engineers, examining the problem of measuring the effectiveness of industrial production, agreed that time standards—production per manhour, week, or year—were the only measurements that could be applied, and compared, on a wide enough scale. The committee added later, however, that existing standards of time study differed considerably between the departments and firms that used them, and that this whole system of measuring productivity suffered from a lack of agreed principles. More recently, research into the consistency of performance of time study technicians in various industries and factories has shown that the accuracy of these technicians' results may vary considerably. A sub-committee appointed by the original group of accountants and engineers recently issued a third report* recommending a detailed syllabus for training in this type of study, as the basis for an accepted course and a recognised standard of competence in it.

The sub-committee suggests that what is needed is a considerably better-trained type of technician and engineer; that his skill ought to cover a considerably wider field than mere stopwatch observation of operations; and that British industry requires considerably more of these workers than it at present employs. It comments that "work study" is a responsibility often tagged on to some already busy executive (for example, the personnel manager), and in such cases it usually remains a dead label:

Talk to such a man of production and he is with you, discuss productivity and he is still with you, yet mention work measurement and work study and he will probably say that these things are quite useful in most other organisations but they would not work in his own "because the conditions are different."

The type of person selected for such tasks, and the training given, also varies widely between companies; and although many colleges and institutions include reference to work study in their syllabuses or examination courses, the sub-committee could find less than half a dozen that could be said to cover more than the superficial needs of the subject.

Its own recommended syllabus comprises about 100 hours of lecturing and 100 hours of tutorial work; if full-time, it is designed for a course of three months, and if part-time, of three years. Training on this adequate scale would require the temporary release by industry of suitably experienced men to act as teachers (and also adequate pay, since work study instructors today are often paid less than those they teach); but it would be a useful investment. The sub-committee's summary of what the work study observer, technician, and engineer may need to learn is comprehensive. So are its estimates of the qualities that people intending to take up such work would require—which may indeed have been pitched a little high. A person possessing in good measure all the qualities that it lists might seem unlikely to stay for long in any medium-grade executive position.

* "Measurement of Productivity—Work Study, Application and Training," issued by the Joint Committee of the Institute of Cost and Works Accountants and the Institution of Production Engineers, 5s.

Scholarships for Latin America

One potential contribution to promoting trade and other ties with Latin America—an intention expressed in the Queen's speech this week—has been announced by the Federation of British Industries. As a result of a mission sent to nine Latin American countries by the FBI this year, increased scholarship facilities are to be provided for the advanced training of Latin American engineers in this country. As a start, fifty scholarships are to be offered to these countries. The Exchequer at present makes a contribution to the cost of the FBI's post-graduate scholarship scheme, but the bulk of the cost is borne by British industry.

It is clear that such training schemes could make an important contribution towards expanding the exports of British engineering products to Latin America. The practical training the young engineers will obtain in this country will familiarise them with British methods and equipment: on their return they may be expected to rise to positions where they can influence the choice of capital equipment used in their countries' development. There is, therefore, a strong case for increasing the support given to such scholarship schemes by both government and industry.

Revising the Freight Index

The monthly index of tramp freight rates compiled by the Chamber of Shipping is widely used as a measure of shipping activity, but it could be improved. Nobody is more aware of this than its compilers, who have now decided to "overhaul the various trades which were taken into consideration and the weights that have been attached to them. The present index is based on trades and weights selected in 1935, since which time some trades have lost importance while others have gained. The current index, for example, excludes eastbound transatlantic coal shipments—though comparison with other freight indices has shown that the omission of this trade in 1951 caused little variation. A committee that has been studying the index has recently recommended this re-assessment, but advised that the index should continue to include only fixtures in sterling, with fixtures for forward voyages being included in the month of fixture. It was not considered practicable at present to include dollar fixtures; this decision, doubtless, was due partly to the difficulty of obtaining information and partly to the fact that for dollar aid cargoes American-flag ships are receiving preferential rates.

So far the Chamber of Shipping index has been confined to voyage rates for tramp ships, but there is a considerable volume of tramp tonnage let out on time charter. It is now proposed that these time charter fixtures should be taken into account. While it is eminently desirable that there should be an index of time charter rates, it must be hoped that no attempt will be made to incorporate such fixtures into the voyage rate index; it would be very hard, if that were done, to know what the index really measured. The question of compiling an index of operating costs has also been considered, since the freight index is no measure of profit or loss; but the committee considered, as might have been expected, that it would be impossible to secure sufficient information about operating costs on which to base an index.

Shorter Note

The last remaining controls over the cotton industry, imposed under Defence (General) Regulations, 1939, are brought to an end by the Cotton Industry (Revocation) Order, 1952, which came into force on November 6th. In particular the yarn licensing system, limiting the period for which spinners could book orders, is terminated. Although the revocations are welcomed by the industry, they will not make much practical difference, because during the recession the restrictive orders had little application.

Company Notes

Fisons.—At first sight the decline in trading profits shown by the Fisons group for the year to June 30th (from £1,901,633 to £1,602,958) appears to be an unusual prelude to a decision to raise the ordinary dividend from 9 to 10 per cent. But this apparent contradiction is resolved in the informative preliminary statement issued this week. The directors point out that the record profits shown in 1950-51 were inflated by unusually large stockpiling orders for fertilisers; when orders returned to a more normal level, a decline in profits was only to be expected. Moreover, throughout the previous financial year and the first six months of 1951-52 raw material prices were rising, so that in this period fortuitous profits were made on stocks; but in the second half of the latest financial year—and particularly in the last three months of it—prices began to fall and "a very considerable loss" was made upon stocks. In fact, at the end of June the company had been forced to write off £300,000 from stocks of raw materials and manufactured products. Despite this, stocks held by the group were valued at £4,968,080, almost double the value (£2,552,428) carried at the end of June, 1951. In itself such a high level of investment in

inventories would be a factor weighing against any increase in equity dividends, unless the company were satisfied that sales would quickly absorb these stocks.

The directors appear to be confident that this will in fact happen. They are able to report that sales this autumn have been good, and that "an expansion in the sales of fertilisers is planned." Equity payments have been raised in the belief—it appears to be something more than a hope—that both in the short and the long run the outlook for sales of fertilisers is bright.

Wall Paper Manufacturers.—The directors of Wall Paper Manufacturers describe the trading year to June 30th last as "one of the most difficult in the history of the company." Shareholders who examine the company's full accounts will not dissent from this verdict; indeed, some of them may be thankful surprised that the company has been able to maintain the deferred ordinary dividend at 12½ per cent. The directors explain in their report that the high price of paper and increases in other raw material prices last year pushed up costs to an extent that was not fully recovered in selling prices. In addition, sales at home—and more recently sales abroad—have fallen off, "with the result that for the first time in many years wallpaper manufacture has proved unprofitable." Following this decline in sales, three of the company's branches stopped manufacturing wallpaper last March; and since the end of the financial year the group has been forced to cut selling prices.

The scars inflicted by this recession are to be found both in the profit and loss account and in the consolidated balance sheet. The group's trading profits have fallen from £4,406,508 to £2,523,713 and its net profits from £1,517,112 to £844,772. In the same period the group's cash balances have been reduced from £1,618,397 to £527,548 and

£759,325 of tax reserve certificates have been used up. Even more ominously, bank overdrafts have increased from £77,859 to £1,104,444. This decline in liquidity has been accompanied by an increase in the book value of stocks from £6,011,205 to £7,936,377. At the end of June the unpleasant decision

to write down these stocks had presumably not had to be taken, but the recent decision to reduce selling prices may since have made this necessary. The year to June 30, 1953, will, at the very best, be a year of convalescence.

John I. Thornycroft.—The full accounts of John I. Thornycroft for the year to July 31st have a reasonably comforting story to tell. They suggest that the decline in the group's trading profits (from £1,160,523 to £776,000) was largely due to the arbitrary incidence of profits credited in respect of delayed contract settlements; it was not, in itself, an indication that the group had passed from prosperity to recession. Indeed the consolidated balance sheet points the other way—towards fairly full order books. The book value of stocks and work in progress, for example, has risen from £2,003,184 to £3,005,397, which suggests that the group is sharing in the generally prosperous activity of British shipbuilding yards. Similarly, the increase in the net book value of fixed assets (from £701,535 to £820,288) and the estimate of outstanding capital commitments (at

* Including profits credited in respect of delayed settlement of contracts (1951: £475,000; 1952: £65,600).

£207,000) indicates that the company itself is not taking a gloomy view of future prospects. Investment on this scale in both fixed and working capital has made some inroad upon the group's liquid resources, and cash balances have been run down from £1,366,393 to £532,663. Nevertheless, equity shareholders, who received in effect the same dividend payment in 1952 as in 1951, may reasonably expect the same dividend again. But they should not expect any more than that.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 1, 1952, total ordinary revenue was £92,097,000, against ordinary expenditure of £62,633,000 and issues to sinking funds £520,000. Thus, including sinking fund allocations of £19,012,000 the deficit accrued since April 1, 1952, was £352,927,000 compared with a deficit of £56,094,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THOS. W. WARD LIMITED

INCREASED GROUP TURNOVER

NEW ACQUISITIONS

MR GEORGE WOOD'S SURVEY

The forty-ninth ordinary general meeting of Thos. W. Ward Limited was held on November 7th in Sheffield.

Mr George Wood, CBE, presided, and in the course of his review said:

Before proceeding to the results of the past year's trading I would like to preface my remarks with a reference to the alterations that have been made in the form and manner of presentation of the annual report and accounts now before you. We feel that these make for improvement both in clarity and design, and that the new feature introduced giving a ten-year record for the parent company and a five-year record for the group will be informative to those shareholders who are interested in reviewing trends.

It will also be observed that for the first time the directors' report focuses attention on the results from a group aspect. When it is considered that we have over £1,500,000 invested in 22 subsidiary companies, in which in all except three companies we control between 80 per cent and 100 per cent of the shares, and that the combined profits thereof before taxation were over £960,000 and the combined total assets nearly £5 million, then the position cannot be fairly portrayed without the inclusion of their results with those of the parent company.

Commencing therefore from the group position, a remarkable similarity will be noticed when the results for the year under review are compared with those of the preceding year. The profits before taxation at £1,882,305 compare with £1,886,950 a year ago. The charge for taxation requires £1,076,564, leaving profits after taxation of £805,741; and, after adjusting for the amounts already dealt with by subsidiaries in their own accounts, we are left with a net profit available for allocation and appropriation in the accounts of the company of £574,955 compared with £550,188, an increase of £24,767.

RECORD GROUP TURNOVER

This bare comparison of profit does not

you will see that we have increased the fixed assets by some £325,000 in accordance with the board's policy of keeping equipment up to date, and trade investments have increased by over £70,000, represented mainly by the further capital which the Ketton Portland Cement Company, Limited, has invested in its associated company, The Ribblesdale Cement Company, Limited, to finance extensions. The expansion in current assets follows from a rising turnover; but despite a considerable increase in stocks and debtors it is satisfying to note that we still retain a remarkable degree of liquidity in our assets, the cash either on short term loan or at bankers amounting to over £1,100,000. Although current liabilities show a considerable increase, they are covered approximately twice by current assets, which by acknowledged standards is eminently satisfactory. A similar pattern is shown by the separate balance sheet of the parent company, and you will notice that the total assets have now reached a figure over £9 million and the group total assets over £12½ million. Quite imposing totals.

TAXATION

We now come to the charge for taxation which, as will be seen, takes approximately 60 per cent of the group profits. During the next six months the group will be called upon to find over £1,100,000 for taxes falling due for payment within that time.

No company chairman can view such confiscatory inroads into his group's finances with complacency. On the one hand industrialists are being urged to modernise their equipment so that they can compete in the world markets and expand the country's trade, whilst on the other they are being deprived of the essential finances to achieve this very object. Added to the previous

intolerable burden, industry has from January 1, 1952, been saddled with the excess profits levy. The fact that your group has a favourable profits standard estimated at £1,800,000 is fortuitous and does not in any way mitigate the fact that this is an ill-conceived tax.

This crushing level of taxation is just as burdensome whatever may be the political persuasion of the party in power; and whilst unfortunately it is inevitable that for a short time taxation must be levied at a relatively high rate to meet the heavy cost of rearmament, it should be a first priority in any government programme to lighten this burden at the earliest possible moment. Our capacity for saving—whether as individuals or collective bodies—is being seriously impaired. Savings provide the store for future development, and unless the means and incentives for saving are restored our whole economy can be seriously jeopardised.

In the meantime it is incumbent on any government to ensure that the colossal sums being taken from industry are administered as diligently as they would have been if control of them was being exercised by the people who had earned them by hard work, skill and ingenuity and not frittered away in irresponsible schemes and extravagant administrative expenditure.

STEEL NATIONALISATION

Since our last meeting we have had a change of government—a government pledged amongst other things to denationalise the production of steel. This has not yet become effective and will, indeed, take a long time to bring to fruition. One can only hope that reason will prevail and that this great industry so vital to national prosperity will eventually be allowed to function untrammelled and unhampered by political controversy,

under management which has intimate practical experience and technical knowledge of its many specialised sections.

We will now deal with the balance of profit for appropriation. From the profit available for allocation and appropriation of £574,955 referred to earlier in this report, we have decided after careful consideration that it is again desirable to allocate a sum of £200,000 to provision for contingencies, making with the allocation last year a total of £400,000. We feel that in these days of exceptional risks it is a prudent measure we should adopt. We have also allocated £25,000 to the taxation equalisation reserve re initial allowances. This leaves a balance on the year of £339,955, added to which we have the balance brought forward from last year of £519,953, giving a total of £859,908. Dividends already paid on preference and employees shares, together with an interim dividend of 5 per cent per annum on the ordinary shares, total £71,398.

The board recommends the payment of a final dividend on the ordinary shares of 10 per cent, together with a bonus of 5 per cent, both less tax, making a total of 20 per cent, less tax, for the year. With the participating rights on employees shares, this will require £90,783. Again we propose a transfer to general reserve of £200,000, bringing the total of that reserve up to £1,400,000. This will leave the carry forward on profit and loss account at £497,727, against £519,953 brought in.

It is a widespread practice among companies to give a brief breakdown of their trading results over the year and further illustrate it in terms of per £ of sales. For those of our shareholders who find interest in such comparisons, we set out on page 423 the relevant figures for the year under review in respect of the parent company.

(a) Breakdown of trading results.

	To nearest £000.	Per cent of gross income
Purchases, including carriage, etc.	16,630	79.7
Wages and salaries	2,045	9.8
Factory, depot and administration expenses	875	4.2
Depreciation	113	5
United Kingdom taxation	607	2.9
Retained as reserves	435	2.1
Distributed as net dividend	163	.8
Total gross trading proceeds and gross income from investments	20,868	100

(b) Analysis per £ of gross income.

	To nearest penny s. d.
Purchases and carriage	15 11
Wages and salaries	2 0
Factory, depot and administration expenses	10
Depreciation	1
United Kingdom taxation	7
Retained as reserves	5
Distributed as net dividends	2
	20 0

Whatever other values such statistics possess, I think you will agree that they very forcibly stress the meagreness of the margin remaining to finance expansion and to give a reasonable reward to capital invested.

FUTURE PROSPECTS

It is both interesting and instructive to review the statistical record over the last ten years. From this it will be seen that, by pursuing a moderate dividend policy and retaining profits in the business, just over £3 million has been added to capital employed since 1943. We move forward backed by very solid resources.

There is undoubted evidence of a recession in trade in many industries. Orders are being worked off at a greater rate than new orders are being obtained, particularly in the export trade. Our manufacturing interests, including those of subsidiary companies, still have satisfactory order books, but the incidence of rising costs may result in some reductions in profit. From a broad viewpoint it can be said that we should not be wise to count on results remaining as good as over the past two years—during both of which turnover and profits were the highest ever experienced—and that we should be prepared for some curtailment. At the same time we consider prospects are still reasonably good, as, judged by ordinary standards, business being offered is still large.

The pleasure that a chairman may obtain in reporting progress in terms of monetary values is somewhat tempered by the knowledge that they are not proportionately representative of progress in terms of real value. Money, apart from being a means of exchange, used to be regarded as a measure and store of value. Unfortunately the past few years have seen a radical departure from such standards so that we have no reliable yardstick by which to measure true progress. Any steps that are taken by a government to restore that stability of value to our currency so that it once again becomes a real measure of value both in our national and international dealings, are to be commended and supported.

The report and accounts were adopted and the dividends recommended declared. The retiring directors were re-elected and Messrs Joshua Wortley and Sons reappointed auditors.

THE BORNEO COMPANY, WILLIAM DOXFORD AND SONS, LIMITED

RECORD PROFITS

The one hundred and fifty-ninth ordinary general meeting of The Borneo Company, Limited, was held on November 5th in London, Mr C. R. Akers, FCA, the chairman, presiding.

In the course of his speech, the chairman said: All our branches have contributed their share to the record profits presented to you. All our subsidiaries also, with minor exceptions, have had a most successful year.

The net trading profit of the parent company for the year increased by £132,911, from £793,084 to £925,995. The group profits, before taxation, showed an increase of £706,438, from £1,122,254 to £1,828,692. Taxation has once again taken a very large slice out of our profits—64 per cent of the profits of the parent company.

After certain adjusting entries, the net available balance for the year was £186,460, of which £63,024 is required to cover the preference dividend and the proposed dividend, described as final, on the ordinary shares for the year and £100,000 goes to general reserve.

The sales of the parent company and its subsidiaries were in excess of £16 million, which is an increase of £5,500,000 over those of last year. However, it would appear that we have now seen the last of the boom years experienced since the war and are facing the inevitable aftermath.

Malaya is the territory which is most affected by the recession, because the economy of that country is so largely based on rubber, but in all the territories since March 31st last we have been faced with a fall in turnover and a fall in gross profits, with no appreciable fall in expenses. There appear to be, however, indications that importers and dealers have cleared the worst of their surplus stocks and have cautiously started to buy again.

THE FUTURE

You will realise that it is impossible to forecast the future. Profits are falling from the exceptional peaks which we have experienced in the last two years. This, I think, is good, as there is no doubt that this inflationary period which we have experienced has been harmful to the peoples of the world and, consequently, international trade.

Your company will continue its function of assisting in the development of the countries where we are established, and in the process I see no reason to believe that we shall not earn our just reward in the shape of reasonable profits.

Perhaps the biggest problem which companies such as ours are faced with is one of finance. Not only do we have to finance stocks and debts, but we are all the time faced with the necessity of buying, or building at inflated prices, houses, warehouses and office accommodation.

Our policy must also be at all times to make finance available for the expansion of our activities and the spreading of our risks. This financing of stocks and debts, and of capital outlays, is extremely difficult in the face of the very heavy taxation which we now have to meet. The total liability for the year to March 31, 1952, amounted to over £1 million; a formidable figure. It is for these reasons that we have conserved our profits as far as possible.

The report and accounts were adopted.

The sixtieth annual general meeting of William Doxford and Sons, Limited, was held on October 31st in London.

Dr E. P. Andreae, the chairman, in the course of his speech, said: The profit for the year is £601,744, as compared with £600,442, but the heavy toll of taxation absorbs £348,000, as against £305,000 for the previous year, thus leaving a net profit of £253,744 compared with £267,442. We recommend a final dividend on the ordinary shares of 20 per cent, making, with the normal interim dividend of 5 per cent already paid, a total of 25 per cent for the year, always provided that we interpret the February interim of 7½ per cent as appertaining to the previous year.

We are again recommending the capitalisation of £50,000 of the undivided profits of the company by applying that sum in paying up in full 50,000 unissued ordinary shares of £1 each.

ALLOCATIONS TO RESERVES

When considering allocations to reserves this year, we decided to add £100,000 to reserve for plant extensions and renewals, because it is treated as a capital reserve, rather than increase the general reserve at the moment. This capital reserve now stands at £700,000, and represents profits already invested in physical assets employed in the company's business.

Bearing in mind our future plans, we feel that the right and proper course is to continue as in the past and to provide for these and other contemplated expenditures out of profits as these permit.

There is little I need say about the balance sheet. You will agree that it shows a capital structure of great strength. The total reserves are now more than double the issued capital, whilst cash and quoted securities aggregate well over £1 million.

Last year I told you that the major reorganisation of our shipyard, on which we had embarked, was almost completed, and although the results obtained from the employment of our new methods had been highly encouraging, we feared that a shortage of steel might prevent us from making the fullest and most economical use of them. I regret to say that our fears have proved only too real. During the year we received considerably less steel than we needed to take full advantage of the new installations. I am glad to say, however, that there now appears to be a gleam of hope that the position will gradually improve.

POPULARITY OF ENGINES

We completed and delivered to their owners three oil tankers and two dry cargo vessels, all fitted, of course, with Doxford Oil Engines. In addition, we supplied four sets of our engines to other shipbuilders.

When I tell you that Doxford Engines representing almost two million horse-power are now on order, you will appreciate the value to us of our many licensees throughout the world, who have helped to popularise it and maintain its reputation as the foremost marine oil engine of the day.

The large number and importance of our licensees, however, imposes upon us a great responsibility, of which we are fully conscious. We meet it, to the best of our ability, by maintaining a staff of scientific and practical research engineers.

Our present commitments enable us to forecast full employment for at least three years.

ABRIDGED CONSOLIDATED BALANCE SHEET

TRINIDAD PETROLEUM DEVELOPMENT COMPANY

ACTIVE AND SUCCESSFUL YEAR

EXPLORATORY DRILLING AND OIL RESERVES

MR KENNETH MOORE'S REVIEW

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held on October 30th at the Abercorn Rooms, London, E.C., Mr Kenneth A. E. Moore, FCA, presiding.

The Secretary (Mr J. Mytton) having read the notice convening the meeting and the report of the auditors,

The Chairman said:

As you will have observed from the directors' report and the accompanying accounts, your company has had another very active and successful year.

Oil production rose to a figure in excess of three million barrels for the first time for nine years, while the balance from production account—which represents the net revenue from oil after charging production and administrative expenses—exceeded one and three-quarter million pounds, a record in the company's history.

On the other side of the profit and loss account expenditure on oilwells and development account was at a high level—over half-a-million pounds on exploratory and semi-exploratory wells and over a quarter-of-a-million pounds on exploitation wells, while depreciation absorbed £285,000.

Thus the net profit for the year amounted to £ 685,313

Out of which the Governments of Trinidad and the UK will take between them by way of taxation £ 448,250

And if you confirm our dividend recommendation, the shareholders will receive £ 185,213 633,463

Which leaves to be ploughed in £ 51,850

Out of this sum £50,000 has been placed to general reserve and the balance goes to increase the carry-forward by a modest sum.

In passing I would draw your attention to the fact that we shall be paying out in the form of taxes nearly two and a-half times what the shareholders are receiving by way of dividend and, of course, in addition, the Government of Trinidad receives from us large sums by way of royalties and rents. These latter sums far exceed the amounts distributed by way of dividends and it is perhaps worth mentioning that we distribute by way of wages, salaries and payments to contractors in Trinidad about £700,000 a year.

In one way or another, therefore, it may be said without fear of contradiction that we are making a very important contribution to the well-being of Trinidad and its economy—a contribution which far outweighs the modest return to those who had the faith and courage to embark their savings in our enterprise.

But, to return to the principal figures which I have mentioned above, some comments are desirable to give them perspective.

First of all, as regards production, I would remind you that when the public were invited in 1937 to subscribe for ordinary share capital to put the company on its feet, production was estimated at 1½m. barrels and profits at £90,000 per annum. In every

year since then these forecasts have been very handsomely exceeded and I should mention that, whereas in 1937 we had oil rights over 24,000 acres on the mainland, today the corresponding figure is in excess of 77,000 acres, quite apart from our marine areas.

IMPROVED OIL RESERVE POSITION

During the war we were required to produce from our proved areas and, quite properly, were not allowed to divert steel and effort to exploratory drilling. Nevertheless, we succeeded for a time during the war in raising production to well above the 3m. barrel mark, but after the war it tended to fall away until in 1948 it was down to a low of 2,662,170 barrels.

Oil reserves are, of course, a wasting asset, and since the war we have had to endeavour to prove up new areas. There were, however, difficulties and delays in getting delivery of new drilling equipment in the immediate post-war years, and it was not until about 1948 and after that we were able to get the deep drilling and other equipment so badly needed.

In each year since then we have spent large and increasing sums on exploratory drilling, and although we have had our share of disappointments we have, in one way or another, restored and improved our oil reserve position, a fact which is reflected in the rising tendency of production in the last four years.

In this connection you will, I am sure, be interested to know how we have fared as regards exploratory drilling since we last met a year ago. On that occasion I referred to our discovery of a narrow belt of the Herrera sand in an exploratory well, Coora No. 188, and I said also that this was the first Herrera production we had achieved in our main fields and that it might be of great importance, although it would be dangerous to jump to premature conclusions.

I also said that in order to prove or disprove the extent and capacity of this Herrera discovery two further exploratory wells had been put in hand but that it would be some time before we knew the answer. These further wells were Coora 190, which was drilled to a depth of 9,478 ft. at a cost of about £60,000, and Coora 191, drilled to a depth of 11,617 ft. at a cost of about £70,000. Coora 190 failed to reach its target although we are obtaining from it a small production from the Miocene formation. Coora 191 reached the Herrera sand, but in that location the Herrera sand proved to be watered "down-dip." However, a further exploratory well, Coora 192, picked up the Herrera sand again at 9,545 ft. and is producing a modest quantity of oil. Whether or not this production will prove fully commercial has yet to be established. It seems that the reservoir is considerable but of poor permeability. It is conceivable that this condition will improve naturally to the westward or that treatment by explosive or chemical means will improve the access of oil to future wells. In any event, the chances of the profitable development of this deeper reservoir are improved by the fact that it is likely to be overlaid in many locations by shallower reservoirs from which commercial production can be expected.

I am sorry to trouble you with this semi-technical stuff, but you will understand that this exploratory drilling is a very expensive

but absolutely vital part of our operations and that, although one may not get spectacular results, it all helps to build up our knowledge of the geological structures and of the potential oil reserves which, of course, have a very important bearing on production prospects.

But, to return to our other exploratory work:

Moruga 2, an essential exploratory well, and a milestone, so to speak, on the hard road to our outlying territory at Moruga Bouffe far to the east, was drilled to a depth of 13,008 ft. in the face of tremendous difficulties, at a cost of over £200,000, and was, quite frankly, a failure, as also was a wildcat well, New Grant 1, drilled to a depth of 7,292 ft., at a cost of about £80,000. However, we have now got some distance with what is perhaps the most important exploratory well of all, Moruga 3, and at the moment are down to over 8,000 ft. In the course of drilling this well we have gone through many oil-impregnated sandy beds at frequent intervals all the way down, and believe we are now approaching the Cretaceous, one of the main objectives. Our geologists and technicians in Trinidad are very optimistic about this well and feel that even at this stage it affords the hope of a new commercial shallow field. Two shallow test wells, Moruga 4 and 5, have been drilled since the end of the financial year alongside Moruga 3, and are already giving production, as yet small, from certain shallow sands. Time alone will show whether the optimism of our experts is justified, but I give you this information so that you may know all that I know on the subject at the present time.

TRIBUTE TO COMPANY'S TEAM

Summing up, our exploratory drilling last year has added a great deal to our knowledge of the geological structures, and it holds out two excellent prospects for the company, which, if they materialise in a form anywhere near a reasonable expectation of their worth, would add considerably to the company's reserves of oil and production prospects.

I need hardly tell you that the drilling activity of the past year, and, in particular, the exploratory drilling in outlying districts, has only been possible as the result of the enthusiastic efforts of our geologists, engineers, drillers and others. Their work is exceedingly arduous and goes on 24 hours a day, often in great heat or heavy rain, in most remote corners of the jungle. It involves the building of roads and bridges, the erection of housing, the provision of water and lighting and all the other services essential to work of this kind. For these reasons I would like you to join with your directors in sending a special message of thanks and appreciation to all our people in Trinidad, whatever their place may be in the team, for the very great contribution they have made to the progress of this undertaking by their strenuous efforts in the past year.

I hope to visit Trinidad again in a few months' time and to express my appreciation personally to all concerned.

ENLIGHTENED POLICY

As I have mentioned on previous occasions, our workpeople in Trinidad are sensible enough to realise that their fortunes are

linked with the continual success and progress of our operations, which alone have made possible the good wages and provident funds and the improved housing, medical, educational, recreational and other amenities which they enjoy. The educational and technical training facilities which we provide are beginning to show important results in improved technical efficiency and in providing opportunities for promotion to Trinidadians.

The enlightened policy we have followed in these matters is greatly appreciated in all quarters in Trinidad and I am only sorry that, in some ways, progress is a little slow. For example, it has not yet been found possible by the Colonial Education Authorities to find a place this year for either of our two scholarship winners at English universities but, fortunately, they are both young and we are sure that an entry in the right technical courses will be found for them next year. It has been the greatest pleasure to us to see that one of the grantees is the son of the West Indian longest in our service, who has risen from the ranks to the important post of assistant chief accountant.

TAXATION BURDEN

To return to our figures and to the accounts, we are, as you will appreciate, disturbed at the very high proportion of our profits—namely, about two-thirds—taken by taxation. Our ordinary dividend has remained unchanged for the last six years, but in that period taxation has risen from £205,000 in the year 1947 to £448,000 in the year just past. Taxation on this scale makes serious inroads into our ability to face the high cost of development and exploratory work and, quite apart from the domestic aspect, on a long view must be damaging to the economy of Trinidad.

So far I have not referred to our balance-sheet. All of you have, no doubt, studied the figures which speak for themselves and show a sound and reasonably liquid position. There is one item, however, to which I should refer—namely, the note to the effect that contracts in respect of future capital expenditure are estimated at £412,000. This sum relates in the main to contracts for the future supply of steel casing for wells and miscellaneous equipment which we have to order far ahead to ensure delivery when it is required. Thus you will appreciate that payment will be spread over the months and even years to come and the rather large sum mentioned in the note does not represent an immediate liability.

ORGANISATION IN FIRST-CLASS SHAPE

I hope, in the course of this address, I have been able to give you a balanced and realistic view of our affairs. They are, I can assure you, in first-class shape, and we are justified in looking forward to the future with every confidence on the operational side. On the financial side, I need hardly say, our fortunes will depend in the main on matters completely outside our control, such as taxation, the future course of oil prices and of the dollar/sterling rate of exchange. You will remember that the whole of our production is sold in terms of US dollars, and therefore any movement in the dollar exchange immediately affects our fortunes.

In this connection, and as mentioned in the directors' report, we have recently renewed our long-term oil contract with United British Oilfields of Trinidad, Limited, on terms more favourable than those previously in force. The new terms give us a secure market and a measure of protection in the event of a fall in the price of oil, and I should like to take this opportunity of expressing our appreciation of the good relations which have existed for so many years between the company and the Shell organisation as managers of United British Oilfields.

Trinidad, Limited, and their understanding approach to our problems in the recent negotiations, which have been concluded to the mutual satisfaction of both parties.

Before concluding I should mention that for a variety of reasons it is desirable that our articles of association should be amended and brought into line with the Companies Act, 1948. In due course we shall therefore be calling a special meeting of shareholders for this purpose.

Finally, I take this opportunity of expressing our thanks to our managing director, Commander Lavington, and to our general manager in Trinidad, Mr Bennett, for their outstanding services in the past year. As I have indicated earlier in my remarks, the company is fortunate in having, both at home and in Trinidad, an enthusiastic and capable team and the prosperity of the company is, in no small measure, due to their efforts.

The report and accounts were adopted.

FISHER & LUDLOW LIMITED

SUCCESSFUL RESULTS

MR ARTHUR KEATS' REVIEW

The thirty-second annual general meeting of this company was held on October 31st in Birmingham, Mr Arthur Keats, OBE, the chairman, presiding.

The following are extracts from his circulated statement.

It gives me great pleasure to be in a position to submit for your approval and adoption accounts which show an expansion of earnings in spite of the difficulties that have had to be faced during the period under review.

It will be noted that the profit of the Group before charging taxation amounted to £927,026 compared with £852,004 for the previous year. The imposition of the Excess Profits Levy and the higher rate of Profits Tax applicable to the period to December 31, 1951, have led to an increased charge for taxation of £584,857 as against £515,857 for the previous year and leaving a net profit of £342,169 compared with £328,167.

BURDEN OF EXCESS PROFITS LEVY

I feel I cannot let this opportunity pass without registering my protest against this latest burden thrust upon industry by the Chancellor of the Exchequer in the form of the Excess Profits Levy and the arbitrary way in which it is charged. So far as your company is concerned the early postwar period was a time of complete re-organisation and transfer to our present works at Castle Bromwich, and it was not until 1949 that the benefits of the long term programme were being reaped and we are now being penalised for our enterprise, the wisdom of which has been proved in the trading results of the last three years. There must be many other companies whose circumstances are similar and who feel the same sense of injustice.

STRONG FINANCIAL POSITION

There is little need to give a detailed survey of the accounts, since these tell their own story of the steady progress of your business and of its strong financial position to meet any exigency that may arise. From our consolidated balance sheet it will be seen our net current assets amount to £3,584,824 of which no less than £1,996,625 is in cash or securities readily convertible into cash. The value of stocks at £1,733,201 represents a reduction in the physical level over the previous year, after taking into account the price

increases of the past year, and will enable us to obtain the benefit of price reductions that are now apparent in certain basic commodities.

Revenue reserves and surplus have been further strengthened during the year and for the Group now stand at £1,359,669 (subject to Note 3) after deducting the recommended dividend of 22½ per cent less tax on ordinary stock and the transfer of £10,000 to the staff benevolent fund.

NEW PLANT AND EQUIPMENT

During the year the process of maintaining our plant at the highest possible level of efficiency has continued with the expenditure of £238,343 on new equipment, whilst further orders for £200,000 were still outstanding at the year end. It is interesting to note that the company has spent over £1,750,000 in new plant and equipment during the postwar period and that the total book value of all our plant now stands at some £950,000.

The profits of our subsidiary companies continue to make very useful contributions to the Group, although the latest restrictions on imports to certain Commonwealth countries are now being felt in the domestic appliance field, in common with other trades supplying consumer goods, and may result in reduced profits from our Bendix company.

EFFECT OF RESTRICTION OF IMPORTS

How far these restrictions are likely to affect the motor car industry with whom we are closely associated, is difficult to assess at this stage, but it seems fairly certain that some reduction of output must be expected. Your directors have had this possibility in mind for some considerable time, and have secured valuable armament contracts for stores and vehicle bodies which are now coming into production.

A steady expansion of trade by our subsidiary company, manufacturing mechanical handling equipment such as the "Flowline" and "Flowlink" Conveyors, and other labour saving devices, is pleasing evidence of the awareness of British industry generally, of the necessity for obtaining the maximum efficiency in production, processing and handling operations. This trend is also reflected in the increasing sales of Pallets, which are used for the transport and storage of partly processed and finished goods, by which means a considerable reduction in floor storage space and production costs can be obtained.

There is much uncertainty on the business horizon and there is no doubt that industry will need to become more competitive if our place in the markets of the world is to be held, let alone extended, but I feel confident that all possible steps have been taken to ensure that the position of your company is maintained and its high reputation enhanced.

You will be pleased to learn that the employees' pension scheme which was recently commenced is functioning satisfactorily. Unfortunately, a number of our employees died during the year, and there is no doubt that the difficult financial circumstances brought about by the loss of the breadwinner have been eased for their dependents by the benefits which are paid by the scheme. Our benevolent fund has continued to pay pensions to older employees who were not eligible to join the main pension scheme.

The achievements before you have entailed much hard work and have called for loyalty and co-operation from management, staff and employees, and I am certain you would like me, on your behalf, to tender your appreciation for the contribution they have made to the success of your company.

The report and accounts were adopted.

TANGANYIKA SISAL GROWERS' ASSOCIATION

MR E. F. HITCHCOCK'S SPEECH AT THE ANNUAL DINNER

The annual dinner of the Tanganyika Sisal Growers' Association took place at Tanga, Tanganyika, on October 30th, when 200 members and guests were present. Sir Edward Twining, KCMG, Governor of Tanganyika, was the chief guest. Mr E. F. Hitchcock, CBE, who presided, in the course of his remarks on the sisal industry, said:

SISAL PRODUCTION

Since Sisal Control was discontinued at the end of 1948, East Africa has produced almost 700,000 tons of sisal of a total value of over £100 million, of which over \$100 million worth went to reduce the dollar gap of the sterling area. That is an achievement, and a considerable contribution to the economy of East Africa, especially of Tanganyika, which has contributed 80 per cent of the total.

This year production is likely to reach 196,000 tons, an increase over 1951 of 6 per cent, although there will be a substantial decline in the Kenya output. The total 1952 value is likely to be £25 million, or £6 million less than in 1951.

During the year to the end of August, 105,000 tons were shipped from Tanganyika ports, showing a shortfall on production of 10,000 tons. The rail and port facilities have not kept pace with the increase of production and this we regret.

THE PRICE STRUCTURE

Fall in World Sisal Prices.—The dramatic fall in the world sisal price from March to August of this year took most people by surprise.

Just over two years ago, in July, 1950, at our annual dinner I said that "the equilibrium of world hard fibre supply and demand was being approached, and that within two years, or even sooner, we might experience a rapid and even a spectacular fall in the sisal price."

World inflation.—What, in fact, happened? Almost before the ink on my statement was dry world values of all primary commodities swept upwards, and with them I may add also all costs, especially of machinery, equipment and stores, which we need for our production.

The intrinsic supply and demand position of commodities had little to do with the case. Certainly the real world consumption of sisal did not appreciably alter. This followed the outbreak of war in Korea, and the expansion in world armament programmes which led to a great expansion in world credit; and a further diminution in the value of the pounds which we receive for our sisal.

The quoted rise was certainly spectacular, from £130 to £250 a ton, and the price in the sterling area temporarily outstripped the price level in terms of the dollar, thus making BEA sisal dearer to the American consumer than dollar-produced hard fibre. The quoted fall, from £250 to £90 a ton, was even more spectacular.

Price Fall as it Affects Growers.—How was the sisal producer affected?

The East African Customs Returns show that in 1951 growers received an average f.o.b. East Africa port price for all their sisal of £167 a ton; during the first six months of 1952, £179; and during the three months July to September of this year, £126—comparable to the pre-Korean price established

early in 1950, as a result of the devaluation of the £ some months previously in September, 1949. I may add that the difference between the f.o.b. East Africa port and the c.i.f. United Kingdom port price was £15 a ton, and the differential between the highest and the lowest grade £23.

The point I wish to make is that the price received by growers has at no time been on the high level of prices which have been publicised throughout the world, and which have involved a good deal of criticism of the producer. Nor indeed was the producer in any way responsible for the rise in price, caused by world influences outside his control.

These extreme price quotations applied in practice to a negligible proportion of production, owing to the established policy of forward selling, which on a rising market is to the advantage of the buyer, the average price to the producer being well below current market quotations.

But such price quotations undoubtedly had an undermining influence on the market, and the financial risks feared impeded normal buying. This was the main factor in the price fall, and everything that followed only aggravated the position, including some irresponsible offerings, due to needless anxiety on the part of a few sellers. But on the whole producers have kept their heads and their solvency.

The price continued to fall, buying being largely for current or near delivery, and by August touched a c.i.f. United Kingdom port quotation of £90 for No. 1 or £80 average for all grades, equivalent to £65 f.o.b. East Africa port. Even above this figure, some estates find that their costs exceed their sale receipts, and this is resulting in some decline in marginal production. The fall was overdone and in the interests neither of producers nor consumers.

A greater confidence has since returned to the market, and the price has steadily risen since August, and today is £110 c.i.f. United Kingdom port for No. 1, while the differential between grades is £10 instead of £23, for demand has temporarily focused on the lower rather than the higher grades. This given as average f.o.b. East Africa port price of £90, a fall of almost 50 per cent on the average price received by growers at the top of the market.

The Price Outlook.—Sisal producers in East Africa wish to make clear to spinners that they have no desire for prices above the level which makes for sound and economic consumption and production. They want no inflationary prices, for they realise the financial risks involved. There is a point, however, below which production is likely to decline.

The price of £110 for No. 1 c.i.f. United Kingdom port or 14½ cents per lb New York is in present circumstances low, having regard to the marginal costs of production, the high costs of capital replacement, as well as the social and political need of sustaining expenditure on the welfare especially of our African staffs, for unless this is provided for, Colonial territories will pay the price in other ways more disturbing and far less economic. The wages of indecision on this matter are great.

The fall in price had the temporary effect of drying up demand, for no buyer will willingly operate on a falling market, and this affected finished goods as well as the raw material. This, combined with abnormal weather conditions, has temporarily caused a

substantial carry over of baler and binder twine surpluses, especially in the American market, and the difficulty of Mexico in selling her henequen, which is weaker than the type of sisal that we produce, added to the difficulties. Mills in America have even been on short time, or have had to dispense with a margin of their labour, and have even been compelled to manufacture for stock.

But I have evidence that these positions are gradually clearing up.

Moreover, there is no world commodity in which stocks bear a lower proportion to production than hard fibres.

Real demand for the variety of basic agricultural and industrial needs for which sisal is a necessity, must still go on, and will not be greatly affected by the price level if it is reasonable. Demand which has been withheld owing to the fall in price is now beginning to assert its influence on the market. I am, therefore, by no means pessimistic with regard to the sisal outlook.

The commodity is, in fact, now on a sounder and more economic basis than it has been for years, and I hope that that position may be maintained with sufficient encouragement, both to consumers and to producers.

Earlier in the year certain representations were made to the Government of the United States to the effect that high sisal prices were caused by a cartel of East African producers.

I need not tell you that within East Africa itself there are a dozen competing sellers, and also competition from a dozen other producing countries. It appears to me that the recent price history is of itself a sufficient reply to such allegations.

RESEARCH

Apart from individual estate expenditure, the sisal industry has collectively undertaken great responsibilities and, by cess and fee, has raised over the years, in good times and bad, a sum of over £1,500,000 to be spent for its better organisation. Of this, almost £1 million has been spent through the Sisal Growers' Labour Bureau, known as Silabu, and a large part of the balance of £500,000 on agronomic and economic research.

The principles established by our agronomic research have now to be applied to the vastly different conditions within the limitations and the large-scale operations on sisal estates.

Our publication, *Hard Fibres*, independently prepared and distributed by *The Economist* of London, has now established itself as the most authoritative and comprehensive statistical review of world hard fibres, and its value has been generally recognised.

We are also turning our attention to trade research overseas, and a committee of the industry has been formed in London to discuss, with spinners and others, how best producers can meet the requirements and needs of consumers. Our main aim is to consolidate established uses, especially rope manufacture, for a sisal rope requires quite a different twist and lay than the traditional make of a manila rope, for it is a fibre of a different structure. I have seen in Canada excellent examples of sisal rope, splendidly constructed and adequately finished. It is a major use in which we would like the interest and co-operation of spinners throughout the world; including specially the United Kingdom spinners.

We may even find new fields of use, includ-

ing the vast unexploited utilisation of the valuable by-products. But apart from research, this will need considerable capital for reorganisation of factory layout and technique which will have to be worked out in East Africa.

LABOUR

Since the price of sisal became remunerative, individual estates, and groups of estates, have greatly increased their expenditure on the care, recreation, and welfare of labour, including medical attention.

The sisal industry employs over one-third of all the labour employed in the Territory, besides contributing 60 per cent of the value of all exports from Tanganyika. By the conditions of its employment and the good personal relations which it has established, it continues to attract labour, and already 70 per cent consist of local volunteers or those from a distance who have decided to settle permanently on the estates.

I have had inquiries from overseas as to whether the present events in Kenya will affect Tanganyika. At least, those who know that Tanganyika is not in the suburbs of Nairobi or Johannesburg, put it that way. I can only reply that one never can tell. On such matters none of us can afford to be complacent and certainly not superior. I can only say that in many ways as well as distance, Tanganyika is far removed from Kenya. We are not affected yet, and I do not think we shall be.

We not only produce sisal in order to earn a profit, but are responsible for the development and contentment of all those who serve our industry. That is our responsibility to Tanganyika. When we are unable to do both these things, then someone else will have to produce your sisal.

EAST ASIATIC RUBBER ESTATES

A RECORD YEAR

The twenty-ninth annual general meeting of East Asiatic Rubber Estates Limited was held on November 5th in London.

Mr H. T. Karsten (the chairman), said: The result of the year's working, namely £326,698 before providing for taxation, is the highest recorded since the inception of the company and again reflects the high price obtained for our product during the year.

Provision for taxation amounts to £185,000, or nearly 57 per cent, leaving a net profit of £141,698. £50,000 has been placed to general reserve and £22,000 to provision for replanting. An interim dividend of 10 per cent, less tax, was paid in December last and the board now propose to pay a final dividend of 10 per cent, less tax.

During the year 496 acres were replanted and 149 acres were in the course of replanting. The crop harvested was 3,638,635 lb, about 150,000 lb short of the estimate. The replanting programme is naturally influencing our crop, but we nevertheless hope to produce our estimate of 3,550,000 lb for the current year.

The cost of production during 1951-52, including export duty, was approximately 50 per cent higher than during the previous year, but the rise in labour costs has now been checked, and we expect to be able to produce at a moderate profit, even at the present price level.

Out of the present year's crop we have sold and accounted for to date 701 tons at an average price of 2s. 7½d. per lb, and 224 tons of first grade rubber have been sold for delivery at an average price of 3s. 3½d.

The report was unanimously adopted.

ANGLO-CEYLON AND GENERAL ESTATES

RECORD TEA CROP

The sixty-sixth annual general meeting of The Anglo-Ceylon and General Estates Co., Ltd. was held on October 31st in London, Mr Francis W. Douse, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year to March 31, 1952:

The operations for the past year may be considered satisfactory. In Ceylon, despite the sale of Holmwood Estate, a tea crop of 5,545,277 lb was obtained, as compared with a crop of 5,160,134 lb for the previous year. This was an all-time record and represented an average all-over yield of just under 700 lb per acre, compared with the previous record of 675 lb per acre during the year ended March, 1950.

The net average price realised was 33.30d. per lb, as against 36.08d. per lb for the year ended March, 1951. The cost of production was higher by approximately 2.75d. per lb, due largely to the season having borne the full impact of the increase in wages imposed in December, 1950.

For the fifth successive year the Island of Mauritius harvested a record crop during the 1951-52 season, 483,500 tons of sugar being produced, as against 456,000 tons for the previous year. The share of this Company and its subsidiary, Mon Tresor & Mon Desert Ltd., was 55,100 tons, as against 57,000 tons last year. From these figures it would appear that there has been a falling off of our production as compared with the Island generally; this, however, is not the case as the increase in the total Mauritius crop was due to extra acreage put under cane by other estates and planters, whereas our estates were already almost entirely fully planted. The short fall of sugar produced by us compared with the previous year was due to climatic conditions resulting in a lower sucrose content of the cane, a factor which affected the entire Island. The net price realised was approximately £30 10s. per ton, against £28 per ton last year. The benefit of this was largely absorbed by higher wages and enhanced cost of supplies.

PROFIT AND DIVIDEND

The trading profit of the company and its subsidiaries amounted to £840,539, including £31,389 surplus realised on the crops of the previous year. This compares with a trading profit of £952,391 for the year ended March 31, 1951. The trading profit, although less than that for last year, is satisfactory. The figures for 1951 constituted an all-time record and covered a period of continued inflation and might therefore be considered as exceptional.

The directors have pleasure in recommending a final dividend of 10 per cent, making 20 per cent for the year, on £1 million of ordinary stock capital. The gross dividend of 30 per cent paid last year on £650,000 stock was the equivalent of 19.5 per cent on the new capital of £1 million.

In Mauritius the prospects for the current year are favourable. It is likely that an increased crop for the Island will be harvested. As regards Ceylon, it is hoped that another good crop will be harvested and that prices will prove to be satisfactory. The burden of penal taxation still exists, and the longer it goes on the more difficult it will become to cope with the expenditure necessary to keep plant, machinery and general maintenance to the level required to cover operations on a long-term basis.

The report was adopted.

THE ALUMINIUM CASTINGS COMPANY

MR R. K. CALDER ON INTOLERABLE TAXATION BURDEN

The forty-sixth annual general meeting of the Aluminium Castings Company, Limited, was held on October 31st in Glasgow, Mr R. K. Calder, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:

Last year I indicated that at that time group turnover and profits were running at a level some 50 per cent above 1950-51. Later in the year, however, there was a sudden and sharp contraction in demand—more particularly for our electrical appliances—and as a result the output for the year registered an increase of only some 20 per cent.

In the circumstances, trading profits did well to advance to £214,769, an increase on the previous year of around £58,000.

Charges on this profit increased, however, by some £17,000, with the result that earnings before taxation are returned at £139,261, an increase on last year of some £39,000.

While the equity shareholders must again forgo a return on their capital, industry's sleeping partner represented by the tax collector exacts an ever-increasing toll. On the former almost intolerable burden of taxation there is now superimposed the very serious impost of Excess Profits Levy, and for the three months of the year during which EPL is effective, we have had to provide over £6,000 to cover this latest penalty on enterprise.

There can no longer be any doubt that the present scale and equally the basis of taxation must be drastically revised.

Coming to the facts, taxation charged increased by some £25,000 to just under £70,000. This onerous charge is below what the profits should bear at current rates since a measure of relief—now almost exhausted—is still being afforded in respect of past losses of certain subsidiaries.

The expansion in trading has been financed largely by the increased bank facilities to which I referred last year. These additional borrowings added to our existing substantial loan account continue to exercise the close attention of your directors.

I am hopeful, however, that in the near future your directors will be able to place before you satisfactory proposals for dealing with the loan account, active negotiations in regard to which are at present in progress.

Developments during the year include a new "Swirlux" Junior washing machine and a substantial repair contract for Jet Engine "Canware" by your Burnley Company.

The Atkinson Company is now producing a development of the "Alligator" track—known as the "Atkitrak"—and production is starting on the Atkinson-Hacker range of tractors and logging equipment.

Scottish Aluminium Ware is now associated with the production of "Anemostar" ventilation and air diffusion equipment and is producing "Cyclaid" bicycle motors on behalf of British Salmson Aero Engines Limited.

Coming now to the prospects for the current year, while we started the year with a record order book, output to date is some 25 per cent down, as compared with the peak figures for the corresponding period of last year. Fortunately, however, I think we have perhaps seen the worst, and output is now showing signs of improvement which, if maintained and perhaps added to, should enable the current year to turn out reasonably well.

I regret that the equity shareholders must again go unrewarded, but the pressure on our finances is such as to necessitate a policy of strictly conserving resources and building up substantial reserves. I am sure that in the long run the shareholders will benefit from this policy of consolidation.

The report was adopted.

MONTAGUE L. MEYER LIMITED

RECORD TRADING RESULTS GROUP'S CONTINUED PROGRESS

The annual general meeting of Montague L. Meyer Limited was held on November 4th in London, Mr Montague L. Meyer (the Chairman) presiding.

The following is an extract from his circulated statement:

I shall be pardoned the justifiable pride I feel at being able to place before you the record figures demonstrating the continued progress made by our group of companies in the year which ended on March 31, 1952.

The accounts I am presenting show a consolidated trading profit of £1,110,033. This figure, which is reached after adequately writing down stocks, is an increase of £633,843 over the preceding year.

The directors now propose a final dividend of 15 5/6 per cent, making the total distribution for the year equal to 20 per cent on the present ordinary capital—the comparable figure for last year being 15 per cent.

After providing for all dividends, including the final recommended on the ordinary shares, the group has £320,351 more at the end of the year than it had at the beginning. This sum has been placed to profit and loss account.

I emphasised in my statement last year that our purchasing of softwoods in the autumn of 1950 for shipment during 1951 was resulting in turnover and profits of unprecedented magnitude for our group—my

remarks have been completely justified. That year was the first since the war that we were allowed to purchase softwoods on our own account from all supplying countries except the dollar areas and Eastern Europe. Thus we were able to increase our sales substantially and our turnover exceeded an average of one million pounds per month.

NEED FOR DECISIVE GOVERNMENT POLICY

The softwood trade is of fundamental importance to the economic life of the country, especially to the housing drive, export packaging and defence. I cannot feel, however, that the Government has yet approached the problems of the trade with the understanding and statesmanship which are equally important for the trade and for our national well-being.

A year ago the Chancellor of the Exchequer announced that the freedom which the trade had been given to buy on private account in certain countries would be extended to allow private purchasing from supplying countries all over the world. The Timber Control's buying activities ceased and the trade was left to ensure the nation's supplies. This liberty, however, was qualified by the imposition of a global maximum limit, and this in its turn led inevitably to the retrograde step of fixing individual quotas for each importer based on previous trading.

For 1953 the authorities have declared that imports will again be subject to a global maximum limit. I venture to repeat my conviction that this regulation is harmful and unnecessary. It must be remembered that at the beginning of 1952 the Timber Control had contracted for the import of 450,000 standards of Canadian timber, and while this fact may have provided some justification for limiting the quantity to be purchased by the trade in that year, no such conditions will apply in 1953, and it may well be found that even unfettered buying by the trade may result in barely sufficient softwood timber being imported for the country's current needs and the maintenance of adequate stocks.

As I commented a year ago, the trade is being asked to play its part in conditions of great and unnecessary uncertainty. The Government would remove much of the difficulty if it would forthwith announce the amount of imported softwoods it is going to licence for consumption in 1953. The trade knows the quantity of imported softwood in stock in this country and the consumption figures would be its guide for buying. With regard to prices, imported softwoods are considerably lower than a year ago—nevertheless, we feel convinced that there must be further reductions before stability is reached. Under such conditions the Government should have no fear that the timber trade will spend an unnecessary amount of foreign currency.

The Government, in its natural and proper concern to safeguard our national foreign exchange reserves, is defeating its own policy, as to decide a global maximum without saying what that maximum is to be has encouraged some importers to purchase for next season at increasing prices. A more decisive policy on the part of the Government would have provided an opportunity to gradually secure the necessary supplies at lower prices and thus conserve foreign exchange.

COLONIAL DEVELOPMENTS

I feel it right to make clear my conviction that for some time to come foreign exchange considerations will greatly affect the operations of the timber trade. It is for this reason, and because of our profound faith in the contribution which Commonwealth sources can make to timber supplies, that we have embarked on a large-scale development of producing and trading units in Colonial territories. These concerns have already shown profits and we have great faith in their future. There is every reason to hope that these producing subsidiaries will also be a source of earning dollars, as both Canada and the United States have expressed interest in the woods produced from our areas.

The report was adopted.

Binding Cases

Binding Cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 13 issues and the quarterly Index; that for RECORDS & STATISTICS will hold 26 issues. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

LEVERHULME RESEARCH FELLOWSHIPS, 1953

Application is invited for Fellowships and Grants in aid of research. The Fellowships and Grants are intended for senior workers who are prevented by routine duties or pressure of other work from carrying out research. They are limited to British-born subjects normally resident in the United Kingdom. In exceptional circumstances the Trustees may waive the condition as to residence.

The Trustees are also prepared to consider applications from groups of workers engaged upon co-operative programmes of research particularly from those engaged upon long-distance programmes. The duration of the awards will not normally extend over more than two years or less than three months and the amount will depend on the nature of the research and the circumstances of the applicant. Forms of application may be obtained from the Secretary, Miss M. Braumey, Leverhulme Research Fellowships, 3/5 Salisbury Square, London, E.C.4. Telephone: City 1910.

Applications must be received on or before December 31, 1952. Awards will be announced in May and will date from September 1, 1953.

MARKET RESEARCH

Leading South African Company (Johannesburg) requires Graduate Statistician with experience in Market Research, especially sampling. Must be British by birth. Starting salary up to £1,000 p.a. according to age and qualifications. Excellent prospects. Air passage advanced, deductible over two years from salary. Apply with full details of experience and salary required to Box 111.

SHIPPING EXECUTIVES who are contemplating the desirability or necessity of adding an experienced executive in his early thirties to their staff may readily solve their problem by directing their personnel manager to communicate with the advertiser who will be available early November with educational, personal and business references of proven worth.—Box 109.

MARKET RESEARCH

We are looking for a man (or woman) who would qualify as No. 2 in our Market Research department. This is a responsible post and practical experience in field survey work is essential, including the planning and execution of surveys and the presentation of results. —Please write fully and in confidence, stating salary required to H. C. Caffin, F. C. Pritchard, Wood & Partners Ltd., Advertising & Public Relations, 25 Savile Row, W.1.

ACCOUNTANT (Chartered or Incorporated) required as Assistant Secretary to a large public company in the textile trade in Manchester. Age 30 to 40 years. Commercial experience desirable. Write, stating age, experience and present salary, to Box 286, Wheelers Advertising Agency, Manchester, 2.

Cleavage on the Axe

THE Labour party rightly chose economic policy as the subject on which to attack the Government in the concluding debate on the programme for the new session. But after making the right and obvious choice, most Labour speakers ran away from the subject. No one had expected them to propound an economic policy of their own; it is becoming common form for oppositions to criticise without recognising any need to be constructive. But even destructive criticism cannot have much effect unless it is based on some defined and coherent attitude to the principal issues. And from this the Labour party is apparently as far away as ever. Its speakers could not decide whether the disaster they feared for Britain was an old-style slump or a further decline in productivity and a new-style crisis in overseas payments. The Government was accordingly blamed for errors in two opposite directions, and therefore effectively blamed for nothing. The most serious discussion of its policy came instead from those Conservative backbenchers who want to swing a vigorous axe at state expenditure.

This internal Tory debate was too general to be related to the immediate problems of falling production and lost export markets. But it is along these lines, if at all, that Government policy may be brought under the searching scrutiny it has lacked and badly needs. During the next few months the Conservatives will have what may well be their best opportunity to do the realistic economic thinking that they failed to do in opposition. For once, ministers have a breathing space for thought about longer-term problems. After only one year in office, they are presumably still relatively fresh in mind. The recent by-elections should make them politically confident enough to face some internal disagreement and even to explore the lines of action they think necessary without bowing before every prejudice and inhibition that has grown up in the protected siege economy of the past twelve years.

If this opportunity is to be taken, the first necessity is to relate the general Tory predilection for cutting expenditure and taxation to the immediate situation facing Mr Butler. After bringing the country's overseas payments into balance—thanks mainly, so far as Government action is concerned, to import cuts—the Government now finds that both production and exports are falling. A rough preliminary estimate suggests that in the middle six months of the year industrial production was 6 or 7 per cent smaller than in the same period of 1951, while the volume of exports was reduced by about 16 per cent. If the Labour party had concentrated on these figures as the cause for alarm, instead of involving itself also in forecasts of an approaching million unemployed and an imagined "return to the social conditions of the interwar years," it might have exposed not only the nature of the country's difficulties but also the real confusion in Conservative opinion. Four reasons for the fall in production can be identified. In the first place, the switch to rearmament work has inevitably caused

some industrial dislocation, especially in face of the steel shortage that is now fortunately ending. Secondly, the financial discipline imposed by tighter credit has enforced industrial adjustments that are in no way less healthy because they involve, in the short run, a net decline in output. Thirdly, there has been some slackening of consumer demand in the home market. For all the fuss that it caused, this has in fact been of major importance in the case of textiles alone, and there demand is now reviving. It is only the fourth element in the decline of production that should cause serious alarm. Though detailed statistical proof is lacking as yet, it seems that some of the slackening of output is now correlated with the slackening of overseas demand for a wide range of British exports.

Mr Butler on Tuesday reaffirmed, with commendable clarity, his general response to this situation. The Government would pursue a selective policy of damping down the home demand for capital goods, for which overseas demand in many cases remains strong; it would not depress the home demand for consumer goods that cannot be sold abroad.

This is a declaration distilling the very essence of gentlemanly moderation and sweet reason. It should please both parties. It will not, of course, quite satisfy Labour's Left-wingers, who want enough inflation to ensure (for a time) that no man ever loses his job and that the foreigner, if he is inconsiderate enough to want what Britain is not producing, should understand that he must go without. But Mr Butler's principle is, none the less, precisely what Mr Gaitskell's would be if he were Chancellor. It is no less attractive to many Conservatives. And it is also a recipe for the economic stagnation of Britain. Its unspoken assumption is that the existing structure of British industry must be defended against change.

It is, apparently, an out-dated liberal idea to think that people should be required to do whatever work, in changing conditions, meets consumers' demands and raises the standard of living of the country. The modern truth is that the preservation of the jobs people are already doing is the first charge on the standard of living. The Tory does not, it should be said, hold this doctrine in quite the same form as the Left-wing Socialist. He recognises that Britain as a trading nation must pay attention to overseas demand. If the foreigner inconveniently wants capital goods, not consumer goods, his demands must be met—as far as is possible without pushing British people and British industry about. Industry at home must be starved of equipment in order to meet the export demand. And the consumer goods industries that cannot sell their products abroad must have the demand at home kept up for them, so that only a few employers and workers are put to the inconvenience of moving into the capital goods industries.

This doctrine is too patently absurd for anyone to embrace it in its logical completeness. But its influence on the practical policies of both parties is strong. It is certainly strong enough to put the more sweeping demands for reduced Government expenditure quite out of line with Mr Butler's actions. The argument for cutting expenditure is that industry cannot be enterprising and resilient unless its burden of taxation is lightened. But the essence of present export policy is that industry cannot have the physical resources, the new equipment and new buildings, that enterprise and

resilience would demand. In these circumstances, large cuts in Government spending would reduce consumption, against Mr Butler's intentions, without increasing real investment. The difference between the Cabinet and some of the Tory backbenchers, in their attitude to Government spending, is more than a difference of degree; it is, if the backbenchers really know what they are about in the present situation, a definite cleavage on policy.

In principle, the backbenchers are plainly right. To export capital goods by repressing industrial development at home cannot be more than a desperate emergency policy. Prolonged, it is a sure way to disaster. If there is a way to maintain a large British export trade in the modern world, it will only be by exporting a larger proportion of capital goods. To that end, some industries will have to get more men and equipment and others will have to lose them. This mobility is the essential requirement, on anything but the most short-sighted view, for full employment; to try to freeze the existing labour force in the consumer goods industries, by offsetting at home the markets lost abroad, is unlikely to do more than delay unemployment until it becomes irresistibly severe.

★

This general argument, however, does not mean that Mr Butler will solve his problems by swinging the axe as his Tory critics advocate. On the other side, the Labour party blames his mildly disinflationary policy for the fall in production. It would be possible, and politically tempting, to meet both criticisms at once—and thereby, unfortunately, to demonstrate the inadequacy of both. Mr Butler could slash, say, the social services and give back the saving not by reducing company taxation but by making large cuts in income tax and in the indirect taxes on consumption. That would please his own backbenchers without in fact doing industry any good and while still encouraging inflation in the consumer trades.

The policy that by now the Tories should have worked out demands more courage. It is to reduce Government spending, and to lighten company taxation, without putting more money into the hands of consumers. It is, in other words, to stimulate not production in general but production of those exports that Britain can sell and those domestic capital goods that Britain needs. It is to release energy and initiative not in the effervescence of inflation but in the tension of industrial readjustment.

This is a great deal to ask of a Government which feels that with its present policies it has found at last the way to success and the key to popularity. On Tuesday it was understandable that Mr Butler, faced with so little effective criticism, concentrated on his account, in glowing terms, of what his policy has already achieved. Thanks to skill and to courage, as well as to good luck, that achievement is remarkable. But Mr Butler himself would probably agree with the verdict of one Conservative member, Mr Richard Law. The Chancellor has gained time; he has conducted an emergency operation with great skill and with little pain to the patient. As a result, "the patient still breathes and lives, but as yet he has no guarantee of recovery." It is through policies which change the pattern of British industry, not through policies to keep it fixed, that some sort of guarantee may eventually be won.

Fruits of Malanism

THE situation in South Africa is gravely deteriorating. Following the race riots in Port Elizabeth last month in which eleven people were killed, there have now been outbreaks of violence at Kimberley and East London. At Kimberley at least thirteen people, all Africans, were killed and at East London ten, including two Europeans, one of them a nun. These developments are new in the history of South Africa and they mark a steady turn for the worse during the past few months in the struggle between the two races, the Europeans and the Africans.

Behind the scenes, less spectacular but no less novel and significant for the future, there has been another development. The Africans themselves have shown that they are learning to organise. Many who have known the Bantu race for a long time were at first unwilling to believe that the Africans, working in partnership with the other non-whites, the Indians and the Cape Coloured, possessed the ability to carry out the threat of a passive disobedience campaign. They have been proved wrong. It is no small task to arrange for a given number of volunteers to turn up at a set place and time, and then merely to sit on the wrong seats or stand in the wrong queue. To behave quietly but provocatively in such circumstances, to act simply as Europeans but to invite arrest by doing so requires a measure of both political consciousness and self-discipline which has come as a disturbing surprise to some of Dr Malan's supporters.

These two developments are not directly connected. The African National Congress, which has been running the passive disobedience campaign so skilfully, has had no apparent hand in inciting the rioting. Before the one-day strike this week it issued a statesmanlike appeal to its followers to observe the peace. Rioting and arson have taken place for other reasons; for example, in East London, the police have tried to break up orderly though forbidden meetings of Africans, and the mounting state of tension in the Union as a whole has created explosive situations only too easy for drunken and irresponsible elements to touch off locally.

If, however, the two trends were to merge, if the organising ability so far put into passive resistance were to be thrown into the scales of violence, there could be little telling where events in South Africa would end. There would certainly be an alarming breakdown in public order; there might be something close to civil war. At present any such possibility may still appear to be some way off. But the situation is tense and unstable, and there is no sign as yet that the Malan government is prepared to countenance any policy other than repression to meet the growing refusal of the Africans to co-operate with the Government. The result is to drive events ever faster in the direction of extremism, and to provoke the Africans into drastic political and economic action which they do not want and which can offer no ultimate solution to the real problems of race relations. And this is being allowed to happen in spite of the absolute dependence of the whole South African economy on its black labour force.

The origins of the present tension lie in the constitutional crisis precipitated by the Malan government's determination to put the Cape Coloured people on a separate electoral role from Europeans. It is true that Mr Strauss and the United Party are, in general, in favour of

a policy of segregation for Africans. Increasing evidence that the Nationalists were prepared to back their way through the tangle of race relations, at almost any cost in terms of public opinion and constitutional procedure, has had an effect of delayed shock on the opposition, white and non-white alike. When the Separate Representation of Voters Bill was declared unconstitutional by the Appellate Division of the Supreme Court, Dr Malan pushed through a High Court of Parliament Act; as a result of this, the government's parliamentary supporters sitting as a High Court—opposition members and senators boycotted the session—overrode the Supreme Court's ruling. Lately the High Court of Parliament Act itself has been declared null and void by the Cape Division of the Supreme Court, now the appeal by the government against this ruling has been turned down in Bloemfontein by the Appellate Division of the Supreme Court itself. It is thus not surprising that what began as a constitutional crisis, caused by a deliberate political decision affecting the everyday life of a large section of the community, should now be reflected in a nation-wide sense of uncertainty, frustration and fear. Dr Malan has only himself to blame for the way his opponents are reacting to the provocation he has given them.

★

Instead of trying to bridge the gap between his administration and the Africans by creating new machinery for consultation—there has been virtually none since the Natives' Representative Council was allowed to lapse by the present government—Dr Malan has only aggravated the deadlock in race relations by more and more use of the police. Instead of recognising the truth, he has now even blamed the British and the Indians as the people primarily responsible for what is happening in his country. Speaking as the Prime Minister of South Africa, Dr Malan this week accused the British of letting down the white races in Africa by their policies in the Gold Coast, and the Indians of deliberately fomenting trouble in the Union by their actions over Natal and at Uno. It is legitimate to wonder how far these tactics may be designed primarily as electioneering gambits in preparation for next year's appeal to the country. Whether they are or not, their effect is deplorable, both on developments in South Africa itself and on the opinion of the outside world. Such a lapse into irresponsibility may sow the wind, but it will reap the whirlwind.

The outstanding political problem in Africa is to promote among the Africans a public opinion interested in working with the whites, while creating among the whites a genuine willingness to see African living standards rise and political rights increase in step with them. These aims, as human as they are inescapable if Africans and Europeans are to live together in united communities, lie behind the British colonial policy of encouraging the maximum feasible consultation with Africans and their gradual participation in government. Dr Malan's accusations, based on the atmosphere now being engendered in South Africa, unfortunately ignore these realities. What has happened and is happening in the Gold Coast represents an attempt to solve the main problem by methods and at a pace suitable to that particular territory. The Gold Coast's progress towards self-government is not intended to undermine the authority of Dr Malan, and

it cannot be made dependent on events and attitudes in South Africa. British policy must have its own doctrine and its own conscience.

It is increasingly true, on the other hand, that what happens nowadays in one part of Africa has repercussions in others. If Dr Malan worries about the Gold Coast—and from his own point of view he has grounds for doing so—other governments with responsibilities in Africa have a right to worry about South Africa. Britain, as a power responsible for many millions more people in Africa than there are in the Union, has a close and direct interest in what happens there. It is always invidious to criticise the internal affairs of another country; but the impact of Dr Malan's racial policies is not confined to his own country. It is strongly felt as far north as the Rhodesian copper belt, and to a growing extent in East and West Africa as well. By making no concessions to the trend of the modern world, the Malan government is not only defying the liberal conscience of international public opinion; it is also creating embarrassing practical problems for countries like Britain which have to live beside it in Africa.

Criticism without responsibility can cause much mischief. Moreover, the effect of some foreign comment

has so far been to help rally South African opinion behind the government and against outside interference. This cannot, however, be allowed to influence the genuine concern of the British people, who stand in a specially intimate and friendly relationship with South Africans as free and equal partners in the Commonwealth. Besides the community of interest in the future of race relations in Africa, the British have in addition a special claim to be heard by virtue of the strategic role which South Africa plays in Commonwealth defence. For the free world to survive in war, it might be that the western powers—including the United States—would have to rely on the use of the Union's ports and airfields, industries and raw materials. All these are factors which make it plain that what happens in South Africa cannot be regarded in isolation. They are a part of the international pattern which concerns the United States and Western Europe as well as Britain. That explains why the events in South Africa have called forth such alarm and indignation among the Union's friends and why, if Dr Malan and the other members of his government are to pursue their aim of racial segregation by their present methods of *apartheid*, there is grave and legitimate misgiving about the consequences.

Development Charge: Kill or Cure?

THE Queen's Speech last week promised legislation "relating to" the Town and Country Planning Acts of 1947. The indefinite preposition was perhaps more appropriate than is usual in the pronouncements of Whitehall. One may assume that the Bill now under preparation will not undo most of the 1947 legislation. The purely planning parts of the law are far from perfect; in particular, they have produced a good deal of petty bureaucracy against which the private citizen is largely defenceless. Nevertheless, they can with advantage be given a longer trial with perhaps some minor amendments.

The new Bill will presumably be more closely concerned with changing the financial provisions of the 1947 Act. No one can be satisfied with the practical working of these provisions and in one respect action has become urgent. The Act set up a fund of £300 million to compensate landholders who from the passing of the Act lost their right to profit from the increase of land values resulting from development. Payments from this fund must be satisfied by the issue of Government stock not later than July 1st next year. It turns out to be big enough to meet the claims on it. But times have changed and any government would, rightly, be reluctant to meet a large bill that experience has clearly shown to be wrongly conceived not in amount but in principle.

With all that has lately been said in criticism of the compensation fund and of the development charge to which it is complementary, it should not be forgotten that these financial arrangements were devised to meet a social problem that in 1947 both parties recognised as urgent—a problem that had, indeed, been emphasised by the house-building boom of the thirties. It was in the light of that boom, and its "ribbon" building from the town out along the roads to the country, that the 1947 Act made a revolutionary change in the land laws of Great Britain. The Act provided that almost all "development" of land (and the definition of develop-

ment was very wide) required planning permission. If the permission added anything to the value of the land, the whole of this added value was to be paid to the state—the development charge—before the development could begin. The exceptions to these rules were slight. The effect was, of course, to take away the existing rights to develop their land possessed by many owners, and the compensation fund was set up in recognition of this fact.

The result, the Labour Government said, would be to remove all the financial drawbacks to comprehensive planning. The miscalculation was the same as with so many of that Government's measures. The diseases it set out to cure, which had been apparent in the thirties, no longer existed in the same form when the medicine was poured down the patient's throat. After nearly five years of operation, the financial provisions of the 1947 Act have brought neither justice nor an equality of injustice to the landowner; they may well have created as many new problems as they attempted to solve. They have certainly created a vast new administrative machine which, in 1951-52, collected some £3,875,522 in cash—at what cost it is impossible to say, since the Central Land Board does not publish the figures.

The main criticism has been directed against the 100 per cent development charge. In times of inflation it has acted largely as a tax on building, not on the landlord. The owner of land who does not wish to develop it himself is given no inducement to allow anyone else to do so; therefore he either declines to sell at all or asks far more than the value of the land in its existing use. Many landowners get that higher price because, during most of the past five years, the cost of a plot of land at "existing use" value, plus the cost of building a house on it, has fallen short of the cost of buying an equivalent existing house with vacant possession. On the other hand, where the landowner has been compelled to sell to a local authority he has received no more than the existing use value, unless his land was technically "dead-ripe" for

development, and has had to wait for the rest of its former value until the compensation fund was shared out. In either case, chance governed his fortune. If he met a potential buyer with the chance of a building licence, he obtained for his land far more than the Government protested that his land should be worth. If it was a local authority that selected his acres, he received a bare minimum in cash and a by no means certain IOU for the balance. Whatever landowners should have felt at this treatment, they were in fact indignant.

This is only one criticism of the development charge. Secondly, the process of fixing the charge is completely arbitrary, because it is artificial. Indeed, it is the difference between two values each artificial in itself because each deliberately excludes many of the elements that a market valuation would include. Further, the charge is fixed by one of the parties to the argument, by a servant of the body that will collect the money afterwards, and there is no appeal from his decision. Official valuers are partisans of the Treasury; they are employed to be that. How can anyone believe that they should be accepted by the ordinary citizen as impartial judges as well?

A third criticism is that the development charge is too closely tied to planning permission; this has done more than anything in the actual planning provisions of the Act to allow bureaucracy to run wild. People have been compelled to pay a development charge for turning the front room of a cottage into a village shop, for putting up goalposts in a field and using it for sport, for laying out a plot as a war memorial. One result has been the necessity of granting a series of exemptions, which in themselves leave arbitrary edges. No development charge is payable if a man converts three terrace houses into flats; if the number is four, a development charge is demanded. The game of putting artificial limits to taxation can never finish, and the new limits are as vulnerable to criticism as the old.

The criticisms of the compensation fund itself are fewer. The main point is that, if there were no development charge, there would be no need for such a fund. But a distribution of the fund will give to thousands of landowners a cash payment for a loss which they have not yet suffered. Indeed, much land with a theoretical development value will never be developed because its owners will never wish to develop it. In such cases, the distribution of a saleable government stock would be a purposeless inflationary gesture.

What, then, should the promised Bill do? Many people have suggested that it should tear down the whole financial structure of the 1947 Act. There is certainly something to be said for dropping the development charge altogether. But the advocates of this course do not always accept the full logic of the argument. If a local authority were required to pay a full, unrestricted, market value for all land it acquired, it could hardly be expected to pay compensation, in any form, for land it did not purchase but on which it imposed planning restrictions. That would be putting the clock back with a vengeance. At present an owner who is prevented from using his land beneficially, because of a planning refusal or restriction, can compel the authority to purchase it; he thus, in effect, gets compensation for his loss. The system of full market value on acquisition, and no compensation for anything short of that, is followed in

Belgium. It seems to restore the rule of the dice box. The lucky owner is the one whose site is selected for industrial development, the unlucky one he who finds that his land has been turned into a Green Belt at the stroke of a local authority pen. Some surrender of the value added to land by social change and development, some compensation for those who suffer in the process, is surely the right compromise; it is certainly difficult to avoid now.

But if the development charge is to survive it must be altered. Its incidence is too wide and its rate is too high. The principle behind the present charge—that any permission to develop should attract a charge if an increase in land value, however small, results—is logical but has proved to be impractical. Not only do the needs of sheer convenience require a wide and arbitrary range of exemptions; much uncertainty remains. Among the applications for assessment made to the Central Land Board last year, it was found in no less than 41 per cent of the cases that either no liability to development charge existed or no change in value had in fact taken place. This is a fantastically wasteful procedure.

★

There is one clear guiding principle by which the incidence of the development charge could be limited. Liability for the charge should arise only where an increase in value is brought about by the enterprise of someone other than the owner of the land that benefits from it; it should not arise where the increase in value occurs because the owner has himself promoted the development. That is the old "betterment" principle, and it is still sound. There should, for example, be no development charge if the use of an existing building is changed, or for rebuilding on an existing site, whatever the cubic contents of the new building may be.

If the scope of the charge is thus reduced, the rate at which it is levied becomes less important. Even so, it should no longer be a confiscation of all the enhanced value given by permission to develop. The purpose of the Planning Acts should be to control and foster development, not to inhibit it; the planning provisions of the 1947 Act give the authorities quite enough power of control. Lord Silkin, the author of the Act, has himself gone some way towards agreeing that the standard rate for the charge should be 75 per cent. If its incidence were limited at the same time, that would be an acceptable figure. But if the incidence is not altered, even a rate of 75 per cent would still be too high.

There are two other points at which the Act and its attendant regulations should be amended. There should be a right of appeal to the Lands Tribunal over the assessment of the development charge. The position of local authorities should be clarified. So far, they must have paid very little in development charges on their housing. All land owned by a local authority on July 1, 1948, and all war-damaged land acquired under the 1944 Act, is exempt from liability; in addition, much of the land bought since 1948 must have been dead-ripe land, on which no development charge is payable. The Central Land Board remarks, in its last report, that local authorities are "rarely paying more, and in many cases are paying considerably less" for their land *in toto* than they would have done if the Act had not been passed. The Board may not, and does not, give preferential treat-

ment to local authorities; but if the practical effect of the Act and regulations is to give a concealed subsidy to local authority housing, the public should know what it is.

There remains the compensation fund itself. This cannot be completely abandoned before it has come into existence, because over the last four years there have been thousands of *bona fide* transactions based on the Act as it stood. Those who have in fact already lost the value of their former development rights should receive their admitted claims from the fund in cash. Quite apart from the practical difficulty of attempting to do otherwise, it would be folly for a Conservative Government to attempt to undo by retrospective legislation past transactions based on an Act of Parliament.

For the future, if a development charge remains, the purpose behind the fund remains. But there should be no payment in saleable securities to people with no known intention of exercising the development rights for which they would be compensated. The issue of stock on July 1, 1953, could take the form of exemption certificates

for stated amounts, not carrying interest, and of use only in payment of a development charge in respect of a stated piece of land; for permanent record, certificates could be made registrable with a local authority under the Land Charges Act, and their sale separately from the land to which they apply could thus be effectively prevented.

What is suggested here is, in summary, that the best policy to be embodied in the new Bill should fall into two parts. For the compensation fund, the aim should be to destroy its inflationary effect and otherwise to make it more exactly what it was intended to be: a method of providing that people who, on July 1, 1948, lost a legal right to develop their land should not be compelled to buy back that right in full from the state if they do wish to exercise it. On the other hand, the original purpose and scale of the development charge has proved to be impractical and should be abandoned; but most of the good it does can be obtained, and the worst of its ill effects can be avoided, by greatly narrowing its scope and reducing the rate of the charge.

Lessons for Economic Federation

IN spite of the postwar vogue for economic "integration," Europe's first and only practical exercise in union making has, oddly enough, attracted little interest. Benelux—the planned economic merger of Holland and Belgium-Luxemburg—was conceived during the war years by the exiled governments in London, and since then the partners have doggedly pursued their ideal, not in conference rooms, but by turning their countries into an actual laboratory. It is possible that the many advocates of federation tend to ignore the working of Benelux because they prefer not to cool enthusiasm by a study of the facts. They may also feel some impatience with the gradualness of Benelux. Admittedly, it lacks the drama and the glamour of the more ambitious community schemes recently put forward by the European six; but, however modest its achievements, this enterprise has now advanced far enough to provide in miniature a valuable working model for similar experiments.

Full economic union implies a wholly free movement of goods, capital and people—and, in addition, a single co-ordinated economic and fiscal policy. Benelux is still a long way short of that point, though it is certainly true that, as a result of the striving toward union, there is a much larger measure of freedom between the three partners today than between any simple member of the group and the rest of the world. They have framed a common tariff *vis-à-vis* other nations and have abolished tariff barriers between themselves. A number of quantitative restrictions on trade between the members of Benelux still remain, notably on Dutch exports of farm products that would otherwise push high-cost Belgian agriculture to the wall. Beyond the transferability of currencies that the Benelux countries, in common with the other Marshall nations, obtain through the European Payments Union, the governments can show little that the independent observer would regard as genuine convertibility. What is significant, however, is the growing alignment, year by year, between the monetary and fiscal policies of the members' economies, with its eventual promise of creating the conditions in which free convertibility can be secured without violent

fluctuations in rates of exchange. Theoretically, no bar exists to the mobility of labour within the area, but, with the exception of "border" workers, labour tends to stay put, owing partly to the fact that people cannot transfer their capital from one country to the other.

To observers on the sidelines this may seem a slight achievement. It does not seem so to the Beneluxers themselves. Some of them have profited from the enlarged market that followed the greater freedom of trade, while others have begun to suffer sharply from the pains of competition—a certain proof that the first steps toward fusion have been realistic. Initially, the biggest gainer was Belgian industry, in particular its textile and steel branches. The "Pre-Union Agreement" was signed in the autumn of 1949 and shortly afterwards the Dutch first began to relax their import restrictions. These Belgian industries, faced with a small slump at home and abroad, were at the time steadied by the voracious demand of the Dutch market, which had been starved of goods in order to balance Holland's international accounts. Once the vacuum was filled, however, and the Dutch economy as a whole had revived, the advantage began to flow in reverse. Today, several of the Belgian consumer goods trades (including tobacco, leather, paper and furniture) are in acute trouble, mainly because of Dutch competition. Although they contribute no more than 10 per cent of Belgium's total industrial output, their embittered protests have led to a series of meetings at which business men as well as ministers are to decide how to lighten the burden.

In spite of these difficulties the members of Benelux will certainly continue the process of compromise, adjustment and persistence. Their determination has already carried them through periods that would have paralysed the will of any less dedicated group of nations. From the record of this experience would-be federalists can discern some of the requisites for economic union.

There appear to be three basic conditions. The first is that the governments and peoples concerned should be able to approach economic problems by compatible methods. It would have been difficult in 1946 to find two nations further apart in this respect than Holland and

Belgium. The Dutch, from inclination as well as necessity, pursued a course of State paternalism, cheap money, full employment and detailed controls over private consumption and investment. Rationing and subsidies were the order of the day. The Belgians—more fortunately placed after the war—chose the incentives of the well filled shop, the spurs of a *laissez faire* economy, and the more indirect control of a mobile bank rate. Union could go forward only when the Belgians moved toward *dirigisme* or the Dutch lost their reluctance to leave recovery to the free play of competitive forces.

As Holland got on its feet, the Dutch gained confidence, and step by step they abandoned most of the controls that seemed to a stricken country essential for salvation. Indeed, most of the adjustments between the two economies have come about as a result of Holland moving closer to the Belgian viewpoint: rationing and food subsidies have been jettisoned, bank rate has been restored as a central instrument of economic policy, and something less than overfull employment has been accepted. Even in fiscal policy, the Dutch have made the turnover tax play a more important role in their Budget so as to conform more closely to existing Belgian practice.

Some may argue that the Benelux countries represent an extreme case, that elsewhere on the continent the problem of creating the right economic climate does not exist and therefore should not be elevated to a first principle. But to realise its importance, it is only necessary to visualise a hypothetical Franco-German union. Would France—to cite only one issue—be willing to adopt, if the need arose, a deflationary policy on the scale acceptable to the Germans?

A second condition for union is that the foreign trade accounts of each partner should be in balance, at least with the non-dollar world; if they are out of balance, union throws an exhausting burden on the shoulders of the solvent partners. Until recently the yawning deficit in the Dutch balance of payments was the biggest single problem that confronted Benelux. Even before the first halting steps could be taken toward union, it was necessary for Belgium and the United States to bolster the Dutch economy with credits and grants.

From a variety of causes the Dutch economy has been transformed. Instead of running a vast deficit, Holland is now steadily building up its gold and dollar reserves. This recovery has not continued long enough to be taken for granted as a permanent phenomenon, and the Belgians have therefore shied away from any such revolutionary move as a pooling of their reserves. This reluctance is reinforced by the absence of any international method to prevent the recurring dollar crises that have beset the world since 1945.

A third condition is that would-be partners must be able to achieve some semblance of equilibrium between their costs, prices and wages. Calculated at current rates of exchange, average earnings in Belgium are approximately 50 per cent higher than those in Holland. About half of this difference reflects Belgium's higher productivity; the rest is due in a large measure to the high prices paid to Belgium's protected farmers. Holland also contributes to the disparity by keeping its wages at a somewhat artificially low level through the retention of a few subsidies and price controls—a policy that has the backing of the Dutch trade unions.

Theoretically, this lack of monetary balance could be wiped out quite easily by some inflation in Holland and

some deflation in Belgium; but so far neither country has shown any readiness to adopt such policies. Indeed, any realistic approach to the problem is being discouraged by indignant howls from injured Belgian industries that they are being undercut by their Dutch competitors, who are blamed for paying low wages. The two governments have now brought together both parties to devise a solution by themselves. The result might well be the formation of a series of cartels that would effectively prevent any move towards that specialisation which was one of the prime objects of the union. It might even discourage the initial moves in this direction that have already begun.

The Benelux nations have made substantial progress toward realising the first two conditions for a worthwhile economic union. In large measure their success is due to Dutch endeavour. The third and perhaps most crucial test is now at hand and it appears to call primarily for action by the Belgians. Their task, it is true, is not easy. The postwar world has yet to produce a government that dares to risk annoying, let alone antagonising, its peasants and farmers. In the present circumstances, however, the Belgian Government has at least a moral obligation to attack such an obvious barrier to union. The attempt might not wholly eliminate the wage and price differentials, yet without making it the Belgians are hardly in a strong position to urge Holland to inflate its wage and price structure. It would be a great pity if, at this stage, Benelux does not muster the courage necessary to carry out the original intent; failing this, there is a real danger that the distortions that existed in the two economies before the union will be left undisturbed and merely papered over by empty agreements.

ADVERTISING

WISDOM . . .

Buyers are human beings

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.

We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

NOTES OF THE WEEK

The Next Election

The more the Conservatives study their by-election victory at High Wycombe, the more they like it. They believe, and there is evidence on their side, that it indicates the mood of the marginal voter throughout the country; and they believe, again with evidence, that this mood springs not only or mainly from fresh distrust of Mr Bevan, but also from a positive liking for the Government's policy. The voters who have been angered in the past year are those who would certainly vote Labour anyway; the rest give the Government credit for the improvement in the balance of payments, for more houses, for Mr Butler's Budget and so on.

This belief, contrasting so sharply with the hostility that the Tories encountered earlier this year, has set some of their more belligerent members wondering whether there is not a strong case for an appeal to the country next year. The spring, it is true, usually finds governments at a low ebb. But after the Coronation? By then, it is argued, the electorate would have a fair experience of modern Toryism in practice; it might give the Conservatives the adequate majority denied to them last year, they believe, only because of the warmonger cry.

These views do not, however, appear to have the support of the party strategists. Mr Butler's declaration on Wednesday that he felt in his bones that the next election would be long delayed may have been more an afterthought than a carefully calculated statement. But it fits in with the present ideas of the party's high command. A government must have a sound reason to give the electorate if it decides on a general election early in its term of office; otherwise it is vulnerable to the charge of being afraid of what the future will bring. The Conservatives' parliamentary position does not supply an excuse. The Tory Whips have found it much easier to maintain an adequate majority in the House of Commons than they dared to hope. The immediate reason, it is true, is that their discipline has been strict, and Labour's discipline somewhat slack. But this is unlikely to change. It is a reflection of the adequacy of the Government's voting margin, rather than a cause of it.

Many speculations are being brought into consideration. If Mr Churchill were to retire after the Coronation, and Mr Eden were to take over, the new Prime Minister could claim the right to put his administration before the country. Mr Churchill has, however, given no clear sign of resigning next year. His intention, so far as can be deduced, is to carry on as long as he is fit enough to play a full part in the Government. The timing of an election would in any case present Mr Eden with a problem. June would be ruled out because of the Coronation; July, August and September are excluded because they are holiday months. That would mean an autumn election, when the warmth of the Coronation festivities had worn off and another winter loomed ahead.

No one can say how things will look six months from now. But for the present, there are two things to record. On the one hand, many Conservatives do now think of the next election in terms of an opportunity they might take rather than a defeat that might be forced on them. But in spite of this, the odds are on Mr Butler's side—as far as present indications go—in his belief that there will be no early election.

Labour's Middle of the Road

In the poll for the deputy-leadership of the Parliamentary Labour Party, announced this week, Mr Morrison duly defeated Mr Bevan by the handsome majority of 194 votes to 82. The Bevanites are entitled, however, to claim that they did better than they expected to do. In addition

to his usual body of somewhat over fifty supporters, the vote for Mr Bevan probably included a few personal foes of Mr Morrison's. The most important reinforcement for Mr Bevan seems to have come, however, from some of those who regard themselves as being in the middle of the road in the party struggle.

In practice, the behaviour of this centre group has been not to go safely in the middle but to lurch from side to side. In the spring its members intervened to prevent disciplinary action against the Bevanites after their revolt in the defence debate. Last month they jumped the other way and supported Mr Attlee's demand that the Bevanite "party within a party" must be brought to an end. If they have now lined up (for the time being) against Mr Morrison, that is evidence of Mr Bevan's weakness rather than of any unexpected strength. The centre group is not looking for the winner. Its aim is to hold the two wings of the party together, and for that purpose its members are willing to shift their weight to whichever side seems to have become relatively weaker. They presumably feel that the new confidence of the Right needs to be curbed if Mr Bevan is not to feel isolated and take up a more intransigent attitude. The wisdom of this strategy may be open to doubt, but it certainly does not mean that Bevanism has gained new adherents. The extra votes were a gesture made precisely because Mr Morrison's success was not in doubt.

They are also, however, an indication of what may happen inside the Labour Parliamentary committee, the twelve members of which are now due to be elected. Mr Bevan will almost certainly, and Mr Harold Wilson may, gain a place in this shadow cabinet. If the middle-of-the-roads also capture a seat or two, Labour's policy in this session may well follow a more zigzag course even than it did in the last session.

Back from Kenya

Mr Lyttelton's statement in the House of Commons at the end of last week accurately reflects a return of confidence in Kenya. But, as he emphasised, this does not mean that the emergency can be ended quickly. All that has been done so far is to take the first shock of the outbreak of violence among the Kikuyu. The resources at the disposal of the Kenya government are slender, in relation to the intractability of the problem, and it has done well. The first phase of its immediate measures was to arrest, under emergency powers, those suspected of leading the Mau Mau organisation; the second has been to increase the number of troops and police—many of them special volunteers—on patrol in the worst areas. The next step will be to expand the regular police force and to increase the number of permanent police posts in the Kikuyu reserve.

These emergency measures are necessary to prevent a breakdown of public order; much ground will have to be regained before the causes and effects of Mau Mau terrorism can be considered and treated dispassionately. But to begin at once the preparation of longer-term measures is as essential as that arbitrary arrest and strong police action should be curtailed as soon as possible.

What those longer-term measures are to be is by no means clear. The new Governor of Kenya, Sir Evelyn Baring, a man with long and intimate experience of Africa, recently suggested that steps should and would be taken to increase the rate of economic advancement of the African. Mr Lyttelton, however, told the House that economic problems have no part in the emergence of Mau Mau. He is right in so far as Mau Mau is a product of the impact of white civilisation on tribal life; it reflects the poverty of education

and the lack of adequate political leadership among the Africans themselves. But this social problem is also rooted in land hunger, and it will be one of the main tasks of the forthcoming East African Royal Commission to suggest the proper economic as well as political reforms. The case for nominating the members of that Commission as soon as possible, and for including at least one African among them, grows stronger every day.

Mr Eden's Entry

There has been a transformation scene at the United Nations Assembly this week. After nearly a month of halting and largely sterile debate between unyielding Russians and unsettled Americans, the delegates of the sixty nations have suddenly been presented with so much meat that they can barely stomach it all at once. The change was brought about by the American elections; but the most striking result of these was not a clarification of American policy, but the appearance at the Assembly of Mr Eden and M. Schuman. Both statesmen at once delivered impressive speeches, and their arrival was the signal for the resignation of the Secretary-General. Mr Lie startled the delegates; M. Schuman brought them up short; but Mr Eden's address, despite its quiet tone, may well prove the most telling of the three statements.

Indeed, the importance of the Foreign Secretary's speech lay in this very moderation. It is not easy to define the distinctive quality that he brings to the international forum, but it is impossible to ignore it. As on the occasion of his first intervention in United Nations affairs last year, delegates who listened to Mr Eden on Tuesday were left with the feeling that something had been added to the atmosphere of the Assembly that was not there before. This was due not simply to the skill with which he presented his four principles for the solution of the deadlock over prisoners in Korea. His argument that no reasonable person could want to see prisoners either forcibly detained or forcibly repatriated was, indeed, a masterly reduction of a complex issue to the level of ordinary common sense and humanity; but there was more to the speech than that. It was a reassertion of the values and techniques of diplomacy against those of propaganda and vituperation. Few of Mr Eden's listeners can have failed to contrast his manner with that of Mr Vyshinsky, who can never resist the temptation to play the prosecuting counsel bent on securing confession of guilt and the maximum sentence. It seems that every time Mr Eden visits the Assembly, the Soviet delegate is made to cut a very poor figure. Unless the advocates of peaceful co-existence are prepared to lose even more ground in these uneven contests between diplomat and attorney, Moscow will soon have to replace Mr Vyshinsky.

Trygve Lie Bows Out

The United Nations Assembly was clearly shaken on Monday, when the Secretary-General announced his intention of resigning. Some attempts have been made to link his decision with the difficulties raised for him by American efforts to smoke out allegedly Communist members of his secretariat; but these are obviously wide of the mark. Mr Lie himself says that he reached his decision during the summer; he confided it to the President of the Assembly at the beginning of this session, delaying a public announcement only until the foreign ministers of the five Great Powers should all be in New York. He feels that by withdrawing at this stage he may help to facilitate new agreements between them. He had good reason for believing this, for throughout the past two years the Russians have flatly refused to recognise his existence, and he has thus been hindered in carrying out the personal liaison between govern-

ments which is an important part of his functions. Yet it is doubtful whether a new Secretary-General would be any more successful in this direction or, indeed, whether the member nations can agree in present circumstances on appointing a Secretary-General at all.

Mr Lie's resignation will at least draw attention to the often forgotten fact that the servants of the United Nations are human beings. The Secretary-General, in particular, has for seven years been required to exercise a superhuman objectivity and restraint, while serving as a unique Aunt Sally for brickbats from every quarter. He has been denounced both for inactivity and for unwarranted intervention, described as a partisan of Moscow and an agent of Washington, branded as a dangerous visionary and an over-paid parasite. He has had to try to operate a cumbrous mechanism, designed on the assumption that there would be at least some degree of unity among the major powers, in the most bitterly divided of worlds.

Mr Lie may have made mistakes in the course he has piloted through these dangerous years, but he has consistently striven, with a good deal of Scandinavian common-sense and patience, to make the United Nations work on a practical, down to earth basis. He deserves a share of the credit for its successes, and little of the blame for its failures. If he now feels the need to relinquish a task that has brought him much frustration and little thanks, he can hardly be blamed. But there will be few enthusiastic candidates for the vacancy, and scarcely one who would be acceptable to all parties, as Mr Lie himself was in 1946. This is by no means a fatal blow to the United Nations; but it may prove a salutary shock for some of its members.

German Citizen Soldiers

Herr Blank, the former trade union official who has been in charge of the embryo German Ministry of Defence since its inception, has given a reassuring broadcast account of what he called the future "European soldier of the German nation." He repeated that this new type of soldier would be a civilian in uniform, who would not live the life of a caste apart. Regulars and conscripts will keep their voting rights, and will be given education in politics and current affairs as well as training for civil professions. Moreover—a revolutionary change for Germans—they will be expected to wear mufti when off duty. Prussian-style drill will be reduced to the minimum, and the greater part of training will be for combat. The only difference of opinion inside his office, said Herr Blank, was about the extent to which these reforms could be made to square with military needs.

Herr Blank revealed that the German contingent will require 22,000 officers, including about forty generals. (As there are no brigadiers in the German army, this figure must be translated into British terms as "generals and brigadiers.") In addition, about 80,000 NCOs and long-servicemen will be needed. How many of these cadres would have to be taken from volunteers of the old regular *Wehrmacht* was not stated, but clearly the majority will have to come from this source. Democracy can only be defended by democrats, declared Herr Blank very rightly. For this reason, a commission of "impeccable personalities" will investigate applicants for all the key posts, and will work out rules for volunteers, including their allegiance to the democratic state. Moreover, the churches, youth organisations and trades unions will form an advisory committee that will be consulted about the nature of the new *Wehrmacht*.

It cannot be said that Dr Adenauer, Herr Blank and his colleagues are not taking care to start the new German army on the right lines. The decision to be slow and safe in the selection of the top ranks is very wise. But the NCOs

and lower ranks of officers are not, it appears, to be combed so thoroughly as the generals, although they may be just as important in their influence over the soldiers. The reformists are indeed faced with the difficult problem of choosing between a slow and cumbrous process, and of setting up an army within a period of two years. If the excellent principles that have been laid before the German people are to be observed, it is clear that a much longer period will be needed. For real success, a new generation of European officers and NCOs will have to be educated from raw material.

More Houses at a Price

The monthly instalment of Mr Macmillan's success story reached a new climax last week with the publication of the housing returns for September. In the month 22,323 permanent houses were completed in Great Britain; this was more than in any other month since the war, and over 5,000 more than in September of last year. The total number of houses completed in the first nine months of the year was 171,093, compared with 139,966 in the same months of 1951.

The Minister's elation at this result will no doubt be tempered, however, by the publication this week of the third report of Mr Girdwood's committee on the cost of house building. This shows that the average cost of a three-bedroomed local authority house continued its steady rise up to the end of 1951 and has since been checked only because houses of a smaller floor area have been built. The committee accounts for the increase—from £1,321 in October, 1949, to £1,450 in October, 1951—as follows: a rise of £40 in labour costs, £136 in materials costs and plant charges, and £16 in overhead charges and profit—partly offset by a saving of £63 due to economies in design and specification. It can find no evidence of higher productivity, which is still 20 per cent below the prewar level and has shown no improvement since 1949. When the committee commented on this fact in its last report it recommended that incentive schemes should be more widely adopted, but it can find no evidence that this has been done. According to a survey by the Ministry of Works in June, 1951, incentive schemes were being operated on less than a third of the housing sites—fewer, apparently, than in 1949 when the committee estimated that about half were built under incentive schemes.

Interruptions in the flow of building materials can no longer be blamed for low productivity in the building industry. Habits of work very easily become fixed and the present rate of working has been sanctified by seven years' usage, and fossilised by a demand which, for political reasons, is unaffected by rising costs. The subsidised rent of an average three-bedroomed house could be reduced from 21s. to 18s. 4d. a week if the building cost of a house could be reduced by £150. The tenants of council houses must blame the building workers if economies of this size can be secured only by building the smaller houses that Mr Bevan has called rabbit hutches.

LIVING WITH THE DOLLAR

Can the world ride over the dollar shortage towards freer trade? This problem lies squarely before the Commonwealth Prime Ministers' Conference and the new Eisenhower Administration. It will be discussed—and detailed proposals for a way out will be formulated—in a special section of next week's issue of *The Economist*.

Lowering Wages Sights

The signs of good sense in wage claims have increased from week to week ever since the engineers and shipbuilders decided not to press for the £2 a week that they originally asked. Last week, after both employers and unions had climbed out of the last ditch, the dispute came peacefully to an end. The offer of 7s. 4d. a week more for engineers and 7s. 6d. for shipbuilders was accepted by the executive council of the unions—so far without protest from any of the local branches. There was a rumour that the much threatened ban on overtime and piecework would be put into operation on Clydeside, but work has continued as usual.

On the other hand, there has been some growth of the miners' protest against the Porter Tribunal's refusal of a wage advance; 22 pits in South Wales, against the advice of their leaders, have refused to work the voluntary shift. This is not due to any special degree of hardship in their area. There are several coalfields in which average weekly earnings (including concessions) are less than the £10 8s. 9d. earned in South Wales, but its miners have always been among the most militant. There was also a pit strike in Scotland last week, but in the rest of the country the miners have been content to await the result of new negotiations between the Coal Board and the union—especially as one grievance has been met by the Board's agreement that miners who have a "reasonable excuse" for missing a shift shall not forfeit the bonus paid for a full week's work. Last week a delegate conference instructed the union executive to ask for an increase for the lower-paid workers.

It has seemed likely all along that the Board would allow a reasonable increase, but the miners had insisted on going to arbitration on a claim for 30s. a week. The tribunal's award seemed at one point almost to favour an increase for lower-paid workers, saying that there might well be some hardship but that this was no argument for a general increase. On the other hand, the tribunal urged two arguments for not giving any increase at all: first, that wages should not be raised to cover minor increases in the cost of living; and, secondly, that the existing agreement should not be altered while the wages structure is under review. How far the Coal Board will be influenced by these arguments—a meeting with the union was being held on Friday—is not known as *The Economist* goes to press. But it seems likely that it will discount the first argument because cost of living increases have been given in other industries; and that it will discount the second because negotiations to revise the wages structure have been going on for a year and have made little progress; to ask the miners to wait for their successful conclusion is to ask rather a lot. In any event, it seems right that moderation should receive its moderate reward.

Misusing the Index

Throughout the parliamentary debate on the Address the cost of living index has served as party ammunition in a way that remains regrettable even though it is far from surprising. It has been treated as a barometer measuring the converse of the standard of living: the higher the index the lower, automatically, the standard, and the blacker therefore the record of the Government. Certainly it is not for the Conservatives to grumble at this misuse of the index; they made enough play with it themselves when they were in opposition. By now, however, both sides might have begun to learn the mutual benefits of accuracy.

Even apart from the notorious technical difficulties of index building, no index of consumer prices can in present circumstances act either as a true barometer of living standards or as a measure of inflation. Consumer prices in a welfare state cover only a part of each citizen's real expenditure. Forty per cent of the British national income is

absorbed, via taxation, in the provision of communal benefits and the meeting of communal obligations; the costs of these things do not appear in any index whatever. Without any change in the real relationship between total income received and total standards enjoyed, an index based on consumer prices alone can, and indeed must, fluctuate with every change in the frontier between communal and individual provision. One can always pull it down by increasing taxation on something that does not enter the index, using the proceeds to subsidise something that does; and to reverse this process is, inevitably to push the index up again. So complete, in fact, is the divorce from reality that an increase in taxation which took ten shillings weekly from every citizen's pocket would be accompanied by a drop in the index, with appropriate political kudos, if at the same time subsidies were increased in order to save one shilling on everyone's weekly expenditure. Today, while net incomes have gained by the tax cuts and increases in social security benefits, made possible by lower food subsidies, the index registers only the countervailing rise in food prices—and still serves, accordingly, as a stick to beat the Government.

It is no use blaming the index; one does not expect the Air Ministry thermometer to measure the nations' fuel supplies as well as to indicate the climatic call upon them. But an honest acceptance of its limitations would—at the price of overcoming some temptation to the making of facile party points—help to bring more realism into economic debate.

Technocrats Around Stalin

Among the crowds which gathered in Moscow last week to listen to official speeches or flocked to watch the parade in Red Square to celebrate the anniversary of the October revolution there were probably only a few who could recollect clearly the birth of the Soviet Republic of Workers and Peasants. The Soviet state is approaching middle age and has just celebrated its 35th birthday. Those who remember its infancy must now be at least in their late fifties. Indeed, Russians were reminded that for about a quarter of a century they have been living in the Stalinist era. Since the bulk of the Soviet population is the product of that era, the insistence on this occasion on the international character of the October revolution may have struck them as a novel departure, but it evoked no special memories. For older citizens it must have recalled the bitter controversies during Stalin's rise to power.

Thus *Pravda*, for example, referred to the October revolution as essentially "an international revolution on the world scale" and similar passages figured prominently in all speeches and articles. Yet, in the 'thirties, when the triumphant Stalin watched over the doctrine of "socialism in one country," such statements would have smacked of internationalist heresy. Now they have again become fashionable; indeed, Stalin himself launched the fashion at the recent Congress, when he declared that Russia has now ceased to be the lone shock-brigade of the revolution. It could be argued that Stalin, at the apotheosis of his power, has been compelled by a strange stroke of history to allow a partial—if only implied—vindication of the prophet of internationalism, the theoretician of permanent revolution, his arch-enemy—Leon Trotsky.

Yet the vindication is only partial. Stalin can claim that he has achieved success and spread revolution through his own methods, chiefly by the strength of the Soviet Union and by Red Army bayonets. He intends, therefore, to go on relying mainly on these methods. The consolidation of the Soviet bloc, the development of Soviet economic might—these seem to be his supreme objectives. The paramount importance of the second is well illustrated by his choice of the chief spokesman for the October anniversary. During

the war Stalin himself spoke on this occasion. Subsequently the job was taken over by his chief lieutenants from the Politburo: Molotov, Zhdanov, Malenkov, Beria and Bulganin. M. G. Pervukhin, who spoke last week, though already a prominent party official for many years, was not a member of the Politburo and has only now been elected to the party's Presidium. He owes his rise to his ability as an economic organiser. He was successively commissar for electric power and minister of the chemical industry. In 1950 he became vice-premier. Technocrats of Pervukhin's type are now most needed for carrying out the master's programme.

No More Rooms for Russians

The economic balance-sheet for the last two years presented by Pervukhin extends and elaborates Malenkov's report on this subject to the recent Congress. It confirms the view that the Russians will try to fulfil their plan ahead of schedule, particularly for heavy industry. Thus, for example, it is claimed that during the first two years of the current five-year plan national income has been rising at an annual rate of about 12 per cent against the planned rate of 10 per cent. Gross industrial production, too, is claimed to have advanced at a rate faster than expected: 14 instead of 12 per cent. If the present tempo is maintained, the figures set for the end of 1955 should be reached at the beginning of that year.

Pervukhin tried to give the impression that this expansion has been uniform, both in heavy and light industry. On closer scrutiny, however, this claim seems unconvincing. While all the basic industries (coal, oil, electricity, iron and steel) look like exceeding their annual objectives, and while the machine building industry is already producing 40 per cent more than in 1950, the rise in the output of consumer goods is chiefly concentrated on foodstuffs. Pervukhin's

When trading with Switzerland, you will want to ensure that you are dealing with a dependable banking organisation able to serve you efficiently. The Head Office of the

data on other consumer goods, such as textiles or shoes, are misleading, since they refer to supply and not to output, and have probably been inflated by imports of, say, Polish cotton goods or Czech footwear. A recent official report has revealed that the production of textile machinery is lagging badly behind schedule.

Yet the Soviet consumer worries little about the source of his goods, and for him the acute shortage of housing probably remains the main worry. In this respect Pervukhin's report brought him no hopes of immediate relief. Indeed, it revealed a striking deterioration. In the first ten months of the current year only about 16 million square metres of floor space have been built in the towns and some 220,000 houses in the countryside. Even assuming that the same rate will be maintained in the two remaining winter months, total house building this year will amount to about two-thirds of last year's level and will be lower than at any time since 1947. In rural areas war damage has not yet been completely made up, and in urban areas—where it has—twelve years' obsolescence and the rapid growth and influx of population make rapid construction imperative; the slowing down of the tempo of new construction will therefore have painful effects on the average Russian. Yet factories must take precedence over dwellings, and this is probably the feature of the cold war economy that weighs most heavily on the Soviet citizen.

The Spanish Main

It is a long time since a speech from the throne contained references to the need to extend British ties of friendship and trade with the countries of Latin America. Further elucidation of the "active measures" the Government has promised to undertake in this direction will be awaited with interest. Evidence of the sincerity of this promise is not lacking. Lord Reading, the joint Foreign Under-Secretary, has already begun his good will tour of the more southerly of the twenty American republics; a party of businessmen left this week, with the blessings of the Board of Trade, to explore the dollar-earning possibilities of the Caribbean area; and a flight of Canberras is giving an impressive demonstration of British skill and enterprise to thousands of Latin Americans. But these brief ventures by the new Elizabethans into the once familiar Spanish Main cannot achieve much unless they are supported by a sustained and vigorous commercial effort.

It was unfortunate that, in the debate on the Gracious Speech, the task of emphasising the importance of trade with Latin America was left to Mr Follick. In between references to spelling reform, the Fort Knox gold vaults, and the sales of his own published works, Mr Follick contrived to make his point after a fashion. But the manner of his speech was such that his fellow Members can hardly be blamed for the hilarity which overcame them when he reached the subject of brazil nuts. More accurate guidance on the intricacies of Latin American trade has been provided in two papers newly issued by the British and Latin American Chamber of Commerce and the Credit Insurance Association. As these point out, the time for well-meaning exhortation has passed, and if the Government's pledges are to be realised the present missions must be followed by practical steps to improve shipping services and to make it easier for the exporter of modest means to enter a diverse and competitive market.

A Monopolies Bill in Ireland

In Dublin the *Dail* has reassembled for its winter session. It meets without Mr de Valera, whose absence in Utrecht, where he is receiving treatment for his sight, has aroused much personal sympathy. In the meantime Mr

Lemass, the deputy leader of the Government, occupies the stage. He has introduced a Restrictive Trade Practices Bill which seeks to establish machinery by which freer conditions of trade will be maintained. Practices which "are designed to eliminate or restrict competition in the supply and distribution of any class of goods or which operate to deprive the individual citizen of the right to engage in legitimate trade in any class of business" will be held to be contrary to the public interest. A Fair Trade Commission, armed with full powers of inquiry, is to investigate complaints of such practices and to report to the Minister for Industry and Commerce. The commission may make inquiry on its own initiative or at the request of the Minister. Any order made by the Minister on the commission's report must be supplemented by specific legislation. Mr Lemass rejected, on the grounds of expense and delay, the suggestion that there should be a general prohibition enforceable by the Courts. He argued that the necessity of parliamentary discussion gave a guarantee that any interests concerned would be given an opportunity to make their case.

A highly protected economy, as Mr Lemass pointed out (somewhat to the surprise of those who regard him as its chief architect), gives every opportunity for the growth of restrictive practices; and some publicity has lately been given to the operation of trading agreements. Our correspondent in Dublin reports that the protests of several trade associations have strengthened the impression that the Bill is badly needed. Certainly it is true that the measure goes far in the regulation of commercial activity; but in Ireland that activity has been so largely the result of protectionist policy that no immediately convincing argument can be raised against regulation. It goes without saying that much will depend on the composition of the commission; and, in a small community, parliamentary discussion on individual cases is open to obvious objections. The Bill seems, however, a step in the right direction and should receive an easy passage.

At the same time the Irish transport system, which in its own way has been a model of restrictive practices, is experiencing its annual crisis. The railway system, which was nationalised by Mr Lemass eight years ago, has found that increasing costs have more than offset the present state subsidy. It proposes to abandon unprofitable branch lines and suggests very drastic limitations on the right of private concerns to carry their goods by road. Acceptance of these proposals would almost amount to a return to the conditions of 1914, the last year in which a fundamentally uneconomic railway system could be run at a profit. There is room for suspicion that these proposed limitations have deliberately been made so drastic in order to awaken public opinion to the transport problem, but there does not appear to be any ready-made solution.

Insurance in the Air

There was an unsatisfactory end last week to the claim for damages by Mr T. L. Horabin, the former MP, against British Overseas Airways Corporation. In January, 1947, Mr Horabin was a passenger in a BOAC aircraft that took off from London Airport at 9.50 a.m. for Lagos. After flying over France for most of the day, it ran out of petrol and crash-landed near Ashford, Kent, just after 4 p.m. in the afternoon. Some of the occupants were killed. Mr Horabin was badly injured and sued the corporation for damages.

Unlike most other purveyors of public transport, the owners of an aircraft on a scheduled run are not normally liable to meet the full damage suffered by their passengers in any accident due to plain negligence. The Carriage by Air Act, 1932, which gives statutory effect in this country to the Warsaw Convention of 1929, makes the operator liable for any damage to passenger and cargo during flight, but only up to a limit fixed originally in gold francs and worth now in

British currency about £3,000. Only if the damage was due to "wilful misconduct" can a passenger recover damages based on his full loss. In this action, Mr Horabin, whose full damages had been agreed, subject to liability, at over £11,000, set out to prove wilful misconduct. The jury (of whom, by chance, Sir Wilfrid Eady, late of the Treasury, was foreman) heard a most careful summing-up by Mr Justice Barry and had the aid of further speeches from counsel on both sides. But it found itself quite unable to decide whether the facts of the accident amounted to wilful misconduct on the part of the air crew or not. And, reading the legal definition of wilful misconduct, it is not hard to see why. Mr Justice Barry said "... it is not easy to apply (the conception of wilful misconduct) to the facts of any particular case," which may be regarded as an understatement. The jury were discharged and Mr Horabin, faced with the cost of a new trial, accepted the fixed damages payable under the convention.

The case has two unsatisfactory features. First, it is hard to justify the limitation of the right to claim damages for death or injury on air travel to £3,000. Such a figure is probably now an underestimate of the value, in terms of full legal damages, of the lives of at least three quarters of those who travel by air; it is very doubtful whether many passengers know that they are underinsured to this extent. Secondly, it is unsatisfactory that a passenger with a substantial claim, and at least some reason for thinking that there has been wilful misconduct by the air crew responsible, should find the law in a state that defeats a normal jury. No air transport company can be blamed for fighting a claim based on "wilful misconduct." It is a pity that operators are forced into that position, but they could meet it by providing for their customers an insurance cover that would be adequate. Accident insurance for air travel is now on a solid enough basis for its premiums to be neither frightening nor prohibitive.

Cold Light on Purchase Tax

The latest Fabian research pamphlet* is something of a curiosity. It is less politically tendentious than many pamphlets that claim to be quite free from bias of any kind. It is a rather academic but very well-written survey, part historical, part analytical, part speculative, of the purchase tax as an element in the fiscal system—that is, as a money-raising device, a planning instrument in the general sense, and a means of inducing particular changes in consumption. The survey is acute and well-balanced, and should be found useful by students as a simple but intelligent introduction to a wider range of fiscal facts and theory than its title implies.

As the statement of a Fabian, or even more generally Radical, viewpoint, it is more salutary to Socialists than novel to others. The author's summary of the possibilities of purchase tax as an instrument of economic control gives overwhelmingly an impression of the difficulties, of the incalculable and undesirable side effects that may come not only from fiscal intervention but from any kind of control beyond the broadest influence on the economic climate. Dealing with the impact of changes in purchase tax on consumption, on the economics of allied products, on exports, on the distribution of real incomes, Mr MacMahon comes irresistibly to the unstated conclusion that any attempt to use it as a means of swift adaptation to changing circumstances is equivalent to playing polo on an elephant. The thing simply cannot be made sufficiently manoeuvrable. The reader, taking a line through his specific arguments, can hardly help reaching a similar conclusion about centralised planning in general. The Fabian Society should keep an eye on Mr MacMahon; he is a dangerous heretic.

*The British Purchase Tax. By C. W. MacMahon. Fabian Society and Gollancz. 28 pages. 1s.

The Economist Diary

The Christmas present for the man who seems to have everything.	A memorandum book, an appointments register, and a complete reference book.	A diary lay-out specially designed to meet the needs of the busy man.
A week's appointments at an opening; a book that lies open flat on the desk.	Facts and figures covering the world always available when required.	All information easily found by means of handy thumb-indexes.
Bound throughout in red leather; title blocked in gold.	Price (U.K. only) 42/- (including postage and purchase tax)	Prices to overseas addresses vary widely; a schedule will be sent on request.

ILLUSTRATED PAMPHLET AVAILABLE FROM

DIARY DEPT., THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1

Japanese Rearmament

In Japan, as in Germany, the resurrection of armed forces is now going on apace, and political complications of a similar kind are involved. It is impossible in either country to rebuild national fighting services without making use of the abilities of former professional officers, and it is difficult to bring them back without rehabilitating to some extent the old militarism. This means more in Japan than even in Germany, since the political influence of the army was much more direct and was exerted independently of any political party. Fear that a new army would inevitably revive the old military spirit has inclined most Japanese liberals since the war to oppose any rearmament of their country. But it is generally felt to be a national humiliation that Japan should be incapable of self-defence, even if the United States were willing to undertake full responsibility for its protection. The Americans on their side are not willing to undertake it unless the Japanese also do something to help themselves. In any case, the United States cannot keep in Japan garrisons strong enough by themselves to beat off a strong initial attack from the mainland; American aid in full strength would take several weeks to arrive across the Pacific. There must be something on the spot to take the first shock.

To provide a component for such a force, Japan now has a National Safety Corps (originally organised by General MacArthur as the National Police Reserve) of 110,000 men under officers most of whom served in the old Imperial Army. Equipment to make this into a first-class fighting force is being provided by the Americans. The naval and air arms

are at present lagging far behind the military development; this is partly because of the very limited financial resources which Japan can spare for rearmament, but partly also because these are the forces which the United States is best able to contribute to the defence of Japan. The Americans—with memories of Pearl Harbour still only eleven years old—are not anxious to see Japan possess overseas striking power. Plans are being made for a small fleet to include light cruisers and destroyers, but no aircraft carriers.

There are signs of a desire among the restored military and naval officers to attain for Japan complete self-sufficiency in defence, which would not only raise their own prestige within the country, but would also provide conditions for an independent foreign policy, perhaps of the kind formerly favoured by Hirota and Tojo. It is very unlikely, however, that funds will be forthcoming for the more ambitious rearmament projects; self-sufficiency in defence would require budget appropriations about six times the present figure.

Franco Knocks at the Door

The rules of the European and Atlantic communities still keep General Franco away from their front doors but there is increasing activity around the back. Strong rumours that a long awaited military and economic agreement between Washington and Madrid is virtually concluded merely underline the extent to which Spain is reasserting its position. A bilateral Franco-Spanish agreement just signed in Paris will lead to a considerable expansion in trade, especially with regard to Spanish imports of rolling stock. Spain has also been re-emphasising its traditional ties with Germany, as was shown by the affectionate and martial welcome extended in Madrid to the new German ambassador, Prince Adalbert of Bavaria. More important is the conclusion of a Spanish-German trade pact which provides for an exchange of goods amounting to some DM400 million for the period 1952-53. Germany will be exporting machinery and receiving valuable ores such as wolfram. On the whole, it looks as if Spain is trying to force the American hand by showing that it has old friends in Europe and strategic materials to contribute towards the common defence.

General Vandenberg's recent visit to Madrid appears to have clinched the negotiations between the United States and Spain which, in their latest stage, had dragged on since March. The American Navy is interested especially in making Cadiz a first line port and in the further development of Cartagena. The Air Force is interested in setting up three major bases, one of which would result from an expansion of Madrid's commercial airport at Barajas. In exchange, Spain would finally obtain the release of \$125 million allocated by the Mutual Security Agency subject to the ratification of an agreement. As most of this money will probably be devoted to the development of Spanish roads and rail transport, strategic interests would be directly served.

Two main factors have, so far, been impeding relations between Spain and the Atlantic powers. In this country, particularly, there has been a good deal of legitimate distaste for dealing with the Caudillo, and in the United States there has been some doubt as to the value of Spain's contribution. Spain now seems to be slowly overcoming memories and prejudices arising out of the Civil War, and the generally accepted arguments for working with Marshal Tito have weakened the case against working with General Franco. A Republican administration, moreover, with its emphasis on strategic concerns and the strengthening of all anti-Communist ties, will not long resist the blandishments of a ruler who so recently proclaimed himself as "the first European to engage in battle against Communism." British opinion cannot ignore this fact or the hankering after unholy alliances revealed in recent statements by Marshal Juin, or in German remarks about renewing old Madrid-Berlin ties.

Old Europe and Young America

The latest advices from the United States have brought us news of the death of Mr Webster, Secretary of State. His decease, at the age of seventy, has caused a great sensation in the States. All the papers appear in mourning for him and all parties concur in his praise. He is not to be honoured, like Wellington, with a national funeral, but, while foreigners know little of his services, he held a high place in the estimation of his countrymen. . . . At all times aged heroes—the links of the past with the present—have passed away; but so many have recently been taken from the world that society seems bereaved of those who in England and America connected the present condition of society with the great revolutions which established the independence of the latter, and compelled the former to submit to almost unexampled national sacrifices. Mr Clay and Mr Webster were the younger contemporaries of the men who figured in the American revolution, and the Duke of Wellington was in Parliament and in office with those who began the war which he so gloriously concluded. If in losing them we lose the connection with the past, future progress is probably accelerated by the natural severance of ties which affection and habit made us wish to continue. Mr Webster being more of the old school of politics than any living American statesman, was more European than they are, and was a favourable conductor for dispersing in peace the somewhat opposing political influences of Old Europe and Young America. As the statesmen disappear from that continent whose policy was in a measure formed by those whose birthplace was Europe, and as its new and vast power inspires new maxims, we may expect a still greater divergence in America from the policy of Europe. There is a growing separation in their political systems, but commerce is rapidly increasing the bond between them, carrying forward Old Europe with Young America, and keeping them together more by the old advancing with the young, than the young becoming stationary.

—so advertisers get more circulation than they buy

IN 1949, The Reader's Digest had a 300,000 circulation. This year—it has a guaranteed 700,000 average net sale. And sales are still piling up.

Advertisers gain handsomely from this rapid rise. This autumn, for instance, they are getting about 100,000 circulation per month free.

They've had a bonus, in fact, each year since The Reader's Digest accepted advertising—for the page rate is based on a conservative guaranteed sale which has always been exceeded.

READ IN THE HOME

Research shows that The Reader's Digest is read *at home* by 90 per cent of its readers. They're people of above-average purchasing power, too. The Reader's Digest is skilfully edited to carry your message to *both men and women*, and page rates for advertising space compare very favourably indeed with rates for other magazines.

COLOUR VALUES

Full colour pages in The Reader's Digest are extra good value, for the colour rates are less than 30% above black-and-white. For consumer goods from cars to clothes, groceries to gas cookers, colour has proved its power to sell.

The proportion of advertising space in the magazine is strictly limited, so space should be reserved without delay.

Books and Publications

Honest Stanley

Stanley Baldwin. By G. M. Young. Rupert Hart-Davis. 252 pages. 21s.

This is the "authorised biography" of Stanley Baldwin, since Mr Young makes it clear in his opening words that Baldwin himself asked him to write it. But it is not the usual "standard life." It is short and readable and it makes no attempt to give a complete account either of Baldwin's life (there are only 9 pages on the fifty years before he first took public office) or of the record of his prime ministerships. This is not the "Life and Times of Stanley Baldwin." Perhaps it is best to be regarded as a character sketch illustrated by episodes in Baldwin's life taken chronologically.

It is, in fact, an uneven book. Mr Young is never a dull writer, and he makes Baldwin come alive; but his highly personal, rather jerky style can be irritating. His selection of material is also odd. In any short biography, the author must choose when to pause and when to race ahead. But Mr Young chooses to give a lot of space to episodes that are already very well known, such as the General Strike and the Abdication, where he has little to add, whereas other events that are still a little mysterious—particularly the Carlton Club meeting of 1922—are passed over very hurriedly (not one of the anti-Coalition conspirators, save only Bonar Law and Baldwin himself, is mentioned by name, except for a reference to Boscawen in Baldwin's own speech).

What is the most curious of all is that Mr Young does not seem to realise how complete an answer is possible to the chief charge that the public memory brings against Baldwin. This is the widely spread belief that Baldwin, in November, 1936, confessed "with an appalling frankness" that he had not told the country the truth about the state of the national defences in the general election of 1935 for fear of losing the election. Mr Young is aware how heavily this charge weighed on Baldwin's last years. But his answer to it is very off-hand. Can it be that he does not know of Mr R. Bassett's conclusive article in the *Cambridge Journal* of November, 1948? What Baldwin actually said was something quite different from what he is supposed to have said. The National Government had been elected on pledges of economy in 1931. To Baldwin, the only way of getting out of a pledge was to dissolve Parliament and seek re-election (he had done so, without success, in 1923). Therefore, when after Hitler's advent rearmament became advisable, he had to ask himself whether he should precipitate a general election and fight it on this issue. But the East Fulham by-election showed that he would certainly lose it, with the result that a pacifist Labour government would do even less to strengthen the defences. Therefore the best thing to do was to wait, and try to bring public opinion round. He was, in fact, talking about a

hypothetical general election in 1933, not the one that actually occurred in 1935; then, indeed, Baldwin did ask for, and got, a mandate to spend money on arms. His attitude in 1933 may not have measured up to the requirements of statesmanship. But there was nothing dishonourable about it.

The point is important, not only as a historical indication, but also in assessing Baldwin's character. A statesman he clearly was not; the deluge that came after him established that. ("In Cabinet, he would ostentatiously close his eyes when foreign affairs were under discussion. 'Wake me up,' he would say, 'when you are finished with that.'") Possibly he would never have laid claim to statesmanship. But as a politician, he stood high—high in the skill he showed (where he was greatly helped by the deceptive appearance of simplicity), and high also in the standards of honour and tolerance that he maintained. The record is not by any means perfect. But Mr Young is right when he claims that the quality of British parliamentary life would be poorer today if Baldwin had never been.

One would like to know what history will make of Baldwin. Will he get more notice than, say, Liverpool or Spencer Perceval? He ought to—not for anything he did but for what he was. "My worst enemy could never say that I do not understand the people of England." Stanley Baldwin approached closer to the dead average of his day than any other Prime Minister has ever done. In his shrewdness of judgment and in the indifference with which he failed to act upon it, in his good-natured tolerance of those who disagreed with him provided they did not try to bother him, in his sincere desire to relieve the sufferings of the unfortunate provided he did not need to lift a finger to do so, in his preference for sentiment and humour over logic and emotion, above all in his profound belief that the worst could be relied upon not to happen to him—in all these things Stanley Baldwin reflected his age. Never more exactly has a people had the government it deserved.

Mr Lie

The Secretary-General of the United Nations: His Powers and Practice. By Stephen M. Schwab. Harvard University Press. (London: Geoffrey Cumberlege.) 299 pages. 31s. 6d.

On June 18, 1950, Senators Knowland and Bridges issued a demand for the dismissal of Mr Trygve Lie, the Secretary-General of the United Nations, on the grounds that he was a "Soviet partisan." On July 9, 1950, the Moscow paper *Literaturnaya Gazeta* described Mr Lie as "the abettor of American imperialism, humbly aiding Truman to wreck the United Nations."

The peculiarly exposed position occupied by the Secretary-General needs no further illustration. It is true that in the three weeks between these two statements Mr Lie had actively endorsed the United Nations action in defence of South Korea. But as early as 1948 *Pravda* had dubbed him "an obedient tool of the Anglo-American bloc"; and as late as October, 1950, the extension of his term of office was vigorously opposed by Nationalist China. At that time, indeed, Mr Vyshinsky (who backed Nationalist China's nominee against Mr Lie) declared that the Secretary-General was *persona non grata* not because of his action over Korea, but because he had brought to Moscow, in May, 1950, "the programme of the US monopolies" in the shape of his famous ten-point peace plan. This in itself was intriguing, as that plan had been received coolly in Washington.

Mr Lie has been Secretary-General from the foundation of the United Nations until his resignation this week, and Mr Schwab's excellent study of the political aspects of the office is also, inevitably, a study of Mr Lie's personal record. The Secretary-General can find little guidance in the Charter, and even less in the tenuous precedents of the League. This book would have been of real value if it had done no more than record what Mr Lie has done, and tried to do, during the past seven years. But Mr Schwab has not confined himself to a bare summary. He has, indeed, studied the documents carefully, but the most illuminating parts of the book are those in which he quotes from his interviews with United Nations officials and delegates and with the two Secretaries-General of the League. These candid personal statements shed light on an office which, despite its prestige and strategic position, can only be exercised with the greatest caution and tact. Mr Lie himself emerges well. Urged on the one hand to confine himself to conciliation, and on the other to stand inflexibly behind every UN decision, he has insisted on the value of both roles—applying, when in doubt, the test of a formidable commonsense. If he has been much criticised, that was surely inevitable from the start; it is worth recalling that in 1948 *Pravda* denounced him as a "diversionary" serving the interests of the "Anglo-American bloc" because he raised the question of the danger of bacteriological warfare.

Despotism Not So New

The Passing of Parliament. By G. W. Keeton. Ernest Benn. 208 pages 21s.

The theme of Professor Keeton's book is that the threat of the dictatorship of the bureaucracy has increased, is still increasing, and must be curtailed. This is not new. Lawyers were in the streets crying "Woe" even before Lord Hewart wrote his "The New Despotism" over twenty years ago. But this book is more powerful than most of its companions.

It is better written, its arguments are more penetrating and its challenge more direct. "In the long run, it is impossible to preserve freedom of the mind when the power to choose has been removed from the citizen in more and more areas of his daily life. In the end, there will have been produced something approximating to the planned stagnation of the Chinese Empire."

Mr Keeton belongs to the school of Lord Hewart, with the advantage that he uses irony as well as direct onslaught. He does not argue that the law courts of today are necessarily better equipped to give justice than the administrative tribunals, but at least they are open, they have a tradition of balance and independence, and, above all, they are not, nor can they easily be made into, instruments of short-term policy. The gravamen of his attack is more serious. No longer, he says, should the independent inhabitant of this country look upon his constitution as the best in the world. On the contrary, it is one of the most defenceless to the attack of the bureaucrat, and of the groups for whom bureaucracy is the ideal form of human organisation. Parliament, as such, has lost the power to initiate legislation or control expenditure. It is a theatre for the dissemination of such information as the Government wishes to release and for the ventilation of such grievances as the parties allow their individual members to raise. There are no safeguards in the constitution for any personal right or freedom that a party in office cannot destroy in well

The Journal of Industrial Economics

Editors: P. W. S. Andrews, Sir Henry Clay, Joel Dean, R. B. Heflebower, John Jewkes and E. S. Mason.

Three issues yearly. Subscription one guinea (\$3); single copies 10s. (\$1.40).

This new Anglo-American journal is primarily devoted to the economic problems of industry and commerce. It will contain articles of a scientific character, of value both to economists and business men, and will offer a medium for the increasing academic industrial research in America and Britain.

Contents of the first number:—An American View of Raw Materials Problems, by E. S. MASON; Shortage of Capital, by N. I. MOMTCHILOFF; Price Policy in a Nationally Administered Industry, by FRED STONES; Steel Price Policy, by R. SHONE; The Problem of Business Forecasting, by A. FRIDAY; Industrial Economics as a Specialist Subject, by P. W. S. ANDREWS.

Basil Blackwell · Oxford

under the statutory life of a Parliament, and neither party shows evidence of any intention to alter that state of affairs.

It is perhaps disappointing to find that Mr Keeton has no remedy to offer. It may be that he thinks the disease has gone too far for any remedy, that this country has crossed a rubicon on its march to the dead Chinese world. If so, many would agree that he is right. It is certainly too late to hope to see here the equivalent of the clause in the constitution of the United States establishing the "due process of law." But a more effective version of the Liberal party's Bill of Rights could reach the statute book, under a Conservative Government, if enough MPs took up the battle. Nothing will hold back the sea if the tide is still rising, yet even a sand barrier will be of some value while there is any hope that the tide can turn. It is, however, discourteous to complain because Mr Keeton has not written a book he never intended to write. Here, well stated, is one of the major political problems facing this country.

New Russians

The New Man in Soviet Psychology. By Ramond Bauer. Harvard University Press. (London: Geoffrey Cumberlege.) 299 pages. 25s.

In this book the field director of the Harvard Refugee Interview Project in Europe pieces together the available evidence on the assumptions underlying contemporary Soviet psychology. He supplements this by giving a brief historical outline of the development of psychology in Russia from the time of the Revolution. Useful references are provided in the notes to each chapter.

Mr Bauer shows how the conditioned reflex psychology of Pavlov and Bekhterev retained its prestige during the 'twenties, though it was greatly widened and modified by such men as Kornilov, Luria and Vygotskii. The development parallels fairly closely the widening of American behaviourist theory over the same period. By 1930, however, scientific and political theories had come to penetrate one another much more deeply, and the successive five-year plans imported an element of expediency. Out of this there grew a dissatisfaction with the Pavlovian model or at least with its implications for action. It made men too much the victims of circumstance, unable to change or create their environments. Mr Bauer quotes Vedenov—

The entire reactionary nature of this approach to man is completely clear. Man is an automaton who can be caused to act as one wills! This is the ideal of capitalism! Behold the dream of capitalism the world over—a working class without consciousness which cannot think for itself, whose actions can be trained according to the whims of the exploiter! This is the reason why it is in America, the bulwark of present-day capitalism, that this theory of man as a robot has been so vigorously developed and so stubbornly held to.

The Freudians, who have never been so

influential, came under fire about the same time; this is illustrated by another quotation (from Zalkind):

Suppose we receive the assignment of studying the child or the adult in an institution composed of Freudians. How would this collective of Freudians carry out their assigned task? Now, for Freud man exists entirely in the past. This past is at war with the present, and it is more powerful than the present. For Freud, the personality poses an elemental gravitation toward the past, and attempts to fight the past from the standpoint of the present lead to profound tragedy. For Freud, the conscious is subordinate to the unconscious. For Freud, man is preserved from the demands of society in a private little world in which he constructs a special strategy of behaviour. For Freud, man is a pawn of internal, elemental forces. What sort of results will we get...? How can we use the Freudian conception of man for socialist construction?

Instead of the behaviourist theory or psychoanalysis still prevalent in the West, we find Soviet psychology laying stress on the importance of consciousness, talking about responsibility and freedom, and insisting upon the relative simplicity of the human personality. In education there is a return to formal schooling with its academic bias and strict classroom discipline. What Russia wants is a supply of well-trained, ambitious and industrious technicians, sure of themselves and their society. Whatever will realise this end is psychologically true. The results are odd and interesting. One feels that Samuel Smiles would find himself at home among the "new Russians" as would a middle western farmer. The complex divided personality that is met so often on this side of the Iron Curtain is no longer produced, or so it is claimed; Western stereotypes of the Russian personality are clearly in need of drastic overhaul. Mr Bauer draws a convincing picture and what he reports has wide implications for the social sciences.

Hazardous Journey

Golden Earth. By Norman Lewis. Jonathan Cape. 270 pages. 18s.

This is an account of Mr Lewis's visit to Burma in 1951. His visit to Indo-China the year before resulted in the remarkable travel book, "A Dragon Apparent." And now he has done it again. This is a fascinating and beautifully written account of a journey which is today beyond the reach of all but the most daring and hardy traveller. Mr Lewis describes his experiences with a detachment and lucidity which enable the reader to accompany him most of the way, but which only occasionally reveal the great hazards and excruciating discomforts of the trip.

The journey starts with an expedition southwards from Rangoon by coasting steamer—Mr Lewis later discovers with regret that he could have gone by junk—as far as Mergui. Then by air back up to Mandalay. Here the main story of his book begins. Mr Lewis hitchhikes, in a series of overloaded and incredibly

ancient lorries, through the country of the Shans and Kachins, to the Chinese border beyond Lashio, then round to Bhamo. There is a jeep trip up to Myitkina, and a gradual return to Rangoon by river and rail, with another interval of lorry riding through the Communist-held territory in central Burma, where the railway line was cut by rebels between Yamethin and Pyinmana.

Mr Lewis has a great gift for describing in detail the atmosphere as well as the condition of the country in which he travels, for interpreting sympathetically its scale of values and its culture, as well as its history and politics. With its magnificent photographs, this book makes an exceptional contribution to an understanding of South East Asia.

Shorter Notices

The Critical Years. By General Baron Geyr von Schweppenburg. Allan Wingate. 207 pages. 18s.

General Geyr was the first German military attaché accredited to the Court of St. James after the 1914 War, and he spent four and a half difficult years in London between 1933 and 1937. His reminiscences are an account of that period seen through the eyes of a German who was acutely conscious of the cross currents of feeling towards his country in England, yet at the same time highly critical of the rulers and policy of the new Germany which he represented.

This conflict of loyalties leads to muddled thinking. General Geyr had few illusions about the policy which Hitler and Ribbentrop were pursuing, and he regarded it as one likely to lead to disaster for Germany. But he cannot forgive those like Mr Churchill and Mr Duff Cooper who were suspicious and hostile towards the Nazi Government. Indeed, for a man who knew the British better than most Germans and in many ways admired them, the author was often wide of the mark in his understanding of the character and traditions of the society in which he lived. It is these sidelights on a German view of Britain and the impressions of War Office personalities and policy which give the book its interest. The story it tells is familiar enough, but it is told from an unusual vantage point.

Baron Geyr has added to the original German edition a first hand account of the occupation of Prague, during which he commanded the first German troops to enter the city, and a chapter on the conspiracy of July, 1944, one of the leaders of which, General Beck, was a close personal friend. One can only regret that he did not go on to give some account of the war years, during which he held several successful commands.

Advertising Expenditure in 1948. By Rodney Silverman. Newman Neame for the Advertising Association. 99 pages. 21s.

A statistical study of advertising expenditure before the war was carried out by the National Institute of Economic and Social Research. Mr Silverman, who was one of the authors of the previous survey, has now presented the postwar picture. His figures contain a large element of estimation, but he has built them up along different channels which seem to converge reasonably close together. The main reliance was placed on the answers to questionnaires sent to advertisers, to advertising agents and to the press and other advertising media. Only

about one out of every four advertisers who were approached did, in fact, co-operate, but the response was higher from agents and from the press.

Tables show in some detail how the estimated total expenditure on advertising of £124 million in 1948 was divided between the different kinds of advertising, but unfortunately this survey did not yield how much was spent on advertising different products. As well as the detailed figures for 1948, some total estimates are carried forward to 1950. One set of interesting figures compares the level of advertising expenditure in Britain and in the United States in relation to their national incomes. The ratio is put appreciably higher in America, but in neither country was it reckoned that advertising expenditure in 1950 had returned to its 1938 level.

American Georgian Architecture. By H. D. Eberlein and C. V. D. Hubbard. Pleiades Books. 132 pages. 42s.

The craftsman newly arrived in the American colonies continued to build in the style of his native country; thus at first American architecture followed closely in the European tradition. Later the method of building was adapted to make the best use of local materials and a distinctively American style grew up. This book, which is clearly written and admirably illustrated, traces the history of the Georgian style in the British colonies during the seventeenth and eighteenth centuries. It shows the gradual transformation into the mid-Georgian or, as it is better known, the colonial style, and finally the story is carried through the neo-classic period to the advent of the Greek revival at the start of the nineteenth century.

Although, as the illustrations clearly show, there are many points of similarity between English and American Georgian architecture, there are also important differences. For example, American building made greater use of timber and substituted it for stone, which was both expensive and scarce. In America the professional architect emerged more than a hundred years later than in England and for most of the period covered by the book he was unknown. For important buildings the craftsman carried out his work under the direction of the prospective owner; Thomas Jefferson was one of these skilful amateurs and George Washington supervised the rebuilding of Mount Vernon.

The Science of Chance. By Horace C. Levinson. Faber. 303 pages. 30s.

In a thoroughly readable fashion, Mr Levinson explains how much everyday actions are bound up with the laws of chance. And, while betting as such may be frowned upon, there are innumerable ways in which it manages to disguise itself, such as in the various forms of personal and business insurance. Elementary theorems on probability are, however, always illustrated in games of chance, and Mr Levinson enters in some detail into the expectations of beating the bank at roulette and winning at poker or bridge. His calculations conjure up a world in which the bridge-player has a set of probability tables beside him, while a slide-rule seems the most modest of the requirements at the roulette table. To speculators on the Stock Exchange he can offer no such help: "The full causes that underlie changes in price are complicated beyond the power of man to unravel." Here, indeed, is a challenge to the econometricians.

It is, of course, quite wrong to think of the theory of chance as a mere mathematical curiosity. Born under the disreputable cloak

of gambling, the theory of probability has had a very dignified offshoot in mathematical statistics. Now the world is less concerned with games of dice and more with problems of science, but the same underlying principles apply. Professor Karl Pearson once said that "the record of a month's roulette playing at Monte Carlo can afford us material for discussing the foundations of knowledge." In the second part of his book, Mr Levinson attempts to show the applications of the theory of probability in the field of statistics. Here his venture is a less happy one, for, even as a popular introduction, his treatment is too superficial and does not give a balanced conception of how statistics are used. Nevertheless, this book is informative as well as readable, and it does make clear the nature of probability without recourse to complicated mathematical expressions.

The History of the French First Army.

By Marshal de Lattre de Tassigny. Allen and Unwin. 532 pages. 42s.

Marshal de Lattre's history of the French First Army, covering the campaigns in 1944 from the landings in the South of France to the final German capitulation beyond the Danube, has now been published in this country. It is translated by Malcolm Barnes and there is a preface by General Eisenhower and an appreciation of Marshal de Lattre by Captain Liddell Hart. The French edition was reviewed in *The Economist* of April 8, 1950.

Text and Reference Books

Statistical Methodology Reviews.

1941-50. Edited by Oscar K. Buros.
John Wiley, New York. Chapman and
Hall, London. 457 pages. 56s.

Bibliography of Basic Texts and Monographs on Statistical Methods, International Statistical Institute. 84 pages. 5s.

The first of these two bibliographies is the latest in a series intended to provide a comprehensive guide to books about statistical methods. It lists 342 such books written in English in the ten years 1941 to 1950, with selections from 842 reviews which had some critical or helpful comment to make. The entries are arranged in alphabetical order by authors, but there is also a roughly classified subject index to assist in finding books on a particular aspect of statistics.

There is no doubt that many students and teachers will find this volume extremely helpful in the selection of text books. On the other hand, some may be confused by the varied opinions expressed about some of the books. Generally it seems to be over the more elementary books that disagreement is most marked—specialists covering their own particular field tend to be more of one mind. Part of the difference in the reviews must, of course, arise from the fact that they are written for different journals whose readers expect—and get—a different treatment. Nevertheless, this collection of criticisms does suggest that generally statistical books are being put to careful scrutiny. The clear production and arrangement of the material make this large volume easy to use.

The second bibliography is a short one which selects a hundred books and monographs on statistical methods and their applications, mostly published within the last ten years. Very short extracts from reviews are included and the chapter headings are listed. The selection cannot hope to satisfy all statisticians, but it should prove a useful, quick guide to students and research workers. It has been compiled at the London School of Economics for the International Statistical Institute.

The Statesman's Year Book, 1952.

Edited by S. H. Steinberg. Macmillan
& Company. 1,586 pages. 42s.

In the 89th annual edition statistical and historical material for all the major countries has been brought up to date; in most cases information is given up to 1950 or 1951. In addition to world statistical tables for the main crops there are four main sections: international organisations; the British Commonwealth; the United States; and other countries. There are also maps of the Kingdom of Libya and of the Canadian oilfields and pipelines.

Economic Measures in Favour of the Family. United Nations Department of Social Affairs. HMSO. 175 pages. 9s.

This survey records the principal forms of economic aid given to families in twenty-four countries by summarising the relevant laws and administrative regulations. It lists, for instance, the income tax relief for dependants, the various types of family allowances, whether cheap food is available for children and any measures designed to relieve families from the costs of housing. It does not, however, cover

the various material provisions to ensure a better standard of living, such as the food subsidies in this country or other indirect contributions from social and welfare services.

The dividing line between the two types of measures is a very thin one. This survey does not pretend to be a complete study of family assistance, but concentrates on the rights conferred on the family either because it is a family as such or because it is a large family. This book brings together a lot of useful material, but it is unfortunate that the particulars relate only to June, 1949.

Bibliography on Income and Wealth.

Volume I, 1937-1947. Edited by Daniel
Creamer. International Association for
Research in Income and Wealth. Bowers
and Bowers. 184 pages. 63s.

This is the first volume in a series of bibliographies on national income and wealth, based on reports from national income experts in thirty-five countries and from the United Nations Statistical Office. Sources of data, books and articles on the national accounts of the different countries and on international comparisons are listed with a very brief summary of the contents. There are some 1,500 cross-referenced entries with a subject index, author index and geographical index.

The value of this bibliography is obvious. But much of the material referred to in this first volume has since been revised—or should be revised—in the light of the continuous improvement which is being made in national income accounting. For this reason, the further volumes which are planned to bring the information up to date will be particularly welcome.

Letters to the Editor

Europe's Own Harwell

Sir,—I read with surprise some of the statements in your issue of October 18th. May I point out the following facts?

There is a very clear division line between military and non-military forms of nuclear research. This is best proved, for those who know how carefully American authorities keep secret all documents which might have (however indirectly) a bearing on military matters, by the fact that all American documentation regarding the accelerators for high energy particles is "declassified" (non-secret).

The United Kingdom did not withdraw from the council for the very simple reason that it never joined it. The British Government was represented at the two conferences where this project was discussed (the second one was held at Geneva in February, 1952), but the participation of any one European state in these conferences did not in any way imply that it would join the proposed new organisation. Although the British Government did not sign the CERN Agreement, British authorities have facilitated the active co-operation of British experts in the various study groups created by CERN, where their experience is, of course, highly appreciated.

The statement that Switzerland's participation may be considered as "a new departure, however slight, in that country's attitude towards European integra-

tion and defence" is, in my opinion, completely unjustified. As you know, Switzerland participates in a number of regional joint institutions other than CERN. The Swiss authorities have, in fact, always drawn a very clear line between endeavours of a cultural or economic character on the one hand, and international political institutions on the other hand.

The statement that "the share to be borne by each country (in the implementation of this project) will be determined by Unesco" is entirely wrong. The future organisation will be sovereign (as CERN already is). It follows that contributions will be fixed according to its own rules.—Yours faithfully,

E. AMALDI, Secretary-General
European Council for Nuclear
Research,
Rome

British Motor Industry

Sir,—Your correspondent, Mr H. J. Tooby, would himself seem to be begging a few questions. It is precisely those technical advantages of the internal combustion engine—stimulating the demand for better, and even new, roads—which at the same time are contributing to increased agricultural production, and at a rate which must far outweigh the loss of potential agricultural land from road development. Without even considering the increased fertility of existing land which the use of the tractor

brings, the fact that nearly one million fewer horses now have to be fed on farms than in 1900 adds at least 4 million acres to the land available for the production of foodstuffs in this country.

The assessment in isolation of any one agent of production at a given moment of time can hardly be adequate to measure the overall effect on the nation's economy which your correspondent seeks to determine. After all, even footpaths alongside ploughed land reduce potential agricultural output.—Yours faithfully,

M. E. WEINSTEIN

Kenton, Middlesex

Sir,—Mr H. J. Tooby doubts whether the advantages derived from the construction of a system of motorways would outweigh the loss to agricultural production, which he calculates at about £350 per mile per year.

It has been estimated that a mile of motorway would result in savings on operating costs to road transport to the order of £15,000 per mile per year. The economic advantage is thus heavily in favour of building such roads. The Ministry of Transport plans to build a system of about 800 miles to serve the main productive and distributive areas. The amount of land required will only be about four times the size of London Airport, some 10,000 acres, and unproductive land will be used wherever possible.

Fly **TWA** to the USA and back for only £146.4s.

TWA's new Thrift Season fares offer you the greatest air-travel bargains ever

By taking advantage of TWA's new thrift season Sky Tourist fares you can save £101 on the standard return to Boston, or £105 to New York.

WINTER'S ON THE WAY!

**Here's the sign of
WINTER WISDOM**

IT MEANS

**Greatest Safety - Greatest Strength
Greatest Service - Greatest Saving**

Get ready now to meet and master treacherous winter road conditions. Fit the tyres that give you greatest winter safety—the tyres with the Gold Seal... 'Dunlop' and Dunlop 'Fort'. The safety secret is in the unique patented tread which, with its scientifically disposed knife-cuts, squeezes the water-film away so that the thousands of staggered "teeth" can get a powerful grip on the road... and go on gripping through the long life of the tyre because the tread pattern goes to full depth. Yet another great feature is the rubber liner moulded to the inside of Gold Seal tyres. It greatly reduces risk of damage from chance under-inflation, deflation and kerb impact.

DUNLOP

THEY'RE FIRST IN SAFETY & LONG LIFE
yet they cost no more!

Trade and industry find the use of road transport so advantageous that 70 per cent of all goods are transported by motor vehicles. Our road system is generally admitted to be inadequate and the construction of motorways on our main industrial routes is the only wholly effective solution.—Yours faithfully,

M. FRANCIS

British Road Federation,
London, W.C.1

Twopence a Stamp

Sir,—Ancient by-laws add very considerably to the cost of building operations.

In Yorkshire there is a peculiarly concise example. A very large brass-works exists which produces "fittings" such as elbows and teepieces for water supply pipes. Many hundreds of thousands of these are turned out monthly and the firm is proud of its products being of a high standard.

The rest of England's water supply authorities accept the type of fitting without question (although they have peculiar ideas about other firms' fittings). But ten miles from the works in question the water authority employs a little man with a punch to unwrap all the packets of these fittings used in that area, in order to stamp them and to charge the user the sum of twopence per fitting for his services.—Yours faithfully,

SMITH OF BRADFORD

Eggs Going to Town?

Sir,—The concluding sentence of the Note in your issue of November 8th, "The townsman has endured long enough a system which, under the pretence of securing fair shares, restricts him to one stale egg a week," is puerile.

At the time of writing we are in the 46th week of the year and so far my firm has distributed to its customers 92 eggs on allocation, plus 13 extra eggs, making a total of 105. Of these 46 weeks, in only 8 has the customer been restricted to one egg. These allocations are quite apart from the regular three English eggs per week to the vitally important class, the priority customer.

What is completely lost sight of in your Note is that the freeing of eggs from Ministry control will not create one single extra egg. It will merely mean that in periods of seasonable shortage only those with a large purse will be able to afford eggs at all. My own experience is that the effect of the grey or black market is grossly exaggerated by the Ministry's estimate of nearly 50 per cent of home production.—Yours faithfully,

ALAN J. SAINSBURY
J. Sainsbury, Ltd.
London, S.E.1

Inflation in Australia

Sir,—The article in your issue of October 25th has rightly drawn attention to serious defects in Australian economic policy in the postwar period. Nevertheless, in some respects your analysis appears to be misleading.

Overfull employment and encourage-

ment of secondary industry, by facilitating the movement of farm labour to the cities and by making it difficult for farm equipment manufacturers to obtain adequate supplies of labour and materials, have undoubtedly checked farm production. But it is important to recognise that even if these difficulties had not obtained it would still have been difficult for Australia to have maintained the volume of exports. This is because of the high rate of population increase since 1948 of 2½ per cent per annum, to which immigration contributed 1½ per cent per annum. Even in the land settlement period of the twenties the annual rate of increase in farm production was below 3 per cent and nothing like this rate is likely to be achieved again. Maintenance of exports is probably incompatible with a high rate of immigration. Your article appears to imply that the economic costs of Australian immigration justify its abandonment. To many Australians, however, the defence and moral arguments for immigration seem strong.

Excess demand has also facilitated over-development of light industries. Even so, it must be remembered that, given the immigration programme, rapid development of secondary industry has been essential. It just would not be possible for farming to absorb more than its own natural increase in population. Moreover, not all basic industries have been neglected. For example, pig iron production increased from 1,100,000 tons in 1938-39 to 1,400,000 tons in 1951-52, and electricity output from 4,688 million kWh in 1938-39 to 11,304 million kWh in 1951-52. Huge development of water supplies is occurring.

Your article also refers to the part played by the Arbitration Court system of quarterly "cost of living" adjustments in the rapid rise in wages and prices. But given the rising cost of living arising from the low productivity associated with conditions of excess demand and from the great increases in import and export prices, and given the strong bargaining power of trade unions under conditions of overfull employment, it is difficult to see how steep wage and price increases could have been avoided under any wage system. As the common Australian failure to relate economic effects to causes is nowhere more evident than in discussions concerning the rise in wages, one wishes you had made clear that this rise is a symptom rather than a cause.—Yours faithfully,

KINGSLEY LAFFER
University of Sydney

Sir,—Your article conveys the impression that during and since the war Australian governments have artificially stimulated the development of urban secondary industry at the expense of rural primary industry, thereby creating "a fundamental maladjustment in the use of Australian resources." If the record were examined objectively it would be found that the main reason for the expansion of our manufacturing industries during and since the war has not been any act of commission or omission on the part of Australian governments, but the world-wide short-

ages of goods, dollars and ships, which together made adequate imports unprocureable until last year. In this connection it is, perhaps, significant that industry expanded while tariff policy was being considerably liberalised, particularly by the admission of goods under Customs department by-laws.

Similarly, the comparative failure of primary industry to expand may be ascribed more to overseas influences than to internal policy. Indeed, the major criticism that might be levelled against Australian policy during the postwar years is that it has shown too much, rather than too little, concern for the interests of primary producers. Had it not been for this solicitude, the exchange rate might have been appreciated on more than one occasion, and more drastic measures might have been taken to intercept the inflated incomes of the wool growers in 1950-51. In that event, the Arbitration Court might never have awarded the increase of £1 per week in the basic wage in December, 1950.

As it is, the Commonwealth Government is now trying to turn the balance in favour of increased food production by raising food prices to a level that is more attractive to the producers. In doing so, however, it has further increased the cost of living, and thereby the basic wage, thus counteracting its own deflationary policy and creating the paradox that retail prices have risen while demand has fallen. Your statement that the Government's deflationary policy has been "quite insufficient to check demand" must seem ridiculous to anyone who has tried to do business in Australia during the past twelve months. Beginning in the textile trade, the deflationary pressure has spread to other types of consumer goods and to the metal and building trades. Had it not been for the policy of trying to stimulate food production by higher prices, the rise in the cost of living and the basic wage would already have been checked.

Finally, your reference to "stagnation in basic development" is a misleading exaggeration. Some curtailment in the more ambitious public works projects of the states has been necessary in the present year, but programmes costing some £A200 million are still going ahead.—Yours faithfully,

WILFRED PREST
University of Melbourne

Comment and Defamation

Sir,—You have, inferentially, done injustice to a great democrat by your statement that John Wilkes "made money for himself" out of his journalism. In fact, he ruined himself by the "North Briton"; he lost his estate, and suffered years of semi-pauperism and exile.

Politically, Wilkes was a man of high principles, great courage, and financial probity. Personally, he was unusually—and too eloquently—fond of fornication. This it was that caused the Victorian age to class him as a scoundrel. A shallow judgment, surely; why repeat it?—Yours faithfully,

RAYMOND POSTGATE
London, N.3

lated resentment against the New Deal, the Fair Deal and Mr Roosevelt and Mr Truman. That resentment will, no doubt, have disappeared by 1956 and it may have been replaced by a new resentment against General Eisenhower, if he takes any of the elementary steps towards liberalism which he must take to hold for his party the votes he was given as an individual in the North.

But, although a two-party system has probably not come overnight in the South, it has been developing slowly in some southern states for many years. Virginia and Texas have both changed in character and Florida has been infiltrated by Northerners, to whom conservatism is synonymous with the Republican, rather than the Democratic, party. This slow development in the South is, however, probably only a part of a larger change—that of the two traditionally amorphous parties in the United States into ideological ones. American political scientists stoutly defend, and are right in defending, the illogical series of regional alliances that go to make up both parties. In a country which is a continent it is important to avoid violent shifts of policy with every change of government. But it seems that the two American parties are tending to become more and more the parties of the right and left and that the decision of so many Southerners to vote Republican this year is an unconscious recognition of the fact,

a recognition that may not become conscious until after many more years of wavering.

At this moment it is harder than ever before to find a Republican left wing that amounts to anything; Senator Lodge has lost his seat and Senator Wayne Morse his patience and there were others who expressed the same feelings as Mr Morse in private though they decided to say nothing in public. And the list of conservatives who left the Democratic ranks this year and issued statements supporting General Eisenhower contained nearly all the names that have proved most embarrassing to the party in the past. If this tendency continues, it might, in a country that is geographically less industrialised than Britain, mean a long period of Republican rule at some point. But that point, because the moment when the parties will be admittedly ideological ones will not come quickly, is some time away. Meanwhile the Republicans have the chance, which is always given to the party in power, to prove that they bear no resemblance when in office to the embittered reactionaries who were in opposition for so long. General Eisenhower can do this if he wants to, but he will have a hard time persuading his allies in Congress to accept such a revolutionary idea. The future of his party probably depends on whether he is able and willing to make them forget their vows to destroy the New Deal.

In the electoral college each state has a number of votes, varying with its population, which are cast as a block for the presidential candidate who has a majority of popular votes, however narrow, in the state. Thus a small majority of popular votes can, as the charts show, become a landslide in the electoral college.

In the Senate the presiding officer, the Vice-President, has a casting vote and the Republicans are therefore sure of a majority after Mr Nixon takes office on January 20th.

American Notes

Preparing to Take Over

It would in any case be a formidable task for any political party to take over the government of the United States after twenty years of irresponsibility. For in spite of the great increase in recent years in civil service coverage of federal posts, a change of government still involves changing not only the members of the Cabinet but also many top officials and ambassadors, and other leading presidential advisers; under the British system they would remain to ensure continuity in the running of this huge machine which is costing \$80 billion a year and employing over 2½ million people. But the task is especially formidable for a President-elect who has had no preparation for his new job either in Congress or local government, and whose experience, great as it is in military matters, the most important branch of government today, is non-existent in domestic affairs.

It is not therefore surprising that General Eisenhower's ten-day holiday in Georgia has turned into a series of conferences to make plans for when he takes over as President on January 20th. He is scrupulously consulting members of both wings of the Republican party, but he has shown an independence that augurs well for the future in his choice of two men, Mr Joseph Dodge and the just defeated Senator Lodge, whom he is sending to Washington to collect information from the present Administration on his behalf. The suggestion that the transfer of public business should be facilitated in this way came from President Truman, as did the proposal that he and the General should meet personally as soon as possible. But it is a measure of General Eisenhower's generosity and statesmanship that, after a bitter campaign, he has accepted an invitation which Mr Roosevelt refused when it came from Mr Hoover in 1933.

Mr Dodge, who is to observe the final compilation of the Budget for the year beginning next July, which Mr Truman will present to Congress before he leaves office, is a Detroit banker with a long experience of government, particularly as financial and economic adviser to the Army in occupation areas. It is presumed by those who are busily building Cabinets in the air that Mr Dodge will be the next Director of the Budget, a post which is at the centre of Washington's financial and administrative web. It is also taken for granted that Mr Lodge, who is now acting as the General's liaison officer with other government agencies, will have an important place in the new Administration, both because of his ability and because General Eisenhower owes his nomination largely to Mr Lodge's hard work.

The General emphasised that Mr Dodge and Mr Lodge were going to Washington only for "indoctrination" and not to take any responsibility for the actual details of government between now and January 20th. Indeed, as far as the Budget is concerned, it is too late for the General to have much influence on it even if he wanted to; his first chance will come when the Appropriations Bills go to Congress. But the presence of these representatives in Washington, and the early choice that is expected of the members of the Cabinet, will ensure that the new Administration has the background knowledge necessary to enable it to make decisions promptly once it takes over and to deal adequately with any crises that may arise, in the Middle East, for example. Meanwhile, however, a hiatus in American policy-making seems inevitable until the inauguration, although there is some hope that the General may be persuaded to state his views at once on questions now before the United Nations. Senator Wiley, the Republican member of the always strictly bi-partisan American delegation, is pressing the General for guidance in order that the Assembly may be able to get on with its work.

Business Dreams Come True

To the commodity markets General Eisenhower's victory was something of a nightmare: prices fell on the supposition that agricultural support programmes would be weakened and, with more reason, that the new government's fiscal policy would be deflationary and that there would be less enthusiasm for international commodity agreements. But elsewhere in the business world the Republican revival was a dream come true, as was shown by the sustained strength of the stock market throughout the week. There it was felt that the deflationary effects of any drop in government spending that General Eisenhower might achieve would be counteracted by the tax reductions which he has also promised. It is too much to hope that taxes may actually be cut next year, but at least it is expected that there will be no extension for either the excess profits tax, which expires on June 30th, or for the 10 per cent increase in personal income taxes, imposed after the Korean outbreak to last until the end of 1953. It is also taken for granted that price and wage controls will be allowed to lapse on April 30th, although it will probably still be necessary to regulate the distribution of materials.

In addition to this negative assistance, positive help for business is also expected from the new Congress, particularly as the incoming chairmen of committees are understood to be more sympathetic than their predecessors—few of whom were noticeably unsympathetic. More important, businessmen are counting on finding a more favourable atmosphere after January 20th in government offices, not only in the major departments but also in the smaller agencies with which many of them have more frequent and direct dealings. The Federal Trade Commission, which keeps an eye on advertising and other business practices, the Federal Power Commission, responsible for regulating electricity and natural gas, the Securities and Exchange Commission, the National Labour Relations Board and the many similar bodies are nominally independent agencies, whose members serve for fixed terms, but it is thought that they may now be inclined to trim their course to suit the Republican philosophy.

Democrats in Ruin

Whatever Mr Truman may decide to do when he leaves Washington—his only pension will be \$95 a month as a colonel in the first war and he has little private income—he will certainly want to have a hand in rebuilding the Democratic party. But he has recognised that Mr Stevenson, in spite of his defeat, is now the rightful leader of that party, in a message asking him to take steps to "revitalise the National Committee and set the wheels in motion towards a victory in 1954"—the next Congressional election year. And Mr Stevenson seems to have accepted the position, although this does not mean that he will necessarily run again in 1956. Mr Stephen Mitchell, who had no political experience until Mr Stevenson made him chairman of the Democratic National Committee last summer, has been sent back to Washington, to tighten up the party organisation there. Mr Stevenson has thus made it clear that he has no intention of giving back control of the Democratic machine to the professionals who allowed it to deteriorate so badly.

That the vote can still be delivered in big cities by an efficient hard-working organisation, in spite of the growing independence of the electorate, was shown in Philadelphia, where a lively young Democratic group, who had already turned the Republicans out of municipal office, won a victory for Mr Stevenson even though the state went Republican. But elsewhere the city bosses, grown rusty after years of easy success, entirely failed to justify their existence. Mr Stevenson even lost his own Chicago and traditionally Democratic New York City; there the Democratic boss has already been forced to resign as a result. Another block of votes that got out of the bag this year were those of labour. For the first

time all three large trade union organisations officially endorsed the Democratic candidate and for the first time the majority of labour votes, as far as can be judged, went Republican.

With all its strongholds, the big cities, the trade unions, the solid South, falling about its ears, it is obvious that the Democratic party must be reconstructed from the ground up. But there is a solid foundation on which to build—Mr Stevenson's 26½ million votes, more than have ever been given to any Democrat, except Mr Roosevelt in his heyday. Mr Stevenson, however, will find many competing architects among the Democratic representatives in Congress, who can claim that they at least know how to win elections. They are also the only members of the party who will have regular opportunities of putting their views on day-to-day questions before the country. Unfortunately those views, at least as far as most of the influential Southerners are concerned, will be the exact opposite of Mr Stevenson's on many subjects. Before it can be soundly repaired, the Democratic party may have to be pulled down even more completely than it was on November 4th.

Voters Pick and Choose

The elections for Governor, held in 29 states this year, showed almost as clearly as did those for the Senate and the House of Representatives that, while American voters certainly like Ike, they are not so partial to some of his fellow Republicans. Since the mechanics of voting allow separate votes for each officer from President to city water commissioner, voters were able to exercise a nice discrimination and meander in and out of party lines, indulging in the "ticket-splitting" that is the bane of machine politicians. Republican candidates for Governor took five states from the Democrats on November 4th, giving the Republicans 30 states in all, the highest number they have held since 1929. But seven states which gave their presidential votes to General Eisenhower kept a Democrat in their highest state office, and there were no landslides in the battles of the governors.

Montana, Illinois and Massachusetts were narrow Republican victories and the young Democratic Governor of Michigan, Mr Mennen Williams, won by just 7,991 votes in a total poll of 2,850,645; he is becoming accustomed to such close shaves for in 1950 his majority was so small that it took five weeks to complete an accurate count. Picking and choosing by voters was especially evident in Ohio, where General Eisenhower carried the state by a 450,000 majority, with the isolationist Republican, Senator Bricker, trailing 150,000 votes behind him. Yet Mr Frank Lausche, the Democratic Governor, probably owed his victory largely to his conservatism; he defeated Senator Taft's progressive brother, Mr Charles Taft, by over 400,000 votes.

In the Senate contests, too, the voters were often very selective as well as closely divided; of the 12 Democrats returned, 10 were from states that gave their presidential vote to the Republicans. Five of these were southern or border states, but one Republican, Mr John S. Cooper of Kentucky, won in a border state that went to Mr Stevenson. The close division of the last Senate—49 Democrats and 47 Republicans—is repeated in reverse in the new Senate, with 47 Democrats, 48 Republicans, and one independent, the self-exiled Mr Morse from Republican Oregon. Had it not been for the death of Senator McMahon, a Democrat

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Banking circles the globe

BUSINESSMEN with foreign interests need a bank whose services circle the globe. The National City Bank of New York, with 56 overseas branches and banking correspondents in every commercially important centre, is well equipped to offer such services.

The London branches of The National City Bank are staffed by men who are experienced not only in British banking but also in the financing of overseas trade. They are, also, uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, the world-wide organization of The National City Bank is at your service.

THE NATIONAL CITY BANK OF NEW YORK

1812—ONE HUNDRED AND FORTIETH ANNIVERSARY—1952

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2. WEST END: 11 WATERLOO PLACE, S.W.1

whose term would not have expired until 1956, and whose seat was lost to a Republican, Mr Morse's position would have been decisive. As it is, the deciding vote in a tie will be cast by Mr Nixon, the new Vice-President, whose vacant seat as Senator from California will be filled by a Republican, to be appointed by Governor Warren. The party position in the House, too, is almost a reversal of the last House. From present indications, with several results undecided, the Republicans will have a majority of about ten in the new House, a far less imposing one than that of the 1946 Congress when 246 Republicans were returned.

End of the Dollar Sign

The American President Line, the foremost US shipping company in the Pacific, is once more in private hands after fourteen years of government operation. But Mr R. Stanley Dollar has failed to buy back control of the \$70 million line founded by his father in 1901, which, until the government took it over and renamed it in 1938, carried the \$ emblem on the smokestacks of all its ships. The Dollar sign is now gone for good. The Court of Appeals upheld Mr Dollar's contention that the voting shares transferred to the government in 1938 were simply security for a loan long paid off and ordered them returned. In June this year the Secretary of Commerce came to an agreement with Mr Dollar to put the shares up to auction and divide the proceeds equally between the government and the Dollar interests.

Mr Dollar and his associates hoped to buy back the shares. But they were outbid by a Californian group headed by Mr Ralph Davies, a leader in the oil industry, who offered \$18 million to Mr Dollar's \$14 million. There had been some criticism of the government's failure to carry the fight to the Supreme Court. But at least the government has not done badly out of the denationalisation of the Dollar Line.

Its half-share of the proceeds amounts to \$9 million. The highest offer in 1945, when the government first tried to sell the shares, was \$8 million altogether.

In the past five years the line's financial position has improved, despite the shutting off of trade with Communist China. But with the revival of Japanese competition, the new owners will have to redouble the line's scouring of the seas for new business. Its most promising venture is a new service from Atlantic ports through the Panama Canal to Indonesia, for which an operating subsidy is being sought.

In the Pacific, continued government aid appears imperative if American ships are to be kept afloat; the wages bill on Japanese ships is about one-eighth of that on American vessels of comparable size. But the whole range of shipping subsidies is now being examined. Construction subsidies—to compensate ship-owners for the extra cost of buying American-built ships—are still up in the air after the Comptroller-General's blast against them last year. The Truman Administration has been equally critical of tax deferment on funds set aside for purchase of new ships, and has asked both the Treasury and the Department of Commerce to find some other method of keeping the merchant marine up to date. The Maritime Commission is including operating subsidies in the study it is making for the Secretary of Commerce. The Eisenhower Administration should have the raw materials, at least, for a thorough overhaul of American shipping policy.

Shorter Notes

Ninety-two new television stations have been authorised by the Federal Communications Commission since last spring when it thawed the "freeze," imposed on new stations two years ago until it had sorted out the congestion on the air waves. Of this number, all of which are for cities that did not have stations earlier, five are already functioning, and nine are non-commercial stations managed by educational groups. There are now 200 television stations in operation or in prospect.

The petroleum industry expects an increase of 3.3 per cent in the demand for oil next year, much below the annual increase in previous years. Domestic demand will rise by 4.9 per cent but will be countered by an anticipated fall in exports of 27.3 per cent. The industry's expansion will also slow down next year because the excess capacity required for defence purposes is now completed; the industry has in reserve facilities which could handle an extra million barrels a day.

Restaurants and snack bars that are plagued by the costs of dishwashing and breakage have found a solution in new plastic-covered paper plates just put on the market. The manufacturers claim these negative virtues for their product; it will not give a paper flavour to food, will not absorb hot food, will not slide around and will not be cut through by vigorous use of cutlery. Most important to restaurants, it will eliminate dish washing, noise and slow service.

Orchestra conductors from small cities all over the United States had an opportunity for expert advice and practice recently during a week-long symposium at the Philadelphia Academy of Music. Eighty-seven conductors attended and twelve of them rehearsed the famous Philadelphia Orchestra, assisted by suggestions from its regular conductor, Mr Eugene Ormandy. The sessions were co-sponsored by the American Symphony Orchestra League which reports there are about 660 symphonic groups in the nation, most of them non-professional.

THE WORLD OVERSEAS

The Soviet Regime—I

Party and State under Stalin

(By a Correspondent)

IN the later sessions of the nineteenth Congress of the Soviet Communist Party, held last month, fundamental problems of the relations between party and state were raised by discussions and amendments to the Party Statute. Official doctrine on this subject is briefly expressed in article 126 of the Constitution, which describes the party as "the directing nucleus of all organisations of the toilers, both social and state." Its supremacy appears guaranteed in two ways: partly by the fact that most leading figures in civil administration, industrial management, trade unions, armed forces and police are members of the party; and partly by the activity of the party's own hierarchy, which extends from the Central Committee down to "primary organisations" in factory or farm. Already the party's eighth Congress in March, 1919, laid down that it must "direct but not replace" the regular authorities. Party organisers must neither leave too much to the discretion of the administrators—which would lead to the "bureaucratic perversion" of the body politic—nor themselves take over routine administration—which would lead to neglect of the inner life of the party, and merge the party in the state machine. Thirty years later the Soviet leaders use the same phrases to denounce the failure of individual party organisers to make the "correct" distinction; but the truth is that the failure is due not to the mistakes of individuals but to the nature of the regime.

Ever since 1917 the party has become more centralised. Nominally the Congress is its supreme organ. In practice already in the first years of the regime the Central Committee, whose nominal function is to lead the party between Congresses, assumed the powers of the Congress. All Congresses since the fifteenth, held in December, 1927, have been occasions not for making policy but for proclaiming policy decisions that have already been taken. But if the Congress lost power to the Central Committee, the latter has now lost power to three smaller bodies elected from its ranks: the Politburo, Orgburo and Secretariat. Already in Lenin's lifetime the Politburo usurped most of the political leadership originally reserved for the Central Committee; while the Secretariat, controlled since April, 1922, by its General Secretary Stalin, usurped the functions of the Orgburo, of which it had been intended to be a technical subsidiary. It controlled all important appointments not only within the party machine but in the state administration as a whole. It is doubtful whether meetings of the Central Committee since 1939 have been more than ceremonial occasions.

Finally, the Politburo itself was completely subjected to the will of Stalin through purges of all those veteran Bolsheviks whose prestige made them capable of challenging Stalin's authority. Since 1939 Stalin has been not only the leader of the party but its absolute autocrat.

A similar centralisation has taken place in government. The Council of People's Commissars of the 1920's was a body of manageable size, firmly controlled by the Politburo. The industrial revolution of the five-year plans immensely complicated and extended the functions of government and made centralisation at the top more essential than ever. This made centralisation at the top exercised solely by the Politburo. Under the 1936 Constitution the number of Commissariats was seventeen. During and after the war it

increased to more than fifty. Ministries—as the Commissariats were renamed in 1946—were set up for every major branch of economic activity. Ministers were, in fact, senior expert officials. The Council of Ministers, like the Central Committee of the party, seldom meets as a body.

By the end of the war, however, there emerged an inner cabinet in the form of the vice-premiers. Today there are thirteen of these, and nine of them were also members of the Politburo. Each vice-premier appears to be responsible for the work of a group of ministries. It has been generally assumed that the supreme policy-making body was the Politburo of the party, and that the office of vice-premier held by all but two Politburo members was secondary. This was probably the case in 1941, but it seems not unlikely that in recent years these men's main job has been to manage the business of government.

The nineteenth Congress abolished the Orgburo and the Politburo; increased the membership of the Secretariat from five to ten and of the Central Committee from about seventy full members and seventy probationary members to 125 full members and eleven probationary members; and instituted a new body, the Presidium of the General Committee with twenty-five full members and eleven probationers.

Stalin the Autocrat

The meaning of some of these changes is obvious. The Central Committee is a purely decorative body. The abolition of the Orgburo formally confirms the supremacy of the Secretariat. The five new members of the Secretariat are assistants to its bosses, Stalin, Malenkov and Krushchov. The abolition of the Politburo deprives the party of its small policy-making body. The vice-premiers continue to exercise the state power. What is not so clear is the function of the Presidium. It is not stated how often it meets nor what are its precise duties. It may conceivably prove to be an important deliberative body, of about the same size as the Central Committee of 1917-1922. But executive power will remain in the hands of the vice-premiers and the Secretariat—all of whose members are also members of the Presidium. And both vice-premiers and Secretariat, headed respectively by Molotov and Malenkov, will be firmly held by the autocrat Stalin.

If this analysis—which can be no more than a working hypothesis—is anywhere near the truth, the relationship of party to state has changed. In the past, the party was what the Constitution called it—the "directing nucleus." It imposed its will on all branches of the state machine. Even the establishment of Stalin's autocracy did not alter this; for he was master of the party but used it to rule the country. Today it would seem that the party is only one of several instruments of power held by the autocrat. The others are the pyramid of soviets (the nominal machinery of central and local government under the Constitution); the economic administration; the army and the police.

It seems probable that the first of these four instruments is to a much greater degree subject to the party than are the other three. Even so, it is probable that the authority of the central ministries, and of their supervising vice-premiers,

over their departments within the provincial and local soviets is often greater than the authority of the provincial and local party committees over the executive committees of the corresponding levels of soviets. In the economic hierarchy the party's influence is probably smaller. The party organisers in factories and agricultural enterprises are constantly exhorted to give political leadership and to supervise the execution of "the plan." They no doubt do their best, but whether their agitation makes for efficiency, and whether it is welcomed by managements, is an open question. The managements take their orders from the central economic ministries and their supervising vice-premiers. In the struggle between party and ministries it is likely that the latter are quite often the more successful.

In the military hierarchy the party exercises influence through the "Political Administration," which controls the political commissars and "directors" (*politruks*). These are responsible for indoctrination and propaganda, but their direct authority over the troops is certainly less than it was either in the 1920's or in the period immediately after the Yezhov purge. Finally, the police hierarchy is a machine apart, which controls its own armed forces and its territorial state within the state, and infiltrates, by its "special" or "secret" departments, into every branch of civil, military and economic administration.

Thought Controls

If it be true that these four hierarchies largely or wholly escape the control of the party, this does not mean that the party is not a powerful and important organisation. Essentially it performs two functions—propaganda and recruitment. There is no Ministry of Propaganda. The whole publicity apparatus is controlled by the party, that is by its Secretariat. The party's propaganda machine decides the content of education in all parts of the Union, and sets the "line" in literature, the arts, historical studies and the natural sciences. When things go wrong, it is the party propaganda apparatus which concentrates hatred on whatever scapegoat the leaders have selected. At all times it may invade even the most intimate private life of every Soviet man, woman and child.

Equally important is the party's role in recruitment to the higher ranks of the regime. Though the civil, economic, military and police hierarchies seem to be growing more independent of the party hierarchy, their highest ranks are filled almost exclusively by members of the party. No one can rise high in civil government or police who does not join the party. In the army and in economic or cultural life a career may be made outside the party, but membership accelerates promotion. The Secretariat is responsible for appointments within the party machine, but also has a voice in the selection of persons for high office in any part of the state, with perhaps the partial exception of the police and the army.

An organisation which enjoys an almost mythical prestige, dictates the intellectual life of the whole community, forces its way with its planned spontaneous enthusiasm into the private lives of all, and controls most of the avenues along which the ambitious must advance, is indeed a powerful force. The mentality of all Soviet citizens in responsible positions has been affected, positively or negatively, by the all-pervading influence of the party. Nevertheless it has lost both power and prestige ever since the mid-1920's, and its decline has gone further in the thirteen years that separate the nineteenth Congress from its predecessor. Real power belongs to the autocrat, who exercises it by balancing against each other both the different hierarchies—of which the party is one—and the leading personalities who are identified with each. This intricately balanced system, of whose operation we have only an occasional glimpse, is the creation of that great manipulator of men and institutions, Generalissimo Stalin. But it is also the result of changes in Soviet society which require consideration in a second article.

(To be concluded)

Dr Chaim Weizmann

WHEN Chaim Weizmann died last Sunday, Israel lost a monolithic president whom it cannot easily replace. The use he had made of life caused him to tower above the ordinary run of man and to stand unshaken by the rough and tumble of his country's politics, sectarian differences and economic quarrels. For some time illness had forced on him a quality of remoteness that some Israelis deplored. Yet when, in spite of this drawback, they re-elected him as their president in 1951, they paid a tribute that does credit to them as well as to him. Part of his distinction lay in the quality of his brain; had he not reached world fame as a political Zionist he would have won the same high grade as a research chemist.

He belongs to a generation that has seen changes greater than in any similar span of history. Yet even within it there can be few men whose end was so far removed from their beginning, yet so markedly linked to it by a chain of spirit and purpose. The main scenes in his history are well known even to Gentiles: they begin with a childhood in the Pripet marshes, marred by the spectre of persecution in Tsarist Russia; then comes clandestine escape to jobs in Germany and Geneva, and the beginning of scientific distinction for research in dye-stuffs; already this is interrupted by the counterpull of political Zionism. At the famous Zionist Congress of 1904 when Theodor Herzl, bent on quick relief from persecution, hung as backcloth to the rostrum not the customary map of Palestine, but a map of Uganda—where the British Government of the day had offered territory—Weizmann led the opposition to the offer. But this incident changed his life's course. "My Zionist views," he wrote forty years later, "led me to look upon England as the one country which seemed likely to show a genuine sympathy for a movement like ours." His instinct was not misplaced. There followed the research job in Manchester and the famous interview with the candidate for North Manchester in the 1906 election ("But, Mr Balfour, we had Jerusalem when London was a marsh"); then, the perfection of his fermentation process which in 1915 produced acetone in adequate quantity and, in 1917, the main political achievement of his life—the Balfour Declaration to the Jewish people.

Waiting for Zion

To the dismay of many Zionists this declaration amounted, for most of the thirty following years, to expectation deferred. Yet Weizmann knew, from the moment of discovery of the conflicting promises that the British Government had made to Arab nationalists, that fulfilment must be slow. Unlike some of his fellow-workers, he was ready to expedite it by means of compromise and at the Zionist Congress of 1937, was in favour of the partition then proposed by Britain rather than of waiting for whole possession of Zion—a dream that has not come to pass. He lived to see his work crowned by the vote of the United Nations in favour of partition—a decision that worked out more favourably for Israel than had been intended, largely owing to the misjudgments perpetrated by the then Egyptian and Arab governments—partly out of native imprudence, but also partly under foreign influence.

In English hearts that are, also Gentile hearts, there must always be a queer mixture of feeling towards this great man. He is endeared to them by his appreciation of English Liberalism, to which he turned so deliberately and desperately in 1904. He owed a debt to it which he paid in World War I by his inventions, and in World War II with the life of his second son, who was killed in the Royal Air Force. Yet his preoccupation with the rescue of European Jewry by the foundation of Israel caused him to work against Britain—sometimes even to the length of agreeing to deplorable methods—during the bitter years between 1945 and 1947. Regrettably, his im-

was, under pressure of mounting illness, finished during the latter year and carries at its end a stamp of animosity that he did not feel for the greater part of his long life.

All who ever met him have carried away with them a few sharp impressions: he was serene because he wore the whole armour of faith; he was driven by a singleness of purpose that made him relentless; yet he deplored panic decisions and appreciated compromise in a way more admired in London and Manchester than in Tel Aviv or New York. For Israel, his death snaps an irreplaceable link with the years of endurance, for the land he has left is no longer Zionist, but nationalist.

Stormy Days for Mr Yoshida

[FROM OUR TOKIO CORRESPONDENT]

THE durability of Prime Minister Yoshida's fourth successive Cabinet must be measured not by the strength of the men who comprise it, but by the strength of the men who do not. On paper, Japan's first Cabinet since the peace treaty was signed looks much stronger than the three that preceded it. Six able men from the great army of political and business leaders, who, it is instructive to recall, were once "purged forever" from public life because of their prewar and wartime activities, have been included and three have been appointed to key posts—Mr Tadaharu Mukai as Finance Minister, Mr Taketora Ogata as Chief Cabinet Secretary, and Mr Tokutaro Kimura as Minister of National Safety and Defence.

But only one member of the Hatoyama faction, which Mr Yoshida humbled, has been included—Mr Mitsujiro Ishii, another depurged, as Minister of Transportation. It is difficult to escape the conclusion that, by picking only one Hatoyama supporter for his team of sixteen, Mr Yoshida has been betrayed by the heady influence of his great personal triumph in defeating Mr Hatoyama's bid for party leadership. The still strong and bitter Hatoyama faction in the Liberal Party will certainly not be placated by this almost contemptuous gesture; it will, however, have the mischief-making advantage of holding a listening-post in the new Cabinet.

True, Mr Yoshida, in his token acceptance of Mr Hatoyama's face-saving insistence that he cease to rule by "his inner clique," also dropped his two intimates, the former Agricultural Minister, Mr Kozen Hirokawa (who expects to fill Mr Yoshida's place when the 74-year-old veteran at last steps down), and the former Cabinet Secretary, Mr Shigeru Hori. But this move was purely tactical and no one believes that the real influence of these two ambitious anti-Hatoyama stalwarts has been in any way diminished. "Behind-the-screen" rule has always been popular in Japan.

The enigmatic figure of Mr Mamoru Shigemitsu, who was sentenced to seven years' imprisonment for alleged major war crimes, casts another shadow over the new Yoshida Cabinet. Mr Shigemitsu's "middle-of-the-road" Progressives number 89, compared with Mr Yoshida's uneasy and disunited team of 242 (of whom 30 are hard-core Hatoyama men). The Progressives are practically indistinguishable from the Liberals. The present situation is a reversion to the Japanese political scene of the thirties, when Westerners could detect few fundamental conflicts between the two main rival parties—the Seiyukai and the Minseito. The degree to which the Minseito was probably more conservative in finance and foreign policy than the Seiyukai is perhaps a measure of the difference between the contemporary Liberals and Progressives. On the vital question of rearmament, Mr Shigemitsu tends to support Mr Yoshida's evasive policy rather than Mr Hatoyama's more honest recognition of the need for rearmament and for a direct approach to the people for an amendment of the dead-letter clause in the Occupation

Constitution prohibiting any Japanese army. Mr Yoshida and Mr Hatoyama are both working strenuously to woo Mr Shigemitsu, who is coyly hiding his face behind a fan.

The Socialists could muster 116 followers if they united their so-called left and right wings. But they lack a leader, denounce rearmament and the retention of United States garrisons in Japan in the same breath, and include in their ranks some pious visionaries who are anxious to enthrone Dr Buchman of Moral Rearmament as a soothsayer among the Shinto gods. The strong man who might have united them is Mr Suehiro Nishio; but he has just been sentenced to 12 months' imprisonment for being involved in the notorious Showa Denko (electric power) scandal which overthrew the Ashida Government.

Against this stormy background of intrigue and disunity, Mr Yoshida's Cabinet must work primarily but quietly for the consolidation and expansion of vital United States aid. Primarily, because if the Korean war ended tomorrow and the United States did not persist in its present plans for the development of Japan as a munitions annexe, Japan's resurgent but precarious economy would collapse; but quietly, because no Japanese party can afford to make this admission openly while the popular Japanese mood is one of exultation at release from the silken but hated shackles of the Occupation. Japan's leaders must pretend to be the free masters of their honourable fate—no matter how unsure they are of the nature of that fate and no matter how vulnerable they remain to the shifting loyalties and cabal conspiracies in the Diet.

Export Trade Prospects

Costs are soaring, textile prices have dropped to a record low, labour disputes are widening and the population is still increasing at the rate of a million a year; yet taxation reductions are promised and the United States is blandly expected to "supply the equipment for Japanese rearmament." Mr Hayato Ikeda, who has been transferred from the Treasury to the Trade Ministry, has been greeted with an export programme forecast of \$1,193 million for the next fiscal year (April 1953—March 1954), compared with actual exports of \$1,405 million in fiscal 1951. (The estimate for the current year is \$1,148 million.) This estimate is partly based on "an increase in the export of light machinery, sundries, marine and agricultural products to the Red China market"—still the mighty imponderable in all Japanese export planning. The glittering prospects of Tonan Ajiya (South-East Asia) remain largely in the glitter stage.

Meanwhile, Mr Yoshida has promised that he will correct some of the "excesses" of the Occupation and it is evident that many of the rigorous anti-inflation measures laid down by the Occupation financial adviser, Mr Joseph M. Dodge, will be jettisoned with loud "banzais!" Already three of Mr Dodge's principles have been quietly discarded: the Bank of Japan is now underwriting food debentures; the ban on underwriting of financial debentures by the Trust Fund Bureau has been lifted; and the Government is selling exchange currency to the Bank of Japan to supply yen funds to the foreign exchange account. Shipbuilders are also urging the revival of the old subsidy for the iron and steel industry, suspended two years ago.

The unhappy fact is that if this Yoshida Cabinet does not survive, there will be no practicable alternative to another election, which may see the passing of Mr Yoshida, who on all counts is the ablest leader available in the dark and troublous days ahead.

* * *

Correction. On page 396 of *The Economist* of last week it was erroneously stated that the number of Kazakhs in the Soviet Union had declined by more than 80,000 between 1926 and 1939. The figure should have been 800,000.

The Watch on Washington

At one forty-five in the morning, on November 5th, Governor Stevenson conceded the American presidential election in the wake of General Eisenhower's overwhelming landslide. All over the world Ministers and private individuals had been sitting glued to their wireless or waiting for the papers. In London the news came before breakfast and in Moscow during the morning break. In the Austral Islands people were finishing supper and in Samarkand they were relaxing after lunch. But wherever it might be, people realised that the world's most powerful ship of state was launched on another four-year crossing with a new but famous captain, a rather disturbing first mate and a new and little-known crew. Everywhere, also, government and press tried to react intelligently to the news, with an air of having expected just this result all the while. For most embassies two sets of congratulatory messages had been prepared; one set was scrapped and over the wires poured messages of felicitation to General Eisenhower and the party he brought into power. Beneath the bland surface of official congratulation much bewilderment or many second thoughts could be made out. In the capitals from Moscow to Madrid, people were asking themselves, "how does this affect us, and is it in our interest?" The variety of answers provided a kind of weather-chart of political expectations on this side of the Atlantic.

Views Behind the Curtain

In Moscow, the public was told briefly that a man had come to the White House whose doctrine of liberating eastern Europe was merely a parroting of Hitler and whose advisers wore the mask of Goebbels. In its news commentary Moscow radio predicted the spread of the Korean war to the Chinese mainland and informed its listeners that most American working men had either abstained from choosing "between two valets of Wall Street" or had voted for the small Progressive party. In Soviet ruling circles, however, the Eisenhower victory will not have been entirely unwelcome, the argument being that tensions between European and American foreign policies, particularly with respect to Asia, will be aggravated by a Republican State Department and a more aggressive Pentagon.

In Warsaw the newspapers commented on the difference between the outcome of the American elections and those in Poland, where 99 per cent had voted for a peace-loving and proletarian National Front. Throughout the satellite press two themes were prominent: General Eisenhower's victory meant a greatly increased danger of imperialist war, and it would make clear to the countries of western Europe what kind of juggernaut they were harnessed to. On the whole, the Republican sweep to power was presented as a first symptom in the predicted break-up of the Atlantic alliance.

In capitals just beyond the fringes of the Iron Curtain these Communist crowings found a certain uneasy echo. The reaction in Belgrade was confused; it was argued on the one

hand that the Eisenhower accession might entail a dangerously high-handed policy in Asia, on the other that he might cut through diplomatic red-tape and come to a high-level understanding with the Kremlin. This latter possibility is a particular thorn in Marshal Tito's flesh, for it could bring with it a relaxation of the international tension on which his present position has been founded and developed. In the Scandinavian capitals there was scant effort to disguise the disappointment created by Governor Stevenson's defeat. In Stockholm a famous aphorism was modified to read: "politics is far too important a thing to be left to generals," and considerable adverse attention was focused on the victories of Mr Nixon and Mr McCarthy. These countries fear any signs of American bellicosity and see their safety lying in the kind of pragmatic and gradual approach to east-west problems advocated by the defeated candidate.

The further west one moved from the Soviet sphere, the more complex and qualified were the reactions to the election result. In Berlin, where conditions are obviously rather special, the Christian and the Social Democrats showed little pleasure, not only because they are suspicious of military men in government but because of their latent hopes for a four power understanding on Germany. The so-called Liberals, on the other hand, rejoiced at the Republican triumph. They have long agitated for a "direct German-American dialogue" and now hope to hear "the voice of Senator Taft who has always been inclined towards a close understanding with our country." They appear to have forgotten Mr Taft's statements about "blowing up the Ruhr." In Bonn, despite Dr Adenauer's swift reassurances, General Eisenhower's success caused mixed feelings and provoked an unmistakable nervousness. The Federal Republic is especially worried about any hints of isolationism, whether in the form of campaign promises to cut down expenditure on rearmament, or the implicit wish to get American troops out of Korea. Whereas to many German circles the name of Eisenhower is synonymous with Germany's defeat and occupation, Mr Stevenson was an unknown quantity and became as such the object of a good deal of hopeful speculation. Nevertheless, even among the most enlightened circles in Bonn, the possibility of a special relationship with a Republican Washington is being kept in mind.

Acid Comments from Italy

Nowhere, perhaps, were the echoes more complex than in Rome. Official circles hastened to express their pleasure, but there is no doubt that a Stevenson victory had been hoped for, if only as a guarantee of a continued pro-Italian lobby in Washington. A major portion of the Italians living in the United States certainly voted for the Democrats and this is not without influence on public opinion in the homeland. Italian socialists, moreover, have taken a pessimistic view of the outcome. They have commented acidly on the fact that Italy's close dependence on the United States puts it doubly at the mercy of a change in American policy or of Republican inexperience. There is, as yet, no question of a fusion between the different brands of socialism represented by Saragat and Romita on the one hand, and by Nenni on the other; but there is no doubt that the swing to power of a Republican administration may create a rapprochement between left parties and a stiffer attitude towards the de Gasperi regime. In Madrid, on the other hand, the Republican victory has been warmly received. As pointed out on page 442, a break in the deadlock of the Madrid-Washington negotiations is now expected, and it is generally felt that the Republicans will prove better friends of Spain than their predecessors.

France, in a sense, summarises the entire range of fears and contradictory responses evoked in Europe by the election result. The extreme Left, of course, takes its cue from Moscow and is prophesying the spread of war in Asia, the further militarisation of France and the rearmament of

Germany, even outside an EDC framework. On this latter point, moreover, it finds a sympathetic hearing in many other quarters. Despite General Eisenhower's message of greeting to France on the morrow of his victory, his reputed pro-German inclinations are feared, and the Republicans' feelings about "dumping money down the French drain" are well known.

The extreme Right in France, on the other hand, seems to be pleased, either because of a natural liking for generals in responsible posts or because of the calculation that Eisenhower will back up anyone working for a resurgent and militant France. The Government is somewhat involved in this dilemma; it fears any return to isolationism, but equally it fears a venturesome policy which might end up in a Washington-Bonn pact or in an even greater military burden for France. With regard to Indo-China and North Africa, however, government spokesmen have been prophesying a more understanding attitude in the new Administration. This whole complex of feelings might be summed up in a statement by *L'Observateur*: "Stevenson aurait rassuré: Eisenhower inquiéterait." That observation might well stand for Europe as a whole.

Party Meeting in Zagreb

[BY A CORRESPONDENT]

THE sixth Congress of the Yugoslav Communist Party which ended last week marks an important milestone in Marshal Tito's progress away from Soviet Communism. Perhaps it would be truer to say it marks the change from retreat to attack. After the Congress had finished, the Yugoslav Communist Party had changed its name, its organisation and its programme. It had not, with the exception of the two black sheep, Neskovic and Djuric, changed any of its main personnel. The Politburo, in future to be known as the executive of the Central Committee, and to be reduced to thirteen, contains all the outstanding associates of Tito; its six-man secretariat is composed of the big four—Tito, Kardelj, Rankovic and Djilas, plus Kidric and the army General Gosnjak. This continued inclusion of Kidric at the very heart of power does not square with the rumours current over the past 18 months that he was about to be arrested, had fallen from power, or had been dismissed from office because of muddle and mistakes in economic planning. The new additions to the Central Committee are all strong supporters of Tito—Tempo, his trusted wartime associate; Salaj, the outstanding figure in the Yugoslav trade unions, and one of the few Yugoslav Communists who spent a sufficiently long time in Soviet Russia to be able to tell bloodcurdling stories of what life in Stalin's paradise is really like; Bakaric, the brilliant Croat who has fought so hard for a change in the official attitude towards the peasants, and Kolishevski, the enigmatic strong man of Macedonia.

Tito Seeks More Friends

The new name of the Party is to be "Union of the Communists of Socialist Yugoslavia"; this is designed to be more in keeping with its most important task for the future—the "ideological education" of the people. The change in name is also designed to give point to "the great historical part" which Yugoslav Communists are now playing in the struggle against "the Soviet-Cominformist revisionism of Marxist theory and practice" and in "unmasking Soviet manoeuvres directed not only against our country but everywhere." Revelations about how the Soviet Union treats satellite states, which were formerly regarded as top secret, now come thick and fast, and Tito added to them in his speech to the Congress. It is not clear whether this policy is designed to

make friends amongst other anti-Soviet forces in the international field, but it will certainly help to do so.

For the first time since the break with the Cominform, Marshal Tito made it abundantly clear that he wants more friends, and is very anxious to abandon the position of isolation between east and west. Yugoslav members of the Peoples' Front (now to be called the "Socialist Federation of Working People of Yugoslavia"), as well as Communist Party members were exhorted as groups and as individuals to try to "play an important part in co-operation in the international field"; and Tito himself has set an immediate example by accepting the British Government's invitation to visit this country. In short, the Soviet attitude to relations with capitalist countries has been thrown overboard.

Delegated Powers

The Congress also endorsed proposals which scrap the whole Soviet conception of the state and of the organisation and role of the Communist party. The new Yugoslav ideas which will take their place are claimed to be more democratic, to be designed to foster real socialism and, in contrast to Soviet deviations, to be more in accord with Marxist principles. The state will now be based on a new constitution which was outlined to the Congress in a speech by Mr Pijade, and will be introduced to parliament in November. Its outstanding feature is the delegation of government to more elected assemblies; "Councils of Producers"—that is, representative bodies for manual workers—will be introduced at all levels of government except the very lowest. The new constitution follows a process of decentralisation that has been going on now for 18 months. Most departments of the central government have already been dissolved and their work is to be carried on at local government level under the control of the newly elected assemblies. This it is claimed represents the withering away of the state of classical Marxism. It also aims at bringing many more of the general public into local government.

The basic problem which still remains unexplained is how the Communist Party is to maintain its hold over government. The final resolution passed by the Congress emphasised the point made repeatedly in the leaders' speeches that

the Union of Communists is not and cannot be the leader in direct control of economic, state or social life, but acts in all organisations through its political and ideological work.

This seems to imply that the Yugoslav Communists, now some 779,382 strong in a total population of over 16 million, are to be an elite which will maintain their dominant position by force of example alone. At the same time, however, Marshal Tito reiterated that the existence of other political parties is not to be allowed; in fact, therefore, the Communist Party will still have a political monopoly.

All the same, great efforts are obviously being made to make sure that the Communist programme and methods arouse less antagonism than in the past. Under the new constitution it would be possible to muster—if voting is free—enough popular votes to oust Communists from office in any section of government. This danger probably explains why manual workers—who may be considered as potential Communist supporters—have been given two votes at all except the lowest level of government.

Lowering the Economic Sights

On the economic side the Congress showed that policy has been considerably modified and along lines long suggested by Western experts. In Mr Kidric's speech—which was a little more intelligible than usual—and even more in Marshal Tito's references to economic affairs, the emphasis was on scaling down industrial planning so that "only those projects

A SURVEY OF INTERNATIONAL BANKING

1952

appears on page 487

will be started for which it is proved that there are financial means both at home and abroad, and which are justified technically and economically." Investment in the near future is to be devoted to finishing industrial projects already begun, to developing roads, railways and transport, and, for the first time to any considerable extent, to developing agriculture. Capital investment is to rely on Yugoslavia's "own forces of production and it will be based on the exploitation of our own raw materials." Thus the Yugoslav planners have at last come down to earth and abandoned what Tito characterised as the "megalomania" of previous grandiose schemes. The party attitude to collectivisation of agriculture does not appear to have changed; the increase of co-operative farms is still urged—but no longer by methods that will antagonise the peasants. The aim now is to make co-operative farms so successful financially that individual peasants will be persuaded to join by the possibility of making larger profits. In fact, throughout both industry and agriculture, financial profit is to be the incentive to greater production. This implies that consumer goods will be available.

The sum total of all these changes is to make a state very different from the Soviet pattern for Communist satellites; very different, too, from the democratic conceptions of the West. The future alone will show whether Marshal Tito has really carried the bulk of his Communists with him. To Communists trained in the old Moscow traditions these apparent deviations must be very difficult to stomach. It is perhaps significant that over a third of the party membership has joined since the Cominform split—that is nearly 90 per cent have joined since the beginning of the war. For Yugoslavia's non-Communist allies the questions of immediate interest will be to see if the changes really make government in Yugoslavia more democratic and less a prerogative of Communists, and whether in doing so they make Tito's government more genuinely popular and stable.

Greece's Defence Burden

TOMORROW the Greeks are again going to the polls to give their verdict on the rival merits of Field-Marshal Papagos's Greek rally and the EPEK-Liberal coalition led by General Plastiras. In the sound and fury of the election campaign it was hardly to be expected that there would be much constructive criticism of Greece's pressing domestic problems. Yet the importance of the elections primarily lies in whether or not they produce a strong and stable government which can apply to the Greek economy the long-term recuperative measures that will enable it to bear the heavy burden of its defence effort.

The Greek voter has, at any rate, been reminded of the important part his country is coming to play in the defence plans of the Nato powers. Fourteen members of the North Atlantic Council arrived in Athens this week to discuss with Greek military leaders the organisation of defence in the Balkans and the eastern Mediterranean. But the Greeks are beginning to wonder whether they will be able to play their allotted role. In spite of millions of dollars of foreign aid, their economy has never recovered from the ravages of war and civil war; and now American aid, which fell from \$206.8 million in 1950-51 to \$182 million last year, is to be reduced still further to \$82 million in the current financial year.

The Greeks now have a total of about 150,000 men under arms and an army of nine to ten divisions; with their impoverished economy they can fairly claim to have sacrificed more than most to the needs of national defence; and, owing to the civil war against the Communists, they have been sustaining a heavy defence burden for longer than the other members of Nato. In 1948-49, 8.4 per cent of the Greek national income went on defence; in the present financial

year the figure has risen to 9.3 per cent. This is a higher percentage than in many wealthier countries, and the sacrifice for the Greeks has been proportionately heavier; whereas in 1950 the national income in France amounted to \$492 per head of population, in Italy to \$261, and in Denmark to \$880, in Greece it was only \$150.

Greece is also devoting a larger proportion of its budget expenditure to defence than are most of its Nato partners. Between 1948 and 1950 45 per cent of the budget went on defence; in 1950-51 the figure rose to 52.8 per cent, and in the last fiscal year it was 49.5 per cent. This includes the cost of war pensions and of the Gendarmerie (who fought against the Communist guerillas) but not the cost of the rehabilitation of the 700,000 made homeless through the civil war. The Greek figure compares with Denmark's 14.5 per cent, Britain's 41.8 per cent, France's 52.8 per cent and a Nato average of 39 per cent.

Permanent Under-nourishment

This heavy defence expenditure has meant that Greece has very little left over for domestic investment. In 1951-52 only 12.5 per cent (or \$266 million) of the national income, including American aid, was available for this purpose. Only Portugal with 10.5 per cent and Turkey with 10.6 per cent invested a smaller portion of their national income; only Portugal with \$249 million invested less in absolute terms. Moreover, the Greeks have had to see the greater part of the counterpart funds derived from American aid swallowed up either directly or indirectly by defence needs. Only 22 per cent (or 1,785 billion drachma) of the counterpart funds available up to June 30, 1951, were devoted to the development of local production. France spent 84 per cent of its counterpart funds during the comparable period for this purpose and Turkey 50 per cent.

One result of this inability to increase the country's productive capacity and improve the standard of living has been the permanent under-nourishment of the Greek people. The average daily consumption in calories per head, which even before the war was only 2,600, fell in 1951-52 to 2,400. In Britain and most west European countries food consumption at present is running at about 3,000 calories. Another result has been a serious deficit in the balance of payments. It is true that the deficit which in 1950 amounted to \$321 million was last year reduced to \$190.5 million. But with the drastic cuts in American aid the Greeks take a gloomy view of the future. They have submitted a memorandum to the OEEC Council suggesting that Greece should be allowed to cut down its imports of luxury and semi-luxury goods, and that other countries belonging to the European Payments Union should buy more Greek exports. The snag here is that so many Greek products are unable to sell competitively in world markets, which is clearly a result of the Greek Government's inability to curb the rise in domestic prices and costs.

Military Service Cut

The new Greek Government will undoubtedly be able to make out a good case to the Nato Council and to the MSA authorities for more of a helping hand. It can point to the fact that it has already been found necessary to cut the period of military service from 30 or 36 months to 2 years; and that although this has not affected the present strength of the armed forces it must inevitably do so next year. The Nato authorities, on the other hand, can fairly point out that the wealthy Greek private investor is not yet doing his bit to build up his country's economy; that the taxable capacity of the wealthier classes is quite inadequately exploited; and, in short, that the Greeks have not done anything like all they could and should to put their house in order by controlling their domestic inflation. The trouble has too often been that what was economically desirable was not politically expedient.

Eyes front!

H. G. Wells once remarked that most people when they think they are thinking, are in fact merely re-arranging their prejudices.

How aptly this applies to many a manufacturer and his advertising! Year by year he launches, and announces to the trade, what he calls an entirely "new" advertising campaign for his products—whereas, in fact, it is new only in the re-arrangement of its prejudices!

The musty trade-mark, the dowdy name-block, the Victorian package, must all go in—for "round those our business was built." He cannot disentangle

himself from the trappings of the past.

Crawfords was founded on and follows a wholly opposite belief—namely, that advertising should keep pace with the swiftly changing times. More—that it should *set* the pace.

For many an intelligent client Crawfords have swept away the cobwebs of his business, re-designed his packaging, modernised his windows and display, and created a style of advertising which puts him *in the lead*.

It has always paid. For in advertising, as in fashion, as in films, as in motorcars—newness and freshness rate first.

Research and development

have been undertaken on a greatly enlarged scale since the war. The Simon companies sell their specialised experience, designs and equipment in over fifty countries, and to ensure that these tangible and intangible products continue to compete in world markets, a large block of new research and development buildings has been built at Cheadle Heath and brought into use in stages during the past two years. A vigorous flow of new ideas in plant and processes is more vital than ever to keep Britain in the forefront as a producing and exporting nation.

These facts are published to show what British workers can achieve in spite of difficulties, with British organising skill behind them.

It can be done

The job was an oil refinery in Britain—and this vital industry demands speed. Every stage of construction was scheduled in advance; and, for good reasons, the day and the hour were fixed for completion of one essential section. This involved complex construction by unconventional methods, requiring 4,000 tons of concrete and steel.

A programme was drawn up showing each day's work for the six months allotted. Everyone responsible had a

copy and everyone worked to it. Whatever the weather—and this was midwinter—progress never departed substantially from schedule; and the work was finished a few hours ahead of time. That programme, though backed by knowledge and experience, relied on the spirit of the men on the job, and it was they who proved it correct.

Good Intentions and Steel

IT no longer seems as certain as it did three months ago that all the Government really hopes to achieve by steel denationalisation is simply the *status quo ante* 1949. Some phrases in the Steel Bill published last week, and some remarks elsewhere, suggest a concern for competitive efficiency as well as for private ownership, and an awareness that the one may not automatically flow from the other. This inference, admittedly, is debatable; and it raises the question whether the Bill as framed would enable the Government to carry out such better intentions.

The potentially significant changes between the White Paper and the Bill have been widely noted. The primary duty of the Iron and Steel Board that the Government proposes to recreate is now to exercise general supervision with a view to promoting the supply of iron and steel products "under competitive conditions." There are some indications that this might curiously be construed to mean only that prices in the industry should be controlled so as to give iron and steel producers as fair margins of profit, and opportunities to provide for replacement and some expansion, as other price-controlled industries enjoy; but other signs are more encouraging. In the somewhat remote possibility that the proposed board might become responsible for the import of raw materials or finished iron and steel, it is expressly denied the power to sell such materials at prices lower than their cost without special Ministry consent; and the power mentioned in the white paper "for the loss to be recovered from appropriate sectors of industry, as is done at present" is no longer specifically provided, though the board's generalised powers to raise levies would probably cover it. These alterations may be considered beside the recent change in pig iron prices to correspond rather more closely with raw material costs, and with Mr Sandys's comment in the Commons three weeks ago that the present system of equalising materials costs in the steel industry

possesses all the disadvantages of any system of price averaging in that it masks real costs and interferes with the healthy operation of normal economic forces.

Such indications of the Government's ideas on policy for the board as have appeared recently, therefore, do indicate some change in emphasis since the white paper was published in July.

In assessing the significance of this change, it should be noted that in this Bill the Government attaches, formally at least, as much importance to the board's supervision of the industry as it does to the extinguishing of the half-baked state steel corporation and the return of its nationalised companies to private ownership. The duties of the board are wide. So is its scope. Apart from general supervision, it is directed particularly to "keep under review" productive capacity, arrangements for obtaining and distributing raw materials, prices, research

and training, safety and welfare arrangements, and joint consultation (apart from that concerning terms of employment). Its purview is wider than the nationalised corporation's: it covers not only the production of iron ore, iron, steel, heavy forgings, tubes, bars, and tinplate or terneplate, but also ironfounding and steelfounding.

The board's powers, however, are considerably restricted. Its power to supervise development, is defined rather unexpectedly, almost entirely in the negative. Iron and steel producers under its supervision may be required to give particulars in writing of any additional production facilities they propose to provide and not to proceed without the board's consent. But the board must "ensure" that no such particulars shall be required for proposals that "would be unlikely substantially to affect the efficient and economic development of production facilities in Great Britain"; and it shall not refuse its consent unless it considers that a proposal "will seriously prejudice" this general development. The responsibility of the 1946 board

to review and supervise programmes of development needed for the modernisation of the iron and steel industry and to watch over the execution of approved schemes in such programmes

has become in this parliamentary draft the power to "consent" or to "withhold consent." Whether it has thereby suffered any sea change is perhaps partly a matter for the lawyers; and the whole procedure, in consultation with the industries' trade associations, can be defined only in practice. But the change in phraseology is interesting. It is at any rate hard to discern in these sharply limited powers the heavy-handed control that some ironfounders have been crying out against. The question, perhaps, is rather whether such powers guarantee the board enough effective influence upon the location and capacity of such economic plants as the industry chooses to provide on a commercial basis. It is possible that the Bill might, in practice, tend to moderate this influence out of existence.

The board's powers to control prices, too, are limited. It may fix maximum prices for any products of the iron and steel industries that it supervises, though it is not obliged to do so; the exercise of price control for the made-to-order products of the many jobbing iron foundries, for example, is hardly likely to appeal to it. These maximum prices will apply only to producers and, by notice, to selling agents handling "the whole or a substantial part" of a producer's output; all other merchants or selling agents may sell at what prices they please. This price control, which seems to have some loopholes, is enforceable only by civil proceedings for an injunction (as is the board's refusal to consent to any development project). It will not apply to products for which the Minister is controlling prices under defence regulations; and since, under existing temporary powers, this Ministry control of the prices charged by all persons could presumably always be invoked in any shortage or

emergency, the freedom of merchants and stockists to charge what they like need not imply freedom to profiteer. But it is perhaps pertinent to ask whether the board's price control (which seems to be a direct descendant of semi-informal powers possessed by the prewar Import Duties Advisory Committee) is really necessary at all. Unless there is a state of shortage or emergency, why should price control become normal?

The crucial point that is left undefined in the Bill is the relation between the new board and the existing trade associations—above all, the British Iron and Steel Federation. At many points, "consultation with representative bodies" is enjoined upon the board, but that is all. It may "secure the performance of" certain of its duties—for example, the publication of statistics—instead of performing them itself, and it is clear that the Federation may be asked to continue to do such work. But the board has no powers whatever to require any course of action by trade associations such as the federation. Nor has it any direct powers *vis-à-vis* the central buying agencies controlled by the federation that at present import the industry's raw materials and steel in bulk. Importation of these materials is not included in the Bill's third schedule; so the board's powers of supervision or price control would not appear to apply to these companies.

Admittedly, the board is given the ultimate power to make its own arrangements to import raw materials if it believes "that satisfactory arrangements do not exist"; and to import finished iron and steel if it and the Minister consider that supplies in Britain are inadequate. These conditions differ; but in reaching a decision whether existing arrangements concerning raw materials are satisfactory, it may be noted that the board appears to receive no formal right in the Bill even to obtain information from these agencies—or from the federation. The denial to the board of power to sell below cost without the Minister's consent, should it engage in importing, in no way affects these agencies' powers to do so and to raise levies from federation members; so far from supervising the famous "industry fund," the board might not even be able to obtain information about it. On the other hand, it is not clear whether the board's powers to obtain contributions from any or all of the producers it controls could be used to draw compulsorily into the federation's levy-subsidy system the non-member ironfounders who at present enjoy the subsidised prices but escape the levies. And it is true that the companies supervised, however, owned, are expressly made subject to the scrutiny of the Monopoly Commission. On one interpretation, moreover, the board's general duty to promote "competitive conditions" in the industry might imply the exertion of its influence to bring to an end any pricing arrangements that "mask real costs," even voluntary ones. But how much influence it could exert remains uncertain. So does the real balance of power in this industry, once supervision and denationalisation begin next summer.

★

Supervision, at its most desirable, might be partly a matter of form. Resale will be a matter of fact. Here, sensibly enough, the drafting of the Bill seems to have been directed to making possible almost every conceivable arrangement that the "Iron and Steel Holding and Realisation Agency" might devise to

"secure the return to private ownership" of the steel companies now publicly owned. Sales can take place "in such manner, and by such stages, and with such postponements of the sale of securities or other assets" as the agency and the Treasury determine. Under the authority of the Treasury or the Minister of Supply, the agency can reorganise the capital of any of its companies, amalgamate or wind them up, or arrange "the sale, or other disposal or lease or hire" of any of their assets. Stamp duty will not be payable upon any transfer of assets between subsidiaries, or on the final transfer to the new private owners. In the meantime, the holding and realisation agency will "promote the efficient direction of [its] subsidiaries." It will be able to advance them money to cover development in the meantime out of a realisation account made up of the publicly owned industry's surpluses and of advances—up to £150 million—from the Treasury.

This extreme flexibility in disposal technique should make the chances that a large proportion of companies could be returned to private ownership slightly better. But it makes them even less possible to gauge. The companies concerned stand in the corporation's books, from the latest reports, at £237 million, in securities comprising some £200 million of equities, £26 million of preference capital, and £7 million of debentures (plus £20 million of debentures owned by the public). But if the agency found it more convenient in most cases to sell back to private owners a much smaller equity and to retain large blocks of fixed-charge capital in its own hands, it would have no difficulty in re-shaping the capital structure of the companies in order to do so. "Private ownership" as defined in the Bill means that the state shall not own securities "to a substantial extent" in the company concerned. Lease or hire of assets, while effectively placing them under private control, might thus not count as a return to private ownership (though hire-purchase would), when the Treasury came to decide the point at which the agency may have "substantially discharged" its main duties under the Bill. But the "substantial discharge" would not preclude the retention in state hands of some companies or holdings that the agency had not been able to sell.

One rather curious section of the Bill provides that the agency may lend money from the realisation account to "any company any of whose securities" it holds. Given the definition of "private ownership" above, this might imply that companies sold back might still be able to obtain loans from public funds (at unspecified rates) so long as the agency still owned an "insubstantial" holding. However, the Minister said in Parliament recently that "once the companies are returned to private enterprise, it will, of course, be the responsibility of their boards of directors to find finance for development"; and Parliament would be unlikely to countenance anything else. This provision of further finance, over and above the compensation value paid for the companies and the further £100 million or more that the Corporation may have spent on development in the meantime (both of which the Treasury can hardly ignore in approving prices), is one of the biggest question-marks for the prospective investor. He might, however, be reassured by the thought that nobody can make him spend his money on development, however the board and the federation might agree that this development was necessary in the national interest.

This is indeed an odd newspaper

TO LOOK AT, the Manchester Guardian may seem old-fashioned. No concessions are made to the mass reader or the vulgar mind. You will search in vain for the tidbit, the juicy item, the Society scandal, the daily big-type bombshell.

What do you find instead? You find the old craft of good reporting and good writing. And that is curiously satisfying. You find yourself meeting minds which are clear, honest, cultured—and not self-conscious about these dying virtues. You find news, leaders, articles, comments, which you can trust.

You are not being bludgeoned into reading the Manchester Guardian. This fine newspaper is not for the millions. It is for the few—but not so few!—who do not ask either for the pompous or the sensational.

If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.

Full examination of the Steel Bill, then, suggests that the improvements it promises over the white paper will need some reinforcement. To promote really "competitive conditions" in the steel industry, after all, is not merely an academic exercise. It might surely make sale to the genuine private investor more feasible, simply by allowing him to know what he is buying when he buys a particular steel company share; and improve the competitive efficiency of British steel in a world where demand may not always remain as pressing as it is today. Some further clarification of the balance of power in the industry, and perhaps some power to influence trade associations as well as the board to promote competitive conditions, may well be the only really important measure of extra supervision that the British

Business Notes

The Uneconomic Debate

The economic debate turned out, after all, to be mainly a political occasion. Both parties seemed more intent upon widening breaches in the ranks of their opponents, than with closing them in the national economy. Perhaps the sharpest feature to emerge was Mr Butler's statement that "the Government must continue with a selective policy of damping down home demand for capital goods, for which overseas demand is high, while not depressing home demand for consumer goods, for which overseas demand has declined." Since it is also the "prime objective" of the Government to reduce the level of taxation, it is clear that there is no intention to create the slack that is necessary if resources are to move away from the production of consumer goods (which foreigners do not want) to capital goods (which they

Indeed Mr Butler "thanked God" that unemployment in the textile industry had fallen by 100,000 since May; he also indicated that the industry itself should give some thanks to the Government for the acceleration of official orders for textiles. This acceleration, together with the Danckwerts award to doctors and the "great progress" of defence production, means that the expenditure of the Ministry of Supply in 1952-53 is likely to run considerably above the original estimate. Since the Chancellor also expects to have to introduce supplementary estimates for the defence departments—for the army, at any rate—the end-year budget accounts will obviously, and at best, fall appreciably short of the out-turn envisaged last March. The extent of the shortfall, however, is still uncertain, for Mr Butler believes that the excess expenditure of the Ministry of Supply and the defence departments will be partially offset by "substantial" economies elsewhere.

Approach to America

On the external side, the big question mark hanging over the debate concerned the proposals that the Government intends to lay before the Commonwealth Conference. Both Mr Butler and Mr Crookshank at least made it clear that this conference will be a prelude to discussions that the Government hopes to hold later with Europe and, above all, with the new United States administration. Indeed the Chancellor defined the Government's policy as that of working to create the conditions in which sterling can become convertible, while recognising that those "conditions cannot be completely realised without the active co-operation of other countries, notably those which are consistently in surplus with the rest of the world." It may be true that the Govern-

ment came within a hair's breadth of dashing for convertibility and a free rate last March; in the debate, Mr Gaitskell, echoing a rumour that has been current in the City for some time, alleged that that hair's breadth to have been no wider than the person of Lord Cherwell. But it seems clear that the objective now is to make a concerted advance, rather than a disconcerting dash, towards such freedom.

This is almost certainly the right policy. It received heartening support this week from Professor John Williams, of Harvard University and the Federal Reserve Bank of New York; who has long exerted a quiet but potent influence for good on United States economic thinking. In the Stamp Memorial Lecture at the University of London, Professor Williams examined possible cures for what he called the "basic tendency toward world imbalance . . . which has its roots in the growing predominance of the American economy." He laid great stress on the need for attracting dollar capital overseas, for the co-ordination of investment programmes in Europe and the Commonwealth, and for devising a trade pattern into which the expected trend in American import demand will fit. On the vexed question of the dollar price of gold, Professor Williams declared that, as an American, he would not welcome an increase, but "I would not weigh my objection too heavily if there were a clear case for it as part of the American contribution to a basic solution of the dollar problem." He also believed that, for the present, military and economic aid must continue, but that "the immediate question is whether this aid can be extended in a way that might make it more palatable to both sides and more directly contributory to the goal of an international balance based on trade, not aid." It is clear that the main tasks for the Commonwealth Conference will be to devise constructive proposals of this sort, and to take the necessary internal steps to make its proposals acceptable to the United States. In a special survey in next week's issue of *The Economist*, it is intended to discuss at length the shape that these proposals should take.

Local Loans—An Experimental Move

The Government's decision to drop the statutory compulsion upon local authorities to borrow only from the Public Works Loan Commissioners has aroused much interest in the City, much suspicion among Labour party economists, and some misplaced budgetary hopes among the economically illiterate of all parties. During Wednesday's debate on the Public Works Loans Bill, the Financial Secretary to the Treasury was at greater pains to allay the suspicion than to dash the hopes. He made it plain—as, indeed, was suggested in these columns last week—that the Government does not

intend "to exclude a number of authorities from the [Local Loans] Fund and force them on to the stock market." The intention is to proceed by agreement with the local authorities, and to ask some of the largest of them to "assist" the Government by issuing their own stocks; but there is not to be a restoration of the prewar arrangement whereby authorities controlling a rateable value beyond a given limit were ineligible for PWLB facilities. Moreover, in making any such requests, the Government will "have regard to the capacity of the market to accommodate local authority borrowing on reasonable terms"—from which it seems reasonable to infer that the Government has not even considered the possibility that the switching process might be an instrument for the stiffening of monetary policy by provoking a rise in interest rates generally. Equally, it is clear that the Treasury will not manipulate the PWLB lending rates with the object of making them less attractive to credit-worthy borrowers than borrowings on the market; these rates will be fixed, as now, so as "to follow the general level of Government credit." Finally, Mr Boyd-Carpenter pointed out that the projects seeking finance would have been already approved by "the proper central department"; and no government would conceivably "frustrate its own approved policy" indirectly by changing the financing arrangements.

These and similar assurances leave no room for doubt that the Government intends to proceed experimentally and cautiously. It thinks it "very likely that recourse to the market will be extremely limited," so that the Local Loans Fund will inevitably continue to be the "main reservoir" of new capital for the authorities. It is to ensure its adequacy that the new Public Works Loans Bill raises the limit upon commitments (covering both the actual advances made during the period before yet another Act is passed and the undrawn portions of new loan approvals given during that period) from £950 million to £1,050 million. The Government expects these extended facilities to be required; hence, whatever changes might be envisaged in the longer run, it is obvious that for some considerable time ahead Government financing of the authorities is likely to continue on a scale not significantly different from that of the past year or so.

This possibility alone ought to quell the hopes of those who thought the switching process might offer scope for significant tax reductions—by lightening the Government's load of "below-line" expenditure. But these hopes were based upon a more fundamental misconception than that of the size of the intended switch. However large it might be (and however great, therefore, the reduction of the "below-line" expenditure), the need for an "above-line" budget surplus would remain—except to the extent that the switching to the market caused a decline in the total volume of domestic investment or an increase in the total flow of genuine new savings. Neither of these results could be expected—not, at least, in any significant degree—unless the switching were allowed to produce its due pressure on the market and a corresponding rise in interest rates. And that policy, which in principle is the right policy, is not, apparently, in contemplation.

Rise in Exports

Provisional trade figures published by the Board of Trade this week show that exports rose sharply in October, to £218.5 million, though they were still £17 million below the level of October, 1951. A seasonal improvement in trade after the holiday period is perhaps the main factor in the margin of £32 million by which exports last month exceeded those in September; the increase this year is indeed little bigger than the corresponding October improvement in the two preceding years. But even on a daily basis exports last month were nearly 10 per cent larger than the exceptionally low monthly average for the third quarter, and

those to the dollar area showed a particularly heartening recovery last month. The provisional dollar total of £28.6 million for October compares with a monthly average of £23.2 in the third quarter of this year and £20 million in the fourth quarter of last year. The United States and Canadian markets appear to have shared equally in this improvement. Exports to the United States, which had fallen to an average of £11.4 in the third quarter, recovered to £14.4 million last month. The upward trend in exports to Canada continued; last month's total was £14.2 million compared with a monthly average of £8.4 million in the first quarter of this year.

Imports also rose sharply last month compared with September; but last month's figure of £267 million was only £4 million above the monthly average for the third quarter, and it was nearly £100 million below the level of October, 1951. Like exports, imports usually show a seasonal increase

* Including re-exports.

in October, and this year's rise does not appear to be exceptional. With re-exports at £12.1 million, the excess of imports (c.i.f.) over total exports (f.o.b.) fell to £36.3 million in October—its lowest level for any month since November, 1950. After making the usual allowance for the cost of insurance, freight, etc., it seems that there may in fact have been a small surplus in visible trade last month.

Labour Returns to Textiles

The continued momentum of recovery in the textile industry is the main trend illustrated by the employment figures for September, published last week. During September the textile labour force grew by 11,000 workers and clothing employment by 6,000; and between mid-September and mid-October the number of people registering as unemployed in the industry fell by 18,500. During the month, though the number in civil employment declined by 22,000, this was borne almost entirely by the basic industries and by the service industries; the manufacturing labour force grew by 30,000. All manufacturing groups industries except food, drink and tobacco showed an increase in employment. The vehicles group gained 3,000 workers, though it is impossible yet to estimate what changes this implies in the aircraft and the motor industries. The engineering group also gained 3,000 (bringing its labour force to 2,563,000, compared with 1,089,000 in vehicles, at the end of September). The declines in employment came in transport, in agriculture and fishing, and in the "professional, financial, and miscellaneous services" group, which lost 28,000 people, largely from hotels and catering.

Unemployment grew slightly during the month, to 397,900 (of which 47,200 were temporarily stopped); but it still represented no more than 1.9 per cent of the estimated total number of employees. Short-time working, according to the

Minister of Labour in the House of Commons this week, is continuing to be reduced, and the amount of overtime worked remains fairly high. As yet, the employment figures have not matched the fall in manufacturing production that the indexes suggest, and it is clear that this summer there may have been a good deal of "under-employment," in terms of slackening inside the factory. Employers have learned to hold on to workers in years of overfull employment; and the summer's decline in production has yet to bring about considerable shifts in the pattern of employment.

Busier Shops

After more than twelve months of slack trading, retailers are enjoying a minor boom. No one seems quite sure what has brought the customers back into the shops, but the value of weekly sales in September of non-food goods was back to the same level as in September, 1950, just before the Korean war set off a buying panic that stripped the shops and the wholesalers' shelves before turning, with equal suddenness, into a buyer's strike that emptied the shops of customers. In September the sales index (1950=100) reached 106 for non-food merchandise, 120 for food alone, and 114 for the combined index. This compares with indices a year ago of 108 for food sales, 10 points higher than in 1950. At that time the value index for sales of other products was only 97, though prices were at their peak. The

index as a whole then stood at 103, only one point lower than in 1950. During the last year, prices of food have risen but prices of other goods have dropped, in some cases sharply: so the September level of sales by value for non-food products indicates a much greater rise by volume.

Sales of food showed no change between August and September, but those of other types of goods rose from 94 to 106, an improvement spread over all types of

product. It has been clear for some weeks that the demand for textiles was improving, and sales of clothing and footwear rose from 91 to 108 between August and September, compared with an increase of 9 points, from 87 to 96, in the same period last year. It was not so certain that sales of other, possibly less essential goods, had shared in this general recovery. But the September returns show a big improvement in furniture sales by big retailers and the independent

shops alike, a revival in sales of floor coverings, which had been one of the most depressed departments, and a surprising jump in sales of hardware, radio and electrical goods. Last year the index for hardware sales by large retailers stood at 109, and for the independent shops at 118. This September the figures are 117 and 121 respectively. Radio and electrical sales by independent retailers, which reached 120 compared with 103 a year ago, show a 20-point increase on the August figure—a tribute to the success of the Radio Show in stimulating interest in an exceptionally slack market. Sales of chemists' goods (which previously had been rising, impervious to the general recession), of jewellery, toys, and leather goods, and sales by tobacconists and restaurants are the only groups showing figures lower than in August; sales of books, stationery, jewellery and tobacconists' goods are also below those for last September.

Figures for retail stocks cover only clothing and shoes, but they do show that in all cases the value of stocks is lower than at the same time last year. The clothing stock index as a whole stands at 99 compared with 122; it has risen only two points since August. "Non-food" stocks as a whole are 18 per cent lower than a year ago; stocks of most kinds of clothing are mostly 30 per cent or more below, and so are stocks of furniture. Food stocks, significantly, show a fall of only 2 per cent. All these indices are complicated by changing levels of price, but it seems that, like the wholesalers, the retailers are holding approximately the same balance of stocks to sales, in terms of value, that they did in 1950; in relation to the rising tempo of consumer demand, they may be understocked. This would suggest that producers in the consumer goods industries, from textiles to saucepans and radio, are likely to experience an expansion in distributors' demand in the coming months.

When Builders Confer

The strongly worded rebuke administered to the London Builders' Conference by the Minister of Works last Friday has surprised but hardly abashed, its members. The objects of this organisation are certainly rather startling. Nearly all the big building contractors are members either of the London group or of regional "conferences" run from the same central office. These conferences have two main purposes. The first is the reimbursement of members for the expense of submitting unsuccessful tenders (which may frequently cost not much short of one-thousandth of the cost of the job). This is a normal business risk that other industrialists accept. The second, and more dubious, purpose is to ensure that the lowest tenderer asks a "fair" price. In practice, both objectives are achieved by the same procedure.

The solidarity of the conference and the success of its operations depend on the willingness of its members to inform the secretary of the price at which they propose to put forward ostensibly "secret" tenders for a contract before that price is actually submitted to the customer, and on their willingness to follow the secretary's subsequent suggestions. As soon as he knows the price of all tenders, the secretary discards the highest one-third of them, and takes an average of the remaining two-thirds. This average is then considered to be the "fair" price for the job. To that price is added a levy out of which the unsuccessful companies will be partially reimbursed for the cost of preparing tenders. The company that prepared the lowest tender is thus assured of getting the contract, but the price he then quotes to the customer is not his original tender price, but the new "fair" price plus levy, worked out in the manner described. All other tenders are raised in proportion, leaving the computed price as in fact the lowest tender submitted to the customer. When the work is paid for, the successful company retains enough to cover his original tender, while the balance is paid to the Conference and shared, presumably, between administrative expenses and payments to other members who

HEAD OF A WARRIOR, a study in red chalk for the cartoon of "The Battle of Anghiari", by Leonardo da Vinci, now in the Museum of Fine Arts, Budapest. Tragically, when the design was transferred to the wall of the Hall of Council, in Florence, the colours ran and the result was a failure. All that now remains of the cartoon itself are a number of studies of fighting men and horses, which were drawn by Leonardo on paper.

If it had not been for the paper on which Leonardo made his preliminary studies in 1504 all record of one of the greatest works of this amazing genius would have been lost to posterity. And it is paper that has enabled this superb study of a head to be seen by millions throughout the world. In the reproduction of great works of art the printer and the paper-maker have combined to bring the masterpieces of the world to those denied an opportunity of visiting the famous art galleries. The spread of culture depends on paper. On it the heritage of the past is constantly renewed, for on paper reprinting can retain knowledge and culture for ever.

Here's the answer to your problem

how to sell in dollar markets

Plan to show YOUR merchandise at the Canadian International Trade Fair in 1953—the Great Dollar Marketplace where, in a few days, you can learn more about the North American market for your product than in a lengthy tour. 22,985 business people from Canada and 1,040 from the United States came to see and buy merchandise exhibited at the 1952 Canadian International Trade Fair. More dollar business was done than at any previous Trade Fair in Toronto.

Get in touch now with your nearest Canadian Trade Representative—in the United Kingdom, write to Miss M. A. Armstrong, Canadian Government Exhibition Commission, Canada House, London.

Brains our common wealth

THE BRITISH COMMONWEALTH is more than a vast area of the world's surface. Our common wealth is also the abundance of technical and inventive genius within that area. BRUSH ABOE are largely concerned with the export of the means whereby the earth may become more fruitful. But to think of export in terms of anything except brains is an anachronism.

It is with the object of encouraging the brains within the Commonwealth that BRUSH ABOE have instituted their Commonwealth Scholarship Scheme. This is planned to provide scholarships for engineering graduates from Australia, Canada, Ceylon, India, Pakistan, New Zealand, Rhodesia, Singapore and South

Africa. Each scholarship is worth about £1,000 and the student receives two years' free training in the factories of the BRUSH ABOE Group. Already arrived in this Country are students from South Africa, India, New Zealand and Pakistan. More are on their way here from various parts of the Commonwealth. And within the Group itself more than 1,000 employees are receiving some form of training. It is by developing the brains within the Commonwealth towards the technical knowledge of what the diesel engine and diesel electric power can contribute to make the earth more fertile that the problem of world food shortages can best be attacked.

tendered unsuccessfully. "Since there is neither entrance fee nor annual subscription, this would appear to be the only way in which the operations of the conference are financed."

The builders have not denied that this machinery exists or that a levy is made to compensate for part of the tendering costs; but they have said that the "fair price" has been applied to less than one in every 500 contracts put out to tender since the war. There is not much evidence, either, to show that prices charged by the members of the conference have been exceptionally high compared with those of non-members. The Ministry of Works usually takes the precaution of getting tenders from non-conference builders as well as conference members but since the member firms include most of the largest and most efficient, this results in little advantage; moreover, the conferences may make special arrangements with non-members. However reasonable prices may appear, the various conferences still do exist, and their quite considerable administrative expenses—if nothing else—do continue to be met without any visible source of income.

What Can Mr Eccles Do?

In his statement in the House of Commons on Friday, Mr Eccles asked the builders to "look very closely again at their arrangements and to end them in the national interest and, I may say, their own." Even if it is true that the London Builders' Conference has not been very active in recent years, the organisation does possess very considerable powers that can make nonsense of the ordinary method of tendering, and must remove the competitive stimulus to efficiency that the tendering system should give to the building industry. But unless the builders themselves agree to disband the London and regional conferences, there is little that Mr Eccles can do to them directly. The Ministry of Works insists that its contractors shall sign an undertaking that they have not revealed the price on their tender to anyone but the Ministry and that the prices are not adjusted by reference to those of any competitor. But the Ministry is responsible for only a small proportion of building contracts placed by public authorities. Most of them are placed by local authorities, and these, with one or two outstanding exceptions, do not appear to have had any qualms about accepting tenders presented by members of the builders' conferences. The Royal Institute of British Architects, however, has suggested more than once that its members should ask for a similar declaration; but there is little evidence that many do. After the declaration, the builders reiterated an offer made previously to the Ministry to abandon the fair price scheme if the Minister agreed to withdrawn what they describe as the "discriminatory" form that tenderers are required to sign. The Minister has, however, already firmly rejected this offer; so, for the time being, there appears to be deadlock with the Ministry of Works. The builders emphasise, however, that they are prepared to suspend the fair price scheme (though not, apparently, the levy) "completely" wherever a contracting authority does not insist upon a declaration that there has been no concerted action in tendering.

It is doubtful whether the Government could induce the local authorities to show the same united front to the builders' conferences that the builders present to them, despite its power over housing policy, which represents the bulk of local authority building. In theory, the obvious course is a formal reference to the Monopolies Commission. Mr Eccles rejected this procedure on Friday because of its slowness, and also, perhaps, because he thought its investigatory procedure might prove ineffectual.

Hot Money Leaves Canada

One of the odder consequences of the Republican victory in the United States elections has been a weakening

of the Canadian dollar. Its premium on the US dollar, which touched 4½ cents in September, has since run off to 1½ cents. In the ten days to last Wednesday, while the spot rate for the United States dollar appreciated in terms of sterling from \$2.80½ to \$2.79½ on the London market, that for the Canadian dollar depreciated from \$2.70½ to \$2.74½; similarly, the forward rate for Canadian dollars in London, which last September stood at 2½ cents premium for three months delivery, and has recently been converted to ½ cent discount, the first occasion on which such a discount has appeared since September, 1951. The main reason for the recent weakening of the Canadian dollar has been the withdrawal of American capital from Canada. Much of the capital that had made its way into Canada during the past eighteen months had been invested on short-term considerations, some of it in search of a quick exchange profit, some looking for the capital appreciation promised by the rapidly developing Canadian economy, and some—or, at least, so market observers allege—propelled from the United States by distrust of the Democratic Administration. This inflow of hot money, which may have gone too far earlier this year, has now reversed itself—although there is very little sign of any reinvestment in the United States, where no Eisenhower boom has yet been unloosed on Wall Street.

These capital movements apart, there is nothing in the balance of payments situation to justify the present weakening of the Canadian dollar. It is true that the winter months between October and March, when the St. Lawrence is frozen, is normally a season of weakness for the Canadian currency. On the other hand, all indications of Canada's external trade in 1952 suggest that this year's exports should equal or exceed the record set up in 1951. Indeed, for the first nine months of this year Canada's visible trade showed a favourable balance of over \$235 million, compared with a deficit of \$324 million in the comparable period of 1951. It is, of course, wholly in keeping with the exchange policy of Canadian authorities to allow the rate to yield to the pressure of capital movements; the Bank of Canada has no intention of giving those who withdraw hot money the advantage of reconverting their Canadian dollars at a high premium, at the expense of the Canadian reserves of gold and US dollars.

Record Steel Output Once More

Steel output last month, in spite of the week's holdup at Margam during a bricklayers' strike, was the highest ever recorded for any October—327,800 ingot tons a week, or an annual rate of 17,044,000 tons. Pig-iron output for the month was 204,200 tons a week. The output of both was slightly below the September figure (329,800 tons of steel and 208,600 tons of iron a week), largely owing to the Margam strike; but it was sharply higher than the 1951 figures for October (300,600 tons of steel and 189,700 tons of iron a week), and higher than the figures for the peak year of 1950. The industry is now entering upon the most productive six weeks of the year; output this month should be higher than October, and it should remain high in December, despite the effect of holidays. It now seems fairly certain that the industry can produce less than 16 million ingot tons for the year, or slightly more.

Imports of steel this year may reach the equivalent of some 2 million ingot tons; and allowing for some rebuilding of stocks, second-hand and re-usable material, and exports, home deliveries should be much larger than in any year since the war. Nevertheless, Government spokesmen in both Houses of Parliament this week remained unwilling to write off the steel shortage. Mr Sandys said that large imports of steel, including some from America, would be necessary next year, and that difficulties still existed in supplies of some types of steel. Lord Swinton, commenting upon the increase in the steel allocation to building in the first quarter—

of next year, said he intended to keep it up for the whole of 1953. If the phrase implies that steel allocation needs to "be kept up" for another twelve months, the Government would appear to be taking a more pessimistic view of supplies than the industry would accept or the obvious prospects seem to support.

Competition and the Commonwealth Bank

The Australian Government is to introduce legislation next February that will effect two important changes in Australia's banking structure. In the first place, the trading department of the Commonwealth Bank—which competes with the commercial banks, in a way that they consider unfair—is to be made a separate legal entity. The department will, however, still be subject to the Bank Board and to the Governor of the Commonwealth Bank; and as privileged information available to the Board and Governor in their capacity as central bankers cannot very easily be denied to them in their capacity as directors of a large trading bank, complaints about "unfair competition" are unlikely to be fully silenced.

The other main feature of the proposed new legislation is a reform of the Special Accounts system. Under this system, which was introduced during the war, a proportion of the assets of each trading bank is segregated in an account that cannot be used as a basis for the expansion of advances. This weapon has proved its adaptability to the Australian climate—in a period of economic fluctuations as violent as the meteorological alternations of drought and flood that Australia has experienced in recent years. It is therefore to be retained, but the amount callable to a bank's Special Account is to be limited to the sum in that account on October 7, 1952 (a total of £A182 million) plus 75 per cent of any increase in a bank's deposits since that date. In addition, the proportion of each bank's deposits remaining callable to Special Accounts is to be limited to 10 per cent, and is to be adjusted to not more than this figure at least once a year. The Commonwealth Bank will be obliged to indicate to the trading banks the changes it expects in deposits and liquid assets, and it is to give them the maximum possible notice of calls to Special Accounts and of releases from them. The Special Accounts system was devised to meet the very special requirements of wartime: the present proposals mark the end of a period during which the accumulations of wartime have been run down, and a situation restored in which more orthodox weapons of central banking are likely to assume at least equal importance. It is unfortunate that, in the peculiar political conditions prevailing in Australia, these welcome—but minor—changes seem likely to become the subject of partisan controversy.

British Oil and the "Cartel"

It was always clear that the anti-trust proceedings brought by the American Administration against 21 major oil concerns for their part in an alleged "world oil

cartel" would give more satisfaction to the critics and enemies of the western world than to anyone else. Judge Kirkland, who is hearing the case in the District Court of Washington, has himself declared that the proceedings could be "the fuseline of a powder keg to set off another war." He has gone some way towards limiting the fantastic number of documents that the Department of Justice had demanded of the companies and has shown himself far from sympathetic to the terms of the department's subpoena. This decision will no doubt disappoint the department's counsel, who had proceeded implacably with their demands and denunciations, and opposed any move that would limit the investigation of documents concerned with the overseas business of the companies, on the ground that they form "the heart of the evidence" in establishing a "criminal conspiracy" among the companies.

The limitation on documents that the Court has ordered need not disappoint the mischief makers in oil producing countries throughout the world, for what remains will give nationalists and fanatics in those countries plenty of opportunity for embarrassing American policy and strategy. They are already seizing their opportunities for fomenting trouble, encouraged by the clear differences between the objectives of the Department of Justice—with a spokesman who can bring himself to declare that world oil arrangements have "developed a danger to national (that is, United States) security"—and the preoccupations of the State and Defence departments in the Middle East and Latin America.

It is eminently satisfactory to learn that the British Government has intervened in this issue so far as the Anglo-Iranian and Shell companies are concerned. The Ministry of Fuel and Power, in a letter to the former company, has forbidden it, on grounds of international comity as well as economic, strategic and political security, to produce to the Washington Court "any documents which are not in the United States and which do not relate to business in the United States, or to give information which does not relate to business in the United States" without the Government's authority. Since the Government is a majority shareholder in the company, and since Anglo-Iranian does no oil business in the United States (though it has an office there) this direction would seem to be quite explicit. A letter in similar terms has gone from the minister to the British companies in the Shell group; there is no Government holding in Shell, and therefore Mr Lloyd's action can be regarded, in both cases, as a political decision. At this Mr Emmeglick, who appears for the Department of Justice, has asserted that these orders are "very regrettable, but not an act of the British Government." It is difficult to know what would satisfy him. The issue of international jurisdiction, to which attention was drawn in these columns when this case started on its fantastic course last August, is now right in the open.

Taking the Air with Fido

The Ministry of Civil Aviation and the two British airlines carried out experiments this week with the wartime fog dispersal installation, Fido, to see whether it could be used for the take-off and landing of civil airliners. The Ministry has one installation in working condition at Manston, which is available for use by civil pilots in extreme emergency; a second one at Blackbushe is being brought on to a care-and-maintenance basis. The installations consist simply of pipes through which a petrol-paraffin mixture is pumped and burnt through nozzles placed at intervals along the pipes. As the Blackbushe installation had to be tested to see that it was still in working condition, it provided a suitable opportunity for making a simultaneous live test with civil aircraft. With the pipes 37 yards away from the run-

way there is no fire risk, and not much to alarm passengers. What was frightening about the test is the cost. Fido burns a thousand gallons of fuel a minute. On the other hand, fog at an international airport delays the airlines' schedules all along the route, and may run up some very heavy hotel bills if the passengers have to be boarded out overnight by the operators.

Until this week's tests, Fido had not been used for take-off. If fog prevents aircraft from leaving the ground on time, the congestion that follows is really serious; those coming in can be diverted to other airports. Using Fido, those same aircraft can, it is believed, continue to take off at the rate of one a minute, if the airlines are prepared to foot the bill for it. In the 18 minutes' test at Blackbushe, four aircraft took off, made one run each across the runway to simulate an over-shot landing, and landed. The Ministry of Civil Aviation has, therefore, proved the feasibility of civil operations with Fido, and would be prepared to put in the installation at the airports under its control provided that each airline will pay for the cost of running the equipment while in use by its own aircraft. The operators may not feel it quite fair that they are penalised for London's bad climate, but London's first-class hotel bills and British Railways' first-class fare from Prestwick, in the long run, may exceed the cost of Fido's fuel at perhaps 3s. to 4s. a gallon.

Gas Consumption Declining

Although less than a quarter of the gas sold in this country is bought by industry, trade recession is bracketed with milder temperatures as the main reason why gas sales, like those of coal and electricity, have failed to maintain their upward trend this year. In the year ended March 31, 1952, upon which the Gas Council and the twelve Area Gas Boards have reported this week, sales appear to have been about 2.1 per cent larger than in the previous year (the accounting periods are not comparable). But since March, from the Ministry of Fuel and Power's periodical statistics of gas made available at gasworks, consumption would appear to have been about 2½ per cent lower than in the comparable seven months of 1951. Regional statistics for gas sales are not generally published, and it is not possible therefore to gauge the course of industrial consumption—which varies from no more than 7.6 per cent of sales in the Southern Board area to 44.9 per cent of sales in the West Midlands. This year has emphasised the importance of detailed fuel consumption statistics, which are published weekly for coal and have recently begun to appear monthly for electricity; published ahead of most other figures, they can give useful pointers to the trend of industrial activity in the country and in the regions. The gas industry might well consider completing this stop-press news published by the fuel industries.

The rising trend of consumption last year gave the gas industry no more than £1,440,916 surplus on a turnover of £261.0 million, after paying £10,118,820 in interest and £1,368,728 for taxation, and placing £500,000 towards a central guarantee fund. Minor items such as "unread gas"—the amount of gas consumed between the last meter reading and the end of the financial year—slightly complicate the accounts, but the cumulative surplus since vesting date now stands at just over £3.4 million, largely in reserves and special provisions for replacement and obsolescence. The Gas Council's central guarantee fund now amounts to about £1.1 million. The industry provided £112.4 million for depreciation. The council admits the importance of rising replacement prices, though it hopes they may turn downward in the future; but until some alteration is made in the Inland Revenue rules concerning special reserves set aside to cover replacement costs, it is not prepared to change the basis of its provision for depreciation from historical costs.

Gas in the Queue

Though the gas industry is not yet claiming to have achieved any recovery in its sagging sales, it seems probable that it will soon have to put its prices up further. Ten of the Area Gas Boards made a surplus last year, and two showed a deficit; but the reserves of the industry are not yet substantial enough to give gas prices any cushion to absorb increases in costs. The most important increase in costs since March has been a wage award that will require about £2 million extra in a full year, which is somewhat larger than the total surplus achieved last year on sales that so far look likely to be larger. The industry is looking anxiously at the application for an increase in railway freight rates, and even at the possibility of rises in miners' wage rates. Coal, and the cost of transport included in coal, is by far its largest item of cost; last year it cost the gas industry £99.1 million out of total operating costs of £151.3 million. The total costs of gas-making amounted to 8.66d. a therm, and after the addition of other charges and the deduction of sales of coke and chemical by-products (valued at some £61 million in all) the total cost per therm sold rises to 12.85d. (about 5 per cent higher than the year before, against a rise of 15 per cent in the price of the carbonisation coals the gas industry buys). The industry is experimenting with other sources of power; it buys some refinery gases and some liquid butane from the oil industry (as well as its normal supplies of gas oil to enrich water gas), and is now considering methane from coal mines and similar "natural gas" from possible deposits in various parts of the country.

Supplies of steel, of which its allocation was fairly sharply restricted this year, have limited capital development; but the industry closed down 47 small gasworks during the year as a result of inter-linking its gasworks by local "grid" schemes. The North-Western Gas Board, which showed a deficit on the year, partly because of an increase in capital charges, is engaged in a particularly large programme of development; it may be 18 months before its re-equipment and re-organisation of gasworks brings considerable results in efficiency and the reduction of costs. The industry as a whole spent about £45 million on capital development last year; its bank overdrafts now stand at about £40 million, and its chairman, Colonel Harold Smith, observed this week that it is already taking "its place in the queue" to raise new money by an issue of stock.

Butter for Margarine

From November 30 the weekly butter ration is to go up from 2 to 3 ounces, but the margarine ration is to come down by an ounce, from 5 to 4 ounces. According to the Minister of Food, who made the announcement, the country cannot at present afford more of both, but must make the choice, because an extra cost in scarce currency would be required to increase both. More than half the butter imported into this country comes from sterling sources. Of total butter imports in 1951, about £90½ million worth, almost £45 million came from New Zealand and about £10 million from other sterling sources. The rest has to be paid for mainly in other European currencies—in 1951 butter imports from Denmark amounted to just over £30 million.

It appears to be the Government's view that any increase in the spending of currencies other than sterling on butter (and possibly cheese) must be offset by a saving on the amounts spent on margarine materials—whale oil and vegetable oils. A margarine ration of 4 ounces involves little dollar expenditure, but a ration above that level involves obtaining raw materials largely from outside the sterling area. The Minister stated that 99 per cent of the present margarine ration is now being taken up; to unration this and cooking fats would involve the purchase of another 225,000 tons of fats and oils annually, costing about £22

LIVING WITH THE DOLLAR

Can the world ride over the dollar shortage towards freer trade? This problem lies squarely before the Commonwealth Prime Ministers' Conference and the new Eisenhower Administration. It will be discussed—and detailed proposals for a way out will be formulated—in a special section of next week's issue of *The Economist*.

million in non-sterling currency, of which £10 million would be in dollars. Almost half of the cheese entering this country, on the other hand, comes from the sterling area (mainly from New Zealand); so the cheese ration can be increased from January 25 next year—by a princely half an ounce per person each week.

The Ministry of Food has been able to arrange some European bacon contracts at slightly lower prices than those prevailing over the past twelve months. The recent contracts with Denmark and Holland were on a basic price of 252s. 6d. per cwt fob, which compares with an average of about 272s. 6d. paid since September last year. In 1951 Britain's bacon imports cost £53,236,000, of which bacon from Denmark cost £35½ million and from Holland almost £8½ million. Imports from sterling countries amounted to only £333,700: so the price reductions on the European contracts constitute a useful saving on the non-sterling cost of bacon imports.

British Oxygen's Issue

A cash issue of new shares by British Oxygen has been in the offing for some time; the directors suggested as long ago as last June that "the progress of capital development already authorised and in contemplation" might make the raising of additional capital necessary. The company has now decided to raise just under £3,750,000 by a "rights" offer of 1,873,315 new £1 ordinary shares at 40s. each (which compares with a current market price of 49s. 4½d. for the existing shares). Ordinary stockholders are being offered these new shares in the ratio of three new shares for every £10 of stock held, together with a right to apply for any "excess" shares. The new shares will rank for any final dividend that may be declared for the year ending on December 31st.

As a result of this operation and of the bonus issue last June, there will be £8,117,698 in equity capital ranking for the final dividend for 1952, compared with £4,162,922 at the end of last December. At the time of the bonus issue the directors stated that "it should not be assumed that the 20 per cent rate of dividend which has been paid for several years will be maintained on the increased share capital." The least sanguine interpretation that could be made of this statement was that the interim dividend rate might be scaled down from 8 to 5½ per cent and the final dividend rate from 12 to 8 per cent. But, in fact, British Oxygen declared an interim ordinary dividend for 1952 of 6 per cent last September. This has thrown estimates of the final dividend into the melting pot; at the worst it seems that the final dividend might be declared at a rate of 7½ per cent and at the best of 9 per cent. The prospectus should solve this riddle, but even on the most gloomy view of a total dividend at 13½ per cent the new shares at 40s. each would offer the attractive yield of 6½ per cent.

Costs in the Copper Belt

The publication of the full accounts of Roan Antelope and Mufulira coincided with the welcome news of the end of the three weeks' strike in the Rhodesian copper belt. Negotiations on the wage dispute have now been recommenced; they may take some time to complete, but in the end a fairly substantial increase in wages—though not of the order of 2s. 8d. a day originally demanded by the unions—seems inevitable. As yet, the increase in costs has lagged well behind the rise in copper prices; the average price of blister copper sold by Roan Antelope in the year to June 30th, for example, rose by £29 15s. a long ton to £205 18s (fob Beira), but average costs a long ton increased by only £9 8s. to £90 17s. This, together with an increase in blister copper production, led to a further advance (from

£5.9 to £8.5 million) in profits earned by Roan Antelope. Mufulira is a "wetter" mine than Roan Antelope, and its output was therefore affected more seriously by last year's shortage—or threatened shortage—of fuel; the increase in its profits was consequently limited to about £400,000 (to nearly £8.2 million). The chairman of both companies, Mr R. L. Prain, declared in his statement that costs in the current year will probably continue to rise; the strike has turned this probability into certainty. Capital costs are also increasing; originally the cost of the new electrolytic refinery now under construction by Mufulira was put at £3 million, but this estimate has recently been revised to £4 million.

The recent report of the Paley Committee in the United States suggests that the long term prospect for the demand for copper is bright. But in the short term the increase in costs threatens to squeeze profits significantly. And, as far as investors in the Rhodesian Selection Trust group of copper companies are concerned, the important question whether the companies will be given permission to transfer their domicile to Rhodesia remains unanswered—although the Treasury will clearly have to make some statement soon. With the ending of the strike one cloud has been lifted from the copper belt, but others may be piling up on its horizon.

Laid-up Shipping and Freights

Freight rates are still hovering near the line below which it becomes advisable to lay up tramp ships, as is demonstrated by the increase shown in the latest returns of shipping laid up in United Kingdom ports. On October 1, according to the Chamber of Shipping, there were 65 British ships, totalling 207,042 tons gross, laid up in UK ports for reasons other than repairs. This is an increase of 45 ships, totalling 170,412 tons gross, in the three months since July 1, when the figure was 20 ships, totalling only 36,630 tons gross; in October last year only 27 ships, of 43,904 tons gross, were laid up. The number and tonnage of foreign ships laid up in UK ports have also increased markedly, from only three ships (4,444 tons) on July 1 to 18 ships (83,351 tons) on October 1 against two ships of 985 tons a year before. It was in June that the Chamber of Shipping index of tramp freight rates fell below the 100 mark after a long period in the clouds, and by August it had declined to 79.2. It can be deduced, therefore, that this was the level at which a number of British and foreign owners decided that laying up had become cheaper than carrying cargoes at a loss. Returns of ships laid up, of course, give only a partial picture: they do not take into account British or foreign ships laid up abroad, nor can they indicate how many vessels on the particular date were working their way home in ballast or with uneconomical cargoes in order to lay up.

But the turn of the market since August may have caused some owners to reconsider laying up ships. The index for October worked out at 94.2; this improvement appears subsequently to have been fairly well maintained, and some reduction in operating costs has also been achieved as a result of the fall in oil bunker prices. On the other hand, the margin of profit at the present time is probably not very great, and the prospects of employment for inefficient ships cannot be considered to be firm, particularly since 50 per cent of the dollar aid cargoes are being reserved for American ships at artificial rates. Nevertheless, the volume of tramp tonnage on offer is rapidly diminishing, since the prolonged decline in freight rates has sent many ships to the breakers and few new ones are being completed. It is possible, perhaps, that the removal of tonnage through scrapping and laying up (not to mention the return of some 500 American Liberty ships to the mothball fleet) has contributed in some measure to the recent improvement in the freight market. If so, any marked increase in world seaborne trade might reveal once more a deficiency of tonnage that could not easily be made up from the ships that are laid up outside America today.

Company Notes

Standard Motor.—The post-war boom in the British motor industry came to an end this year and short-time working is now the rule rather than the exception. All the leading manufacturers have suffered from keener competition by foreign manufacturers in markets where consumers' resistance is growing, and from import restrictions in the Commonwealth. Of those that have recently published preliminary statements, Standard Motor appears to have fared the worst. Its trading profits fell sharply from £3,918,085 to £3,041,443 in the year to August 31st. Thanks partly to the need to set aside £135,000 for EPL, the total provision for taxation has remained almost unchanged, at £1,205,000, in spite of this decline in gross earnings. By declaring an ordinary dividend of 12 per cent the directors of Standard Motor have, in effect, recommended the same equity payment as in 1950-51—once account is taken of last year's 250 per cent scrip bonus. As shareholders are to receive the same slice from a smaller cake, however, the directors have only been able to plough back £72,599 (against £395,037) into the business. The margin of net earnings to ordinary dividends now appears to be uncomfortably low.

One of the gloomiest portents for the future is the fact that the company has recently had to reduce its production of tractors. Tractor

production should return to a more normal level in the New Year, but shareholders, who will be aware of the contribution that the production of tractors made to profits last year, will realise that even a temporary dislocation in tractor production can have a serious effect upon earnings.

British Motor and Rootes Motors.—The preliminary statements issued by British Motor—the product of the Austin-Morris merger—and by Rootes Motors have a more encouraging tale to tell than the statement issued by Standard Motor. But shareholders will note that the accounting periods of these two groups ended on July 31st, a month earlier than the end of Standard Motor's financial year. They will also remember—indeed the rest of the motor industry, and potential consumers, remember only too well—the speech recently made by Mr Lord, which drew attention to the deterioration in trading conditions that has taken place in the last few months. The trading results of British Motor and of Rootes Motors must therefore be interpreted as an accounting for the past and not as an indication of present or future trends. In the first four months of its existence the British Motor group earned a profit of £5,804,002, of which £3,239,345 had to be set aside for taxation; although a precise comparison between these figures and the earnings of Morris and Austin before the amalgamation is impossible, it seems clear that earnings were being well maintained until the end of July. Similarly, profits earned by the Rootes group in the year to July 31st were only very slightly lower (at £3,425,697) than the profits of £3,473,873 reported in the previous financial year. But, in common with British Motor, the Rootes group had a heavy tax bill to meet; in fact, the provision for taxation increased—thanks presumably to the group's EPL liability—from £2,069,925 to £2,270,118, so that the

net balance after tax fell from £1,403,948 to £1,155,579.

Now that the "cold wind," to which the chairman of Rootes referred a year ago, is whistling around the ears of the motor manufacturers, the industry's dividend disbursements are likely to be conservative, at best. When the Austin-Morris merger was announced, the directors of British Motor declared that it should be possible to pay a dividend at an annual rate of not less than 52 per cent; a dividend payment for the first third of the company's first year (the four months to July 31st) has accordingly been recommended at precisely 17½ per cent. Similarly, the ordinary dividend of Rootes Motors has again been maintained at 32½ per cent. On the basis of a 52 per cent dividend the 5s. ordinary shares in British Motor at the current price of 28s. 6d. yield 9.1 per cent; the 4s. ordinary shares in Rootes Motors at the current price of 16s. 3d. yield 8 per cent.

Ind Coope and Allsopp.—Traditionally, the brewing year ends on September 30th, and for the first time since the end of the war the brewers have been able to announce that in this period there has been a slight increase in beer production. It is against this background—and against a background of higher prices and some working economies in the industry—that Ind Coope has been able to report an increase in group trading profits, from £2,582,677 to £2,703,217, in the year to August 31st last. Sales of draught beer in Ind Coope's "tied houses"—the company has more of these than any other brewer—have probably been well maintained, but it is to an increase in the sales of bottled beers, particularly of the heavier gravity beers, that

	Years to Aug. 31, 1951	1952
Consolidated earnings:		
Trading profit.....	2,582,677	2,703,217

Capital reserve.....	174,000	175,000
Reserves.....	416,558	278,469
Added to group carry forward.....	17,819	1,233

the expansion in earnings can be attributed. Ind Coope sells its bottled beers on a national scale, in "free houses," off-licences, and "tied houses" owned by other brewers, but competition in this market is growing—and will certainly continue to grow—keener. Ind Coope, for example, has not only to face competition from three other "national" breweries selling bottled beers throughout the country, but also competition from the smaller local breweries that are now paying a great deal of attention to the sales of their own bottled beers.

An interest in the bottled beer trade does not therefore necessarily mean that further increases in profits are going to be easy; and, in any case, such increases as are attained go mostly to the tax collector. The increase in Ind Coope's taxation provision last year (from £1,083,290 to £1,192,137) limited the increase in its net profits to a mere £4,254, so that the directors, by declaring a dividend of 12 per cent, could only in effect recommend the same distribution on ordinary capital as was made the year before. The season of brewing results has started well with the announcement of increased profits from Benskin's Watford Brewery and from Mitchells and Butlers as well as from Ind Coope. But in all three cases the companies have been merely content to maintain their ordinary dividends; this is all investors should expect when other breweries announce their results.

EXCHEQUER RETURNS

For the week ended November 8, 1952, total ordinary revenue was £88,303,000, against ordinary expenditure of £54,975,000 and issues to sinking funds £787,000. Thus, including sinking fund allocations of £19,800,000 the deficit accrued since April 1, 1952, was £320,385,000 compared with a deficit of £53,825,000 for the corresponding period of the previous year.

BRITISH CELANESE LIMITED

MR G. H. WHIGHAM'S STATEMENT

The thirty-third annual general meeting of British Celanese Limited was held on November 11th in the Great Hall, Winchester House, Old Broad Street, London, E.C., Mr G. H. Whigham (chairman) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended June 28, 1952.

The net profit before taxation has fallen far short of the record levels of the last two years, earnings for the second half of the year being drastically affected by the severe recession in the textile and plastic industries. It will be seen from the consolidated balance sheet that the reserves have increased from £5,330,646 to £8,456,520. Of the increase £2,951,899 was attributable to share premium account following the issue of ordinary shares in November, 1951.

The net expenditure during the year on buildings, plant, machinery and equipment was £1,772,000. Current assets less current liabilities (including future taxation) increased by £3,389,114. Despite the special stock write-down referred to in the report, there is a substantial increase in the value of stocks, mainly attributable to the larger volume held. Raw material stocks are higher than normal in relation to current activity, owing to the rapid development of the recession, but are gradually being reduced. Product stocks are being reduced more rapidly and will shortly be at a satisfactory level.

Since the end of the war, fixed assets and working capital of the group, after providing for future taxation, have increased by £10,621,791, of which £6,264,601 has been provided out of the proceeds of the issue of shares, the balance having been provided out of the company's resources.

The amount of funding certificates outstanding, as shown in the balance sheet, was £382,939 and you will see from the accounts that £131,125 has been set aside out of the year's profits for the further redemption of certificates under the conditions of issue and, when applied, will reduce the certificates outstanding to the amount of approximately £258,000 out of the original issue of £1,700,000. During the year £76,020 of debenture stock was redeemed.

TAXATION AND DIVIDENDS

Out of the net profit for the year of £2,546,233, taxation requirements amount to £1,612,611. Successive Governments come into office, but in my view none, in spite of the submissions made to them by the most responsible representatives of industry, has really tackled the problem of how to ensure that industrial companies shall be allowed to retain enough profits to keep their plants up to date, either by means of larger allowances for depreciation on a replacement basis instead of a historical basis, or by reducing the rate of direct taxation. In the course of time all companies consume their fixed assets in their business and many today are not left with sufficient funds out of taxed profits to replace what they consume.

In a company with a capital structure such as ours one glaring unfairness to the ordinary stockholder, who really puts up the risk money, is the fact that the gross amount distributed on preference stock is subject to a distributed profits tax at the rate of 22½ per cent, or 20 per cent more than the tax of 2½ per cent on undistributed profits. Thus

the existence of preference stock now involves not only the payment of fixed dividends, but also the distributed profits tax on such dividends in priority to any payment of dividend on the ordinary stock.

On the basis of the 20 per cent differential in the tax on distributed profits, the fixed dividends on the two classes of our preference stock involve the payment of £112,750 per annum for such tax, which amount would ordinarily be available for distribution as dividend to ordinary stockholders, equivalent to approximately 6 per cent on the increased issued ordinary capital. This profits tax on distributed profits is, I submit, inherently unsound and might have the effect of causing the fresh capital required by industry to be raised by way of loan capital, which cannot be in the best interests of stockholders or of the national economy. The incidence of the distributed profits tax levied on the fixed preference dividends could conceivably result in no profits being available for dividend on the ordinary stock in years which would otherwise permit of modest distributions.

TRADING

In my speech last year I reported that our chief problems had been concerned with production rather than sales; indeed, for many years our difficulty has been to produce enough goods to supply the demand. The first signs of a slackening in demand for the products of your company were appearing towards the end of 1951, and the second half of the year under review has found us facing a recession in trade for the first time since before the war.

It was particularly unfortunate that a sudden and serious decline in the demand from the home market coincided with an even sharper and unforeseeable drop in exports. Not only were we unable to export our yarn and fabric, but the export trade of our yarn customers in this country suffered in the same degree. The heaviest of these blows has been the virtual closing of the Australian market since March, 1952.

Other countries, while not imposing a ban on imports, have set up such a high tariff barrier that it has now become very difficult to sell our goods at prices attractive enough for the market. This tendency on the part of countries to become self-contained will, if continued, have serious repercussions on international trade.

The producers of foodstuffs surplus to their own requirements must take payment in manufactured goods for the produce which they export to those countries which cannot entirely feed themselves. This is particularly so in the case of the USA, and although it would be entirely contradictory to her long-established economic policy, she must make it possible for more manufactured goods to enter her territory if she hopes to maintain a commercial export trade not bolstered by loans and grants, or indeed if she hopes to have the loans she has already made, and may make, serviced and repaid in due course.

PRICES OF RAW MATERIALS

The supply of raw materials during the year under review has been easier than during the previous year, but prices remained very high until recent months. A company such as yours must always carry such adequate supplies of raw materials as will guard against a sudden stoppage of supply. This means that, when prices fall, the raw materials

being currently consumed have been bought at more than replacement costs.

These are the conditions which obtained during the latter part of the year under review, mainly as regards cotton linters and wood pulp. On this account your board decided to write down the value of the cellulose stocks, as will be noted from the report.

PLANT EXPANSION AND MODERNISATION

The board have continued their policy of plant expansion and modernisation, and during the year further substantial expenditure has been approved. As a result, our factories are today in a far better position to meet existing adverse conditions as well as any future competition.

As regards the proposed plant at Wrexham, the construction of the buildings for the first unit is proceeding but, pending clarification of the immediate business outlook, contracts have not been placed for the plant. The new factories at Wigan, Jarrow and Blyth have operated satisfactorily, although production was reduced during the second half of the financial year due to the state of trade. It is now being stepped up again as business improves.

RIVER POLLUTION

The problem of increasing the purity of the country's rivers has lately been made the subject of increasing public interest and of recent legislation. The result has been the imposition of added responsibilities upon industrial undertakings. In March, 1952, an injunction was granted against the company to restrain it from polluting the River Derwent by discharging trade effluent and heated cooling water from our Spondon factory. In the same proceedings injunctions were granted against the Derby Corporation and the British Electricity Authority.

We have always maintained an effluent treatment plant at Spondon. Realising, however, that increased activities there necessitated further measures being taken, we approached the local sewage authority, prior to the writ being issued, with a view to their taking and treating our trade effluent. Our negotiations with the local sewage authority are still continuing and meantime the operation of the injunction against us has been suspended for two years.

We are taking active steps to deal with the whole problem and, although the period of suspension is not expected to be of sufficient duration to enable the problem to be completely solved, considerable progress is expected to be made. The expense involved in these remedial measures cannot be forecast with accuracy at present. With a factory the size of that at Spondon the best measures to meet the situation are bound to require considerable investigation and to be not inconsiderable in size and scope.

RESEARCH AND DEVELOPMENT

The successful conduct of a business in synthetic fibres requires making provision for expansion by expenditure on research and development. To remain satisfied with one's achievements means to lose ground. Even apparently well-established processes need careful periodical re-examination in the light of new knowledge, the availability of new chemical engineering materials and methods, or change in the relative merits of raw materials.

For this reason, you hear from me year by year that we have continued work on both short and long-term projects and each year brings us to the satisfactory conclusion of items in our research programme which, as they pass to the development stage, are succeeded by other new and promising ventures.

Poor trading conditions indeed only serve to bring about a greater sense of urgency in the application of already made discoveries, but the exploitation of items already proved feasible in the laboratories, workshops and pilot plants requires substantial capital, and the provision of capital is, of course, rendered more and more difficult as a result of the high rate of present-day taxation. The selection of suitable new processes for development is indeed a matter requiring accurate judgment, and one of the guiding principles in our expansion is that of developing new manufactures within the fields of textiles, plastics and chemicals which make use of skilled techniques and equipment available within the organisation.

CURRENT TRADING

The world-wide textile recession followed a period of very heavy buying started mainly by the Korean war and the fear that the rearmament programme in the various countries might lead to a textile shortage. There are, however, definite signs of improvement, particularly in the home trade and in the yarn export trade. Accumulated stocks are being worked off and idle machinery is gradually being brought back into commission. The improvement does not yet affect every section of the trade and the increase in production is bound to be slow because of the loss of labour which has inevitably occurred, so that it will be some considerable time before the effects of the recession on production and on profits are fully overcome.

I am sure you will appreciate that, under these conditions, your board cannot forecast the future level of profits or dividends. I shall be able to give you more up-to-date information regarding the state of business at the annual meeting to be held on November 11th next.

The production of rayon and acetate yarns is a continuous process and the problem regarding temporary stoppage of plant is a more serious one than that experienced by other textile industries. The reduction in our labour force occurred at a time when there was a heavy demand for labour by other industries, particularly engineering and mining. For this reason, as business improved, it has been necessary to replace a number of the skilled operatives who left us by those less experienced, and it will naturally be some little time before the new entrants reach the normal standards of efficiency.

FUTURE OUTLOOK

It is reassuring to observe how the acceptability of man-made fibres increases daily and how far-reaching their applications are becoming. The outlook for them is also improved by the widening range and varying sources of raw materials available for their production, thus overcoming the possibility of being unable to meet demands as their fields of usefulness extended. Acetate yarn maintains its position in these developments and I am still full of confidence in its future.

For some years the Government has been considering the possibility of increasing the use of man-made fibres in Service departments and branches of the public service. Recently, as a result of representations by the industry, existing textile specifications for articles in these spheres have been examined, and an appreciably larger proportion of these fibres,

including acetate, are now being introduced into many articles.

We must expect, in course of time, increasing competition from countries which have cheaper labour or which have in their own territories abundant supplies of raw materials. This, however, only spurs us on to increase further our efficiency in production and especially to accelerate development work so as to enable us to keep abreast of the times.

If the British rayon industry is to obtain its share of the export trade, it must be competitive. Increased wage rates without a corresponding increase in productivity would make this much more difficult. Yarn prices in the rayon industry have been the most stable of any textile yarn, and the maintenance of this stability will be considerably helped by the exercise of understanding and common sense on the wage question.

CHANGE OF ACCOUNTING PERIOD

Your directors have had under consideration for some time the question of changing the company's financial year to terminate at the end of March. Such a change would correlate the company's year to the Government's fiscal year, which would be more convenient from all points of view. At present, as the company's year closes on or about June 30th, the precise rates of taxation in relation to profit for the period covered by the accounts are not known, since the Budget proposals are not normally submitted to Parliament until the following April. This necessarily involves an estimation of taxation liability based on rates which may subsequently be subject to alteration in later Budget proposals and any such alteration would involve adjustment in the succeeding year's accounts.

On the other hand, with the company's financial year terminating at the end of March to coincide with the Government's fiscal year, the Budget proposals placed before Parliament in respect of taxation relative to the period covered by the company's accounts would be known prior to the completion of such accounts and their effect would accordingly be incorporated therein.

While it is unlikely that such a change would affect other than to a minor extent the amount of tax actually payable, the large sums which, under current practice, the company sets aside to meet estimated future taxation payments would be reduced.

In the opinion of your board, it is important, in view of the high rates of taxation on company profits, that the effect of the Budget proposals governing the taxation on profits disclosed in the company's published accounts should be known and incorporated in such accounts before presentation to the stockholders, and accordingly the board have decided that the next balance sheet to be issued shall be as at the end of March, 1953, and the profit and loss account annexed thereto will therefore cover a trading period of nine months only.

EPL STANDARD

From a preliminary examination of the Finance Act, 1952, it would appear that no liability on the company is likely to arise in respect of the new excess profits levy unless profits are earned in excess of those disclosed in the 1949-50 accounts.

PERSONNEL

I mentioned in my statement last year that it was the board's intention to set up a fund, the primary object of which would be the payment of pensions to long-service works employees, and that a scheme had been submitted to Inland Revenue for approval. The scheme was duly approved and the fund, to be administered by trustees appointed by the

board, has been established under a trust deed.

In common with the greater part of the textile industry, we were compelled by the trade recession to lose the services of many skilled and valued workers of long standing. Some of these have already been re-engaged, and we hope that, as trade improves, many more will be able to return to employment with us. Those who do so will not lose, on account of the interruption in their period of service, any of the benefits for which such service may otherwise have qualified them.

In the difficulties created by adjustments to production the heavy calls upon the staff have been responded to with their customary loyalty. As regards conditions of service, we endeavour to keep abreast of modern ideas and to effect improvements. These help not only to maintain a high efficiency, but enable the staff to equip themselves for opportunities for promotion within the organisation. It is most encouraging to observe that, in making awards of scholarships for higher education under our scheme, there is no dearth of suitably qualified candidates for university entrance from the families of our own staff and workers.

As regards wage rates, it cannot be denied, and yet seems insufficiently appreciated, that the situation regarding the balance of payments is critical, and unemployment in Great Britain generally, but more particularly in the textile trade, would be made much more serious should we price ourselves out of world, and especially dollar, markets.

The co-operation and understanding shown by the workers and their representatives was of very material help to us when it unfortunately became necessary to stand off some workers, to put others on short time or to transfer others out of their usual departments to other work, and I take this opportunity of thanking all for their loyalty and hard work during the past year. The board are keenly aware what the efforts of the employees have meant in all the company's different activities throughout this difficult period.

The chairman said:

Ladies and gentlemen—I regret that Dr Camille Dreyfus, who is in America, and Mr Hill-Wood, who is returning from a visit to America, are unable to be present. I propose with your agreement that the report and accounts, and my statement circulated therewith, be considered as read.

As promised in my statement accompanying the report and accounts, I now give you some further up-to-date information regarding the state of business.

During the first quarter of the current financial period the position has improved and we made a small profit in spite of the fact that July and August were difficult months owing to holidays and the influx of new labour. Production is steadily increasing following improved demand, and costs are being progressively reduced. The immediate trade prospects are that the increasing output of yarn will be fully disposed of and that consequently earnings will steadily increase but I am not in a position to forecast at this time the final results for the current financial period to the end of March next.

For the benefit of our workers at our various factories, who are equally interested with our shareholders in the business outlook of the company and who showed such co-operation and understanding when unfortunately it became necessary to stand off so many of them, I would like to say that the board see no reason why full time working for our present labour force should not continue. In fact, a return to full output in all our factories would mean the engagement of additional labour.

The report and accounts were approved.

BENNIS COMBUSTION, LIMITED

A SUCCESSFUL YEAR

The seventeenth annual general meeting of this company was held on November 7th in Manchester, Mr Thomas Hough (chairman and managing director) presiding.

The following is an extract from his circulated statement for the year ended April 30, 1952:

Despite the great difficulty in securing all the materials and labour we would wish, we have come through the year successfully. The order books are still very satisfactory and the outstanding orders should keep our workshops busy for some considerable time ahead.

In addition to the British Electricity Authority's contract for the Huddersfield generating station, we have been allocated a further generating station contract for the Midlands, for completion in 1956. We are still engaged on work for the gas industry and the National Coal Board as well as for industry generally.

Again, an appreciable amount of time and labour has been expended in furthering the development of our new machines, which are now well launched on the market. Sales of both our "Aries" Coking Stoker and the travelling Chain Grate for internally fired boilers are satisfactorily increasing, and the demand for "Bennis" products.

The provision for taxation amounts to £32,500, and, after deducting this we are left with a net profit of £30,545, which compares with £24,772 for the previous year. A final dividend of 5 per cent, making 10 per cent for the year is recommended.

The report was adopted.

HAROLD WESLEY LIMITED

(Manufacturers of Paper Products)

The sixth annual ordinary general meeting was held on November 6th in London, Mr Percy Day-Winter (chairman and managing director) presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended June 30, 1952:

During the first months of 1952, the prices of paper and paper board were reduced very sharply. The price reductions resulted in depreciation of stocks of raw materials amounting to £38,194, which your directors decided should be written off against the profit for the year under review. This special writedown is shown in the accounts as a separate item and the stock depreciation reserve of £20,000 created last year has been retained intact, in view of the probability of further reduction in price levels.

The high price of paper and delayed deliveries led traders generally to expect a shortage of supplies. In consequence it is reasonable to say that all sections of the paper trade placed orders and received deliveries far in excess of their immediate requirements, so that with the first break in the price of raw materials, buyers restricted ordering, using their stocks to bring them to within reasonable limits. This factor caused a recession in trade and a reduction in sales for the last six months of the year. However, I am pleased to report that at the date of dictating this statement, your company has, for some weeks, been in full production. Your company's subsidiary, Wesley and Clark Engineering Company Limited, is working fully and has had a very satisfactory year.

The report was adopted and a final dividend of 13 per cent, making 22 per cent for the year, was approved.

ROAN ANTELOPE COPPER MINES LIMITED

The following is an abridgment of the statement, dated October 7th, by the chairman, Mr R. L. Prain, OBE, circulated to members.

RESULTS FOR THE YEAR

The year to June 30, 1952, was a record one from the point of view of both the tonnage of ore hoisted (4,368,000) and of blister copper produced (81,027). The rate of hoisting towards the end of the year was running at about 5 million tons per annum, which makes Roan at present the largest underground copper mining operation in the British Empire.

The average selling price received for our copper increased from £176 3s. 7d. in the last financial year to £205 18s. 1d. per long ton blister copper f.o.b. Beira in the year under review. The gross profit before taxes and reserves amounted to £9,531,681. Of this, £1 million was transferred to the replacements and obsolescence reserve and £450,000 to general reserve. Taxes absorbed £5,888,767, equivalent to about 62 per cent of the gross profit. The board recommends a final dividend of 1s. 7½d., making the total dividend for the year 2s. 3d. per unit of stock or share.

After referring to the company's participation in the prospecting of new areas in Northern Rhodesia, the problem of fuel supplies and the negotiations which had taken place for the supply of power to the Copper belt from a hydro-electric station to be constructed in the Belgian Congo by the Union Minière du Haut-Katanga, Mr Prain continued:

LABOUR

Following a claim by the Salaried Staff Association for a 15 per cent general increase and the adjustment of certain anomalies, increases in the salary schedules have been made without, however, any overall flat increase. Two other wage claims, those of the Northern Rhodesia Mine Workers' Union and of the Northern Rhodesia African Mine Workers' Trade Union, are at the time of writing under discussion or negotiation, so it would not be proper for me to comment on them. In any case, we hope they will have been settled by the time you read this. I must content myself with the general observation that the total remuneration accruing to our employees under the various headings is high by any comparable standards. All employees share in the prosperity of the industry through cash bonus schemes which are related to profits, and all enjoy cost-of-living allowances which vary according to an official price index.

Employee relations, in any industry, must be one of management's first concerns. We have tried to make them so in our industry and not, I think, entirely without success. We are now finding what other industries have found, namely, that these relations can become more difficult in times of prosperity. The apparently large gross profits of the copper mining companies are bound to attract the attention of employees. I must emphasise what so many other chairmen today are emphasising, that the word "profit" is often misleading. For an industry to maintain its productive power and efficiency year after year requires the provision of very large sums which have to be ploughed back into the business. These cannot be charged to working costs and have to come out of the apparent profits, whereas,

in fact, they are nothing but an additional operating cost, which under a more enlightened accounting system would show an increase in cost and a correspondingly smaller so-called profit. It is almost a certainty to say that circumstances leading to higher copper prices will also lead to higher costs of equipment, materials and supplies which we have to purchase to keep the business going year after year by means of replacements and new capital ventures.

Mr Prain referred to the copper price and to certain tax legislation introduced during the year in Northern Rhodesia and the United Kingdom. He continued:

DOMICILE

In my last two statements I have dealt at some length with the question of domicile. In the statement I made last January I stated that events were now moving towards a shift in the centre of political gravity for Northern Rhodesia affairs from the United Kingdom to Rhodesia. As a result of the discussions on the subject of the federation of the two Rhodesias and Nyasaland, and of the political developments both to the south and to the north of Rhodesia, the tempo in this matter has increased rapidly. Your board, which has been watching the position closely in recent years, decided in May that the time had arrived to carry out the transfer of residence which had been under consideration for so long. Under the existing United Kingdom laws it is, as you know, now necessary to obtain permission for such a transfer and on May 23rd application was made to HM Treasury for permission to transfer residence to Northern Rhodesia. This decision was thus the logical outcome of the board's previous views on the matter, and will have come as no surprise to members.

There is much I could say on this subject, but since the matter is now *sub judice* it would be improper for me to do so. We expect to receive a decision in the near future and that will be the proper time to make any comments.

FEDERATION

We are naturally closely concerned with the question of the possible federation of the Rhodesias and Nyasaland. The talks on this matter have now gone so far that it would be dangerous if finality should not be reached. A successful completion of federation would re-create conditions where investors could be confident about further investments in the Rhodesias. Without such investment it is not only difficult to see how some existing enterprises can be carried on but also a great opportunity will have been missed of opening up these potentially rich territories for the benefit of the Commonwealth and free nations as a whole.

While the copper companies have not taken any direct part in this question of federation, it is interesting to reflect that their enterprise in developing the mines of Northern Rhodesia has perhaps been the outstanding factor making this development possible. Without the copper revenues of today, Northern Rhodesia would have little to contribute towards a joint federal enterprise with its southern neighbour. The companies can take a pride in their contribution to this great imperial development, the outcome of which they will watch with the greatest interest and sympathy.

MUFULIRA COPPER MINES LIMITED

The following is an abridgment of the statement, dated October 7th, by the chairman, Mr R. L. Prain, OBE, circulated to members.

FINANCIAL RESULTS

Despite the lower output and the higher cost per ton, the increased price received for our product resulted in a record year financially. The average selling price received for our copper increased from £174 18s. 1d. in the last financial year to £205 18s. 6d. per long ton blister copper f.o.b. Beira in the year to 30th June, 1952. The gross profit before taxes and reserves amounted to £9,269,743. Of this, £1 million was transferred to the replacements reserve and £1,250,000 to general reserve. Taxes absorbed £5,651,927, equivalent to about 61 per cent of the gross profit. The board recommends a final dividend of 5s. 3d., making the total dividend for the year the same as last year, namely 8s. 3d. per share.

Mr Prain referred to the company's participation in the prospecting of new areas in Northern Rhodesia, the problem of fuel supplies and the negotiations which had taken place for the supply of power to the Copper belt from a hydro-electric station to be constructed in the Belgian Congo by the Union Minière du Haut-Katanga.

CHIBULUMA

Construction and development has begun at the property and is satisfactory. So far all expenditures have been found out of the capital already subscribed and no calls have yet been made for United States Government funds under the agreement with the Economic Co-operation Administration.

It is probable, in view of the big general increase in costs and prices in the last eighteen months, that the total cost of Chibuluma may exceed the original estimate. This matter is now under review, but it will be difficult to make a final estimate until more is known about the mill to be constructed at Chibuluma, which will depend to a large extent upon the metallurgical treatment that is finally decided upon for the Chibuluma ore. Tests are now being made on this ore.

After a reference to claims for increased wages submitted by the three employee organisations on the Copperbelt, and to the general question of employee relations, Mr Prain stated:

COPPER PRICE

The company has continued to sell its available output of blister copper to the Ministry of Materials throughout the year. For the first eleven months of the year the price was based on the f.a.s. New York export price for electrolytic copper, as reported by the *Engineering and Mining Journal*, which has been considered as representative of the world price. This remained stable at 27½ cents per pound throughout that period. At the end of May, however, the agreement which previously existed between Chile and the United States for the sale of Chilean copper in the American market was terminated and, as a result, the New York price immediately increased. For the month of June the average quotation was approximately 34½ cents per pound, but it was not until the price of Chilean copper considered that the price of Chilean copper resulting from the breakdown of the agreement was fully representative of world market conditions. A period of instability was thus introduced, and at the request of the

FAIREY AVIATION

FACTORIES BUSILY ENGAGED

The twenty-fourth annual general meeting of the Fairey Aviation Company, Limited, was held on November 13th in London.

Sir Richard Fairey, MBE, Hon. FRAeS (chairman and managing director), said that the available net profit of the group was £382,994 compared with £404,493 last year. While the consolidated trading profits were higher this year, that increase was more than offset by the considerably higher provision required for taxation. After the deduction of profits retained by subsidiary companies, the net profit was £258,633. The board recommended a dividend of 2s. 6d. per share, less income tax, the same as for last year.

Their factories were busily engaged in the production of their new naval anti-submarine type, the "Gannet," which was on the Government super-priority list, and of the well-established "Firefly," deliveries of which would taper off in due course as the "Gannet" took over.

Their aircraft subsidiaries in Canada, Australia and Belgium had all had a good year and were between them making a substantial contribution to the consolidated profit and loss account. Their non-aircraft subsidiaries had during the year improved their position and contributed to the company's profit. Their guided weapon activities had ever-increasing importance.

Their various plants at home and overseas were working at high pressure and they had good orders in hand. They had not yet reached peak output and, in common with the rest of the aircraft industry, they could absorb more labour as it became available.

The report was adopted.

ABERFOYLE PLANTATIONS LIMITED

The eighteenth annual general meeting of Aberfoyle Plantations Limited was held on November 7th in London, Mr P. J. Burgess (the chairman) presiding.

The following are extracts from his circulated statement:

Throughout the operating period covered by the accounts rubber prices were falling.

We have to meet intense opposition by labour to reduction of rates, to compensate for the reduced value of the rubber for which the inflated wages are paid. We are in consequence facing now a period of depression, and profits are diminishing.

We show a substantial profit for the twelve months ended March 31st. We paid an interim dividend in December, 1951, and we recommend now a final dividend of 20 per cent.

The sum paid as export duty, £69,549, represents 13 per cent on the proceeds from our rubber. Taxation on profits absorbs a further £73,852.

After the sale of the Durian property your company now has 7,737 acres planted prior to 1931, and it ought to be replanted. The capital to do so will, I believe, have to come from our own savings. This is why I look with such apprehension upon the predatory policy of excessive taxation which starves the goose that has laid the golden eggs, and if continued will kill her entirely.

I regard the current price figure for plantation rubber as unrealistic. The natural increase in total consumption will, I am confident, take care of price as ensuring production at a fair profit in the future.

The report was adopted.

Ministry of Materials negotiations took place between the Ministry and the Empire producers. These negotiations resulted in an agreement to try to stabilise the position until further notice, and today the price basis stands at 33½ cents per pound electrolytic. This is equivalent to £268 per long ton electrolytic copper, c.i.f., while we receive, of course, a somewhat lower price, due to the blister and shipping differentials.

TAXATION

I referred last year to the new legislation which the Northern Rhodesian Government then proposed to introduce to enable new mines to amortise their capital expenditure rapidly. This legislation has now been enacted though, under present United Kingdom law, companies resident in this country do not benefit from it. Any tax relief given to them by the Northern Rhodesian Government would merely reduce the double taxation relief available to them in this country, and they would still be subject to the higher United Kingdom tax rates.

In the United Kingdom the past year has seen the introduction of a new and dangerous tax, the Excess Profits Levy. Not only does this add to an already excessive tax burden suffered by industry as a whole, but it is particularly inimical to enterprise and new development.

While the Finance Bill was before Parliament it was amended so as to moderate some features of the new tax as originally drafted. These amendments have materially lessened the impact of the tax on overseas mining companies, but, as you will see from the report and accounts, it remains a severe impost even on an established company. Its worst feature, however, is its effect on an expanding production and, at a time when base metals form so vital a part of the national economy and defence programme, it is clearly wrong to impose a tax which inhibits the development of new overseas mines. So long as the present level and structure of tax in this country prevails, it is exceedingly unlikely that money for Colonial mining enterprises will be invested through United Kingdom companies.

DOMICILE

In the statement I made last January I stated that events were now moving towards a shift in the centre of political gravity for Northern Rhodesia affairs from the United Kingdom to Rhodesia. As a result of the discussions on the subject of the Federation of the two Rhodesias and Nyasaland, and of the political developments both to the south and to the north of Rhodesia, the tempo in this matter has increased rapidly. Your board, which has been watching the position closely in recent years, decided in May that the time had arrived to carry out the transfer of residence which had been under consideration for so long. Under the existing United Kingdom laws it is, as you know, now necessary to obtain permission for such a transfer and, accordingly, on May 23rd application was made to HM Treasury for permission to transfer residence to Northern Rhodesia. This decision was thus the logical outcome of the board's previous views on the matter and will have come as no surprise to members.

There is much I could say on this subject, but since the matter is now *sub judice* it would be improper for me to do so.

Mr Prain also referred to the question of the possible federation of the Rhodesias and Nyasaland.

This organisation, with correspondents throughout the world, is able to offer to those concerned with trade or travel abroad all the services a modern Bank can perform for its customers.

A COMPREHENSIVE BANKING SERVICE

In their capacity as private bankers, Glyn, Mills & Co. have always arranged that the service placed at the disposal of their customers should be truly comprehensive, covering all financial problems from those of the large public corporation to those of private individuals. They are equally well equipped to accept duties as Company Registrar, or to act as executor or trustee for large or small estates.

EXPORTS & IMPORTS

As in the days of Adam Smith and of Napoleon, we have to be a nation of shopkeepers. But now we must be better shopkeepers than ever. National Provincial Bank can, does, and will help our national and international shop-keeping in every way possible.

Enterprising merchants often find their business is increased and their own time saved when they take advantage of N.P.B. services. Market reports on business possibilities abroad are available as well as information on the credit and standing of potential customers.

Not your job?

Every now and then some question of business or finance arises which, you feel, really isn't your job. But it may very well be ours. For the convenience of our customers, we keep upon our staff a number of people who are very knowledgeable in all kinds of matters which are not, strictly speaking, 'banking'. These specialists will obtain currency for foreign travel (and passports too, if required). They will act as a customer's Executor, help with his Income Tax problems and so on. Indeed, on all those occasions when the services of a financial expert would be more than a little helpful, it is sound commonsense to step into the nearest branch of the Westminster Bank.

Named by Captain Cook

In 1770, Captain Cook took possession of the eastern coast of Australia, naming it "New South Wales".

"New South Wales" was still the name of all the settled part of Australasia when Australia's first public company — the Bank of New South Wales — was established in 1817.

This explains why the Bank which provides banking service at over 850 points in Australia, New Zealand, Fiji, Papua and New Guinea is still called —

INTERNATIONAL BANKING SURVEY

This survey, and the accompanying 15-page selection of International Banking Statistics that appears in this week's issue of the RECORDS AND STATISTICS Supplement, is complementary to the similar survey and statistical analysis of banking in the British Commonwealth, published on June 7th last. These half-yearly features together comprise the new form of THE ECONOMIST BANKING SUPPLEMENT, which has been published for many years.

Lessons of American Monetary Policy

IN the last eighteen months the advocates of orthodox monetary policy have won a signal victory in the United States, and the course of events has fortunately allowed them to win it in a thoroughly diplomatic way. Those events—and the two main lessons that spring from them—deserve to be closely studied, not only by those now responsible for the administration of America's affairs (the Republicans are, in any case, traditionally a "harder money" party than the Democrats), but also by monetary theorists in this country.

In blunt summary, the main lesson from American monetary policy between 1946 and 1951 was that selective credit controls and obligatory reserve requirements simply do not work as effective disinflationary forces—so long as a peg is maintained in interest rates. The main lesson from American monetary policy in 1951-52, on the other hand, has been that a comparatively small movement in interest rates in an advanced industrial economy can work disinflationary wonders—not (at least not primarily) because it damps down borrowers' eagerness to borrow, but because it reduces lenders' willingness to lend. In recent months there has been a tendency for certain British economists, who originally opined that dearer money could not be an effective disinflationary force at all, to find refuge in the argument that dearer money has only done clumsily what selective controls could have done tidily. Any study of American experience suggests that this is merely a shift from an argument that has been generally exploded in many different countries in the past eighteen months, to one that was specifically exploded in the United States some years ago.

In the postwar years four main weapons of credit management have been brought into action in the United States: obligatory reserve requirements, selective credit controls (chiefly on instalment purchases and housing), voluntary credit restraint (broadly analogous to the Chancellor's "requests" for qualitative credit control in Britain), and finally—in the main since March, 1951—flexible interest rates. Of these, the weapon of obligatory reserve requirements very soon proved to be a broken reed. It should have been obvious from the start that it would do so—so long as interest rates remained pegged. The dominant feature of the American banking scene before March, 1951, was that the commercial banks could raise all the cash they wanted by selling Government securities to the Federal Reserve at par, and could then pyramid their loans upwards by four or five times the amount of cash thus raised. All that happened when

reserve requirements were raised from (to cite the example of banks in New York and other central reserve cities) 20 per cent of demand deposits in the first two postwar years to the peak figure of 26 per cent in 1948 was that the pyramiding potential was lowered from five to just under four times the cash raised by security sales. The movements in bank assets at the turn of 1950-51, when reserve requirements were raised to their present levels,* delineate the pattern clearly. Between the end of November, 1950, and the end of February, 1951, member banks' obligatory reserve holdings at the "Fed" were raised by some \$2.2 billion. The commercial banks responded by selling precisely \$2.2 billion of Government securities to the "Fed" in this period and \$0.5 billion of securities to other investors; and they then found it possible to expand their loans by \$1.9 billion in these three months. In other words, credit expansion was not diverted by one iota from its inflationary course.

It would be unfair to say that a story of quite such persistent failure dogged the selective credit controls—Regulation W, which imposed down-payment minima and maturity maxima for consumer credit, and Regulation X which did the same for real estate credit. The former control was applied in the early phases of the postwar inflation, relaxed in the recession of 1949, reintroduced in the autumn of 1950, modified in the summer of 1951 and scrapped altogether in the summer of 1952, along with the new Regulation X. These controls, in short, have been political shuttlecocks; and it is widely believed that one school of thought at the "Fed" has reconciled itself to allowing selective controls to be wafted about in this way, without determined resistance, because it has never regarded them as vitally important or effective. This view, of course, is not unanimous—and it may be wrong. It is clear that the initial impact of consumer credit controls in the autumn of 1950 did not have as great an effect on spending as had been hoped—until the fall in long-term bond prices in 1951 reduced the institutions' willingness to lend; on the other hand, the rise in consumer credit since Regulation W was abandoned in May of this year has been as great as in any previous six-month period.

* Banks in central reserve cities must hold reserves at the "Fed" equal to 24 per cent of their demand deposits; the equivalent obligation on banks in ordinary reserve cities is 20 per cent, and on country banks 14 per cent. The reserve requirement against time deposits is 6 per cent for all member banks.

But this is a field in which statistics can be misleading. The basic feature of controls over consumer and real estate credit is that they can work only through their impact on borrowers; they do not, by themselves, have any effect on the institutions' willingness to lend. Just before the introduction of Regulation W in the autumn of 1950, some monetary experts had estimated that the regulation would squeeze out of the market between 5 and 15 per cent of those who would otherwise have bought cars (especially secondhand cars) and household fittings or appliances; these estimates were derived from surveys of consumers' finances and liquid asset holdings, and were based mainly upon the belief that those without accumulated savings would be unable to meet the new minima for down-payments. It is obvious, however, that calculations of this sort can be sent wildly awry by changes in consumers' expectations about the future trend of prices (and thus about the right moment at which to buy durable goods); and in any case, if hire purchase transactions are cut down, there is no guarantee that the spending power that would otherwise have been utilised for instalment payments over a number of years will not

merely be diverted to increase the pressure of demand for other sorts of goods. The best that can be said for Regulation W is that it may reduce the immediate demand for certain types of durable products; it can therefore most usefully be imposed when the resources that are used for the manufacture of such products happen to be the sort of resources that can most profitably and easily be employed elsewhere. But it is very difficult to build up any stronger case for selective credit controls than that.

When the Federal Reserve withdrew Regulation W in May, 1952, it scrapped the Voluntary Credit Restraint programme as well; the "Fed" thereby showed that—if it had to throw two of its children to the wolves in an election year—there was not much doubt in its mind which two to tip off the sledge. The essence of the VCR programme was that local boards advised bankers which loan applications should be granted and which refused "in the national interest." Under VCR, American banks honourably and sincerely strove to turn away all loans that seemed inessential, as British bankers, acting in accordance with the Chancellor's "requests," still do here; but experience in both countries has shown that a banker's definition of what is an "essential" loan inevitably changes when his own liquidity changes. When the fall in bond prices made bankers anxious to restrict their loans, the priorities advertised under VCR

may have helped them to decide which applications to refuse; but many responsible observers in the United States affirm that it is an exaggeration to ascribe even this limited usefulness to the programme. Nevertheless, some regret the passing of VCR, for it was a harmless convenience for a banker to be able to explain to his customers that their loan applications had to be refused not because of the bank's own concern for its liquidity but because of the "meddlers in Washington."

*

It would be a great mistake, however, to allow these minor achievements of unorthodox controls to obscure the main lesson of America's monetary experience—the lesson that credit restraint did not become in any way effective until after the "accord" on interest rates between the Federal Reserve and the Treasury in March, 1951. The terms of that accord are still in some dispute, not least among the signatories themselves. When the Patman Committee opened its hearings on credit control this year, question 18 in the memorandum that it addressed to the Secretary of the Treasury, and question 29 in that addressed to the chairman of the Federal Reserve Board, asked for a description of the nature of this accord; it was widely reported in Washington that the mutual alignment of replies to these two questions was a matter of no little delicacy.

In broad terms, the "Fed" interpreted the accord as meaning that interest rates should be allowed to rise until monetary policy became an effective restraining force; in return for this, the "Fed" agreed to support the Treasury's re-financing and conversion operations (including a rather unorthodox initial conversion in March, 1951, itself), in much the same modified way as the "departments" help Government financing operations over their first hurdles in Britain. The Treasury, on the other hand, almost certainly interpreted the accord as meaning merely that interest rates would be allowed to rise to some limited, though undefined, extent—and that then it would wait and see. Fortunately, no harm came of this difference in interpretation, since a very small rise in rates proved sufficient to bring credit inflation under control. In the first year of the accord the yield on US Government bonds (1950 average 2.32 per cent) never went over 2.75 per cent, that on Government three-month bills (1950 average 1.20 per cent) did not go above 1.73 per cent, and the average bank charge for short-term business loans in 19 major cities (1950 average 2.7 per cent) did not go above 3.5 per cent. Yet, as the accompanying charts show, the accord of March, 1951, brought a significant check to the expansion in the "Fed's" holdings of Government securities and to the rate of rise in the commercial banks' business loans; this year, moreover, as the second of the charts shows, the commercial banks, which had coasted through the easy money period with larger reserves at the "Fed" than they needed, have been forced into extensive borrowing from the "Fed" instead; this means that the central authorities are much more firmly in the saddle over credit policy than before.

Why did this very small rise in interest rates have such a sharp effect? The answer seems to lie mainly in a reason that had been adduced by some, before the accord, as proving that dearer money would cause intolerable disturbance in the national economy. All through the era of easy money and inflation the capital and reserves (both

published and hidden) of the banks, insurance companies and other financial institutions had declined considerably relative to their assets at risk; the banks had been able to forget their qualms on this point so long as Government securities could be off-loaded on to the Federal Reserve at fixed prices, and thus remained a relatively riskless asset. Some of those who recognised this trend believed that the introduction of flexibility into the Government bond market would therefore cause disturbance amounting almost to financial panic. In fact, however, the trend meant merely that a very small fall in bond prices—and much more important, the injection

of uncertainty about the future—caused bankers to clamp down immediately on any extension of their most risky assets, namely business loans. The importance of this element of uncertainty needs to be stressed. A once-for-all drop in bond prices, to a new pegged level, would not have done the trick. It would have reduced the willingness of some banks to raise cash by selling securities to the "Fed"—and thus make a capital loss—but it would not have exploited the full force of the weapon of restoring bonds to their proper role as a risk asset. In this respect, far too much emphasis has been laid by some commentators on the nature of the legisla-

tion that controls the conditions under which some American banks can write Government bonds into their audited balance sheets at par, whatever their market value. If this legislation had not been in existence, only a very few of the smallest banks would have acted otherwise than they did.

It is true that there were several subsidiary factors that happened to make March, 1951, a particularly auspicious moment in which to introduce a dearer money policy in America. The caution of the lending institutions was reinforced by the fact that they were caught with an uncomfortable pile-up of forward commitments and by the decrease in personal spending, which made advances to some consumer goods industries more doubtful risks; the fall in commodity prices was a cause as well as a consequence of the damping down of bank loans, and the Federal budget was not then in as grave deficit as it seems likely to be this year; moreover, some insurance companies and other institutions were wondering, in March, 1951, whether their postwar switch out of government bonds into mortgages and other forms of active lending had not already gone far enough—a consideration that was reinforced when the very small rise in government bond yields made it actuarially possible for the insurance companies to cover individual policy risks by a more conservative investment policy.

It is also true that the United States economy happens to be one in which disinflation can most conveniently and effectively be enforced by monetary policy; swift disinflationary action through the budget is impossible owing to the political conventions ruling on Capitol Hill; and a larger proportion of total spending in America is dependent on credit injections than in any other economy in history. If, as is expected, the new administration relies more heavily on monetary management than the old, it is likely to have a good wicket to bat on—so long as disinflation remains the chief problem. It is possible, however, that the ill-considered policy of pegged bond prices up to March, 1951, may have queered the pitch for the day when a cheap money policy (and much else besides) may be really needed—the day when recession returns.

Monetary Orthodoxy in Europe

IN the sixteen months since the outbreak of war in Korea there has been a marked revival of orthodox monetary policy in Western Europe. That revival cannot justly be called a revolution, but it can be said that a dichotomy has been swept away. In the early postwar years European Governments were divided into two economic schools. Those countries that had seen the evils that followed when confidence in the national currency was undermined, very deliberately built up their postwar economies on the foundation of scarce money—postwar economies on the foundation of scarce money—Italy and Belgium deliberately adopted dear money policies—while, as Table II shows, France also had a high interest yield on Government bonds from 1948 onwards, because it could not help it. The other school, led by Britain and the northern countries, tried to keep interest rates down, and to put their main reliance for disinflationary policy in the early postwar years on budgetary measures and physical controls.

Since Korea the second school has, to a large extent, merged into the first. The conversion to orthodoxy has not been a wholesale one, and many countries still seek to exert control over credit by a strange hotchpotch of reserve requirements and qualitative controls—as well as by bank rate action. But it is now generally recognised in most European countries that, when balance of payments difficulties become acute, official discount rates should go up; and, conversely, when European Governments think—not always correctly—that external solvency has been re-attained, discount rates tend to come down. Table I shows that ten European countries have made changes in their official discount rates since Korea, most of them more than once. Although there are some dangers in judging trends in interest rate policy in isolation from trends in other branches of economic policy, it seems worthwhile to summarise recent changes in European bank rates in some detail—and to examine where interest rates in Europe have got to now.

The three earliest and most important exponents of dear and scarce money in Europe were Belgium, Italy and Western Germany. In Belgium, from the early days of liberation, the rate on government bonds was allowed to find its own level; it rose from under 4 per cent in 1944 to nearly 5 per cent in 1948, since when it has fallen to about 4½ per cent. Throughout the postwar years the official discount rate has varied according to conditions prevailing in the money market: after a gradual increase from 1½ per cent in 1945 to 3½ per cent in 1947, the rate fluttered in line with Belgium's external balance. By the eve of Korea it stood at 3¼ per cent. Partly as a result of the fact that the Belgian authorities had thus placed themselves in a strong position to control inflation, the Belgian balance of payments remained relatively strong after the outbreak of war in Korea. Belgium was not, therefore, under the same degree of external pressure to take drastic measures, in the face of the commodity boom of 1950-51, as were the other industrialised countries of Western Europe. As Table I shows, the Belgian authorities made an increase of half of one per cent in the official discount rate in September, 1950, but reversed this in the middle of 1951, as one measure likely to contribute towards reducing Belgium's surplus with the European Payments Union. Thus Belgium was among the first European countries to raise its discount rate after the Korean war began, and it was also the first to make a subsequent reduction.

Italy has also made consistent use of monetary measures to check inflation ever since 1947, when the official discount rate was raised from 4 to 5½ per cent, in accordance with the "Einaudi experiment"; further credit restrictions were simultaneously imposed upon the banks, who have found that the central bank keeps a stern watch over any developments that would inflate the money supply. By the middle of 1950 the discount rate had been reduced to 4 per cent, and no changes in it have been found necessary during the post-Korean period. The interest yield on government bonds has, however, risen steadily—from just under 4½ per cent in 1947 to 5½ per cent in mid-1952. Quantitative restrictions have also played an important part in Italy's monetary policy, in particular the requirement imposed upon the commercial banks to hold Treasury bonds and cash balances with the central bank to cover a given percentage of their total deposits. Qualitative controls have not been resorted to, apart from advice to the banks to discourage loans that might be used to finance speculation in commodities during the post-Korea price boom. Thanks partly to this regime of orthodoxy, Italy had an accumulated credit balance of \$161 million with EPU at the end of September, 1952.

The course of monetary policy in Western Germany since the currency reform of 1948 has been one of the

most interesting features of the European conspectus. When the D-mark was created in 1948 the German authorities deliberately made it a scarce currency; the very rapid increase in German production after the currency reform naturally generated a demand for an increase in the money supply, and the Bank Deutscher Länder was put in a sound strategic position to keep control over this. Its object throughout this period was to see that the money supply did not rise faster than—and perhaps not even as fast as—the increase in production made desirable. The difficulty of enforcing a disinflationary budget in a country with Western Germany's federal constitution made this control over the money supply vital; and the Bank Deutscher Länder was aided in its task by a varied array of weapons—such as reserve requirements on the American model, stern qualitative regulations for re-discounts and quantitative controls on bank advances.

*

In 1949 it seemed as if this control over inflation was working almost too well. As unemployment remained obstinately high, the discount rate was lowered twice in that year—from 5 to 4½ per cent, and then to 4 per cent. Then came Korea. The immediate consequence of this and of the commodity boom that followed was an upsurge of spending and inflation in Germany amounting almost to a flight from the currency into goods. The Bank Deutscher Länder responded to this by raising its rate from 4 to 6 per cent in October, 1950, and by tightening all the taps that controlled credit supply. At first this did not have the psychological impact that had been hoped for; the flight into goods went on, and by the beginning of 1951 Germany was racing towards exhaustion of its permitted overdraft facility with EPU and had to receive special assistance. But, as the external deficit continued and money drained out of the country, the commercial banks' liquidity was necessarily impaired; with the central bank still refusing to open the tap, credit began to dry up and the stockpiling boom came to an abrupt end. By the summer of 1951 Germany had begun to recover as swiftly as it had previously been approaching collapse, and by the end of September, 1952, it had recovered so far that it had accumulated a credit balance of \$435 million with EPU. It was aided in this remarkable recovery by the suspension of import liberalisation at the depth of the crisis; but there is no doubt that its policy of relying mainly on monetary orthodoxy to check spending was dramatically vindicated in the end. In May of this year the authorities felt able to reduce the discount rate from 6 to 5 per cent, and they reduced it again, to 4½ per cent, in August.

The experience of the Netherlands since Korea has also provided a lesson in the effectiveness of monetary discipline. Up to the middle of 1950 the Netherlands authorities had never followed such a "hard money" policy as their neighbours in Belgium had done. But after the outbreak of the Korean war there was a pronounced movement towards the greater use of monetary weapons. The yield on long-term bonds, which had remained at about the 3 per cent level since 1945, was allowed to rise towards 3½ per cent, whilst the Netherlands Bank raised its discount rate from 2½ per cent to 3 per cent in September, 1950—which placed the Netherlands among the first countries to react in this way to the commodity boom. A further rise in the discount rate (from 3 to 4 per cent) took place in April, 1951. In the second half of 1951, the Netherlands balance of payments improved remarkably and the central bank was

able to reduce the discount rate to 3½ per cent in January, 1952. It is noteworthy that from April, 1951, until last August, the Netherlands, which had previously eschewed monetary orthodoxy, had a higher discount rate than Belgium, although the yield on long-term government bonds in the Netherlands has remained about one per cent below that in Belgium.

Denmark was another northern country that acted swiftly in the face of the deterioration in its balance of payments in 1950. Between July and December of that year its discount rate was raised, in two stages, from 3½ to 5 per cent, while the yield on Government bonds was allowed to rise from 4½ per cent in the middle of 1950 to nearly 5½ per cent in September, 1951. During 1951 there was a very marked improvement in Denmark's balance of payments—despite the fact that its terms of trade deteriorated between 1950 and 1951, before starting to improve again this year. Finland also raised its

official discount rate at the end of 1950—from the already high figure of 5½ per cent to 7½ per cent. It reduced the rate again to 5½ per cent at the end of 1951.

Among the other Scandinavian countries, the Swedish government had, up to the outbreak of the Korean war, relied almost entirely upon budgetary policy and physical controls to check inflation. The Riksbank had automatically provided the cash required to keep interest-rates at a fixed level. But the resurgence of inflation in 1950 led to a brief revival of monetary policy, in the form of a tightening of the cash reserve requirements of the commercial banks and the withdrawal (in July, 1950) of the Riksbank's peg in the bond market. In December, 1950, the official discount rate was raised from 2½ to 3 per cent, but the Riksbank then continued to support Government bonds at their new—and slightly lower—level. This creation of cash, in turn, made the new reserve requirements ineffective. It was not until early in 1952 that credit expansion was checked, largely because of heavy tax collections. The Riksbank has also attempted to induce the commercial banks to follow a rigid policy of qualitative credit control. Had Sweden not been shielded by its primary exports from the balance of payments deterioration that affected the industrial exporters of Western Europe in 1950-51, it would have found it far more difficult to pursue this relatively "cheap money" policy.

The experience of France, which has tried to follow a policy of selective—and very complicated—credit control, is described more fully in a subsequent article in this survey. High interest rates on Government bonds have been a feature of the French economy since the war, but this has been a consequence of internal inflation and the desperate need for Government borrowing, not of monetary orthodoxy. In fact, Table I shows that France and the United Kingdom—which both made increases in their discount rates in the last quarter of 1951—held their discount rates below 3 per cent longer than the other West European countries. It is unfair to say that it was solely because of this that their external payments difficulties persisted longer than those of their neighbours. But it is fair to say that the experience of the last sixteen months has shown plainly that higher interest rates are a powerful weapon for the battle against, though not for the complete conquest of, recurring external deficits. Haltingly, and probably still insufficiently, Europe has begun to learn that lesson.

The New Structure of German Banking

WITHIN the past few weeks the structure of commercial banking in Western Germany has undergone its second major reorganisation since the war. Thirty separate banking units, each confined to operations within a single Land, have been transformed into nine large units with much wider regional spheres of operation. The reorganisation thus marks an abrupt reversal of the principles that guided the Allied Governments in the drastic recasting of the commercial banking system of Western Germany after the war. To appraise the new system, and the reasons for the change, it is therefore necessary briefly to recall the pattern of the first reorganisation and to consider the weaknesses it has shown in operation.

In banking, as in industry, the aim of Allied policy was

to break up large units, to "deconcentrate" and disperse organisations that formerly were nation-wide, in the interests of security. In commercial banking, this involved the disintegration of the powerful Big Three "D" banks—the Deutsche Bank, Dresdner Bank and the Commerzbank. By the reform of the banking system in 1946-47, these banks were split up into thirty "successor banks," and no bank was permitted to have branches in more than one of the eleven Länder into which Western Germany is divided. In the sphere of central banking, the reorganisation took the form of the erection of a Federal banking system, on the American model, with a central bank for each Land and a single note-issuing bank—the Bank Deutscher Länder at Frankfurt, which is owned and nominally controlled by

the Land central banks. The weaknesses of the new system in practice arose most noticeably from the breaking up of the large "D" banks, a system never popular with the Germans; and it is only this part of the earlier reorganisation that is now being changed. The splitting up necessarily resulted in the loss of the goodwill associated with the big names, in a reduction of working efficiency and in a need for greater liquidity. The credit needs of such areas as the Ruhr have been less readily met by smooth transfers of funds from surplus areas than when the branches concerned were within the same nation-wide banks. Moreover, the restricted area of operation has made it more difficult for banks to spread their risks.

To meet these and similar difficulties, the reform of September, 1952, establishes nine banks instead of thirty and permits each of these new banks to have branches throughout any one of the three major banking districts

into which Germany is to be divided. Branch banking will therefore be possible on a much larger scale than hitherto and the worst defects of the previous system should be avoided.

As this is intended to be a more permanent form of organisation, the three "D" banks have entered into liquidation. On September 25, 1952, the Deutsche Bank, the Dresdner Bank, and the Commerzbank formally transferred their businesses to the successor institutions. These, in accordance with the resolutions adopted at the general meetings on that day, have been "re-founded" out of the former Big Three banks under the terms of the German law on the Regional Scope of Credit Institutions of March 29, 1952.

The establishment of the new banks has not been greeted with unqualified approval in Germany; at the general meetings considerable disappointment was expressed that the Allies, after lengthy and difficult negotiations, had not permitted the "D" banks to resume business in the Federal Territory in their former shapes. The fear of an excessive concentration of economic power upon the Big Three, it was asserted, was without foundation. On the other hand, it may be noted that there has been considerable co-operation among the thirty successor banks, and there seems no reason why co-operation should not be at least as close amongst the nine—especially among the offspring of the same "D" bank.

The institutions thus created should be much better equipped to finance the economy of Western Germany than were the thirty so-called "successor" institutions. An end has been put to the provisional stage in which the banking units have not been independent legal persons, but have merely borne the names of branch groups of the "D" banks in the various Länder; this was a most unsatisfactory interim phase, entailing a number of legal complications. There are now in the Federal Territory nine joint stock banks with legal personalities of their own. This is probably the best solution available, granted the intention to keep the power of the big banks as small as is consistent with efficiency. No central banking place and money market, such as formerly existed in Berlin, has as yet developed in Western Germany. These functions are now to be performed in the centres of the three new banking regions of the Federal Territory—at Frankfurt, Dusseldorf and Hamburg.

The Law providing for these changes derived from two years' negotiations between the German and Allied authorities. According to this Law, credit institutions in the corporate form of *Aktiengesellschaften* (corresponding to joint stock companies) or *Kommanditgesellschaften auf Aktien* (similar to general partnerships with shares) may maintain branches in only one

of the three banking districts of the area of the German Federal Republic; and they are not permitted to exert, by share participations or in any other manner, a dominating influence on other banks outside their banking district. The North German banking district comprises the four Länder of Hamburg, Bremen, Lower Saxony and Schleswig-Holstein. The Land North-Rhine-Westphalia forms a banking district of its own. The third district consists of four Länder in Southern Germany—Baden-Württemberg, Bavaria, Hesse and Rhineland-Palatinate. The banks are, however, permitted to transact business in the entire Federal Territory.

To ensure a continuing degree of "de-concentration," it has been prescribed by law, in accordance with the requests of the Allied authorities, that the shares of these successor institutions must be registered and not bearer shares, but they will carry dividend coupons, so that they will be easily marketable. No successor institution of a "D" bank is permitted to participate in another successor institution by purchasing shares in it. Moreover, other investors, although free to acquire an unlimited number of shares in any one successor institution, may not buy more than 5 per cent of the shares of another successor institution. The activities of the members of the boards of managers and of the boards of directors are confined to one successor institution.

In fulfilment of the plan of reorganisation, each of the Big Three banks has formally "re-founded" three successor institutions, making nine in all; and the liabilities and essential assets required for their business operations have been duly transferred to the successors. Creditors of the "D" banks whose claims are in foreign currency subject to special restrictions on disposal—notably the standstill creditors—now have the right,

exercisable within one year, to require their claims to be transferred to another successor institution of the same "D" bank. It may be noted, too, that the Law makes the successor institutions and the re-founding institution jointly liable for such debts as could not be transferred to the successor institutions because in present circumstances the creditors concerned could not have recourse to the Big Three banks—this applies, for instance, to liabilities to persons residing in the Soviet zone of occupation, by branches located in that zone.

★

Shortly after the promulgation of the Reorganisation Law, the Bank De-concentration Laws introduced by the three Military Governments after the capitulation were repealed, by a Law of the Council of the Allied High Commission, dated April 8, 1952. This new Allied Law also provided that the so-called "Transfer" Regulation made under the Conversion Law should apply to the "D" banks; the effect of this was to bring the Berlin branches of the former "D" banks within the scheme, as having been transferred within the Federal Territory. For the creditors, the result of the transfer was that credit balances held by residents of the Federal Territory with the Berlin branches of the Big Three banks could be converted in the ratio of DM 6.50 for RM 100.

The old "D" banks continue to exist; in Berlin they are among the inactive credit institutions that had to suspend their activities for the time being under the "Suspension Directive" of the Berlin "Magistrat" dated June 5, 1945. In Western Germany the old "D" banks are not permitted any activities except those necessary for winding up their business.

Table I shows the former Big Three banks and their nine successor institutions in the Federal Territory, as well as the successor banks founded in Western Berlin, and the styles of the former thirty provisional banks. The table also shows the nominal capital of each of the nine banks formed from the thirty successor banks of the Big Three, and the shareholdings in each of the new banks that will be received by the owner of a RM. 1,000 share in the parent "D" bank. In accordance with the statutory provisions, the new stock has been registered in the name of the Bank Deutscher Länder (the central bank of the Federal Republic) as the trustee; the bank will endorse the stock and thus transfer the title to the shareholders. Apart from the issue of this new stock, it should be noted that the old shares of the Deutsche Bank, Dresdner Bank, and Commerzbank A.G., which will continue to be expressed in RM and will be exchanged for new RM shares, will still have a certain value, since they represent a share in the assets of the banks in Berlin, in the Soviet Zone of Occupation, and abroad.

With the reorganisation of the "D" banks, the issue of banking statements and other necessary information about the banks once more became possible. Previously, since the thirty individual successor banks were not independent, and since the organs of the old banks were not allowed any activities, it was impossible to meet the justified demands of the public for regular information on the development and position of the banks. In these peculiar conditions, confidence in the individual successors had to rest upon the reputation and goodwill of the "D" banks, whose former branches were continuing to operate under new names. The initial balance sheets of the new successor institutions have now been published, and these banks will henceforth regularly submit data for public review and criticism.

In view of the special interest attached to these opening statements, their principal details are reproduced in Table II. The aggregate balance sheet total was around DM 8,000 million, comprising DM 3,800 million for the successor institutions of the Deutsche Bank (with DM 140 million of nominal capital and reserves) DM 2,500 million for the successors of the Dresdner Bank (DM 115.5 million of capital and reserves), and DM 1,600 million for the Commerzbank A.G. successors (DM 55 million of capital and reserves). The capital resources of the nine successor banks thus amount to about DM 310 million; only a small proportion of this sum represents the capital provided by the currency reform; for the greater part of it has been derived from profits made since then, as well as from the bringing in of hidden reserves. The banks were legally permitted to make use of such reserves, and their employment was encouraged by the granting of tax reliefs.

As Table II shows, the liquidity of the new banks is high. This is partly due to the regulations governing minimum reserve requirements. This fact, coupled with the greater flexibility and wider opportunities afforded by the recent re-organisation, seems to afford grounds for the optimism with which their future is viewed in Germany. Certainly this reversal of the earlier disintegration of the German banking structure should do much to improve the working of the system. But it cannot be assumed, even now, that the structure will be permanent. German opinion will probably continue to favour a full restoration of the Big Three. And the erection of a branch banking system operating over several Länder may perhaps prove difficult to reconcile with a federal banking system that gives each Land its own central bank.

Credit Control in France

DURING the past twelve months France, like Britain, has brought the weapon of dearer money to the aid of other methods of credit control. In the autumn of 1951 the Bank of France raised its discount rate, in two steps, from 2½ per cent to 4 per cent—the first of these moves being made some three weeks before the Bank of England made its historic change on November 7, 1951. But France has not put any such reliance upon monetary orthodoxy as Mr Butler has done. In the latest phase of its perennial fight against inflation, little has been heard of monetary measures and there has been no further increase in the Bank of France's rate—despite the sharpness of the threat to the franc before M. Pinay launched his essay in stabilisation. Resort to non-monetary action at moments of acute danger is, however, no novelty in France; and it would be wrong to deduce from recent policies any new judgment by the French authorities upon the worth of monetary weapons.

France's experience does, however, drive home some important lessons about particular kinds of monetary technique. For inflation-ridden France has been operating since the war an extraordinarily detailed and highly organised system of "selective" control of credit and discipline of the commercial banks. The evolution of this system, and its performance under conditions of high inflationary pressure, deserve closer study than they have

generally received so far—especially by those who, in other countries, cherish the hope of devising new qualitative controls to diminish the need for orthodox ones.

The legal basis of the postwar system of control in France was the law of December, 1945, which, apart from nationalising part of the banking system, created the National Credit Council, a body with a widely spread membership, with the governor of the Bank of France as permanent vice-chairman. This body was given very wide powers, and its central responsibility is to formulate and ensure a consistent monetary policy for both the government and the banks. Alongside the council, making up the rest of the structure of control, are the Bank of France, which acts as an expert adviser and as executive agent for the council, and the Banking Control Commission, staffed from the Bank of France, which collects information, is responsible for bank inspection, and generally guards the "soundness" of the commercial banking system.

The council initially favoured qualitative rather than quantitative control of bank credit, with the object of maintaining cheap money, and because of the desire to ensure that, in a time of reconstruction, no physical

But anyone familiar with ceramics would know that it is a piece of world-famed Delhi blue pottery.

Through years of specialized study, the ceramics expert has attained a high degree of skill and discernment in his particular sphere and this is also true of the National Bank of India and its unrivalled knowledge of eastern trading. As a result of many years of continuous experience the National Bank of India can now provide much information vital to the success of modern trading ventures. Your enquiries will be welcome at the Head Office or at any of the Bank's branches.

Musical accomplishment

We recently had a call from a manufacturer who had heard that Argentina, after a lapse of nearly two years, was again ready to grant import permits covering certain goods from Britain. "Are musical instruments among these goods?" he asked. Within a matter of minutes we were able to give him chapter and verse of the relevant Argentine Central Bank Circular. This invited applications for foreign exchange to pay for the import of, among other things, musical instruments from Britain provided that payment was made at the free market rate and that applications to import were lodged within a specified time. From few other sources could this information have been obtained so quickly, and our client was at once able to make arrangements with his agent in Buenos Aires.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

resources should remain unused merely because bank credit was not available. In 1946 the Bank of France recommended that credits should be made only in order to help production, and a highly centralised control was set up to enforce this canalisation. In January, 1947, it was provided that all requests for advances of over 30 million francs (a figure subsequently raised to 50 million) should go to the Bank of France for approval. Moreover, considerable documentation had to be demanded by the banks in support of any application for an advance of over 2 million francs, and the Bank of France could demand justification of the advances by the bank concerned. The important exception to these controls was the commercial bill, which remained completely outside control until September, 1948, and was not subjected to the major control demanding specific Bank of France approval for large amounts until as late as October, 1951. This exception was held to be justified on the grounds that a commercial bill represented actual goods in production or in movement, and so could not be inflationary—a naïve policy that had the inevitable effect of turning more and more borrowing into this unrestricted channel.

A further important control was introduced in October, 1947, when banks were told not to grant further credit unless the funds were urgently needed and could not be raised in any other way, while advances for certain purposes were explicitly forbidden. The intention of all these qualitative controls was to pay regard to the "economic utility" of an advance, in addition to the usual banking criteria of risk and profitability. The Bank of France, in its consideration of the larger requests, was almost wholly concerned with this general criterion, although it does seem to have turned down some requests for credit on the ground that it would bring the amount of credit outstanding into too high a relationship with the firm's turnover. "Economic utility" was widely construed; since the reconstruction industries, agriculture, and the export industries were all given priority, little French economic activity other than commerce failed to receive favour.

It seems, moreover, that in these early and highly inflationary years, the National Credit Council was unwilling to enforce even qualitative controls in too firm a manner, for fear that physical resources should become unemployed. Very few requests that went to the Bank of France were refused; it is possible, however, that an appreciable number of applications were rejected by the commercial banks and that some projects were held back by the would-be borrowers themselves, on the assumption that they would not pass the new scrutiny. The small number of refusals by the Bank of France may have been partly attributable to the fact that the controls were administered by its Discount Department, which probably found some difficulty in judging credits by the new criteria instead of the traditional ones. At all events, during the serious inflation of 1947 and the first three quarters of 1948, there seems to have been very little check on expansion of bank credit for non-Government borrowers; indeed, this expansion became the dominant factor in the increase in the money supply. About the best that could be said for the system by one of its leading home apologists was that the increase in the supply of money was lagging behind the rise in wages and prices—a common symptom of any advanced inflation.

During the first half of 1948, however, physical and psychological circumstances were becoming more favourable to an ending of inflation; production was rising, a good harvest was coming, Marshall Aid was getting under way, and the aggressive power of the Trade Unions was being weakened. In these more propitious circumstances, it was obvious that a successful check to the excessive expansion of credit could have significant, if not decisive, results. At the end of September, important measures of new quantitative controls and a strengthening of qualitative controls were approved by the National Credit Council. The sale of Government securities by the banks in order to allow expansion of private credit had been a big source of difficulty; the new regulations therefore formalised certain existing gentlemen's agreements by requiring that banks should keep minimum holdings of Treasury paper. These were to be maintained at not less than 95 per cent of the volume held on September 30, 1948, plus an amount equal to at least 20 per cent of any net addition to deposits after that date. This was the first formal reserve requirement in the history of French banking. In addition, formal rediscount ceilings were established, limiting the total amount of rediscounting the commercial banks could expect to make at the Bank of France. The ceilings for the banks individually were kept secret, but the total for the whole banking system was originally around 188 milliards of francs.

These policies were rapidly followed by a marked abatement of inflationary pressure. It cannot be assumed too easily, however, that the new credit policy was the main cause. The strongest single factor seems to have been the good harvest—for the inflationary pressure had undoubtedly been aggravated by the marked inelasticity of the average Frenchman's demand for food. Credit restriction has to be regarded as one of several influences that worked concurrently to relieve the pressure. If factors such as the recovery of production and the decline in the strength of the Trade Unions had been less propitious, and if Marshall Aid had not started to improve the prospects both for the foreign balance and the supply of goods, credit policy alone would probably not have been—or would not have been allowed to be—strongly influential. If a bigger burden had been placed on credit measures in less promising circumstances, it is all too likely that the policy would have been allowed to weaken and dissolve—for the underlying assumption that reconstruction should not be held up for lack of credit remained strong.

The lukewarmness towards credit policy did in fact show itself in the following two years, fortunately without any evidently untoward results, at all events in the short run. Of the weapons of credit control created in 1948, the one that was potentially the most effective was the limit to total rediscounts at the Bank of France. If this weakened, the whole structure of credit control was bound to weaken too, because experience showed that little reliance could be placed upon the purely qualitative controls. Such a weakening did in fact take place, in two separate ways. By October, 1951, the ceiling for all the banks together had been raised by more than one half, to around 285 milliards of francs. These concessions were made partly in response to complaints from individual banks that their limits were unfair, partly as a deliberate policy of expansion at moments when recession appeared threatening, and partly to allow for other special factors such as the rise in import prices induced

by the Korean war. When the conflict was one between imposing painful discipline upon the economy and of reducing the pressure of credit controls, it was found all too easy to reduce that pressure.

The other weakening of the structure of control took place as a result of a kind of window-dressing. The ceilings applied only to the amounts outstanding at the ends of months, and at other times they were frequently exceeded. Moreover, when it became difficult to "window-dress" the accounts back to a position within the limits at the month-end (because of serious inflation in the middle of the month), the Bank of France stepped in with open market operations, thereby still further impairing its system of control.

The weakness of these credit controls as anti-inflationary measures became fully apparent when the steep rise in international prices induced by the Korean conflict began to have a serious effect on the French economy. In October, 1951, price inflation had become so serious that more forthright action became necessary. The bank's discount rate was raised from 2½ per cent to 3 per cent, and then, in November, to 4 per cent. This marked the most noticeable swing towards orthodoxy that France had made since the war. Short-term interest rates had hardened gradually through the inflation of 1946-48, but no great reliance had then been placed on the short-term rate as a means of combating inflation. Nor, even in 1951, did the National Credit Council intend that orthodox weapons should work without other monetary devices; in an economy where business men were accustomed to paying fairly high rates for short loans, and where prices were rising sharply, an increase in interest rates of this order was not expected to have much effect unless accompanied by other restrictions.

The less orthodox weapons were therefore strengthened simultaneously. A new rediscount ceiling for the whole banking system, which was to be "*en principe infranchissable*" was introduced, and was to operate daily instead of merely at month-ends. It was set at 500 milliards of francs, a high level calculated to take account of the immense amount of window-dressing that had been practised; the enforced discontinuance of this practice led in October to additional Bank of France assistance to the amount of 150 milliards of francs. The new ceiling also allowed a margin for future expansion, because the council considered that a "brutally restrictive attitude" could not be applied to developments that were based on the general economic policy of the country. Even so, it was provided that additional discount facilities could be granted for temporary periods for up to 10 per cent of the individual bank's rediscount ceiling; for these facilities a higher rate was charged. Attempts were also made to strengthen the purely qualitative control. New instructions were issued to the banks, exhorting them to grant only such credits as were regarded as in the national interest, and the regulations were changed to ensure that the Bank of France scrutinised all credits, including discounts of commercial paper, where a firm's borrowing exceeded 500 million francs. This is a large amount, and presumably only relatively few borrowers were affected; the intention appears to have been to give the Bank opportunity to look with real care at all applications required to be submitted to it—and perhaps also to meet in this way complaints that the system had worked against the interests of small and medium-sized firms.

It is difficult to believe that these several credit policies, including the increase in interest rates, have done much to stem the course of inflation during the last year. Sharp increases in prices, the expansion of the monetary circulation and speculation against the franc all continued for several months after the new measures were introduced. The degree of stabilisation that had been imposed under M. Pinay's régime has been little connected with credit policy; its main causes have been control over Government spending, a reduction in the violence of the economic dispute about the division of the national income between different groups in the community, and a reversal of speculation in response to the improvement in general confidence. The dispute about the distribution of the national income tends to come to a head when total national income is low or is tending to fall. It shows itself in an inflation of costs; and this can continue even if there is no excess of total demand over total supply, when monopoly is as strong as it is in France. In such an economy, credit policy is bound to be of secondary importance unless it is applied with great vigour. Otherwise, when cost inflation is active, it can prevent only the most serious excesses of speculation.

In France, as this account has shown, credit policy has not been pushed very far, despite the comprehensive character of the new apparatus of control. The lesson of France is that, in a country with a strong inflation neurosis, monetary measures have to be pursued with great determination and real conviction to be successful when inflation is active. The French experience also throws light upon the relative merits of orthodox and unorthodox credit controls. Qualitative controls have shown themselves to be very weak, while the unorthodox quantitative control by discount ceilings may cause dangerous rigidities that are almost bound to force the authorities to relax their grip. In the particular context of France, however, questions about the merits of particular techniques are plainly of less importance than the question why there has been a general lack of will to use any varieties of monetary control whenever their use would cause appreciable discomfort—although they would certainly have effect if used with firmness. The answer lies at the centre of France's postwar experience: there are few important groups left in the country for whom the removal of inflation is more important than anything else. If monetary stability can be attained at no great cost, then it is brought about, as in 1949 and 1950. But, at least under the Centre coalitions since the war, stability has always taken second place whenever a choice has had to be made between economic objectives. For the planners and official circles, one of the most important choices has been between monetary stability and the pursuit of a heavy investment programme; for the major economic groups in the country, who have more or less immediate protection against serious loss of real income through rising prices, the choice has been between monetary stability and the loss of real income. In each case where the conflict has been sharp monetary stability has been sacrificed. Lack of will to control inflation explains its continuation and the weakness of credit policy. The tools of credit policy that are available would be adequate if they were in resolute hands; it still remains to be seen whether France considers the price of monetary stability worth paying.

Decision and the Dollar

THE Commonwealth Conference, which will convene in London next Thursday, has been preceded by more portentous ministerial preparations than any economic conference since the war. To draw up the agenda for it Mr Butler abandoned his intended visit to Mexico City in September, several dozen Commonwealth officials have flown half-way across the world and back again, two preparatory committees have been in intermittent session for many months, and cabinets in London and the dominions have exchanged detailed memoranda with an enthusiasm that has sometimes extended to acerbity. This mountain of preparation must now surely bring forth some major policy changes; it would be too much of an anti-climax if it produced only a mouse.

But what policy changes are in prospect? The main topic before the conference will be how sterling can live on more friendly and less fearful terms with the dollar; which means how it can be extricated—initially, at any rate, it would have to be with American help—from the barbed entanglement of present exchange restrictions. A survey on page 579 of this issue analyses this problem, and suggests lines along which a solution might be sought. That survey proffers a blueprint for what might be done. It does not, unhappily, state any expectation of what will be done. For the difficulties to be overcome are immense. Indeed, the immediate danger is that the Prime Ministers may make their countries' economic problems worse. They will certainly do so unless they recognise and evade two insidious traps that lie in wait for them. The first trap is innate in the mechanism of Commonwealth consultation itself. The second, and more important, is rooted in a tendency, on both sides of the Atlantic, to underestimate the extent of the problem to be faced.

The trap that is of the Commonwealth's own making arises from its familiar eagerness to ensure that family disagreements do not relapse into anything so definite as deadlock. The result is that they often get bogged down in compromise instead. That is the first danger that will beset the Prime Ministers next week. The preparatory work for this conference originated in two committees that were set up after the last Commonwealth Conference in January to investigate the possibilities of integrating Commonwealth development and of achieving sterling convertibility respectively. According to report, the United Kingdom representatives entered the first committee thinking that its terms of reference promised that the sterling area would make a united effort to press forward with those development schemes that would earn or save dollars, and to restrict those that would not; the sterling dominions entered it thinking that planning for Commonwealth development meant that they should discuss how they could secure the continuation and extension of their own industrial development. The United Kingdom representatives entered the second committee thinking that convertibility meant that foreign countries that earned sterling should be given the unfettered right to buy dollars

from the sterling area pool, while Commonwealth countries cut their demands upon that pool still further; the dominions' representatives had vaguely thought that convertibility was a six-syllable word that meant that they should have more dollars to spend themselves.

It ought to be quite impossible to throw a bridge across these hugely differing interpretations, but the danger is that frantic efforts will be made to construct one. It is frighteningly easy to picture this Bridge of Sighs. The Commonwealth Prime Ministers could, for example, recommend that the Commonwealth should press ahead with development, meaning by that an increase in the dominions' dollar-saving investment schemes but without any further restrictions on their dollar-spending; they could express the hope that it might be possible to make some sort of advance towards convertibility, meaning by that many more dollars for foreign earners of sterling and a few more for India and Australia; and finally they could suggest that Mr Churchill should cross the Atlantic early next year to ask President Eisenhower to underwrite the whole experiment with a stabilisation loan.

★

Any mission based on such effortless thinking would almost certainly meet with disaster. There would be no guarantee, in the first place, that the Americans would listen to proposals that rested on internal contradictions of this sort. Secondly, and much more dangerous, President Eisenhower might go part of the way with Mr Churchill—but only on conditions about the speed with which convertibility was to be attained and the degree of non-discrimination against dollar imports that would have to go with it. In these circumstances, Britain would either have to start its relations with the new administration in Washington by curtly refusing an offer that the Americans themselves would consider generous; or else it would have to try to take on rather more than it believes it can handle, with rather less aid than it had hoped to get, and with the need to put rather more pressure upon the dominions than the dominions themselves had bargained for.

If more realistic proposals than these emerge from the Commonwealth Conference it will happily be possible to dismiss this as excessively gloomy, though perhaps not untimely, adumbration. And, if the Commonwealth does intend merely to poke at its economic problems, there may still be some who will regard this article as mischievous speculation—on the thesis that now is the time for all good men to help to swing the lead. Those who argue in this way must be hopelessly out of touch with the present political atmosphere in America. In the struggle that almost certainly lies ahead between Mr Eisenhower and his own right wing, it may be possible for the President to induce Congress to attempt a once-for-all solution of the world's trading problems—especially if it is a solution that seems different from that which the Democrats espoused. But if the first attempt fails, any second plea for rescue funds will come up for consideration on a hopelessly queered pitch. And this is also the answer to those who believe that, even if no advance to convertibility is attempted, it will be possible to fall back on the present stop-gap system of annual American grants-in-aid. In future, successive approaches to Congress seem likely to yield steadily diminishing returns.

It is, therefore, of the highest importance that the first

approach to President Eisenhower should not be based on an underestimate of the cushion that is needed and on an overestimate of the advances that can be achieved. There have lately been frightening rumours that Washington and London are thinking in terms of a stabilisation loan of some two billion dollars; with this backing, it is argued, the Commonwealth and Western Europe should be able to make some advance to non-discrimination and a full-scale advance to currency convertibility, provided that exchange rates are set free to float. Recent history suggests that any such experiment would in all probability fail. In each of the postwar years the surplus on America's balance of payments has been between \$5 and \$8 billion, except in 1950 (when it was rather lower) and 1947 (when it was considerably higher). It is, of course, a disgrace that four-and-a-half of the five continents should have so grossly overspent their dollars in this way. It should not be impossible to devise a disinflationary programme that would be sufficient to bring the sterling commonwealth, at any rate, back to dollar balance in all except very bad years, so long as present discriminatory exchange restrictions remain in force. But it is idle to suppose that in the first year of any significant easing of exchange restrictions, and in any bad years thereafter, the American surplus may not swing back to or beyond its postwar average. It will not necessarily do so, but it is at least more likely to than not. And with some £3,400 million of short-term claims on London resting uneasily in overseas hands, the brunt of any such swing, in a world of convertible currencies, would fall on sterling.

★

Does this mean that any advance to convertibility and freer trade must be abandoned, at best in an atmosphere of anti-climax and at worst after an experiment and crisis? Does it mean, in fact, that since annual American grants-in-aid are likely to diminish, the non-dollar world will have to retreat even further and even more fearfully behind a barrier of discriminatory import restrictions? It would be tragic to have to draw any such conclusions. But if the Commonwealth Prime Ministers are to cut a way out of the present thicket—and a way that will not lead straight downhill to disaster—they will have to think first about what they can offer to America, and only afterwards about what they may hope to get from it. The proposals in the survey have been drawn up on this line of reasoning.

These proposals have three main features. The first is a programme for deliberate disinflation in the Commonwealth, based mainly on a sharp cut in the uneconomic industrialisation programmes of the sterling dominions and on the switching of resources in Britain from the consumer goods industries into the capital goods industries; a programme of this sort will be needed whether an advance to sterling convertibility is attempted or not. Secondly, it is suggested that the cushion for an experiment in convertibility (and it would have to be a capacious one) should not take the form of American grants-in-aid; the best of several other ways would seem to be for the American central banking system to accept payment for part of any American surplus in a new sort of claim on other countries' resources, on the analogy of the credit lines now granted to one another by European countries under the European Payments Union. Thirdly, steps would obviously have to be taken to ensure that the Americans were not asked to take up more of these

claims than they were willing to hold. One way to do this would be to enable the Americans to restrict, at their own volition, the volume of American goods that foreigners can buy, but in addition any countries that kept on running into debt would have to yield to the international authorities managing the new payments system powers that have hitherto been regarded as the inviolable prerogative of national economic sovereignty.

These proposals are put forward as a basis for discussion. They may not be sufficient for the aims in view and there may be better technical ways of achieving them. There will also be those

Stocktaking for Uno

IS the fate of the whole United Nations experiment in the balance? After the events of last week, a good many of those who have been following the Assembly's activities in New York seem to agree that it is. Their despondency is hardly surprising. There had been a general hope that, once the American elections were over, the Assembly would at least be able to show a turn of speed. Instead, it has been confronted with obstacles and perils on almost every side. On the heels of Mr Vyshinsky's brusque rejection not only of the terms of the United Nations Command for a Korean truce but also of formulas proposed by several disinterested parties, the Assembly has heard French and South African speakers deny that it has any right to intervene in their countries' affairs; it has listened to Arabs and Israelis pursuing their endless wrangles, and has learned that India and Pakistan are no nearer to a settlement in Kashmir; it has been embroiled in quarrels ranging as far as colonial Africa and back to its own budget. The Secretary-General has announced his resignation; his chief legal adviser, Mr Abraham Feller, has killed himself in a mood of despair aggravated by the incessant harassing of the Secretariat by Senator McCarran's committee; and that committee has wasted no time in announcing that it proposes to continue and extend its campaign, which takes the form less of a judicial inquiry into alleged subversive activities than of a serial soap opera, complete with promises of thrills in the next instalment. Meanwhile, those who look to the President-elect for a sign that would clarify future American policy have so far looked in vain.

The United Nations now presents a gloomy picture: a badgered and embittered Secretariat; a disillusioned Secretary-General whom it will be difficult indeed to replace; an Assembly, unable to solve any of the major problems on its agenda, bickering over budget contributions and even less important issues, and beginning to talk of extending into February a session originally intended to last only eight weeks; and, in distant Korea, an army tied down in a war with no end in sight.

With this massive pile of evidence to support them, those who predict the imminent collapse of the whole edifice of the United Nations may well feel sure of their ground. Yet, if they study the record of the organisation over its seven years of life, they may pause. Almost every Assembly since the founding of Uno has produced its chorus of croaking Cassandras. As early as 1948 it was confidently asserted that the United Nations was no longer dying but actually dead. Soviet rejection of

who, after reading the survey, will decide that convertibility and non-discrimination would be too dear at such a price. For the Commonwealth and Western Europe—who cannot really expect to go on living off American aid while discriminating against American goods—this conclusion would be faint-hearted and false. For Americans, the balance between advantage and loss may be more difficult to strike; that is for American opinion to decide, after weighing the political as well as the economic considerations that are involved. One thing is certain: convertibility and lasting non-discrimination cannot be attained more cheaply.

Marshall aid, the blockade of Berlin, the signing of the Atlantic Pact, the deadlock over Chinese representation and the outbreak of the Korean war have successively been hailed as heralding its demise. Nevertheless, in spite of disillusion, deadlocks and the outbreak of a full-scale war, the organisation still exists.

Given Uno's remarkable capacity for survival, it is more sensible to take another look at its present troubles. Taken together, they present a sombre picture; but none of them is necessarily fatal. Neither the French nor the South African reaction to criticisms raised in this Assembly was unexpected or without precedent, and the problems of Kashmir and Palestine are equally old and familiar turns in the UN repertoire. Feeling has run high on colonial issues during this session, but it would be difficult to assert that the United Nations has been placed in mortal danger thereby. The resignation of the only Secretary-General whom the member nations have ever succeeded in appointing came as a dramatic surprise; but, while it symbolises all too clearly the unresolved conflicts within the United Nations, it does not in itself threaten the life of the organisation. Mr Lie may yet be persuaded to serve for at least another year; agreement on a successor is full of difficulty but not wholly impossible; and at a pinch the United Nations could make shift without a Secretary-General for some time. As for the damage done to the morale of the Secretariat by the McCarran committee's tactics, these directly affect only the American members of a multinational staff. The logical outcome of the committee's activities would seem to be a sharp reduction in the number of Americans serving in the Secretariat; and this might prove less embarrassing to Uno than to those members of Congress who brought it about.

None of these difficulties would loom so large if it were not for the atmosphere that surrounds them—an atmosphere of frustration and anger, born of the failure to stop the bloodshed in Korea. American impatience over Korea, heated by some of the brash statements made during the election campaign, finds vent in criticism of Uno's Secretariat and budget. Asian feeling about Korea, skillfully exploited by the Communists, contributes to the malicious attacks made in Assembly committees on some of the colonial powers. There is little doubt that Korea played its part in the different decisions taken by Mr Lie and by Mr Feller. And, with a curiously cynical indifference to their own casualties, the Chinese and Korean Communists have recently stepped up their pressure on the front to a degree that gains them

nothing of military value, but which is nicely calculated to increase the demand for a quick settlement in the free world and particularly in the United States.

Despite the bluntly negative attitude of Mr Vyshinsky (who is evidently empowered to reject truce proposals without even consulting the nominal belligerents in Peking and Pyongyang), further initiatives for a Korean settlement are being made, and it is too early to give up all hope of ending the fighting. The latest developments towards a truce are discussed in a note on page 521. The point that must be stressed is that, given the Communist technique of playing on the sincere longing of all western peoples for peace, those who now decry the United Nations are merely encouraging the Russians to raise their price for peace in Korea. Mr Stalin has frankly indicated his objective of opening rifts in the free world. What better start could he make than the destruction of Uno? And, failing that, what better consolation prize than to secure better terms for himself over Korea by presenting these as the only alternative to the collapse of the world organisation?

The Communists cannot have failed to note that their chances of destroying American support for the United Nations are the greater because that support was originally so strong and uncritical. Before the Korean war began, the American attitude to Uno bore a marked resemblance to British feeling about the League of Nations in the twenties. A healthy willingness to work hard and contribute generously towards the realisation of a great ideal was combined with reluctance to look too closely at the hard facts of the particular situations with which the United Nations had to deal. Intervention in areas such as Indonesia or Kashmir, in colonial matters or human rights, was enthusiastically endorsed; but the limitations of the organisation, the complications caused by some of its actions, and the strain that full implementation of its ideals would put upon the United States itself, were never realised. Perhaps the present time of troubles may yield one dividend in the shape of an

increased American readiness to see the United Nations steadily and see it whole, and another in a realisation among other nations that they cannot for ever rely on the United States to underwrite every decision taken by Uno.

On both sides of the Atlantic, this more realistic approach ought to have the effect of sorting out the true friends of the United Nations from its fair-weather supporters. To the realist, the mistakes and defects of the organisation are perfectly clear. But equally clear are the contributions it has been able to make towards limiting conflict in Greece, Kashmir, Palestine and Indonesia; its role as the common ground on which the lifting of the blockade of Berlin was secured; its many humanitarian and economic achievements; and, above all, its unique position as the rallying point from which, for the first time in history, nations in all six continents launched out on the common defence of a single victim of aggression. In the perspective of time, this last and boldest experiment may be seen to have changed the course of world affairs.

To destroy the organisation through which these things have been made possible, without putting anything in its place, would be an act of self-mutilation from which all but the most embittered minds would recoil. Yet there is, perhaps, a more subtle temptation. It has long been recognised that the United Nations possesses no impetus of its own; if it is not kept in motion, paralysis will quickly set in. It would be supremely ironic if, at the very moment when the world has made the ancient dream of collective resistance to aggression into a reality, it permitted its first effective instrument for that purpose to wither away. The gravest danger that threatens the United Nations is not that of being brusquely dissolved, but that of being quietly embalmed in honeyed words, to remain indefinitely as an unburied corpse above ground. If the events of the past fortnight lead to a new and realistic stocktaking, the United Nations may at least be saved from that fate.

Restless Iraq

THIS week and next, in the presence of kings, presidents and other notables, the Iraq Petroleum Company is holding impressive ceremonies in Iraq and Syria to mark the opening of the new 30-inch pipeline from the great oilfield at Kirkuk to a terminal at Banias on the Mediterranean. Kirkuk's output, always potentially great, has hitherto been limited by the size of the pipelines to Tripoli in Lebanon and Haifa in Palestine, and by the Iraqis' refusal to pump to the Haifa terminal since the birth of Israel. Now, production is to rise at speed. Kirkuk's output will jump from 8 million tons in 1951 to 22 million tons a year. When to this is added the smaller but also rising output of the fields run by IPC's two blood relations—the Mosul and Basra Petroleum Companies—Iraq's annual export of crude oil will reach 30 million tons in 1955. By the terms of the 50:50 oil agreement with the companies which the Iraqi Parliament ratified last February, the country's revenue from oil will therefore rise from 31 million Iraqi dinars in 1952 to I.D. 59 million in three years' time (1 Iraqi dinar=£1). Some conception of what this figure means can be gained by comparing it with the ordinary budget, which during the last decade

has ranged between I.D. 20 million and I.D. 25 million.

But Iraq is next door to Persia, and during the past eighteen months there has been speculation whether nationalism, which is strong, will drive the country to follow the Persian example and to paralyse its only industry in order to satisfy its pride. It has not done so partly because Iraqis do not find Persians impressive, and partly because Iraqi leadership in cabinet and parliament has, throughout the recent term of office of Nuri Pasha al-Said, shown a streak of common sense that places the need for national development above emotional considerations. At the moment, however, the prospects that this smooth management of national affairs will continue are not as bright as they were. A general election is due. Last July, in order that the election might be held without the taint of being rigged by the government in power, Nuri Pasha resigned, giving place to a caretaker team. The opposition to Nuri now feels that this team will work to his advantage, and it is pressing for changes not only in the cabinet that will manage the elections but also in the method by which they will be carried out. By statute, a new parliament must meet four months after the dissolution of the old—

in this case, four months from October 27th. Since an Iraqi election takes six weeks, it must begin shortly. Outward signs that trouble is feared are to be seen in the resignation this week of the Finance Minister, and in a new appointment to the Ministry of the Interior.

A restlessness that is taking the outward form of vituperative electioneering and argument whether voting shall be direct or indirect has deeper causes. Of these, by far the most profound and most difficult to eradicate is social despair. A rising middle class is hopelessly outnumbered and outvoted by a peasant population that is still in thrall to a small sheikh and landlord class; this class therefore rules the country and seems likely to continue to do so until a land reform occurs—for which the landowners will not vote—or until their sons have some measure of education, which will take a generation. Even this cursory description of the country's social structure is enough to show that only in a few towns does the apparatus of democracy produce a result that represents the view of the people. A majority in any Iraqi parliament therefore tends to favour tranquillity and to vote with the government of the day.

The disquiet of the urban intellectual at what he feels

to be a dead hand upon social progress can be imagined. Moreover, his group has for some time been feeling economic hardships that increase its dissatisfaction, and the events of 1952 have considerably stimulated his emotions. The year has brought him news of immense revenue from oil, but this has produced no results that he can see. He wants fruit, however unripe. He feels and says that the national development board, which for the

two and a half years of its existence has been receiving 70 per cent of the oil revenue, is "doing nothing"; this criticism is unfair, and arises from his ignorance of the time it takes to translate plans such as the Haigh Report of 1949 on flood relief and irrigation storage into specifications and contracts, let alone actual works. There are points to criticise in the development board's management, but slowness is not one of them. A second and sharper cause of his unrest is the news not from Persia but from Lebanon and Egypt. He reasons that if fundamental changes in leadership can take place so smoothly and easily as in these two countries, why should not the same thing happen in Iraq?

Expression of these feelings takes on a complex shape in current Iraqi politics. Five political parties are contesting the elections, three of them founded during the life of the last parliament and all based on loyalty to personalities rather than to differing party principles. One is the Constitutional Union Party, into which, late in 1950, Nuri Pasha welded a large section of the government's supporters in parliament; a second, similarly based upon landowning and tribal interests, is the Umma Socialist Party of Salih Jabr, founded in 1951.

Both these leaders have experience of office, and they are now the only serious contestants for it. They have been known to serve together but are at present rivals, one difference of note between their parties being that the first has a Sunni Moslem and the second a Shia Moslem leader. There has so far been no religious bitterness in Iraq between these two branches of Islam; but the Shia, who were as a matter of course the underdogs in Turkish days, are in fact more numerous and, with the spread of general education, their numbers could begin to count as a political force. Two other parties, the Independence Party of Mohammad Mahdi Kubba and the National Democratic Party of Kamil al-Chadirchi, enjoy the support of most of the discontented townsmen and students; their chief strength is their ability, in times of unrest and for limited periods and objectives, to rouse the urban mob. The fifth party—the United Popular Front led by General Taha al Hashimi—has won less public support, though it has the silent sympathy of a certain number of intellectuals.

At present, all parties except Nuri Pasha's want to change the present two-stage electoral system for a direct system, and they say that they will boycott the elections

if this it not brought about; all want abrogation of the Anglo-Iraqi treaty and "neutrality"; all the town-based parties want land reform and reduction of feudalism; some want amendment of the constitution so as to reduce the King's rights; some, the nationalisation of public services and of the oil industry. For the moment, interest in programmes has been brushed aside by the struggle for direct elections, which is being

conducted regardless of the hard fact that the practical issue is not the method of voting—which cannot affect the family and tribal hold on a majority of the seats—but whether and how far the process shall be rigged or free. Rigging is simple to achieve by such devices as appointment of scribes of "safe" views to record the wishes of illiterate voters, or of local supervisory committees that will announce the required result. Whatever the method of voting used, Nuri's party seems likely to head the poll, though direct elections might increase Salih Jabr's following because some Shia peasants might cease to vote with their Sunni landlords.

But the period in which unrest is to be feared is not the one after the elections; it is the three months before their result is known. At the moment, the task for all who have Iraq's welfare really at heart is to secure a caretaker government which will impart confidence to a maximum number of the opposition parties, so that all or most of them will participate in the poll. If they do not do so, the prospect that a caretaker government will be capable of maintaining order is not bright. Parties that are not campaigning are likely to be tempted to stir up trouble; that trouble is not far below the surface is

suggested by recent strikes, by refusals of peasants to pay rent, and—in one area—by a tribal clash which seems to have had nothing to do with politics but which has been interpreted by wishful thinkers as a first round between the followers of Nuri and the followers of Salih Jabr. Increased Communist activity during the past year does not lessen misgivings lest some spark at election time should touch off violent disturbances.

These would naturally serve Communism and not the public good. It is therefore in the self interest at least of the two principal parties not to let the situation get out of hand. They might avert trouble either by agreeing on a strong caretaker government, or by reaching some compromise on the question of direct elections—such as that of altering the electoral law as soon as this can be done by a parliament and therefore constitutionally. The basic facts are that only a strong government can run Iraq smoothly and that only one of the two major parties can produce such a government; that neither could have proceeded with immediate and

spectacular development financed out of oil revenue any faster than Nuri's government proceeded during the life of the last parliament; and that even a changed electoral law cannot alter the country's social structure and therefore its parliamentary structure, the basic causes of its discontent. To cure this there is no short cut except a dictatorship supported by classes other than the land-owners (of which there is no sign), or else a violent revolution. Otherwise the change must take time. Those who watched the young King Feisal open the valves at Kirkuk last Tuesday might well have contrasted the smooth flow of the oil with the turbulent nature of the problems that face him when he comes of age next May. He inherits a land that possesses the three boons of money, living space and water. It is, therefore, a land of promise; but it is also a country which, under the influence of education at home and lessons from abroad, will see great social changes in his lifetime. A generation of such profound changes promises him no easy reign.

Family Anatomy

THE preliminary results of the 1951 Census have now been completed in a second volume (HMSO, £2), based again on a representative sample of one out of every hundred. As before, the smallness of the sample will introduce some errors, but for most purposes this preview should be sufficiently accurate. Indeed, for certain sections there is no choice, for not all of the sample analysis will reappear in the full census tabulations.

The new volume draws the most complete picture of the British household that has ever been attempted. It shows it in its many different forms and traces how its size varies with the childbearing record among women of different ages and social status. How old is the head of the household? Is he—or she—married or single? How many incomes are coming into the household? How does age of marriage affect the number of children? In which occupations do parents have the most children?

Certain reservations about the Census answers to such questions must be made. A household is not the same as a family, for it also includes any resident domestic servants, lodgers or visitors on the night of the census. One section of the report attempts to separate some of these "outsiders," leaving what is called in true sociological style the "primary family unit"—the head of the household, his wife if married (or her husband), any children, close relations or resident domestic servants. After excluding visitors altogether, all but two million households were found to belong to this simple type. But for several reasons the Census cannot give an exact picture of the relationship between people living together in a single household. The exclusion in this particular analysis of nearly a million visitors from the households in which they were staying does not right their omission from their normal residence. Many thousands of husbands and wives were not enumerated together and there is no means of telling whether they were temporarily or permanently apart. Some 800,000 people were in hotels or boarding-houses on Census night, but casual visitors are not distinguished from residents. The table below, therefore, can claim to give no more than

a broad impression of the make-up of households.

Visitors are excluded throughout. In 251,000 households with a married head the wife, and in 402,000 the husband, was not enumerated on the schedule but is included here among married couples. So also are 115,000 missing husbands, and 17,000 missing wives among married couples without their own home. Widowed persons without children and without their own home are not included in the table.

There seems to be little doubt, however, that about a million married couples have no homes of their own.

	Numbers in Thousands of:		
	Married Couples	Widowed or Divorced Persons	Single Persons
<i>In own home without "outsiders"</i>			
And without relatives.....	9,268	1,656	609
With one or more near relatives.....	580	118	270
<i>In own home with "outsiders"</i>			
Without relatives.....	1,061	623	165
With one or more near relatives.....	64	24	44
Total in own homes.....	10,973	2,421	1,088
<i>In other people's homes</i>			
Those of relatives.....	802	550	*
Others.....	149	*	*

* Not obtainable.

Only some 37,000 of these are grandparents living in the home of a child; mostly they are younger couples living with the parents of one of them, and well over half have children. It is a pity that the Census has to stop short at this point; there were no questions that could show the extent to which these mixed households were a direct outcome of the housing shortage.

The Census deals with many other things, but it is the findings on households and families which are of most interest, and which are illustrated in the following two pages.

Nearly three out of every five households in Britain contain no children (a "child" is deemed to be under 16) and about one-fifth have only one child. In nearly 50 per cent of households there is only one person going out to work. Although most households without any earned income coming in are childless, there are some 200,000 with children but without a pay packet.

Three-quarters of all households have a married person as their head. Of those aged under 40, about 77 per cent had children, including step-children or adopted children.

The Census officials have been bold enough to work out a code of social classes. The household's class is judged by the occupation of its head. People unemployed at the time of the Census, or retired from a job, are included according

to their former occupation; but it excludes some 2 million households where the head was neither earning nor retired.

Any division into social classes must raise many doubts and probably some indignation here and there. The criterion has not been an income one but a somewhat undefined conception of the standing given to a type of occupation by the community as a whole. Nobody would quarrel with the placing of all judges in the top class. But in applying a single classification to an occupation which may have many different levels, some absurd anomalies must occur. A musician, for instance, whether he be a conductor of a national symphony orchestra or the leader of the local jazz band, is allocated to the same class—class III. And since this group sweeps in one-half of the households, it may be reasonably argued that the grading is too unrefined.

Yet there is no doubt that it produces divisions which do show different characteristics. One is in the numbers of earners in a household. Naturally there tend to be more earners per household the more people there are in it. But for the same size of household, those where the head is an unskilled labourer have the highest proportion of other earners; the professional classes have the lowest proportion.

No census was needed to show that the resident domestic was becoming a thing of the past, yet it may still seem surprising that the numbers have dwindled so sharply—they are no more than a quarter of what they were twenty years ago. Nearly 5 per cent of households in England and Wales in 1931 had one or more domestics living in; today the proportion is only just over 1 per cent. The multi-servant household has practically disappeared—only some 20,000 households in Britain now have more than one servant. These figures are not, however, a measure of the amount of domestic help; they exclude the daily "char" and the baby-sitter.

The most common age for women to marry in recent years has been 21 or 22. But one out of ten women marrying has done so at nineteen or even younger; just about the same proportion marry after reaching the age of 30.

Naturally the age at which women marry affects the number of children they have. In late marriages the time available for childbearing is short. Among all the married women aged 45 to 49 at the time of the Census—those, therefore, who had generally completed their families—only four out of every hundred of those who married under 20 were childless. With later marriage the proportion gets steadily higher.

The size of the family depends to some extent, therefore, on the age at which the mother has married. The connection is not, however, a simple one. Among married women aged 45 to 49, 3.70 children had been born on the average to women who married under 20, compared with an average of less than one child to those who were over 35 when they married. But if the childless marriages are excluded, the average size of family increases quite sharply for the later marriages. Even for those marrying as late as 40 and over, 1.5 children are born on the average to those women who have a child at all. When they have started a family, most couples, whatever their ages, are reluctant to confine it to one child only.

The mother's age at marriage is, of course, only one factor affecting the total size of families. The census of fertility makes possible some assessment of the other factors, social and economic. It shows clearly that women marry younger into the households of manual workers than into those of the professional classes. Of married women aged under 50, one out of every five whose husband was an unskilled labourer had married under the age of 20, but only one out of every twenty among the professional classes had married so early.

All classes have much smaller families than they had forty years ago, but the shrinkage has been sharper for the labourer than for the middle classes. Today, the family is

more uniform; no social class is very far from the average of 1.72 children per family where the mother is under 45.

The last chart shows the childbearing record for wives of different types of workers—a more distinct division than the broader social classes. Here the fertility record (of women under 50, married only once) has been adjusted for differences in the age and duration of marriage among the groups. If

this were not done, the clerical record would be even poorer, at 75 per cent of normal, for their wives marry comparatively late. Here, clearly, economic pressures are playing a large part in restricting families. Regional differences naturally reflect the occupational ones. Women in rural districts have more children than those in the towns, while London and the South-East, with its high proportion of office workers, is less fertile than any other region. But the one is not just a mirror of the other; the more sophisticated life of the towns is presumably an important influence.

NOTES OF THE WEEK

Softened Blow at Bevanism

If it had taken place under the old rules the voting for seats on the Opposition front bench would have been, clearly and unquestionably, a serious blow for Mr Bevan. In the first ballot for the twelve seats he scraped into the twelfth place with 108 votes. Ahead of him were not only Mr James Griffiths, with 194 votes, but a long list of Mr Bevan's most determined opponents; they were, in order of voting, Mr Chuter Ede, Mr Hugh Gaitskell, Mr Alfred Robens, Mr Hugh Dalton, Mr James Callaghan, Dr Edith Summerskill, Mr Emanuel Shinwell, Mr Philip Noel-Baker, Mr Glenvil Hall, and Sir Frank Soskice. These results showed unmistakably that the Parliamentary Party stands by its orthodox leadership. Even the middle-of-the-road group attracted little support in the ballot.

Under the former rules, these twelve would have been the members of Labour's parliamentary committee. Mr Bevan would have reached the front bench with a minimum of prestige and with his authority inside the committee accordingly impaired. But the changed rules, hastily adopted by the party the day before the ballot began, may prove to have softened the blow. Under these rules, only those candidates are elected who got a vote—one out of each man's twelve—from 50 per cent or more of Labour members. This happens to put the first six of the list directly on to the committee, leaving Mr Bevan and the others to go forward to a second ballot with the next six runners-up. Mr Bevan has with him in this second poll two of his supporters who would otherwise have fallen by the way—Mr Harold Wilson, who got 91 votes, and Mr Geoffrey Bing, who got 71 votes. But there is little comfort for the Bevanites in this second chance; it is quite possible that even Mr Bevan will be defeated.

His opponents now face an awkward decision. Many of them clearly want to keep Mr Bevan off the front bench, and they probably have the power to do so. But would it be too dangerous? If Mr Bevan is defeated in the second round, he will be able to claim that only a last-minute alteration in the rules has kept him from the place to which his popularity in the constituencies gives him strong claim. He can retire to the back benches claiming martyrdom once again, and the disciplinary rules cannot in practice prevent him from renewing from there his attacks on the official leaders. On the other hand, his presence in the shadow cabinet might also raise acute difficulties. They are inevitable in either case, so long as the Labour party remains in its present divided state.

The Transport Debate

Divisions among the Conservatives were less apparent this week, in the debate on the new Transport Bill, than many people had expected. The Government's supporters marched unitedly into the division lobby on Tuesday to give this first measure of denationalisation its second reading by a majority of twenty-six. Yet few major pieces of legislation can have ever gone forward in so malleable a state. The Minister of Transport went out of his way to emphasise the Government's willingness to consider modifications even to its third attempt at a scheme for transport. It may be an exaggeration to say, as did Mr Alfred Barnes in an able speech for the Opposition, that the Bill simply will not stand up in committee, but certainly it will get a severe buffeting.

The most powerful criticism of the Bill from the Government's own benches was made, as in the past, by Sir Ralph Glynn. In asking for an inquiry into its financial consequences, he suggested that there was no reason for violent hurry about the Bill. This, presumably, was the reason why his well-argued case got no proper answer from his own front

bench. After so much delay and hesitation, the Government now no doubt feels that its prestige will suffer if it does not get one major Bill into law early next year. There is, however, a better side to this determination. By no means all the criticism of the Bill from the right of the political fence is evidence that it is weak or unworkable. In small part, at least, it arises because the Government is standing up to pressure from some of the special interests among transport operators and traders who expect a Conservative measure to be tailored for them. Such a demonstration of independence is all the more necessary after Mr Churchill's remarkably plain confession that in interfering earlier this year to moderate the increases in London transport fares he had the imminence of the local elections in mind.

This confession provided the Opposition with its easiest point in the debate, but its case as a whole was skilfully put. Transport is a familiar subject for Mr Morrison, and he was ably supported by Mr Ernest Davies as well as by Mr Barnes. But it was left to Mr Callaghan to succeed in putting a relatively dignified gloss on Labour's latest and most outrageous threat to penalise people who act in good faith on the strength of an Act of Parliament. He suggested that a future Labour government might not merely limit compensation when re-nationalising road haulage; if necessary, it would simply refuse to renew the licences of hauliers who buy up the nationalised vehicles. That would certainly be a form of expropriation without compensation.

A New Plan for Korea

The free world will sympathise profoundly with Mr Acheson in the heavy decisions he must make during these last few weeks of responsibility without power. The American attitude of caution towards the latest Indian proposals for a truce in Korea would be understandable at any time. Today the Secretary of State is placed in a particularly difficult position. To back the Indian proposals would not only be to accept a course of procedure which yields a few more inches to the Communists with no guarantee of success. It would also commit the incoming Administration to a policy which discounts General Eisenhower's proposed trip to Korea, and might lay the Truman Administration open to specially bitter accusations of selling the pass on the very eve of changing of the guard. It is not surprising that Mr Acheson, so long harried personally by his political opponents at home, should hesitate.

A great deal must depend on the way the Indian proposals would be carried out if adopted. At their face value they represent an ingenious and feasible way of breaking the present deadlock over the prisoners of war by evading it. They also have the special point that they have been discussed with the Chinese before being put forward—though there is no suggestion of prior Chinese or Russian approval. The essence of the proposals is that, on an armistice being signed, all prisoners of war would be handed over to a four-power commission consisting of Sweden, Switzerland, Poland and Czechoslovakia. This commission would supervise repatriation; exactly how is deliberately left unclear. At the end of ninety days the case of any prisoners not repatriated would be dealt with by the general political conference called to follow up the truce negotiations.

There are many obvious loopholes in this procedure and it begs a great many questions. It does, however, meet the United Nations by avoiding the provision that prisoners will be repatriated by force, and the Communists by not requiring them to accept the principle of voluntary repatriation as a condition of the armistice. It represents in fact a possible lesser evil than continuing the war. When the two side

have taken stands which cannot be reconciled without one or the other retreating, but when the price of standing still is to fight a continuous pitched battle, there is something to be said for evading the issue by postponement. The trouble has so far been that it could not be postponed. If the supreme aim is to stop the war and then retire by agreement, this could now provide an honourable means of starting to do so. For Mr Acheson, with the American stake in his hand, the rewards of possible success may seem worth the risk.

Bonn Delays the European Army

Dr Adenauer has failed in his efforts to secure final ratification this year of the European Defence Community treaty and the contractual agreements with the present occupation powers. He has suffered setbacks from both the Upper and Lower Houses in Bonn. In spite of his pleas, the foreign affairs committee of the Upper House, consisting of the premiers of the *Laender*, has decided to await the verdict of the Federal Supreme Court on the constitutional issue before the House takes its vote. The Supreme Court does not begin its deliberations until November 26th. It will then have before it the request of President Heuss that he should receive a legal opinion before he signs the instruments of ratification. If the verdict goes against Dr Adenauer the treaties will need a two-thirds majority in the Assembly; and not even the greatest optimists believe that possible.

The Lower House this week decided to put off the final debate on the treaties scheduled for the end of this month. It is just possible that the *Bundestag* may still vote on ratification before Christmas; and to this extent the Germans may give the French a lead. But the Social-Democrats have another move in mind if the decision of the *Bundestag* goes in favour of the treaties. They propose to ask the Supreme Court to pronounce on another aspect of the constitutional issue, in addition to the President's request for a legal opinion. The long and short of these manoeuvres is that the *Bundesrat* will not debate the treaties until the end of January, or even later. It is thus very doubtful whether the treaties will be approved by all concerned before the French Assembly begins its debate.

The big temptation will be to wait until the French have made their decision, or even to put off the matter again until the German federal elections have been held in the early summer. The results of the recent council elections in three *Laender* have shown the Social-Democrats that they still have a good chance of ousting Dr Adenauer's government in favour of a new coalition headed by themselves.

With this prospect of further delays imposed on them by lawyers and politicians, it will not be surprising if the soldiers who have been working out the European army on paper for the last two years become impatient. Discussion has also started in the German press of pros and cons of alternatives to the European Defence Community; and the idea is growing that Germany needs an army in order to conduct an independent foreign policy. With an increasingly self-assertive tone, political writers are insisting that, if Germany becomes a direct member of Nato, it must be free from any American controls of its external as well as internal affairs.

Statesmen Fail in the Saar

The Franco-German dispute over the Saar has gone from bad to worse, as each side takes up new positions in public from which it will be hard to retreat. This is particularly unfortunate, as the best hope of reaching a settlement lay in postponing action until M. Schuman and Dr Adenauer could come to terms, and the federation of Europe could take shape. In spite of the advantages of delay, elections in the Saar are being held on November 30th with those parties banned that would like to change the constitution and reunite the Saar to Germany. An exception has

been made in favour of the Communist party, which is allowed to pose as a patriotic pro-German organisation. A German propaganda campaign, operated with funds supplied from the Federal Republic, is now in full swing. Apart from less obnoxious means of persuasion, leaflets reminiscent of the Hitlerite era are being distributed in Saar towns by "the resistance movement" warning the police not to interfere with "coming actions."

All the major parties in the Bonn *Bundestag* joined on Tuesday in recording a strong protest against the "muzzling of the fundamental rights of democracy" in the Saar. The assembly returned at the elections would not be recognised by the *Bundestag* as it would result from "the intrigues of the separatist power machine." The *Bundestag* approved the banned parties' appeal to the electors to stay away from the polling booths or to destroy their ballot papers; and it promised full support to the "oppressed Germans in the Saar." Dr Adenauer's statement for the government was not so hysterical as this protest, but it was strong enough to show that a serious deadlock has been reached in his negotiations with M. Schuman.

Developments seem therefore to be proceeding with the same disastrous inevitability that marked similar disputes after the first world war. The British and American governments approved the economic attachment of the Saar to France and its political detachment from Germany at a time when German nationalists dared not raise their voices. They are now faced with the distasteful fact that the French have had to take undemocratic measures to protect their acquisition from German agitators. Unless a concerted effort is made to prevent history repeating itself further, it is to be feared that the concessions that are being denied to Dr Adenauer will one day be granted to some nationalist demagogue successor to the German chancellorship.

Compensation in Moderation

The Government's proposals for town and country planning were published on Monday in a White Paper full of meat—some good cuts off the joint and some offal. The title—"Amendment of Financial Provisions" of the 1947 Acts—is a little misleading. It is only the financial provisions of the law that are to be altered, but the whole structure of planning rests on its finance; the proposed amendments will certainly change the practical effect of the remainder of the Acts.

There should be little criticism of the Government's method of dealing with the difficulties of the past five years' planning, of the period that ends next July. As had been expected, it proposes to abandon the compensation sections of the 1947 Acts, which require the disbursement of £300 million in saleable stock on July 1, 1953. Five years of investigation have shown that the admitted rights for development values existing on July 1, 1948, were worth in total about £350 million. The rights will be paid for in full as then valued, but only when their loss actually matures. Where it has matured already, the claims will be met in the autumn of 1954. But the Treasury will not pay anything to owners who, during the five years, have in fact sold their land at a price that includes its 1948 development value in addition to its existing use value.

In principle, these proposals restore sanity to part of the 1947 legislation by confining the payment of compensation to cases of real loss and excluding payments in cases where the loss is no more than hypothetical. Where a development charge has been paid and the land sold, the unscrambling of the compensation egg will in some cases be very complicated, and the justice of the provisions is bound to be at times, at least, a little rough. But no better alternative is apparent, and in this part of its proposals the Government is able at once to fulfil its election promise of a "drastic" overhaul and to claim the support of non-partisan opinion.

Development without Betterment

The financial structure that the Government proposes for future planning is less satisfactory than its way out of the present compensation muddle. It has, indeed, an attractive simplicity. The essence of the 1947 scheme was that the state bought development rights—out of the compensation fund—in X cases and the builder bought them back—through the development charge—in Y cases. That was a laborious way of providing compensation for X minus Y, and the Government proposes that in future money shall change hands only in X minus Y cases. This compensation may be claimed in two circumstances, when land is compulsorily acquired or when its use is curtailed by a planning restriction. In future public authorities will pay, on compulsory acquisition, the value of the land in its existing use plus the value of the development rights on July 1, 1948, if compensation for those rights has not already been paid. When a planning restriction is imposed, compensation will not in general be paid at all if the restriction is based on the principle of "good neighbourliness." This expression has an admirable sound but its practical meaning will depend on the words actually used in the Bill; comment must therefore be deferred.

In effect, these proposals treat development values—the element in the purchase price of land that is based on the prospect of its being put to a more remunerative use—as having been buried by the 1947 Act. This is a reasonable position provided that no consideration is given to the incentives for development. But the private individual or firm has no powers of compulsory purchase, and for him the effect of the new scheme will be to restore the rule of the dice box. The Government proposes to abandon not only the development charge in its present form but the whole idea of collecting betterment—the element in the value of land that arises from development in which the owner of a particular piece of land has played no part. If, therefore, an owner finds a private developer for his land, he can get, and keep, the full market price. That may be much more than a public authority needs to pay him; and if the authority afterwards chooses to sell all or part of the land it has compulsorily acquired, it can then get the full market value and pocket the difference.

This system offers neither much encouragement to the private developer nor equality of treatment to landowners. The arguments for dropping the development charge completely, without putting anything in its place, are certainly the weakest part of the White Paper. Fortunately, they need not be taken as the Government's last word. The short Bill published this week merely authorises the end of the development charge and sets aside the obligation to pay out £300 million next July. This is the simple and popular part of the proposals. The second stage of the legislation will not follow for twelve months, when the real difficulties will have to be faced. There is, therefore, time in which to explore the methods by which private development might be given more encouragement, betterment might be secured to the community that creates it, and an equality of treatment for all owners of land might be provided.

More Questions for Corporations

The Select Committee appointed last December to consider Parliament's relation with the nationalised industries has concentrated, in its first report, on questions to Ministers; but in doing so it has inevitably raised wider, and perhaps insoluble, problems. There is little difficulty in laying down broad principles about what questions can properly be answered in Parliament, but there is much difficulty in interpreting the principles in practice. The Minister's powers as actually exercised may be wider or narrower, according to the personalities concerned, than those laid down in the

statute; questions of day-to-day management may both illustrate and merge into questions of long-run principle.

By trial and error, a practical balance has been struck with which, on the whole, the Committee is content. It is concerned, however, about one interpretation of the rules. There has always been a ban on the actual repetition of questions already fully answered; this has been extended to cover questions "repeating in substance questions already answered or to which an answer has been refused"; and this amended rule is in practice used to forbid not merely verbal rephrasing but is also extended "from particular questions, readily identifiable, to whole categories of questions."

The effect of this extension is limited by the Speaker's discretion to admit questions to which answers had previously been refused, where these concern matters of sufficient public importance. But the committee is not satisfied with this concession. Agreeing that questions about detailed administration should not be permitted, it nevertheless believes that the present exclusion of whole classes of questions on the strength of a single refusal is too sweeping. The committee's solution is that questions otherwise admissible should appear on the order paper for the Minister to answer or not as he sees fit. Realistically but tentatively, it also invites the House to consider reducing the number of questions for oral reply from three to two per member per day. These recommendations are procedural only, but their effect would be slightly to tilt the corporations' present uneasy balance between dependence on the Minister and irresponsibility towards Parliament—to tilt it in the direction of dependence. Parliament surely ought not to make a decision on this one point until the committee has also offered its advice on the other aspects of the corporations' relations with Parliament.

Recession Recedes in Europe

The pessimists have again been proved wrong. A few months ago they foresaw an imminent slump that would engulf not only Western Europe but the whole world. Indeed, they had facts to bear out their gloomy forebodings. Production in practically all European countries had ceased to rise, and in many it had fallen; textile industries were sacking workers; overseas trade accounts showed alarming deficits. Fortunately this state of affairs did not persist. Already industrial output in all the OEEC countries except France is now recovering. Part of this movement is seasonal, but a part is also due to the underlying buoyancy of the European economy. And what is more important, inflationary pressures in most countries have been curbed so that the revival in trade this time will have a more solid foundation.

In Germany, unemployment is at its lowest level since January, 1949, and industrial output is continuing above last year's level. The rise in Italian unemployment appears to be arrested, according to provisional figures, and production has started to increase once more. In both Belgium and the Netherlands the textile industries, which were severely hit by the recent recession, are showing signs of recovery. In Britain, the Chancellor of the Exchequer, in a recent debate in Parliament, was able to show, some improvement and stated that employment in both Lancashire and Yorkshire (the two black spots six months ago) was now rising. Only the French economy is stubbornly resisting recovery; motor-car production is declining while unemployment and the number of business failures are increasing. On the other hand, French steel production last month was the highest ever recorded.

The underlying causes of this recovery are difficult to trace. Nobody thought that even a mild recession could be possible at a time when countries were devoting some 10 per cent of their output to rearmament. And yet it happened, though it was concentrated entirely in the consumer goods industries. American off-shore purchases, which have

amounted to over \$700 million in the fiscal year ending June, 1952, have undoubtedly helped countries to balance their overseas trade accounts and to keep their basic industries fully employed. Indeed the fact that activity in the basic industries was maintained greatly reduced the chance of a major recession. A significant feature of any slump is a declining trend in disposable income, which occurs usually through a declining output in the investment goods industries, since they supply income immediately and goods only later on. The consumer goods industries, on the other hand, supply income and goods more or less simultaneously. When their output declines, the reduction in income and goods is matched and so equilibrium is often restored fairly quickly. Europe seems to have proved this simple theory.

British Industry at Luxemburg

Weeks or even months may elapse before the association between Britain and the European Coal-Steel Community takes any tangible form. This will be a time of sparring and bargaining. But some hint of how the wind blows can be inferred from the first formal meeting in Luxemburg this week of the Joint Committee, which has the task of working out future relations. Putting the view of the coal-steel group, M. Monnet, president of the High Authority, stressed the importance of "common action, responsibilities, rights and obligations shared on an equal footing." In other words, the Community is still determined that in order to qualify for a share in the benefits of the scheme, Britain must also share some of its obligations—no British contribution to the levy on production, then no share in investment credits; no willingness to join the six in freeing coal-steel trade among themselves and erecting a common tariff wall, then only limited co-operation on commercial policy. Sir Cecil Weir, head of the British delegation, replied in terms familiar to continental ears. "In our view," he said, "the rules and regulations which will govern our relationship should be based on experiences in dealing with practical disputes rather than on general principles. As you know, we prefer an empirical approach."

It would be surprising if this cautious statement accurately reflects the sentiments of the British coal and steel industries themselves. If an amorphous policy of wait-and-see was all it had in mind, the National Coal Board would hardly have assembled at Luxemburg the most powerful delegation it has yet dispatched abroad. This action suggests that the British coal industry has had a profound change of heart. A year ago it regarded the coal-steel scheme with scepticism, even aversion, but meanwhile two things have happened; the Community now looks as if it will become a going concern, and the sellers' market for British exports is disappearing. In these circumstances the obvious interest of the industry lies in coming to terms with the only group of countries that could threaten markets or engage effectively in cut-throat price slashing. Much the same considerations must be present in the minds of leaders of the British steel industry.

At the recent meeting British representatives agreed to complete the same questionnaires as those being circulated to industries in the Schuman countries on production, investment and markets. Britain will not, at this stage, be invited to sit on any of the committees of the High Authority, but a joint secretariat will be established to study and co-ordinate the information collected. Any further progress must wait until after the Commonwealth Economic Conference, which has provided representatives of Great Britain with an iron-clad excuse for procrastination in a variety of contexts. There is every reason to believe, however, that ultimately the skirmishes at Luxemburg will cease and the two parties will reach a realistic settlement. For economic as well as political reasons, a working agreement is clearly just as important to the Community as to British industry.

Gatt Waives the Rules

At the latest session of the General Agreement on Tariffs and Trade (Gatt), the contracting parties granted the waivers necessary for the six nations taking part in the Coal-Steel Community to remain Gatt members in good standing. The provisions of the coal-steel treaty collide with the members' obligations under Gatt at four points. The first is their declared intention to abolish all import and export duties between themselves without passing on these benefits to other members of Gatt—a step that conflicts with the most-favoured-nation clause. A second is the proposal to eliminate quantitative restrictions among themselves without extending the same privilege to other contracting parties. In addition, three members of the Community—Holland, Belgium and Luxemburg—plan under the coal-steel treaty to impose tariff quotas for steel imports during a transitional period; these will be followed by an increase in the present tariffs on steel. Both actions amount to a withdrawal of concessions already granted to other Gatt members. Finally, during the initial period of the Schuman pool, Belgium proposes to protect its coal industry by quota restrictions, a measure that also conflicts with Gatt obligations.

Before consenting to grant these waivers, the other members of Gatt obtained definite assurances from the community that it would pursue a liberal international trade policy. The interests of both suppliers and buyers would be respected, and the common tariff against the outside world to be eventually established by the community would be lower than the present average of the six separate tariffs. These assurances are all very well on paper, but in the event of any transgression, Britain—the country most likely to be affected—might well find itself unable to mobilise effective support for sanctions. For example, the American Government is so anxious to see the Community succeed that it would undoubtedly adopt a tolerant attitude. Britain's weakness in this situation will strengthen those in this country who believe the best safeguard lies in very close association with the Community itself.

Rain on the Just

For two stricken hours last week the House of Commons debated an Order imposing purchase tax at 100 per cent on "parts and fittings of umbrellas, other than covers, ferrules, or material shaped for use in the manufacture of covers." Its motive was to be found in a particular piece of business ingenuity applied, in the best contemporary manner, not to technical progress or commercial expansion but to the more profitable end of baffling the tax collector. For good and obvious reasons, very small producers with an output below £500 a year are exempt from purchase tax. In this an ingenious manufacturer found an opportunity. Buying "a number of moribund companies" but preserving their legal identity, he devised a plan by which these companies bought umbrella components in their own names and "employed" the parent company to make up and market the finished umbrellas, nominally on their behalf. None of these puppet firms handled over £500 worth of output; no umbrella, therefore, paid purchase tax; the Exchequer lost between £10,000 and £20,000 a year; and the more virtuous or less ingenious umbrella-makers suffered a competitive disadvantage of some eight shillings a gamb. This, Authority decided, would not do; and the organiser of corporate outwork has been checkmated by an unavoidable tax on his raw material.

So far, so good. But "the rain, it rains with equal force upon the just and unjust fellers." What, said various indignant members, of the genuine small firm, penalised for no fault of its own; what of the still smaller repairers whose trade will be priced out of the market; what of the walking-stick makers, who, because certain components of their product are indistinguishable from those used in umbrellas,

House on the cards

However conveniently you live (thanking TI for ready hot water, well cooked dinners and well ironed shirts) the future holds surprises. There seems quite a chance that the house of tomorrow will draw all its heat from the soil in the garden . . . that your telephone will take messages by night and pass them on in the morning . . . that your food will be cooked by radio-frequency waves. It's by no means impossible that your clothes will be cleaned by sound instead of soap. . . . What's the link between scientific principles and practical politics? Component parts. When TI is consulted about the components, good ideas take shape.

must suffer higher costs? (One safeguard indeed remains. Ferrules remain untaxed. Why? Because even plain wooden sticks need ferrules; these sticks, painted white, are used by the blind; it is ethically revolting to tax white sticks, administratively impossible to distinguish the future white stick from the permanently self-coloured; so plain wooden walking sticks, and their equally unidentifiable ferrules, must not be taxed. QED.)

Is it really beyond the wits of the Department of Customs and Excise to emulate the Inland Revenue and find some less cumbrous means of dealing, case by case, with devices to avoid tax? Would it not have been better to reduce the rate of tax on finished umbrellas—no luxury, after all, in this climate—and so to take most of the gain out of an intrinsically rather inefficient form of business organisation? Above all, has this absurd legislative episode caused any salutary uneasiness in official minds about the merits of nice fiscal manipulation as an instrument of policy, about the merits of sledgehammers as a means of cracking nuts?

Tidying up Church Schools

The new Education Bill, published this week, merely clears up some anomalies in the working of the Education Acts of 1944 and 1946. Its most important provisions relate to the building of voluntary schools and are designed to ensure that the churches play the part in the educational system that was assigned to them eight years ago. One such provision relates to "aided" and "special agreement" schools. These are mainly some 1,800 Roman Catholic schools for which local authorities pay half the cost of structural maintenance. The Act of 1944 provides that, wherever a rehousing scheme has brought a "substantial number" of pupils from one of these schools, the Minister of Education can grant to the denomination concerned up to half the cost of a new school building to accommodate them. In practice, however, the children have not arrived in substantial batches. They have trickled into the state schools, and having once done so, they no longer qualify as pupils displaced from voluntary schools. The Bill extends the definition of displaced pupils to cover all those who, in the opinion of the Minister, would have attended a voluntary school if they had not had to move, even though they have been to a state school meanwhile. It thus automatically increases the size of the grant that can be paid towards building a new aided school.

Another form of help is provided for "controlled" schools—that is, Church of England schools entirely financed by local authorities but having one-third of their governors representing the Church. Under the Bill local authorities will have a new power to build controlled schools. This will be important in areas where there are perhaps two or three existing schools which it is unsatisfactory to extend or attempt to bring up to standard. The local authority will be able to build one big controlled school to serve the whole area. The Bill will also allow it to enlarge a controlled school for the sake of providing more places in secondary schools.

The rest of the Bill clears up minor points. The duty of local authorities to provide a school dental service by appointing their own officers is explicitly stated, instead of being left implicit, as it was under the 1944 Act, in the clause about the school medical service. Where the local authorities are to find their dentists remains to be seen, but evidently dentists are expected to drift back into the service now that charges are made for visits to them under the national health service. When the Bill is in committee there will no doubt be an attempt to make it unnecessary for local authorities to refer to the Minister the appointment of their chief education officers—an obligation that is resented as an encroachment on their autonomy. But in general this Bill, though it fulfils a Conservative election pledge, should be assured of an easy passage as a piece of non-controversial tidying-up.

Pique and Pieck

In France both the Gaullists and the Communists are passing through moments of crisis and self-mutilation. The Communist Party is trying to fight down the shadow of its more militant past in order to lead the ranks of peace-campaigners and united fronts. But it is proving awkward to drape olive branches around hammers and sickles, and doves will not always alight on sub-machine guns. It is seven weeks since the first communiqué was issued about the left-sectarian activities of MM. Marty and Tillon, who were accused of insubordination to the party and lack of loyalty to M. Thorez, its faraway and beloved leader. A rigid and complete act of self-criticism was demanded from them, yet neither has complied. Their case has now been referred to the central committee and the final act of ostracism may soon follow.

The extent of their tenacity and the fact that both men should harbour hopes of a change in the party line betrays the confusion which at present afflicts French Communism. M. Tillon has been extremely popular with left-wing Resistance circles and his exclusion, if it occurs, will be yet another symptom of the undercover battle going on between Moscow men and French Communists of the glorious anti-Nazi days. A recent skirmish in this battle resulted in the banishment from the party of Georges Guingoin, former chief of the Maquis in the Haute-Vienne and Mayor of Limoges. Several local cells have refused to obey the central committee's decree and one, in mocking reference to M. Duclos's professional past, has declared "that one Marty was worth all the pastrycooks in France."

Why is the French Communist Party so determined, at this very moment, to silence some of its most heroic adherents and to tone down its memories of the Resistance? A major part of the answer is to be found in Eastern Germany, where President Pieck has launched a powerful campaign for

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, *The Economist Diary* is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, man-power, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 42/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of *The Economist Diary* are given in an illustrated pamphlet available from:

Diary Department, *The Economist*,
22 Ryder Street, St. James's, London, S.W.1

Franco-German collaboration against imperialism. The press in east Berlin is devoting increasing space to the question of a close understanding with the French people and with such neutralists as the Catholic editor Jean-Marie Domenach and the deputy Henri Bouret. It is expected that particular emphasis will be placed on French-German amity at the Vienna Peace Congress in December. Despite the traditional agility of the Communists, it would be difficult for men such as Tillon or Guingoin to share a platform with German colleagues. Even the pronouncements of a Soviet Party Congress do not entirely obliterate the memory of Belsen for many French Communists and partisan fellow-travellers. But for M. Duclos and his orthodox subalterns, these difficulties are mere figments of deviationist sentimentality; M. Duclos will share a platform with anyone who can further the Stalinist cause. He is at present trying to eliminate those who cannot imitate his catholicity of taste. Whether this process may not prove of extreme peril to his party remains an open question.

Victory for Papagos

Not since the sweeping victory of Eleutherio Venizelos in 1928 have the Greeks shown themselves so much of one mind about who they want to govern them. At last Sunday's general elections Field-Marshal Papagos and his Greek Rally were swept into power with an overwhelming majority of 178 seats. His chief rival, the Liberal-EPEK coalition led by General Plastiras, gained all the remaining 61 seats, but

there was a formidable holocaust of its leading figures; twenty-three ministers and under-secretaries in the previous EPEK-Liberal government, among them General Plastiras himself and MM. Rendis, Tsaldaris and Cartalis, fell by the wayside. The extreme left-wing EDA, which had received the support of the exiled Communist leader, Zachariades, over the Free Greece radio, polled slightly fewer votes than last year, but under the majority system of voting lost all the ten seats it had previously held. Although the Greek Rally, on the other hand, benefited greatly from the new system of voting, there is no doubt about the decided swing of the popular vote in its favour; whereas last year it received 624,316 votes, or 36.53 per cent of the total, this year it got 779,982 votes—49.36 per cent; and if the army had been allowed to vote, it would have done even better.

At last, Greece now has prospects of a period of strong and stable government. The new administration will probably be strongly conservative, but there is no real danger that Field-Marshal Papagos will attempt a military autocracy; on the contrary, he is strongly opposed to military interference in politics. Nor is there much danger that the new Prime Minister will be gravely handicapped by divisions and disruptions within the Greek Rally. Those politicians who jumped on to Papagos's bandwagon for purely opportunist reasons do not form a dangerously large proportion of his majority. If they decide to jump off again he should not be greatly discommoded, and if they try to bargain with him he can afford to ignore them—a fact which may deter many from making the attempt. It is more likely that the EPEK-Liberal opposition, which took under its wing a very motley collection of politicians, will disintegrate into its component parts.

The generalities in the Field-Marshal's election speeches gave few clues about his detailed plans; but at first sight his cabinet, with the energetic M. Markezinis in charge of economic planning, promises well. Papagos has always held out for an adequate majority of his own and no collaboration with other parties. Now he has got his way, it remains to be seen whether he can make the most of his opportunity.

Bars or Bobbies

It is a curious fact, and one that was mentioned by Lord Simon in withdrawing his motion on prisons in the House of Lords this week, that a public which is distressingly eager to read about crime and criminal trials is quite indifferent to what happens to the criminal as soon as he has been sent to prison. It is a curious, and perhaps significant, fact that whereas a month ago no fewer than four judges spoke in the debate on corporal punishment, not one thought it fit to speak this week about prisons, the form of punishment that was revised and strengthened by the Criminal Justice Act of 1948.

The overcrowding of prisons, the shortage of staff, the long dreary hours spent in the cells—all this has been told before in the prison commissioners' annual reports and retold more dramatically in the report of the Select Committee on Estimates a few months ago. But in this week's debate the Lord Chancellor was able to take the story a little farther and show that, in spite of the great limitations on spending and building, the commissioners are making slow but steady progress in providing new accommodation. Since the war, they have added seven cellular prisons, nine open prisons and eight borstals, and a start will soon be made on others. A ban placed by the Government on the recruitment of more prison officers has been lifted, and with more staff goes the hope of giving prisoners a longer working day.

The commissioners are, indeed, often frustrated by the local objections that are raised when they try to start a new prison, especially of the open variety. If people appreciated the importance of better prison conditions in combating

crime, perhaps fewer objections would be heard. But it is far cheaper to prevent crime than to punish it. The prison commissioners' task would be much relieved if the limited money were spent on getting the police force to its full strength. It is certainly not flogging, it is not even prison, that is the most effective deterrent to crime; it is the likelihood of being caught.

Plea for Municipal Munificence

By producing an official report that is both pleasant to look at and vividly readable, the Arts Council has set a fitting example. But the story it tells does not give unmixed pleasure. Despite the many achievements recorded, there are reasons for alarm about the future of some of the institutions now receiving the Council's support.

Of the Treasury grant of £575,000 for 1951-52 (excluding a grant for the Festival of Britain) £236,000 was spent on Covent Garden, Sadler's Wells and the Old Vic. None of these is paying its way. For ballet and opera this may be inevitable. Even with a full house each performance of grand opera loses on an average £540; and although there has been a small increase in the price of seats, this is a remedy that must be applied very cautiously if it is not to finish the patient off—now that box-office takings have sharply declined from the high levels of last year. The Old Vic's losses were perhaps less due to circumstances beyond its control, for it was a year of resignations and controversy. In the new season its finances have improved, and they should improve still more if progress can be made with two proposals now under discussion. One is for an Old Vic-Stratford axis, with an exchange of productions. The other is for releasing productions from fixed runs, so that failures need not be kept on for weeks or the public be prematurely deprived of outstanding successes like that of *Romeo and Juliet*. To make this change is not easy, however. The Old Vic pays a maximum of £45 a week to its stars, and as they can earn perhaps £350 a week on the commercial stage, and more in film work, they do not want to sign up for long.

The symphony orchestras live permanently in an atmosphere of crisis, and their plight will not be improved if the industrial court, which has recently heard a claim by the Musicians' Union, awards a wage increase. The Arts Council and their home towns have so far been able to tide them over each wave of the emergency, but a wider and more solid basis is needed. This could be provided by contributions from the lesser local authorities in their geographical regions; but when an appeal of this kind was recently made by the Birmingham Symphony Orchestra, it did not meet with great success. Few authorities will agree that to give their

aid to music, drama or painting is no different in kind from giving it to a public library or museum. Yet, as the council's report observes,

if the arts are to survive in the equalitarian State, some form or forms of collective patronage must assume the obligations formerly sustained by the private benefactor.

Counting Italy's Votes

The new electoral agreement among Italy's four centre parties is a major success for Signor de Gasperi, the Prime Minister. He has often been strongly opposed within his own party, the Christian Democrats, for attaching too much importance to coalition with the smaller, lay parties. Nor has it always been easy for the leaders of the Social Democrats, the Republicans and the Liberals to secure support among their own followers for political alliances with the Christian Democrats which the latter are bound to dominate by sheer weight of numbers. The most important terms of the agreement are that the four parties will support the government's new electoral reform Bill and will fight next year's general election with affiliated lists of candidates, which may not be added to without the consent of the parties already on them.

The effect of this agreement will be to secure the passage of the proposed electoral reform through parliament and probably the return of a government of the centre for another spell of five years at the forthcoming elections. The essence of the reform is to allot 385 seats out of the six hundred in the lower house to the group of parties coming at the top of the poll. This ensures that they have a strong working majority. Such a far-reaching proposal has naturally been causing many political searchings of heart during the past few weeks. Some people gravely doubted its practical wisdom; if the centre parties do not come head of the poll, power will have been handed to either the Communists or the extreme right on a plate. Others quarrelled about the proportion of seats to be given to each party in the coalition. And the Communists themselves bitterly opposed the whole plan—as they still do.

In a sense Italy has abandoned proportional representation by this proposal without going over to a system on the English model; if the new Italian law existed in Britain, Mr Attlee would now be in Downing Street. But the idea is as morally defensible as it is ingenious. The opportunity for victory is still open to all: indeed the risk to the centre should not be dismissed too lightly. Yet if democracy is to stand up against the attacks of those who use it simply to destroy it, the true democrat must be allowed to forge weapons with which to defend himself.

Letters to the Editor

Shades of Himmler

Sir,—I read the article in your issue of November 1st with great interest. I believe that the majority of Germans will agree—as I do—with the opinion given in that article. There are, however, two points I would like to make:

(1) On page 284 you write

It is unthinkable that France and other members of the EDC would allow their serving soldiers—even if they were willing—to work with former members of Himmler's special and shock troops.

How is that compatible with the fact that France makes big use of former

SS-men in her troops in Indochina?

(2) After the war Germany was disarmed and any German was forbidden to bear arms, even for defending his country. But nevertheless France has been doing its best to hire Germans as troops in Indochina since the end of the war and does not object to hiring former SS-men for this purpose. And that is done in German territories against existing German laws.

If, as you pointed out in your article, the western world objects to the use of former SS-men in the future European army, then the western world should not use these soldiers in its colonial

armies. Otherwise, some doubt will be felt whether there is one law or two.—
Yours faithfully,

Wiesbaden

W. MAUSS

[It is true that the French have taken Germans, including men of the *Waffen SS*, as volunteers to the Foreign Legion. But it is well known that the principle of the Foreign Legion is to draw a veil over a volunteer's past; and there is no parallel between it and the future European army. Our proposal was, moreover, confined to men who had volunteered for the *Waffen SS*, and not to the hundreds of thousands who were drafted into it towards the end of the war.—
EDITOR.]

Strike on the Copper Belt

Sir,—Your note on the Northern Rhodesian copper strike discloses a state of affairs most saddening to industrialists in the British West Indies. In Jamaica, citizens of African race hold high positions in every field of industry. Black and coloured managing directors, general managers, chief engineers, chemists and agricultural superintendents are among the ablest in the sugar industry, and as fine a set of men as one could discover in any part of the world. Experience here proves what is obvious to all but the bigoted, namely that, if given the education, experience, and opportunity, the black man has every bit as much ability as the white in every walk of life.

It is bad enough to see these un-Christian and potentially disastrous policies followed by the Government of South Africa. It is truly shocking for such things to be allowed to happen in a British colony. I therefore extend a cordial invitation to employers and managers in the Northern Rhodesian copper belt to come over to Jamaica to learn what people of African descent can achieve in industrial and agricultural management, when provided with the opportunity and incentive.—Yours faithfully,

R. L. M. KIRKWOOD,
Chairman
Sugar Manufacturers' Assocn.
(Of Jamaica) Ltd.

British Motor Industry

Sir,—As a Dutchman and as a car enthusiast I should like to make a few comments on Mr H. Meyer's letter in your issue of November 8th.

It can readily be conceded that the English models are somewhat cheaper and of superior appearance than the German Volkswagen; but to say that the Austin A-30, the Ford Prefect, and even the Ford Anglia "are all superior in many respects" is ridiculous. It may be that the English cars are more convenient and more pleasant to the eye; alas, as motor-cars, in their essential task they simply cannot be compared to the Volkswagen.

Any stock Volkswagen can easily stand a run of hours on end at full speed, meaning the foot all the way down all the time and doing about 70 mph. Any of the English cars mentioned above would be ruined after such handling and would never have attained the same speed. In road holding, spring action and steering, the German car is as steady, responsive and docile as a really first-class make, enabling it to go through curves at a speed which would turn turtle the English cars. These features, combined with low petrol consumption and a very simple and dependable air-cooled engine, cannot but make up a satisfactory car.

The Volkswagen is in its class a superior vehicle and it is no use pointing to certain minor defects in appearance, convenience and, perhaps, noise—which, after all, are only side issues. Every driver who has had the opportunity of testing a Volkswagen in the open will immediately recognise its qualities. Consequently his custom will be lost to an industry which as a counterpart can

only offer an Austin A-30, a Ford Prefect, a Ford Anglia or a Morris Minor, even if he by nature prefers English models.

I predict that if the British industry does not at once develop a car with qualities at least comparable to those of the Volkswagen it will find itself all but pushed out of the small car market, which in the long run would not be to the benefit of any of us.—Yours faithfully,
Amsterdam M. P. STREUS

Food and Roads

Sir,—Your correspondent Mr M. E. Weinstein suggests that increasing agricultural production on our remaining acres will far outweigh any losses on account of road development. This may well be true and I gladly acknowledge the contribution of the motor industry in this direction. But this does not mean that there is any room for complacency. There are on this earth something like 2,400 million people, perhaps half of whom are underfed. The net increase is about 20 million every year. World food production is increasing too, but less rapidly. The short-term implications of this situation are surely that while we have now to export our manufactured goods in a buyers' market, we must buy our imports of food in a sellers' market. The long-term implications are that we can no longer take it for granted that all the food we wish to import will be available. Every road construction scheme must therefore be closely scrutinised from all angles before even a few acres of agricultural land are sterilised in perpetuity.—Yours faithfully,

H. JOHN TOOBY
Bransford, Near Worcester

Soviet Central Asia

Sir,—With reference to your recent articles, it seems extraordinary that the colonial powers, Britain, France, Holland, etc., submit to repeated interference at the United Nations in the domestic affairs of their possessions without ever drawing attention to conditions in Russian colonies.

Surely all backward peoples should be brought within the orbit of the United Nations Trusteeship Council and not merely those who happened to change their allegiance after the 1914-18 War.—Yours faithfully,
London, W.8 D. H. STEELE

Meteors for Cotton

Sir,—I am astonished to learn from your issue of November 8th that a barter deal with Brazil is to be permitted and I find it hard to believe that Mr Thorneycroft "can do nothing to stop a private transaction of this sort." The Treasury and the Board of Trade have never found any difficulty in stopping such transactions in the past, as those who have tried to promote them know well.

In the last few years certain companies with which I am connected have put up numerous similar proposals, only to have them consistently rejected. We learned at an early stage not to use the words

"barter" or "compensation," which were anathema to the authorities. We spoke of "two-way deals," we used such expressions as "reciprocal trade," but to no avail. Every suggestion, however advantageous financially, however beneficial to the export trade, was turned down flat. The very idea that it might be possible to export at a loss and cover that loss from the profit on a compensating import, or vice versa, was apparently regarded as immoral.

It may be, as you say, that there are some objections to this particular transaction. If, however, official acquiescence in it heralds a change of policy at the Treasury and the Board of Trade and a belated recognition that, in the absence of all other possibilities of trade, barter deals have their redeeming features, I and many other struggling and frustrated traders will welcome it wholeheartedly.—Yours faithfully,

Paris ● J. C. WHARRY

Eggs Going to Town?

Sir,—Mr Sainsbury, in his letter published in your issue of November 15th, puts the point of view of a retailer.

Under the present system the retailer has a government-guaranteed margin of profit, no worries about buying or selling and, for all practical purposes, freedom from competition and a conditioned queue of customers ready to be fed by the hand they cannot bite. It is a system that would appeal to the established business and the bureaucrat, but it is harming the country and our digestion.—Yours faithfully,

London, W.8 D. V. KING

D-Day for Furniture

Sir,—In your issue dated November 8th you state in your reference to the furniture industry "This is a moment that the industry has been dreading ever since the budget."

I think you are completely wrong over this. I have never heard of anybody dreading this moment; everybody I speak to is looking forward to the time when the utility scheme for furniture is swept away in favour of the "D" plan.—Yours faithfully,
Croydon J. A. LAWRENCE

Unfortunate Testament

Sir,—Your characterisation of Professor Laski in your autumn book supplement as "shyster" hardly meets the very high standard of propriety in public controversy that one expects in England. It is saddening to find even a single example, in the higher reaches of British journalism, of the *argumentum ad hominem*; shocking to see ability poniarded for what could be any human's share of weakness. Professor Laski, a frail man physically, gave himself unreservedly to his students, to his school, and to his conception of a better world. If in so doing his resources eventually ran low, we should recollect the advantage that all of us had during the years in which they were being spent.—Yours faithfully,

London, N.10 R. WULIGER

Decline and Fall?

Professional People. By Roy Lewis and Angus Maude. Phoenix House. 284 pages. 18s.

What makes a professional man? The possession of difficult skills attained through a regulated course of training and subjected to recognised tests; the solidarity of professional brethren; the existence of organised professional bodies serving for discipline and for common action—these link the profession on the one hand with the “mystery” of the medieval gild and on the other with the modern skilled trade union. More and more often, one meets the opinion that the professional man is simply a particular kind of skilled technician or expert, distinguishable only by snobbish class feeling from the trained artisan. Politically, it follows, he should line up with the artisan; economically, he should expect no more differential reward than the few shillings daily which mark the superiority of the artisan over the labourer; socially, he should assimilate himself to the artisan's ideal one-class society; ethically, he

should accept the artisan's relationship with client or employer—a cash nexus modified at best by public spirit and pride of craftsmanship.

The authors of “Professional People”—whose “English Middle Classes” will be remembered for its solid scholarly quality and entertaining manner—will have nothing to do with this idea. They recognise the kinship of the profession with the gild and thus its collateral relationship with the union; they trace, indeed, in detail and with humour, the growth of the learned professions from their humble back-door beginnings. They recognise the accession of new disciplines and skills to professional status. But for them the essence of that status is the professional ethic, the non-economic, fiduciary element in the professional attitude.

The authors see this element as an essential component of healthy social life; they see it today beset by dangers arising from the coincidence of the Cult of Bigness with the Cult of the Common Man, from the paper perfectionism of a welfare state intolerant of its own limitations, and from the sheer economic pressure of egalitarianism on the standards of professional life. There is the danger of loss of independence where the state is sole employer or sole guarantor of professional income. There is the danger of dilution, the lowering of standards in order to eke out a strictly limited supply of professional ability to meet the unlimited demand of over-ambitious social welfare schemes. There is the danger of dilution in a wider sense, the deterioration of the professional ideal resulting from the growth of new bodies which claim parity of esteem with the older disciplines but do not make equal ethical demands on their members. There is the danger of over-specialisation, loss of contact with the humanities, a danger exacerbated by deprivation of leisure.

The analysis opens up a depressing vista at the end of which there appears, to the speculative reader, the figure of the new professional man, the utility model. Salaried, he is at best a conscientious technician, a dull dog intent on struggling without too much discredit through a stint which grossly overtakes his inadequate mental powers and still more inadequate education. Dimly or grimly he will cling, for a generation or so, to older virtues, doing his best regardless of the economic calculus, remembering that certain things are expected of the scholar and gentleman whom, once upon a time, his qualifications would have shown him to be; eventually he will revert to the old status of pettifogger, apothecary or scrivener. Free lance, he is a privateering Ishmael, uninhibitedly acquisitive, despising the subordinate, pension-earning majority, hating it for its power to vote the fruits of his skill out of his

pockets into its own, and getting his own back on it by scamped work, faked tax returns, and general fiddling. The authors draw no such distasteful picture, but it is implicit in their findings.

It would be wrong to give the impression that this is a dreary and self-pitying book. It is highly entertaining, extremely stimulating, and full of fighting high spirits. Readers of “The English Middle Classes” will be glad to know that the standard of the chapter headings, like that of the writing itself, is as high as ever.

Fact Without Illumination

A Short History of the International Economy, 1850-1950. By William Ashworth. Longmans Green. 256 pages. 18s.

The title of this book is intriguing, but the title is more ambitious than the subject-matter. The first two-thirds of the book are not about the international economy at all; they are a potted economic history of the leading European countries and the United States, with occasional reference to others. Here the emphasis is on changes that are common to all—the growth of industry, the transformation of agriculture, the building of railways, the growth of large-scale enterprise, and the usual range of topics. The author is very knowledgeable and writes well, but he packs too much material into a small space. There are too many facts for the casual reader, and not enough for the serious student, who, in addition, would appreciate the book much more if it carried footnote references, so that he would know where to find fuller discussion of points that he wished to follow up.

The history of the international economy is covered in the last eighty pages, allowing only 23 pages to the crucial period, 1850-1914. Having announced in his preface that he prefers to rely upon “historical method” rather than upon “any theoretical system,” the author confines himself to giving us “the facts.” Before 1914 international trade expanded a great deal; there was a lot of migration, and of foreign investment, and so on. He does not ask why this happened, at all or at this particular time, and is therefore, not surprisingly, unable to tell us why it did not continue to happen after 1918. Is it meaningful, without a system, to try to make sense of a mass of material? The procedure is not scientific and the result is not illuminating. All the same, since this is the usual procedure in writing economic history books, and since this one is not less illuminating than are most other such books, it would not be fair to complain too much about what the author has failed to do. Wide reading and skilful summarising have gone into the book, and it will prove useful to anyone who is seeking a short introduction to the economic history of the past hundred years.

The Inaccessible Countries

The Tragedy of the Baltic States. By J. A. Swettenham. Hollis and Carter. 116 pages. 15s.

Many Englishmen who had never heard of Estonians, Latvians or Lithuanians before they met some of them as displaced persons in Germany or as refugees working in this country after the war, were so much struck by their virtues and moved by their plight that they determined to make their case known to those who have eyes to read. Mr Swettenham is the first of those Englishmen to succeed. But it is only a partial success, for his equipment is that of a soldier rather than of a writer, and his book is neither easily readable nor altogether convincing.

According to the sub-title it is “a report compiled from official documents and eyewitnesses’ stories.” The documents are not new to English readers; they have already been made available in translation. Nor are most of the eyewitnesses’ stories, which are quoted from books published in London. It is useful to have this selection, but it would be more useful if the sources were clearly and fully indicated. In the case of new stories there is no indication of sources at all; we are told general tales of atrocities and must take them or leave them.

No corner of Europe has been so inaccessible from the West as the Baltic republics for the last twelve years. They were under Nazi occupation from 1941 to 1944, and there is a great deal of

German information to be collated. For the rest the only sources are Soviet official documents, newspapers and broadcasts, the reports of two or three Swedish travellers, and the accounts of refugees. Mr Swettenham has not looked at the German or Swedish evidence or at the Soviet press and wireless news, and even the refugees’ stories he has not attempted to sift. No doubt his heart is in the right place, but for an historian patriotism—even other peoples’ patriotism—is not enough.

The Paradoxical Revolution

The Big Change, 1900-1950: America Transforms Itself. By F. L. Allen. Hamish Hamilton. 308 pages. 15s.

Mr Allen would have to confess a degree of sympathy with the boy who even after seeing the giraffe at close range resolutely persisted in his conviction that there was no such animal. In the final pages of this exploration of the meaning of the course of American life during the past fifty years Mr Allen is staring up at the subject of his portrait and inquiring, “What have we got here?”

As he himself acknowledges, his answer has little of novelty to recommend it. Its essentials have already been put forward by the editors of *Fortune*, in “U.S.A.; The Permanent Revolution” as well as by others. The view may be summarised as a paradox. The Americans “have not been constructing a

system as such, but tinkering with and repairing and rebuilding, piece by piece, an old system to make it run better.” But in the course of this tinkering they have in fact created a United States that is evolving towards a civilisation completely different from any other of the past or present. They have created what Mr Allen believes to be “potentially the most revolutionary force on earth.” This “evolved system,” he holds, has long taken in its stride problems for which Marxist theory attempted to provide a solution during the nineteenth century.

Mr Allen has traced the course of American life with the same skill he brought to his earlier picture of the twenties and thirties, and in this more comprehensive task he has been considerably sobered by its huge dimensions. His book will be read all the more attentively in this country because it is an interpretation which has provoked wide discussion in the United States itself.

so odd, and so deeply rooted in the conventions of English life, that one could hardly expect it to offer much guidance to those who have to deal with a similar problem in America. That is the conclusion reached by all three authors, whose memoranda, independently produced for a private committee, are here published side by side. But if America cannot profit directly from their work, Great Britain can. Three trained minds, attacking the question from similar but not identical standpoints, and reaching similar conclusions, give an admirable stereoscopic view of the system.

They are agreed that, at present, it works; by a quiet process of personal contact between like minds, it reconciles the irreconcilable. The Government pays and gives guidance; the universities remain independent—but somehow follow the guidance. "One cannot but admire—up to a point," says Dean Hacker. Differences are all resolved, behind the closed doors of the Athenaeum. Is it right that they should be resolved in this particular way? The system is *prima facie* a good one, but no system is exempt from faults. Should not more information be given, so as to display goodness and faults alike? Academic autonomy must be preserved, but the state must have some say in the spending of the enormous sums now required. The conclusion to which these essays point is that the system is in a state of unstable equilibrium. Parliament constantly presses for more information and, however discreetly, for more control. The problem is how to restore equilibrium without upsetting the system, for, says Mr Dodds, "I suggest that... the principle of greater accountability to Parliament will in the long run come out victorious."

Shorter Notices

The Journal of Industrial Economics.
Vol. I. No. 1. November, 1952.
Basil Blackwell, Oxford. 10s. or \$1.40.
Annual Subscription (three numbers) 21s. or \$3.00.

Some of the academic studies of economic policy and practice within industry that have become more common in recent years at present achieve publication in existing economic periodicals. But contributions to the subject from within industry—in particular from the growing number of economists employed in industry or businessmen trained in economics—are published much less frequently. This new journal, designed as a medium for these two kinds of contributions in particular, should be extremely useful.

Mr P. W. S. Andrews, who as general editor will have the assistance of a board of other distinguished British and American economists, holds that economics lacks both a workable approach to prices and a workable theory of the behaviour of the individual business, and that "to get the theory we need we cannot continue to tinker 'realistically' with what was originally a derivative of theorising at a different level." That characteristic opinion will be debated; but his statement that "the kind of economic theory which is most useful to industrial economics as a specialist subject will be best helped forward by concentrating attention on empirical studies" can be more

generally accepted. By publishing such studies and theoretical discussions drawing on them the new journal may well command a wider audience than the purely academic, more particularly if its price, which seems high for 80 pages of small format, could be reduced. Its first issue is promising: in addition to two valuable articles on steel price policy (to which reference is made elsewhere), it contains discussions of the shortage of capital and business forecasting, and comments upon the recent report of the Paley Commission on materials policy for the United States by an American economist who served on the Commission.

The Methods of Statistics. By L. H. C. Tippett. Williams and Norgate. 395 pages. 38s.

The fourth edition of this textbook has been quite substantially revised and brought up to date. In particular, the treatments of sampling theory and the analysis of variance have been enlarged and a new chapter added on the analysis of time series.

With the author's considerable experience of statistical applications in research and technology, it is natural that the book should be designed particularly for experimenters. But with its now somewhat wider scope, many other users will also find this book an excellent introduction to statistical methods. It contains one of the clearest expositions of the analysis of variance with many practical examples. Mathematical proofs are given where they are not too complicated and particularly helpful, although it is not essential to be able to follow these.

Essays in Economics. By A. C. Pigou. Macmillan. 241 pages. 15s.

The ephemera here collected range in date from 1939 to 1951, in subject from the status of economists to the gold and dollar reserve, and in manner from the conversational to the mathematical. Except for one analytical study of John Stuart Mill's wage fund theory, they are all addressed to the non-specialist, though the Stamp Memorial Lecture of 1949, on wage statistics and wage policy, offers tough going to the layman. They form at once a shrewd running commentary on the economic issues of the war and postwar years and a pleasant revelation of the personality and ways of thought of their author. They hardly add to his reputation; that reputation, however, is safe enough without their help. In Professor Pigou's case no one would think of defining the word "emeritus" as he here defines it, as "with any merit one may once have had drained out of one."

The Sources and Nature of the Statistics of the United Kingdom. Volume I. Edited by M. G. Kendall. Oliver and Boyd for the Royal Statistical Society. 352 pages. 21s.

This volume collects together the first 20 articles, previously obtainable separately as reprints from the Society's *Journal*, in a special series describing the sources of statistical information in various fields. Most of those papers have already been mentioned in these columns when they first appeared; the three most recent ones, which have not, covered the statistics of the chemical industry, the motor industry and publishing in the United Kingdom. Some additions have been made to earlier papers where new information has since become available.

This makes an extremely useful reference book and it is to be hoped that the proposed second volume, covering further subjects, will materialise.

More initials! But these have nothing to do with horse-power or the Houses of Parliament. They stand for High Purchase Potential—the most valuable asset to advertisers, and a quality possessed in a high degree by readers of *The Listener*. And who are the readers of *The Listener*? Amongst others they include men and women of all interests, doctors, lawyers, professors, industrialists, and Members of the Government, in fact a large cross section of the British Public who are "influential" in the best sense of the word. This compact readership of serious-minded people is a market that many far seeing advertisers consider to be well worth cultivating. An ever extending range of goods and services is enjoying cumulative benefit through the advertisement pages of *The Listener*.

AMERICAN SURVEY

Reasserting Civilian Control

Washington, D.C.

"A GENERAL in the White House." In the classic tradition of American politics, those six little words, blazoned across the country as they were by President Truman, should have acted as a powerful counterweight to the magnetism of General Eisenhower's personality and the desire of the American people for a change in Washington. As it turned out, they were merely chaff in a much stronger wind than the President, the General or anyone else had foreseen. Clearly, whatever motives guided the hands that marked the ballots and pulled the levers on the voting machines, the fear of weakening the supremacy of the civil over the military power was not one of them. Admittedly the newly chosen President, whether in uniform or in civilian clothes, looks as unlike a potential Bonaparte as it is possible to look.

Nevertheless, it is certain that the General will have to lean over backwards to demonstrate that the military have not taken control of policy-making in Washington. It follows that the armed services are now less rather than more, likely to have the last word in determining American foreign policy. For this reason, the General's victory at the polls was greeted by the defence chiefs in the Pentagon with somewhat less enthusiasm than one would have expected from a group of people who are, for the most part, natural Republicans.

General Eisenhower is reported to have his own ideas about the reorganisation of the federal government and, in particular, about the present method by which foreign aid is handled by several different departments. He may well find that one of his most urgent tasks after he assumes office is to straighten out the organisation which he himself helped to bring into being, the Department of Defence and the Joint Chiefs of Staff. It has become increasingly clear that unification of the services, arrived at with so much pain and grief, is at present working to weaken civilian control over military decisions. Because the services, especially the Navy, were unwilling to accept a unified control of planning and administration, the task of reconciling the needs and functions of the armed forces has fallen almost entirely on the Secretary of Defence. He and the service secretaries—the civilian authorities—are buried under an enormous load of administrative problems which give them little or no time to take part in discussions of broad issues.

The Chiefs of Staff, both jointly and separately, concern themselves with matters of strategy, and all questions affecting strategic policy come directly to them. Consequently the Joint Chiefs can make policy on their own, provided that they can get the agreement of the President through the National Security Council and can carry Congress with them. As Mr Hanson Baldwin of the *New York Times* stated in an article last April:

Over the last three years the military have often passed judgment on matters in which they have no competence, and the Joint Chiefs of Staff gradually have been clothed with a power in foreign and economic policy that never was dreamed of five years ago, a power that has posed definite dangers to the tradition of civilian supremacy over military.

As long as General Bradley remains chairman of the Joint Chiefs of Staff, sanguine people have been able to reassure themselves that his calm common sense would prevent the system from getting wildly out of control. But General Bradley's term of office finishes next summer and there is growing feeling that the question must be taken in hand. General Eisenhower, in a speech at Baltimore on September 25th, one of the best and most original that he made, proposed that a civilian commission should be appointed to re-examine the operations and functions of the Department of Defence. Clearly the General knows what the trouble is:

Special interests in the armed services have repeatedly been carrying their appeals to Congress—sometimes without the knowledge of their civilian superiors. Service disagreements have become public brawls.

Dr Vannevar Bush, who would be a logical choice for the chairmanship of such a commission, suggested in an address on the same day that the best means of reasserting civil control over the military would be to divorce the function of command from each chief of staff, so that each service would have both a commander in chief and a chief of staff. The Joint Chiefs of Staff would be purely a planning group giving advice to the President and the Secretary of Defence. Policies would only be carried out by these civilian officials giving orders to the commanders. It is likely that legislation embodying this idea will be put before Congress in the coming year.

*

To British ears this all sounds unnecessarily complicated. From Cardwell to Churchill, the British method of keeping the military under control has been to appoint experienced and energetic ministers who do not feel inhibited from imposing their views on the chiefs of staff on questions of military strategy as well as administration. Moreover, the hand of the minister is greatly strengthened by being a member of a Cabinet responsible to Parliament. But it has certainly not been lack of energy or experience which have prevented Mr Forrestal and Mr Lovett from being fully masters in their own house. The difference between London and Washington is not one of personalities, but of the attitude to military questions. The American services have successfully implanted the idea that there are such things as purely military factors and that questions which involve them cannot be adequately assessed by a civilian. British theory and experience denies both these propositions, and points triumphantly to the person of Mr Churchill.

It is this difference in approach which accounts more than anything else for the current conflict of views between the British and the American Chiefs of Staff over the size of the forces necessary to defend Western Europe. The British Government's paper suggesting that, with increased air power and atomic weapons, a considerably smaller number of ground troops than the 96 divisions originally envisaged

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

would be sufficient to defend western Europe from attack, fell with a dull thud in Washington some time ago. The Pentagon insists that the original figure was reached on sound military grounds; there is a tendency to believe that the British Chiefs of Staff have allowed themselves to be influenced by economic and financial considerations which are irrelevant and that they are indulging in wishful thinking.

In part, of course, the argument is caused by different intelligence estimates of Russian strength, the British believing that the Americans have created an unreal monolith out of the Russian armies and are suffering from their habitual tendency to overinsure. But at bottom it stems from two different attitudes. The British staff officer who forms part of a closely knit team with civilian officials and politicians in Whitehall does not recognise the existence of a purely military argument. His American counterpart is prepared to take responsibility only for military factors and resents the intrusion of the civilian mind into any decision on their relative importance.

The incoming President has an opportunity to resolve not only this kind of problem, but also to adjust the whole relationship of military to economic and diplomatic strategy. President Truman, the man who grew out of a boy who wanted to go to West Point, has always been at a disadvantage in dealing with military men. Despite the bitterness of his political campaign against the General, he has always held them in awe.

President Eisenhower will come to office at a time when the conflicts between the Pentagon and the State Department may be very acute. The stalemate in Korea has created a recrudescence of the "give 'em hell" and "let's go it alone" philosophy among certain American commanders in the field. If France fails to ratify the European Defence Treaty the temptation to make a separate arrangement with the Germans will undoubtedly be strong both in the Pentagon and among its friends in Congress. If Mr Eisenhower, newly turned civilian, can demonstrate to his old colleagues in arms that he intends to refresh the principle of civilian supremacy, and also that military and diplomatic planning are only differing aspects of the same question, he will have done the western alliance a very good turn.

American Notes

Eisenhower Tees Up

General Eisenhower will be the first golfing President since Coolidge, but he has already found that the political game leaves little time for any other. Even during his holiday in Georgia he spent more time in conference than on the course, and when he left his meeting with President Truman last Tuesday it was obvious from his bearing that he realised the full size of the task before him. The purpose of the meeting was to arrange an orderly transfer of government business and to let the General into the secrets of the international situation. It was hardly to be expected that Mr Truman would make light of the difficulties involved and General Eisenhower must now understand, even if he did not do so before, exactly how slim are his chances of bringing back a satisfactory truce from his Korean visit.

It has once more been emphasised that neither General Eisenhower nor his two ambassadors at large with the present Administration, Mr Dodge and Mr Lodge, can take any governmental responsibility until the new President is actually inaugurated on January 20th. But the General is now in a sufficiently well-informed position to begin drafting his legislative programme. This naturally entails consultation

with the Republican leaders in Congress, the party's most influential conservatives. The fact that the General has spent much of his time this week with Senators Taft and Bridges and with Mr Martin, the next Speaker of the House of Representatives, does not therefore necessarily mean that the Republican diehards already have the new President in their pockets. But Mr Taft came away very well satisfied from the conference, which covered a large number of topics, including apparently the budget, tax reduction, and labour and social security legislation.

More ominous is the news that Mr Dewey, whose political experience would have been as valuable to the General as

First Tee

Herblock in the Washington Post

his liberal influence, has refused a post in the Cabinet and has definitely decided to complete his term as Governor of New York, although he will be available in emergencies. It is difficult to see who, except Mr John Foster Dulles, can now become Secretary of State, but General Eisenhower is still keeping silent on his plans for Cabinet appointments. Senator Taft, however, gave him his views on these and on filling some of the many other vacancies that will be available in the government service. Applications for these have been coming in in their hundreds, and a special bureau has been set up to deal with them at the General's headquarters.

Labour in a Cold Climate

The death of Mr Philip Murray has left the Congress of Industrial Organisations leaderless just as the whole trade union movement is savouring its bitterest political defeat and is thrown back on its own resources. For the first time the leadership of the three main trade union groups—the CIO, the American Federation of Labour, and Mr John L. Lewis's United Mine Workers—pulled together in an election. But they were pulling against a tide which carried many of their members with it. The labour leaders have never claimed they could deliver the whole labour vote, but the returns from the industrial states make it clear that many

WORKERS
(Index 1939=100)

SPENDING PER HEAD

trade unionists, and many more of their wives, must have voted Republican. Only Mr Lewis, supporting a Democratic presidential candidate for the first time since 1936, had the satisfaction of seeing his candidates for Governor and Senator win in West Virginia, a mining state, and of holding it for Mr Stevenson.

The unions are not so much afraid of General Eisenhower as of what Congress may do, particularly if there is a recession accompanied by industrial unrest. The General's campaign speeches were friendly and, if he wants to be re-elected in 1956, he will not care to alienate trade union votes. But the labour leaders can no longer count on the government intervention or the warm reception at the White House which have been theirs for twenty years. General Eisenhower is certain to insist on labour and management settling more of their own disputes; the Department of Labour and the government boards dealing with labour problems are likely to take a more conservative line. With a Republican Congress no repeal, or even substantial amendment, of the Taft-Hartley Act is likely. General Eisenhower promised a labour-management conference to discuss changes in it. But Senator Taft does not seem inclined to wait. His staff is already drafting the relatively modest concessions to labour which the incoming President promised. What alarms the trade unions are the proposals for much more radical changes favoured by some conservatives of both parties such as a ban on industry-wide bargaining.

With the future chilly and uncertain, the two big labour federations may well draw closer together, something they have tried, and failed, to do many times. Mr Murray's death, and the probable retirement of Mr Green, the 80-year-old head of the AFL, should make way for more flexible new leaders. The danger to the CIO is that it may be weakened by an internal struggle over the leadership. Mr Murray commanded the loyalty of all. The CIO convention, which was to open this week, has been put off a fortnight in the hope that agreement may be reached behind the scenes. The main contenders are Mr Walter Reuther, the young, aggressive, politically-minded head of the Automobile Workers, who make up a third of the CIO's membership, and Mr Allan Haywood, who is older, more orthodox and has no big union to back him. But he was apparently Mr Murray's choice, and is supported by the steelworkers and others suspicious of Mr Reuther's ambition and ideas.

Superatomic Explosion

President Eisenhower will apparently find the hydrogen bomb waiting for him on the White House doorstep, just as President Truman found the atom bomb when he took office in 1945. That at least is the interpretation being placed on the Atomic Energy Commission's circumspect announcement that satisfactory "experiments contributing to thermo-nuclear weapons research" have just taken place in the Marshall Islands. Dr Harold Urey, the atomic expert, was not the only one to whom this sounded "like official language for a successful H-bomb," especially after the newspapers had been publishing a series of letters from servicemen and others attending the tests, describing in detail an explosion "brighter than ten suns," which blew up an island completely and dwarfed all previous atomic detonations.

It is now suggested that this may have been a hybrid bomb, part atom, part hydrogen, but enough to prove that the scientists have solved the problem of releasing energy by nuclear fusion. This has been done in less than three years from the day on which President Truman ordered the AEC to try to make a hydrogen bomb; but it will be 1954 before sufficient materials are available to permit production of these bombs in quantity. The invention of the hydrogen bomb will lie even heavier on the American conscience than did that of the atom bomb, for this latest destructive weapon brings with it no accompanying compensation in the form

of scientific and industrial advances. Nor will it bring with it such a strong sense of superiority as accompanied its much less powerful predecessor, for this time no one has any illusions about the Russian ability to make a similar bomb before long.

The scientists are, however, convinced that the Russians have not yet done so, and it is difficult not to feel that the news of the latest American experiment was allowed to leak out intentionally, even though the authorities are investigating whether security regulations were violated by the letters "purporting" to describe the tests; in the past there has always been strict secrecy. The knowledge that the United States has, or soon will have, H-bombs up its sleeve could give it a temporary advantage in negotiations with the Soviet Union. The knowledge will also encourage those who argue that safety against aggression can be had cheaply by increasing expenditure on the development of nuclear weapons and reducing it on other types of armaments. That is an argument which appeals to voters who, as the election returns show, are tired of heavy taxation and of seeing their sons in uniform. But no one knows better than General Eisenhower that no bomb, however big, can win a war by itself and that the heavy industrial concentrations of the United States are more vulnerable to attack by H-bombing than are the more scattered factories of the Soviet Union.

Two-party South?

With four southern states and most of the border ones supporting General Eisenhower and with his total vote below the Mason-Dixon line running only just behind Governor Stevenson's, the once solid Democratic South is fluid as it has never been since the Civil War. But that does not mean that it is going to resolidify into the two-party pattern of

the rest of the country. The four million Southerners who helped to elect General Eisenhower were voting not for the Republican party but for a man they liked personally and against the policies of a man, President Truman, whom they disliked violently. Except in a few districts they ignored such Republican candidates as there were for other national and state offices. Furthermore, these voters were led into the Eisenhower fold by Democratic shepherds, Governor Shivers of Texas, Senator Byrd of Virginia and others who have no intention of sacrificing their independence now that Mr Stevenson's defeat has given them hope of being able to drive their own disrupted party in the conservative direction they have always wanted it to take.

Should the northern liberals once more gain control of the Democratic party, then these southern leaders might take up permanent residence in the Republican mansion. Meanwhile they are keeping a foot in the Republican door by offering to support General Eisenhower in Congress when he asks for legislation which they consider sound. The smallness of his Congressional majority does not allow the General to ignore this offer, but sooner or later he may have to slam the door in these Democratic faces by asking for the legislation on civil rights for Negroes and other minorities which his northern supporters will insist on.

The Republicans' only chance of consolidating their purely temporary strength in the South is by building a permanent structure of their own local organisations under shelter of General Eisenhower's popularity and prestige. He has undermined, even if he has not entirely destroyed, the old southern prejudice against the name Republican, a prejudice which in any case is not shared by the South's new middle class. His nomination and his victory have weakened the hold of the local professional politicians, who were for Senator Taft, on such moribund Republican organisations as there are, and the General's more vigorous supporters can now step in and revive them. Once revived, they can be nourished by the patronage that the Republicans have been without for so long. A Cabinet post for a Southerner would help, but much more important are the local jobs in the federal service, the vacancies for post-masters and so on, which can now be given to deserving party workers. This is the stuff out of which a lasting two-party system can perhaps be made in the South.

Burnt Fingers on the Public Pulse

The inability of the three main public opinion polls to see the Eisenhower landslide coming seems, to the layman, a far greater confession of failure than the outright false prophecies of the much closer election of 1948. Not one of the poll-takers was willing to trust his own figures, all of which gave General Eisenhower a substantial lead over Governor Stevenson; all three refused to pick the winner. The joker this year, as in 1948, was the "undecided" voter. But it was precisely Dr Gallup's diligent attempt to learn from the mistakes he made in allocating the undecided vote in 1948 which led him astray this time. Instead of splitting it evenly, as he did then, he gave the lion's share to the Democrats. It was this which brought Governor Stevenson's total up to 49 per cent, or even 50 per cent, and prompted Dr Gallup to prophesy a nip-and-tuck race. His only satisfaction is that for the first time it was the Republican, rather than the Democratic, vote which was put too low. The prophet may have been wrong twice, but at least he has been wrong impartially.

No one should underestimate the difficulties of predicting a presidential election result. The poll-taker must make his way through a quagmire of uncertainties: the refusal of many voters to make up their minds in time or to deal candidly with interviewers; the impossibility of spotting in advance those who will not vote; the enormous complication of the electoral, as opposed to the popular, vote. The Gallup poll

this time stayed within, though only just within, the 4 per cent error it claims is justifiable in predicting the division of the popular vote. What must almost make a serious and conscientious poll-taker change his profession is that the light-hearted "cigarette poll," of the number of identical Eisenhower and Stevenson cigarettes sold, gave the General a lead in 40 states with an electoral vote of 461.

Sheer lack of faith, which robbed the polls of the honour they might have had, also clouded the debut of Univac, the room-size electronic brain which the Columbia Broadcasting System consulted on election night. The computer, whose "memory" had been stuffed with statistics of past elections, calculated on the basis of the first 3,000,000 ballots that General Eisenhower would win 33 million votes, carrying 43 states with 438 electoral votes. This was an estimate of startling accuracy, for the General actually received 442 electoral votes, but those in charge refused to credit it. Instead they made the machine "forget" enough of its teaching to go on predicting a close race long after Governor Stevenson's defeat seemed inevitable to non-electronic judgment. Crestfallen humans may be glad to know that when newspaper editors were asked who would win in their states, an electoral vote of 357 for the General was predicted.

Presidential Succession

It is well known that vice-presidential candidates are not chosen with an eye on the succession. They are picked to please a vital state or region, to unify a party, or for their campaign appeal, but not for their presidential stature. Nevertheless, ten Vice-Presidents have, in fact, succeeded; the latest, Mr Truman, spent over three years in the White House before the people had a chance to vote on his merits. Those who detest Mr Truman and those who dislike Mr Nixon, General Eisenhower's brash and ambitious young running-mate, agree on one thing at least: that it is an undesirable state of affairs that the people may have to put up for three or four years with a President they did not choose. The subject is receiving particular interest because the most elaborate security arrangements cannot make General Eisenhower's trip to Korea wholly safe.

The situation would be much more complicated if General Eisenhower were to die before December 15th. For, technically, the voters on November 4th did not vote for General Eisenhower or Governor Stevenson. They voted for groups of electors pledged to the candidates, and until these electors cast their votes on December 15th, General Eisenhower is not even President-elect. After that date, if anything happens to the General, Mr Nixon will automatically succeed. But before it, the death of the successful candidate would leave the choice of the next President in the hands of the electors.

This seems extremely high-handed and undemocratic. But it must be remembered that the writers of the Constitution, in the eighteenth century, had no faith in the people; they intended the electors, men of discretion and standing, to choose the President at all times. The system of voting they devised, under which all the electoral votes of each state go to the candidate with a majority, however small, of the popular vote, is an even more dangerous anachronism. In 1876 it led to the inauguration of a President who had a majority of the electoral, but not of the popular, vote. This might happen in any close-fought election.

Reforms may have to await the indignation that would be aroused by another minority President or the succession of a highly unpopular Vice-President. But Senator Smathers at least will give Congress a new chance to adopt the electoral reform it has turned down so consistently in the past, the allocation of electoral votes according to the popular vote in each state. Coupled with this will go a proposal that, if the President dies in the first two years of his four-year term, the voters should choose a new President at the time of the mid-term Congressional elections.

Surely, it was later than that, Doctor?

Sir Alexander Fleming discovered penicillin in 1928, but it was many years before the benefits of this anti-biotic could be widely applied. In the large-scale production of penicillin, phosphoric acid is used to maintain correct conditions in certain stages of the process. This is yet another example of the ways in which Albright & Wilson's phosphorus compounds are applied in manufacturing processes of the most diverse kinds, sometimes playing a major, sometimes a minor, but almost always a significant part.

THE WORLD OVERSEAS

General de Gaulle's Dilemma

(From Our Paris Correspondent)

FOR the second time this year General de Gaulle's *Rassemblement du Peuple Français* has suffered a schism. Last July some thirty of its deputies joined forces with M. Pinay: last week ten municipal councillors of Paris parted company with their leader. The dispute was about the municipal elections next May. In 1947 the newly founded *Rassemblement* triumphed, with fifty-two seats and an absolute majority, at the Hotel de Ville, a success which was repeated in many of the big towns of France. It was the epoch of almost desperate economic conditions and the country was still very much in the Communist grip. General de Gaulle's implacable campaign against "the separatists" and the Fourth Republican politicians who were for ever making *combinaisons* with them appealed resoundingly to all sorts of patriots.

In the autumn of 1952 the political scene appears quite different to many Gaullists of 1947. One sign of the times was the willingness of a number of RPF municipal councillors to form an electoral cartel with some of their Independent and Radical colleagues. It was this manoeuvre which drew the wrath of M. Pierre de Gaulle, brother of the General and Mayor of Paris, and evoked iron disciplinary action from the General himself. The leader of the RPF personally excommunicated the three ringleaders, MM. Paul Coirre, Jacques Ferron and Jean-Louis Vigier. M. Vigier, who was one of the General's closest associates, described his dismissal in the following terms: "I was invited to meet General de Gaulle and explain my reservations to him. On my arrival I found myself ordered to make an autocriticism—with five minutes' grace to do it in. I refused to say what I did not believe; and so here we are turned out of the *Rassemblement* for having exhorted the French to unite."

Almost immediately after the schism the RPF held its national "assizes" in Paris to which a large number of militants came from all over France. The General poured boiling lava on the dissidents who, he said, had abandoned the cause "for the ante-chamber and the dining-room." This attitude to parliamentary politics. "The regime, its powers and its temptations, its propaganda and the lure of money inseparable from it, excel in the exploitation of men's weaknesses. Indeed it is the only field in which the regime is successful." General de Gaulle used at the assizes the full range of his talent for destructive criticism with that distinction of language which holds the audience to even the driest of his constitutional formulae.

The inescapable difficulty of the RPF is that which has caused the two schisms: how at the same time to be an ideological, protestant group and to live a constructive political life from month to month. If the *Rassemblement* had won a third of the seats in the 1951 election instead of less than a fifth, it could almost certainly have led a governmental coalition—largely impregnated with its own ideas, constitutional reform included. As things are, the Gaullists must either try to hammer out a common programme with the Conservatives and the Radicals or remain in permanent opposition alongside the Communists in the hope that the Chamber will one day prove ungovernable.

As long as the centre provided the Prime Minister and the right remained discontented, the RPF had its chance.

But since the advent of M. Antoine Pinay last March, the Gaullists have been at a loss. The capitalist, "Vichyste" part of the General's following, which had viewed the RPF as an anti-Communist police force, had withdrawn most of its support even before the 1951 election: now it is wholly in the Pinay camp. Although the Communist electorate varied little between 1946 and 1951, the danger of revolutionary Communism had receded to vanishing point, as a result of the long process of weeding out Communist personnel from key positions initiated by the Socialist Minister of the Interior, M. Jules Moch. During the last six months, the Pinay government has been able to play cat and mouse with the Communist Party, arresting its leaders, releasing them *en liberté provisoire* and—most important—charging them with demoralization of the army. All this means that the "separatists" of 1947 are no longer a *raison d'être* for the RPF. The General did not even mention them in his speech.

The *Rassemblement's* social and economic ideas, of which the most prominent is the profit-sharing device tabulated in a draft bill for *l'association capital-travail*, have never caught the public imagination. Last week, however, M. René Capitant advanced a new revolutionary doctrine to the militants; it rested on the propositions that in the twentieth century the parliamentary regime stifled political democracy while the capitalist system of property-relations made a mockery of social democracy. Therefore sovereignty should be returned to the people by a constitutional reform which facilitated the dissolution of parliament and established the referendum as a normal means of popular consultation. True social democracy could only be achieved by the workman recovering the liberty which he had alienated in accepting salaried status. He must be organically associated with the production of the enterprise in which he worked.

"Tight-Rope Walker's Fantasy"

M. Capitant's ideas were enthusiastically received by the younger members of his audience, who were also thrilled by the horizons of M. André Malraux, the *Rassemblement's* most gifted orator. It is possible that the more concrete and less nationalist notions of Gaullist philosophy will influence the political leaders of thirty years hence, after the Resistance and the defence against Communism have passed into the perspective of recent history.

General de Gaulle's other principal plank, the misconduct of foreign and French Union affairs, is still fairly solid under his feet. If the European Defence Community were to collapse or barely scrape through the Assembly, and if the new American administration did not give genuine support to French rule in North Africa, the General's arguments would be fully justified. The RPF is demanding a referendum on the EDC. Unless indeed the Government can muster a very large majority for ratification of the treaty, the military part of European federation will appear, in General de Gaulle's words, as "merely a tight-rope walker's fantasy leading to nothing unless to German hegemony." General de Gaulle is still, as Mr Churchill saw him, the Constable of France and is listened to as such by many who do not accept his remedies for the disaster of French parliamentary democracy. Whatever the electoral fate of the *Rassemblement* the General's intellect will continue to radiate.

Uno's Week of Trial

[FROM OUR UNITED NATIONS CORRESPONDENT]

AN affection for Rudyard Kipling and a short course in modern psychology are useful aids in approaching the curious behaviour of the United Nations' seventh Assembly. "The bear that walks like a man" here bars useful action; thus far no truce with him has proved possible. The "lesser breeds without the law" are here, sprawling in the delegates' lounge, clamouring in committees for help but reluctant to make any pledges in return. Some of their irresponsibility and intransigence may arise out of the 19th century attitudes of which Kipling sang. Certainly they cannot be explained solely in terms of the political and economic pressures of 1952, or even of the Declaration of Human Rights.

The remarkable thing is that this Asian-African bloc should hang together as well as it does. Half a dozen personalities in it might well claim that leadership should be theirs alone. Mrs Pandit, who talks like an angel of peace except when she is discussing Indians in South Africa, Zafrullah Khan whose bearded benediction keeps him above the battle but inclined to make allowances for Russia, Entezam of Persia, Khalidy of Iraq, Bokhari of Pakistan—these seem held together chiefly by the negative force of complaint against the British. Their enthusiasm for constructive measures has thus far taken two main forms—attempts to pry into the internal affairs of older powers, and demands for help for underdeveloped countries, which is to say themselves.

At times, as in the proposal for a commission "to study the international aspects of the racial situation in South Africa," they combine with the Philippines and certain Latin American states. At times, as in efforts to find a way around the Korean impasse, they group and re-group with the effort-less flow of mercury blobs. Thanks, perhaps, to recent elections in Latin America which have swept off the stage certain leaders who figured in Paris, they have little competition from that quarter of the world. For all the irritation which their tactics arouse among older diplomats, there is a tendency to regard them as the not impossible bridge between Russia and the West, and to value them accordingly.

Speculation About Mr Lie

The general debate, interrupted by the American election, ended on November 13th in the midst of a tempestuous and tragic week. The resignation of Mr Trygve Lie, the delivery of major speeches by the foreign ministers of Britain, France and Belgium, a second and more bitter diatribe from Mr Vyshinsky, the suicide of Uno's chief legal counsel, Mr Abraham Feller—these events strained the most ample press resources. Quite understandably, the emotional factors won first attention, and some of the speeches were less fully considered than they deserved. By the end of the week the sense of strain was such that reporters took refuge in a small absurdity—a negro formerly employed by Uno made his way to the executive offices and reported that "voices" had told him he was the new Secretary-General. "Voices" may well be needed to find a successor to Mr Lie, but while startled clerks were admitting this the *exalté* took an elevator to the marble foyer on the ground floor and, anticipating investment in his new office, started to disrobe. The following morning he awoke in the psychiatric ward at Bellevue Hospital, announcing that he had changed his mind and did not wish to be Secretary-General. Thus far no other candidate has been so open in his desires, or so quickly disillusioned.

Mr Lie's intention of resigning was the best-kept secret in a building where rumours commonly seep through glass walls. Speculation as to why he submitted it at that moment is still lively. A few informed observers have accepted Mr Lie's own explanation that he was removing himself as an obstacle to peace, but others protest that he has merely

presented the divided world with one more issue, and that the not impossible deadlock might wreck Uno itself. Thus far there are no signs that the powers are stirring themselves to find a new Secretary-General. Mr Eden began his address by hoping that Mr Lie could "yet be persuaded to reconsider his decision"—a form of courtesy which seemed excessive to those who think that whatever the Secretary-General's value in the early days of Uno, he should now be replaced by a sound executive who is sure of his ground and thus able to impart to his subordinates some sense of his own solid purpose. Those who share this view have yet to name their candidate.

In all the turmoil the only speech which has dealt with the world's economic problems rather than with its political fever spots got little attention. M. Van Zeeland, Foreign Minister of Belgium, had the misfortune to take the stand immediately after Mr Lie's announcement, and to speak in French to an audience too bemused by the implications of what they had just heard to put on head-phones and follow him in translation. He was thereby robbed of the attention due to an address of real importance. M. Van Zeeland dealt at length with the present phase of European reconstruction; and the need for new ways of attacking the continuing lack of balance between dollar and non-dollar zones. With the utmost courtesy he read a succinct lecture on "the normal rules which govern the position of the creditor-country," and it seems only fair to believe, given time and place, that he hoped Americans close to the incoming administration might listen and take heed.

His suggestions for action follow to a certain extent lines laid down in Mexico City at the summer meeting of the International Bank and the Monetary Fund. He asked for a conference between the leaders of the chief creditor countries and those of the chief debtor countries. M. Van Zeeland said here, as on other occasions, that he believed the needed dynamic equilibrium in international trade can come only through a policy of expansion. He would, however, prefer that, in the case of raw materials at least, expansion be hedged about by international agreement on the general lines of the wheat agreement, which Belgium, being a wheat-importing country, has found eminently satisfactory. Perhaps because political exigencies at home forced his departure almost immediately after he had finished his speech, no public comment has been made on it. It is hoped that he may return to Uno early in December.

The Soviet Regime—II

The New Privileged Classes

[BY A CORRESPONDENT]

THE essence of the Bolshevik Revolution of 1917-1920 was political rather than social. Its main result was to destroy all political groups other than the Bolshevik, and to give to Lenin and his comrades absolute power. It is true that it eliminated landlords and industrialists as a class, but it left untouched individual peasant property and small craftsmen, and made use of the services of thousands of members of the old professional class, and even of all ranks of the former bureaucracy. The social revolution proper came with the first Five Year Plan of 1928-1933. This turned Russian society upside down, forced the peasants into collective farms, tore millions from their homes, flung them from one end to the other of their vast country, and mingled together in the new industrial centres persons from completely different backgrounds. The American "melting-pot" of the nineteenth century was by comparison as mild as a Sunday-school treat. By 1937 the nation was beginning to recover, when a new convulsion, the Yezhov purge, again shook society to its

foundations. By the spring of 1939 the hurricane had spent its force; but two years later a new scourge appeared in the form of Adolf Hitler. The war losses of the Soviet Union are not accurately known. But the eminent Russo-American sociologist Timasheff estimates that the population of the Soviet Union in 1945 was 37 million less than it should have been—a loss of one sixth.

The society that has emerged from these catastrophes is far more different from the society of 1928 than was the Russia of 1928 from the Russia of Nicholas II. The party organisers, civil servants, industrial managers and intellectuals of 1952, who control the political, economic and cultural life of Russia, are neither old-style professional revolutionaries nor old-style experts. The men like Pervukhin the chief spokesman at this year's October revolution anniversary, are creatures of the Stalin age, with its peculiar social, cultural and moral values.

It is a commonplace that the Soviet Union is passing through its industrial revolution, but it is not widely understood that this process is producing, in the dominant social group, a human type very similar to that produced in the early stages of European capitalism. It is a commonplace that the Soviet Union has the most totalitarian regime yet known to human history, but it is not generally realised that, side by side with government interference in public and private life on an unprecedented scale, there exists rugged individualism in the most extreme form. To try to understand the atmosphere in which the upper stratum of Soviet society has lived since 1928 one must imagine the Spanish Inquisition of Philip II established in a Californian town during the gold-rush.

The Ordeal of the Bosses

The Soviet manager or administrator of 1952 is a man who has passed through a hard school, and has seen many of his kind fall by the wayside. If he runs a factory, he knows that he must achieve the target set him by the central planners. He knows that, with the raw materials and labour force provided for him, he is likely to fail; and that if he does he will face at best demotion and poverty, at worst savage punishment for sabotage. If he observes the law and carries out orders, he is doomed. To save himself he must cook his accounts, falsify his contracts, hoard his materials, bribe his foremen, exploit his workers and make illegal transactions with other factories. If he fails, his illegalities will be found out, and he will be a scapegoat for the impossible policy of the government. But if he succeeds no one will bother about how he did it, and his career will be brilliant. The party organiser's problems are similar. If there are economic failures in his district, he will be held to blame. To ensure success in his district, he will cheat and rob both his own subordinates and the resources of other districts and enterprises. This struggle of all against all involves appalling waste for the economy as a whole, but great rewards and dazzling careers for those who can stand the strain.

The scraps of information that can be pieced together from official and unofficial Soviet sources make possible an approximate picture of the successful boss and the successful manager. They are tough and self-confident. They have much in common with the pioneer capitalist in 19th century Europe or the town boss in the American West of the frontier days. There is the same combination of contempt and vague benevolence towards the masses. There is the same indifference to the interests of society as a whole, coupled with loyalty to the smaller community or clique of which the boss is the leader and protector. The nepotism and corruption repeatedly denounced not only by speakers at the Nineteenth Congress but also in the columns of *Pravda* for many years past, result as inevitably from the Soviet social milieu as they resulted from that of early European industrialism. Exhortation by party propagandists will not eliminate these practices. As long as the autocrat

sets tasks that cannot be fulfilled, and savagely punishes those who fail, the fight for survival of bosses and their cliques will continue, by every means both fair and foul.

Two features commonly associated with the rising capitalist class of early European and American industrialism appear to characterise the ruling caste that is emerging in Soviet society. One is philistinism in arts and letters. Originality in architecture or music is as abhorrent to the arbiters of Soviet taste as it was to our Victorian grandparents. In the Soviet Union it is denounced as "formalism," and the accusation is supported in Marxist jargon phrases. But the official preference for ponderous palaces in Russian cities may be compared with the taste of those who made Glasgow and Birmingham what they are. When Zhdanov condemned Soviet composers, and asked for nice catchy tunes, he was not simply acting on the whim of a dictator: he reflected the tastes and prejudices of his caste and his generation. The other feature is imperial condescension towards non-Russian nations. The generation of Lenin subdued by force the former colonies of the Tsars, but they did this in the belief that they were spreading to Tartars or Kirghiz the blessings of proletarian revolution: for the earlier struggle of these peoples against the Tsars they expressed sincere admiration. Today, however, the 19th century Russian conquest of Central Asia is represented as a beneficent action, and rebellions against the Tsars as reactionary plots organised by British spies. President McKinley wrestled all night with the Almighty before deciding to annex the Filipinos for the good of their souls. Cecil Rhodes hoped to civilise Africa and the Africans too. Soviet writers explain that the Russian conquest was an objectively progressive phenomenon, which brought the Uzbeks from a feudal to a bourgeois stage of social development. The terminology is different, but the attitude is similar.

Penalties of Privilege

The life of a Soviet boss is tougher than that of his forerunner in the industrial revolution of the West, because he must not only outmanoeuvre and outcheat his rivals, but be proficient in Stalinist theology and go through the motions of political enthusiasm by taking part in political meetings and demonstrations. Economically, the Soviet senior bureaucrat, manager or intellectual is well off: the difference between his material position and that of the masses is probably greater on the average than in a "capitalist" country. But mentally and spiritually these men are oppressed. The manager suffers from the constant interference of the party propagandist and of the "special section" of the security police, both installed in his factory. These are not wicked men, but they must do their job. Their activities, however, constantly disorganise economic life. They are social parasites, or, in Marxist jargon, a "fetter on productive forces."

For the teacher or writer or scientist things are still worse. Not only is he confined between intellectual blinkers: he has to manifest ritual enthusiasm and gratitude for the blinkers. Neither the manager nor the intellectual have security for themselves or for their families. It is true that they have made some gains; it is much easier for them than for workers or peasants to place their children in good schools. But as the new Soviet bourgeoisie becomes wealthier, and more aware of the extent to which it is doing the real work which is making the country strong, its political disabilities and lack of personal freedom or security become the more onerous. Its position somewhat resembles that of the French bourgeoisie at the end of the 18th century.

It is wrong to describe this tension—of which the Soviet press, Soviet literature and the testimony of Soviet refugees all give scraps of evidence—as one between the *intelligentsia* and the party. This discontent also affects members not only of the party but of the party machine. The conflict is essentially between the educated class (including some party and state officials as well as army officers, managers and

intellectuals) and the autocracy. The conflict is present within the minds of individuals who are at the same time members of the frustrated social group and servants of the autocracy. Their frustration is a product of the totalitarian political system, whose essence is the domination of the autocrat, ensured by an ingenious balance of party, civil government, army and police. What they need is not material comfort—this they have already—but personal freedom. In 20th century Western Europe the great struggles have been about social and economic claims. In Russia the real issues are not economic but political. The things that are beginning to matter are the things that mattered in the England of Charles I.

Autocracy's Weapons

It should not be thought that most, or even many, members of the Russian educated class are fully aware of this. Moreover the non-Russian element will react differently from the Russian. Its main concern will be national freedom from russification—a subject that requires separate consideration. But the experience both of pre-revolutionary Russia and of other countries suggests that these forces are at work.

This does not, however, mean that sensational political changes may be expected in the Soviet Union. A *coup d'état*, like the Decembrist conspiracy of 1825, might, of course, occur: there is no reason to suppose that it will. The autocracy has two powerful weapons. One is the security police. Unlike the police of old-fashioned dictatorships, the Soviet MVD is not content with negative repression; its vast machinery of espionage, provocation and coercion is designed positively to organise society. It tolerates no association of persons that is not under its control. Beetle-fanciers and philatelists may meet only under the far-seeing eye of Comrade Beria. It is difficult in these conditions even to think of plots.

The autocracy's second weapon is its capacity to mobilise the masses against the élite. This is an old trick of despots; it was practised during the Yezhov purge. The spectacle of the mighty fallen does not fill hungry bellies, but it relieves the emotions. The new élite cannot challenge the autocracy without support from the masses, but in contrast to their predecessors, the *intelligentsia* of Imperial Russia, they have neither the means nor the inclination to contact the masses. They are out for themselves, not for the people's welfare, and the police cuts them off from the masses far more effectively than its predecessor, the *Ohranka*.

Neither the internal regime nor the foreign policy of the Soviet Union will be suddenly changed by the development of these new social forces. But beneath the monolithic surface they are at work, and in time they will modify the structure and the nature of power.

(Concluded)

Perón Seeks New Roads

SOME streaks of light have appeared in the economic darkness that has hung over Argentina throughout 1952. The people of Buenos Aires are now permitted to eat beef on Fridays again. Harvest prospects are good; after a rainy winter, the southern spring brought mild, showery weather to delight the farmer's heart, and the desperate expedient of buying wheat from the United States, to which Argentina was reduced only a few months ago, will not apparently have to be repeated. Moreover, the feverish increase of currency in circulation has been checked for the time being.

But the picture as a whole remains one of gloom. Bread is still dark and petrol rationed, while many goods are now unobtainable. Although there is no great unemployment in the strict sense, it has only been avoided by many thousands of workers going on to short-time, while others have been

suspended without pay. There has been an alarming increase in bankruptcies and liquidations, especially in the metallurgical and textile industries, and the stock exchange has had a black year. However good the harvests may prove, the austerity imposed at the beginning of 1952 cannot be noticeably eased at any early date.

Indeed, the unbalance in foreign trade which is at the root of Argentina's troubles is still worsening. Since 1946, the first year of full-fledged *Peronismo*, the trade balance has deteriorated every year, except in 1950, when the country benefited from the Korean boom; and official figures show that in 1952 the downward trend has been even faster. The Argentine public is not encouraged to familiarise itself with such unpleasant statistics. In the Budget debate in September, Dr Gómez Morales, the Minister of Economic Affairs, revealed to members of Congress that the estimated adverse balance of payments for 1952 was 1,500 million pesos. This statement was not reproduced by the Argentine press, and it came to light only with the issue of the official report of the debate a month later.

BALANCE OF PAYMENTS (Million Pesos)			
1946	+ 239	1950	+ 693
1947	- 989	1951	- 560
1948	- 1,872*	1952 (estimated) ..	- 1,500
1949	- 203		

* This large adverse balance was due to the purchase of the British railways in 1948 for 2,029 million pesos.

The Minister's estimate may be taken to be an optimistic one, but it is depressing enough when considered together with published figures of the Central Bank's reserves. At the end of October the Bank held assets in gold and foreign currencies of only 2,428 million pesos, against liabilities abroad of 1,530 million; and of its assets only 813 million pesos were in gold and 143 million gold-guaranteed, while 1,472 million were in "other currencies," an embarrassingly large part of these being Spanish pesetas.

Since the beginning of 1952, even General Perón has been forced to look these unpleasant facts in the face. The regime of austerity for the consumer introduced early this year has been succeeded by other measures intended to stem the tide. Restrictions on imports reached a peak in October, when it was forbidden to import any goods of types that are also produced in Argentina. Credit restriction has forced the collapse of many mushroom industries.

Wooing the Farmer

But the most important feature of the new policy is its emphasis on agriculture. The farmer, the forgotten man of General Perón's first five-year plan, is now effusively wooed. The President himself declared a few weeks ago that "the revival of agriculture will be the backbone of the second five-year plan." He has held out to the farmers the cheering prospect of the abolition of IAPI, the official trade promotion institute, through which, for the past six years, they had been stripped of their profits for the benefit of industry and the state. His new Minister of Agriculture, Señor Hogan, the former Ambassador in London, has been stumping the country appealing for the biggest possible sowings; and the credits that are now denied to industry are offered to the farmer to enable him to restore the losses of six years of neglect.

But as well as credits and guaranteed prices the farmer needs machinery, fuel, and labour, and it is less easy for the government to provide any of these. Some labour will no doubt gravitate back to the land now that the bonanza years for the urban proletariat are so clearly over, and the govern-

ment is seeking to buy fuel, tractors and agricultural equipment wherever it can: the recent mysterious visit to Europe by Sr Juan Duarte, the President's secretary and brother-in-law, may have been partly for this purpose. But it will be some years before either herds or crops are back to pre-Perón levels. The agricultural census which began this week is a useful first step on the road to revival; but in view of what they have suffered at the hands of the regime since the war, the farmers may not reveal their assets as frankly as General Perón, who has been making personal appeals to them, hopes. Nor, despite the good weather and the frantic encouragement they have received, have they sown as much land as the Government wanted.

Estimates of the size of the coming wheat crop range between 6 and 6.5 million tons. Of this as much as 4 million tons may be required for internal consumption, seed and reserves, and of the remainder a major part is theoretically earmarked to reduce adverse balances on bilateral trading account; Brazil and Japan hope to get, respectively, 1.2 and 0.3 million tons in this way. Little wheat is, therefore, likely to be available for wider trading, and for this reason great efforts have been made to encourage sowing of maize, which is now proclaimed the "backbone of Argentina's grain trade." The estimate of area sown to maize in the table below is, however, only a tentative one.

	GRAIN SOWINGS (Million hectares)			
	Current Estimate	Current Target	1951-52	Annual Average 1935-40
Wheat.....	6.3	7.5	4.8	7.6
Maize.....	3.5	3.8	2.5	6.5
Rye.....	2.2	2.5	2.0	1.0
Oats.....	1.3	1.6	1.2	1.4
Barley.....	1.0	1.2	0.9	0.8
Linseed.....	1.0	1.6	0.7	3.0

Yet, whatever its first results, the switch in policy has clearly been made. Agriculture is now the favoured child, and the urban masses face a long future of tightened belts. It is hardly surprising that the trend in this direction has accelerated since the death of Señora Perón; but it is interesting that the President has been able to carry the new policy so far without greater opposition from organised labour. Sr Espejo, the secretary-general of the CGT, the trade union federation, and one of Señora Perón's chief instruments, has now been replaced, after a bitter struggle within the federation, by a mild and moderate chemist, Sr Vuletich, who is unlikely to give the President much trouble.

Moreover, something more than coincidence is suggested by the fact that, at the climax of the CGT crisis, the Government chose to launch a sudden onslaught against Uruguay. The pretexts for this outburst were that Uruguay had agreed (in 1947) to let British aircraft land at Montevideo en route to the Falkland Islands, which Argentina claims, and that an Uruguayan honorary vice-consul has been officiating in the Falklands (since 1924). For these sins, Uruguay is now being denounced by every Buenos Aires newspaper as a traitor to the Americas; travel between Argentina and Uruguay has been virtually forbidden; and on October 30th, the day the visiting Canberra bombers reached Buenos Aires, the school-children of the city were given a holiday, marched to the British Embassy and encouraged to spit on the windows. Their banners bore such slogans as "Maté si, whisky no!" (maté being the national drink), which have been trotted out on many earlier occasions when it was expedient to divert popular discontent into xenophobic channels. If this is to be the symbol of Argentina's new path, it is doubtless well calculated to appeal both to the proletariat and to the Army, on which General Perón may need to lean heavily in the months to come.

Free World and Eastern Europe—III

Exiles from Eastern Europe

[FROM A NEW YORK CORRESPONDENT]

WHILE the East European exile groups differ from each other as well as among themselves about their plans for the future of their countries and of Eastern Europe as a region, they have three common denominators. The first is the understandable difficulty of keeping several parties of divergent views working together in a single organisation, particularly when there is no immediate prospect of return to the native country; the second is the lack of financial resources, which must be sought largely from sources in the United States; and the third is disagreement as to the character of the political and economic system which should succeed Communism after liberation.

Here are thumbnail sketches of the principal East European exile organisations and their programmes:—

Czechoslovakia.—In February, 1949, on the first anniversary of the Communist coup in Prague, the Czechoslovaks established the Council of Free Czechoslovakia in Washington, headed by Dr Peter Zenkl, former Czechoslovak Vice-Premier as chairman, and Dr Jozef Lettrich, former chairman of the Slovak National Council, as his deputy. The Council was supported by representatives of six political parties, as well as by several prominent independents. It did not recognise representatives of the prewar Small Businessmen's and National Democratic parties, and three groups remained in bitter opposition to it. Internal tensions between the six participating parties led to an open split in January, 1951. But after protracted negotiations, the two groups were reunited and reorganised on July 4, 1952. The Agrarian party remains outside the Council, although many of its most prominent members are strongly in favour of joining.

The Council's programme declares that the goal of its efforts abroad "is the restoration of democratic freedoms in an independent, democratic, united and indivisible Czechoslovak republic in her pre-Munich borders." The Sudeten German question is regarded as finally settled by the Potsdam agreement, and the friendly co-operation of a democratic Germany is invited. The Council rejects the 1949 constitution and affirms its adherence to the First Republic's legal acts. Its programme emphasises the necessity of letting the voters decide the country's political and economic structure. However, it states that "private and public ownership will be the foundations of our future economic system," which will be such "as to lead to a healthy national economy. . . ."

Hungarian Council

Hungary.—The activities of the Hungarian exiles who fled their country after the establishment of Communist rule have been complicated by the presence abroad of former members of the Arrowcross organisation, who favoured Nazism, opposed the western powers and are still doing everything they can to prevent the formation of democratic unity among the Hungarians. Moreover, the Hungarian exiles who left after the Communist victory reject the co-operation of Communist Hungarians who have fled abroad in recent years on the ground that they oppose democracy.

In 1948 the non-Communist Hungarian exiles formed the Hungarian Council, headed by Dr Bela Varga, a Roman Catholic priest who played an important part in Hungarian politics for many years. Ferenc Nagy, former Prime Minister and a member of the Smallholders party, to which Dr Varga also belongs, is a member of the executive committee of the Council and its expert on finances, while Tibor Eckhardt, a Smallholders party leader who left

Hungary in 1940, is its expert on military problems. In addition to the Smallholders party, several other groups are represented in the Council, which opposes both communism and national socialism. It assumes the responsibility of reconstructing the country on democratic principles after liberation, and believes that the successful reconstruction of the country is not possible without a basic land reform.

Poland.—True to their tradition of internal divisions, the Polish emigration (numerically the largest of the exile groups) is divided into three principal organisations. The first is the 'shadow government-in-exile, organised in London in 1949 as successor to the wartime exile government by August Zaleski, Foreign Minister in 1926-31, and now headed by the former General of Artillery, Odzierzynski, who enjoys the support of General Anders.

The second is the Polish Political Council, which has its headquarters in London and is composed of members of two important Polish prewar parties, the right-wing Polish National Democratic party and the Polish Socialist party, and several minor groups. The main difference between these two groups is that the first supports the 1935 constitution because it gives continuity to the Polish state but wants to apply it in a democratic way, while the second considers the 1935 constitution as the basis for continuing an authoritarian government.

The third Polish exile group is the Polish National Democratic Committee in Washington headed by Mikolajczyk, who returned to Poland in 1945 and fled to the West in 1947. This committee is composed of members of Mikolajczyk's Peasant party, a group of the Labour party and the Democratic party. Mikolajczyk agrees with the Polish Political Council on the need to have a democratic constitution after liberation, but sees no reason for recognising the 1935 constitution simply to maintain the continuity of the Polish state.

Poles United Over Lost Lands

Despite their political differences, all three Polish organisations agree that the Oder-Neisse line would be the best frontier in the West and that the claims to the territories lost to the Soviet Union should be maintained and defended. The Polish Political Council, and the Mikolajczyk Committee base their programmes on the declarations formulated by the Council of National Unity in underground Poland during World War II. These declarations provide, among other things, for democratic liberties, a sound agricultural structure based on individual peasant holdings, full participation of all citizens in the local and central government system, and industrial development. Both these groups emphatically condemn the prewar dictatorship of the Pilsudski regime. The shadow government leans towards an authoritarian government, but it is not believed that it would urge the restoration of prewar social and economic inequalities.

Jugoslavia.—The activities of the Yugoslav exiles are hampered by the seemingly well-entrenched position of Marshal Tito and his increasingly friendly relations with the Western powers. They are also hampered by the old animosities between Serbs, Croats and Slovenes which have persisted in exile.

Among the Serbian groups the principal are the Yugoslav Committee in London, headed by Slobodan Jovanovic, former Prime Minister; and the Central Serbian National Council in the United States, headed by Constantin Fotic, former Ambassador to Washington. The former is in favour of democracy, monarchy, a federal organisation of Yugoslavia, and a Balkan union. The latter agrees with the main points of this programme but favours a unified, centralised internal organisation of the state. Among the Croatian groups are the Croatian Peasant party, headed by Dr Vladko Macek, former Deputy Prime Minister, which stands for Croatia as a federal state inside a democratic Yugoslav republic; and the

Croatian "Ustasi" party, headed by Dr Ante Pavelic, former head of the "Independent State of Croatia" created during the war by the Axis powers, which supports an independent Croatia and authoritarian government. The Slovenians are represented by the National Committee for Slovenia, composed of representatives of all democratic political parties which influenced Slovenian political life before World War II, and headed by Dr Miha Krek, chairman of the Christian Democratic Populist party, and a former Deputy Prime Minister. The Slovenian Committee stands for democracy and a federal Yugoslavia.

Rumania.—The Rumanian exiles are faced by the same problem as the Hungarian exiles, since among the emigrés from Rumania are many former members of the reactionary pro-Nazi Iron Guard. The pro-democratic anti-Communist Rumanians refuse to allow the Iron Guard to participate in plans for the liberation of the country. King Michael, son of King Carol, who now lives in England, is considered by most Rumanian exiles as a symbol of the continuity of the state, and keeps in touch with exile activities.

The Rumanian National Committee, formed in Washington in 1949 under the leadership of Nicolas Radescu, a non-party man and a former Prime Minister, broke up into two factions, one of which is headed by Radescu and the other, which is supported by King Michael, by Visoianu. The prospects of bringing the two factions together are given a 50-50 chance. The two groups disagree about the degree and speed of returning industry to private ownership. But they are agreed on a good many points including the restoration of the 1923 constitution, which provides for parliamentary monarchy, and the return of Russian-annexed Bessarabia and Bukovina.

Bulgaria.—Not all the Bulgarians in exile are yet joined together in a single organisation. At the present time there are several groups which claim to represent and defend Bulgarian interests abroad. The Bulgarian National Com-

mittee is the only exile group which has set up an organisation of its own; the strongest party represented in it is the Bulgarian Agrarian National Union. The programme of the Committee stresses the following points, among others: reinstatement of the Tirnovo constitution; abrogation of all anti-constitutional dictatorial laws and decrees issued during the period of Soviet occupation as well as after it; election of a constituent national assembly in accordance with the provisions of the constitution; and the reorganisation of the army into a non-party force entrusted with the defence of the people and the interests of the nation.

So far as can be ascertained, the East European exile groups in the United States have been more disturbed than pleased by the discussion of "liberation" during the recent election campaign. They fear that premature talk of "liberation," unless accompanied by concrete measures for accomplishing it and definite plans for reorganisation of the liberated countries, might do more harm than good. The Kremlin, in their opinion, may use American talk of "liberation" as an added excuse for strengthening its control over the satellite countries on the ground of self-defence against Western "encirclement."

(Concluded)

Rakosi Shortens Rein

THE latest government reshuffle in Eastern Europe has just taken place in Hungary. Five new deputy premiers have been appointed, four of them being former departmental ministers—Mr Erno Gerö, President of the Economic Council; Mr Karoly Kiss, Foreign Minister; Mr Arpad Hazi, Interior; and Mr Imre Nagy, Agricultural Co-operatives; the fifth is a leading Communist theorist, Mr Istvan Hidas. At first sight it looks as if the Hungarian Communists are now to suffer the purges which have already been visited upon their comrades in Czechoslovakia and Rumania. Slansky was kicked upstairs into a vice-premiership when he was turned out as secretary-general of the party. Mme. Pauker could not receive this treatment because she was already a vice-premier; but the fact that she was for a time allowed to retain this title, after she had been shorn of most of her other glories and was obviously in disgrace, showed that its significance was small.

It is, however, possible that the changes in Hungary are in fact what they are said to be—an administrative reshuffle. There is a recent precedent for this in the East German government changes of last May. Five co-ordinating ministries were then appointed and formed into a Presidium of the Cabinet under the Premier and above the departmental ministers; all had been either in the East German Cabinet or important Land ministers. Herr Grotewohl said at the time that the change (which was in line with the Soviet system) had been made necessary by the administrative machinery's failure to keep pace with the country's economic development. It seems not unlikely that Hungary's economic planning has also suffered from administrative inadequacies; and, in addition, that Moscow is anxious that the benefits of a closer and more comprehensive control from the top which has been evolved under the Soviet system, should be more widely extended among the satellites.

Mr Rakosi's assumption of the premiership last August—his official title had previously been vice-premier—may have been designed to clear the ground for this latest development. It is significant that the Hungarian Communist Party has been unaffected by the changes; there have been no promotions or demotions in the party hierarchy. Of the five new deputy premiers, four—as far as is known—remain members of the Politburo and the fifth of the central committee. In the past the orthodox Communist purge has begun at home—within the party.

More cars for export, more figure-work — faster

AT LONGBRIDGE, the great Austin Motor Company is now turning out well over 3,000 cars every week — the greater proportion for export.

This phenomenal production rate owes much to the output from the new Car Assembly Building, which houses the most modern assembly lines in the world.

Austin's full production programme, however, has thrown new burdens on office departments, where the pay-packets for nearly 20,000 workers — and all that additional information on P.A.Y.E. operation, needed by Government and Tax Authorities — have to be prepared every week.

Could office production be stepped up and streamlined, too? Austin's thought so, and called in Burroughs to help. After investigation, Burroughs suggested the installation of their Class 30 machines to handle all Payroll problems, and, just about the time the new Austin assembly plant was ready, these machines went into operation.

Result: The Austin Payroll can now be prepared, and payslips issued, as fast and as smoothly as car-assembly in the shops. The workers are paid from one unit of

14 machines — less than half the number of machines previously employed.

Every worker gets a concise, fully-informative payslip which tells him exactly where he stands, and how his pay is made up. These machines also produce prompt figure facts, which include the main Cost Analysis, and up-to-date Tax and Earnings Records that provide immediate answers to tax queries.

What about you? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment.

Call Burroughs today. Sales and Service offices in principal cities round the world. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Photographed here is Miss Madge Tomlinson, of the Burroughs Installation staff, who instructed the Austin operators in the use of the Burroughs Class 30 machines on Payroll work, and helped to solve the Case of the Extra Austins.

Air Subscription Rates for 1953

Owing to increased costs, some increases in air subscription rates to *The Economist* will have to be introduced from January 1st, 1953. The countries affected are:

Australia : £8 5s. (sterling) Malaya : £6 15s.
Hongkong : £7. New Zealand : £9.
Japan : £9. S. America and
W. Indies : £7 15s.

The substitution of an airfreight for an air mail service to Egypt makes it possible to reduce the air subscription rate to £5 5s. Rates to all other destinations remain unchanged:

Anglo-Egyptian Sudan : India, Ceylon : £6.
£5 5s. Iran : £6.
Canada : \$21.50 or £7 14s. Iraq : £6.
East Africa : £5 5s. Pakistan : £6.
Europe (except Poland) : Union of S. Africa :
£4 15s. £5 10s.
Gibraltar, Malta : £3 15s.
Gold Coast & Nigeria : U.S.A., \$21.50 or
£5 5s. £7 14s.

A Completely New Accounting Machine

READY FOR ANY JOB

AT THE TURN OF A KNOB

"COMPLETELY NEW" — those are words that can be applied, without reservation, to the Burroughs Sensimatic Accounting Machine. If you find it hard to visualize an accounting machine that is *limitlessly* adaptable, capable at the turn of a selector-knob of doing countless different jobs for a small firm, or a vast amount of one particular job for a large organization, it is time you saw the Sensimatic in action.

The key to the machine's astonishing versatility is the newly discovered principle of "Sensimatic Control" — the incorporation of a "mechanical brain" that directs the machine through every mathematical function and every carriage movement during a posting operation. Each Control Unit guides the machine through four separate operations, and, since there is *no limit* to the number of different units you can use, there is *no limit* to the number of accounting jobs the Sensimatic can do, and the Control Unit can be changed by the operator in a matter of seconds.

You owe it to your business to let Burroughs show you the Sensimatic today.

Burroughs

Sensimatic

COMPLETELY NEW

● **ADAPTABILITY** — A turn of a knob — that's all the effort needed to switch the Sensimatic from one posting operation to another, from Accounts Receivable (say) to Stock Records, Stores, Costs, Payroll, Purchase Ledger, General Ledger, Statistical Analysis; the Sensimatic is reset in a moment for all these procedures . . . and many, many more.

● **SPEED** — The Sensimatic's light key depression, positive form alignment, early key release, make its operation far simpler, far faster, far more easily learnt. Anyone who can operate an adding machine can get the Sensimatic into full production!

This is a Sensimatic Control Unit — which, at a flick of a switch, guides the machine automatically through every mathematical function and carriage movement. Each panel gives you any four accounting operations in any combination.

THE BUSINESS WORLD

Comity and the Oil Companies

MR GEOFFREY LLOYD'S answer to a parliamentary question last Monday has brought officially into the open, on this side of the Atlantic, a marked difference of view between the British and American authorities on an important point of jurisdiction in the anti-trust case against the oil companies that is now being heard in Washington. A business note in last week's issue of *The Economist* gave news of the intervention of the Minister of Fuel and Power in the proceedings. On Monday, Mr Lloyd explained his reasons in some detail and they go to the heart of the matter. He explained that the American Department of Justice had served on the Anglo-Iranian Oil Company, and on a number of other oil companies, subpoenas couched in the widest terms, calling upon them to produce records and documents relating to the conduct of their business outside the United States. Mr Lloyd's statement continued:

Her Majesty's Government consider it contrary to international comity that British companies should be required, in answer to subpoenas couched in such wide terms, to produce documents which are not only not in the United States, but which do not even relate to business in that country; and they further consider that the disclosure of some of these documents might well prejudice or endanger the economic, strategic or political interests of Her Majesty's Government and of the Western Powers.

For these reasons, the companies were required not to produce documents not in or relating to business in the United States, or give information not relating to such business, without the authority of Her Majesty's Government. For this explicit statement there will be much relief. From its terms, it is quite clear that considerations other than security have weighed the Government's decision; the main ground, indeed, is that of international comity.

This is not the first anti-trust case in which the question of international comity has come into prominence. But it is doubtful whether any previous case has raised the issue in quite such acute form. The present proceedings are concerned, at this stage, with the earliest preliminaries to a possible criminal trial of the 21 companies on whom subpoenas have been served. The lawyers for the companies have argued against the fantastic width of the subpoenas and their terms have now been narrowed to less grotesque proportions. But that is a domestic decision. Anglo-Iranian is a British company and a citizen of the United Kingdom for purposes of international law. The company is required to produce, among other documents, its entire correspondence with "sovereign governments" relating to the exploration of crude oil deposits outside the United States, as well as many other matters. Asiatic Petroleum Corporation is an American company, owned by the Royal Dutch-Shell group. Asiatic Petroleum has been required to produce, among other documents, "originals of all communications received from, and copies of all communications sent to," the two parent companies; thus the extraordinary process of discovery on which the

American Department of Justice has embarked seeks to extend itself to the activities outside the United States of these two companies—Royal Dutch and Shell—neither of which is an American subject. Such an extension of the investigation amounts to an assertion that the United States authorities can apply American criminal legislation to acts done by British and non-American subjects outside the United States.

To the reasonable man, there appears every justification that a foreigner should be subject to the criminal jurisdiction of a state within the territory of which he has committed a criminal offence. If American law says that certain business practices are criminal, and if such acts are proved against companies in the United States, they must suffer the penalty. But the reasonable man is not likely to accept the proposition that a state has the right to exercise its criminal jurisdiction over acts committed by foreigners abroad. In these views, the reasonable man is supported by an impressive weight of legal authority, and it is on these broad and fundamental grounds that Mr Lloyd has taken his action. It has not, incidentally, wholly satisfied Judge Kirkland who is hearing the case in the District Court at Washington. After referring to the presentation of Mr Lloyd's letter by counsel appearing for the Anglo-Iranian company, the judge last week observed:

The thing that was troubling the Court, and still does, is, I didn't see that great, big red seal that most of these British documents are issued under. You know, if there is anything you have got to give our British cousins credit for, it is their order and decorum, and they do seal up things very well. . . . But I think that there is a showing, at least *prima facie*, that the position of Anglo-Iranian Oil Company in this case is that the sovereign of Her Britannic Majesty's Government has asserted a privilege and that if this matter is properly brought to the attention of the court it may be the means of releasing that company from the burden of this subpoena. . . . But I do want that document authenticated.

Interludes such as this give pleasure to the student pursuing his way through the longeurs and labyrinths of American anti-trust proceedings.

It will be noted that these comments, which hold out some prospect that Anglo-Iranian may be relieved of the subpoena to produce documents, are subject to a condition—that the judge is satisfied that Mr Lloyd's letter is an act of sovereignty of the British Government. They do not amount to a decision that the rules of comity overthrow the desire of the Department of Justice to pursue its fishing enquiry against the Anglo-Iranian company; they are based on the expedient ground of avoiding an impasse between two sovereign governments. In fact, the courts of both countries have generally paid scrupulous regard to the rights and dignities of each other. Yet this case and other recent anti-trust cases in the United States have begun to raise in an acute form questions of comity that, for the well-being of the western world, demand an early practical solution.

The basic American law from which these proceedings stem are the Sherman Anti-Trust Act of 1890 and the Clayton Act of 1914. These are dates of considerable economic importance. Both precede the participation of the United States in two world wars; both are contemporary with an America still in a formative economic stage; both mark early beliefs that the way to prosperity for the United States was the utmost competition inside a ring fence so high that outside competition could never jump; both precede by a generation America's emergence as a creditor country and by half a century its acceptance of the need for growing international co-operation, whether in the form of private ventures or in the form of public policies. On the question whether anti-trust legislation is still consonant with the needs of the American economy today it is now possible for some Americans to have doubts and still enjoy the respect of their fellows; Mr David Lilienthal is among those who are questioning its relevance to modern conditions. But that is an issue that must be left to Americans. What interests, and occasionally dismays, the outside world is the construction that prosecuting lawyers seek to place on these Acts as a means of establishing criminal charges against American companies in respect of their operations abroad. It is necessary to emphasise that a conviction does not mean that harm has been done to the United States and its people, much less to other countries and other peoples; it means that an offence has been committed against two Acts that were passed long before the United States emerged as a positive participant in the world's economic affairs.

To a prosecuting attorney, these external considerations will carry no weight. To a Department of Justice whose decision to engage in legal battle against the trusts may be weighted by considerations of domestic politics, the harm appears in an offence under the anti-trust Acts (whether the economic and political results of the offender's action were good or bad) and any damage to the wider interests of the United States that may result from the proceedings—and all the evidence shows that such damage is already occurring—is purely coincidental. As the anti-trust law has been interpreted and pursued in recent years, there is a serious threat of harm to the tenuous relations that have been built up between industry in the United States and abroad. This goes further than a mere conflict of law, important though that may be. For example, in the case of British Nylon Spinners *v* Imperial Chemical Industries, the issue is whether the plaintiffs can prevent the defendants from reassigning rights already granted to the plaintiffs as they have been directed to do by an American court in the course of an anti-trust action against ICI. In the Court of Appeal last month, the Master of the Rolls observed;

So far as the English patents are concerned, it seems to me, with all deference to his Honour's Judgment (in the District Court for the Southern District of New York), to be an assertion of an extra-territorial jurisdiction which we do not recognise for the American Courts to make Orders which would destroy or qualify those statutory rights belonging to an English national who is not subject to the jurisdiction of the American Courts.

The Court of Appeal's decision has led the American Court to hold its judgment in abeyance. But it is important to note that the prosecuting attorney in that Court thought it proper to insinuate that since ICI holds 50 per cent of British Nylon Spinners' capital it could have blocked the action, and to ask the question whether ICI

had voted in favour of the action. The courts in the two countries may preserve, as they do, an entirely correct attitude towards each other; but what is the businessman in countries outside the United States to decide when he is anxious to secure American co-operation in finance, technique, or even commercial policy if at the same time he exposes himself to harrying campaigns by spokesmen who purport to present the policy of the United States Government?

The United Kingdom is not by any means the only country that is affected by this wide casting of the anti-trust net. The Canadians have recently been at odds with another decision of the American Courts on the breaking up of the partnership between du Pont and ICI in Canadian Industries Limited. Each company holds 42 per cent of the stock of CIL, and the partnership is to be broken up in one of four ways which, remarkably enough, include the sale of shares owned by either du Pont or ICI to the other, or the segregation or physical division of CIL's plants and properties between ICI and du Pont "so as to create," it is said, "a situation in harmony with United States law." In this case, too, the judge deemed it to be irrelevant whether the arrangements between the two parties actually injured the public interest or whether the public benefited from them.

To the outside observer, concerned with obtaining fruitful co-operation with American industry, and admitting at all times the prerogative of sovereign states to order their domestic statutes, these recent manifestations of the international consequences of anti-trust procedure are alarming. Comity and the avoidance of conflict of laws are important in an orderly, co-operative world. But the damage threatens to go beyond that. The turn that these cases have taken in recent times is bound to inhibit the economic co-operation between western nations that is so urgently needed—by the United States not less than the rest. While the lawyers are pursuing their wordy way through the mazes of fact and opinion in these proceedings, it is to be hoped that the new Administration will spare time for thought about the harm that is resulting to the whole of the western cause.

Competition for markets

The Economist Intelligence Unit publishes quarterly reports for exporters and others doing business abroad. These reports give a concise analysis of economic conditions and trading prospects in each country and contain essential information on such matters as import regulations, trade and financial agreements and commercial policy. Each report has a comprehensive statistical appendix, and is prefaced by a short summary of the main facts and conclusions.

Reports are available on 43 countries, and may be obtained by annual subscription or singly.

Bullion Market under Pressure

MORE than a year has passed since the International Monetary Fund abandoned its efforts to suppress the sale of non-monetary gold at premium prices, and threw the onus of controlling such sales on to the gold producing countries themselves. Since then all the important producers have embarked on a policy of selling at a premium, and in exchange for US dollars, as large a proportion of their gold output as they judge that the market will bear. The amount of such gold reaching the free market has recently been estimated at some 800,000 ounces a month, or approximately 40 per cent. of current production of new gold outside the Soviet Union. But this expanded trade has not been as profitable as most producers had originally hoped. When the IMF withdrew its unenforceable ban in the autumn of 1951 the most experienced market observers believed that the "free" price would not fall below \$38 per fine ounce (compared with the official price of \$35 per fine ounce); if the premium demanded fell as low as \$3 per fine ounce, it was widely expected, a whole new class of hoarders would take the view—to quote the last annual bullion review of Messrs Samuel Montagu—that "the purchase of gold is the best insurance man can have against such further political and economic ills as are waiting to beset him." In fact, however, the free market price has fallen as far as \$37.05—a figure at which it must be seriously questioned whether it is profitable for some gold producers to incur the expenses of the formalities that are still needed to "prove" that the gold they are selling is non-monetary (and thus eligible for free markets).

There have been three other factors, in addition to the pressure of increased supplies, that have helped to depress the free market price of gold in the last year. The first of these has been the slight improvement in the world political situation. The correlation between the trend of bullion prices and the swaying hopes and fears of peace and war remains as close as ever in the Far East. Those who view the proposed intervention of General Eisenhower in Korea with trepidation rather than optimism may therefore regard the recent downward trend in bullion prices with some suspicion. A second depressing factor in the past year has been the damping down of recurrent hopes of an increase in the official American buying price of gold; Mr Snyder's categorical statement last September against any such increase was a bear point for the market—although it remains to be seen whether his forthcoming departure from the US Treasury is a bull point or not. A third depressing factor has been that expectations of currency devaluation in some European countries—and especially in the main hoarding country, France—have receded since the autumn of 1951.

These varying factors, however, can be understood only after an analysis of the nature of—and cross-currents in—the main free markets. One of the principal sources of weakness throughout 1952 has been the Indian market. Theoretically, the import of gold into India is prohibited except under licence, but the prohibition is circumvented by widespread and highly organised smuggling. The gold makes its way into India by small

fishing boats across the Gulf of Arabia, from Kuwait and other Arabian centres; in these centres gold is available abundantly and on terms that, by dint of competition, are very near the dollar price quoted in the markets of continental Europe. Gold also makes its way into India by illegal air transport and overland smuggling. For every ounce that is caught and confiscated over 100 ounces get through.

The smugglers are amply rewarded for their trouble, for even today—after a prolonged slump—the free market price of gold in Bombay is far higher than free market prices elsewhere. It stands now at 83 rupees per tola, or £16 per fine ounce, compared with over 107 rupees per tola at the beginning of this year. The highest price reached for gold in the Indian market was 120 rupees per tola, or £24 per fine ounce, in June, 1951. The collapse from these levels principally occurred during the speculative crisis of March, 1952, when the slump in Indian commodity markets unloosed considerable liquidation both in the security and bullion markets. For a time trading in the bullion market had to be stopped and it was some weeks before up-country demand mopped up the metal that reached the market as a result of this forced selling. Even after the reopening of the market the underlying trend remained weak, and in the last month or so the prices of both gold and silver have fallen sharply again.

The weakness of the market in India has been accentuated by the concurrent weakness in Hongkong and other Far Eastern markets. In Hongkong the price of gold has recently dipped towards the price quoted in Europe for free gold in terms of US currency—that is, to between \$37½ and \$37½ per ounce. The main reason for this has been the "political atmosphere," but the fall has been accentuated by a more technical factor, namely, a project to create a gold market in Bangkok. There is a real possibility that the Siamese capital may set up as a major competitor of the Portuguese territory of Macao as a transit centre for the traffic in gold with Hongkong. At the moment much of the gold that is traded by Hongkong makes its way there via Macao. The whole of the transit trade in that Portuguese territory is in the hands of a well-known monopolist who holds his privilege from the authorities, and charges highly for it in licence fees. The belief that a competitive and much cheaper transit centre may be set up in Bangkok has inevitably brought pressure on the gold price in Hongkong.

For the time being therefore the offtake of gold, both by the Bombay and Hongkong markets, has been negligible, while the inflow of newly mined metal into the free market continues undeterred. This has inevitably increased the importance—for gold producers—of hoarding demand in Western Europe, and particularly in France. There are no restrictions on free dealings in gold in the French market. Anyone who can put up the required amount in francs can buy gold in coins, small bars, or even standard 400-oz. bars in the Paris market. Those who buy gold in this way infringe no regulations, and many of them place their orders through the offices of the nationalised deposit banks. The only restriction

RHODESIAN ANGLO AMERICAN LIMITED

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR ENDED
30th JUNE, 1952

ACCOUNTS

The Profit for the year to 30th June, 1952, after charging all expenses was	£ 4,017,754
Taxation payable was estimated at	63,001
(The Company's income consists mainly of dividends paid out of profits on which Northern Rhodesian Income Tax has already been paid).	
Profits unappropriated at 30th June, 1951, were	3,954,753
Making a total available of	4,763,382
An Interim Dividend of 1/3d. paid on 31st May, 1952, amounted to	744,576
The Directors recommend the payment of a Final Dividend of 5/- absorbing	2,978,304
	3,722,880
Leaving profits unappropriated amounting to	£ 708,255

INVESTMENTS IN SUBSIDIARY COMPANIES

RHOKANA CORPORATION LIMITED—Year ended 30th June, 1952—Capital—The holdings of Rhodesian Anglo American Limited were increased by the purchase of a further £7 "A" Stock to £1,285,121 Ordinary Stock and £24,762 "A" Stock, representing 52.395% of the total Ordinary and "A" Stock in issue.

Accounts—The net profit for the year, after taxation, including an exceptional profit of £400,000 arising from depletion of normal stocks, was £7,860,922 (against £6,765,395 for the preceding year) which the Directors have dealt with as follows:—Appropriations to: Preference Share Redemption Fund £7,500, General Reserve £1,800,000, Sales Equalisation Reserve £62,484, exceptional profit referred to above £400,000, Preference Dividends £62,484, Ordinary Dividends 10/- per £1 Stock Unit £1,250,001, Final—35/- per £1 Stock Unit £4,375,003, (£7,894,988) reducing Unappropriated Profits from £488,415 to £454,349, i.e. by £34,066.

Copper Production—Total saleable output for the year was 82,764 long tons (against 74,179 long tons in the previous year) of which 25,854 tons (5,314) were in the form of Blister Copper and 56,910 tons (68,865) in the form of Electrolytic Copper. The increase was however achieved by running down stocks of Blister Copper. The increase was however achieved by running down stocks of Blister Copper. The increase was however achieved by running down stocks of Blister Copper.

Cobalt Production—1,698 short tons of cobalt alloy containing 645 short tons of cobalt were produced during the year as against 1,978 short tons of alloy containing 747 short tons of cobalt during the preceding year. The Electrolytic Cobalt Refinery was completed early in 1952 but operational difficulties delayed production and the first electrolytic metal was not rolled for shipment until September, 1952.

Copper Price—The American f.a.s. Export price for Electrolytic Copper from July, 1951 until May, 1952, remained at 27.50 cents per lb. Towards the end of May the price moved upwards and during June ranged between 30 and 37 cents per lb. The price payable to the Company from the Ministry of Materials, continued throughout the year to be based on the monthly average of the American price, applied to deliveries three months later. The wide price fluctuations in June in the official American quotation, however, led to a special price being negotiated with the Ministry for that month, to apply to September deliveries; special prices were later agreed with the Ministry for subsequent months.

Coal Supplies—Coal deliveries again failed by a large margin to reach the level of requirements and the burning of wood in place of coal continues on an even more extensive scale than hitherto.

NCHANGA CONSOLIDATED COPPER MINES LIMITED—Year ended 31st March, 1952—Capital—The Company's holdings remain unchanged at £1,490,581 representing 21.294% of the Stock in issue. The Company's interest, direct and through Rhokana, in the Nchanga capital remains unchanged at 38.921%.

Accounts—The net profit for the year, after taxation, including an exceptional profit of £750,000 arising from depletion of normal stocks, was £6,255,600, (against £3,112,917 for the preceding year) which the Directors have dealt with as follows:—General Reserve £2,000,000, Sales Equalisation Reserve (in respect of the exceptional profit referred to above) £750,000, Dividend 10/- per £1 Stock Unit £3,500,000, (£6,250,000), increasing Unappropriated Profits from £104,516 to £110,116, i.e. by £5,600.

Copper Production—Production of Blister and Electrolytic Copper during the year to 31st March, 1952, was 68,816 long tons against 54,550 long tons the previous year. Plant extensions which are planned to raise production to 108,000 long tons per annum are expected to be completed during the early part of 1953.

RHODESIA COPPER REFINERIES LIMITED—Year to 30th June, 1952—Capital—Rhodesian Anglo American Limited has no direct holding in the Refinery Company though it controls the latter indirectly through Rhokana and Nchanga. Its indirect interest remains at 45.658% of the Ordinary Stock.

Accounts—The net profit, after taxation, for the year amounted to £85,578, against £82,776 for the preceding year. After appropriating £25,300 to the Preference Share Redemption Fund and paying Preference Dividends amounting to £63,229, profits of £27,337 were carried forward, against £40,288 brought forward from the previous year.

Production—The production of Electrolytic Copper for the year was 102,269 long tons against 96,371 long tons for the previous year.

Extensions—Owing to delays in the arrival of equipment, it is not now expected that the extensions for production of vertically cast copper will be in operation until the middle of 1953. When the vertical casting plant is in operation the available capacity of the Electrolytic Refinery will, it is anticipated, enable virtually the whole of the production from Rhokana and Nchanga to be converted into electrolytic shapes, of which a substantial proportion will be vertically cast in special high-quality shapes.

OTHER INVESTMENTS

MUFULIRA COPPER MINES LIMITED—The Company's direct interest in Mufulira, and its indirect interest through Rhokana's shareholding, remained unchanged during the year.

During the year the Company received the following dividends from Mufulira:—Second Interim Dividend for year to 30th June, 1951, of 4s. 3d. per £1 share.

Final Dividend for year to 30th June, 1951, of 1s. per share.
Interim Dividend for year to 30th June, 1952, of 1s. per share.
A Final Dividend of 5s. 3d. per share for the year to 30th June, 1952, recommended by the Mufulira Board in October, 1952, will appear in the Accounts for the current financial year.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED—The Company's holding remained unchanged at £228,171 stock. The Accounts for the year to 31st December, 1951, show a profit after taxation of £3,600,436 (against £1,753,736 for 1950) out of which dividends totalling 4s. 6d. per 5s. unit were paid against 2s. 3d. for 1950.

COPIES OF THE FULL ANNUAL REPORT AND ACCOUNTS OF THE COMPANY AND OF THE OPERATING SUBSIDIARY COMPANIES MAY BE OBTAINED FROM THE HEAD OFFICE, KITWE, OR FROM THE TRANSFER OFFICES AT 44, MAIN STREET, JOHANNESBURG, AND 11, OLD JEWRY, LONDON, E.C.2.

Green fingers

No one grows roses like old Charlie. He knows his soil and plants, and experience tells him how to get the best from them.

We help to make things grow too — industries, homes, businesses. Our soil is Australia, New Zealand, Fiji, Papua and New Guinea. For our fingers we have over 850 branches and agencies throughout these lands. And our experience dates from the first banking business in the South-West Pacific.

If experience and local knowledge can help your ventures to success in this area, consult and use—

that, on paper at least, hampers the free functioning of the gold market in France is the ban on imports of the metal, except under licence. This ban, however, is honoured in the breach far more than in the observance; smuggling is a recognised and respected occupation in the Alpine villages along the Swiss and Italian frontiers.

As a result of the increase in supply and the fall in competing demand in the Far East, the price of bar gold in Paris has fallen sharply in the past year, and it now represents a dollar price of no more than \$38½ per fine ounce. Frenchmen are willing, however, to pay fancy prices for gold coins, because of the ease with which they can be carried and hoarded, and gold coins still command a premium of between 35 and 40 per cent on the price for gold bars in the Paris market. That premium would be higher if the Bank of France had not seized the profit available to it by selling coins in its gold reserve against purchases of bars. The bank has been able to do this without risk, for if need arose it could always reconvert the bars into new coins at little more than nominal cost. The lack of confidence in the franc and the tendency to hoard gold have, however, tended to diminish in the past few weeks, and the demand for gold in France has recently fallen to a small fraction of what it was earlier this year. This, in its turn, has reinforced the effect of events in India and the Far East in imparting a weaker undertone to the free gold market.

Price fluctuations in the silver market have, of course, been much more gentle than those in the free gold market during the past year. But here, too, the price in Bombay has declined, to Rs 153½ per 100 tolas compared with Rs 157 a month ago. The London price of silver for essential trade purposes was recently reduced from 73d. to 72½d., without waiting for the customary lead from the New York quotation. In general, however, the Bank of England has continued to quote and offer silver for essential trade purposes on the basis of the prevailing New York price, and last year rather more than 16 million ounces were sold in this way; of this, over 13 million ounces were used for domestic purposes and over 2½ million ounces in connection with the Government export scheme for silver in manufactured and semi-manufactured form. The larger part of this silver—about 10 million ounces of it—was provided from demonetised coin. Demonetisation, however, has been hampered by the shortage of cupro-nickel and it is probable that this year the amount of silver made available from demonetised coin will be smaller than last.

The most interesting developments in the silver market have occurred in the market for exportable silver, where the prevailing price has fluctuated at a narrowing premium over the London official rate. For a time this premium followed very broadly the discount at which transferable sterling was quoted in terms of the official dollar rate. This was a clear indication of the prevalence of commodity "shunting." The overseas trade figures of several continental countries have made it abundantly clear that their purchases of silver in Britain have been far greater than the amounts that they needed for their domestic requirements. Much of the silver bought through London has been intended for re-export, and it can safely be assumed that the operations have been financed by cheap sterling.

With the recent narrowing of the discount on transferable sterling, the premium on exportable silver has fallen. Latterly the price for free exportable silver has come very close to the rate for official silver quoted day by day by the Bank of England. This recent decline in the free silver price has also been helped by some—partially effective—new steps taken by the British authorities to ensure that a larger proportion of the silver bought in the London "free" market is intended for use in the immediate country of destination. In addition, more recently still, the quotation for free silver has been further depressed by resales from stocks in continental countries—notably from Belgium, where substantial amounts of silver acquired for coinage orders have been freed and have been offered for sale in other continental markets.

★

Another bearish development that has recently loomed over the international silver market has been the report from Tokyo that the Japanese Government has begun to liquidate its stocks of silver, which are estimated at over 320 tons. The current production of Japanese mines exceeds domestic requirements and the Japanese authorities have decided to reduce their silver reserves and convert them into dollars. So far, however, these sales have been very modest and have had no perceptible effect on the New York market. But the market is in no fit state to absorb special sales of demonetised metals of this sort. All industrial and other requirements in the United States continue to be fully met by sales from Mexico; the Mexican Government buys the whole of its country's domestic production from the Bank of Mexico, and its policy is thus by far the most important influence on the silver price. But it is not likely to trim that policy *pour les beaux yeux* of Japan and other producers.

In the dim background of the international silver market, too, lies the spectre of the 410 million ounces of silver that were supplied by the United States to Allied Governments during the war on special lend-lease terms. When lend-lease settlements were negotiated in 1945 and 1946, it was specifically provided that this lend-lease silver would be excluded from the over-all settlement and that the recipients would be called upon to repay the silver in kind within five years of the end of the emergency. This 5-year period began to run on April 28, 1952. The silver in question, of which 88 million ounces is the direct liability of the United Kingdom Investment, will thus have to be repaid on or before April 28, 1957. This obligation has never been waived, and it is probable that when the British and Indian Governments decided to demonetise silver coin, and replace them by other metal, they were prompted by the need to accumulate a reserve out of which these repayments might be made. The fact that so large a part of the demonetised silver has in fact been sold for industrial purposes on the domestic market may suggest that the former beneficiaries of lend-lease are hoping for more mercy from the Americans, but this is an issue on which Anglo-American conversations will have to take place in the near future. If the United States insists on fulfilment of this contract, some extraordinary developments in the world market for silver can be apprehended. In short, the future of silver—like the future of so much else—depends on which way the Eisenhower Government moves.

Business Notes

Britain the Creditor

The settlement for transactions in the European Payments Union in October was made last week. It was of a rare and refreshing pattern. There were only three creditors among the fifteen members; and two of them, Austria and Switzerland, had very small surpluses indeed—\$3 million a-piece. This left the United Kingdom dominating the whole picture with a surplus of \$95.7 million, the whole of which was taken in gold. After this settlement the United Kingdom's cumulative accounting deficit with E.P.U. was \$1,089.5 million or only \$29.5 million in excess of its quota. This excess is expected to be cleared as a result of the November operations, and thereafter Britain will no longer be able to recoup wholly in gold any further surpluses that the sterling area may earn with Europe. Verification has thus rapidly been provided for the Treasury's contention that Britain had achieved the immediate objective of last August's concessions on arbitrage in dollar commodities with the EPU countries. Any renewal of such facilities would now, on balance, cost gold and dollars.

The twelve countries in deficit in EPU in October were unfortunately again led by France; it had a debit balance of \$42.1 million, of which \$29.4 million was settled in gold and \$12.6 million added to the French overdraft with EPU. This overdraft is now \$311.2 million, and France's cumulative deficit with EPU has thus reached \$517.4 million, or within a mere \$2.6 million of the quota of \$520 million. In other words, France seems likely to have to pay wholly in gold for almost any future deficits with EPU. The other main countries in deficit in October were Italy (\$21.4 million), Sweden (\$10.2 million) and Germany (\$6.6 million). These deficits were undoubtedly affected by the echoes of the commodity arbitrage purchases negotiated with Britain in August, but that only began to be paid for last month. Apart from these, however, more normal seasonal factors came into effect, including the dwindling of tourist expenditure in France and substantial payments by Continental countries for seasonal imports of sterling area raw materials.

Transport Rates Rise

The increase in charges on railway freights, docks, canals and road haulage that are to come into effect on December 1st total about £14½ million a year. They should recoup about two-thirds of the deficit that might result next year from the additional costs that the Transport Commission has incurred since the last changes in transport rates and fares. To cover the remainder of the increase—which would still imply a loss of about £6 million on a full year's operations—the commission may apply for higher passenger fares. But it cannot do so before March next year in the case of fares in London and May for fares outside London—in each case twelve months after the latest alterations in passenger fares came into force.

The sum of the increases in costs, on a full year, is about £32.8 million, £17.8 million of it having arisen from the latest rises in the wages of transport workers. Apart from this increase in wages, the Transport Commission might have made a surplus of about £1½ million in 1952; but the cost of paying higher wages during part of this year will probably turn that surplus into a deficit of £2½ million. Counting the increase in capital charges arising from the latest issue of Transport stock, the Transport Tribunal has estimated that in a full year, unless charges were raised, the commission would face a deficit of £20-£22 million. "The only measures immediately available which would meet the situation," according to the tribunal, would be an increase of 7½ per

cent in freight, dock, canal and haulage charges. An increase of 5 per cent, which will not fully "meet the situation," was the minimum contribution that in the circumstances could be required from these services: the increase of £12 million a year in charges on railway freight, docks and canals represents only about 80 per cent of the amount that the tribunal considers properly chargeable to these services. The commission, in asking for only 5 per cent, has therefore showed anxiety to avoid loading its industrial freight customers with any proportion of the burden properly attributable to its passengers. But the regulations that confine its power to alter fares will mean that for several months at least it will have to carry its passengers much too cheaply.

The increase in railway and canal freights will bring about an automatic increase in the price of coal to most final consumers, whether this is sold originally by the National Coal Board at pithead prices or at delivered prices; coal is expected to go up by about 1s. a ton. In steel costs it may add about 4s.-5s. a ton. Both, of course, are elements in the cost of transport; though this increase should add only notionally to the cost of the coal that the railways buy, and the effect upon its purchases of steel may take some time to come round.

Viscounts for Canada

The order for 15 Viscount turbo-prop airliners that Vickers-Armstrongs has received from Trans-Canada Air Lines is the first sale of this aircraft where the customers' shortage of dollars might not have been presumed to give the British company a slight advantage over its American competitors. Trans-Canada is accustomed to operate with American- and Canadian-built aircraft (although it has used Rolls-Royce engines), and it therefore faced the difficulty common to all such operators in deciding to re-equip a fleet with aircraft needing spares and servicing equipment built to different national standards. The order is a big one, valued at £4.1 million, and it cannot have been lightly placed. It is possible that Trans-Canada, which operates services linking cities in Canada and the United States in direct competition with United States operators, was influenced by the strong passenger attraction of a gas turbine over a piston-engined aircraft. But the manufacturers are also convinced, and their customers do not contradict them, that the aircraft is more economical to operate than any of its piston-engined competitors. The Canadian order for Viscounts will, like the Pan-American order for Comets, make it harder for other airlines to continue to temporise about whether they will or will not throw in their lot with gas turbines. Vickers have undertaken to deliver all 15 aircraft between September, 1954, and April, 1955, a remarkably short period. The company is stepping up the production of Viscounts to 100 a year; it expects to be producing at this rate at the beginning of 1955. Since it has signed orders for only 75 aircraft it is clear that, like de Havilland, it is sufficiently confident of the future to be prepared to produce aircraft for sale over the counter, with no firm buyers in sight. Both companies resent the all-too-frequent comment that the British industry has not the capacity to produce for world markets; Vickers' production target for Viscounts has been approached by only two post-war American airlines, the Douglas DC6 and the Convair 340 (the Viscount's principal rival). It expects to reach this target output in addition to, and not instead of, its considerable military commitments.

In February a Viscount is being despatched to Canada for route tests, and it is likely that the aircraft will then make a sales tour, its first, of the United States. The feeder-line Dove, built by de Havilland, is the only other British aircraft

to have made a similar tour in recent years, and the venture has been followed by a satisfactory volume of business. The Viscount will, however, come up against the same difficulties as the Comet in so far as the American authorities are not yet prepared to accept a British Certificate of Airworthiness for a gas turbine aircraft.

Smaller Volume of Imports

The reduction in the total value of imports this year has been achieved almost entirely by cuts in the volume of goods imported, and hardly at all as a result of a fall in prices. This somewhat surprising fact emerges quite clearly from the Board of Trade's latest index numbers of the volume of trade, which have been recalculated taking 1950 as the base year. According to this new index, the total volume of imports in the first three quarters of this year was 7 per cent lower than in the same period of 1951, while the value declined by only 8 per cent. Import prices during the period were very little lower than in the corresponding period of last year.

Measured by volume, imports were higher in the first three months of this year than in 1951, fell in the second quarter, and dropped sharply in the third quarter to a level about 20 per cent below that of the corresponding period of 1951. The "average value," or price, of imports followed a similar trend; but for the nine months as a whole it was only about 1 per cent lower than in the first nine months of last year.

The reduction in volume took place in manufactured imports earlier than in food or raw materials; the volume of manufactured goods imported fell steeply in the second quarter, while other categories of imports declined most

sharply in the third. The main exceptions to the general decline were iron and steel, of which imports during this year were two to three times those last year, and machinery—imports of which have increased strikingly with the purchases overseas of defence production equipment, in spite of the ending of the duty-free import of many machines.

Prices and the Deficit

Exports so far this year have also fallen in volume compared with the first nine months of last year—by about 6 per cent—but this fall has been more than offset by a rise of 7½ per cent in export prices. As a result, the total value of exports this year has been slightly higher than in the first nine months of 1951. Export prices have varied little during this year, but over the nine months as a whole they have been higher than in the corresponding period of last year. In the first quarter of this year the volume of exports was well above that in the first quarter of 1951; in the second quarter it fell sharply below, and in the third quarter it remained below 1951. Textiles show a sharp fall compared with the first nine months of last year, but there was a small increase in the third quarter of this year. Exports of metals and engineering products, which began the year at a much higher level than at the beginning of 1951, fell away in the second and third quarters. But, as a later note points out, it was in this group that exports showed the most heartening increase in October.

On the basis of the figures given in the Board of Trade's new analysis it is possible to assess the extent to which the reduction in deficit on visible trade this year can be attributed respectively to changes in the volume and in the value of trade. The following diagram illustrates the reduction in the visible deficit—from £925 million in the first nine months of last year to £654 million this year—on the basis of United Kingdom exports and retained imports. The decline in the volume of exports this year would have increased the deficit by £112 million had it not been offset by an increase in export prices that has contributed £136 million worth to this year's export earnings. The deficit has then been steeply reduced by the fall in the volume of retained imports,

equivalent to a reduction of £253 million in the import bill. It is difficult to relate these trade figures to those shown in the balance of payments, mainly because of the difference in timing of payments for imports and exports. As the Board of Trade remarks, "In a time when prices and volumes are subject to considerable fluctuations, the effect of these adjustments can be considerable." However, the Board estimates that in the first half of this year about a third of the reduction in the visible deficit, as an annual rate compared with 1951, was due to changes in price.

Gone for a Burton

In the last twelve months clothing and textile companies and stores have shown a remarkable range of differing ability in riding over the problem of having to write down stock values in line with the steep drop in commodity prices and the sharp recession in trade. This problem, however, has been particularly grave for those dealing in woollen manu-

factures, and it is not surprising that nearly all the multiple tailors have had to report some hard knocks in their accounts for 1951-52. Montague Burton, which was carrying exceptionally heavy stocks, has now suffered the worst blow of all. In the year to March 31st last a trading profit of £1,036,509 was turned into a loss of £566,188. This loss was arrived at after writing down cloth and yarn stocks by £1,601,496—the reverse side of the medal to trading results in 1950-51 when profits were inflated by automatic inventory gains. In addition, the Burton group has had to make a provision of £1,000,000, appropriated from general reserves, to cover estimated losses on future commitments. The actual loss that the group has made may be even heavier than £566,188, for this figure is struck after taking credit for £191,200 recoverable from a British tax provision; to cover this loss £500,000 has been written back from general reserves and the carry forward has been drawn down from £891,328 to £507,220.

Ordinary shareholders have not escaped from this debacle. The final dividend has been passed; all that equity shareholders receive is the 6 per cent interim dividend declared last February, compared with a full dividend of 12 per cent paid in 1950-51. Shareholders, who had to be content with a stable dividend in the boom years, have now had to suffer sharply with the first whiff of a recession; they saw their 10s. ordinary shares marked down 1s. 10½d. to 15s. 9d. when the results were announced. Their hope for the future is that all the losses on stocks will have been covered and that the revival in trade, of which there have been signs in the last few months, continues. But these results are an ominous reminder of the penalty that attends those that invest heavily in stocks at the height of a commodity boom, without cocking a sage weather eye on future price possibilities.

BOAC Back in the Red

It seems unlikely that British Overseas Airways Corporation will succeed in making a profit this year. The accounts for the first half of the year 1952-53 are now in; they show a profit of £622,804 and a net surplus of £149,602. But the six months from April to September cover the period of heaviest traffic, and within that period operators have not only to cover operating costs, but to build up a revenue surplus with which to carry over the six winter months when traffic is at its lowest and many services flown at a loss.

At the beginning of the financial year, the corporation expected that its profits during the first six months would be more than twice those it has actually achieved. The fuel strike in the United States during May and June caused a loss of revenue of £600,000 and reduced profits by between £250,000 and £300,000. This is serious, but not as disturbing as the fall in revenue from mail and freight. These two items between them bring in almost as much revenue as passenger fares; and the increase in mail rates granted by the Post Office at the beginning of 1951 was the principal source of BOAC's operating profit in 1951-52. It brought in an extra £1.3 million in that year, and an increase in the volume of mail added another £1.2 million. But the whole of that second addition to revenue is likely to vanish this year. The chairman of BOAC, Sir Miles Thomas, has reported that the drop in mail traffic is likely to cost the corporation £1.25 million over the 12 months; and last year's operating profit, before payment of interest amounted to only £1.23 million.

This drop in mail and, incidentally, in freight traffic, is primarily the result of the reduction in world trade and political disturbances in Africa and Asia; it affects all airlines. Last year many other airlines as well as BOAC achieved small operating profits for the first time since the war, and they too are likely to find that falling traffic and steadily rising costs will combine to make 1952-53 an unprofitable year. Not all these airlines are operating the tourist services

that are proving a substantial source of extra revenue to BOAC. The North Atlantic tourist flights have been operating since the spring, and a new tourist service to Nairobi began this month at a fare of £110 single, compared with £154 for the first class service and £98 for the "coach" service operated by two independent British companies. Because the Corporation's Comets are flying consistently nearly full, as against the average load factor of 60 to 70 per cent of seating capacity, these aircraft too are providing a little extra revenue to offset the drop in other traffic. But the chances that expansion in these directions will be sufficient to compensate for the fall in other revenues at present seems to be remote.

Australian Import Concessions

British exporters—especially in the textile and engineering industries—should be the main beneficiaries of the import concessions announced by the Australian Government last week. These concessions, which are being made in a discriminatory manner and will not apply to imports from dollar countries and Japan, may allow between £16 million and £20 million a year of additional imports to come into Australia. Their basic feature is that Australian importers' quotas will remain unchanged at the level, between one-fifth and three-fifths below 1950-51 totals, to which they were reduced last March; but orders outstanding when the March import cuts were imposed will be allowed in without being allocated against the fixed quarterly quotas for the current year. When the axe fell in March, goods that were in course of shipment were allowed to enter Australia, but an equivalent amount was deducted from the quotas for the current year, while contracts booked for goods still unshipped were also made to rank against current quotas. In many trades these outstanding orders were so considerable that no new contracts seemed likely to be placed for nearly a year, until the old orders were worked off. Now that importers' quotas are being freed from the burden of this back-log, Lancashire hopes that some of the orders that were somewhat arbitrarily repudiated in the spring, on the ground of *force majeure*, will be reinstated by the importing firms.

This relaxation of Australia's import restrictions follows a modest recovery in its external position in recent weeks. London funds, which had fallen from over £600 million to about £230 million in little more than a year between June, 1951, and June, 1952, have shown a modest but persistent tendency to recover. They are now estimated at over £250 million, and with wool receipts now in full swing this recovery should make further headway in the weeks ahead. In so far as last week's decision implies that Australia has got its internal inflation sufficiently under control to be able to rely on less clumsy weapons than import restrictions, the relaxations deserve to be generally welcomed. But how far such an implication is justified, only the future can tell.

More Freedom for Sugar

Another important step towards complete freeing of the British commodity markets was taken this week when "recognised" firms were given freedom to take part in international dealings in raw sugar. Under new Bank of England regulations, which follow closely those that apply to free dealings in other commodity markets, "persons and firms having a continuing interest in the import or marketing of sugar and recommended to the Bank of England by the Sugar Traders' Association," will be allowed to make purchases and sales of raw sugar in any part of the world. These operations will be subject to *post facto* control by the Bank of England. The Sugar Traders' Association is a body that was recently

So far...and yet so near by B.O.A.C.

When you fly by B.O.A.C. to any of fifty-one countries on all six continents you gain a new perspective of distance. With its immense network of world-wide air routes, B.O.A.C. brings you within easy reach of many people and many places remotely distant by any other means of transport. You arrive in a comfortable hurry, secure in the knowledge of B.O.A.C.'s 33-year-old tradition of experience and unrivalled airmanship.

First Class services to NEW YORK BOSTON or MONTREAL overnight

FLY FIRST CLASS from London in double-decked *Stratocruiser* spaciousness. Enjoy a swift, sure flight at fine-weather heights. Relax in deep-seated comfort; enjoy complimentary meals and mealtime drinks. Meet congenial companions in the lower-deck lounge. Retire to the privacy of a foam-soft berth (nominal extra charge). Attentive night-long service — including breakfast in bed, if you wish!

OR FLY TOURIST CLASS at substantially lower fares on the popular "Mayflower" service to New York or Boston; "Beaver" service to Montreal. Fully pressurized 4-engined *Constellation* airliners. Moderate charge for meals.

Current "off-season" fares mean big savings for you

Until 31st March, fly the Atlantic by B.O.A.C. 1st Class or Tourist services at lowest-ever return fares. Your Travel Agent has details.

Consult your local B.O.A.C. Appointed Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611), or offices in Glasgow, Manchester, Birmingham and Liverpool.

"The old plant
will be entirely
replaced..."

Where Vickers
can help

The policy decision that new plant is to be laid down, the discussions on layout and production planning, lead on to consideration of the new equipment itself. It is here that a great world organisation such as the Vickers Group can give valuable help.

Companies within the Group manufacture plant for many industries, both basic and secondary. The experience of succeeding generations of engineers has led to a standard of design in Vickers products which does much to ensure the success of new industrial projects.

Among the products of the Vickers Group are: ACCOUNTING MACHINES
LETTERPRESS AND OFFSET LITHO PRINTING MACHINES • MACHINERY
FOR MALTING, BREWING AND BOTTLING, BOXMAKING, SOAP, INK
AND PAINT INDUSTRIES • CONSTRUCTIONAL STEELWORK

WEIGHT AND HEAT

OIL-BEARING ROCKS do not always release a flow when penetrated by the drill. In such instances the rock at the bottom of the borehole must be opened up by other methods. Early in 1949 this problem arose at an oilfield in Pakistan when drilling had reached a depth of $1\frac{1}{2}$ miles! Deciding that explosives would have to be used, the oil company asked the I.C.I. organisation in Pakistan for assistance. Conditions in the borehole were such that the explosive, packed in a container 5 inches in diameter, would have to withstand temperatures close to the boiling point of water and a pressure of 4 tons per square inch. I.C.I. Nobel Division in Glasgow were given the facts and special explosives and blasting equipment were developed and sent out to Pakistan. These were assembled and placed in the borehole, under the supervision of an I.C.I. technical service mining engineer. The charge was fired and a column of crude oil, under immense pressure, shot 140 feet into the air.

FOR THE PETROLEUM CHEMIST there are unknown continents to be explored in his laboratory.

Already crude petroleum has yielded chemicals that play an indispensable part in the manufacture of new materials as diverse as plastics, paints, cosmetics and detergents. Oil and water DO mix—in your own home on washing day.

This is but a beginning. In the research laboratories of Anglo-Iranian Oil Company new uses are still being discovered for this, one of the world's most versatile minerals.

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company
LIMITED

formed to give a regular organisation to the market and to provide the means of exercising the disciplinary control over participants that the Bank of England seems to require in its commodity account schemes. This extension of freedom follows a first step taken last October, when British refiners and dealers were given permission to buy their own raw sugar for their refined sugar exports to hard currency and certain other areas.

The latest extension of freedom in this market does not, however, go so far as to allow the reopening of a terminal market in sugar, and it does not alter in any way the fact that the Ministry of Food stands between producers and the British consumer; incidentally, the Ministry's contract to buy the whole surplus of Commonwealth sugar producers means that there will be no raw sugar from the Commonwealth available for dealings on the new market. There is little hope of restoration of a terminal market until the domestic allocation of sugar is freed from rationing, but on present indications it may not be necessary to wait long for that next and logical development. Meanwhile, London sugar merchants will again be able to take part in international operations and by their earnings add to the nation's receipts from invisible exports. The latest initiative derives much of its importance from the fact that sugar is largely a dollar commodity. In these circumstances it is a welcome token of faith in free enterprise and of confidence in the state of the balance of payments.

* * *

Motor Engineering Issues

The market had been expecting for some time the two major motor engineering issues that were announced this week. They are, of course, issues that differ fundamentally both in kind and purpose. The £19.3 million bonus issue by the British Motor Corporation—the product of the Austin-Morris merger—is designed solely to correct the disparity between the corporation's issued capital and capital employed. Rolls Royce, on the other hand, is to raise £2,333,000 in new money for its programme of capital development and extension. As had been expected the cash offer by Rolls Royce takes the form of a rights issue. Holders of the ordinary and workers' stock now in issue are to be offered 933,334 new £1 ordinary shares at 50s. each, on the basis of three new shares for every ten held. Dealings began in the new shares at 8s. 4½d. premium and the old shares were marked at 57s. 6d. ex rights. On the assumption that the current rate of dividend of 15 per cent will be maintained, the new shares are being offered at a yield basis of 6 per cent. This new issue has not been directly prompted by the rearmament programme; the new money will finance the expansion of the company's normal business—particularly abroad, where Rolls Royce is committed to establishing facilities for the maintenance and overhaul of its aero-engines. Some, if not most, of the money may be spent on expanding the company's subsidiary in Canada; this expansion may not be unconnected with the successful development of A. V. Roe Canada Limited and it may have been encouraged by the policy of "strategic dispersal" in the aircraft industry.

Now that the Government looks with more favour and good sense on the question of bonus issues, it is natural that British Motor should take the opportunity to correct the glaring discrepancy between its nominal and real capital. To do this, the corporation is to capitalise £19,305,439 from its share premium account. This capitalisation, which ranks next in size to that recently made by Imperial Tobacco as a record operation of its kind, will involve the issue of 77,221,756 5s. ordinary shares, on the basis of four new shares for every share held. The new shares do not rank for the ordinary dividend just declared for the four months to July 31st last, but they will rank for all future payments.

Steel Prices Debated

Public discussion of steel prices in Britain generally suffers because few people outside the industry are sufficiently informed and few people inside it often express themselves in the public domain. This makes two lengthy articles on the subject in the new *Journal of Industrial Economics*,* both written from inside the industry, the more interesting. Mr Fred Stones, secretary of a steel company, discusses "Price Policy in a Nationally Administered Industry" (which steel is likely to remain whatever the political future) as an informed critic; and he is answered very frankly by Mr Robert Shone, director of the British Iron and Steel Federation.

Mr Stones is concerned partly with what he considers to be defects in detail in the present central system of setting steel prices, and partly with the broader considerations that should be taken into account in price policy. He believes that improvements in the methods of arriving at standard costs for individual products are possible, based upon the costs of the more efficient plants, though "the question of levies and remissions on steel-making materials will probably have to be cleared up before a correct price policy can be formulated." To compare national standards in this country with steel efficiency in other countries, he advocates "an economic study of the industry by an independent body," to be repeated at regular intervals of, say, 10 years. Finally, he poses the question whether prices should cover provision for depreciation at replacement costs, and whether they should also include some margin for "self-financing" of expansion and modernisation in the industry.

Mr Shone feels, with some justice, that the more accurate costing of individual products suggested by Mr Stones might make price control by a central body "almost completely unmanageable." The function of a price control authority, as he sees it, is to make sure that "the general level of price is correct as between producer and consumer," and to leave the details to the industry itself, which can be presumed to be interested in getting the proper relationship between the prices of different products. He discusses various alternative ways of setting prices: on the basis of the costs of the least efficient producer whose output is required to meet demand, which as he fairly points out would accord with marginal pricing principles, on the average cost of all producers (the present method), or on the costs of new plant (which might be no lower, owing to heavy capital charges). But he indicates no preference. He is confident that depreciation (and possibly interest charges) should be provided upon the basis of replacement, not historical costs, and that prices, which have long been held too low, should make "a sizeable contribution towards the funds needed for further expansion."

*

But perhaps the most interesting observations that Mr Shone has to make concern the system of levies and subsidies operated by the industry. He mentions the Federation's view that greater realism in the prices charged for imported ore was desirable (this will presumably since have been effected in part by the recent changes in the prices of pig iron); and adds

it is to be hoped that the unrealistic element in the imported ore price arrangements will... later [be] eliminated entirely, through falling purchase prices, as in 1950.

He feels that the levy on steel made from scrap and the remission on steel made from pig iron "is designed to correct an artificiality—not to create one." The Federation's view has always been that to allow fluctuating purchase prices for scrap in this country would not call out more scrap than the low controlled price now paid—"the degree of scrap collection achieved here is at least as high as anywhere else in the world." This particular arrangement, Mr Shone argues,

* Basil Blackwell, Oxford, 10s.

relates the costs of steelmaking from scrap and pig iron "on the sort of basis that would prevail over a period in the case of competitive purchases." There is obviously room for more discussion here. But it is useful to have the practice so frankly outlined and the policy so fairly stated.

Trade in October

Detailed figures of overseas trade in October show that a wide range of industries shared in last month's £32½ million rise in exports. But they also suggest that much of the improvement was due to seasonal factors; for whereas almost all exports were larger last month than in September, they were generally smaller than in October, 1951. Exports of metal goods were an exception. At £25 million, they showed substantial increases both on September this year and on October of last year, in fact, they even exceeded the record levels reached last winter and spring. Shipments of iron and steel goods rose sharply, to £17.7 million last month compared with £13.2 million in September and £14.6 million a year ago. The increase in exports of non-ferrous metals was proportionately even more striking: the figure of £7.5 million last month compares with £5.8 million in the preceding month and £5.6 million in October, 1951. Shipments of machinery amounted to £34.9 million, but although this was nearly £5 million above the September total it was only slightly above that for October a year ago. Exports of other metal using industries are not faring so well. Shipments of vehicles totalled £39.7 million last month—an increase of £4 million compared with the preceding month but a decrease of nearly £6 million compared with last October.

Although the recovery in textile exports is continuing, shipments last month were still lower than those of a year ago (at £31 million compared with the monthly average of £20 million for the third quarter of 1952 as a whole). Wool manufactures remain in the forefront of the recovery; at £11.3 million they were only £2.5 million lower than those of a year ago—and shipments to Canada and the United States were actually some 50 per cent higher than last October. There are also signs that the general recovery in the cotton trade is at last spilling over into the export field. But there is still a lot of leeway to recover, for exports last month were only £11 million, compared with £18 million a year ago.

The recovery in the wool trade is also reflected in the import side of the trade returns. United Kingdom buying is known to have been much heavier so far this season than it was a year ago, and imports of raw wool last month amounted to £10.5 million compared with only £6.4 million a year ago. With the exception of metals and machinery, almost all other imports now show substantial declines compared with last year. Some of the most striking falls are in food and tobacco; the category "other food," which besides sugar includes a wide variety of unrationed foods, amounted to only £15.3 million compared with £21.2 million in October last, and tobacco imports cost only £7.0 million compared with £17.5 million a year ago.

Acid in Abundance?

The fall in the production of sulphuric acid recorded in the third quarter of the year is a measure of the contraction of demand rather than, as might at first have been expected, of a persisting shortage of natural sulphur. The expected famine in sulphuric acid has gone the way of most of the immediate post-Korean material shortages of early 1951. The immediate result of the restrictions on the export of natural sulphur from the United States, which were imposed at the beginning of that year, was to cause a sharp fall in acid production in this country. But the long-term result

has been to encourage consumers—and there is hardly an industry that does not use sulphuric acid—to devise means of economising in its use, or even of converting to alternative acids; the temporary boom in prices also brought on to the market marginal supplies of sulphur and sulphuric acid in and outside the United States. In October, 1951, 2,564 tons of sulphur was imported into this country from these outside sources, at an average cost of £52-odd a ton. The average price of imported American sulphur in October, 1952, was little more than £12 a ton, and it is significant of the change that has taken place in the market that only 116 tons of high cost sulphur, averaging £43 a ton, was imported and none at all in the previous month.

There has also, of course, been a sharp decline in activity in the main consuming industries which has brought a big fall in the demand for sulphuric acid from the major consumers. Dye makers, whose fortunes are closely linked with textiles, used only 5,978 tons of acid in the third quarter of the year compared with 21,260 tons in the same quarter of 1951; the rayon industry and manufacturers of transparent paper used only 24,322 tons in the same period compared with 57,471 tons the previous year. The fertiliser industry is still limited to supplies sufficient for two-thirds of its rated capacity, but the chairman of Fisons said last week that this was adequate for today's level of demand.

The improvement in the textile and other industries that has taken place with the start of the winter trading season does not, however, mean that there is any likelihood of a return to a scarcity of acid. The search for new sources of sulphur has yielded results more spectacular than was at one time believed possible; Mexico, for example, has emerged as one of the leading suppliers. In the United States, all domestic controls over the use of sulphur were lifted early this month; and the big producers believe that export controls could be lifted as well since some countries are not

PRODUCTION OF SULPHURIC ACID

	1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	Total
1949	...	...	402,926	435,190	1,660,267
1950	449,085	461,025	442,968	449,621	1,802,699
1951	391,102	402,082	402,666	410,228	1,606,078
1952	417,807	346,521	316,515	...	...

even taking the quantities allocated to them by the International Materials Conference. Canada, for example, lifted all controls over sulphur this week. These developments have been rapid, and it is probable that had they been foreseen, the ambitious plans for erecting plants in this country to produce acid from anhydrite, and to convert acid-producing plants from sulphur to pyrites might not have been undertaken so precipitously; the cost of sulphuric acid obtained in this way is likely to be higher than when it is made from natural sulphur. There has, however, been a tendency to argue that these projects are justified if they relieve British industry from its present dependence on imported materials, and especially dollar materials, for production of a strategically important commodity.

Confidence in Shoes

A few days before the opening of the shoe industry's annual exhibition this week, the Bata Shoe Company (which is not an exhibitor) announced that the price of its men's shoes was being reduced by up to 10 per cent. Bata has already reduced the price of its women's shoes and cut the price of its rubber shoes by 20 per cent. This new move will hardly commend itself to the rest of the industry; most manufacturers are expecting to increase prices. The tanners, who lost heavily on their stocks when hide prices

collapsed this year, have been buying in recent months only against firm orders from their customers. In marked contrast with last year's show, trade in the opening days of the exhibition was brisk, and the industry realises that the tanners will have to go into the market and buy hides immediately—at whatever prices are asked—to cover the orders that they are taking. The prices of the better quality leathers have already risen by 25 per cent between June and October and there is nothing to suggest that this fresh pressure of demand will not encourage them to rise still further. But manufacturers or retailers, who expect to pass on these increased costs to the consumer without encountering resistance may have to think again.

Spending on shoes has dropped drastically this year. In the second quarter sales at home totalled £48 million, compared with £52 million in the same quarter of 1951. Production was accordingly cut back from the average of 10 to 11 million pairs a month throughout 1951 and the first quarter of this year to an average of less than 9,500,000 pairs a month in the second quarter. The industry has only a fragmentary export trade, and the few big military orders for between 2 and 3 million pairs that were placed this summer did not go far among so many manufacturers. It was wholly dependent on the domestic consumer for its sales and by September the value of retail sales was only just catching up with the figure for the corresponding month last year. But in spite of the imposition of purchase tax on a whole range of shoes that were previously sold tax-free, retail prices on the whole are probably lower than they were a year ago, so the volume of sales will have been rising and retailers are re-stocking.

If leather prices are rising, there are a number of alternative materials that can be used. A large number of the shoes exhibited were either made by the big rubber manufacturers, or incorporated soles made from materials bought from them. Most of this is natural rubber, the price of which has dropped

sharply. Some, however is synthetic, with properties more closely resembling those of leather. Neolite synthetic rubber, which is one of the standard soleing materials in the United States, is being produced here by Goodyear from imported materials at a price equal to current leather prices. Any further rise in the prices of hide prices therefore, will give it a price advantage over leather.

* * *

Wholesale Prices Still Falling

Wholesale prices in general fell slightly in October, continuing the gradual downward trend that has been uninterrupted since February of this year. The Board of Trade index of prices of basic materials for industry was 153.4 for October (June, 1949=100), 1 per cent lower than in September and 16 per cent lower than a year before, when the index was 182 and about 30 per cent lower than in March, 1951, when the index at 220.4 was the highest for the year. The decline in the basic materials index for October this year was due mainly to a drop during the month of 31.4 per cent in the average price of lead, and of 5 per cent in raw cotton prices. These, together with small declines in the prices of zinc, rubber and wood pulp, more than offset a rise of 4.6 per cent in the price of raw wool and increases in the prices of sisal, aluminium, tin and hides.

The other Board of Trade indices, for materials used in particular groups of industries, also showed slight declines in October. The index of prices of house building materials fell by 1 per cent, as did the index for materials used in the

PRICE INDEX NUMBERS OF MATERIALS FOR INDUSTRY
June 30, 1949=100

	1952		1951 Annual Average
	Sept.	Oct.*	
Basic materials (excluding fuel) for non-food manufacturing industry	154.9	153.4	193.3
Materials used in mechanical engineering industries	151.4	150.6	134.3
Materials used in the electrical machinery industry	168.3	166.6	151.9
Building and civil engineering materials	133.2	130.9	125.6
House building materials	130.1	128.7	123.0

* Provisional figure. Source: Board of Trade Journal.

electrical machinery industry; that for materials used in mechanical engineering fell by half of one per cent. The largest fall recorded was in the prices of building and civil engineering materials, where the index was down by 1.7 per cent, mainly as a result of declines in the prices of lead and zinc, but also because of lower prices for cement, hardboard and paint. Among indices representing individual commodities, a notable change in October was a decline of 6.1 per cent in the price of cotton yarn.

* * *

Dollars for the Colonies?

The purpose of the Colonial Loans Bill (which was given its Second Reading on November 15th) is to permit the Treasury to extend its guarantee of total borrowings by the Colonies from the International Bank from £50 million to £100 million. Such a guarantee is necessary since the colonies are not members of the Bank in their own right. Hitherto the World Bank has made only one loan to a territory affected by the Bill—that of \$28 million to Southern Rhodesia. But missions from the Bank now in Central and East Africa are expected to recommend loans amounting to

£15 million. Moreover, a mission from the Bank is about to begin work in West Africa, and loans for these Colonies are expected to follow its investigations.

The Colonial Secretary emphasised that these loans were necessary because the rising scale of borrowing by the Colonies was likely to exceed the capacity of the London capital market. Since the total interest charge on World Bank loans (amounting to 4½ per cent in all) is relatively high, the Colonies will be anxious to raise money in London rather than from the Bank if they can. But the Bank's loans will presumably be made in dollars; and London will no doubt be anxious that projects that need dollar equipment should be financed in this way—provided they are projects that should reap sufficient, and if possible more than sufficient, additional dollar earnings to meet the dollar interest charges involved. There seem to be plenty of schemes that should satisfy both conditions.

* * *

Open Licences for Softwood Imports

By allowing softwood importers to have "open individual licences" that technically would permit them to import as much softwood as they like during 1953 from where they like, the Government has made a marked change in its method of limiting these imports, most of which have still to be paid for in scarce currencies. Hitherto it has placed a quantitative limit on the amount of softwood that private traders could import, and in September the Ministry of Materials announced that import licences would be available for 1953 for 500,000 standards, about half the general estimate of consumption for the year. This, together with the simultaneous abolition of the previous system of quotas for each importer, led to a scramble to secure buying contracts and licences before these were exhausted. It was generally expected that the Government would soon announce licences to import another 500,000 standards or more; instead, it has now given freedom to merchants to import according to their own judgment.

This freedom, however, is more apparent than real. The Government is now relying on three main restraining influences. First, control of the use of softwood by consumers is to be maintained and strictly enforced, which will limit the importers' potential market. Second, since the timber traders not only took up all the original licences for 500,000 standards of softwood but also entered into contracts and applied for licences for about another 200,000 standards, much of the trade's available finance is already committed to cover about two-thirds of next year's purchases, and there can hardly be finance available for very much additional buying. Third, with commodity prices generally tending downwards, merchants are likely to be cautious for some time to come. The Government has of course the power to terminate these open licences if the volume of buying should exceed its expectations. Nevertheless, despite its limitations and the scepticism of the trade, this experiment in freedom for softwood imports in 1953 will be watched as a guide to the possibilities of extending similar freedom to other imports at present restricted for balance of payments reasons.

Made in Hongkong

The belief that Hongkong continues to be used by unscrupulous merchants to flood Commonwealth markets with cheap goods of Japanese or Chinese origin masquerading as goods "made in Hongkong" dies hard among British businessmen affected by competition from the colony's imports. It was recently mentioned in these columns, for example, in the controversy over prices of rubber footwear. It now seems clear that the conditions that might have enabled such an abuse have disappeared since the war.

For exchange reasons, all Japanese goods come under import and export licensing, and re-export to the sterling area is forbidden. Hongkong's imports from China since the advent of the Communist regime have been confined to foodstuffs, oils, fats and other forms of Chinese produce, and the Communist authorities have themselves banned the export of consumer goods. Moreover, Hongkong is no longer solely an entrepôt. It has also developed into a manufacturing centre of importance in the Far East: the annual value of its local manufactures is now between a quarter and a third of the total value of all its exports.

Before a "Hongkong Government Certificate of Origin" is issued, the factory must have been registered with the authorities and given a comprehensive inspection by Customs officers. Spot checks are made of individual shipments, and any false declaration renders the manufacturer liable to a heavy fine and a period of imprisonment. Such certificates at present certify only that manufacturing or processing has taken place in Hongkong and omit any reference to the origin of the raw materials used. But the latest United States import regulations require that the raw materials used for processed goods must be of non-Chinese origin. The Hongkong system of certification is now being amplified to specify the source of the raw materials.

To obtain Imperial Preference for his exports to the Commonwealth, a Hongkong manufacturer must, in addition, first apply through chartered accountants approved by the Hongkong Government. It is only after a detailed examination that takes into account the origin and cost of the raw materials, overheads, local labour costs, and packing charges, that a certificate may be issued that the goods contain not less than the required percentage of "Empire content"; and a separate costing has to be made for each shipment. As far as rubber boots and rubber-soled canvas shoes are concerned, no such imports have come into Hongkong from China during 1952 and the total imports from Japan up to the end of September consist of 500 dozen pairs of rubber-soled canvas shoes valued at less than £1,200. In the same period the colony exported 333,490 dozen pairs of rubber footwear valued at £854,507; 225,210 dozen pairs valued at £558,158 were sent to Britain.

Owing to its proximity to Communist China, Hongkong has also had to devise a system whereby imports of essential materials for its own factories can be guaranteed as required for local consumption. This system, which provides heavy penalties, has been administered scrupulously enough for the United States, with its strict embargo on shipments to China, to accept the certificates issued by the Hongkong Government as a guarantee that goods are for consumption locally and not for re-export.

Shorter Notes

The future of the three-cornered transaction between the Brazilian Government, the Raw Cotton Commission and the Gloster Aircraft company will be decided when the representative of the Raw Cotton Commission, who has completed his examination of the stocks of cotton held in Brazil, makes his report to the Commission next week. The Commission is only prepared to buy cotton of a certain quality, stocks of which are rumoured to be lower than expected. If this is in fact true, the sale of this cotton to the RCC will provide finance for the purchase of far fewer than the 70 Meteors originally planned.

*

The Stock Exchange Council formally celebrated a victory at the beginning of this week when it confirmed the new rules relating to the new scale of commission rates and rebates to agents. The new charges, differing only in detail from the original proposals made at the beginning of August, will come into force on December 1st.

Company Notes

Tube Investments.—By running down its stocks of raw materials and by scouring the world's markets for other material supplies Tube Investments secured—in the chairman's words—"another crop of records" in the year to July 31st. The group's exports of cycles increased by 22 per cent, and its total direct export sales increased by £3 million to over £20 million. This expansion in sales was accompanied by an advance in the group's trading profits from £3,694,400 to £10,574,315. But £1 million of this increase represented fortuitous profits, arising from an appreciation in stock values after a rise in steel prices. If this windfall element is excluded from the reckoning, then the increase in trading profits was limited to only a little over £500,000. The chairman, Mr Ivan Stedeford, draws attention to the contrast between this increase and the increase of £9 million in the value of the group's sales. In other words, sales have only been increased because profit margins have been kept down—a reminder, as Mr Stedeford points out,

	Years to July 31, 1951	1952
Consolidated earnings:		
Trading profit	8,694,400	10,574,315
Total income	9,039,984	10,809,554

Taxation	4,732,894	5,879,675
Net profit	2,979,162	3,388,970
Ordinary dividends	475,453	539,691
Ordinary dividends (per cent)	25	15
Retained by subsidiaries	585,803	881,994
Dividend reserve	1,417,693	1,430,754
General reserve	203,698	187,959
Added to carry forward	18,103,979	19,731,523
Cons. balance sheet analysis:		
Fixed assets, less depreciation	21,671,962	23,948,258
Net current assets	13,058,602	15,933,459
Stocks	4,216,058	3,930,275
Cash	28,511,991	27,841,231
Reserves	3,412,668	6,856,980
Ordinary capital	1,417,693	1,430,754
Added to carry forward	203,698	187,959

that a sellers' market has given way to a buyers' market. Shareholders in Tube Investments should keep this warning in mind in judging what the effective increase in the company's ordinary dividend from 12½ to 15 per cent portends for the future. It is clear from Mr Stedeford's statement that the group, in common with many other British exporters of consumer goods, is feeling the cold wind of recession in many of its overseas markets; exchange and import licensing regulations have, for example, brought to "a virtual standstill" a number of markets to which the group exports bicycles. To some extent the group has forestalled overseas import restrictions by encouraging the local manufacture of its products. But the contribution that the group's factories in Canada, Australia, and India can make to profits is limited, and investors should be prepared for a decline in total earnings in the current year.

Glaxo Laboratories.—The steady expansion in the business and profits of Glaxo Laboratories that has taken place since the end of the war has been brought to a halt. The chairman, Sir Harry Jephcott, warns shareholders that in the immediate future "operations may be less profitable than in the past few years." The company's 10s. ordinary stock units cannot therefore be safely regarded any longer as "growth stocks," nor can the advance in trading profits (from £3,945,265 to £4,198,392) and the increase in equity payments (from 22½ to 30 per cent) in the year to June 30th last be taken as indications of present or future trends. Stiffer competition in export markets and import restrictions began to make their mark upon the group's earnings towards the end of the financial year. In the current year this mark may be turned into a scar. Between the end of June and the end of October the group's sales abroad, though generally maintained in volume, brought in less money than in the corresponding months last year; and Sir Harry adds that "the effect upon profitability has been more than

proportionate." The downturn in the group's fortunes may persist for some time. Since the outbreak of the Korean war over £10 million has been spent upon new antibiotic plants in the United States, but the world demand for antibiotics—the "bread and butter" product of Glaxo—has not increased as rapidly as productive capacity. The long-term prospects for the company's export trade, in which the group has invested over £4 million, either in subsidiary companies or in stocks and debtors outside Britain, cannot therefore be regarded as bright as they were a few years ago. It is worth noting that some "growth stocks" in the "wonder drug" trade in America itself have taken a substantial tumble on Wall Street in the last year.

	Years to June 30, 1951	1952
Consolidated earnings:		
Trading profit	3,945,265	4,198,392
Total income	4,047,043	4,322,866
Depreciation	453,418	511,358
Taxation	2,260,796	2,231,083
Net profit	1,326,829	1,580,425
Ordinary dividends	94,068	125,424
Ordinary dividends (per cent)	22½	30
Replacement reserve	278,111	270,000
General reserve	661,567	668,868
Added to group carry forward	Dr 26,776	83,808
Cons. balance sheet analysis:		
Fixed assets, less depreciation	3,627,542	4,439,914
Net current assets	4,036,937	3,875,315
Stocks	3,283,412	4,269,795
Cash	1,313,605	1,829,583
Reserves	4,642,058	6,125,776
Ordinary capital	796,350	796,350
Added to carry forward	18,103,979	19,731,523

In deciding what effects increased competition will have upon dividend payments, investors should also bear in mind that the full effects of EPL and other tax changes have not yet been felt—and that the group's obsolescence reserve does not yet cover the shortfall between the depreciation provision made upon the original cost of fixed assets and the actual replacement costs of these assets. The group's reserves are strong, but shareholders should not expect anything more than a dividend of 15 per cent upon ordinary capital, after it has been doubled by the issue of a 100 per cent scrip bonus.

Fisons.—The decision by the directors of Fisons to increase the ordinary dividend from 9 to 10 per cent appears to have been based upon present prospects and not upon the past year's trading results. In the year to June 30th last the group's trading profits fell from £2,561,417 to £2,304,165, and its net profits from £753,792 to £643,660; at the same time an increase in the book value of the group's stocks (from £2,552,428 to £4,968,080) was accompanied by a fall in the group's cash balances (from £1,474,810 to £859,487). Normally these movements would be regarded as a danger signal, and many boards of directors would have been content, at best, to maintain the ordinary dividend. The decision to increase Fisons's dividend appears to have been made on the assumption that these stocks would be quickly liquidated, and that the group's cash balances would consequently be reinforced. This reinforcement has, in fact, been enjoyed in the first months of the current financial year, so that—in the short term—the increase in equity payments has been justified. What, however, are the longer-term prospects for profits and dividends? Here, too, the chairman, Mr F. G. C. Fison, is confident. He thinks that it is "probable that the consumption of fertilisers should continue to increase"; after drawing attention to the "exceptionally good demand" for fertilisers this autumn, he declares that the company expects this demand to continue in the spring. But before counting too many chickens, shareholders should remember that the group's plants do not yet appear to be working at full capacity. At the current price of 31s. 6d. the £1 ordinary shares yield £6 7s. per cent.

EXCHEQUER RETURNS

For the week ended November 15, 1952, total ordinary revenue was £73,228,000, against ordinary expenditure of £82,767,000 and issues to sinking funds £670,000. Thus, including sinking fund allocations of £20,470,000 the deficit accrued since April 1, 1952, was £330,593,000 compared with a deficit of £56,129,000 for the corresponding period of the previous year.

TUBE INVESTMENTS LIMITED

"ANOTHER CROP OF RECORDS"

EXPORTS UP TO £20 MILLION

MR IVAN STEDEFORD ON COMMONWEALTH CONSULTATIONS

"Another crop of records" in the progress of Tube Investments Limited is reported by Mr Ivan Stedeford, the chairman, in his annual statement, circulated with the accounts to stockholders on November 18th. The annual general meeting will be held in Birmingham on December 10th.

Turnover, productivity and earnings were up, he said, and prices had been kept down. Exports totalled £20 million, a gain of £3 million over the previous year's record, sales to America and Canada having increased substantially. Over half the British bicycles exported to the US came from T.I.

Profits had risen by £1,515,061 to £9,291,834, but when exceptional items, like price changes in materials stocks, were deducted, the additional real trading profit before tax amounted to little more than £500,000—this for an increase in sales of nearly £9 million. Here was a measure of costs absorbed and other efforts to keep turnover high, and a reminder that the sellers' market was behind us.

It had been felt for some time that an increased dividend was due to stockholders, but none had been recommended because of circumstances and appeals by three successive Chancellors of the Exchequer. The directors now considered that a bigger dividend could be paid, and they judged their recommendation, which made a rate of 15 per cent for the year on the increased ordinary capital, to be within the bounds of national policy.

Mr Stedeford continued: The Aluminium Division continued steadily on its way throughout the year. A certain overall recession in demand, largely due to adjustments to the rearmament programme, occurred during the latter part of the year, reducing the forward order book to more manageable proportions. Overseas sales leapt up immediately upon the ending in May last of the restrictions on aluminium exports, and progress here continues.

ALUMINIUM PRICE FACTOR

A problem of increasing concern to British fabricators of aluminium is the recent instability in the price of the metal. In only three years the price has risen from £90 to £166 per ton. While this may be largely attributable to the weakening of sterling in relation to the Canadian dollar, the fact remains that in this country—though not in the USA or Canada—the price relationship of aluminium to steel has moved considerably in favour of steel. In this situation, the full significance of Britain's continuing dependence on a single supplier outside the Sterling Area is easily appreciated. I feel sure that our good Canadian friends who produce the aluminium will not misunderstand this comment—for we both have an important stake in the British aluminium industry, which we all believe has before it a promising future if it is not priced out of the running. In confidence that the industry will retain its competitive vigour, our aluminium companies continue in their plans for servicing a wider range of industries and the development of new products.

New production records were achieved by the Cycle Division, with exports up by 22 per cent, thus further consolidating T.I.'s lead as the world's largest manufacturers in the industry. But it was a difficult year. Shortage of materials hampered production in the

earlier part, and then another series of economic crises wrought their worst in one country after another, and the exchange and inevitable licensing regulations which followed brought a number of markets to a virtual standstill.

WORLD CYCLE LEAD

It is a tribute to the competitive appeal of T.I. machines that the progress of the Division should have continued unabated in the teeth of this marketing tornado. It also offers evidence of the world prestige of British bicycles, demonstrating generally their pre-eminence in overseas markets, where they stand virtually unassailed by either Continental or Oriental competitors. Our efforts to develop the American market yielded most satisfactory results, exports to the United States representing more than half the total exported by the British bicycle industry.

Restrictions at home and bans abroad were enough to discourage the most stout-hearted, but the Electrical Division tackled all difficulties undismayed and finished the year making a not unsatisfactory contribution to the Group's total profits. The question might be asked whether it is intended to discourage the use of electricity for domestic purposes for another generation, for it would seem that this is what the present policy means. This prolonged period of depression by decree is forcing householders and manufacturers alike to turn their attention elsewhere. Any change of heart in national fuel policy would certainly receive the enthusiastic co-operation of manufacturers of electrical goods, but there is a limit to the years they can wait for it.

The serious position regarding steel supplies for the manufacture of tubes, which I reported last year, did not show the improvement we were entitled to expect. The various assurances we received, that the adverse balance would be largely corrected, have not as yet been implemented. Deliveries from the British steel industry got worse, and, finally, supplies from the United States diminished to a trickle. This situation presented us with grave problems. With steel input dropping by about 25 per cent and with our steel stocks already seriously depleted by the previous year's operations, the employment of some 25 per cent of the workers in a dozen or more of your tube factories was at serious risk, while the profits of the Division obviously were also in jeopardy.

TUBE STEEL SHORTAGE

To overcome these formidable obstacles we resorted to every manner of expedient and compromise. The application of methods for the more economic use of steel was intensified even to the point at times which normally would be regarded as uneconomic. We searched the wide world for steel, and scraped the world barrel for short tubes and second-hand tubes and surplus tubes, all of which we further processed; we reduced our remaining steel stocks to a bare hand-to-mouth level, and concentrated on manufacturing the more highly finished tubes involving the maximum employment for our workpeople. We take pride in a great all-out and successful effort to maintain employ-

ment, turnover and profits in the face of the fierce odds which confronted us, and at prices which did not reflect the total increases in costs imposed upon us.

But we are still faced with the same dilemma—which I submit again is inimical to the interests of the country—that unless determined action is taken by somebody somewhere Britain's precision tube manufacturers must continue to depend on imported supplies for an unduly large proportion of its steel—and hard experience has shown that these supplies can dry up almost overnight.

The results of the General Engineering Division beat all previous records. Our search for new products has met with gratifying success, and our activities in repairs and maintenance of aircraft and the design and manufacture of aircraft parts have been satisfactorily expanded. A first year's ownership of the New Conveyor Company has shown considerable potentialities in the manufacture of mechanical handling equipment, and whilst full advantage is being taken of present opportunities, I hope to announce further developments on another occasion. Since the close of the year terms have been agreed for the acquisition of Brookes (Oldbury) Limited, manufacturers of machine tools.

OVERSEAS DEVELOPMENTS

T.I.'s manufacturing interests and activities in Argentina, Australia, Canada, India, New Zealand and South Africa had shown satisfactory progress, the investment in each case mounting in value, said Mr Stedeford. A new project in cycle saddle manufacture had been joined in South Africa. The increasing shift in overseas demand from consumer to capital goods was a trend which many would not welcome, particularly those making the products likely to be unwanted as a result. It was, however, a fact which had to be recognised. Nothing could be done by Britain to stem it, and if we did not co-operate other countries would. If industrialisation, with British help, led to greater wealth in the countries concerned, then new markets should open up.

Mr Stedeford continued: Our direct exports for the twelve months totalled over £20 million, exceeding those of the previous year by £3 million, thus establishing another all-time record for the seventh successive year. Part of this increase was due to rising prices, but there was also a greater volume of goods shipped. The Commonwealth continued to provide our best markets. Our earnings of Canadian and United States dollars were also substantially increased. This record, good though it may be, offers no grounds for complacency. Some of the darker threats which confronted us last December, and which prompted the reservations I then made, did not fully materialise, but they were taking their course and now are being joined by some equally unpleasant fellow travellers.

As to the future, I am confident that T.I. will get its full share of the world trade that comes within our reach. We shall continue to devise new products and improve designs of old ones at attractive prices; we shall endeavour to meet competition wherever we find it; but it is difficult to see how a further

expansion in the volume of our direct exports is possible under the present very difficult world conditions.

COMMONWEALTH CONSULTATIONS

For some years, in my annual addresses, I have urged the need for international agreements, particularly on the distribution and economic pricing of raw materials. With the object lesson of the last two years before us, can there any longer be doubt that many of the troubles of the Sterling Area—and the international payments of the United Kingdom in particular—are directly attributable to a lack of co-operation in these matters. It is to be hoped that joint action by the whole Commonwealth, and understanding with the United States, will spring from the meetings of Prime Ministers later this month.

Do we need further bitter evidence than the crises of 1949 and 1951 that one of the serious weaknesses in the Commonwealth is the lack of an effective system for framing the broad lines of economic policy month by month? Measures are taken in individual capitals, in the local atmosphere, often with a view to scraping through to the immediate future. It would seem that only when something has gone crucially wrong is enough attention paid to the efforts and interests of other sterling countries, or, indeed, to long-term sterling solvency. Each Commonwealth country's interests are so closely and directly affected by the management of the Sterling Area that surely it calls for something in the nature of an economic consultative or advisory body of the Sterling Area. The sterling countries, however, cannot solve the international payments problem without American co-operation.

Despite a substantial and progressive increase in British output and productivity since the war it is apparent that the overall result is yet far from adequate, and that most American industries are still operating at substantially higher levels of productivity. Portents suggest that United States industry is on the verge of yet another great rise in productivity. There is no mystery about the way these American developments are being achieved. They stem in the main from a phenomenal capital investment in new plant; the rapidly increasing use of electronic control techniques, and the further application of highly geared automatic production lines by the spread, at great cost, of such devices as the transfer system of machines. Other countries, too, it is believed, have travelled far along the same way.

BRITAIN'S ANSWER

Britain's answer to this formidable challenge has had to be a curtailment of development expenditure, a drastic tightening of credit, and additional taxes on an industry already overburdened with them. We know that the authorities are aware of the perils inherent in such a policy, and official hopes have been expressed recently that greater expenditure on the expansion and modernisation of industry, though far short of what is needed, will be possible next year. I would urge that the matter is of greater urgency than this. Whatever else we deny ourselves, and can we afford—in any circumstances, and particularly in times of a production crisis—to continue to "go slow" technically while others advance at the double.

Discussing incentives, Mr Stedeford concluded: It may be easier and more certain of short-term and limited results to deny and restrict instead of giving, but it is surely a recognisable fact that an expanding economy cannot be built out of a contracting share of the proceeds for those who are expected to do the building. If stunted effort incurs no unpleasant consequences and greater effort the little pleasanter consequences, how can the country hope to get from society the purposeful endeavour it must have if it is to gain comfortable survival.

HORLICKS LIMITED

FACTORS AFFECTING PROFITS

The annual general meeting of Horlicks Limited was held on November 20th at Slough, Mr O. P. Horlick, chairman, presiding.

The following is an extract from his circulated statement:

Special reference was made last year to the peaks achieved in turnover and profit in the period then under review; it was also explained that these results had been contributed to by a temporarily more favourable milk situation which had made it possible to discontinue the rationing of "Horlicks" and also to restore to a normal level the scanty stocks previously carried by traders.

It was further pointed out that the absence of these special factors, together with the continued upward trend of costs in all directions, made it necessary to take a cautious view of the prospects for the year which it now falls to me to survey.

PROFIT AND LOSS ACCOUNT

The trading profit of the group of £659,138 compares with £721,665 for the preceding year, while the net profit before taxation, after miscellaneous income and charges have been brought into account, amounts to £527,222 against £551,642. In considering the decrease of £24,420, it is necessary to point out that it would have been £71,522 had it not been for a non-recurring credit of £47,102 which has been brought into account on this occasion and arose in the main from the disposal of certain redundant buildings and obsolete plant at our American factory. Provision for all taxation at home and overseas, assessed and assessable, requires £332,265 against £356,273 a year ago, and leaves the net profit after taxation at £194,957 against £195,369 last year.

In many respects the period under review has been far from easy. Events during the last quarter of 1951-52 brought home to us the severity of the impact on some industries, including our own, of the policy which the Government has been obliged to follow in its efforts to bridge the gap between imports and exports.

PROSPECTS

Perusal of some of my predecessor's addresses to you on similar occasions shows that for various reasons he almost invariably found it necessary to step warily when prospecting in the realm of the future. I have a similar diffidence, as at the present time there are several factors, particularly in connection with our markets abroad, which, if not alarming, are a source of continuing concern. Our United States subsidiary in particular is the cause of anxiety, for, in addition to the normal difficulties of the extremely competitive domestic market, it has, during the past months, had to contend with its full share of local labour troubles.

On the brighter side, our home trade keeps up surprisingly well considering the adverse factors. One reason for this, which our researches reveal, is that Horlicks is purchased so largely because of the knowledge our public has of its contribution to family health and well-being. We have reason to hope that planning and hard work will help us progressively to overcome the current unfavourable factors, and we can also hope for some easing of the burden of increasing costs which has proved such a bugbear in recent years. When practicable we shall, of course, pass on to our consumers any substantial amelioration of our costs and thus make the well-known beneficial effects of Horlicks available to an even wider public.

The report was adopted.

R. G. SHAW & COMPANY

BETTER GROUP PROFIT

The eleventh annual general meeting of this company was held on November 17th in London, Mr J. L. Milne (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The parent company, R. G. Shaw and Company, Limited, has two wholly-owned trading subsidiaries, namely, Shaw, Darby, and Company, Limited and Shaw Scott and Company, Limited. During the year under review the group profit was higher than in the previous year but, per contra, the provision for taxation was also higher and absorbed much of the improvement.

We ended up with a group profit of practically £2,500 better than the previous year, when we strengthened our resources by some £50,000. £15,000 has been allocated to general reserve and £6,000 to contingencies reserve. After providing for this and for the dividend of 10 per cent, there is a group carry forward of £84,097, which is £29,439 higher than last year. The group reserves and undistributed profits at June 30, 1952, are £50,439 higher than a year ago.

Our results are to a considerable extent influenced by the prosperity of the Tea and Malayan Rubber Plantation Industries, both of which are passing through an unhappy period following falls in prices. It will not be easy for rubber companies to make ends meet on the present price level.

As regards ourselves, conditions during our year to June 30th last were very good, but it seems unlikely that results in the current year will prove equally satisfactory.

The report was adopted.

CEMENTATION COMPANY, LIMITED

RECORD TRADING PROFIT

The thirty-second annual general meeting of this company will be held on December 10th in London.

The following is an extract from the circulated statement by the chairman, Mr Harry Clayton:

The trading profit for the year to March 31, 1952, is a net figure of £510,413, again a record in the history of the company. Figures appearing in the balance sheet do not indicate the volume of work on which the company is employed and the approximate value of uncompleted work on which the company was engaged at March 31, 1952, was as last year £8 million.

Turning to our large civil engineering contracts, Loch Erne was officially opened on October 1, 1952. The Bowland Forest Tunnel for the Manchester Corporation is maintaining good progress, while the Lawers Project for the North of Scotland Hydro-Electric Board has made an excellent start.

We have undertaken substantial work in Israel during the year. In India and Pakistan our activities grow, and we are now reaching a position of being able to recoup our initial expenditure.

A new activity during the year has been experiments in the underground gasification of coal. Our bored piling system has again been most successful and turnover has increased. The boring and drilling work of the group maintains its position among our major activities. Our South African company has again had a most successful year. We have pleasure in proposing a dividend at the rate of 15 per cent.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

CONTINUED RISE IN COSTS

MR P. H. ANDERSON'S REVIEW

At the fifty-fourth annual general meeting of shareholders in Johannesburg on November 18th, Mr P. H. Anderson, the chairman, said conditions continued to be difficult in that the supply of non-European labour followed the general downward trend that has existed over the last few years, further restrictions in the supply of power were imposed and costs continued their upward inflationary trend, although I am pleased to say that there have recently been some signs of a slackening off in the rate at which they are rising.

In my address to you last year I reviewed at some length the position on each of the five reef horizons being worked and showed how the stage had been reached where primary development had practically ceased, and operations were confined, firstly, to probing down the dip by means of winzes in an attempt to locate further zones of payability, and secondly, to internal development in the more promising areas already explored by primary development. As was to be expected, there was therefore a further decrease in the development footage accomplished during the year. No results of any significance were obtained in the various winzes, but some payable values were located on the 66th Level Main Reef drive connecting 60 W2 and 60 E1 winzes. Further development work is being carried out in this area. Internal development yielded some satisfactory results and the ore reserve positions on the Kimberley, Main Reef Leader and Main Reefs improved; but on the Bird and South Reefs, the two main sources of tonnage, the ore developed was insufficient to replace the ore mined from reserves during the year. A considerable tonnage was lost to reserves due to the rise in the pay limit, and there was on balance, therefore, a further material decrease in the total ore reserve.

INCREASED TONNAGE MINED

In view of the decrease in the labour force and the dislocating effects of power cuts, it is gratifying to note that there was a material increase in the tonnage mined during the year. This was offset to some extent by increased sorting and a reduction in the tonnage taken from surface dumps; but nevertheless there was some improvement in the tonnage mined compared with the previous year. This, coupled with a small increase in the value of the ore treated, resulted in an improvement in the quantity of gold produced, and the total revenue was higher in spite of a falling off in the additional revenue received from sales of gold at enhanced prices. Due to the continued rise in working costs, however, the profit was lower, and dividends had again to be reduced.

Results to date for the current financial year show a continuation of these tendencies. There has been a further decrease in the supply of non-European labour, with a consequent decrease in the tonnage mined. While there has been some increase in the yield of gold per ton, this has been insufficient to offset the reduced rate of milling, and in addition income from sales of gold at enhanced prices has fallen off. Total revenue has therefore decreased, and at the same time there has been a further rise in costs. Profits have suffered accordingly.

The report and accounts were adopted.

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

RECORD WORKING PROFITS

SATISFACTORY TREND OF MINING OPERATIONS

MR W. M. FRAMES ON URANIUM PRODUCTION

At the fifteenth annual general meeting of shareholders in Johannesburg on November 18th, Mr W. M. Frames, the chairman, said, although there was a small improvement in the average number of employees in service, both European and native, during the year under review which contributed largely to the increase of 205,000 tons in the tonnage milled, compared with the figure for the previous year, the labour supply was far short of requirements and in consequence the mine operated at a level considerably below its capacity. The yield per ton milled was 1.509 dwt lower but the increased output, coupled with a decrease of 10d. per ton milled in working costs, resulted in an increase of £168,670 in the working profit, which reached the record total of £7,695,319. The yield at 12.622 dwt. conformed more closely to the average value of the available ore reserve. During the first four months of the current financial year the number of non-Europeans in service has fallen severely in comparison with the figure for last year and in consequence the total tonnage milled is lower, working costs are higher and the working revenue less than for the corresponding period last year.

MINING OPERATIONS

I dealt at some length last year with the trend of mining operations and development results in order that shareholders might appreciate the position regarding grade at the mine and the probable operating results until the area below the 7th level is sufficiently opened up to contribute a significant tonnage of ore to the mill. Since then progress in the sub-incline shafts has been satisfactory and high values have been exposed in the development so far completed on the 8th level in the vicinity of No. A1 sub-incline shaft, which augurs well for future operations below the 7th level in the eastern portion of the mine. In the central section the limited amount of development accomplished exposed highly satisfactory values. To the west of No. 2 shaft the values exposed averaged 296. inch-dwt, which, although slightly better than the figure for the preceding year, continued to be considerably lower than the average for the whole mine.

ADDITIONAL PUMPING UNITS

In preparation for the future sinking of two sub-vertical shafts near the southern boundary of the property to deal with the reef at depth, twin haulages are being driven southwards from the 6th Level at Numbers 1 and 2 Shafts. The lengths of these haulages will be between 7,000 and 8,000 feet. The sub-vertical shafts will be stopped some distance above the reef horizon, which should obviate the necessity of leaving shaft pillars.

The quantity of water pumped to the surface increased substantially during the year. The mine is equipped however with a pumping capacity more than sufficient to meet the present position. In view of the larger quantity of water being handled capacities are being further increased by the installation of additional pumping units,

which are either at the mine and in course of erection or are on order for delivery in the near future.

URANIUM EXTRACTION

During the year a revised agreement was entered into with the Atomic Energy Board of South Africa in terms of which the operations of the company for the extraction of uranium are to be expanded. In addition to treating current residues the company will also treat the accumulated residues from its slimes dam and a larger plant than was originally contemplated is therefore being erected. The capital cost of the uranium plant is now estimated at £3,358,100. The whole of this amount will be provided by means of loans, which will be repayable solely out of the proceeds of uranium sales during the contracted ten-year production period. Shareholders will therefore not be called upon to provide any of the finance required and the company will be relieved of the capital risks incurred in erecting the plant. The erection of the plant is proceeding satisfactorily and it is anticipated that it will be ready for operation early in 1953.

PROFIT MARGIN

In terms of the revised agreement the company will receive a higher price for its product than that agreed upon at the end of 1950. Such price ensures the redemption of the capital cost of the plant plus interest over the contracted ten-year period of production and in addition allows a satisfactory margin of profit to the company. As production will be on a larger scale and in view of the higher price to be received for the product, it is anticipated that on the basis of present taxation costs the net profit which will accrue to the company will be greater than was stated in the directors' report for the financial year ended June 30, 1951.

Shareholders will realise that as taxation in regard to uranium production is on the same basis and formula as that applicable to gold mining and as the profits from the two sources are taxed conjointly, the capital expenditure of the uranium plant has brought about an immediate increase in the redemption allowance. This benefit will, however, diminish as the unamortised balance is reduced and the company will, in time, be faced with increased taxation and lease consideration as its taxable profit increases.

The report and accounts were adopted.

HOVIS LIMITED

SATISFACTORY DEMAND

The fifty-fourth annual general meeting of Hovis Limited was held on November 20th in London, Mr J. F. Morton (the chairman) presiding.

The following are extracts from his circulated statement:

In the accounts of the previous year, £100,000 was set aside to capital reserve for the replacement of fixed assets. This year there has been added the sum of £85,000 appropriated from profits (including £20,000 by a subsidiary) and £70,000 transferred from Contingencies Reserve. The object in view is to build up the reserve in order that, as and when it becomes necessary to replace any of the existing assets, provision will have been made to meet the increased cost of replacement, which will not have been provided by the normal depreciation based on past costs.

As it is considered essential to make the provisions to which I have referred and to conserve the group's finances to meet them, it has been decided to propose the capitalisa-

tion of part of the undivided profits necessarily ploughed back into the business and to issue to Ordinary Stockholders as fully paid up one new Ordinary 5s. share for every nine 5s. units of Ordinary Stock held.

The demand for Hovis continues to be most satisfactory. The control of flour milling operations continues to be exercised by the Ministry of Food, but it is hoped that the efforts that are being made to provide a measure of freedom to encourage enterprise and promote efficiency will be successful. We have been aided in keeping alive these essential qualities of a progressive business organisation by the operations of our subsidiary interests excluded from control.

The report was adopted, and the capitalisation proposals approved.

KEYSTONE KNITTING MILLS (1928)

PERIOD OF EXCEPTIONAL DIFFICULTY

The twenty-fourth ordinary general meeting of the Keystone Knitting Mills (1928) Limited was held on November 19th at Elstree, Hertfordshire.

Mr H. N. Lewis (chairman and managing director), who presided, in the course of his speech, said:

The company's trading in the first six months of the year under review was profitable, but the sudden cancellation of export orders and the equally sudden decline in home trade sales detrimentally affected the results for the next six months' period to a very considerable extent. Losses were incurred due to the reduction made in the controlled selling prices of our main hosiery product nylon stockings at a time when production costs were rising. The sudden withdrawal of the utility schedules had the effect of immediately dating certain of the company's products and thus making them saleable only at considerably reduced prices. These unusual conditions made the period one of exceptional difficulty.

Despite the setbacks reference to the balance sheet will assure you of the company's strong position. The company's freehold properties, plant, machinery and other fixed assets which cost £491,943 have been written down by no less than £253,115 and are included at £238,828.

Current assets at June 30, 1952, are shown at £300,868, and in reaching this figure stock has been written down to cover all reductions which were apparent to your directors at the date of these accounts.

For the reasons already mentioned, the year's trading after providing for depreciation of £20,622 and bringing into credit a net amount of £14,704 in respect of taxation, has, I regret to say, resulted in a loss of £30,653.

As the company had retained from profits of previous years £87,339 it was decided to pay the interest of 4 per cent on the funding certificates and a dividend of 5 per cent on the preferred ordinary shares on July 1st last and you will be asked to agree to the directors' recommendation to pay a dividend of 5 per cent on the deferred ordinary shares. The balance of profits to be carried forward will then be £45,174.

In regard to future prospects, although the outlook is still unsettled, I am pleased to be able to inform you that for the period since June last sales show a considerable improvement over the figures for the same period of the preceding year and if this improvement is maintained I hope to be in a position to report more favourably next year.

The report was adopted.

DEBENHAMS LIMITED

RESULTS OF A DIFFICULT YEAR'S TRADING

MR G. M. WRIGHT'S REVIEW

The ordinary general meeting of Debenhams Limited will be held on December 11th at the Wigmore Hall, Wigmore Street, London, W.1.

The following is an extract from the statement by the chairman, Mr G. M. Wright, ACA, circulated with the report and accounts:

Shareholders may remember that in my last review I thought it prudent to take a cautious view of the immediate outlook and refrain from giving any forecast of the prospects for the coming year. I think they must agree that this attitude has been justified by events.

The year under review, far from bringing any relaxation of our difficulties, proved to be a most anxious and disturbing period, calculated to tax to the utmost the resourcefulness of all engaged in our businesses.

The directors' report shows the balance on profit and loss account of £1,855,400. Debenture interest, trustees' fees and directors' fees, £74,992, and the amount required for national taxation, both current and future, £1,041,000, are deducted, leaving £739,408. The balance brought forward from last year, £406,817, is added; the payments of the preference dividends and the interim dividend of fourpence per share on the ordinary shares are deducted and the directors recommend that from the available balance £50,000 be placed to reserves, £150,000 be provided against stock contingencies and, as last year, a final dividend of elevenpence per share be paid on the ordinary shares, making one shilling and threepence per share for the year. The resultant carry forward is £419,125, an increase of £12,308.

BURDEN OF TAXATION

Taxation once again takes its very heavy toll. The amount of £1,041,000 which is to be set aside is no less than 58 per cent of our company's profit and if to that figure is added tax deducted from salaries and wages and purchase tax charged to customers, you will appreciate the enormous sums for which your company is responsible to the Government. As from January 1st last, a further burden has been introduced in the form of the excess profits levy and although I am advised that no liability arises in respect of the period under review, I must express my disagreement with a fiscal policy which exerts yet further pressure on the financial resources of the country's industry and commerce.

The fall in net profit from £3,590,610 to £3,194,943 bears witness to the difficult trading conditions which the group experienced in common with its competitors and upon which I have already spoken. I am sure, however, it is gratifying to our shareholders to note that, notwithstanding this reduction in profits, the amount carried forward in the group after charging taxation, setting aside reserves and paying the same dividends as last year, has increased in total by £212,459.

THE FUTURE

With regard to the future, the outlook is still very unsettled and if caution was advisable last year in predicting the course of events it is not less necessary today. I can only say that we are constantly endeavouring to find ways and means of improving the efficiency of every branch of our organisation. Our interests are well-spread, we have ample financial resources and shareholders may rest assured that no effort will be spared to promote the welfare of the company.

EASTWOODS LIMITED

HEAVY DEVELOPMENT PROGRAMME

The thirty-second annual general meeting of Eastwoods Limited was held on November 20th in London.

Mr George W. A. Miller, FCIS (chairman and managing director), in the course of his speech, said: The consolidated balance sheet of Eastwoods and its subsidiaries showed the written down value of fixed assets last year amounting to £1,786,000, to which we have added during the year £359,000 in capital development.

Current assets include stock-in-trade £881,000 and debtors £902,000. These two items show substantial increases reflecting the overall expansion of the business.

The development expenditure is already producing valuable results beyond all earlier expectations, and the current assets are actually £336,000 higher at a total of £1,877,000.

Share capital and capital reserves are unaltered at £1,950,000. The general reserve has been increased to £350,000 by a further transfer of £50,000 out of the profits of this year, and revenue reserves and surplus now total £513,000.

The tax equalisation account stands at £100,000, having been augmented this year by £15,000 in respect of initial allowances carried forward, plus a further £15,000 from taxation provided in previous years but now found to be in excess of requirements. Quite apart from, and additional to, the amount of £149,000 set aside to meet current taxation liabilities the joint reserves for taxes now total £273,000.

In view of our widening sphere of activities and the general expansion of the business as a whole, current liabilities and miscellaneous provisions are much higher with a total of £948,000 against £606,000.

We usually supply a diagram showing what happens to the money received from every pound's-worth of goods made, sold and delivered by your group for the year ended March 31, 1952.

The diagram can be best described as follows:

WHERE THE MONEY GOES

	s.	d.
Per 20s. of sales turnover.		
Manufacturing materials, transport, repairs, and spares, supplies and services, local rates, insurances, and general expenses	12	3
Employees' wages, salaries, and other benefits	4	3
Taxation on profits of the year ...	1	8
Depreciation and amortisation	0	11
Re-invested in the business	0	6
Dividends on Preference and Ordinary stock	0	5
	20	0

When the figures of production and sales for the postwar years are compared it will be seen how persistently our efforts in support of rearmament, housing, and export have resulted in turning out essential materials in larger quantity, better variety, and improved quality in parallel with the avowed policy of expansion and mechanisation.

Old layouts have been reorganised, old processes abandoned, works rebuilt and extended, and indeed there is hardly a single direction in which one could not say that these influences are at work throughout the organisation and that present successes are the combined result of all those efforts.

The report was adopted.

COCHRAN & COMPANY, ANNAN

(Engineers and Boilermakers)

The fiftieth annual general meeting of Cochran & Company, Annan, Limited, was held on November 14th in London.

Mr R. P. W. Adeane, the chairman, who presided, in the course of his speech, said: The trading profit at £221,737, as against £178,314, is the highest in the history of the company. In spite of this the net profit, after taxation, was not much higher at £68,234 as against £65,334 last year.

Whilst the year under review was a satisfactory one, it was not an easy one. Low deliveries of steel from our suppliers caused us in turn to disappoint many of our valued customers, a matter which has caused us grave concern, and the fact that orders have continued, and still continue, to flow in is a sign of the high esteem in which our products are held.

I am convinced that we are going into a period of intense competition in which only the fittest will survive. In search of new markets your directors have, during the year, visited South Africa, East Africa, Canada, Scandinavia, the Middle East and several countries in Europe.

That your directors believe in the future of the company is shown by the considerable extensions in the works to improve our capacity, which are being carried out. This year is the seventy-fifth year since the first Cochran boiler was constructed. During the last three-quarters of a century it has steadily grown in popularity, and with the improvement in steel supplies, which we anticipate and which has already made itself felt, I consider the outlook for the future to be good.

The report was adopted.

KOLAR GOLD MINING COMPANIES

MYSORE, CHAMPION REEF,
OOREGUM, NUNDYDROOG

At the annual general meetings of the above named companies, held at Ooregum on November 10, 1952, at which the results for the nine months ended December 31, 1951, were considered, Mr Arthur H. E. Taylor, in the chair, referred to the fall in the price of gold in the early part of this year, from Rs.294 per oz to Rs.233 per oz and reported that there had been a further fall in the price recently and that sales are now being effected at around Rs.220 per oz. This fall is having a serious effect upon the KGF companies' earnings.

Mr Taylor gave figures which showed a substantial increase in production of the KGF companies, except Champion Reef. As a result of the setbacks and the fall in the price of gold, Mr Taylor said the dividend of the Champion Reef (KGF) company for 1952 is likely to be considerably lower than 15 per cent.

The chairman said there is little prospect of any dividend for the current year from the Ooregum (KGF) company. For the Mysore company the dividend is likely to be meagre. The excellent developments and increase in ore reserves in the Nundydroog Mine, enabling the operating company to increase its output substantially, should make an increase in dividends from that company possible, provided the gold price does not fall further.

Mr Taylor said the present rate of output of the Ooregum mine could not be maintained and that under present conditions, mining has become unprofitable. He said

that schemes for the Ooregum (KGF) company to amalgamate with or to sell its undertaking to the Champion Reef (KGF) company were being considered and when the ultimate scheme is complete particulars will be put before the members of the Champion Reef and Ooregum sterling companies. When the scheme has been settled it is the intention to liquidate the two sterling companies.

The chairman referred to the Indian super tax which has to be paid by the sterling companies on any dividend received from the KGF companies; this tax, he said, would be avoided by distributing the shares in the KGF companies to the stockholders of the respective sterling companies.

Mr Taylor said the Mysore and Nundydroog (KGF) companies needed the financial support of the sterling companies, but as soon as it is possible to do so, without jeopardising the position of the Mysore and Nundydroog (KGF) companies, it is the intention to liquidate the respective sterling companies.

When the Mysore, Champion Reef and Nundydroog companies are liquidated, the shares in the respective KGF companies will be distributed to the members with the proceeds of sale of the respective UK investments. On the liquidation of the Ooregum company, the proceeds of the sale of its investments and of its other assets resulting from the scheme to be adopted, will be distributed to its members.

The reports and accounts were adopted.

HOSCOTE RUBBER ESTATES, LIMITED

The twentieth annual general meeting of Hoscode Rubber Estates, Limited, will be held on December 17th in London.

The following is an extract from the statement by the chairman, Mr H. B. Egmont Hake, CBE, circulated with the report and accounts for the year to June 30, 1952:

The lower levels in the price of rubber and the higher costs of production during the financial year under review—both features common to estates operating in Malaya—leave us with a trading profit well below the figure earned in the previous year: it was £80,792 against £208,281 in 1950-51. Taxation accounts for £44,687, which leaves us with £36,105.

Our cost of production was higher than we could have wished, our estates being in districts specially affected by communist intimidation. A drive for cheaper production is under way on all our properties, and with the fall in the price of the commodity some adjustment in wages has already been negotiated. In recommending a dividend of 15 per cent, we shall be reducing the carry-forward from £17,814 to £15,782; this your board feel can safely be done in view of the strength of the company's financial position. Production for the year was 2,341,649 lb against 2,440,078 lb for the previous year. These quantities are below the company's potential, which in normal conditions could well be 3 million lb.

The industry has now moved into a situation where there is an abundance of natural rubber, and consequently into a period of severe competition with the synthetic product. Producers are willing enough to face the realities of free and fair competition with an alternative product which has come to stay, but the competition we are now facing is heavily loaded against us by the restrictive practices of US Government agencies. One relates to what is called the mandatory use of synthetic rubber which has the effect of compelling manufacturers to produce and use GRS up to a minimum of 450,000 tons: present legislation calls for a compulsory minimum of only 200,000 tons,

but government agencies administering the law have arbitrarily raised this to 450,000 tons. Another is the arbitrary fixing, by the US authorities who own the plants, of the price of synthetic rubber at a figure which does not reflect normal private industry pricing practices.

The effect of these protective measures is in the first place to narrow the area of competition, and then to force down the price of natural to the level of this artificially low price, at which even for efficient producers there is not a sufficient margin of profit, after the excessive taxation which they suffer, to cover the cost of replanting and replacements. This compulsory use of synthetic rubber no longer has any justification now that there is an abundance of rubber and a stockpile of natural rubber of well over a million tons; and it should be the constant aim of British diplomacy, at the highest levels, to press the US Government to get rid of it, as well as to price synthetic more realistically—not only in justice to natural producers but also for the sake of the economic and political stability of South-East Asia, and the maintenance of the sterling area's dollar earnings. Given complete freedom of competition, natural rubber could be expected to give a good account of itself.

LEETHEMS (TWILFIT)

FACTORS AFFECTING RESULTS

The twenty-fourth annual general meeting of Leethems (Twilfit) Limited was held on November 20th at Portsmouth, Mr C. H. Reynolds, JP (chairman and managing director), presiding.

The following is an extract from his circulated review:

The first months of the financial year witnessed normal and satisfactory trading and profits. Towards the end of October a marked change commenced in the textile trade. Following a period of exceptionally high prices for the cloth necessary to maintain production, trade deteriorated and was accompanied by a fall in cloth prices to more reasonable levels. We were left with no alternative but to bear the excess costs incurred. This and increased costs attributable to short time working in the factories, accounts for the decrease in trading profits.

Measured by volume, the decline in production was more pronounced for export sales than that for the home market; the latter being less than at one time feared.

Sales are again buoyant and, backed by a very satisfactory order book, we are encouraged to believe that the trough of the depression is passed.

We are happy to state that the extension of our Kingston (Portsmouth) factory, referred to in previous reports, has come to fruition. The advantages are already apparent.

We recommend that the final distribution on the ordinary shares be 6 per cent (less income tax), making 9 per cent for the year.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

LIVING with the DOLLAR

THE DELICATE CRUSADE
CHASM OR GAP?
FIRST PLANKS FOR THE BRIDGE
THE COMMONWEALTH'S TASK
IS DISCRIMINATION INEVITABLE?
ATLANTIC PAYMENTS UNION

LIVING WITH THE DOLLAR

The Delicate Crusade

THE Commonwealth Prime Ministers will meet in London next week to face an agenda that is baffling in its complexity, but grandiose in its design. There is now not much secret about their aims. They will seek to chart a course that would lead the sterling area nearer—at any rate, somewhat nearer—to lasting dollar balance; and then, with this chart as their testimonial, they will ask President Eisenhower for help in establishing a bolder and less restricted system of world trade. The emphasis will be on the strategy for advance to convertibility, not on the tactics for retreat from crisis. In Mr Churchill's mind—and, so long as the design is still innocent of aggravating detail it is Mr Churchill's mind that matters—this is to be Casablanca, not Dunkirk.

It will be a tragedy if these high hopes disintegrate as soon as they reach solid ground. But, if they are not to do so, the proposals that emerge from this conference will have to satisfy three exacting tests: First, they will have to be sufficiently ambitious to capture the imagination of the new American Government; secondly, they will have to impose a sufficient degree of economic discipline upon the Commonwealth to deserve that capture; and thirdly—and most important—they will have to be sufficiently realistic to work.

There are signs, unfortunately, that the last hurdle may also be the most difficult to surmount. In recent months a surprising number of leading bankers and public servants on both sides of the Atlantic, looking out upon the sorry mess of postwar exchange controls, have become converted to the philosophy of Rupert Brooke's fish:

"This life cannot be All," they swear,
"For how unpleasant, if it were!"

This emotion, with a few technical trimmings, has been the main force behind the recent agitation in favour of a dash for sterling convertibility and for freedom in the exchanges. It is true that the United Kingdom sponsors of this dash have not meant quite what the Americans, and some sterling dominions, thought they did; in particular, the United Kingdom's conception of convertibility has always been that foreign countries that earn sterling should be given the unfettered right to buy dollars from the sterling area central pool, not that British countries should ease their own restrictions on dollar imports in any way. But since a programme for some such move to freedom—with a few conditionals added and some second thoughts put in—may still be the basis of the British proposals to be put before the Commonwealth conference, there is a clear need to examine the sort of world trading system in which such an experi-

ment, and if possible something wider, could possibly work.

That, in brief, is the object of this survey. There are three lines along which the examination needs to progress. The first of the five following articles makes a sober—which unfortunately means a depressing—assessment of the supply of dollars that is likely to become available to the free world in the next few years. The conclusion emerges that it will be a very difficult task to keep the world dollar gap below \$5 billion a year—or indeed below \$10 billion a year if exchange and import controls are to be significantly eased. The third article examines what progress the Commonwealth could make towards achieving its share of this difficult task; its conclusion is that the Commonwealth could certainly do something—chiefly by curbing its two major extravagances, the uneconomic industrialisation programmes in the dominions and the uneconomic sheltering of consumer goods industries in the United Kingdom. At least so long as it continues to shelter behind the barrier of the present import controls, it should be possible for the Commonwealth to improve on its performances of the last seven years, which have never progressed beyond a fleeting dollar balance every other year, when its stocks have been running down and American production has been running up.

But the dominant conclusion remains that any further advance—to the sort of world that was dreamed about at Havana and talked about at Bretton Woods—could only be achieved within the framework of a new international payments system. The last of the articles in this survey sketches a suggested framework for such a system. In brief, the main proposal is that if the United States (or any other creditor country) continues to run a large external surplus, and thus piles up claims on other countries that it does not immediately wish to use, it should do so in a way that will not have a disastrous effect on international liquidity; in other words, its central banking system should be prepared to hold these claims in media other than (though equal in value to) dollars or gold withdrawn from other people's attenuated reserves. Quite clearly, any such system would have to be guarded by many watchdogs if worldwide inflation is to be held in check; and quite clearly, too, the decision whether to introduce such a system would have to depend wholly on the judgment of the new government in the United States. All that can be urged from this side of the Atlantic is that any serious American observer with access to the public ear should examine the case carefully, and should not delude himself or his public that there is any easier way to a world of freer, non-discriminating trade. It is a delicate hothouse flower that freer traders are trying to make burgeon; and it could so easily be destroyed by a premature blast of political wind.

Chasm or Gap?

IT is against this background that the non-dollar world needs to scout where it is going and look where it can leap. The first results of any such scouting are hardly encouraging to complacency. They suggest that the dollar problem is not merely not likely to get better; unless special steps are taken by both the Americans and their customers, the problem is actually likely to get worse. The reader should be forewarned that the analysis in this article (which deals with the likely development of United States demand for imports) and in the first part of the following article (which will deal with the prospects for United States overseas investment) is going to sound singularly depressing. A road does seem to open up at the end of the tunnel, but it is not going to be an easy one to tread.

Scope of the Problem

In five of the seven postwar years the United States surplus on current account has amounted to between \$5 and \$8 billion; the exceptions were 1947, when its surplus shot up (exceptionally) to \$11½ billion, and 1950, when it came down (probably even more exceptionally) to \$2.2 billion. On present trends, the gap is likely to remain of this order even if discriminatory restrictions imposed by most other countries against imports from the United States continue in force. If ever these restrictions were lifted, the gap would widen much further still.

All this is a relatively new problem, for before the war there was no such thing as a serious dollar gap shortage. Between 1934 and 1938 America's exports averaged about \$2.7 billion a year and its imports

about \$2.4 billion a year, so that its total surplus on current account (including invisibles but excluding silver purchases) was kept down to an annual average of about \$470 million. This was a smaller surplus than Britain ran in the days when it was the leading world industrial power and thus the fountain head of international investment. It is true that the United States was unfortunately not a fount of overseas investment just before the war; after investing abroad up to \$1 billion a year in the twenties, it recoiled like a burned child in the thirties; and after 1934 it began to import about a billion dollars a year of foreign funk money instead. But this was hardly to be regarded as a durable feature of international trade, and in any case the annual production of over \$900 million of newly mined gold outside the United States went a long way to finance it.

What then have been the reasons for the deterioration in the postwar years? The charts accompanying this article tell the story in detail. It will be seen that the answer lies mainly in the fact that while the volume of America's imports in the postwar years has never risen by as much as 30 per cent above the 1937 level, its exports have been consistently between 80 and 160 per cent above it. In the fourteen years to 1951 America's production nearly doubled and its exports much more than doubled, but its imports increased by only 26 per cent.

Raw Material Imports

All available evidence suggests that this lag in imports is not a short-term aberration but a long-term fact. Unfortunately, this judgment must apply both to future American demand for imports of raw

materials (on which the evidence recently collected by the Paley Commission has been widely misunderstood) and to future demand by the United States for other sorts of imports, especially "tariff-protected" manufactures. These two vistas now need to be scanned in turn.

Nearly three-fifths of US imports consist of raw or semi-manufactured materials for industrial use. In the late twenties and early thirties, the ratio between the value of imported raw materials and the total value of US manufactures varied between 7 and 8½ per cent; it was falling fairly rapidly just before the war and by the late forties (before the distortions introduced by rearmament) it seemed to have settled down at between 3 and 4 per cent. American industry has been economising in the use of raw materials, finding synthetic substitutes from domestic production and making much more intelligent use of scrap. It is true, as the Paley Commission has pointed out, that the United States is now near to exhausting some of its domestic raw material resources, especially in metals; but this seems more likely to benefit its immediate neighbours—in Canada and northern Latin America—than anybody else. If the big investment schemes presaged by this emerging gap in American metal resources do in fact take place in these

neighbouring areas, the capital equipment to carry them through must be expected to come mainly from the United States, and the upsurge in local incomes associated with these schemes will be spent mainly on US consumer goods—because of the geographical propinquity of tastes, if of nothing else. In other words, the dollar area may grow larger, but the dollar gap, for all countries outside the Americas, will not thereby grow less.

This implication of the recent report of the Paley Commission has not been sufficiently recognised, either in the United States or abroad. In particular it is not generally known that that report was a quite frightening document for the sterling area. One of the chief tasks of the Paley Commission was to collect some detailed, and many vague, estimates of demand for imported raw materials in 1975—on the very sweeping assumption that American industrial production, following the trend of the past century, would have exactly doubled by then. The commission estimated that America's demand for some metals would increase by 200 or 300 per cent, but that its demand for rubber and tin would fall and its demand for fibres would lag well behind the trend of production and incomes. Of those industrial materials for which the commission gave detailed estimates, there

were eight (wool, rubber, tin, manganese, copper, lead, chrome and bauxite) that are exported by the sterling Commonwealth; these commodities brought in some \$620 million—or nearly 40 per cent of the sterling area's total dollar earnings—in 1950. Even if the Commonwealth maintains its share of the American market in each of these commodities (and that means that it would have to increase its production of some of the metals substantially) the rise in its earnings from those of the eight commodities for which demand is expected to increase would actually be offset by a decline in earnings from those for which demand is expected to droop; in fact, at 1950 prices, the sterling Commonwealth's total earnings from these eight commodities would fall from \$620 million in 1950 to under \$515 million in 1975. Admittedly, this gloomy arithmetic takes at face value the commission's very suspect estimate of a precipitate fall in US imports of natural rubber (by \$200 million at 1950 prices); but even if allowance is made for this, the prospect for a notable increase in dollar earnings from sterling-area raw materials in the next twenty years does not seem very bright. And this, be it remembered, is on the assumption that American production doubles by 1975; which means that the supply of American goods that the outside world would like to buy is presumably expected to double too.

The Tariff Delusion

What now of the prospect for United States imports of food and manufactured goods? Unfortunately these, too, seem certain to increase less than proportionately with American national income. In the late twenties and the thirties the United States imported between 4 and 5 per cent of its food; since the war the proportion has hovered on either side of 3 per cent. There may be some reversal of this trend in the near future; as America grows ever richer—and its population larger—it will be surprising if there is not some relative drift from the land. But foreign dairying interests, who have had some unpleasant experiences in the United States market in the recent past, would do well to remember that any drift from the farm is bound to be slow, so long as the manufacture of feather beds for farmers is the main competitive industry for the congressionally inclined.

United States imports of manufactures, which represented between 3 and 3½ per cent of total consumer expenditure on non-food items in the thirties, have also lagged since the war; in the last five years the average proportion has been nearer 2 per cent. This decline has occurred despite a reduction of over 60 per cent in the United States tariff on dutiable imports between 1937 and 1951; in other words, even if the whole of the remaining tariff were swept away in the next twenty years, the consequent gain to foreign exporters would not be as great as that which they have secured—and been unable to make much use of—in the last fifteen. This statistic illuminates the two sides of the great tariff delusion, which is as self-righteously believed in on this side of the Atlantic as it is fearfully clung to on the other. Because of these false fears the political obstacles in the way of further tariff reductions in America are very great; indeed, in 1953, when the United States Trade Agreements Act (on which all the GATT concessions hang) comes up for congressional renewal, non-dollar countries are likely to be on the defensive on this battleground. But even if the defence is successfully accomplished, and American liberals succeed in further assaults on a tariff

structure that is admittedly a disgrace to the world's leading creditor nation, the outside world should not expect that its opportunities for earning dollars will be greatly and immediately strengthened thereby. Total US imports of manufactured goods subject to tariff amounted to only \$1 billion in 1951. The remaining tariff is not so high that its removal could be expected to lead to more, at the very best, than a doubling of the present rate of these imports—and more probably to an increase of 50 per cent or less.

The blunt fact is that the domestic productive facilities and marketing institutions that have been created behind the American tariff wall are now so firmly entrenched that it is an exorbitantly expensive business to start up in competition with them. This does not mean that foreign exporters should not make every effort to overcome these difficulties; it simply means that they should not expect that reductions in the United States tariff can significantly help them in their task. The best that the outside world can reasonably hope for is that the Customs Simplification Act, which would remove certain barriers to imports into the United States caused by tariff procedure rather than tariff rates, will eventually pass through Congress; and that some effort may be made to modify or repeal the legislation that requires the US Tariff Commission to recommend (though it does not require the President to enforce) an increase in duties, if it finds that a domestic industry stands to be injured by any tariff reduction caused by a trade agreement.

The Emerging Gap

The prospect emerges formidably that there is little likelihood of American imports coming to bear a larger proportion of American national income over the next few years—the proportion is more likely to fall still further. There are, moreover, three further factors that need to be taken into account. First, this discussion has so far been set in the context of continuing boom. The Economic Co-operation Administration has estimated, from analyses of experience in the slump of 1930 and the recessions of 1938 and 1949, that when United States consumption falls by 4 per cent, its total imports fall by about a quarter and its imports from the sterling area by about a third; it would be optimistic to suppose that there will not be some setbacks of a larger order than this in the next twenty years. Secondly, it must be remembered that American industry is now replacing its machinery at least twice as fast as is British industry; it is therefore lengthening its already long lead in competitive efficiency with every year that passes. This advantage may be partly offset by a faster increase in labour costs in America than Britain—and/or (probably and) a further depreciation of sterling against the dollar. But in the modern world the advantage in exploitation of new inventions and new techniques will be with those who have the access to new capital equipment, not to cheaper labour. Thirdly, if American demand for any particular commodity imports (such as South African uranium) does increase notably, then America can resort to bulk buying and prevent the terms of trade from turning against it by exploiting the sheer force of its bargaining power. Mr Stuart Symington (in the case of tin) and Mr Jess Larsen (in the case of rubber) used this weapon of socialist and monopolistic exploitation against Malaya and Bolivia in 1951; and they gained considerable political popularity in a country whose liking for free enterprise tends to be outweighed by its suspicion that

it is always being done down by clever foreigners, whether in dhotis or striped pants.

It is devoutly to be hoped that some of these prognoses are too gloomy, but it will be surprising if all of them are. They suggest that the natural growth of America's need for imports cannot be expected to go very far towards closing the now customary dollar gap of between \$5 and \$8 billion a year, even if American production continues to rise and with it America's demands for imports of materials. The second condition would imply a further rise in the dollar incomes of the producers of such materials, but it would not guarantee the closing of the gap, unless exports from the United States were screwed down to or below their present level. How then is the gap to be financed?

In postwar years it has been financed by between \$4½ and \$6½ billion of annual "foreign aid," and between

Factors reducing dollar gap between 1937 and year in question are shown on the left of each pair of blocks, and those increasing it on the right.

\$700 and \$1,700 million of "remuneration-seeking" investment (including dollar investment by such institutions as the International Bank). Foreign aid obviously cannot go on for ever; the countries of the Commonwealth and Western Europe cannot really expect to continue to enjoy a tolerable standard of life largely because—and this is a statistic that should be pinned up in every trade union committee room—each American worker continues to lend or give to them between 9s. and 14s. of his weekly wage.

But if foreign aid is to taper off and American imports are not to be spontaneously increased, then one of three things will have to happen:

Either American investment overseas will have to go up

Or other ways of injecting dollars into the free world will have to be found

Or American exports will have to go down.

It is to the discussion of the first two of these possibilities that the next article in this survey is devoted.

First Planks for the Bridge

WHAT, first, are the prospects that "remuneration-seeking" dollar investment will increase above its recent average of rather over \$1 billion a year? They are frankly not very bright, except perhaps for investment in Canada and in primary producing ventures in Latin America (which, together with the oil areas of the Middle East, have absorbed the lion's share of direct American overseas investment in the postwar years).

There are two essential differences between the position of the United Kingdom in its industrial heyday and that of the United States today. First, nineteenth-century Britain was a tight little island which depended on overseas sources for much of its food and raw materials, and which could start up primary producing ventures overseas in the sure knowledge that it would want to buy the fruits that came out of them. Incidentally, the fact that the bulk of Britain's imports in this period were primary essentials, while many of its exports were already secondary inessentials, meant that the British economy tended to relapse into a deficit in times of slump; as a result, the years in which private investors were inhibited against pumping out sterling on capital account happened to be the years in which the country was pumping sterling out on current account instead. It was for this reason that there was no such thing as a sterling shortage in the nineteenth century. The United States, on the other hand, is a vast and remarkably self-supporting sub-continent, and the years of recession in which its businessmen will be most inhibited from investing abroad are likely to be the years in which the country will be running a very large current surplus indeed.

A second major difference between the mid-nineteenth and mid-twentieth centuries lies in the changed political climate for foreign investment. In part, this is a matter of changing power and changing fashions in diplomacy; there were no Abadans in Lord Palmerston's day. In part it is an effect, as well as a cause, of the very size of the dollar gap; in a world in which American businessmen could feel sure that they would always be able to draw back their profits (and, if need be, their capital) in dollars, dollar investment in foreign countries might increase—especially if it was fostered by a favourable tax policy both in the United States and overseas. The easing of this particular transfer problem might be one of the major contributions that would flow from the setting up of a new payments system—but to postulate such a solution at this juncture is to answer a question by assuming the initial question-mark away.

Prosperity through Point Four?

The next possibility to be considered is that of United States Government investment which is not motivated by purely commercial considerations—in particular, of course, the generous concept of Point Four aid for under-developed countries. This year Point Four aid is expected to reach some \$350 million and this figure is more likely to rise than fall in the next year or two. The programme,

as at present conceived, is one for making available American expertise and technique, not for providing substantial injections of dollar capital; it has never been intended that Point Four aid itself should rise from millions to billions. But there is perhaps a hope that projects for lending to under-developed countries may capture the imagination, both of American officialdom and of private American foundations, rather more easily than projects for making similar loans to America's industrial competitors. The outside world should do all it can to keep this generous impulse flowing. The other developed countries such as Britain should constantly aim at a surplus in their overseas payments, in order to be able to add their dimes to American dollars in developing the neglected areas. Up to now, Britain has not been doing this; it has been lending to the developed dominions but borrowing from the undeveloped colonies on a scale (in relation to income per head) that has not been far below its borrowing from the United States.

* Mainly composed of net movement in foreign gold and dollar reserves. In years when these have increased they are set at left of relevant block.

But, even if the development of backward areas becomes part of an integrated international design, it would be idle to suppose that it will do much to bridge an annual dollar gap that seems likely to be measured in billions of dollars. In the first place, many of the dollars that are lent will be used for additional purchases of American machinery, so that the disbursements made are not likely to result in significant net accretions to the

world's dollar supply. In the second place the enthusiasm that has generated the whole programme is likely to have to ride over some bitter disappointments. These disappointments may be partly political and partly economic. It needs to be frankly recognised that an increased flow of development aid will not necessarily stimulate anti-Communism or damp down anti-Americanism. In the early stages of economic development (as distinct from the advanced stages of economic decay), it is not very poor men that become Communists but men who are getting richer more slowly than they like; and it is not neglected and primitive peasants who become anti-Americans, but labourers and clerks who are envious of the standard of living of resident American advisers and irked at the conditions that necessarily have to be attached to American aid. On the economic plane, too, there are bound to be some disappointments from grandiloquent investment schemes in countries that are

* Excluding Iraq. US investment in colonies partly estimated.

not yet well prepared to handle intricate modern equipment, and not inclined to work as hard as Americans do; for Englishmen, there is now a wealth of bitter experience in the one word "nuts." Moreover, American enthusiasm for such projects may be somewhat damped by the sheer size of the task to be accomplished. There are over a billion people in the world with an average annual income of less than \$100; if the Americans devote a billion dollars a year to aiding them, they will provide the funds to buy each one a new hoe and not much else.

It will be a grave misfortune if these difficulties cause the Point Four programme (and the programmes that other developed countries should introduce to supplement it) to falter before it has taken its first steps. But the fact must be faced that economic disappointments may cause such aid to be more and more grudgingly given, and political developments may cause it to be more and more grudgingly received. Certainly it would be most unsafe to assume that this concept will do much to bridge a world dollar gap of the order of \$5 to \$8 billion, and to believe that any dash for exchange freedom can be partially carried on these slender wings of hope.

* * *

So far, this survey has been concerned with factors in the dollar problem that the free world probably cannot do very much about; they are factors in the lap of those historical and sociological impulses that the ancients thought were gods. Economists are never wise to tinker with such forces; their proper sphere of action is in the field of Mammon instead. And it is on this home ground—that is to say, the ground of estimated advantage to mutual and material self-interest—that the first tentative proposals for narrowing the dollar gap can be made. It is here that this survey can cease to be a passive contemplation of a gloomy future, and enter the stage of making controversial calls for action.

Apart from further disinflation in the non-dollar countries and the establishment of a new international payments system, there are three major problems that deserve consideration. America and its allies should look anew at

- the problems of defence finance;
- the dollar price of gold; and
- the stability of American raw material purchases;

and decide whether their individual best interests would not be served by some change in their policy towards these questions.

Defence Finance

On the first of these problems, there is real reason to fear that defence support aid, under the present system, will taper off before rearmament can safely be slackened. Congress seems likely to keep up its steady pressure on the yearly appropriations, and Stalin to keep up his on Western Europe. This is not the fault of the Americans, but of the whole North Atlantic Treaty Organisation. For Nato has not made as significant an advance towards setting up a common defence budget as was at one time hoped.

In any national defence effort people are taxed according to their incomes; weapons and materials are bought in the cheapest market; and troops are deployed in the most effective way. These decisions are made quite independently of each other; any suggestion that there should be a separate vote to decide what proportion of the taxes paid by the citizens of Birmingham should be spent on the manufacture of arms in Birmingham instead of along the Great West Road (or for that matter what

proportion should be spent on equipping the Warwicks instead of the London Scottish) would rightly be regarded as absurd. But at the moment there is a separate vote in Washington on what proportion of US defence funds should be spent at home instead of abroad; and there is a tight watch in London to see that virtually none of the defence funds in the British budget is spent abroad at all.

Part of the difficulty lies in the transfer problem, which might disappear if there were a fully effective international payments system. In effect, Nato could be given a quota of its own in a worldwide clearing union. Obviously enough, however, the contributions from the individual countries to set up this quota would have to be decided by some independent criterion. Perhaps the best system would be to relate the contribution made by each European country to that made by the United States; Congress will not be denied the unfettered right to determine the scale and direction of the United States defence effort whatever happens. But European countries, who are much nearer to the main source of danger, should seriously consider whether it would not be in their best interests to make a bold declaration that their contributions to the common pool will be a stated proportion of that made by the United States, dependent not merely on their relative national incomes but also on certain defined rules of progression (possibly those written into the American tax system). In this way it could be clearly laid down in advance how far the proportions of income paid out by rich countries should exceed the proportions paid out by poor ones. Obviously, too, once these contributions were decided, individual countries could not contract out of them and still remain in the pool; the ordinary taxpayer cannot tell the inland revenue that unexpected pressure of circumstances—such as his desire to buy a new house—makes it impossible for him to meet his tax obligations as fully as he had hoped.

The pool formed by these contributions could then be used for the purchase of armaments in any member country, on a basis of full competitive tender. It is impossible for an outsider to judge how far such pooling arrangements could extend; they obviously could not extend over more than a fraction of the whole Western defence effort, for there are many real political and technical difficulties (such as varying military commitments outside the Nato area) as well as national and professional prejudices in the way. The insider who would be best fitted to work out such a scheme is the new President of the United States. All that can be said here is that the more that purchasing decisions can be made by military experts at Nato solely on grounds of relative cost and not on grounds of political expediency, the more defence per dollar will the whole free world get; and, it so happens—relative efficiencies and costs (especially in the production of aircraft and warships) being what they are—that the system would also be likely to lead to an upsurge of American defence purchases in Europe. Such purchases could almost certainly be bigger than the \$500 to \$1000 million a year of "offshore purchases" that now seem to be in prospect. Any such system, it must be emphasised, would give the American taxpayer more for his dollar, as well as giving European countries more dollars to spend. This would be trade, not aid.

The Price of Gold

The problem of the dollar price of gold is more difficult and more open to debate. Before the war the sterling Commonwealth used to earn over \$500 million a year from sales of newly mined gold; the fact that the dollar price of gold has remained constant while all other commodity prices have doubled has hit its finances very hard. In fact, if the price of gold had moved in line with other American commodity prices, the sterling area would have enjoyed a net increase in its dollar reserves in each postwar year except 1951 and (possibly) 1947; moreover the dollar value of the central reserve would be some three or four times larger than it is now. It is quite clear on which side of this problem the sterling area's bread is buttered.

It is not so clear what attitude can reasonably be expected of disinterested American opinion. On the one hand, it can be argued that this is not the time to encourage the diversion of capital equipment and other resources to the socially useless task of gold mining; that an increase in the world price of gold would have inflationary consequences in many countries (including America) unless internal monetary measures were taken to sterilise them; and that the invidious benefits of such an increase would go primarily to South Africa and other gold producing countries, not to the deserving poor. On the other hand, a rise in the world price of gold would clearly increase world currency reserves and thus make possible some advance towards freer international trade; it seems likely, for this reason, that if trade had been more evenly balanced since the war—so that all countries had been sometimes net buyers and sometimes net sellers of gold—then the desirability of an increase would have been generally conceded. This may be another case, in fact, where the exercise of America's monopoly buying power has had undesirable economic consequences that Americans have not realised or intended.

Raw Material Contracts

The third problem on which an approach can reasonably be made to the United States concerns the stability of its annual purchases of raw materials. Potentially, this is the most important question of all. With international currency reserves at their present level, a quite modest American recession can generate, through the immediate fall in American purchases of raw materials that occurs with it, a desperate financial whirlwind all over the world. It could also grievously set back the investment needed to provide the raw materials which, according to the Paley Commission, American industry is going to require in increasing measure if it is to expand. The obvious answer to these problems seems to lie in some form of long-term purchasing arrangements.

Unfortunately postwar experience has shown that even a flexible purchasing agreement, like the International Wheat Agreement, can quickly get out of date. In a time of inflation the maximum price soon becomes too low to encourage increased production, and in a time of slump the minimum price may ride so high above free prices as to cause restiveness among consumers. Perhaps the answer should be sought along the lines of the American internal "farm parity" schemes; in other words the United States should seriously consider whether it would not be in its own interests to decide in

which materials it wants world production to expand, and then to guarantee that its annual dollar expenditure on purchasing stated quantities of these materials would not fall below a certain level—which would vary with the movements of prices in general, or perhaps of the prices of American exports. Obviously this would mean that some official body would have to be set up that would lay in stocks of these materials in years when private American purchases fell below the level stipulated; obviously, too, there would be some knotty problems about the price index by which "real" dollar expenditure should be measured, the period over which the contracts should run, and the commodities in which increased production should be encouraged.

Moreover, there is one other factor that would inevitably tend to dampen Washington's reaction to any such proposals. No American administration can afford to be in the position, during a slump, of making American industry's materials dearer than they need be. In other words, for any such scheme to be politically possible, Washington would have to stand all the cost of keeping prices up, while passing on to industry all the profits from keeping them down. Against this, however, the American authorities should carefully weigh the fact that such proposals should lead to increased production of the materials that America is most going to want, and that

The Commonwealth's Task

WHATEVER happens to American imports, overseas investments and grants in the next few years, it is obvious that the outside world will have to continue to keep down its purchases of American goods. The major question at issue is whether those purchases should be kept down by discriminatory import controls or by tighter monetary discipline in non-American countries. If Britain and its partners are to honour their obligations—and, more prosaically, if a new request for American help in solving the dollar problem is to have any hope of success—there is only one answer that can be given to this question. The countries of the Commonwealth and Western Europe—by their membership of IMF, Gatt and the rest of the alphabetical galaxy—have repeatedly and most formally promised that they will practise non-discrimination to the maximum possible extent. They have therefore a definite obligation to solve as much of their import problem as they can by general disinflation, leaving to be solved by discriminatory import controls only that part of the problem that cannot, with advantage to anybody, be tackled in any other way.

What does this mean? In practice, it means that each major country is pledged to try to solve its general balance of payments problem by general disinflation, leaving only its specific dollar problem to be solved by discriminatory controls or—if the dollar countries co-operate—by other means. The dividing line between rigid non-discrimination and what may be called the IMF type of non-discrimination is quite easy to draw. If Britain has not got the dollars to buy tobacco from America, obedience to the rules of rigid non-discrimination would require its government to grind down personal incomes (by deflation and the deliberate creation of unemployment) until the British consumer had no pounds left to buy tobacco from

they might help the dollar gap to be further bridged by private American investment (which is surely the sort of bridge that liberals should prefer). If contracts could be drawn up that would guarantee a minimum real dollar expenditure, then American investment in the exploitation of these "Paley" commodities might be much easier to arrange; in fact, it is not difficult to envisage clauses that could legitimately be inserted in the contracts with the deliberate object of safeguarding the interests of American investors. America should be talked to softly, and told it can carry a big stick.

If the United States could be persuaded to make a favourable response to each of these three approaches—and it is fair to say that there would be an economic, as distinct from a mendicant's, case behind each of them—a first significant step towards closing the world dollar gap would have been made. But it would not be any more than a first step. It is clear that a major task of further dollar economy would still lie before the countries of the Commonwealth and Western Europe. The following article traces the way that the Commonwealth should set about its share of this general task; it is, after all, the Commonwealth countries that are now about to meet in conference, and it is for them that the disinflationary prescription now needs to be most specific, if not necessarily most harsh.

anywhere else. This once pure milk of economic orthodoxy is now fortunately too sour for democratic consumption. To drink it would not do anybody any good, and neither the IMF nor anything else (since the gold standard was de-throned) obliges any country to try. All that the postwar obligations against discrimination imply is that a country should press forward with disinflation so long as this helps (instead of hinders) other nations, and so long as this conduces to its own long term interests by helping it to lasting balance and by aiding a desirable redistribution of productive resources.

Postwar Failings

It is by this test that the postwar experience of the Commonwealth must be measured, and found grievously wanting. By any criterion of sober judgment the countries of the Commonwealth have relied far too much on discriminatory import controls and far too little on internal monetary discipline in the past seven years; and sober judgment here does not mean only what the Americans would have liked (though that should be important) but what would have served the Commonwealth's own interests best. Ever since the war the sterling area has bumped along from crisis to crisis, with the individual independent members (by a co-operative effort) curbing their dollar imports whenever things have looked really bad, and then (by an unco-operative sidling manoeuvre) increasing them whenever things have looked rather better.

This system has had at least three evil consequences. First, since the dollar prospect has looked worst when the American economy is receding and best when it is

inflating, the Commonwealth has tended to buy least when dollar prices are low and most when they are high. The economics of stocking and de-stocking have been stood on their head, not (or at least not entirely) because of the natural affinity between bureaucratic purchasing missions and old Father William, but of that between the dollar crisis and the Cheshire cat.

Secondly, since the dollar pooling arrangements have never been buttressed by anything more than a tactful moral pressure against profligacy, far too many dollars have been drawn out and they have been far from economically divided. Rigid rationing of dollars has inevitably had to be tempered by political considerations; in informal pooling arrangements in a body so loosely and delicately held together as the sterling area, those who are ready to act most huffily always get the most cake.

Thirdly, and most important, too much reliance on physical controls and too little on monetary discipline and the price system has prevented the proper redistribution of resources and of demand. This has not merely been annoying to American exporters, whose share of the

Three Clues

The problem of finding out what redistribution of demand and resources a free market would have affected is a treasure hunt with three fairly obvious clues. The first of these clues is provided by the chart on this page, which shows estimates of the overall external deficits run by Britain and by the overseas dominions between the end of 1947 and the middle of 1952, and of the way in which those deficits were financed. This chart is based partly on unofficial data; this fact and certain technical difficulties (for example, in assessing the dollar value of sterling trade in the half-year that straddled devaluation) make it impossible to claim any precision for it. But the broad picture presented is almost certainly right.

That broad picture is that the United Kingdom's fairly small external deficit of under \$600 million in these four-and-a-half years was more than covered by borrowing from the colonial empire, while the dominions' massive external deficit of over \$2,500 million swallowed up five-sixths of American aid. The rest of the lending from the colonies and the aid from America, together with the residual fall in the gold reserves, was absorbed or accounted for, by lending to non-sterling countries or by debt repayments (of which the £564 million fall in the sterling balances of non-sterling countries was the main component). The delegates at the Commonwealth conference should be squarely confronted by the fact that Britain's share of European Recovery Programme dollars has been absent-mindedly poured down the drain of Australia's high cost industrial boom; and that it has had to be replaced by absent-minded borrowing from other capital exporting countries—such as Malaya and West Africa—instead.

The most intriguing feature of this chart, however, is its indication of what would have happened to the dollar reserves in London if the United Kingdom had kept back its Marshall Aid to itself (as other European countries did), if it had demanded payment for all its exports in dollars (as the United States has done) and if it had refused to allow any capital outflow to the dominions or debt repayments to foreign countries between the end of 1947 and the middle of 1952. If it had done all this (and done it without provoking import restrictions on the part of its customers), then the dollar reserves in London would have increased in these four and a-half years by well over \$3 billion (if the colonies are included with Britain) or nearly \$2½ billion (if they are divorced from it). If the dominions alone had been excluded from the sterling area (and made to pay in gold for their imports from Britain), while all else remained unchanged, then the gold and dollar reserves would have risen by more than \$2 billion; the reserves would thus have been nearly two and a-half times as large as they are now.

This is the first clue for the Prime Ministers' treasure hunt. The second clue, which is much more shattering to smugness in Britain, is to be found in the import restrictions that the overseas dominions imposed early in 1952. There is no doubt that if Britain had turned off the capital tap to the dominions in the early stages of

limited world markets open to dollar goods has not been determined by their relative competitive efficiency but by the relative pugnacity of a gentleman in Canberra (who wants machinery) and a gentleman in Whitehall (who wants films); it has also been deleterious to the long-term economic health of the Commonwealth.

If the Prime Ministers are to make a serious search for economic remedies, as distinct from political expedients, next week, there are two puzzles that they must set themselves. First, they should examine what redistribution of dollar demand and dollar earning resources would have been effected since the war if free market forces, instead of their own civil servants, had been allowed to be the arbiters. Secondly, they should see what can be done to hasten—in, say, the next two years—the redistribution of resources that the free market would normally have accomplished in the last five. The motto of the conference should be the opposite of Mr Attlee's cry in Washington, in 1946, that "we are not going to be beaten by economics"; the Prime Ministers should recognise now that they are not supposed to be fighting against economics, but to be battling on its side.

the Marshall Plan, such import restrictions would have been imposed much sooner, and probably with much more force. And they would have fallen on broadly the same products as have in fact suffered this year—that is to say, on the imports that the dominions consider least essential, namely British consumer goods. The immediate consequence of this would have been an upsurge in unemployment in Lancashire and other centres of the consumer goods industries in Britain; it should be noted that three-quarters of Britain's exports of cotton piece goods in 1951 went to the sterling commonwealth, compared with just over half in 1938. The second consequence would have been that the United Kingdom would have suffered a rapid widening of its own external deficit—unless it had succeeded in making up for the decline in its consumer goods exports by an increase in the exports of capital equipment that the Commonwealth really wanted.

The third clue for the Prime Ministers' treasure hunt is provided by the other two charts accompanying this article, which are based mainly on data drawn from the Economic Co-operation Administration's recent massive survey of *The Sterling Area*. The large chart at the bottom of this page shows why the sterling area's annual average surplus of \$250 million with the dollar area in 1934-38 turned round to a dollar deficit of \$340 million (including losses of \$190 million to countries outside the Western Hemisphere) in the year just before the outbreak of war in Korea. Broadly, the story is one of all-round deterioration. The United Kingdom's visible deficit widened by \$120 million and its invisible surplus fell by \$110 million; the overseas sterling area countries swung round from a surplus of \$50 million to a deficit of the

same amount, and their sales of newly mined gold brought in \$70 million less than in 1934-38. Moreover it must be remembered that the year before war started in Korea was a relatively good one for the sterling area; the United States was building up its stocks after the inventory recession of 1949, and the sterling area was making a special effort to keep its dollar imports at 25 per cent below the previous year's level.

Just how good a year it was can be seen from the third chart, on the next page, which shows that the sterling area's merchandise trade deficit of \$249 million with the United States in 1949-50 was only \$22 million greater than in its annual average deficit in 1934-38. The real value of this last chart, however, lies in the fact that it delineates in some detail the factors that have affected this bilateral balance. It will be seen that the United Kingdom, if only world prices had not turned so sharply against it, would have shown an improvement of \$300 million instead of a deterioration of \$7 million. In terms of constant 1949-50 prices its imports from the United States fell by \$280 million (or more than 30 per cent) below the 1934-38 level and its exports rose by \$20 million, but it lost \$307 million through the adverse movement of its terms of trade. The overseas sterling area countries, on the other hand, contributed the remaining \$15 million of the \$22 million deterioration wholly because of the extravagance of their import policy. In terms of constant 1949-50 prices their exports to the United States rose by \$338 million and they gained \$61 million on the movement in their terms of trade; but all this was wiped out by an upsurge of \$414 million (or over 80 per cent) in the volume of their imports from the United States. Their

imports of American machinery more than doubled and their imports of American chemicals and steel mill products multiplied four times over.

One Remedy

In these circumstances, if the Commonwealth Prime Ministers do not see the way that they should go towards dollar solvency, it can only be because each is determined to put a telescope to his blind eye. The first feature of any realistic programme for the Commonwealth should clearly be a determination to reduce industrial investment in the dominions to the amount that can be both financed and physically implemented from within the sterling area; in many cases this cut could be accomplished by a direct reduction of the capital expenditure of the dominion governments concerned, while in other cases it could be fostered by a rise in interest rates and a change in tax policies. The labour resources freed by this cut in industrial investment could be readily absorbed in dollar-earning primary production or dollar-saving work on the land. Britain's share in this programme should be to take stern measures to divert

the main features must be a sharp cut in industrial investment in the Dominions; some cut (or at least no rise) in consumption and social expenditure in Britain; some increase (eventually) in investment in metal mining and other forms of primary production in the overseas commonwealth; and a significant increase in investment in certain branches of British manufacturing industry that had to live on their capital equipment so voraciously during the war.

It would be idle to suppose that there are any glowing hopes that a programme of this sort will in fact emerge from the Commonwealth conference. There are many political barriers in the way. Some dominion representatives have come to London with pipe dreams about enlarged commonwealth development; by this they mean that they should be allowed to enjoy the sort of industrial boom that has roared across Canada in the last five years—though they have few of Canada's geographical advantages, fewer of its economic attractions, and nothing of its economic discipline. Others have come from countries where the building up of high-cost secondary industries has recently been accorded new encouragement behind the shelter of import restrictions. And the United Kingdom representatives have apparently thrown their own spanner into the works by proposing that margins of imperial preference might be widened; any such widening would tend to foster employment in consumer goods industries much more than in the vital capital goods field. The best that can be said is that most of these wrong-headed proposals seem to be opposed by other delegates in their turn, although often also for the wrong reasons.

But the prime object of this survey is to discuss soberly what ought to be done, not to speculate gloomily on what will be. If the Commonwealth Prime Ministers screwed up their courage to the sticking points delineated in this article, the direct saving on dollar imports by the Dominions might con-

ceivably amount to some \$200 or \$300 million a year, and the increase in exports of British capital equipment to non-sterling countries might perhaps be of the same order. If the Americans agreed to the three proposals put forward in the preceding article—and if American capital could be attracted into various schemes for the development of raw material production, of which much may be heard at next week's conference—there could then be a reasonable chance that the sterling area might run a dollar surplus more frequently than a dollar deficit; but only so long as sterling remained inconvertible and present dollar import restrictions remained in force. In four of the six postwar years the sterling area's net dollar deficit has fluctuated in the range \$900 million to \$1,750 million (and it has been \$938 million, excluding defence aid, in the first ten months of 1952); the two exceptions were 1947, when there was a net deficit of \$4,131 million, and 1950, when there was a net surplus of \$805 million. It seems quite evident, however, that a further safety valve would be needed before the sterling area could seriously consider—as distinct from lightheartedly embrace—any notable advance to freer trade or to general convertibility of sterling.

resources from consumer goods industries to capital goods industries; this could only be achieved by the creation of some transitional unemployment in Lancashire and elsewhere.

As and when production in the capital equipment industries rises, there can be some resumption of capital exports to the overseas commonwealth (preferably for the branches of metal mining which, in the view of the Paley Commission, should enjoy a mounting dollar demand) and a continuing increase in exports of capital equipment to non-sterling markets. But it should also be realised that British capital equipment industries badly need to eat more of their own young; according to the Economic Co-operation Administration, gross fixed investment in the United Kingdom increased by only £100 million (at constant 1949 prices) between 1938 and 1949—a figure that compares startlingly with the increase of £120 million (at constant 1949-50 prices) in British machinery exports to the overseas sterling area between 1934-38 and 1949-50.

If there is to be any serious attempt at an economic re-distribution of the Commonwealth's productive effort

Is Discrimination Inevitable?

THE programme delineated so far in this survey has been one that, if pursued, might lead the world back towards a precarious and discriminatory dollar balance. If present import restrictions remained in force, and if everything went right, the sterling area and Western Europe might then balance their accounts with North America more years than not; but there would still be bad years—and they might be very bad years indeed, while the good years might be only moderately good. In these circumstances it would be idle to suppose that the non-dollar countries would have much scope to make any major advance to freer trade; or, in view of the initial difficulties to be ridden over, that they would have any real incentive to try.

The tremulous attitude of many British and European economists towards currency convertibility and non-discriminatory trade is more soundly based than the impatient advocates of a dart for freedom profess to believe. For more than thirteen years demand for American goods in four and a half of the five continents has built up unassuaged behind the dam of discriminatory import restrictions; nobody knows quite how high the water has mounted now, but it is significant that whenever any government has allowed a hole to be punched in the dam, it has found the pressure greater than it had expected. Certainly, that has been Britain's experience. In the summer of 1947 a limited British experiment in sterling convertibility was washed away in less than ten weeks; and in the summer of 1952 a limited British experiment in commodity arbitrage was inundated in less than ten days. However sternly disinflation in the non-dollar world succeeds in keeping down current demand for American goods, it is clear that a great flood of accumulated demand will surge over into the American market as soon as import and exchange restrictions are modified—and there is no guarantee that that flood will be a once-for-all phenomenon. Moreover, as has been pointed out earlier in this survey, the strain would be even greater at a time of American recession; according to a recent United Nations estimate, a fall of only 4 per cent in the level of American employment might increase the world dollar gap by as much as \$10 billion a year.

Unless some mechanism is set up to take the strain of this initial flood-water, and to stand by for a rescue operation in the event of American slump, any advance towards convertibility and non-discrimination is going to be unwilling and weak. There would, indeed, be evident danger that such an advance might be swamped before it was really started. If this happened the course of freer trade would be set back for a generation. In fact, the worst outcome of the international conferences now impending (for America as for everybody else) would be the creation of conditions in which sterling convertibility and some sort of an advance towards non-discrimination might have a bare, but improbable, chance of succeeding—but in which it was a pre-requisite of American aid that Britain put this chance to the test. These conditions would give more power to the political elbow of either exactly the wrong people in Britain (if America exhorted the authorities here into a dangerous

experiment) or exactly the wrong people in America (if Britain refused to budge).

Floating Rates

Before going on to consider the sort of payments system under which convertibility and freer trade might be possible, it is necessary to consider whether the conclusion just reached is not contrary to common sense. It has, in effect, been argued above that, even if every disinflationary device is utilised as efficaciously as can reasonably be expected, there may still be an obstinately irreducible dollar shortage. This implies that there is a disequilibrium between dollar and non-dollar currencies so severe and organic that it cannot be removed by the techniques of the market, even if they are given free rein. Is this conclusion feasible—especially if the market techniques employed include that final adjuster, a floating exchange rate?

This is a subject about which more superficially learned nonsense has been propagated than about anything else—and in the field of economics that is saying a lot. It is almost certain that if an experiment in sterling convertibility (and in some sort of advance to non-discrimination) is attempted, then sterling must be set free to float. Those who still argue the case for trade freedom and rigid fixity of exchange rates are fighting a battle that was lost twenty years ago. No modern government is going to force or allow swingeing changes in its internal price and income levels merely to disguise or counteract similar swingeing changes in the real external strength of its currency—and there is no reason why it should try. In the long term it is almost certainly desirable that sterling and its associated currencies should depreciate against the dollar; such a depreciation, by making dollar goods more expensive, would discourage the dominions' extravagant imports of American capital equipment and encourage the production of materials that are at present bought from the dollar area. And, even on short term considerations, it is illogical to suppose that the appropriate exchange value for the dollar against sterling when commodity prices are at a boom-time peak is not lower than the rate that is appropriate when commodity prices are at a slump-time nadir.

In other words—in the metaphor of a preceding article—exchange movements, handled intelligently, would form another useful plank for the bridge. But there is no evidence to suggest that, by themselves, they could span the whole gap. Experience since the war has shown that America's entrenched economic position is so strong, the sensitivity of its trade balance to price (as distinct from income) changes so small, and its distance from Soviet Russia lends such a powerful support to the attraction of the dollar for capital, that the exchange rate might have to move a very long way indeed to achieve equilibrium—certainly in any political crisis or industrial recession. It is true that, at any one time, there must be some dollar exchange rate that would choke off foreign imports from America to such an extent that America's trade would balance. But the rate that would discourage

rich men from buying too many Packards (out of tax-free business expenses) might be one that would prohibit a poor man from buying any Canadian wheat at all; and the rate that might choke off dollar payments till they equated with dollar receipts at a time of recession might be a third or a quarter of the rate desirable in a time of commodity boom. It is silly to suppose that any British or European government could allow rates to fluctuate to this extent, merely to ensure that non-discrimination remains in force.

If sterling and other non-dollar currencies are devalued again, or set free to float, governments will therefore want to choose their moment very carefully, and they will need to determine themselves the limits within which rates move. Depreciation might be an indispensable weapon if prices of primary commodities fall sharply, and it almost certainly would be a useful opening cannon on the dawn of a great advance. But there is no reason to suppose that it can, by itself, blast the way clear for a major dash to convertibility and unrestricted trade. The IMF rule that seeks to prevent exchange rates from fluctuating by more than 1 per cent on either side of a fixed parity should be widened or withdrawn, but this would be a pill—not a panacea—for present trading ills.

★

The conclusion that, in the absence of special currency arrangements, the world may face an irremediable shortage of dollars is not one that should surprise the trained economist; and it is one that has probably already been instinctively accepted by the untrained as an obvious and banal fact. Even the classical economists of the nineteenth century recognised that there could be limiting cases whereby very strong economies might wreck the sort of trading system that the gold standard enforced in their day,* and that the charter of the International Trade Organisation dreamed about for ours; and in his recent Stamp Memorial Lecture Professor John Williams, of Harvard University, in effect traced the way in which the growing predominance of the American economy has transformed this theoretical threat into a practical barrier in the way of facile advance to a world governed by the gospels of ITO. Those who have always pointed to the obvious fact that there is a specific dollar problem, as well as a general balance of payments one, are therefore at last in a good position to face up to those who have hitherto maintained that a specific dollar problem has no theoretical right to exist; they are now no longer in the same awkward condition as the bumble bee, which still buzzes about its daily tasks in obstinate ignorance of some convincing scientific proofs that it is aerodynamically impossible for it to fly.

Haven or Springboard?

This is some comfort, but not much practical help. For it suggests that a blunt choice must now be laid before the American public. This survey has argued that, if the measures delineated in this and the two preceding articles are determinedly put into effect, then the Commonwealth—with Western Europe and other non-dollar countries clinging to its coat-tails—ought to be able to reach a state of what might be called discrimi-

natory dollar balance. That is to say, they should eventually be able to stand free of all aid (at any rate so long as an American slump is avoided), but not free of discriminatory import restrictions. Anybody who believes that they can do more than this, even if exchange rates are allowed to float, is putting great emphasis on hope and precious little on recorded facts.

It is for the Americans to say whether such a trading system—so much better than that experienced since the war but so much worse than that dreamed about in the original Atlantic and ITO charters—would be enough. A world in discriminatory balance would certainly be a very much pleasanter place to live in than the crisis-ridden chaos of the past seven years. There would be more years in which non-dollar countries might seem to be hobbling to freedom, and fewer in which they were plainly scuttling to safety. There would be less danger of Communist contamination, and more prospect of Communist containment. But, in spite of this, the process of dividing the free world into two or more economic blocs would continue. Many American capital goods and most American consumer goods would still be kept out of non-dollar countries by import quotas; there would be no real approach to an economic distribution of labour. Moreover, as the years passed, the divergence between the two systems of economic practice would inevitably grow wider; a programme of the sort outlined so far might make recurrent short-term crises less frequent, but it would not stop the long-term drift to disunity and thus to disaster. For it would be idle to suppose that economic differences will not eventually exacerbate political ones. The supreme economic fact of the twentieth century is that it is only in an ITO world that sterling and the francs can really strive to look the dollar in the face; in all other worlds, to quote Lord Keynes, they will secretly strive to kick it in the bottom. The problem therefore remains: Under what sort of payments system would an approach to an ITO world be possible?

Defects of a Stabilisation Loan

In recent months many American Government agencies and liberal-minded public servants have been busily engaged in writing conflicting memoranda on this problem. This is a matter that British observers should treat with caution, for unofficial reports of the contents of these memoranda may be as misleading as unofficial assessments of the degree of support they command. But—at the risk of appearing ill-mannered—it does seem worthwhile to look the two most publicised of these phantom gift horses in the mouth. For one of these reported schemes seems to be just the sort that should be avoided, because it might lead to failure and disillusion; and the other—although almost certainly impractical in its present form—seems to be just the sort that the Commonwealth Conference might accept as a basis for discussion, and work on to make it more palatable to the new American administration.

The first of these reported projects is that for a straight stabilisation loan. As long ago as last spring there seem to have been some semi-official suggestions in Washington and Ottawa that if Britain decided to take the plunge into full-scale sterling convertibility, then the United States Congress and the Canadian Parliament might be induced to put a contingent credit

of some billions of dollars at Britain's disposal; the three governments would jointly express the hope that an experiment in convertibility would not make it necessary for Britain to draw on such a credit, but the cushion would be there if the worst befell.

Any such scheme would suffer from three major defects, which have jeopardised the success of all other "aid, not trade" arrangements in the past seven years. First, by relating aid to need, a stabilisation loan would reward failure and penalise success; although brave efforts were made to ignore the fact, this fault was one of the chief mistakes of the Marshall Plan. Secondly, the loan would presumably have to be liable to periodic renewal; it would involve another exercise in the insidious—and increasingly difficult—art of bilateral mendicacy. Thirdly, it would lead to nothing more than a coconut shy at convertibility by a groggy nation with a possibly unsteady aim; America and Canada would stand ready to pay for part of any really serious damage, but the loan technique would not by itself add measurably to the prospects of convertibility's success. The thesis behind such a loan seems, in fact, to be that there is some underlying equilibrium that will be uncovered once convertibility—and with it confidence—is restored. There is no evidence that any such underlying tendency to equilibrium exists. Unless, therefore, a stabilisation arrangement carries with it special measures to restrict dollar payments by, or to encourage dollar investment in, the non-dollar world, then the stabilisation dollars might flow back to the United States as quickly as the Anglo-American loan of 1946 (which was the first of many post-war plans drawn up on the same false assumption of underlying equilibrium).

That "Green Book"

The second of the projects that have recently been mooted is that reported to be contained in the unpublished "Green Book" drawn up by certain individual officials in the Mutual Security Agency. This book was not in any way an expression of the MSA's viewpoint; it was only one of the many working documents now circulating in Washington, and it is only as a working document that it requires to be considered. According to the American press, it put forward three main proposals. The first was that the currencies of Nato nations should be backed by a common reserve, to which each country should contribute in accordance with its gold holdings; the United States would therefore put up over 80 per cent of the whole. Secondly, it was suggested that there should be an Atlantic Commodity Board which would deal with problems of development and long-term purchasing contracts. And, thirdly, it was suggested that there should be an Atlantic Economic Board, which would serve as a forum for discussing the co-ordination of the economic policies of member countries.

This project, if it has been accurately reported, seems to have three subsidiary advantages, a number of technical oddities, and one crushing defect. The subsidiary advantages are that it would be collective and not bilateral; that it would be based (or so it appears) on a large initial contribution and not on an annual congressional vote; and that it would form the basis of a new system that might attract an increased flow of private dollar investment to the outside world. But these advantages are overwhelmed—and the technical oddities

rendered inconspicuous—by the project's major defect. That defect is that, in its present form, the scheme would not—and should not—have the ghost of a chance of attracting the support of any American administration.

The reason for this is clear. The authors of this document, being American citizens, have not felt in a position to propose any *quid pro quo* that the outside world could offer to America for its participation in such a scheme. This is the Commonwealth's opportunity. The Commonwealth Prime Ministers, in conjunction with the leaders of European countries, should propose two major amendments to this and other reported plans for an Atlantic Reserve scheme. First, they should suggest that countries that remain in persistent external deficit—which could only mean some of themselves—should surrender part of their economic sovereignty to the international body that would administer such a scheme. Secondly, they should submit proposals that would transform the reserve scheme into a full-scale clearing union; as will be seen from the following article, this would mean that those countries that maintained import restrictions would then find it actually unprofitable to discriminate against dollar goods. If these amendments were introduced the Atlantic Reserve Scheme, or Atlantic Payments Union as it might be called, could fairly be represented to the American public as a device for "trade, not aid"—because it could be justified economically by a clear historical analogy.

Towards a Clearing System

For, as so often, history surely provides the answer to this whole problem. This survey has shown—it is hoped plainly—that there is a hard core to the problem of trade restrictions that cannot be eradicated by further disinflation in the non-dollar world (although there is still plenty of room for that). It can only be eradicated by a new system of international payments, which recognises that an increase in world trade can only take place concurrently with an increase in world currency reserves; and which recognises, too, that this can never happen so long as the currency that is hardest to get is the one that everybody wants to hold. The great increase in national production and trade that took place in the nineteenth century would never have occurred if the system whereby internal purchasing power depended wholly on fluctuations in gold supply had not been swamped by the happy accident of the spreading cheque system; in the twentieth century the combined supply of dollars and gold to the outside world seems likely to be just as tight as the supply of gold alone in the nineteenth, and—within limits over which the United States should be given the main control—there is an urgent need for the adoption of the cheque system in the international sphere.

In other words, central banks must be prepared to hold part of their currency reserves in the form of deposits at some new international clearing union and only part in the form of hard cash; just as private individuals (whose rights would not, of course, be affected in any way by such a scheme) have grown accustomed over more than a century to holding part of their liquid claims over current resources in bank deposits and only part in bank notes. The following—and culminating—article in this survey suggests how such a new payments system might be devised.

* See, for example, Appendix J to Alfred Marshall's "Money, Credit and Commerce."

Atlantic Payments Union

IT is always dangerous to turn from the general to the particular—unless the general is very woolly indeed and the particular still peculiarly imprecise. That is why politicians rarely do it; they know that to expose detail is to expose too many sectors of their general argument to attack. But the concept of a World or Atlantic Payments Union is so vague an idea in the minds of most of its sponsors that this seems to be a subject on which it is imperative to play fair. This article will seek to set down squarely the main objectives at which a clearing union should aim, and reasonably detailed proposals about the way in which it might seek to attain them.

There are three general objectives. The first is to restore non-discrimination in world trade—not by getting Gatt or some other international body to enunciate rules that it is profitable for some countries to break, but by setting up a new payments system that would make it unprofitable for any country to discriminate in its import policy. This cannot be done so long as some imports can only be bought with very desirable currencies while others can be bought with currencies that everybody is willing to get rid of. In other words, it is a pre-requisite of non-discrimination that all exports and imports should be paid for in units of equal worth; and it is difficult to see how this can be done unless the central banking system of the United States (and of other potential creditor countries) is willing to receive payment for some of its country's exports—at such times and to such extent as it is necessary to do so—in the form of deposits at an international clearing union. These deposits should be immutable, interest-bearing claims upon other people's resources; the objective should be to make them not less valuable than gold.

The second general objective must be to ensure that the United States (and other creditor countries) are not asked to accumulate more of these claims upon other people's resources than they are willing to hold. This can only be done by keeping down the balance of payments deficits of other countries; and, if world trade is really to be freed, this has got to be done by giving an international body much more power over the internal economies of debtor countries than sovereign nations have hitherto been willing to concede. It should be emphasised, however, that no country can be obliged to accept this surrender of economic sovereignty; if it does not wish to accept, it can always resign from the clearing union and revert to the present system of international payments. The third general objective of the clearing union should therefore be to leave the way open to any such resignation—but to devise a mode of operation that will make it plain that any member country that resigns in this way will be giving up advantages that its electorate will not like to forgo.

Inducements to Hold Deposits

The proposals put forward in this article have been designed with these three objectives in view. They are intended as a basis for discussion, at all levels just a little lower than the stratosphere; certain technical difficulties have been omitted, but it is believed that they could all be circumvented by technical dodges.

One of the main problems of the scheme would be

to secure recognition of the idea that deposits at the clearing union were "as good as gold," and to prevent (in the initial stages, at any rate, it would have to be defined and mutually accepted obligations) a "run on the bank." For these reasons the units of account in the clearing union, in which deposits and overdrafts would be measured, should be specifically linked to a given weight of gold. Whether they should be called anything other than "gold ounces" seems a matter of little significance (after all, dollars in a checking account are not given a different name from dollar notes); in his proposals for a worldwide clearing union in 1943, Lord Keynes suggested the term "bancor" but this seems to be an unnecessary exercise in francophile linguistics.

When a country runs a balance of payments surplus, it should receive interest upon the credit balance that it accumulates at the clearing union; the funds for this should be accumulated by interest payments made by debtors. The provisions in Lord Keynes' proposed clearing union of 1943 whereby creditor countries would actually have been obliged to pay interest if they deposited too much with the union should certainly not be written into any new plan. They would not have served as any significant deterrent to countries that ran balance of payments surpluses (as Keynes intended they should) and they were a grave political blunder. They inevitably had the effect of helping to make his proposals stick in America's throat.

It would be idle to suppose, however, that the fact that the accumulation of deposits at the clearing union would attract interest would make countries more eager to receive payment in the form of such deposits rather than in dollars or gold. For this reason each country would have to be given a stated deposit obligation (that is to say, it should agree to receive payment in clearing union units for any balance of payments surplus up to a stated amount) and a stated overdraft facility. Under the European Payments Union, which has pioneered the way for a wider scheme, each member's maximum deposit obligation is equal to its maximum overdraft facility; there is no real reason why it should be, but perhaps also no real reason why it should not. What does seem clear, however, is that the EPU's method of calculating the relevant obligations and facilities has been a mistaken one. Each member's deposit obligations and credit line under EPU were originally set at some 10 per cent of its total trade in the year preceding the introduction of the scheme. Deposit obligations of this size soon proved quite insufficient even for a European scheme—and they would prove still more insufficient for a world scheme; they were also quickly proved to have been drawn up on the wrong criterion. If international division of labour is to be pushed to its proper limits, the smaller the country, the bigger should be the ratio of national income represented by its exports and imports. Even with international division of labour as imperfect as it is, a system relating individual quotas in a world wide clearing union to individual trade totals would have absurd consequences. It would impose upon Holland a deposit obligation and an overdraft facility which—in relation to its national income—would be ten times as large as those taken up by the United States.

If a clearing union were to have any chances of success, those who drew up the rules for it would have to avoid the main mistakes committed by those who have drawn up the rules for all other postwar instruments of international financial organisation—IMF, EPU and so on. They would have to avoid the temptation to underestimate the need for increased international liquidity. A minimum requirement—and even this might require a deep breath—would seem to be to set each member's deposit obligation (and possibly also its overdraft facility), at 50 per cent of one year's trade or 5 per cent of one year's gross national product, whichever was the greater. On the 1951 figures this would give Commonwealth countries a combined deposit obligation of up to nearly \$25 billion and the United States one of up to nearly \$17 billion. And, since the object would be to accommodate the surpluses and deficits of a long run of years, it would really be better if deposit obligations were fixed at double this amount.

It needs again to be emphasised what a US deposit obligation even as big as this "double amount" (say about \$35 billion) would mean. It would mean that if the United States continued to run a balance of payments surplus (and it should be given all the help it wants in keeping that surplus under control), then it would agree to receive payment for that surplus in up to \$35 billion of interest-bearing claims on other people's resources. It would not mean that the United States would not be paid for its surpluses but that it would have to take payment in the only way it can be taken—in imports from, or investments in, other countries. In the past twenty years it has covered its surplus instead by giving away about \$40 billion of foreign aid (excluding wartime aid) and receiving over \$20 billion in non-interest bearing gold.

Effect on Trade

What would be the effect on trade of the establishment of a clearing union of this sort? The first effect would be that European and Commonwealth countries would no longer have any cause to discriminate against imports that come from hard currency sources, compared with those that did not. Imports from all areas would be paid for in the same clearing union units; a British merchant who bought food from Canada or machinery from the United States would not cause the Bank of England any worse headaches than one who bought food from Denmark or machinery from Germany—and he could thus be allowed to make his choice solely on grounds of price.

It may be that there should be some initial shock-absorber here. Since some import restrictions would have to remain, although there would be no incentive to make them discriminatory, the immediate consequence of the establishment of a clearing union might be a massive reshuffle of the sorry pack; restrictions that particularly affected imports from the United States might be torn down, and restrictions that particularly affected imports from other countries put up in compensation. Perhaps the best way to avoid this would be to say that any import restrictions that were newly imposed (though not any that were newly lifted) would have to be approved by the clearing union; as will be suggested later, the union ought to be given some supervisory powers over members' import restrictions in any case. The result of

this would be that countries would have a continuing incentive to move towards non-discrimination when their overall external position improved; but not—as at present—a continuing incentive to move towards greater discrimination when their external positions got worse.

Moreover, the clearing union might well be able to hasten this general jostle to freedom. The EPU has set an example here, by its successful experiment in negotiating the progressive liberalisation of certain percentages of each country's import trade. A world clearing union would, of course, only be able to manoeuvre around such liberalisation within certain limits. The most crippling of these limits, on the system envisaged here, would be that a United States quota of even as much as \$35 billion could be swallowed (in a non-discriminating world) in three really bad years, or even less. The proper way to prevent this would be to bring big guns to bear on the internal policies of debtor countries.

Sanctions on Debtors

The EPU has devised three weapons to discourage countries from running into debt. It makes members settle part of their current deficits in gold, on a "sliding scale" basis, at a fairly early stage of their career as debtors; it reluctantly allows extreme debtors to default on the general liberalisation quotas; and it issues periodical special reports recommending debtors to tighten their internal policies. It can be argued that sliding scale arrangements would not be suitable for a world clearing union; such arrangements work in EPU because EPU units of account—which cannot be used for the purchase of dollar goods—are clearly not "as good as gold," while world clearing units would be meant to be. But since, in the early stages of the scheme at any rate, most countries would have a larger reserve of clearing union units than of gold, sliding scale arrangements would have some deterrent effect. They should therefore be incorporated into the scheme—and applied to creditors' receipts as well as debtors' payments—though not, probably, on the EPU formula.

The main weapon to force debtors towards solvency should, however, be a far greater insistence on internal disinflation—and probably also, if necessary, on fluctuations in exchange rates. A world clearing union would have to be much tougher than EPU has been about allowing defaults on liberalisation of trade; a body of case law might be built up, under which there could be a general assumption that a debtor country could still do more to put its external balance to rights so long as it had less than 3 per cent unemployment. This suggestion will, of course, be political dynamite, but the charter of any clearing union should be blandly explicit about what sort of club is intended. So long as a country wants to belong to the club, and enjoy drawing rights upon it, it should abide by the rules; if it wishes to resign, and return to the present system of international payments, it would of course be quite at liberty to do so—and perhaps the union should be rather generous about the funding arrangements for any accumulated debt with which it withdraws. So long as the United States continued to accept clearing union units in payment for its exports, there probably would not be many such resigning members; and those that did resign would not be much loss to the union's solvency and general peace of mind.

No Sanctions on Creditors?

So much for sanctions upon excessive debtors. The union would be able to plan these in the knowledge that it should be in a good position to enforce them. What now of sanctions against excessive creditors? It is easy to think up some unimpeachable case law here—to delineate, for example, the reflationary measures that creditor countries should take if they have more than 3 per cent unemployment. But, unless the United States volunteers proposals of this sort, economists on this side of the Atlantic should not bark learnedly through the obvious gaps in their teeth. In particular, nothing should be done to suggest that a creditor country will be asked to cut down the value of its accumulated holding of clearing union units. Indeed, if one country does emerge as a dominant creditor—and everybody can guess which it might be—then proposals might be made for the devaluation of all other currencies in terms of clearing units and of gold; this would increase the power of the claims over other people's resources represented by the creditor's holding of clearing units. And, of course, voluntary depreciations would do so, too.

The one sort of sanction that might be considered against creditors would be a scarce currency clause, on the Bretton Woods model. It has already been argued that the union, like EPU, should be able to issue instructions about "general liberalisation quotas"—that is to say, it should be able to say that no country can protect more than a certain percentage of its import trade by licences and other restrictions. If the general liberalisation quota had reached, say, 50 per cent and one country ran a persistent balance of payments surplus, then the union might be empowered to say that 50 per cent liberalisation need not apply to imports from it. There would, of course, be difficulties here, for most importing countries would not want to discriminate in this way; imports from the creditor country, like imports from all other countries, would still be paid for in the same clearing units—and only those countries that were in grave overall balance of payments difficulties at the point of 50 per cent liberalisation would feel forced to grasp at this straw. But, on the whole, European countries would not be wise to suggest that even a mild clause of this sort should come into operation until a member's deposits have reached a very high figure—unless the United States, as the country most likely to be affected by it, volunteers proposals to the contrary. It should be made clear, however, that if ever a creditor country wants purchases of its exports to be restricted, then the union will ask members to impose the necessary—and discriminatory—import restrictions. It might seem unlikely at this stage that any country would wish to risk the wrath of its exporting interests by making use of such a "discrimination by request" clause; but this could be an important feature of the clearing union.

Of course, if the worst befell and the United States, or any other creditor, ran such a huge surplus in this world of non-discriminatory trade that it exhausted its deposit obligation, then trade with it would have to revert to the present payments system. In that event other countries would again have to be allowed to discriminate against US exports, and they would again have every incentive to do so. If this return to the full scale discrimination of 1952 brought the world back into dollar surplus, then America would begin to utilise its clearing union deposits for its own imports—and thus get back into the club. If this sad return to full scale

discrimination did not bring an early return to dollar balance then nobody would be better off than they are now. But they would not be worse off either.

Several technical difficulties of the scheme have not been discussed in this article. They concern such things as loopholes in exchange controls; creditor countries might have to be asked to co-operate in preventing an inflow of capital to them. There would also be problems about currencies such as sterling that have been widely used as media of payments in international trade hitherto; and about the translation into clearing union units of existing sterling balances and even (if the scheme worked well) of existing gold holdings. There would be room for discussion whether commonwealth countries (and certain other groups) should have a combined quota or not. But these are not insoluble difficulties; and to discuss them here would be to pile unnecessary gristle into an already full plate.

America's Choice

That main question must be: Is such a clearing union politically possible? There is no doubt that it would take great courage for the Commonwealth Prime Ministers to sponsor it. There would be a howl of protest in Britain about the degree of international supervision over a debtor's internal economic affairs that it would entail; this howl would reach some way to the right of the Bevanite group. It would also be an act of great political courage for the new American Government to embrace it; the howl of protest there would extend past the Bevanites' natural allies in such matters—the *Chicago Tribune* group—some way towards the centre. All that can be done here is to put the kernel of the problem squarely before informed opinion in this country and abroad.

Under a clearing union system American business men would receive payment for their exports (as they do now) wholly in dollars; and the American central banking system would receive payment, as it did before it started to give foreign aid, wholly in claims upon other people's resources. The only difference would be that foreign countries—because they would have more claims on their own resources to hand out and no incentive to discriminate against dollar goods—might buy more American exports. They might, in fact, buy more than America thinks they should. In that case the United States would have two weapons. First, through its voice in the management of the clearing union, it would have more chance of regulating internal extravagance in foreign countries; secondly, under the "discrimination-by-request" clause described above, it could, if it wished, drive world trade back into its present pattern and cut down to or below their present level foreign demands upon United States industry.

The difference between the pre-Marshall Aid world and a clearing union world can, in fact, be summed up in one sentence. Under the old system foreign countries practised only as much non-discrimination against American goods as, in their weakness, they felt they could afford; under a clearing union system foreign countries would have every incentive to practise as much non-discrimination as America, in its strength, thinks that it can afford to let them have. That, in essence, will be President Eisenhower's choice. It is for him to say whether he will welcome such proposals if they come to him; or, if they do not, whether he will beckon them. If this survey has carried conviction, then the reader should by now be hoping that he will.

Waiting for Eisenhower

IT was hardly surprising that Mr Vyshinsky should have rejected the Indian proposals for an armistice in Korea. For there is no reason why he should at this moment be in a hurry to end the fighting, which is having political and strategic effects that were certainly neither expected nor hoped for when the attack on South Korea was first launched. To keep important American forces bitterly engaged; to cause dissension between the United States and its allies by the inequality of sacrifice that is revealed in the casualty lists; to strain the resources of the Soviet Union's rivals without losing a single Russian soldier—this all adds up in Moscow to an immensely profitable operation of war by proxy. There was a moment last summer when the Chinese and North Korean forces were saved from disaster by a Russian hint that led to truce negotiations. Now the situation is transformed. It is American public opinion that has expressed its desire for an end, by one means or another, to a war that cannot be won and must not be lost. It is the American President-elect who is pledged to seek a solution by personal intervention. It is the Communists, refreshed and reinforced in the lull caused by the Panmunjom talks, who have been on the offensive, attacking the vital Kumhwa ridges at enormous cost, losing two divisions in six weeks and expending ammunition on the scale of the Normandy battles. To them it must look as if it is the cause of the United Nations that is wilting: it is therefore a time for toughness about terms.

It is impossible to judge whether the Chinese want peace now or not; moreover, there is no evidence that the Indian Government has substantial grounds for believing that they would look kindly on the latest armistice proposals. It remains a main objective of Chinese policy to get the Americans out of South Korea; and if Peking is thinking primarily of protecting China, Moscow will be thinking primarily of neutralising a resurgent Japan. Even if Peking is not master in its own house, there must be a feeling among Mao Tse-tung's advisers that their bargaining power has lately grown. The fact that the decisions in American policy now lie with the Republicans, who used to criticise Mr Acheson for weakness, and that these same Republicans seem to wish to end the campaign must loom very large in Chinese eyes. Their military plan at the moment seems to be to make the campaign even bloodier, the tension even tenser, while General Eisenhower makes up his mind.

The background against which the Indians made their proposals was, therefore, far less favourable than seems to have been realised. They made certain concessions—by no means the first—to the Communist view on the handling of prisoners, which were probably interpreted by Mr Vyshinsky as a sign of weakness, not of strength. This was, perhaps, one reason why Mr Acheson, acting in the shadow of his Republican successor Mr Dulles, regarded them with suspicion. To negotiate from strength has been article one of his diplomatic creed; and at this particular moment—indeed, ever since General
