Taken together, these two books are a valuable survey of the postwar experiments in nationalisation. Alone, neither could be widely recommended. Mr Neuman writes for specialists, and the more general book is too uncritical to be read alone. It will disappoint those who know its foundation—the deservedly successful issue of *The Political Quarterly*, for April-June, 1950, which was devoted to a series of essays on nationalised industry. Another two years is a long time in the experience of postwar nationalisation, and the original essays had enough suggestive points for one to hope that by now they might have been developed into a searching survey of that experience. In fact, the book is rather a useful, if casual, peregrination round well-worn paths of discussion—and most of the paths are followed two or three times in the course of the 390 pages.

This repetitiveness is the inevitable consequence of Professor Robson's method. In calling himself an editor he is too modest. He reprints six of the original essays and adds six more, mostly short, from contributors; the most interesting—by Professor Gilbert Walker and Mr Condie—is on compensation. The other five new essays deal with organisation, joint consultation, the consumers' interest, public relations and scientific research. Longer chapters by Mr Robson provide the beginning and end for this part of the book; one is an introductory essay on the public corporation and the other compares nationalisation in Britain and France. The second part of the book, occupying over a quarter of its length, consists entirely of Mr Robson's "general conclusions."

In his preface Mr Robson asserts disarmingly that "it will be conceded by intelligent and fair-minded readers that there is no tendency in this book to complacency or to regard nationalisation as in itself a great achievement." Tendency, perhaps, there is not; absolute determination there certainly is. Twice Mr Robson asserts that the public corporation is "destined" to be as important in the next fifty years as the joint-stock company was in the past hundred years. But this, with its implication that nationalisation will soon extend to other industries, is a relatively modest statement of faith. Mr Robson asserts not only that the "outlook" for Britain's nationalised industries is generally favourable but that it is "infinitely" more favourable than it would have been if private ownership had continued.

These rhetorical generalisations do not inhibit Mr Robson from a frank and sober discussion, mostly on familiar lines, of the more detailed problems and

difficulties of nationalisation. But his underlying conviction that nationalisation must succeed does deter him from analysing deeply the major difficulties. For example, he much underrates the fundamental difference between the pre-war corporations—based on a general willingness to keep the BBC and the Central Electricity Board out of politics and therefore almost free from ministerial control—and the postwar giants whose affairs cannot be kept out of politics. Mr Robson believes that the new corporations can attain a "correct" balance between freedom in day-to-day management and Government control over matters of major policy, but this belief is not based on any solution to the problems of public accountability that most people find so baffling.

Mr Neuman, by contrast, is refreshingly penetrating. He provides a precise account, partly in tabular form, of the economic features of the various corporations. If his main conclusions are fairly obvious, their implications have certainly been too rarely appreciated. The nationalisers were quite certain what kind of legal change they wanted to make but unsure of the institutional framework that their purpose required. The institutions are therefore largely the creation of the Civil Service and, Mr Neuman suggests, this explains both their centralisation and the pricing policies that the corporations have pursued. In his view the issue of centralisation versus decentralisation is less important than the distinction between the competitive and cartel patterns of economic behaviour. In theory, a public corporation might choose either; in practice, cartel behaviour—designed to balance total revenue and total costs, with little regard to particular demands and particular costs—has been almost universal. Mr Neuman does not offer solutions, but he penetrates to important problems that Mr Robson in his optimism ignores. In particular, he asks what are the likely effects on productivity if decisions in so much of the economy are weighted by the non-economic criteria that the public corporations are tempted to use.

Bludgeoned Hero

Bolívar. By Salvador de Madariaga. *Hollis and Carter.* 711 pages. 45s.

For over a century the glory of Latin America's greatest historical figure has been, in Señor de Madariaga's words, "defended with a heroism worthy of Bolívar himself." To break through these defences is the declared aim of this new biography, and there is little doubt that some of the gaping holes that

it leaves will never be plugged again. The mass of contemporary material cited in these pages provides incontestable evidence of the tortuousness, the sporadic cruelty and the unflagging ambition which marked the Liberator's life. The heroic equestrian figure that rises from so many pedestals in a dozen American countries will never again be so immaculate. And yet, while Señor de Madariaga succeeds in robbing Bolívar of his purity, it cannot be said that he has unhorsed him.

Indeed, if this had been the author's intention, he would have done well to adopt a different approach. Where Lytton Strachey exploded his victims' reputations with a deft pink from a rapier, Señor de Madariaga chooses a bludgeon; and even after he has beaten Bolívar about the head with seven hundred large pages of documentation and polemic, the man remains both alive and great. So lovingly does the book dwell upon his indecisions and manoeuvres, his mistakes and defeats, that even the most uncritical reader is forced to ask before long how on earth such a man as this could have led ragged armies over and along the Andes for thousands of miles and torn five countries from the grasp of Spain.

No doubt all the sources cited are as reliable as Señor de Madariaga claims; but it is possible to suspect that, in his anxiety to strip away the veils of mythology that have long shrouded the Liberator's true personality, he has allowed a disproportion to creep in. Certainly his treatment of such an event as Bolívar's arrest of Miranda smacks more of the prosecuting counsel than of the judge. This attitude is scarcely surprising, for the present volume is explicitly presented as the completion of the series of weighty historical works in which Señor Madariaga has striven to correct posterity's judgment on Spain's record in the Americas. It is therefore no more than consistent in its emphasis on the benefits, and its somewhat cursory references to the crimes, of the Spanish conquest and domination.

Intelligent Man's Guide

Introduction to Economic History, 1750-1950. By G. D. H. Cole. *Macmillan.* 233 pages. 10s.

To compress into 190 pages of text, even with the aid of some statistical and graphical appendices, the course of the world's economic development over the last two hundred years is a job which few people would attempt and in which fewer would succeed. "Success" in any case is relative; there must be omissions, oversimplifications, an uncomfortable choice between the carefully balanced but colourless phrase and the more vivid language in which bias is betrayed. Within these inevitable limitations, Professor Cole's success is brilliant. He has always been in a class by himself as a populariser; he has the essential gift of

knowing when to generalise and when to particularise, he is sure-footed among the pitfalls which gape for those treating technical matters in the vernacular, and he knows what sort of audience he is writing for. This "Introduction to Economic History" is even better than readers of his many similar works would expect; for it is almost entirely unblemished by those sudden spiteful asides, those loaded phrases, those implied imputations of motive, which betray the partisan rather than the teacher.

Mr Cole tells his story in terms of certain broad classes of change: population growth, the extent of the division of labour, urbanisation, the relation between techniques and the size and organisation of commercial and productive units, the uneven development of different countries and the effects of this unevenness on their relations. The familiar story of Britain's industrial, commercial and agrarian revolutions is thus set in its world perspective in a way never accomplished before—at all events in any work likely to attract the non-specialist reader; while at the same time a vivid light is cast on the antecedents of the modern American and Russian economies and on the essential nature of today's explosive triangular relationship between the advanced capitalist countries, the Soviet constellation, and the backward peoples.

One can pick holes, inevitably, on matters of emphasis and judgment. Mr Cole cannot quite keep his ineradicable dislike of America out of his picture, nor would anyone guess from his pages the nature of the "sacrifices" made by the Russian people in "their" attempt to telescope several centuries of economic development into a few decades; and not all economists would find his views on tariffs—particularly the American tariff—acceptable. But he has been sufficiently scrupulous, in his warning of the different interpretations to be placed on the facts, for readers to feel the necessity of using their own judgment. His book is a real contribution to popular understanding not only of the present-day world but of the nature of historical development.

Philosopher-Historian

Benedetto Croce. By Cecil Sprigge. *Bowes and Bowes.* 62 pages. 6s.

The philosophical approach to history is characteristic of the twentieth century, in which the systems of Spengler, Ortega y Gasset and Toynbee have provided a framework for imitators and a target for dissidents. Signor Croce, whose influence on Italian thought has been all-pervasive, predicates that philosophy is history, that there can be no scientific or metaphysical cause of events, and that all history is contemporary in the sense that its presentation depends on the intuitive capacity and bias of the historian. These ideas have not been generally acceptable to the empiricism of British philosophers and historians, who, with few exceptions, have preferred the

view that there is always a hard core of facts which is not susceptible to intuitive treatment and from which definite conclusions may be drawn.

Croce's concept of history includes art and economics. For him, economic action is man's typical vital operation, irrespective of morality; and art or language is the operation of the theorising spirit, irrespective of reality. He did not regard this comprehensive and interconnected pattern as a static body of doctrine, and he therefore created the literary review *La Critica* in which, from 1903 to 1943, his ideas were discussed in open debate—in later years, with a conscious desire to shape the minds of a new governing class in Italy after the disastrous interlude of Fascism. It is a misfortune that the evolving thought of this anti-mystical, anti-utopian humanist has not been available to a wider British public, because he expounded it in images that we can readily appreciate, and we ought not to be ignorant of the teaching of one who believes that:

A truly intelligent Liberal can never be converted to the authoritarian or reactionary, nor to the communistic, ideal, because he already contains these ideals within himself, within those limits where alone they are acceptable.

It is therefore most appropriate that Bowes and Bowes have included in their series of "Studies in Modern European Literature and Thought" an essay on Benedetto Croce by an authority on Italian politics and culture who follows the philosopher's own method by conveying the spirit rather than the formula of his thought. This little book is a stimulating introduction, which whets the appetite for the announced English translation of selections chosen by Croce himself from his entire works. Perhaps Mr Sprigge gives rather too great a proportion of his limited space to Croce's philosophy and too little attention to the power and range of his criticism. The former is so integrated into the body of his whole work as to defy extraction, and did not influence his contemporaries, who chose to follow D'Annunzio and Mussolini in action; but Croce's methods of criticism have had a most significant effect, not only on the Italian, but also on the whole Western approach to literature and art in the last fifty years. Nevertheless, the author of this essay gives us, in sixty-two succinct pages, an intriguing glimpse into an outstanding and adventurously flexible mind.

The Middle Ages in Old Age

England in the Late Middle Ages. By A. R. Myers. *The Pelican History of England.* Vol. IV. *Penguin Books.* 363 pages. 3s.

The study of the history of the fourteenth and fifteenth centuries in this country has been bedevilled by an attitude of mind summed up in the two catchphrases most frequently used in writing of this period, "bastard feudalism" and "the waning of the

middle ages": that this period can only be seen in terms of a falling away from the high ideals of earlier medieval society. Moreover, Huizinga's famous work has popularised the idea that the special features of late medieval society were the hectic, unhealthy iridescences of an organism in decay.

One of the chief virtues of Mr Myers's book is that, without minimising the chaos of many aspects of later medieval England, he brings out clearly the real achievements of the period, in economic life, in literature, in art and in the art of living. In addition, his limits are well chosen; by carrying the story down to the Reformation he plays his part in the current undermining of that *pons asinorum* of text-book history "1485."

It is therefore a pity that he subdivides his book into three chronological periods and considers political, economic, religious and cultural matters

The Theory of Economic Policy

In English Classical Political Economy
LIONEL ROBBINS

This work is based on a series of lectures given at Manchester on the Simon Foundation. Although bearing indirectly on modern controversies, the book is essentially historical and expository. 15s.

Introduction to Economic History

1750-1950

G. D. H. COLE

An elementary work that sets out the course of economic events which have changed the life of society over the world as a whole during the past two centuries. With charts, maps and tables. 10s.

The Sterling Area

A. R. CONAN

"To those who want to learn the reasons for the 'sterling area,' its problems, its structure and its policy, I can recommend this book. . . . Mr. Conan's conclusions are as original as they are soundly substantiated by independent research."—*Investors' Review.* 16s.

MACMILLAN

in watertight compartments within each period. Not only this, the individual sections are of unequal merit. Those on economic matters are perhaps the best; the political sections the worst. These defects, together with a pedestrian style, produce the impression of a text-book rather than a work for the general reader.

This is not necessarily a condemnation; there is room for a good text-book on this period. Unfortunately, Mr Myers's book does not fill that gap. There are too many minor inaccuracies of detail, too many half-truths, too many vague phrases. The impression is also given that questions are now closed, and there is little indication of the very large amount of research now in progress on this period (a fault reflected in the uncritical bibliography). A sense of new inquiry, new thinking and new discoveries of fact is the first essential of a good text-book.

It must also be said that this book suffers from comparison with the volumes surrounding it in the same series. The attractive mosaic of evidence from all sources patiently composed by Miss Whitelock in "The Beginnings of English Society"; the brilliant picture by Lady Stenton of "English Society in the Early Middle Ages," in which each impressionistic stroke from contemporary sources finally comes together to form a balanced whole; the vigorous synthesis by Professor Bindoff of recent research on "Tudor England"—all these in their different ways are models of what "history for the general reader" can be. Each is a stimulus to further reading and each provides a sure guide to such reading. True, each of these authors had a firmer foundation of previous work to build on than did Mr Myers; even so, their work has a quality which his lacks.

Shorter Notices

What's Ahead for American Business?

By Sumner H. Slichter. Little, Brown and
Company. Boston. 216 pages. \$2.75.

Professor Sumner Slichter is an erudite optimist. Despite the fact that the lectures that are reprinted here were originally delivered only just after the Korean outbreak, this makes his book still a joy to read. He believes that the rapidity of technological progress, the prospects for an increase in the proportion of Americans of working age who will want to join the active labour force, and a hotchpotch of factors that should encourage ever greater output per man-hour, all mean that the prospects for the rapid growth of American production are excellent.

He also believes that large individual holdings of liquid assets, the abnormally small total of outstanding personal debts, the trend towards increased Government spending and bigger budget deficits, and the continued importance of the replacement demand for capital goods indicate that "the effective demand for goods should grow at least as rapidly as the capacity of the economy to produce goods."

Finally, he believes that "it would not be surprising to find that foreign countries could undersell domestic producers in nearly 15 per cent of the commodities produced" in the United States; although he does not believe that American imports will increase rapidly, his calculation suggests that they could eventually increase to between two and three times their present proportion of national income.

The world of the future that Professor Slichter envisages would therefore be a very pleasant place to live in. There are many economists who will have counter-acting doubts—who believe, for example, that the high level of American industrial investment since the war has been motivated by exceptionally high consumption. But it is precisely these economists who should be most heartened—if not wholly convinced—by the mass of argument that Professor Slichter mobilises on the sunny side of the ledger.

Applied Statistics. Vol. I. Nos. 1 and 2. A Journal of the Royal Statistical Society. Edited by L. H. C. Tippett, Oliver and Boyd. 80 and 68 pages respectively. Single number; 10s., annually, 25s.

This new journal, which is to be published three times a year, is intended for the practising statistician and the scientist or executive who wants to know how to handle the information provided for him. By obtaining contributions from experts describing how statistics are used in their particular field, the editor has apparently set no limit to the subjects which may be covered. Some articles deal with general development, others with technical aspects. But throughout the emphasis is put on the practical uses of statistics and not on the theory behind the technique.

The danger in embracing such a wide scope and in attempting to avoid an intricate treatment is that the papers may skim the surface too lightly. But the first issues of the journal promise well. Contributions range over such widely different subjects as industrial quality control, the chemical analysis of pyrethrum, retail prices and sales and some ingenious suggestions in the less accepted field of social statistics. If the standard is maintained in future issues, readers may well obtain some useful ideas from this journal. The presentation of the material is excellent.

Census 195 of Scotland. Volume I.—Part I. City of Edinburgh. HMSO. 47 pages. 7s. 6d.

Volume II.—Population of Towns and Larger Villages (Excluding Burghs) and of Urban and Rural Areas. HMSO. 26 pages. 4s.

These two publications are the first of a series which will make up the final detailed report on the census of Scotland. (Previous publications have given the preliminary general figures and those based on a one per cent sample.) The report on Edinburgh gives particulars of the population in various parts of the city and their housing conditions; similar reports will follow in the next two years on Glasgow, Aberdeen and Dundee and on each of the Scottish counties.

The second volume includes the first estimates since 1901 of the populations of towns and villages that are not burghs but have a population of a thousand or more. Over the whole of Scotland, the census figures show that the proportion of people living in rural areas decreased from 25.7 per cent of the total population in 1901 to 17.1 per cent in 1951.

Annual Review of United Nations Affairs, 1950. Edited by Clyde Egleton and Richard N. Swift. New York University Press. (London: Geoffrey Cumberlege.) 265 pages. 36s.

Reliable and up-to-date books on the United Nations are so few and far between in this country that it is disappointing to have to record the appearance of yet another apparently promising work which fails to live up to expectations. This account of the proceedings of the second New York University Institute for Annual Review of the United Nations contains a good deal of useful information about the work of the organisation and its agencies, and in particular about such poorly documented subjects as recent developments in the handling of international disputes, public information activities and American policy in the United Nations. But although the survey purports to cover 1950, it in fact contains no mention of events later than June of that year, and is consequently of little more than academic interest today. It seems a pity that even American authorities on the United Nations, who are particularly well placed to obtain the latest information on the subject at first hand, cannot do better than this.

The New Issue Market and the Finance of Industry. By R. F. Henderson. Bowes and Bowes. 172 pages. 25s.

It is all too rarely that academic economists come down to the City of London, and their analyses are not always unblemished when they do. In his short book, Dr Henderson corrects some of the errors made by earlier visitors, presents some careful (though not very up to date) statistics on new issues and their cost, and sprinkles his exercise with a sturdy liberal philosophy. Some of his judgments—and especially his concern about the so-called "Macmillan Gap"—may seem rather more suited to the conditions of the 1930s than of the 1950s; the problems created for all types of private investment by postwar taxation and inadequate depreciation allowances have made the "gap" in the provision of risk capital for small enterprises look like a gap in the middle of empty air. This is not therefore the full analysis of the postwar British capital market that is so badly needed, so much as a modest and useful pathfinder along that road.

AMERICAN SURVEY

Republican Hurdles

Washington, D.C.

THE forecast is that the coming presidential campaign will be fought on a high level, since both candidates are men of character and intelligence. It is also believed that, in the courtly phrase of Senator Lodge of Massachusetts, "it's a horse race." The Senator means that he expects a hard contest and a close finish; and since he is one of the most important members of General Eisenhower's brains trust, his prognostication reflects an unusual candour and modesty. But this, at least in the present preliminary stage, is the Spirit of '52.

Of the two sides the Republicans have contrived up to now to sound the more diffident. This is so attractive a contrast to the disastrous over-confidence exhibited by the party in 1948 that it would probably be justified on that ground alone. But there are other and better reasons for the wise decision, hinted at by Senator Lodge before the Republican strategy conference at Denver, that General Eisenhower should be encouraged to "run scared."

This cannot be what he expected before he left the peace and security of Shape to enter the political paddock. The story is that General Eisenhower was promised that, once he had beaten Senator Taft out of the nomination, the rest would be plain sailing, so high was his prestige and so anxious were the American voters for a change of government. Then it seemed quite possible that Mr Truman might run again and no serious thought was given to the possibility that the General's opponent might be Governor Stevenson of Illinois.

General Eisenhower has won the nomination, but almost nothing else has gone according to the schedule sketched out in Paris. Instead of coming home and allowing the "clear call to duty" to develop to such a point that he would merely have to express his willingness to serve, General Eisenhower had to work and fight up to the last day but one of the Republican convention. Instead of being matched against a politically debilitated Mr Truman or a substitute desperately trying to hold the Fair Deal fort, he is up against a man who was in truth drafted without any effort on his part and who has now acquired a stature undreamt of in the earlier Republican philosophy.

Governor Stevenson is the first reason why General Eisenhower will have to fight an all-out campaign. The second reason arises from the unforeseen strains which have been placed upon his own party; the third from the unforeseen easing of the strains within the Democratic party. All this has been superimposed, since General Eisenhower's return to the United States at the beginning of June, upon the recognised obstacles to the election of a Republican President—such as the fact that the Democrats are the

majority party, the fact that they can be presumed this year to have a reserve of over a million votes that went to Mr Henry Wallace and his Progressives four years ago, and the fact that the electorate after twenty years of Democratic rule is enjoying unprecedented prosperity.

Even before the convention cheers which greeted General Eisenhower's nomination had subsided it had become crystal clear to his strategists that a reconstruction crew must be swiftly put to work with double pay for overtime to cement over the jagged crack that had developed in the Republican party. Last week Mr Arthur Summerfield, the new Republican National Chairman from Michigan, was going earnestly about this task. Senator Taft, he said, was "one of the greatest Republicans this country has ever seen, certainly one of the ablest statesmen of modern times." Senator Bricker of Ohio, who laboured mightily to prevent General Eisenhower's nomination, was "that good soldier of our party, that wise, outstanding statesman." And Senator Dirksen of Illinois, who at the convention hurled accusations and taunts at Governor Dewey of New York (without whose help General Eisenhower might not have succeeded), was among those invited to the Denver conference.

There are early evidences, however, that it takes more than one to compose a fight as well as make one. And although the General needs to enlist Senators Taft, Bricker, Dirksen, and the rest of the old guard professionals in the Eisenhower crusade, what of the amateurs who have put their heart and soul into the Eisenhower movement? What sort of say are they to be given in planning and fighting the campaign?

The question was raised very bluntly last weekend by the co-chairman of the National Citizens for Eisenhower movement, which organised 2,900 Eisenhower clubs all over the country, enrolled 250,000 active workers and raised \$1,500,000 in campaign contributions. After three days of dogged negotiations a "peace pact" was signed at Denver last Monday allowing the volunteers to enjoy a separate existence, but making them subject to the supervision of a professional, Mr Wesley Roberts, the party's director of organisation, who will see that their activities are "co-ordinated" with those of the National Committee. This is, no doubt, a reasonable compromise, but it is clear that most of the independent workers for the General feel considerably less enthusiasm for the Republican old guard than Mr Summerfield has shown and will not take kindly to a campaign programme which exalts the Taft-Bricker-Dirksen company over them.

Still less joy over any such programme will be shown by the liberals in the Republican party, some of whom had begun well before the convention to find General Eisenhower too conservative for their liking. The dissatisfaction of this fairly small, but by no means negligible, wing of the party was apparent the other day when Senator Morse of Oregon observed on a radio programme that the Republican platform "takes us back to the days of McKinley." The whole thing will have to be rewritten, Senator Morse said, for "they cannot stand on that platform and win. . . . It was

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

written when the reactionary Republicans were in control of the convention."

Senator Morse has a point, but prickly points, publicly displayed, are not likely to be popular in Denver just now. Senator Morse, in a mood of ruthless realism, went on to suggest that General Eisenhower, for a start, had better make it clear that the "very poor compromise" effected by Mr John Foster Dulles in the foreign policy section of the platform does not include a pledge to carry out "a preventive war in Asia." It was Senator Morse's belief that a great many people would interpret the foreign policy plank as "making some gesture" toward such a war.

The Republican vice-presidential candidate, the youthful Senator Nixon, paused on the way to Denver to rough out his notion of what the campaign should stress. He indicated that the line should be (1) that it is time for a change and (2) that no change can be expected if Governor Stevenson and Senator Sparkman should be elected, since they are "the captive candidates" of President Truman and the labour and Democratic machine bosses. Beyond that, Senator Nixon promised to exploit to the utmost the Alger Hiss case—to which he himself largely owes his swift rise to national prominence, as he pressed the case in its early stages in the Un-American Activities Committee.

Whether the reminder that the Truman and Roosevelt Administrations unknowingly harboured in the State Department a man now convicted of perjury, on the basis of his denials that he was a Communist and a traitor, is still capable of arousing the electorate to loathe all Democrats remains to be seen. Indeed, there is much, not altogether surprisingly, that remains unclear. But there are some basic truths which suggest that Senator Lodge was not being over-modest when he visualised a close unpredictable race. One of them was underlined last weekend by the Gallup Poll. Noting that the Congressional preference poll (meaning the state-by-state replies to the question "Would you rather see the Republicans or the Democrats win the elections for Congress?") has been through the years an excellent guide to political sentiment, it reported that the proportion of voters who are now declaring a preference for Republicans is only 1 per cent more—51 per cent instead of 50 per cent—than it was in August, 1948, three months before the Republicans lost both their bid for the Presidency and their control of Congress. That is, the Republicans have only a fraction more strength than they had in 1948 as a margin against voters changing their minds as the campaign progresses.

American Notes

Prices After the Strike

Stabilisation officials have the gloomiest forebodings about the price rise granted to the steel companies over their heads. With their authority over prices weakened by Congress and their funds cut, they feel they can offer relatively little resistance to a new wave of inflationary pressures; a number are considering resigning, or have already done so. The cost of the steel settlement—between \$5 and \$6 a ton—may not be quite as high as the conveniently round \$100 a family at which the Price Stabiliser puts it, but higher steel prices will make it hard to resist the demand of steel-using industries for relief. The price of automobiles, for example, is expected to go up substantially next year. Users of aluminium will find themselves in the same boat. The industry has just been granted a 5.5 per cent price increase, half it asked, after it had averted a strike by granting its

workers concessions very similar to those won by the steel workers. The petroleum companies are next in the queue of basic industries.

The decline in wholesale prices has not been felt by consumers. Since June, when living costs reached an all-time high, there have been further increases in food prices, and more are on the way as a result of the drought and the refusal of Congress to allow fruit and vegetable prices to be controlled. The price of cotton has leapt forward. Consumers are spending more freely after their long abstinence and borrowing more, now that credit controls have been relaxed.

Among the trade unions pressing their claims in the wake of the steel settlement are the electrical, copper, shipbuilding, meatpacking and rubber workers—and the miners. Two or three months' supply of coal above ground would argue a weak bargaining position, but Mr Lewis has two aces up his sleeve. He approached the northern operators first, among whom are the steel companies, with their "captive" mines, in the hope that the steel industry will not tolerate a second interruption of steel production; as it is, civilian industries may be starved for several months to allow defence producers to catch up. And by timing his strike notice for September he seems to be gambling that in the midst of an election campaign no one will want to treat the miners roughly.

Even if it comes to a strike, the Wage Stabilisation Board will have no hand in the settlement. The old board was killed off by Congress for its over-generous steel recommendations, though otherwise its record was a successful one. The new board, which took office this week, has no authority in labour disputes, but merely the power to lay down wage policy and allow or disallow specific agreements, and this only in conjunction with the price authorities. The trade unions, who are disillusioned with stabilisation, and attached great importance to the old board's right to intervene in disputes, threatened at one time to boycott the new body, but they have thought better of it. As members, they can hope to speed a new regulation permitting "productivity" wage rises. This is almost the only score under which new wage increases can be justified, and strikes averted. Most of the big trade unions have exhausted the bulk of their claim to wage rises on account of past increases in the cost of living.

Disaster by Drought

At this time last summer Kansas and Missouri were digging themselves out of the mud and devastation left by the rampaging river floods. This year the south-east, which can usually count on moisture-laden winds from the Gulf, has been parched by dry winds from Texas and New Mexico and scorched by the heat which has afflicted the whole country. In the north-east, normally temperate New England is also affected. Maine potatoes and blueberries, Massachusetts tomatoes and apples, and Connecticut tobacco are wilting. In the south, hay and livestock, tobacco, peanuts and maize have been hard hit. It has been exceptionally dry further west, too, in Texas, Colorado, and Montana. The food packers, who have been bemoaning the lack of tinplate to save the fruit and vegetable harvest, may have to start worrying about what is to go in their tins now the end of the steel strike means they are likely to get them.

As the map shows, the federal government by the end of last week has designated eight states and parts of Arkansas and Missouri as "disaster areas" and was studying the situation in seven others. Farmers in disaster areas are eligible for federal loans, when they cannot get credit from other sources, to tide them over until their next crops are in. Some \$40 million has already been dispensed; it is an ironic touch that available funds are being supplemented by transferring \$30 million from the Missouri flood relief fund.

One of the main aims in the south is to save its livestock. This is a new industry and one of which much is expected in increasing southern prosperity. Loans will help to relieve the farmer of the necessity of liquidating his herds by making it possible for him to buy hay in unaffected areas—the Great Lakes states, for example, which, so far from suffering from drought, have had so much rainfall that Lake Superior has been dangerously high. The railways are being asked to set low rates for the shipping of hay and feed into the stricken states.

In the drought areas it rained late last week; in Connecticut nature relented just as professional rain-makers had been brought in. But so far it has not rained enough to save many crops. In the south livestock and crop losses are already put at over \$500 million, and the possibility that farmers will reach the near-record goals set for them this year by the Department of Agriculture is now very remote.

Atoms and Atmospheric

Senator Brien McMahon, who has just died at a sadly early age, had made an outstanding reputation in Washington by his able handling of a vital job which he created for himself. After the war he had a large part in transferring the control of the atomic energy programme from military to civilian authority, helping to secure the establishment not only of the Atomic Energy Commission but also of the Joint Congressional Committee on Atomic Energy. This acts as a liaison between the highly secret work of the commission and the Congress which must finance this work without any means of judging whether the country is getting its money's worth. Mr McMahon's sympathetic but critical and close interest in the affairs of the commission did much to convince Congress that its atomic dollars were being well spent. His absence—he was already in hospital—was felt in the closing days of the last session, when an attempt to cut atomic funds for the coming fiscal year almost succeeded.

The \$3 billion the commission wanted was, however, rescued at the last minute and since then contracts have been let for expansion at both the existing atomic energy installations in Tennessee and Washington State, and those still being built in Kentucky and South Carolina. Over \$1 billion of this appropriation was for a huge plant not yet begun in the Ohio Valley. This expansion has been made possible, as the latest semi-annual report of the commission emphasises,

by increased supplies both of fissionable material, as the result of working existing facilities to capacity, and of unprocessed uranium, from Australia, Canada, South Africa and from domestic mines on the Colorado Plateau. The commission had recently been criticised for neglecting the development of these and other possible supplies of uranium at home in favour of foreign sources which might cease to be available in time of war. A plant for the recovery of uranium from phosphoric acid, one of the new domestic sources suggested, is now being built in Illinois.

The sense of urgency, which has pushed the cost of the atomic energy programme up from \$1.6 billion in the last fiscal year to \$4.1 billion in the current one, presumably arises from the belief that the Soviet output of atomic weapons is climbing rapidly. Oddly enough, however, people seem more inclined to credit a new American secret weapon, rather than a Soviet one, with responsibility for the latest invasion of flying saucers. This is being taken with unusual seriousness, since the "objects" appeared over the national capital and on radar screens, and were chased by jet aircraft, at a time when journalists had little else except the heat to occupy their space. The heat and the saucers are in fact connected in the official explanation given at a reassuring Air Force press conference. Those saucers that are not weather balloons or other tangible objects are said to be mirages caused by differing densities in the atmosphere. But the Air Force takes these mirages seriously enough to have ordered special equipment capable of tracing them back to their source of reflection.

Copper Almost Unlimited

The Reconstruction Finance Corporation has just arranged the largest loan made under the present defence programme, for the expansion of copper and molybdenum

output, a purpose for which other loans had already been granted. The Magma Copper Company and its subsidiary, the San Manuel Copper Corporation, are being lent \$94 million, and a further \$20 million or so will have to be found privately, to open up an underground mine and provide milling, smelting and transport facilities in Arizona. The government will guarantee to buy the output, which will eventually amount to 140 million pounds of copper and 6 million pounds of molybdenum a year, increases of 8 per cent and 16 per cent respectively over last year's domestic production of these two metals. There are estimated to be at least 500 million tons of low-grade copper ore in this new field, the largest in the country, and the project will turn the little Magma Company into a leading producer.

The new mine will, however, take about five years to develop fully and for that reason its importance as a defence project lies rather in the strategic reserves it will provide for the future, than in the contribution it will make towards relieving the present shortage of copper. Indeed, the end of that shortage, critical a few months ago, is already in sight, partly as a result of the curtailment of industrial production caused by the steel strike, but mainly as a result of improved world supplies and of the price differential that now allows American consumers to buy copper abroad. The price ceiling on domestic copper remains 24½ cents a pound, but 80 per cent of the difference between that price and the cost of foreign copper, at around 35 cents a pound, may be passed on to buyers of copper products.

In July copper quotas under the Controlled Materials Plan were divided into domestic and foreign shares, which made it possible to increase the total for the month by about 30,000 tons. Foreign copper made up 40 per cent of each allotment, but some consumers have apparently failed to take up their high-cost foreign quota. Most of them are, however, buying all the copper they are entitled to for the moment, since there is a danger that last year's disastrous copper strike may be repeated. The copper companies' contracts with the Mine, Mill and Smelter Workers' Union have expired, or are expiring, and negotiations on new wage rates and other benefits have been dragging on unsatisfactorily. Once a settlement is reached, however, many American consumers may stop buying foreign copper until prices drop.

Beginner's Luck

The American woman who cannot mend a fuse and the man who cannot deal with a leaky tap are fast being replaced by a generation which is addicted to "How to" books and pamphlets: how to assemble a boat, make an unfinished attic livable, or decorate a house. Partly it is the old American fondness for tinkering and doing things with the hands. But for many, it is economic necessity which drives white-collar people even into building their own houses. Labour is scarcer and more expensive than ever, and a \$75 a week book-keeper cannot afford the services of a \$150 a week carpenter or plumber.

Not many are ambitious enough to tackle a whole house, though there are cases of families building one at night and at week-ends for half what it would cost otherwise, and the old custom of "barn-raising," at which neighbours and friends volunteered their services, is coming back into fashion. But nearly two-thirds of all the wallpaper is now put up by amateur hands, and even more of the paint and distemper goes on without benefit of a professional painter. Shrewd businessmen, recognising a big new market, have made it easier for people to do such jobs themselves. They have put on sale to amateurs a "roller-coater," which applies paint more easily and less messily than a brush, and new paints—the resin emulsion and latex emulsion paints—which need no undercoat on most surfaces and are easy to apply. Wallpaper comes trimmed, and is put on with a slow-drying

paste which makes tearing it off and starting again an easy matter. Plywood, the amateur carpenter's delight, now comes in "Handy Panels" of convenient size; floor coverings, such as asphalt, cork, and linoleums, are sold in easily handled tiles rather than bulky lots. The Sears Roebuck Company sells a kit for linoleum laying at less than a dollar. In quite another world, permanent waving moved into the home after the war. Hair tinting seems likely to follow it.

For many of the heavy new jobs, particularly in the garden and workshop which more suburban living makes possible, there are power tools: motor mowers, an all-duty tractor which can be hitched up to snow ploughs, mowers, harrows, or seeders, and woodworking tools such as lathes, drills, and power saws, most of them adapted to home use. With the electrification of the countryside, and more leisure, such workshop tools, once the playthings of rich men's weekends, are coming into middle class homes.

Shorter Notes

Acting in the spirit of the new Puerto Rican constitution on the day before the official establishment of the island as the first overseas commonwealth of the United States, President Truman commuted to life imprisonment the death sentence on Mr Oscar Collazo. The Puerto Rican Nationalist was one of two (the other was shot by guards) who killed a White House guard in an attempt to assassinate the President on November 1, 1950. The case was under direct US jurisdiction but changing the sentence to conform to Puerto Rican law has pleased the Puerto Ricans and deprived the Nationalists of a martyr.

*

"King" size cigarettes (85 millimetres long compared to 70 millimetres for the standard size) have been winning an increasing share of the smoking market in the last few years. While most tobacco firms make longer cigarettes, they are sold, at the same price as standard ones, under separate brand names. Now Chesterfields, the third most popular cigarette in America, are to be available in two sizes with the same brand name, the king-size package selling at one cent more than the regular size. The firm has thus stolen a march on this highly competitive market with little additional advertising expense and with a substantial increase in revenue. One of the most telling arguments in favour of the longer cigarette has been that it is healthier, since the extra length is supposed to act as a filter.

*

Air cooling units, already in heavy demand for office and home use, have moved into a new field with the announcement by the General Motors Corporation that 1953 Cadillac and Oldsmobile cars will have them as optional equipment. Mounted in the rear of the trunk compartment and using non-toxic freon gas, the units can keep automobiles cool even in desert temperatures as high as 110 degrees.

Railway tickets are the latest commodity to be made available in vending machines, so the traveller, in addition to shining his shoes, stamping his letters, getting hot coffee (with or without cream and/or sugar) and buying a trip insurance policy from automatic devices, can avoid a queue at the ticket window. The Grand Central Station in New York has installed a number of these machines that can issue 650 different tickets to 160 separate destinations over several lines. For every trip the machines are geared to issue a one-way coach, parlour car or sleeping car ticket, a return ticket in these categories, and return tickets at the reduced rates given to children and members of the armed services.

Fly to Frankfurt in **TWA** Constellation comfort

You enjoy the luxury of Constellation travel when you fly TWA to Frankfurt. You fly in one of TWA's world-proved, four-engined Constellations, the experienced traveller's choice for spacious comfort and on-time arrival. There are frequent flights from London—complimentary drinks and a delicious *hot* meal served en route. Now's your chance to experience the friendly hospitality and personal attention of TWA service. Single fare: £17.2.0, return £30.16.0. Remember, your fare does not come out of your Foreign Travel allowance.

THE 'CONSORT'

*A car to be proud of
for many a long year—*

SINCE it was introduced, the Consort has won nothing but praise from owners and critics alike. A car conforming to Daimler standards of luxury and elegance, it is at the same time most manageable in traffic and reasonably economical to run. And of course the famous fluid transmission* makes it the most pleasant and restful of cars to drive. For the man with a position to keep up, for the firm with its prestige to think of, the Daimler Consort is the natural choice. Write to us for the name of your nearest Daimler distributor or dealer: and we are sure that he will be able to arrange a very reasonable delivery date for your Consort.

*Licensed under Daimler & Vulkan-Sinclair patents

FROM THE 'AUTOCAR' ROAD TEST

'The presence of the fluid flywheel gives almost infinite top gear performance down to zero speed.'

'No car is easier to drive...'

'This car swings along very satisfactorily at 60 plus, and up to a full 70 m.p.h., which is not by any means the maximum...'

'There is a very strong impression of safety about the behaviour at all times.'

'It is a restful car, psychologically as well as physically, to the driver and passengers.'

What is Happening to Nato?

(By a Special Correspondent)

IT is only six months since the Atlantic Council met at Lisbon, yet already its chief member governments seem to be moving away from the programmes that were adopted there on the basis of expert economic advice. Mr Churchill says that he will let the Council know the result of his fresh thinking about the British defence effort by the end of the year. M. Pinay has been despatching his thoughts on French arms production to Washington by special envoy, although Nato's headquarters are in his own capital. Belgium is under pressure to reduce its two-year term of military service. Soon the layman will have to ask whether Nato is really functioning as a source and co-ordinator of international decisions.

Superficially, much the same situation—the assertion of national independence, and the scramble to make bilateral deals with the American benefactor—existed before the Ottawa meeting of the Atlantic Council last autumn. Then the ministers of the Nato countries were shocked into realising that their organisation had made little progress towards setting up Western Europe's collective defences, and that they could blame nobody but themselves. They had given Nato a great many functions but no powers. They realised that something, short of a complete surrender of national sovereignty, had to be done to define its functions and to increase its powers. The result was the appointment of the Three Wise Men—Mr Harriman, Sir Edwin Plowden and M. Monnet—who took two important steps forward. Because they had been appointed in a mood of emergency, they managed to lead the way to an agreement on a joint programme of defence production and expenditure for the coming year. Because they represented no more than a temporary expedient, they were able to get the consent of the Nato governments to arrangements for an annual repetition of their work.

Men Around Lord Ismay

But now their programme for this year is withering away. And what has happened to their proposals for future international planning in Nato? Listening to Mr Churchill and M. Pinay, one gains the impressions that this, too, has been lost. Yet this is to do less than justice to the recent activities of Lord Ismay and the permanent Nato staff in the Palais Chaillot. What was needed, according to the Three Wise Men, was "staff action on a continuing basis in the direction of current reconciliation of screened military programmes" (as drawn up by the international staff at General Ridgway's headquarters) "and politico-economic capabilities" (as expounded by national representatives to the civilian headquarters of the Council). The Council agreed that this task should be carried out, first, by improving the "means of obtaining prompt co-ordination of governmental decisions," and secondly, with a "strengthened and unified international machinery to lay the basis for such decisions and to follow up."

To meet the second requirement, Lord Ismay has been recruiting a "staff secretariat" to work with, for and alongside the technical staffs of the fourteen national delegations. In these men and in Lord Ismay himself Nato hoped to acquire a distinct and positive personality. It was to be, for the first time, something more than the sum of its members; it

was to have a place where a Nato view, in contrast to the lowest common denominator of fourteen national views, could be developed.

The staff secretariat operates in three sections: one, headed by an American, being concerned with production, including the placing of offshore purchases; one, under a Frenchman, with economics; and one, headed by an Italian, with so-called "politics," a slightly misleading term for the wider concerns of Nato in time of peace. The last is still in embryo. In dealing with production and economics, the secretariat works in the first place with a technical committee of national officials. It has both to suggest a basis of agreement on technical problems between these national representatives, and to expound their disagreements and possible bases for agreement to the Permanent Representatives of the fourteen governments, presided over by Lord Ismay. The attempt is thus being made to reduce fourteen viewpoints to one, or to as few as possible, before the fourteen governments have their final say.

Cable-Bound Officials

To meet the other requirement, the "prompt co-ordination of governmental decisions," the Atlantic Council decided at Lisbon to replace its moribund Deputies with the Permanent Representatives. It was clearly intended that the Representatives, unlike the Deputies, should wherever possible take final decisions themselves; in other cases they should be the agents through whom the Nato view and the national views should be reconciled; only in the last resort would they simply be defenders of their respective governments' positions. The fourteen Foreign Ministers would act as their chairman in rotation, and the Secretary General as deputy chairman. Thus the gulf between the Representatives and the governments on the one hand, and the Representatives and the Nato entity on the other, was to be as small as possible.

This is the way it was all intended to work. Yet, in spite of the staff secretariat, which includes some excellent as well as some indifferent personalities, and in spite of the presence and perseverance of Lord Ismay as Secretary General, it is as yet scarcely working at all. The prime offenders are, as always, the governments themselves who refuse to give their representatives any of the powers of a delegate. So long as fourteen experts meet only to expound the contents of their latest cables from home, the secretariat will labour in vain to propound a Nato solution. So long as the Permanent Representatives meet in turn only to defend their prepared redoubts, Lord Ismay will get no agreement on any issues except those too small or too obvious to be controversial. And this is what is happening at the moment. Even the budget, which was to pay the Secretary General and the secretariat he was instructed to recruit, was agreed only after bitter struggle.

In these circumstances the new machine can work little better than the old. The Permanent Representatives can be no more effective than the former Deputies; and they are for the most part, the same people. Even if the Representatives were allowed or were capable of a change of heart, they would still need a more intelligent direction from their respective capitals.

Canada's Attitude to the Commonwealth Conference

[FROM OUR OTTAWA CORRESPONDENT]

THE details of the Canadian approach to the November Conference of Commonwealth Prime Ministers are not yet formulated, and cannot be until the senior officials of the Commonwealth countries meet in September for their preparatory talks. But the broad lines of Canada's attitude are almost predetermined by this government's economic philosophy and by the line it has always taken with the sterling countries of the Commonwealth.

Politically and psychologically Canada's position is not easy. One report from London says the British are "weary of being lectured for their profligacy." Another urges Canada to abandon its "posture of Olympian detachment from Commonwealth affairs." Canadians can understand these rather irritated expressions of British opinion: they can even sympathise with them. But it is another thing to stop the lectures and abandon the supposed detachment. At a certain level of policy the accusation of detachment is entirely true, but it is the detachment of helplessness not of disinterest.

In the early postwar years Canadians grew accustomed to a constant anxiety about what exports would be slashed next. Through recurrent crises of negotiation and argument Canada saw them cut one by one. Apples, bacon, cheese, canned salmon, jam pulps, tobacco, some kinds of timber—all these have been through the process. Now nothing significant is left in the agricultural field except wheat and flour. But the anticipated tragedy has not ensued. Producers of many commodities would be delighted to recover the British market, but somehow or other they have averted ruin without it. Now they have almost ceased to believe that Britain will ever again buy their products. The dreaded "loss of the British market" has happened, and catastrophe has not followed.

Crises Taken Calmly

Canadian exports to Britain this year have been running at high levels, but they are concentrated in three lines. The only significant volume is in wheat and flour, metals (aluminium, copper, lead, zinc, etc.), and in timber and its products. The first two of them, which have composed over two-thirds of the total exports, may be reasonably proof against further cuts, because they are the raw materials essential to feed the people and supply the export industries as well as for defence. The timber is certainly vulnerable. The last contract of the British Timber Control is being carried out, but it ends in the autumn. New contracts have always been doubtful and are now doubly so. Canadian hopes are turned to a revival of house-building in the United States. But with this one exception Canada feels it has probably been hurt just about as much as it can be.

This is one reason why the recurrent sterling crises are apt to be taken more calmly than they once were. But there is a more important one. It is the considered conviction in government circles that no outside aid for sterling can begin to have any long-term effect until the policies of the sterling countries are drastically changed. The much-heralded announcements of Mr Butler and Mr Churchill at the end of July resounded here as dully as a cracked dinner-gong. It seemed here to be the same old dose of restrictions, with no suggestion, not even as much as there was in the March budget, of any new approach to a constructive solution. In government circles there is growing up a weary feeling of treading an inescapable treadmill.

In many ways—most of them small in themselves—more assistance could be given to British sales in the Canadian

market. The federal government and all the provincial governments could use various devices to promote British exports in the Canadian business world. There is admittedly less chance of influencing business than there was in earlier years when Canada had import controls to conserve its own stocks of US dollars. But more could undoubtedly be done if the enthusiasm could be revived. Enthusiasm, however, is not characteristic of a donkey in a treadmill.

Escape from the Treadmill

The only escape from the treadmill, as it seems here, is along the lines of the now too familiar Canadian "lecture against profligacy." This, of course, is a misinterpretation of the text of the Canadian lecture. It is very little more than an assertion of the general principles which seemed to be agreed at last January's conference of Commonwealth Finance Ministers. The very encouragement which Canada derived from that meeting enhances the disappointment that is felt now. If those principles have been forgotten by everyone else (as the latest Butler announcements and the British pressure on Mr Menzies to abandon his import cuts seems to suggest), they have not been forgotten here. Nor is it forgotten here that in his March budget Mr Butler made at least a start on the necessary steps to restrict credit, reduce consumer demand and restore incentive. Now we are back to the old restrictive nostrums. The Canadian Government is left with its lecture in its pocket, but it is becoming rather self-conscious about delivering it.

This largely accounts for the feeling of helpless detachment in Canadian Government circles, and it goes some way towards frustrating the urgent sense of concern about the sterling deficits. To supply artificial aids from outside seems here to be encouraging the sterling governments to postpone the action which they will ultimately have to take if the sterling area's purchases are ever to be balanced by the sterling area's earnings. If Britain, with the support of the others, made a serious start on a fundamental cure, then the attitude here would very quickly change. But so long as the British Government offers nothing but the old restrictive policies, most Canadians lack much spirit for the effort to help. This Government has never liked the policy of restriction. It likes it less and less the more often it is repeated. This seems bound to be the main burden of Canada's contribution to the Prime Minister's Conference.

Imbroglia in Tunisia

It is high summer in Tunisia and no one spends more time inside Tunis town than he can help. The temperature does not lend itself to hustle. It is unsuited, therefore, to the pace at which the Pinay government is trying to get the Bey to put his signature to the reforms whereby it proposes to fulfil its promise of internal autonomy. In Tunisian circles, by contrast, siestas and long hot evenings are moments for devising the cross-ruffs, finesses and like tactics at which Tunisian politicians excel. The events of the last few weeks suggest that each of several Tunisian groups intends, for reasons that are not always identical, to postpone any action until October—the month in which friends abroad will be able to improve Tunisian bargaining power by bringing pressure to bear on France at the United Nations Assembly.

The early history of the reforms was told in *The Economist* of April 19th. They were to be hammered into shape by a mixed commission of Tunisians and Frenchmen. But this commission, deplored by extremists on both sides, and opposed even by the Tunisian moderates so long as several Tunisian cabinet ministers were under French arrest, was in the end still-born. To make up for its failure to materialise, the Pinay government slightly redrafted the reform proposals,

giving them a shape that ought to have been more welcome to Tunisians, since it was much less welcome to their adversaries, the local French settlers and officials. It also released from detention all the more moderate of the nationalists whom it had clapped into concentration camps during the troubles of last spring.

The latest version of the proposed reforms is, in summary, as follows. In legislative matters the Bey is to remain supreme; a parliamentary regime is not envisaged until the Tunisians have had some practice in local government. The Bey will for the present simply be advised by two Councils—one wholly Tunisian, and nominated by himself, handling legislative matters, the other handling financial matters, and partly composed of Frenchmen. Executive power is, as at present, to be in the hands of a cabinet that is to be part French, part Tunisian, but its seven Tunisian members are to be autonomous; of the six ministries still run by Frenchmen, four are to be furnished with Tunisian assistant ministers; as is justifiable under the Protectorate treaty of 1883, defence and foreign affairs are to remain in French hands. In administrative matters, the French Resident-General is to abandon his right of countersigning decrees (*droit d'agrément*) but is to be able to question their legality before an administrative tribunal of jurists, part French, part Tunisian. Local government is to be promoted, with French representation on elected municipalities in the towns. Lastly, access to government service is to be open to Tunisians only, subject to the right of present holders of jobs to retain them till retirement, to the temporary appointment of Frenchmen when no trained Tunisian is available, and to the earmarking of some 150 to 200 jobs out of 20,000 for Frenchmen.

Debonair Procrastinators

These propositions do not go the whole way towards the 7-point programme formulated by Habib Bourguiba, the leader of the Tunisian Néo-Destour party, in 1950. Bourguiba then demanded sovereignty for the Tunisian people (as opposed to the Bey) and the establishment of an independent government capable of negotiating a treaty with France on an equal footing. No French government could go so far as this while the French settler is in this part of North Africa and continues to enjoy the support in Paris of an important element in any French government of the centre, the Radical party. Yet the current French proposals are a very considerable advance on the present state of affairs. To the conservative, aristocratic Tunisian who fears the left wing of his own people, they might seem less alarming than the impetuous and radical propositions that emerge from the ranks of the Tunisian trade unionists. Yet he does not support them. He is evading judgment upon them firstly because he is a nationalist and must be worthy of the label, and, secondly, because unless he runs with the crowd he may not keep his place in its front rank. All his very considerable talent for postponing the day of judgment is therefore being deployed.

The elderly, peace-loving Bey and his equally elderly, debonair prime minister, M. Baccouche, both belong to this sheltered class. Both therefore have been exercising their talent for procrastination. It will be remembered that the French Parliament discussed the reforms at the end of June, and, because both Gaullists and Socialists voted against them, failed to give them the endorsement that might have helped the French Foreign Office to get them adopted. They survived only because no party had an acceptable alternative to offer. During July, M. Baccouche and his cabinet of notables nevertheless discussed and amended them, item by item, and forwarded the amendments to Paris. To amend a proposition is to admit that it has some worth; French hopes rose.

But in the last days of July a telegram from the Bey to the President of the French Republic dissipated these hopes overnight. M. Baccouche, it said, had exceeded his func-

tions; the Bey, being sovereign, was alone entitled to pronounce such judgments. (This is correct: the French themselves have always insisted and still insist that the Bey alone is sovereign; the argument has at times proved convenient for use against the Néo-Destour, but it is inconvenient when turned against Paris.) Behind this telegram was, it seems, a violent protest by the Néo-Destour against the way in which M. Baccouche was suiting Paris's book. The Bey's son, Chadly—a jovial, ambitious Destourien and nationalist—intimated as much in an interview with an American news agency in which he attacked the reforms as retrograde. He put his finger on the core of the trouble when he added that French residents could not expect representation in Tunisian political institutions when they were not Tunisian citizens. M. Baccouche added his nail to the coffin by issuing a statement that he and his cabinet ministers had considered points of drafting only, having no powers to handle points of principle or substance.

The Bey Plays Another Card

This week the Bey has played a further card. He has announced that he is consulting a selection of Tunisian opinion—lay and clerical, political and professional—before formulating his sovereign view. The representative figures that he has chosen to consult range from wealthy conservative moderates, through the middle-of-the-road Jewish community to Néo-Destouriens and trade unionists. Both the last are outspoken opponents of the French plan. The body so chosen, forty strong, has been named "The Councillors of the Crown" and the fact that it has been consulted causes the Bey to be locally acclaimed as a good democrat. This move is embarrassing Paris, which has hastily despatched a fresh emissary to Tunis with a message for the Bey. The French can hardly upbraid him for consulting public opinion; yet they are being manoeuvred out of the role of progressive protector, forever making generous but abortive offers, into that of a governess who has failed to keep pace with her pupil. At the same time, the move may bring to the Bey personally some distasteful repercussions at home: it reveals the strength of uncompromising nationalism in Tunisia and the extent to which deference must be paid to it by the conservative ruling class to which the French have hitherto looked to apply a convenient brake. It is likely that impetuous trade unionists will want to travel faster than staid old aristocrats care to travel. Neither Bey nor French government has much room for manoeuvre, but, of the two, the latter has the less.

A Congress of Nostalgics

[FROM OUR ROME CORRESPONDENT]

AT the annual national congress of the Italian Social Movement (MSI) in the castellated Apennine hill town of l'Aquila one could test the justice of the descriptions which are showered from various directions upon this numerically up-and-coming party, which is hampered but also stiffened and glamourised by the recent "Scelba" law against the resuscitation of Fascist doctrine and practice. For the first time since its electoral successes (Minister Scelba banned the intended Congress of 1951) the "Missino" leadership could be viewed in the mass.

Relative well-wishers or potential allies in electoral contests have got into the habit of describing the MSI as one wing of "the national forces," the other wing being the Monarchist party. But the young and vocal part of the l'Aquila Congress reacted with noisy hostility to any suggestion that the "Missino"—Monarchist electoral understanding should be perpetuated; it is plain that the present leadership cannot yet safely aim at a merely "nationalist" aspect for the party,

such as might win the full sympathy of the Monarchists and some others. The fiercest opponents of all truck with monarchy and Monarchists were the faction of "Missini" known as *Milanisti*, who are the inheritors of the memory of Mussolini's Republic of the North under German occupation. But more broadly, the anti-monarchist, which is also the resolutely anti-Atlantic and anti-capitalist side of the party, commanded about a third of the Congress votes, and almost all the young speakers were on this side.

Relics From the Past

"Reclaimed scrap" was a relatively polite description of the Congress used by a Communist journalist. It certainly exhibited numerous key men of the old Fascist hierarchy, that plethoric organisation which fell asunder in 1943 and was partly pulled together to groan on for a couple of years before finally ending in the bloody and hopeless collapse in the spring of 1945. Thus one saw at l'Aquila the Mussolinian Social Republic's one-time Deputy Chief of Naval Staff, as well as its Ambassador to Hitler, and the last Fascist editors of the *Corriere della Sera* and the *Stampa*. Many of these former dignitaries are relics from a dim past and now are painfully at a loose end; and yet they are separated by no very evident abyss of ideas, character, or temperament from others whom better luck or superior foresight has enabled to regain a niche in the existing Italian political world.

Another description made use of by adversaries to describe the "Missino" leaders is "cynical adventurers." One sees most clearly what they mean. But this is patently inapplicable to some of the leading figures of the Congress, like Professor Roberti (one of the five "Missino" parliamentarians) whose intently followed arguments on social economics smacked of the earlier G. D. H. Cole. The Congress followed him, and it followed an elderly General who soberly analysed Italy's real potentialities in the present-day balance of military power, more attentively than it followed the several impassioned (though owing to the Scelba law, tongue-tied) exponents of Fascist mystical imperialism. The Congress consisted in the main of an upper class of former Fascist leaders who are tired of Fascist doctrine and behaviour, yet obliged to base their fortunes on a rank and file which would like Fascism raw and juicy. Naturally there are some spell-binders ready to profit by this appetite. The accomplished Giorgio Almirante, who considers himself the founder of the party, is biding his time.

Stuffed Shirts on the Platform

Whither are the "Missini" heading? Remembering the history of the original Fascists, who began as a group of eccentric nationalist landowners with their bailiffs and game-keepers, and of the conservative business classes, one may guess at a possible tendency for the MSI, if it should greatly expand its voting total above the present approximate two millions (the figures are statistically controversial). It might become a straight right-wing party challenging by its "secular" character the all-too-clerical right-wing Christian Democrats, and by its colour and rhetoric the all-too-professional Centre parties which have their roots in the Resistance. Regionally, an evolution into a straight right-wing party would mean that the southern elements of the party, who are akin to the Monarchists, had taken it wholly in hand, disarming the fanatical "Milanists." The youthful elements at l'Aquila watched such an evolution happening under their eyes, and the air was thick with mutterings of "treason" and whispered appeals for ex-General Graziani to be brought in to make short shrift of the stuffed shirts on the Congress platform. To prevent the scandal of a breach at the Congress, considerable verbal concessions have been made to the "Milanists" in the final resolution, but control remains with the stuffed (and none too black) shirts.

Japanese Communist Anniversary

THE Cominform Journal has published a declaration by Kyuichi Tokuda, General Secretary of the Japanese Communist Party, to mark the thirtieth anniversary of the party's foundation. The statement is of interest as revealing the current line on which agreement has been reached in the Japanese party after what are admitted to have been serious internal conflicts, and its relation to the Communist lines now being put over in other countries; it is also instructive to compare it with the exposition of Italian Communist policy by Togliatti published in the same issue (July 4, 1952).

According to Tokuda, the Japanese Communist party, which came into existence in 1922 after a congress of Far Eastern revolutionaries held in Moscow, had for its original programme simply the overthrow of the monarchy and the establishment of a democratic republic. In 1927, however, the programme was extended to include expropriation of landlords, a seven-hour day and a worker-peasant government:

Having smashed the liquidator group of economists headed by Jamakawa and the leftist group of Fukumoto which, with their petty-bourgeois abstract theories sought to isolate the Party from the masses, the Communist Party of Japan became the genuine vanguard of the working class.

There follows a somewhat mysterious account of the Pacific war and its aftermath. It is stated that up to 1945 the party was subjected to brutal persecution and that its membership never exceeded 1,000; nevertheless, the effectiveness of its preparatory work was proved by the subsequent "extremely rapid growth of the Communist Party which now has a membership of several hundred thousand and enjoys the support of the broad masses." This expansion followed the defeat of Japanese imperialism (by whom is not stated), the repeal of the repressive "fascist" laws (by whom is not stated) and the release from prison (by whom is not stated) of "many Japanese comrades headed by the leadership of the Communist party." It is impossible not to admire the dexterity with which Tokuda avoids any mention of the fact that it was the Americans who established political liberty in Japan, ordered the release of the imprisoned Communist leaders (all of any consequence were in 1945 either in prison or in exile) and allowed the party to build itself up without interference. We are merely told that "receiving for the first time the opportunity of legal existence, the Communist party immediately developed its activity."

Heretical Deviations

Later, after General MacArthur's ban on the Communist-promoted general strike in February, 1947 (when we first hear of "US imperialists" in Japan), the Communists sought to widen the basis of their appeal:

The aim was not to confine the activity of the Party to the working class alone, but to extend it to the peasantry, students, intelligentsia, small and medium manufacturers and traders, and in this way create a broad national-democratic front. The Party also sought to extend its activity among the youth and women.

The Party, however, suffered from heretical deviations of a most reprehensible kind. There were "opportunists" who "underestimated the reactionary essence of the American occupation regime and claimed that there was a possibility for the victory of the revolution by peaceful means through Parliament." Hardly less dangerous were those who held that the task of the Party was "struggle only against the US occupation troops, saying nothing about the struggle against the Yoshida Government." These heresies were overcome, but there still remained a "lack of

Progress in agriculture...

Shell Chemicals

Woodstock Farm, near Sittingbourne in Kent, is the agricultural research station of the Shell Group in this country. Here, in up-to-date laboratories and in the surrounding orchards, hop gardens and farmland, teams of experts are carrying out a broad programme of investigation devoted to the control of insect pests, the prevention of plant disease, the selective destruction of weeds in growing crops and other problems of importance to the nation's food production. Some research is long-term and fundamental; other lines of attack are the day-by-day screening of all new petroleum-derived chemicals for possible use, and the maintenance of carefully controlled trial plots. If promising, these lead on to full-scale trials under normal commercial conditions. This policy of step-by-step progress ensures that new products bearing the name Shell have an informed background and proved capabilities before they are offered to the farmer.

The first automatic flour mill

in the world was built by Henry Simon in 1881, using mechanical handling appliances instead of manual labour to transport the mill products from process to process. This was the first step in the transformation of flour milling into one of the most highly mechanised of all industries. Pneumatic handling of mill products is now replacing mechanical methods in many of the latest mills. Pneumatic mills by Henry Simon are at work or in course of installation in over a dozen countries, including the United States and Canada.

clarity," for which in retrospect Tokuda is humbly apologetic. There was a dispute whether postwar Japan should be reckoned as still an imperialist, or as now a colonial, country, and the Japanese party left this issue in suspense until the recent formulation of the so-called "new programme." As Tokuda writes:

the leadership of the Party failed to give a clear definition to the character of the revolution as a revolution in a colonial, dependent country, a revolution the principles of which were explicitly elaborated by Comrade Stalin. . . . We worked pretty hard on this question, but failed all the same to achieve complete clarity. The significance of the new programme is that it eliminated this vagueness and defined the character of the oncoming revolution in Japan as a revolution in a dependent country, that is, a national-liberation democratic revolution. The new programme of the Communist party is gradually becoming the programme of the entire people.

It is clear that there was a strong objection within the Japanese Communist party itself to declaring that Japan had become a colonial country. Japanese national pride clung obstinately to the belief that Japan was still imperialist. It is, of course, wicked to be imperialist, but also rather grand, whereas to be a colonial country after being an imperialist one is merely humiliating. The classification, moreover, links industrialised Japan with backward and undeveloped countries with which the Japanese are not anxious to be ranked. But Moscow requires this classification in order that Japan may be assigned a national war of liberation against "the U.S. imperialists" to be carried on with nationalist slogans. The line also involves a wooing of the Japanese bourgeoisie with the bait of trade with Communist China and a campaign of protest against restrictions on exports of strategic materials to Soviet bloc countries. It is noted with special satisfaction that "three representatives of Japanese capitalist circles" who recently attended the Moscow Economic Conference are now representing Japan on the preparatory committee of the peace conference to be held in Peking in September.

Tokuda concludes with a doxology which is interesting because of the discreet apportioning of veneration between Stalin and Mao Tse-tung.

Reviewing the activity of the Japanese Communist Party during these thirty years we are particularly aware of the need to arm our Party with the theory of Marxism-Leninism and unswervingly to follow the guiding ideas of Joseph Vissarionovich Stalin, the great leader and teacher of all working people and standard-bearer of peace. The ideas of Mao Tse-tung who applied Marxism-Leninism to the Chinese revolution and blazed a new pathway for China must also be our constant guide.

This formula leaves no doubt of the pre-eminence of Stalin as the prima donna of the world revolution, the leader and teacher of all working people everywhere. The achievement of Mao by contrast has been a local application of the Marxist-Leninist doctrine; nevertheless it is conceded that Japan can learn from this example as well as from the Russian.

The Quakers Take Stock

[BY A CORRESPONDENT]

THE Quakers have been sitting in judgment on themselves at Oxford. The conference marked the tercentenary of George Fox's vision on Pendle Hill and was attended by nine hundred representatives from yearly meetings in all parts of the non-Communist world (representatives from East Germany were hoped for till the last minute but failed to arrive). Half those present were Americans and they came to confess their guilt in participating in the privileges of the richest nation on earth. They were eager to learn from the under-privileged what penances they should perform.

The official theme of the conference was "What is the Vocation of Friends in the Modern World?" It might equally well have been, "What has happened to the Christian dynamic?" or even "Why are there no more visions?" Three hundred years ago the Quakers were taking the initiative in rousing the social conscience; they were thundering and making people quake. Now the initiative is in the hands of others, in the hands moreover of a materialist creed which yet seems to satisfy a spiritual as well as a material demand. The Quakers have been asking themselves how this could have happened to them and what should be done; and at Oxford they have had the benefit of advice from Friends who work in the borderlands between East and West. The attitude of Quakers towards the Communists is an ambivalent one. As pacifists they want to come to an understanding with them, even if unilateral disarmament is a prior condition; as philanthropists and social revolutionaries they want to be able to look on them as workers in the same field; but as seekers after primitive Christianity they must try to seize the initiative for their own faith.

The conference did much of its work in discussion groups that reported to the main meeting. Rather to the disappointment of some of the Friends, who wanted to emphasise the practical nature of Quaker work, the majority of representatives decided to concentrate on questions of faith. Not all were prepared to go the whole way with Professor Trueblood (of Earlham College, Indiana), who wanted them to be like the early Quakers, "strange people who alarmed their neighbours." But there is still strong reaction against the idea of proselytising; German, Norwegian and Swedish Friends, for example, called for a sound basis of quiet service before the use of "great words," or even the mention of Christianity. To this degree have Christian vocabulary and practice become suspect in Europe.

Two Approaches to Communism

This division between those who want to work in private and those who prefer dramatic strokes when the occasion offers also appeared in the discussion on East-West relations. Some think the best that can be done to reduce world tensions is to cultivate personal relations with different groups, including Communists; others want the Society to intervene at a higher level in international politics. The difference is between influence on individuals and pressure on governments; in either case Marx and Lenin must be carefully read, even at the risk (and the Americans made it clear that for them it was a serious risk) of being misunderstood, so that the Communist point of view should be thoroughly grasped.

The Quakers are refreshingly unafraid of the word Peace. But they have nothing very new to say about it. They are, of course, in favour of disarmament, either by agreement or unilaterally—the Finnish representative cited his country as an example to the world of a nation with a very small army living without fear on the boundaries of a great power. If only the tensions in the world were between, say, the original participants in the last war and between the former imperialist powers and their ex-colonies, the Quaker approach would stand a good chance of success in the present temper of the world. But the Quakers themselves realise that the conflict with Communism is rather different. What they have to suggest includes Indian mediation in Korea, the diversion of resources from rearmament in favour of economic aid for backward areas, and the development of a Christian dynamic as an alternative to Communism. But there is some strange thinking here. There seems to be an idea that if it is explained to the Communists that Christianity is really a revolutionary force that aims at overthrowing existing social forms and bringing equality to the under-privileged, then the Communists will be easier to get on with. The lack of a dynamic creed that seems applicable to the lives of the coolie or the peasant is certainly a handi-

cap in fighting the cold war; but the presence of one would intensify the struggle, which is presumably not what the Quakers want. When followers of two dynamic creeds meet they do not form a discussion group.

While the Friends have not yet contributed anything very original towards breaking the international deadlock, two main lessons have emerged from the discussions in Oxford that should be taken to heart. The first is that Christian (or, for that matter, democratic) countries need to set their own houses in order if their message is to carry any weight. To take one example, the Quakers, and particularly the Americans, are very much concerned about race relations. One of the discussion groups was devoted to that subject. There were representatives from the Deep South to put the case for gradualism, but there was very strong support for the view that white Friends should force the issue by refusing to allow negroes to be segregated from them. One embarrassment is that there are still a few Quakers' schools in America that practise discrimination. But the Quakers have already done more by personal example than perhaps any other group towards amending the perpetual insult that is offered to all coloured races by any and every assertion of white supremacy.

The second thing the Quakers have to teach is how to give graciously. Everyone nowadays supports the Colombo Plan, Point Four and so on, and some people talk as if the pouring of foreign capital and foreign technicians into under-developed areas will automatically immunise them to Red fever. But the Quaker emphasis is on the personal qualities and approach of the person on the spot who is giving aid, and this emphasis is surely right.

A Federal Belgium?

[BY A CORRESPONDENT]

Two Belgian MPs have begun an attempt to change the constitutional structure of their country. A similar attempt was made in 1947 but failed to "receive parliamentary consideration" because constitutional revisions in Belgium cannot take place during a regency. This time, M. Joseph Merlot (a Minister of State and President of the National Walloon Congress), and M. François Van Belle (a Deputy Speaker of the House) are not offering a fully elaborated plan in the draft proposal which they recently laid before the Lower House of Parliament. They simply state that the findings of an independent commission of inquiry—the *Centre Harmel*—which was set up to investigate the grievances of both the Walloon and Flemish communities, make it clear that the present political framework of the country is conducive to political and economic domination of the Walloons by the Flemings. They therefore suggest that three territorial units—Wallonia, Flanders, including Antwerp and Luxembourg and the Brussels area—should federate under a central Federal Parliament and Government.

The differences between the Flemish and Walloon communities are indeed real. Their ethical difference is evident enough; their demographic evolution is even more striking, for while Flanders is fertile Wallonia is probably the least prolific among the countries of Europe. Religious and philosophical outlooks also vary as do the political and social views of the two communities.

The Walloon provinces are economically and technically neglected because a majority of Flemish MPs not unnaturally vote a bigger slice of credits for their own region. In eighteen years, between 1920 and 1938, 1,700 million francs were spent on waterways development in Flanders as against only 314 million in Wallonia. The new tendency is obvious in the development of roads, aerodromes, railways and also in private capital investments in industry. Capital indeed has a tendency to move away from industrial Wallonia towards those regions where manpower is abundant and

cheap. The unbalance in demographic evolution together with the variance in religious views has also led to the Catholic Flemish majority voting massive subsidies for their own schools against the volcanic but helpless protests of free-thinking Walloons.

If the "proposal" of MM. Merlot and Van Belle is declared "receivable" by a simple majority vote in each Chamber, Parliament must then be dissolved and a new one elected within forty days; after that, each Chamber must sit on its own as a "Constituent Assembly" under the Head of the State and discuss and vote the points submitted for constitutional reform. To become law these reforms must gather two thirds of the voting strength in each House.

In theory, the debate must take place on the "points submitted for revision." In practice, however, the debate can range far and wide and all sorts of suggestions can be made and solutions offered. Among them it is very likely that the well-known "Plan for a Belgian Federation" elaborated during the war by a group of socialist lawyers would be brought forward.

"Community States"

This plan is based on the principle that "in Belgium the citizen has the right to be represented in the parliament of its 'community state' and that each 'community state' has the right to be represented in the Federal Parliament." The aim, of course, is to protect local interests and to render the Federal Parliament and administration as "unbiased as is humanly possible." Each of the three constituent states would have its own parliament—the Lower House would be the legislative body while the State Senate would act only in a consultative capacity. Each state would also have its own government headed by a Governor General appointed by the Federal Government.

The Federal Parliament would also have two Houses: the National Council made up of members drawn from the States' Lower Houses; and the States Council with members "appointed" by the States' Lower Houses. The Lower House would be representative of the nation's citizens and its membership would therefore be proportionate to the numerical importance of each state: 45 members for each of Wallonia and Flanders and 15 for Brussels. The latter would be representative of the states and responsible for keeping a "healthy balance" between their interests; it would thus contain an equal number—fifteen—of representatives of each state.

The plan defines clearly the powers to be assumed by the Federal and State Governments. The former would be responsible for "international relations, Federal finances, the armed forces, the national currency, colonial administration, transport and communications, commercial and penal law (and some aspects of civil law), questions of nationality, emigration and immigration." The latter would deal with education "at all degrees"; social and industrial legislation (thus leaving the door open of course to nationalisation in a socialist Wallonia), economic legislation, agriculture, public works, popular education, health, religious matters and police.

It can fairly be said—and has been said—that the system outlined in this plan, which preserves the monarchy as head of the state, could be a source of satisfaction to all concerned. It would receive the support of the Socialist Party (despite the known opposition of some of its Brussels and Flemish leaders—among them, M. Spaak) and of all the Walloon federations of the Liberal Party. (What the Flemish liberals would do is an open question. They are known to be reluctant to support a system which would "drown them in the sea of a Social Christian Flanders.") But MM. Merlot's and Van Belle's proposal is unlikely to come to anything, because the majority party, the Social Christians, are certain to oppose it. For one thing, they are determined to avoid elections at all cost; and for another, they see in the proposal a first step towards the complete secession of Flanders and Wallonia.

Look up

Look down

... you see **DURALUMIN**

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of re-armament are satisfied. Our development department will advise, entirely without obligation.

The Reserves: Balance or Snatch?

IT was reported from Helsinki that the best of the British weight-lifters, after establishing a new record at snatching and doing better than most of his predecessors at pressing, failed altogether with his three attempts at the jerk. His was a cautionary tale that will strike a sympathetic echo in Whitehall. There may now be some grounds for believing that Mr Butler's monetary and fiscal policy has sufficed to snatch Britain from the depths of the crisis in which it was engulfed when the present Government took office; and the sorry inadequacies of last week's debate should not obscure the fact that the degree of disinflationary pressure stemming from that policy—although insufficient in a world of mounting foreign competition—is greater than any previous postwar government might have dared to allow. But there is as yet no sign at all that the latest balance of payments crisis, any more than the two postwar crises that preceded it, will be followed by the convulsive jerk that is needed to get the country out of the rut that will lead—inexorably and incontinently—to another crisis when American buying next turns down.

It is against this background that the first of the Treasury's new monthly statements about the level of the gold reserves must be judged. The jerk has been delayed—at best until after the Commonwealth conference in November, at worst until after the next crisis (or perhaps the next but one). All that last week's figures illustrate is the progress of the snatch. In this very limited perspective, they are reasonably heartening. They show that the sterling area's gold and dollar reserves rose again in July, for the third month in succession. During the month \$23 million of gold was lost to Europe and \$7 million to other non-sterling countries, but these losses were more than offset by receipts of \$61 million of American aid. In consequence the reserves increased from \$1,685 million to \$1,716 million, which is \$16 million above their level just before the budget.

The implication of these figures is that the recovery which set in after the budget, and which was heavily fortified by non-recurring receipts in the spring and early summer, has since been maintained, though not notably strengthened. As the accompanying table shows, the main improvement has been in the sterling area's dollar deficit outside EPU—that is to say in its net dollar payments to non-European countries, after taking credit for receipts of newly mined sterling area gold. Gold losses in this sector amounted to \$224 million in January and to \$172 million in February; in March they fell abruptly to \$21 million and—despite a temporary increase to \$41 million in June—they have since remained within manageable proportions. Throughout the last five months these accounts have undoubtedly derived some support from the decline in outstanding foreign credits, following the Bank of England's door-slammings directive in March, and from exceptional sales of raw materials to the American stockpile. The expiry of most of the credits concerned and the completion of the tin agreement may

combine with seasonal factors to restrict any further improvement in this sector in the next few weeks, but there is no real reason to fear that they will turn the tide of recovery back to full ebb.

In EPU the prospect is less satisfactory. After touching \$94 million in February, the sterling area's monthly gold loss to Europe remained obstinately stable at between \$45 and \$51 million a month from March to June. It fell to \$23 million in July, thanks wholly to advance receipts of \$25 million on the Anglo-Belgian arms contract, but the payment to be made in the middle of August will rise to \$99 million. The transfers made to EPU in the middle of each month, it may be repeated, are determined by the sterling area's deficit with Europe in the month preceding. The sharp rise in this deficit to \$99 million in July was due partly to a bonus payment to Denmark under the Anglo-Danish bacon agreement, partly to annual capital transfers to Holland after the completion of the financial years of the Shell and Unilever groups, and partly to adverse but customary

seasonal influences. It will be seen from Chart I that the sterling area's balance of payments with Europe always tends to be unfavourable in July; in each year except 1951 it has tended to recover thereafter—at any rate from August onwards. The Government is confident that this autumnal recovery will occur again this year; together with the latest import cuts, this may suffice to bring the accounts back to balance by the time of the December or January settlement.

The third factor that has staunched the gold drain in the past three months, in conjunction with the improvement in the EPU accounts and in net dollar payments to other countries, has been the increased flow of American aid. Receipts of Mutual Security dollars were negligible in the first three months of 1952; they then rose swiftly to a peak of \$95 million in June and are likely to come in throughout the next six months at an average rate of rather over \$50 million a month. Britain still has about \$75 million of the congressional appropriation for 1951-52 on which to draw, together with \$100 million already allotted to it from the appropriation for 1952-53; if the

£30 million saved on floors

In response to a question as to the saving in softwood imports as a result of the Government regulations requiring solid ground floors, THE RIGHT HONOURABLE DAVID ECCLES replied:

"Approximately 300,000 standards of softwood, the current value of which would be nearly £30 million, have been saved since the use of softwood suspension floors was stopped in 1946."

In response to a question to the Parliamentary Secretary to the Ministry of Works as to what relative figures the Building Research Station has of heat loss as between solid floors in dwelling houses and traditional wood suspension floors, Mr. Molson replied:

"The generally accepted value of the coefficient of heat transmittance through solid floors on the ground is of the order of .15 to .20; that through suspended timber floors is of the order of .35 to .40. This means that heat passes more readily through a suspended timber floor than it does through an 11 inch unventilated cavity brick wall, while it passes less easily through a solid floor on the ground than it does through such a wall."

Solid floors with thermo-plastic tile coverings save imports, save fuel and save money. Information regarding the various types of thermo-plastic tile and their advantages in house building and industry is available on request.

rough estimates made by a spokesman of the United States Administration before a congressional committee some weeks ago are a guide to Washington's present intentions, Britain may expect another allotment of about \$270 million from this 1952-53 appropriation later in the fiscal year, together with the last \$9 million bespoken under the Katz-Gaitskell agreement of 1950 (under which ECA agreed to compensate Britain for the use in EPU of accumulated European sterling balances). In the year to June, 1953, as a whole, therefore, Britain may receive about \$515 million of American aid (excluding American purchases of military equipment, but including the \$24 million of Mutual Security aid and \$37 million of Katz-Gaitskell money received in July). The Chancellor apparently expects to draw about \$320 million of this projected \$515 million before the end of 1952.

If all these forecasts are fulfilled, the gold reserve should either be maintained or, more probably, continue to rise slightly in the next five months (despite a possible temporary setback in the current month itself). On present prospects, however, any such recovery in the reserve will be achieved only by dependence on American aid and on extensive import cuts by Britain and the Dominions. The dominant question before this country is whether this cut-back in imports will reduce supplies far below the level of domestic demand. If it does, the consequent increase of inflationary pressure is likely to

impede any sensible re-alignment of the country's effort and drag off into the home market resources that should be devoted to an expansion of exports; in other words, success at the snatch may only be achieved at the expense of failure in Britain's third attempt at the jerk.

Unfortunately, the available evidence on this prospect is very slight, and it was presented in a confusing way by Government spokesmen in last week's debate. Mr Butler's statement made it clear that the Treasury hopes to cut Britain's deficit with the non-sterling world from £275 million in the first half of 1952 to about £115 million in the second half. Figures presented later in the debate by the President of the Board of Trade suggested that imports may fall between the two half-years by nearly £50 million a month on a c.i.f. basis—or, say, rather over £40 million a month on a truer balance of payments reckoning. Most of these cuts will presumably fall on non-sterling imports. Compared with the present rate of non-sterling imports (about £200 million a month) this is a very heavy cut indeed, and it does not suggest that the authorities expect any notable increase in non-sterling exports in the second half of the year—despite the signs of an upturn in American and Canadian demand and the prospect for increased sales of arms to America, Canada and Europe.

Exports to the sterling area, on the other hand, will almost certainly be much smaller in the second

half of the year than in the first. In part, this may be an inevitable consequence of sterling area import cuts; but the Government seems to have extracted a dubious virtue from harsh necessity by writing in the expected decline in exports (and the consequent expected increase in available supplies for the home market) as an integral part of its disinflationary policy. Mr Butler's statement last week did not make it clear how much relief he expected from this reduction of unrequited exports to the sterling area in the current half-year; indeed, he managed to create needless obscurity about the size of those unrequited exports in the half-year just past. If his phrase "excluding American aid" means "excluding the imports paid for by American aid" then Britain's surplus with the sterling area in the first half of 1952 was "substantially" more than £125 million; if it means "excluding aid receipts from total receipts" then that surplus was substantially more than £200 million. It is now believed that the latter reading is in fact correct; and that Britain's surplus with the sterling area in the past half-year apparently soared well above the previous record surplus of £171 million in the second half of 1951. Since Mr Butler declared that he hopes that Britain will be "at least in balance" with the world as a whole in the second half of 1952 (compared with a deficit now estimated at under £75 million in the first half-year), the implication is that while the deficit with the non-sterling world is falling by anything up to £160 million in the current six months, the surplus with the sterling area may fall by up to £100 million.

A final question mark hangs over the trend of invisible receipts. Mr Butler's statement last week that Britain's overall deficit in the first half of 1952 is now estimated at under £75 million compares with earlier unofficial estimates of a deficit of over £100 million. This suggests either that the value of imports recorded in the trade

returns have included a much bigger proportion of shipping and insurance charges payable to British interests than is usual, or else that invisible receipts in the past six months have been considerably more than half of the £270 million odd that the Economic Survey had forecast for 1952 as a whole. It is known that a larger share of world trade has recently been carried in British bottoms; but official comments have suggested that other invisible receipts have not been substantially above estimate, although they have probably been well up to it. It is possible, however, that the Government always expected to run a bigger invisible surplus in the first than in the second half of 1952. This would be in accordance with the trend shown in 1951, when the invisible surplus was £135 million greater in the first half of the year than in the second; in the second half of 1950 (a peak period of post-Korean boom) the invisible surplus was £46 million greater than in the previous six months, but that was before Britain was obliged to pay out £40 million each December as interest on the American loan, and before Persian oil was lost.

These figures provide grounds for hope that Britain is now holding tolerably well to the course charted at budget time, and that it may ride without great difficulty over the current and customary seasonal squall. Indeed, since there are signs that invisible earnings (especially in the oil accounts) are now gradually improving, the short-term objectives set out in the Economic Survey for 1952 as a whole might conceivably be surpassed. But only the short-sighted will suppose that the present series of desperate expedients—postponement of essential imports, releases to the home market of frustrated exports, and extravagant drafts on the limited supply of American aid—can provide anything more than a temporary passage over the hump. And short-sightedness is dangerous for a nation on a trapdoor.

Reinsurance at Work

INSURERS are themselves the biggest insurers of all. By means of reinsurance they may lay off a part—often a large part—of a risk in any branch of their business, national or international. Reinsurance is as old as insurance itself; without the world-wide facilities for spreading large risks the services offered by all insurers would be severely curtailed. The United Kingdom has since the war attained a lead in reinsurance to match its dominating position in direct insurance.

Reinsurance is not a device for passing on hazardous risks to others and obliging a client at the reinsurer's expense. The real purpose of reinsurance is to stabilise the experience of each office as much as possible, avoiding unduly favourable results in some years and extremely unfavourable ones in others. The successful conduct of the business of insurance depends upon a limit being set to the amount at risk under any one insurance and the spread of the business upon the books of the insurer. This transfer of business between insurers by reinsurance cannot be measured. Insurance accounting in this country is modelled on the forms laid down in the Assurance Companies Acts, 1909-46; these provide that, for all classes of insurance, revenue account items are to

be entered net of reinsurance receipts and payments. No information about the volume of reinsurance business in relation to aggregate premiums received from or claims paid to the public is provided by any of the leading offices. One of the smaller companies, however, shows in its accounts that about 25 per cent of its gross fire and accident premium income was paid out to reinsurers. Perhaps in fire insurance, where reinsurance is most highly developed, reinsurance premiums paid may be of the order of one-half the gross premiums received from the public, but the proportion will vary for individual offices according to the composition of their business. In marine insurance, reinsurance occupies an important place, for an underwriter, whether at risk on the hull of a ship or not, is often offered insurances on different parts of its cargo by their respective owners that in the aggregate would involve him in an amount at risk greater than he is prepared to run.

Two methods of reinsurance, known as facultative and treaty reinsurance respectively, are in common use. (A third method, which involves the pooling by a number of insurers of the whole of a given type of risk, or of the surplus over a certain limit, is employed where the

hazard of the business is particularly great.) In the early days of the business, facultative reinsurance was the only method. Full details of each risk of which it is desired to reinsure part are submitted by the direct insurer to each prospective reinsurer. A reinsurer may accept as much of the business offered as he chooses (but only on the terms offered), or may decline the business altogether. Reinsurance business always tends to be less profitable as a class than direct insurance, because the smaller insurances that are wholly retained by the direct insurer are generally the most profitable. Reinsurers, therefore, like to retain as much control as possible over the business coming to them, and from the underwriter's point of view the facultative method is attractive to them. But in practice facultative reinsurance is cumbersome and expensive. Considerable delay is involved in submitting particulars of a large insurance to a succession of prospective reinsurers; meanwhile the client of the direct insurer cannot be granted cover until the whole of the reinsurance has been arranged. The facultative method has, therefore, been very largely displaced (except in life assurance) by treaty reinsurance.

Reinsurance by treaty is now by far the most highly developed method. It takes several forms—some of them ingenious adaptations of the basic types—under each of which the direct office is bound to give out and the reinsurer to accept all business falling within the treaty. Thus the system is automatic; cover can be given at once to the insured; and administrative costs are low. The reinsurer, however, has no power of selection over the business ceded to him; indeed he may not know the risks for which he is liable. That this system operates satisfactorily, as it does, testifies to the good faith between insurers themselves; in spite of the conscientious observance of the utmost good faith by direct insurers, however, reinsurers pay considerable attention to the experience and quality of management of those offices with which they conclude treaties. It is important to the direct office that its treaties should in the long run yield a profit to those who accept them; otherwise, reinsurers will sooner or later exercise their option to terminate the contract. As the price of stabilising his results, the direct reinsurer must be prepared to forgo part of the profits that would otherwise have accrued to himself; he must pay enough to the reinsurer to give the latter a modest profit in the long run. It is usual, on the other hand, for reinsurers to rebate a percentage of the profits under treaties to the ceding offices.

The most common form of treaty is the "surplus treaty," under which that part of any risk that exceeds the maximum amount that the direct insurer deems it prudent to retain at his own risk is reinsured. A treaty is arranged for a given number of "lines," each "line" being the amount retained by the direct insurer. For example, under a ten-line treaty a direct insurer prepared to retain £5,000 of an insurance at his own risk could immediately accept £55,000, of which £50,000 would be automatically reinsured under the treaty; if the retention were £500 no more than £5,500 could be accepted without making further reinsurance arrangements. The other important form of treaty is the "excess of loss" treaty. This type relieves the direct insurer of any loss under a given claim in excess of a fixed maximum amount. There may be an upper limit to the reinsurer's liability; the risk that a claim may cost more than this

amount must then either be reinsured under another treaty or carried at the risk of the direct insurer. This type of treaty eliminates the considerable volume of work that is entailed in apportioning premiums under surplus treaties in thousands of individual cases and in similarly apportioning and recovering losses from several different reinsurers. Excess of loss treaties are in accordance with the true function of reinsurance, which is to cut off the peaks and the troughs that would otherwise appear in the loss curve; with the increasing pressure to cut down costs of management they are likely to continue to gain in popularity over surplus treaties.

Since reinsurance is concerned with the widest possible distribution of risk by the reinsurer the business is international in scale—though some countries which have prohibited the placing of reinsurances abroad, or set up state reinsurance offices, most unwisely try to limit it. In most of the free reinsurance markets, British companies play a large part. For example, out of net premiums of \$125.9 million paid during 1949 by United States insurance companies for reinsurances ceded to foreign insurance companies, \$113.8 million, or just over 90 per cent, was paid to United Kingdom insurers. The next largest share, \$7.3 million, went to Switzerland. The lion's share of the reinsurance business passing in the opposite direction was also taken by the United Kingdom; British insurers paid \$7.8 million in premiums for reinsurances assumed by United States insurance companies out of a total of \$14.1 million paid to them by all foreign insurers.

During the war the sharp contraction in overseas reinsurance facilities made necessary the absorption on the home market of a much greater proportion of reinsurance business than had previously been thought wise. The results were much better than was anticipated and the wartime experience has therefore led to a permanent increase in the proportion of reinsurances; direct insurers now seek reinsurances on a scale they would never have contemplated before the war. There has also grown up a widespread demand for reciprocity by those giving out reinsurances; while on occasion reinsurers have themselves to reinsure—for example when they receive reinsurances of a given risk from various sources to an aggregate amount greater than it is prudent for them to retain at their own risk. As a result of the growth of reinsurance, the overseas income of the British insurance industry has undoubtedly been increased since the war; but as a corollary, a proportion of large losses, wherever they may occur, is virtually certain to fall on the British insurance market, and they may be especially large under excess of loss treaties. Whilst every effort is made to stabilise the experience of each insurer and reinsurer, insurers as a whole cannot protect themselves against catastrophes. One example of such a loss was the severe wind-storm that swept over the eastern United States in November, 1950, and involved British and American insurers (and their reinsurers in some other countries) in total losses estimated at some \$150 million. Again, the derisory profits of little more than half a million pounds secured by the leading offices last year from accident insurance out of a premium income of almost £200 million (compared with a profit of nearly £8 million in 1950 on a considerably smaller premium income was due to a worldwide upsurge in the cost of motor insurance claims.

Business Notes

Higher Stock Exchange Commissions

In recommending an increase in some, but by no means all, commissions on share transactions, and a reduction in the rebates allowed to agents participating in them, the Council of the Stock Exchange has followed the course most likely to ensure a willing acceptance of the changes it has proposed. The clearing banks, the most important agents in share dealings, were consulted on the proposed reduction in rebate rates before the council sent out its letter to stock exchange members this week; the banks were assured that since the reduced rate of rebates will apply to a higher scale of commissions, their total income should not be adversely affected. Stock exchange members will have up to August 30th to offer suggestions and criticisms on the rates proposed; as soon as practicable thereafter the new rates will be posted on the board at the House, but there will be a further lapse of time (probably until about mid-November) before they are finally confirmed.

As the present scale of commissions has remained practically unchanged for the last forty years while brokers' costs have been steadily increasing and turnover falling, customers of the "House" can hardly cavil at a reasonable adjustment, but the increases proposed have had to be pitched at a level that will not keep more investors out of the already under-populated market. For this reason the council has held out a special concession to the small investor by proposing that there should be no increase in charges on transactions of less than £100. At the other end of the scale, some, though not many, institutional investors may be protected by the recommendation that there should be no change in charges on transactions involving more than £50,000. A more important gesture to the institutions, however, is that no increase is proposed in the $\frac{1}{4}$ per cent commissions on transactions of over £10,000 in British Government and other gilt-edged stocks; below this limit commissions will be raised from $\frac{1}{4}$ to $\frac{1}{2}$ per cent. The £2,500 rule, under which the commission on any bargain above the £2,500 limit is reduced, will remain unchanged.

Subject to these blanket provisions, the council proposes a number of changes in the gradation of commission rates on shares of different market prices. Under these proposals, commissions on the lowest priced shares (up to the 2s. 6d. limit) will be reduced, while all shares of a price of over £10 will attract a flat commission of $\frac{1}{4}$ per cent in place of the present scale that ranges between 1s. 6d. on a share worth more than £10 to $\frac{1}{2}$ per cent on a share priced above £25. In the important middle range of 3s. 6d. to 50s. a series of new steps is proposed that will increase the cost of some transactions and leave others unchanged. Above this limit the rate of commission will be increased by about 25 per cent. In the case of registered stocks the proposed proportionate rate of increase is even higher since the present scale of commission ranging between $\frac{1}{4}$ and $\frac{1}{2}$ per cent will be replaced by a flat rate of $\frac{1}{4}$ per cent.

Effects on the House

Without a reduction in agents' rebates, the proposed increases in commission rates would not go far towards compensating stockbrokers for the steady increase in their expenses. The council proposes, however, that the rate of rebate to agents on the general register should be reduced from 25 to 20 per cent, and that allowed to agents on the Register of Banks from 33 $\frac{1}{3}$ to 25 per cent. At the same time, however, the trustee departments and companies of the banks would be moved from the general to the bank register; given the higher scale of commission on "packets" of gilt-edged stocks worth less than £10,000 the remuneration received by these departments should therefore increase.

There is no mention of the Public Trustee in the council's recommendations; presumably this body will remain on the general register and will receive a lower rate of rebate.

These proposals appear to be sufficiently carefully framed to avoid aggravation of the main problem before stockbrokers—the dearth of business in the "House." But they obviously do nothing to cure it. They are not likely to find a welcome among the issuing houses, who will feel that their work of creating stock exchange business deserved better recognition than a cut in rebates. Nor do they touch a fundamental issue of efficient security markets—the provision of adequate capital for jobbers. It is becoming increasingly clear that the council and the members of the stock exchange will have to make a more determined attempt to arouse and diffuse an interest in investment throughout Britain. If this is not forthcoming the increase in stockbrokers' commissions will do little to postpone the day when the number of stockbrokers will have to be reduced.

* * *

Bank Holiday New Issues

The time-honoured calm in the capital market over the August Bank Holiday was broken last week-end by the announcement of three new issues and by the news of the spectacular welcome given to the new Rugby Portland Cement debenture stock, in which dealings began on Tuesday at 22 premium. The most important of the new issues, the conversion loan issued by the City of Johannesburg, was pitched on terms that sought to make allowance both for the effects of dearer money and South African political malaise. In order to replace its 3 $\frac{1}{2}$ per cent inscribed stock maturing on September 1st, either by a direct exchange by the holders of the stock or by cash applications for any balance left unconverted, the City of Johannesburg had to offer £1 million of a 5 per cent redeemable stock, 1959-62, at 98. The yield to the latest redemption date was thus a few pence over 5 $\frac{1}{2}$ per cent. Hard on the heels of this issue came the details of an offer on behalf of the Nyasaland Government of a 4 $\frac{1}{2}$ per cent stock, 1971-78, at 98 $\frac{1}{2}$ per cent. The total amount of the new loan is £2,060,000, but £460,000 of this has already been placed; at the issue price of 98 $\frac{1}{2}$ the gross redemption yield to the latest date is 4.6 per cent. This longer dated trustee stock is obviously aimed at institutional investors.

A newcomer to the market is Technicolor, Ltd., the British subsidiary of the well-known American company whose trade name has now become part of the English language. This company, which has an issued equity capital of £780,450, is placing 310,000 of its 5s. ordinary shares in the market. As the total footage of film sold and profits earned by Technicolor, Ltd., have increased impressively in the last ten years, and as the company does not have to bear the direct financial risks associated with film production and distribution, the promise of an ordinary dividend of 17 $\frac{1}{2}$ per cent should be sufficient to allow dealings in the newly placed stock units to begin at around 11s.; at this price they would offer a yield of about 8 per cent. The attempt by Free State Geduld Mines to raise £5 million in new money in order to complete its shaft sinking and development programme may, however, receive a less cordial welcome from the market. The company hopes to raise £2,250,000 immediately by offering existing shareholders the right to take up one million 5s. reserve shares at 45s. each, in the ratio of one new share for every six held; it will then seek to raise the remaining £2,750,000 by October, 1953, through the grant of options to subscribers to the new shares to take up a further share at 55s. each. The 5s. equity shares in Free State Geduld were marked down 1s. 10 $\frac{1}{2}$ d. to 55s. on consideration of this offer.

Tin Loses a Prop

The tin market has been in a dismal mood this week; the spot price which stood at £961½ a ton at the end of July had slumped to £916 a ton by Wednesday. The reason for the gloom is that the British Government and the Reconstruction Finance Corporation (the official US buying agency) both appear to have withdrawn from the market. Last Friday the Secretary for Overseas Trade stated that purchases under the agreement with the United States were virtually complete. The agreement, which was made in January, provided that the British Government would sell 20,000 tons of tin this year to the United States at a fixed price of 118 cents a lb (£944 a ton). But these special American purchases are only part of the story. The RFC recently disclosed that its total purchases of tin this year amounted to 84,000 tons made up of 20,000 tons from the British Government, 19,000 tons from Indonesia, 8,000 tons from the Belgium Congo, 13,000 tons from Bolivian stocks and 24,000 tons from "other sources." It is generally believed that most of this 24,000 tons came from the Straits market under "shunting" operations, by which European merchants bought tin with cheap sterling and resold it for dollars. Although the result of these purchases with cheap sterling was a loss of dollars to the sterling area, they were an important factor supporting the market. Now they are likely to cease.

From the beginning of this month American importers have again been allowed to trade in tin; they may buy metal "at any price." The RFC retains the right to buy and sell tin at the American ceiling price of 121½ cents a lb (equivalent to 118 cents paid for Malayan tin). Thus, in effect 121½ cents a lb, after having been a floor price for the past six months, has now become a ceiling; American importers will be able to find customers for their metal only if they can offer it below this level. So far American traders are showing no inclination to buy even at much lower prices than this. Demand from the continent is also slack. It is not surprising, therefore, that the tin market should be feeling the loss of its floor so keenly.

Beyond the immediate future the prospects for tin are a little brighter. Commercial stocks in the United States are believed to be small and it seems unlikely that American traders will be able to remain out of the market for long. The use of tin is still controlled in the United States, but several restrictions have recently been lifted, and this may be the first stage towards restoring complete freedom to consumers.

Wholesalers Count Their Pennies

The wholesale textile trade has expressed its disappointment at the sharp fall in the value of sales in June. Its members do not yet appear to have adjusted their outlook to lower price levels; these inevitably result in their handling a smaller volume of money for a given turnover. A year ago, wholesalers were dealing in utility goods at the highest price levels ever reached, and they were in many cases working on fixed profit margins. This summer, they have been stocking cut-price textiles, many of them job lots for which manufacturers have been thankful to get almost any price, and ideas of fixed profit margins have gone overboard. The wholesale value of turnover of textiles in June was 32 per cent lower than in June last year, but the volume of trade cannot have shown a reduction of this order. In general, textile prices have not fallen by as much as 32 per cent, but the prices of many of the bargains sold this summer were cut by much more, and some factory stocks have been sold off at well below replacement cost. It does not necessarily follow that the full saving has been passed on to the consumer, but it has undoubtedly affected the value of the wholesale turnover.

The index of wholesale sales (1947 = 100) fell from 116 in May to 83 in June. In part this fall was seasonal, and not

specifically attributable to cuts in prices between May and June. When allowance has been made for the two influences, there was presumably a residue representing a real fall in business, and the centre of this secondary depression appears to be the sale of piece goods. Sales shared to only a small extent in the general textile revival that took place in the spring and early summer. In June they were still nearly 62 per cent lower than in June, 1951, when signs of a textile recession were already apparent. Stocks of piece goods have remained high; the index fell in June only 10 points to 250 compared with 283 in January. The fall in stocks of other goods has been much sharper; the index generally has dropped from 200 to 174, while stocks of men's and boys' cloths have dropped from as much as 312 to 272 in the same period. The figures may suggest that the fall in the prices of made-up clothing is at last leading to a reduction in the home dress-making that underwent a remarkable renaissance during and after the war.

Cut in Tobacco Imports

The authorities seem to have been somewhat coy about announcing the cut in this year's allocation of dollars for tobacco purchases. The cut in fact turns out to be no more than had been expected. Ten days ago, in reply to a question about the volume and value of imports from the dollar area this (calendar) year, the President of the Board of Trade said that they "are expected to amount to 103,500,000 lb—a reduction of 56 per cent on imports of 233,740,933 lb from these sources in 1951," and made no mention of value. He also did not refer to the fact that some 65 million lb of dollar tobacco had already arrived this year—31 million from Canada and 34 million lb from the United States. Presumably, therefore, imports for the rest of this year are not expected to exceed 38 million lb, compared with about 195 million lb in the second half of last year. Asked later in the week what cuts were to be made in the allocation of dollars for purchases of tobacco in 1952-53, Mr Thorneycroft stated that the allocation for purchases from the 1952 American and Canadian crops will be 23 per cent of the 1951 total. This appears to provide 33½ million US dollars and 4.9 million Canadian dollars. The dollar totals, being for a crop year, cannot be easily related to the calendar year import figures given above. At the current price of leaf tobacco, British manufacturers may obtain enough dollars to buy 80 to 90 million lb of American and Canadian tobacco. Sales from the current season's crop began in July, but as Britain's buying is concentrated on the autumn auctions, presumably only about half the purchases from the current crop will arrive before the end of 1952. This the Board of Trade has apparently assumed in arriving at a total weight of 103,500,000 lb for the calendar year.

Although the cut in the dollar allocation is severe, there will be no shortage of tobacco for British smokers this year. At the end of May, stocks of leaf were equivalent to about 2½ years' consumption. But tobacco requires about a year to mature and manufacturers are concerned that the sharp reduction in their buying now may lead to a shortage of matured leaf in eighteen months' time. To avoid this risk, British manufacturers have arranged to earmark supplies from this year's American crop that they do not at present have sufficient dollars to buy. They will have the option of concluding such purchases in 1953 from next year's allocation of dollars.

Consumption of tobacco in this country has been falling; in the first four months it amounted to 70 million lb compared with 75 million lb in the same period last year. Even so, it is doubtful whether imports will be sufficient to avoid some reduction in stocks this year. The Rhodesian crop, which is Britain's main source of non-dollar tobacco, is much smaller than was expected and it is doubtful whether Britain will get the 75 million lb of Rhodesian tobacco that had been

Announcement by

Anglo-Iranian Oil Company, Limited

In order that there should be no misunderstanding as to the scope and effect of the recent decision by the International Court of Justice in respect of the Persian oil dispute Anglo-Iranian Oil Company, Limited wishes to bring the following statement to the attention of all concerned:—

It has already been made clear that the decision of the International Court is not a decision on the merits of the case and that it does not in any way affect the Company's claim that the Persian Government has acted illegally towards the Company in Persia. The decision means simply that the International Court, which only has jurisdiction to the extent that individual states have either generally or in a particular case accepted the jurisdiction of the Court, has decided after considering the arguments advanced by both sides that it has no jurisdiction in this case.

The Company's title to crude oil and oil products derived or to be derived from the area of its operations in Persia is in no way affected by the decision. In attempting to deprive the Company of this title and appropriating to itself the Company's properties in Persia the Persian Government has acted in complete disregard of its solemn obligations to the Company and of the basic principle of the sanctity of contracts—a principle which is essential for the maintenance of the necessary confidence for the continued development of world trade.

In these circumstances the Company remains confident that no oil company of repute nor any tanker owners nor business men of standing will countenance any direct or indirect participation in the unlawful actions of the Persian Government. Should, however, any concerns or individuals participate directly or indirectly in transactions affecting the crude oil and refined products concerned this Company will take all such action as may be necessary to protect its rights in any country.

Sell to CANADA!

There is still room on the Canadian market for millions of dollars' worth of the right British goods. Canada's first and oldest Bank will be glad to offer valuable information and advice on trading conditions and opportunities.

Enquiries welcomed.

BANK OF MONTREAL

47 Threadneedle Street, London, E.C.2

Head Office: MONTREAL

Over 570 Branches throughout Canada

Assets Exceed \$2,000,000,000

(Incorporated in Canada in 1817 with Limited Liability)

Facts for the investor

In the first half of 1952:—

- 1 Ninety eight per cent of the loans approved by this Society were secured on private residential property.
- 2 These loans were well distributed geographically throughout the Society's eight administrative regions, viz:—

London Region.....	16%
Southern Region.....	16%
Western Region.....	13%
Midland Region.....	21%
N. Eastern Region.....	12%
N. Western Region.....	11%
Scotland.....	6%
N. Ireland.....	5%
- 3 The average amount loaned was £978.

These facts are evidence that when you invest your money in the Co-operative Permanent it not only serves the useful purpose of helping men and women to buy their own houses but is safeguarded by a wide geographical spread.

2½%
INCOME TAX PAID

Personal investments up to £5,000 earn 2½% income tax paid by the Society — equivalent to 4½% where the investor is liable for income tax at the full standard rate.

Assets at 31st December, 1951, £66,000,000.

sought this year. Imports from all sources may reach about 175-180 million lb but consumption is likely to total about 210 million lb for the year.

Pottery Free of Control

After a few weeks' experience of a home market quota system for decorated pottery, the Board of Trade has decided to remove all control from the industry. Licences had been granted for the sale of about £2.2 million worth of decorated "frustrated exports" and home quotas, varying from 12 to 20 per cent of individual companies' 1951 outputs, had been issued for roughly double this amount. These concessions were intended to ease the difficulties that the industry has encountered in the export markets, and in the Australian market particularly, but they could not meet the needs of individual companies that had been sending the greater part of their output to Australia and had specialised in catering for Australian taste in colour and decoration. Suggestions that some companies should be given bigger concessions than others have not been popular in the industry; yet the alternative to granting a big increase in some individual home quotas was to stand-off decorators at the affected potteries. The supply of decorators has been the limiting factor on pottery production since the war, and the industry fears that it would be hit at its most vulnerable point if decorators were lost to the local armament industries because of a temporary shortage of orders.

The Board of Trade seems fairly confident that freeing the home market will not lessen exports. The pottery industry has always been a big exporter, its capacity is far in excess of what the home market could ever absorb, and the slow rate at which even limited supplies of decorated ware have been selling recently suggests that manufacturers will not be tempted to divert more goods to the home market than the contraction in exports makes absolutely necessary. Exports during the first half of this year have been deceptively high, reaching £9.2 million compared with £7.6 million in the same period of 1951. The emerging picture is better shown by the sharp fall in shipments to Australia in June to £47,500 compared with £224,500 in June, 1951. Many companies had a considerable volume of orders outstanding, and as these are worked off, shipments are bound to fall. The opportunities now granted to the industry in the home market could well be used for experiment with new ideas to strengthen its power to meet competition from Japanese and the local North American potteries, its two most serious and its traditional competitors. Few will regret the end of the control, and with it the disappearance of the hideous crime, punishable by fines and imprisonment, of selling coloured cups and saucers at home.

Re-exports to EPU Countries

The Bank of England announced this week that it is prepared to consider applications by merchants resident in the United Kingdom, who wish to purchase certain raw materials from the dollar area for resale to European Payments Union countries. This new facility is intended to cover most raw materials except those that are still scarce enough to be subject to allocation by the International Materials Conference. The permissible sphere for such re-exports will include the overseas monetary areas of Belgium, France, Italy, the Netherlands and Portugal. This development should help the slowly reviving free commodity markets in Britain to recapture some of their former elbow room. Hitherto their transactions have been considerably curtailed by what is generally known in the City as the Bank of England's "league table"—that is, its list of non-sterling countries set out in

order of the hardness or desirability of their currencies. In general, the Bank of England has given permission for re-export trade to take place up, but not down, this list of countries. For example, it has for some time been permissible to import coffee from Brazil and sell it to Belgium, but not to import tobacco from the United States and re-export it to France.

This league table, which is never published, has changed considerably in recent times. The formation of the European Payments Union caused all members of the Union to be bracketed together, since all rank alike for the monthly compensation. More recently the exhaustion of the United Kingdom quota and the fact that any deficit with EPU must be paid wholly in gold has, temporarily at least, caused EPU currencies to be bracketed together with US and Canadian dollars. It is in the light of this situation that the relaxations announced by the Bank of England this week have to be read. As the Chancellor of the Exchequer ruefully admitted in a review of the balance of payments situation earlier this year, "alas, all currencies are now hard." If and when Britain reduces its cumulative deficit with EPU below the point of 100 per cent gold payments, the authorities will presumably examine these concessions again.

New Zealand Import Cuts

New Zealand's balance of payments is expected to show a substantial deficit this year. Drastic steps have now been taken to bring the account into balance in 1953. The New Zealand Reserve Bank announced this week that allocations of overseas exchange next year will not exceed 40 per cent of the total for 1950. Contracts for which import licences have already been allocated will be duly honoured, if the imports in question come from the sterling area. Licences for other imports will be issued only on the understanding that they carry no assurance that exchange will be provided. Allocations will be made only if the exchange is available. This decision on the part of the New Zealand authorities introduces a new and disturbing element into sterling area exchange control practice. Hitherto the basic rule has been that control is exercised through import licensing and that any import licence carries with it an automatic right to the exchange expenditure involved. It is to be hoped that the New Zealand precedent will find no imitators in the rest of the sterling area. There is no greater enemy of expanding trade or of amicable commercial relations than the arbitrary guillotine of exchange quotas which falls without warning and decapitates existing contracts and operations in course of shipment.

Report from Threadneedle Street

The report of the Bank of England for the year ended February 29, 1952, gives its usual purely factual review of financial events, and adds its customary mite of new information on the use of transferable sterling. In 1951, the Bank reports, there was a substantial increase in the amount of sterling transferred between countries outside the sterling area, both under the automatic facilities and under the administrative facilities available at the Bank of England. Excluding sterling moved into and out of American accounts, the sums transferred, in terms of £ million, were:

Year ended Dec. 31st	1948	1949	1950	1951
Automatic facilities	88	144	143	241
Administrative facilities....	152	125	155	222
	240	269	298	463

These figures are a remarkable token of the increasing use of sterling in international trade despite the shocks to confidence in the currency during 1951.

The report is accompanied by its now customary supplement on United Kingdom overseas investments. The latest figures cover the year 1950, and show that the nominal value of these overseas investments fell from £2,038 million to £2,020 million in that year. The distribution of this capital and the comparison with the years 1949 and 1938 are shown in the following table (all figures in £ million):

	Nominal Capital Value			Income		
	End 1938	End 1949	End 1950	1938	1949	1950
Govt. and municipal loans...	1,521	795	785	55.1	21.1	20.6
U.K. companies:—						
Share capital	817	590	587	48.6	55.0	72.8
Loan capital	367	106	106	11.4	3.1	2.7
Overseas companies:—						
Share capital	473	373	374	29.3	33.1	41.5
Loan capital	368	174	168	11.0	4.0	4.2
Commonwealth countries....	1,998	1,133	1,134	102.7	74.1	90.5
Foreign countries	1,422	775	751	35.2	26.5	32.1
Not classifiable by area....	126	131	134	17.5	15.7	19.3
TOTAL	3,545	2,038	2,020	155.4	116.4	141.8

It should be emphasised that the fact that these figures exclude direct (as distinct from portfolio) investments and show only nominal (as distinct from market) values makes them a somewhat misleading guide to the true change in British investments overseas. In his recent book on *The Sterling Area* (Macmillan, 192 pp. 16s.), Mr A. R. Conan estimated that the total value of British overseas investments in 1949-50 was probably about £4,200 million, compared with £4,500 million in 1938. Even in the portfolio investments themselves, as the table shows, the decline in interest and dividends received has been much less than the fall in nominal values since pre-war days might imply. The appreciable jump in the income between 1949 and 1950 was due to higher dividends on the equity capital held overseas and can in part be attributed to the rise in commodity prices and the consequent profits made in the course of 1950. The comparatively high proportion of commodity shares in total British portfolio investments tends to lend support to the British balance of payments just when it is most needed—namely when the terms of trade have turned against this country.

David and Goliath Airborne

The terms of reference of the reorganised Air Transport Advisory Council throw out a challenge to the independent air transport industry that the latter may well feel to be a little one-sided. First and second class services on existing routes are reserved for the two nationalised corporations; the Council's authority is to make recommendations to the Minister on proposals for any type of service on a new route and for the new "colonial coach" and some freight services on existing routes. It will hear such proposals from any applicant, nationalised or independent, that appears fit to operate the new services for which permission is sought. An interesting and unexpected innovation is that applications for new helicopter services will be considered regardless of whether a fixed-wing service is already operated on the same route.

Had there been a robust independent air transport industry clamouring for room for expansion as there is in the United States, here would be its opportunity. But the independent operators of this country in the main are not financially strong and they lack the resources to enable them to go pioneering into the colonial empire unless a new route offers the prospect of immediate profit. Air transport is not an industry characterised by quick returns, and this characteristic, rather than any lack of competitive opportunity, may be the explanation for any failure of competition to

materialise. On the other hand, the joint venture of two companies, Hunting and Airwork, in a colonial coach service to Nairobi shows that even with limited resources of money and aircraft, the independent operators are in some cases able to take immediate advantage of the government's new concessions. The cautious reaction of BOAC to the new Nairobi service suggests that these concessions are not quite as meaningless as the independent industry sometimes suggests. These colonial coach services are not, however, to be reserved to independent operators, and there may be some interesting developments if the corporation should develop the urge to start them too.

The principal grounds of complaint that the independents have against the terms of reference under which the Air Transport Advisory Council will work is that in all cases applications from the corporations are put on an equal footing with theirs, whether for new routes, or for cheaper services, for inclusive holiday tours, for freight or for helicopters. David has beaten Goliath before, but this did not make the contest any the less unequal, and the independent operators had hopes that certain routes and services would be reserved for them. The ATAC has been given no instructions on how to decide between an application from a corporation and from an independent for the same service. It will indeed be difficult for it to give a precise meaning to equal opportunity and fair competition.

Helicopters on Show

Trial helicopter landings made on the South Bank last week were intended to show whether the noise at the proposed helicopter landing site would contribute an intolerable addition to the cacophony of existing traffic in the district. But they marked a stage in the development of helicopter services, less dramatic, perhaps, than the operations in Korea where multi-seat helicopters have recently evacuated a complete battalion and its equipment from an untenable position, but nevertheless of real significance. The two examples, indeed, are typical of the differences in the British and American attitude towards helicopters; work in this country has proceeded almost exclusively on civil lines, while in the United States helicopter development has been almost wholly military.

Each approach must tend to give lop-sided stimulus to the work of companies engaged in developing and building helicopters for their home market. In the United States, the marines show particular enthusiasm over the potentialities of helicopters for moving troops and equipment on terrain that cannot be crossed by conventional transport. Big production orders have therefore been placed for multi-seat helicopters; 10-12 seat machines are being delivered and larger ones are under construction. These, however, are single-engined machines, and therefore are not suitable for inter-city civilian services where a minimum of two engines is needed to eliminate any risk of forced landings in built-up areas.

Whereas there has been little or no civil helicopter development in the United States, in this country British European Airways has already operated the world's first helicopter passenger service. The corporation is now waiting to see how the twin-engined 10-12 seat helicopter built by the Bristol Aeroplane Company will shape. This machine will almost certainly be too small for economic operation, but it should provide a useful intermediate machine with which to develop inter-city services until the 40-50 seat helicopters, for which BEA has issued specifications, have been developed. BEA itself, however, can hardly provide the helicopter industry with enough orders to sustain large-scale, and therefore low cost, production of such machines. Manufacturers will also need some assurance of a military market and this is unlikely to materialise so long as the attitude prevails of regarding the helicopter as a flying jeep, which must be as economic as a jeep before money can be spent on it.

NEWS FROM THE FISHING INDUSTRY

Making no bones about it!

Have you ever considered the economics of cutting, filleting or processing? Did you know, for instance, that more than half the weight of a fish is made up of head, tail, bones, etc.? Thus it takes more than 2 lb. of whole fish to produce 1 lb. of fillet. In terms of price, fillets from a whole fish that sells for 4½d. per lb. on the quay-side will cost about 10d. per lb.

This however is still the quay-side price. It does not cover the additional expenses that must be incurred before the fillets reach the housewife's shopping basket. Labour, boxes (now 5 times their pre-war price) and ice must be paid for. Heavy transport charges raise the bill still further. Finally, the wholesaler and retailer are entitled to reasonable profit margins. Thus the price of 4½d. for whole fish at the ship becomes about 1½d. for fillets at the shop.

What prospects are there of cheaper fish in the future? The discovery of new fishing grounds; the invention of scientific instruments to locate the fish; the commissioning of new and faster trawlers; improved cold-storage facilities—all these will help in time, and the Fishing Industry is doing all it can to speed the day.

British trawlers know their job!

Issued by the British Trawlers' Federation Limited

Business any better?

No. Frankly I'm worried
Could it be your advertising that's at fault?
Everyone says our new scheme is very good and we're spending more on space than ever
In what papers?
Oh, all the usual ones.
How often do you go in the Daily Mirror?
I don't go in it at all. I dislike it intensely
So do quite a lot of people. But more than four million, four hundred thousand people like it very much. That's how many buy it every day. Quite a potential market, isn't it?
I suppose so
Now come on, be honest with yourself. Do you really believe that in these hard times you can afford to ignore

millions of possible customers because you don't like the newspaper they read?

I suppose not
That's better. And I might mention that space in the Daily Mirror, on a square inch per thousand basis, works out cheaper than that of any other national daily Really?
Really. Now what about you giving me a tip. What do you fancy for the next race?

DAILY MIRROR

HIGHEST DAILY NET SALE IN THE WORLD

We've solved some problems in our time!

TIME—1939: PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means? Every available mine-sweeping trawler must be fitted at once with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an 'electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country—if not in the world—is at industry's service always: ready at any time to tackle another problem.

Steel Planning and Coke

For some months, coke supplies have been a source of particular anxiety to the steel industry, and the plans for further expansion that the industry is now propounding suggest that this shortage may last for several years. The whole of the planned increase in steel output—from 16 million ingot tons a year to 20 million tons—is to be based upon pig iron. Eventually this means a pig iron output of about 15 million tons a year, compared with about 10½ million tons now; and that in its turn would need nearly 5 million tons more coke a year. In 1951 the iron and steel industries used about 10½ million tons of coke to make 9.7 million tons of iron; about two-thirds of this coke came from coal carbonised in the steel industry's own coke ovens, and the remainder from the National Coal Board, independent coke oven operators, and the Beckton gas works. Fuel efficiency in the blast furnace has been increasing, and the production of steelmaking iron, up to 1951, was rising faster than the consumption of coke used in making it. But since last year the need to use much more low-grade home ore has once again increased the average amount of coke consumed in making a ton of iron.

The steel industry has relied upon its own resources to provide almost all the extra coke it has needed since the war. Since 1948 production of coke in ovens owned by the steel industry has risen by about 20 per cent; it now almost equals production in other ovens, which has risen by no more than 2 per cent. To support its further expansion the industry is still planning to provide almost all the extra coking capacity itself; but this policy cannot insulate it from dependence upon outside suppliers. The Coal Board and other outside suppliers have recently stoutly maintained that they are fulfilling all undertakings for the supply of coke that they entered into with the steel industry, and they have suggested that the steel makers should take their case for more hard coke to the Ministry of Fuel and Power. But on the further question of the maintenance of coking capacity, they may be more vulnerable. In recent months, the Coal Board has been order-

	Coke deliveries to Blast Furnaces			Consumption in making Basic and Hematite Iron (used in Steelmaking)

ing new coke ovens faster than for some years; but it is not yet clear that it has attained a sufficient rate of new building to keep its full capacity in being, still less to provide for any general expansion in the supply of smokeless fuels. Moreover, coke supplies depend finally upon supplies of coking coal; and the steel industry alone will need some 7 million tons of this coal a year to support an annual steel production of 20 million tons. Reserves of the best coals for this purpose are limited; and even after the recent adjustment of coal prices to take account of quality, some of the mines producing these coals are still operating at a loss. The steel industry and the Coal Board are now discussing together the expansion of output of coking coals. But the prospect remains that in the future British blast furnace operators will probably have to accept a proportion of coal of lower grades than in earlier years.

New Methods for Blast Furnaces

Most British iron and steel makers are only now needing to consider seriously the technical problems of smelting iron with fuels other than the best coking coals; abroad, such techniques are more familiar. The blending of strongly-coking with lower-grade coals to make coke is already accepted in Britain to some degree; it is significant that John Summers, a company that is now extending its steelworks at Shotton backwards into pig iron production, has incorporated most elaborate blending arrangements in its coal handling plant. But better methods of making coke from less promising coals, and of preparing the low-grade home ores, should enable Britain to maintain its iron production upon the orthodox lines of smelting with coke. For this reason Britain is collaborating rather less actively than other European steel-producing countries in research into the other forms of smelting associated with the "low-shaft furnace."

The very high efficiency of the normal blast furnace is attained largely by the use of a high stack that gives the rising gases time to yield heat and to take part in the chemical reactions of reducing the ore; but the great weight of materials inside this high stack demands ore and fuel that are hard, porous and mechanically strong. In low-shaft ovens the object is to make the gases do their work in so short a furnace that the weight of burden is reduced and much weaker fuels and ores can be used. The most familiar of these furnaces is the electric furnace, used for smelting iron and ferro-alloys in such areas as Scandinavia, where hydro-electric power is cheap. Blast furnaces with a low stack may offer a more practicable alternative to countries without sufficient coking coal or hydro-power. One such furnace is now being prepared at Liege in Belgium on behalf of OEEC, and should be operating by the end of this year. Its height, in relation to the diameter of its hearth, will be only half the normal. This blast furnace is designed for eventual operation with an oxygen-enriched blast; oxygen will be added to the air blast to increase the temperature of combustion and reduce the volume of gases needed to reduce the iron. Another method has already been tried at a works in Cologne; the ore, fuel and flux are powdered and pressed into briquettes before being charged into a low-shaft furnace, and this closeness of contact between the reacting materials obviates the need for a long journey down the furnace stack. Neither method has yet been proved commercially; but both offer the possibility of considerable advantages, not least in capital cost of the blast furnace. If the low-shaft blast furnace turns out to be an economic proposition, it would be far more widely applicable than the electric iron furnace and, in addition, it would provide considerably larger quantities of by-product gas.

Principle in Price Fixing

In its third report of the session 1951-52, published last week, the Committee of Public Accounts returns to a controversy with the Ministry of Supply and the Treasury that has vexed it on several occasions since the war. This concerns the prices paid by Government departments for iron and steel products. Since the war the Government has in fact paid the maximum controlled prices—fixed by the Minister of Supply—for its purchases. The Committee has the power to scrutinise the prices paid by Government departments for their purchases; and it contends that unless and until there is any real price competition in tenders, the Comptroller and Auditor General should have access to all the information upon which the contract prices—and therefore the maximum control prices—are based.

The Ministry has in fact not supplied the Comptroller and Auditor General with this information regarding prices paid for iron and steel products since 1946; and the Treasury still

supports it in refusing to do so. The Treasury argues that since the Minister of Supply, in fixing the prices, has the duty of ensuring that the consumer does not pay an exorbitant price for them, the Committee should accept prices so fixed as fair. Its view has always been that since purchases of steel by the Government form, in general, a small proportion of steel output, the Committee of Public Accounts should not look behind the prices that the departments pay, as these are the same as the prices paid by any consumer of steel. For the Committee to examine and perhaps criticise these prices, the Treasury holds, would be to give Government departments an unfair advantage in comparison with private consumers who have to pay the same price. The Committee's scrutiny, though carried out in relation to Government purchases, would in fact call in question the whole basis upon which maximum prices were fixed; and Parliament has made no provision for investigating methods of price control for the country as a whole.

The Committee remains unconvinced. If there is no effective competition on prices, it still believes it ought to be enabled to judge whether the prices paid are fair and reasonable; and it does not agree that the exercise of this normal function of price scrutiny should be unfair to other purchasers. Further consultations between the Comptroller and Auditor General and the Ministry have been promised; and the Ministry has furnished information showing the general basis of price fixing. This will, presumably, be published later; in its current report the Committee remarks only that at the end of 1951 the prices being paid appeared to yield a return on capital of the order of 6½ per cent.

* * *

Revised Production Index

The Central Statistical Office has not yet provided full details of the methods used in preparing the new index of industrial production that it produced, as a successor to the old "interim index," this week. In general, this is a revision of the old index, which weighted the importance of the industries concerned according to estimates based originally on the 1935 Census of Production, so that it will in future be weighted on the basis of the 1948 Census. In the new index the weight given to the building and contracting industries has been increased, and that given to public utilities considerably reduced, while mining and manufacturing have been slightly reduced in importance. Within manufacturing, which is now almost exactly three-quarters of the total, textiles and paper and printing have a larger share than before, while chemicals and the metals-engineering and vehicles group have a smaller weight. This metal-using group now accounts for rather more than a third of the full index; inside it, vehicles and engineering are weighted slightly lower than before. Apart from the reweighting, a larger number of production series have been incorporated to measure monthly changes in output, more reliable figures of price changes are now available to enable value series to be put into volume terms, and there have been certain other refinements.

So far, the monthly figures have been carried back only to 1950 and annual figures back to 1948, but annual figures for earlier postwar years will be published later. The new total index suggests a greater growth in production since 1948 than the old index implied. The component indices show more variation; the new index for engineering, shipbuilding and electrical goods rises more rapidly (largely as a result of additional production series), while the vehicle index rises less rapidly (owing to its diminished weight).

	Old Index	New Index
1948	100.0	100.0
1949	106.4	106.8
1950	113.5	116.2
1951	117.3	119.6
1952 (first quarter)	120.2	122.3

Monthly figures, issued on the new basis, put production in May at 118 compared with 111 for April and with 116 for

May, 1951. On information so far received, the index for June—in which Whitsun fell—seems likely to be 109-110, compared with 122 in June, 1951, when there was no holiday.

Shorter Notes

The news that France, like Britain, showed a deterioration in its EPU position in July—it had a deficit of about \$5 million compared with a surplus of \$22 million in June—has combined with the further rise in French wholesale prices to undermine confidence in the franc this week. On the Paris market the kilo of fine gold had risen in price from Frs. 506,000 to Frs. 524,000 by Wednesday evening; the price of the 20-franc gold piece had again reached the neighbourhood of Frs. 4,000 and would have gone beyond it but for the special intervention of the Bank of France.

*

Under a new Treasury order certain radio relay equipment and loudspeakers for use with radio sets will in future bear purchase tax at the same 66½ per cent rate as ordinary radio receivers. Removal of this anomaly is of little practical importance, since sound relay systems, which today serve about a million subscribers, have probably passed their stage of major expansion. Viewing equipment for the new and still experimental relay television systems, which offer the most promising field for development of the relay industry, is already liable to tax. The second provision in the order would appear to bring loudspeakers into the small group of radio components liable to purchase tax, which so far includes only valves and cathode ray tubes.

*

Lancashire spinners and cotton merchants have now received from the Ministry of Materials details of the procedure for importing cotton on private account after September 1st. These arrangements may be modified in the light of experience. No limits are placed on the import of cotton from the sterling area, but spinners will be allowed to import non-sterling cotton only to the limit of the entitlements. Merchants acting on behalf of foreign shippers may, however, import non-dollar cotton "on consignment." By this means they will be able to import such cotton freely and foreign currency will not be needed until the cotton is finally sold.

*

Since the Notification of Vacancies Order—which channels all workers changing their jobs through the employment exchanges—came into force at the end of February, the number of men and women placed by the exchanges has nearly doubled. Placings in "first preference" work—employment on defence and exports of particular importance—have more than doubled in number. These Ministry figures do not accurately measure the efficacy of the order, since many workers may have been entering these jobs on their own initiative before the order came into force; but they indicate that it is assisting in easing some of the labour difficulties of the switch to defence and export work in the engineering industries.

*

The Agricultural Mortgage Corporation has raised its interest rate for new loans from 5½ per cent to 6 per cent. The last increase in rates, from 4½ per cent to 5½ per cent, was made in February.

*

The Cable and Wireless operating company has this year cut its dividend to the Treasury from 4 to 2½ per cent; not from 6 to 2½ per cent as stated in these columns last week.

HOW MUCH STEEL

from
six
new
blast
furnaces?

ONE of the six new blast furnaces to be completed in this country in 1952 will be the largest in Europe. They will have been built by firms on the North-East Coast, in the Midlands, in South Wales, and near the North Welsh Border. When in full operation they will produce enough pig iron to increase Britain's annual output of steel by three-quarters of a million tons. These new blast furnaces are all part of the steel industry's first post-war development plan—the great £240,000,000 project begun in 1946, as part of which one of the world's largest steel works has been built.

"Don't forget me!" says JACK SCRAP
The steel industry still needs all the scrap which engineering firms and other steel users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

Company Notes

William Cory.—The accounts of William Cory and the statement by its chairman were prepared in advance of Mr Butler's hopeful statement in the economic debate that Britain may export twice as much coal as it did last year. If these hopes are fulfilled, the trading outlook for the company may be brighter than the chairman suggests. It was because of "the less favourable trading outlook" that the directors were content merely to maintain the ordinary dividend at 22½ per cent for the year to March 31st last, despite an advance in group trading profits from £1,809,750 to £2,200,333. This advance in profits seems to have sprung directly from an increase in the volume of coal distributed by the company: more coal was distributed to British industry, and the company's export

department, which was concerned in the shipment of coal from the United States to Britain and other European countries, also sold more. At home, however, the accumulation of coal stocks by industry and the present recession in trade have already reduced the volume of coal distributed by the company. This factor, together with the reduction in the quantity of oil supplied either as bunkers or cargo by the company following the seizure of Abadan, probably induced the chairman to make his guarded warnings about current prospects. In addition, smaller profits must be expected from the company's South African subsidiaries in the next few years, owing to transport difficulties between the ports and inland consumers. It seems improbable, however, that a catastrophic slump in the world-wide demand for coal will occur until the very late stages of any general trading recession, so that the maintenance of Cory's ordinary dividend should be well assured.

British Glues and Chemicals.—Unlike the spokesman of the heavy chemical industry, the chairman of British Glues and Chemicals, whose products must be regarded as consumers' rather than as capital goods, looks to the future with some anxiety, though not with undue pessimism. In the year to April 30th last the company's turnover increased by about a fifth, but most of this increase took place in the early months of the financial year. In the later months, and in the first months of the current financial year, demand receded, and selling prices tended to fall; working costs have remained high and profit margins have been reduced. Despite the increase in turnover, this return to more competitive conditions has led to a fall in group trading profits from £1,114,249 to £966,081. Net profits have also fallen, from £422,434 to £348,618, but an ordinary dividend of 15 per cent is being paid; when allowance is made for the share bonuses issued in 1950 and 1951 the distribution to equity shareholders is therefore in effect slightly increased.

Although demand was tapering away towards the end of the financial year, pro-

duction at the group's factories was substantially maintained. To some extent this has been reflected in the increase in the book value of stocks from £509,290 to £668,438.

4s. ordinary share at 10s. 3d. x.d. yields £5 17s. per cent.

In the current year the return to a buyers' market, in which consumers may be content to live upon stocks accumulated in the past and in which the company cannot expect to earn windfall profits on its own inventories, may lead to some reduction in the group's output. Shareholders must therefore be prepared for another fall in profits, particularly if the group's employees are successful in their claims for higher wages. But the outlook for British Glues and Chemicals and allied concerns certainly does not look as gloomy as that before the other important division of the light chemical industry, the manufacturers of plastics.

W. Barratt.—Along with other boot and shoe manufacturers and retailers, W. Barratt has taken a hard knock from the recent slump in sales. In the year to June 30th it had to reduce both its output and its retail prices, and its gross profits fell in consequence from £512,487 to £273,425. The full effect of the cut in retail prices has, however, not yet been felt in the company's retail branches and, in recognition of this, the directors have decided to transfer £100,000 from a contingencies reserve to a "price adjustment reserve." Some revaluation of the company's stocks must also have

taken place, at £1,404,901 (against £1,365,326) stocks are now entered "at cost or estimated realisable value, whichever is the lower." In these circumstances the decision to maintain the ordinary dividend at 17 per cent, despite a fall in net profits from £160,958 to £74,728, can only imply a greater degree of confidence in the future than the accounts themselves would suggest; the chairman does, in fact, point to a slight revival in trade towards the end of the financial year. Despite this revival, shareholders cannot reasonably expect anything more than the maintenance of the equity dividend this year, and before counting even on this they should take some account of the increase in the company's bank overdraft, from £135,449 to £208,640.

EXCHEQUER RETURNS

For the week ended August 2, 1952, total ordinary revenue was £85,466,000, against ordinary expenditure of £71,148,000 and issues to sinking funds £125,000. Thus, including sinking fund allocations of £8,942,000 the deficit accrued since April 1, 1952, was £202,153,000 compared with a surplus of £72,862,000 for the corresponding period of the previous year.

COLTHROP BOARD & PAPER MILLS

RECORD TONNAGE PRODUCED

MR FRANK W. J. SMITH'S STATEMENT

The thirty-fourth annual general meeting of Colthrop Board & Paper Mills, Limited, was held on July 31st at the registered office of the company, Thatcham, Berks., Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended May 31, 1952:—

The net profit for the year just closed, before taxation, amounts to £466,921, which is second only to last year's results in the history of the company. In view of the difficult conditions prevailing during the latter part of the period, to which I shall refer later, the result will doubtless be considered satisfactory.

Unfortunately, more than two-thirds of the net profit is required for taxation, the amount being £316,864, including an estimated sum for the Excess Profits Levy for the five months from January 1st last. After adding the balance of the profit and loss account brought forward from last year amounting to £41,364, and after deducting the net cost of the interim dividend £24,563, there remains a disposable balance of £166,858.

DIVIDEND MAINTAINED ON INCREASED CAPITAL

The directors recommend the payment of a final dividend of 15 per cent, which with the interim dividend of 10 per cent paid in January last, makes 25 per cent for the year. The dividend for the entire year is payable on the capital as increased by the bonus issue of last autumn when one bonus share was issued for every two shares held. The net amount of the year's dividend will be £61,407, compared with £40,938 for last year, when the rate was 25 per cent on the lower capital. The directors also propose to transfer £80,000 to general reserve, increasing the general reserve to £180,000, and to carry forward the balance of £50,014 against £41,364 brought forward from last year.

During the first nine months of the year under review business was extremely active. This was followed by a sudden fall in the value of our chief raw materials, wood pulp and waste paper, with further falls later. You will, however, recollect that last year we set aside a reserve of £110,000 for possible future falls in the value of stocks. This sum has now been increased to £117,000, which will have the effect of minimising any further falls should they occur this year.

The fall in the value of raw materials was accompanied by a sudden recession in business throughout the country with a slackening in the demand for our products, and here I must emphasise that as, in the main, we are manufacturers of packing materials, we are largely dependent upon the volume of trade throughout the country. In spite of our difficulties during the year, the mills have produced a greater tonnage of board and paper than ever before.

STRONG FINANCIAL POSITION

At this time it is more than usually difficult to forecast the future. The demand for our products has not yet fully recovered, but the company is in a strong financial position, with ample reserves, and current assets amounting to £1,132,492, against current liabilities and provisions of £659,640. The assets figure includes £421,970 in cash and tax reserve certificates, against £283,133 last year.

Taking everything into consideration, we cannot expect the profit for the ensuing year to reach the high level of the last two years, but this depends, of course, upon the general trade of the country. Our standard for the Excess Profits Levy has not yet been definitely fixed, but the tax will, of course, be chargeable for a full year in our next accounts.

My thanks are due to my co-directors, to the staff and employees for the excellent results which have been achieved during the past year.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, addressing the meeting, said:—The statement which appears on the back of the report was drawn up about four weeks ago and I had hoped to be able to tell you that there has been a marked improvement in business in the meantime. There has been an improvement certainly, the volume of orders has increased, especially those orders that reach us through our associated companies, but customers are not taking delivery so rapidly as we would like. Doubtless this will improve as time goes on.

There is one point that I wish to emphasise—the terrible weight of taxation that industry is carrying. I said in the statement that more than two-thirds of the net profit is required for taxation. The actual figure this year is 67.86 per cent. In other words, of every £1 that we earn in trading, 13s. 7d. is taken away from us by taxation. Only 6s. 5d. is left for the expansion of the business, the purchase of new machinery and the payment of dividends. This is very serious, especially in an industry where machinery is so complex and expensive, and requires constant alteration to keep it up to date.

The statement covers, I believe, all the most important points regarding the present position, so I will now propose the resolution, after which I shall be very pleased to answer any questions you may wish to ask. I now propose:—

"That the report of the directors and the accounts of the company for the year ended May 31, 1952, be, and they are hereby, approved and adopted that a final dividend of 15 per cent, less income tax, be paid to shareholders registered at the date of this meeting; that £80,000 be transferred to general reserve; and that £50,014, the balance of the profit and loss account, be carried forward."

Mr J. R. Henry, OBE (joint assistant managing director) seconded the resolution, and it was carried unanimously.

The retiring director (Mr Harry F. Smith)

was re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths & Co.) was duly fixed.

TRIBUTE TO DIRECTORS AND STAFF

Mr F. E. Armstrong, in proposing a cordial vote of thanks to the chairman, directors and staff, expressed the view that the balance sheet was a very satisfactory one considering the very anxious and difficult times that industry was going through. He was very pleased that the directors had, without weakening the financial structure of the company, seen fit to continue to pay the same dividend of 25 per cent on the larger capital. He pointed out that whereas shareholders were receiving £61,407 as the result of the year's working, no less a sum than £316,864 had to be provided for taxation, and said that what agitated him at the moment was how long industry was going to be subjected to such staggering taxation.

Mr Eric Davenport, in seconding the motion, said that although the industry was going through a difficult time, he was quite sure that the company would get more than its fair share of the business that was available.

The motion was carried unanimously, and the Chairman in a brief acknowledgment said that he had had all possible support from everybody in the organisation.

WALSALL CONDUITS LIMITED

TAXATION OFFSETS IMPROVED RESULTS

MR A. E. READ ON ESSENTIALS FOR SUCCESS

The sixteenth annual general meeting of Walsall Conduits Limited, was held on August 1st at the Grand Hotel, Birmingham, Mr Albert E. Read (the chairman) presiding.

The following is his statement which had been circulated with the report and accounts:

As indicated by the attached accounts the combined profit of the parent company and its subsidiaries for the year ended December 31, 1951, before providing for taxation, was £440,338, compared with £396,004 for the year 1950. The increase in profit has, however, been more than offset by the larger provision for taxation which, based on the legal liability to December 31, 1951, amounted to £230,904, as against £176,983 provided for in the 1950 accounts. The final net profit for the year 1951 is therefore £209,434, as compared with £219,021 for the preceding year.

The consolidated balance sheet discloses a further strengthening of the liquid position, the excess of current assets over current liabilities at December 31, 1951, being £905,727, as compared with £772,112 at the end of 1950.

SUPPLY PROBLEMS

In my statement last year I referred to difficulties which were being experienced in obtaining supplies of raw materials. This scarcity of materials continued during the period covered by the accounts and adversely affected the result of the year's trading. For the first time in 60 years a portion of the company's plant was, for a short period, closed down owing to lack of steel. I am, however, glad to be able to report that there has recently been a definite improvement in the steel supply position.

Two new service depots have been opened and stocked since December 31, 1950. In-

cluded with the accounts you will find a full list of the company's depots as at to-day's date. These form an important part of our sales organisation.

We have at the present time, I am pleased to say, a full order book for all our products, with the exception of ceramics in which branch cancellations of orders from Australia have had some effect on output.

While I feel that the shareholders have every reason to be satisfied with the result of the year's trading, as disclosed by the accounts, I would point out that generally speaking there is not today the same urgent demand for the supply of goods that there was during and since the conclusion of the war and that in common with all other manufacturing concerns we shall in the future have to meet increasing competition both from home and abroad.

TAXATION DRAIN ON INDUSTRY

The bogey of ever-increasing taxation continues to cast a shadow over industry in general and, with the addition of the new excess profits levy, industry is being drained of its life-blood, namely ready cash.

The essentials for success of any business consist of four things—production, salesmanship, finance and efficient administration. Each of these constituents is of vital importance to and must keep in step with the other three. The weak link in the chain today is finance, as owing to the drain on liquid resources due to the demands of taxation, it is becoming increasingly difficult to provide the necessary funds for an expanding and progressive business.

With 50 million people to sustain, a maximum effort will obviously have to be made by every section of the community if our present standard of life is to be maintained and however much we may dislike the thought, our very existence as a first-class nation may well necessitate the working of longer hours.

BOARD'S "PAY AS YOU GO" POLICY

The business of this company was built up the hard way upon the old-fashioned but still, in my view, sound principle of "pay as you go." We had to make and save each £ before we spent it. If we needed new factory space, plant or equipment we made sacrifices and saved until enough money had been put by to pay for it. This has been the policy of the company during the 50 odd years that I have been responsible for its conduct, and I believe it still to be the only safe foundation upon which the superstructure of a successful business can be built.

In conclusion the directors wish to join me in expressing their thanks and appreciation to the management, staff and all employees at the various factories and depots for their efforts during the year which have enabled such satisfactory results to be achieved.

The report and accounts were adopted.

At a subsequent extraordinary general meeting resolutions were passed increasing the capital of the company to £500,000 by the creation of 750,000 additional ordinary shares of 4s. each; paying up in full at par 250,000 ordinary shares of 4s. each to be issued in the proportion of one new ordinary share for every three held and amending the articles of association.

Referring to dividend policy the chairman said:—

"Whilst I cannot, of course, at this stage commit the board regarding the total dividends to be paid for the current year, I think it is right that I should intimate that the directors intend to maintain the interim dividend of 20 per cent on the ordinary capital as increased and payable at approximately the usual time.

BRITISH GLUES & CHEMICALS LIMITED

ANOTHER SUCCESSFUL YEAR

SIR ROGER DUNCALFE'S REVIEW

The directors' report and accounts for the year ended April 30, 1952, were issued to the stockholders on July 31st. The following are extracts from the review by the chairman, Sir Roger Duncalfe:—

A year ago, in concluding my review, I said that, whilst the immediate prospect was prosperous, the future remained obscure and I suggested that, throughout the world, prices for raw materials and commodities had been raised to levels which could not continue indefinitely. The event has justified my warning that there would be some reaction. During the year under review we produced and sold more, and prices showed some advance, consequently there was a considerable increase in turnover; these movements, however, were most noticeable in the earlier part of the year. In the later months, although production was substantially maintained, demand receded, prices showed a tendency to fall, and our profit margin was lower. Raw material prices only reacted slowly to the fall in product prices and working costs remained high. For these reasons our profit is less than a year ago.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Consolidated profit after all charges other than United Kingdom taxation is £821,618 (last year £892,434). Included in consolidated profit is £56,926 relating to previous years. After deduction of United Kingdom taxation, amounting to £473,000, the net profit is £348,618 (last year £422,434).

Profits amounting to £36,810 are retained in the accounts of subsidiary companies; £41,236 balance of profit is brought forward from the previous year. The amount available for appropriation is therefore £353,044 (last year £393,907).

Appropriations have been made as follows:—

- (a) £100,000 to General Reserve, making it £300,000;
- (b) £80,000 to Replacement Reserve, making it £240,000;
- (c) £50,000 to our Pension Schemes, representing substantial completion of our objective of making back service benefits the same as current service benefits.

DIVIDENDS

On the ordinary stock of £550,000 (as increased by last autumn's £325,000 bonus distribution) the directors have declared a second interim dividend of 10 per cent, making 15 per cent for the year, compared with the previous year's distribution of 30 per cent on £225,000 of ordinary stock. They do not propose any further payment.

TAXATION

Based on the actual results for the four months ended April 30, 1952, we are advised that no provision for excess profits levy is required in our 1951-2 accounts.

Substantially increased as it is by the allowance on profits retained in the business, our standard for excess profits levy is estimated at approximately £550,000 for our company year 1952-3.

I am greatly concerned at the danger which industry faces with taxation at its present punitive level, under a system which treats

as profit the inflationary rise in stock prices and also the sum by which inadequate wear and tear allowances on fixed assets fail to meet present replacement costs.

But now that profits are falling, where will industry turn to find the necessary finance to maintain its present productive assets, continue its expansion and keep its plant up to date?

PRODUCTION AND SALE

The total turnover of our Group exceeded last year's record by about 20 per cent, but sales towards the end of the year suffered some recession, which has continued to date. Our total exports increased by nearly 40 per cent.

Our works were well maintained throughout the year; our production reached a new record, which was handled smoothly by our factories; our technical department again contributed notably to progress by way of new process development, which was a marked feature of the year.

THE FUTURE

The start of our new year has been disappointing. The difficult conditions which affected the closing months of last year, and which I refer to in my opening paragraph, have continued. Whilst costs and prices are finding their new relationship there must inevitably be, for us as for industry generally, a difficult period of readjustment. I am confident, however, that timely recognition of the factors I have mentioned, coupled with appropriate action, will carry us through the recession in world trade, should it develop, and also enable us to take full advantage of better trade when it comes.

HENDERSON'S TRANSVAAL ESTATES

SIR JOSEPH BALL'S REVIEW

The fortieth annual general meeting of Henderson's Transvaal Estates, Limited, was held on July 30th, in London.

Sir Joseph Ball, KBE, chairman and managing director, in the course of his speech, said: Although the profit before taxation, at £99,274, is lower by some £4,000 only than the amount earned last year, taxation has nevertheless risen from £48,566 to £54,596 for the year under review. The net profit after taxation, at £44,678, was, however, sufficient to enable your directors to recommend the payment of a dividend of 15 per cent for the sixth successive year.

With regard to the company's South African coal interests through Tweefontein United Collieries, Limited, the accounts of that company for the year ended December 31, 1951, show that the profit on coal amounted to £129,099, being £42,703 down on that for the previous year. This substantial reduction in profit was due to a loss of revenue resulting largely from the complete embargo placed on exports just over a year ago. Plans are under active consideration for the exploration and establishment of further reserves of coal from the intact areas contiguous to the existing workings at Waterpan and Tweefontein.

White's South African Portland Cement Company enjoyed another very successful year.

Vryheid.—Prospecting is taking place on the company's asbestos properties in the Middelburg district, where fibre is already being produced on tribute.

The report was adopted.

KELVIN & HUGHES, LIMITED

MR RALPH GORDON-SMITH ON PROBLEM OF FINANCE

The annual general meeting of Kelvin & Hughes, Ltd., was held on August 6th in London.

Mr Ralph Gordon-Smith (the chairman), who presided, in the course of his speech said:—

The total capital and reserves for the group amount to £1,141,430, an increase of some £218,000 from £923,190. This increase, in addition to the increase in future tax requirements, represents provisions made in previous years no longer required, and the profit of the year £96,977, less the relatively small sum of £18,449 for shareholders. Although the £218,000 ploughed back into the business has wholly gone in net current assets, it has been insufficient to finance the increase of over £250,000 in stocks and £90,000 in debtors, which is a direct reflection of the substantial increase in output and sales.

Last year I referred to the problem of the additional funds required to finance the company's expansion and the effect of inflated prices. Your Board has decided that under present conditions the situation can best be met by means of bank loans, at least until such time as the future can be more accurately assessed.

EPL: A TAX ON PROGRESS

So far as the retention of profits is concerned, your directors have given recognition to the increase in working capital resulting from changes in the purchasing power of money by transferring to capital reserves £50,000 out of this year's profits and £200,000 out of past accumulations. Working capital is the life-blood of industry, so it is all the more regrettable that the enormous amount drained off by taxation has been still further increased by the excess profits levy, imposed by the most complex piece of tax legislation ever produced. This tax is a tax on progress, and is bound to hit hardest those progressive companies whose activities are most likely to help the country to rise above its present economic troubles, especially those with a large export trade like our own.

For a number of years the ordinary dividend has been stabilised at 7½ per cent, and your board feels it is time shareholders had a more reasonable return on their investment.

The year under review was an all-round record in the history of our group of companies. Output was up by nearly 50 per cent on the previous year's total and all our commercial divisions—marine, aviation, and industrial—contributed to this increase; over half of your company's commercial output was exported in the face of increasing foreign competition.

PRICES A VITAL FACTOR

As such a large proportion of our business is derived from overseas markets, it is essential to realise that price is once again rapidly becoming a vital factor in getting orders from other countries, and it was with the utmost reluctance that we were compelled to increase our prices during the year due to wage increases. Most nations are trying to become self-supporting, and we are now meeting competition from Germany; the Japanese are also showing signs of entering the instrument field. International trading has now reached the dangerous stage where higher prices will definitely mean less business, with serious consequences for the country.

The future outlook is so largely conditioned by circumstances beyond the company's control that it is quite impossible for me to make any accurate forecast of future results, but I think I have told you enough to show that the company is in a very healthy condition and progressing steadily.

The report was adopted.

AMALGAMATED DENTAL COMPANY, LIMITED

CAUSE FOR SOBER SATISFACTION

The forty-seventh annual general meeting of the Amalgamated Dental Company, Limited, was held on August 1st in London, Mr Aiken Watson, QC (the chairman), presiding.

The following is an extract from his circulated statement:—

The year under review has been one of considerable difficulty. The recession in home sales which followed the restrictions on free dental treatment imposed in May, 1951, was serious, and the full effect thereof is not reflected in the year under review.

In the field of overseas trading National self-sufficiency has entered the field of secondary industry. World-wide restriction of exchange has been followed in many cases by total exclusion of imports save within the narrowest limits.

These difficulties coupled with the general rise in the cost of labour and materials have all played their part in reducing the volume of your company's trade.

The end result for the year, if not a matter for congratulation, at least should bespeak sober satisfaction.

Until some of these adverse conditions are removed and a review of penal taxation takes effect, the outlook for the company negatives any immediate expansion of trade.

The company has recently put on the market a new acrylic filling material called "Sevriton." This material has received the highest professional endorsement.

In the field of anaesthesia, the products of your company's subsidiary, Medical and Industrial Equipment Limited, have earned high praise for their quality.

On the financial side your company is experiencing the difficulties of a capital structure designed to meet other conditions. Should occasion demand the board will have no hesitation in consulting the stockholders.

The report was adopted.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

KEPONG (MALAY) RUBBER ESTATES, LIMITED

MR T. J. CUMMING ON THE OUTLOOK

The forty-seventh annual general meeting of this company was held on August 5th in London, Mr T. J. Cumming, the chairman, presiding.

The following is an extract from his circulated statement for 1951:—

The results of the year's working show a profit of £617,029 before providing for taxation, which is placed at £375,000. It is proposed to pay a final dividend of 10 per cent, less tax, making 30 per cent, less tax, for the year. While profits for the year exceeded those of the previous year by over £111,000, increased provision for taxation absorbs the greater part of the increase.

The crop at 10,051,500 lb was somewhat disappointing but in view of the conditions it is really a fine achievement to have harvested so much. The main production continued to be latex in various forms which passed through the bulking installation in Singapore and in this country at Hull, where increased accommodation made it easier to deal with deliveries. The average net price realised for rubber of all grades was 3s. 4.03d. per pound.

The outlook as regards market price is doubtful. The competition from a low-priced synthetic output will be hard to combat on present Malaya costs. Various statistics tend to show that the rubber likely to be produced in the not too distant future will be required to meet the world's demands, but in the meantime we must be prepared for reduced prices.

The report was adopted.

AMALGAMATED BANKET AREAS, LIMITED

The sixteenth annual general meeting of this company was held on August 6th, in London, Major General W. W. Richards, CB, CBE, MC, the chairman, presiding.

The following are extracts from his circulated statement:—

The directors' report and the statement of accounts cover the financial year ended on September 30, 1951. The net profit of £227,497 is the best ever attained by the company. It was necessary to charge this profit with the expenditure incurred in the maintenance and development of the Fanti and Tamsu mines, £113,106, and we recommend a dividend of 2½ per cent, less tax. This modest recommendation will mark the return of our company to the dividend list after an absence of 14 years.

For the third successive year a record tonnage of ore was mined and milled and, at 656,545 tons, showed an increase over the previous year of 118,855 tons, with a gold recovery of 93,749 ounces.

Development of the 20th level of the Abbotiakoon mine has, since the end of the year, met with some success. To date, on 20 "C" East Limb Drive North, the reef has been sampled over a length of 620 feet giving an average value of 5.7 dwts per ton over a width of 39.5 inches. This is a development result of major importance.

In the Fanti section, better values are being encountered in the latest development of No. 14 Drive South in the Fanti South shaft. The last 185 feet sampled have averaged 5.9 dwts per ton over a width of 42.2 inches. The total ore reserves are computed at 4,255,035 tons.

The report was adopted.

Moderates' Rally

IN the past fortnight the official leaders of the Labour party have begun their long-expected counter-attack on Mr Bevan. They had remained patiently on the defensive for fifteen months. Under the blows of Mr Bevan and his associates, they sometimes stood and fought; sometimes they dodged; sometimes they ran away. They never took the offensive. But now at last the party's leaders seem to have had enough of their humiliation. Whether that is a mark of strength or of desperation remains to be seen. But it certainly merits some congratulation. It also provides a faint chance that the whole mood of British politics will be changed.

The counter-attack is on two fronts. One is emotional; it is a renewed and outspoken appeal to party loyalty. The other is doctrinal; Labour has published this week a new statement of policy for home affairs. If its positive import is concealed in platitudes, it has the negative virtue of being firmly moderate; it is as far removed from the outlook of Mr Bevan as any official Labour declaration has ever been.

Immediately, however, the doctrine is less important than the emotional appeal. That has the great virtue of abandoning a pretence. Hitherto the Labour leaders, with their eyes on the electorate, have on the whole made light of the split behind them. That has benefited no one but Mr Bevan. In fact there now is a Bevan party: that is to say, a group of Labour MPs hold their own meetings, decide on a distinctive group policy, choose their speakers to express that policy in Parliamentary debates, and generally act as a party within a party. In what is obviously a co-ordinated series of speeches, various members of the last Government—Mr Stokes most prominently—have begun to say so. Merely by abandoning the past pretence, they have taken a powerful weapon into their hands. There is little doubt that if Mr Bevan's Parliamentary tactics were widely understood, they would deeply offend the loyalist instincts that count for so much in the Labour party. If his opponents can in time carry conviction in the charges they are now making against him, his popularity may dissolve almost overnight. That should be borne in mind even if, at the party's forthcoming annual conference, the popularity seems to be greater than ever.

But if Mr Bevan does prove to be a balloon, clearly the pricking of it will settle nothing. The important thing is not Mr. Bevan's personal fate; it is how far Labour policy will be influenced by the ideas which have for a time found expression through Mr Bevan—but which are certainly more abiding. Those ideas are hard to define; indeed, perhaps their main characteristic is a negative determination to be against the Tories. But in some way they involve more nationalisation, more squeezing of the rich and more controls, as well as less arms and a foreign policy nearer to neutralism. This vaguely Left-wing doctrine certainly does not provide a coherent policy, but still less does anything else that Labour has produced since 1948. It is weighty because the rest is a vacuum. In the long run, the moderates are

likely to re-establish their leadership only if they can fill the vacuum, if they can provide the Labour movement with a new, distinctive policy. What is moderate as Labour doctrine is not, of course, necessarily a good policy by other standards; it may be merely cautious, when the policies this country needs are extremely radical. But at least it would not sharply divide the nation as a Bevanite policy would; it might have more positive virtues.

The reason for pessimism is the patent inability of the Labour moderates to provide at present any clear and distinctive policy. But the reason for despair has been their insistence on pretending that they could. Just as much as the Left wing, they have been trying to act as if their ideas were fresh, as if they had a policy and knew where they were going. The second half of the counter-attack that the moderates have now begun is simply that this pretence, like the pretence of party unity, has been abandoned. One may assume that this is deliberate, if only because the new party document is called "Facing the Facts"; and the fact in it that is unmistakable is its own nakedness. It is an "interim" statement of policy, which apparently means that it is intended to explain why there is no policy.

There is one exception to this. The statement repeats fairly definitely the promise that Labour will abolish the health service charges imposed by Mr Gaitskell as well as by Mr Butler. Medicine, glasses and false teeth will be made free again—"at the earliest opportunity"; even here the conditional phrase could be important. Elsewhere the qualifications leave every issue entirely open. Will the next Labour government nationalise more industries? It will—"wherever the nation's overriding needs demand it." Even the nationalisation of 1945-50 is not, perhaps, so sacred after all; it will be restored in road transport and steel—"wherever the public interest requires." And so on. There should be more social services—if more resources can be found for them. Rearmament is necessary, but

we believe that there should be a periodic review of our rearmament programme with our allies, and that this review should take account of our economic circumstances and the international situation.

Certainly Mr Churchill would not disagree.

Champions of European Unity

IF the Schuman Plan finally proves to be—as its authors intend—the first step on the road to full European federation, the achievement will have been the work of a mere handful of men. Perhaps the great changes in history are usually accomplished in this way. The masses may have veto power, for there are certain things which cannot be done without their compliance; but constructive enterprise is the work of the few. Even so, the creators of European union are much less numerous than, say, the Founding Fathers in America and the Whig magnates of 1688. In the crucial area of parliamentary action, they are only three—and two of them are over seventy. Without the efforts of M. Schuman, Dr Adenauer and Signor de Gasperi, the Schuman Plan would have remained a planners' blueprint, and for the future the staying power of the three men and of the parties they represent is the key to any further federal advance.

One cannot be quite sure that the Labour leaders intended to make their lack of policy so plain. But if not, they have carried concealment by platitude to its final absurdity; they have failed so completely in pretending to have a policy that no one will think they were trying. The effect, at any rate, is as if they were deliberately asking this year's party conference not to have a policy. And probably that aim is at least half-conscious. Certainly there is a specific hope that policy discussions will go on "throughout the coming winter months."

The practical effect of this may, of course, be purely a postponement. If Labour comes away from this year's conference without a policy, the field is still open for Bevanism. The danger is real, but so also is the possibility that the Labour leaders have carried negation so far as to make something positive out of it. The platitudes are so wide that they can be accepted by almost anyone—except a Left-wing socialist. The one thing which is certainly implied is that Labour is not a party at present advocating rapid social change. This effect is studiously reinforced by the unusual emphasis, in a Labour pamphlet, given to the country's difficulties. Labour cannot promise overmuch: it thinks it might avoid disaster where the Tories certainly would not. And in the meantime it is politically sober and virtuous: "we do not blame the Government for things it cannot help, nor do we mislead the people with vain promises." In short, the orthodox Labour leaders are asking their party to keep an open mind and give them, for the present, a mandate for moderation.

One must assume that in all this Mr Attlee and Mr Morrison are recoiling in proper horror from the irresponsibility and immoderation with which Her Majesty's Opposition has conducted itself in the past six months. Whether any practical improvement follows no doubt depends on whether the party conference does give any clear mandate for moderation. That question is open. But at least the mandate is being asked for, and the new strategy is rather more promising than the old. By persuading the party to stop and think, the moderates may gain not, indeed, a victory, but a breathing-space. That will serve if the thinking follows—and if it can be tied to the faith and enthusiasm on which, rather than on moderation and caution, political parties feed.

With one or two exceptions, the parties of the Left are opposed to federation. The parties of the Extreme Right are either opposed or lukewarm. Only the Catholic parties of the Centre which these three men lead are committed unequivocally to the federal ideal. These Catholic parties, however, no longer exercise the commanding influence that was theirs some two or three years ago. The Christian Democrats in Germany and Italy and the Popular Republicans (MRP) in France were all strengthened inordinately by the special circumstances of the war. For a time after the Allied victory all movements of the Right were discredited, and in France, Italy and Germany, the Catholic parties represented the most conservative group to which votes could respectably be given. In the first years after liberation, therefore, they were powerful parties, their numbers swollen by many who were far from sharing their political philosophy.

This philosophy is distinct and moderate and probably, because of its religious bias, little understood in this country. Its Christian basis makes it an enemy to extreme nationalism and has undoubtedly strengthened its federal leanings. In economic affairs it is conservative, favouring private enterprise and fearing excessive state control; yet a strongly marked social philosophy makes it sympathetic to the claims of the trade unions to influence and status—as in Germany—to the need for social services—as in France—and not averse to some measure of radical change, such as the proposed land reform in Italy.

These parties cannot be called clerical, for in the main they represent the activities of Catholic laymen in the political field and not the direct influence of ecclesiastical authority. This distinction can be most clearly seen in Italy where Signor de Gasperi has attempted, throughout his seven years of office, to govern in conjunction with a coalition of other moderate parties, including the small right wing of the Socialists; while other Catholic leaders in his Cabinet have pressed for an outright Catholic majority, working in close co-operation with Dr Gedda's Catholic Action in the country at large—a movement which can be counted clerical. Signor de Gasperi has consistently resisted this pressure, even though at times the Vatican has appeared to favour it.

★

The philosophy of the three Catholic parties is sufficient to explain why, as the war has receded and the Right recovered confidence, their influence and voting strength have been whittled away. Their sympathy with some at least of the ideals of the welfare state and their links with the workers have made them seem too radical for many of Europe's businessmen, peasants and small traders, whose votes have been transferred to other small parties of the Right, the Free Democrats in Germany and the Radicals and Independents in France. In Italy, Republicans, Liberals and Monarchists have to a more limited extent been beneficiaries of this revulsion.

But the most dangerous undermining of the Catholic parties has followed from the revival, not of economic conservatism, but of nationalism. They have suffered from the rise of authoritarian and semi-authoritarian parties of the Right. This process can be seen most clearly in France, since it is there that a general election has been held since the recovery of confidence on the extreme Right. General de Gaulle's Rally of the French People decimated the following of the moderate Catholic MRP by attracting to itself nationalists, ex-Pétainists, anti-communists of every kind and even some dictatorially-minded reformers, who had previously voted for the Popular Republicans. After brilliant successes in local elections in 1947, the General's rally polled nearly a third of the votes in last year's elections and became the largest party in the Assembly.

Conditions in France cannot, it is true, be absolutely equated with those in Italy and Germany. Long periods of dictatorship culminating in defeat in war have discredited authoritarian nationalism more fully than could the brief essay in Pétainism in France. General de Gaulle is, moreover, a hero of the war and associated with liberation and victory. Nevertheless, in both Italy and Germany, the extreme Right has made some progress in reorganising itself and the new parties seem bound, at next year's elections, to draw votes away from the Catholic parties. In Italy the *Movimento Sociale*

Italiano, or "Missini," draws its mass support from those who followed Fascism to its bitter end in Mussolini's Social Republic. In Germany, a number of nationalist parties of the Right receive their backing from ex-Nazis, ex-officers and the refugees.

In both countries, too, if votes given to this nationalist Right were seriously to undermine the Catholic Centre, no alternative constitutional coalition could be created rather further to the Left in order to continue the programme of European federation. In France alone are the Socialists ready for federalism; they have supported M. Schuman's foreign policy in Europe whether they were in or outside the government coalition—though often with hesitation and misgiving. In Italy and Germany, no such shift of alliances is possible. The large, well-organised German Social Democratic Party puts German unity before European federation and is, therefore, anti-federalist, in practice, if not in theory. The right-wing of the Italian Social Democrats is too small to serve as a counterweight to the fellow-travelling wing under Signor Nenni.

The elections of next year are thus likely to be a turning point in the development of European federalism. If the present leadership provided by the moderate Catholic parties is undermined, it seems very unlikely that any further advance towards European union will be secured. The chances of these parties appear, in turn, to depend upon two factors—upon the type of electoral system adopted for the elections and upon the internal cohesiveness of the Right. Both issues are still in doubt. The Christian Democrats in Germany would like to see further modifications in the German system of proportional representation in the direction of single member constituencies on the British model. This system, by eliminating splinter parties, concentrates votes on the major groups and would tend to leave the Christian Democrats in a commanding position. But Dr Adenauer depends in his coalition on the support of smaller parties which might not agree to electoral change.

In Italy, Signor de Gasperi is known to wish to fight the 1953 elections in a renewed coalition with the other small Centre parties—Right-wing Socialists, Liberals and Republicans—which worked with him for some time after 1948. Those who support this concept of a *Union Sacrée* of the constitutional groups also favour the idea of introducing a system of proportional representation whereby any party or *bloc* gaining 50 per cent of the votes would automatically receive two-thirds of the seats in parliament. Support for this change is, however, far from unanimous, even among Signor de Gasperi's followers, for it creates a dangerous precedent for future manipulations of the vote. Moreover, the Right-wing of the Christian Democrats is not enthusiastic for a policy which would link the party with elements of the anti-clerical Centre and Socialist Left. They hanker rather for a coalition of the Right stretching from Christian Democrats through Monarchists to the neo-fascist "Missini." In fact, the egregious Dr Gedda tried to create such a coalition before the recent municipal elections in Rome and nearly lost the Capitol to the Communists as a result.

His failure throws light on the problem of how cohesive any grouping of the Right may be expected to be. The reaction to the Gedda proposal showed how strong anti-fascist sentiment still remains and how compromised any groups can still become if they advertise open fascist leanings. Nor is the Right any longer

homogeneous in Europe today. Since the experience of dictatorial rule, it is divided between constitutional and unconstitutional elements. The recent split in the Gaullist Rally, in which a third of its parliamentary representation abandoned the tactics of pure opposition in order to support M. Pinay's coalition, illustrates the difficulty of holding together in one party traditional conservative right-wing politicians and industrialists together with radical authoritarians and often youthful reformers. In Germany, too, businessmen and conservative politicians learnt after 1933 that they could not ride the Nazi whirlwind which they had helped to raise, and the lesson is not forgotten. Something of the same difficulty also appeared in Italy at the recent Congress of the MSI. Its leadership is largely conservative and constitutional and would be prepared to make an electoral alliance with Monarchists and Christian Democrats to bring into being a right-wing government. Such an alliance, they hope, would secure the financial support of Italian industry. But so far they have found few backers, since the mass following they offer is largely made up

of ardent young neo-Fascists who are "socialists" in the Social Republic tradition and who regard parliamentary co-operation as playing with pitch. Similar sentiments smoulder in many brooding young Nazi breasts and often lead them to eschew voting altogether. It need not therefore yet be assumed that a strong Right will inevitably emerge from the next elections or that, even if it achieved electoral unity, it could hold together once the business of government began.

The chance that the Catholic parties of Europe may retain their influence in coalitions of the Centre is thus perhaps rather better than ever. So, too, is the possibility that the work of European federalism will go on. It may seem surprising that so great a change should be wrought by so small a force, yet it should be remembered that in the twentieth century most of Europe's mass movements have been movements of destruction and that the very modesty and precariousness of the federal forces may be their salvation at a time which is predominantly one of wariness, disillusion and lack of faith.

The Uneasy Triangle—II

The Limits of Free Bargaining

THE first article of this series sought to establish two points. First, it is impossible for any community to have very full employment and completely free collective bargaining and stable prices. Either one of the three will be completely sacrificed, or else all three will have to be modified. Secondly, though it is possible for a time to concentrate on full employment and free wage bargaining and let prices rise continuously—as Britain has done in recent years—such a policy will before long undermine the employment and the free bargaining at which it aims. But thirdly, though a degree of price stability must therefore be included among the objectives of economic policy, it need not be an absolute degree. From this corner of the triangle, in short, a contribution to the reconciling of all three can be made. It remains to enquire whether similar concessions can be made from the principles of absolute full employment and absolutely free wage bargaining, without going beyond what public opinion will tolerate. And when all three absolutes have been modified as far as possible, will they work in with each other? At the cost of only a gentle rise in prices, can a satisfactory degree of full employment be maintained, either by putting a tolerable measure of restraint on wage bargaining or by substituting for it some other method of fixing wages?

Experience has shown that mere "voluntary restraint," the effect of patriotic appeals to the civic sense of the organised workers, is not enough. It is certainly helpful, and the limited success which it achieved during the immediate postwar period is highly creditable to the trade union movement. But restraint by itself offers no reliable solution. For one thing, the more success it achieves in preventing an inflationary general rise in wages, the more thoroughly, at the same time, it disrupts that process of change in relative wage rates which is essential in inducing shifts of manpower from industry to industry. For another, it is always liable to incalculable breakdowns; a change of political atmosphere, an imported increase in the cost of living, the rise to power,

in a single key union, of a militant personality or two, is enough to wreck it. Perhaps most important of all, permanent and deliberate restraint would run flatly counter to the historic mission of the unions, which is precisely to increase wages and to use their bargaining power to the very best of their ability. Sooner or later, if union leadership fails to carry out what in the eyes of the rank and file is its proper job, the rank and file will rebel.

In the short run, this danger can be partially fended off—as it has been in this country—by a whole armoury of fiscal measures and physical controls designed to keep both profits and the cost of living below the levels which would otherwise result from the current balance of supply against effective demand. But the controlled economy is as inherently unstable as "restraint" itself. The distorting effect of controls on economic life, the paradoxical encouragement they offer on the one hand to the production of uncontrolled "non-essentials" and on the other to the wasteful use of essentials themselves (such as houseroom), the fossilising effect of quotas that are allocated, or of taxes that are imposed, according to the data of an increasingly remote and irrelevant "base year"—all these things are only too familiar. No one questions the possible usefulness of controls over a short period—they are the essential apparatus of the siege economy. In any but a frankly totalitarian state, however, it is no more justifiable to argue from the usefulness or success of controls over the short period of siege to their permanent practicability than to deduce from a swimmer's success in diving under a single obstacle that it would do him no harm to stay permanently submerged. As a means of dealing with the inconvenient implications of a state of things which everyone wants to maintain permanently—that is, full employment with stability of values—an apparatus of controls would be hopelessly inadequate even were both public discipline and administrative skill more remarkable than they have shown themselves to be.

One can, of course, step out boldly along the Road to

Serfdom towards the straightforward totalitarian solution, the *gleichschaltung* of the trade unions into a state economic mechanism which fixes wages along with prices, output, and everything else. That solution works, which is more than can be said for well-meaning half-measures. But for most people in this country, whether inside or outside the trade unions, the price is far too high. Plans have, however, been proposed by certain Left-wing intellectuals which would almost certainly arrive at much the same thing. They are attractive and ingenious plans. There is the system of "points rating" for jobs, whereby wages would be objectively determined according to skill, responsibility and net advantage, by a process of joint ascertainment. There is the simpler proposal that the total margin available, year by year, for wage increases over the whole economic field should be determined by official statisticians and distributed between different groups of workers, either by inter-union negotiation or by the TUC itself. The first of these plans has the grave disadvantage, no less in a planned than in a competitive economy, that it takes no account of shifts in demand for different kinds of labour and so, like "wage restraint" itself, fails to make provision for necessary changes. (The "points rating" of a flint knapper's job would on any objective standard be higher than that of a production-belt worker's in an aircraft factory.) The second plan suffers from the extreme and demonstrated fallibility of official forecasts.

Moreover, once the unions turn themselves into mere ascertaining bodies, mechanisms for registering "public interest," they will have abdicated from their historic role as thoroughly and as suicidally as by acquiescence in indefinite "restraint." Abdication would be all the more suicidal since the bargaining strength of even the unorganised individual worker is, in a strong sellers' market for labour, sufficient to drive up wages without trade union intervention; so that refusal by the trade unions to press for increases would soon leave the official rate as an inoperative and obsolete minimum, standing evidence to the rank and file of their union's impotence or actual opposition to their interests. The obvious result would be the spontaneous growth of a rebel union movement; and the official "objectively" determined wage scales would have to be either abandoned (leaving the situation just where it was before), or authoritatively enforced (which reaches the nakedly totalitarian solution by a different route). It is, in fact, hardly more possible for a free society to jettison collective bargaining than to jettison stability.

This does not mean, of course, that there should be untrammelled liberty to convert every piece of negotiation into a knock-down-and-drag-out fight. The unions' function is in no way impaired by the existence of consultative machinery; there is everything to be said for cooling-off periods, much to be said (in spite of the Webbs' strictures) for arbitration, and indeed for every device which prevents negotiation from breaking down into dispute. Improvements along these lines, however, could not supply the whole answer. They could reduce the wastes and hardships, both to participants and public, which result from overt industrial strife; but they would not achieve the major, all-important end of preventing the upward pressure of wages from jeopardising full employment and the necessary minimum of price stability. The contribution that is needed from the wage-bargain corner of the triangle must go further than this, while still not going so far as to endanger the basic freedom to bargain.

Perhaps the answer is to be found in the legal conditions under which that freedom is exercised. The development of law and of public opinion has entrenched the unions in a position of power and privilege which, were it enjoyed by any other type of bargaining agency, would be recognised at once for an anomalous blend of monopoly and anarchy. One has only to imagine a trade association of, say, biscuit manufacturers, able not merely to fix a minimum price and agree on certain trade practices, but to veto the entry of any new firms not connected with existing members or satisfying conditions laid down by themselves; to prevent, over the heads of Parliament and Government, the import of biscuits; to impose obsolete techniques on its members; to forbid them to use flour or shortening produced by non-cartellised millers or manufacturers; to use boycott or obstruction, without the victims being able to get redress at law; and to evade all the normal penalties of breach of contract and civil tort in general.

These peculiar privileges and immunities have not been achieved entirely without justification. In the climate of chronic underemployment and semi-feudal inferiority in which the unions grew up, they served as some counter-weight to the fearful bargaining weakness which that situation imposed; they were analogous to the arming of a hopelessly outclassed boxer with a knuckleduster to make up for his lack of weight and reach. Today, however, in a climate of full employment and increasing social equality, the weight and reach of the trade unions are greater than those of any possible opponent. Instead of imploring them to pull their punches, it would be much better to remove the knuckleduster. The monopoly power of the unions, in short, should be drastically reduced. If they remain fully free to bargain on wage rates, they should be disqualified from practising the various kinds of restriction into which their strength has betrayed them.

Such a conclusion, of course, invites denunciations of the most apoplectically self-righteous kind. It is the more important to emphasise that it is no more than a proposal that the unions should be put in a position of equality with other associations. The proposal does not include the break-up of any large existing unions into feeble "splinter" bodies; competition between rival unions within the same industry, indeed, is likely to be a competition in destructive militancy. Nor does it mean a foredoomed attempt to get back to the early Victorian ideal of a wholly competitive, atomised labour market. Even were trade unions economically superfluous, the support and status which they confer on their members is essential in human terms. Even in a general sellers' market for labour, the individual worker in all but the smallest sort of enterprise needs that support and status; the trade union system is an indispensable part of the social fabric. It is precisely because the trade unions are indispensable, precisely because they can only preserve themselves from disruption and supersession by the free exercise of their bargaining function, that there must be compromise on the powers which they bring to the bargaining table.

The attempt that is being made, although in a very gingerly way, to define and condemn restrictive monopoly practices on the side of industry ought, then, to be

extended to labour. These definitions will not be easy to devise nor, certainly, will the condemnations be easy for working-class opinion to accept. But Britain cannot afford another 1926, or another Trade Disputes Act like that of 1927. Reform must be, in the face of whatever difficulties, basically agreed; an agreed codification of permitted and forbidden practices, an agreed outlawry of those features most conducive to mutual blackmail. It should not be impossible to convince the unions that they will do better to protect the basic freedom of the wage

bargain at the cost of abandoning their restrictive powers than to have their functions wholly taken away from them. A genuine understanding of the alternatives should bring at least the necessary measure of consent. That understanding and consent are obviously a long way off. That is all the more reason why the subject should be seriously studied and publicly debated; for until they are achieved an undue strain will be imposed on the other two sides of the triangle, and either stability or full employment, or both, will be under constant threat.

Choosing the President:

A Guide to the Election

THE European observer who wants to understand an American presidential election must first put out of his mind any idea that any part of it resembles anything he knows at home. With the nominating conventions, which were held in Chicago last month, that is easy, for there is nothing like them anywhere else in the world. But once the party champions have been chosen, the temptation is to think that the President is elected by some form of nation-wide plebiscite. It is true that the American system usually achieves the same result as a plebiscite: that is to say, the men elected President and Vice-President are almost invariably the candidates who get a majority, or at least a plurality, of the votes. (In the American language, "majority" means more than half, "plurality" more than anyone else.)

But this result is, so to speak, accidental, not necessitated by the system, and to understand what will be happening in the United States between now and November 4th, the election day, it is essential to understand the system.

The fundamental point is that each of the 48 states votes in practice as a unit, *en bloc*. The next President and Vice-President will actually be elected, not by the 98 million persons of voting age, or even by the 52 million or so who are expected to go to the polls, but by 531 persons who, though they never meet face to face, are known as the Electoral College. By the Constitution, each state has a number of votes in the Electoral College equal to the number of members it has in both Houses of Congress together. Every state has two Senators, neither more nor less. The total membership of the House of Representatives is fixed at 435, but the total is redistributed among the states after each decennial census in proportion to population, with the proviso that each state must have at least one Representative. Therefore in the Electoral College even the smallest states have three votes, while New York has 45. What happens on November 4th is that the voters in their separate states choose their members of the Electoral College.

The intention of the Founding Fathers was that the Electoral College should consist of experienced and independent citizens who would exercise their own judgment, and even perhaps choose a President and a vice-president from different parties. Almost from the start, however, the Electoral College became a mere formality. Today, the voters in each state choose one or other of the party lists of Electors—each list having 45 names in New York, 32 in California and so on—and since the Electors can be relied upon to vote for their party's nominees (one of the Tennessee Electors did desert to the enemy in 1948, but that was very exceptional), the result of the whole election is known as soon as the Electors are chosen early in November.

In reality the Electors will not meet, each group in its own state capital, until December 15th and their votes will not be officially counted, before a joint session of Congress, until January 3rd. Only then, in the eyes of the law, will the Republican General Eisenhower or the Democratic Governor Stevenson be the President-elect who is to take office on January 20th.

The Constitution leaves it to each state to decide how its members of the

Electoral College shall be appointed. In fact, however, every one of the 48 states chooses its Electors by popular vote, the party whose list receives the highest number of votes (a plurality, not necessarily a majority) getting the whole of the state's vote in the Electoral College. This custom is one of the reasons why the minor parties, the Socialists, the Prohibitionists and so on, who put up presidential candidates regularly, never get a single vote in the Electoral College; though the special interests to which they appeal may be represented in every state, they form a majority, or even a plurality, in no single state.

The consequences of the custom of casting each state's electoral votes as a block was well illustrated by what happened in New York in 1948. Governor Dewey, the Republican candidate, received only some 46 per cent of the total

vote cast in the state, but he got every one of the 47 votes that New York then had in the Electoral College. Over the country as a whole, Mr Truman's majority over Mr Dewey was only a little more than 2 million out of a total popular vote of nearly 49 million, but he had 303 electoral votes to Mr Dewey's 189. The whole electoral vote of an important state may turn on how a comparatively small group votes—the Jews and Italians of New York, the Negroes of Chicago—and this is why so much attention is given to the prejudices and desires of these minorities, so long as they do not throw their influence away by forming parties of their own.

★

The Constitution leaves the regulation of voting procedures to the states. No two state electoral laws are identical, although every state allows voting at 21 years old. The southern states use a variety of methods to keep the number of voters very low and thus to keep the South solid for white supremacy—and for the Democratic party. Lack of interest where Democratic victories seem certain reduces still further the number going to the polls in the South. The effect of this can be seen by comparing voting in 1948 in Connecticut, a hotly contested northern state, and South Carolina, two states with very similar populations of about 2 million, and each with 8 votes in the electoral college. But each of the 8 electoral votes that Mr Dewey got from Connecticut represented 54,719 Republican voters, while each of South Carolina's 8 votes for the States' Rights candidate represented only 12,826 voters. Unless the Republicans can crack the "Solid South"—as General Eisenhower, born a Texan, has some hope of doing this year—the Democrats start with 128 votes, very nearly a quarter of the total, safely in hand. If they can add to these the barest majority of the popular vote in a few large northern states, they will win even if the Republicans sweep the board everywhere else. It is thus mathematically possible for Governor Stevenson to get fewer popular votes than General Eisenhower, and yet be elected.

American electoral calculations are therefore a matter of adding up blocks of states. In the panels below an attempt is made to show how each of the two parties is at present hoping to build up a majority. Each table starts with the states that the party in question is most sure of and works down to those

of which it is doubtful. The states in italics are those that appear on both lists. A total of 266 electoral votes is needed for election. The Democrats' calculation, it will be seen, is that the South will remain solid (or nearly so), that the normally Democratic states on the fringe of the South can be counted on, and that Illinois will vote for its present Governor. To this the Democrats hope to add the mainly urban states of the East. This is the traditional Democratic combination of the South and the big cities. The Republicans' hope is that they can hold the Dewey states of four years ago and that General Eisenhower will have just enough more appeal as a candidate, especially to "independent" voters, to win the states where the margin was very close. The Republicans hope to win back the farm states and even to invade Democratic territory in Texas, perhaps in Virginia and possibly in Massachusetts and Rhode Island, where the Catholic church is very strong and Mr Stevenson's divorce will tell against him.

The thing that emerges most clearly from these lists is the crucial importance of the four big states in the middle of both lists—New York, California, Ohio and Michigan. These four states are not only very large, but they are all very closely balanced in their party allegiance. It is in them that the election will probably be won or lost. The Republicans think they can carry California, where their vice-presidential candidate, Senator Nixon, is a proven vote-getter. The other three states have the feature in common that their big cities, with an important labour vote, are Democratic and the rest of the state is Republican. The Republicans hope to increase their vote outside the big cities and inside them to get back some of the Negro vote that Roosevelt won for the New Deal. They will use for all it is worth the fact that the Democrats have nominated a Southerner, Senator Sparkman, for Vice-President.

There is, however, one factor that could undermine all calculations. The total poll in an American election is always low by European standards. The highest figure in recent years was 59 per cent in 1940; it was as low as 52 per cent in 1948. Normally it is assumed that the marginal voter tends to vote for the Democrats, who therefore gain from a large poll. But this time the Republican candidate is a man whose fame exceeds that of any regular politician and who may be able to attract to the polls a million or two voters who would otherwise never vote. This is the Republicans' main hope.

THE EISENHOWER CALCULATION

	Electoral Votes	Cumulative Total
Solid Republican States		
Maine (5), Vermont (3), North Dakota (4), South Dakota (4), Nebraska (6), Kansas (8).....	30	...
States with Dewey Majority in 1948		
Pennsylvania (32), New Jersey (16), Connecticut (8), Maryland (9), Delaware (3), Indiana (13), New Hampshire (4), Oregon (6).....	91	121
Border-Line in 1948		
New York (45), California (32), Michigan (20), Ohio (25).....	122	243
Farm and Mountain States, Republican in Local Politics		
Wisconsin (12), Minnesota (11), Iowa (10), Colorado (6), Idaho (4), Utah (4).....	47	290
Captures from Democratic Territory		
Texas (24), Virginia (12), Massachusetts (16), Rhode Island (4)...	56	346

Note.—States in italics are those that appear in both lists.

THE STEVENSON CALCULATION

	Electoral Votes	Cumulative Total
The Solid South		
North Carolina (14), Georgia (12), Alabama (11), Tennessee (11), Louisiana (10), Florida (10), Arkansas (8), Mississippi (8), South Carolina (8), Texas (24), Virginia (12).....	128	...
Illinois	27	155
Border and Semi-Southern States		
Missouri (13), Kentucky (10), West Virginia (8), Oklahoma (8).....	39	194
Metropolitan States with Truman or Truman-plus-Wallace Majority in 1948		
New York (45), California (32), Michigan (20), Ohio (25), Massachusetts (16), Rhode Island (4)...	142	336
Other Large States with Truman Majority in 1948		
Wisconsin (12), Minnesota (11)....	23	359

NOTES OF THE WEEK

Duumvir or Dictator?

General Neguib is already finding it impossible to do as he had hoped in Egypt: to cut out of public life the two cancers of "The Palace" and "corruption," and then to retire to barracks and let politicians run the country. Both in political action and in the matter of keeping public order he has been forced to assume authority. On Tuesday he announced that a joint committee of army officers and civil servants would henceforth coordinate government policy. On Wednesday, following riots for higher wages and better conditions in one of Egypt's main textile towns, he ordered troops to the scene. He also issued a warning "to all sections of the population, and particularly employees," to remain orderly on pain of indictment for treason, in order to afford the government time to effect "reforms for the welfare of the whole people."

The general seems to be caught in a cross fire. On one side of him are his chosen civilian colleagues—experienced statesmen such as Aly Maher, who knows that, for purely practical reasons, changes cannot quickly be pushed through without harming efficiency and prosperity. On the other side is a group of officers junior to himself, but instrumental in pushing him into prominence, who have no practical experience of public administration and who want social change at once. The existence of these two groups explains a difference that has arisen between cabinet and army over tobacco duties. The first group knows that indirect taxation is a tried method of raising quickly the revenue which (as will be seen from an article on p. 403) is needed immediately; the latter contends with reason that any indirect tax penalises the poor man, and that higher direct taxation of the upper class is the only method that can be considered. A corresponding difference may well arise over land reform, which the army radicals want to bring about by immediately breaking up large estates; but to more experienced minds this involves the drawback of breaking up some of the best run and nationally most valuable units in Egypt. True to a type familiar in other countries, these young reformers want to pour some immediate bounty into the poor man's lap. But, also true to type, they ignore the fact that to take such action in a hurry means causing want and discomfort to all who do not at once share in the benefit. It produces fiscal upheaval and leads to social disturbances; for to throw a sop to a hungry man merely stimulates his appetite.

If, in the tug of war that impends inside the new co-ordination committee, his more impetuous army followers get their way, General Neguib is likely to have to repeat this week's use of troops to maintain order. If, on the other hand, the army members are to be outvoted, he may have to give the casting vote against them. For the new Regency Council, though it comes as near to neutrality as any trio of Egyptian personalities could do, does not appear to have the calibre of an effective umpire. However little the General may desire personal power, he seems likely to become less of a duumvir and more of a dictator.

The Schuman Pool Exists

The High Authority of the Schuman Plan now exists—and that is half the battle in getting the coal-steel pool to work. Nine members from six nations met for the inaugural ceremony in Luxemburg this week and M. Jean Monnet is its first president. The appointment is entirely fitting, for it was his mind that conceived the plan and his vigorous and practical idealism that were largely responsible for turning it into reality. The danger now is that too much will be expected of it too soon, for the Schuman Pool is many things

to many men. Internationalists like M. Schuman, Dr Adenauer and the first President cherish a political as well as an economic purpose. By creating a single market for coal and steel among members they hope to get greater efficiency and higher standards of living; but they also hope to wear away Franco-German antagonism by submerging the two peoples in a larger community.

Successful working must depend on Europe's industrialists, who will look at the plan from the standpoint of self-interest. The Ruhr steel producer sees the promise of a cartel larger and more successful than he dreamed of before the war. The French manufacturer hopes to get German coal supplies on the same terms as German industry. The High Authority's most important immediate task is to level barriers to coal and steel trade in the common market; this will mean dismantling tariffs and quotas and enforcing sternly the anti-cartel provisions of the Treaty. Both measures are likely to be fiercely resisted by the protectionist tradition of generations. The investment programme will also provide a severe test. Can the High Authority in fact channel new investment to those plants which the operation of the free market shows to be most economic? Or will the pressure to maintain the current balance of industrial power between members prove undefeatable?

The High Authority can execute the treaty only if its members act in a supra-national spirit in cases where they are granted the requisite powers. They will need at all levels the support of a body of opinion which puts co-operation above sectional interest and accepts competition and expansion as the means to higher living standards. M. Monnet reminded listeners at Luxemburg last Sunday that this is only the "beginning of the effort that Europe must accomplish in order finally to achieve unity, prosperity and peace." That is to say: other schemes of integration, like the Defence Community, must go ahead; and their prospects must not be wrecked by political differences like those (analysed on page 400) that have arisen over the Saar.

Servants of Europe

In this and other supra-national enterprises the quality of men and women attracted to their service will be decisive in the early stages. Do there exist sufficient competent officials with the devotion and independence of mind to support men like M. Monnet? And is there in member countries a body of opinion strong and vocal enough to sustain them? To the first question the answer is probably Yes; experience in the United Nations, the OEEC and other international bodies is producing the right people, and no one in this country should underestimate the extent to which educated Europeans are weary of nationalist views and incompetent governments. Many of those who will not dedicate themselves to the nation state will be attracted to permanent work for Europe.

To the second question the answer is more doubtful; and it is as well to be realistic about it. M. Monnet and his colleagues in the High Authority are in their own countries men of established reputation and fortune. If they fail in the international venture, that is not the end of their careers; but for younger people there is a real difficulty. A civil servant, professional man or technician who joins a body like the coal-steel pool and distinguishes himself by loyalty to its purposes will sometimes have deliberately to work against the special interests of his own country. Whether he is to suffer for it when he resumes his career in its national setting is a matter of some importance.

There is a clear case for paying such international civil servants outstandingly well and for asking governments which

are members of such organisations to guarantee re-employment of those whom they second to such service. Indeed, the necessity arises also outside Europe. The work of the United Nations in technical aid, the execution of the Colombo Plan, the spending of Point Four funds, all call for a new type of international official. He should be able to devote himself to service outside his own country and to governments other than his own with full confidence that his prospects and reputation will not be injured by his zeal. There is a question here well worth discussion. Is there already, or could there be, a professional association of such persons? Can the idealist be promised a career?

Engineers Think Twice

By contrast with many of the gloomy prophecies that used to be made, the Conservative Government has been brilliantly successful to survive for nine months without any disturbance of the industrial peace which Labour used to claim as one of its greatest achievements. This week the country has lived through the first serious threat to that peace. The Confederation of Shipbuilding and Engineering Unions has been holding its annual conference at Southsea. The Amalgamated Engineering Union, angered at the employers' flat refusal of its claim for an extra £2 a week for all its members, sought support from the other unions belonging to the confederation. It proposed that all should hold a ballot among their members. The choice would not be between industrial action and arbitration—they might then choose arbitration, as they did by an overwhelming majority in 1950; it would be between supporting the claim by strike action and supporting it by a ban on overtime and piecework. If a resolution proposing this ballot had been put to the conference, it would almost certainly have been passed, for the AEU would have

WAGE CLAIMS

The table below shows the wage claims which are outstanding and, as far as can be ascertained, the number of workers who would benefit if they were granted.

Type of Workers	Approx. numbers involved ('000)	Claim	Estimated Annual Cost (£ inn.)
Engineers	2,700	£2 a week	280
Shipbuilding workers	280	Substantial increase (probably £2 a week)	30
Miners	770	30/- a week	60
Busmen	300	Probably just over £1 a week for drivers and probably £1 a week for conductors	15
Shopworkers	2,100	Mainly 10/- a week for men, 7/6 a week for women	35
Railwaymen			
Conciliation and salaried staff	390	10% increase	20
Shopmen	130	Probably 10% increase	10
Wholesale clothing workers	200	6d. an hour	2
Tobacco workers	40	£1 a week	...
Building workers	1,250	Claims to be made after end-September	...

had the support of the Communist-led Electrical Trades Union and probably also of the boilermakers and foundrymen.

Fortunately, moderate opinion has for the moment prevailed. Members of the two big general unions are also affiliated to the confederation. They are relatively right-wing, and being less tightly organised than the craft unions, are also less ambitious. Many of them would think it foolish to act in support of such an extravagant claim. For the present, however, they do not have to make up their minds. An agreed resolution put to the conference proposed that further talks should be held with the employers. But the AEU's plan is shelved, not rejected. If no offer comes from the employers before the confederation's special conference on September 10th, it will no doubt be revived.

During the negotiations that took place in June and July the engineering employers made no counter-offer to the union's claim. They pointed out that the workers had been

granted an increase of 11s. a week and an extra week's annual holiday as recently as last November, and they urged the dangers of increasing costs just when the industry was facing increased competition from Germany and Japan. If it were granted, the engineering workers' claim would cost the industry some £280 million a year. It represents, as the accompanying table shows, over half the present pressure for higher wages. If all the claims now outstanding were granted they would cost some £450 million. If the actual gains were to represent even half this sum it would put an end to the Chancellor's hope of a fall in the prices of most things other than food—and it would greatly increase the difficulties of achieving solvency.

Wages Councils Insist

Of the twelve wages councils in the distributive trades that were asked to reconsider their recommendations for wage increases, four have now submitted unchanged proposals to the Minister of Labour. In each of these councils the employers had wished to recommend smaller increases, the unions, of course, wanted to return the original proposals to the Minister without alteration, and the casting vote of the independent members was given on the unions' side.

In theory the Minister could refer the proposals back to the councils a second time. His predecessor, Mr Isaacs, referred back a proposal twice, but for two different reasons. In the explosive atmosphere of today Sir Walter Monckton could hardly risk that course—even if he wanted to oppose these relatively moderate increases proposed for relatively badly paid workers. A few weeks may pass before he makes the orders, for he will await the verdict of the central co-ordinating committee for some of the wages councils, which meets on August 18th and 29th, and the necessary printing and distribution takes time. But probably the orders will be issued by the end of September. Sir Walter has made his point that wage claims should be considered in the light of the Chancellor's appeal for wage restraint. In principle he was right. To have confirmed these wage increases at the first asking would have encouraged everyone to ignore the appeal. On the other hand, it is hard to see that in practice the Minister's intervention has strengthened the cause of wage restraint; the councils' consideration of the appeal has appeared, at least, to be something of a formality.

Pistols at the Table

Many things will be remembered to Mr Acheson's credit when he retires from politics in the next few months. Among them is an aptitude for defining simply the foreign policy objectives of the Atlantic alliance. His famous "negotiation from situations of strength" still holds its field against feeble attempts to define what it is hoped to achieve one day with the Russians. At the Honolulu conference last week, the American Secretary of State presented his slogan in even simpler and more colloquial terms, which deserve to be recorded and remembered:

When those centres of strength are developed it is not our purpose to say to anybody: "Now we are strong, now you must do what we say." What we say is: "Now we are equal, now we'll sit down and talk sense. But we're not going to sit down with a pistol at our heads and nothing in our hand at all."

This ought to do very nicely, even for Labour party meetings addressed by Bevanites. That the main purpose of rearmament is to make possible negotiation with the Russians on equal terms is too often forgotten in British discussion; yet it is noticeable that the Soviet Government, as the West gets stronger, is showing more interest in maintaining things in Europe as they are than in negotiation. The time may be coming when those of the Left, in Europe as well

as Britain, who have been most eager for talks with Stalin will oppose a policy of negotiation on the grounds that he clearly does not want it. They must not be surprised to find one day that they are lined up with the Communists and Russians in defence of things as they are in Europe, arguing from the feeling that to advocate change, especially if one is an American, is to be aggressive.

Ridgway Stakes His Claim

General Ridgway has broken this week the wise silence he has maintained since he took over the supreme command in Europe from General Eisenhower. He has said firmly that the defence programmes agreed at Lisbon last February can be carried out this year by members of Nato. This needed saying, as it has become fashionable to suggest that the Lisbon conference was a mere exercise in wishful thinking. In fact it was not, as the progress made in air defence will one day show. Because European governments have still not taken the steps necessary to form adequate reserves of ground troops, it does not follow that Nato—if they tried—could not have 25 reserve divisions in some state of readiness by 1953.

The insistence of Supreme Headquarters on the need for reserves has increased lately. General Gruenther, the Supreme Commander's Chief of Staff, has asked for "a relatively small active force, backed by a very active vitalised reserve," ready to fight within a few days. Even the cold war demands, in his view, readiness behind as well as in the German front line. There is, perhaps, a growing realisation of the role played by the Soviet divisions in Eastern Germany. They stand there as an army in being, exerting power by their mere presence, and causing difficulties for the West by the fact that they could go into action without an extensive preliminary build-up. Supreme Headquarters used to believe that this build-up would be necessary and would give Western Europe warning of trouble to come. It seems to have changed its mind.

It remains true, so far as can be judged, that the Russians show no signs of wishing to involve themselves in world war by attacking Western Europe. But that is no reason for neglecting or delaying its defences. There are explosive situations in other parts of the world where Communist thrustings are felt; the fact that the western defences are not fully manned is constantly present in the minds of Americans, British and others who have to plan to meet them. It would perhaps be salutary if Mr Churchill and his colleagues explained to the public from time to time that the Soviet army in central Europe immobilises on the Continent the pick of the British army. Thereby it affects British strength and dispositions everywhere east of the Mediterranean. Nato's strategy may begin in Europe but it should not end there; otherwise the Russians could quite fairly claim that they, and not the West, are doing the "containing."

Test of Belgian Loyalty

Mutiny in the armed forces is always a serious matter, and political action in support of it can be even worse; but how bad depends on motives and circumstances. In the recent case of Belgium some sympathy must be felt with the national service men who demonstrated against their two-year term with the army. For they had both the general grievance, shared by the population, that Belgians alone of the six peoples in the European Defence Community are serving two years; and the particular grievance that various ministerial statements had led them to believe they would be released this month after 18 months' service.

What is remarkable and creditable is the restraint that Belgium showed. It is true that the Socialist General Federa-

tion of Trade Unions supported the soldiers; a series of minor strikes throughout the country culminated last Saturday in a token 24-hour general strike. But it was not an unqualified success. The Christian Social and Liberal trade unions refused to take part, and some even of the Socialist trade unionists opposed a strike for political ends. Moreover, the Socialist trade union leaders have never suggested that Belgium should be disloyal to its military commitments; they have no quarrel with an 18-month period of service; and they constantly warn workers against Communist provocation.

It was not to be expected that representatives of the Defence Community—which does not yet exist—should agree at their meeting in Paris this week to solve Belgium's problem by raising their terms of service to its level. The French cannot make up their minds about it until next year, because of their disappointments over American aid; the Italians are unlikely to move ahead of the French; and in Germany the question is not even actual. M. Van Houtte therefore found the problem thrust back on his hands. Having indicated that his government would have to revise the period of service if its allies did not increase theirs, he found himself in a difficult position. The right and strong attitude would have been to explain that Belgian troops cannot hold their own with British comrades in Germany, either in quantity or quality, without two years' training. But M. Van Houtte's political position is not too firm and he has been forced to fall back on a compromise. The principle of a two-year term is to be maintained, but for the present conscripts will be released after 21 months. This means that by the end of the year Belgium will have about 20,000 fewer men than estimated; it will presumably have to revise its defence commitments to Nato accordingly.

Housing Regardless

As Minister of Housing Mr Macmillan is carrying all before him—even, one may assume, the Treasury. Committed to a very heavy housing programme at a time when economic circumstances make it thoroughly inopportune, he is certainly

executing it with great vigour. The target of 300,000 houses a year, so rashly set up by a Conservative party conference and later by election propaganda, will not, of course, be hit

Gracious living at its best

What a joy it is to relax; what masters of relaxation are Cunard. In these great ships you enjoy precious days that have no equal ashore. Atlantic air, convivial company, wines, cocktails, all conspire to brace and soothe you and prepare the way for meals that are truly superb. From every corner of Europe, from the U.S.A., from the East, a thousand culinary delights have been gathered... There is restful quiet or sparkling gaiety. Games, cinema, carnival and dance, laughter and well-being; all blend in one glorious unforgettable experience. Your Cunard days are indeed gracious living at its best.

this year or even next; but house-building has already been greatly speeded up.

In the first half of this year some 21 per cent more houses were completed than in the first half of 1951. Most of these houses were, it is true, started under the Labour Government, but it is satisfactory that they have been built rather less slowly. Of the brick houses completed, only 80 per cent took more than seven months to build, compared with 87 per cent in the first half of 1951. At the end of June the number of houses under construction was 18 per cent higher than in June, 1951. The number of houses started was 31 per cent higher; and of these, houses being built for sale have shown a higher proportionate increase than those which will be let. This is a slight shifting of the balance towards housing as it was before the war, and as Conservatives would wish to see it again, when most houses were built by private builders and local authorities concerned themselves mainly with slum clearance and the relief of overcrowding.

Higher productivity, no doubt, has something to do with the improvement. So, too, has a more economical use of materials. A higher proportion of houses—about 60 per cent—are being built with only 2 bedrooms, which gives a saving of about £120 per house. But the good results are mainly due to an increase in the number of men employed on housing. At 253,000 in June, this was 15,000 higher than in June last year. Tighter money has probably drawn men away from black market work, and the cuts in capital investment have diverted them from industrial building. It is not quite fair to say, as Mr Gaitskell has done, that the Tories are building more houses by building fewer factories; the cut in industrial building saved steel, which is hardly used in houses, as well as manpower. But this does not alter the main point that so large a housing programme conflicts sharply with the rest of economic policy.

Two Islands

Whatever the rights and wrongs of the dispute between the Maltese Prime Minister and the Secretary of State for the Colonies, it is unfortunate that it should have been allowed to occur. Doubtless Mr Lyttelton was anxious to make a statement on the British offer of financial aid before Parliament adjourned; but it is not clear why Dr Olivier's failure to sign on the dotted line by a certain time should have been castigated as a rejection of the offer when Mr Lyttelton knew, apparently, that he was prepared to accept it.

The offer itself seems generous. The British Government would give Malta £500,000 in the current financial year, and for four years beginning with 1953-54 would meet two-thirds of the cost of an emigration programme to be agreed with the Maltese Government, up to a maximum contribution of £200,000 a year. These sums would be additional to the £1½ million provided from the Colonial Development and Welfare Fund to meet half the cost of Malta's "social equipment" projects. Yet more aid would be considered if the Maltese Government has more difficulty in balancing its future budgets than is expected.

Mr Lyttelton pointed out that the offer is distinct from the £31 million granted to Malta for the repair of war damage and reconstruction. Unfortunately, here, too, there appears to be misunderstanding between Malta and Britain. The British people, at least in Maltese eyes, regard this grant as a sort of spontaneous thanksgiving fund for Maltese services in the war. The Maltese, on the other hand, regard it as their due under the laws of war and that "in respect of this settlement Malta fared much worse than most enemy countries."

The outcome of the unhappy affair is still uncertain. The Maltese deputation departed last weekend, leaving behind a letter apparently expressing willingness to accept the offer but without a signed declaration of acceptance. The next move is thus with the Secretary of State. He ought to be

more conciliatory than he appeared in the House. It ill becomes a large island to give even the appearance of bullying a small one, especially when the small one may again be called upon to give valuable strategic assistance in time of war.

Soldiers of Peking

"Conspicuous by their absence" is a horrible cliché, but it is useful to keep it in mind when reading official accounts of formal occasions in Moscow and Peking. When, for example, Soviet Navy Day was celebrated on August 10th there was a notable absence of references to American aggression and armaments. They were missing—unlike last year—both from the special leading articles and from the Order of the Day issued by the Soviet Navy Minister, Admiral Kuznetsov. During the air parade last month anti-American posters appeared on Moscow walls, provoking a protest from Mr Kennan, the American ambassador. Perhaps it had some effect.

In Peking the omission is of a different kind. The twenty-fifth anniversary of the People's Liberation Army was kept with great fervour, and the general political department of the People's Revolutionary Military Council issued one slogan for every hour of the day. The fact that seven of them were anti-American is less remarkable than the fact that none of them was pro-Stalin. One has come to expect at least "Salute Stalin, standard bearer of peace and father of all the workers of the world"—well up the list. In the Soviet Union itself, however, the correct tributes duly appeared from the pen of Chu Teh, Commander-in-chief of the Forces in a leading article for *Pravda* of August 1st. The Chinese Communists, he said, "applied in practice the revolutionary theory of Marx-Engels-Lenin-Stalin and of Bolshevik power" in developing their army. The Chinese should "exert all their strength to study Comrade Stalin's military teaching"—and so on. The compliments prescribed by Communist protocol were duly paid, but not in the hearing of the Chinese public.

It would be unwise to regard Chu Teh's article as merely complimentary. It provides interesting hints of the role that he sees his "highly modernised" troops playing. They will not merely defend Chinese territory; they have the "new historic mission of rebuffing imperialist aggression." In the future, when the armed forces "have been perfected," China will also have the "honourable task of jointly defending the cause of peace with the great bulwark of world peace, the Soviet Army." That might take the People's Liberation Army quite far afield.

Mr Rhee and the Ballot Box

The most interesting thing about the South Korean elections was not the casting of three-quarters of all votes for President Syngman Rhee, but the casting of one quarter against him. This evidence of opposition can, of course, be variously interpreted. Communists will claim that it shows that not even brutal repression could silence the voice of the people. General Mark Clark, who congratulated the victor in curiously fulsome words (are all democratic peoples really inspired by Mr Rhee's fight for freedom?), would presumably cite the opposition vote as evidence that true democracy exists in South Korea.

The truth would seem to differ from both claims. Pains were taken to make the ballot as fair as possible; votes from different electoral districts were mixed in order to protect any district voting against the President from victimisation. A small group of United Nations officials visited as many polling stations as they could. Little concrete evidence of illegal pressure on the voters has as yet come to light, and it is doubtful in any case whether such pressure would greatly affect the result. Both as President, and as a veteran national leader, Mr Rhee has a unique position in the imagination of the average Korean.

The same cannot be said of the successful candidate for the vice-presidency. Mr Ham Tai Yong is a virtually unknown judge, even older than the 77-year old President, and won a million more votes than the former prime minister, Mr Lee Bum Suk. Mr Lee is perhaps the second best known man in Korea and has a long patriotic record, but his obscure opponent defeated him purely on the strength of Mr Rhee's backing. If this is not enough to show the electoral advantage that the man in possession holds in a rural country like Korea, it is also to be noted that in the Pusan area, where people are relatively well informed and politically conscious, Mr Rhee got less than 40 per cent of the votes. It would seem, therefore, that the President's prestige and his control over local officials and police sufficed to win him overwhelming majorities among the simple villagers, but that the official machine did not operate so crushingly as to affect the urban vote. President Rhee cannot simply be classified as a dictator. But his ambitions and authoritarian ways have led him to use unnecessarily forceful methods.

Wisdom from Marshal Tito

The second instalment of the International Bank's loan to Yugoslavia is now under discussion in Belgrade. That the negotiations should succeed is of extreme importance to the Yugoslavs. Without substantial help they have little chance of reaching even the modified aims of their industrialisation plan now due to be completed by the end of this year. The Bank's first instalment of \$28 million, granted last October, is almost spent; and the western powers have declined to stretch their tripartite aid programme to include funds for capital investment.

It will not be easy to close the gap between what the Yugoslavs think they need and what the Bank's representatives think they ought to have. The latter feel that the Yugoslavs have jeopardised their case for aid both by failing to correct their foreign trade deficit and by grandiloquent—and in some cases unsuitable—industrialisation plans. Many western observers have felt there has been too much preoccupation with factories and too little with exporting food and raw materials. In the first half of this year, Yugoslavia's total imports were worth 52,500 million dinars, and exports 45,300 million, thus showing a deficit of 7,200 million. As, however, 18,400 million dinars worth of the imports were financed by the tripartite aid programme, Yugoslavia's foreign exchange reserves increased during this period by 11.2 million dinars. But foreign aid programmes will not go on indefinitely.

It is, therefore, encouraging to hear Marshal Tito, in a recent speech at Gline in Croatia, telling his audience some of these things. He indicated that next year agriculture, hitherto sadly neglected by the planners, will be in "the forefront of our problems" and that it is to receive a fairer share of the investment available. Although he stressed the importance of completing the "key projects" now under construction, he added that "we will not indulge in megalomaniac plans." Future planning will be based on "our country's possibilities." New factories will be built only if they are really essential and if 50 per cent of the raw materials they need can be provided inside the country. These are welcome signs that the Marshal's advisers are beginning to see the advantages of cutting one's coat according to the cloth available.

Danckwerts in Practice

The supplementary estimate implementing the Danckwerts award to general practitioners was voted in the House of Commons before the recess. But payment was always conditional upon the doctors agreeing to a new method of distributing the central pool, and the absence of debate on

the supplementary estimate does not mean that the working party's proposals (discussed in *The Economist* of June 14th) have lacked criticism. In the current issue of the *British Medical Journal*, Mr Marquand has given notice that the Opposition will seek an opportunity in the autumn of debating the proposals and putting forward "constructive criticisms." The declared opinion of the Parliamentary Labour party is that through the present Government's acceptance of the working party's report

a most valuable opportunity has been missed to better the general practitioner service to the public and to improve the standards of doctoring throughout the country. Moreover, the report fails adequately to improve the position of the young and poorer paid doctors having small lists of patients, and gives the greatest increase of payment to those who are already receiving higher rates of remuneration. Its proposals for the encouragement of group practice are grossly inadequate.

These criticisms obviously accord with general Labour sentiment. Success should not be rewarded, and individualism in enterprise should be discouraged. Between this view and the opposing view that there should be no restriction on earnings, the working party's proposals are a compromise which is apparently acceptable to most doctors. They should encourage partnerships, the nucleus of group practice—though it is far from certain that group practice is always and everywhere desirable. They provide for initial practice allowances to be paid to young doctors in under-doctored areas. They load the capitation fee by 10s. for patients on a doctor's list in excess of 500 and up to 1,500, and they abolish any payment for patients in excess of 3,500.

Presumably, the Labour party—and some doctors—would prefer to include the first 500 patients in the loading. But it can be assumed that doctors with very small lists—except the elderly for whom special provision is made—either do not depend on family doctoring in the health service for the bulk of their income or else are not successful. There must, surely, be some point at which it becomes financially unrewarding to be a bad doctor, and the point chosen by the working party seems reasonable.

Rises for Clerks

There have been sharp changes during the past two years in scales of office pay. The fifth biennial analysis of clerical salaries, undertaken by the Office Management Association,* shows that clerical salaries rose between March, 1950, and March, 1952, in much the same proportion as wage-rates; they about kept pace with the cost of living. Although these surveys in different years must not be compared with too much statistical precision, because of sampling differences, there is no reason to question this general result. Most offices have had to make at least one, and often two or even three, upward revisions to their salary scales in the last two years. Less foreseeable is the survey's indication that during the last two years the differentials in pay between men and women, and between the upper and lower grades, have at last stopped shrinking. Another change suggested by this survey is that the white collar is less attractive to boys leaving school than it was two years ago.

Salaries are recorded separately for different areas and industrial groups and for six grades of clerks, distinguished according to the skill and quality of work expected of them. In the lowest grade are the office boys and messengers; in the highest the supervisors, personal secretaries and cost accounting clerks who now earn on the average a little over £11 a week if they are men and £8 a week if they are women. Outside London, where salaries are naturally highest, there are no very marked regional differences in rates of pay.

* Clerical Salaries Analysis 1952. Office Management Association, 8, Hill Street, London, W.1. 68 pages. 25s.

Among industries, the highest salaries are recorded in metal manufacture and in the transport and chemical industries; in the distributive trades the pay is below average. Clerks in government offices, nationalised industries and banks are not included in the main survey, but their scales are summarised separately. Bank clerks are well at the top of the list. When he is twenty-five a male bank clerk gets nearly £2 a week more than a clerical officer in the civil service at the same age.

With the movement towards more standardised scales, it is perhaps surprising that the response to the last survey was less good than before—the number of clerks covered dropped from 73,000 to 56,000, although more offices were asked to take part. It would be a pity if this particular form-filling were found to be too irksome; the figures it provides—if not entirely comprehensive—fill a much-needed gap.

* * *

Lessons of American Farming

A study of American agriculture* by Mr A. N. Duckham, who was formerly the British agricultural attaché in Washington, contains some lessons for British farmers. The output per worker on farms in the north and west of the United States is much higher than in Britain, although the American average is dragged down by the large number of poor farms in the south. The American advantage lies in the field of farm management and labour economy. The key to greater efficiency has been the great advance in mechanisation in recent years. In the brief period since 1944, the number of grain combines and milking machines has more than doubled, while that of farm tractors has increased from 2,215,000 to 3,940,000.

A similar process has of course taken place in Britain. But the significant difference seems to be that American mechanisation is directed towards reducing labour costs (which are high) to a much greater extent than in Britain. Great attention has been paid to simplifying working routines and to improving working conditions, with the consequence that the regular farm worker is well paid and labour relations are good, apart from the treatment of migrant labour. Successful mechanisation is also aided by the close association between the motor-car and the farm-implement industries, and the good distributive and repair facilities which are thus available to the farmer.

The comparison is, however, by no means wholly unfavourable to British agriculture. In the United States, specialisation is pushed to the point where it is often inconsistent with good husbandry, whose requirements get much closer attention in Britain, to the ultimate benefit of the land. Many American methods of boosting output are quite unsuitable for use in a small island. Mr Duckham believes that the basic difference between the two countries lies in the attitudes of their agricultural populations. The American farmer and worker, spurred on by a successful pursuit of higher living standards and uninhibited by any sense of social inequality, display a degree of enterprise not matched in this country.

* * *

Europe's Farmers

Feather beds for farmers have been a feature of post-war Europe as well as of postwar Britain, even if they have lain somewhat less softly in the past year or two. Yet it has always been difficult to measure just how soft the feather beds were because of the lack of reliable data about farm incomes. A recent joint report by the Economic Commission for Europe and the Food and Agricultural Organisation† fills this gap to some extent. It attempts to show changes in

farm incomes from crops and livestock products in sixteen countries of Western Europe and in Czechoslovakia.

Two general points emerge. The first is that in the years just after the war prices for livestock products rose much more sharply than crop prices; but since 1950 the prewar relationship between prices in these two groups has begun to reappear. The second is that up to 1951 farm incomes from livestock products in almost every country rose much more sharply than the general level of wholesale prices when compared with prewar years. In at least half the countries farm incomes from crops also rose in the same period more sharply than wholesale prices. For both groups of agricultural products the period since 1951 has shown a smaller proportional rise than for wholesale prices. In short, it needed the commodity boom that occurred after the Korean war broke out to rectify the favoured position that European farmers enjoyed.

The results of this study, obtained by questionnaires submitted to various countries, must be treated with some reserve. It is difficult to obtain accurate information about the prices actually received by farmers, including subsidies and premiums; and there is also the technical problem of striking an average for a crop-year. Even comparisons between countries are suspect, because methods of compilation and definition vary from country to country. It is clear, none the less, that prices of crops (especially feed crops) have risen relatively more in those countries where livestock production is important. And it is precisely there—in Britain, Scandinavia and the Netherlands—that the farmer's lot has improved most since the war.

† Prices of Agricultural Products and Fertilisers in 1951-52—United Nations.

The State of Politics

Foreigners, the most intelligent, are apt to fall into strange errors respecting English politics. . . . The able and accomplished Editor of the *Debats* was in England during the late general election, and the conclusion at which he arrives is, "that the new English Parliament has neither principle, idea, nor doctrine: that the old mechanism of the constitution, government by parties, is broken up: that England can produce but negative majorities: that the Legislature is incapable, and Government of no use." We do not wonder that such impressions were produced on the mind of a stranger when he saw a Government holding power which was, and still is, admittedly in a minority, and when he saw an opposition forming a decided majority, but consisting of so many sections and with so little accord, that it is doubtful if by a little ingenuity the minority will not govern in spite of the majority. But the conclusions arrived at by the *Debats* are the reverse of the truth when the state of the English Parliament and English parties is looked at beneath the surface. . . . One of the great characteristic differences between the French and the English is, that the former have not the necessary patience to work out any system of government. . . . Representative government, no doubt, has its periods of difficulty like others. And it is only by patiently enduring them, trusting to the good sense of public opinion and a free Press, that all comes right in the long run, and that a country in the main makes great strides of progress from period to period. From some points of view, owing to the circumstances we have named, we look to be in a "fix"; but a little time and public opinion will soon unravel all our apparent incongruities and anomalies; and the more quickly and creditably, the less fastidiously public men adhere to their preconceived associations from personal considerations.

August 14, 1852

a vital industry

The Thames Board Mills' story is one of vision and enterprise. Here is an organization known wherever British-made "cardboard" is used; proud to be the largest of its kind in the British Empire. Here, modern craftsmen, with their mammoth machines, transform tiny fibres into thousands of tons of "THAMES BOARD" a week. Large reels, small reels, sheets of many sizes, white, brown, grey and coloured—vital board to pack millions of pounds-worth of British goods or to bind books and to make ceilings and walls in buildings of all kinds. Food, soap, clothing, footwear, medical supplies, hardware, electrical apparatus—all manner of goods—need the protection of cartons made from "THAMES BOARD," plus (of course) "FIBERITE" PACKING CASES, to get them safely to market.

PROGRESS in ELECTRONICS

THE HEART of every electronic device is the electron tube. Without it there would be no radio, no television, no telecommunications, no nucleonics, no radar.

The development of electron tubes is a major activity of the Mullard organisation. In extensive research laboratories, Mullard scientists are continuously at work increasing the efficiency of existing techniques and designing new ones to meet the ever-changing needs of industry, communications and medicine.

Bringing the benefits of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

Mullard

PLASTICS

inspire new ideas

What is to be done about metal drums? They are excellent from the protective standpoint, but some products—delicate liquids in particular—are contaminated by contact with the metal. Plastics have again provided the answer. Lined with a collapsible bag of BX Polyvinyl Chloride, the drum portion of this container, produced

by Tanks & Linings Ltd., Droitwich, in co-operation with Reads Limited of Liverpool, makes no contact with the contents at all. After emptying

through a tap, by injection of compressed air between liner and container, or by pouring, the lining can be removed for use again. There is no need for CO₂ or filtered air; nothing touches the contents but the bag.

The industrial uses of BX plastics are innumerable. It will pay you to check up on their possibilities in relation to your own needs, through our Technical Service Department.

NEW Comet

JETLINER SERVICE.

to India and Ceylon

An eight-mile-a-minute Comet jetliner service is now operating to Bombay and Colombo via Rome, Beirut, Bahrain and Karachi.

This is additional to the London-Johannesburg Comet service three times a week.

Shortly, Comet jetliners will be introduced on the B.O.A.C. air route between London and Singapore.

Watch for the starting date.

Remember: It costs nothing extra to fly by this fastest ever service to India and Ceylon.

Consult your local Travel Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VICTORIA 2323) or 75 Regent St., W.1 (MAYfair 6611).

Books and Publications

Royal History

King George V. His Life and Reign. By Harold Nicolson. Constable. 570 pages. 42s.

Uniformly good men are said to make dull heroes and an official biography of King George V might well have been an indispensable but ponderous compendium. It is therefore most fortunate that the task was entrusted to Mr Harold Nicolson, a master of all the arts and crafts of contemporary history and biography, a man, too, who has moved all his life in exalted circles and is not afraid to be amusing in the discharge of a task which would have kept humbler scribes continuously on their knees. His book is quite excellent. Not the least of its merits is its length, less than half as long as Sidney Lee's biography of Edward VII; yet no aspect of the subject is inadequately treated, for Mr Nicolson is a quick mover and, like a good card-player, knows what to discard. Equally admirable is the balance between "Life" and "Reign," biography and history, the man so simple and straightforward and the events so complex and multifarious. If ever we think we are getting submerged in the familiar history, we are brought back to biography with "The King viewed these developments with apprehension and wrote to his Prime Minister . . ." and there follows something that the best informed among us did not know and could not have known before.

The character of the King is well understood, though it has never before, perhaps, been delineated with such a combination of sympathy, candour and felicity. The peculiarity of the reign from the royal standpoint was the number of occasions which, in the course of a mere twenty-five years, raised problems of the nature, extent and limits of the royal prerogative in the political field. Bagehot said long ago that the reign of George III was "a sort of museum of the defects of a constitutional King." The reign of George V was a museum of exhibits of the opposite kind. On all of these exhibits Mr Nicolson throws fresh light, prefacing his account with an analytical survey of the subject which may come to be recognised as a classic text.

First there was the problem of the promise to create peers, if necessary, to ensure the passage of the Parliament Bill. Was Mr Asquith entitled to ask for such an undertaking before the election of December, 1910, or only after he had won it, and at what point was it proper that the undertaking should be made public? Then there was the demand of the Opposition that the King should in certain contingencies revive the royal veto at the expense of the Home Rule Bill. The contention seems, and perhaps was, absurd, but Unionists seriously argued that, by curtailing the powers of the House of Lords and refusing to implement their promise to reform that institution, the Liberal Government had brought the royal veto

back into the arena of practical politics. Then there was the problem of choosing a new Prime Minister—Curzon or Baldwin—created by the incapacitation of Mr Bonar Law, and the problem created by the break-up of the Labour government in 1931.

Needless to say the book abounds in memorable phrases:—Ramsay MacDonald "a blend of silk and tweed," for example. Minor matters such as ecclesiastical appointments are skilfully handled. As an illustration of the conscientiousness of all concerned in this particular line we are told of the number of persons of unimpeachable wisdom whose approval was secured before the vicar of St. Margaret's, Altrincham, was made a Dean. We are not told the name of this parson. The reader is left to guess it—an intelligence test.

China's Course

Revolution in China. By C. P. Fitzgerald. The Cresset Press. 290 pages. 21s.

Professor Fitzgerald has made a name for himself as a historian of China; his "China: A Short Cultural History" in the Cresset Historical Series is a standard work. With this background of knowledge of the remoter Chinese past he has undertaken the task of interpreting the very recent past and present of China—including events of which he was a close observer or even an eyewitness, for he was in Peking during the Kuomintang-Communist civil war and at the time of the Communist capture of the city.

The result of the combination of long-term perspective with overwhelming close-up fragmentary impression has not, however, been altogether satisfactory. There is wisdom and discernment in much that he has to say about the continuity in Chinese political attitudes from past times, and his account of his own direct observation of what happened in and around Peking is a valuable contribution to the record of those years. But Peking itself at the time was at the mercy of every kind of rumour and speculation about what was going on, and Mr Fitzgerald appears to have been unduly influenced in his judgment by the climate of opinion in the Chinese academic circles in which he moved—circles particularly prone to illusions about Communism, which in many cases have been discarded only when it is too late. The author came away from China with strong sympathies for the Chinese Communist cause and a tendency to explain away anything to its discredit; more recent events have apparently modified his outlook, but the new convictions have not entirely absorbed the old, so that there are curious inconsistencies and contradic-

tions between different parts of the book.

One of the crucial issues in any attempt to write a history of the Communist revolution in China is the assessment of the intention, extent and effect of the aid given by the Soviet Union to the Chinese Communists in Manchuria. Mr Fitzgerald's account of this aspect of the conflict is open to grave objection. He considers that Soviet policy in 1945 was not planned but improvised, and he argues that the fact that the Russians allowed the Kuomintang to take over certain Manchurian cities and looted Manchurian industry instead of handing it over intact to the Communists proves that they did not have at the time a policy of backing the Communists. He does not mention the collusive transfer of the Japanese arms stocks to the Communists or the Soviet blocking of landings, not only at Dairen, but also at Hulutao and Yingkow, which would have kept the Nationalists out of Manchuria altogether if they had not, nevertheless, succeeded in breaking through by the land route from Hopei.

Soviet policy was not so mysterious as Mr Fitzgerald makes it out to have been, if it is borne in mind that the Russians wished to make at least a show of observing the treaty with Chiang Kai-shek which they had just signed and were probably anxious also to provide for the contingency that the Chinese Communists would be defeated—after all, they could not know in advance that American policy would be what it turned out to be. The result of Soviet policy—and it is only reasonable to suppose that such also was its intention—was to give substantial, and perhaps decisive, aid to the Chinese Communists without committing the Soviet Union to any open intervention on their behalf.

In a final chapter Professor Fitzgerald foresees a "two-world era" in which the European-American and Russo-Chinese power blocs will contend for "marginal lands" without the prospect of decisive alterations to political system in their "base lands." This view of the future seems to have been shaped by the experience of the (so far) successfully localised Korean war, but the author assumes far too easily that similar conflicts in more important areas could likewise be kept within limits. It is unlikely that further violent advances of Communism in Asia can now occur without involving a major war, and it would certainly be foolish to suggest to the policy-makers in Moscow or Peking that they can raise the stakes without risk.

Defining Power

Power and Society. By H. D. Lasswell and A. Kaplan. Routledge and Kegan Paul. 295 pages. 23s.

Taking political science to be an empirical study in "the shaping and sharing of power," these two American authors attempt to provide a "con-

ceptual framework" for such an inquiry. Their essential task is to translate political abstractions such as "state" and "sovereignty" into observable relationships between individuals influencing and controlling each other. They are concerned to define suitable technical terms and to put forward propositions intended to facilitate research; they do not, however, set out to apply their apparatus to specific problems, nor to substantiate their propositions with supporting evidence. Ultimate judgments upon their proposals must, consequently, be deferred.

The authors begin by providing a terminology for describing the conduct of persons acting singly or in various groups. However, their basic concepts, "indulgence" and "deprivation," seem to be indistinguishable from the more familiar "utility" and "disutility" or even Bentham's "pleasure" and "pain." In the second, and perhaps most useful, part of the work, some sixty different types of power are distinguished according to the values on which power may be based (wealth, skill, respect, etc.) and according to the values over which it may be exercised. Finally, a distinction between formal power (authority) and effective power is elaborated, technical descriptions being supplied for the several groups exercising different forms of power and for the social structures within which they are employed.

If the virtue of a system of concepts lies in simplicity and clarity, this project hardly succeeds. Several terms are ambiguous; the definition of "power," for example, given in terms of participation in the making of decisions, is not supported by a satisfactory account of what "participation" means. Moreover, the authors' addiction to technical language makes their work difficult to use; there is some disproportion in an infant science so heavily shod. Nevertheless useful distinctions are made, and though the reader familiar with the work of Pareto, Tawney or Russell, for example, will be acquainted with many of them, the authors have done a service in supplementing them and in attempting to give them systematic expression.

Utopias and Eutopias

Welfare Economics in English Utopias.
By J. K. Fuz. Martinus Nijhoff. (The Hague.) 113 pages. 7 Guilders or 13s. 6d.

To an economist or a historian of economic thought Utopias are apt to provide no more than a byway for recreation or an occasional entertaining anticipation or parallel. Dr Fuz, selecting for study not even Utopias in general but that particular set of Utopias imagined in a single century, the seventeenth, may be thought to have narrowed his field beyond any possibility of fruitful cultivation; but in fact there emerges from his comparative research a surprisingly coherent body of thought, the more recognisably so from that very detachment from current events which the Utopian form provides. He distinguishes, very properly, between the

mere "Utopia of escape," which assumes away the existence of scarcity, and the "Utopia of realisation" which recognises it. Only the latter can conceivably interest an economist.

The seventeenth-century Utopians, from the near-Communist Winstanley to the arch-individualist Mandeville, recognised scarcity, but not as nineteenth-century thinkers did; in their preoccupation with unemployment and the development of unused resources they were far closer to our own day. There is, however, an enormous difference, not only to be ascribed to different degrees of knowledge; none of Dr Fuz's Utopias display what is almost the characteristic feature of current Utopianism, the conviction that the nations are impelled by a wind of history which, according to their wisdom or unwisdom, will drive them to rapid destruction or carry them on to whatever the propagandist regards as felicity. They do not proclaim "These things shall be." Today's Utopia is no longer, in Dr Fuz's words, the "creative leap into the future" of a few powerful imaginations; it is what ought to exist here and now if only we all had our rights, if only they, the others, were not such malignant fools.

Dr Fuz's evidently considerable labours have produced a pleasant and original book; but the English text ought to have been more thoroughly vetted and the proofs more rigorously read. An unusually agreeable piece of book production is marred by altogether too many misprints, misspellings, and understandable but irritating mishandlings of English idiom.

Twenty-One Years

Majority, 1931-1952. An Anthology of 21 Years of Publishing. Hamish Hamilton. 1,035 pages. 25s.

Mr Hamish Hamilton started publishing in 1931 and now he can look back upon twenty-one fruitful and (one must hope) profitable years. It cannot have been often that a young man, starting in the exacting trade of publisher at the bottom of a slump, has built himself so solid a reputation in so short a time.

"Majority" is a sample of his wares, and one of which he may justly be proud. It is, of course, a book to read in rather than to read, for the selections have been made (as Mr Hamilton hints in his preface) as much because they were of the right length as because they were the best things by these authors that have appeared under the same imprint. But it is a brave parade of names. Mr Hamilton has always specialised in books by journalists, especially foreign correspondents, and quite particularly Americans. They are here—John Gunther, Alan Moorehead, John Mason Brown, R. J. Cruikshank. There are also the representatives of that closely allied genus, the academics writing current history—D. W. Brogan, Sir Lewis Namier, A. J. P. Taylor. But it would be wrong to regard Mr Hamilton just as a "current affairs publisher"; he has Arthur Koestler, Harold Nicolson,

Angela Thirkell, James Thurber and Stephen Spender on his list. Even Bernard Shaw is there—in a Preface written for a re-issue of "Great Expectations." And there are many more who could not be squeezed into one cover.

On all this Mr Hamilton (who is the most human, the least parasitical, of publishers) deserves congratulation. The book, however, also most vividly reveals one thing that has happened to publishing in the past twenty-one years. It is very expensive.

Third Balkan War

The Origins of the War of 1914: Volume I. By Luigi Albertini. Translated and edited by Isabella M. Massey. Oxford University Press. 612 pages. 50s.

It has been estimated that the student of the origins of the first World War has at his disposal some 60,000 documents, but it has to be remembered that many important documents were not made public until a few years before the outbreak of the second World War. Among these was the collection of French documents published in the late thirties as a result of a campaign by French scholars who were indignant with the inadequacies of the French Yellow Book of 1914. The late Senator Albertini has written with the advantage of having seen many documents not seen by his precursors; his work was first published in Italian in 1942-3. He had the advantage of consultation, whether by correspondence or in conversation, with many of the leading personages involved, and was himself in a sense an actor as the editor of one of the world's most respected newspapers. The result is a work of first importance and its translation into English is greatly to be welcomed.

This first volume begins with the *Ausgleich* of 1867, which was one of the principal results of the defeat of Austria by Prussia in the preceding year. It carries the story down to the very eve of the Archduke's fatal visit to Bosnia. The emphasis throughout is on central European affairs, a useful corrective for the English student who is apt to concentrate on Anglo-German rivalry. The main theme of the volume is the creation at Berlin in 1878 of an order for eastern Europe and the overthrow of that order just thirty years later by Aehrenthal, when he annexed Bosnia-Herzegovina and renounced the Monarchy's rights in the Sanjak of Novibazar. The principal feature in the background is not the rise of the German Reich but the decline of the Ottoman Empire. In Austria-Hungary it was easy to suppose that the retreat of the Porte would be accompanied by a corresponding advance by the Austrians and the Hungarians, who had checked the Turks in the sixteenth century and contained them ever since. In fact, however, the Christian subject races of the Porte had other ideas, and the Habsburg Empire, deprived by the retreat of the Turks of its historic mission, became the principal casualty in a war which, though it developed into the first World War, started as the third Balkan War.

Mediterranean Strategy

The Struggle for the Mediterranean, 1939-45. By Raymond de Belot. Princeton University Press (London: Geoffrey Cumberlege.) 287 pages. 25s.

In this book Admiral Raymond de Belot succeeds in keeping a map of the whole Mediterranean constantly in front of the reader's eyes. Most war diaries and books on World War II are written from the point of view of one side or the other, but this French author has succeeded in presenting the events not only as viewed at the time by both sides, but also as seen in retrospect with the full knowledge of all the information made available since the war, particularly from the secret papers of the Axis powers.

The author does justice to both sides and a reader with an unbiased mind, be he British, French, German or Italian, will find that justice has been done to the achievements of his own nation, while at the same time there is sober appraisal of shortcomings or faulty strategy wherever they occur. A British reader, for example, will find praise for the Royal Navy and its ascendancy over an enemy superior in numbers on the sea and in the air. An Italian reader will find that justice is done to the courageous fighting of individual ships and individual men—in particular to the brave crews of the "human torpedoes" whose hazardous work achieved such brilliant success and such far-reaching results—and the fair-minded Italian reader will not dissent from the author's strictures on the Italian High Command and admirals in command at sea for their excessive caution and their preoccupation with the safety of their ships. British and French alike will appreciate the fairness and sympathy with which the author recounts the tragedy of Mers el Kebir.

The book is a valuable contribution to clear thinking on the strategic importance of the Mediterranean and the Middle East at the present time when these topics are of such public interest and the subject of Anglo-American controversy. Both the author and his skilled American translator, James A. Field, who has written an introduction to the book, share the British view, that control of the Mediterranean and the Middle East by the western powers would be vital to their success in war. They describe how Britain never wavered in its Mediterranean strategy in the recent war, and even ran great risks at home in order to maintain its hold upon the Middle East. The Axis powers, on the other hand, by faulty or hesitant strategy, failed to wrest the Mediterranean from Britain in spite of golden opportunities of doing so.

This is a most readable book containing intensely interesting descriptions of the main naval incidents such as Taranto, Matapan, the convoy actions, the struggles for Crete and Malta, and the landings in Sicily, Italy and Southern France. Each incident is seen in its true perspective against the background not only of the struggle for the Mediterranean but of the World War itself.

Letters to the Editor

Commonwealth Migration

Sir,—It is disappointing to find that the tendency for young people to migrate and to leave the elderly at home is still regarded as a serious obstacle to agreement on Commonwealth migration policy. If, as you suggest, an essential condition of migration were that "the Dominions must accept a cross-section of the British population" it would indeed be a formidable difficulty, since some degree of compulsion would be required to obtain the cross-section: and compulsion must surely be ruled out, at least at this stage.

But the condition postulated would only hold if the Dominions and ourselves were quite incapable of coming to an agreement on actuarial economics. Provided the receiving country and the home country can arrive at an agreed figure for the emigrant's "value," positive or negative, to the country he is leaving, it would be in the interests of both countries to make financial adjustments between themselves rather than to try to distort the natural pattern of migration. One method of assessing the emigrant's "value" would be to compare the current capital value of pension rights forgone with the current capital value of future insurance contributions lost to the country on the emigrant's departure. Under present conditions the latter would, on the average, exceed the former. The excess would indicate the size of the financial adjustment necessary. This might well take the form of a transfer of Government bonds (in normal circumstances, from the Dominions to the home country).

Such a scheme would enable the home government to regard the loss of young emigrants with no more concern than is now caused by the different population structures of Bath and Dagenham.

—Yours faithfully,
P. G. POWESLAND
Makerere College, Uganda

July Masquerade

Sir,—In your issue of August 2nd you write of housing generators in prefabs instead of brick cathedrals. It is interesting to compare present power station construction with the new oil refineries which are being built in this country. The essential parts of a power station are large enclosed furnaces containing pipes in which water is heated to convert it into steam, pipes to transport the water and steam and turbo-generators to transform the steam into electrical power; the processes all being operated automatically by instruments. The parts of an oil refinery are essentially the same, large enclosed furnaces containing pipes in which the oil is heated, pipes to transport it and, instead of generators, distillation vessels to break it up into its constituent parts; the processes all being operated automatically by instruments. Similar temperatures and pressures are used in both cases.

In the case of the power station, furnaces, piping, generators and the ancillaries are all housed, whereas the oil refining unit is not housed at all; the only buildings to be seen are small pump houses and an instrument panel room.

There is no doubt that a large part of a power station could be allowed to stand out in the open without any covering other than that which the units themselves provide and the resulting structures would be far less unsightly than many industrial plants. On the Continent and elsewhere where people are too realistically minded to attempt to build cathedrals to the greater glory of the electric motor (or industry for that matter) this is already being done to the greater saving of man-hours and materials.—Yours faithfully,

R. M. WYNNE-EDWARDS
London, W.1

Capital Transfers

Sir,—On page 353 of the issue of *The Economist* for August 9th, in referring to Britain's position in EPU, it is stated that the increase in July in the deficit is due partly to annual capital transfers to Holland after the completion of the financial years of the Shell and Unilever groups.

The financial year of the Unilever group ends at December 31st, and there are no annual capital transfers made to Holland; nor have there been any special transfers in the month of July or at any time during the current year. My board have asked me to bring this to your attention, as you appear to have been misinformed, and they feel that in a matter of this sort your readers should not be under any misapprehension.—Yours faithfully,

HUGH SAUNDERS,
Secretary, Unilever Limited
London, E.C.4

ILP Jubilee

Sir,—Since this is the Diamond Jubilee year of the Independent Labour Party, it is intended to stage an exhibition of documents, photographs, books, etc., showing the development and history of the party over the past sixty years. This exhibition will be first shown in Bradford, the birthplace of the party, and afterwards in Manchester and Glasgow.

We wish to make this exhibition as representative and informative as possible, and we would welcome the loan of any books, documents, letters, election addresses, handbills, etc., relating to the ILP at any period of its history. Those of your readers who are able to help may rest assured that great care will be taken of all material loaned, and this will be returned when the exhibition ends.

All material should be sent to me.—Yours faithfully,
G. W. STONE
ILP Office,
318, Regent's Park Road,
London, N.3

SWITZERLAND for ALL TASTES and ALL PURSES

The Swiss Franc is a "hard" currency. Its exchange value in "soft" money countries is very high. A Pound, for instance, only buys Swiss Francs 12.23, but 980 Francs in France and 1,740 Lire in Italy. Does this mean that holidays in Switzerland are dearer than elsewhere? Not at all. To begin with, **a hard currency tends to keep prices stable.** Furthermore, that they are in Switzerland not only stable but in every way competitive, is very clearly shown in a recent investigation made by the Swiss National Tourist Office.

Prices for transportation, accommodation and meals, as well as expenses incidental to travel, were examined on a uniform basis in 10 European countries. On the data obtained from altogether 10 countries (Switzerland and 9 others), 10 price categories were established, the first being the cheapest, the 10th the dearest. It was established that with regard to the cost of transportation—190 miles by rail—Switzerland belongs to the 6th category for 2nd class and the 5th for 3rd class travel. The price of 63 cts per litre of petrol (Fr. 2.86 per gallon) places Switzerland in a category considerably cheaper than that of four other European countries. At a medium class hotel in a large Swiss holiday resort, the price for dinner, bed and breakfast, including tips, is in the 4th category. In the case of an inclusive holiday arrangement for a minimum of 3 days, Switzerland is in the 5th category. Three-quarters of all hotels and inns in Switzerland belong to the middle and lower price categories. As to incidental expenses, 15 items were investigated and an average established for each country. As a result Switzerland was found to be in the very favourable 4th price category.

Adding to these reasonable prices the beauty and diversity of the scenery, the excellent service provided by the hotels, as well as the tourist organisations generally—features which are difficult to express in figures—the holiday maker will find that **Switzerland satisfies all tastes and purses.**

Advertisers Welcome History TODAY

Since HISTORY TODAY was first launched in January 1951, more and more advertisers have come to recognise its value as an advertising medium. For this is a magazine that is read—not merely skimmed through: and not only read from cover to cover but preserved by its readers as a work of reference. Its readership, moreover, consists of men and women who take a keenly critical interest in every new development. They buy HISTORY TODAY because its scope is world-wide—because it interprets the past in terms of the present, and covers every form of human activity from political history to industry and economics, from the battle-field to the scientist's laboratory and the artist's studio.

Among the readers of HISTORY TODAY are the consumers whom you wish to attract.

AMERICAN SURVEY

Stevenson's Strategy

Washington, D.C.

THERE is more than a passing resemblance between what happened last month to Governor Adlai Stevenson, the recipient of the Democratic presidential nomination, and what has happened from time to time over the last few years to a handful of fortunate Americans who have won television and radio jackpots just by staying at home and tuning in to the right programmes. There they were, sitting in their shirt-sleeves in their living rooms, when the telephone bell rang and an exuberant voice said:

Do you happen, sir, to be watching your television set? You do? And are you by any chance enjoying the "Fortune's Favourite" programme? You are? Well, sir, can you give us the answer to this question: How many members were there of the original group of Blind Mice? How many, sir? Three? You're absolutely right, sir, and you have won the "Fortune's Favourite" cumulative prize of half a million dollars, together with thirty cases of Slosh, the Miracle Detergent!

The winner has reason enough to be gratified that, while those around him have been toiling to accumulate wealth, he has outdistanced them all without doing a hand's turn. But when the prize is delivered and the Slosh is stacked in his entrance hall he realises that he has acquired most of the anxieties which beset those who have become rich by more orthodox means. General Eisenhower had to work for the Republican nomination (although he did not work as long or as hard as did Senator Taft, who lost it), and when success crowned his pre-nomination campaign it was clear to all that the effort he had expended was nothing like the effort he would now need to expend. Mr Stevenson won the Democratic nomination without working for it; but from then on his comfortable shirt-sleeved evenings were over.

Both the candidates are moderates; and so each of them has as his first task the conciliation of the extremists within his party whose hopes and ambitions have been frustrated. General Eisenhower's most pressing job has been and still is to make peace with the Republican right wing without either surrendering his independence or appearing to have done so. Governor Stevenson's problem is to placate the Democratic left. He might also have had very serious trouble on the right, with the Southerners who have long exercised upon the Democratic party an influence wholly disproportionate to their numbers and abilities. But the evidence up to now is that the moderates who took control of the convention in order to nominate Governor Stevenson and Senator Sparkman of Alabama behaved with sufficient skill to make a new Dixiecrat rebellion look unpromising and unprofitable to the more realistic of the southern leaders.

There are still dissentients in some of the southern states. Governor Shivers of Texas is threatening to withhold his support unless Mr Stevenson embraces the doctrine that all off-shore oil is, and of right ought to be, the property of the states and not that of the federal government (a doctrine the Republican platform enunciated and the Democratic platform ignored). Mr Lumpkin, the ex-Governor of Mississippi, is leading a group of dissatisfied States-Righters down on the Delta. They say they like Ike; and the Associated Press reports that there are 54 southern newspapers—an unre-

cedented number—which have taken or are preparing to take the defiant step of recommending their readers to vote Republican. None of these phenomena, however, is as important as the vote of the Democrats in Georgia to go along with Governor Stevenson and the recommendation of Governor Byrnes to the Democrats of South Carolina that they should do the same. However, having told the state convention last week that he would vote for Mr Stevenson "if today were election day," but would not bind himself for the future, Mr Byrnes this week signed a petition designed to place General Eisenhower's name on the South Carolina ballot paper.

Where this embittered "on-again, off-again," leadership will get Governor Byrnes has yet to be shown. But the Republican strategy board in Denver is reported to have advised the General to scale down an earlier plan for a week-long campaign in the South, and to make instead a couple of speeches and then call it a day. If this report is true, the inference must be that the Republicans no longer entertain any substantial hope of picking up votes in the South and feel that the candidate's time will be better spent in the vital industrial states and the mid-western farm belt.

But, as Governor Stevenson's relations with the southern conservatives grow more cordial, those with the Negro voters strategically placed in big northern cities grow less so. Representative Adam Clayton Powell, the Negro Democratic Congressman from Harlem, made a fiery speech last week denouncing his party for its "ambiguous" civil rights plank and threatening a Negro boycott of the election unless the Democratic candidates take a more liberal stand. The threat may not mature. Nevertheless, there are liberals in important places, notably in New York, who will be affected by what is said or left unsaid by the candidates on the civil rights issue. The 580,000 New Yorkers who supported the local Liberal party last November could conceivably determine whether Governor Stevenson will win or lose all the state's 45 electoral votes.

★

These and other matters will have to be worked out by the Stevenson forces during the next few weeks. But they are all subsidiary to the main problem, which is the maintenance of the right (meaning the effective) relationship between the Governor, the prospective new leader of the Democratic party, and President Truman, the old but not yet superannuated leader. When, a month or two ago, Mr Truman was looking forward with relish to a 1948-style whistle-stop campaign in support of the new Democratic presidential candidate, he may well have assumed that the candidate would be unreservedly pleased and grateful. That it is not quite turning out this way is a reminder of the difficulties of political forecasting, even for a politician of Mr Truman's calibre.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

There are two main reasons why the Governor cannot now indent for a Truman *tour de force*. One is that he will have to concentrate, during the relatively short time left, on making himself far better known to the average voter. It would be a bad mistake if Mr Truman were allowed to absorb too much of the available limelight. The other is the new Republican line, which alleges that the Governor is a "captive candidate" of the President and that his election would frustrate the widely felt desire for a real change in the government. This will have to be taken seriously.

By setting up his headquarters in Springfield, Illinois, by announcing his intention of being master in his own house, and by surrounding himself with lieutenants (Mr Stephen Mitchell, the Chicago lawyer and chief counsel to the committee investigating Mr Truman's Justice Department, now brought in to displace Mr Frank McKinney as chairman of the Democratic National Committee, Mr Wilson Wyatt and Representative Mike Monroney), none of whom bear any marks of identification as Truman Fair Dealers, Mr Stevenson has begun to establish his own independence. On the other hand, anything that looks like a feud or even a rift with Mr Truman will have to be avoided. Last Tuesday's meeting at the White House with the President and the Cabinet helped materially to dissipate that danger. Mr Truman, demonstrating once more that he is a veteran and a professional, had already announced that he regarded himself as "a private in the ranks." He is giving every sign of a readiness to co-operate with, and defer to the wishes of, Governor Stevenson.

The Democrats, in brief, appear to be acting with notably good sense and they appear to be notably well equipped to start the campaign. They sang a song at their convention about the prosperity twenty years of Democratic rule have brought to the farmers, factory workers and businessmen. "Don't Let 'em Take It Away!" the song was called, and it admonished the voters:

They'll promise you the sky,
They'll promise you the earth,
But what's a Republican promise worth?

Unlike the Republicans, the Democrats have a record to run on, and it is good enough, when all is taken into account, to be made into a campaign theme. They also have an attractive and accomplished candidate. On the basis of what has been said on both sides, even before the real public campaign has begun, it is difficult to doubt that Governor Stevenson will be capable of running oratorical rings around General Eisenhower. That does not guarantee him the victory, but the Republicans cannot believe that it is going to make their struggle any easier.

American Notes

Washington's Best Foot Foremost

However much Governor Stevenson may want to dissociate himself from Mr Truman's mistakes, he must stand on the Democrats' record, and Mr Truman is doing his best to put the Democrats' best foot foremost. The drought has given the Administration a chance to underline its sympathy for the farmer with ready cash; no delay is being tolerated in making disaster loans and, in one state at least, the order is, when in doubt, give the farmer the benefit of it. Maine, indeed, protests it is being offered loans it does not want. In addition, livestock farmers in Tennessee and Kentucky are being given direct federal aid to bring them cheap cattle feed.

The problem of how to deal with the rising cost of living, with political profit, if possible, is not so simple. The Presi-

dent has let it be known that he is watching prices with a view to taking the advice of the retiring Price Stabiliser, Mr Arnall, that he recall Congress and demand stronger control legislation, as he did in 1948. Then the refusal of a Republican Congress to act provided first-rate political ammunition. But this year even some Democrats are saying that prices are rising because the Administration has encouraged wage demands, not because of weaknesses in the law. The Administration itself is embarrassingly divided. Mr Brannan, the Secretary of Agriculture, pointing out that the South is not a major food-producing area, flatly contradicts Mr Arnall's prophecy that the drought will drive food prices up. Mr Putnam, the Economic Stabiliser, thinks Mr Arnall is too pessimistic in assuming the battle against rising prices was virtually lost when steel was given an increase of \$5.20 a ton. No one imagines that Congress, if it were recalled, would re-write an Act that is due to expire, in any case, next March, when a new Administration will be in power. Moreover, with this Congress (unlike that of 1948) nominally controlled by Democrats, it would not be easy, and would be only partly fair, to saddle the Republicans with responsibility for high prices. Governor Stevenson, whom Mr Truman has certainly consulted, may not consider this somewhat shop-soiled manoeuvre worth while.

Meanwhile, there is discreet tidying up of corners which Republicans feel merit a new broom. The Bureau of Internal Revenue is being reorganised after the tax scandals. The House group investigating the Department of Justice seems to be prudently folding its tents, but it has strongly urged Mr McGranery, the new Attorney-General, to restaff his department. This is all the easier because, unfortunately, few of the first-rate men in the department seem anxious to remain. Mr Perlman, the Solicitor-General, is an outstanding loss. But on the credit side is the departure of Mr Vanech, the Deputy Attorney-General, who had such difficulty in passing his bar examinations. Mr McGranery has also hired a private firm to survey the Office of Alien Property. This may have good results, and in the meantime it helps to frustrate the efforts of a Senate sub-committee to investigate charges of favouritism and excessive legal fees in the disposal of enemy property.

Sitting for the Senate

With the presidential nominations decided, the parties are now turning to the nomination of candidates for the House of Representatives, all of whose 435 members must be re-elected, and for the Senate. In addition to the 32 seats normally coming up there this year, there are another three seats vacant through death, in Kentucky, Nebraska and Connecticut. In the last-named there is as yet no sign of order in the chaos of candidates competing for the vacancy left by Senator McMahon's untimely death. Another important vacancy in the Senate has, however, already been filled for all practical purposes. Senator Connally, who is not standing again in Texas, will be succeeded by Mr Price Daniel, the State Attorney-General, for he was unopposed in the Democratic primary election for the Senatorial nomination and there is no likelihood of a Republican winning a Senatorial election in Texas.

Another state in which the Democratic nomination means automatic election is Tennessee, and here a Senator even more picturesque than Mr Connally, Mr McKellar, has just been ousted. The supposedly typical Southerner, beloved of cartoonists, with flowing hair and tie, frock coat and broad black hat, will soon have disappeared from Congress as he has from the world outside. In his 36 years in the Senate Mr McKellar was on the right side in some historic struggles, notably those on votes for women and on American participation in the United Nations. But he owed his reputation, or rather his notoriety, to his exploitation of the spoils system and to his brow-beating of witnesses before

Congressional committees, especially those representing the independent Tennessee Valley Authority, the only federal organisation in his state whose appointments he could not control. Mr McKellar relied on the support built up by long years of patronage to save his seat for him, and did little campaigning. This, and his age, 83, gave his opponents an opportunity of which Mr Albert Gore, a comparatively young Representative, took full advantage.

Mr McKellar's overwhelming defeat in the Tennessee Democratic primary was also a defeat for his friend, the state's political boss, Mr Crump, who had already been dealt a staggering blow four years ago when Mr Kefauver won the other Senatorial nomination for Tennessee. Another unlovely and shaky Democratic machine, in Missouri, also received a further blow in a Senatorial primary last week, and from the same source—an independent candidate who, like Mr Gore, went out and wooed the voters. This was Mr Stuart Symington, who showed the same energy in fighting his first political campaign in Mr Truman's home state as he had in fighting the President's battles in Washington, most recently as head of the Reconstruction Finance Corporation. But Mr Truman's loyalty to the organisation that gave him his start was greater than his loyalty to his colleague. Mr Symington's defeat of the machine candidate, by a large majority on a heavy poll, was a rebuff for the President but one that can do him little damage now. In Missouri the Democratic nomination does not mean election, and Mr Symington still has to knock out the incumbent Republican, Mr Kem, one of the least constructive members of the Senate.

Senior Voters

General Eisenhower is learning the facts of political life fast. He has just spent the obligatory day at a Red Indian ceremonial, but of much greater consequence are America's "senior citizens," the euphemism for voters over 65 who now make up about 13 per cent of the electorate. General Eisenhower returned from his visit to California, a state whose climate brings it far more than its share of old people, with the news that he favoured legislation to lighten the burden of the high cost of living on the old folks, and that extension of the protection afforded to them was one of the reforms in the social security law which needed to be dealt with. With this statement the General was mending not only his own political fences—he will never be allowed to forget that he once said: "If all that Americans want is security, then they can go to prison"—but those of his party. For Republicans in the last Congress laid themselves open to the charge of being unkind to senior citizens by defeating, under pressure from the medical lobby, a Bill to raise benefits under the old age and survivors' insurance scheme.

Congress, however, came to its political senses in time to pass a similar Bill before it adjourned, without the clause relating to disabled persons which had offended the doctors, but with additional provisions, which will appeal to voters, for increased federal payments under the public assistance programme. It was to these rather than to insurance benefits that General Eisenhower was apparently referring when he advocated more aid for senior citizens. But if only public assistance goes up, the amount that an old person receives as a right, by virtue of past insurance payments, will fall below the amount that he might receive as a charity. There are wide variations under both schemes, but the average insurance benefit to a single pensioner is now \$42 a month and the average payment for a needy, blind or disabled person, or a dependent child, is \$45 a month.

About 5 million such persons now receive public assistance and the federal government's higher contribution, an addition of \$5 a month for each recipient of aid (except children, who get only \$3 more), will cost about

\$250 million a year; the total federal cost of the programme in 1951 was \$1.2 billion. Another 4.5 million widows and retired people over 65 will also, as a result of the new Bill, begin to receive increased payments under the insurance scheme in October, just in time for the election. The average rise will be about \$6 a month and these increases

will cost about \$300 million a year. The insurance fund is large enough to carry this increase, for many years at least, and also the additional demands that will be put upon it as the number of persons of pensionable age mounts—by about 30 per cent by 1960. The rising number of old people may, however, put a strain on the public assistance programme, which is financed through taxation, and General Eisenhower, if he is elected, may find it hard to reconcile his promise to the country's senior voters with his promise to reduce the national deficit.

The CHASE NATIONAL BANK

OF THE CITY OF NEW YORK

(Incorporated with Limited Liability under the Laws of the U. S. A.)

Through the Chase Banking organisation, with its broad contacts throughout the United States, Anglo-American trade will find both increased access to American markets and important facilities to expedite its transactions.

Austerity in the Air?

Civilians on the Aircraft Production Board, created just a year ago by Mr Charles Wilson to clear the obstacles out of the way of the aircraft programme, have just launched their first rocket. The deputy director, in a recent talk which has become public property, has strongly urged the Air Force and the Navy to get together and agree on a single aircraft for each job, to abandon production of other models, and concentrate all resources on a few outstanding types. In his view, this would speed up production and assure a higher proportion of modern aircraft in the 143-group force which it is hoped to have in existence by the middle of 1955. He even submitted a list of the models which he felt should be dropped, and of those whose production should be increased.

Military members of the board were taken aback by this civilian assault, and the aircraft industry does not conceal its alarm. The industry fears another period of contract cancellation and change similar to that which accompanied the stretching out of the defence programme last winter. It is an old complaint of civilian administrators that the military cannot make up their minds what they want and are unduly reluctant to freeze models so that mass production can get under way. The forces have until the middle of September to reply, but Mr Lovett, the Secretary of Defence, has already somewhat heatedly retorted that the moment has not yet arrived when it would be safe to abandon experimenting in the interests of economy or production. The Air Force likes to have some insurance in the shape of a second type in case the first is a disappointment.

The production board has no power to force the services to weed out their aircraft. But Congress is already very critical of the waste, duplication, and inefficiency which persist despite the nominal unification of the services. The new powers over procurement given to Mr Small, the chairman of the Munitions Board, are designed to appease the critics and head off demands for a "procurement czar" in the Department of Defence. However defiant the Air Force may feel, it knows it will have to practise more austerity if it is to reach its goal by 1955, and the likelihood is that some models will be eliminated, even though they may not be as many, or exactly the ones the APB favours.

Lifting the Housing Lid

It now seems certain that government controls over housing credit will follow those over consumer credit into the wastepaper basket on October 1st. This is what the Defence Production Act requires if the number of houses started in three consecutive months, on a seasonally adjusted basis, falls below an annual rate of 1,200,000 a year. The figure for June is 106,000 and when allowance is made for

the high summer rate of activity, it is below the very high rate fixed by Congress. The totals for July and August are expected to be lower. It does not, however, follow that any borrower can buy a house with a nominal 5 per cent deposit. Private lenders will continue to demand much more and so may the Federal Housing Administration.

Should the number of houses started soar up again to an annual rate of 1,200,000, controls can be reimposed. But this rate was exceeded only in the boom year of 1950 and most housing experts believe that the edge has now been taken off the postwar thirst for houses. In the past five and a half years nearly 6,000,000 non-farm homes have been started. What acute need remains is among the poor who cannot afford commercial rents. On this score, however, the House of Representatives, which was quite willing to vote another billion dollars or so for government purchase of mortgages, stood firm; it refused to finance the building of more than 5,000 public housing units this year. Not more than 10 per cent of these may go to any single state. New York, for example, which has plans for over 10,000 units it wants to build, will receive Federal aid for only 500.

Although the number of houses started in the first six months of this year is slightly below the first half of 1951, construction as a whole has never been greater, either in value or physical volume. This is due primarily to government contracts for military and atomic projects and to industrial expansion, and the Federal Reserve Board sees no reason, though housing officials disagree, why credit controls on commercial construction should not be swept away with those on home building. Except in critical defence areas, where accommodation is strained by an influx of defence workers, federal rent controls also will be lifted on September 30th from the homes in which more than 50 million people live. The Defence Production Act provided that it might be extended only if local communities so requested.

Shorter Notes

Fourteen Californian Communists, who took charge of the party in the United States after its leaders were sent to jail last year, have also now been found guilty, under the Smith Act like their predecessors, of conspiring to teach and advocate the overthrow of the government by force. They have all been given the maximum sentence of five years in jail and a fine of \$10,000, but are expected to appeal.

The first official estimate of this year's cotton crop puts it at 14,735,000 bales, compared with an output of 15,144,000 last year. The calculation does not make full allowance for the drought in the South, but it is unlikely that the Department of Agriculture has run any risk of overestimating the crop this year in view of the trouble it got into when it did so last year. Combined export and domestic demands are put at about 14 million bales and the carryover for last season, one of the smallest for many years, at 2.5 million bales.

Planning produces results in the dollar market

Successful selling in the U. S. market requires a carefully planned sales approach. As one of America's oldest commercial banks, Irving Trust Company knows this great market thoroughly... will gladly work with you in locating competent organizations to help develop or expand your sales there.

2 out of 3 of the world's total population of 2,400,000,000 live a life untouched by electrical power

CIVILISED LIFE, as we know it today, based on power applied to the machine, is little more than 150 years old. As yet, less than one third of the world's total population enjoy the full benefits of electricity — the modern source of power for industry. The great mass of mankind still live on a primitive grain economy and are supplied, for the most part, by village handicrafts. They use the same modes of production, the same sources of power, light and heat that were used 2,000 years ago.

The Indian peasant crouching over his fire of dried cow dung; the Mexican peon shuffling along dusty tracks to his water hole; the Egyptian fellah trudging behind his water buffalo; the African tribesman squatting in his mud hut — these are typical of the living standards endured by 2 out of 3 of the world's population today. This is the measure of the task before the industrial west. With a world population increasing at a rate of over 20,000,000 a year, living standards in backward regions cannot be raised quickly without electrical power — power that can be applied to the machine. And until the living standards

of these backward regions are raised, political doctrines that threaten the free world are certain to flourish and spread.

In 1951, over 70% of the output of THE BRUSH ABOE GROUP was exported

THE BRUSH ABOE GROUP has been formed from a number of old-established British engineering companies with a high reputation for the design and making of diesel engines and electrical generating and distribution equipment.

Production has been rationalised and a world marketing network developed in order to meet the world's urgent and ever-growing demand for industrial power. The group produces every week over 2,000 internal combustion engines ranging in power from 3 h.p. to nearly 3,000 h.p. In 1951 over 70% of this vast output was exported — mainly to the backward regions of the world. The exported output of THE BRUSH ABOE GROUP accounted for 34% of the total United Kingdom exports of diesel engines and diesel generating sets and exceeded the total exports of similar plant from the United States. There are almost unlimited opportunities in front of THE BRUSH ABOE GROUP as it tackles one of the world's most pressing economic problems — the supply of quickly installed and easily serviced plant that can be used immediately as a source of industrial power.

The Group is also helping the country's export drive to the utmost of its resources through the very high proportion of its total output that is sold for foreign currency.

"I thought dictating machines were bulky things"

The trim, streamlined Dictaphone Time-Master is changing ideas about dictating machines!

Many a business man has been amazed at his first sight of the Dictaphone Time-Master. It is so small, so good-looking, such a credit to an office desk.

Yet this smart little machine also represents the last word in dictating efficiency and simplicity. It records on Dictabelts—little plastic belts, each one taking 15 full minutes of crisp, crystal-clear dictation. Dictabelts fold flat for filing and may be posted in an ordinary envelope, up to ten at a time for a 2½d. stamp.

EASY TO OPERATE

Another big Time-Master advantage is its sheer simplicity.

Controls are few and simple, and wherever possible, automatic. There are no intricate adjustments. It is a machine you can operate, literally, with one finger.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform backspacing, immediate place finding.
4. Simple automatic operation.
5. Mailable, filable, expendable Dictabelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107, Kingsway, London, W.C.2, or ask for a demonstration at your local Dictaphone branch.

"Defiance" in South Africa

(From Our Johannesburg Correspondent)

BY August 8th, 1,968 persons had been arrested in South Africa for breaking *apartheid* laws since the defiance campaign began on June 26th. The resisters' technique has become almost stereotyped. A group of Africans, sometimes with an Indian leader or two, approach a railway station or post office (but post offices have fallen out of favour since a Port Elizabeth magistrate ruled that *apartheid* did not apply to post offices and therefore no laws were being broken there). They approach openly, and make for the entrance marked "For Europeans Only." The men (and sometimes women as well) wear on their arms the band of the African National Congress, which has three colours, green, black and gold (green for the country, black for the people, gold for the country's wealth). Waiting for them are several European policemen, usually armed with revolvers or, where a really big demonstration is expected, with rifles also. The "defiers" seek to pass through the "whites only" entrance. The police stop and formally caution them. The resisters announce their intention of proceeding. The police then arrest them. Another gambit is for groups of Africans to parade in orderly fashion through the streets after curfew hour—without passes. In their anxiety to be arrested they nearly always forewarn the authorities of their intentions.

The sequel is not always as quiet as the arrests have invariably been. At Port Elizabeth, and also at Grahamstown, police with batons charged a crowd of Africans, estimated in each instance at about 200, who had congregated outside the court where "defiers" were being tried. On both occasions, a number of people were injured. These police baton charges have recently become a regular feature of South African life. The police have come in for a great deal of criticism, even from persons who are not in sympathy with the "defiers." The Minister of Justice, Mr Charles Swart, has brushed these criticisms aside, and the Government resolutely refuses to hold any inquiry into police behaviour. Mr Swart declares that he is determined to stamp out violence. But unfortunately for this argument, the "defiers" have so far been impeccably non-violent: all the violence has come from the side of the police.

White Opinion Disgusted

These police charges have undoubtedly disgusted a section of white public opinion. This may be the intention of the organisers of the defiance campaign. They have concentrated cautiously on the coastal towns, like East London and Port Elizabeth, and the inland oases of scholastic peace like Grahamstown, where violent scenes are seldom witnessed. Although the campaign started in Johannesburg, the organisers have since left the stormy Witwatersrand severely alone. They may be saving it up for their (still undated) grand finale. But, even where there is no violence, people have become weary of the sight of large numbers of native men and women surrendering themselves to arrest and being herded into huge police vans. There is something offensive to decent instincts about the very passiveness of those arrested; a thing the wily organisers have probably also counted on for discrediting the Government and the police. And, of course, there is the guilty knowledge that the men and women being herded into the police vans have not committed much of an offence: it is only since the present Government came to power that *apartheid* has become a

law and breaking it a crime. Before that it was only "segregation," enforced by custom.

This aspect of the matter worries the Government too, but for a different reason. Mr Swart is plainly itching for the power to impose much heavier sentences on the "defiers" than their minor technical offences justify under the law as it stands. The sentence is a fine of £1, or sometimes £8 in cases of "trespass," with the alternative of a few days in prison. The "defiers," being pledged to "fill the jails," refuse to pay the fines. At first the courts ordered that, whether they elected to pay or not, whatever money they had on their persons should be seized and paid in as fines. Now the "defiers" are careful to carry no money.

The *Oosterlig*, a Nationalist newspaper published in Port Elizabeth, has its own interpretation of these events, and its own suggested remedy. "The great majority (of the resisters)," it declares angrily, "are without shelter. They find prison a pleasant abode. These people only understand the lash." If it were so, it would be a revealing commentary on the conditions of the majority of the Africans in such prosperous little towns as Port Elizabeth and East London (where in fact the squalid "locations" do harbour thousands of homeless families). But some at least of the "defiers" are comparatively well to do, educated people like Mrs Nompie Njongwe, the wife of one of the African National Congress leaders.

Mass Police Raids

Africans always crowd into court when resisters come up for sentence. When the resisters appear in the dock, the friends in court give them the African National Congress sign (clenched fist, thumb up) and call out the Congress slogan: "Africa!" The resisters return the sign and the cry. There is no doubt what their feelings are: they are virtuous, uplifted fighters in a virtuous cause. Smilingly, they tell the unhappy magistrate (who may have his own feelings about *apartheid*): "The *apartheid* laws insult human dignity"; or they ask pointedly: "How would you like your children to be made to carry passes?"

The patience of the police, never strong when dealing with non-Europeans, is wearing thin. Mass raids, rather clumsily deployed, have been carried out on the homes and offices of Congress leaders. The police said they were looking for documents containing evidence of "Communist conspiracy." Pressmen were warned off and threatened with arrest for "obstructing" the police. Dr James Moroka, president of the African National Congress, whose Bloemfontein home was raided, remained unperturbed. "They will find no such evidence," he declared. "We have no secrets." But the fact remains that the defiance campaign has a good deal of Communist as well as Gandhiist inspiration. Dr Moroka is largely a benevolent figurehead. The real leaders have ideas in advance of his somewhat naive recipe for a "fully democratic South Africa with equal rights for all." They are conscientiously whipping up a black nationalism as potent for mischief as Dr Malan's brand of white herrenvolkism. This is quite obvious to "moderate" non-Europeans. But the "moderates" now find that they have to go with the popular tide.

Suppression is the Government's simple remedy: how to apply it is proving more difficult. Fines have been

increased; but the resisters are in any case pledged not to pay fines. They want to "fill the jails." The rank-and-file have worked out a technique for not suffering unduly. One African said frankly to his employer: "Next week I'm on call for arrest. Can my cousin take my job until I come out again?" He added cheerfully: "Then I can get my job back and it will be his turn to go to prison." Many employers are reluctant to sack resisters: they are already half won over to sympathy with their cause. *Apartheid* in principle has a good deal of support among white South Africans, but not *apartheid* in the clumsy, pin-pricking way the Government is applying it.

The Government is now experimenting with flogging instead of trying to impose a fine. Resisters under the age of 21 are to be flogged. This treatment may well be extended if the campaign goes on. Staunch Nationalists are all in favour of it. But lashings are unlikely to deter the resisters. When they volunteer, they know that in any case they stand a fair chance of being knocked about by the police (usually explained away as "tripping on the stairs leading down to the cells" or "falling against the corner of a table in the charge office"). The flow of volunteers shows little sign of drying up.

The million or more Cape Coloureds have so far stood aloof from the defiance campaign. But they are thoroughly resentful of the Government's determination to deprive them of their cherished common roll voting privilege. At present they are still trying, through the courts, to arrest this legislation. If they finally fail it is quite likely that many will decide to join the resistance campaign.

Meanwhile, almost every day, somewhere in South Africa, another few scores of Africans march to a railway station, or parade without passes after curfew. The police vans arrive. The marchers are bundled inside and driven off. A few more white eye-witnesses feel the dangerous tremor of self-disgust. Crowds of Africans continue to pray and to sing their melancholy songs outside the courts and jails, or, exultantly, to greet the arrested with the thumbs-up sign and the shout of "Africa!" There is little doubt which section in South Africa feels that, if it has not yet got might on its side, it has right. The dispossessed have found a powerful totem: nationalism. It has turned out not to be Dr Malan's sole patent after all.

Rivalry over the Saar

OF all the questions that confront postwar Western Europe, few have generated more confusion and heat than that of the Saar's future. At the Moscow conference of 1946 Britain and the United States agreed that the territory should be politically detached from Germany and economically attached to France. The Saar Statute later gave constitutional form to this formula. The biggest of the steelworks were requisitioned by France in agreement with the Inter-Allied Reparations Agency, but their ownership is still in doubt. The coalmines were leased to France for fifty years. The territory was included in the French monetary sphere, and a French Commissioner has exercised political control which has been progressively loosened over the past few years.

From a strictly legal point of view indefinite postponement of a decision about the Saar's future can be justified. The Potsdam agreement left it to the signatories of a four-power treaty with Germany, and such a treaty seems as distant as ever. But the French Foreign Minister has recently suggested that France and Germany should themselves settle this dispute at once by agreeing to "Europeanise" the territory as the first step toward the federation of Western Europe. M. Schuman is said to feel that all projects for West European co-operation are in jeopardy until this irritant is removed. Moreover, some move was needed because the Bonn Govern-

ment will bring before the next meeting of the Council of Europe in September a motion about the lack of democratic freedom in the Saar, unless Germany receives some satisfaction from France in the meantime.

Closer examination of both the French and German views on this question will show why an amicable solution is proving so difficult. They can be ascertained only roughly, because the periodic negotiations between M. Schuman and Professor Hallstein, German Secretary for Foreign Affairs, have so far been conducted in secret.

The French Case

Saarbruecken.—The French propose that this might become the headquarters of the Schuman coal-steel pool. In offering to accept a German-speaking town as Europe's District of Columbia they consider they have made a generous gesture. The national inclination is to select a French town; but this proposal reflects, they say, their free acknowledgement that Germany is bound to play a dominant role in a West European community. Mindful of Germany's record, they feel that victims of German militarism are showing a generous willingness to abandon reasonable suspicions and give the nation its rightful place in the new partnership.

European Authority.—Although they have not said so officially, the French are believed to be ready to transfer what remains of their political jurisdiction over the Saar to the European political authority proposed by M. Schuman, or to an interim international commission. The French are not prepared to incorporate any portion of French territory in a Europeanised Saar.

Elections.—Their attitude towards the German demand for free elections in the Saar is affected by their desire that the territory shall be "Europeanised." They seem to accept elections with pro-German parties taking part fully and freely—for the first time since the war. But they want the elections to take place with everybody understanding clearly that the Saar is to be "Europeanised," and for that a prior Franco-German agreement to this effect is needed. It is ridiculous, they argue, to give power of veto in a great international problem to a group of small towns and villages. Self-determination in the Saar is Wilsonianism pushed to a crazy extreme; once admit the principle that decisions of the states that have set up the Schuman pool are subject to approval by small communities affected by them, and the work of the High Authority—or, indeed, of any future political authority—becomes impossible. The French strongly oppose a referendum, and they regard the present clamour in Germany for free elections as an effort to embarrass France and as a bargaining counter to get more concessions.

Ownership of Coal and Steel.—The French intend to keep their hold on the territory's coal and steel resources, for that is the chief guarantee that France enters the coal-steel pool having industrial "parity" with Western Germany.

Economic Union with France.—They show no inclination at present to give up the fiscal and customs union with the Saar. The Saar makes a valuable contribution to the French balance of payments. If the coal-steel pool works smoothly, customs barriers against coal will disappear automatically in five months, and those against steel in eight months. This would presumably leave manufactured goods and agricultural products subject to tariff and quota restrictions until the complete economic federation of Western Europe is achieved.

The German Case

"The Saar is German."—All Germans regard the territory as part of Germany. They have no more renounced their claims to it than to the eastern territories. To renounce either area would be an act that nationalists could exploit to bring down any freely elected government responsible for it. Disappointment at the failure to attain German unity has increased the sensitiveness of West Germans in this matter.

Sober Thought on Egypt's Finances

"ONE of our first objectives," said Aly Maher last week, "is to stabilise our finances and economy on a solid basis, and," he added, "in sincere collaboration with the foreigner." Most Egyptian newspapers, however nationalist, gave prominence even to the final phrase. Sobriety is in the air. The time has come for it, for the deterioration of Egypt's internal financial position during the budget year that ended on June 30th was considerable. Some of it was caused by circumstances beyond local control; the fall in the world demand for textile fibres, for instance, has hit all countries that depend on cotton or wool for prosperity.

But it could have been foreseen that the high price level caused by world stockpiling in 1950 was not eternal; the greater part of Egypt's distress must be put down to bad management. The prime example of this is well known: it was the Wafd government's bid to save the pockets of a few speculating party members and supporters at the expense of the Egyptian treasury. By fixing minimum cotton prices at a level which it hoped would save its friends, it threw the Egyptian price level out of all relation to the world level, clogged Egyptian warehouses and imposed upon Egyptian governments in two successive years the necessity for buying an unwanted commodity in order to hold the market and prevent collapse at home. A second sample of heedless management was the disregard for the cost of pursuing Egypt's "national aspirations"; between October, 1951 and mid-1952 the Wafd's anti-British campaign entailed the expenditure of some £12 million in compensation to Egyptians whom it caused in one way or another to lose wages or property. The cash cost was not counted at the time, but needs to be weighed now.

Foreigners Scared Away

Any man who sets out to straighten Egypt's finances and economy must realise that he faces two vital tasks, the first of which is nearly insoluble. How is he to improve the lot of a population that has doubled in the last 15 years, and that is still rising at a rate that is causing the national income per head to drop and the acreage of land per family to fall year by year and decade by decade? Ordinary expenditure on improvement never stems the rising tide. In a country that is fast becoming aware of the unfairness of the distribution of local wealth, every financial measure taken to improve the state of the exchequer must now be weighed in the light of its social repercussions. The second task is to persuade peasants who are instinctive cotton-growers, but otherwise ignorant people, to produce more of commodities other than cotton, so as to enable them to stand up when need be to the buffets of inflation and of world trade. Cotton possibilities apart, local agricultural production is on the down-grade. The production of maize, the fellah's main food, was lower in the 1940s than in the 1920s; sugar production, which met the local demand till 1949, is now 30 per cent below it. Wheat yield figures tell the same story; last year Egypt imported nearly as much as it grew.

Industrial productivity at present holds little hope of restoring the balance because, congenitally, the Egyptian investor likes to sink his capital in ventures entirely within his personal control—land or houses—out of which he hopes to squeeze a 20-30 per cent dividend. Stocks and shares in other men's companies he deems to be neither promising nor safe. The foreigner, once the chief source of investment in industry, has spurned Egypt ever since the nationalistic company law of 1947 decreed that local companies must be primarily Egyptian as to management, staff and capital.

Looking immediately ahead in the light of these facts, Egypt's internal finances, though shaking, do not seem to be

This attitude has led, very understandably, to the suggestion from an official source in Bonn that the French should make a territorial sacrifice to the European ideal by Europeanising a portion of Lorraine.

Dr Schumacher's View.—The extreme nationalist case was vividly stated this week by the Social Democrat leader. The Bonn Government, he said, is not entitled to cede German territory such as the Saar either to France or to any European group. To do so would be to follow the example of the East German Communist régime, which has abandoned claims to territories beyond the Oder-Neisse line.

Demand for Free Elections.—Pro-German parties in the territory have hitherto been prevented from organising. Western Germany asks that freedom for all parties should be restored in time for them to organise and campaign before elections. This demand is heard in all quarters, ranging from die-hard nationalists to moderates like Dr Adenauer. Indeed, he asserts that the democracies should follow their own precepts, among which is the right to self-determination. "I must press," the Chancellor has said, "that the final decision must belong to the Saar. Only free elections can give any value to decisions about the Europeanisation of the Saar."

Economic Proposals.—If the German Government formulates its other demands, they are likely to include points made in proposals for Europeanisation put forward a few weeks ago by pro-German Social Democrats in the Saar. They suggest:

(i) that the customs union with France be abolished in favour of complete freedom for imports and exports between the Saar and other members of the Council of Europe.

(ii) that the French transfer the administration of the Saar mines to a European body and make them European property;

(iii) that a European currency be established within the framework of the European Payments Union which would become the currency for the Saar.

Inequality of Sacrifice.—The Germans maintain that the French seek from them an unequal sacrifice for the European ideal. Germany is asked to renounce the Saar permanently—in return for what? An act of political renunciation by the French—it is true—and the placing of the Saar under European authority; but their economic domination is to continue through the Saar's economic union with France and through French control of the territory's coal and steel, until the day when total federation erases all economic boundaries.

Horse-Trading instead of Gestures

The Germans entirely ignore the "intangibles," such as the French proposal to make Saarbrücken a West European capital. Such concessions might have satisfied them five years ago when they were still numb with defeat and the nationalist spirit lay dormant. (Guilt they have never felt.) Today most Germans are conscious only of their economic recovery, their mounting strength and prestige, and the fact that the Federal Republic has been promised treatment as an equal and free partner. They feel, therefore, that negotiations should be on a straight horse-trading basis. Moreover, they feel time is on their side; if Europeanisation can be put off a little longer, then the Saar will be drawn from the soft franc zone into the hard mark area.

The French are infuriated by German failure to recognise their concessions for what they are. They also suspect that the Germans are half-hearted about European unity, especially when it involves any sacrifice on their part. The Germans are equally resentful that the French have failed to acknowledge the sacrifice Germany is asked to make. In Dr Adenauer's words:

If we Germans accept the Europeanisation of the Saar with the reservation as to the Saar population's approval, we shall have made a sacrifice which should be recognised. This is the clash of interest and emotions that has to be overcome if the business of European unity is to go ahead. What solution is possible will be the subject of a further article.

beyond restoration to the comparatively superior level of two years ago. This, though it left a good deal to be desired from a sociological standpoint, at least spelt solvency. In 1950-51 revenue amounted to £191.8 million and expenditure to £190.2 million, the principal sources of the former being £93.2 million from customs and excise, and £24 million from direct taxation on land, property and income. Principal outgoings were £30 million on education, which has become a laudably heavy item now that it is free, and—as has become customary in the years since the Palestine war—just under £50 million on the armed forces. (Ten years earlier total budgetary expenditure was only £46 million.) But it should be noted that the 1951-52 budget surplus was, as were similar and rather larger “savings” in the ten previous years, made up of unspent allocations on works designed to improve the lot of the poor man. Such “savings” totalled £20.7 million in 1951-52 and £71 million over the five years beginning in July, 1946. They were pumped into a so-called Reserve Fund which has proved a boon to governments in need of money for ventures that do not appear in ordinary budgets. Thus the system of state budgeting which prevailed till last year was, though orthodox, inadequate if weighed by social standards.

Financial management in the year 1951-52 was wanting on both grounds. Cotton exports fell by 700,000 bales or to almost half their 1950-51 level and a main source of revenue—the cotton export tax—therefore fell away; the government that took over after the January riots was obliged to cancel duties, notably on kerosene and sugar, in order to enable the poor to compete with the cost of living; the swift changes of government led to uncertainty of tenure and loss of morale in the civil service, with the result that tax collection became defective. Arrears are said currently to amount to £18 million. For all these reasons revenue fell off. Simultaneously, expenditure rose; the government bought cotton on contract to the tune of £30 million; it spent £7 million on compensation to Canal Zone workers and £5 million on claims for damage in the Cairo riots; cost of living subsidies increased by £3 million to £19 million, of which £13 million was for wheat alone. The 1951-52 budget deficit, which the Maher government now has to meet, is said to be between £35 million and £40 million.

The balance remaining in the domestic Reserve Fund is unpublished, but it is certainly not sufficient to meet continued overspending on such a scale. The account must be balanced in 1952-53. To achieve this, Aly Maher and his finance minister, Abdel Gelil el Emary, will have to accustom an easily dissatisfied public to two distasteful facts. One is that increased expenditure on social services—which is now-days desired by all Egyptians—cannot be afforded unless there is both a rise in revenue caused by increased, and more efficient, taxation and by cuts in wasteful expenditure. The second is that unless large additional sources of revenue are disclosed expenditure on the army and on social services cannot rise simultaneously.

Looking farther ahead, once this first dose of fact is administered, there are other distasteful notions to implant. Egypt must swallow the fact that the great public works which are the only way to improve living standards—electrification of the Assuan dam; multi-national agreement on the use of the Great Lakes; perhaps, also, in a more remote future, the harnessing of solar energy—cannot happen without seeking great quantities of foreign help, which will not be forthcoming unless Egypt is correspondingly co-operative.

Correction.—In the article called “A Federal Belgium?” in *The Economist* last week, the statement that “the ethical difference” between the Walloon and Flemish communities is evident enough, should have referred to their “ethnic differences”; and the statement that the proposed territorial unit of Flanders would include “Antwerp and Luxembourg” should have read “Antwerp and Limbourg.”

Australia's “Incentive” Budget

[FROM OUR MELBOURNE CORRESPONDENT]

In his incentive Budget presented to the Commonwealth Parliament this month, the Federal Treasurer (Sir Arthur Fadden) framed the Government's proposals in the light of an economic situation which has undergone considerable deterioration in the last twelve months. The Treasurer, in conceding tax concessions of £49,550,000 for the current financial year, sought to give an “incentive to investors and businessmen and to the community at large.” But the Budget, despite its concessions, contained nothing designed to redistribute the nation's resources so as to expand export income; it is the fall in this which is the basic cause of the present financial stringency. In its simplest terms, Australia is suffering from the effect of a halving of the price of wool last season. In consequence, export income fell in a year from £A979 million to £A665.8 million, an ill-fortune aggravated by a tremendous increase in imports which in twelve months leapt from £A741.4 million to £A1,049.5 million. The financial year to June 30th last ended with a trade deficit of £A383.7 million; as a result Australia ran down its international reserves by nearly £A500 million.

It was against this gloomy background that Sir Arthur Fadden had to devise a Budget to bring about some

COMMONWEALTH REVENUE AND EXPENDITURE

	1951-52 Estimate	1951-52 Actual	1952-53 Estimate
Revenue	£ 1,041,404,000	£ 1,002,395,000	£ 959,890,000
Expenditure	926,872,000	903,895,000	959,430,000
Surplus	114,532,000	98,500,000	460,000

revival of business confidence and with it a stimulation of public spending. Individual taxpayers will find welcome enough the abolition of the special 10 per cent levy imposed last year, but companies, which have been given only token tax concessions, cannot be blamed for not having shown wild enthusiasm about their share of the Budget incentives. Tax reductions are important in helping to prevent too sharp a contraction in business activity, but they are only partly the answer to Australia's problem. The country is now saddled with a high cost price structure built up during the years of buoyant prosperity. Against this, export income, the life force of the Australian economy, has declined alarmingly, and unfortunately shows little signs of immediate expansion. In the meantime, as Sir Arthur Fadden rightly points out, “cost inflation” continues merrily on its upward course, serving only to aggravate the conditions which the Budget is attempting to alleviate.

The Budget for 1952-53 was not framed to achieve anything more than a nominal surplus. Last year, the Commonwealth finished with a substantial surplus of £98.5 million, which was £16 million less than the original estimate of £114.5 million. The surplus for 1951-52 has been applied to finance States' public works in fulfilment of the Commonwealth's undertaking to make itself responsible for meeting the difference between the £225 million works programme and the funds raised on the public market. Now, the Commonwealth Government has resolutely put its foot down against budgeting for a surplus to finance the capital works of the States.

The Thou* is a Wily Beast

Give a thou half a chance and he will do the oddest things, such as making typewritten characters jump up and down on the page. This is shocking and we are very stern about it. We discipline our thou's, controlling their waywardness by as rigorous a system of testing as has ever been devised. A typewriter, if it be worthy of the name, is an intricate mechanism, made very accurately. And having to be so accurately made, isn't it a wonder that the Imperial Good Companion is such a hard-working, knock-about, quick-typing, long-living, easily-transportable and inexpensive portable typewriter?

THE CASE OF THE FLYING PAY CLERK

Was his machine
jet-propelled too?

PAY DAY in Royal Air Force establishments produces its own special problems. The great number of personnel to be paid, differing from man to man in rank, entitlements, allowances and deductions, makes speed in the accounts sections absolutely essential. The fact that personnel are liable to move from one station to another is just one more difficulty to be faced.

During World War II, the vast increase in man-power threw a heavy burden on accounting sections. Pay Clerks were hard-pressed to keep up with the amount of checking necessary, and individual airmen found, sometimes, that their full pay details lagged behind their postings from unit to unit.

Anxious to ease this situation, the R.A.F. consulted machine accounting specialists of Burroughs Adding Machine Limited.

In association with officers of the Air Ministry, Burroughs studied the problem, and it was decided to instal Electric Adding-Subtracting Machines to speed up the work.

Result? Using these Burroughs machines, accounting sections can check, quickly and smoothly, the exact financial status of the airmen they deal with. The new system makes it possible to supply each airman with a simple copy of his account every four months, and,

ON R.A.F. STATIONS a new streamlined machine is speeding the work of the accounting sections...

since duplicates of the figure information obtained are used as transfer documents, there are no delays in the dispatch of pay details.

WHAT ABOUT YOU? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line

of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment.

Call Burroughs today. Sales and Service offices in principal cities round the world. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Although the Treasurer indicated that the Federal Government does not in the current year intend to finance state works out of Commonwealth revenues, it is nevertheless still obliged to find about £130 million for the States' works requirements. This is because it gave an undertaking at the Loan Council to underwrite States' works to the extent of £180 million, and of this sum not more than £50 million can reasonably be expected to be obtained from the public loan market unless there is a miraculous change in investment sentiment in the next few months. The Commonwealth obviously does not anticipate a buoyant loan market in the current year for it has decided that "loan raisings for essential works of a truly developmental and productive kind should receive some special assistance from bank credit." In other words, the Commonwealth has completely changed its attitude on maintaining economic activity by the inflationary expedient of credit expansion.

No indication was given by Sir Arthur Fadden of the extent to which the Commonwealth intends to rely on Treasury bills for maintaining spending power through expenditure on public works, but not less than £100 million could well come from this source in the current year. The Australian economy has suffered such a tremendous loss of its generating force—income from the sale of its exports—in the last twelve months that it is clearly recognised by the Government that a little additional dose of inflation would be a far lesser evil than the development of a business depression with its inevitable consequence of unemployment.

It is indeed surprising that the deterioration in overseas trade in the last twelve months has not made a more serious impact. The Australian economy reacts most sensitively to fluctuations in its overseas reserves; but much of the deflationary effect of this fall has been cushioned by substantial releases of "excess deposits" of the trading banks, which the Commonwealth Bank held since 1939 as a means of controlling the credit base. Releases from this source since June, 1951, total £375.7 million.

This, then, is the general economic background to the 1952-53 budget. There seems little hope of effecting a substantial increase in exports, while at the same time "cost inflation" continues unabated. The continuing rise in the basic wage is, however, due to a deliberate Government policy of permitting rises in the prices of basic foodstuffs in an attempt to give a further incentive to producers. As long as this policy continues, further increases in the basic wage may be expected, making it harder for both primary and secondary industry to meet the difficulties brought about by falling incomes.

Red Cross Purposes

In two cities, Helsinki and Toronto, the Soviet Union has recently made a dramatic return to the community of nations. But the contrast between the two events has been both ironic and instructive. Stalinist "tactics" evidently required that friendship and moderation should be the order of the day at the Olympic Games, but that at the Red Cross conference a barrage of polemics must be put down to distract attention from the organisation's undeniable achievements and to mar its reputation for impartial service to humanity. Events have indeed justified the fear that the aim of the large Communist delegations sent to Toronto a fortnight ago was to use the International Conference of the Red Cross purely as a propaganda platform, and if possible to wreck the organisation.

Nothing can stop the Communists from withdrawing from the Red Cross even the tenuous recognition they now give it, and then denouncing it as a "western" organisation, if they choose to. Many conciliatory moves have been made at Toronto in order to avert an open split, but whether the split

is a final one must depend on the Communists themselves. Meanwhile, however, their propaganda seems to have overreached itself. Its hollowness was most clearly exposed in the case of their proposal on atomic weapons. Lieutenant-General Slavin, for the Soviet Union, had sponsored a resolution on the familiar theme of "prohibition" of such weapons by a convention. But when this resolution had been amended, on British initiative, to include a reminder of the more practical form of prohibition on which the UN Disarmament Commission is now working, the Communist bloc dropped it abruptly. The conference was then treated to the curious sight of the Soviet resolution being adopted by 48 votes to none, with all the Communist delegations abstaining.

On "germ warfare" the Communists fared no better. While other delegates, recognising that Peking and Moscow were too deeply committed in their campaign against the International Committee to retract, toned down a proposal for an inquiry into the "germ" charges and omitted any reference to the Committee, the Chinese Communists refused to make any corresponding concessions. Indeed, they extended their tabu on the Committee to cover any inquiry linked to the Red Cross. The upshot was that the conference rejected by 68 votes to 13 a Communist resolution which treated the alleged "atrocities" as an established fact, and voted 69 to 12 for an inquiry "on the basis of a common agreement." Even this mild suggestion was denounced by General Slavin as "political."

Prompter for the Poles

After quickly adopting South Korea's resolution calling on North Korea to admit the Red Cross to prisoner-of-war camps, the conference then went on to approve by 80 votes to none a Polish recommendation that all governments should ratify the 1925 Geneva protocol against germ warfare. This vote took even more wind out of the Communist sails, for they had hoped to manoeuvre the United States into opposing this resolution, and in the event the American delegate supported it. Moreover, the Communist machinery creaked too audibly. Belgium proposed an amendment asking that ratification should be without reservations—an awkward point for Russia, which had reserved full rights to use germ warfare if it thought it was being used by an opponent. Mr Pashkov of the Soviet delegation promptly went over to brief the Poles, who then withdrew their acceptance of the amendment. But at the final plenary session, presumably after a little self-criticism, the Poles switched back to accept the "without reservations" formula. However, Poland, made up for these missed catches by a superb piece of nonchalance. When, after floods of irrelevant invective from the Communist delegates, a Maltese representative referred to North Korea's refusal to allow Red Cross inspection of prison camps, the Polish government delegate at once denounced him for "injecting propaganda."

If the Communists' aim was to destroy faith in the Red Cross and its International Committee in some sections of the free world, they failed signally. When the revised statutes of the Committee were approved by 70 votes to 17 after prolonged denunciations of its conduct by spokesmen for the Soviet bloc, the conference was in effect passing a vote of confidence in the Committee, with only the Communists in opposition. The last resolution of all was a declaration of "faith in the Red Cross as a movement concerned solely with humanitarian activities which help to promote mutual understanding and goodwill between nations, whatever their political differences," and of determination not to allow political issues to undermine its work. This was carried by 65 votes to none, the Soviet bloc, abstaining even on this general issue, being as isolated as it had been throughout the conference. The net result of the whole Communist propaganda effort seems to have been, as on other occasions, to bring other nations together rather than to split them apart.

THE BUSINESS WORLD

Germany's Prewar Debts

AFTER more than two years of preparatory work and five months of almost continuous negotiations in London, the representatives of the several groups of creditors and debtors have issued an agreed report on the settlement of Germany's prewar external debts. The report sets out suggested terms of settlement that have been agreed between creditors and debtors and are now recommended for the approval of the governments concerned. An inter-governmental agreement will have to be drawn up to ratify these terms, but this further stage need not be regarded as more than a formality, despite the clamour of protest that has been aroused in certain circles in Germany. The twenty-three governments concerned—twenty-two creditors and one debtor—have been kept continuously in touch with the London negotiations and their consent may be taken as a matter of course.

The agreed terms promise a more satisfactory settlement than many observers of the London Conference had expected. Until quite recently, these discussions had been viewed with caution, and even scepticism, owing to the immense complexity of the problem, to the ominous start given to the discussions by Germany's first and derisory offer, and to the subsequent development of deep differences of views between various national groups of creditors—differences that gave German delegates a perfect opportunity of playing off one against the other. But at the final stage these difficulties were satisfactorily overcome. The complexity of the problem, arising from the split of German territory into two insulated parts, from the fact that no less than 22 creditor countries were represented and from the extraordinary variety of debts to be dealt with, remained to the end. If agreement could none the less be reached, it was due to a spirit of co-operation and conciliation that very few expected to find at a conference of this kind. The initial German offer, which cast such a gloom over the opening discussions, can in retrospect be seen as a hopeful "try-on," well in the tradition of international negotiations. As for the differences of views between groups of creditors, notably those between the American bondholders and the rest, they were finally smoothed over by mutual concessions that have a significance ranging well beyond these particular negotiations.

The details of the agreement, which are summarised in tabular form on page 409, do not lend themselves readily to general description: because of the wide variety and differing priority of the debts, there was never any possibility of a general or uniform settlement. The following generalisations can, however, be made:

(1) The proposed terms cling as closely as possible to those of the original contracts; they do not, in most cases, entail any reduction in the original principal amounts.

(2) Arrears of interest have been recalculated in most instances at about two-thirds of the contractual rates and on the basis of simple interest. These arrears are to be funded, usually into twenty-year bonds carrying interest at 3 per cent. Bonds representing the arrears up to the end of 1944 will be issued immediately. The remainder will not be issued

until the unification of Germany, and payment on this part of the funded bonds will not begin until then.

(3) The future interest rates on the debts have been reduced below those of the original contracts; for example, the rate on the Dawes Loan (British issue) is reduced from 7 per cent to 5 per cent and on Young Loan from 5½ per cent to 4½ per cent.

(4) Amortisation will begin after five years. The maturity dates have been extended, but provision has been made for an acceleration of the repayment where creditors are prepared to accept payment in blocked Deutsche marks for investment in Germany.

(5) Contracts with dollar or gold clauses are being redefined as though the value of currencies of issue of the loan had been defined in relation not to gold but to the United States dollar. The gold clauses become dollar clauses but the dollar clauses are being honoured to the full.

This last arrangement resolves some of the most intractable of all the difficulties encountered in the course of the negotiations.

The American bondholders had objected to any invocation of gold or exchange clauses on the ground that this would discriminate unfairly against them, arguing that each group of national bondholders should accept the risk of what happened to its own currency—despite the fact that the exchange clauses had been introduced into the original contract to provide some protection against precisely that risk. In the end agreement was reached by an understanding that gold clauses should disappear altogether but that exchange clauses should remain. For example, in the case of the Young Loan, it was decided that although the amounts due in respect of the various issues would be payable only in the currency of the country in which the issue was made, the basis for calculating this currency payment should be adjusted to the depreciation of the currency concerned against US dollars between the time at which the loan was issued and August 1, 1952. In consequence, on the sterling tranche of the Young Loan, on which the rate of interest in future will be 4½ per cent, the amount to be received on a £1,000 bond will be £45 × 4.866 ÷ 2.80, or £78 4s.

An adjustment of this kind will be applied to all bonds carrying dollar clauses. It will mean that all payments due to British bondholders will be scaled up by 74 per cent. The protection of the exchange clause will continue to apply. If the rates of exchange of any currencies in which German bonds (with a dollar or exchange clause) are expressed vary by more than 5 per cent, the amounts to be paid on them are to be calculated by reference to the currency that has depreciated least since August 1, 1952; the amounts thus computed will, of course, be paid in the currency of the country of issue. Thus, if in future there is depreciation in the value of sterling and of the dollar, but not of the Swiss franc, the interest on Young bonds expressed in sterling will be adjusted in accordance with the fall in sterling in relation to the Swiss franc.

These "concessions" to the non-dollar bondholders have been balanced in the settlement by granting American issues somewhat higher rates of interest in future than will be paid on non-American issues. Thus, on Dawes bonds the rate will be 5½ per cent on the American issue and 5 per cent on the others. For the Young loan the rates will be 5 per cent and 4½ per cent respectively. This "douceur" to the Americans can also be justified on the ground that before the war, when the service of Germany's partially defaulted external obligations was governed by bilateral arrangements, the American holders were getting a worse deal than the others—for example, they were receiving only 5 per cent on the Dawes loan as against 7 per cent paid to British holders.

It should be noted that the importance of these arrangements relating to gold and exchange clauses lies not only in the application to the German debts but in the fact that they provide a precedent that can hardly be ignored in the Japanese debt discussions that are now in train.

The burden that the arrangements will place on the German balance of payments is difficult to assess with any precision. Complete information has not yet been collected about the amount of the debts in question. Again, some of these external obligations are held in Germany, so that it is impossible to calculate precisely the extent to which the facility to pay in Deutsche marks will be used. Nor is it possible to estimate the effect of the exchange clauses. Broad orders of magnitude can, however, be indicated. The German external debt at the outbreak of war amounted to the equivalent of approximately £700 million at current rates of exchange. The arrears calculated at the contractual rates but at simple interest would represent roughly a further £200 million. The first German "single package" external debt offer made at the beginning of the London discussions would, after providing for the postwar debts to the three occupying western powers and for payments to Israel, have made available the equivalent of about £17 million annually for the service of these prewar external debts. The present arrangements involve an immediate annual service of about £35 million, but rising to between

£45 and £50 million when the sinking fund payments begin in five years' time.

Two comparisons may help to show this burden on the German balance of payments in perspective. The first is the fact that the British Government, on the United States postwar line of credit alone, is committed to an annual service of about £40 million, or more than Germany will now be called upon to pay on the whole of its prewar external debt. The second is that in so short a period as the fifteen months to June, 1952, Germany's position with the European Payments Union, i.e., its current balance of payments with Western Europe, improved by the equivalent of £225 million, or something like seven years' service on the prewar debt at the initial rate and about five years when full sinking fund payments are in operation. These criteria reduce to their proper dimensions the complaints that are already being heard in Germany that this settlement is altogether too onerous.

The advantages of a satisfactory and mutually acceptable prewar debt settlement with Germany are self-evident. It should once again open the door of the world capital market to German borrowers. By restoring German credit abroad it will strengthen domestic credit. This settlement, if ratified, will mark one more step in the return of Germany to the community of western nations. Allied with the election of Germany as a member of the International Monetary Fund and the International Bank, it will again forge the normal links of international credit and capital relations between Western Germany and the main lending countries in the world.

For the securities whose fate has now virtually been settled, most of the speculative fun is over. German bonds have given market operators an exciting and, on the whole, a very profitable run for their money. The flavour of excitement will soon depart from them and the task will be to find investors prepared to hold them for income rather than capital appreciation. These holders will demand a yield in keeping with the political risks involved and not least with Germany's unenviable record as a debtor between the wars. It is by its performance and not merely by the appending of signatures to an agreement that Germany will work its passage back to the community of wholly credit-worthy nations. The proof has yet to come.

THE RECOMMENDATIONS SUMMARISED

Summary of terms agreed by the four committees set up by the London Conference to deal with the main categories of German prewar external debts.

I—Debts of the Reich and of other public authorities

	Interest rate %	Arrears calculated at %	Maturity	Sinking fund %
1% Dawes Loan	5½ (American) 5 (others)	5	1969	3 (American) 2 (others)
5½% Young Loan	5 (American) 4½ (others)	4½	1980	1
6% Match Loan	4	4	1994	1½
Konversionskasse	Contractual rates	Two-thirds waived	Extended by 17 years	2
States and Municipalities	Three-quarters of contractual rates minimum 4% maximum 5½%	One-third waived	Extended by 20 years	1 rising to 2

II—Medium and Long-term German Debts resulting from private capital transactions

No reduction of principal. Two-thirds of outstanding interest calculated up to the end of 1952 to be funded and added to the principal. Future interest rate at three-quarters of the contractual rate. Maturity to be extended from ten to twenty-five years from beginning of 1953. Amortisation to commence at the beginning of 1958 at the rate of 1 per cent per annum for five years, and thereafter 2 per cent per annum.

III—"Standstill" indebtedness

No reduction of principal. Credits to be "recommercialised" so as to finance Western Germany's current trade with other countries without loss of foreign exchange to the Federal Republic. (This means, for example, that German banks that are "standstill" debtors of London banks or accepting houses on credits now in the form of "cash" advances will, as and when their domestic financing of Germany's imports from sterling sources

permits, send the relevant bills to London for account of their creditors. The proceeds of the bills when discounted will be applied to repay the cash advances, but the amount of the original credit line will be maintained by conversion into a commercial credit. Creditors who grant new credit lines to Germany, in addition to any amount recommended, to be entitled to repayment of existing indebtedness to the extent of 3 per cent of each three months' availing of the new lines of credit. Arrears of interest calculated at 4 per cent simple to be added to the principal or to be postponed. Current interest and acceptance commissions will be payable in the currencies of the debts. Payments received by creditors in respect of distribution of German property seized during the war, unless applied against other German debts, will be applied

Business Notes

Near to Balance?

The trend of Britain's overseas trade in July was reasonably well in line with the trend that Mr Butler has forecast for the second half of the year. Imports last month are provisionally estimated by the Board of Trade at £290 million, or £16 million less than the monthly average between April and June; figures given by Mr Thorneycroft in the economic debate suggest that the monthly average between now and December may be £20 million lower still. Exports also continued to decline in July, although less steeply than imports. They amounted to £208 million or £1 million less than the average for April to June; they were higher than the total for June itself, but this was because of the low number of working days in that month. Despite this general sagging, however, exports to the United States and Canada rose to £24½ million in July—to 15 per cent above the average for the second quarter of the year. In contrast to previous months, most of the improvement in July came from a sharp recovery in the Canadian market. Exports to Canada reached £13½ million—no less than 33 per cent higher than the average for the June quarter—while exports to the United States, at £12 million, were much the same as in June.

After allowing for a recovery in re-exports, to £12.9 million, the excess of imports (c.i.f.) over total exports (f.o.b.) was only £69 million in July, compared with a monthly average of £78.6 million in the first half of the year. This suggests that the total external account, after allowing for

TREND OF UNITED KINGDOM'S OVERSEAS TRADE

	£ Million—Monthly Averages or Calendar Months			
	Imports c.i.f.	Exports f.o.b.	Re-exports f.o.b.	Excess of Imports over Total Exports
1950	217.4	180.9	7.1	29.3
1951, 1st half	309.4	206.7	10.6	92.0
2nd "	343.0	223.3	10.4	109.2
1952, 1st qtr.	328.1	239.5	18.3	70.4
2nd "	306.3	209.3	10.1	86.8
July*	290.0	207.9	12.9	69.1

invisible receipts and the freight and insurance element in the import figures, must now be getting very near to balance. That, at any rate, is the implication that emerges from Mr Butler's estimate that the overall deficit in the first half of this year was "substantially" under £75 million, and from reports that net invisible receipts (apart from certain exceptional payments made to Europe in July) have recently been tending to improve.

in reduction of standstill debts to the extent required by law or elected by the creditors.

IV—Commercial and miscellaneous debts

On amounts due in respect of goods, one-third to be paid as soon as individual agreements under the plan are concluded and the balance in ten equal annuities thereafter. On amounts due in respect of salaries, wages, etc., payment to be made in five equal annuities. On other debts under this heading payment to be made in ten equal annuities. Creditors may opt for payment in Deutsche marks. Two-thirds of the arrears of interest calculated at simple interest to be added to capital. No payment of interest until 1958, thereafter three-quarters of the contractual rate with a minimum of 4 per cent.

The Sources of Improvement

The Board of Trade also published this week a full analysis of the distribution of trade during the first half of this year, and thus made it possible to review Mr Butler's estimates of the overall balance in some detail. The Board's figures show that the excess of imports (c.i.f.) over exports (f.o.b.) in British trade with the non-sterling area fell from a monthly average of £95 million in 1951 to one of £75 million between January and June. Making the usual allowance of 12½ per cent for freight and insurance charges in recorded import values, these figures suggest that the "true" visible deficit with the non-sterling area may have been some £300 million in the first half of this year; since Mr Butler put the overall deficit with the non-

UNITED KINGDOM TRADE BY AREAS
(£ Million—Monthly Averages)

	Imports (c.i.f.)		Total Exports (f.o.b.)		Excess of Imports (c.i.f.) Over Total Exports (f.o.b.)	
	1st Qtr., 1952	2nd Qtr., 1952	1st Qtr., 1952	2nd Qtr., 1952	Year 1951	1st Half, 1952
Dollar area	69.9	70.4	29.7	29.8	35.9	40.4
OEEC and possessions (non-sterling)	84.0	71.6	59.8	54.4	28.2	20.7
Other non-sterling area	54.7	44.0	36.9	34.0	30.6	14.0
Total non-sterling area	208.6	186.0	126.4	118.2	94.7	75.1
Sterling area	119.5	119.9	131.4	101.3	5.9	3.3
TOTAL	328.1	305.9	257.8	219.5	100.6	78.4

sterling area at £275 million in this period, the implication is that net invisible receipts from the area amounted to about £25 million between January and June, compared with £11 million in the whole of 1951. The Board of Trade's figures for trade with the sterling area show an excess of British imports (c.i.f.) over exports (f.o.b.) of £3.3 million a month between January and June, compared with £6 million a month in 1951. On the usual method of reckoning, this would indicate a true visible surplus with the sterling area of about £70 million in the first half of 1952. Since Mr Butler's speech in the economic debate suggested that the total surplus with the sterling area in this period was over £200 million, the implication here is that the monthly rate of net invisible receipts from the sterling area was rather greater in the past half-year than in 1951 (when total net invisible receipts from this area amounted to £257 million). It is possible, however, that these estimates exaggerate the part that invisible receipts have played in Britain's recent recovery. It has been suggested that a greater proportion of Britain's reduced imports is now reaching this country in British ships—and that, despite the fall in freight rates,

an allowance of only 12½ per cent for freight and insurance charges in the recorded import bill gives a falsely gloomy impression of the visible balance.

The improvement in non-sterling trade this year has been mainly due to a decline in imports from OEEC countries, which means that the recent disappointing EPU figures may be largely the fault of the overseas sterling area. Thanks largely to successive doses of import restrictions, British imports of unrationed foods, textiles and certain raw materials have fallen sharply compared with last year. On the other hand, larger imports of metals and machinery, including machine tools, have been needed to feed the rearmament programme; these have come principally from the dollar area. Exports to the non-sterling area increased by 3 per cent in January to June compared with 1951; larger exports of metals and engineering products offset the fall in textile shipments to Europe. Re-exports to the United States were abnormally high because of heavy shipments of rubber and tin during the first quarter.

That's Commodity Arbitrage—That Was!

British merchants, after one week of frenzied scrambling for exchange licences to engage in arbitrage in dollar raw materials, have now had the door slammed in their faces—to be held fast, it seems, for a month at least. The Bank of England's announcement last week that, for the time being, it was prepared to authorise purchases of dollar materials for re-sale to EPU countries produced a flood of applications far surpassing its expectations—applications relating to grain, coffee, sugar, non-ferrous metals, silver and other commodities. The scheme had, in fact, a success so overwhelming as to embarrass the authorities—and, now, to exasperate the merchants. It was evident from the outset that the Bank's willingness to grant these facilities arose solely from the fact that, so long as Britain has to settle any EPU deficit wholly in gold (or secures full repayment of any EPU surplus in gold), every EPU currency is as hard as the dollar. Any outgo in dollars for commodity arbitrage that brought a return in EPU currencies therefore promised a net gain in hard currency to the extent of the merchandising profit—provided that the sales to the EPU area did not mount to the point at which Britain's current EPU surplus would be settled only partially in gold.

The Bank did not make it clear what it would do if and when this point was reached—because, last week, it required an improvement of no less than £158 million in Britain's EPU position to attain it. Yet by Thursday last, utterly confounding the official expectations, applications for exchange had well surpassed this sum—and so, even, had the Bank's authorisations. The authorities therefore had to think fast; they have not overtly withdrawn the scheme, but, for the time being, they are stamping merchants' applications with a reject mark that suggests a re-application in a month's time. Since not all the business that has been projected will necessarily materialise, the position may ease; but, in any case, it is far from certain that the facilities will be restored for all the commodities that have been in question this week. Grain, in particular, could involve a very large business, and the first dollar transactions in it were sufficient to swing the dollar quotation down by ½ c., to \$2.78½, not much above the lower dealing limit. In silver, where the scale could possibly have become still more embarrassing, no permits were issued. Gold was outside the scheme in any case.

One of the consequences of the facilities was to cause, in some commodity markets, a quick movement of prices sufficient to wipe out, or greatly to reduce, the scope for arbitrage profit. Another effect of the emergence of London as a temporary arbitrage bridge between the dollar world and the continent of Europe was to strengthen the rate for trans-

ferable sterling. The re-exports to the Continent must have that effect by mopping up European holdings of sterling. There is also keener competition from continental merchants who have hitherto had exclusive rights to this type of trade; their monopoly has now been threatened by British merchants, and in defending their business they have been bidding for transferable sterling. The rate this week has hardened to \$6.67, which reduces the discount on the official market rate to about 4½ per cent.

* * *

Preparations for Mexico City

Preparatory work is now in full swing for next month's annual meeting of Governors of the International Monetary Fund and International Bank in Mexico City. It was announced this week that the British delegation will be led by Sir Arthur Salter, and not, as was originally intended, by Mr Butler. There are said to be no items on the IMF agenda that will demand the Chancellor's presence in Mexico City, and certainly none that should drag him away from his urgent task of preparing the policy that will be presented to the Commonwealth Economic Conference in November. In view of this impending Commonwealth conference, all Ministers dealing with economic affairs have been asked to be available in London for consultation during the month of September. It remains to be seen whether this means that important decisions of policy are about to be taken, or whether the agenda for the Commonwealth conference is still a vast vacuum that has somehow to be filled.

One of the IMF's tasks in Mexico City will be to welcome two new members—Western Germany and Japan. This will raise interesting issues, not only for the general body of members but for the new recruits. Germany in particular has lately shown a *penchant* for old Schachtian devices in financing its trade with South American countries—devices complete with commodity barter agreements and special provisions for changing payments into accounts that can be used only for strictly bilateral trade. Germany will have to turn its back on much of this technique when it becomes a fully fledged member of the IMF.

* * *

How Labour Has Shifted

How far have rearmament, the textile recession, and the special emphasis now placed upon engineering industries, altered the pattern of British employment since 1950? The Ministry of Labour's employment figures for June, published last week, make possible a broad survey of shifts between industrial groups during the period—though its detailed figures of unemployment, in particular, are as usual subject to special seasonal influences. The unemployment figure, for example, which showed a fall of 46,600 over the month ending July 14th, to 393,500 and the figure of textile unemployment, which fell by 41,500, both probably exaggerate the real improvement. Some unemployed textile workers do not register during the traditional holiday weeks of some towns in Lancashire and Yorkshire; and certainly these lower figures of textile unemployment did not imply any increase in the textile labour force, which fell by 20,000 in June, continuing its fairly steady decline of 106,000 since the beginning of the year.

This fall in textile employment has been the most marked change in civil employment during the two year period, in which an increase of about 370,000 in the total working population was very largely offset by an increase of 180,000 in the armed forces and one of 140,000 in the registered unemployed. The employed population, therefore, rose only by the residue of 50,000; in June, indeed, it was 170,000 smaller than a year before. During that year the textile industries reduced their labour force by almost

exactly 150,000 people (some 14 per cent), and the number engaged in the clothing industry dropped by about 70,000. In textiles the labour force is still declining, particularly in the rayon industry; in clothing, employment seems to have stabilised in about April this year and subsequent minor changes may be only seasonal. No other important industrial groups show a significant decline in employment over the two years, though in recent months the distributive trades have shown a slight decline and a fall has taken place in the number of central government employees (partly offset by an increase in local government).

*

For the past two years, there has been a steady increase in employment in the industries most concerned with rearmament and now selected as the "spearhead" of exports; and over the last 19 months an increase, occasionally interrupted, in coal, the basic industry most in need of labour. The vehicle group's labour force, since June, 1950, has risen from 1,011,000 to 1,080,000; much of this increase has gone to swell the aircraft industry, and this year the rise in aircraft employment has offset actual declines in some months in the labour force of the motor industry. Aircraft employment, as measured by the Ministry of Labour figures, has now risen to 192,000 compared with about 150,000 late in 1950; a more realistic definition of the size of the industry's labour force might put it not far short of 250,000, with perhaps roughly 180,000 to 200,000 engaged on rearmament work. Employment in the other engineering industries rose between June, 1950, and February, 1952, by 133,000, but the group has since lost 27,000 workers; and indeed the main increases in the manpower of these industries took place before the Government selected them as export favourites. The shift of labour within the whole engineering group, on the whole, has perhaps been more satisfactory than was feared at the end of last year, particularly as other circumstances have conspired to delay the programme; though the recruitment of sufficient skilled men is very far from satisfactory. But the shifts toward successful exporters, within engineering, and towards the group as a whole since it was nominated for its "defence plus exports" role, are as yet not very considerable. If steel becomes more plentiful in the next six months, the capacity of these industries to attract labour for their dual tasks will be tested.

* * *

Germany Heads the EPU Creditors

The German Federal Republic was the largest creditor in the July compensation of the European Payments Union. The West German surplus amounted to \$57.7 million. This latest surplus carries Western Germany's cumulative surplus to \$368.8 million, for which it has received \$134.4 million in gold, the remaining \$234.4 million being the German credit balance with the Union. This puts Germany second in the order of cumulative creditors, the first being Belgium whose surplus, however, dropped sharply last month to \$8.7 million, from \$21 million in June. The Netherlands ranked as a substantial creditor in July, with a surplus of \$38.1 million. This surplus was in part due to capital transfers, which adversely affected the British position with EPU last month. The detailed British figures, as published in a Treasury statement this week, show that the July deficit amounted to £35,211,429, or \$98,592,000. No further use of existing resources took place during the month. Having exhausted the credit available under the agreement, Britain had to settle the whole of its deficit in gold, carrying the gold paid over by Britain to EPU to date to £207,733,214. The British overdraft with EPU at the end of July stood at £227,143,000.

Industrial Stocks and Safety

Will supplies of industrial raw materials be adequate to support the growth in production that ought to be possible during the remainder of this year? The "safe level" of stocks to which the Treasury has drawn attention this week offers hope that they will, if perhaps not quite so much encouragement as the Treasury draws from it. Certain of the records of stocks upon which the "Bulletin for Industry" has based its graphs are summarised in the accompanying table. Counted with prospects of current supplies, they should in most cases enable an increase in industrial output. But the Chancellor has already made it fairly clear that these stocks will have to be heavily drawn upon in coming months. Unless the improvement in the country's financial reserves by the end of the year is greater than now seems likely, it may be very difficult to replenish stocks of materials to Mr Butler's "reasonable and safe level" for production in 1953.

Set against current rates of consumption, and current supplies, the levels of stocks vary sharply between industries. The steel industry has less than two weeks' pig iron in hand compared with about a month's in June, 1950;

INDUSTRIAL RAW MATERIAL STOCKS (1950-1952)

Unit	Pig Iron	Ferrous Scrap	Virgin Copper	Refined Lead	Sulphur	Pyrites	Raw Wool	Soft Wood
	Thousand tons						mn. lb.	'000 stands.
1950 June	776	839	125.2	74.1	118.1	74.9	267	170.2
December ..	760	618	104.3	62.0	81.1	70.2	205	216.8
1951 June	357	329	117.7	26.0	92.9	106.3	165	272.2
December ..	380	257	119.3	74.0	99.4	214.9	141	723.6
1952 January	395	242	111.8	89.8	117.2	213.9	149	734.2
February	379	222	108.1	104.2	115.4	223.5	144	699.8
March	352	205	108.5	110.6	105.3	238.3	143	669.0
April	359	203	112.8	116.3	109.9	249.2	161	646.0
May	357	232	119.1	120.3	142	303.1		648.2

and little more than a week's scrap. Its ore supplies are higher than ever this year, and pig iron output is growing; on the other hand imports of scrap are down to no more than 500,000 tons a year now, and the drive for extra scrap in Britain has yet to produce impressive results. The metals industries have about three months' consumption of copper, five months' zinc, three months' tin, and more than a year's consumption of lead in stock. Sulphur stocks for acid would cover about five months' consumption at this year's rate, and with the fall in consumption of sulphur-bearing materials stocks of pyrites have mounted to well over a year's output. This high level of sulphur stocks, however, has accumulated partly through a combination of high imports and recession in the rayon and dyestuffs industries, and the Treasury still considers the need for economy in this material as great as ever. The wool industry has about five months' supplies in stock, but the Bulletin says "these stocks, apart from strategic reserves... appear to be little more than sufficient for the present low level of output" and suggests that any sharp recovery in demand might make raw wool supplies hard to obtain immediately. Stocks of building materials, apart from cement, are higher than a year ago; stocks of softwood and building bricks are large, but have fallen sharply this year as building output has risen.

* * *

Steel Supplies Improving

Last month's steel output was not quite as high as some in the industry had hoped. But it was satisfactory enough to support their forecast—to which the Treasury has now lent official authority—that slightly more than 16 million tons of steel can be produced in Britain this year. For the first six months of the year, production was at the annual rate of

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand goldfield alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

**BANK OF
NEW SOUTH WALES**

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA
LONDON OFFICES: 29 Threadneedle Street, E.C.2,
and 47 Berkeley Square, W.1
FIRST and LARGEST COMMERCIAL BANK in the SOUTH-WEST PACIFIC
(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE BANK THAT CONDUCTS THE LARGEST BANKING BUSINESS IN NEW ZEALAND

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 300 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or projected interests in the Dominion.

You are invited to contact the London Office
or the Head Office.

and Labasa (Fiji); Apia (Samoa).

only 16,046,000 tons; and output in this third quarter is, of course, affected by holidays. Steel production in July was at an annual rate of 14,236,000 tons, compared with rates of 16,252,000 tons a year in June and of 13,317,000 tons a year in July, 1951. The August output figure will probably not differ greatly from that for July. But the increase in production that will be necessary in the remaining three months to achieve 16 million tons will be backed by considerably greater blast furnace capacity than in the first half of this year. Pig iron production in July was at an annual rate of 10,482,000 tons, a million tons a year higher than this time last year. And the Treasury is now predicting what the steel industry has argued for some months—that the supplies of steel for the home market, swelled by much increased imports, should be greater in 1952 than in 1951.

It is this access of supplies, rather than any revision of the rearmament demands for steel, that has made possible the fairly general increase of 5 per cent in the total steel allocation to industry—which masks rather greater increases for some favoured sections of engineering heavily engaged in defence or export work, and little or nothing extra for less favoured consumers. This method of increasing allocations may partly account for the sharp discrepancy between various consumers' estimates of the seriousness of the steel shortage. In some industries, consumers seem inclined to accept the steel-makers' view that there is little real shortage, except in supplies of certain special shapes or of alloy steels. Other major consumers—notably the shipbuilding industry—continue to complain bitterly that the increases they are promised are as nothing beside what they need. Shipbuilding would appear to have sufficient direct and indirect export significance to justify generous treatment. Certain of the Government departments responsible for sharing out steel are now extending the practice of giving most of the extra steel to particular companies within industries if these companies can prove particular success in exporting. It is perhaps typical that this additional refinement of physical control should be brought into wider use just as the period of extreme shortage that might have made it partly effective may be passing away.

Argument about the Film Levy

The British Film Production Fund—more familiarly known in the cinema business as the Eady levy—entered upon its third year of operation last week with two pressing questions unanswered. How should it approach the growing number of cinema exhibitors who are refusing to pay this special contribution—a farthing or three-farthings from the admission prices paid for each seat—to British film producers? And should the arrangement, which as things now stand will end in August, 1954, be extended?

The number of recalcitrant exhibitors has not yet been divulged, but it is clear that as yet they constitute more of a problem in the internal politics of the trade than in the finances of the fund. They mainly represent small cinemas with comparatively cheap seats, and their refusal to pay is probably as yet depriving the fund of little revenue. In the 47 weeks that it was operating in 1950-51, with the levy at a farthing for every seat sold, the fund collected just under £1½ million, which it divided between the producers of some 450 long films and 550 short films, allotting at the same time £50,000 for the production of special films for children. In 1951-52, with the levy on seats costing more than a shilling increased to three-farthings, it was expected that some £3-3½ million a year would be collected as an additional contribution to British film production; and roughly this figure appears to have been realised. But refusal to pay this figure appears to have been spread quickly, and the Cinema Exhibitors' Association is uneasy. The levy is voluntary, neither statutory nor contractual, and it cannot be enforced upon exhibitors. But the obligation to pay it was accepted by the trade association in exchange for concessions in En-

tertainments Duty that cost the Treasury some money and enabled the industry to collect much more from the public. Some exhibitors in industrial areas would argue that those concessions did them no good. They were not in a position to raise seat prices, and in some cases reduced them; and since their patrons do not like the kind of film now generally made in Britain, they see no good reason to pay contributions from their box-office receipts, over and above film hire, on behalf of films they seldom show.

Some claim exemption on the ground that they are making a loss; and the exhibitors' association is putting forward to the producers' and renters' representatives who share with it control of the fund a suggested definition of an operating loss—which is not altogether easy to define in the cinema business—that might serve to check applications for such exemption. Certain small cinemas with very low weekly takings are already excused from paying the levy. But the main problem of refusals to pay still remains; and it will obviously complicate the reception of the proposals for extending the period of the levy that the producers—with support from the main cinema circuits, which have financial interests in film production—are now putting forward. Given circuit support, it may be that in the long run the levy will inevitably be given a longer life; but "how?" and "when?" are complicated tactical questions for the trade.

Shortage of American Cotton?

The official forecast of a smaller American cotton crop has not led to booming prices on the New York market. After an initial spurt before the week-end, prices have declined this week following reports that the damage caused by drought may not be so large as was originally believed. The Department of Agriculture's first estimate of the 1952-53 crop is only 14,735,000 bales compared with a target of some 16 million bales; and with last year's crop of 15,130,000 bales. The fact that the official estimate turns out to be so close to unofficial guesses based on planted acreage is surprising; evidently recent fears about the extent of drought damage in the South have been excessive. Although about 40 per cent of the South Carolina crop has been damaged and crops throughout the South are generally light, there are heavier yields in Texas, Arizona and California. Moreover rain since the beginning of August has improved the prospects in the stricken South-East.

There have recently been signs of improvement in American demand for cotton and it is now thought that consumption in the coming year may reach 9,500,000 bales compared with 9 million bales last year. On the other hand, American officials estimate that only 4,500,000 bales will be needed for export this year compared with 6 million bales last year. If these forecasts prove correct a crop of 14,735,000 bales would still leave some elbow room. But the eventual outturn seldom comes up to the original estimate—last year's crop, for example, was nearly 2 million bales smaller than the August estimate. And this year there is no large carry-over from which any deficit in the current year's stocks could be made good. The carryover of 2,600,000 bales at the end of July—although slightly above that of the previous year—was much smaller than the prewar carryover. With the prospect of a smaller crop, any world-wide recovery in cotton textiles could quickly lead to a shortage of American growths. Should such a shortage occur, the United States would no doubt consider the re-introduction of control of exports of raw cotton. American cotton prices are likely to be sensitive to any increase in demand or reduction in supplies during the coming season.

Spare Parts and Service

During the last few weeks, at an overseas oilfield owned by one of the major British oil groups, twenty motor trucks

of the same British make have been standing idle for lack of spare parts. Only by "cannibalising" thirteen of them, indeed, have some of the remaining vehicles in the field's fleet been kept in commission. Orders for the parts were placed in good time, in some cases as long ago as 1948; delivery was promised at different dates in late 1950 and 1951; the spares have still not arrived. These are not replacements for obsolescent vehicles that would need to be specially made; they are spares for postwar vehicles, some of them even to complete the original kit of spares ordered with the truck. The instance is not isolated; some while ago, at one of the same group's overseas refineries, forty vehicles were out of commission for the same reason. Nor is the trouble confined to vehicles. When American equipment in these same areas requires a part replaced, its manufacturers can usually fly the spare there straight away.

This oil group, in the past, has criticised delays in delivering complete British equipment. But its recent experience has driven it to complain that the delivery periods promised for spare parts are even longer than those for the equipment itself, and that the promises carry even less hope of being kept. Delivery of spare parts is seldom promised in less than four months from the date they are ordered, and often runs to a year or longer; and probably half of all the orders placed are not delivered by the date promised. It is current gossip in the oil industry that various American companies operating in Europe and the Middle East have refused to buy British plant that would otherwise have suited them simply because they believed that spare parts would not be available at short notice. The British companies, under official pressure to buy British and save dollars, in most cases do not opt to buy elsewhere; they have to wait, "cannibalise," or improvise the spare parts expensively in machine shops on the spot. Interruption of output for this reason is particularly irksome to an industry in which technical advance is so rapid that a refinery needs to recover its investment over a comparatively short period, and an industry accustomed to the most elaborate and solicitous service from an American equipment industry that grew up with oil.

It would be unfair to label this as a special weakness of an industry that has in any case really developed only since the war—the manufacture of petroleum equipment. For "petroleum equipment," as defined in the impressive totals of orders that have frequently been published, covers everything that oil companies buy, and the inadequacies in the supply of spare parts revealed by this British group therefore concern a fairly wide range of British engineering industries—and some of the best-known firms in them. A few of these are making exceptional efforts to catch up with spare part deliveries. Some others simply explain that all their parts—which include a considerable proportion of "bought-out" components—are going into new equipment; or even dismiss American after-sales service with the comment that "Americans load the prices of their spares to make service profitable; we don't." The large majority, according to this large-scale customer, admit the deficiency, and promise to correct it—but nothing happens. If this is a fair sample of the exporting behaviour of British engineering concerns, it suggests a short-sighted wish to sell the maximum amount of complete equipment overseas once and for all, compared with the American doctrine of selling productive capacity and keeping it producing. Is bad after-sales service a general weakness of the industry upon which most of the country's export hopes are being based?

Outlook for Rubber

The rubber market has been calm during the past two months and the London spot price has hovered almost idly

around 2s. 2d. a lb. Now that partial freedom has been restored to natural rubber in the United States there is little reason to expect any new drastic fall, while synthetic production will no doubt prevent any sharp rise. But the production and consumption statistics for the first half of this year are to some extent disquieting. World output of natural rubber totalled 847,500 tons, compared with 972,500 tons in the first half of 1951. World consumption, on the other hand, amounted to 737,500 tons against 805,000 tons a year ago. This declining trend during the past twelve months is perhaps of less significance than the balance between production and consumption in the first half of this year. Up to June, production exceeded consumption by 110,000 tons, but during the same period total commercial stocks fell by 97,500 tons; the comparison suggests that nearly 210,000 tons of natural rubber went into official stockpiles in the six months. Only 300,000 tons went into strategic reserves in the whole of 1951. Thus the rubber market has become much more dependent on official purchases than ever before, and yet the price this year has fallen from 3s. 6d. a lb at the beginning of January to 2s. 2d. The present high rate of stockpiling cannot continue for ever, though producers hope that it will be maintained until world consumption begins to recover.

Production and consumption of synthetic rubber are still increasing. Production in the first six months of this year amounted to 468,000 tons, compared with 421,000 tons in the first half of 1951, though this rate was slightly less than in the second half of last year. On the other hand, consumption reached 442,500 tons, nearly 50,000 tons more than twelve months ago and one of the highest half-yearly totals ever attained. Stocks at the end of June had increased by 30,000 tons to 172,500 tons, so that on balance no synthetic rubber appears to have gone into the various national stockpiles. These statistics have yet to show the effect of the lifting of restrictions in the United States on the use of natural rubber.

Metals in Confusion

The confusion that has recently affected copper prices is now spreading to other metals. A week ago American producers reduced their price for zinc from 15 cents a lb to 13½ cents a lb; this week they have increased it to 14 cents a lb. The Ministry of Materials has followed these American price changes step by step and is now charging £122 a ton for zinc compared with £130 a ton before the two adjustments.

Zinc supplies have improved steadily this year, and by the end of May the International Materials Conference was able to bring international allocation to an end. American consumption of some grades of zinc began to fall during the spring but for a time this movement was masked by continued strong demand from the galvanising trade. As soon as the American steel strike curtailed the demand for iron and steel for galvanising an immediate reduction occurred in zinc prices—the first fall since October, 1949. When the steel strike ended it was hoped that zinc prices would recover promptly. In the event, the weight of stocks accumulated during the strike proved too heavy and the announcement that smelter stocks had reached nearly 97,000 tons by the end of July sent prices tumbling to 13½ cents a lb. At this level smelter business apparently picked up so rapidly that within a few days the price recovered to 14 cents a lb—and there are signs that revival may go further. But this succession of sudden price changes has left zinc consumers in this country and in the United States bewildered and a wave of nervousness has spread to the American lead market.

Copper has remained immune from the slackening in demand that has affected lead and zinc during the last few months. But there are signs that American consumers may

QUICK TURN ROUND

THE S.S. "Eumaeus" rammed the quay at Hongkong and stove in her bows. The hole was filled in with concrete and in this state she steamed back to Glasgow to be repaired in the Barclay Curle & Company shipyard. The first step in the repair was, obviously, to dislodge the concrete. It *could* be chipped out—all 4 tons of it—a few pounds at a time with road drills, crowbars and chisels. But at this point I.C.I. was asked to remove it with explosives. Though it is easy enough to break up concrete by this means, it was more difficult to find a way of blasting without at the same time damaging either the rest of the ship, the nearby ships in the yard, or the adjoining property. The technical service department of I.C.I.'s Nobel Division, drawing on 80 years' experience of explosives, knew the answer.

The concrete was removed safely, and the S.S. "Eumaeus" was back in service in a comparatively short time.

THE ORGANISATION OF HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £1,800,000)

is associated with

The British Metal Corporation (Pakistan) Ltd.
The Cyprus Co., Ltd., Drew, Brown Ltd. (Canada),
Sandilands Buttery & Co. Ltd. (Malaya), and C. Tennant Sons & Co.,
of New York, as well as with the associates of The British Metal
Corporation Ltd., Australia, Canada, India, South Africa
and Central Africa.

The Group provides manufacturers and producers of finished articles and raw commodities with an economical method of marketing their products

throughout the world. Expert knowledge in distribution and salesmanship is available through the various units of the Group.

Arthur Guinness Son and Company Limited

(Incorporated in England under the Companies Acts, 1862 to 1883.)

The following letter has been addressed to the Stockholders accompanied by a Notice calling an Extraordinary General Meeting of the Company for the 4th September 1952:—

At the last Annual General Meeting I pointed out that the growing size and complexity of our business and the fact that we are operating throughout the world and brewing in three different countries made it desirable to introduce some administrative reorganisation, so as to secure the maximum devolution and flexibility and greater efficiency. I pointed out then that there were many problems involved, and it is only now that we have been able to find what we consider to be a satisfactory solution.

My great-great-grandfather acquired the brewery at St. James's Gate, Dublin, in 1759, and until 1936 it was our sole brewery. The present Company, when formed in 1886 had its registered office in London, but the executive control was efficiently and easily maintained in Dublin. The growth of the English market led to the building of our Park Royal Brewery which started operations in 1936. In 1943 we acquired an interest in brewing in U.S.A. which, though initially on a small scale, will, we hope, develop. In 1949 we reorganised and consolidated our export trade in a subsidiary Company called Guinness Exports Ltd., which has proved an unqualified success.

We have found that it is no longer possible efficiently to retain as one administrative unit the two great breweries with their trade departments and ancillaries, operating as they do in different countries and in circumstances different in every way. We propose therefore to form two wholly owned subsidiary Companies, to come into operation on 1st of October next, the one to be responsible for the Park Royal Brewery and the market in England, Wales, Scotland, the Channel Islands and the Isle of Man and the personnel and organisation involved, together with our hop farms; the other to be responsible for the Dublin Brewery and the markets in the Republic of Ireland and Northern Ireland and the personnel and organisation involved. The Dublin Company will undertake all brewing for export and will also under a long-term agreement with the Park Royal Company continue to supply stout as at present for the market in Great Britain.

The English Subsidiary Company will be called Arthur Guinness Son and Company (Park Royal) Limited and the Irish Subsidiary Company Arthur Guinness Son and Company (Dublin) Limited. These two Companies will be separate legal entities, but their shares will be wholly owned by the present Company. The only publicly owned shares will be those of the present Company, and the assets which are behind those shares will be unaffected, except that they will be subject to decentralised control which we are satisfied will operate more efficiently under the conditions that have developed. The present Company will retain the ultimate responsibility for the formulation and administration of policy inherent in its position as the sole shareholder; and will itself hold the American interests and Guinness Exports Ltd., and control any other interests we have, or may acquire.

Our decision, though it involves an internal reorganisation only, is a major matter which I have felt it desirable to put before the Stockholders. It is for this reason that I have decided, with apologies, to call you together again, so soon after the last Extraordinary Meeting. Although the Preference Stockholders are not entitled to vote at such Meeting I have addressed this letter to them also, and we would welcome any of them who would care to attend.

The proposals, though simple and usual in themselves, have not been without their difficulties, particularly from a taxation point of view. Every precaution has been taken to see that the reorganisation will not give rise to any additional liability for taxation and I would wish to pay tribute to the Authorities in both England and Ireland for their helpful and co-operative attitude. It is proposed in due course, unless in the Board's opinion circumstances make it undesirable, and subject to the necessary U.K. Treasury consent, to transfer the management and control of the Irish Subsidiary Company to that country.

Arrangements have been made for securing all existing pensions, as well as the pension rights and conditions of all staff and employees hitherto in the service of this Company who in future will be employed by the two new Subsidiaries.

It is difficult for any Board to foresee all the problems and difficulties of the future, but your Board, after full consideration of all the factors involved, is satisfied that this reorganisation is, and will be, wholly to the advantage of the Company and should lead to increased prosperity and strength.

Yours faithfully,

IVEAGH

Chairman.

PARK ROYAL BREWERY,

OF A SERVICE TO INDUSTRY

Brown & Polson STARCH PRODUCTS

IN SUGAR CONFECTIONERY

THE largest single use of glucose is to improve the products of the sugar-confectionery trade—boiled sweets, in particular. Every day, millions of young hearts are rejoiced by the sight of gay glass jars in sweet-shop windows, full of brightly-coloured 'cushions' of flavoured sugar, clear and translucent as the jars that display them.

But boiled sweets did not always shine so bright. Once (long ago, it is true) the sugar confectioners were vexed by the crystallising of the sugar in their sweets, which dulled their surfaces and spoiled their translucency. The first attempt to cure the trouble was by adding cream of tartar and so 'inverting' enough of the sugar to prevent crystallisation. That did stop the crystallising to some extent, but invert sugar is hygroscopic—it absorbs atmospheric moisture, and makes the sweets that contain it damp and sticky.

Glucose as a Crystal Inhibitor

Later, glucose was used instead of cream of tartar, with complete success. The glucose, itself an energy-providing food, affords a colloidal medium in which sugar crystals cannot form, and keeps the wares in the sweet-shop windows permanently bright.

The provision of glucose for confectioners to use as a crystal-inhibiting medium is one example of the varied services that the Brown & Polson Group performs for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to:

CORN PRODUCTS COMPANY LIMITED

The Industrial Division of

Brown & Polson

BROWN & POLSON LTD., WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

not continue much longer to pay the current high prices for imported copper; last week the *Engineering and Mining Journal* export quotation—which is compiled from sales of foreign produced copper on the New York market—averaged only 34.808 cents a lb compared with 35.171 cents in the previous week. Copper is still rationed in the United States and consumers receive 60 per cent of their allocations in domestic metal at the ceiling price of 24½ cents a lb; the remaining 40 per cent must be taken in imported metal. Copper users are probably still taking up the whole of their allocations, partly because they fear a repetition of last year's strike in the copper mining industry and are therefore anxious to replenish stocks; and the demand for copper products is still firm. The British price for copper was reduced at the beginning of August by £2 to £287 a ton, following the conclusion of a new six weeks' contract with the Commonwealth producers.

* * *

More Meat at Higher Prices

Housewives will probably soon have to pay more for the Sunday joint. From this week the Ministry of Food is to pay 1s. 3d. a lb for Australian lamb—or 2d. a lb more than last season. Meat is supplied to this country by Australia and New Zealand under long-term agreements but the contract price is reviewed each year. Preliminary discussions about the new season's price for New Zealand meat have been in progress for some time and this week the New Zealand Minister of Agriculture arrived in this country for talks with the Minister of Food. Meanwhile, the annual tussle over Argentine meat supplies is taking place in Buenos Aires. Argentina is said to be demanding a price of nearly £200 a ton for its meat, to which Britain is unlikely to agree; but a larger quantity of Argentine meat in the next twelve months will probably not be obtainable without making some advance on the average of £129 a ton paid last year.

Shipments from Argentina have ceased since last year's quota was fulfilled two months ago but they may be resumed shortly on a temporary basis pending the conclusion of the present negotiations. Even without additional shipments from Argentina total supplies of meat this year are expected to be larger than they were last year. The chief factors in this improvement are an increase in home-killed meat from 978,000 tons last year to 1,080,000 tons and larger imports from New Zealand. The first consignment of New Zealand chilled beef since the war reached London this week. During the first half of the year 146,000 tons of New Zealand meat arrived in this country and shipments for the full year may amount to 360,000 tons compared with 270,000 tons last year. Imports from Argentina so far this year have been 106,000 tons or 16,000 tons more than the total for the whole of last year. On the other hand the Australian drought has reduced meat supplies from that Dominion to a minimum—only 20,000 tons are expected this year (of which 8,000 tons arrived in the first half year) compared with imports of 65,000 tons last year. Imports from Uruguay are also expected to be smaller than last year.

On the basis of these estimates (and without further shipments from Argentina) the Ministry of Food expects that the country's total meat supplies will amount to 1,600,000 tons against 1,435,000 tons last year. According to the official forecast this should permit an increase in consumption from 59.5 lb a head to 67.1 lb a head; total consumption will rise from 1,350,000 tons in 1951 to 1,500,000 tons this year. In the first half of this year only 700,000 tons of meat was consumed, but the ration has since been increased to absorb the seasonally large supplies of home-killed meat.

Patent Trouble with Nylon

British Nylon Spinners has been granted an interim injunction against Imperial Chemical Industries, to restrain ICI from parting with certain nylon patents used by BNS. This action is the outcome of an order from the American courts to ICI, ordering ICI to return to the American manufacturers, du Pont, the nylon patents that du Pont had first licensed and then assigned to the British company. The order arises from successful anti-trust proceedings against du Pont and ICI. Using du Pont patents, ICI produces nylon polymer in this country, which is then spun and marketed by British Nylon Spinners, a company in which ICI and Courtaulds have a joint interest. Under the original agreement with du Pont, ICI had exclusive rights to these patents in the British Empire, with the exception of Canada and Newfoundland where du Pont had made separate arrangements, and in the majority of the countries in the Middle East. Non-exclusive rights were granted for some European countries. British Nylon Spinners held a sub-licence from ICI covering the manufacture and sale of nylon yarn (not the polymer) in those same territories. Anti-trust hearings began in 1944 and in 1947 du Pont assigned the patent rights for these territories outright to ICI. That company then told British Nylon Spinners that a new agreement would have to be drawn up since the company was now a direct licensee of ICI. This formal agreement has not been completed, but the companies have acted in accordance with its intentions. Mr Justice Upjohn remarked on Wednesday that there is some doubt in any case whether "a court of foreign jurisdiction has power to impose on a company domiciled in this country an order which would compel it to break contracts entered into quite properly in this country."

International Harvester Expands

International Harvester's decision to double the company's productive capacity in this country is a step likely to have repercussions on British makers of farm machinery. Since the war, British producers have taken the opportunity offered by the dollar shortage to expand production of tractors and machinery several times over and to sell this equipment in non-dollar markets—including the home market—that had previously relied for a large proportion of their supplies on the three great North American producers, Massey-Harris, Allis-Chalmers and International Harvester. Each of these three manufacturers has since decided to meet its customers' lack of dollars by setting up factories in the sterling area. Restrictions on building and on capital investment held up progress with their British factories, but each now has a factory in full production in this country. Some of the equipment that is being produced in them, such as combines and pick-up balers, is not made on any scale by British manufacturers, but a good deal of the machinery range is directly competitive.

The International Harvester factory at Doncaster is already employing 2,000 people and turning out 4,500 to 5,000 tractors a year. It is now proposed to double the size of this factory, and extend its foundry capacity in proportion. This will make it possible to step up production of certain types of equipment, such as balers, and to widen the range—in particular by the introduction of a crawler tractor. About 80 per cent of the Doncaster factory's output is being shipped to the company's overseas dealers who have been cut off from supplies from the United States, and this high export ratio is likely to be maintained when the new plant comes into operation in approximately two years' time. To meet the cost of the new factory, the American parent company has recently subscribed the dollar equivalent of £1,000,000; earlier this year the company borrowed £1,000,000 in this country and it has also arranged in London for overdraft facilities of up to £1.5 million.

American companies have been the world's suppliers of farm machinery for so long that many farmers are strongly predisposed towards them, and it is an open question whether the British farm machinery industry will be able to retain its lion's share of the non-dollar markets when it has to sell in direct competition with British-built American designs. Much depends on the improvements that have been made in British designs in the intervening years, and on whether British companies have had sufficient time to build up a distributive system equal to that which, say, International Harvester already possessed before the company came to Britain. It is interesting to note that International Harvester has not committed its designs to direct mounting to the same extent as some British companies. Its machinery range is described as "general purpose," designed for any tractor, and not necessarily only International Harvester tractors. This policy is in line with that followed by some of the oldest and wisest of the British producers.

New Money for Monsanto

A new pattern in international finance was set last week when Monsanto Chemicals Ltd., the British company controlled by the American one of the same name, decided to by-pass the London market and look to Canada for finance. It is to raise £3,500,000 by placing a 5 per cent unsecured loan stock at par with three of the leading Canadian insurance companies. The first £1,500,000 of the stock was issued to these institutions last week end, and the balance of £2,000,000 will be available for issue up to the end of 1954, in stages and at the option of the company. As the stock is being placed privately, no stock exchange quotation will be sought. This placing carries distant echoes of the surge of unsecured loan issues made by leading British companies in 1949 and 1950, but the coupon rate and the redemption terms of the Monsanto stock show how effectively dearer money has changed the face of the capital market since then. The final redemption date of the stock is July 1st, 1982—an indication that the life companies, Canadian as well as British, are becoming more attracted to good long term yields as the long term liabilities in pensions business grow. Monsanto has the right to redeem all or any part of the stock after the end of 1953, but only on the payment of quite substantial premiums to the institutions. If the stock is redeemed before June 30th, 1957, the company will have to pay a premium of 10 per cent; thereafter, of course, the premiums become smaller and after June 30, 1980, the stock can be redeemed at par. An annual sinking fund for redemption will be started in 1963.

The specific developments that will be financed by this new money are not detailed in the circular sent out to shareholders in Monsanto. The chairman, Mr Edward A. O'Neal, is content to indicate that the Government, to whose policy in delaying the construction of new projects he made reference in his last annual report, has now given Monsanto the signal to go ahead with its expansion and development plans. Some of the money (particularly the £2,000,000 that is not to be raised immediately) may be intended to finance the second stage of the development of the Newport factory, while part of it may be needed to finance the company's latest ventures, still in their embryonic stage, in the production of Krilium and the synthetic fibre, Acrilan. If this is so, additional plants to produce the necessary raw materials will also have to be built.

Shorter Notes

Some misunderstanding has arisen about the steps taken in New Zealand (and discussed in a Business Note last week) to reduce allocations of overseas exchange for 1953 to 40 per cent of the 1950 total. These steps will affect imports both from sterling and non-sterling countries, but the specific

provision that licences for imports into New Zealand will be issued only on the understanding that they do not convey an automatic right to exchange, will not apply to imports from the sterling area. This preferential treatment does not excuse this rather novel type of import control in New Zealand, but it will reassure many exporters in Britain and other sterling countries, who may have seen in this development a serious deterrent to their future trade with New Zealand.

The cash issue by the Nyasaland Government of a 4½ per cent stock (1971-78) and the cash-cum-conversion issue by the City of Johannesburg of a 5 per cent stock (1959-62) were both over-subscribed. Dealings in the Johannesburg began on Tuesday around the issue price of 98 and then eased to ½ discount, but by Thursday's close the price had recovered to par. The Nyasaland loan opened on Wednesday at the issue price of 98½ and by the close had risen to ½ premium.

In the note "Revised Production Index" in these columns last week, the table showing production indices since 1948 was reversed. It should have read:

	Old Index	New Index
1948	100	100
1949	106.8	106.4
1950	116.2	113.5
1951	119.6	117.3
1952 (first quarter)	122.3	120.2

The new total production index therefore suggests that the growth in production since 1948 has been smaller, not greater, than the old index implied.

Prospecting licences covering the mineral deposits in the Sukulu region of Uganda have been granted to the Tororo Exploration Company, which has been formed jointly by the British Monsanto Chemicals, Rio Tinto Company, Frobisher, Ltd., and the Uganda Development Corporation. Among the minerals mentioned are pyrochlore, magnetite, apatite, francalite, baddleyite and zircon. The pyrochlore deposits of Nigeria have an appreciable uranium content, but it is not clear yet whether this is true of the Uganda deposits as well.

Arthur Guinness has announced a scheme of internal reorganisation that in effect will split its business into two. Two wholly owned subsidiaries are to be formed, one to be responsible for the Dublin brewery and the markets in Ireland as a whole, and the other for the Park Royal brewery and the market on this side of the Irish Channel. The Dublin company, whose management and control (subject to the consent of the Treasury) will in due course be transferred to Ireland, will undertake all brewing for export and will continue to supply stout for the market in this country.

The consolidated net earnings of International Nickel rose again in the second quarter of this year. They amounted to \$17,191,909, compared with \$16,346,318 in the preceding quarter and with \$14,653,656 in the corresponding quarter of 1951. As a result net earnings in the first half of 1952 were equivalent to \$2.23 a common stock, compared with \$1.94 a common stock in the first half of 1951.

Two motor companies, Rootes and Jowett, have announced price reductions for certain models. The Humber Snipe comes down from £1,045 (excluding tax) to £830, compared with £695 for the slightly smaller Humber Hawk, the price of which remains unchanged. The Jowett Javelin, which was £725, is down to £695, and the price of the larger Jowett Jupiter is also reduced in the same proportion.

Company Notes

Ruston and Hornsby.—The directors of Ruston and Hornsby have presented shareholders with news of another advance in trading profits (from £2,027,944 to £2,475,750), an increase in ordinary distribution (from 9 to 11 per cent), and accounts that are full of more than usually informative detail. A seven year review of the group's progress shows that the ratio between the net dividend and the book value of ordinary shares fell from 3.1 per cent in 1945-46 to 2.35 per cent in 1951-52. Yet in this period profits, before tax, have risen from £193,415 to £2,197,886, net working capital from £2,530,494 to £7,758,889, and the net book value of fixed assets from £857,368 to £2,519,296. Even when allowance is made for the steady increase in prices since the war, these figures represent a substantial growth in the group's business and stature. But as the chairman, Mr W. J. Ruston, makes clear in his review of the trading year to March 31st, these achievements have not been without their growing pains—in the shape of mounting taxation, relentless increases in costs and the associated problem of securing an adequate flow of raw materials.

Consolidated earnings :—

	Years to Mar. 31, 1951	1952
Trading profit	2,027,944	2,475,750
Total income	2,203,415	2,562,086
Depreciation	280,283	328,508
Taxation	1,040,407	1,299,585
Net profit	746,975	898,991
Ordinary dividends	193,725	236,775
Ordinary dividends (per cent)	95.797	161.604

Reserves	4,100,000	4,100,000
Ordinary capital		

£1 ordinary share at 37s. 9d. and yields 5s. 10s. per cent.

The increase in costs forced the company to raise its selling prices twice last year, steps that it took very reluctantly in view of growing German and Japanese competition in the world markets for oil engines and the locomotives. The difficulty of "obtaining the right materials and components, in the right quantities, at the right time" caused some of the group's factories to run under capacity; it has also resulted in a large and unbalanced stock and in a failure to deliver "a record number of engines, almost completed, but held up very often for the lack of one or more components." The basic difficulty of facing the company is the shortage of carbon and alloy steel. The Government has not granted the group sufficient authorisations to ensure full capacity working, and the company is finding it extremely difficult to persuade the steel makers to deliver the steel against the authorisations that have been allotted to it. The company has a record in the order book, and last year's growth in the number of employees, from 8,838 to 9,248, shows that it is not short of labour, so that much will depend on an increase in steel supplies. Even if this bottleneck is opened out shareholders should not bank on bigger dividend warrants this year. Taxation and outstanding capital commitments of about £1 million are likely to make a heavy call on both current earnings and liquid resources.

Furness Withy.—Although a substantial proportion of Furness Withy's earnings is derived from sources other than shipowning, the heart of the group's business remains the operation of liner and cargo steamship services on most of the regular trade routes of the world. It is almost certainly from shipping that the remarkable boom in profits in the year to April 30th stems. Group net profits, after tax and all other charges, rose

from £1,515,308 to £2,893,688, despite a staggering increase in the provision for British taxation from £723,494 to £3,164,994.

Equity stockholders are to receive their due share in this expansion in earnings. The ordinary dividend, which was raised from 8 to 9½ per cent in 1950-51, has been increased to 12½ per cent. This is an effective increase of 3½ per cent, for the special tax-free bonus of 2½ per cent paid in 1950-51 was distributed out of a surplus arising from the sale of investments and not out of the year's profits. The group's earnings will almost certainly fall this year, as there has been a sharp contraction in the volatile freight market; liner conference rates are, of course, more stable, but in this field, too, the growth in import restrictions is likely to reduce the demand for cargo-liner space. Nevertheless, the directors' decision to raise the ordinary dividend indicates a certain confidence in current trading prospects—although the decision to classify 2½ per cent of the dividend as a "cash bonus" may carry some implications the other way. At the current price of 31s. 6d. the £1 ordinary stock units yield just over 7.9 per cent.

Whitworth and Mitchell and Tootal Broadhurst Lee.—The slump in the textile trades has not as yet produced an odder contrast in trading results than that revealed by the preliminary statements issued by Whitworth and Mitchell and by Tootal Broadhurst Lee, whose financial years both ended on June 30th. After writing down stocks (by about £347,000) to their market value, Whitworth and Mitchell report a trading loss of £233,234, compared with a profit of £363,055 in 1950-51. Its net loss amounts to £270,354, compared with a net profit of £174,055 in 1950-51, and this has been met by writing back £52,000 from the company's general reserve and £165,000 from a stock reserve. This has enabled Whitworth and Mitchell to pay a dividend on the 6 per cent cumulative preference stock for the half-year to December 31st last and an interim ordinary dividend of 2½ per cent, but the preference dividend for the latter half of the financial year and the final ordinary dividend have been passed.

In very sharp contrast to this gloomy record, the directors of Tootal Broadhurst Lee have recommended an increase in the distribution on equity capital from 13½ to 15 per cent. This increase has been recommended despite a drop in net profits from £669,292 to £339,138, and an even more steep decline in profits before tax, from £1,980,000 to £574,000. In these circumstances the decision to increase equity payments can conservatively be described as surprising—especially as the company has deemed it necessary to make a provision of £125,000 (compared with £110,000 in 1950-51) against losses by subsidiaries.

The contrast between the "first degree burns" inflicted on Whitworth and Mitchell by the recession in the textile trades and the "second degree burns" suffered by Tootal needs some explanation. Tootal is, of course, a much bigger organisation than Whitworth and Mitchell, and therefore its internal finances are stronger. In the middle of last year Whitworth and Mitchell possessed in effect no liquid resources, having a bank overdraft of over £40,000 in contrast to its cash balance of just over £300, while the Tootal group had a cash balance of just over £1,800,000. Another reason that can be advanced is that Whitworth and Mitchell seem to have a bigger stake in the rayon trade than Tootal. The £1 ordinary stock units of Whitworth and Mitchell are currently quoted at 15s. 7½d., and the £1 ordinary shares in Tootal at 56s. 9d., to offer a yield of 5.3 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 9, 1952, total ordinary revenue was £87,527,000, against ordinary expenditure of £68,279,000 and issues to sinking funds £1,020,000. Thus, including sinking fund allocations of £9,962,000 the deficit accrued since April 1, 1952, was £183,925,000 compared with a surplus of £86,263,000 for the corresponding period of the previous year.

On August 11 applications for 91 day bills to be paid from August 11 to August 16, 1952, were accepted dated Monday to Saturday as to about 68 per cent at 499 7/8. 9d., and applications at higher prices were accepted in full. Treasury Bills to a maximum of £220 million were offered on August 15th. For the week ended August 16th the banks were not asked for Treasury deposits.

ALBERT E. REED & COMPANY

PERIOD OF EXCEPTIONAL TRADING CONDITIONS

SIR RALPH REED ON WIDE RANGE OF ACTIVITIES

Sir Ralph Reed (Chairman), presiding at the forty-ninth annual general meeting of Albert E. Reed & Company, Limited, paper manufacturers and converters, held in London on August 12, 1952, said:

Ladies and gentlemen,—In moving the adoption of the report and accounts for the year ended March 31, 1952, which have been in your hands for the requisite period, I should like first of all to refer to certain changes which have occurred in your Board of Directors.

As you will have seen from the report, Lt. Col. W. H. Wild retired at the end of 1951 after 29 years on the board, and Mr. F. F. Edwards, who had given almost a working lifetime of service to the company, including 32 years as secretary, and had been a director since 1928, retired at March 31st. We look back with gratitude on our valued and harmonious association with these two gentlemen, and their services to the company for so many years.

Mr. E. S. Birk was appointed a director on January 1st and his wide business associations and legal knowledge will be very helpful to us, while Mr. T. E. G. Baker and Mr. C. V. Oliver, both of whom have reached high executive responsibility after many years' excellent service to the company, were appointed directors on March 4th. These three appointments will require your confirmation at this meeting.

GENERAL TRADING CONDITIONS

Before referring to the principal features of the accounts and balance-sheet, I think it may be helpful if I give some outline of the general state of affairs in the paper trade since I addressed you last November.

Until the beginning of January the demand for paper and paper products was maintained at a very high level and the extraordinarily high prices ruling for woodpulp and other raw materials inevitably resulted in extremely high prices for our products. The Government then decided to take joint action with certain Continental countries in an endeavour to bring down the artificially high prices of woodpulp. This decision was taken at a time when the American economy indicated at least equilibrium if not a surplus in the pulp and paper supply position, and this factor was probably the most important one in producing the remarkable change which took place in our industry in the early part of 1952.

PRICE MOVEMENTS

In February last the Government fixed ceiling prices for woodpulp imported from sources other than North America, for the second quarter at figures which varied between 25 per cent and 35 per cent below the average prices which were then ruling for chemical pulps and about 12 per cent in the case of mechanical pulp. These prices were accepted by our suppliers and, when they became effective, the market prices for paper were reduced accordingly.

The peak prices of pulp and paper which were reached in the latter part of 1951 compared with prewar prices in 1939 as follows:

Chemical pulps had risen to no less than fourteen to sixteen times, and mechanical

pulp to about eight times the prewar prices, while our selling prices for the many kinds of paper we produce rose in varying degrees, depending upon the nature of the raw material used, up to a maximum of nine to ten times the prewar 1939 prices.

In the case of newsprint, the selling price of which was still controlled until ten days ago, the highest price reached was about six and one-half times prewar. The price of this paper was not reduced during the second quarter of 1952 by anything like as much as that of those other kinds of paper which we make from chemical pulp. Among the reasons for this are, firstly, that newsprint is made mainly from mechanical pulp, the price of which, as I have said, had risen in much smaller proportion than the more expensive chemical pulp and had fallen to a much lesser extent this year, and, secondly, that newsprint production and prices have had the full benefit, by Paper Control direction, of the imports of Canadian sulphite pulp, the price of which did not rise nearly so much as that of the much larger European supplies used in the production of other papers and had not fallen to anything like the same extent.

Meanwhile, European pulp prices for the third quarter of this year have again been falling by very substantial amounts, and the selling prices of many of our products have been further reduced.

Having dealt at some length with the important matter of price movements, I must now add a word about the equally important matter of the demand for our products. A very serious falling off in demand has occurred in recent months and I think it is true to say the fall has been very much heavier than anyone could have foreseen at the beginning of 1952. This has been due to a heavy stock position in many directions, the lack of confidence among buyers owing to falling prices, certain restrictions imposed in export markets, and also to a general recession of activity in many other industries which use paper and paper products in various forms. All this has involved a very substantial reduction of output in our organisation and in the paper-making industry as a whole, and it is not surprising in all the circumstances that the Government recently took steps to release from control, as from August 2nd, the selling prices of newsprint and mechanical printings, these being the only two descriptions of paper which were still subject to price control up to that date.

PROFIT AND LOSS ACCOUNT

The trading profit for the year amounts to £6,307,000, out of which we have to find no less than £3,691,000 for taxation, leaving a balance of £2,616,000, out of which we have set aside a provision of £1,500,000 against the effects of the falls in values of woodpulp to which I have already referred.

Our trading results have recently been the subject of a considerable amount of publicity particularly in relation to the selling price of newsprint, and were even referred to in Parliament. In a debate in the House of Commons, as reported in *Hansard*, June 23rd, your company was referred to as being "confined almost exclusively to the manu-

facture of newsprint," thus implying that our profits for the year ended March 31, 1951, were almost entirely obtained from that source. This mis-statement perhaps arose from the fact that we are, as is well known, the second or third largest producer of newsprint in this country, but it is so very far from the truth that I think I should give you the facts.

During the past two years our production of newsprint, large as it is, has been not more than one-quarter of our total production of paper, and a much smaller proportion of our total paper sales values, quite apart from the very large additional turnover of converted products manufactured by subsidiary companies in our Group. For in addition to newsprint we make very substantial quantities of other kinds of printing paper, etc., while our production of wrapping papers has exceeded our output of newsprint and other printing papers combined and is, we believe, larger than that of any other producer in this country or, indeed, in Europe.

I informed you a year ago that newsprint represented only a small fraction of our paper-making profits. It represents a still smaller fraction in the year now under review. This means, of course, that our profits on our other products, the selling prices of which, unlike newsprint and mechanical printings, were not controlled, have been much larger than we should have been justified in making under more normal conditions. I must stress the point, however, that, firstly, this has been primarily due to the effects of the unprecedented rises in the prices of woodpulp, and therefore in the market prices of paper, which occurred in 1950 and 1951, and, secondly, if under such inflationary conditions we had been content with the same profit margin during the last two years on our other kinds of paper as has been allowed to us on newsprint under Paper Control Prices Orders, we could not have provided against the stock losses, running into millions of pounds, which have taken and are taking place, and we should now have been faced with a truly disastrous situation. This is true not only of your company, but also of the papermaking industry as a whole in proportionate degree. Much as we regret the unprecedented prices we have had to charge for our products, we feel that we have been fully justified in doing so.

NON-CONTRIBUTORY PENSION SCHEME

During the year we introduced a non-contributory superannuation scheme to provide pensions for all those employed in our group when reaching the age of 65 for men and 60 for women. This scheme, which operates under a trust created for the purpose and takes the place of the voluntary arrangements under which we have paid pensions to retired employees of long service for many years past, had an extremely good reception from all concerned and we believe will consolidate still further the excellent relationship which has always existed with our employees. In view of this important new commitment, we have deemed it appropriate to carry the sum of £1 million to pensions reserve.

ORDINARY DIVIDEND

In view of the results disclosed in our accounts we recommend the payment of a

final dividend of 13 per cent on the Ordinary shares, making 20 per cent for the year. We feel that this is all the more justified by reason of the restriction imposed upon us a year ago owing to the special circumstances which I then explained to you, as well as the restraint which we voluntarily exercised in several previous years.

BALANCE SHEET

Turning to the balance sheet, you will see that the additions to fixed assets during the year amounted to £727,000 in continuation of our policy of expansion and maintaining our plant in the highest degree of efficiency. You will observe that the current assets have increased by some £6 million during the year. The bulk of this figure is represented by the increase in stock values and debtors.

The current liabilities have increased to a much less degree and stand at £5,100,000, £2 million more than the figure shown last year, and you will observe that the difference between current assets and current liabilities amounts to £10 million, compared with £6 million last year.

TAXATION

The incidence of taxation on businesses like ours which have been subject to such extreme and unprecedented fluctuations of costs and prices is indeed a tremendous burden to bear. While the total amount of taxation will have to be paid in cash, the trading profit on which it is levied may, in fact, never be realised in cash to anything like the full extent. For this reason alone, apart from others which have been stressed in so many quarters, we feel strongly that some method should be found to relieve industry of the very heavy financial burden imposed by such an anomalous situation.

EMPIRE PAPER MILLS

You will probably have seen our recent announcement that we have agreed to purchase the whole of the share capital of Empire Paper Mills, Limited, from Associated Newspapers, Limited. We are very pleased to have had the opportunity of acquiring this important paper mill on the lower Thames, the various products of which fall quite naturally and logically into our general production scheme. The purchase was duly completed on August 1st and we are confident that the operation of this mill, in addition to our present Aylesford, Tovil, Bridge and London Paper Mills, will in the long run prove extremely beneficial to the group as a whole.

PRESENT PROSPECTS

You will not expect me to predict, in such times as these, what the current year has in store for us. We shall not, of course, repeat anything like the exceptional trading results of the past year, nor would anything like such a scale of profits be needed now that the back of the recent inflation has been broken. Falls in values of paper and raw materials have been adequately provided for in the accounts before you, and that being so I am able to inform you that we have earned satisfactory profits in the first three months.

We are, however, still facing the severe recession in trade to which I have referred. At present there are no indications of a general revival of demand, but we have confidence in a return to much better trading conditions in the not distant future, and when the paper market regains stability, which we do not expect to be long delayed, our products should again be in sufficient demand to give us a high level of production.

Meanwhile it can certainly be said that we have strongly fortified the company financially against this period of comparatively unfavourable conditions. Further, by continual progress in the direction of efficiency

and productivity, and a further widening of the range of our products, we are better equipped than ever before to meet the future, whatever it may bring.

TRIBUTE TO STAFF

I am glad to pay tribute once again to the zeal and efficiency with which our executives and staff, and all others employed in our organisation, have performed their allotted tasks and have thereby contributed so much to the success of our operations in the year under review.

The report and accounts were adopted.

CHARRINGTON, GARDNER, LOCKET AND COMPANY CONTINUED PROGRESS

The forty-ninth annual general meeting of Charrington, Gardner, Locket and Company, Limited, was held on August 12th in London, Sir John Charrington (the chairman) presiding.

The following is an extract from his circulated statement:

It is satisfactory once again to be able to report further progress in the affairs of the company.

All departments of the company contributed satisfactorily to the group profit of £284,019 which was an improvement of £32,997 on the preceding year.

It must be admitted that the conditions during the period under review were almost ideal for the economy of the coal distributor. The long drawn-out winter of 1950-51 had left cellars empty and industrial stocks low, so that the company's plant was kept fully employed during the following summer. The winter of 1951-52 was, fortunately, unusually mild, which helped us to get through the period of heavy demand without undue difficulty; but, in contrast to this time a year ago, stocks at consumers' premises are now much greater. Nevertheless, deliveries are being maintained at a good level.

SECTIONAL ACTIVITIES

Within the industrial fuel section of our business we have had a most satisfactory year. Our coastwise shipments surpassed any previous year's performance; railborne tonnages were well maintained, and deliveries to industry in our own transport showed a marked increase.

I alluded last year to sales by your company of liquid fuel. This section continues to expand satisfactorily. On the domestic side, your company works very closely with the Coal Utilisation Council, the chief aim of which is to raise the standards of sales and service in both the domestic appliance and coal trades.

In the industrial field we also play our full part in the activities of the Combustion Engineering Association which is already a most useful body to promote the efficient use of fuel in industry.

The importance of research to the future of the country is often emphasised, and I should like to take this opportunity of declaring the connection which this company has always had with the British Coal Utilisation Research Association at Leatherhead. Close contact with the various sections of the Association is maintained, from which we learn much of practical value in both the domestic and industrial fields.

In the lighterage department trade has been well maintained. We are continuing to build a number of steel barges for ourselves and other users at our Dartford barge yard.

While the ideal conditions of 1951-52 are

unlikely to be repeated, I can, nevertheless, state that the company is in a good state, and I see no reason to look for anything but a progressive future.

The report was adopted and a total dividend of 22 per cent, less tax, was approved.

THE BRITISH SHAREHOLDERS TRUST IMPROVED TRADING RESULTS

The thirtieth annual general meeting of The British Shareholders Trust, Limited, was held on August 14th in London.

Sir Bernhard Binder, FCA (the chairman), who presided, in the course of his speech, said: It is pleasing for me to be able to report to you improved results. Our gross revenue for the year amounted to £113,306 compared with £88,812, and, after deduction of all expenses (including £40,504 for taxation as against £28,035 last year), the net profit is £43,536, or £9,164 more than for the year to March 31, 1951.

The directors propose that a final dividend of 4½ per cent, together with a bonus of 2½ per cent, both less income tax, should be paid on the share capital, making a total distribution of 10 per cent, which is the same as last year.

Notwithstanding a substantial decline in security prices during the year, the valuation of our investments still shows an appreciation over their book value. The present Government's dearer money policy has, of course, had a substantial effect in lowering Stock Exchange values, but, at the same time, if we are to restore the value of our currency and stop inflation, a much firmer hand must be kept on the control of credit than has been the case in recent years.

BURDEN OF HIGH TAXATION

The vital difficulty facing us today is the high rate of taxation. In this connection I should like to point out that if one studies this country's Budgets over a period of years it will be seen that after the first four years of peace following the end of World War I, Government expenditure from 1922-23 ran steadily for many years at about one-third of the peak expenditure in 1917-18. Since World War II expenditure has been more than one-half of the high point reached in 1944-45, and the rearmament programme increased it in 1951-52 to more than two-thirds of the war peak. Put another way—if the precedent of budgetary policy after the First World War had been followed, the UK Budgets from 1947 until rearmament became vitally necessary should have been at least £1,000 million per annum less than they actually were. Everyone knows where a great deal of this expenditure went and that the aims and objects were, in the main, laudable, but perhaps it is not yet generally realised how much such expenditure contributed to inflationary tendencies in this country. The main cure must be increased production, and to secure this incentives must be provided. We hope that the present Commission on taxation will be able to find some method of alleviating and simplifying existing methods of taxing profits and income.

As time goes on the burden of Estate Duty is making the preservation of family businesses more and more difficult. To those who have this problem to face I would say that we have given this matter considerable study and that we would welcome the opportunity of helping and advising as to the best methods of financing these needs and at the same time preserving, as far as possible, the continuity of management and control which has contributed so much to the building up of free enterprise in this country.

As to the future if, as we all hope, the measures taken by the Government to curb inflation prove successful the need for further wage increases should be minimised and, as a further result thereof, it is devoutly to be wished that sterling will gradually resume its

former status among international currencies. If some of these measures have proved to be unpalatable it must be remembered that drastic action was and is needed and that the alternative of ever-increasing inflation would be disastrous.

The financial and economic difficulties with which this country is faced make it hard to see far ahead but the recent slight improvement in our balance of payments enables us to maintain hopes of further recovery. The report was adopted.

THE TUNNEL PORTLAND CEMENT COMPANY. LIMITED

A SUCCESSFUL YEAR

RECORD HOME AND OVERSEAS TURNOVER

MR N. M. JENSEN ON INEQUITY OF EXCESS PROFITS LEVY

The forty-first annual general meeting of The Tunnel Portland Cement Company, Limited, will be held on September 8th at 105 Piccadilly, London, W.1.

The following is the review by the chairman and managing director, Mr N. M. Jensen, which has been circulated with the report and accounts:

Lord Leathers resigned from our board in October, 1951, on his appointment as Secretary of State for the Co-ordination of Transport, Fuel and Power. This is not the first time that Lord Leathers has been called upon to serve his country because, as you know, he was Minister of War Transport from 1941 to 1945. His wide experience and wise counsel are greatly missed by his colleagues on our board, but I sincerely hope that when he has completed his important task we shall be able to have him back with us again.

ACCOUNTS

As you will see from the statement of accounts, your company has had a successful year. The profit on trading, before charging depreciation, has gone up from £1,252,764 to £1,713,714. The rise is mainly due to the large increase in our export trade and the higher profit obtained from this.

Income from investments, on the other hand, is down by £27,225. As you are aware, we have a substantial investment in an Egyptian company, Helwan Portland Cement Company, which has consistently given us a good return. At the last annual general meeting of that company, held in February, the same dividend as for previous years was declared, but unfortunately the Egyptian exchange control authorities have so far refused permission for the amount due to be remitted. We are given to understand that this is on account of the lack of sterling which may have been caused by the slump in the cotton market, but, in any case, we are hoping the difficulty is only a temporary one.

The National Portland Cement Company, of the USA, in which we are interested, has resumed the payment of dividend on its preferred stock which has provided a partial compensation for the lack of dividend from Egypt.

Taxation, including income-tax equalisation reserve, absorbs £961,655, although it only covers Excess Profits Levy on one-quarter of the profit—namely, the period from January 1 to March 31, 1952.

In previous years I have referred to the very difficult question of providing for replacement of property, plant and equipment. Two years ago we decided to place to general reserve various amounts set aside for replacement. Our board has again considered the matter and come to the conclusion that a strong case can be made out for having funds which are earmarked for a particular purpose separated from the general reserve.

Your directors also wish to underline that only after making reasonable provision for such replacement should the balance of profit be considered as being available for appropriation. A reserve for replacement of fixed assets has therefore been created to which has been transferred £800,000 from general reserve and, in addition, £200,000 is charged against the year's profits.

A transfer to general reserve of £500,000 has been made and the dividends already paid—namely, on the two classes of preference shares and the 2½ per cent interim dividend on the ordinary shares and stock, absorb a total of £64,098. The board recommends a payment of a final dividend of 12½ per cent, on the "A" ordinary shares and "B" ordinary stock, which will absorb £160,365, leaving £469,657 to be carried forward.

Net additions to property, plant and equipment amount to £579,944, which includes the balance of the cost of extending the Pitstone works and new plant installed at West Thurrock.

There are various changes in investments. We have taken over the balance of the shares of the company which produces the bulk of our paper sacks and this is now a 100 per cent subsidiary. The net reduction in trade investments is mainly due to the redemption of preferred stock of the National Portland Cement Company, to which I shall refer later, less a loan of £100,000 to Ribblesdale Cement, Limited. The proceeds of the redemption have been reinvested and are shown under other investments.

PRODUCTION AND DELIVERIES

Deliveries of cement, both in the home market and for export, have exceeded previous records in turnover and in tonnage, and I am pleased to say that the demand still continues to be heavy. I would like, however, to stress once more how much our present prosperity is derived from our export sales. Out of our profits before taxation, 26 per cent was obtained from sales in the home market, 52 per cent from export, 12 per cent from investments and 10 per cent from other activities. Present export prices will tend to be reduced the moment supplies are substantially in excess of demand, but your company is in the fortunate position of having possibly one of the lowest costs of production of any cement works in Europe and is, therefore, well equipped to meet competition when it comes.

Your Pitstone works has been extended with a new unit which has only recently come into full production. At the West Thurrock works we are replacing one of the older kilns with a new and more economical kiln, which we expect to have in operation by the end of the year. Unfortunately, the dismantling of the existing kiln has for a time slightly reduced our output from this works, but the new plant at Pitstone is making up for this more than twice over.

To help to meet the growing demand for cement in Scotland, we have decided to increase the capacity of the grinding plant at the Clydebank works, which is operated by our subsidiary, The Clyde Portland Cement Company, Limited.

OVERSEAS INTERESTS

Your company has an interest in Cement, Limited, of Eire, which has works situated at Drogheda and Limerick. These works are both being extended and, as a result, the capital has been increased. Your company has taken up its proportion of the new shares.

The works in Jamaica of the Caribbean Cement Company, Limited, in which we have a small interest, was completed and commenced operations in January of this year.

The National Portland Cement Company, of the USA, has had another successful year, but unfortunately the tax burden there is also very high. The company has been able to pay off some of the arrears of preference dividend, and it has also decided to redeem a further amount of its preferred stock. As a result, we have now available a total of about three-quarters of a million dollars which are temporarily invested in American securities and bonds.

Last year I said that we were examining the possibility of interesting ourselves in a new works in New Zealand and in Cyprus. The New Zealand venture has not yet materialised because we have deemed it advisable to insist upon a fair proportion of local capital. We have, in co-operation with local interests, exercised an option on the necessary land, and we hope that before long the present financial stringency will improve so that we can proceed with the scheme. Mr Cave and I have recently paid a visit to Cyprus, where we have decided to build a new cement works. A local company has been formed, and William Baird and Company, Limited, will be partners with us in this new undertaking, which, I am pleased to say, has the full support of the Cyprus Government.

BURDEN OF TAXATION: EXCESS PROFITS LEVY

Last year I referred to the heavy burden of taxation. In the year under review this burden has increased further for, roughly speaking, 57 per cent of your company's profits, after providing for normal depreciation, has had to be paid or reserved for taxation, as against 55 per cent in the previous year, 13 per cent is paid in respect of dividends to shareholders and 30 per cent is being retained in the business by way of transfer to reserve, after allowing for a reduction in the carry forward.

Even this is not the whole story for, as I have already indicated, normal depreciation

tion based on historical costs does not provide for replacement of plant and equipment at the inflated postwar prices. When we consider profits, after deducting the sum transferred to replacement reserve, as well as to normal depreciation, we find that some 65 per cent. has to be paid or reserved for taxation.

Furthermore, Excess Profits Levy is payable only in respect of one-quarter of the period covered by these accounts, and the burden of this tax will therefore be correspondingly heavier in respect of the full current accounting period.

Many people have rightly called attention in general terms to the inequity of the Excess Profits Levy and the way in which it discourages enterprise and deals particularly harshly with an expanding business such as ours. I feel I must mention a particular example of its effect upon your company.

Our new Padeswood works, in North Wales, was financed by an issue of capital in January, 1946. Owing to the postwar necessity of obtaining permission to raise new capital, we were unwilling to embark upon the building of the new works until we had secured the necessary capital. Furthermore, due to the many new regulations introduced, the difficulty of obtaining steel, shortage of labour, etc., the works was not completed until April, 1950. The delay increased the cost of the new works and, for a number of years, the capital raised was virtually unremunerative, since we were only able to obtain a modest rate of interest. It is only from 1950 onwards that we have begun to get some reward for our enterprise, which was planned as far back as 1945.

Now under the Finance Act, as it stands, your company will have no profit standard based on the capital invested in the Padeswood works, because this was raised before 1947 and there is virtually no standard based on profits because production only commenced after the end of 1949. So far as we can see, every £1 profit earned by the new Padeswood works will be subject to the maximum rate of Excess Profits Levy applicable to your company, and out of every £1 so earned by the Padeswood works some 16s. will have to be paid in tax.

We know we cannot escape the heavy taxation of these days, but, all the same, this is a poor reward for your company's enterprise in pressing on, under most difficult conditions, with a task of national importance, namely, the completion of the first new cement works in this country since before the war. We have made the strongest representations to the Government about this injustice, but so far without any success.

We are told that profits tax has for its object the discouragement of dividend payments, but why should incomes from abroad be subjected to this tax, and, what is perhaps worse, why should such income carry the burden of Excess Profits Levy, which was introduced on the grounds of taxing increased profits in connection with rearmament?

YOUR COMPANY'S RECORD

Your company has been in existence for just over 40 years, and I thought it might interest you to see in graphic form the development that has taken place during that period. The graphs which are attached to the report also illustrate clearly two of the points I have referred to—namely, the much higher return we have enjoyed in recent years from our export trade as compared with our home trade, and how serious a factor present-day taxation has become.

May I, once more, record our appreciation of the wholehearted co-operation of the management, staff and operatives in our various companies.

UNITED DOMINIONS TRUST LIMITED

RECORD TURNOVER AND PROFITS

MR J. GIBSON JARVIE ON NATIONAL CONDITIONS

The thirtieth annual general meeting of United Dominions Trust Limited was held on August 12th at Regis House, King William Street, London, E.C.

Mr J. Gibson Jarvie, the chairman, in the course of his speech, said:

Since we last met we have had a general election following which I think we were entitled to see some radical changes in government policy. So far as one can see, singularly little has been accomplished.

In spite of all the restriction with which we have had to contend, your company has contrived to produce another record year both in profits and in the volume of business handled. But what a year it could have been under free enterprise!

GOVERNMENT INTERFERENCE IN BUSINESS

I wonder how many people in this country actually realise how far we have gone towards becoming a totalitarian state. There are controls in every industry which place almost supreme power in the hands of government departments and, in certain cases, in the hands of the trade unions. I can think of no business in which those engaged in it may follow their own bent and act according to the training and traditions which built up the business. Even a manufacturer producing goods for export and rearmament has to wait many weary months for permission to extend his factory that was the position with our subsidiary, The Laystall Engineering Company, Limited. We had to wait five months for a licence to extend one of our factories and we only got it then because we forced the issue. We therefore lost five months' output: the nation lost five months' production! There are literally thousands of factories throughout the country with a similar or even worse experience. And that is only part of the price we are paying for bureaucracy! That is the position under governmental red-tape methods today. There are so many departments, and so many divisions within departments, which insist on being consulted. It is true to say—bitterly true—that because of governmental interference the manner in which business is being conducted in Britain today is wasteful in time, money, labour and patience. It might, perhaps, be nearer the mark to describe the present state of affairs as farcical and certainly inexcusable in view of the country's economic state.

COMPANY'S RIGHT TO EXPAND

I have seen it suggested in one or two newspapers that our future volume of business may be affected by the Government's restriction of credit. To me that seems unlikely. I cannot see any diminution of demand for our services, nor can I see any possibility that we will be unable at any time to serve our customers. Therefore, I can see no reason why your companies should not continue to grow. It is precisely because of my expectation of a continued steady growth in our various businesses that I want to establish the company's right to add to its capital. There is neither logic nor common sense in the Capital Issues Committee's refusal to allow us to make an issue. The Committee is a part of that bureaucratic body which rules over us today.

The active government of the country would appear to have been usurped by the bureaucrats and, so far as I can discover, the

nominal Government accept the position and are making no serious attempt to bring us back to that freedom for enterprise to which they pay lip service.

CHIEF CAUSE OF INFLATION

It cannot be a secret from anybody that the Government itself through the bureaucracy is the chief cause of inflation and by its controls is holding back and lessening our production. In these days, when we should be producing to capacity, not one single practical step has been taken toward that end. Indeed, the very reverse is the case: the controls which are holding up production are as rigid and as stupid as ever. If the Government would only free industry to handle its own affairs in its own way, without the questionable assistance of bureaucratic departments, there would be fewer bottlenecks, more goods and lower prices.

NEED FOR LEADERSHIP

I believe that the country is hungry for a lead; not the kind of lead which merely says that we must work harder and export more and that we are turning the corner. That is not leadership. The British people have an uncanny capacity for knowing the truth when it is spoken and they want it now. We know that there will have to be harder work—real work—and longer hours for the same pay. But it isn't enough to keep repeating that. New working arrangements will have to be devised and ordered. Social services may have to be cut: we must make up our minds to that. But better some uncomfortable things now than disaster later. If present conditions continue for any length of time, I shudder to think what may be the quality of the next generation, even if we survive. There is not a worth-while practical man or woman in the country who is not near despair through sheer frustration and disappointment with purely negative leadership. There was a time, too, when the people of this country could raise their voices on vital issues and compel the government to take notice. But even that day seems to have gone. Has this persistent frustration, this regimentation, made us so apathetic that we are incapable of speaking up for ourselves?

I regret that I should have found it necessary again to bring politics into my annual general meeting address but, as I have said, we live in strange and extraordinary times. Time was when British governments confined themselves to governing and when business was left to the men engaged in business. It was under these conditions that we became strong industrially, commercially and financially and, in consequence, a great power in the world. It was the people by their genius and their labour under free enterprise who created a prosperous Great Britain.

In conclusion Mr Jarvie said: Is there no group of men in the City who could give a lead by banding together to demand the freedom without which our situation is hopeless—a body of men strong enough to secure the scrapping of that gigantic machine which has grown up almost while we slept—a machine which is itself the greatest drag on our recovery, yet which rules us absolutely today? Can we not have done with theory and get down again to the bedrock of incontrovertible fact? Time will tell, but time is short.

The report was adopted.

W. H. SMITH & SON (HOLDINGS), LIMITED

SUBSTANTIALLY INCREASED SALES IN ALL SECTIONS

THE HON. DAVID J. SMITH'S REVIEW OF PROGRESS

The third annual general meeting of W. H. Smith & Son (Holdings), Limited, was held on August 8th, at the Holborn Restaurant, London, W.C.

The Hon. David John Smith, the chairman, presided and the following is his statement which was circulated with the report and accounts: I am again able to report a substantial increase in sales in all sections of the business of W. H. Smith & Son, Limited. This increase is mainly due to an all-round uplift in the prices of the goods we sell, particularly in the case of national daily newspapers, the prices of which were increased in May, 1951. The directors are satisfied, however, that there has been no diminution in the number of customers served either in the retail or wholesale side of the business.

EXPENSES

Expenses still continue to rise in all sections of the business. There have been further wage increases granted during the year and a large claim is outstanding on behalf of those members of the staff in London who are responsible for the packing and dispatch of newspapers, books and stationery. There have been further increases also in the charges made by the railway executive for the carriage of our merchandise. The tendency of the size of newspapers and periodicals to grow has meant a rise in carriage and cartage costs and this item is likely to cost more as a greater amount of newsprint becomes available to publishers.

DEVELOPMENTS

During the year new shops have been opened at Plymouth, Swansea and Southsea. These branches replace those which were wiped out by bombing during the war. In addition a new retail business was purchased in Bury, Lancashire.

BOOKSTALL CONTRACTS

I am happy to report that mutually satisfactory financial terms have been agreed with the railway executive for a renewal of our main-line bookstall contracts for a further period of 21 years.

Negotiations are still proceeding with the London Transport executive.

PROPERTIES

The directors continue to authorise alterations to the company's shops, bookstalls and wholesale houses and in doing so are endeavouring to bring them into line with modern requirements. I can again assure you that all the properties owned by W. H. Smith & Son, Limited, and Hambleden Estates, Limited, are being kept in a good state of repair.

OVERSEAS BUSINESS

The company's business in Cairo was, unfortunately, completely destroyed in the riots of January, 1952, though I am happy to say that no member of the staff received any injury. Your directors have decided that it would be unwise to reopen this business. A substantial claim has been lodged against the Egyptian Government.

Although your subsidiary company, W. H. Smith & Son (Canada) Limited, is still

operating at a loss, it is showing a healthy increase in sales. It is becoming well known not only in Toronto, but in other parts of Canada, and we retain our confidence in our prospects in that country.

I am glad to say that our export trade continues to expand. We are doing successful business with traders in most countries of the world, and we shall retain a considerable number of the customers who were previously served by our branch in Cairo.

We are also sending considerable supplies of newspapers, books and stationery to shops which have been opened in areas where British troops are stationed overseas. Two notable examples of this are in Germany and in the Canal Zone in Egypt.

ACCOUNTS

The profit shown in the consolidated profit and loss account of W. H. Smith & Son, Limited, and its subsidiaries, on pages 14 and 15, namely, £1,756,459, before charging taxation, shows an increase of £409,103. This is after charging the sum of £93,119, representing the amount required to fund the liability of W. H. Smith & Son, Limited, in respect of supplementary pensions paid to the present pensioners of the existing superannuation and pension funds. It is our intention to set aside in future accounts further sums which will be for the benefit of certain classes of prospective pensioners.

The increasing burden of taxation is reflected by an increase in the tax liability for the year of £366,055, the total being £1,185,622, against £819,567. It is to be noted that the figure of taxation for the year includes £28,500 for excess profits levy which is the estimated liability for the quarter beginning January 1, 1952.

After charging taxation the consolidated net profit for the year amounted to £570,837. We have been able to transfer £294,000 to reserves, an increase of £54,000 over the previous year, and to increase the carry-forward by £4,986.

The consolidated balance-sheet, on pages 12 and 13, shows that the total of the share capital and reserves, representing the funds employed in the businesses of W. H. Smith & Son, Limited, and its subsidiaries, amounted to £4,639,527 at March 29, 1952, an increase during the year of £402,096.

Fixed assets, comprising properties, plant, motor vehicles, fittings, fixtures, etc., have increased during the year by £67,488, after deducting depreciation charges and sales. The gross capital expenditure during the year under these headings amounted to £311,426. The surplus of current assets over current liabilities and provisions has increased during the year by £608,721, of which the stocks and debtors together accounted for £478,877. At the same time the additional amount which it has been necessary to set aside for future income tax requires £283,275.

DIRECTORS

The directors of W. H. Smith & Son, Limited, have elected Mr P. W. Bennett to join them, and your directors have done likewise. Mr Bennett is a chartered accountant by profession and a Canadian by birth. His election to your Board will come

before you today in accordance with the articles of association.

STAFF AND STAFF WELFARE

I must again thank the staff for their part in a successful year's trading. They have given yet further proof of their loyalty and hard work.

At the end of the financial year we inaugurated an insurance scheme designed to ensure some measure of security for dependents of members of the staff who might die while still serving the company, or during retirement up to the age of 75. The company bears the full cost of this insurance scheme, amounting to approximately £14,000 during the financial year ended March, 1952.

In addition, the directors decided that all men who have served 40 years and more, and women 35 years and more, on retirement at the age of 65 and 60 respectively shall receive a gold wrist watch. Both these measures have been well received by the staff.

I have already referred to the supplemental superannuation and pension funds under the heading of accounts.

FUTURE PROSPECTS

At the beginning of my statement I mentioned the inflationary character of the increase in sales during the past year. I cannot hold out any real prospect of a further large increase in sales during this year, especially as it is hoped that the rise in prices has now been halted. If this is so, some equilibrium in expenses must be sought, and this is particularly necessary in the case of wages, where any further rise will only accentuate the inflationary spiral.

The Board are constantly seeking means to expand and develop the company's business, and there is no sign of any falling off of the confidence which the public has in the services which the company provides.

The report and accounts were adopted.

The chairman announced that since the report was printed satisfactory financial terms had been agreed with the London Transport Executive for a renewal of the bookstall contract for a further 21 years.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

CHUBB & SON'S LOCK AND SAFE COMPANY, LIMITED

STEADY PROGRESS

MR. H. EMORY CHUBB'S REVIEW

The sixty-ninth annual general meeting of Chubb & Son's Lock and Safe Company, Limited, was held on August 13th at 40-42, Oxford Street, London, W., Mr. H. Emory Chubb, CBE, MIMechE, chairman and managing director, presiding.

The following is an extract from the chairman's review, which has been circulated to the shareholders with the report and accounts for the year ended March 31, 1952, and was taken as read:

Once more I am able to report steady progress in the affairs of your company. Last year in my review I referred to the effect of our expanding trade activities, which, this year, has been even more marked. In August last we issued further ordinary shares which, together with the premium on issue, amounted to some £59,000, and in October we received £50,000 from the private issue of Unsecured Notes. In spite of these additions our bank overdraft and sundry creditors have further increased.

Fixed assets have been most conservatively valued, depreciation, amounting to £32,630, having been written off during the year. The effects of this policy can be illustrated in the holding company's balance sheet, where fixed assets of £91,996 are valued, for fire insurance purposes, at £370,400.

In common with all expanding businesses our stock and work in progress has risen. As a provision against a possible fall in steel prices we have increased the stock depreciation reserve to £20,000.

THE AUSTRALIAN SUBSIDIARY

During the year it was thought wise to re-form the Australian subsidiary as a company registered in Australia, the detail of which was finalised by the Hon. G. C. H. Chubb, who visited Australia during last August and September. It remains a fully owned subsidiary, but whereas its issued capital was small, being supplemented by a large loan from the parent company, the capital has now been brought into line with the scale of operations. This has meant that in addition to converting the loan into shares, it has been necessary to capitalise reserves and the balance on the profit and loss account.

Further capital was also subscribed during the year to our South African company.

PROFIT AND ALLOCATIONS

The consolidated trading profit is £184,915, the net profit being £106,729. Taxation at £60,454 is again very large. After adding back revenue reserves no longer required, following the conversion of the Australian company, there is available £62,417. The directors recommend the transfers to reserve of £45,000, and the payment of dividends, at the same rate as last year which absorbs £16,065, leaving £1,352 to be added to the carry forward, which now becomes £17,222.

During the year under review we have been hampered by material shortages and rising prices, not all of which have been passed on to our customers.

In common with other manufacturing enterprises we are feeling the incidence of abnormal taxation, and are being compelled to restrict our programme of capital expenditure

and replacement of machinery. Our factory here is working to capacity and whilst we could sell more goods than we are able to turn out we shall not be in a position to produce all we would wish until further extensions to buildings and plant are made. This matter will be in the forefront of your directors' deliberations during the present year, and if it is decided that such expansion is wise the question of available capital will have to be further considered.

PROGRESS OF LOCK BUSINESS

Our lock business has made much progress, and I venture to think that our name as locksmiths, which was universally known fifty years ago, but which was less heard of between the two wars, has now recaptured its position of supremacy.

There are great potentialities for expansion at home of sales of our certified record protection equipment which, as you know, consists of filing and door cabinets built to resist fire. But it is impossible for us to take advantage of this so long as our intention is that our exports must be greater than the volume of our home trade, which has been achieved in the year under review.

REARMAMENT

To the rearmament programme we have given much attention and I am pleased to say that our efforts have been appreciated by those in authority. Work on certain projects has been successfully carried out and the foundation laid for a department which could be rapidly expanded should an emergency arise.

OUTLOOK

With regard to the future and without being unduly optimistic, I see no reason why the progress of the company should be curtailed unless any unforeseeable conditions fall upon us, and it is my hope that some alleviation of the penal burden of taxation may be felt in the years to come, and thus allow us to further renew our machinery, to increase our reserves, and eventually to be of greater benefit to our shareholders than in the past.

It is my hope that the increased turnover of the parent company may be maintained during the coming year in spite of restrictions in certain countries. I have no doubt but that in course of time these contrary influences will be overcome, and I believe that during the past year our goodwill has been increased and the potentialities for business in normal times enhanced.

TRIBUTE TO STAFF AND WORKMEN

In conclusion I would say that the balance sheet results could not have been achieved without the sympathetic and loyal co-operation of the staff and workmen, to whom the directors extend their very sincere appreciation.

The report and accounts were unanimously adopted, and a resolution was passed increasing the authorised capital of the company to £350,000 by the creation of 650,000 additional Ordinary shares of 4s. each.

BRITISH MATCH CORPORATION, LIMITED

LARGER GROUP PROFITS

The twenty-fifth annual general meeting of this company was held on August 13th, in London, the Hon. Hugh K. M. Kindersley, CBE, MC, deputy-chairman, presiding.

The following is an extract from the statement by the chairman, Mr Arthur Hacking, OBE, circulated with the report and accounts for the year to March 31, 1952:

The average return on the corporation's investments for the year, including both subsidiary and trade investments, is 9.349 per cent, as against 9.191 per cent last year. The production and sale of matches by the two principal manufacturing subsidiaries in this country again slightly exceeded those for the previous year. Costs, however, were higher.

For the current year our difficulties in regard to timber supplies persist and the outlook in regard to supplies from Canada is uncertain.

The importation of matches from Western Europe under open general licence ceased from March 11, 1952. The Board of Trade has announced a quota of £685,000 (c.i.f. values) for individual licences to be issued for the period ending December 31, 1952. The corporation's home production has been increasing, however, and no shortage of matches is to be expected during that period.

Our gross consolidated trading profit this year is increased from £2,242,687 to £2,574,011. This increase in group profits is a reflection of improved results of the corporation's overseas subsidiaries, which more than offset the fall in the profits of the United Kingdom companies.

The report was adopted.

W. & J. GLOSSOP LIMITED

(Public Works Contractors)

IMPROVED TRADING RESULTS

The seventeenth annual general meeting of W. & J. Glossop, Limited, was held on August 13th in London.

Mr Henry Stephenson (the chairman), who presided, in the course of his speech, said: I am pleased to report an improvement over last year's figures. The profit for the year under consideration is £39,402. The carry forward from last year, added to our available balance, gives us a total of £87,656, from which the directors recommend a final dividend of 15 per cent be paid on the ordinary shares and on the employees' shares, leaving a balance to carry forward to next year of £82,191.

The current year, so far, looks reasonably good, both in progress and in contracts booked. It is widely known that our road system is far behind the requirements of modern traffic, which continues to increase and will go on increasing, both in volume and in load weights. The continued failure of the Government to make adequate provision for even ordinary maintenance, much less new construction, means an accumulation of work ultimately to be done.

It has always been the policy of your board to maintain the company's capacity so as to be able to take advantage of the opportunity when the time comes. Meanwhile, we are keeping our order book reasonably full, though often at highly competitive prices, but it is a policy we believe to be sound; and we hope ultimately to get a fair reward for our efforts.

The report was adopted.

Limelight on the Kremlin

SIX weeks hence, Moscow may be stealing some of the limelight that would normally focus at that time on the last laps of the American presidential election. For the world is to learn in October not only the main directives of the current Five-Year Plan (1951-55) but also details of changes in the Soviet political hierarchy which may prove to be of great significance. That two long-delayed events—the 19th congress of the Communist Party and the publication of the Plan—should at last be taking place is in itself interesting; for this is the first time since 1939 that the great Party conclave has been held, and for many months observers in the West have hoped to discover from the Plan whether there are important changes in the direction and progress of the Soviet economy. But what is even more interesting is that the leading role of the occasion—the presentation of a report on the Party's work in the tremendous years since 1939—is to be performed by the fifty-year-old, up-and-coming Georgi Malenkov. If Malenkov, not Molotov, is to do a job hitherto done only by Lenin and Stalin; if the notorious Politbureau and Orgbureau have been abolished; if the congress is to discuss changes in the structure of the Party which leads not only the Soviet Union but all Communist parties save the Chinese—then, indeed, things are happening. Just what those things are may remain uncertain for some time; but it is a reasonable surmise that preparations are being made to begin Stalin's gradual withdrawal from the exercise of supreme control and to groom a successor or successors.

Observers in the West can therefore look forward to an autumn feast of clues to future Soviet developments. They may in the event be disappointed, but there is good reason for expectancy. According to official Soviet definitions the congress is "a great event in the life of the Party and of the entire country." What it decides is binding on the whole Party. It hears and endorses the report of the Central Committee (which virtually rules the Soviet Union), revises the Party's programme and rules, determines tactics in "fundamental questions of current policy" and elects the central committee. Its public proceedings provide the directives for Communist activity everywhere until further notice.

Henceforth, according to Moscow Radio, the congress will meet every four years and not every three. There is to be a new body called the Presidium of the Party, which has never been mentioned before, and which is presumably to take the place of the Politbureau and Orgbureau. This and other changes in structure are to be proposed by Nikita Khrushchev, associated in the past with political control in the Ukraine and the policy of building agro-towns. The stage is clearly being set for change; whether it will be radical or cautious, no one outside the Kremlin can yet tell.

Too much must not be made of the role assigned to Malenkov. As a Vice-Premier and member of the Politbureau his prestige has been rising for some time. He is of the generation of leaders who

grew up in the early years of the Bolshevik revolution. Above them there are two generations: that of Stalin himself and Voroshilov, the ablest of which were liquidated in the thirties; and then the generation over sixty years old, which includes President Shvernik and Vice-Premier Kaganovitch, and is headed by Molotov. It is in the third generation that Malenkov stands alone, Zhdanov having died and mysterious disgrace having removed Voznessensky, the planner. It cannot be taken for granted that he, rather than Molotov or Beria, is being groomed for the succession. All that can be safely said is that Malenkov's career, modelled on that of Stalin, makes him a likely bet. He is the consummate bureaucrat, the controlling figure in the Orgbureau which has hitherto watched over the party cadres, the skilled manipulator of the party machine. If Stalin wished to become the elder statesman and to leave direction of the party in other hands, Malenkov might be his choice; but it is also possible that the proposed changes in the party organisation are intended gradually to disperse among several men the power that was concentrated in Stalin's hands over twenty-five years.

*

The evidence about the current Five-Year Plan is more straightforward and familiar, and confirms provisional estimates previously made in these pages. To compare it with the previous Plan (1946-50) is difficult because postwar reconstruction could obviously command a more

SOVIET BASIC PRODUCTION				
	1940	1950	1955 Target	% Increase 1955 over 1950
Coal(mn. tons)	166	260	372	43
Crude petroleum ..	31.0	37.8	69.9	85
Electricity ('000 mn. kWh)	48.3	90.3	162.5	80
Pig iron(mn. tons)	15.0	19.4	34.0	75
Crude steel	18.3	27.3	44.2	62
Rolled steel	13.1	20.8	34.1	64

special effort and a quicker tempo than could be expected in normal years. But, from the figures published this week, it looks as if the pattern and rhythm of industrial effort are little changed and similar to those of 1951. The rate of development in the iron and steel industry may slacken slightly; for the fact that the planned increase in pig iron is greater than that for crude steel may mean that steel-making capacity is greater than the available supply of raw materials. On the other hand, it seems that the rate of development in light industry is to be speeded up, to the benefit of the long-suffering consumer. Likewise, there is a striking emphasis on greatly increased agricultural output, which has been so disappointing in the past; grain production alone is scheduled to rise by 40 to 45 per cent.

The more general figures are equally ambitious and noteworthy: in five years national income is to rise by 60 per cent, real wages by 35 per cent, and gross industrial output by 70 per cent. In other words, gross industrial output is to rise annually by 12 per cent, with producers' goods (13 per cent) slightly ahead of consumer goods (11 per cent). It is fair to point out that in previous plans the output of the villages and the benefits to the consumer of increased industrial produc-

tion have always fallen short of expectations, while the programme of heavy industry has been over-fulfilled.

This Five-Year Plan—the fifth—appears twenty months late; that is to say, the last Plan ended in December, 1950, and its successor has been heard of only this week. The delay is not unusual; indeed, it is normal. It is worth noting, for example, that the third plan, which was due in 1937, was not proclaimed until March, 1939, when the last congress of the Party was held. The reason for postponement was clearly the fear that Nazi Germany and Japan might, sooner rather than later, attack on two fronts. It may be that similar uncertainties have played their part in the present postponement and that the Plan is intended to impress western strategists. What view Moscow takes of the international situation will be more easily judged after October; but on present evidence (from the Budget as well as from the Plan) it looks as if the Russians are planning not for peace or for war, but for what the West calls cold war. They may be losing to the Atlantic allies some of the advantage in sheer military strength that they established during the years when the United States and Britain were disarming, but they are building up a formidable potential for the future to be used as they think fit.

It must never be forgotten that the Soviet economy can switch resources from civil to military production, from consumer goods to industrial equipment with a speed, ruthlessness and secrecy that no government in the free world could hope to match in peacetime. Indeed, from the point of view of the Soviet rulers, the cold war is probably the ideal planning situation, for just sufficient tension can be maintained to justify the priority given to heavy industry over consumer goods production, and to convince most workers—without frightening them unduly—that the delay in improving their standard of living is due, not to their own government, but to the threats of the capitalist world outside. Certainly the Soviet planner faces few of the political difficulties of his western colleague, who is being constantly told that butter is at least as important as guns and that money being spent on arms would be better spent on rescuing Africans, Arabs and Asians from poverty. In the Soviet Union the plan is presented, the Party gets its orders from the congress, and the whole power of the political system is harnessed to the productive effort without further question.

*

Events in the Communist world should be carefully watched from western capitals during the next few weeks; for it looks as if political as well as economic plans are being refurbished. The recent tidying up of the Communist parties of Eastern Europe, the preparations for a great congress in Peking of the partisans of peace, the present visit of a Chinese mission to Moscow, the recent reshuffle of Soviet ambassadors, and now the decision to hold the Party Congress—all these events coming close together suggest, if not changes in policy, at least much fresh thought about policy. It does not follow that the results of this thinking will be welcome to the free world. It should be assumed that what is said and done in October will strengthen, not weaken, the Soviet Union and its Communist allies. It is pleasant to think of the Politbureau as dead, but who knows what the new Presidium may be like? And if Stalin is preparing to leave the bridge for the cabin, who knows what course his lieutenant will steer?

Living Space or Living Standards

THE Government's success in building more houses is its best bid for popularity. Mr Macmillan's vigorous and optimistic reports shine brightly in the naughty world of no red meat and higher prices. And, politics apart, any criticism of the housing programme seems inhuman when so many families are still living in uncomfortable and even horrible conditions. To count the cost of social advance, to let economic facts set limits to social ideals, is always to be accused of subordinating people to statistics. But in fact it is nothing of the kind. There is nothing inhuman in considering the interests of people in the long run as well as in the short; to count the cost is simply to estimate what the country as a whole must give up in order that some people may move into new houses. Is it right to devote more resources to this one aspect of living standards at the expense of living standards as a whole? Are the British people being rehoused so fast that they will dangerously hamper themselves in achieving solvency and earning the living they are accustomed to? These are not inhuman questions, and they are questions to which the Labour government whose general disposition was hardly to sacrifice immediate social benefits to long-term economic gains—gave more attention than the Conservatives.

There is much in the present housing policy to praise. It has four main elements. First, there is a shift of emphasis from local authority to private building. Secondly, many more of the local authority houses are being built with two bedrooms instead of three. Thirdly, various measures are being taken to improve the efficiency of the building industry—to raise productivity and to get more houses out of a given supply of the scarcer materials. Fourthly, more of the national effort—more men and more materials—is being put into building new houses.

It is only the last of these that is open to fundamental criticism. The others are welcome in principle even if they might be pushed too far in practice. For example, if most new houses have only two bedrooms and rent control remains as rigid as ever—so that smaller families have no incentive to move out of the older, bigger houses—there is a danger that growing families will be cramped. As yet, however, the cut in the average size of local authority houses is helping to correct the balance, which had been distorted by Mr Bevan's housing policy, and the saving of about £120 per house has been worth making even if it has been disappointingly small.

There are other sensible features of the Conservatives' building programme. Many new houses are now smaller not only in number of bedrooms but also in total floor space. The "People's House," plans for which Mr Macmillan inherited from Dr Dalton, saves by this means about ten per cent of the structural materials required for a house and five per cent of the timber. Some two-thirds of the houses now being tendered for are of this type. Critics proclaim the folly of inflicting "substandard" houses on future generations for the sake of a small saving now, but substandard is a strong adjective to use when the main difference is that hall and landing are a little smaller and the ceiling a little lower; and now is the time when small savings matter.

With these useful economies in materials there has been also an improvement in the productivity of the

building industry. The Minister of Housing would probably attribute this to the psychological stimulus provided by his "no limit" programme and by the greater scope allowed to private building. If this is true, it is certainly a point on his side—so far. But it carries a significant implication; it means that the increase in productivity is largely a once-for-all gain. It has helped to give the first upward push to the rate of house-building, but the further and much greater expansion that Mr Macmillan's programme is designed to achieve will depend on using more men to build houses.

This is the critical point. In its first, and easiest, stages Mr Macmillan's programme has done a lot of good at—thanks to considerable ingenuity—a relatively small immediate cost. But it was never the early stages that caused concern. And the evidence is multiplying, indeed it is becoming irrefutable, that the programme can be pressed on only at a cost which the country is in no state to stand. Indeed, there is probably no exaggeration in saying that Mr Macmillan's new houses are now beginning to wreck the Government's economic policy.

*

So far the economic strain imposed by the housing programme has not been blatant because it has largely been absorbed within the building industry. This can be seen in the manpower figures. The number of workers building new houses is 6 per cent greater than it was at this time last year; the number of workers on other kinds of construction, and on repair work, has fallen. It is certainly better to use men and materials for new houses rather than for illicit work to benefit people who are already comfortably housed. But that is only one side of the picture. It is wasteful to use men and materials for new houses while existing houses decay because landlords cannot look after their property. And it is shortsighted to use them for houses at the expense of factories and schools. At present, it is true, the Government has an excuse: the immediate reason for slowing down the school-building programme and cutting industrial building was to save steel. The test of the Government's policy will come as steel supplies improve. Will it go on holding back factory-building while housing continues to expand? That would indeed be a flat admission that the Conservatives are prepared to mortgage Britain's future for votes at the next election.

What is at issue here is the right balance between housing and industry within an investment programme of given size. But soon the problem will be wider than this. Unless industrial construction is to be cut still further, the housing expansion can go on only if more resources are drawn into the building industry from outside. The costs of such a policy can be grouped under four heads. First, it would directly inflate Britain's import bill. About four-fifths of the softwood now imported is paid for either in dollars or, if it comes from Europe, in gold. So far the value of softwood imports has hardly increased: it was £47 million in the first half of this year, against £43 million in the same period of 1951. But that is because the importers have been holding off the market, waiting for prices to fall. Unless imports are increased, softwood will be scarce next year.

The Ministry of Housing is preparing for this by experiments—now well advanced—in reducing the amount of timber used in houses. But these experiments are unlikely to be so successful so soon that the housing expansion can go on unchecked without bigger timber imports—at a time when most imports are being cut to the bone. The programme can be carried out only by excepting housing from Mr Butler's austerity prescription for the rest of the economy; and therefore the austerity elsewhere must be all the greater. Directly and simply, the British people can have the houses they are promised only by having less food; the food would be for all and the timber is for a few.

The second impact of the housing programme falls on the engineering industry, and therefore indirectly on exports. Such things as grates, pipes and baths are made from iron that would otherwise have been used to make more steel; because steel is scarce, either fewer goods made from it are exported or more steel is imported—for dollars. And even if British steel were plentiful, the fittings for houses would still absorb manpower in the engineering industry that could otherwise be switched to work for export or for defence.

These are the direct costs of the housing programme falling at strategic points in the economy. The third aspect is the indirect cost. As the programme expands, the strain it imposes is bound to spread more widely. Builders will be trying to recruit more workers; so, already, are supplying industries such as bricks, tiles and cement. As there are few unemployed workers of a suitable kind to draw on, even small gains to building and its suppliers add to the general over-fullness of employment.

This general extra pressure on the economy is not apparent yet. But it is unmistakably foreshadowed in the finances of the housing programme. This is the fourth, and grimmest, of its effects: Mr Butler's policy is being quite literally undermined. The cutting tooth in that policy—credit restriction—is having a healthy direct effect in industry, but it is not working any sharp change over the whole economy. Bank deposits are rising in spite of the tighter monetary policy. They are rising because Government expenditure is proving to be very heavy; in effect, the Government itself is borrowing

from the banks what its policy was designed to prevent other people from borrowing. And a large item in this heavy Government spending is represented by its loans—"below the line" in the Exchequer returns—to local authorities; these loans are mainly to finance house-building. By this means the Government is with one hand injecting into the economy the money that with the other hand it is supposed, by credit restriction, to be keeping out of the economy.

There is nothing remote or indirect about this process. The money that is injected will be spent. The pressure of demand that Mr Butler intended to contain will in fact rise. As yet the pressure is only on Exmoor; but no less certainly than the water of last week's floods, it must sweep down the valleys and deliver to the whole British economy an inflationary push that could be as disastrous as any natural deluge.

★

In theory, of course, all this does not necessarily make the housing programme mistaken. It means only that if more houses are to be built, something else ought to be cut more drastically. But in fact the Government plainly does not intend to make any such cut. It would be foolish if it did. For it is certain—as certain as anything of the kind can be—that if the British people were free to choose they would not want more living space at the expense of their other living standards. At present, their choice is weighted for them. The demand for new houses appears to be insatiable because rigid rent control and mounting housing subsidies make it so. The country cannot choose what it wants because the alternatives are not offered to it at their real costs. To make the costs real—to raise rents—would halve the waiting lists for houses; it would enable landlords to repair their houses instead of letting them fall to bits; it would induce people to move more and waste less housing space. It would, also, of course, be very unpopular. But would it be half as unpopular as the drawn-out failure to restore the British economy that the Government is inviting—sabotaging, for the sake of houses for some tens of thousands of people, such policy for solvency as it has?

Allies Out of Line

THE allies in Western Europe, having clenched their fists last winter in expectation of a perilous summer, have been showing a tendency to relax, hands in pockets. That this should happen in the period of public holiday and parliamentary recess may be deplorable, but it is hardly surprising. Six months ago there seemed to be a risk that their moves toward making armed allies of the West Germans might provoke counter-moves and menaces from Moscow; but, in the event, all that has happened is that the Russians seem to have resigned themselves to the division of Germany and are busy arming their own Germans inside a new Soviet state. They have accepted a major diplomatic rebuff, if not with good grace at least without baring their teeth. If anybody is seriously alarmed at the prospect of 12 German divisions manning Western Europe's defences by 1954, it seems to be the French rather than the Russians. It is therefore understandable that all kinds of difficulties and grievances about rearmament

should now be ventilated by ministers, who think they see yet another chance of postponing the difficult choice between adequate standards of readiness and accepted standards of life. When they met at Lisbon in February, as members of Nato, they thought that they had struck a reasonable balance between the demands of the soldiers and the objections of the treasuries; now, as individuals who see yet another summer passing with Europe unscathed, they talk differently.

If, since February, there had been any notable change in the disposition of Soviet forces or in the general direction of Soviet policy such a change of mind would be justifiable, but even then only on one condition: that all the western governments had agreed on a fresh assessment of the strategic prospects carried out by the Standing Group and intelligence staff of Nato. There is, however, no evidence that such a revision of views has taken place. On the contrary, even the layman has noticed that what is said by Nato's Supreme Commander and

its other spokesmen is in direct conflict with what politicians and commentators have been saying. To take the most striking example: General Ridgway has firmly declared that a two years' period of military service is needed to produce an efficient soldier. The Belgian Government, on the other hand, confronted with mutiny and other protests against the two-year period, decides to reduce it—not after consultation with Nato but after consultation with other European governments whose reluctance to accept two years was already well known. Less striking, but in the long run more important, were Mr Churchill's hints in the last economic debate that the British defence programme was being radically revised to meet the needs of a long cold war. It may well be that Britain's programme, for good military as well as good economic reasons, needed such revision; for the demands made on its armed forces by events in the Middle East and by the cold war in Asia are of a special order. But it is difficult to avoid the impression that in London and other capitals there has emerged a definite tendency to run away from Nato's plans to defend Europe.

★

About the Lisbon programmes there has been much pessimistic and misleading comment. It has been said that they were too ambitious and inspired by wishful thinking; that to abandon them is to be realistic and to cling to them is to be visionary. Such criticism rests on a misunderstanding of what was attempted by Nato at Lisbon. First there was the agreed plan for 1952-53; secondly, there was an agreed provisional estimate for 1953 intended to get detailed staff work started; finally, there was a rough guess at what might be done by the end of 1954. Running through the discussion was the guiding thought that there should be a fairly specific medium-term programme for Western Europe's defence that should be kept under constant review, from an economic as well as from a military point of view. It was never intended that the plan should be rigid, and it is worth recalling what was said on December 18th last year by Mr Harriman on behalf of his colleagues of the Temporary Council Committee, which drew up the first draft of the Lisbon plans:

The Committee recommends flexibility as to longer-term goals to allow for the many factors which may influence future decisions: changes in international tensions, revised estimates of military danger, new weapons and military techniques, changes in economic conditions and other factors.

The suggestion which is now being heard that the Lisbon plans are millstones around the necks of the Atlantic allies is inaccurate and unfair; there is full provision in them for revision and second thoughts, and no justification for unilateral action by member governments.

Even more important is the fact that the short-term plans which were agreed at Lisbon have turned out to be remarkably accurate. By the end of this year General Ridgway will have a number of divisions not far short of the fifty he was promised; if there is a deficiency of a few divisions it will be in reserves rather than in front-line formations. How well trained the latter are will be shown in the manoeuvres about to begin in Germany. In aircraft the total number of machines available will be only a few hundreds short of the 4,000 planned. The work on bases, communication lines and headquarter systems has made remarkable progress. There are not

enough men and weapons on the spot to make Western Europe impregnable—but no one ever thought there would or will be. The military purpose is to confront any Russian threat in Central Europe with powerful delaying action; the political purpose is to remove from the minds of western statesmen the fear that they can nowhere in the world act firmly and boldly for fear of exposing Western Europe to a threat that could not be resisted. Both those purposes must remain unchanged so long as the present diplomatic deadlock continues; and nothing has occurred this year in Europe to suggest that anything more than a slight easing of tension is likely. In Asia the outlook is as uncertain as ever, and has a direct impact on Europe's safety by the demands of Korea, Malaya and Indo-China on American, British and French strength.

★

While statesmen rest and the rearmament debate is temporarily suspended, two points should be held firmly in mind. One is that the first effort at joint defence planning by the Atlantic allies cannot be written off as a failure; on the contrary, its practical success in strengthening Europe's defences is proven. The recommendations of Mr Harriman, M. Monnet and Sir Edwin Plowden to the Lisbon conference were cautious and realistic, and are as relevant now as they were in February; they said that Nato could take rearmament in its stride if member governments took the necessary steps to increase production and efficiency. In other words—and this is the second point—the question of how much rearmament can be afforded is in each country as much political as economic. The purpose of calling for a report from the Three Wise Men was to have an independent Nato view of what should and could be done, which could be set against national and party preferences: against, say, Mr Macmillan's housing programme, or against a programme of investments in heavy industry designed to keep France ahead of Germany, or against Congressional insistence on cutting appropriations for aid.

What is being undermined is not the determination to become stronger sometime and somehow—it will take much better manners in Moscow to achieve that—but the resolve to make plans and take decisions in common. When Mr Churchill and M. Pleven recently defended the right of their governments to take important military and economic decisions without consulting allies they were missing the point. The Atlantic organisation was not created to whittle down the powers of national governments; its purpose is to make possible by the sharing of burdens a scale of rearmament that is far beyond the resources of individual nations. Yet the chances are at the moment that Nato will be confronted at the end of this year with decisions by the British, French and other governments which do not dovetail, which will not make the best use of American plans for off-shore purchases, and which will delay by weeks or months the plans for 1953. If a new American President, a new House of Representatives and a partly new Senate are confronted early next year with such a disarray in the allied ranks the effect will be deplorable. There is no good reason why the permanent machinery of Nato should not be used now to consider the military second thoughts and the economic difficulties that are now pulling the allies out of line.

How Full Employment?

THE preceding articles in this series invoked the spirit of compromise as the only means of reconciling the triple incompatibility between full employment, a stable price level, and free collective bargaining. Concessions from absolute stability of prices can go a certain way, but no further; they cannot safely pass the point at which savings begin to melt and the currency to be distrusted—if they do, then it is not only the stability of money but full employment and, in the end, freedom for the unions that will vanish. Some concession from absolute freedom of collective bargaining is similarly, though less measurably, limited; whatever may be done by the growth of a sense of national responsibility in the trade unions, by the fuller use of conciliatory devices, and by the pruning of their present monopoly powers, the essential nature and cohesion of the trade union movement must be preserved. This final article applies the same question to the third corner of the triangle. Could public opinion be brought to approve any concessions from the absolute principle of full employment? And would they be such as would combine with the concessions from the other corners of the triangle into a workable policy providing as much as possible of all three principles?

The need for some concession from the absolutism of full employment hardly needs to be pointed out; nobody believes that 100 per cent employment is possible outside an army or a prison. But "full employment" has come to mean, in the minds of most of the Left, an unemployment index of 2 per cent or less; and though experience shows that this can be achieved for short periods of time if it is the paramount object of policy, it certainly cannot be reconciled with the minimum requirements of price stability or, for very long, with the free wage bargain. Two per cent unemployment implies that barely enough time is spent between jobs (an average of one week in the year over the whole labour force, including the most inveterate job-swappers) to cover the most obvious seasonal shifts and any changes in the fortunes, or unevenness in the programmes, of different firms. It allows no margin for changes in industrial technique or in the relative sizes of different industries. Both sorts of change are essential in any economy which is not stagnant and autarkic; both demand shifts in manpower; the shifts in each case must take time—and a shift in manpower which takes time is the same thing as unemployment.

Unemployment has two dimensions; it consists of the number of jobs lost, multiplied by the length of time needed, on the average, to find another job. It is worth underlining this rather obvious fact, because in the two-dimensional nature of unemployment there lies a valuable clue to the question of how full employment can be. There must be shifts; which means that jobs must be lost. One dimension has, in fact, a virtually irreducible minimum, even supposing that no mishandling of monetary and fiscal policy produces a general recession and chronic slump. This minimum varies with the fortunes, of foreign trade, with the shifting tastes of consumers, with the nature of technical change, and with the still obscure cyclical pulsations in the activities of the capital goods industries; and the more progressive

is the economy concerned, the more closely geared to a dynamically changing outside world, the bigger the number of jobs lost per annum will be—and ought to be. The other dimension, however, the average time taken between the worker's loss of a job and his establishment in a new one, is quite another matter. The further it can be reduced the better, both from the economic and from the human point of view.

Unfortunately, this entirely desirable end can be pursued by highly undesirable and ultimately self-defeating means. An unemployment index of two per cent or less may mean not merely that necessary shifts are, as in Great Britain over the last six years, failing to take place on an adequate scale, that the shortening of the average period between jobs is being achieved by the legerdemain of inflation. Inflation means deceptively high gross profits. Practically every employer feels prosperous, even if his product is only being bought, as a second or third or tenth choice by people unable to spend their inflated incomes on the things they really want. Practically every employer, therefore, wants to hold on to his workers for as long as they are willing to stay. Attractive terms are offered even for comparatively untrained or otherwise unsuitable workers. Thus a greater number of workers can both choose their own time to give up their existing job and learn the new one as they earn—which obviously reduces the average time spent between jobs. The reduction itself is an excellent thing; but since it is only made possible by the effects of a powerful inflationary "forced draught" on the employers' demand for labour, it is plain that this state of affairs must come to an end as soon as prices stop rising. Brimful employment, in fact, is inseparably linked with inflation, both as a consequence and as a cause; its inconsistency with stability of values and the free wage bargain, even if these are interpreted in the widest tolerable sense, is doubly and trebly demonstrated.

Suppose, however, that the sights were lowered; that public opinion, particularly Labour opinion, were willing to compromise to the extent of being satisfied with an employment index of 95 per cent or so. (But for the experience of the postwar years, the achievement of such an index as a peacetime norm would have been hailed, as loudly by organised labour as by anybody else, for a resounding economic triumph.) Would it be possible to reconcile full employment, on this less ambitious definition, with the necessary minimum of price stability and with trade union freedom? In the light of what has been said above, the question can be put in a more practical way: can workers be made mobile enough, can the average period between jobs be shortened enough, to make 5 per cent unemployment tolerable to public opinion in Britain, as it is in many other countries?

A great deal of attention need not be paid to the fact that, in prewar Britain, wages and prices seemed, to start moving upwards whenever unemployment fell below about 10 per cent. The unemployment index was swollen by the existence of the Special Areas, where the un-

employment was due to world-wide and permanent shifts in trade and industry. This "structural" unemployment—dreadful though its human consequences were—has little relevance to the problem of avoiding inflation. If it is removed from the prewar figures, one finds that the unemployment rate in the rest of the country was often down to about 6 per cent before any inflationary symptoms appeared. But 6 per cent is still too high for postwar public opinion to accept. If reasonable degrees of full employment and of price stability are to be reconciled, the "safe" figure for unemployment—"safe," that is, in terms of its inflationary potential—will have to be brought down below what it was in this country before the war. How can the average time between jobs be shortened for workers who are not agglomerated in ice-blocks of the inter-war variety? Many methods suggest themselves, some of them much easier to specify than to put into practice. Mobility between jobs often demands mobility between places; and mobility between places is at present only too obviously handicapped by the housing shortage. Whether that shortage can best be overcome by sheer force of new building or by deflating the present demand for houses to its real level is the subject of another article in this issue; what is relevant here is that the existence of enough houses to meet the demand would increase mobility between places and so between jobs. Moreover, rent control in its present form, with the irrational privilege which it bestows on the sitting tenant, offers a large premium on staying put and is thus an obvious agent in lengthening the period between jobs.

The administrative efficiency of the labour exchange system is already high, and not much further gain can be expected from that source. But comparatively little use is made in this country, so far, of the technique of job analysis which yielded such striking results in the United States during the war—the breaking down of different skills into their elements with a view to recognising the affinities between apparently unrelated jobs and so saving both misdirection and expensive re-training. The subject of training grants and "transfer grants" (as suggested in one interesting Swedish study) bristles with difficulties, but there should be more scope for this kind of direct aid to mobility. And on the side of industry a very wary eye needs to be kept on those intrinsically excellent things, pension schemes and promotion ladders, which today are becoming a more and more important feature of large-scale enterprise, whether private or public. Few things could be less conducive to mobility than a system of recruitment which makes every change of job a compulsory slide to the bottom of the promotion ladder.

If management is partly to blame for building barriers against the older recruit, there is still more room for improvement on the side of the trade unions. Here, also, the original motives for the present barbed-wire entanglements against mobility were not unreasonable. They grew up primarily as a means of making jobs secure; they are part of the workers' self-defence against unemployment. But the defence which they provide is only against the initial loss of jobs, against the necessity of change and adaptation; and their effect is accordingly not so much to reduce unemployment as to change its incidence and, by reducing mobility, actually to increase its total amount.

Once, indeed, the conquest of unemployment is seen less as a matter of preventing the loss of jobs than of ensuring that new jobs shall be quickly found, monopoly and restriction in every shape appear as arch-enemies of full employment. For it is not only the effects of monopoly as a strengthener of bargaining power which are relevant. Its importance lies also in its very nature. Monopoly exists where competition is shut out; and the shutting out of competition is essentially the shutting out of new resources, whether of capital, manpower or business ability, which could produce more and earn more in the monopolist's field than they can outside. Monopoly can, in fact, be described as the denial of employment opportunities.

Any attempt to re-define full employment thus has very far-reaching implications. It involves, first, a general willingness—in the interest of other desirable things—to acquiesce in a level of employment impossible to define to the last decimal point, but certainly less ambitious than that ruling in Britain during the post-war years. It involves, secondly, compromise over the whole complex of measures by which both trade unions and business units have tried in the past to achieve security. To a certain extent these compromises are alternatives. The denser and higher the network of security-motivated restrictions, the lower is the safety-level of full employment. But if the British people were content to have two million unemployed, they would not need to do anything about the monopolies and the restrictions that flourish among them. There can hardly, however, be much hesitation in choosing between them, either on strictly economic or on human grounds.

Under each of the three heads, therefore, it is possible, within the bounds of practical politics, to suggest some retreat from absolutism, in order to reconcile all three. But are the concessions sufficient to achieve the reconciliation? If public opinion could be brought to accept an unemployment total of 5 per cent, provided the turnover within the total were rapid; if the unions concentrated on their primary task of representing the workers in the wage bargain and dismantled their monopolistic restrictions—would it be possible to preserve the value of money from falling more rapidly than the economy can stand or the public will tolerate?

In the last resort the answer will be given not by economists or by administrators but by public opinion. At each corner of the triangle, the limiting factor is what public opinion will stand, and the degree of comprehension that public opinion will show for an economic policy that tries to preserve balance between competing objectives. Moreover, the uneasy triangle that has been under discussion in these articles is not the only awkward relationship in economic policy. It is a domestic triangle; and even if its conflicts can be resolved, there is still the question whether the balanced internal policy will enable the country to pay its way in the external world; at this point the triangle takes on a third dimension. No particular combination of compromises between these various pressures is sacrosanct; what matters, if there is to be any conscious direction of economic policy, is that whatever combination emerges shall be logical, deliberate, self-consistent. At bottom, the resolution of the uneasy triangle is a test-case for democracy.

(Concluded)

NOTES OF THE WEEK

And Watch the March . . .

The good sense of the General Council of the Trades Union Congress is almost unvarying. And, almost as consistently, it has no relation to the actual policies of the majority of the unions. The council looks at the state of the nation and sees—imperfectly, perhaps, but on balance shrewdly—what is best for the British workers as a whole. The individual union goes on doggedly pursuing what is immediately to the benefit of its own members—to their benefit provided that no one else does anything. And the council shuts its eyes in order to conjure up some justification for the behaviour of its constituents.

No man has ever had more reason to be disappointed by this process than Mr Butler. He has clearly found common grounds in his talks with the TUC. The council's statement on the economic situation, published this week as part of its annual report to the Congress, accepts in full Mr Butler's case for keeping wages almost steady.

In the absence of a rise in productivity, which cannot be expected to occur quickly, substantial wage increases are bound to raise costs. . . . Rises in the costs of our exports could in themselves price Britain out of world markets.

And such an increase may therefore have "the most serious consequences for our standard of living." No one could say fairer than that. And the TUC admits its share of responsibility: costs are "largely within our control—and to some extent within the control of the Trade Union Movement."

But when it comes to any means of exerting this control, the TUC runs away. No sort of wages policy, not even the smallest departure from present methods of wage bargaining, can be contemplated. No reform is considered on its merits: there is simply a blank assertion that any interference would lead to strikes (is that outside the unions' control?) and so do more harm than good. Instead, the TUC merely offers, by implication, two justifications of the pressure for higher wages that on its own analysis may be disastrous. The first is a special plea for the lower-paid workers—although it knows perfectly well that they are likely to lag behind, and become relatively worse off, in a free scramble for more money. Secondly, it asserts that the scramble is Mr Butler's fault: the unions are justified in their ruinous pressure for higher wages because he started the whole thing by not taking the TUC's advice about the Budget. As an assertion of fact this is probably false. The unions showed every sign of putting their claims whatever, within the bounds of practical possibility, the Chancellor did. And the criticisms of the Budget certainly bear no relation whatever to the grim facts of the economic situation as the TUC expounds them. Comforted by what are at best party points against the Budget, the TUC is apparently content to sit and watch

. . . . the march of this retreating world
Into vain citadels

—to watch its constituent unions lead their members to probable disaster, with no more than a sad murmur of "they can't help it."

Government versus the Farmers

The Minister of Agriculture has firmly turned down the request from the National Farmers' Union for a special review of farm prices. This may be no great surprise to the union, but it nevertheless shows an unwonted independence in a Minister of Agriculture. The last Government promised that it would compensate the farmers for any "sudden and substantial increase in costs" arising in between the annual price reviews. The farmers claim that the award of an additional 5s. a week to farm workers (making the minimum agri-

cultural wage now £5 13s.) constitutes just such an increase in costs. In this they are certainly following precedent. Except in one case—when the annual review was close at hand—every previous rise in wages since the war has been followed by a special review, resulting more or less automatically in a rise in prices equivalent to the rise in wages.

There are, admittedly, some differences in circumstances this year. The farmers, for the first time, did not oppose the increase in wages; the Minister may therefore argue that in a sense they brought it on themselves and should pay. Secondly, some agricultural costs—such as the costs of fertilisers, tyres, and machinery—have fallen in the last few months, although these are minor changes probably offset by minor increases elsewhere. Thirdly, there is also the complication that the Scottish wages board, not for the first time, has refused to follow the English board in raising wages.

These circumstances enable the Minister to offer some rather specious reasons for refusing the farmers' claim. But they are not the real point. The fact is plainly that a special review, conducted on the same principles as in the past, would lead automatically to a further increase in farm prices, passing on almost the full cost of the wage increase either to the consumer or to the taxpayer. Following so closely on the price increases awarded at the last annual review, this result would be intolerable to the Government. Sir Thomas Dugdale cannot say this bluntly because he does not want to throw over a convention established by his predecessor. But it is a stupid convention. It is absurd that, however well farmers may have done at the annual review, they should be entitled of right to full recoupment of any subsequent increase in costs. Yet that is in fact what they had been led to expect, and they are understandably disappointed. The Minister's perfectly sensible action has caused some justifiable resentment.

The lesson of this incident, in which both farmers and the Minister in a sense have right on their side, should be plain to both sides. If farmers demand, or are led to expect, too much security of income, they are bound to get sudden disappointments. Governments should avoid giving to the farmers undertakings which they (or more probably their successors) must later repudiate, in spirit if not in letter, in the national interest. Sir Thomas Dugdale has declared his intention of shortly reviewing, in conjunction with the farmers' organisations, the present procedure for fixing prices. If this very necessary overhaul is to yield good results, the lessons of the present episode will have to be assimilated.

Chou En-lai in Moscow

The Russo-Chinese conference in Moscow is clearly a serious affair, at which matters of moment are to be discussed, covering political, economic and military questions. The Chinese Prime Minister, Chou En-lai, has taken with him a delegation which includes not only Peking foreign ministry officials but also leading personalities concerned with Chinese heavy industry and communications, and a strong representation of the armed forces. This mission has to be viewed in relation to recent signs that the Chinese Communists are considerably more zealous for continuing the war in Korea than are the North Koreans, and to the fact that they have not been able during the last few weeks to prevent heavy American bombing of North Korean targets. Soviet military aid to Communist China has certainly been on a large scale and quite indispensable for the build-up of the present Chinese strength in Korea; but it has not been sufficient to enable the Chinese either to win outright on the ground or to protect their rear against air attack.

It is no wonder that the North Koreans have begun to talk in less flamboyant terms than their embarrassingly bitter-end Chinese allies. They are, after all, bearing the real brunt of the war and, being a small state without pretensions to invincibility or great power prestige, they would lose much less by accepting the terms offered by the United Nations. China is both less embarrassed by the war and less disposed to terminate it in any way which would damage the inflated prestige of the Peking regime. On the other hand, China's military leaders must realise that it is dangerous to continue the conflict without sufficient first-class armaments, that it may prove impossible to keep the North Koreans in line unless more air cover can be provided, and that the strain of the war is seriously interfering with China's schemes of economic development. The solution from a Chinese point of view is much more Russian and satellite aid both in finished armaments and in heavy industrial equipment.

The Soviet Government is unlikely to extend such aid without a substantial *quid pro quo* in the form of an agreement which will bind the Chinese People's Republic to it more tightly than before. To sustain a large Chinese army, at the end of long lines of communication, with first-class fighting equipment against a continual wastage of material and the possibility of further battles is no light undertaking. There are Soviet needs and those of the satellites to consider. It is indeed to Moscow's advantage that large American and other UN forces should be pinned down in Korea, but a contest of material attrition with large armies (as contrasted with guerrilla action on the Malaya model) may not be the type of cold war which suits it best. If Mao and Chou want Soviet help they must be prepared to grant something in return, and not simply in commercial terms; for China's exportable surpluses will not pay for what it needs. To strike the bargain is probably the purpose of the present conference.

Dr Schumacher

Death has suddenly, but not unexpectedly, removed Dr Adenauer's most doughty political opponent. Dr Kurt Schumacher had been almost continuously ill during the critical events of the last six months in Western Germany, but the fervour of his temperament had still shown itself in the Social Democrats' opposition to the Chancellor's European policy. Few Germans active in politics had suffered as he had from war and Nazism, and there were times when his political thinking and behaviour showed the dangerous fanaticism of the persecuted. He was a man of bitter memories, outstanding among them the recollection of how the moderate German Left had proved almost powerless to resist the nationalism of the Right, first under the Weimar Republic and later in Hitler's early years. He seems to have believed—and there are many Germans who think like him—that his party could gain and hold power only by being more nationalist than the men of the Centre and Right. In particular, he cherished the illusion that national unity could be attained on terms which would ensure a free, democratic Germany in which his party would be more than a match for the Communists of the East and their Russian backers.

Next month the congress of the Social Democrat Party will take place and Dr Schumacher's successor will have to be chosen, if he has not been groomed already. The most likely candidate is Herr Ollenhauer, who has been a faithful deputy and might well prove more moderate as a leader. The change could be of great importance, not only to Dr Adenauer's chances of pushing his policy through the Bundestag, but also to the outcome of next year's elections. Tribute is due to Dr Schumacher for the part he played when German political life was reviving after the war; but the pacification and integration of Western Europe should be easier now that the roaring voice of the bitter demagogue is silent.

Who is for Five-Power Talks?

Mr Malik is certainly earning his salary these days as Russia's representative at the United Nations. In the Disarmament Commission he has had to wriggle out of some of the most awkward positions a Soviet spokesman can ever have found himself in. When the Anglo-American-French plan for a fair limitation of the armed forces of the Great Powers was originally put forward, Mr Malik said it was just a trick, and that the United States would still be able to keep its naval and air forces at full strength. But last week the British delegate, Mr Coulson, showed that this would be impossible even on the Soviet figures. Then Mr Malik complained that the plan involved "a definite time lag" between general disarmament and control of atomic weapons, only to be assured by the American delegate that both matters would be dealt with simultaneously.

The western plan would place a ceiling of between 1 million and 1,500,000 men each on the forces of America, Russia and China, and one of between 700,000 and 800,000 on those of Britain and France. This would leave the two groups into which the Big Five are divided as fairly balanced as could be imagined, while the Russian proposal for a one-third slash all round would merely perpetuate the Communist's present advantage. Last week Mr Malik himself implicitly acknowledged this, for he complained that the western plan would make little difference to Britain and France, while it would force Russia and China to reduce their forces considerably. He was happier when he fell back on the hallowed doctrine of the big lie, and roundly asserted that

the Soviet delegation has repeatedly stated that the Soviet Union stands for the most detailed disclosure of armaments. We are for the checking and verifying of such information, but we do not want the Ridgway headquarters doing this task. It is one for the United Nations.

The full humour of that statement can only be appreciated by those who have seen the Russians consistently voting against the whole series of proposals for an arms census which have been approved by majorities in the United Nations ever since 1948—three years before the "Ridgway headquarters" existed.

But Mr Malik's worst moment came when the three western powers suggested that a five-power conference should be held as the first step towards disarmament. Five-power talks have been a Communist propaganda slogan for so long that Mr Malik must have felt like a cat suddenly bitten by a truculent mouse. In his embarrassment he fell back on the cosily familiar theme of "germ warfare." But he did not so much as refer to five-power talks, although the Soviet Union might have been expected to welcome the proposal as fervently as the appearance of a prodigal son.

Dogma of Nationalisation

It seems that the whole Labour party, and not merely the Bevanite wing, is trying to escape from the actual disappointments of nationalisation in a flight of metaphysical fancy. The party's latest discussion pamphlet,* written by Mr Ernest Davies, sets out soberly some of the practical problems and offers remarkably little in the way of solutions. So the only thing to do is to change the problem—but not, of course, by retreating from nationalisation. Perhaps—the hope is cautious—things would be different if only the Minister of Transport had nothing to do with the Transport Commission, and so on, but instead the cabinet contained one Minister for Nationalised Industries. Then "there could be a new conception of nationalisation, and a fresh approach to its integration in the country's economy."

It is rather difficult to detect the nature of the revolution that Mr Davies hopes to achieve by this single change. But

* "Problems of Public Ownership," Labour Party. 41

one practical advantage he does make explicit. Some of the nationalised industries might then be propped up by the others; only the accounts as a whole would need to balance. In other words, there would be no need to bother so much about efficiency; who, indeed, would be competent to pass judgment on the individual limbs of the giant? Life is easier—as private capitalists have realised before Mr Davies—the bigger the area over which a monopoly can be established.

There are, however, two practical difficulties. The more blatant the state monopoly is, the less convincing is the standard Labour argument that monopoly is an evil making an industry ripe for nationalisation. And, secondly, the subsidisation of one nationalised industry by another promises real help to the weaker brethren only if the others are pretty profitable; and that suggests more nationalisation. On this point Mr Davies is not specific. But he widens the criteria that the Labour party has in the past laid down—that an industry should be “basic,” or it should be a monopoly, or it should be inefficient.

Nationalisation may well be necessary to enable Labour to carry through further stages of its Socialist programme even if it does not fall solely within the above criteria.

It sounds rather like nationalisation for nationalisation's sake; the “new conception” comes down to earth, remarkably enough, at the point of the familiar dogma.

Wages in Depressed Industries

Trade union leaders always talk about preserving free collective bargaining, but what they have in mind is by no means always free Arbitration, according to a recent Fabian pamphlet,* was responsible for about a twelfth of the wage increases granted between 1945 and the end of 1951; two-thirds of them were due to direct bargaining and one-sixth to decisions of statutory boards. Recent decisions of the Industrial Disputes Tribunal would seem to indicate that arbitration is now doing more for the workers than direct bargaining would do. While workers in one industry after another have had their claims rejected, at least as a first stage, the tribunal has stuck to the arbitrators' now traditional practice of making awards midway between what the workers asked and the employers offered. Out of 16 wage claims heard by the tribunal, between the Chancellor's appeal for restraint in May and the end of July, only one resulted in no award. That was in the glove industry, where the employers successfully argued that there was unemployment and short time.

That decision, at least, seems to have produced the result that would have been obtained by direct bargaining. Will workers in other depressed industries do any better? In one such industry—furniture—nearly 100,000 workers were deciding, when this issue of *The Economist* went to press, whether or not to strike because the employers have, after due notice, repudiated the rather generous cost of living scale for wages. If there is no strike the question will go to arbitration, for the employers have reported the dispute to the Minister of Labour under Order 1376. Workers in the carpet industry, on the other hand, have agreed to a suspension of their cost of living scale, except for the lower paid workers.

Recent experience has shown that wages councils, like the tribunals, are recommending increases that might not have been obtained by direct bargaining, even if the workers had been more strongly organised. An exception is the clothing industry, where the wages council seems in practice to give statutory effect to agreements reached beforehand between the largest organisations in the industry. Last week the

Wholesale Clothing Manufacturers rejected for the second time a claim by the National Union of Tailors and Garment Workers for an increase of 6d. an hour. In the industries most affected by recession no method of wage negotiation has so far resulted in increases. But it seems again to be proving true that in time of recession it pays the worker to have his wages settled by a tribunal or a board.

Reviewing the Rates

The Society of County Treasurers has produced some interesting comments on the working of the Exchequer Equalisation Grant to local authorities. It is convinced that the principle of the grant is “fundamentally sound,” and points to the considerable measure of equalisation of rates in the pound which has already taken place. Whereas, for instance, rates in county areas varied between 13s. and 27s. in 1947-48, the range in 1949-50 was only from 15s. to 23s.

The equalisation grant is highly selective in its operation. About 36 per cent of the population live in areas which receive no grant whatever; as these areas contain just over half the country's rateable value, their comparative wealth is unmistakable. Nevertheless, among these “richer” authorities resources and needs vary greatly, so that there is a certain unfairness in treating them all alike. At the other end of the scale, many local authorities lean very heavily indeed on the equalisation grant. It covers more than 30 per cent of the total expenditure which would otherwise fall on the rates in no fewer than 34 counties, mainly the smaller and more rural ones. Whether or not this high degree of national aid causes local extravagance and waste, it may become the cause of a still tighter central control.

The greatest defect of the present arrangements is that uniformity of valuation has still to be achieved, and according to the Government may not now happen before 1956. Both the Exchequer equalisation grant and the important education grant are largely based on figures of rateable value which, because of different standards of valuation, are often an inadequate guide to the “wealth” or “poverty” of local authorities. This matter ought not to wait for attention until 1956. Also, the Society of County Treasurers believes that an unfair burden is being thrown on rapidly expanding areas because the costs of new public services are so much higher than before the war. These points need attention in the review of the equalisation grant which is now being undertaken.

Finally, the society feels some alarm at the present trend of financial relations between Government and local authorities. The relief to the rates represented by the postwar transfer of certain services into national hands has now been absorbed by the rising cost of the remaining local services. The dependence of local authorities on Government grants gets increasingly heavier—and with it the extent of central control. The society believes that the best relief to local government would be to re-rate industry and agriculture in full, a measure which “would be of relatively small financial significance to the industries concerned, including agriculture,” but which would create an additional £60 million of rateable value. This proposal, which is attracting growing support, well warrants a thorough investigation by the Government.

Increasing Europe's Coal Production

Few people imagined twelve months ago that the demand for coal would follow the same trend as the demand for other commodities and show a marked decline during a period of rearmament. At the beginning of this year the Organisation for European Economic Co-operation was so

concerned about the Continent's large imports of American coal that it set up the Ministerial Coal Production Group. This body was to encourage a rapid expansion of Western Europe's output so that it could do without these imports by 1954. After its recent meeting in London the Group admitted that, although the increase of 3.4 per cent set for this year is unlikely to be achieved in full, it is much more likely than it was three months ago that the so-called “exceptional” imports will not be required in 1954 except, perhaps, for certain special types of coal. The balancing factor has been the decline in coal consumption.

The progress made towards this year's objective can be seen from the accompanying table. Britain is the only country whose output in the first half of this year has

WEST EUROPEAN COAL PRODUCTION
(Million Metric Tons)

	Output, 1951	Objective, 1952	Per cent increase	Output first 28 weeks, 1951	Output first 28 weeks, 1952	Per cent change
UK	226.4	229.4	+1.3	122.8	124.9	+1.7
W. Germany ..	118.9	126.0	+6.0	63.6	64.9	+2.1
France	53.0	56.0	+5.7	29.4	31.0	+5.4
Belgium	29.7	31.0	+4.5	16.1	16.7	+3.8

TOTAL	456.7	472.2	+3.4	247.4	252.8	+2.1

Source: Organisation for European Economic Co-operation.

increased at a higher rate than was forecast, though production in France and Belgium is not much below the planned rate. In contrast, output from the Saar and the Netherlands has fallen instead of increasing, while the rise in German production has been only modest. An encouraging sign is that the increase in British output has been achieved by an expanded labour force (hitherto one of the major deficiencies); by the end of June there were more underground workers than the National Coal Board expected to have at the end of the year. On the other hand, output per manshift was not only well below expectations, but also smaller than in the first half of 1951, because of the large number of recruits that have gone into the mines in the past few months. Employment has also increased in the German mines; but in France the number of workers has declined but output per manshift has improved.

Germany Caught Out?

Now, other difficulties are emerging in the attempt to increase Europe's coal production. Among them is the unwillingness of producing countries to continue an all-out effort to expand output—precisely because demand is falling. Indeed, German output in the past two months has been falling quite sharply. Only part of the decline can be explained by holidays and other extraneous factors, and these should have been offset by the high rate of new investment that has been taking place to increase current output.

Apart from self-financing, German mines have recently obtained DM 100 million from commercial banks for modernising equipment, and expected an additional DM 50 million from counterpart funds of the Mutual Security Agency. Yet their output failed to show the expected increase, whereupon MSA decided to withhold the unspent portion (DM 20 million) of its grant. The Germans claimed they must have even more investment before output can expand. But it was obvious that they were not really attempting to achieve the coal programme set by OEEC. New investment had been used not to increase production now at any cost, but to increase it later at low cost, when the ownership of the mines was settled and when a buyers' market for

coal had emerged. There have been reports—not so far substantiated—that new shafts have been sunk in German mines and new tunnels bored almost to the coal face and then left, so that later on output could be increased with the minimum of effort. Meanwhile Europeans, and Germans, import American coal.

Co-operation does not mean keeping to the letter of an agreement, but willingness to make sacrifices for a common end. Europeans cannot work together effectively without mutual trust, and nothing destroys it more easily than the knowledge or suspicion that one country is gaining at the others' expense by its astuteness. The Mutual Security Agency did not say outright that the German coal industry had done this, though it implied it. This week, MSA has decided to release the funds again, but the decision was taken more from legal considerations than from any conviction that the Germans will mend their ways.

Bacon and Butter Bargaining

In the cat-and-mouse bargaining of the present bacon talks between Denmark and Great Britain, nobody would really want to blame the Danes for resenting the role of mouse. Since the negotiations were broken off in London last week, the Danes are nervously awaiting the outcome of the meeting to be resumed in Copenhagen on August 26th.

Bargaining from a position of strength, the Ministry of Food is demanding a 15 per cent cut in the present price of Danish bacon. This would bring the price back to its level in 1950-51, but would mean a serious reduction in revenue to the Danes. They face the loss of the bonus scheme—a 28½ per cent increase in price for deliveries beyond 110,000 tons—which was put into effect last October, together with the flat increase of 12½ per cent. This has

ADVERTISING

WISDOM . . .

Buyers are human beings

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.

We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

* “Arbitration.” By H. A. Turner. Fabian Research Series.

turned out to be handsomely profitable to the Danes. But it is a profit that they may well deplore because the bonus scheme put them in their present weak bargaining position by greatly stimulating Danish bacon production. As a result, they feel they have been trapped; while they are already resigned to losing the bonus scheme, they angrily oppose a reduction of the 12½ per cent basic increase granted them last year, or the price of 262s. 5d. per cwt. Not unreasonably do they argue that too drastic a price cut now would simply mean reduced production with consequently higher prices next year.

At Aarhus this week, Britain agreed to pay 7½ per cent more than last year for Danish butter, bringing the price up to 337s. 6d. per cwt., or 3s. a lb. It is doubtful whether the Danes will feel this as being in any way a just compensation for what they fear may happen to their bacon. In view of the present world shortage of butter, and of the 7½ per cent increase recently granted Australia and New Zealand, this was a minimum British concession so far as the Danes were concerned. Meanwhile, *Aalborgs Stiftstidende* tried to convince its countrymen that a reduced profit did not spell catastrophe. Soothingly it said: "Of course it is important that we sell our bacon, but there is really no reason to lose our wits. Let us try to be more British than the British: let us wait and see."

Shock Treatment

Four years after the passing of the Criminal Justice Act, the first detention centre for young offenders has been opened. The Act restricted the powers of the courts to impose a sentence of imprisonment on young people; no court is to sentence anyone under 21 to prison unless it is of opinion that no other method of dealing with him is appropriate.

The detention centre is to provide one such alternative. Another, less drastic, is an attendance centre. Magistrates' courts can sentence persons aged 12-20 to attend these centres for a certain number of hours each week. Several of these centres have been opened in the last two years; in effect, the young offender is punished by being kept in under the supervision of a police officer after school hours or on Saturdays. Detention centres are intended to be a much more drastic method of dealing with offenders aged 14-20 who require, in Mr Chuter Ede's words when he was explaining the relevant clause in committee,

a short, sharp punishment that will cause the young offender clearly to realise the injudiciousness of attempting continuously to flout the law.

They are for offenders unlikely to respond to probation but who have not yet got to the stage of requiring long-term training in an approved school or borstal. An important stipulation, written into the Act, is that no one who has been to prison or to a borstal can be sentenced to a detention centre, in order to avoid the risk of contamination.

Mr Ede made it quite clear that the centres were not intended to be short-term approved schools. The first centre (for boys aged 14-16) unlike an approved school will be "secure," not open, though presumably not so secure as a prison. Again unlike approved schools and borstals, the emphasis is not on instilling a sense of responsibility and self-discipline but on physical training and hard work. Life, in fact, is to be unpleasant enough to bring the offender to his senses. That, at least, is the hope. Much will depend on whether the courts send the appropriate type of offender to the centre. Much will also depend on what sort of life the offender returns to and how he adjusts himself to the shock. In committee, Mr Ede said it was intended to attach after-care committees to the centres, which would arrange voluntary supervision for the offenders on their discharge. It is to be hoped that this intention will be carried out at the new centre.

Educating Civilians in Uniform

The army authorities have just issued a threepenny pamphlet reminding men about to be called up for service of the many opportunities of study that exist for them. The main emphasis is naturally upon general education, but trades and cultural subjects have not been neglected, and help is promised to any man "who wishes to pursue a course of individual study." As far as it goes, this is valuable; but is any attention being given to the wider problems that forces education could help to meet? To have to cut two years out of virtually every young man's civilian life at the age of eighteen has now become such a well-established necessity that it is often forgotten how new the practice is in this country. Most European countries have no clear memory of the day before conscription but for British industry the long-term effects of national service on recruitment and training are quite unknown. There may be, as is often claimed, very bad effects—unsettling young men, deterring them from serious application to their jobs. There may be—and nobody knows because nobody has seriously investigated the matter—a considerable net advantage to civilian industry in the shape of the better discipline, greater physical fitness or heightened self-reliance of the demobilised national serviceman compared with their opposite numbers in the prewar period.

It is not the purpose of army service to improve the raw material of industrial recruitment; the case for or against conscription must always rest solely on grounds of military necessity. But the effect of these two years' military service on the labour force of the future, on its attitudes towards work and on its general efficiency is potentially very great, whether for good or ill, and cannot be altogether ignored. One would like to see, while conscription is still new enough for its effects to be observable, some serious investigation

Pomp and Pageantry

The anniversary of Napoleon's birth was celebrated with considerable pomp in Paris on the 15th inst. Unfortunately, the weather was not propitious. A heavy storm blew away part of the Alps that Bonaparte was represented crossing on horseback, and swept away the canvas covering of the ball room, so that the Dames de la Halle were deprived of the honour of dancing with the President. Otherwise, the sham naval engagement, the passage of Mont St. Bernard, the illuminations, the processions, and all the accompaniments of two days' fêtes, went off with great éclat, and the President has gained showers of applause from a vast multitude congregated in Paris from all parts of France and many parts of Europe. It is rather the fashion here to mock at these festivities, in which a homage to the Virgin is mingled with reverence for Bonaparte; and yet no people are fonder than ourselves of connecting religion with politics, of retaining old processions that have lost their original meaning, and celebrating remarkable occurrences by national illuminations. In all times, and amongst all people, ceremonies and festivities, shows and games, have formed a great part of their social and political lives. At an early period they were the chief means of commemorating remarkable national events, and even now are much more impressive than the written and printed records on which journalists and historians exclusively rely. They really made the events they commemorated a part of the life of society, while mere narrations, through the cold medium of an abstract alphabet that depends for all its power on previous association, can never affect the mind like some visible representation—mock fight, mock race, or mock procession, it may be—of the deed to be commemorated.

being made into these long-term questions. Meanwhile, any evidence that Army education is being treated as more than a mere formality is encouraging.

India and the Gurkhas

The Indian politicians who are demanding that present arrangements for enlisting Gurkhas into the British army should be ended presumably see the matter as a useful stick with which to beat Mr Nehru's government. Their joint statement, loaded with references to the tainting of "our sacred soil, watered by the blood of many a martyr in the freedom struggle," suggested an unscrupulous appeal to nationalism, not a considered judgment. India's Communists, who have long been plugging the Gurkha theme, must have been delighted by their success in lining up the conservative opposition parties behind their effort to make trouble between India and Britain; but the conservatives can hardly have considered the implications of their action for their own country's security.

The point at issue is that, by agreement between India, Britain and Nepal, recruiting stations for Gurkhas have for several years been maintained at two points on the Indian side of the Nepalese border. These are not British bases, and the Gurkha recruits are given no training there; they are simply enrolled and medically examined. The stations are on Indian territory only because of the peculiar geography of Nepal, which makes it difficult to locate them across the border. The arrangement is unusual; but so is the whole relationship between India and Nepal, for the latter cannot be reached except through the former's territory, and communication between different parts of Nepal is often more difficult than communication across the border. India has recognised in many other ways the strategic importance of Nepal, and its need for special facilities to overcome its geographical problems; and there is no evidence that the existence of the recruiting stations has led to any friction.

The critics have apparently found some support among more realistic Indians who fear that the Gurkhas, by volunteering for service in Malaya, are leaving their own country ill-equipped to meet any threat from the north. But the facts are very different. First, British recruitment of Gurkhas today is on no greater a scale than before the war. Second, Nepal emerged from the Japanese war much stronger both in trained men and in equipment than ever before. Third, and most important, the present enlistment of Gurkhas for short-term service abroad means that Nepal regularly receives back well-trained men, experienced in modern war, and with a much clearer understanding of the wider world than they could acquire in their own villages. Such men, accustomed to friendly relations with both Briton and Indian, are not easy targets for Communist propaganda. And they bring back with them not only training and education, but savings. Indians who are genuinely concerned with the defence of their own country should consider these facts.

Communists in Sarawak

Earlier this month Sarawak had its first taste of Communist terrorism. Signs of activity by the party have as yet been few and far between, and it is impossible at this stage to assess accurately the significance of the recent incidents. The extortion of money from some shopkeepers, the distribution of some Communist leaflets, and the murder of one policeman and the wounding of two others, do not in themselves amount to a great deal; but the promptness with which the government declared a state of emergency in the area affected and made a small number of arrests may have caused the terrorists to move cautiously.

They are said to belong to the "Sarawak Indonesian People's Liberation Army," of which very little is known. It

is probable, as some evidence reported this week suggests, that they are being directed from Indonesian West Borneo. The Chinese Communists there, who are believed to be in touch with Peking, may regard Sarawak as an easier field for activity than their own territory. It is also possible that General Templer's successes in Malaya have made the Communists feel it necessary to step up trouble-making elsewhere in the area. In Sarawak opportunities to do serious economic damage are limited; but the territory adjoins the protectorate of Brunei, where the Seria oil-field is the third largest in the Commonwealth and now produces 100,000 barrels of crude oil daily.

If the Communists are planning more intense and wide-spread activity in Sarawak—which is by no means certain—they will not find it easy. They may expect some co-operation from the Chinese, who form just over a quarter of the

population, for many of their young men have caught the Communist infection. But the Chinese, like the rest of the population, have been enjoying a general prosperity that makes Sarawak unresponsive to Communist propaganda. Although there are only about a thousand police (now supplemented by a hundred lent from North Borneo) to defend the colony, the authorities have not yet felt it necessary to ask for military aid. Nearly 35 per cent of the population are Sea Dayaks, whose loyalty and fighting qualities are both beyond doubt; they could be formed at short notice into formidable local security forces. The proposed visit of Sir Rob Lockhart, director of operations in Malaya, indicates that plans are being considered to send troops if a really serious emergency arose.

The Cost of Votes

The official returns of candidates' expenses at the last general election have recently been published (HMSO, 2s. 6d.). They show, constituency by constituency, how much each candidate spent and where the money went. The following charts illustrate some of the conclusions that may be drawn.

The legal limits imposed on expenditure were the same as in the 1950 election. In England, Wales and Scotland a candidate could spend £450, with an additional allowance for each elector of 2d. in the counties and 1½d. in the boroughs. In Northern Ireland the limits are lower; 2d. is allowed for every entry in the electoral register, but there is no basic allowance except that £75 in the counties or £50 in the boroughs can be claimed for agents' fees. Over and above the ordinary expenditure, all candidates can claim £100 for personal expenses. If the personal allowance is included (as is done throughout this analysis) the legal maximum in Britain ranged from £776 in the small constituency

of Caithness and Sutherland to £1,155 in the Middlesex county constituency of Spelthorne. As would be expected, candidates differed greatly in the closeness with which their actual expenditure approached their permitted maximum. But there are unmistakable patterns in the variations.

First, the Conservatives put more money into the campaign than did the Labour party. The average expenditure of Conservative candidates was £775, while that of Labour candidates was £117 less. In relation to the support received, the election cost the Conservatives 8½d. per vote and the Labour party 7d. per vote. Naturally, both parties paid more heavily for success than for defeat. The average Labour MP spent £50 more than the unsuccessful Labour candidate; for Conservatives the difference was £80. Although Liberal expenditure was generally much below that of the two main parties, the six successful Liberal candidates spent on the average only a little less than the average Labour MP.

In the lower right-hand chart the expenses of the two main parties are shown in more detail. The expenses of each candidate were calculated as a percentage of the permitted maximum, and the candidates were then put into groups according to how successful they were—more precisely, according to the margin, expressed as a percentage of the poll, by which they won or lost the seat. For example, the expenses of successful candidates whose votes exceeded those of the runner-up by no more than 5 per cent of the total votes have been averaged together; then those with a winning majority of between 5 and 10 per cent, and so on. The losers have been grouped in a similar way according to the margin by which their votes were behind those of the winner. The final figure for each group, shown on the chart, is the candidates' average expenditure as a percentage of the permitted maximum. No account is taken of constituencies where the two main parties did not take the first two places in the polls. Excluded also are the four seats

that Conservatives won, and Labour lost, by a margin of more than 50 per cent of the poll, since the cases are too few for an average to be significant.

The averages conceal wide variations within each group, but the general tendency is plain. The level of expenditure of both parties was strongly influenced by the closeness of the contest. Both parties generally spent most heavily in the marginal constituencies and economised both on the safe seats and on the hopeless seats. This is, of course, the reasonable policy; the fact that it can be pursued shows how well both parties identify the marginal seats beforehand.

Expenditure fell off less steeply for the very safe seats than for the hopeless ones, and Conservative spending, besides being consistently higher, varied less than that of Labour. Even when the issue could not have been in doubt, Conservatives spent as much as 80 per cent of the permitted amount. On the other hand, as many as 24 Labour seats were won without spending half the permitted amount; no Conservative candidate won as cheaply as this. The most economical of successful candidates were the Labour MPs for the Gorbals and Bridgeton divisions of Glasgow, who spent only 23 per cent of the permitted maximum.

For the same reason—or unsafeness—of the seat candidates in county and borough constituencies spent about the same proportions of the permitted amount. It looks, therefore, as if the extra ½d. for each elector in a county constituency is—generally—a fair provision for the extra cost of electioneering to a sparser population. The distribution of expenditure is, however, rather different in the counties; a rather higher proportion than in the boroughs tends to be spent on agents and on public meetings, and a smaller proportion on printing and stationery. But almost everywhere printing and stationery account for at least half the expenditure, and for over three-fifths in the country as a whole. If printing costs should continue to rise some new budgeting may well be called for at the next election.

Books and Publications

Sterling and Statistics

The Sterling Area. An American Analysis. Published by the ECA Mission to the United Kingdom. Obtainable from HM Stationery Office. 672 pages. £1 18s.

The Sterling Area. By A. R. Conan. Macmillan. 192 pages. 16s.

The British talent for unprofitable compromise is continually surprising those people who profess to see in it something much more cunning. It is an extraordinary achievement that the nations of the British Commonwealth (excluding Canada, but in partnership with a number of smaller independent countries) have managed to share a common dollar reserve since the beginning of the second world war—and that they have done so without formal alignment of import programmes and yet with a minimum of bickering. It is perhaps not so surprising that each member, at different stages of the trade cycle, has tended to draw out rather more foreign exchange than it earned.

Because of the structure of the system, with its heavy dependence on primary commodities for its dollar earnings, the run on the reserves tends to be worst when prices are relatively low. The usual remedy sought for such a run has been to call a Commonwealth Conference, which proceeds to recommend that all members cut their imports.

The last conference was held in January. The next, which promises to be unusually important, is due in November. It is therefore fortunate that there should be published now two enterprising analyses of the difficulties—and the mistakes—that have beset the sterling area since its inception. The first of these books is a massive study by the ECA Mission to the United Kingdom; its chief virtue lies in the care with which it has gathered together the available statistics on the trade of the area as a whole, on the economies of the individual members, and on the commodities on which the area chiefly depends. The commentary is cautious and diplomatic. The second study is a private enterprise venture by Mr. A. R. Conan, the able economist of the Commonwealth Economic Committee; it says much for Mr Conan's ingenuity—and willingness to make bold estimates where boldness is needed—that he manages to put his statistics through some hoops that the ECA mission has not thought of. But Mr Conan, too, is content to let his figures show where the sterling area has been going in the past, rather than say himself where he thinks it ought to go in the future.

One of the chief accomplishments of both these books is that they carry their analyses back to prewar days—a period for which no statistics on the sterling area had previously been published, for the simple reason that the sterling area did not then exist. Both the ECA and Mr Conan suggest that the sterling area tended to run a gold and dollar surplus just before the war. A "typical" pattern between 1934 and 1938 was,

apparently, for Britain to run a deficit of about \$350 million with the dollar area, for the overseas sterling area to run a surplus of about \$50 million with it, and for receipts of newly mined gold to bring in about \$500 million. This heavy former reliance on gold sales underlines one of the main reasons for the sterling area's unfavourable experience since the war—the fact that the dollar price of gold is about the only price that has not gone up since the 1930s. Simultaneously, however, the sterling area's current trading position has deteriorated. In 1948 and 1949 Britain ran a direct deficit of between \$700 and \$800 million with the dollar area, and the overseas sterling area ran a deficit of between \$500 and \$600 million. In 1950 both groups made a much better showing than this, but in 1949 and the second half of 1951 a much worse one.

These bare figures, however, conceal an important difference between the postwar experience of Britain and of the overseas sterling area. The widening of Britain's dollar deficit since the 1930s has been wholly due to an adverse movement of the terms of trade; Britain's dollar imports, in terms of volume, have been rigidly restricted while its dollar exports have expanded. The widening of the overseas sterling area's deficit, however, has been wholly due to the fact that, in most years, the volume of its dollar imports has increased by more than that of its exports. Sales and output of jute, rubber and tin have been particularly disappointing; only in wool, its other really important export, has the overseas sterling area fully cashed in on the American boom—and that largely because it had on hand stocks accumulated during the war.

It is tempting to argue from this that Britain has been cursed since the war with bad luck, and the overseas sterling area with bad government. But a glance at the figures collected by the ECA should correct this impression. They show that much of the reason for the sterling area's postwar dollar deficit has lain in its heavy imports from the United States of machinery, steel mill products and chemicals; meanwhile, Britain has continued to pump out consumer goods to the overseas sterling area, and seen them paid for largely out of capital exported from this country. The core of the problem is that while the overseas sterling area has pushed ahead too rapidly with its real investment programmes, Britain has not sufficiently adjusted its productive effort to meet this change in demand from the Commonwealth. This seems to be the main lesson that emerges from both these valuable studies—even though in both of them the lesson is expressed less clearly in words than in statistics.

Science and Guns

Ballistics in the Seventeenth Century.

By A. R. Hall. Cambridge University Press. 186 pages. 21s.

Mr Hall's book is of much greater interest than its title suggests. At a time when the inter-relations of government, science and technology are the subject of so much discussion and exhortation it is valuable to examine them in an earlier period when both scientists and governments were rapidly enlarging their jurisdictions. It has been suggested, not only by Marxists, that the major scientific achievements of the seventeenth century were prompted by the new technical problems of industry, navigation and war. Mr Hall has taken the study of ballistics as a test case, for here the utilitarian explanation is extremely attractive. There was the obvious and growing importance of artillery in war, the attention given by Galileo, Torricelli, Huygens and Newton to ballistics, and abundant evidence that governments, especially in the age of Louis XIV, directed mathematicians to work on problems of gunnery and provided for the scientific training of military and naval officers.

Mr Hall very effectively discredits this plausible interpretation. First, he shows that the mathematical precision of ballistical theories was largely useless to gunners since manufacturing technique was so crude that weapons were highly erratic in performance. Both soldiers and sailors continued therefore to insist on getting, in Nelson's words, "so close to our Enemies that our shot cannot miss their object." Secondly, Mr Hall demonstrates that scientists worked on ballistics not primarily because they hoped to improve the accuracy of long range bombardment, but because the analysis of the trajectory of a projectile conveniently assembled fundamental questions of physical science, questions which could only be solved by the development of refined mathematical techniques. To Newton ballistics were linked with astronomy and gravitation in general rather than with practical war needs. And indeed the general solution of the problem in 1719 was provoked by a challenge issued by an ill-tempered Scots professor of astronomy anxious to humiliate an academic opponent. Then as now academic achievement was stimulated far more by a concern for truth and prestige than by a regard for general political and economic ends.

Mr Hall is keenly aware of how much work remains to be done on the history of war and science in the seventeenth century; and fuller exploration may well modify his conclusions. But although his readers will have to face mathematical expositions, anyone interested either in general seventeenth-century history or in the relations between government, science and technology will find this book an illuminating example of what is being achieved by the historians of science.

Victorian Tragedy

Marian Evans and George Eliot. By Lawrence and Elizabeth Hanson. Oxford University Press. 402 pages. 25s.

Mr and Mrs Hanson are perhaps more concerned with Marian Evans, the woman, than with George Eliot, the novelist. That is to be welcomed, for it means they have been able to devote themselves to a wealth of fresh material about her brave, unhappy life. Here at last is the full, thoroughly documented biography of George Eliot which has been long awaited. It should destroy forever the myth that George Eliot was the school-ma'am in excelsis of Victorian literature, the superior person in bombazine, full of didactic preachments. She was a woman of the deepest and warmest emotions, and, for the sake of love, was willing to defy the lightning of Victorian conventions.

It is impossible for those living in the more tolerant atmosphere of 1952 to realise how much Marian Evans suffered from the obloquy of the respectable and the derision of the disreputable when she entered into her union with George Henry Lewes, who was married but could get no divorce. It was, in all but name, the truest and happiest of mar-

riages, a steadfast partnership lasting until Lewes died twenty-four years after.

Marian Evans was the child of the harshest school of Midlands Puritanism, to whom even Handel's oratorios were works of the devil. She had freed herself through agnosticism from this narrow tyranny, but she was never to know any rest from the goadings of conscience and the scourgings of duty. She was a woman of massive intellect and learning, and was a more subtle moral teacher than most of the ecclesiastics of her time. Imagine then the courage it needed to challenge the taboos of the tribe.

It is one of the marvels of English literature that Marian Evans, the ultra-solemn scholar, became George Eliot, the novelist. The sympathy of Lewes played a great part in the transformation. Such novels as "Adam Bede" and "The Mill on the Floss" were prodigiously successful, and had a profound influence on the Victorian sensibility. Underneath the ethical teaching there was all the warmth of a generous and rebellious heart. The love scenes in "The Mill on the Floss," for example, make Dickens and Thackeray appear almost amateurish in their treatment of human passion.

It is a queer irony that after Lewes dies George Eliot marries an insipid young man, John Cross, twenty-three years younger than herself. How appalled were the friends who had stood by her throughout the long ordeal. But it was a very human longing on the part of the Victorian rebel to be buried as a respectable matron. She lived but a few months after marrying Cross. The Victorian age is getting more and more interesting now that research is revealing the lineaments of great figures hidden so long under the whitewash.

Trade Imperialism

The Founding of the Second British Empire, 1763-1793. Vol. I. Discovery and Revolution. By Vincent T. Harlow. Longmans. 664 pages. 45s.

An iconoclastic wind is blowing down many conventional signposts and boundary marks in the fields of British imperial history. And rightly so. Too many were put up by historians concerned narrowly with the formal Empire of political control to the neglect of the wider, informal Empire of trade, investment and political influence. The effect has been to distort somewhat the picture of British expansion overseas since 1750 by blocking it out into imperialist periods of extending dominion, and anti-imperialist periods when the political frontiers have remained static.

In fact, the movement of imperial frontiers is not the only, nor the most reliable, criterion of the strength and character of imperialist activity. It is only useful in conjunction with the indices of the expanding economy—with changes in the direction and character of overseas trade and investment. Slowly, ideas about British expansion are being modified in this sense. And periods long thought of, on

the old political view, as years of stagnation and anti-imperialism turn out to be years of continuing expansion in terms of commercial penetration and informal political influence.

Professor Harlow's first volume on the founding of the Second Empire provides a good starting point for the re-interpretation of later eighteenth and nineteenth century imperial history on these lines. For on the old political assumption it seemed that the loss of the American Colonies, which broke up the first empire, was followed by thirty years imperial "apathy, neglect and negation," before the founding of the second.

Mr Harlow almost convinces us that a new Empire of Oriental trade, based not on dominion and colonisation, but on "a chain of trading posts, protected at strategic points by naval bases," began thirty years before the American catastrophe. During this time British Governments were carrying out well conceived plans for a trade empire in *Terra Australis* and an Anglo-Indian-Chinese emporium in the Malay Archipelago. How consistently they pursued these aims is not altogether clear. Almost all the examples are chosen to illustrate the thesis. Nevertheless, one cannot but accept the conclusion that, by the Napoleonic Wars, this Oriental trade imperialism was the characteristic form of British expansion. It is the more unfortunate, therefore, that Mr Harlow was unable to uncover more completely the economic changes which underlay this change of character.

But the heart of the book is a magnificent study of Shelburne's imperial ideas and policy, hanging upon the part he played in the peace negotiations leading to the Versailles settlement of 1763. The scholarship is impeccable yet wide-ranging. Here is a vivid account of how British statesmen from Shelburne and Fox and the second Chatham, faced with American nationalism on one side of the Atlantic and Irish nationalism on the other, sought in vain for acceptable new forms of imperial relationship.

The Corporate Sepulchre

Corporate Trustees. By D. R. Marsh. Europa Publications, Limited. 318 pages. 25s.

It is surprising that this should be the first serious attempt to describe the functions and organisation of the corporate trustee. The Victorian trustee was a part of the novelist's equipment, to ruin the family or save the threatened heiress. Galsworthy humanised him; Soames might not be able to manage his own affairs but he could certainly be trusted with those of his clients. Then came the Public Trustee, safe, backed by the Consolidated Fund itself, and the banks and the insurance companies; the personality of the individual was replaced by the correctness of the institution. The corporate trustee, today, is to many no more than one aspect of the bank manager, with considerable charm

but limited authority. In the background there is always a Head Office. In this book, Mr Marsh, aided by the Houblon-Norman Fund at the Bank of England and given time by his own bank, has explained Head Office, for which he deserves the greatest thanks.

The sad thing is that, in so many ways, this book was out of date—at least, out of period—before it was written. Mr Marsh, inevitably, must look on wills and settlements as the circle of covered wagons around the financial citadel of the threatened family; they are still proof against the arrow and the tomahawk, when those weapons are still used. But the legal perfections of the last

century have now become the barbed wire around the concentration camp. The spendthrift is no longer the young man moving from the Gaiety to Romano's. He lives on the other, the southern, side of the Strand and his gas chambers for the family property are the annual Finance Acts. Legal interests and estates for life can decimate an estate as surely as any Regency buck in St. James's Street, with the additional disadvantage that there is no possibility of any change in luck, no chance ever of a win against the Inland Revenue croupier. The cards are arranged and marked, and the rules changed, each year, in April.

Today, the ideal trustee would be the man who hated trustee investments, whose drinking companions were the more buccaneering types of chartered accountant and stockbroker, and who could be trusted to put nothing into writing. The corporate trustee has achieved honour and respect at the moment when he has gone over to the enemy. His reputation prevents him from seeking loopholes in the laws of taxation. Mr Marsh's book is admirable in its writing and in its knowledge, but his experience would be of far greater practical value on a man-to-man basis over a glass of refreshment at the 19th hole.

Letters to the Editor

Champions of European Unity

Sir,—According to Dr Toynbee's well-known analysis, the Catholic Church, since it laid down the foundation of modern Europe, has now the task to give a lead in the Continent's present predicament. Indeed, Catholic thinkers were among the first to feel towards a supra-national European consciousness: Chesterton and Belloc in England, Papini in Italy, Gertrud le Fort in Germany.

On the other hand, the four statesmen most prominent in instigating the political movement for a United Europe were M. Spaak in Belgium, Mr Churchill in Britain, Signor de Gasperi in Italy, and the late M. Blum in France. Out of the four only Signor de Gasperi can be associated with Catholic public life. The Catholic background may have contributed to M. Schuman's and Dr Adenauer's European policy, but it appears certain that religion was not their ultimate concern. M. Schuman's original "Plan" was confined to ending the protracted Franco-German strife—an obvious and commendable target for a French politician with German education. For Dr Adenauer—the Prime Minister of a defeated country—the European stage offered the coveted part of a twentieth century Talleyrand. In any case, Catholic dogmas bear little reference to the coal and steel pool.

A close association of the Catholic Church and the United Europe Movement would hurt the European cause by alienating non-Catholics unwilling to accept the "Vatican supremacy" and Catholics unwilling to drag religion into politics. It would also hurt the Catholic cause by jeopardising the position of the faithful in other parts of the world. The Catholic attitude towards Europe was clearly defined in 1945 by His Holiness Pius XII: "Europe is in need of the Church, but the Church is in no need of Europe."—Yours faithfully, GEORGE A. FLORIS

Edenbridge

Japan and Gatt

Sir,—In your issue of July 26th, referring to Japan's application to accede to GATT, you state that "as a contract-

ing party Japan would have automatic right to claim most-favoured-nation treatment from Britain and all other members."

This is not quite correct; for Article XXXV of GATT permits a contracting party to withhold application of the agreement (or applications of its own schedule of negotiated tariff items) from another contracting party with which it has not entered into tariff negotiations. Thus if the United Kingdom, or any other GATT member country, decided not to undertake tariff negotiations with Japan, Article XXXV could be invoked. Action taken under this article requires no vote of approval by the contracting parties as a whole. Several GATT members which have wished, in special circumstances, to withhold most-favoured-nation treatment from one or other of the parties to the agreement have in fact resorted to this clause.—Yours faithfully,

RICHARD R. FORD,
Information Officer, GATT
Geneva

Export Markets for Cars

Sir,—I must confess that I am not altogether sorry to learn, from Sir William Rootes's letter in your issue of June 21st, that British car factories "are running at an average of not more than 60 per cent of capacity." If they were running 100 per cent I can well imagine that the unfortunate purchaser would get even less service and consideration than he gets now. Nine months ago I bought a new car. Within one month the front wheel bearings had given way and had to be replaced, while all the four door handles had "frozen" solid. In each case the fault was caused by the failure of the factory to put any grease on the part on assembly. A friend of mine damaged his car almost six months ago. He is still without it for lack of the necessary spares. The factory in England has not even acknowledged his written requests for prompt dispatch of the parts. This place has recently been visited by a special travelling representative of a car manufacturer. In response to one complainant of bad service, he frankly declared that he couldn't care less.

Within my own small experience I

Spare Parts and Service

Sir,—The complaints of the oil companies voiced in your issue of August 16th, regarding the apparent inability of British engineering firms to give after-sales service comparable to their American competitors, are largely justified.

It is not generally appreciated, however, that the root of the trouble lies in the purchasing policy of the oil companies themselves. So long as they are content to place their orders in London, on price alone, there is little inducement for a British manufacturer to build up a proper distributor organisation in the territory in which his plant will operate. It cannot be too strongly emphasised that the availability or otherwise of a distributor organisation holding adequate stocks of spares, regularly replenished, is the key to the spares problem. Vital parts can be sent by air in an emergency, but for normal supplies the cost is prohibitive. The man on the spot, with factory-trained service engineers and a comprehensive spares stock, is the real answer to continuity of plant operation.

If oil companies, mining companies, and the numerous other London controlled organisations operating overseas were to make it an invariable rule that orders were only placed with manufacturers who had an effective distributor organisation in the territories concerned, there would very soon be a change of heart and a rapid improvement in spares available where they are needed—on the spot.—Yours faithfully,

T. W. STANIER
Retford, Notts.

BLOOD, OIL & SAND

The Middle East Crises RAY BROCK

Here is an up-to-the-minute book about the hottest place in the world today—the Middle East.

Raging nationalism, political intrigue, and above all the oil of the Middle East have been constantly before the eyes of the world in recent months; and the crises there are likely to recur in more dangerous forms in the near future.

Ray Brock presents the first overall picture of this most critical area covering every nerve centre from Pakistan to Yugoslavia, from Persia to Tunisia, and he writes with personal knowledge of Mossadegh, ex-King Farouk, the Mufti of Jerusalem and many other leading figures. This is the most informative book about the Middle East to have appeared since the war.

12s 6d

THE BODLEY HEAD

PICTURE POST IS NOW 4d AGAIN

Hulton Press announce that PICTURE POST was reduced in price from 6d. to 4d. on August 20th. A large increase in sales is expected. The publishers believe that it is sound business logic to sell more copies at 4d. than fewer at 6d. An immediate circulation of one million is guaranteed to advertisers and will continue to be guaranteed until the end of this year.

This is the first price reduction of any national newspaper or magazine in Great Britain since the war. The publishers are proud to join those companies which are countering the dangers of inflation and planning to meet the uncertainties of the future with the same challenging policy.

Abnormally high paper prices during 1951 forced PICTURE POST to increase its price first to 5d. and then to 6d. These paper prices have now passed their peak. It is now possible, by selling more copies at 4d. to pass on to the public at the first opportunity the benefit of the lower prices now operating.

PICTURE
POST

AMERICAN SURVEY

Middle Eastern Dust Storms

Washington, D.C.

THE 1952 crop of Middle Eastern dilemmas finds the United States in the heat of a presidential election, when nobody wants to announce new policies or even to take up, on behalf of old ones, positions so exposed that they can be assaulted by the opposition. The opposition has made it clear that it is determined to assault wherever possible; General Eisenhower is not so confident of election that he can afford to neglect any profitable area of attack upon the Administration. Whatever may happen when the fight is over, bipartisanship in foreign affairs, despite the gallant efforts of Senator Wiley, is to be largely suspended during the campaign. The Department of State must therefore be doubly careful this year. It is not safe from irresponsible attack from without and it is certainly not safe from criticism within. Many Democrats who lost in 1950 blamed their defeat on the Secretary of State, and it was noticeable that, in all the days of oratory at the Democratic Convention, the word "Acheson" was only spoken once.

This is no time, therefore, to expect brave, new policies and it is perhaps fortunate that nobody thinks that brave, new policies are needed. It is also fortunate that British and American views on what should be done or not done are closer together now than they have been for some time. The State Department's eyes are naturally focused all the time on the Tudeh party and the likelihood of its coming to power. The department therefore thinks the British preoccupation with Abadan somewhat irresponsible, but events themselves have made irrelevant many of the disagreements over immediate tactics, and long-term policy must wait upon the evaluation of the meaning of these events. When the *New York Times* correspondent in Teheran wrote, after the collapse of Qawames Saltaneh, that "spiritual and intellectual fundamentals were involved, not merely a matter of who should manage an oil company," he was saying something that would hardly have been understood a year ago but that is now accepted.

That is not to say that any official in Washington has developed lately a higher opinion of the policies and strategy of the Anglo-Iranian Oil Company during the dispute, but only that bemoaning them or trying to alter them in retrospect would solve nothing. There is still a general view in Washington—though, in the nature of things, it can not be based upon more than guessing about what might have been—that a little sense two years ago would have enabled the company to get a better settlement than it can ever get now, and that whatever settlement was made then would have lasted for some years—very important years in terms of the present situation in the area. And there may come a time again when negotiations have reached a point at which the State Department will once more complain that a British refusal to compromise is unrealistic. It certainly was not thought to have come when Dr Mossadegh recently made overtures to the British Embassy, recanted, and then disguised an offer to negotiate with the oil company under stiff demands for money. Nor does anybody expect much result from the present British approach.

Had Qawam been able to stay in power—or rather in office since he was never in power—long enough for anything to happen, he would have had full support from Washington. Those who have criticised the United States government for not coming to his help could hardly have expected that anything could be done in the four days that he held office, or that he could have lasted long, even with foreign aid, without any basis of support at home. Now that he has gone, there is a feeling that Dr Mossadegh will, despite his initial triumph, soon find the pressures within the National Front as difficult as ever. Had he been as firmly in the saddle as he seemed when he first mentioned negotiating on the oil dispute again, there would have been hope that a solution was possible. As it now seems that intransigence is his only formula for staying in power, there is only pessimism in Washington.

★

Over Egypt, however, there is considerable, if guarded, optimism. The departure of King Farouk has made further Anglo-American arguments about recognising him as "King of the Sudan" redundant for the time being, and the photographs of him since he left have dried any tears that officials might have thought of shedding. As nobody knew anything about General Neguib when he seized power, there was both ignorance and apprehension about his intentions. But his behaviour in the last few weeks, and that of Aly Maher Pasha, has been the only piece of cheerful news from abroad for a long time. It is thought that the limitation of land holdings can, by itself, change the sources of political power and make genuine reforms possible.

The most immediate American interest is, naturally, in the effect of the changes in Egypt on the fortunes of the Middle East defence organisation. It was unfortunate that news of the British suggestion to establish a preliminary planning organisation leaked out when it did, because its timing suggested that it was something that had been proposed since General Neguib's *coup*. Whatever its merits before the *coup*, the State Department felt that the present was no time to start anything without Egyptian participation. Whereas a year ago the situation called for speed, it now seems to call for caution. In three or four months it will be easier to see which way Egypt is going and meantime nobody wants to make any irrevocable moves which will make it harder for the new government to co-operate if the present spirit of destructive nationalism gives way to one of excitement about reforms at home.

Nobody in the State Department would ever dare to use again the valuable phrase about "letting the dust settle" but that, as far as the two recent dust storms in the Middle

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

East are concerned, is what everybody would like to do—and would even have liked to do if there were no election this year. There is no confidence that the United States could do much to hurry its settling or to change the way in which it settles. If the dust settles wrongly, however, and does so before the election, the Administration will be accused of "losing" the Middle East as it "lost" China. So there is always apprehension that it may let slip some opportunity and be blamed for letting it slip. Otherwise this dangerous area may be kept out of domestic politics because the Republicans have no vested interest in it, no dictator who is their partisan pet and, apparently, no significant changes in policy to suggest.

Where Stands the South?

[FROM A CORRESPONDENT IN ALABAMA]

GENERAL EISENHOWER is now planning to start his election campaign with a two-day whirlwind tour of the southern states by air, descending at the larger airports to speak to however many listeners he finds there, instead of making an orthodox but much longer tour by train, stopping wherever people collect at the sound of the engine's whistle. The experiment will have good publicity value, but it is also a recognition that there no longer seems to be any point in wasting much of the General's time in a search for southern votes.

The Republican party will still spend both energy and money putting a brave face on its faded hopes of invading the South successfully at last, but the Democratic Convention clouded the once bright prospect that the South could this year be weaned away from its loyalty to the Democrats. The only states whose allegiance remains at all doubtful at the moment are Texas, Louisiana and, perhaps, South Carolina and Virginia. The best qualified political opinion today is that General Eisenhower will not carry more than one southern state for the Republicans, and probably none at all.

The sudden disappearance of any serious possibility of the Republicans winning any worthwhile number of votes in the South—votes which many consider crucial to General Eisenhower's chances of victory—can be credited chiefly to the Democrats' choice of Governor Adlai Stevenson of Illinois and Senator John Sparkman of Alabama as the party's presidential and vice-presidential nominees. Both men are considered in the South to be able and honest, progressive yet sound, and cast more in the Roosevelt than the Truman mould.

This last distinction is a major reason why the South has accepted the Stevenson-Sparkman ticket. The fixed emotional opposition to President Truman among Southerners in recent years, based largely on his attitude to the Negro question, has become intense. Before the Democratic Convention much of the support for General Eisenhower in the South was rooted in the fear that the Democratic party, unable to find a formidable new candidate, would turn in desperation to Mr Truman once more. That fear was carefully nurtured not only by the Republicans but by the rebellious Democrats who in 1948 formed the Dixiecrat or States' Rights party. But with Mr Truman no longer available as a bogey, the Dixiecrats and Republicans are finding that southern voters, now less emotional, are taking a more objective interest in campaign issues and personalities.

While Governor Stevenson has been seen very little in the South, he somehow had generated an amazing confidence among Southerners even before the nominating Convention.

A great number of delegates from the South, though pledged to Senator Russell of Georgia, looked to Mr Stevenson as their second choice. If he had ever been in any danger of being beaten by Senator Kefauver, the Russell delegates would have swung almost solidly to the Illinois Governor. They were a Stevenson reserve, never called up into the line.

Governor Stevenson's strength in the South comes partly from his connections, but chiefly from the man himself and his record. He could hardly have chosen his southern sponsors better: with Vice-President Barkley of Kentucky and Senator Russell to vouch for him, it is difficult for critics in the South to label Mr Stevenson as "nothing but Truman's man." But far more important than these connections is the approval which Mr Stevenson has won for himself on his record, and on a certain quality of leadership that holds peculiar appeal in the South. It is a quality, loosely referred to as "statesmanship," which to Southerners implies the ability of a public official to accomplish his objectives with dignity, and on a high administrative level, without accumulating too much grime of battle. President Truman, the sturdy gamecock, relishes both battle and grime. Governor Stevenson, by a more detached and intellectual approach, gives the impression that, while he is in command of the struggle, he is well above it.

Mr Stevenson's record of economy, resistance to corruption, and general competence as Governor of Illinois provides a solid basis for the respect in which he is held in the South; so does the impression made by his two electrifying addresses to the Convention. There is a special appreciation among Southerners for the literary and religious aspects of Mr Stevenson's speeches. More important, perhaps, is his apparently moderate position on federal laws for the protection of minorities which, in the South, mean Negroes. He has said he favours leaving this question to the state governments and that he believes in federal action only if the states do not act.

This civil rights issue has already provoked a controversy around Mr Stevenson's running mate. The selection of Senator Sparkman, from Alabama in the Deep South, naturally has not pleased northern liberals, who consider him too conservative on both civil rights and labour questions. But southern conservatives are not happy either, for they allege that Mr Sparkman, in order to win the nomination, sacrificed his southern convictions. However, the complaints from both North and South seem likely to die down. Mr Sparkman is a big dynamo of a man who has worked and studied his way up from boyhood on an Alabama tenant farm to high respect in the Senate and great popularity among radio and television audiences. He stands somewhere in between his extremist critics, a hard-working, honest liberal, a humanitarian who yet recognises the realities of political life. He will be a potent factor in holding the South within the Democratic party, and also may win votes in the North and West by his exceptional ability in debating the issues.

Detractors of Mr Sparkman in his home state have made much of the fact that he proposed General Eisenhower as the Democratic candidate for President in 1948, as opposed to Mr Truman. Mr Sparkman's reply is simple: "I did not know he was a Republican." The answer is defensible, since it is true that General Eisenhower did not state his party allegiance until a short time ago.

The presence of a strong Southerner on the Democratic ticket as a partner for the redoubtable Mr Stevenson is only

one of General Eisenhower's difficulties in the South. He also has to overcome a vivid recollection of Republican neglect of the South in pre-Roosevelt times, including hungry days under the last Republican President, Mr Herbert Hoover. The South's enormous economic gains under Democratic rule cannot be denied, though Republicans say these gains would have been even greater had they been in power. Such claims are hardly supported, however, by their votes in Congress against such popular programmes as soil conservation, rural electrification, and the Tennessee Valley Authority.

Furthermore, even among many southern Republicans there is a notable lack of fervour for General Eisenhower. Most long-time Republicans in the South were for Senator Taft, and the defeat of their candidate at the Chicago Convention by a movement that included unofficial Republicans from the South, who were not approved by the local party organisations, has drained much of the enthusiasm from the official Republican workers there.

If, as now seems likely, General Eisenhower does not have any substantial success in the South, the gradual trend toward a two-party system there will be sharply set back. As late as May, it was freely predicted that the Republicans, with their most attractive personality for many years as candidate, would capture half the southern states and break the Democratic monopoly there. Failure to win more than one or two southern states in 1952 may kill Republican chances below the Mason-Dixon line for some years.

American Notes

No Escape for Watches

President Truman's refusal to raise the already high American tariff (an average of 37 per cent *ad valorem*) on Swiss watches has been greeted abroad with a relief which is a measure of the doubts which are felt there about the genuineness of the American belief in freer trade. These doubts have certainly been justified recently by Congress, but the Administration itself has done little, if anything, to deserve them. It is very well aware, as Mr Truman pointed out in his explanation of why he had rejected the Tariff Commission's recommendation on the watch duty, that international trade must be expanded if "friendly nations" are "to earn their own dollars and pay their way in the world."

The escape clause in the Trade Agreements Act permits an industry to appeal for relief if it thinks that it has suffered, or is threatened with, serious injury as a result of a tariff reduction. But the President said that the clause

was not intended to give domestic industry freedom to ignore the changing pattern of domestic demand or to provide an escape from normal, healthy competition.

This was what he felt the American watch manufacturers were trying to do. Since the trade agreement with Switzerland was concluded in 1936, their share of the domestic market for watches has certainly fallen substantially, but that market has grown so much that their total sales have nearly doubled. The increase in the duty on hat felts permitted some time ago under the escape clause applied, on the other hand, to a commodity for which the American market was shrinking

UNITED STATES FOREIGN TRADE

rapidly, while the increase in the duty on dried figs, allowed by the President this week, is said to be only temporary because of abnormal American crop conditions.

Other considerations also entered into the watch decision. Many American workers are employed in making cases for imported Swiss watch movements; if the tariff were raised, unemployment in this branch of the industry would cancel out to some extent any increase in employment in other branches of it. Furthermore, the President doubted whether under the present tariff there was any danger of the watch industry being damaged to such an extent that it would be inadequate in time of war. Finally, and this was the main reason for the pressure by farm and labour organisations alike against the rise in the watch duty, the Swiss had made it clear that, if the tariff were increased on an article that makes up about half their exports to the United States, they would be obliged to raise barriers on their side against at least some of their imports from the United States, which include cotton, tobacco, office equipment and automobiles.

The recent rush of demands for hearings under the escape clause will be discouraged by the President's decision on the watch question, and by his recent rejection of a higher duty on garlic, even though that was probably inspired as much by the taste of Italian voters in New York for cheap garlic as by concern for Italy's foreign trade. Businessmen who feel they are being injured will wait to see whether the election brings any hope that the escape clause may be interpreted more favourably from their point of view. There is little reason to suppose that General Eisenhower and his advisers are any less aware than is Mr Truman of the need for increasing American imports. But a Republican Congress is likely to be even more short-sighted on this question than was its nominally Democratic predecessor.

Blunder Over Briefing

The Republicans have undoubtedly come politically best out of the White House comedy of errors over the "briefing" of the two presidential candidates on secret aspects of the international situation. It all began with the laudable idea that both candidates should be given sufficient background to ensure that they did not embarrass their country's officials by irresponsible campaign speeches. When Governor Stevenson went to Washington last week to meet the President and the Cabinet, he was also given an opportunity of picking the brains of General Bradley of the Joint Chiefs-of-Staff and General Bedell Smith of the Central Intelligence Agency. This appearance on the political stage of military men whose responsibilities are officially supposed to be above politics brought a blast of boos from General Eisenhower's headquarters at Denver. The General himself was especially chagrined at this apparent defection of his old colleagues, and President Truman added to the insult by asking the General, as an afterthought, or so it seemed, to come to a similar meeting a week later.

General Eisenhower refused with righteous indignation, saying that he felt it his duty to remain free to criticise the Administration and that it would confuse the public if he conferred with the President. He added that he would, however, be glad to see the CIA's weekly reports, provided he was left free to discuss foreign affairs as he judged suitable. It then came out that the President had intended to offer these briefing facilities to both candidates at the same time, about a week earlier, but that General Bradley, a simple soldier who did not appreciate the political importance of the request, had thought it would be all right if he mentioned the matter to his old friend, General Eisenhower, next time they met.

The Republicans will certainly not hesitate to use this blunder as evidence that under the present Administration Washington is in a muddle and that none of the nation's affairs has been kept above politics. Moreover, Governor

Stevenson's visit to the White House proves, it will be alleged, that he is in Mr Truman's pocket and, if elected, will not provide the change for which the voters are supposed to be longing. In fact the main purpose of the Governor's visit was to get out of Mr Truman's pocket without offending him, and in this Mr Stevenson seems to have succeeded. He took two of the President's advisers back to Illinois with him, but he resisted suggestions that he move his headquarters to Washington. He also resisted attempts to send Mr Truman off on one of his favourite cross-country speaking tours, which would have distracted attention from Mr Stevenson's own trips, and which in any case the Democratic party could hardly have afforded. The party funds are being stretched to the limit this year to pay for television time.

President Truman is, however, to be allowed to open the Democratic campaign simultaneously with Governor Stevenson at Milwaukee on September 1st, when the Governor will be speaking in Detroit. Both will be addressing labour audiences, as is becoming on Labour Day in a year when the labour vote is vital and the Republicans are hoping to attract some of it. The Congress of Industrial Organisations has already endorsed Mr Stevenson, as was to be expected. What is less expected is that the traditionally aloof American Federation of Labour is also probably going to endorse a candidate this year.

Catching Up with Steel

True to form, Mr John L. Lewis has started his latest negotiations for a new contract for his coal miners with a bang. From today until September 2nd, a period which includes only five working days, the 475,000 members of his union are staying away from work, as their present contract allows, in memory of comrades who have suffered in mining accidents. As a result most of the country's coal mines will be closed down. Mr Lewis's ostensible purpose is to give the mine owners an opportunity of inspecting their properties and making them safe; he claims that, when asked to do this individually, they usually say they cannot afford to stop production unless their competitors do so as well.

The memorial holiday will also draw attention to the failure of the last Congress, which passed a new federal law on mine safety, to provide funds for enough inspectors to enforce the new regulations. And the publicity given to mine accidents by the memorial tributes will mobilise popular sympathy for the danger of a miner's life just as the negotiations on the new contracts open. Of more practical importance, the memorial period will also mean a reduction of about 10 million tons in stocks of coal above ground, which are at present enough for eighty days or so—not, from the miners' point of view, a very auspicious starting point for a possible strike.

Miners will not in fact be very anxious to strike, for the poor demand for coal means that they have been working only three or four days a week and are one of the few groups who have recently earned less instead of more. But their present contracts expire at the end of September and Mr Lewis is obviously counting on the reluctance of politicians to alienate the labour vote at that time by invoking the Taft-Hartley Act just before the election. If, on the other hand, an 80-day injunction against the strike were obtained under the Act, and the miners observed it, it would run out at the height of winter when coal stocks would be quickly exhausted if mining stopped. The timing of Mr Lewis's move is obviously designed to enable him to win on both swings and roundabouts. What he wants to win is not yet known, but it is presumed to be a shorter working day, perhaps of six hours, in order to spread the reduced work load over more men, and higher wages to make up for loss of time.

Mr Lewis must also get higher wages for his miners in order to catch up with his rival, Mr Murray, on the wage

ladder. The workers have now gone back at all the steel mills—the Allegheny Ludlum plants have only just reopened—although the details of the new contracts have in many cases not yet been agreed. The new Wage Stabilisation Board has announced that similar increases of 16 cents an hour will be allowed in those industries, such as steel fabricating, which have traditionally followed the pattern of steel settlements. Other unions, notably the meat-packers and rubber workers, are also hurrying to catch up with, or even to pass, the steel workers; there have been a number of local walk-outs in both industries, and a full strike against one rubber company, in protest against the slowness of negotiations.

Pollsters on Hot Bricks

Last week Dr Gallup released the results of the first tests of "voter preference" in this year's election campaign, conducted by the American Institute of Public Opinion as soon as both presidential candidates had been nominated. The national poll showed that the Republicans had chosen wisely: only 45 per cent of those surveyed would have wanted to see the Republican party win if the election were being held that day, but 47 per cent of them wanted General Eisenhower to win; the figures for the Democratic party and for Governor Stevenson were 43 and 41 per cent respectively. But at much the same stage of the 1948 election Mr Dewey was ahead of Mr Truman by 48 per cent to 37; and since Governor Stevenson is as yet hardly known at all in the country at large, while General Eisenhower is a national hero, the General's advantage is likely to decline as the campaign progresses.

In the southern states General Eisenhower was also ahead of his party, and of the Republican vote in the South in 1948, although not far enough to make it seem likely that he could beat Mr Stevenson there, except possibly in one or

two border states. In the big cities of the North, with populations of 500,000 or more, the General again seemed more popular than his party and than Mr Dewey in 1948. But in about half of them the probable Republican vote, according to the poll, was still less than 40 per cent of the total; General Eisenhower must do better than that in these normally Democratic cities if he is to win the election. Another thing that he must do is to divert a large proportion of the 14 million independent voters from their Democratic leanings. This he, with the help, perhaps, of the failings of the Democratic party, seems to have a good chance of achieving, if the Gallup survey is to be trusted. In the last three elections, the Republicans were never supposed to have had more than 43 per cent of the independent votes, but this year, at the time the poll was taken, 52 per cent of them favoured the Republicans.

But independent voters are notorious among "pollsters" for changing their minds as the election campaign progresses. It was partly because so many voters did that at the last moment in 1948 that the polling organisations were so badly burned. This time Dr Gallup is going to keep on surveying until two days before the election and have the final results telegraphed to his office. The other group of voters who let the pollsters down badly in 1948 were those who were undecided and in the end supported Mr Truman by three to one, instead of dividing evenly as they were meant to do. This year both Dr Gallup and Mr Elmo Roper are hoping to be able to guess accurately what the undecided voters will do by asking them searching questions about their voting habits and their political philosophy. But between now and November 4th, the pollsters will be prophesying on hot bricks; they have managed to induce their newspaper and commercial clients to overlook their failure in 1948, by promising that it cannot happen again. But they have no hope of being given another chance should they once more estimate wrongly.

**THE
NATIONAL
CITY BANK
OF
NEW YORK**

BUSINESS AROUND THE WORLD

For a hundred and forty years, The National City Bank of New York has been developing a world-wide service for businessmen.

Today the Bank has fifty-six overseas branches in the principal centres of commerce, and is in direct touch with nearly 1,000 correspondent banks around the free world.

The London branches of The National City Bank have long experience of both British and international banking. They are uniquely equipped to advise on trade with the dollar areas, and they can command the resources of a global organization.

Whatever your problem and wherever your business, The National City Bank of New York can assist you.

Kicks and Ha'pence for Austria

(From Our Vienna Correspondent)

THE Soviet authorities have recently been mixing so many ha'pence with the kicks Austrians have become used to receiving from that quarter that they are almost in danger of losing their position as the most hated of the four Occupants. The distribution of baksheesh began in the early summer when the Soviet High Commissioner, General Sviridov, announced that civilian prisoners convicted by a Soviet military court would no longer be sent out of Austria to serve their sentences but would be handed over instead to Austrian custody. At about the same time, prisoners of war in the Soviet Union were suddenly given permission to write home, a privilege hitherto denied them. They may even receive post-free and customs-free parcels. On top of these concessions came an intimation that the Soviet Government was ready to give an assurance to the Danube Shipping Company that its ships (which had only ventured out of the American Zone of Austria two or three times since 1945 lest they should be seized by the Soviet authorities as German property) could journey between Linz and Vienna as often as they pleased. Since July 12th, therefore, the Austrian flag has again been seen regularly on this sector of the Danube after a lapse of fourteen years. Almost simultaneously there was a sudden reversal of the policy of making difficulties over the movement of Austrian-made goods between the Soviet and non-Soviet Zones of Austria. In the middle of June over 700 consignments were held up because the Soviet authorities had not issued the necessary permits, some of which had been outstanding since the beginning of the year. Three weeks later, all the arrears had been cleared away.

Unlawful Kidnapping

Meanwhile, however, the kicks are still continuing. Individuals "wanted" by the Soviet authorities are still unlawfully seized by Soviet agents when living in sectors outside Soviet control. Again, a deputy of the Lower Austrian Diet was called to the local Soviet Kommandatura on June 30th and ordered to hand over a list of names of people who had recently joined the local branch of the Socialist Party. He refused to do so and was ultimately allowed to go home. In other parts of the Soviet Zone local Austrian officials have been ordered to set up show cases for Soviet and Austrian-Communist propaganda. In some places, they have even been ordered to give advance notice of their business meetings. Near Urfahr, in Lower Austria, Soviet officials have been issuing orders to deface all monuments to dead Austrian soldiers on which the German uniform is depicted. And at Blumau, in another part of Lower Austria, the inhabitants have been forbidden to set up a monument to citizens who lost their lives during the war. Throughout the Soviet Zone there are constant interferences with the freedom of the press, and no fewer than 163 publications have been banned this summer, many of them permanently. There have also been numerous examples of pressure on the school authorities to include Soviet propaganda in the curriculum. On the radio service, Ravag, the programmes are subject to strict censorship. Finally, Soviet authorities still insist on continuing the postal, telegraphic and telephonic censorship on international traffic in spite of repeated demands by the Austrian Government and the other three occupants to abolish it.

Trying to evaluate these contradictory aspects of Soviet

policy is rather like trying to understand a joint composition by Sir Alfred Munnings and Picasso. All one can say for certain is that the ha'pence definitely represent a new trend—a minor one presumably, as there is no sign that the Soviet Government is ready to sign a State Treaty. The change seems to represent a wait-and-see policy pending the inauguration of some new offensive against capitalism in general. How new it is can be judged from the fact that when Mr Acheson visited Vienna in May, the Austrian Communists were first told to stage violent demonstrations and then hauled back on a taut leash at the last moment with the result that they were made to look extremely foolish. It is perhaps worth noting in this connection that the Cominform journal has recently been toying with the idea that capitalism is facing a "general crisis"; evidence of this is found in a rising strike movement involving not only conflicts with factory owners but with the State apparatus. Talk on these lines has coincided with blandishments to Austrian industry. Thus, early in August the Communist press went to some pains to point out that only the timely intervention of the Bulgarian Government had enabled the glass industry to maintain full employment instead of having to lay off workers.

Iron Gates Ajar?

Similarly, on August 6th, *Oesterreichische Volksstimme* dropped a fly baited with the suggestion that Austrian ships can now carry cargoes right into the heart of the Soviet Union, thanks to Uncle Joe's foresight in opening the Volga-Don canal at almost precisely the same moment as he allowed Austrian ships to ply between Linz and Vienna. There is, of course, not the slightest indication at present that Austrian ships are to be allowed to use the lower reaches of the Danube. Indeed, they still may not go as far as the Slovak capital, Bratislava, or even to the Austro-Czechoslovak frontier. But Austrians are certainly given the impression that if their government behaves itself, the opening not only of the Iron Gates but also of the whole Iron Curtain area is within Austria's reach.

A slightly more conciliatory attitude has also made its appearance further down the Danube. For example, at the bi-yearly meeting of the Danube Commission at Galatz in June, the perennial Yugoslav request for an increase in Yugoslav staff on the Commission's permanent secretariat was not turned down out of hand as in the past but was simply held over till the next meeting; meantime it is to be "carefully considered" by the other members. In other words, Yugoslavia was presented with what bore some faint resemblance to a vegetable which good behaviour during the ensuing six months might possibly cause to turn into a carrot. Similarly, one of the first acts of the new Rumanian dictator, Gheorghiu-Dej, after he had got rid of his potential rivals, was to inform the Austrian Government that 86 Swabian-Rumanian prisoners of war whose families fled to Austria in 1944-45 were to be released and allowed to proceed to Austria forthwith. It is noteworthy that these men were not Austrian citizens, that the Austrian Government did not ask for them and that in the past it has been extremely difficult for any Rumanian citizens of German origin to get permission to leave the country.

Perhaps Vienna is too near the scene of action for observers there to be able to see the shape of the wood formed by these

individual saplings. In any case, the saplings themselves must obviously be considered in the wider international pattern not only of Europe but of Asia. For example, about the same time as the Austrian Communists called off their offensive against Mr Acheson, the West German ones were hauled back from making the disturbances they had threatened if the General Treaty with the West German Republic was adopted. Again, has the fact that the Sino-Soviet agreement calls for Soviet evacuation of Port Arthur and the Manchurian railway in the course of 1952 any bearing on what has happened in Austria where recent developments have temporarily, and rather late in season, put the Russians on a good wicket?

Controversy Over Amnesty Laws

Meanwhile the Americans have been putting themselves on a bad one. They were alone, for instance, in vetoing a bill passed by the Austrian Parliament to amnesty some 1,100 ex-soldier members of the Nazi Party and SS who had been released from Soviet prisons after April, 1949. They look like being out on a limb in regard to the wider amnesty laws passed by the Austrian Parliament to free 32,000 minor "convicted Nazis" from the special taxes and social consequences of having joined the party. The Americans hold the view that indemnification of the victims of the Nazis should precede an amnesty to the Nazis themselves. This really means that Washington requires the Austrian Government to reach agreement with Jewish claimants for compensation before amnestying any more Austria, ex-Nazis. The question of Jewish compensation is an extremely complicated one bound up with the negotiations at the Hague between West German and Israeli representatives, with Austria's general financial situation, with the fact that some of the Jewish assets in Austria are in the hands of the Russians and that many Jews who have migrated from Austria are now perfectly free to return here to live but prefer not to do so. In any case, whether the Americans are morally right or wrong, Washington's attitude has certainly incensed many Austrians who have no love at all for the Russians. Another difficulty is that there has been a certain degree of indiscipline among the American soldiers at Salzburg which the Communists have exploited to, and indeed beyond, the utmost limits of propriety.

The resulting situation is one which requires careful watching. There are no signs whatever that Austrians are turning to Communism—rather the reverse. But they are certainly relieved that the Russian knout is being wielded less vigorously and that the Soviet Union has placed itself on record as having no objection to their request to be allowed to join Uno. To the Austrians these gestures, such as they are, have been welcome. But they will not have much more than a face-saving value unless and until the Soviet Union decides to sign the State Treaty and go home.

Politics and Pigment

[BY A CORRESPONDENT IN WEST AFRICA]

SOME years ago it was reported that a team of American scientists had discovered a method of changing the pigmentation of the human hair and skin. They might be able, it was said, to change a negro into a fair-skinned "white" man; the coal-black mammy might become a golden-haired blonde. But only the colour would be changed. There would still be the wide nose, thick lips, and the tight-curled hair, and, of course, all the other physical and non-physical attributes would remain the same. It is interesting, by the way, that the West African nationalist press regularly carries advertisements for such things as cosmetics to bleach the skin, and combs to straighten the hair.

But just as a change of pigment will not transform Africans into Anglo-Saxons, neither will the introduction of the ballot

box transform them into democrats. Democracy will have to make its accommodations in West Africa just as the historic religions have had to do. The results may be disconcerting to those who believe in the true milk of the gospel; but even absolute ideas, if there are any, do not produce uniform results wherever applied. This is not to say that the policy of introducing English parliamentary practices into West Africa is wrong. There is nothing else to be done. The West necessarily equates self-government with its own form of democracy, and is under its own spiritual compulsion to thrust the same equation on its colonies.

The difficulty is that the basic tenets of European democracy—such as liberty, equality, and fraternity—are not wholly acceptable in West Africa. Liberty from a foreign yoke is all right, but few Africans have any conception of individual freedom as conferring rights of free judgment and action, since the individual as a unit is not important in African communities; and there is a much less confident assertion of the rights of free speech now that the batteries of the African press are being turned against other Africans instead of against "the pot-bellied British imperialist." African politicians are super-sensitive to criticism, at home or abroad. Even *The Times* has been described as a cesspit of journalism, and because Mrs Elspeth Huxley, after a recent visit, made some mildly astringent comments on African affairs it was suggested that foreign journalists should not receive help from officials. Since mainly African governments came into power there has been talk of tightening the press laws, although under the British régime there has never been the slightest attempt to control a very ebullient press.

As for equality, African society is the least egalitarian in the world. The ordinary African peasant earns a pound or two in cash every year. The highest paid government post now held by an African carries a salary of £2,500 a year. Quite apart from the big business or professional men who earn far more, or the great chiefs with huge incomes, even after the payment of income tax, the ratio of the highest to the lowest is something like 2,000 to one. An African likes to be a big man or walk in the shadow of one. As for fraternity, it was an African who said the other day to the present writer—"Black men hate each other."

An Uncontrollable Infection

The demand for self-government in West Africa is not a democratic demand at all, but a nationalist one. A Nigerian peasant said to a district officer after the last elections, when representatives were chosen for the different assemblies, "Why are you handing us over to these people?" But far from invalidating the demand, the element of nationalism simply makes it irresistible. Europe's most potent legacy to Africa is not a gift but a quite uncontrollable infection. The constitutional advances of Nigeria and the Gold Coast in the last few years do not represent a successful imperial effort at guidance so much as capitulation to a time table extorted by nationalism. But, again, what does nationalism mean in West Africa? It has to attach itself to a unity of some sort, geographical, political, or tribal, and all these unities are either completely artificial in West Africa, or too localised, or they cut badly across each other. So opinion oscillates violently between such different things as "Mother Nigeria" (a Frankenstein creation if ever there was one) and "Pan Africa." A young man who is now a minister in the Nigerian Central Council of Ministers in Nigeria was asked, before his appointment, what he would do if he had complete power. "I would lead an army of liberation to South Africa," he replied. But when a distinguished Gold Coaster was thought to be in the running for a big job in Nigeria, there was gossip that a prominent Nigerian nationalist had spoken of assassination.

African politics are also peculiarly characterised by the need for a bogey. Nobody shoulders blame, and misfortunes are far more easily recognised than faults. When things go

wrong, there must be an external reason for it; crops are lost because the rain god is offended; examinations are failed because examiners are unfair; poverty exists because the British have created it. "Probably," wrote a Lagos paper in January, 1952, "history will record that one of the greatest disasters which the human race has suffered was British white imperialism." Nobody sees that if ever the British people believed in militant imperialism they have ceased to do so now. So what happens when your biggest bogey abdicates? There is a story that when Zik was asked what he would do if the British were to leave Africa on October 1st in any year he answered, "Take the boat for England on September 30th."

But hardly anyone thinks beyond the end of British control. To the question "What next?" Africans reply, "Self-government in five years," although this is an evasion, not an answer. And there is an even more startling unawareness of what is happening outside Africa, to the rest of the world. Most of them have no understanding whatever of Europe's economic difficulties, and therefore no sympathy; they never give the world strategic situation a thought, and simply don't notice their own good fortune in spending only a fraction of a per cent of their total expenditure on defence. Indeed their ideas of defence do not rise above the level of "we must have our own atom bomb" or "if Japan could build battle-ships out of scrap why can't we?" Their absorption in the nationalist struggle precludes interest in wider horizons. It even precludes African recognition of what is really wrong with Africa—not imperialism, but poverty.

Asia's Rice Shortage

[FROM A CORRESPONDENT]

THE UN Food and Agriculture Organisation recently announced plans for an international conference to deal with the increasing shortage of rice in South East Asia, caused by falling production and a rising population. It is not, however, always realised that the shortage is permanently exaggerated by political considerations and by the system of government trading widely practised throughout the area. The trouble springs from the fact that when the International Emergency Food Council controlled rice supplies in South East Asia after the war, it was engaged on what was primarily an emergency problem of making sure that such supplies of rice as were available should be distributed to the best advantage all round. Somewhat naturally, the problem was assessed against the background of prewar conditions and prewar rates of consumption. There was also a great deal of malnutrition to be overcome. Under the system of allocations it was perhaps natural that areas which had suffered from an acute shortage during the war should tend to overstate their real minimum needs and that the supplying countries should be cautious in promising future supplies. A real shortage did exist but the effect of these factors was to overestimate it.

Today, this assumption that there is a wide gap between real needs and available supplies still persists. There appears to be a strong official disinclination to recognise that in reality the emergency has ceased, in the sense that the danger of starvation or of serious and widespread malnutrition is past. The emergency has become political in that those engaged in the management of rice supplies consider that, unless the rice trade remains under government control, there will be a danger of certain areas becoming so short of their staple food that chaos leading to Communism is likely to ensue.

For some time the practical business man with a wide experience of rice and the rice trade has tended to recede into the background and his place has been taken by the civil servant who cannot be expected to appreciate the finer points of an extremely complex trade. The result is that when government officials try to negotiate with the supplying

countries they are at a distinct disadvantage. They are trying to buy rice and carry out a policy at the same time. Against oriental bargaining this cannot be done; the cards are too heavily stacked against them, as the past two years have shown. In order to carry out their instructions they have had to give way on price. Thus, although the supply position has been alleviated during this period, rice prices rose much higher and are still soaring.

The Food and Agriculture Organisation is a permanent institution, devoted to proving that there is not enough food in the world to go round, and that with the growth of populations this state of affairs will get worse; it also tries to demonstrate what measures can be taken to remedy this situation, and does in fact give much useful practical advice and assistance. It is natural that FAO propaganda should urge greater and more intense cultivation, but it is unfortunate that it should be such a powerful agent to strengthen the sellers' market for rice.

One of the complexities of the rice industry is that a higher price does not necessarily bring forth greater supplies. The needs of an Asian farmer are small and, in the conditions in which he must live, they are not capable of any very great expansion. He works simply to produce enough to cover the somewhat primitive needs of himself and his family. Consequently, if the price he receives is high he may decide that his wants can be fulfilled with less effort. Furthermore, if the export price of rice becomes unduly

high, the internal price in the supplying countries must mount with it so that, unless strong counter-measures are taken, inflation is bound to ensue.

In Siam, where there is a government monopoly of the trade, the export price of rice bears little relation to the cost of production or to the sums paid by the government to the millers. The government receives a very large revenue from rice profits, the economic pressure of demand is prevented from having its effect, and the farmer and the miller are insulated against world conditions and probably against the promptings of the FAO. The rice merchant, whether European or Asian, knows well that price means little unless quality is unmistakably defined and unless machinery exists to enforce correct deliveries. In Siam, owing to the general rise in the cost of living, the rice miller and through him the farmer, finds that the government price paid to him is too low. Consequently he finds he must produce a poorer quality unless the foreign purchaser is willing to pay the difference. We have indeed reached the curious state of affairs where governments, having negotiated for their purchases, find it necessary to pay an additional "bonus" to the millers of the selling country in order to get the qualities that have been promised. This is a direct outcome of government trading.

It would seem that governmental interference in the rice trade of South East Asia has the effect of buttressing a state

High-purity sulphur

Shell Chemicals

The chemicals-from-petroleum industry is now helping in yet another way to meet this country's urgent need of raw materials. A shortage of sulphur means a severe drag on production. Rubber, rayon, steel, paper, dye-stuffs, many essential chemicals—even more homely things like starch and gelatine—all utilise sulphur at some stage of their making. In this country most sulphur is used for producing sulphuric acid, a vital need in literally hundreds of

processes, not least in the manufacture of the super-phosphate fertilisers so important in present-day farming. Though Britain's sulphur is mainly imported, plants have been established to produce it here—plants very different from the traditional kilns. The first of these new plants to come into operation is at Shell's Stanlow refinery where rock sulphur, 99.9% pure, is now being produced from petroleum.

A GREAT NEW TYRE BUILT TO CUT RUNNING COSTS THE *de Luxe*

All-Weather Tyre by
GOODYEAR

New all the way through!
New Carcass! New Tread!
New Shoulders! New Side-
walls! Tougher—Stronger—
Steadier—Safer—The
New de Luxe by Goodyear
is the greatest car-tyre value
obtainable at the Standard
Price Level.

It will save you money. The
tread is thicker, tougher, wider,
flatter, for longer mileage. The
strong, resilient cord carcass
combines reliable sidewall con-
struction with comfortable
riding. The smart, fugged
shoulders protect the sidewalls.
The famous diamond-tread
design, still further improved,

ensures greatest grip on all
surfaces and safer cornering.
By all standards the new de
Luxe is the right tyre for the
times, at the right price, and
obtainable now at your regular
supplier.

When next you buy a tyre—insist on Goodyear

You can trust

of artificial disequilibrium and in creating an exaggerated sellers' market, and that the measures taken in the interests of the consumers may be defeating their own ends. If the position of the rice trade is to be reviewed afresh, as it plainly should be, it is necessary, first of all, to ask whether there is in fact a rice shortage, and if so, how serious it is. There is certainly very much less rice available now than there was before the war. It is also true that people are consuming less rice than they did. FAO statistics are largely based on these two facts. But to leave the matter there is to ignore two very important facts: one is that the demand for rice at £4 10s. a ton, is something quite different from the demand at £50 a ton. The other, and complementary, factor is that in the years since the war, the people of South East Asia have, in one way and another, adapted themselves to reduced supplies.

A better approach to the question posed above is to ask a further question, which is, to what extent does a material degree of malnutrition exist and in which areas is it found, bearing in mind that seasonal shortages have always happened in certain areas in South East Asia and probably always will. It is probably true that at present prices, supply and demand are roughly equated. This is a further argument against government trading, for it has done nothing to prevent the price of rice from rising quite sharply, and may in fact have helped the rise by perpetuating the sellers' market. If the rice trade were freed, it is possible that the complex influences of self interest would have the effect of reducing, and perhaps ultimately bringing to an end, the monopolistic selling power of certain countries. As things are the "terms of trade" are likely to swing more and more against the buyers.

Poland Prepares for Elections

It was announced last week that the Polish electors will go to the polls on October 26th to choose a new parliament, the first ordinary Diet since the war. The Legislative Diet which has been in office for the last five-and-a-half years finally ended its extended term two weeks ago. Before departing, however, it voted a new electoral law, an impressive document of fourteen chapters and eighty-seven articles, which apparently provides every possible guarantee that the elections will be "universal, equal, direct and secret." There will be one deputy for every 60,000 inhabitants—over 400 in all, and they will be chosen on the majority principle. In theory the voters will have the right not only to choose but to revoke their representatives.

This preoccupation with legal niceties may seem somewhat paradoxical, since the regime of "People's Democracy" is now openly referred to as a special form of dictatorship of the proletariat. Neither is there any longer a need—as there was during the last elections of 1947—to court the favour of the western powers by a pretence of "bourgeois democracy." As a deputy pointed out during the debate on the new law, the position has changed radically since the last elections. Then it was "a bitter and sharp struggle . . . against the active reactionary forces which were still of considerable strength." Now, although in theory candidates can still be chosen by all political parties—and not by the Communist Party alone, as in Russia—and social organisations, in fact there are no opposition parties. Mr Mikolajczyk's Peasant Party was smashed. Its truncated and obedient remnant—the United Peasant Party—as well as the Democratic Party for the urban middle class and the Christian Social Party, are mere puppets tolerated by the regime. The Socialist Party has been amalgamated with the Workers' (Communist) Party into a United Workers' Party.

Rubber-stamp Parliament

Even within the latter, since Gomulka's disgrace, an iron discipline has been imposed and no deviations from the official line are tolerated. Probably through fear of "heresy" or discontent no Party Congress—in theory the highest organ of the Party—has been convened since 1948. The Central Committee itself loses in importance, power becomes more and more concentrated within the Politbureau. Hence, it will probably be the latter, or even just one section of it, which will have the final say in the choice of candidates. As to the electors, they are given the right to vote but not choose.

It should not be forgotten that monkeying with parliamentary democracy is no novelty in eastern Europe. With the exception of Czechoslovakia, parliamentary tradition never took roots in these countries. In fact the last prewar Polish electoral law, that of 1935, used to be called the "needle's eye law," since it was apparently as difficult for an anti-government candidate to enter parliament as to pass through a needle's eye. Now, despite the "guarantees" of the law, an opponent of the regime will really have to be a magician to penetrate into the new Diet. Byron's words may well be addressed to Stalin:

How nobly gave he back the Poles their Diet
Then told pugnacious Poland to keep quiet. . . .

It is no longer the task of Parliament to indulge in "political nonsense." It may vent minor grievances, scrutinise the economic situation and rubber-stamp the Government's economic plans. The emphasis is now undoubtedly on the economic field, since it is through material benefits and not through political liberties that the regime hopes to gain the support of the masses.

Yet the Government will follow carefully the response of the electorate, which, if it cannot choose, can still probably show its mood. In fact, there is a special provision in the new law that no candidate can become a deputy if less than half of those entitled to vote went to the polls in his district. In the coming weeks there is likely to be a strong campaign to drag as many voters as possible to the polls. If not the outside world, at least the Polish rulers will be able to use the elections as a partial test of the popularity of the regime. From this they may well gather how far it is safe to venture with the speeding up of the tempo of economic development and social change.

Two Years of Technical Aid

[FROM OUR UNITED NATIONS CORRESPONDENT]

THE recent meetings of the technical aid bodies which are subordinate to the Economic and Social Council have shed light on both the problems and the rivalries which seem inherent in this work. There are too many programmes, too many groups handling them and not enough co-ordination between them. Aims are ill-defined, authority overlaps, goals conflict, empire building is by no means absent, and competition for manpower is almost as heated as competition for dollars and frequently harder to find. At the same time nations ask for aid and then diddle with the necessary formalities until the expert adviser they need is called to another job. And the need for a common method of briefing experts before they start is felt both in the field and in the high command.

The worst of the confusion is said to have been cleared up at the closed sessions of the Technical Assistance Board, and the need for more clarity in the top command may be met now that Mr David Owen, hitherto Assistant Secretary-General in charge of Economic Affairs, has taken office as executive chairman of the Board. It is to be hoped that he will be able to sort out the different functions of the various technical aid bodies. There is the Technical Assistance

Administration (TAA) which is Uno's own operating agency on the secretariat level. It gets its sanctions and its funds from the Technical Assistance Committee (TAC), which is a subordinate organism of EcoSoc and exercises supervision at the government level. Lastly there is the Technical Assistance Board (TAB) whose job is to co-ordinate on the operating level; it is made up of representatives from Uno itself and from its specialised agencies.

But at least one technical assistance official in Uno maintains that co-ordination as between agencies and programmes is neither the present need nor the difficult problem it looks from outside. He argues that underdeveloped countries are so vast and their requirements so numerous that all the outside men and money now at work in them can only scratch small sectors of the surface. This impression was apparently reinforced at recent closed sessions of the Technical Assistance Board. Nevertheless, the layman will continue to worry until the emphasis put on the new machinery of co-ordination, both at headquarters and in the field, catches up with the stories he has been hearing about misdirected experts and misguided programmes.

Shift in Emphasis

TAB's report covering the work of its two financial periods (the first from July, 1950, to December 31, 1951, and the second running to March, 1952) should have a quieting effect on complaints of piecemeal treatment. It shows in great detail where member agencies are working and what they are doing there. It also shows why officials claim that requests for, and grants of, aid are moving from the general to the particular. If in the beginning certain backward countries sought a general survey which would show possibilities of development that their own citizens had overlooked, some of those same countries now seek aid for specific projects based on survey proposals. Bolivia and Indonesia, for instance, both show this shift in emphasis. Both of them asked for help in planning social and economic development for their people, both received detailed and expert surveys. Both are now at work on certain aspects of recommended plans.

It will be remembered that the 1950 Uno mission to Bolivia took the lid off this small Andean country and proceeded to survey it from the subsoil to its capitol. Their report, considered a model of its kind, neither pulled punches nor promised miracles. Among its many recommendations perhaps the most novel was that after the national government was organised, the civil service should be strengthened by the addition of experts in administration, drawn from other countries, who would be able to take revolutions in their stride and provide continuity even if presidents fell. Two presidents have fallen since, but though the government which signed the technical assistance pact with Uno is long vanished, the work of national reconstruction goes on. Of the ten administrative assistants recommended, eight are at work and two more remain to be found. Bolivia pays their salaries, with the aid of a \$200,000 grant from Uno. In addition, short term experts will work on projects which range from the drawing up of improved tax legislation to the development of hydro-electric power and the installation of sugar mills. The implications of the Bolivian programme are far greater than the money spent on it would seem to indicate. Whether weak and unstable governments can be given stiffer backbones by technicians from the outside remains to be seen; but at least the experiment is being tried.

Advisers for Indonesia

The Indonesians, too, feel the need to train government civil servants with the aid of administrative experts imported from other countries. They have also asked for help in other fields, from the development of small industries to

the organisation of a mass campaign against yaws. The various agencies represented in TAB have recruited experienced advisers for them; and on the government side, a planning bureau has been set up to co-ordinate Indonesia's requests and the work of the experts sent in.

Three principles govern in all this. The first is that however obvious the need to an outside eye, aid is not thrust on countries; they must make their own requests. The second is that as far as possible governments are given what they ask for. But this principle is sometimes strained when five of them ask simultaneously for the same world-famous expert. The third is that requests and grants should now go to a central routing office, and thence to the agency most obviously concerned, and should be co-ordinated with other work in the field.

In practice this produces, for example, the present education programme in Siam, which asked Unesco for experts to help plan, organise and operate the first stage of a ten-year education plan. A New Zealander made the first survey, school was set up in an old Buddhist monastery, and an international team, made up of a Dane, a Briton and an American, followed. Specialists on food health and labour added their skills. Uno is providing some of the money, so is the United States, and Siam meets local costs.

Then there is Yugoslavia, which asked for short-term industrial missions and intensive training in certain industrial skills and is getting an American mining team, two experts on cement—one Swiss and the other French—a Belgian zinc processing expert, a Norwegian experienced in the casting industry, and Dutch engineers skilled in heating and sanitation. Most of these went for a few weeks or a few months, but an expert on rural electrification is to stay a year.

Cross-Fertilisation of Cultures

Along with the new co-ordination among agencies and programmes goes an extraordinary cross-fertilisation of cultures and ideas. This is helped by training centres—Cairo and Karachi have centres for civil aviation, Brazil and Turkey for public administration, the Philippines are to have a Far Eastern centre on mechanical logging, and Malaya one on lumber grading. But these programmes are not just largesse distributed by the industrially advanced countries to others not so far along the road. Some of the most interesting and valuable exchanges are those between the less fortunate countries. Java helps Haiti improve its food supplies by introducing a fish culture long familiar in the east, but hardly known in the west. India gets an Italian to help drain marshes, and a Greek to help control malaria. It also plays host to experts from Pakistan, Burma, Ceylon, Indonesia, Indo-China, Siam, Malaya, the Philippines and Japan who come under the sponsorship of FAO to study ways of increasing rice yields.

The money spent is remarkably small. The whole complex of TAB projects cost only \$20 million in 1950-51. In the early summer of 1952 some \$19 million had been subscribed, and it was hoped that this could be increased to \$25 million. The problem now is to persuade the donor countries that the work is abundantly worth doing and must go on, with more money rather than less. The United States has shown signs of cutting grants, and recipient countries are complaining that the local costs assigned to them are at times more than they can bear. The whole movement is entering a period when it must prove itself or go down. Yet it cannot afford loud advertising of its successes or loud complaints about its difficulties. The dragon of local pride keeps watch, not to mention the suspicious Russians, who thus far have contributed neither cash nor experts. From their point of view this must look like one of the smartest moves the non-Soviet world has made, and one to be discouraged in every possible fashion.

The large-scale introduction of strong, light hygienic aluminium to the food industries has been the main pre-occupation of the WARWICK PRODUCTION COMPANY since 1945. Fifty thousand liquorice boards for the confectionery industry is a typical effort.

ENTERPRISE IN ALUMINIUM

Warwick Production Co. Ltd. of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP; a sister company to SMD Engineers of Slough, who built the Aluminium Structure of the Dome of Discovery, and the world's First All-Aluminium Aircraft Hangars at London Airport.

Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

A sulphur famine is not the least of the many threats that confront British industry.

Much of the energy and experience of Simon-Carves is being devoted to building plants to produce sulphuric acid from pyrites. Most of them embody a pyrites "flash roasting" system which (besides many other advantages) on large plants enables enough power to be generated from waste heat recovery to run the pyrites-burning and acid-producing units, thus avoiding any demands on Britain's already overtaxed resources of coal and electricity.

These facts are published to show what British workers can achieve in spite of difficulties, given opportunities and backed by enterprise

It can be done

In July 1950 a team of men started work at Fawley in Hampshire. Their job was to construct the administration building for the Esso Petroleum Company's new refinery, the largest in Europe. This building—550 feet long, containing 64,000 square feet of office floor space, a fully equipped medical section and stores—was to be completed in twelve months.

After a flying start, six weeks' delay in the first delivery of structural steel put back commencement of the main work until autumn. Then the Esso Company asked for the completion date to be advanced. It was the wettest winter for years. The men worked on. At night they worked by floodlight. The steel framework took shape

and was clad with over a million bricks. Roof, woodwork, fittings, decoration, a terrazzo staircase four floors high... The building was finished and occupied before the end of June 1951. The two hundred men who did the job overcame the difficulties; they played their part in a great industrial effort: and more—they showed us what can be done.

THE BUSINESS WORLD

Steel in Suspense

AT this date, the only real significance of the first annual report of the Iron and Steel Corporation of Great Britain lies in its account—relating to a period that ended eleven months ago—of the nationalised steel companies that its successor will try to denationalise by selling them back to private owners. This report covers only the corporation's period of growing pains between the vesting date, February 15th last year, and September 30th; by the end of October its days were numbered. The present Government then announced its intention of "providing for the reorganisation of the iron and steel industry under free enterprise with an adequate measure of public supervision"; and its recently published proposals for doing so include the abolition of the corporation, whose assets will pass to a holding and realisation agency directed to "secure the return of these companies to private ownership." The corporation, during its bare eight months of unfettered operation, never succeeded in gaining any practical control over the industry it owned, for it faced the adroit rearguard action conducted by the British Iron and Steel Federation; and on November 13th last it was formally directed by the Minister of Supply to "hold the position." It is not surprising, therefore, that this report should be subdued, cautious, and circumspect, and that it should leave much unsaid. The voluminous accounts now published of this mammoth holding company and of its subsidiaries individually may facilitate elaborate speculation about how to sell steel back, but their immediate usefulness is that they set out the broad facts—as they were last autumn.

Admittedly, the report does measure certain dimensions of the industry that have not before been expressed in terms of value. The corporation owns almost the whole of the heavy end of the iron and steel industry, plus a majority or a substantial minority holding in most of the finishing sections of the industry that were not nationalised, and certain engineering and other outside interests. Its 298 companies, which employ some 292,000 people, had in the seven-and-a-half months under review a turnover (including inter-company transactions) of £372.2 million, and made a profit before tax of £34.5 million, after setting aside £5 million in the accounts of the holding company (out of taxed profits) against replacement costs, in addition to the depreciation provided by the companies. Taxation required £19.6 million and the interest on British Iron and Steel stock £5.3 million gross; after payment of other expenses, there was a balance of £7.8 million (of which £7.1 million was retained by the subsidiary companies). Of this turnover—which implies an annual rate of some £500 million a year—some £58 million, or nearly 16 per cent, comprised sales to other companies in the publicly owned group. About 77 per cent of the total sales by companies came from sales of steel products, another 10 per cent from the sale of iron ore, iron and by-products, and nearly 13 per cent from the sale of engineering and other "outside" products.

The companies' profits, it will be seen, were at an annual rate of some £64 million. The report provides no comparable estimates for earlier years, but it will be remembered that Mr Steven Hardie, in the controversy over steel prices that led to his resignation from the chairmanship, put these at rates of £42 million in 1949 and £53 million in 1950. During the same debates Mr Sandys suggested that the £64 million annual rate of profit for 1951 would include £8 million as a "windfall profit" from revaluation of stocks when prices rose in August, £10 million from profits on undefined "extraneous activities," and about £12 million from the premium earned on exporting steel at higher than home prices. The £8 million from revaluation of stocks would presumably be included in full in the earnings of the period covered by this report; but Mr Sandys' other estimates, being annual rates, would suggest that these earnings might also include profits of some £6 million from "extraneous activities" and £7.5 million from export premiums during the period under review. It is obviously unsatisfactory that the corporation's figures of total profits should be exploratory only with the aid of fragments from a controversy between the Minister and its late chairman; but the report's scope here may have been necessarily circumscribed. The report adds, "It is not expected that the same level of profitability can be maintained when more normal trading conditions return." Perhaps; but another rise in prices this year will again have boosted the value of stocks, even though this rise was officially designed to yield the steel industry about £19 million a year less than its costs had risen. Output in the year to this September, too, will have been lower; but 1951-52 can hardly be considered "more normal" than the part of 1951 considered in this report, and the corporation's profits in the second year now almost completed may not have altered greatly.

Here and there in the document can be discerned hints—or vestiges—of the policies that the corporation, in its first period of Labour Government support and of Mr Hardie's command, was beginning to formulate. Last year's much-discussed changes in directorships are explained mainly upon the ground that under the 1949 Act the companies had to avoid any discrimination or preference between customers, so that some directorships representing old ties became "no longer appropriate or desirable." Mr Hardie's ambitions of regrouping are scaled down to an unexceptionable expression of belief that certain companies in the group—as, for example, those digging home ores—might more effectively be associated with others. It records one view that other nationalised industries might well consider—that the best way to deal with some of the companies or shareholdings it acquired in activities outside iron and steel, in Britain and abroad, might be "to make other arrangements for their continuation." In its policy towards depreciation, also, it can afford to be more realistic than any other nationalised industry; its special central reserve of £5

million "to make good at current replacement costs the depletion of fixed assets" was in addition to £8.4 million provided by the companies for normal depreciation based on historical costs. The corporation discloses that the *modus vivendi* it eventually reached with the British Iron and Steel Federation entitled it to receive a six-monthly statement of income and expenditure for the "Industry Fund"—the system of levies and subsidies controlled by the federation to adjust the manufacturing costs of steel-works using the industry's various raw materials. It comments:—

While this price equalisation policy protects the consumer of foreign ores from the full blast of the rises in world prices, the distribution of the burden of the loss and the anomalies created are such as to need review,

and mentions in passing that the sale under the same system of imported scrap costing £20 a ton at the controlled home price of some £6 a ton causes another heavy loss that the federation covers out of levies.

Perhaps the only positive measure that the corporation was able to carry through in its first eight months (apart, perhaps, from some tightening of internal accounting procedure) came as a financial consequence of common ownership—the central deployment of the liquid resources of the industry. As a holding company, the corporation arranged to borrow the surplus resources of companies with cash lying on deposit and to lend this to companies needing extra money for development, in the form of unsecured loans, repayable on demand. It paid and charged the same rate of interest—3 per cent in the period under review—on the £19 million thus redistributed, whereas the companies had formerly paid at least 3½ per cent on bank overdrafts and had received only about ½ per cent on deposits. The new practice, it is estimated, saved the publicly owned industry as a whole some £200,000 in interest charges.

This sensible but small measure, however, can hardly alleviate the magnitude of the problem of financing further development that will continue to face the corporation or its successors to ownership of the steel industry. Of the original postwar development plan, estimated in 1945 to cost some £168 million, the corporation records that certain of the more ambitious projects—totalling about £70 million at 1945 prices—were not started by the time that it took over ownership. But further development proposals that will overtake, or where appropriate include, schemes left over or partially completed from that plan, and will raise the industry's capacity to some 20-21 million ingot tons of steel a year, are now being examined; together with urgently needed replacements, they will cost the industry some £60 million a year for several years. During the calendar year 1951 the publicly owned companies spent about £57 million, and required an increase in working capital of £7 million, of which total they provided about £34 million from retained profits and depreciation and £30 million from special receipts (e.g., colliery compensation), tax reserves, and a reduction in their cash balances. At the end of September last the corporation's companies had liquid resources amounting to £45 million. With further funds arising, it expected to be able to meet the industry's requirements for capital investment throughout 1952; but early in 1953 new money will have to be raised in one way or another. The industry, it estimates, could not be expected in future to cover off of retained profits more than half the £60 million a year that it is planned to spend. Whoever acquires the steel industry

or its larger expanding companies in 1953, it thus becomes abundantly clear, must be prepared to raise in addition to the purchase price some £30 million a year of new money for several years to come.

In broad outline, then, the wares that the holding and realisation agency has to market have not been given a very inspiring puff by the corporation's report. The steel industry, however, is not going to be sold back to private investors in broad outline; it is going to be sold back in individual units. And although the individual units that went into the crucible of steel nationalisation have not been as awkwardly fused as those that went into the crucible of transport nationalisation, they will not emerge unaffected by it. They have already changed very significantly in capital structure, size and relative attractiveness as investments.

The first of the accompanying tables shows how significant the changes in capital structure have been. The nominal value of the securities taken over by the corporation amounted to £74 million in ordinary capital, £34 million in preference capital, and £17 million in debentures. The compensation paid to individual stockholders was equal in most cases to the market value of these securities in October, 1948, and amounted to £172 million for the ordinary, £48 million for the preference and £17 million for the debentures. These amounts were, of course, taken into the corporation's accounts at compensation values, yet by September 30, 1951, these figures had changed to £187 million of ordinary capital, £34 million of preference and £8 million of debentures—as a result solely of switches from one class of capital to another and of the elimination of certain cross-holdings within the corporation's books. The biggest individual changes have been the conversion of the whole of the preference capital of Dorman Long, Richard Thomas and Baldwins, and Thomas Firth and John Brown into ordinary shares, and a large-scale redemption of debentures by these companies and by Stewarts and Lloyds, Guest Keen and Baldwins, South Durham, and Park Gate. Since September 30th—but presumably before Mr Sandys's standstill order—Stewarts and Lloyds and South Durham have followed suit in converting their preference shares into equities. The loan to The Steel Company of Wales of £28.2 million from the Finance Corporation for Industry and its £15 million debenture (as well as the £5 million debenture on John Summers) held privately have not, however, been redeemed by the corporation. These capital changes were logical so long as the corporation was the industry's sole stockholder; to say that part of the profits paid over to the corporation should be regarded as debenture interest, part as equity dividends, and so on, involved a meaningless splitting of hairs. To some extent, too, they were due to a very natural desire of some companies to get rid of the heavy burden of some of their prior charges. There seems little doubt that others of the companies would have accepted this change willingly had it not been halted by the standstill order last November.

It is by no means clear, however, that these changes, although they tend to simplify the capital structures, will make it easier to sell the industry back to private hands. Since October, 1948, the date on which compensation values were based, industrial debentures have fallen in value by some 25 per cent and preference shares by about 30 per cent (as measured by the Actuaries' Investment Index). But in this period the price of industrial ordinary shares has fallen by some 15 per cent, and although

* Estimate of a full year's profits before tax prepared by the corporation on the basis of profits actually earned by a company between the end of its financial year and end-September, 1951. † End-September, 1951. ‡ In calculating net current assets no account has been taken of investments in and amount due from or to the corporation or its subsidiaries. § Including development expenditure (1950: £3,902,000; 1951: £7,970,000). (a) Including development expenditure of £3,832,000. (b) Including development expenditure (1950: £41,350,000; 1951: £57,029,000). (c) The corporation's report states that "the amount does not include commitments with other companies in the group."

certain steel equities may have some attractions as a long-term investment, the immediate prospect for equity dividends will not be bright so long as the need to plough back earnings for replacement and development persists. Apart from that, the industry will have to beware of underestimating the extent to which the supply of risk capital has dried up in these days of a stranglehold by taxation.

As was explained in these columns three weeks ago, some sections of the steel industry have been arguing that the easiest part of the realisation agency's task would be to sell back to former owners the securities, now valued at about £60 million, that represent holdings in their former major operating subsidiaries, and to sell back to the public between £50 and £60 million of equity capital in other leading producers; on these assumptions, between £80 and £95 million in equity capital, and between £15 and £20 million in preference capital and about £8 million in debenture stocks would be left in the hands of the agency.

The second of the accompanying tables summarises the recent experience of the seventeen largest companies, whose combined ordinary capital (as valued in the corporation's books) amounted to £145 million on September 30th last. It will be seen that in a year in which the total profits of the steel industry rose by about 17 per cent, four of these companies showed a fall in profits before tax, and five showed a fall in the ratio of before-tax profits to net worth (defined as the ordinary and preference capital at nominal value, plus ploughed back profits, but excluding reserves for future taxation). These figures should be compared with the capital commitments, either authorised or outstanding, of each company, shown in the last column of the table; they certainly do not suggest that the realisation agency's task of selling back the shares will be lightened by any very hopeful prospect of dividend increases to come. The picture is not universally gloomy, either of these larger companies or their smaller *confrères*. In some cases market values in October, 1948, on which compensation values were based, were right out of line with real values; as an extreme case, the Upper Forest and Worcester Steel and Tin Plates Works, Ltd., which had been recommended for closure, earned 32 per cent more last year than the whole of the compensation money paid to its unfortunate former owners. For the industry as a whole, moreover, book values at the vesting date of the tangible assets less liabilities of all companies exceeded the compensation paid in Iron and Steel stock by £14.6 million; this sum, computed after setting aside £6 million more than the companies had done for the equalisation of taxation to spread the benefit of initial allowances, has been placed to a "Consolidation Reserve" in the holding company's accounts. Even so, it would be idle to suppose that many of the companies can be sold back now without involving the Treasury in a book loss.

On the problem of marketing the steel properties, these accounts therefore offer much information for further digestion; but their considerable limitations in this context must also be borne in mind. The absence of any directors' statements, or even of detailed notes upon the individual accounts, means that a prospective investor cannot guess, for example, how far exceptional gains through stock appreciation affected the results of individual companies. The standardised accounting procedure favoured by the corporation has by no means been uniformly followed; some of the major companies

remain steadfastly uninformative. There is some question whether the companies remaining in the hands of the realisation agency may not be able to raise finance for development on more advantageous terms than their competitors; and there are some doubts about what will happen under the new regime to the £19 million of loans repayable on demand to the corporation (the Steel Company of Wales, with £7,800,000, and Hadfields, with £2,174,000, are the main debtors). Nor do the figures published for outstanding capital commitments indicate the cost of the various new development schemes, totalling £60 million a year, that individual companies are now contemplating.

The most important obscurity, as ever, concerns the Federation's subsidy-cum-levy scheme, and the way in which its effects, hidden in manufacturing costs, have distorted the results of individual companies. Last year, fairly obviously, steelworks on home orefields will have been, in effect, heavy net contributors to the revenues of their "competitors" who used imported ores or imported scrap; this effect may have been moderated by now. But such deductions as these are much too vague and general to inform judgments on the investment problem. If the realisation operation is to be a success, the Government (if it has found out) and the industry (if the Government is still in the dark) must reveal far more about the workings of this complex and hidden system. The corporation and the federation, according to this report, are now examining the system and its effects; and the corporation's second accounting period ends next month. Probably the most useful task that the Government could set this proscribed public corporation would be to carry out, and to publish in its second report early next year, the detailed examination of the Industry Fund and its ramifications that the next owners of the steel industry deserve. The capital market is not at present in such a healthy state that it will willingly buy even a fattening pig in a poke.

WORLD RECORD

Week by week the record of world events — industrial, commercial, and financial — appears in condensed form in the *Records & Statistics* supplement to *The Economist*. Each week in this supplement more facts are put more promptly on record than anywhere else in the world — and the facts can be found without difficulty by means of the cumulative index that appears in the first issue of alternate months.

Records & Statistics is obtainable by postal subscription only, at £2.10.0 a year; a combined subscription to it and *The Economist* costs £5.0.0 a year.

A specimen copy of *Records & Statistics* may be obtained from:

Business Notes

Britain Blackballs Japan

Japan's first attempt to become a signatory of the General Agreement on Tariffs and Trade has failed. It had hoped to get in by the quick method of entry evolved last autumn during the sixth session of the contracting parties in Geneva. Under this quick method its application for membership was made the subject of a postal ballot of the existing contracting parties, but only three refusals were needed to reject it. Britain and two other members decided to return negative votes — ostensibly on the grounds that this special procedure is not suitable for the candidature of an important trading country, and that the adhesion of Japan to the General Agreement on Tariffs and Trade ought therefore to be discussed fully at the next meeting of the contracting parties in October. It no doubt will be so discussed, and it will then be seen whether the British official objection in fact derives from deeper roots than this nice consideration for the formalities of entry. The accession of Japan to GATT would not automatically involve any compulsion on Britain to grant Japan most favoured nation treatment; it could specifically contract out of any such obligation and refuse to enter into tariff negotiations with Japan under GATT's aegis. But the real rub is that not many of the other members of the overseas sterling area might be willing to do the same.

It seems unlikely, in any event, that the British Government's initiative in blocking Japan's accession to GATT will have more than a delaying effect. The Japanese application for adhesion must now pass through the mill of normal procedure. This has two stages. In the first place Japan will seek permission to start tariff negotiations with individual countries under GATT's aegis. This permission can be secured by a simple majority vote of the existing contracting parties. Once these tariff negotiations are completed, Japan can apply for full membership, and for this an affirmative vote by two-thirds of the contracting parties will be needed. It seems probable that this affirmative vote will eventually be forthcoming. In these circumstances it must be questioned whether Great Britain has been wise to give offence not only to Japan but to the United States, which has been the main sponsor of Japan's earliest possible adhesion to GATT. Negotiations for a settlement of Japan's pre-war internal debts are now taking place in New York. Britain's part in trying to blackball Japan's membership of GATT is hardly calculated to help them on their way.

Sterling and Commodity Arbitrage

The merchanting community of London has this week been taking its bearings after the excitements that followed the reopening of commodity arbitrage between the dollar and the EPU areas, and the subsequent sudden suspension of these facilities after they had been in operation for less than a week. An appreciable part of the applications made to the Bank of England apparently related to highly tentative transactions, which had their basis in the hopes rather than in the expectations of the applicants. Altogether applications for as much as £150 million of business may have streamed into the Bank of England, but only between £50 million and £60 million of these seem to have been authorised; total authorisations were thus restricted to Britain's extra-quota deficit with EPU — that is to the amount that could be recovered wholly in gold if the British cumulative deficit with EPU were reduced to the full extent of the dealings. The Bank will now watch the position to see how much hard business is in fact done on the licences granted. In the light of that experience, and of the EPU position a month hence, it will then be decided whether or not to renew last week's

short-lived experiment. The licences granted will in any case become void unless they are used within a month, so that by mid-September the Bank should have a clear view of the road ahead.

Although many of the authorisations referred to operations that had little hope of being converted into hard business, it seems that some contracts were in fact entered into by merchants who expected to get licences but were caught by the unexpectedly early standstill order. In these circumstances, with some licences outstanding from which no business is likely to emerge, and some contracts negotiated for which no licences were issued, it was inevitable that a market in authorisations should develop. Tentative deals of this kind have, in fact, already been arranged, although they infringe the policy and wishes of the Bank of England, which had no intention to grant the right of transferability to its authorisations. Following the suspension of these arbitrage facilities, there has been a reaction in the rate for transferable sterling, from the peak figure of \$2.67 reached last week to \$2.62. In addition, the business that has actually been transacted under the authorisations granted has helped to weaken the spot sterling-dollar rate from over \$2.79 last week to \$2.78½. The logical counterpart of this movement has been a strengthening of sterling against guilders, Belgian francs and other European currencies; it is in these currencies that payments are now being made for the grain, oil seeds and other goods shipped from the United States to Europe on United Kingdom account.

* * *

Insurance and the Exmoor Floods

On a rigid interpretation of the conditions of insurance policies the flood damage in Lynmouth and elsewhere in the Exmoor district is unlikely to involve insurers in substantial liability. It is, however, almost certain that, in tune with the widespread sympathy for the victims of this extraordinary disaster, the members of the Fire Offices' Committee (the "tariff offices"), who will no doubt be followed by the remaining insurance companies and by Lloyd's underwriters, will meet the claims under policies that cover storm and tempest damage even though they do not cover damage due to "flood subsidence or landslip." So as to avoid creating a possibly awkward precedent, all such claims will no doubt be expressly paid *ex gratia*. No assessment of the extent of the damage to private property can yet be made; at a very rough guess, it may be of the order of £1 million. Insurers will, at worst, be faced with an aggregate loss of considerably less than the total cost of the damage done. Some property will have been uninsured, some substantially under-insured; of the remainder, some will have been insured by policies under which insurers, however generous their attitude, cannot be expected to make any payment in the circumstances. Payments that may total several hundreds of thousands of pounds would, however, make the Exmoor floods a major item to insurers accustomed to annual "fire" wastage in the United Kingdom (storm and flood claims fall into the fire account) of the order of £20 million a year. Moreover, relatively little of this accustomed wastage normally occurs in private houses and hotels.

Comprehensive "fire" insurance policies of the contents of private dwelling-houses do cover loss or damage by flood; this cover is extended (up to 15 per cent of the sum insured) to property of the insured temporarily removed elsewhere in the United Kingdom, Ireland or the Channel Islands, except when it is in transit or being worn. Similar policies insuring buildings, however, do not cover the risk of loss or damage by flood; it is under these policies that insurers are

expected to make *ex gratia* payments without admitting liability. But, where the insured sought cover only against fire (including explosion, lightning or thunderbolt), whether for a private house or for another type of building, no question of liability, or of *ex gratia* payment, arises for flood damage.

Cover for Cars

For fear of appearing to create a precedent, insurers will probably be cautious about making any clear-cut public announcement of their attitude to claims arising out of the Exmoor floods under policies upon which they are not liable. Flooding of a less violent nature than in this disaster is of course commonplace near many rivers at home. Abroad it reaches very serious proportions on occasions; in Kansas City last summer and in Winnipeg in the spring of 1950, for instance, extensive flooding caused very serious damage over a considerable area. Flood damage is a catastrophe against which normal prudence is of little avail; it is therefore excluded from the insured perils in policies on buildings. Another reason why insurers exclude cover against flood damage is that when claims arise they often do so in considerable numbers and for a large total sum. Separate insurances may, however, be effected against flood damage, for then the insurers have the opportunity to charge a rate of premium commensurate with the extent of each individual risk, and they can decline to insure any particular property.

A considerable number of motor cars are reported to have been swept into the sea or otherwise damaged at Lynmouth and to have been washed into the road at Dulverton. Comprehensive motor insurance policies cover loss of, or damage to, the insured vehicle by any means, so that claims up to the insured value will be met under such policies. Holiday-makers' baggage is often separately insured; if it is claims for flood damage will be met. Under the extension charge in comprehensive private house "contents" policies, baggage would be covered (up to the specified maximum sum) except when in transit.

More Freedom for Food

The Government is at long last making good its election promise to return to private trade those foods of which supplies are more or less sufficient to meet demand. This week the Ministry of Food announced the abolition of price control on coffee and the restoration of private import of coffee beans. The Ministry has certain long-term contracts with suppliers (notably East Africa) that do not expire until 1954, so that at first merchants will be allowed to import only the balance. But in two years' time they will be responsible for all imports. Retail prices are not expected to show much change; if anything, they may fall, particularly if the tea market shows no marked signs of recovery. The important thing from the consumer's point of view in this reversion to private import is that the blends available in the shops will improve just as they did for tea; and if public behaviour is consistent, demand will be concentrated more on the better blends. This happened with tea to such an extent that cheap teas are now selling, unsubsidised, at their former subsidised price. It is only a matter of months before tea will be accorded its full freedom—freedom from rationing and from price control.

The other step towards freedom is in sugar. As from the end of September, sugar refiners will be permitted to buy their own raw sugar to cover exports of refined sugar to certain destinations, such as members of the European Payments Union, the dollar area and certain other countries, e.g. Spain, Israel and Abyssinia. This new freedom is at the moment very limited and probably covers no more than a tenth of Britain's annual imports of sugar. But it is a step in the right direction, for it gives refiners an opportunity to exercise their marketing sense. In future they stand to gain or

lose from their judgment of price trends, and this will give them practice for the time when they will be permitted to buy for the home trade as well. There is every sign of a burdensome surplus of sugar, particularly in Cuba, but lack of dollars prevents Britain from building up its depleted stocks at low prices. As far as the British consumer is concerned, sugar might be just as scarce as in 1947. The Commonwealth contract will prevent the lower Cuban prices from being reflected in British retail prices; but Commonwealth producers have still not expanded output sufficiently to enable rationing to be abolished in this country.

Austin Clears the Decks

The Austin Motor Company's decision to reduce its labour force by 4 per cent during coming weeks—dismissing 800 out of its present total of 20,000 workers—is a sign of the times in more ways than one. The decision is not really due to any drop in sales. It is a deliberate attempt to streamline the company's organisation into better shape to meet foreign competition. The fact that Austin is likely to cease production of its A.90 sports car and the big Princess saloon has little bearing on the dismissals; neither car was produced in any quantity, and it is in any case certain that total Austin production will begin to rise again towards the end of the year.

During the first six months of 1952, production in the industry as a whole has been severely limited by shortage of steel. The total number of cars produced, 228,000, is 16,500 fewer than in the first half of 1951. Export shipments have not fallen as much as this. They are down only from 214,787 to 209,467 over the first seven months, which is a measure of the industry's success in finding alternative markets for cars originally destined for Australia. The allocations of steel to the industry are expected to be increased by roughly 10 per cent in the fourth quarter of this year, and since there is now considerable discrimination in the way the allocations are shared out, those companies with the best exporting record—Vauxhall, Ford and Austin in that order—are likely to get a rather higher proportion of the extra steel than companies whose products are meeting stronger sales resistance.

In these circumstances it may seem surprising that a company as efficient as Austin proposes to dismiss so many workers as this when in a month or so it expects to increase production and also to introduce a new model, the postwar Austin 7. For some time companies in the engineering industries have been holding on to men whether or not there was sufficient work to justify their retention, for fear that they would not be available when needed later. The Austin management has announced that some of the 800 people dismissed may be taken on again when the Austin 7 comes into production, which shows that this company, at any rate, no longer fears it may lose them permanently to other industries in the Birmingham area. "Concealed unemployment" of this kind has contributed to keeping up the price of British engineering products. In the motor industry, where a large proportion of car prices is set by the cost of components bought from outside, a reduction in the labour costs of assembly is one of the few ways in which a motor manufacturer can cut his own production costs. The list prices of the company's bread-and-butter cars are £340 for the Austin 7, £457 for the A.40 and £627 for the A.70. These prices, especially that of the Austin 7, do not compare too well with prices of Continental cars of about the same power, nor with the reduced prices recently introduced by Ford; a cut in Austin prices therefore seems more than likely.

Other British manufacturers may be expected to cut prices by withdrawing existing models and introducing new ones, as the Standard Motor Company is now doing. Standard has reduced both output and employment on its car assembly lines, but has been able to avoid dismissals on the Austin scale by transferring men to the tractor lines and to the

new Avon aero-engine line, which is now almost complete. But in other car factories, piecemeal dismissals ranging from the 800 workers sacked by Humber early in the year to the 80 dismissed by Rover this week are likely to become more common as production methods are overhauled and also, unfortunately, as sales resistance leads to lower production.

Imports into New Zealand

Some major misunderstandings have arisen in London about the exact nature of the cuts in imports into New Zealand for 1953 that were announced earlier this month. This confusion has arisen partly from the fact that the full official communique was not available in London and partly from a misinterpretation of the expression "scheduled countries," which apparently has a totally different meaning in New Zealand from that current in the United Kingdom. The "scheduled territories" here means the sterling area. In New Zealand "scheduled countries" means exactly the opposite, namely, the dollar area, Japan, the Russian bloc and a few other hard currency countries. Now that this important difference has been explained and fuller information about the proposals is available in London, it is possible to get a clearer perspective of what is proposed. The basic allocation of exchange for each importer in 1953 will be 40 per cent of the amount of exchange sold in 1950 to that importer for non-governmental imports other than motor vehicles and goods paid for under third-party certificates. For the present year, the basic allocation was fixed at 80 per cent, but in practice the control has been operated with considerable elasticity. At the 80 per cent figure for 1952, non-governmental imports into New Zealand would have amounted to about £110 million; actually, they may exceed £170 million.

Provision has been made for exercising a similar flexibility, in principle, in the 1953 allocations. Additional allocations may be made by the Reserve Bank to meet essential requirements. Importers who had firm orders as at April 1, 1952, for which exchange has not been allocated for remittance in 1952, will be able to submit applications to the Reserve Bank for the amount required in 1953. The Reserve Bank has undertaken to provide funds in full to pay for motor vehicles imported under licence and for licensed imports from the "scheduled"—i.e. hard currency—countries. All motor vehicles are imported under licence, and licences have also to be obtained for all goods imported from the hard currency area. The only import licences that carry no assurance of an allotment of exchange—the objectionable provision whose scope was exaggerated by the first, confused interpretations in London—relate to a few goods where protection to local industries is involved. It is estimated, however, that about four-fifths of the goods imported on private account into New Zealand from sterling area and other soft currency countries are free from licence. Hence, if they are to be sure that exchange will be forthcoming in payment for these goods, sellers in Britain and the other countries concerned will need to satisfy themselves that the buyers in New Zealand are operating within their basic 40 per cent allocation. Uncertainty on this point may in fact place serious difficulties in the way of normal trade with New Zealand, an uncertainty that will not be entirely mitigated by the knowledge that the regulations will be applied with good sense and elasticity. Furthermore, the elasticity with which the allocation scheme is being operated this year is largely responsible for the fact that the 1953 basic exchange allocation will be only half that for 1952.

Lancashire's Troubles Never Cease

The chairman of the Bleachers' Association, Mr P. L. Wright, put into words last week a fear that has been at the back of many minds in the textile industry when he suggested that the mills might not be able to deliver sufficient

cloth to meet the present revival in demand. The recent difficulties of the textile industry have arisen from an excessive accumulation of stocks at each stage of distribution; but recently the liquidation of those stocks has been taking place with increasing momentum, which has in turn led to "signs that more interest is being taken and confidence may be slowly returning." This would justify an increase in production from its present low levels, but the textile industries have dismissed so many workers during the slump that recovery may now be hampered for lack of labour.

Mr Wright was concerned solely with the supplies of grey cloth coming from the mills for finishing. Imports of grey cloth have been suspended, presumably for the duration of the slump, and the very considerable finishing capacity is at present wholly dependent on home supplies. The labour force of the spinning sections of the industry fell from 190,000 last winter to 101,600 at the end of July, and in the weaving sections from 135,000 to 132,680 by the end of June. With its previous labour force of 325,000, the cotton industry was producing an average of 47 million yards of cotton cloth a week. In recent years, production has varied directly with the number of workers in the mill. With a reduced labour force of 234,000 engaged directly on spinning and weaving (omitting the intermediate operations), the industry may not be in a position to produce much more than 34 million yards a week. More than 100,000 people are still registered as unemployed textile workers; in the Lancashire area as a whole, for example, there were 117,000 people out of work in mid-July. Whether alternative jobs are sufficiently easy to find to enable these workers to stay out of textiles is none too certain. But the industry may have lost for ever part of the labour force it built up so painfully in the postwar years.

If demand should increase faster than the industry can get back its workers, there are two ways in which it could face this situation. The first is to re-commence imports of grey cloth; during the past years about a fifth of the cloth finished in this country came from overseas. The second is to increase output per head in the mills. Methods by which this can be done are well known, and it is possible that with a reduced labour force Lancashire might become more generally receptive to ideas of re-deployment. Some such development is essential if Lancashire prices are to be brought into line with falling world prices. Mr Wright stressed that prices and delivery dates were key factors in regaining and increasing the British hold on the export markets of the colonies, out of which the industry was pricing itself last year. If cloth and clothing manufacturers persist with their present methods of production, then it may be true, as their spokesmen said so vehemently over the weekend, that hardening raw material costs and the end of stock liquidations will lead them to make some increases in their current selling prices. But the markets of the world are in no mood to pay higher prices, and to argue that there is nothing that Lancashire or other textile areas can do about them would be defeatist.

Another Scottish Bank Merger

The second amalgamation among Scottish banks within three years was announced last Tuesday. Unlike the earlier arrangement, which joined two Scottish affiliates of the Midland Bank—the Clydesdale and North of Scotland banks—the new proposal concerns two of the independent banks and will reduce the number of Scottish banks to six, three in each category. The banks now involved are the Bank of Scotland, established by special Act as long ago as 1695, and the Union Bank of Scotland, which was incorporated in 1830. The arrangements provisionally concluded by the unanimous agreement of the two boards aim eventually at complete fusion through the medium of the Bank of Scotland, "to preserve the seniority, the constitution and the name of that institution." But since it would obviously be

undesirable for the Union Bank to lose its identity too quickly, that bank will for a time continue to operate as a separate entity. The first step, therefore, will simply be the acquisition of its issued capital by the Bank of Scotland, which will shortly offer fully-paid stock at the rate of £7 for every four Union Bank shares, whether "A" shares of £5 (£1 paid) or "B" shares of £1 (fully paid), and will in addition pay 2s. 6d. in cash for each "B" share it acquires. The merger is conditional upon an assent by holders of at least 90 per cent of the Union Bank shares of each class, and, of course, also upon approval by Bank of Scotland stockholders of the creation of the requisite additional capital. At present, the Bank of Scotland's issued capital, all fully-paid, stands at £2,400,000, while the Union's paid-up capital comprises £1 million in "A" shares and £200,000 in "B."

A significant feature of this merger, by contrast with the earlier one, is that the businesses of the two banks are competitive rather than complementary, and that both embrace extensive networks of branches throughout Scotland. The potentialities for the concentration of branch business should therefore be a good deal wider than those presented by the Clydesdale-North merger, though the pace at which this process could be tackled, when the initial phase of separate working is over, will naturally be limited in any case by staff considerations. It is significant that the reason given for the cautious approach at first is not the need to safeguard established connections, but the desirability of full consideration of "such important questions as the alignment of terms of employment and pension benefits of staff." If such issues are handled judiciously, the eventual scope for administrative economies may be considerable, and might give the combined institution a welcome means of combating the pressure of rising costs that has certainly been not less worrying to the Scottish banks generally than to the English clearing banks. Indeed, the smaller the institutions, and the more thinly their business is spread through the branch networks, the more severe this pressure tends to be; its impact upon them, moreover, is accentuated by the growth of the more specialised banking services that require highly-trained staff in central departments—such as foreign exchange and trustee business.

Biggest Scottish Bank?

It is noteworthy, therefore, that the banks that are now to merge are the two smallest of the independent institutions. Since the disappearance of the North Bank, the Union Bank has been the smallest of all seven Scottish banks, having £71 million of deposits (though a proportionately larger branch system) at April 2nd last. The Bank of Scotland, at end-February, had £92 million—roughly three-quarters of the amount held by its nearest independent competitor in point of size. Even so, the combined deposits of the new institution should exceed those of the Clydesdale and North Bank, at present the largest Scottish bank, with deposits of £153 million at end-1951. It is not to be supposed, however, that this merger derives from considerations of relative size, as distinct from the advantages of larger-scale working in general. Moreover, despite these advantages, which may be reaped in the longer run, the question is bound to be asked whether the timing of the operation is not in some way related to the pressure recently thrown upon all banks by the severe fall that has occurred in gilt-edged values. However cautious investment policies may have been, the Scottish banks are particularly susceptible to this pressure, because they have habitually carried a much larger part of their assets in the form of investments than the English banks do. The ratio of investments to deposits in Scottish banks was, until recently, appreciably over 50 per cent, whereas the English proportion, before last year's funding operations, was generally only about half that figure, the difference being only partly explicable by the special importance of note issues in Scottish banking. The Scottish ratio has lately been falling, but it is not clear how far this has been due to writing-down or to actual sales. It is noteworthy that the Union Bank's

latest balance sheet, the only one made up by a Scottish bank since the second rise in Bank rate, revealed a sharp contraction of investments, from £41 million to £31 million, reducing the ratio to 43 per cent. At the same time, the bank's advances again rose steeply and, at £27.7 million, actually exceeded those shown by the Bank of Scotland two months earlier. Its published profit dropped slightly from £245,000 to £237,000; but this movement was not noticeably out of line with that shown by banks that had accounted before the change in Bank rate. The Bank of Scotland's profit dropped from £304,000 to £290,000.

One rather regrettable incidental feature of this merger is that whispers of it could be detected in the stock markets for more than a week before the announcement, and although some of the resultant rumours named Scottish banks that were in no way concerned, the information available to some operators was obviously sufficiently near the mark to cause a sharp rise in the shares of the Union Bank. Between end-July and August 11th the "A" shares were unchanged at 73s., but on August 12th they rose by 1s., and then by a further 6s., to 80s., by Friday of last week. During this latter period, the Bank of Scotland stock, which had previously been unchanged at 47s., rose to 48s. The significance of the market's anticipatory response is shown by the fact that since the announcement the Bank of Scotland stock has remained unchanged, while Union "A" shares have settled down at only 2s. 6d. above last Friday's price and the "B" shares at 4s. above it. At these levels the securities are close to the equilibrium basis implied in the terms of the offer. Before the disturbance of prices the Union Bank "A" shares, with their traditional 18 per cent dividend, were showing a yield of fractionally under 5 per cent, while the Bank of Scotland stock, with its 12 per cent, was showing just over 5 per cent.

Zinc Controls Go

At long last the authorities have recognised that the shortage of zinc is over. This week the Ministry of Supply and the Board of Trade brought to an end all controls on the use of the metal. Licences will still be needed to buy virgin zinc, and by this means the Ministry will be able to control the size of commercial stocks. The consumption of zinc may gradually rise over the next few months as a result of the lifting of these restrictions; but no sudden increase is expected, for in recent weeks manufacturers have not been buying the whole of their allocations.

Controls on the consumption of zinc have been in force since December, 1950, and have been of two types. There was a list of "prohibited end-uses" in which zinc could not be used; and in addition supplies to the "first line" consumers putting zinc into other products were rationed. The Copper and Zinc (Prohibition Uses) Order, which banned the use of both metals and their alloys in a miscellaneous collection of household goods, building fittings and agricultural tools, has now been amended to exclude goods for which copper is not required (copper remains under control). When the control was first imposed, fear of a shortage of domestic necessities such as buckets, dustbins and coal scuttles led to a run on the shops. Nevertheless, wholesalers' and manufacturers' stocks have generally been sufficient to tide the retail trade over the last eighteen months, while manufacturers have been allowed several extensions of the time they were given to complete semi-finished articles in the banned categories. For many prohibited articles, for instance, gutters and roof flashings, substitute materials were easily found. The allocation of zinc was taken over by the Ministry of Materials when that Ministry came into being. Brassfounders, galvanisers and die casters were allowed to use the metal freely for any purpose not specifically prohibited, with one exception: the use of zinc in galvanising iron and steel sheet and wire products was under the additional administrative control of the Ministry of Supply.

Zinc consumption has been falling sharply since the

To some *this is just a Vase!*

But anyone familiar with ceramics would know that it is a piece of world-famed Delhi blue pottery.

Through years of specialized study, the ceramics expert has attained a high degree of skill and discernment in his particular sphere and this is also true of the National Bank of India and its unrivalled knowledge of eastern trading. As a result of many years of continuous experience the National Bank of India can now provide much information vital to the success of modern trading ventures. Your enquiries will be welcome at the Head Office or at any of the Bank's branches.

NATIONAL BANK OF INDIA LIMITED

Branches in: INDIA, PAKISTAN, CEYLON, BURMA, KENYA, TANGANYIKA, ZANZIBAR, UGANDA, ADEN and SOMALILAND PROTECTORATE. Bankers to the Government in ADEN, KENYA COLONY, ZANZIBAR and UGANDA.

Head Office: 26, BISHOPSGATE, LONDON, E.C.2.

THE *National* CLASS 31

'DIRECT ENTRY' ACCOUNTING MACHINE

for all branches of
COMMERCE, INDUSTRY, GOVERNMENT & FINANCE

10 Totals each with direct subtraction.

ALL balances—positive AND negative—computed and printed automatically.

Feather touch, "standard" adding keyboard for speed and accuracy.

All-electric typewriter for unlimited narrative description.

Constantly visible printing line gives confidence, aids speed.

Instantaneous and infinite adaptability to any accounting work.

Fluid-drive carriage moves automatically by oil pressure in both directions.

Simultaneous addition or subtraction in ANY combination of registers.

Automatic carriage opening and closing with instantaneous form alignment.

Fully automatic spacing, column selection and carriage return.

A. PRODUCT OF THE NATIONAL CASH REGISTER COMPANY LTD.
206-216 Marylebone Road, London, N.W.1 and all principal centres.

Established by the Joint-Stock Banks in 1945 to provide finance by means of loans or the subscription of loan or share capital or otherwise for industrial and commercial enterprises in Great Britain particularly in cases where the existing facilities provided by banking institutions and the Stock Exchanges are not readily or easily available.

Over 630 Offices in Australia. Assets £288 Million

beginning of the second quarter of this year. In June it amounted to only 19,600 tons compared with a monthly average of 26,600 tons in 1951. But some growth in demand can be expected from the galvanising industry, which uses about a third of all the virgin zinc consumed in this country. Diecasters may also take slightly more metal in a few months' time, as the motor industry, which uses a large number of zinc alloy diecastings, is to receive more steel later this year. On the other hand, the use of zinc for brass will be limited by the quantity of copper available. Any recovery in demand for zinc is likely to be welcomed by the Ministry, as Government stocks (excluding the stockpile) have increased at an embarrassing rate this year. By the end of June these amounted to nearly 75,000 tons, compared with some 26,000 tons at the end of 1951. Commercial stocks, however, have fallen from 17,500 tons at the end of March to 14,000 tons at the end of June. So far this year the manufacturers, fearing further falls in zinc prices, have been glad to leave the burden of carrying stocks to the Ministry.

More Wheat?

When negotiations for the renewal of the International Wheat Agreement are resumed next January, the contracting powers are likely to find that wheat is much more plentiful than it has been this year. In the United States, although the spring wheat crop has been damaged by the recent drought, an exceptionally large winter crop is expected; this may bring total output for the year to some 1,250 million bushels compared with less than 1,000 million bushels last year. In Canada, provided the weather remains good in the next few weeks, the crop will probably be a record one—latest official estimates put it at about 656 million bushels, or 100 million bushels more than last year. Harvests in Western Europe are also likely to be above average, although the dry spell in the middle of the summer will cause yields to be a little lighter than was previously expected. Nevertheless the French crop may well reach 40 million quarters compared with 32½ million quarters last year. The Italian wheat harvest is also likely to be bigger than in 1951, and the Spanish crop will probably not be far short of last year's postwar record. In the southern hemisphere the harvest is still some four months away, but it is known that a much larger acreage has been planted in Argentina this year. Exceptionally, the Australian crop is not expected to be larger than the meagre level reached last year.

As a result of this expanding production, North America is expected to have a surplus of some 1,400 million bushels this year; while Argentina, which last year was forced to import wheat from the United States because of the failure of its own harvest, will probably again have a surplus available for export. But the demand for these potential exports seems likely to fall. Less wheat will need to be sent to the Far East to supplement local food crops, and ample harvests in other importing areas should reduce net requirements. But all this does not mean that wheat prices will necessarily fall. The farm price scheme in the United States has in the past acted as an important prop to prices, and in Canada both domestic and export prices are tied to the International Wheat Agreement maximum of 180 cents a bushel; free market prices are still a little above this level. But it does not look as if the Canadian farmers, who are demanding that a large increase in the IWA price should be allowed after the January conference, will be batting on a very favourable wicket.

New Money for Farmers

The rise in interest rates has not apparently proved much of a deterrent to new borrowing by farmers, and on Thursday of this week the Agricultural Mortgage Corpora-

tion again came to the market, to borrow £5 million. Its issue took the form of a 4½ per cent trustee debenture stock, 1977-82, at 96½ per cent and ranking *pari passu* with the £22.1 million of debentures already issued by the corporation. A cumulative sinking fund of 1 per cent a year on the nominal amount of the issue, together with a further sum equal to one year's net interest on all stock previously purchased out of the sinking fund, will be started in 1954. At its issue price the new stock yields £4 13s. to the latest date of redemption, so that its terms were somewhat finely drawn in relation to the corporation's outstanding 4½ per cent debenture stock, 1961-91, which was quoted at 96½ on Wednesday evening. But the maturity dates of the new issue were carefully chosen to appeal to institutional investors and, moreover, the stock will be free of stamp until fully paid next January; in these circumstances it was well received and soon oversubscribed.

This new money has inevitably had to be raised on much stiffer terms than when the corporation was last in the market in September, 1951; then it was able to raise £3,250,000 by the issue of a 3½ per cent debenture stock, 1961-63, at par. Mr E. J. Bunbury, the chairman of the corporation, has emphasised more than once that the rate at which the corporation can issue its debenture stocks governs the rate at which it makes its own loans to farmers. These lending rates have, in fact, been steadily increased in the last eighteen months. In May, 1951, the corporation raised its lending rate from 4 to 4½ per cent and then, sharply off the mark after the increase in Bank rate, it was stepped up to 4½ per cent at the end of last November. In February of this year, before the second increase in Bank rate, the rate was raised further, to 5½ per cent, and a fortnight ago it was levered up yet again to 6 per cent. Up to the end of July the corporation had made about £37 million of loans on mortgage, of which nearly £22.3 million remained outstanding.

* * *

FCI's Quiet Year

In the year to March 31st the Finance Corporation for Industry's holding of investments fell from just over £54.5 million to just over £52.8 million. The latest figure still includes nearly £40 million of advances to now nationalised steel companies that the Iron and Steel Corporation has not chosen to repay and the FCI has not chosen to recall. Although there is no evidence that the FCI has found any really important outlets to offset the perhaps temporary loss of iron and steel, it has not been entirely idle during the year. The apparent fall in its investments is more than accounted for by about £3 million of loan repayments during the year (including about £1 million each by F. Perkins, Ltd., the diesel-engine manufacturers and by Ultramar, and £400,000 on one of the steel loans), while commitments for further loans at the date of the balance sheet amounted to £17,125,000 compared with £13,945,000 a year earlier. The names of those it has helped to finance are not disclosed by the corporation, although the clients themselves sometimes do so—as Socony-Vacuum has done recently—but it is known that several of its important early foster children, including the much discussed Petrochemicals, have now passed the first bout of their teething troubles and reached the production stage.

Some problems, however, have clearly persisted. The FCI has written off its investments to the extent of £489,540 in the past year; this compares (it is now revealed) with £418,959 in the previous year. Once again, therefore, it has no net profit to report. In part this is due to the fact that it prefers to make advances at a low rate of interest while its clients are still in the development stage; after their construction period and when they become able to finance themselves by the normal mechanism of the capital market the FCI obtains its reward by exercising its conversion option, on the equity of the ventures. The all-round

rise in interest rates during the past year has not dealt very kindly with this method of operation. The corporation's agreements with clients make it possible for the rates charged to be raised somewhat, if this becomes necessary in view of a rise in the rate at which the corporation can itself borrow. But as the agreements stipulate a maximum rate that may be charged, the FCI is not protected from all loss on this score. Although the effects upon the FCI's finances of the rise in interest rates have not been noticeable hitherto, they may be appreciable in the current year.

Britannia Airborne

The successful first flight of the Bristol Britannia airliner last week-end was an occasion for widespread relief—for BOAC, which had taken the considerable commercial risk of ordering 26 of the airliners off the drawing board; for the Bristol Aeroplane Company, which was still smarting over the fate of the Brabazon project; and for the industry as a whole, which is putting the Britannia into its shop window in answer to the slow-flying, low-cost piston-engined giants to which the American aircraft industry is still pinning its commercial future. The Britannia is capable of carrying 50 first-class or 104 tourist-class passengers non-stop across the Atlantic with a high but not an absolute degree of regularity. With a still-air range of 4,000 miles (in practice the range is reduced considerably by allowing a big safety margin for delays over the airport or diversion to alternative airports) and a speed of about 360 miles an hour, the cost of operating the Britannia has been calculated at about 8½d. a ton-mile, although these costs rise rapidly when the aircraft exceeds its most economic stage-length, which is about 2,500 miles. Operating costs non-stop across the Atlantic will, therefore, be a little higher than the figure quoted, but should still be below those of any other long-range airliner either built or being developed.

Whether the aircraft will fulfil these estimates when it goes into service depends very largely on the degree of success that the Bristol company has had in developing the turbo-prop engines with which the aircraft is powered. It is far more difficult to build a propeller-driving gas turbine aero-engine than a straight jet; the Proteus engines in the Britannia, though the third of their series, are the first to go into production. The fuel consumption of such engines is much lower than that of the jet; on the other hand, the Comet jet airliner, with a capital cost a little lower than the £600,000 estimated for the Britannia, can do one and a-half journeys to every one by the slower airliner. On the medium ranges, which may include first-class Atlantic travel, the Comet is likely to be the more attractive proposition; the Britannia is designed for the longer ranges beyond the scope of the present generation of Comets. It is the only airliner that the British industry can offer for such routes in competition with several American designs. All the American airliners, however, have the disadvantage of being piston-engined, and the number of American visitors to the Bristol company testifies to the US operators' growing impatience with the slow progress of gas turbine development in their own industry. With a production line capable of turning out 18 Britannias a year, Bristol cannot offer delivery to foreign customers much before 1956, when it is possible that a turbo-prop version of the Super-Constellation will be on the market. It is likely, therefore, that American requirements will be met by licensing the design to Canadian contractors in order to give delivery competitive with Lockheed. There is still much work to be done before the success of the Britannia is assured, and not much time in which to do it. The company maintains, however, that all that it learnt, and unlearnt, in developing the Brabazon has gone into the Britannia, in this case working from an oversized prototype to a smaller-

scale production model. This should mean that the company will in the final proving stages of the Britannia reap the reward for the tears that it shed over the Brabazon.

* * *

Sisal Prices Falling

Sisal prices are still falling and this week BEA No. 1 fibre reached £90 a ton—the lowest level since 1949. Heavy purchases for commercial needs and stockpiling drove the prices to peak levels last year and as recently as the end of March last the price of sisal was still over £230 a ton. Some fall was, however, inevitable, because world production of hard fibres was expected to reach 610,000 tons this year and to exceed requirements by some 40-50,000 tons. But a surplus of this dimension could hardly account for a 60 per cent drop in sisal prices during the last five months. A stronger reason for the decline was that the price had clearly risen too high last year. Spinners, having bought heavily last season, were less eager to buy this year. For their part, the growers, faced with larger supplies to dispose of, pressed their sales on an already weak market. Prices fell steadily, in a series of large jumps from the end of March to the end of May, when they reached £144 a ton. The London agents of the East African growers met regularly to agree on selling prices; their efforts were probably successful in arresting the fall for a time. After a while, however, members of the committee found it difficult to observe the agreed minimum prices; the weakness of the market proved too

great for such delaying tactics and the committee gave up the attempt to steady prices. From the end of the first week in July the fall in price was renewed at an even more rapid rate than before—without the temporary support provided by the growers committee, prices have declined from day to day. In little more than four weeks they have dropped by £50 a ton.

The fall in prices has undoubtedly caused the demand for sisal to be even weaker than it otherwise would have been. In spite of the prospect of large harvests throughout the northern hemisphere, spinners have not received the normal demands for baler and binder twine: merchants and farmers, seeing that prices were falling, have tended to use up stocks rather than buy afresh. For a similar reason the demand for cordage has also fallen off this year. As a result spinners are likely to be left with a carry-over of binder twine and cordage that will probably have a depressing effect on sisal prices during the coming buying season. On the other hand, if prices continue at their present low level, demand may revive, as it will probably again become profitable to use sisal in marginal products such as matting. Within the last two weeks there have indeed been reports of increased inquiries from spinners, and this may indicate that the decline has nearly run its course.

HHEAD OF A WARRIOR, a study in red chalk for the cartoon of "The Battle of Anghiari", by Leonardo da Vinci, now in the Museum of Fine Arts, Budapest. Tragically, when the design was transferred to the wall of the Hall of Council, in Florence, the colours ran and the result was a failure. All that now remains of the cartoon itself are a number of studies of fighting men and horses, which were drawn by Leonardo on paper.

If it had not been for the paper on which Leonardo made his preliminary studies in 1504 all record of one of the greatest works of this amazing genius would have been lost to posterity. And it is paper that has enabled this superb study of a head to be seen by millions throughout the world. In the reproduction of great works of art the printer and the paper-maker have combined to bring the masterpieces of the world to those denied an opportunity of visiting the famous art galleries. The spread of culture depends on paper. On it the heritage of the past is constantly renewed, for on paper reprinting can retain knowledge and culture for ever.

The capture of Diana's Stag was the third Labour of Hercules, and the chase led him beyond Arcadia; for a whole year the animal eluded him, running all over Europe through every kind of country.

The Nickel Organisation, too, has had to follow the quest wherever it led, however inhospitable the country. The best nickel deposits exist in remote places, and the making of communications has been part of the hard task. Many miles of railway are operated, handling over two million tons of material monthly. The trains keep running in every kind of weather—and temperatures of 55 degrees below zero have been recorded at the Copper Cliff mines, in Northern Ontario. Exploration engineers, too, are constantly at work. Such is their success that proved ore bodies are now considerably greater than twenty years ago, in spite of heavy withdrawals. Yet the search for new deposits must go on, so rapidly does the demand for nickel increase.

Towards Agreement in Rubber?

The special working party of the International Rubber Study Group that has been meeting in London for the past three weeks to devise a new commodity scheme adjourned last weekend without reaching any definite result. It was not a case of agreeing to disagree, for much progress had in fact been achieved. Both the main producing and the main consuming countries, represented at the meeting, are now convinced that once stockpiling stops, the rubber market is faced with a surplus of 200-300,000 tons a year. At this stage the discussion centred in the most appropriate types of agreement that should be considered and in the end the choice lay between a multilateral contract (similar to the wheat agreement) used in conjunction with a buffer stock, and the simple buffer stock scheme first proposed immediately after the war.

Comment on either of these schemes must await publication of the detailed proposals; but one point is clear. Any scheme intended to provide some measure of price stability without restricting output must include some form of buffer stock. Even with a multilateral contract, a buffer stock of one kind or another would be required, since consumption of raw materials may fluctuate quite substantially over a period of four or five years; with foodstuffs such as wheat, on the other hand, annual consumption is fairly stable. In either type of scheme two vital points that need to be decided are the price at which rubber is put into the buffer stock, and whether control of this stock is in the hands of producers or of consumers.

No answer to either of these questions was supplied by the working party. It was concerned only with evolving a primary formula that might limit the wide fluctuations in the price of rubber, thus providing security for producers in time of surplus and for consumers in time of shortage. This naturally brought into question the problem of synthetic rubber. It is not beyond the realms of possibility to draw up a commodity scheme covering both natural and synthetic rubber, but, even if synthetic rubber should be excluded, it remains one of the determinants of the price of natural rubber. All these contentious topics were discussed by the working party; the adjournment was decided upon to give the countries concerned time for further thought. The United States, instead of playing the role of the adamant consumer, has come to believe in the need to create some mechanism to preserve stable commodity prices, and this time it was the producers who were not certain what they wanted.

Retrenchment in Shipping

For some weeks the charterers of tramp ships have had their own way, with the downward trend of freight rates assisted by the eagerness of owners of less efficient ships to snatch at the last of the market before their margin of profit disappears. But freights have now dropped so low that it is no longer possible for these inefficient ships to be assured of profitable voyages, and as they return to their home ports they are beginning to be laid up or sold for scrap. The number of new tramp ships being built today is negligible; so scrapping and laying up directly reduce the number of ships on offer and increase the chances of employment for the more efficient vessels that can still manage to make a profit out of current freight rates. Tramp companies that have provided themselves with new ships since the war have now some reason for satisfaction. The first signs of a downward movement of some of the commodities that form part of a ship's operating costs are also discernible. Even the cost of oil bunkers has declined by 5s. a ton, though the price is still much higher than it was a year ago. Less money, too, is being wasted by delays in port, because fewer ships and smaller cargoes have relieved congestion—but ironically enough this improved turnaround has still further increased the amount of tonnage on offer. Nevertheless, the

older established tramp companies take the view that the market is now in a "healthier" state. As Mr J. R. Ropner put it recently, "speculators of many nationalities have for so many months found the maritime field a happy hunting ground that the recession may not be altogether unwelcome."

Meanwhile, many ships are still operating at satisfactory rates on time charters that may not expire for as long as 12 months ahead; and although some charterers are anxious to obtain ships on time charter at the current low rates, ship-owners generally seem to be prepared to hold out a little longer in the hope of an improvement. The end of the strikes in American steel and British Colombian lumber were expected to increase the volume of business, and the prospects of a good Australian grain harvest are not too remote. The next grain season, too, will not find a surplus of tonnage waiting in Australian ports after having discharged its cargoes of British exports.

Shorter Notes

Electric and Musical Industries Limited has at last confirmed reports that the company intends to put two types of long-playing record on the market this autumn, 10 and 12 inch discs revolving at 33½ revolutions a minute compared with the standard speed of 78 rpm, and 7 inch discs revolving at 45 rpm. While the full-size long-playing records are suitable for long works, the small discs, which play for no longer than a 78 rpm record, will be used for short pieces and there is scope for building them into serious rivals of the 78 rpm record for popular music since they are both easy to store and almost unbreakable. The Decca Record Company, which has been marketing 33½ rpm records for the past 2½ years, will introduce 7-inch 45 rpm here at the same time as EMI. The first shots in what is likely to be a battle royal between the two companies will be fired at the coming Radio Show, when EMI will be showing for the first time reproducers for its new records and possibly also the records themselves. No prices have yet been announced.

Argentina is to ship 4,000 tons of frozen meat to this country, pending the conclusion of a new agreement. The meat will be invoiced at last year's protocol prices subject to adjustment later. The Ministry of Food has agreed to this shipment to relieve the large stocks that have accumulated at Argentine ports since shipments under the 1951 protocol ceased two months ago.

The London Metal Exchange will reopen for dealings in lead on October 1st. At the end of July, when the Ministry of Materials first announced its decision to reopen the market, it said that it hoped to do so on October 1st. Following discussions with the committee of the London Metal Exchange this has now become a firm date.

Company Notes

Distillers.—Once again the full report of Distillers can be described as disappointing—disappointing not because of the strength and profitability that it reveals, but because of the paucity of information that it contains. In contrast to the reports of many other industrial giants, the only indication in Distillers' report of its widespread industrial interests is a bare list of its subsidiaries, and the only hint of current trading prospects is the bald statement that "in view of present market conditions it has been decided that substantial additions should be made to the existing stock contingencies reserves of the group." In the accounts of the parent company and its subsidiaries, £1,561,274 (against £439,190) has been transferred to this reserve from net profits of £7,170,450, which compare with net profits of £6,858,925 in 1950-51. Stockholders receive an unchanged dividend of 22½ per cent, but they are given no yardstick by which they can measure the reasons for this conservatism. Are the directors, in fact, hinting in the report that falling prices and stock losses are probable this year, or only merely possible?

In any event, any such losses should be small in comparison with the weight of stocks held by the group—or so the reserve appropriations suggest. The book value of stocks has risen from £42,770,446 to £56,416,256, a sign as indicative as the advance in trading profits, from £17,947,229 to £21,265,450, that a further expansion in business was achieved last year. This growth in investment in current assets has made some call upon the group's liquid resources. Cash balances have fallen from £10,322,940 to £6,818,299 and the group has realised some of its investments, the book value of

Consolidated earnings :—	Years to Mar. 31,	1951	1952
Trading profit	17,947,229	21,265,450	
Total income	18,411,095	21,729,345

Cash	10,322,940	6,818,299
Reserves	28,705,166	33,512,688
Ordinary capital	22,589,770	22,589,770

4s. ordinary stock at 17s. 9d. ad yields 15 1s. per cent. which has fallen from £4,846,289 to £2,029,010. These factors, together with the continuing increase in fixed capital, show why the recent £10 million issue of the convertible loan stock was made. The ingenious method chosen to raise the new money presupposed both a steady growth in business and a steady expansion in profits. The full accounts suggest that both these desiderata are already in train.

Pinchin, Johnson.—Record sales in the last completed financial year and a decline in sales in the current trading period have been familiar themes at many annual general meetings in recent months. Mr G. R. T. Taylor, the chairman of Pinchin, Johnson, has now added his voice to this swelling chorus. In the year to March 31st the volume and value of sales by the Pinchin, Johnson group again created fresh records; its direct exports, for example, increased by 48 per cent in value. Since the end of the financial year, however, the volume of sales has declined. So far this decline has been of only modest proportions, but, together with rising costs, it may have a perceptible effect on this year's profits. Last year's increase in trading profits, from £1,648,599 to £1,958,819, was due almost entirely to the growth in sales; Mr Taylor explains that "demand was to some extent encouraged in the earlier months of the year by the inflationary conditions then prevail-

ing." The decision merely to maintain the ordinary dividend at 25 per cent may reflect the directors' belief that such conditions are not likely to prevail this year.

The company's dividend policy must also have taken some account of the need for new money; since the end of the financial year this has induced the company to raise £1,250,000 on a 5½ per cent unsecured loan stock (1959-64). Part of the proceeds of this loan was used to acquire a controlling interest in a Canadian company that produces industrial surface coatings; in addition a substantial interest has lately been acquired in Styrene Co-Polymers, Ltd., a British company that produces certain synthetic resins used by the Pinchin, Johnson group. Some of the remainder of the loan will presumably be used to finance further capital developments, but the balance sheet, which shows outstanding commitments at just under £470,000, suggests that these may not be on a very large scale. On the other hand, last year's expansion of sales has clearly increased the group's working capital requirements. In the year to March 31st the value of stocks rose from £3,992,314 to £5,055,055; this was accompanied by a decline in cash balances from £753,059 to £470,614 and a growth in bank loans and overdrafts from £271,263 to £550,246. At the current price of 35s. 6d. the 10s. ordinary shares yield just over 7 per cent.

Great Universal Stores.—The reports and accounts of the companies in the retail furniture division of Great Universal Stores have been published in advance of the accounts of the group as a whole. Against a background of reported retail slump and of tighter hire-purchase restrictions in many countries of the world, they are quite unexpectedly heartening. The companies concerned—Jays and Campbells (Holdings), Smart Brothers, Jackson's Stores, and their subsidiaries—are able to announce that net profits before tax advanced from £2,330,825 to £3,013,257 in the year to March 31st. The directors of both Jays and Campbells and British and Colonial Furniture report that a further improvement in trading results would have taken place had it not been for difficult trading conditions in Canada, chiefly because of hire-purchase restrictions there. Since the end of the financial year these Canadian hire-purchase restrictions have been lifted. Partly in consequence of this, the directors of all three of the trading groups are able to report that turnover and profits so far in the current year compare favourably with the results achieved a year ago.

The balance sheet drawn up on March 31st carries on this cheerful story. A further increase in hire-purchase debtors, from £25 million to nearly £27.9 million, is one indication that sales are being well maintained. So, perhaps, is the decline in the book value of stocks, from £5 million to £4.3 million, though this decline may also reflect some cuts in retail prices. Another unexpected feature is that the increase in hire purchase debtors has been accompanied by a fall in bank overdrafts and loans, from £5.4 million to £4.3 million, and by an increase in cash resources, from just over £900,000 to nearly £1.5 million. Shareholders of the GUS group should, of course, remember that in 1950-51 the profits earned by these three retail trading groups accounted for only about one-third of the profits earned by the group as a whole. If any slackening of trade has occurred it may have had its effects further down the chain of production and distribution—that is, in the wholesale and manufacturing divisions of the group. But shareholders should certainly be feeling more optimistic than they were before these accounts appeared. After these accounts were published the 5s. GUS ordinary shares were marked up 6d. to 14s. 9d., to offer a yield of nearly 6.8 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 16, 1952, total ordinary revenue was £74,024,000, against ordinary expenditure of £114,667,000 and issues to sinking funds £430,000. Thus, including sinking fund allocations of £10,392,000 the deficit accrued since April 1, 1952, was £224,998,000 compared with a surplus of £40,424,000 for the corresponding period of the previous year.

BLEACHERS' ASSOCIATION, LIMITED

IMPROVED TRADING RESULTS

EVER-RISING BURDEN OF TAXATION

MR P. L. WRIGHT ON NEED TO CONSERVE RESOURCES

The fifty-third annual general meeting of Bleachers' Association, Limited, was held in the Assembly Room, Blackfriars House, Parsonage, Manchester, on Friday, August 15, 1952.

Mr P. L. Wright (the chairman) presided. In proposing the motion for the adoption of the report and accounts, Mr Wright said: Ladies and gentlemen: The report of the directors and the accounts have been in your hands for several weeks. May I have your agreement that they shall be taken as read? (Agreed.)

Before proceeding with the business of the meeting, I have to record with deep regret the great loss which the Association has sustained during the year by the death of our chairman, Mr R. C. Reynolds, which occurred in February last. This was indeed a bitter blow, for it can be truly said that no man was ever more unflinching in his efforts to further the welfare of the Association. Not only shall we in this company sadly miss his guidance and direction, but we have good reason to know that his judgment and wise counsel, freely given in the wider sphere of the cotton trade as a whole, was greatly appreciated. His presence and exceptional ability will be greatly missed.

My colleagues on the board have appointed me as their chairman, and you have my assurance that I will do everything I can to further the interests of the Association.

CHANGES IN DIRECTORATE

It will be seen from the report and accounts, which were circulated recently, that we have appointed four new members to the board of management. These additional members, namely, Mr G. Bennett, Mr C. E. H. Charlton, Mr C. D. Greenhalgh and Sir Hereward Clare Lees, had, before their appointment in March of this year, each served the company for many years as senior branch managers. Since 1949 they have acted as executive directors and, in that capacity, have had experience in the work at our head office. They are thus well tried, and their appointment materially strengthens the board of management.

We have also appointed four of our managers, namely, Mr G. H. Crook, Mr F. Farrington, Mr G. D. Mucklow and Mr B. Stowell, to be additional members of the board of directors, and their appointment is before you for confirmation today. These appointments are in accordance with our established policy of appointing to the board full-time working directors who possess, in their respective spheres, a thorough practical knowledge of our business.

BALANCE SHEET AND RESERVES

If you will turn to the Association's balance sheet you will see that the net figure of fixed assets is lower by £50,000 than the corresponding figure a year ago. This reduction is after taking into consideration the proceeds of sales of fixed assets and the amount of a claim for fire loss which occurred during the financial year. The actual additions to these assets during the year were, in fact, some £381,000, which indicates the policy which

the board have pursued in improving the plant and buildings of the Association with a view to increasing productive efficiency.

Investments, you will see, are reduced by approximately £150,000, due to two redemptions, the proceeds of which were retained for use in the business.

Current assets have increased by about £670,000. Of this amount advances to subsidiary companies are higher than last year by £330,000. This item represents the increase in working capital required to finance business under present conditions of high prices and the need to maintain adequate stocks of materials in short supply. Debtors are up £390,000, mainly due to the inclusion of a substantial amount which is outstanding in respect of insurance claims following the fire at River Etherow Bleaching Company on October 31st last. Cash with sundry bankers is down this year by approximately £50,000.

On the liabilities side of the balance sheet it will be seen that the reserves have again been strengthened. The market value of the association's quoted investments at March 31, 1952, was £88,000 less than cost. Since that date the market value has further declined. The board have therefore appropriated £50,000 to the investments contingency fund in order that the total of that fund shall approximate to this loss in values. In addition, they have allocated £100,000 to contingencies fund and £100,000 to fixed assets replacement fund. In regard to the appropriations to these reserves, you will remember that I mentioned earlier that expenditure on fixed assets during the year amounted to £381,000. This figure is rather higher than normal and is very largely due to the additional plant which has been installed at several of our works with a view to increasing their productive efficiency and competitive ability. Stockholders will appreciate that such modernisation is essential for the maintenance of their business. The continued rise in the price of such plant and the inadequacy of allowances for depreciation in the computation of income tax assessments require substantial appropriations out of taxed profits. Under existing taxation conditions that applies to every year, but this year we have especially to strengthen the Association's resources in order to meet the contingencies inherent in the present trade recession.

TAXATION AND TRADING RESULTS

The Association's profit and loss account shows a profit of £1,046,000 before providing for taxation. This is £173,000 more than a year ago, but this additional profit has been reduced by an additional taxation charge this year over last year of £148,000, leaving an increase in net profit of only £25,000. There are three reasons for this increase in taxation: firstly, it is due to the additional charge on higher profits earned; secondly, to our feeling the full effect of the increased distribution rate of Profits Tax (for you will remember this rate was increased from 30 per cent to 50 per cent as from January 1, 1951, and only one quarter's increase was reflected in the previous year's charge); and, finally, to the Excess Profits Levy, which is payable as from January 1, 1952. The burden of taxation is thus greater than ever. This latest imposition of the Excess Profits Levy, ostensibly aimed at excess profits made as the result of rearmament, must, in actual fact, hit hardest all those firms which have shown the greatest efficiency and enterprise in increasing production. The protests made during recent years by a large body of responsible people in industry against this ever-rising burden of taxation appear to go unheeded. But it still remains a fact that to load industry with the present level of taxation encourages inflation, destroys incentive, and drains all firms of those resources which are so vital to the maintenance of their efficiency. Nothing short of our ultimate ability to compete in the export trade of the world is at stake. Because the erosion of capital is a gradual one, there is a very great danger that the realisation of its effect will come too late.

After providing for preference dividend, your directors recommend the payment of an ordinary dividend at the rate of 6 per cent for the year. I can well understand that holders of our ordinary stock may find this disappointing, in view of the increased profits for the year under review, and it was only after the most careful consideration of all the factors that the board decided that it would be imprudent, and even misleading, to declare the same dividend as was paid last year, when trade prospects are today so different. In face of current trading conditions and the uncertain future, prudence in dividend is essential and conservation of our cash resources is imperative.

There is little else in the Association's accounts which calls for any comment, though there is one item in the profit and loss account to which I wish to make reference, since it appears to lead to incorrect conclusions, despite the details which are clearly shown. I refer to the item of directors' emoluments. It is, of course, necessary under the terms of the Companies Act, 1948, to include under this heading the salaries and commissions of all those full-time working directors who are employed at our various works. Since it has always been our policy to have a large representation of branch managers on the board of the Association the charge appears high, due to the figure being computed on this statutory definition basis.

The consolidated balance sheet is not greatly different from that of the Association's balance sheet, but the picture is rather changed on the assets side by the breaking down of the shares in and the advances to subsidiary companies. On the liabilities side it is so similar in make-up to the Association's balance sheet that I do not feel it calls for any comment. The difference between the balance carried forward in the Association's profit and loss account and that in the consolidated profit and loss account is some £97,000—this representing the amounts that are carried forward in the accounts of subsidiary companies and which are needed by them to finance their current business and to meet capital expenditure.

INCREASING COSTS

In October last an agreement was reached with the trades union whereby the wages of

our workpeople were linked with the cost of living by quarterly adjustments in direct relation to the variation of the Ministry of Labour index figure. Also during the last 12 months the finishing industry has fallen into line with other sections of the textile trade and agreed to extend the holiday period to two weeks with pay. You will appreciate that the effect of these two items must entail a substantial increase in our wages bill and points to the necessity of continuing our policy of stepping up manhour output by improved methods of working, the use of incentives, mechanical aids, and so on. In what we have already done in this respect I am pleased to say that we have had the close co-operation of the trades union.

In addition to higher wage costs, we are experiencing ever dearer coal and power, more expensive materials for use in finishing and heavier carriage costs—all factors of the same inflationary trend and all inevitably tending to detract from the ability of the industry to sell abroad.

THE OUTLOOK

The accounts we have been looking at deal with a year which on the whole proved satisfactory. It was only during the last few months of the period that the effects of the recession in the textile industry were felt by the Association, so that the full impact is reaching us, as finishers, in the current financial year. The first three months to June show a considerable decline in our turnover as compared with the same period last year, and in the second quarter, including as it does the holiday weeks, the fall will be even more severe. After that there are grounds for hoping that we may look for a subdued revival.

All of us no doubt knew that the conditions enjoyed during the last six years could not last—what no one expected was that they would end so abruptly. Four months or so ago there were virtually no buyers—today there are signs that more interest is being taken in cotton goods, and confidence may thus be slowly returning. But the casualties suffered by the trade during this last year must influence the speed at which we can regain the position of a year or two ago. The tragic loss of workers in the spinning and weaving sections must seriously affect the supply of home-produced grey cloth, on which we, as commission finishers, so essentially depend. The ban on foreign grey cloth, imported for finishing prior to re-export, is not as serious, but it nevertheless represents a not unimportant restriction on our supply.

During the war years, and since, the pattern of our trade has changed. Approximately 70 per cent of the bleaching trade's much-reduced production is now absorbed in the home trade and only 30 per cent in export—in former years this position was almost exactly reversed. Expansion in our export trade is, therefore, a great need, and we warmly welcome the developments which are now in progress and from which it is hoped the Lancashire cotton industry will once again become the main supplier to our Colonial Empire, particularly the East and West African markets. If the price and delivery requirements of these markets are to be satisfied, however, co-operation between all sections of the trade will be essential.

All the signs point to a hard year before we meet again, but, in the face of them, your board is determined to retain a full share of what business is available, carefully to husband the resources of the company and to sustain, through our research and development section, a constant endeavour towards new and improved products. Particularly are we resolved to adjust our economy to these difficult times without impairing our capacity to take immediate advantage of any improvement which comes along.

TRIBUTE TO STAFF

You must allow me, before I sit down, to say a word in recognition of the service which has been given throughout the whole of our organisation. I would like to express on your behalf, as well as my own, our thanks to my colleagues on the management board, their co-directors, to all our branch managers and to the staff at head office and at our works, as well as that grand body of workers upon whom we depend, for all that they have done to contribute to the results we have placed before you. It is good to be able to say that the wonderful spirit of co-operation and loyalty which has so long existed in this Association is fully maintained today.

The report and accounts were adopted.

The retiring directors were re-elected and the fees of the joint auditors, Messrs Jones, Crewdson & Youatt and Messrs P. & J. Kevan were fixed.

A vote of thanks to Mr P. L. Wright for presiding was moved by Mr E. R. Clark and carried unanimously.

SPURLING MOTOR BODIES LIMITED

INCREASED TURNOVER

The fifteenth annual ordinary general meeting of Spurling Motor Bodies Limited was held on August 21st in London, Mr W. F. Spurling (managing director) presiding.

The following is an extract from the chairman's circulated review of the year ended February 29, 1952:

Again we are able to report a considerable increase in turnover.

Your directors have decided to recommend a final dividend of 15 per cent, making 25 per cent for the year, as compared with the 30 per cent paid last year.

I am very pleased to be able to present a report on our group of companies which I believe you will consider excellent. In every case with the exception of Marble Arch Motor Supplies Limited, each and all have improved their results. Already all departments are showing results which indicate that the Spurling Group of Companies should continue moving in the right direction. The results for the early part of the current year are certainly very encouraging. Today our sales business in connection with Vauxhall cars and Bedford trucks is centred round some of the largest operators in the country, many of whose trading names are household words. Our turnover in the service and parts departments has increased, and our production of specialised Commercial bodywork embraces new lines, both for the overseas and home markets. Our order books remain heavy.

The report was adopted.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

22 Ryder Street, St. James's, London, S.W.1

EDGAR ALLEN & CO., LTD.

MR W. H. HIGGINBOTHAM'S REVIEW

The fifty-third annual general meeting of Edgar Allen & Co., Ltd., was held on August 14th at Sheffield.

Mr W. H. Higginbotham, FSAA, FSS, the chairman, in the course of his speech, said:

The company's trading activities are especially noteworthy in that they resulted in a total turnover greater in value by some 30 per cent than that of the previous year (itself a record figure) and produced a net revenue after full provision for depreciation (but before taxation) of £758,075. These remarkable results have been achieved in face of ever-advancing labour and other costs and the reimposition by the Government of licensing and control of steel sales in general.

ALLOCATIONS FROM PROFITS

Turning to the profit and loss account, I have already given some explanation of the unusually high earnings of the year. Interest and dividends from trade investments (gross) at £30,883 compare with the balance sheet valuation of £30,483; profits (net) and dividends from subsidiaries, totalling £24,993 as against £13,640 last year, show a return of roughly 10 per cent on the amount of our interests in these companies, shown in the balance sheet at £250,636. The total revenue of £916,242 (which compares with last year's figure of £591,436) after provision of £108,585 for depreciation of fixed assets (which, incidentally, is very considerably more than the amount of wear and tear allowance for taxation purposes), and after charging the remuneration of the directors (all full-time executives), and for contributions to staff and directors' pensions schemes, is reduced to £758,075.

From this amount must be deducted provision for income tax (£304,400), profits tax (£100,200) and for the charge proportionate to this year (i.e., three months to March 29, 1952) on account of the new excess profits levy (£20,000), less certain allowances in respect of rehabilitation expenditure; the net charge for taxation under all these heads being £416,003, equal to 55 per cent on the net trading revenue. The corresponding figure last year was 57 per cent, but the effect of a full year's charge to excess profits levy in future accounts must not be overlooked.

CAPITAL PROPOSALS

I should like to make a brief reference to the proposals for appropriation of profits and for capitalisation of reserves set forth in your directors' report. It has been suggested to me—and I do not disagree with the suggestion in principle—that a distribution of profits at a rate of 5 per cent on the capital employed is not an unreasonable expectation from a manufacturing business, especially when trade is good; this would amount to a gross distribution of £140,000 roughly, as against the gross distribution of £101,189 proposed in the report. Your directors have had very much in mind their duty to maintain the security and stability of the business as a going concern and, in so doing, they have weighed very carefully the various claims, immediate and prospective, on the company's resources in the light of the best knowledge they possess.

The time has come to bring share capital more into line with capital actually employed, and the proposals for capitalisation of reserves are a considerable step in that direction. I hope that you will agree that in these, and in their recommendations as to dividends, your directors are acting in the best interests of the company and its future.

The report was adopted.

GLOBE TELEGRAPH AND TRUST

YEAR OF FURTHER PROGRESS

SIR EDWARD WILSHAW'S SPEECH

The seventy-ninth annual general meeting of the Globe Telegraph and Trust Company, Limited, was held on August 15th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the chairman), who presided, in the course of his speech said:

The income for the year amounts to £559,716, which is £84,826 greater than last year. Income tax has risen following the improved results and amounts to £183,455, an increase of £38,979, so that the net profit for the year is £34,052 higher at £204,537.

The directors have felt justified in recommending to you the payment of a final dividend of 5 per cent, making 8 per cent for the year, compared with a total dividend of 7 per cent last year. This total dividend of 8 per cent requires £163,053 and leaves £41,484 to be added to the profit brought forward, making a total sum of £151,093 to be carried forward.

I do not think I need say more about the documents issued to stockholders. I think you will agree that they demonstrate very clearly the further progress which has been made since last year.

Perhaps I may be forgiven for reminding you that the underlying principle of an investment trust is to provide an opportunity for the man in the street with only a few hard-earned pounds left to him by the tax gatherer, to invest his money so as to receive a steady return on it.

It is the duty of these trusts, of which your company is one, to pay to the shareholders such a dividend as it can reasonably expect to maintain in the future, and by the selection of its portfolio, to smooth out the vagaries, due to changing economic conditions, of the dividends paid on many industrial and similar shares.

To this end it is the considered policy of your directors to spread its investments over a wide field, covering not only this country but the Commonwealth in general. The reward which we hope to reap as a result of our foresight should secure our dividend prospects and at the same time assist in the development of those countries on which we may have to depend so much in the years before us.

The three investment trusts, Cable and Wireless (Holding), Cables Investment Trust and Globe Telegraph Company, have very much in common, both in policy and in administration, and it is gratifying to know that progressive increases in dividends have now reached 8 per cent in each of these three companies.

CONFIDENCE IN CHANCELLOR

No one, of course, can foretell what the future may have in store, but there is no doubt that the present Government has reawakened confidence in all. I do feel that great credit is due to Mr Butler, who as Chancellor of the Exchequer, has taken drastic steps with the object of arresting inflation and the drift towards insolvency. The recent improvement in the balance of trade seems to indicate that his courageous actions have not been unavailing, but we have far to go before we regain our position as a leader in the world of commerce and finance with the pound sterling once more established as a currency that is willingly accepted in any part of the world.

The report was adopted.

W. J. BUSH & COMPANY, LIMITED

RECESSION FOLLOWS BUOYANT TRADE

The fifty-fifth annual general meeting of W. J. Bush & Company, Limited, was held on August 21st in London, Dr Percy C. C. Isherwood, OBE, FRIC, chairman and managing director of the company, presiding.

The following is his statement circulated to shareholders with the report and accounts for the year ended December 31, 1951:

The accounts now submitted show that the trading profit of the group has increased from £802,931 to £855,404, but the net profit, after providing for depreciation and estimated sums for taxation, shows a fall from £398,648 to £340,722.

During the year under review the company has continued its programme of expanding its productive capacity, and the net expenditure involved is reflected in the increase in fixed assets of approximately £387,000.

SOUTH AFRICAN SUBSIDIARY

For many years the company has operated in the Union of South Africa through branches of the London company, but in the early part of 1951 the business was transferred to a wholly owned subsidiary incorporated in the Union. This has had the effect in the holding company's accounts of an increase in the investment under the headings of subsidiary companies, and reductions under the headings of current assets and liabilities. These figures are not therefore comparable with 1950 except in the consolidated balance sheet, where they are included in both years.

As the resolution authorising the increase of the ordinary share capital by £300,000 "A" shares was not passed until January, 1952, this change in capital does not appear in the balance sheet as at the end of 1951. The directors' report bears a note, however, indicating that the recommended dividend will be paid on the capital as increased.

In my statement last year I drew attention to the ever-increasing demands on the company's liquid resources by reason of taxation, the carrying of adequate stocks and the maintenance of plant. In order to increase the company's working capital an issue of £500,000 5 per cent unsecured loan stock, 1957-61, was made in February, 1952.

STOCK IN TRADE RESERVE

Throughout the year under review the buoyant trading conditions which have obtained for some years past continued to be experienced, and the company's plants were fully employed to meet demand. The position in the current year, however, is that during recent months there has been a recession in business due to a reluctance on the part of buyers throughout the world to add to existing stocks and to commit themselves to business under the more competitive conditions now obtaining. Unless there is a recovery during the remaining months of 1952 the results for this year must inevitably suffer. This slackening of trade has resulted in a drop in the value of commodities, and in these circumstances your directors have considered it prudent to place a further sum of £150,000 to stock in trade reserve, bringing it up to £300,000.

Once again I wish to take advantage of this opportunity of placing on record my appreciation of the loyalty and hard work of my colleagues and the company's staff both at home and overseas, without which the successful results which are now under review could not have been achieved.

THE ECONOMIST, August 23, 1952

The report was adopted and the proposed final dividend of 7½ per cent, less tax, on the ordinary share capital, making 10 per cent, less tax, for the year, was approved.

PURNELL AND SONS (Printers and Bookbinders)

RIISING COSTS OFFSET RECORD TURNOVER

The eighteenth ordinary general meeting of Purnell and Sons, Limited, was held on August 15th in London, Mr W. Harvey (chairman and managing director) presiding.

The chairman said: I have pleasure in submitting to you the accounts of your company which, I think you will agree, are not unsatisfactory in view of the formidable increase in the prices of raw materials which occurred during the year under review, including an increase of about 50 per cent in the price of paper.

Although the turnover of the group and the production of its factories increased during the year 1951 to the highest level yet reached and was approximately £600,000 more than in 1950, the group profit for the year, before providing for taxation, shows a decrease of £119,863, the comparative figures being: 1951 £441,938, 1950 £561,801. It has always been the policy of your directors to preserve the goodwill of the business, and in continuance of this policy it has been necessary during the current year to maintain prices as near the level of 1950 as possible, notwithstanding the heavy increase in cost of production partly due to higher wages, but mainly consequent upon the higher cost of materials.

HARSH TAXATION

In reviewing the accounts presented to you at the last annual general meeting, I referred to the harsh effect of taxation on industry. This appears to intensify each year and is illustrated by the figures under review, when taxation was equivalent to 14s. 3d. in the £, as against 12s. 11d. in 1950. It may be of interest to you that since the formation of the company, out of a profit of some six and a half million pounds, more than four and a half million pounds have been paid in taxation.

A further matter for comment is that under the Finance Act, 1951, the initial allowance given in respect of capital expenditure has been withdrawn, in spite of the factor that it is obvious the ordinary wear and tear allowances given will be quite inadequate to cover the cost of installation of new plant which will be necessary in the future. It has been the constant aim of your directors not only to maintain, but to improve the efficiency of the plant and to keep abreast of all new developments—but this is becoming increasingly difficult due to the factor that replacement costs continue to rise at a rapid rate.

THE CURRENT YEAR

During the first six months of this year there has been a recession in some branches of printing, but the position has now improved and the improvement may be maintained if the price of materials continues to descend to a more reasonable level. We now have substantial orders in hand and while the total production will not be at the same high level as last year, the prospects generally are satisfactory.

I should like once again to pay tribute to my colleagues on the board, all of whom give their full time to the service of the company, and to express my thanks to the staff and workpeople, without whose whole-hearted support the satisfactory results shown by the accounts could not be maintained.

The report was adopted.

The Economist

Founded 1843

August 30, 1952

Margate Rocks

AT Margate next week and at Morecambe a month later there is, fundamentally, the same question to be answered. It is whether the British Labour movement can be effectively led from behind. Both in the trade unions and in the political Labour party, the Left wing almost always has the initiative. The moderates are as often shame-faced. They step in, always apologetically and usually somewhat furtively, to try to save their followers from irresponsibility after the extremists have had their say.

At Morecambe the official leaders of the Labour party will not be proposing any constructive alternative to the Bevanism they oppose. They will ask the annual conference to reject the Left wing nostrums so freely expressed in the resolutions of its constituency delegates—which are discussed on page 488—but they will do so by suggesting instead the well-meaning but vague platitudes of the recent party document on "Facing the Facts." They will, that is to say, ask the conference not to settle but to postpone the real issues that the Left has raised; they will hope that then something else may turn up.

When the Trades Union Congress meets at Margate next week, leadership from behind will not take such a negative form as this. After several of its constituent unions had passed resolutions favouring cuts in the rearmament programme, the general council of the TUC in May stepped in with a firm statement on the priority that ought to be given to defence. Again, after some of the unions had pressed ahead with unusually extravagant wage claims—and had not, to say the least, been discouraged by the TUC's bitter comments on Mr Butler's Budget—the general council last week stepped in with a realistic statement of Britain's economic difficulties; without quite drawing the conclusion in so many words, it almost fully endorsed Mr Butler's contention that nothing but harm can come from a general rise in wages.

On both these points the TUC's leaders will be strongly challenged next week. For rearmament they have no direct responsibility and Mr Churchill himself has now thoroughly blurred the issues of principle; the vote at Margate will therefore have little significance in relation to anything except the personal struggle for power by Mr Bevan and his supporters. But the debate on wages policy will go to the heart of the issues facing the movement. In recent years it has often seemed that the exceptional responsibilities of the TUC arose from the existence of a Labour Government to which it claimed exceptional advisory rights. In fact, the first postwar Congress to be held with Labour in opposition proves to be one when the TUC's responsibilities are greater than ever. The issue, in essence, is unchanged. Will the Labour movement help to make the mixed economy—the economy that war and the Labour movement have created—work?

It is still an open question whether the real social advance that this country has achieved since 1939 will be the precursor of plenty or of

permanent impoverishment. If the trade unions cling to the cruder ideas of Socialism surviving from the thirties, they can make impoverishment inevitable whatever the party in office. Their choice is still uncertain, though it would be grossly unfair not to recognise that, in the TUC much more than in the rest of the Labour movement, those cruder ideas have since the war been to a considerable extent set aside. In 1945 the British trade unions came to a power such as they had never dreamed of, and promptly found it to be bitter. The rank and file remained more conscious of the new power than of the strict limits that economic circumstances set to its use. The leaders, with the help of Sir Stafford Cripps, soon realised that in a fully employed economy bargaining power could not raise the real wages of the workers as a whole. For the stronger unions, which inevitably set the pattern for the rest, the traditional aim of exacting as much money as possible from the employers became dormant. Appearances, of course, were generally kept up. But the real issue for the responsible union leader was whether he could keep his followers satisfied without insisting on rises that would make inflation worse for everyone.

*

Extravagant and unjustified though many union claims have been—and are—the trade unions as a whole certainly have not been for the past six years the dominant cause of inflation. On the contrary, they have done a little to repress its symptoms. The initiative in raising money earnings has quite as often been taken by employers who were willing, in order to attract scarce labour, to pay much more than the union rates. In this situation, the official leader found himself more and more remote from his followers; thrusting shop stewards, negotiating with the employers on the spot, seemed to become the individual worker's real friend. These serious strains have been faced not, indeed, heroically but with good sense. For all its selfishness, its short-sighted conservatism, its slowness and its circumlocution, the trade union movement has on the whole made a difficult adjustment as well as most institutions do.

But is the achievement secure? The immediate issue at Margate is whether it can at least be maintained—in changed circumstances. The changes are two. First, the

economic logic of the appeal for wage restraint no longer has the powerful reinforcement of loyalty to a Labour government. Secondly, and more important, the economic climate has become less inflationary. Such industries as textiles are in no position, for the moment at least, to raise wages and prices, whatever the pressure from the unions; elsewhere, there are certainly much stricter limits than before to the wage increases that may conceivably be granted. The bargaining power of the unions has been reduced. But—as is shown by the rises already granted—the power is still, by any normal standards, very great. And precisely because it has fallen, there is now more temptation for the unions to use to the full the power they have—which is still quite sufficient to price many British exports out of world markets and destroy the chances of national solvency. Rises such as the £2 a week demanded by the engineering workers are plainly out of the question. But that is not the only road to ruin. Will some unions strike rather than accept the much smaller awards—of perhaps five or ten shillings a week—that might be made?

It is here that the effectiveness of the TUC's leadership will be tested. Its case for wage restraint is leadership from behind in the sense that it comes too late to affect the round of extravagant claims. There the hotheads have had their way. In fact, though not in form, the general council is asking the more militant unions to climb down gracefully, to be content with rises less favourable than the conventional proportion—varying from 40 to 60 per cent—of their claims. The appeal comes dangerously late. For five months since the Budget the TUC has wavered. Once again it has in the end—and at the top—shown moderation and good sense. It will not, surely, be stampeded now. At Margate the general council will no doubt be attacked for what can be represented as helping the Tories. If its spokesmen are apologetic and hesitant under this charge, their influence in future will be weaker than ever; they as well as the country will be the poorer. They have made their choice for continuing moderation. They now have everything to gain by throwing their weight on that side of the scale as fully and openly as they can. The future of the Labour movement depends quite as closely on their success as does the survival of Britain under a Tory government.

Saar: Cockpit or Capital?

IN this century the relations between France and Germany have been haunted by furies as terrible as any in Greek and Elizabethan drama. For France the spectre's name is fear; for Germany pride and the lust of power. Each strengthens and stimulates the other, and once this dreadful dance is set in motion, reconciliation, tolerance and a lasting settlement vanish with the furies at their heels.

After each convulsion there is, however, a lull and Europe is living through one of these. Germany has been defeated and has lost—for the time—its aggressive Prussian half. Moreover, Dr Adenauer's sincerely European spirit has put a bridle upon the uncontrolled nationalism of other Germans. France is therefore not yet too frightened to consider means of conciliation. On the other hand, the lulls do not last long and there are already signs that this one may be drawing towards its close. Western Germany's economic recovery has taken place with such speed that even without the Eastern zone

it is once again a formidable power. The spirit of nationalism, though still dormant, is being exploited by the Social Democrats in opposition. Elections must be held in Germany next year and they may mark a dangerous decline in Dr Adenauer's influence. The French see all this and feel the more strongly the danger of concession and the need for reinsurance. There is a direct risk that the work of reconciliation may be halted in the very months during which it enjoys its best chance of success.

Nowhere is this fateful interplay of national sentiment more apparent than in the negotiations over the future of the Saar. This little industrial area, tucked into an angle of Europe's frontiers, has become the touchstone of success in European reconciliation and also the chief obstacle to its achievement. For France, the Saar has been and still is a solid practical means of achieving some measure of parity with German industrial strength. In 1946 it was politically detached from Germany and

attached economically by currency and customs union to France; its steel companies were sequestered by the French with the sanction of the Interallied Reparations Agency. In 1950, a convention with the Saar Government confirmed the transfer of the coal mines on a 50-year lease to France and integrated the Saar railways with the French system. The agreements reinforced the French in just that sphere of heavy industry where their comparative weakness was most apparent. The setting up of the High Authority of the Schuman Plan does not, at least for the time being, lessen the importance of the Saar to France, for the national ownership of the coal and steel is not affected by the High Authority, and France still relies upon Saar production to give it comparable production figures to those of Germany in coal and steel and to bring it into the merger on the basis of "industrial parity."

For Germany the issue of the Saar is more political than economic. The German view, in its simpler form, is that the Saar is German and that its people should enjoy the right of "self determination" to bring them back into political union with Germany if that is their desire. Hitherto the French have not permitted branches of German parties to be organised in the Saar, and so long as the German economy was in ruins and France was giving the Saar privileged economic treatment, a majority of the Saarlanders were ready—as is their custom—to go where the bread was most thickly buttered. Now Germany's economic recovery is exercising its usual appeal and if pro-German parties are organised in the Saar, fresh elections might well result in a victory for them. German nationalist opinion demands either such elections or the holding of a plebiscite so that the Saar may, as it did under Hitler after the 1935 plebiscite, "come home" to Germany.

Into this cauldron of competing national fears and interests, M. Schuman, with the fertility of ideas customary to French postwar diplomacy, has thrown the concept of the "Europeanisation" of the Saar, a proposal which may yet provide the needed catalyst. The Saar territory is, of all European provinces, probably the one most suited to such an experiment. Throughout its history, the shifting tide of dynasties and alliances has washed it from sovereignty to sovereignty—one reason perhaps for the predominance of economic advantage in the disposal of its loyalties. To become Europe's "District of Columbia" and to see Saarbrücken as the capital of Europe could well be profitable enough to ensure the Saarlanders' support. Economically, the Saar forms an integral part of the great complex of Ruhr-Luxemburg-Lorraine heavy industry, and its Europeanisation would thus be not only consistent with the working of the Schuman Plan but almost a condition of its development.

M. Schuman's suggestion may, therefore, be some-

thing much more than a symbolic gesture. Nevertheless, it is already clear that negotiations on this new basis between France and Germany have run into difficulties, and any easy optimism about their outcome would be quite out of place. The French maintain that, in offering to abandon their political control of the Saar and in giving up the claim of Strasbourg, or of some other French city, to be Europe's future capital, they have offered a magnanimous example of European co-operation. But the Germans see only that the economic life of the Saar will continue to be under French control for some time to come, that a "German" province is not to rejoin Germany—hence the suggestion that France should show "parity of sacrifice" by giving up a strip of Lorraine for inclusion in the federal territory—and that the Saarlanders' "right of self determination" may be endangered. Both sides now feel the other has failed in generosity. Both sides tacitly accuse the other of talking the language of Europeanisation while pursuing the objective of narrow nationalism.

The deadlock, however, may not be complete. Very sensibly, the discussions are being pursued in private, and it is impossible to say what stage they have reached; but it is clear that there are a number of points on which further negotiation might uncover a real measure of agreement. It must certainly be hoped that this is so. For it should be clear to everybody that since matters have reached the present pitch, some international, or at least neutral, solution for the Saar is essential if the great project of Western European unification is to proceed. Either of the nationalist alternatives would bring the structure down in ruins. If the Saar were now, whether as the result of a plebiscite or

otherwise, to return to Germany, the French would disown M. Schuman and retreat into apprehensive isolation. If, on the other hand, it is insisted that the Saar remain under the French umbrella, the German nationalists will be given a perpetual handle in their campaign against Dr Adenauer's policy of moderation, and the continuing feud would very soon put an end to the work of Franco-German reconciliation. The only way out is that the Saar should, in some form, be internationalised.

The desirable next step, then, is to work out in some detail what internationalisation would mean for the Saar. This is not a task for the French and the Germans alone. The United States and the United Kingdom are vitally interested, not merely as parties to the agreement reached in 1946 but also because they have based their foreign policies on the construction of a solid Western European community. At a point in the negotiations that may be approaching, the good offices of the Americans and the British may be urgently needed, for some friendly pressure may be required on both the principals.

The French will have to be urged to make it much

more clear than it yet is what they mean by the internationalisation of the Saar. To whom is the political control of the territory, now exercised by the French Ambassador, M. Grandval, to be transferred? And what of the currency and customs union with France? It could not be abolished overnight, for the Saar is not a viable economy. Nor could all barriers between the Saar and the six nations of the Schuman Pool be raised without immense disturbance to orderly commerce. But the French should be willing to state clearly at which point they would be prepared to fuse their currency and customs union with the Saar in a wider union embracing the other six. The duties on coal and steel will in any case vanish within the year under the Schuman Plan. At what stage do the French envisage a general extension of the principle?

The most precise point of all turns on the question of the ownership of the Saar's coal and steel. What is proposed for the steel mills—now sequestered by the French—and the coal mines—now leased by the French? That is the hub of the question. That the French are unwilling to see these industrial resources pass under German control is understandable. But if they mean to keep them for themselves, then it is not really internationalisation they are proposing. A possible solution could perhaps be found in a genuine development of interlocking capital in the Saar—the form of ownership, incidentally, before 1913. The French, for instance, might offer to buy a large share of the sequestered steel shares from the former German owners, while the mines, which have long been state mines, could possibly be transferred to the control of the High Authority, or placed under some form of Franco-German control. With ownership thus internationalised, the French could claim to have done their share in making Europeanisation genuine.

At present, the German reaction is in some doubt. No one can deny Dr Adenauer's strong desire for a European solution. But he is under pressure from the nationalists and has already been compelled to talk of

raising the Saar issue at the Council of Europe. It follows that in any offer of British and American good offices, it is not only—and perhaps not mainly—on the French that pressure may have to be brought to bear. France, attacked and ruined in two wars, and, largely as a result, the weaker partner, can hardly be expected to make all the concessions. The Germans, too, must play their part and their contribution should lie in the political field—in the acceptance, in principle, of the experiment of internationalisation, at least for such time as is necessary to see whether it will work. To press for the licensing of pro-German parties and for elections in the Saar in the immediate future means inevitably that sides will be picked and passions unleashed on the straight nationalist issue—whether to join Germany or to join France. If consultation is delayed, the Saarlanders will have time to taste the fruits of European status and to learn that their great German neighbour sincerely believes internationalisation to be the right solution. Ultimately they must of course be consulted but their views cannot, in an issue of European magnitude, be the sole or even decisive factor. Nor is there much reason to suppose that they would opt for a German nationalist solution if the Germans themselves had specifically abandoned it.

The crucial point is thus German acceptance of the principle of internationalisation, but pressure may be necessary to bring them to accept the fact. The Saar, if settlement is delayed, will drift their way. It is France, not Germany, that is in urgent need of a settlement, yet France inevitably plays the weaker hand. It is for this reason, if for no other, that Britain and the United States cannot afford to remain aloof. The French, reinforced by strong British and American backing, would find it possible to be flexible. The Germans, negotiating with three great powers, might think it worth their while to be so. But if they are left to themselves, the fear of one side and the over-confidence of the other can wreck negotiation and lead Europe back down the fatal road of disunity and disintegration.

Rootless and Homeless

IT has rightly been said that the century of the common man is also the century of the displaced person. The problem of refugees has, indeed, been with us now for so long that people are hardened about it. There is a widespread feeling that as much as could be expected has already been done to ease the plight of the homeless; and that the continued existence of the problem, after years of effort, indicates that no final solution is possible. In this atmosphere of dwindling interest, most people have failed to notice that the whole nature of the problem has been transformed in recent months.

At the beginning of this year, the International Refugee Organisation (IRO), the United Nations agency which had resettled over a million displaced persons in its five years of activity, came to the end of its resources. At one time there had been a general hope that it would be able to clear up the whole task entrusted to it before its funds were exhausted. But the receiving countries were less hospitable than had been expected. Some of them jibbed when presented with the bill; some refused to join IRO at all; and others, keeping their doors theoretically open, picked at the refugee camps with cautious and finicky fingers. While they selected the best human

material from the mass of DPs with the deliberate slowness of a bargain hunter in Petticoat Lane, IRO's funds were quickly exhausted by the vast responsibility of maintaining hundreds of thousands of people in forced and unproductive idleness; and when the bargaining was done, the camps were left with a frighteningly high proportion of sick, disabled, and aged people, the so-called "hard core" of the refugees. At the beginning of 1952 it was estimated that 400,000 refugees, within the United Nations definition (which excludes persons living in the countries of their ethnic origin, such as the Germans expelled from Eastern Europe and now living in Germany), were still in Europe. About 120,000 of them were living in camps; these included 50,000 in Austria, 50,000 in Western Germany and 10,000 in Italy.

It is true that the winding up of IRO did not completely end the possibilities of a new life in a new country for every one of these people. At a conference in Brussels last December sixteen governments agreed to set up a new organisation with the cumbersome title of the Provisional Intergovernmental Committee for the Movement of Migrants from Europe. This committee, inevitably known to the initiated as PICMME, embarked on a

limited programme of transporting some 115,000 Europeans to other continents; it has already moved some 40,000, most of whom had been granted entry visas through IRO before its extinction. But, as its name implies, it was not created to deal only with refugees. Its terms of reference were to make a first assault on the much wider problem of surplus population in Europe.

The British Government have not joined this committee. They were represented at Brussels but abstained in the vote by which the committee was created; and, although it was announced at the time that the Government would carefully consider whether they should join, the gist of a recent parliamentary reply is that they will not. In that reply Mr Nutting referred to balance of payments problems as the chief reason for the British decision. The cost of participation would not be high; the committee's budget was fixed at \$36 million, of which \$10 million was to be contributed by the United States, and this country could make a worthwhile contribution to the programme for less than a million pounds. It will therefore be asked whether, despite all economic difficulties, Britain should not crown the considerable part it has already played in solving the refugee problem by taking on a last, and relatively small, burden of this kind.

But to pose the issues in this way is to misrepresent the present state of affairs. The provisional committee cannot finally empty the refugee camps. Even if its programme were confined to refugees formerly in IRO hands, it could only move a quarter of them; and its programme is not thus confined. By its nature, it symbolises the change that has come over the refugee problem. While tidying up some of the loose ends left over from IRO, it is entering upon the wider field of assisting migrants who are not refugees. Its creation amounted to a recognition that most of the remaining DPs will never now leave Europe.

That the era of mass intercontinental movement by refugees has ended is due to several factors, of which the exhaustion of funds is only one. To feed and care for a million and a half refugees, and to move a million of them across the world cost IRO nearly \$400 million, of which the United States contributed \$237 million and Britain \$76 million. Expenditure on this scale could not have continued much longer, especially in view of the fact that only eighteen out of sixty United Nations members were contributing; but it might have continued a little longer, if that were all that was necessary. But the situation was complicated by the appearance of so many "new" refugees from postwar Eastern Europe; by the increasing selectiveness with which immigrants have been

received; and above all, by the growing competition that the refugee must face from other emigrants.

Inevitably, the migrant who has behind him the protection of his own government enjoys several advantages over the refugee when he seeks to enter another country. He has a regular passport; the receiving government knows that if he becomes a nuisance or a burden he can go, or be sent, home; and his own government can not only help him to make the journey, but can also negotiate favourable terms for him with his new hosts. Moreover, he is generally fit and active, while most refugee populations carry an unusually heavy load of sick, old and very young persons. Now that the cream has been skimmed off the DP camps, few of the remaining refugees can hope to compete for entry visas with the vigorous and valuable emigrants who now seek, owing to population pressures, to leave Italy, Greece, and the Netherlands. Probably less than ten per cent of the refugees will succeed in this contest. For the rest, the only alternative is to be absorbed into the communities among whom they now live.

On February 2nd the United Nations Assembly adopted a resolution authorising the raising of an emergency fund for the relief of the neediest refugees, urging that refugees should be allowed to benefit from migration programmes, and asking countries directly affected to "pay special attention to this problem when executing programmes of economic development." The UN High Commissioner for Refugees, Dr van Heuven Goedhart, has made no secret of the fact that he regards the last of these three clauses as the most important. The response to his appeals for contribu-

tions to the \$3 million relief fund has been scant. He has received \$69,000 from Switzerland, \$19,000 from Sweden, \$14,000 from Norway, \$13,000 from Germany and about \$8,000 from other sources. At the end of June the British Government pledged a contribution of £100,000; but in the absence of corresponding pledges from other countries the fund's prospects are poor indeed.

This month, however, a considerable stimulus was given to the High Commissioner's efforts to give refugees useful work in the countries where they now find themselves. The Ford Foundation announced that it would grant \$2,900,000 to be used by Dr van Heuven Goedhart for this purpose. It stipulated that this grant should not relieve governments of their moral responsibilities; but it should at least encourage those chiefly concerned, in Austria and Western Germany, to pay more attention to the part that refugees can play in the economic life of their countries.

The High Commissioner has already persuaded the Bonn Government to extend to non-German refugees a small part of the credit facilities which it already provides for Germans expelled from beyond the Oder-Neisse line. With the Ford grant behind him, he may be able to do more in Germany. In Austria, where his responsibilities extend to the protection of *Volksdeutsch* refugees as well as non-Germans, Dr van Heuven Goedhart has for some months been pressing the government to adopt a two-year programme for the rehabilitation of some 100,000 refugees. Many of these are competent farmers, and there is much marginal land in Austria on which they could be settled, with obvious benefits to Austria's food production, if a certain amount of capital were provided. The capital cost of the two-year plan has been estimated at about \$21 million, half to be drawn from Austrian and half from foreign sources; and while the Ford grant can-

not meet more than a fraction of the latter requirement, it could serve as an invaluable pump-primer.

These projects do not solve the problem of the disabled, sick, or aged refugee. It is essential that more assistance for these helpless people be provided, either in the form of contributions to the High Commissioner's emergency relief fund, or by way of such offers as that recently made by the Swedish Government to admit tubercular refugees from Trieste. But as regards the able-bodied refugee, who is still in the majority, it must be recognised that the prime need today is integration, not emigration. For until it is clearly understood that for most refugees the future must now lie not in the Americas or Australasia, but in Europe, neither the refugees themselves nor the governments and peoples of Europe can be expected to tackle the task of integration wholeheartedly.

Bureaux Against Bureaucracy

BEFORE the war there were no such things as Citizens' Advice Bureaux. Now there are some five hundred of them. They are little offices, usually managed by public-spirited philanthropists, usually staffed by only two or three people, whose business it is to give information or advice to callers on every conceivable kind of personal problem. The number of these enquiries, carefully recorded, is more than a million a year. Here is a significant comment on the functioning of the welfare state; here, incidentally, is a very English way of meeting (despite their name) the challenge of bureaucracy.

The bureaux were set up at the outbreak of the war. A voluntary body, the National Council of Social Service, obtained funds from the Ministry of Health to finance the establishment of one thousand information centres to guide the public through the jungle of unfamiliar regulations concerning evacuation, rationing and call-up. They were staffed by capable and sympathetic people, selected with some care; many were voluntary workers, but they varied widely in background. The centres rapidly acquired a vitality and popularity beyond all expectation. With the return of peace their winding-up was postponed from year to year. Local charities stepped in as government funds were withdrawn, and as local charities felt the strain local authorities began to vote donations. At present about one-third of the bureaux receive no public money whatever. One or two are entirely dependent on local authority grants.

All, however, have the strongly independent character of voluntary social service, which is preserved by their extensive use of part-time volunteer workers. They depend on their own central headquarters for organisation and advice, as well as for an excellent and business-like information service, which is the lifeline of Citizens' Advice Bureaux. It is produced on a shoestring, by a group of professional men—again largely volunteers; nevertheless, it is a digest not only of statutory regulations and announcements of public bodies, but also of useful departmental circulars and other unpublished information. Indeed, the service is made possible by the cordial attitude of government departments. Another example of this cordiality is the departments' readiness to receive—or even request—reports as to where, in their vast operations, the shoe pinches the public. The

launching of the National Insurance Act was one occasion when local officials were too overwhelmed by the task in hand to make any detached, let alone statistical, appraisal of the causes of public misconception and confusion. The call-up of Z class reservists was another case in point. No government department was immediately aware, as were the Citizens' Advice Bureaux, of the muddle and distress caused by the absence of provision for heavy mortgage and hire purchase commitments among the men recalled. It was partly because of their timely representations that this was put right before it caused too much trouble.

The middle classes—accustomed to consulting their bank manager, their lawyer or their professional acquaintances in cases of difficulty—may wonder why yet another free service should be provided for people who cannot manage their own lives. One part of the answer is that the welfare state, which looks on paper as though it carried people in its arms from birth to death or after, still creates a deeply distrustful attitude on the part of the ordinary man and woman for whom its ministrations are intended. "Please tell me what I'm entitled to before I go to the Assistance Board" (or the Revenue or the Local Welfare Office) "because if you don't know the ropes you can't get anywhere with those people." This attitude is no less real for being, in large part, mistaken.

When an unexpected spanner is thrown into life's routine the individual is often quite ignorant of how to get the help due to him. When an elderly lodger dies penniless, does one order the funeral first and claim the cost afterwards? And from whom? When a new utility sofa bursts at the seams, does one prosecute the dealer? Or the maker? Or is it something to do with the Board of Trade? And if a waitress in a small town is dismissed without her holiday pay, she may complain to the Ministry of Labour; she may even identify, and write a coherent letter to, the appropriate Trade Board Inspector in an adjacent town; but she is much more likely simply to declare that "all these regulations are only a farce when it comes to the point." Sociologists may discern a lag between the growing complexity of institutionalised welfare and the social skills necessary to

manipulate it; cynics say that the government has invented a new kind of hard labour—running from place to place trying to get something for nothing.

Nor is everything plain sailing when the right office has been approached and the right form filled in. Big organisations make plenty of individual mistakes, however beneficent their general policy. Not all the clerks who deal directly with the public are the right sort of people for the job, and the difficulties of selection and training are little consolation to the timid caller whose story is rambling; the caller with a grievance whose dates are vague; the perfect paragon of callers faced with a liverish jack-in-office. All alike suffer a sense of outrage when the almighty state says "No" and they are convinced it should have said "Yes."

*

It would be wrong to imply that Citizens' Advice Bureaux are chiefly concerned to champion the individual against the government machine. First and foremost they represent, to the man in the street, a human sympathetic listener, prepared to consider a difficulty from all sides, rather than anxious to say "that's not our department." Almost as important, they enable him to lay his troubles before an "educated" person in the superstitious sense of that word—before someone who, though he may not know all the answers, has a good idea where to find most of them. But perhaps most important of all, they stand for a kind of human reference-book independent of authority. Bureaux workers have the time and skill to interpret complicated regulations in simple terms and thus dispose of a good many supposed grievances; and when administrative injustice is seen to be done, they usually know how to get it put right without fuss. To a large extent, they have replaced older pillars of wisdom—the leisured family doctor, the parish priest and the village schoolmistress—who have for various reasons ceased to be the natural resort of the poor man with a problem. In some localities, the reputations for sound advice that Citizens' Advice Bureaux have gained are very high indeed.

The variety of problems is extraordinary. Not only the tenant, the customer and the employee, but also the landlord, the shopkeeper and the employer appeal to the bureaux for advice. Many enquiries are of the emergency kind that would otherwise go to the police—destitution, children left uncared for, matrimonial violence. Some require expert advice—legal, financial or psychiatric. And some defy all classification, like the man who had escaped from a mental home and wanted to know where to get a ration book. Simple legal guidance is often in demand, and an astonishing number of people do not know that they can get it for as little as half-a-guinea without suffering that fate comparable to death, "getting into the hands of the lawyers." The bureaux send many people to solicitors who would not otherwise have gone. Often they co-operate with a poor man's lawyer service. But at the same time they answer many more elementary legal points directly. "Can I stop paying rent to force the landlord to mend the roof?" "Can I get a divorce for incompatibility?" "Can I marry my father's step-brother?"

The universal character of the enquiries which it must be prepared to receive is, inevitably, the weakness of the organisation. It is very much a matter of luck whether in any town the right people can be found to match so much promise with performance. Trained social

workers, retired solicitors, bank managers or public officials, married women whose families have grown up—these are fairly typical of the people who run bureaux, sometimes for a salary, often for an honorarium. Recruitment would be easier if the bureaux could pay better salaries, but this is only part of the answer. A stronger headquarters organisation to provide training courses and visiting officers, who would make the bureaux less isolated, would do even more to raise the status of their work and attract the right people.

In The Hunting of the Snark, the captain

Had only one notion of crossing the ocean
And that was to tinkle his bell.

Many people fear that, while social service is all very fine in theory, it saps initiative, and that soon the man in the street will have only one notion of coping with life and that will be to tinkle the bell of some agency and lay his problems at its feet. There is a real danger here. But the champions of Citizens' Advice Bureaux point out, with some justice, that so far from encouraging people to be helpless, this organisation simply provides armchair advice as to how people can best help themselves. It hands out no money. It has no reformist or moral mission. Its own status is anomalous and its finances precarious, but it sets out to do a job which can make a very respectable contribution to the smooth running of the welfare state.

Railway Disasters

The public has been almost frightened within the last few weeks by numerous accidents on railways. Several persons have been killed, and a greater number of disasters than on the average appears to have taken place. This is alarming, because it occurs where, with proper regulations and proper care, no accidents ought to occur, and because these accidents are successively increasing year after year. Instead of increased skill, as the invention becomes better known and more used, lessening the number of accidents, they are becoming more frequent. . . . The bulk of the accidents, whether traced to the wearing out of the road, inefficient machinery, want of punctuality, or want of sufficient number of servants, may all be ascribed to one cause—the parsimony of the companies. The means employed do not correspond to the work to be performed. The necessity of providing a dividend swallows up the means that should be applied to take care of the passengers. Of course all this is to be resolved into waste, or mis-employment of the companies' resources, and to mismanagement at head-quarters. The profusion of the companies in one direction has necessitated parsimony in another. Every person endowed with ordinary sagacity has from the first condemned, for example, the useless expenditure for ornament about railway termini, etc., before the actual necessities of traffic were provided for. To pay for embellishments out of earnings, is good taste that deserves to be applauded; to pay for them out of capital till every part of the passengers and goods traffic is perfect, is little less than a crime. But every railway in the kingdom has wasted enormous sums on mere show, and now sacrifices the lives and comfort of passengers in a vain effort to retrieve the error. Interest must be equally paid on the capital invested in magnificent saloons as in locomotives and in the payment of drivers' wages. The extravagance which the sight-loving public has applauded is now felt in danger to life and limb.

NOTES OF THE WEEK

Humpty-Dumpty Diplomacy

The latest Soviet Note on the future of Germany is an example of a type of diplomacy that is sometimes baffling to the Western mind. To the comparative realists of the occident words are meant to convey meanings, rather than to create impressions. A lie is disgraceful, and it is shaming to be caught out telling one. If a line of policy has been proposed one day, the Westerner shrinks from bare-facedly proposing something quite different shortly afterwards. In Moscow and Tokyo negotiators are taught quite a different conception of words. They learn that there are two kinds of lie. One is meant to deceive, and may be comparatively credible; the other is pronounced boldly, knowing that the other party's reason will tell him that it is not true. The point is to maintain the negotiator's position and, by constantly reiterating even a palpable untruth, to undermine the opponent's confidence. Since this is approved technique, nothing could confuse a Russian or Japanese less than to be caught out in a contradiction.

As Humpty-Dumpty remarked of words, "The question is, which is master?" In the Soviet Note published last Monday, the Moscow government blatantly ignores the fact that it proposed only a few months ago that a peace treaty should give Germany a national army, and that former Nazis and officers should be freed from disabilities. It equally overlooks the formation of a German army in the Soviet Zone, announced with a blare of trumpets by the German Communist leaders, to the discomfiture of their colleagues in France and Britain. Now the Soviet Government reverts straight back to Potsdam, in a passage that could have been, and probably was, written five years ago. It declares that the first thing to verify before elections can be held in all Germany is the extent to which the Potsdam decisions on the demilitarisation and denazification of the country have been implemented. Certainly, Soviet propaganda tries to solve the dilemma of its followers by inferring that there is a distinction between a national German army and "militarism." But to the ordinary man Moscow's contortions make nonsense.

It was clearly decided some time ago in Moscow that German unity was not to be achieved by the previous methods, chiefly because the Germans themselves refused to rise and overthrow Dr Adenauer's government. From then onwards Russian policy has been to seal off and strengthen the Soviet section of Germany. Stalin hardly tries to veil his proposals, which are unacceptable to the Germans. He now makes perfectly plain that he will only agree to elections after a peace treaty has been prepared and an all-German government "formed." The point of the Note, it appears, is in the first place to attract not Germans, but those sections of opinion in France and Britain that are most anxious to find a way to avoid German rearmament and hanker after a global settlement with the Soviet Union.

The Note ends with a proposal for a conference "not later than October this year"—that is to say, before the European Defence Community has been ratified, and before the presidential election in the United States. There is little that the Western Powers can do in return but restate their decision that elections must precede a peace treaty. That would at least prevent the Kremlin Humpty-Dumptyies from being master of the last word.

"Liberation, not Containment"?

When, in addressing the American Legion last Monday, General Eisenhower asked that the American Government should "never rest" until the "enslaved nations" of Eastern Europe and Asia are again "masters of their own fate,"

he was no doubt chiefly expressing the legitimate dislike honest men feel for the methods of Soviet imperialism and their pity for the captive peoples of the Soviet sphere. But it is quite possible that he was also trying to draw a distinction between his own and President Truman's foreign policy. His otherwise admirable speech was very largely a restatement of the policies pursued since 1945 by the Administration. At some point the individual note was needed. It was found in the doctrine of non-recognition.

This dilemma is not new. One of the great problems facing the framers of Republican foreign policy in America is that it is exceedingly difficult to improve on Mr Acheson's formula of "containment"—unless a Gadarene rush to isolationism is preferred. Containment faces the fact of Russian hostility, sets a limit to Russian expansion, yet avoids the direct risk of a third world war. It cannot be accused of appeasing Moscow. Yet it does not make war a precondition of success. How can the Republicans go one better?

This undoubtedly has been Mr John Foster Dulles's main preoccupation, and no doubt the suggestion he put forward in July—that "liberation, not containment" should be the aim of American policy—seemed a clear way out of the difficulty when first it flashed into some planner's brain. It promised more than containment, it could make containment look cautious and cowardly, it could pick up some disgruntled Czech and Polish votes and—so the sponsors probably argued—it would not increase in any way the risk of war. The Republicans could still cut taxes, just the same.

Unhappily "liberation" applied to Eastern Europe—and Asia—means either the risk of war or it means nothing. There is no way in the foreseeable future in which Poland and Czechoslovakia can be released from Soviet bondage except by force of arms. In Asia the situation is even more discouraging, since the bulk of the Chinese would probably actively resist "liberation." Even to incite Eastern Europeans to seek for liberation entails the risk of world war, for if they were to rise against their Russian masters—as the Poles did in 1864—America and its allies would have the choice of intervening to support the rebels or of suffering the shame that came Palmerston's way. "Liberation" entails no risk of war only when it means nothing.

Naturally, to recognise such a fact is not to accept or condone Russia's conquests. Nor does it entail any lessening of the effort by radio and by every other means of contact to keep open communication between the enslaved and the free. But all this is not and cannot be "liberation," and it follows that "containment" is at once a more precise and a more honest formula.

Cross-Currents at Morecambe

The rank and file of the Labour party is left baffled and uncertain by the retreat of its leaders from the policies that were once the hallmark of socialism. The very strong tradition of loyalty to the established leadership conflicts with an irresistible desire to re-assert the difference between Labour and Conservative policies. The relics of pacifist sentiment are outraged by rearmament, socialist ideals seem tarnished by alliance with the American citadel of capitalism; and it is hard to admit that anything should take priority over claims to higher living standards now. The cross-currents are clearly seen in the resolutions for submission to the Labour party conference, the agenda for which was published this week.

Almost all of the resolutions come from constituency parties. In domestic policy, about ten seek to add substance

to the executive's soothing assurance that industries will be nationalised wherever this is in the public interest. Two or three of them would still nationalise all the means of production and distribution, or at least all the major industries. Others name their candidates. But the obsession in domestic policy is that the present scale of defence expenditure is too high. Some sixty resolutions urge this view, rationalising it by arguments that are now familiar: that Britain's best security is its economic strength, which is jeopardised by rearmament, or that the best way to fight Communism is to help the backward countries. Sometimes, however, no justification is attempted; it is enough that the workers' standard of living is impaired.

Many of the resolutions about foreign affairs are an appeal to the executive to put forward a "truly socialist foreign policy," whatever that may be. Coventry Labour party comes nearest to a definition, perhaps, with its quaint demand for "a foreign policy clearly distinguishable from Tory foreign policy." Those that venture to outline a policy show a simple faith in talking it over with Stalin and agreeing to disarm. A motion from the mineworkers' union would have the conference place on record "its appreciation of the work of the Labour Government under the leadership of the Rt. Hon. C. R. Attlee." But South Worcestershire would add "and also the foresight of the Rt. Hon. Aneurin Bevan, in the attitude that he adopted towards rearmament." On paper the conjunction is "and also"; in reality it is "or." A vote on this amendment could not, whatever the result, change the leadership of the party; but it would plainly demonstrate the relative strengths of Labour's two parts.

The Bevan Bid

The temper of the resolutions at first sight augurs well for the success of the Bevanites in the elections to the national executive. Six of them—the same number as last year—are standing for the seven seats in the constituency section, and their appeal has been increased by the substitution of Mr Crossman for Mr Harold Davies. There are other candidates who, although they are not Bevanites, would, if they were elected, tend to strengthen the opposition to the official leadership. Mr Silverman's views are well known; Mrs Braddock is a left-wing spirit; and even Mr Shinwell, since he took to advocating a shorter period of national service, is almost an asset to the Bevanites.

The opposition that the Bevan faction will have to encounter, however, is much stiffer than last year. Mr Gaitskell, Mr Anthony Greenwood, Mr Jay and Mr Robens are new candidates. A sweeping gain for the Bevanites certainly cannot be taken for granted.

Wages Advance

The dams that are holding back a general round of wage increases have weakened this week. The Minister of Labour has confirmed the increases recommended by four of the wages councils whose proposals he had previously sent back for reconsideration. Faced with the same proposals a second time, and with the TUC's awful warnings against interfering with wage negotiations, he had no choice but to give the increases statutory force. Minimum rates for workers in shops selling food, footwear, outfitting and drapery, hair-dressing, bookselling and stationery are thus raised by between 7s. 6d. and 10s. a week. The Minister has still to consider the second recommendations of eight other wages councils in the retail trades, and the increases recommended by about a dozen other councils whose proposals he held up but did not refer back.

In the furniture trade a possible strike has been averted,

and arbitration called off, by agreement on a compromise cost of living scale. The scale that the employers had given notice to terminate provided an extra 1d. an hour for every three points that the cost of living index rose above 108. As the index is now 138, the bonus would on this scale have been 10d. The employers have agreed instead to pay 9d., with a further 3d. an hour for every two points that the index rises above 138. This increase in costs must be highly unwelcome to the firms most affected by recession, but the employers as a whole presumably thought that they would do no better if the case went to arbitration.

Altogether over two million workers have their wages governed by sliding scales, and of the wage increases awarded in July, totalling £73,000 a week, £54,000 a week was the product of these scales. When so many workers are getting more money in this way, arbitration tribunals can hardly be expected to refuse any increase to others.

Britain and the Schuman Pool

For friends of the Schuman coal and steel pool, this has been an encouraging week. One of the first tasks for M. Monnet, the new President of the High Authority, was to establish close and friendly relations with Britain. Following his recent visit to London, the British Government has arranged to send a permanent delegation to the headquarters of the Authority. The chairman of the British delegation is Sir Cecil Weir, and the other three members are Mr James Marjoribanks, of the Foreign Office; Miss Elizabeth Ackroyd, Under-Secretary, Ministry of Supply; and Mr Charles de Peyer, Under-Secretary, Ministry of Fuel and Power. The team will also include several technical experts from the British coal and steel industry. Between them, the members so far appointed have an impressive record of business experience, technical knowledge and successful inter-governmental co-operation. Sir Cecil is one of Britain's few counterparts of a type more commonly found in America—the industrialist who is equally at home in industry or the government office. In addition, as economic adviser to the British Control Commission in Germany during the years 1946-49 he acquired an intimate knowledge of German industry, while at the same time displaying a talent for not arousing antagonisms.

There is still no question of Britain becoming a fully fledged member of the six-nation pool, but the communique makes it clear that on this occasion Britain cannot be accused of dragging its feet. It states that "the delegation will have the task of laying the foundations for an intimate and enduring association between the Community and the United Kingdom." The word "enduring" can be taken as a measure of the change that has occurred in Britain's attitude toward the pool.

Close co-operation is thus assured at the working level. On the ministerial plane the machinery and good will for co-ordination already exist. All that remains is to devise some formula for associating Britain and the other European countries outside the pool with the activities of the Schuman Assembly. As they stand, the Eden proposals for linking the Strasbourg and Schuman Assemblies have not found favour with the French. But, fortunately, Mr Eden's proposals were sufficiently general to permit modifications or interpretations that should be satisfactory to all parties.

The Closing Door

Not so long ago the "open door" in China was an objective of both British and American Far Eastern policies. In the 1930s it was the Japanese who were trying to close the door against non-Japanese competitors in that market;

Z/RD

The hind-legs propel him up. The fore-legs are tucked in, clear of the bar. The rider leans forward, shifting his weight over the neck. His thighs grip the saddle. His toe is light in the stirrup. The reins are firm in the grasp of a master. **It all adds up to a faultless round.**

WELL GATHERED

The companies which are gathered together to form Associated Electrical Industries have names which are household words. In Britain alone, thirty factories in twenty different towns produce between them over £60,000,000-worth of equipment in a year. The companies of AEI, working separately and together, are a fine example of co-ordinated effort for the public good.

These are the companies of AEI

- Metropolitan-Vickers Electrical Co Ltd
- The British Thomson-Houston Co Ltd
- The Edison Swan Electric Co Ltd
- Ferguson Pailin Ltd
- The Hotpoint Electric Appliance Co Ltd
- International Refrigerator Co Ltd
- Newton Victor Ltd
- Premier Electric Heaters Ltd
- Sunvic Controls Ltd

It all adds up to

Associated Electrical Industries

to-day, it is the Chinese themselves who are relentlessly closing the door by a policy which the historian may compare to that of the Chinese emperors in the days of seclusion before 1842, but which is also in conformity with the general commercial practice of Communist states towards the free world. The activities of British and other foreign business firms in China in the century between the Nanking Treaty and Pearl Harbour may have been too pervasive to continue unchanged in a country asserting full control over its own national economy; but the strangling of foreign enterprise and the curtailment of foreigners' residence by Communist states go far beyond any restrictions formerly imposed by sovereign states. The state control of foreign trade under a Communist regime means an almost complete indifference to popular demand for consumers' goods, and concentration on capital goods and materials of strategic importance. At the same time the residence of foreigners for business purposes is discouraged in order to isolate the people from all foreign contacts.

The process of eating away what is left of British economic interests in China has now been carried a stage further by the requisitioning of the two principal British-owned dockyards in Shanghai. This is understood to be partly a reprisal for the judgment on appeal of the Judicial Committee of the Privy Council in favour of an American company's claim to the aircraft in Hongkong sold to it by the Nationalist Government before the British Government's transfer of *de jure* recognition to Peking. In accordance with the Communist principle that there is no such thing as judicial independence, the Privy Council's decision has been denounced as an expression of British "hostility" towards China and made the occasion for fresh paroxysms of propaganda. The requisitioning of the dockyards is an act which was to be expected soon in any case; apart from a general tendency to nationalise enterprises of this kind, recent moves to build up a Chinese Communist navy with Soviet assistance imply that all docking and shipbuilding activities must now become state secrets. The loss of these important British enterprises—with only the most shadowy chances of any compensation—is a heavy blow to lingering hopes that the decision of the principal British firms in May to withdraw from China would cause Peking even at the eleventh hour to reconsider the policy of killing geese that have laid so many golden eggs—for China as well as for the British investor.

Canada and Commonwealth Economics

The Canadian Government could not be expected to conceal its dissatisfaction with the draft agenda for the economic discussions at the Commonwealth conference in November. The Canadians thought that it put too much emphasis on the things that might be done to help Britain; it did not provide for a thorough discussion of the internal economic policies of this and other sterling countries. Such a protest can have caused no surprise in Whitehall, and it seems to have been gracefully accepted. That is welcome. In essentials, the Canadians are right; and it is easy to understand why they are getting increasingly out of patience with this country's economic policy. The soundness of the reasons does not, however, make the impatience any less alarming—for both sides.

There is an element of exaggeration in the Canadian attitude. Mr Churchill's Government at first inspired the officials and Liberal politicians of Ottawa to hope for too much. The brave words of the last Commonwealth finance conference in January were taken to imply a sharper change towards freedom in British economic policy than Mr Butler has managed to make, or perhaps than he ever intended. In their disappointment the Canadians have perhaps reacted a little too strongly. The British Government's policies are

gravely inadequate, but they are not entirely negligible; it is not fair to talk as if nothing at all had changed since October, 1951. The need for a more courageous policy of disinflation is certainly not disputed in these columns. But from the viewpoint of Ottawa there is some tendency to forget that sound liberal policies come relatively easily to a country so buoyant, with such vast resources to develop, as Canada; difficulties such as Britain has to face multiply the obstacles to liberalism as well as the need for it.

But if there is some exaggeration in Canadian criticism of Britain, it must also be said that the British Government contrives to give strong reason for much more than that—for suspicion of its motives and distrust of its intentions. In fact it has no dark designs for making the Commonwealth conference the means to an intensified restrictionism in the trading policies of the sterling area; as yet, it has no particular plans at all. But the vague importance it has attached to the conference, its equivocation about GATT, its slighting of the opportunity for international discussions at the forthcoming annual meetings of the Bretton Woods institutions—all these combine to create the worst impressions. Both Canadians and Americans could easily find grounds for being more impatient than they are, and the initiative in removing suspicions must rest with Mr Churchill's ministers.

* * *

Freezing Pensions

Once again, the Ministry of National Insurance has made a valiant attempt to bring home to the public the heavy burden that old age pensioners will sooner or later place on the national finances; sooner rather than later, for even in 1954-55—that is, the financial year after next—the expenditure from the national insurance fund will begin to outstrip its income. From then onwards, the Ministry's third annual report (Cmd. 8635) points out, the gap will increase rapidly. If the provisions of this year's National Insurance Act are taken into account, the deficiency to be made good will be:

£100 million a year by 1957-58 (five years from now).
£275 million a year by 1967-68 (fifteen years from now).
£420 million a year by 1977-78 (twenty-five years from now).

The italics are the Ministry's. So is the emphasis on how short is the time left for action. This presentation of unpalatable facts should be applauded, and it is to be hoped that the politicians will take notice. But can they take any action? In the debates this spring on the new national insurance benefits, members on both sides of the House of Commons showed for the first time a general awareness of the financial burden of pensions; none professed to see how it could be lightened. It could, however, be prevented from becoming any heavier. This year's increase in pensions to existing pensioners must be the last, whichever the party in power. It is one thing to say that people will be able to draw a higher pension when they have paid an adequate number of contributions at a higher rate. It is quite another to go on increasing pensions for people who have ceased to pay contributions at all.

If the cost of living continues to rise, freezing of pensions means that they will fall below the subsistence level—or rather that they will fall even farther below than they are at present. At the end of last year 766,781 retirement pensioners out of over four million were drawing national assistance to supplement their pensions.* This was some 91,000 more than in 1950. Most of these people would be drawing assistance to pay their rent. At the end of this year, with the cost of subsistence, apart from rent, actually higher than the old age pension, the number of pensioners drawing assistance is bound to increase sharply. Any

* Report of the National Assistance Board. Cmd. 8632.

pretence that pensions are on a subsistence level has thus been abandoned. The Government should firmly resist any pressure to reduce the gap. A shilling on to pensions appears a small concession now. But it is the future cost, as well as today's, that must be counted.

Foot-and-Mouth

The Minister of Agriculture has now appointed the committee that is to review methods of dealing with foot-and-mouth disease. It starts with a discouraging report*, published this week, on the research so far carried out at the Pirbright institute. It is difficult to gain from this report the assurance Lord Woolton hopes it will provide—"that the work is being prosecuted with both vigour and competence." The complexity of the research, the care and caution it requires, are convincingly explained. For a long time, therefore, it had to be done on a small scale. Conveniently, the stage at which the institute can safely be extended, and the work speeded up, has just been reached. But at this point the report seems unduly modest about the considerable knowledge of the disease that the scientists have gained; it is by no means clear that the extension could not safely have begun before now.

The report is no doubt right in its insistence that, even with the "greatly extended" institute, "there is no short cut to the provision of vaccines which will give full protection . . . much more remains to be done." But it is most important that the committee on policy should not be blinded by scientific perfectionism. The committee's task is to choose between imperfections. The present slaughter policy is very far—as the seriousness of this year's outbreak has shown—from giving "full protection," and it is wasteful as well. The scientific report shows that it may well be a long time before foot-and-mouth can be entirely eliminated. But the immediate question is whether scientific knowledge now goes far enough to make some wider experiments in the use of vaccines, as an alternative to slaughter, a reasonable risk. On that, the Pirbright report is quite inconclusive.

Japan Courts the Overseas Chinese

Following the visit of the Chinese ex-Premier Chang Chun to Tokyo as personal representative of Chiang Kai-shek, it is reported that a joint Japanese-Chinese corporation for the promotion of trade with South East Asia is to be formed. The significance of this lies not so much in any contribution which Formosa itself can make to such trade, as in the part which Tokyo hopes that the Nationalist regime may be able to play as an intermediary between Japan and the Overseas Chinese. The local trade of South East Asia remains largely in the hands of Chinese merchants; the Japanese lost most of their commercial contacts in this region as a result of their forced repatriation after the surrender in 1945. To build them up again and expand trade to an extent which may partially compensate for the loss of markets in mainland China—an aim which has American approval as helping to keep Japan free of economic dependence on the Communist bloc—Japan must gain the goodwill of the Overseas Chinese. But as long as Japan is ranged in the anti-Communist camp, it is no use seeking the favour of the Communist Chinese; the only practical course is to get the maximum advantage out of good relations with the Nationalist government in Taipei. That Japan does not regard such relations as a mere formality for pleasing Washington is shown by its appointment of Mr Kenkichi Yoshizawa as ambassador to the Nationalist government. A former Foreign Minister and previously Minister to China, Mr Yoshizawa was one of the outstanding figures of Japanese

prewar diplomacy, and though at the age of 78 he may no longer be at the top of his form, the accrediting of so distinguished an elder statesman certainly adds to the prestige of the Taipei government and commits Japan to the Nationalist side more strongly than might have been expected.

The struggle for the allegiance of the nine million Overseas Chinese is of both economic and political importance. There is a strong Communist element among them, and when the Nationalist regime seemed on the verge of extinction the Chinese merchant class in South East Asia thought it prudent to fellow-travel. But the massacres in China, the hardening of American policy towards Peking, and the strengthening of the Nationalists in Formosa by renewed American aid have caused a considerable revulsion of feeling among Overseas Chinese—at any rate outside Malaya. Diplomatically, the present position is that the United States, Japan, France, the Philippines and Siam recognise and have diplomatic relations with Taipei; Burma and Indonesia recognise and have diplomatic relations with Peking; while Britain recognises Peking, but has no diplomatic relations with either Chinese government. It is a situation which offers some promising opportunities to Japan.

Greece in Search of a Policy

Last week, the Greek government accepted the challenge thrown down by General Papagos, leader of the main opposition party, the Greek Rally. A special session of Parliament was summoned, and after several days of acrimonious debate the coalition government was rewarded by a vote of confidence carried by a majority of nine. Although most of the causes of friction between government and opposition were gone over, the chief interest centred on General Plastiras's account of his economic stewardship.

It was, indeed, the growing dismay over Greece's economic plight, felt not only by the politicians in opposition but throughout the country, that led General Papagos to ask for a special session. It is not likely that the government materially lessened this dismay. It could underline its difficulties—the extremely heavy defence burden, which takes over 40 per cent of the budget expenditure, and the successive cuts in American aid, which this year will amount to only about \$80 million. It could point to some successes—budget estimates balanced for the first time since the war and some check to the rising cost of living. It could also stress its determination to grapple with the main economic problems, and in particular to do its best to reduce the deficit in the balance of payments, which is running at a rate of nearly \$300 million a year and shows no signs of diminishing. But it could not convince anyone that, even if it could agree on effective and strong measures, it would be politically strong enough to carry them out. Its parliamentary majority could at any time be virtually wrecked by the eight deputies belonging to the extreme left-wing party, the EDA. And its internal cohesion is continuously threatened by differences not so much over economic policy as over the pacification and internal security problem.

General Papagos has steadily refused all invitations to join a tripartite government with the Liberals and the EPEK. He argues that if he did, he would be in a minority and would be forced to accept measures with which he did not agree. This is understandable, but somewhat unconvincing, since he has never made it clear that his economic policies would radically differ from those of the present government. If the next elections, which are unlikely to be long delayed, should be held under the majority system, and if Greece's weariness with political instability should sweep the Greek Rally back to power with a comfortable majority, General Papagos would have a more favourable climate in which to carry out a strong economic policy. But this prospect would be more promising if it was plain that the Rally has such a policy to carry out.

The Straffen Case

The Court of Criminal Appeal has dismissed the appeal of John Thomas Straffen against his conviction for the murder of a girl of five during the few hours he was at liberty from Broadmoor Institution this spring. Straffen thus remains under sentence of death, unless the Home Secretary reprieves him; in that case, he might either be sent back to Broadmoor, where he would clearly have to be kept under the strictest surveillance, or be transferred to Rampton, an institution for criminal mental defectives.

To the layman, the puzzling feature of this case is that a man who six months before his escape was found unfit to plead to the charge of murdering two children at Bath should at his later trial be considered not only fit to plead but legally sane when the issue of insanity was put to the jury. Of his earlier unfitness to plead there was no doubt. But presumably his six months' stay in Broadmoor adjusted him sufficiently to appreciate, however dimly, what was happening at his trial last month. What could not have been altered was his mental deformity; Straffen was, and is, a certified mental defective. When, however, the question of insanity is raised at a trial, judge and jury are bound by the hundred-year-old McNaghten rules, which determine whether a person is insane enough, at law, to be deemed not responsible for his actions. It has been held, however, that a mental defective is excluded from the scope of the McNaghten rules because they expressly refer to disease of the mind—that is, mental illness, not incomplete mental development. In evidence to the Royal Commission on Capital Punishment, the British Medical Association urged that cases of mental defectiveness should be brought within the rules.

There are, therefore, good grounds for the Home Secretary to grant a reprieve. But, technicalities apart, is there not something peculiarly revolting in carrying out all the panoply of execution on someone with the mentality of a nine year old? Is it not wrong that the same penalty should be handed out to a man whose very crimes show him to be grossly abnormal as to a gangster who murders to escape arrest? Straffen is a social menace—but the state does not hang people to get rid of social menaces. It hangs people as a punishment and as a deterrent, and it is impossible to see how either purpose could be served by the execution of this mental defective.

Unsettled Persons

The phrase used in the National Assistance Act to describe tramps—"persons without a settled way of living"—turns out to have some force behind it. A report from the National Assistance Board (HMSO 15.) shows that today these persons rarely tramp the country sleeping "rough" and living by odd jobs or by begging. Most of the 2,000-odd who used the reception centres—casual wards is the old terminology—in 1951 were not casual visitors; a special inquiry showed that more than a quarter had been at the centre where they were interviewed for at least a month and nearly half were frequent applicants. So far from being lovers of the open air and the countryside, they now mainly frequent the cities; "London and a few other large towns account for about half of them."

Yet it is doubtful if there is much fundamental difference between the postwar unsettled person and the prewar tramp. Few tramps were as romantic and picturesque as popular imagination, with the help of authors, made them out to be—although, seen in the open air, they were undoubtedly more attractive than they appear in the reception centre of a big city. Their common attribute is an unwillingness or inability to work; or, as a correspondent—not a tramp, but an assisted person—put it recently, "I can, and do, work, but am unable to follow employment." Official policy now

aims at settling unsettled persons. The old are sent to local authority homes and the sick to hospital, and last year 11,000 were "submitted to employment." This large figure, large in relation to the numbers using the centres, covers several placings for one man. Few casuals stick to a job for long, sometimes because they cannot find suitable lodgings, but usually because they prefer to drift.

The immediate issue, which prompted the Assistance Board's report, is whether unsettled persons should be its responsibility or that of the local authorities or whether the present arrangements, by which the local authorities act as the board's agents in running the centres, should continue. The board thinks that it should. At present, it points out, the question boils down to what is practicable. It is regrettable that local authorities should sometimes have to accommodate tramps in part of their premises used for old people's homes. But the alternative is unthinkable. To set up everywhere separate reception centres would, apart from the capital cost, involve expenditure on wages alone of £3 per week per "tramp." Here surely the limits of the welfare state must be firmly drawn.

Guide to British Women

The Central Office of Information has issued a lengthy document telling the overseas reader all he wants to know about Women in Britain. Their legal rights, their usual occupations, their free codliver oil and the height they must reach to be policewomen—all are faithfully described. There is a bibliography ranging from Mrs Beeton to Mrs Braddock, and a list of women's organisations with an account of their objects, from the political and feminist to the well-intentioned or merely cosy:

To promote true friendship and the development of acquaintance as an opportunity for service and the betterment of social conditions. To promote good international relations through the interchange of ideas and a spirit of service among the womenfolk of Rotarians.

After much about women in employment, the overseas reader may be surprised to learn that "most but not all housekeeping is done by women." But he will probably get the impression that the Englishman's home is his joint industrial council. For it is a "serious fact" that "housewives cannot rely on any recognised scale of remuneration for their work but must normally depend for their housekeeping and personal allowance on the goodwill of one individual." It is evident that the British housewife wants a statutory minimum wage, with overtime for washing up the supper things and darning the socks.

The task of the overseas information services is, or should be, to explain the British point of view and to clear up misunderstandings. The moral of this latest effort would seem to be that where there is no particular misunderstanding, it is better to let well alone, save public money and allow foreign journalists to do their own research.

Aircraft and Airpower

Great opportunities are open to the British aircraft industry. Having made great strides since the war, it has now to keep abreast of rapid changes in civil and defence needs. Next week's issue of *The Economist* will include a special series of articles on the achievements and prospects of the

Agenda and Non-Agenda

The Theory of Economic Policy in English Classical Political Economy. By Lionel Robbins. Macmillan. 217 pages. 15s.

Popular mythology has dealt hardly with the great classical economists of the eighteenth and nineteenth centuries; less with their abstract analysis, which remains a historical datum towards which feeling can properly be as neutral as towards Stephenson's "Rocket," than with their social and political views, which appear in the myth as a unique mixture of heartlessness, impracticality and intellectual dishonesty. Indifference to human suffering; ignorance of human behaviour and its motives; an exclusive and unscrupulous concentration on justifying the ways of irresponsible capitalism; such are their chief characteristics—in the myth. Professor Robbins's study, unlike most works on the history of economic thought, leaves to one side both the development of classical analysis and the assessment of its correctness or error, to concentrate precisely on the political and social theory underlying it; and in his preface he expresses, though with some misgiving, the hope that his book may "be some safeguard for a few years against the grosser forms of misunderstanding and misrepresentation."

It certainly should be; there is not much left of the myth by the time Mr. Robbins's urbane but deadly argument is concluded. His first concern is with the nature of that economic freedom for which *laissez faire* is so compendious but misleading a label. It emerges, from his survey of the classics' pronouncements, as a freedom realistically circumscribed and conditional, a thing desirable and possible only within a setting of law and public vigilance poles apart from the atomistic anarchy of the mythologists' imagination. Hardly less remote from legend is the classics' view—though here there is more difference between individuals—of the functions of the state. Even if the "non-agenda" and "sponte acta" of Bentham's classification are wider than even liberal opinion would accept today, the "agenda" are far nearer to those of, say, Keynes in "The End of Laissez Faire" than to the extreme individualism of the French physiocrats. To saddle the English classics with the absurdities of Bastiat or Mercier de la Rivière is to push to its limits the dubious doctrine of guilt by association.

From this general theme Mr Robbins turns to consider the classics' attitude to the "Condition-of-the-People Question." Here he is on more difficult ground. He has, indeed, no difficulty in showing that they were sincerely and deeply concerned with this question; that the welfare of the masses was the chief aim even of their apparently most hard-hearted policies. But the combination of pessimism about overpopulation with optimism about the inherent adequacy of demand, and hence of

employment, led them in practice to play a role not dissimilar to that of the sixteenth-century surgeons who believed, with equal sincerity, in the need to cauterise bullet-wounds with boiling oil. It is not only in the form of socialism that sincere benevolence combined with over-confidence in principles can produce unward results; and while, as Mr Robbins points out, there is a considerable difference between "the workhouse which Senior recommended and the workhouse which actually came into being," the mythologists had some promising material to work on.

The classics' attitude to socialism is analysed in considerable detail in the second half of the book, John Stuart Mill getting the lion's share of attention. The socialism which the early classics analysed and rejected, and to which Mill was intermittently drawn, was, of course, very different from the state-capitalist enterprise or planned economy of today. The continuity of the debate, from Hume to the present day, nevertheless stands out clearly; in the last resort, it is the difference not between "a denial of the necessity for state action on the one hand and an affirmation on the other, but rather a different view of what sort of action is desirable." To the socialist, the characteristic product of the State is the Plan; to the liberal, it is the Law. Mr Robbins's book is not only of historical interest, for it establishes the pedigree of modern liberalism and vindicates its intellectual forebears.

Intrigue and Fiasco

Franz von Papen: Memoirs. Translated by Brian Connell. Andre Deutsch. 630 pages. 25s.

Von Papen was for six months, from July to December, 1932, Chancellor of Germany. His chancellorship began with an intrigue and ended with a complete fiasco. The intrigues of the East Prussian junkers and of General Schleicher had, together with the disloyalty of Hindenburg, led to the fall of Chancellor Brüning, the very man who had just helped Hindenburg to become President a second time. Papen, a keen Catholic, like Brüning belonged to the Zentrum Party; he had promised its chairman, Dr Kaas, to refuse the chancellorship twenty-four hours before he accepted it. Drawing his support solely from the favour of the senile President, he collected together the "Cabinet of Barons." By misusing the extraordinary powers of the President he abolished the Prussian government, consisting of Social-Democrats, Democrats and Zentrum, the last strong bulwark of the Republic. In spite of twice dissolving the Reichstag, he did not succeed in gaining any parliamentary support. The Communists became

stronger than ever. He did a great service to National-Socialists by lifting the ban on the Storm Troopers, without, however, winning them over. It is true that he inflicted a defeat on the Nazis in the second election, but his attempt to take them into his government foundered on Hitler's refusal to take anything less than the chancellorship. Thus he had to resign. But scarcely had Schleicher taken his place when it was learned that Papen had met Hitler for confidential talks on January 4th. When Hindenburg called Hitler to the chancellorship on January 30, 1933, nobody was surprised that Papen joined him as Vice-Chancellor. He imagined he could keep Hitler in check with the help of the "bourgeois" cabinet majority. That this policy again ended in fiasco is well known.

It was only to be expected that a man who had so manifestly foundered would follow the example of other German generals and politicians who have tried to prove by their memoirs that they were innocent. But Papen's memoirs, in spite of their wealth of detail, are unlikely to make opinions about him any more favourable. Here and there he does indeed admit a mistake, but on the whole he merely repeats the old slogans. There are frequent inexactitudes, which occasionally look like distortions. One cannot let him get away with it when he says that the State Supreme Court declared his action against the Prussian government to be "completely constitutional." The Court in fact ruled that the presidential measures, sponsored by Papen, had in important respects exceeded the competence of the President. Papen tries to camouflage with ambiguous phrases the fact that he prevented the execution of that part of the judgment which was unfavourable to him. Many more illustrations of his inaccuracy could be given.

The gravest charge against Papen's character is that he remained in Hitler's service after the latter's gangsters had murdered his two closest collaborators on June 30, 1934. He tries to dispose of the evidence of the letters, which he then wrote to Hitler and which were adduced against him at Nuremberg, by remarking that "some of the phrases in these letters now seem open to criticism." This is how Papen wrote to Hitler: "I desire to shake your hand, as I did on January 30, 1933, . . ."—the hand still stained with the blood of his closest friends. In order to give the affair its logical ending, Hitler's executioners murdered Papen's confidant, von Ketteler, immediately after the German entry into Vienna, and, a year later, Papen became Hitler's ambassador in Ankara. That, too, he tries to justify.

The Nuremberg Court acquitted Papen of the accusation of sharing the responsibility for the war. The judgment of history, which has to examine many other charges as well, will not acquit him.

Putting Over America

Public Relations and American Democracy. By J. A. R. Pimlott. Princeton University Press. (London: Geoffrey Cumberlege.) 265 pages. 25s.

The temptation to anyone writing about American public relations to draw on the style and devices of the creator of Babbitt and Elmer Gantry might well seem to be irresistible. Mr Pimlott, many might think, has resisted temptation only too well. His book is the product of researches made in the United States in 1947-48 and material gathered subsequently, and it presents his findings with a decorum proper to a distinguished member of the British Civil Service and to the holder of a Commonwealth Fund Fellowship. It eschews all flippancy and sweeping generalisation, looks at every issue with an entire absence of prejudgment, quotes chapter and verse wherever possible and gives to the practitioners of public relations the benefit of whatever doubt remains at the end of its exhaustive examination.

Much, though by no means all, of what it has to say is concerned with public relations in American government, and it is here that Mr Pimlott's touch seems surest and his conclusion most firm. Partly, no doubt, this is due to the greater ease with which the official data can be collected and examined, compared with the unofficial and, in particular, the commercial. But it is also because, by virtue of his own British training and experience, Mr Pimlott is more at home in this world than in the other, even less ordered, stamping-grounds of American public relations men.

It is an irony of the whole American practice of public relations to which Mr Pimlott draws attention that for persons whose chief tools are words their level of literary skill is astonishingly low. There are time, alas, when some of the verbal "smog" of their technical jargon seems to have leaped into Mr Pimlott's own pages. Either this, or some more subtle infection, has at one or two points not only sullied his prose style but also blurred the commonsense which is usually the hallmark of his analysis. For example, need one seek as far as he does for the roots of public distrust of public relations? Is it not natural, and healthy, to distrust anyone who is hired to handle the most universal manifestation of our common humanity, a man's relations with his fellow human beings? "Bigness" and the development of huge corporate entities may necessitate this specialisation; they cannot make it natural. Again could not Mr Pimlott have probed further into the question of why it is America which has seen the especial efflorescence of public relations? Or, to put it another way, can his subject be properly understood if it is not seen in relation to American society and American life in general?

That these questions arise is in part a tribute to the stimulating character of Mr Pimlott's book. It ranges wider and probes deeper than any other treatment

of the subject. It is genuinely a book which no one who wants to explore the field can ignore.

World Trade Theories

The Commerce of Nations. By J. B. Condliffe. Allen and Unwin. 884 pages. 36s.

Professor Condliffe's book provides in a form easily readable by the beginner, or, indeed, by the complete layman, an account of the growth of international trade from the earliest times to the present day, together with a parallel and interwoven discussion of the development of doctrines bearing upon international commercial policy. This necessitates summarising a very considerable part of the history of economic theory, and it is not surprising that such a book, though (it must be repeated) highly readable, is long. Indeed, it has been pointed out that Mr Condliffe runs the rather similarly named work of Adam Smith within ten pages or so.

The book is divided into four parts. The first deals with the history and doctrines of international trade up to and including the period of mercantilism. The second, and longest, concerns the nineteenth century, and deals with the doctrine of *laissez faire*, its application in commercial policy, its nationalist and socialist opponents, and the emergence of the classical and neo-classical theories of international trade. It also includes an account of the pattern and monetary mechanism of international trade as they developed during that century, and the part played by international capital movements. It is here, perhaps, that the analytical weakness of the more modern section of the book becomes apparent. The part played by income variation in the international adjustment mechanism of the nineteenth century can hardly be said to be sufficiently discussed. Nor in the treatment of neo-classical theory, in this and the succeeding section, is the Bickerdike-Edgeworth attack on the classical case for unilateral free trade given its place.

The third section of the book deals with the changes of the last forty years. As one might expect from Mr Condliffe's earlier works, it makes a mournful story, lightened only by the discussion of the new international machinery at the end. It is perhaps a little difficult for the reader to appreciate the extent to which the developments of this time arose, not out of war and wickedness in high places, but out of the inevitable changes in world economic structure.

The last section is called "The Modern Problem." It is the least strong, for the enormous difficulties of surveying the elements in that problem, as modern theoretical and applied studies have begun to reveal them, are above the level at which Professor Condliffe is writing in this book.

The difficulty that thus emerges progressively towards the end of the book suggests the reason why there was this gap for the author to fill. International economics is one of the most difficult branches of the subject. To write a clear

book for beginners covering the enormous range which Professor Condliffe has courageously chosen must involve a dangerous degree of oversimplification. He is no doubt aware of the dangers he has risked. If he is judged to have fallen a victim to some of them, he at least has the consolation of having escaped a great many others.

Dicey Refuted

Principles of Administrative Law. By J. A. G. Griffith and H. Street. Pitman and Sons. 316 pages. 30s.

Dicey maintained that this country had no such thing as administrative law. Generations of lawyers grew up believing him and, what is worse, believing that anything which looked like administrative law must be of a dubious parentage and best ignored. Dicey may have been substantially right in his statement when he made it (although the licensing justices were, and are, an example of an administrative court of considerable antiquity) but he was describing a state of affairs which had begun with the Star Chamber and ended with the creation of the county councils. Today it is the complaint of the lawyer that we have far too much administrative law and, what is worse, that what we have is frequently ill considered and poorly adapted to the ends of justice. Administrative law has been left in charge of the civil servant, and to the civil servant the individual is something that may become a precedent, and an awkward one at that.

The authors of this volume are lawyers who are also lecturers at London and Manchester respectively. The subjects covered range from the origins of administrative law, the law-making powers of the administration, to the use which the administration makes of its powers and the controls which the public, directly or through Parliament, has on the administration at work. It also contains two chapters of great value, one on suits by the individual against the administration, the other on public corporations, which are already creating a new field of legal and social relationships. The earlier chapters cover ground which seems more familiar, although so much has changed in the last ten years that a new guide is extremely useful. The chapter on public corporations is a valuable summary of their legal framework, but no more than (as the authors agree) an approach to one aspect of the *massif*. Perhaps the most useful single section, in the breaking of fresh ground, is that part of Chapter IV which discusses the elements of "natural justice" that should be present in every proceeding before an administrative tribunal.

The book leaves one prevailing impression, that this is a field of social organisation which has suffered a great deal from the absence of basic principle and basic thinking, below the level of contemporary politics. It is not surprising. As the authors point out, politely, neither the Law Society nor the Bar Council includes administrative law as a subject in their professional examinations. The practising lawyer must learn after he is qualified and without the benefit of a study of principle that should

be a part of his first training. Fortunately it is still true that law and administration are shaped by those who write about them as much as by those who practise them. That may well be the principal contribution to both that the authors are making.

International Patenting

The Economics of the International Patent System. By Edith Tilton Penrose. Baltimore, Johns Hopkins Press. (London, Geoffrey Cumberlege.) 247 pages. 32s.

It is commonly assumed today that a statesman is in some degree an economist as well, or at least that he knows where to find economic data relevant to his work. Unfortunately, the reverse does not always seem to be true. In this book an economist attacks a treaty without taking into account the objectives of statesmanship in treaty-making.

Dr Penrose's book was written to demonstrate that the International Convention for the Protection of Industrial Property, in existence since 1884, needs revision in order "to alleviate the restrictions on trade and industrial activity which unregulated international patenting permits." Starting from the hypothesis that national patent systems are economically undesirable, the author's reasoning leads her to the dual findings that international patenting has no significant effect in promoting technology but that, so long as national patent systems remain, patenting limited to a single country would exert an uneconomic influence on the international location of industry. From these findings she concludes that an international convention between major industrial countries having patent systems is a present necessity. But "it would be good policy," she urges, to permit all other countries "freely to use all foreign originated inventions," a result which could be achieved by releasing them from their treaty obligation to grant patents to foreigners. The author's object is to enable those who do business in these "backward" countries to secure prompt and efficient (i.e., royalty-free) access to inventions made in the major industrial countries—a kind of "Point 4" at private involuntary expense.

The argument overlooks one of the important reasons why civilised nations make treaties. Experience long ago taught us that men are angered by the acts of men in other lands which they deem, rightly or wrongly, to be an indecent depredation upon their private "rights." Those who have invested capital in the creation of "foreign originated inventions" are surely not immune from such sentiments.

The views of Dr Penrose upon the economic value of national patent systems are derived from highly debatable arguments, and in applying them to the area of international compacts she has overlooked the main purpose of treaty-making—the reduction or prevention of international differences. National representatives, when they next meet to revise the convention, are not likely to follow her example.

Letters to the Editor

Our Maps

Sir,—As a geographer who has for many years been a regular and appreciative reader of *The Economist*, I have often sought, though hitherto in vain, to fathom the mysteries of its cartographical policy. During the bleak years immediately following the war, for example, not even the merest molehill appeared to block the way of the massed might of potential aggressors, whether in Greece, the Far East or South-east Asia, and the proverbial glance at the map was sufficient to start one shivering in one's shoes. About 1949, however, perhaps because of a growing sense of confidence or perhaps because—having taken to task an eminent authority for writing "Flat Geography"—*The Economist* indulged in a fashionable bout of self criticism and found itself wanting, a notable change took place. Coastlines lost their whiskers and acquired the well-groomed appearance appropriate to Throgmorton Street and, more significant still, hordes of little woolly caterpillars appeared in the vicinity of Alps, Himalayas and Pyrenees—providing, of course, that nothing more specifically economic could be found to take their place. In the early days of this experiment, it is true, these slender and ill-fed creatures were too innocuous to cause much anxiety to an invader, but more latterly they have gained in confidence and corpulence to an extent which should make even the Kremlin think twice.

So far so good; but on page 442 of your issue of August 23rd a new development appears. The caterpillars are visibly wilting in the equatorial heat of Indonesia and the whiskers, admittedly transmogrified into a more respectable stipple, have returned. But what is their significance? Here, indeed, we are in deep waters unless, as at first sight appears, they are meant to mark the shallow waters of the Sunda shelf. But, if so, what on earth has that to do with Communists in Sarawak unless, of course, in such an amphibious region as this, subversive movements are classed as undersea activities? And, even so, would it not be better to introduce a little more accuracy and reinstate Wallace's Line to its time-honoured place between Borneo and Celebes?—Yours faithfully,

CHARLES A. FISHER
University College, Leicester

Limits of Free Bargaining

Sir,—In your issue of August 16th you suggest that "points rating" systems are the device of "certain Left-wing intellectuals." This is not true within the industries where such systems apply, nor is it true to say that the desire for the extension of this system on a national basis is confined to the "intellectuals" of the Left. The attempts in Holland to provide such a national wages structure have not been altogether unsuccessful, and I would

suggest that such a system has many advantages, even from the economic point of view.

You say that such plans take "no account of shifts in demand for different kinds of labour." But wage rates play only a secondary role in the allocation of labour resources, and present-day wage rates bear even less relationship to the free market price of labour than a scheme such as that suggested. All point rating schemes seek to assess, in effect, the scarcity value of different types of occupational "disutility." These include factors for training, (i.e. skill), hazard, discomfort, and, in some schemes, responsibility. It should not be too difficult to provide a points system which, if not completely accurate, at least places such jobs in a relationship acceptable to both employers and men.

It is, of course, quite true that under such a system a flint knapper would be assessed higher than a production belt worker, and indeed it is in the best interests of economic production that this should be so, since many so-called "skilled" trades are only made economic at the moment by grossly underpaying the resources devoted to the training of their operatives. If people want flintlocks, they should be prepared to pay the necessary premium for the skill involved.

The production line worker, on the other hand, is often grossly overpaid, particularly in the motor car industry, by comparison with his more highly skilled opposite numbers in other trades. This is, of course, achieved by various alleged incentive systems, which have the effect of making the incentive proportion far higher than the base rate. It is impossible in the space of a letter to suggest means of implementing a national "points rating" system, but a useful start in this direction would be to assess the wages bill for an industry on an agreed proportion of the standard week's base rate, and to levy company taxation on any wages paid in excess of this, either in overtime or bonus payment. This would at least have the merit of stabilising wages instead of allowing them to be raised out of proportion by firms who happen to be temporarily, at least, in a better trading position.—Yours faithfully,

D. H. BROOME

Derby

From Colorado to Cape Cod

Sir,—In your issue of August 2nd a correspondent refers to "Salem, Massachusetts, famous for witch-burning." In one sense he is correct, for the Salem witch-burnings are indeed a common article of faith. In fact, nineteen women were hanged for witchcraft in 1692 and one man suffered the *peine forte et dure* for refusing to plead. But no witches were ever burned in Salem.—Yours faithfully,

ROBERT D. HOLRAN

AMERICAN SURVEY

Eisenhower's Burden

Washington, D.C.

EVERY four years the Republican party announces with anticipatory glee that, as General Eisenhower said a week or two ago, "the American people want a change." So far this estimate of public desires has proved sadly inaccurate but the old phrases are being used again this year, and this year they have a better chance of turning out to be true. Whether they do or not will depend on the decision of the independent voters, that quarter of the electorate which does its own thinking and is obviously unimpressed by such mis-statements as Senator Nixon's repeated cry that the comparatively conservative Mr Stevenson is a captive of the left-wing labour organisations. The independent voters are impressed, however, by evidence of corruption in the federal government and by the casual way in which this has been treated by one Attorney-General after another. And their concern over this state of things would probably ensure victory for the Republicans if the Democratic candidate appeared unwilling to do anything about corruption, and if General Eisenhower had not an even heavier burden to carry.

The General's burden is the weight of his fellow-crusaders standing for election to Congress and, particularly, to the Senate. It is now well known that the Republicans have only an outside chance of getting a majority in the Senate, even if their presidential candidate wins by a comfortable margin. It would be far better for him, and for his policies, if many of his "supporters" were soundly thrashed by their Democratic opponents, who would be much more likely to give President Eisenhower the only support that counts, votes in Congress, for the programmes in which he believes. But, under pressure from those in the party who accused him of not being an "organisation" man, General Eisenhower stoutly affirmed his trust in party organisations and, in his speech accepting the nomination, said that "we must have . . . a Republican majority in the United States Senate . . . to achieve these aims"—a programme of progressive policies, the uniting of the country, the strengthening of freedom and the building of a sure foundation for sound prosperity at home and a just and sure peace in the world.

Just how the kind of Republicans who are running for the

Senate this year are going to contribute to the achievement of these aims has not yet been explained by the Eisenhower headquarters, and many of those who expected a decisive lead from the General are perturbed. *The Reporter* magazine last week expressed their feelings in verse:—

Jenner and Kem, Jenner and Kem,
What are we going to do with them?
Oh Lord! the sins that we shall see
Done in the name of unity,
When those who wish each other dead
Must share one platform—and one bed!
Crusade for what? An answer, please—
And skip the generalities.

General Eisenhower has spent the weeks since the convention in appeasing the Republican Old Guard instead of wooing the independent voter—with, it seems, not too much success. As far as can be ascertained, Senator Taft is still irreconcilable and is going to provide the minimum of support compatible with decency, except in his own State, Ohio, where he will work for his brother and Senator Bricker. And the Taftian faithful throughout the country will be waiting for a lead from the master before exerting themselves. Meanwhile the independent voter, having been offered an alternative candidate who seems to have an irresistible attraction for intellectuals, is

deserting the Eisenhower Crusade. And for the sake of the independents the Alsop brothers have lately been appealing, apparently without success, to General Eisenhower to keep away from at least Wisconsin and Indiana and overt support for the notorious Republican Senators standing in those states, Mr McCarthy and Mr Jenner.

This problem faced General Eisenhower from the moment that he decided to run for the Presidency, and he was warned months ago of the effect on the independent votes of endorsing such characters as Mr McCarthy. But the argument which *Newsweek* calls "a shatteringly fierce one" still goes on as if the dilemma were new. The uneasy compromise which the General presented to press correspondents when his hand was forced satisfied nobody, and saddened the *New York Times*. Unfortunately he cannot afford to snub, or even to ignore, all those who will be liabilities if they are elected or re-elected.

With a few exceptions, it can now be seen what the contests in the Senate will be like and how well placed the Democrats appear to be. There are 35 seats to be filled this year: the normal one-third of the Senate and three additional changes caused by deaths. In the Eighty-second Congress, the Democrats now have a majority of three, 49 to 46, with one seat, that of Senator McMahon in Connecticut, vacant, and they hold 15 of the seats coming up against 20 held by the Republicans. Of those 15, six, in Florida, Mississippi, Rhode Island, Tennessee, Texas and Virginia, can be considered safe. Of the 20 Republican seats, there are also six, two in Nebraska and one each in California, Maine, North Dakota and Vermont, that are equally safe. This leaves, therefore, 14 Republican and 9 Democratic seats which could change hands.

In these contested seats the quality of the individual Senators and their opponents is of importance. Some months ago, the *New Republic* published an order of merit in the Senate, drawn up by a group of political scientists on the basis of the various Senators' attitudes on domestic and foreign issues, their legislative and intellectual ability, and their personal integrity. Though it is possible to quarrel with these ratings in detail, they are accepted as a reasonably accurate guide. In the opinion of these political scientists, nine of the fourteen Republicans and only one of the nine Democrats who could be in trouble come from the worst half of the Senate and, of the Republican nine, four come from the last five on the list; the other member of the quintet is the Democrat, Senator McKellar, a liability of which the voters of Tennessee kindly relieved Mr Stevenson in the primary election. Of the worst four, Mr McCarthy seems almost certain to be re-elected, but the other three, Mr Jenner, Mr Cain, of Washington, and Mr Malone, of Nevada, may well be beaten. So may others among the General's problem children, unless he carries them home on his back; for example, Mr Kem, of Missouri, Mr Watkins, of Utah, and Mr Ecton, of Nevada. If they are beaten it will, to a great extent, be because their Democratic opponents are demonstrably superior individuals.

At the moment Senator Bricker, of Ohio, eighty-sixth on the political scientists' list, Senator Martin, of Pennsylvania, fifty-third, and Senator Alexander Smith, of New Jersey, thirty-fourth, seem likely to win without difficulty, although all three are opposed by energetic campaigners who could transform the struggle if things once began to flow their way. Unfortunately, the best of those Republicans running this year, Senator Lodge, of Massachusetts, seventh, is in serious danger. Although his opponent, Representative Kennedy, the son of the ex-Ambassador to Britain but by no means a chip off the old block, would no doubt be a good Senator, it would be a disaster if Mr Lodge, or any other of the Eisenhower group, among them Mr Ives, of New York, twelfth, or Mr Thye, of Minnesota, forty-second, were beaten, particularly if most of the Old Guard team were to be re-elected.

The danger to those Democrats seeking re-election is not as great. It would be gratifying if the worst of them, Senator Underwood, of Kentucky, sixty-sixth, lost to Mr John Sherman Cooper, who has already had a short term in the Senate and has represented the United States at the United

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Nations. But the seats most likely to be lost are those of Mr Blair Moody, of Michigan, nineteenth, Mr Benton, of Connecticut, fifteenth, and that of Senator McMahon for whom a successor has not yet been chosen. Connecticut is a state which has been slowly changing from the Republican to the Democratic side. In 1950, for the first time in a non-presidential election year, Democrats were elected to the Senate and, with Mr Stevenson's help, Mr Benton, at least, should scrape through this time.

To gain a bare majority in the Senate, the Republicans must hold all their own doubtful seats and win some of the doubtful Democratic ones; this will be a hard task, unless the Eisenhower campaign suddenly catches fire and burns up the Democratic opposition, a phenomenon which few people now expect. And the General finds himself in a difficult position when faced with independent voters who want a change. He is unable to promise, as Mr Stevenson is, to clean house. The dirt in General Eisenhower's house, if he is elected, will have been brought in by the voters of the die-hard Republican states; the exigencies of politics, which insist that a Republican majority is needed in Congress, will not only have forced the General to help those voters to bring it in, but will oblige him to let it stay.

Mr Stevenson, on the other hand, though he has a hard task, has not got an impossible one. Appointed officials can be dismissed—some left the Justice Department precipitately as soon as he had been nominated—and it is appointed officials who are responsible for the dirt which must be swept from his house. And who can doubt that he will try to do it when he had the temerity, the unnecessary temerity, considering that it was a moment when platitudes could have been excused, to say, in his acceptance speech, with the President beside him on the platform: "Do you doubt the power of any political leader, if he has the will to do so, to set his house in order without his neighbours having to burn it down?"

Labour Stands Firm

[FROM A CORRESPONDENT IN WASHINGTON]

GENERAL EISENHOWER'S failure to win any substantial support in the American labour movement is one of the ironies of the Republican election campaign, for at the time of the nominating conventions one of his backers' best selling points was that he would be a unifying force. Republican leaders were warned that, if Senator Taft were nominated, all of the labour leaders would be alienated, but were promised that, if the party chose General Eisenhower as its presidential nominee, the magnetic attraction between the Democratic party and the heads of the trade unions would be neutralised. After that, the Democrats nominated Governor Stevenson, perhaps their most conservative candidate since the Wall Street banker, Mr John W. Davis, in 1924. Yet, even so, the organised labour movement has polarised around Mr Stevenson as decisively as it ever did around Mr Roosevelt or Mr Truman.

First, the executive board of the Congress of Industrial Organisations met, within a few weeks of the Democratic convention, and warmly endorsed Mr Stevenson as the authentic guardian of the New Deal and the Fair Deal, in spite of the fact that he has been unsympathetic to some of the more left-wing policies of the Truman Administration. Mr Stevenson particularly disapproved of the President's handling of the steel strike and criticised him publicly for his failure to restrain it by obtaining a court injunction under the Taft-Hartley Labour Act.

As regards the Act itself, the bugbear of the labour movement, Mr Stevenson, before his nomination, stood for its revision, but not for its repeal. But since his nomination he has trimmed his words to fit the Democratic platform, which once more promises to abolish the Act. Mr Stevenson now explains that "repeal" is a form of revision, and that perhaps it would be wise to rid the law books of the political symbolism of the title of the Taft-Hartley Act. But, while the praises of the trade unionists were still ringing in his ears, Mr Stevenson went out of his way to dissociate himself from their good friend in Washington, President Truman, and demonstrate that he was not the "captive" of any man or any group, in spite of Republican allegations to the contrary.

The powerful American Federation of Labour, which claims 8 million members to the CIO's 6 million, is also climbing aboard the Stevenson bandwagon, in its own more cumbersome way. Its executive council has invited both presidential candidates to address the AFL's national convention in New York later in September and has announced, unofficially, that at that convention the council might, for the first time since 1924, recommend the delegates to endorse one of the presidential nominees. The invitation to both candidates has the outward appearance of complete impartiality, but General Eisenhower will be speaking against a strong bias at the AFL convention. The overwhelming majority of the trade union leaders in the federation are wholly committed to Mr Stevenson and the Democratic party.

The surprising thing about this concentration of organised labour strength around the Democratic nominee is that the Republican General Eisenhower has always had many friends in the labour movement, and there was real reason to expect that he would at least temper the tendency of trade union leaders to regard the Democrats as their best political hope. For in 1947, when President Truman was floundering in his leadership and had not yet begun his sensational political comeback, Mr Philip Murray, head of the CIO, and other labour leaders were amongst those who thought that General Eisenhower was the man who could revivify the Democratic party, if he became its candidate for President in 1948. Later, when in Paris, he made many good friends among labour leaders, for the General was intensely interested in the efforts of British and American trade unionists to counter the influence of Communism among the trade unions of Western Europe.

There are still traces of this friendship, although General Eisenhower has been unable to make political capital out of it. The labour leaders, even though they have swung to Mr Stevenson, have spoken kindly of the Republican nominee; the CIO executive board justified its position by declaring that

no candidate, however respected and however well intentioned, could wrest power from the entrenched Old Guard who still control the Republican party.

This statement ignores the fact, of course, that the Democratic nominee has as many undesirable political relatives as the Republican. But in a political fight there is an indisputable psychological advantage in being the first to point to the skeletons in the opposition's cupboard.

The Republicans have naturally tried to minimise the advantage of the labour endorsements that Mr Stevenson has won. Senator Nixon, the Republican nominee for Vice-President, greeted the news from the CIO and AFL meetings with the sour comment that the labour leaders could

not deliver the vote of the trade union rank and file. There is, indeed, no guarantee that they can deliver all of it everywhere and there is some evidence that, in the 1950 Congressional election, too ardent support from labour organisations did some candidates more harm than good, by alienating independent voters. But the trade unionists are now well aware of this danger and the Republicans can certainly not afford to ignore the importance of Mr Stevenson's labour support. For if the union members are efficiently registered as voters and brought to the polls on November 4th, a question of organisation to which labour leaders have always paid much attention, their influence could swing closely contested states like California, Illinois, Michigan and Ohio into the Democratic column. And it is on these large industrial states that both candidates are counting for victory.

American Notes

Boiling Oil

If any proof were needed that, between now and next November, the heat will be put on in Washington by domestic politics rather than by international considerations, it has been provided by the smoking out of the Federal Trade Commission's report on the alleged cartel arrangements between the five leading American petroleum corporations and the Anglo-Iranian and Royal Dutch-Shell companies. Together these seven firms are supposed to have eliminated competition in the international trade in oil, from production through refining to distribution, by means of agreements, on marketing and pricing, made between 1928 and 1934.

A report dealing with restraints on trade by the industry—which is traditionally the favourite target of the trust-busters—is obviously just the fuel the Democrats need for building a fire under Republican big business, and for warming up the anti-monopolistic prejudices of the voters. In addition,

Located in the heart of the City, the London office of this old established bank offers its services to those interested in trade with countries in the Americas and throughout the world.

THE HANOVER BANK

(Incorporated with Limited Liability in U. S. A.)

NEW YORK . . . 70 Broadway

the Democratic vice-presidential candidate. Mr Sparkman, is the chairman of the Senate Small Business Committee, which has long been interested in the FTC report because of its concern about the danger to the independent domestic oil producers of competition from the international companies. Although Mr Sparkman denies having pressed the President, it must be for the sake of sticking a useful feather in his campaign cap that President Truman has at last consented to the publication of a report which deals largely with negotiations over the development of the Middle-Eastern oil fields; for the political situation in that area is as delicate now as it was last year when the report was suppressed in order not to embarrass the State Department.

The companies are reserving their defence, which rests partly on a denial of the charge, partly on a claim that many things now being objected to were done with the full approval of the State Department, until next week when a grand jury is to consider whether or not they should be indicted under the anti-trust laws. Meanwhile, however, the American companies concerned, with the exception of the Gulf Oil Corporation, which may be included later, are already being sued for \$67 million in damages by the Department of Justice, acting on behalf of the Mutual Security Agency as the Economic Co-operation Administration's successor. The charges arise out of one of the practices described in the FTC report, under which oil prices all over the world are based on costs at the American Gulf ports, far higher than costs at, say, Persian Gulf ports. The companies justify this practice by claiming that oil prices depend on world supply and demand, not on costs of production.

But the practice, it is alleged, meant that European countries buying Middle-Eastern oil from American companies were charged "exorbitant" prices and that the American taxpayer suffered, since payment came from foreign aid funds. Furthermore, the price of Middle-Eastern oil "dumped" in the United States, is said to have been much lower than that charged in Europe, thus contravening the legal requirement that no foreign aid money should be used to buy commodities at prices higher than those prevailing in the United States. But there is a suspicion that election politics may also enter into this case. For these contracts were approved by Mr Paul Hoffmann, now one of General Eisenhower's advisers, when he was in charge of ECA; they are being queried by Mr Averell Harriman, a leading Democrat, who heads MSA.

Absorbing the Steel Shock

The federal budget is one of the few economic indicators that has turned downwards lately; in its case that is the way it ought to go. The President's revised estimates, now that the 1953 fiscal year has actually begun, show revenues, at \$68.7 billion, expenditures, at \$79 billion, and the coming cash deficit all falling below last January's forecast, the deficit by \$4 billion. The decline in revenue is because corporate profits are yielding less in taxation than had been expected; nevertheless there is no doubt that the tax collectors' record haul, of almost \$65 billion, in the 1952 fiscal year will be surpassed. Congressional pruning of appropriations is the main reason why estimated expenditure has fallen, but the steel strike is also partly responsible, for it means that spending on armaments will be prevented, by shortages of steel, from mounting as sharply as had been expected.

This has, however, the advantage, from the point of view of the national economy, that the defence programme will be stretched out still further than had been expected—the peak period will not now come before mid-1953—and that the critical moment when government spending begins to drop has again been postponed. But the shock both to rearmament and to ordinary industrial output resulting from the steel strike is being absorbed surprisingly quickly. During the

present quarter the gross national product is bound to stop rising, but well before the end of the year it should have resumed its upward climb, a climb which is not simply in dollar value but in actual physical output. It was government spending on national security that speeded up the rise in the gross national product so noticeably in the second quarter of this year and armament factories are of course getting first claim on scarce steel supplies, with the day when there will be plenty for everyone put off until next year. But with an election round the corner the Government does not want to risk unemployment in civilian industrial centres; in consequence makers of automobiles and other consumer goods are not being kept so short of steel as they had feared.

Many of them in retrospect regard the steel strike as a relief rather than a shock, for it enabled them to get rid of uncomfortably large stocks of the refrigerators and washing machines which had been selling badly for so long. Demand for these has now been stimulated by Congress's insistence on relaxing restrictions on instalment credit but,

still afraid of nipping this reviving market in the bud, manufacturers are hesitating to pass on to consumers all the increases in their costs arising from the increase in the price of steel which was part of the strike settlement. That settlement is therefore unlikely to be as immediately inflationary as was predicted by the Price Stabiliser, Mr Ellis Arnall, who has now left Washington to its fate.

But even the Secretary of Commerce, who always took a more cheerful view of the situation, admits that another spiral of rising wages and prices may be on the way. This depends on whether the steel settlement was the end of the last round of inflation or the beginning of the next. It looks as if it might be the beginning, for between now and the election the Administration will hardly dare to refuse wage increases to voters faced with a rising cost of living: in July the consumers' price index went higher than ever before. The stimulus came from food prices, pushed up by the drought; they have steadied now, but the general trend is still upwards and Congress took away what power the Administration had to reverse it. Mr Tighe Woods, Mr Arnall's successor, will find it as hard to preserve stability in his new job as he did in his old, where he was supposed to hold down rents.

Candidates on the Middle Road

This week both General Eisenhower and Governor Stevenson began their election campaigns with supposedly non-political speeches to the American Legion convention in New York. From there both are taking to the road and it

looks like a middle road for both. Careful planning will probably prevent them meeting again geographically, but ideologically they are far too close together at the moment to suit the politicians. This is partly because both are naturally moderate in their views, partly because both want the support of the independent, undecided voters, to whom extremes do not appeal.

The need to strike out in a direction of his own is at least one of the reasons why General Eisenhower in his address to the Legion advocated what seems to be a dangerously aggressive foreign policy. For a few days earlier he had commended, in principle at least, President Truman's policy on Korea and some of his domestic social policies as well. As a result the General found that he was earning the "me-too" label that is supposed to have cost Mr Dewey his victory in 1948. So far it has only cost General Eisenhower the support of Colonel McCormick and the *Chicago Tribune*, which he can well do without; the Colonel is forming a new "American party," but will confine its activities to the Congressional elections for the present. However, as the Scripps-Howard press has warned General Eisenhower, a candidate campaigning on the "need for a change" cannot win by endorsing the policies of the Administration that is supposed to need changing.

Mr Stevenson, on the other hand, has been getting into trouble for admitting that the Administration, which he wants the voters to continue, does indeed need a change, that there is a "mess in Washington." For him, as Mr Truman has sharply reminded him, the danger is that he will dissociate himself too much from that Administration's record and undermine the solid foundation of party workers and trade unionists on which past Democratic victories have been built. To get back to the Truman line, and also certainly in order to be true to his own high principles, Mr Stevenson last week bravely risked cracking another of the Democratic corner-stones, the solid South. In an interview with Governor Shivers of Texas, a large southern state which the Republicans already hoped to win, Mr Stevenson refused to compromise on the tidelands oil issue. The oil under the coastal waters of the states is now, according to a Supreme Court decision, controlled by the federal government and Mr Stevenson made it clear that if Congress again tried to give this oil to the states he would follow Mr Truman's example and veto the Bill. And a furious Mr Shivers left declaring he would not vote for Mr Stevenson and might lead his friends into the Eisenhower camp if they wanted to go.

In his speech to the American Legion Mr Stevenson showed his sympathy for another of Mr Truman's courageous stands, that against exaggerated anti-Communism. The way in which Mr Stevenson explained this problem, and that in which he elaborated the main theme of his address, the meaning of patriotism, has confirmed the faith of those who believe that here is a man who could be a great President.

Scraping the Barrel

Europe is not alone in worrying about soldiers for its armies; in the United States, the men called up when conscription was resumed in September, 1950, after the Korean outbreak, are nearing the end of their two-year period of service. Of the Army's present strength of 1,558,000 men, about 700,000 will be released during the next year, and the armed forces altogether will need about 1,200,000 men between now and next June for replacements and expansion. While the Air Force (1,061,000 men), the Navy (835,000 men) and the Marines (243,000 men) draw entirely on volunteers, the Army leans heavily on conscription, and it will soon be scraping the bottom of the barrel of 18½ to 26 year olds now liable for service. The sharp upward swing in the number called up or "drafted" by local Selective Service boards at the Army's request—from 30,000 in

September to 47,000 in October—reflects the accelerating need for replacements, to be found from a diminishing supply.

Over a million men have been drafted in the past two years, and 700,000 have volunteered. The Selective Service policy has been to begin with men of 25 and work downwards; 20 year olds are now being taken and before long men of 19 will be called. Although about 800,000 boys reach registration age each year, many of those between 18½ and 20 have already volunteered, or are excused because they are students or apprentices. Of the entire 18½ to 26 age group, 1.6 million are automatically excluded because they have already done military service while nearly 3.5 million are at present deferred.

Draft officials, driven by the need for about 50,000 men a month from October on, are therefore being driven to take stock of the deferment policies which keep such a large number out of uniform. Over 300,000 men are deferred because they are engaged in essential work, another 100,000 are farmers, and there are 200,000 in school and college with sufficiently high academic standing to keep them out of the Army until their schooling is completed. Unsatisfactory health has caused the rejection of 1.5 million more, but it is doubtful whether mental and physical standards, now as moderate as they were during the war, can be lowered further.

The most likely candidates for review and the largest remaining group of deferred men, totalling almost a million, are those with dependents, usually children. While technically liable to be called up, fathers are now exempted by executive order, but Army officials forecast that by next summer they will be forced to ask for the drafting of "post-Korea" fathers. This step can be taken under present laws, while other solutions for manpower difficulties, such as raising the age limit or lengthening the term of service, would need new legislation; this would be even less acceptable to Congress than in the past, now that European conscription has begun to move in the opposite direction. Until the election is over, the services will content themselves, and try to content the Congressional critics of the way they use money and men, by making efficiency surveys; the Air Force has already announced plans for "rigorous austerity" to reduce the number of "chairborne" personnel.

Shorter Notes

The McCarran Internal Security Act has forced a judge to rule, with much regret, that a Finn, Mr Karl Latva, who has lived in the United States for many years and has an American family, must be deported because he once paid 90 cents in dues to the Communist party. This happened eighteen years ago, and Mr Latva claims to have had no connection with the party since. He revealed his Communist membership voluntarily when seeking US citizenship and the Department of Justice expects to find some way of avoiding his deportation.

Modern alchemists searching for a method of purifying salt or brackish water in large quantities will have the aid of a \$2 million grant from the federal government over the next five years. Most of the money will be given to private firms for research on the project, which is actively sponsored by the Department of the Interior.

Non-melting ice, which is available at temperatures from -8 to 32 degrees Fahrenheit and can be used over and over again, has been developed by a Californian firm and is already in use by shippers and industry. A mixture of water and a special powder produces a gelatin material that can be frozen and thawed at will with no gas or water seepage; the amount of powder fixes the temperature when frozen.

THE WORLD OVERSEAS

The Fifth Soviet Five-Year Plan—I

Keeping Up the Pressure

THE Soviet planners have finally revealed their cards and published a draft of their Five-Year Plan for the years 1951-55. Some eighteen months after the completion of the first postwar plan, we can at last get a glance at its successor. Although its ultimate targets have remained secret, the plan has been in operation, and some time ago the Russians published a balance sheet of its first year. It is now possible to see what changes they propose to make in the next four years, including the current one.

High targets are no novelty to a student of the Russian economy, and he has come to take average annual increases of about 10 per cent in the national income and 12 per cent in gross industrial production almost for granted. This is in fact what the new plan foresees; i.e., a rise over the five years of about 60 per cent in national income and 70 per cent in the gross output of industry. The rate is somewhat slower than in the previous plan, but this can be explained partly by the naturally quicker tempo of postwar reconstruction and partly by the introduction of a more realistic measuring rod—the current 1951 prices instead of the obsolete 1925-7 prices used in previous calculations.

In heavy industry the pattern is changed but little. In absolute terms, output of coal, electricity and pig iron will increase on an average during the four years slightly more than last year. The average annual rise in oil production—about 7 million tons—is substantially higher and only in steel does the annual rise fall from about 4 to some 3½ million tons. In fact among the basic industries steel seems to be the only one where a temporary stage of diminishing returns has set in and the rate of expansion is considerably slowed down—least for pig iron and most for crude steel. Possibly steel capacity has outstripped its supply of raw materials and, in addition, scrap is no longer as plentiful as it used to be. This relative set-back in expansion is apparently to be compensated by a great improvement in quality. On the other hand, the output of electricity—thanks partly to the opening of the large hydro-electric stations—and that of oil, are forging ahead at an increasing pace. On the whole, as one would expect, the Soviet planners are intent on maintaining the terrific rhythm of development in heavy industry.

More Consumer Goods

What is startling, however, is that they are apparently to maintain this pace in heavy industry without neglecting the other branches of the economy. In the last plan, for example, total industrial production was scheduled to exceed the 1940 level by nearly a half, and actually exceeded it by nearly three-quarters, while most consumer goods were only to reach the prewar output and even so some of them failed to reach their targets. Now, if the output of producers' goods is to rise by over 80 per cent in the five years, that of consumer goods is to increase by over 60 per cent. This is not all. There are still more ambitious plans for agriculture. For instance, the 1950 grain target—at 127.5 million tons—was only a few million tons higher than the 1940 output. Even this proved too stiff and the actual crop fell some 3 million tons short of it. In 1951 it was still lower and the present yield is not likely to be very much better. Yet for 1955 the Russians are planning an

output of between 175 and 187 million tons of grain. In other words, for the next three years the Soviet grain harvest should increase on average by at least 15 million tons a year.

The previous plan, as well as its predecessors, owed its success to a large extent to a continued expansion of the industrial labour force. Thus by 1950 industrial production was 73 per cent higher than in 1940, but during the same period the number of workers and employees rose by somewhere between 6,700,000 and 8,800,000 or by 25 to 30 per cent (the official figures were somewhat ambiguous). If the longer working hours are taken into account, actual productivity could not have risen by more than 15 to 20 per cent, though the Russians have claimed twice that level. During the new plan, the number of workers and employees should be raised from 35.2 million to 43.7 million, that is by only 15 per cent. Hence productivity will have to increase by about 50 per cent in fact and not merely on paper, if the plan is to be fulfilled.

Heavy industry should reach its targets whatever happens, and may well reach them ahead of schedule. If there is no emergency revision and if production continues for some time at the speed now prescribed by the planners, the long-term goals outlined by Stalin could be reached just on time. Speaking in 1946, Stalin declared that after three five-year plans the Soviet Union should be able to produce 50 million tons of pig iron, 60 million tons of steel and oil and 500 million tons of coal. If the present pattern continues this

PER CAPUT PRODUCTION
(Kilograms)

	1951					1955
	USA	UK	W. Germany	France	USSR	USSR planned
Coal	3,500	4,500	2,480	1,250	1,384	1,730
Oil	2,050	1	29	7	208	325
Electricity*	2,468	1,199	1,070	850	500	756
Pig iron	426	197	223	206	109	159
Steel	635	317	281	232	154	206

* kWh.

will actually be the output of Soviet industry in 1960, with the exception of oil, whose target should be reached—or rather exceeded by 10 million tons—by 1955. Incidentally, Stalin's figures, though announced only in 1946, were apparently based on long-term calculations made on the eve of the war, and but for the ravages wrought by the Germans, they might well have been nearing completion now.

The war was a terrible set-back and even with the greatest exertions the prewar level was recovered only towards the end of 1948. This has also spoilt, or at least postponed, the great Soviet dream of "overtaking and outstripping the advanced capitalist countries." One does not know what use Malenkov and Saburov will make of the economic material at their disposal during the forthcoming 19th Congress, but at the previous Congress in 1939 both Stalin and Molotov made ample comparisons with the West.

What are silicones, Mr. Sims, Sir?

The silicones are a most interesting group of materials based on organic compounds of silicon.

To industry the most outstanding merit of silicones is their marked resistance to the effects of intense heat and cold. They are used, for example, in jointing and insulating materials for jet engines and electric motors. They have other special applications in heat-resistant paints, car polishes, and the shower-proofing of textiles.

Midland Silicones Ltd. are the marketing organisation for the full range of silicone rubbers, resins, varnishes and fluids, some of which are already being manufactured by Albright & Wilson Ltd.

Chemicals for Industry

ALBRIGHT & WILSON LTD

49 PARK LANE, LONDON, W.1

EW168

After boasting the superior rate of progress in the Soviet Union, they both insisted that the rate of development should not be confused with the level of development. Taking figures for 1937 they computed a table of per caput production of the chief industrial products and after candidly admitting the relative backwardness of Russia they stated that the advanced Western output must be reached and exceeded to pave the way to Communism. The table above is built on the same lines as Molotov's with data for 1951 and Russia's planned figures as well.

Comparing these data with Molotov's one can see both the glory and the handicaps of Russia. In 1951, Soviet per caput output was already substantially higher than before the war. By 1955 per caput output of pig iron and steel should be nearly twice the 1937 level, over twice for coal, over 3 times for cement, and for electric power, $3\frac{1}{2}$ times. It will become comparable with the current output of France, but still distant from that of Germany and the United Kingdom, and with the United States per caput production looming far on the horizon.

	BASIC PRODUCTION (Million metric tons)			
	1951	1955		
	United States	UK, France† and West Germany	USSR	USSR planned
Coal.....	523.0	398.4	281.0	372.0
Oil.....	309.0	1.7	42.3	70.0
Electricity*	370.2	147.4	103.0	162.5
Pig iron.....	63.9	29.3	22.1	34.1
Crude steel.....	95.4	39.2	31.3	44.2

* 1,000 million kWh. † Excluding Saar.

Yet per caput output tells only part of the story. It is important for the standard of life, not for economic potential. Here the Soviet Union's prospective economic weight holds the balance well against the combined current output of the United Kingdom, France and Germany. True, these countries will not remain stationary; and the American levels of production are still unattainable for the Soviet Union. But even such a supremacy on the economic front in Europe was unbelievable not so long ago. This must be the Soviet

SOVIET FIVE YEAR PLAN

DETAILS NOW AVAILABLE

This week's issue of the *Records and Statistics Supplement to The Economist* contains detailed information about the latest Russian Five Year Plan. Economic data from Russia and Eastern Europe are difficult to obtain, but whenever they are available they are given in *Records and Statistics*.

Subscription rates: £2.10.0 a year, or, together with *The Economist* £5 a year. For a specimen copy please apply to: Records and Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

rulers' consolation and may well dictate their policy. They hope to reduce slowly the West's advantage in economic potential to such proportions as to be able to counterbalance it with their other trump cards. On paper, at least, they do not look as if they are planning in expectation of an imminent conflict. Possibly in the near future now the Russians will bank on General Time as they once did on General Winter.

(To be continued.)

Hesitation in Egypt

[FROM A CORRESPONDENT]

WHEN Egypt got rid of King Farouk on July 26th and threw his sycophantic followers into prison, the exhilaration of the country swept it straight forward into plans for a benevolent revolution which, without bloodshed, would narrow the immense gap between rich and poor. There would be, in particular, an agrarian reform which would affect 70 per cent of the population and, at the outset, a purge of those venal people whose activities had cankered the very roots of national life.

Except in the Moslem Brotherhood which has the idea of an "Islamic State" based on the teachings of the Koran, there was no ideological context to this movement. The most extreme results envisaged would not exceed the aims of modest democratic socialists in the West. To a large extent, the execution of reform has been entrusted to people who in any country other than Egypt would be considered reasonably conservative. Nor does Egypt need, at the moment, anything greater than the creation of an efficient, trustworthy administration, the reconstruction of political parties, the punishment of those grossly dishonest in the immediate past and a carefully constructed plan of agrarian reform to be executed within the possibilities of the Egyptian economy; for although this would leave the social structure fundamentally unchanged, the effects would be revolutionary. Even such modest aims as these would be difficult to achieve, but the attempt would still enable Egypt to retain enough stability to encourage foreign economic co-operation, upon which its regeneration must to a large extent depend.

After one month of "the new Egypt," however, it is being pertinently asked whether in fact the structure of government which has grown up around an orthodox Cabinet and the Army makes it possible to achieve even these moderate aims. The Cabinet, led by Aly Maher, is clearly intent on careful management of finance and reform and strict adherence to legal procedure in operating the purge. The Army, which purged the palace by force, breached the constitution and now supplies the power on which the Cabinet depends, is to a large extent accepting government by the Government; but in so doing its radicalism is losing its momentum. Premier Aly Maher and the Army leaders are not in conflict over their broad aims, but they are having to work hard to agree on targets, timing and methods.

This is evident in some of the hesitation on major questions. Two weeks have passed since Khamis was sentenced to death in summary fashion for leading the revolt of workers at Kafr el-Dawar which resulted in several deaths. Major-General Mohamed Neguib described him as a traitor and said it was better that one should die to save many. Yet there is no date fixed for the execution of Khamis and, although he may be hanged, it is clear that his case has caused anxiety. If the first to die in a movement for workers and peasants is a worker it is unfortunate; and, in any case, there is a feeling that the Kafr el-Dawar workers were as much stirred by the mood of the hour as by instigators. The Army pledged the breaking-up of the big estates, but the Government is obviously drawing attention to the technical difficulties involved in this very necessary reform. Then there is the

Thank heavens
I had some
Elastoplast
in the house!

It's Elastoplast-very you want to live old. A small investigation shows that a lot of people who ask for a brand of first aid dressings prefer Elastoplast.

5
FEATURE
COMFORT
AND
D SEAL
R SHOP NOW!

The Red Seal brings you Slumberland's greatest contribution to sounder sleeping—5 feature comfort. Some mattresses may have some of these features—but Slumberland has them all. No wonder the Red Seal is so magnificently comfortable.

1. ORTHO-FLEX SPRINGS (Red). These Slumberland springs are specially shaped so that every coil of every spring shares the weight. The resilience gives support, the comfort is heavenly gentle. Ortho-flex springs don't wear out.
2. SLUMBERDOWN (Red). This is the most comfortable cushioning of all. Layer upon layer of silky Slumberland down covers the Ortho-flex springs. Comfort upon comfort.
3. PRE-FORMED BORDER. Slumberland's special border and side-wall is pre-formed and quilted to ensure that the edge of the mattress remains supple and perfectly "rolled" throughout its long life.
4. SELF-ACTING VENTILATION. Air is gently circulated through the inside of your Slumberland with every movement you make—helping it always stay sweet.
5. SUPERB TICKINGS. Rich and attractive, they are specially woven for Slumberland and "finely" to each mattress to give an immaculate finish.

BE WISE—GET YOUR
SLUMBERLAND SOON!
The Slumberland Red Seal costs from £13.10.0, for the 6'6" model to £15.10.0, for the 6'9" model. Look for the Slumberland label—it's your first step towards better sleep.

TOTTENHAM COURT ROAD, LONDON, W.1. TEL. 7400

YOUR FIRST Yachting Week-end

Written specially for landlubbers by "PETA JAMICE" who tells you how to keep relaxed at sea.

There isn't much room on a yacht, unless of course it's a very special affair, so the main thing to remember once you're aboard is—keep put. Sailors don't like even the prettiest girls to get tangled up in the rigging—besides, it alters the trim of the boat.

Sea air and your skin

Sea air is terribly drying, so first give your face a gentle massage with a good nourishing cream, then a shiny greasy lipstick, then perhaps a trace of brillianine on the hair. You won't need rouge to colour your cheeks. And remember, salt spray can make a sorry mess of makeup.

What to wear aboard

To look your best, choose simple things. Pull on knee-length slacks, a jaunty striped jacket if it's hot or a turtle-neck sweater if it looks cooler. Avoid jewellery—rings can slip off if your hands get wet. And no heavy frock coats, unless of course it's a blizzard you're after.

Even on her first sail a girl can look, and feel as self-assured as an ocean mistress. And, by the way, if it just happens to be one of your difficult days—see Lilia. Most girls know do things days. There're no such things as worry-free days. If you prefer the outdoor world you should try Lilia. Putting everything in the whole mood of peace, so enjoy yourself and "see you"!

CHANDOS HOUSE • PALMER STREET • LONDON • S.W.1

Height of transmitter—200 feet . . .

. . . transmission area—THREE CONTINENTS!

TWO HUNDRED FEET into the air of Barbados, most easterly of the West Indies, rises a lattice steel mast, flanked by two others. They identify the station of Cable & Wireless Ltd., one of the most important places in the Commonwealth communications system, and their purpose is to ensure that London can always keep in touch with Montreal and Melbourne with London.

Messages between places far apart normally go direct through the cables or by wireless. But there are times when direct radio-telegraph contact is difficult, as, for instance, when sun-spots or magnetic disturbances affect reception between London and Montreal. To keep the traffic moving rapidly and securely Cable & Wireless Ltd. have installed long-distance relay

links. The radio waves from London are diverted southwards to Barbados, which automatically sends them northwards without interruption. Barbados also links Melbourne with London, across 14,000 miles, when atmospheric conditions affect the direct route.

To carry the load of messages that maintain Commonwealth communications and earn currency from foreign countries, Cable & Wireless Ltd. provide security and speed. That entails constant maintenance and development, no easy matter when labour and materials are rising in cost. But progress continues and the Company carries every kind of message from birthday greetings to State despatches, fulfilling its function as part of Britain's Business.

purge, which shows signs of being bogged down in legal inquiries as thoroughly as was that intended by Naguib el-Hilaly.

On the evidence of Aly Maher's policy, one would judge that he seeks to maintain three things: first, a sound economic policy; secondly, carefully graduated reforms; and thirdly, the support of as wide a section of the population as possible. It is the third aim which seems inconsistent both with the intentions of the movement and the position of the Army. In a country where corruption and social privilege are so deeply embedded, real reform can only be achieved in face of antagonism from powerful vested interests.

There seems equal evidence that the Army does not see its own position clearly. Its insistence on restoring the constitution and parliamentary life, its tacit acceptance of next February as the possible date for elections, its constant reiteration that government is the duty of the civil authorities, suggests a faith that tortuous legal processes, constitutional reform and the reconstruction of political parties can by persuasion and civil action complete the revolution which the Army started by force. In fact, the parties and the medley of vested interests involved are sitting tight. They know that in Egypt time can cure all.

The Wafd party is convinced that sufficient momentum has already been lost to justify counter-action and is sensible enough of the state of the country to realise there are many of its opponents who would now be willing to see it stage a come back. Its counter-attack is simply an attack on the Palace as being responsible for corruption, and on the British and the Palace together for all those events, mainly the burning of Cairo, which discredited the Wafd. The Army and the Wafd, and only these two, could regenerate Egypt. The Army is wonderful, but not least because it promises to restore the constitution and obey the will of the people; for the Wafd is the people, and the people are the Wafd. Let all now concentrate on the struggle with Britain; that is, not on the corruption and calamities of Wafd rule, which are sinister lies of "the imperialists." That this case, as presented in *Al-Misri* and a speech by the Wafd's leader, Mustapha Nahas, is a hotchpotch of special pleading and prevarication does not mean it can be disregarded. If it is sustained it will have its effect in the streets and restore to the Wafd some political initiative. Its aim is to palsy the Government and the Army, so that they fall apart and the movement disintegrates, leaving the country to the Wafd machine. The new order would change, giving place to old.

Danger from Extremists

It is natural for business interests, particularly foreign interests, to consider the moderation of the reform movement as a good thing; and, in a country such as Egypt where the economic and social conditions are chaotic and complicated, carefulness is certainly required to avoid a complete breakdown. But the action of the Wafd has given one pointer to the dangers of too slow a change for the better. This country and, more particularly, this Army, will not easily accept disillusionment or forget the lesson of the *coup d'état*. The Wafd almost certainly miscalculates in believing that the Army will let it recover power, but the defeat of the Wafd could be caused by a new upsurge of extreme elements within the Army. The worst thing that could happen to Egypt is the overthrow of the new movement by a newer movement formed from conflicting, extreme groups which have nothing in common but xenophobia and ill-digested ideas of sweeping reforms.

One might fairly conclude that the best thing that could happen in Egypt is the rapid extension of radical reforms and of the purge by the present moderate Army and civil leaders, in order to maintain the momentum of the movement; in other words, a more logical acceptance of the responsibilities which the Army accepted when it dethroned the King.

The Cost of Telling the Truth

ONE might think that close and constant attention would be given to any activity which can be described simultaneously as "one of the main links of the Commonwealth" and "one of the main facets of the rearmament programme." But in the past there has been surprisingly little public interest in British broadcasting to other countries. The Select Committee on Estimates from whose report the above words are quoted is the first independent body to publish a detailed inquiry into the subject, and its recommendations and minutes throw much new light on to the BBC's external services.

In recent months, the massive jamming operations mounted by Communist governments in an attempt to cut their sub-jects off from their last means of getting news from abroad have focused attention on the part of the radio "front" that coincides with the iron curtain. The new report is a useful reminder that British external broadcasting covers a much wider field than this. In addition to programmes for Europe and Asia, it provides news and entertainment for the whole Commonwealth, for English-speaking listeners throughout the world, and for British forces overseas. The Treasury grant-in-aid on which these services depend has to cover "Calling All Forces" as well as news bulletins for Eastern Germany, and programmes in Maltese and Afrikaans go out alongside those in Russian and Czech.

Relaying the News

The Commonwealth countries clearly appreciate the BBC's efforts. Its short-wave news bulletins are rebroadcast by stations in New Zealand and Ceylon, and by Canada's French-language network. Indian and Australian stations rebroadcast other BBC programmes, and even South Africa, where rebroadcasting of BBC news was stopped in 1950, still relays non-political programmes such as sports reports. The North American service finds Canadian stations willing to use as much material as can be supplied, and BBC recorded transcriptions are also widely used by United States networks; last December 1,383 American and 105 Canadian stations were rebroadcasting London programmes, and one weekly programme is regularly rebroadcast by over 200 American stations. The external services are also doing a good deal to help colonial territories to develop their own broadcasting systems. Some thirty BBC employees are at present seconded to various colonial services, ranging from the West Indies to Uganda, where the protectorate's first station is now being set up with BBC aid. Six are now in Nigeria, helping to organise the local service launched in Lagos a few months ago, which will cover the whole territory by next year. Existing colonial stations rebroadcast a high proportion of programmes from London, and use BBC news as the basis for their own transmissions.

The grant-in-aid also has to cover the cost of the monitoring service, which collects from other countries' broadcasts a generous supply of news and background information. The Select Committee was told that perhaps only a quarter of the monitoring service's activities could be regarded as of direct value to the BBC departments concerned with putting out news. Most monitoring, in fact, is a service to the Foreign Office, the Board of Trade, the defence departments and other organisations which need a full and rapid supply of political, commercial and strategic information from all parts of the world. Here the emphasis is naturally on countries in which the press cannot operate freely. The Soviet Union, its satellites in Europe, and China are covered as fully as possible, while very little monitoring of western European

stations is done, and none at all of stations in the Commonwealth or the United States.

A summary of the main divisions of the external services' expenditure shows how the funds available are stretched to cover very different purposes:

(£ '000)

	Total	English language	European	Asian	Latin American	Monitoring	Transcription
1947-48 ...	3,896	1,472	1,286	521	591	251	275
1948-49 ...	4,132	1,367	1,346	575	555	281	210
1949-50 ...	4,382	1,413	1,450	575	567	350	227
1950-51 ...	4,754	1,428	1,574	735	559	355	237
1951-52* ...	4,659	1,451	1,688	624	541	444	251
1952-53† ...	4,820	1,530	1,900	559	175	454	292

* Provisional. † Estimate.

When it is remembered that the monitoring service is primarily an intelligence service, and that the English programmes and the transcription service are largely concerned with the needs of the Commonwealth and forces overseas, the costs of actual broadcasting to foreign countries can be seen more clearly. The Select Committee saw this clearly enough. They recommend that monitoring should henceforth be financed by a separate grant-in-aid, and that the question of Commonwealth participation in the cost of news service should be examined. The merits of the second point seem doubtful. It is arguable that Commonwealth countries owe the BBC something in return for its entertainment programmes, and indeed in some cases they pay for transcription rights; but news is a very different matter, and it may be held that Britain gains more from the fact that Commonwealth countries look to London so much for news than could be gained by any appeal for financial support. A similar view may be taken of the committee's suggestion that, where appropriate, BBC transcription programmes should be supported by commercial sponsorship—a project which does not hold out much hope of either diplomatic or commercial success.

A Threat to Exports

Moreover, as the committee learnt, the scope for the transcription service has been severely reduced by recent economies. Until last year nearly a quarter of this service was directed to Latin America, where some 250 stations out of 400 were regularly using BBC transcriptions. Now the Corporation has had to close its offices in Argentina, Brazil, Colombia and Mexico, and the lack of representatives on the spot has made it impossible to distribute transcriptions in an area where there are so many independent stations that personal contacts are essential. Direct rebroadcasting of British programmes by Latin American stations has also fallen off for the same reason; the loss involved may be gauged from the fact that before the cuts BBC programmes formed thirty per cent of all broadcasting in Chile. Together with the reduction of direct broadcasts from London in Spanish and Portuguese from nine hours daily to four hours, these cuts have made many Latin Americans feel not only that Britain is in a very serious economic plight, but also that British interest in the continent has fallen off dramatically. The Select Committee takes the view that "it may well be that the abandonment of most of the Latin American services will cost Britain dear in exports."

In this connection, the committee was surprised to learn that, while the Foreign Office, the Colonial and Commonwealth Relations Offices and the defence departments are "prescribing departments" for the external services, the Board of Trade is not. The committee's minutes give the impression that, if commercial factors had been more fully considered, the Latin American services might not have been left to bear the main brunt of this year's cuts in output. It is therefore now recommended that the Board of Trade

should become a prescribing department, and should be more closely associated with the external services.

Formally, of course, the external services, like the rest of the BBC, deal with the Post Office rather than with any other government department. But the Select Committee found that for most practical purposes the Post Office serves as little more than a clearing house; its representative, under questioning, seemed at one point to be on the verge of saying that it was, in fact, just a post office. Moreover the committee felt "grave doubts" whether the present procedures are the best way of reconciling adequate operational freedom for the BBC with adequate parliamentary control over the spending of public money. They do not suggest that opportunities for economy are being missed; indeed, they point out that cuts have had to be made every year throughout the last five years, and that there is little scope now even for minor economies. But they propose that, if Parliament is to determine the broad distribution of effort between such different aims as Commonwealth broadcasting and broadcasting to eastern Europe, an annual White Paper should be presented showing the main headings of intended expenditure.

At the same time, they recommend that the annual grants-in-aid should be replaced by five-yearly grants. Whatever the level of expenditure, the advantages of allowing the BBC to see its way clear ahead for several years seemed to be overwhelming. External broadcasting is a delicate plant, slow to take root in the affections of foreign listeners, and easily damaged by abrupt changes. The BBC has built up, over a decade or more, an international reputation which is still potent even today when rival broadcasting systems have far outstripped it in terms of output; and if the external services must now be kept on a tight rein owing to lack of funds, there is all the more reason for enabling them to plan on a long-term basis.

India and Communism

[FROM A CORRESPONDENT IN INDIA]

WHEN the Upper House of the Indian Parliament passed the anti-Communist preventive detention bill recently, one Communist member made the startling declaration that if the Communist Party came to power it would bring all "landlords, capitalists and black marketeers" before the people and, if necessary, shoot them. This is typical of the sound and fury of the Communists in the Indian Parliament. But since the novelty of their outbursts has worn off there has been a relapse into a too comfortable feeling that their mischief value has perhaps been exaggerated. In the House of the People their numbers (27 out of 497) do not qualify them to be treated formally as the Opposition: in the two State Assemblies of Madras and Travancore-Cochin, where they are sufficiently strongly represented to threaten the stability of Congress governments, they have not so far shown signs of being able to unseat them. In Madras, Mr C. Rajagopalachari has just obtained a comfortable majority on a vote of confidence, and in Travancore-Cochin the danger has been averted by a timely closing of Congress ranks.

If one were to regard the legislatures as the main battlefield, complacency might be justified. The Communists have cut a poor parliamentary figure. A. K. Gopalan, their Leader in the Lower House, is more used to mob oratory, and finds the time limit on speeches too restrictive. Hiren Mukerjee, a Bengali intellectual, is too theatrical. They have had opportunities for scoring points, since Congress Party members, for so long an irresponsible Opposition themselves and now the supporters of a cautious, orthodox administration, are sometimes placed in an awkward defensive position: but the Communists have overdone the ranting and abuse. Also they have made it too crudely obvious that their only interest in some of the issues they support, for example, linguistic states, is to create and foster divisions. They have provided openings for Congressmen, both Ministers and back-

GLOBAL OPERATIONS

SYMBOLIC of Anglo-Iranian's global operations, these Hortonspheres are used for the pressure storage of liquefied butane gas in the Company's refinery at Grange-mouth, Scotland. By 1953 the yearly output of Anglo-Iranian's four refineries in the United Kingdom will be some eleven and a half million tons—a valuable contribution to the country's increasing refining capacity.

In Australia, plans are now progressing for the construction of a new refinery with a projected annual capacity of three million tons. Throughout their existing overseas refineries, Anglo-Iranian and its associated companies are rapidly increasing output to meet the world's demand for petroleum products.

benchers, to score off them by hard hitting or ridicule. It is satisfactory to hear the government provoked into forthright defence of such things as Commonwealth membership, the virtues of British businessmen, and American aid. It is refreshing to find that there is Congress young blood, such as the adventurous Dr S. N. Sinha, ex-officer of the Russian Army and pupil of Maxim Gorki, capable of accusing, with authority, Indian Communists of extra-territorial loyalties, and of conduct which, in countries known to him, would earn the guillotine. The Communists have indeed succeeded in striking some welcome sparks out of the Congress Party.

But Parliament is not the main battle-field. It is a good site for a loud-speaker through which the simple theses of Communist doctrine can be blared, with damnable iteration. The Communists do not mind who hears the answers, so long as their own voices are heard. The larger audience to whom these are addressed are not impressed by debating points, but by noise. For the Communists, Parliament is a sideshow; and there are some doubts in the party about the usefulness of their presence there. Their Cominform mentors have probably not revised the long-standing dictum that the Communist Party enters parliaments not for constructive work, but so that the masses may destroy from within the bourgeois state machine and Parliament itself. The real trial of strength is outside Parliament. Here the Congress Party is at a disadvantage, for whereas the Communist organisation is efficient and energetic, Congress is still an amorphous and imperfectly disciplined mass. Nehru and his Working Committee are making great efforts to pull it into shape. The residue of Congress prestige and the inherited framework of a sound administration have given the government in power a start; but the Communists have wiped out some of the handicap. Their flair for selecting weak spots and concentrating efficient organisation on them brought them surprisingly good results in South India at the last elections, and is still being put to good use. They may be numerically negligible as an opposition, but the other opposition groups, except the discredited communal right-wing Mahasabha, are no stronger, and the blurred edges of their policy make them ineffective. The Communists are therefore at the moment, though at a long remove, the potential successors to Congress. Not often, but still too often, one hears the Indian in the street say: "The Congress have promised much and performed little. I shall vote Communist next time."

Four Critical Years

It is, however, extremely unlikely that India will "go Communist" after the next elections. It is possible that Congress majorities may be reduced, but by no means certain that Communist representation in Parliament, or even their strength in the country, will be increased. Three points have to be remembered in order to keep a perspective. First, the Congress Party still has four critical years in which to produce from its Five-Year Plan results which can be paraded in time for the next election campaign. Some results in the form of fertilisers, locomotives, and power and irrigation projects already in an advanced stage of development, will certainly be apparent. Additional results which can be, and may well be, shown four years hence, in terms of more food and more employment will strengthen the Congress position against the Communists.

Secondly, the voter, if he is dissatisfied with Congress, has more than one alternative. Apart from the right wing groups, there are, to the left of Congress but to the right of the Communists, the Socialists and the Krishak Mazdoor Praja Party, now contemplating an improbable alliance. If they serve no other useful purpose, they are wedges of political blotting paper which can catch and absorb the spill-over from Congress before it reaches the Communists. Thirdly, the Communists, for all their apparent compactness, have their own divisions, and these may well become accentuated. B. T. Ranadive, under whose leadership the Communist Party of

India tried for three years to exploit, by insurrection and violence, the country's post-independence difficulties, and who was suspended from membership, is said to be making a comeback, assisted by the poor showing of Communists in Parliament. His return would be bitterly resisted by several of the present Communist leaders.

Meanwhile the guerilla war in the Telengana districts of Hyderabad has been called off, though hard bargaining goes on over the terms on which arms will be surrendered. The Communist Party headquarters has been moved from Bombay (which rebuffed them in the elections) to Madras, and there are signs that the Communists are turning their extra-parliamentary attention to industrial labour. A feature of the elections was the small success Communists achieved in the industrial cities. Employer-labour relations in industry have shown some improvement recently. Although there is still plenty of indiscipline and "go-slow," prolific labour legislation and the steering of disputes into the slow and devious channels of labour courts and tribunals have led to fewer strikes. Now a new policy is emerging, under the inspiration of G. L. Nanda of the Planning Commission and V. V. Giri, the Labour Minister, which promises further improvement of relations by encouraging the settlement of disputes through discussions and conciliation outside the courts. But industrial peace does not fit in with Communist plans. Opportunity has been taken of concessions awarded to labour by tribunals in one part of India, to promote agitation for similar concessions elsewhere, where conditions may be entirely different. This agitation is being conducted almost entirely by Communist unions, which thereby acquire merit in the eyes of labour *vis-à-vis* the more moderate Congress-sponsored unions. The object is political, and the bidding up of demands (aided by the tendency of tribunals to make on principle at least some concession to labour in any dispute) already attracts increasing support for the Communist unions.

Books and Films from Russia

There has been an increase in the visible distribution throughout India of literature emanating from Soviet Russia, well printed, on good paper, with excellent illustrations, the sale price of which is clearly far less than the cost of production. It is widely assumed that the sale proceeds go as a contribution to CPI funds. The Government of India has been puzzled how to deal with this form of propaganda, little if any of which could be described as subversive; it is rather a glorification of Russia and Communism in general, like "The Fall of Berlin" film, which is being shown all over India. A first tentative step to control the flood has been taken by an official instruction to railway administrations to discourage the sale of Soviet books on railway bookstalls, since these "are frequently of a tendentious nature."

The return some weeks ago of the Indian Cultural Mission from their five-week tour round China has aroused public interest in the progress of India's large Communist neighbour. Most members of the Mission have kept a discreet silence. Some saw only what they wanted to see, and have testified to the contagious enthusiasm, cultural renaissance and desire for peace. Others have given valuable objective accounts. Admitting a remarkable achievement in a short time by Mao Tse-tung's government, in the unification of the country, agrarian reform, stabilisation of the currency, reduction of brigandage and corruption, and pointing to some lessons which India could learn, they have also recorded the existence of a police state, and purgation by terror. The extinction of the rule of law, individual freedom and liberty of expression is a price which India is not yet prepared to pay for material progress. Nor does the question arise. There is little that is comparable today between Nehru's India and what was Chiang's China. Yet these contacts with what is happening in China are making some people ask whether the western type of democracy is the last word in democratic government so far as the East is concerned.

THE BUSINESS WORLD

Boom in Gilt-Edged

THE gilt-edged market has swung violently from the apprehensions that weighed upon it at high summer, and now is quite plainly hitching its behaviour to hopes of a golden autumn. Even by postwar standards of volatility, the speed of change in mood, from black pessimism to easy optimism, has been remarkable. At midsummer, prices of most stocks stood at their lowest for twenty years, with irredeemables offering flat yields ranging up to—and on War Loan beyond—4½ per cent and dated stocks showing redemption yields of 4½–4⅝ per cent. The recovery that began then was temporarily reversed by the rumblings from the Prime Minister, but got well under way as soon as the end-July debate had shown these to be merely extraneous noises-off. It has gathered momentum ever since, generating some crackling movements in the price-lists. On Monday last, despite the pace of the previous advance, the gains ranged up to 1½, and the new debenture of the Agricultural Mortgage Corporation went to a premium of almost that amount in its first two days. Over the past two months, some stocks have risen by fully 6 points, and in the long-term section generally the appreciation exceeds 7 per cent and in some instances is around 9 per cent. The upshot is that yields are down by three-eighths or even one-half per cent, with the flat return on 2½ per cent. Consols at £4 3s. per cent and on War Loan at £4 10s. per cent. More striking still is the fact that net prices of most long-dated stocks are now appreciably above, and those of irredeemables not much below, the levels ruling on the eve of the budget and the 4 per cent Bank rate.

This behaviour is easier to explain than to justify. To a great extent it derives from the same influences as those that produced the even more unexpected rally that set in soon after the budget—from diversified investment buying by the general public, especially by the "little man" and by others who were attracted by the income yields and who yet felt satisfied that they faced no risk of capital loss so long as they were prepared to hold for a few years at least. By contrast with the returns offered during the previous decade and more, the yields looked so attractive as to make such buyers more anxious to get in quickly than to try to get in at the bottom. Most of them, too, were probably not well acquainted with, or were prepared to disregard, the underlying economic trends—provided that no new storm seemed imminent. They went on buying until the stock exchange as such swung characteristically from a mood of complacency into one of exaggerated alarm, which it did in the latter part of May.

During that month the view gained ground that the much-discussed midsummer "hump" of strain on the gold reserves would be the signal for new and drastic measures. It was widely believed, especially overseas, that another devaluation of sterling was imminent, or at least that there would be a dash for convertibility

combined with the adoption of a flexible rate; and that either of these measures would be accompanied by a further increase in Bank rate or, alternatively, that such an increase would be necessary if the existing parity was to be successfully defended. For the more sophisticated, who were disposed to scout these rumours, there was the argument that, since so much of the Government's economic policy depended upon monetary action, it could hardly refrain from taking new steps to stiffen the credit discipline or at least to prevent it from slackening; and such steps, even though they fell short of Bank rate action, could still be very unpleasant for the gilt-edged market.

Such were the influences that checked the first wave of investment buying and provoked the severe break in the market during the latter part of May and early June. But soon afterwards the Chancellor was making soothing

noises. The mid-year danger point was seen to have been passed without any very apparent difficulty and without any new démarche in economic or monetary policy. And overseas operators had begun to cover their short positions in sterling. The markets took heart afresh; and the quakings momentarily revived by Mr Churchill were more than allayed by the Chancellor's speech on the eve of the recess. That survey of official hopes for Britain's economy in the second half of the year was read as giving the markets the green light for some months ahead. Since then the investing community has piled up a whole succession of optimistic assumptions. It is widely assumed that the painful phase in surmounting the crisis that threatened early this year is already over (whereas the truth is that little pain has been experienced so far, because the cuts in imports have yet to show their full effects upon consumers' supplies); that the threat of drastic domestic measures has been lifted; that if British exports are frustrated by the stringency in overseas

markets, the home market will get the benefit, without any unpleasantness for the industries concerned; that the Government is not disposed to make any bold moves in the matter of sterling convertibility; that it is well content with the workings of the credit squeeze, so that stiffening measures are unnecessary; and that Bank rate would never be raised except as a last resort—in circumstances that are no longer expected to arise.

In addition, the gilt-edged market has benefited from more tangible factors. Since the credit pressure has not been intensified, the effects upon the market of the search for alternative means of finance have lost much of their early force; the institutional investors themselves completed their initial adjustments some months ago; and the sharpness of the impact upon industrial liquidity has lately been blunted both by the credit creation necessitated by the Government's own borrowings from the banks and by the incipient revival of demand in the textile and other industries that had been embarrassed by excessive stocks. The slowing-down of output in these industries, by short-time working and release of labour, has obviously had some effects in reducing demands for finance, and there has probably been some decline in investment outlays in other directions, too.

To the extent that the market's assumptions reflect the view that the Government is relieved to find an excuse, if not a justification, for avoiding forthright action, they are probably well-founded. Except for the fact that some technical reaction is likely to follow so fast an advance in prices, it is not difficult to make out a plausible bullish case for gilt-edged in the short run. But such arguments no longer deceive the astute operators and the big institutions. The general investment demand from individuals who can afford to disregard short-term fluctuations has gathered pace, and it has been joined both by some short-run speculation and by moderate buying from those institutions that cannot afford to let liquid funds pile up indefinitely and yet have not recently been able to find an outlet in the new issue market. The big rises in prices have resulted from the impact of this demand on a market short of stock, with disproportionate effects in some instances. This summer boom has not been provoked by any massive action by the big battalions of the gilt-edged market. Most of these expert observers are taking a very cautious view of the market for the medium-term, and they are not blind to the dangers that may beset it even in the short-term. For the short run, they point to the risk of labour disturbances and to the possibility that the meetings in Mexico City and especially the Commonwealth Conference may provoke a revival of rumours about convertibility (and therefore about a rise in Bank rate), either of which could shake the market.

Apart from this, most institutional investors seem to have grasped the fact that if Britain succeeds, as the government now hopes it will do, in coming close to its objectives for the balance of payments in the second half of this year, the transformation will have been brought about mainly by restriction of imports and of home investment. These are not only non-recurring sources of relief that cannot be used again—whether to help the economy towards its next vital objective of building up an external surplus or to meet any new adverse trend. They are also measures that sooner or later will have to be reversed; the restraint upon industrial investment, in particular, cannot be long sustained without provoking loss of productive efficiency. Stock market operators are accustomed to dismiss such longer-range considerations;

but the breathing-space before the penalties of this living upon capital become fully apparent is now very short, and the measures necessary to avoid these penalties have to be taken long before it ends. The pre-requisite is a more determined pressure than any yet applied to switch resources to the capital goods industries. And, in default of adequate budgetary restraints upon consumption or a check to social investment such as housing, the only means of working towards this vital objective is to keep the monetary reins tight.

But in fact the reins are being slackened. It is true that the banks appear to be responding to official wishes just as loyally as they did earlier in the year; but it is clear that if their liquidity ratio had not been allowed to rise sharply in the past few months (it had reached 35.9 per cent by mid-July), the credit squeeze would have been

tighter still, and there is now some risk of marginal relaxations. More serious still is the fact that the cause of this easing of the banking position, the excessive borrowings by the Government itself, is doing damage directly, by helping to restore the liquidity of the economy at the very time that banking policy is supposed to be contracting it. All this is happening, moreover, at a time when Britain is enjoying the reliefs from the non-recurring import cuts but has not yet felt the inflationary impetus that will come when the loss of supplies is fully apparent in the shops. The inflationary tinder now lying around is providing fuel for still bigger wage demands—and still bigger difficulties for British exports.

In one sense, the rise in markets—in equities as well as gilt-edged—can be regarded simply as a reflection of these tendencies, but to some extent it is also in itself an aggravating influence. The Treasury, by the tone of its monthly economic summary, has this week furnished a large ingredient in the market optimism. But this stimulus was certainly quite unintentional. Indeed, however timid the Government's approach to the wider economic problems, it seems that the monetary authorities cannot—and certainly should not—allow the slackening of monetary tension to go much further. Unfortunately, the fact that major refinancing operations

must soon be undertaken may make the authorities less objective and nearer-sighted than they seemed earlier this year. The first of the Serial Funding Stocks, of which there is £450 million in issue, matures on November 14th, a further £60 million of 1½ per cent yearling stock temporarily placed with the National Debt Commissioners by the Transport Commission matures in the following month, and £522 million of 2½ per cent National War Bonds, 1951-53, has to be dealt with before March 1st next.

It is true that the authorities, if not far-sighted have at least been circumspect. They have not tried to restrain the rise, but, equally, they do not appear to have fostered it by any net buying. Indeed, they even seem to have been inactive lately in the matter of the 1951-53 bonds, which, on past precedents, they might have been expected to have been rapidly absorbing—if possible in exchange for longer stocks. In the market one widely surmised explanation of this inactivity is that the first of the maturities, the Serial Funding Stock, is not expected to present any difficulty, on the assumption that the banks (which hold more than half of it) can readily be "persuaded" to take a replacement stock of, say, three or four

years' life. If this is indeed the official intention, it is an unhealthy one. Almost the only thoroughly healthy and promising innovation that the Conservative Government has made in economic policy was the move towards a flexible and effective rate of interest. The virtues of this policy are not to be attained by the methods of directives and a dragooning of investors, whoever they may be. They require a respect for the principles of the market-place; and the only proper way to refinance this stock is by a normal issue on the market, on whatever terms are necessary to ensure such banking and public support as monetary policy requires. And if that policy is to keep the incipient inflationary tendencies in check until the Government takes a more forthright view in its wider economic policies, the market operations that will be needed will be larger than is popularly supposed. The Government ought not only to refinance its maturities, but also to fund its additional Treasury bill borrowings from the banks—if possible by sales of longer securities to the public. The gilt-edged market may face squalls in 1953 in any case; but if monetary policy were to be fully realistic, golden autumn would turn to bleakness before then.

Taking Stock in Engineering

IN the first half of 1951, although British industrial production as a whole was slightly lower than in the first half of 1952, engineering output was probably slightly higher, and in the quickening of industrial activity that can be hoped for in the remainder of this year the "metals, engineering and vehicles" group should play a major part. These industries have already received some increases in their steel allocations for the fourth quarter, and by the end of the year, at least, any general shortage of steel may have passed away. The steel industry expects consumption in Britain this year to reach 11,350,000 tons, some 360,000 tons more than last year and more than the British metal-using industries have ever received in time of peace. A proportion of this—though probably less than the million or million and a half tons that have often been loosely quoted—will be for rearmament. But some of the defence equipment produced, it now appears, will be exported; and other undefined "alterations in the pattern of defence production in a way that limits its demand on the engineering industry" are being made. This should

clear the decks for the engineering industry to devote its expected increase in output to export markets. But what is its competitive strength in those markets likely to be?

The postwar growth in importance of these metal-using industries within the economy has been even greater than the rise in their consumption of metals. In absolute volume their output has risen by more than 50 per cent since 1946, and is probably nearly double their 1935 level; their share in the country's total output has risen from perhaps a quarter in 1935 to a third in 1946 and two-fifths in 1951, and productivity within them by probably 20 per cent since 1935. In an informative article on "Steel Supplies and Industrial Production," in its current statistical bulletin, the British Iron and Steel Federation constructs an index of industrial production weighted by the steel usage of each component industry, and plots this against total steel consumption in the economy. This chart shows that while steel consumption rose by 33 per cent between 1946 and 1951, output in the steel-using industries rose by 49 per cent. Between 1947 and 1951, it can broadly

METAL-USING EXPORTS (£ million)				
	1938	1947	1951	1st Half 1952
Vehicles (incl. locomotives, ships and aircraft)	44	173	480	262
Machinery	58	176	365	219
Elect. goods and apparatus	14	49	97	57
Cutlery, hardware, implements and instruments	9	35	63	36
Total of above	125	433	1,005	574
All other exports	346	705	1,575	773
GRAND TOTAL	471	1,138	2,580	1,347
Metal-using exports as percentage of total	% 27	% 38	% 39	% 43

be said, total consumption of aluminium rose by 18 per cent, total consumption of copper, zinc and lead hardly changed, and consumption of tin fell: the use of magnesium nearly doubled, but remained very small. Recent restrictions on the use of some metals are now being removed, since manufacturers have not been taking all they were allocated, so that their supplies should not limit the growth of output of metal goods. On the face of it, there would seem to be no obstacles from the materials side to a continued growth in the production—and hence the exports—of the engineering industries.

These exports, since the war, have grown in importance in the nation's economy almost as much as has total engineering output. In value, they now represent more than two-fifths of the country's total exports, and judged by their rise in volume they have considerably outpaced all other exports, having more than doubled since 1947. The growth of metal and engineering exports, as of output, has of course been uneven, as will be seen from the table. The vehicles group—ships, rolling stock, motors, cycles and aircraft—now represents half the total of steel consuming exports and about a fifth of the country's exports as a whole. The dependence upon vehicle exports was sharply underlined by the effect of import restrictions in Australia and elsewhere in the second quarter of this year, when exports of this group declined in volume by some 13 per cent and of this group declined in volume by some 13 per cent and those of the whole "metals, engineering and vehicles" group by 10 per cent; the total volume of the country's exports fell concurrently by 13 per cent below their level in the first quarter. This set-back in their exports has made many engineering industrialists more cautious than Whitehall about their future as exporters.

They certainly share the official apprehensiveness about German competition. This is now almost back to its prewar strength. West German industrial production as a whole was about 7 per cent higher in 1951 than in 1938; and by late last year its exports had probably also risen above their prewar volume. Most of this development has been crowded into the past 3½ years. West German exports, which before the war were about 80 per cent of the value of British exports, were only about a tenth of British in 1948; last year they had reached 46 per cent (and incidentally almost covered German imports, while the value of British exports

covered only 70-75 per cent of imports). The postwar emphasis on exports of coal to obtain foreign currency has now passed, and Germany is returning towards its prewar pattern of exporting; in 1951, steel and metal goods accounted for about half its exports. By early in 1951, its exports of metals and manufactures to Europe were 182 per cent of Britain's, and of machinery 91 per cent.

For engineering exports in particular, Germany is not the only major competitor, and the trends in world engineering production since the war indicate that competition will be more intense than in prewar years. Since the war, America has shared most of the world market for metal products with Britain; it has indeed, despite the dollar shortage, made rather better headway than Britain in improving upon its prewar share of world exports of most engineering products—with some notable exceptions, such as motor vehicles and tractors. The general trend has been to decrease specialisation and thus increase competition; for example, Britain has lost its dominance of the textile machinery, motor and turbine markets, but has made inroads into America's command of the world trade in tractors, farm machinery and office equipment. Competition in particular markets, too, seems likely to increase. Western Germany is now partly shut out of markets in eastern Europe that used to rely mainly upon it, and Japan is shut out of China and Manchuria; both these traditionally strong exporting countries are directing their energies into the sterling area and Latin America. In a chart on page 518 the exports of machinery and electrical equipment from Britain, the United States and Germany into a range of important markets are plotted for 1949, 1950 and 1951.

It is in their assessment of Britain's particular competitive strengths and weaknesses that some engineering exporters might differ from the Government. For many products, price does not yet seem to be so vital a determinant of whether orders are lost or won as some Cabinet pronouncements have recently suggested. It certainly is very important in the world market for vehicles, where competing vehicles have been closely priced for some time; but only one major British producer has yet shaved its export prices. For other engineering exports, price clearly is a significant factor—except for ships and certain very heavy capital equipment

where contracts can still be fixed on a cost-plus basis—but its relative importance differs between products and markets. Britain is meeting some tight quotations from Germany for certain products, and Japanese prices are often lower than British. But British engineering prices, though they have increased in the postwar period more than American, have still probably not quite exhausted the advantage they received from devaluation. Between 1949 and the end of 1951 they were, in many cases, below what the markets could have borne; but today, whether or not some equipment is strictly still under-priced, there are few products for which the market is firm enough for any increase to be advocated without danger of losing further orders. Jet aero-engines and civil aircraft constitute perhaps the only sphere in which British engineering has today a marked technological lead, but the robustness and quality of most British equipment leave it with little reason to fear competition on this score. But the delivery period that can be promised—and the likelihood that it will be fulfilled—is probably still more important than price in obtaining orders for capital equipment. That delivery dates from Britain should in general be much more extended than those offered by competitors is an inevitable consequence of the industry's much greater volume of orders—swollen, perhaps, by too-low prices. But that Britain should generally do worse in meeting the contractual dates, as has recently been suggested, is evidence of a more significant weakness, and the same applies to some recent disquieting complaints about British after-sales service and supplies of spare parts. Nevertheless, German deliveries of engineering equipment have been lengthening noticeably in recent months, partly in consequence of the fuller employment of manufacturing capacity, and partly because of shortages of materials. Moreover, talk of German arms production suggests that the engineering industries there—which have done fairly well out of British defence orders for machinery—might in their turn be partly diverted from export production.

The further outlook for engineering exports, then, is distinctly unsettled, despite Whitehall plans. Government departments, unweaned from the taste for physical controls, are to some extent manipulating steel allocations to "promote exports"; as steel becomes less scarce, this well-meaning discrimination will carry less weight.

From the industries, there are some complaints about the Treasury's unskillfulness in negotiation with countries whose import restrictions affect some industrial equipment, as well as motor vehicles; and requests are being made for longer credit facilities. Such facilities may be forthcoming to some extent, in consequence of expected relaxations by the Exchange Control and through new arrangements by the Export Credit Department; on the other hand, there are signs that the Germans, who some months ago were offering lavish credit facilities to obtain orders in Latin America, have recently become less ready to offer such temporarily unrequited exports. Some industrialists are hoping that special financial rewards of one kind or another may be offered to successful exporters, as is done in various European countries. So far, industry in general has probably received from this Government more direction and exhortation of the old type, yet less consultation than it felt able to expect last October.

A point that cannot be overlooked is that many business men are more apprehensive than the Government and some economists about the future course of world trade. Many of them have experienced some shrinkage in total demand in the last few months. They are aware of the arguments for believing that this may be succeeded by a new phase of inflationary tendencies, yet they remain apprehensive of a deeper and more fundamental recession a few years hence. Such fears, deriving partly from the knowledge that, apart from sustained demand for a few types of major capital equipment, nothing now remains of the sellers' market, and that certain existing orders might wither away in a cold draught, are widely expressed in engineering. This view—which is here recorded, not assessed or accepted—is not holding the engineering industries back from the most strenuous and ambitious salesmanship on behalf of their products in the meantime; and there is some confidence, for example, that the advance in German competition is at present slackening. But it explains many engineering employers' hesitation to instal extra capacity or think of much enlargement of the industry (which has already gained 600,000 additional workers since 1946), whatever the role chosen for it in Whitehall.

Green fingers

No one grows roses like old Charlie. He knows his soil and plants, and experience tells him how to get the best from them.

We help to make things grow too—industries, homes, businesses. Our soil is Australia, New Zealand, Fiji, Papua and New Guinea. For our fingers we have over 850 branches and agencies throughout these lands. And our experience dates from the first banking business in the South-West Pacific.

If experience and local knowledge can help your ventures to success in this area, consult and use—

BANK OF NEW SOUTH WALES

First and largest commercial bank in the South-West Pacific

MAIN LONDON OFFICE—29 Threadneedle Street
D. J. M. Frazer, Manager

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

GB5205E

The pulse of Canada

You can feel the pulse of Canada through our Monthly Commercial Letter, which will be sent to you regularly upon request.

With over 600 branches strategically located throughout Canada, we can provide authoritative economic information on the products, markets and opportunities of interest to British business men.

The Canadian Bank of Commerce

2 Lombard Street,
London, E.C.3
Head Office: Toronto, Canada

These people write from Aracaju

THEIR INQUIRY is interesting. What, however, is their commercial standing? You do not know—but the Westminster Bank almost certainly does. And even if it does not, the facts can quickly be obtained because the Bank has representatives in every town of importance throughout the world. This unrivalled Credit Information service is part of the much wider service which the Bank places at the disposal of all who trade abroad and which is fully described in the booklet 'The Foreign Business Service of the Westminster Bank'. A copy will be sent gladly on request.

WESTMINSTER BANK LIMITED

Business Notes

Shell and Anglo-Iranian Under Fire

There have been prompt replies from the Shell Transport and Trading and Anglo-Iranian Oil companies to the charges that they are concerned, together with five American oil groups, in an international oil cartel. The charges come in a concentrated fire from several official American sources. With one of them the two British groups are not concerned—namely, the allegation of overcharging on oil supplied by American companies from the Middle East to Europe and paid for by the Economic Co-operation Administration. This is an argument of two years' standing, and is now to be pursued by civil action in the American courts. But they are directly involved in the move of the Department of Justice and of Mr McGranery, the American Attorney-General, to obtain an indictment of the seven groups by grand jury proceedings which open in Washington next Wednesday. Anglo-Iranian itself appears to have been served with a subpoena (the company has an office and agent in New York) and Asiatic Petroleum (an American company in the Shell group) has also been summoned.

The terms of the subpoena make it quite clear that the proceedings will cover the same widely ranging allegations, and involve the same extensive groupings of more than twenty companies, that have been under investigation by the Federal Trade Commission. After long delay, the Commission's report has this week been published in Washington; in brief, it asserts that combinations and cartels in the working and selling of oil outside the United States have existed among the groups in the past and still dominate the behaviour of the industry. To this charge, the Shell Transport and Trading Company has denied that there is any international oil cartel, and asserts to the contrary that the oil industry is keenly competitive. Anglo-Iranian's statement denies that the company is a party to any cartel activity or to any action "contrary to the laws of any of the countries in which it operates."

That the oil industry has come to consist of large units is in the nature of its economic and technical history; that it should come under attack for alleged monopoly practices is partly historical and partly a matter of current American politics. The fact, familiar enough, that five American and two British groups dominate the production and selling of oil in the world market is far less shocking to opinion on this side of the Atlantic than it is to Senator Hennings, who has been active in the campaign against the companies. Nor, on this continent at any rate, does it appear that agreements between the groups on prices and production (if such agreements in fact exist) have been exploited to the consumer's disadvantage. But considerations such as these are not likely to weigh heavily in the grand jury proceedings. This relic of the British criminal law can presumably be relied upon to decide that a *prima facie* case exists against the companies for violation of the Sherman Act. It will not be for want of factual material if it fails, for the companies are under pain to produce documents from the beginning of 1928 on agreements entered into by themselves or their associates with any other parties, or correspondence, or minutes of directors' meetings, under thirteen headings concerned with their business outside the United States. Such a mountain of documentation ought certainly to provide the prosecution with enough to convince the grand jury that there are matters requiring investigation by trial. The campaign, indeed, promises to stretch into the longest proceedings ever known in the history of American anti-trust investigations.

The Issue of Jurisdiction

No doubt the two British companies affected by these charges are giving careful consideration to the important issues of jurisdiction that they raise. But these jurisdictional issues, important though they are to the two companies that are immediately affected, extend even beyond them. They clearly call for close consideration by the British authorities and by those sections of British industry that are concerned in world trade and have links, at the same time, with American concerns. What is at issue is the propriety and the relevance of subjecting British companies to criminal proceedings in American courts on matters concerned with their business in countries outside the United States. The process of discovery by which these proceedings are conducted in the American courts probes into every corner of their business, every contract, every agreement with foreign governments. It asserts, indeed, that American processes of law in investigating the alleged activities of cartels allow the American authorities to govern what British companies should and can do outside the United States.

If this proposition were pushed to its logical conclusion, it would make fruitful contact between American and British industry difficult to the point of impossibility. To take the case of oil alone: no important British group would deny the importance of the freest contact with the American oil industry. The United States is the centre of gravity of the industry, and its technical prime mover; from the United States, Britain and the rest of the world have derived the advantage of continued competitive stimulus. But no industry, oil or any other, would consider these advantages, important though they are, worth the price of sacrifice of its right to pursue its trading policies (to borrow from the Anglo-Iranian statement) within the laws of any of the countries within which it operates. It must be hoped that the authorities on both sides of the Atlantic will accord to this point the fundamental importance that it deserves.

An Extended EPU?

The second annual report of the managing board of the European Payments Union covers an eventful year, and gives a detailed description of the intricate changes in quotas and clearing arrangements that marked the transition from the second to the third year of the Union. It also throws out the interesting suggestion that the area of multilateral payments now covered by the Union might be extended. In particular it is proposed to examine whether this area can include the countries of Latin America. The countries of southern Latin America—with which, incidentally, Britain has run a surplus in each of the last four years—are in many ways complementary to the present economic bloc of EPU, which contains not only the countries of Western Europe, but of the overseas sterling area as well.

The managing board feels that at the end of the second year of operations of EPU "considerable achievements can be recorded"; but much remains to be done and that "much" is the responsibility of the individual members. "They alone can take the necessary steps to ensure that their internal economies are stable; that the level of production in their basic industries is rising; and that productivity, particularly in their export industries is also increasing. It falls also to individual countries to ensure that the internal value of their currencies is properly reflected in the official rates of exchange which they maintain, and that they do not impose restrictions on imports which are unnecessary for

balance of payments reasons and are maintained chiefly in order to protect home producers from the effects of foreign competition. Creditor countries in particular should endeavour to ensure that their surpluses are not increased by the maintenance of unnecessary restrictions on imports." Here is as concise a summary as could be desired of the universal recipe for solvency and economic salvation. If the world does not accept and apply it, it will not be for want of tedious repetition.

Defence behind a Curtain

As the only independent body granted some power to examine the progress of rearmament in any detail, the Select Committee on Estimates has added considerably to the extent of public information on the subject by the reports it has published on the defence programme. But its third report, published this week, shows that the Select Committee this spring began to encounter much more difficulty over questions of security than it did in the earlier stages of the programme. Its records of evidence from Government departments have suffered much more obviously than before from strict pruning, and are spattered with asterisks that signify figures given only in confidence. Public information is not the Select Committee's responsibility; so that is by the way. But there are some signs that the security curtain is being used by officials as a shelter from pertinent questions, and thus is hampering the Select Committee's ability to carry out its real job—scrutinising the spending of public money. Sir Ralph Glynn's despairing complaint at one point that, "It is no use putting nothing in our report; we must put something in," may sound slightly petulant to civil servants. But his remark on another occasion, "There has been more extravagance in expenditure due to documents being labelled 'Secret' than from any other single cause. . . . The word 'secret' is very often applied in order to cover up extravagance" remains entirely justified. The departments, in several cases, apparently remained adamant—though Sir Ralph was able to point out that certain detailed information withheld by the Ministry of Supply had in fact been disclosed by Mr William Batt in Washington a week previously, before the Senate Foreign Relations Committee.

This partly inevitable obscuring of detail for security reasons has tended to reduce some of the Select Committee's report to unexceptionable generalities, and perhaps also to send it exploring safer byways where the facts are more easily forthcoming, such as the storage of military equipment. Its general comments cover the supply of labour, regarding which they confirm the outside impression that skilled labour which they confirm the outside impression that skilled labour is short but general labour easier; the call-up of apprentices, which it thinks might be even further curtailed to reduce its effect upon munitions makers; and the allocation of priorities to Government production and research projects, about which it is still not satisfied. The Committee mentions that some schemes have been deliberately delayed, causing considerable increases in cost; and others carried forward upon a rather lavish scale. Certain fairly expensive work, for example, was carried out for the Fighting Vehicles Design and Proving Establishment at Chobham, which is at present under notice to quit its present location in 3½ years' time; this departure, its director believes, would mean the loss of 50 per cent of its staff, who would not be prepared to move to alternative areas such as Bournemouth, which has been suggested. The Select Committee suggests that the system of priorities that takes account of the needs of industry and the export trade needs official review and independent inquiry.

Recruiting Brainpower

One factor that the Select Committee believes is seriously affecting the development of defence equipment is a shortage of scientists arising from the inadequate

salaries offered by the Government. From the evidence published, it would seem that the Select Committee was expecting to find this complaint to be rather more general among the Government's scientific establishments than it proved to be; but it probably has some effect at the margin of recruitment for all defence research. Professor Hall, director of the Royal Aircraft Establishment, quoted the case of one of his best men who left an official job in which he was receiving about £1,000 a year to join the aircraft industry, where he received £2,200 a year plus a car and a house. But he added that though most of his really valuable staff could certainly obtain twice as much money in industry, they remained fairly satisfied to stay in the Government service; they had "intellectual freedom" and the best plant available, which seemed just to tip the balance. In the main, he added, the men who left were the weaker rather than the stronger in scientific quality.

The official view regarding the scientific civil service—expressed by the Ministry of Supply in a memorandum to the Select Committee about recruitment for the atomic energy programme—is that the scientist entering Government service is probably underpaid in comparison with other employment. So is the scientist at the top of an establishment. But the men in the middle—who can reach, say, £2,100 a year at 31—command salaries and conditions that compare well with their counterparts in industry, where promotion for the research man may be slower. Sir John Cockcroft—who remains director at Harwell though he has also taken over the chairmanship of the Defence Research Policy Committee formerly held by Sir Henry Tizard—felt that salary scales there were not depriving the Atomic Energy Research Establishment of the best men. On the other hand, this applies mainly to Harwell, which has become a kind of "atomic university" to which all young British scientists intending to specialise in nuclear physics tend to gravitate. It may not be so true of the nuclear "production establishments" at such less glamorous places as Windscale, Aldermaston and Capenhurst. The Select Committee's anxiety upon this issue in general may seem to have been somewhat deflated by most of the official witnesses. It appears to have derived partly from the views that the present Paymaster-General expressed while in opposition last year. But there are some signs of a drift of highly-qualified scientific brains from Britain to America in recent months—two universities have thought it worth reporting to the Ministry of Labour—and the country certainly cannot afford to spoil the vast amounts it is spending on research equipment through parsimony in paying the best men to use it.

How Imports have been Cut

The pattern of imports as shown in the trade returns deserves particularly close scrutiny for the closing of the balance of payments gap now depends primarily on a continued fall in the import bill. Recently Mr Thorneycroft implied that the cuts imposed by the Chancellor would reduce imports for the year to some £3,500 million—or £400 million less than last year's total. To fulfil this forecast the monthly average during the second half of this year must not exceed £270 million, so imports during the remaining five months will have to average at least £20 million less than the July total of £290 million announced a fortnight ago.

The detailed returns for the month now show that raw materials continue to bear the brunt of the reductions. But the decline has not been due to import cuts alone. Lower prices have played their part in bringing down the cost of imports of materials to £108 million, compared with £158 million in July, 1951, and with an average of £122 million in the second quarter of this year. Wool and rubber imports were only half the value of those in July last year. On the other hand, raw cotton imports fell in value from

£25.9 million in July, 1951, to £8.9 million last month principally because a smaller quantity was imported; and the volume of imports of paper materials also declined. But there are important exceptions to this general decline in the import of materials. The expansion

in the rearmament industry led to a rise in imports of metal ores, compared with July, 1951; and, indeed, those of iron ore and scrap last month were higher than the average for the second quarter of this year.

As a result of the cuts, imports of many types of food amount to less than they did a year ago. Imports of "other foods," which include preserved fruits and vegetables, biscuits and sugar, were much lower than in July last year. Smaller quantities of grain, feeding stuffs and dairy products were imported, but these reductions were partly offset by a sharp rise in meat imports. Although the value of imported manufactured goods was lower last month than in July last year, it was above the average for the second quarter of this year. Larger imports of metal goods and machinery—no longer duty free—account for most of the rise in recent months; imports of most other manufactured goods have declined.

Textile Exports Cease to Fall.

At long last British textile exports may be turning the corner. Last month they ceased to decline for the first time this year. Admittedly, the improvement so far is slight, but if it continues it may be sufficient to reverse the downward trend in total exports. This was continued last

month when the total value of exports fell to £207 million, compared with an average of £209½ million in the second quarter. Exports of nearly all manufactured goods except engineering products and textiles are now declining. Non-ferrous metal exports fell from £6.9 million a month in the second quarter to £6.1 million last month, and iron and steel exports were lower in value and volume.

Textile exports in July amounted to £29 million and were unchanged from the monthly average of the second quarter

—in spite of a fall in shipments to Australia. But increased shipments of other textiles mask a further fall in cotton and a smaller fall in rayon goods. Exports of wool manufactures increased from a monthly average of £9.2 million in the second quarter to £10.1 million in July. Britain's main markets for wool goods are the United States and Canada, and shipments to both these countries have been improving lately. Exports of cotton goods, on the other hand, go chiefly to the sterling area, many parts of which have imposed restrictions on textile imports; in others, as for example the colonial territories, there is sharp competition from other cotton exporting countries.

According to the Board of Trade index the terms of trade have improved by no less than 6 per cent since the beginning of the year and are still moving in this country's favour. Last month the fall in import prices more than offset a further decline in the price of exports. The price of manufactured imports fell from 104 in June to 101 in July (1951=100), raw materials from 92 to 90, and food, drink and tobacco from 107 to 105 during the same period. Prices of textile exports again fell sharply in July, causing the index of export prices to lose another point. The prices of metal and engineering products remained unchanged; other manufactured exports became slightly cheaper.

Radio States Its Case

The radio industry is going through a comfortless period of falling home sales and no early prospect of the type of defence order that will provide alternative employment. The industry is now, perhaps, the chief victim of the Chancellor's policy of deflation in the home. Ordered to reduce home deliveries of domestic radio and television receivers by one-quarter at the beginning of the year, it has received a temporary reprieve until the autumn, but the trend of sales suggests that, whatever bargains it strikes with the Ministry of Supply, the industry must willy-nilly cut its production for lack of demand. This week both Pye and Cossor have reported a fall in sales in the past year and the chairman of Pye attributed this to the 66½ per cent purchase tax (the rate was doubled in 1951) and the hire purchase restrictions. A move to cut prices was started by Electric and Musical Industries this summer; it has been followed by companies such as Pye and English Electric, but those companies that have reduced prices are reluctant to attract too much attention to the fact, and some of the leading manufacturers maintain that costs have risen so much that any reduction is out of the question.

The drop in radio sales was perhaps to be expected in view of the competition from television, and since television receivers contain far more components than radio, no fall in employment need have followed. But the television figures themselves are disappointing, considering that two new

transmitters, one covering an area as densely populated as the London transmission area, have opened this year. The fall in home sales has also to be interpreted in light of the fact that the industry was basing its plans for production on a rate of sales considerably higher than those of 1951.

Defence orders are running now at an annual rate of £40 to £45 million. This represents a substantial slice of the industry's total output, which reached £110 million in 1951. But it means much less in terms of actual employment, since a large part of the orders is for capital equipment, where the cost of materials alone represents a high proportion of the total value. These orders employ skilled engineers and designers, but give no employment to the set assembly lines, whilst the recent changes in the air rearmament programme will cause an immediate reduction in current requirements for the type of transmitting and receiving set that might have provided such employment. Moreover, as military designs become more complex, they become less and less suited to mass assembly work. The industry's total exports, which are running at an annual rate of £25 million compared with £22.7 million in 1951, are likely to continue to expand, but overseas demand is also for the complex type of electronic apparatus and component already in demand for defence purposes. Exports of radio and television receivers totalled £2.8 million in the first seven months of this year, but are bound to fall later in the year; Australia, which took 4 per cent of these supplies, has now virtually banned any further imports of receivers.

TV and Circuses

The all-out effort being made by the radio industry and the BBC to stimulate public interest in the annual radio show that opened at Earls Court this week will almost certainly ensure a bigger attendance than last year. But it

is not by any means so certain that the exhibition will be able to achieve its primary purpose of stimulating sales of domestic receivers in what is usually a very slack period of trade. The truth is that there is little to whet the appetite of potential customers; and if this year's exhibition, with its ingenious sideshows, resembles a radio circus rather than the decorous display of earlier years, that serves only to demonstrate the impasse that the industry has reached. Apart from the BBC studios, which have a back-stage interest of their own, these sideshows are almost entirely made up of industrial and military exhibits, the only fields in which the industry has scope to exercise its ingenuity free from the inhibitions of cost. Such displays as television cameras, underwater television, radar, guided missiles, mobile transmitters of all sizes and radio-control apparatus suggest that in future the industry hopes to become less dependent on the market for domestic receivers than it is today. This field is, however, open only to those companies with good research facilities, and these are still a minority in the industry.

In the domestic field, the need to hold prices down, combined with the preoccupation of the industry's best design staff with defence work, has restricted innovation, and designs are dominated by considerations of economy. In radio this takes the form of dual purpose sets capable of running off mains or on a battery, combining sometimes a gramophone and in one case a radiogram. Nearly all manufacturers in television have dropped the small 9-inch screen set in favour of sets with screens of 12 inches or more to meet the public demand for a bigger picture. The 12-inch screen accounts for nearly 70 per cent of current sales; sales of sets with larger screens are hampered by their high price and their high maintenance cost. A 16-inch tube receiver, for example, costs 140 guineas including tax, compared with £82 for a receiver with a 12-inch tube made by the same company. A second difficulty lies in the cost of tube replacement. The retail price of a cathode tube works out at roughly £1 an

inch of screen size plus tax, bringing the retail price of a 12-inch tube to £15; and maintenance costs thus rise with each increase in the size of the screen. This explains the growing number of projection receivers going into production. These receivers use a 2½-inch tube to project the televised image on to a mirror, from which it is magnified on to the viewing screen. This cuts both maintenance cost and the size of the receiver, but involves the use of a complicated optical system, making the price of the receiver higher than that of the equivalent direct viewing set. The system is, however, in its infancy and clearly capable of further development. The appearance of one or two projection sets that throw a picture on to a 3 ft. by 4 ft wall screen shows the technical possibilities of the system, but its development along these lines must be limited while the BBC continues to transmit pictures on 405 lines only.

Fiduciary Issue Reduced

In the week to last Wednesday the active note circulation fell by another £12 million to £1,459 million; and, as expected, the fiduciary issue (which was increased from £1,450 million to £1,500 million in the fourth week of June, and then to £1,550 million in the fourth week of July) has been reduced to £1,500 million. As will be seen from the accompanying chart, the customary seasonal fluctuation in the note issue on either side of the August Bank holiday has been sharper in 1952 than in previous

postwar years. At the end of last April the active note circulation stood at £1,410 million, compared with £1,314 million at the end of April, 1951. Between the end of April and the August Bank holiday peak, the active circulation increased by £98½ million in 1952 compared with £51½ million in the same period of 1951; but by August 27th of this year it was already £49½ million below its Bank holiday peak, compared with only £35 million below it on August 29, 1951. The reflux in the last two weeks alone has amounted to over £34 million, compared with only £13 million in the corresponding period last year. Although it is clear that the increase in prices and wages since last year has caused a general increase in the amount of money that people find it convenient to carry about with them (rather than leaving on bank deposit), the increase in this respect since the spring has not been as great as the very heavy pre-holiday efflux of notes at first seemed to suggest. In late June and early July the banks obviously drew out more notes into their tills than they eventually needed.

IMF Dollars for Australia

It was announced this week that Australia is purchasing \$30 million in US dollars from the International Monetary Fund. The purchase is being completed before September

30th so as to secure urgently required dollar finance during Australia's leanest balance of payments season—that is, before receipts from the wool sales begin to come in. It should be stressed that this Australian purchase of dollars from the IMF has nothing to do with the loan for \$50 million that Australia has recently negotiated with the International Bank for Reconstruction and Development. Figures have recently been published of the dollar deficit that Australia incurred in the twelve months to June 30, 1952. This amounted to \$165 million compared with a surplus of \$71 million in the previous twelve months. Part of this dollar deficit was financed from Australia's own resources, but \$131 million was withdrawn from the sterling area dollar pool, compared with a net contribution of \$97 million in the previous year.

Coal Stocks and Industrial Output

At this time last year fuel experts were sensibly warning the country that the winter might bring a renewed coal crisis, and the British Electricity Authority, beseeching industrial electricity consumers to spread their power load, was quoting frightening estimates of the gap between peak demand and generating capacity. Today, coal is wreathed in comparative contentment; stocks stand already at almost the minimum winter "safety level" required by the beginning of November, which should free about two million tons more for export between now and then. This year the BEA has again asked industrial consumers to reduce their load during peak hours by 10 per cent (compared with 20 per cent last year); but after a winter virtually without power cuts, it has not waxed very alarming about the gap between peak demand and capacity. Both public utilities bear witness to the most important development in Britain's fuel budget during the last twelve months—the disappearance of the sharp growth in internal fuel consumption that had marked the previous two years.

Inland consumption of coal in the first 32 weeks of 1952 was 2½ million tons lower than in the same period of the previous year. In the same way, electricity consumption was only a fraction higher than the year before, and some tables of electricity sales recently issued confirm that the trend, particularly since April, seems to be downwards. In 1948-49 and 1949-50, the number of units sold rose by about 8 per cent each year (adjusted for normal weather and standard working days), and in 1950-51, they rose 11 per cent; but in 1951-52, the increase was only 7 per cent, and in each month since March the percentage by which sales exceed those a year before has declined.

Broadly, it can be assumed that these roughly parallel trends in consumption of coal and electricity follow the flattening curve of industrial activity; better weather, and increased use of private generating equipment (which the BEA is advocating this winter) probably had some additional influence upon electricity consumption. Today's lull in fuel forebodings may not prove the most suitable atmosphere for the Ridley report on fuel economy that is due in some weeks' time. But the fact that this lull is almost entirely a consequence of slackening industrial output should temper any complacency.

* * *

Extrapolation in Coal

Nobody would suggest that the experience of the last eight months could offer a satisfactory basis for forecasts of the country's coal consumption in the future. But it once again emphasises the difficulty, in making such forecasts, of selecting the particular trend to follow. Sir Hubert Merrett, who two years ago prepared an extensive survey of the potential overseas market for British coals during the next decade, is the latest expert to enter the lists with a forecast of future consumption in this country. Total inland con-

sumption here last year was 209 million tons; Sir Henry, in an article in the current National Provincial Bank Review, expects this to reach 227 million tons in 1956 and to 237 million tons by 1961. Assuming that production of opencast coal will have ceased by 1955—which is not now likely—he thinks the British industry cannot produce more than about 226 million tons in 1956, and is doubtful whether the long-term plan—already seriously behindhand—will in fact achieve the output of some 240 million tons at which it aims by 1961-1965. He comments:

It would seem, therefore, that our coal export trade will shrink rapidly from 1954 onwards and die out completely by 1956 unless further measures are taken.

This extinction, he judges, will not be allowed; but Britain will enter the ranks of "importing-exporting" coal countries, with foreign imports as permanent a feature of its fuel economy as small coal exports.

Sir Henry's estimate of future coal consumption in Britain is thus far above the Coal Board's original calculation in the 1950 plan—205-215 million tons—but somewhat below the figure of 263 million tons for 1965 forecast recently by the Federation of British Industries. Both of these independent estimates were built up from estimates of future consumption by different groups of consumers. But the FBI's figure in fact amounts almost exactly in total to a direct projection of the sharp upward trend in consumption during 1950 and 1951, while Sir Henry's follows this trend up to 1956 but assumes some moderation in the growth of consumption in the five years following. Statistically, this short period would not provide a satisfactory trend for extrapolation. Such statistics of coal available for home use since the beginning of the century as exist might well suggest a consumption much nearer to the Coal Board's estimate than to the two independent figures. But as an example of the pitfalls of any such projections, it may be noted that the rise in consumption between 1900 and 1917—before electricity began to affect the fuel balance significantly—would have suggested a home consumption by 1951 of some 250 million tons. Estimates made upon the best forecasts that can be applied for individual groups of consumers have more weight; but no individual forecast can be free from the same weaknesses in assumption that beset projections made from the total. Even were the coming Ridley report to serve no other purpose than to draw together such estimates of future demand from the widest possible range of experts, and to provide its own tentative assessment, it might be valuable.

Boom in the Copper Belt

The Rhodesian copper producers are still riding on the crest of a boom. In the year to June 30th last, Roan Antelope increased its sales of copper from 74,520 tons to 81,027 tons, its gross revenue from £13.1 million to £16.7 million, and its estimated before-tax profits from £5,925,000 to £8,281,000. Mufulira, which had to follow a cautious policy of coal conservation in the early part of 1952 (because

floods threatened its rail communications), saw its total sales in the year fall from 83,681 tons to 76,369 tons; but, thanks to higher prices, its gross revenue rose from £14.6 million to £15.7 million, and its estimated before-tax profits from £7,877,000 to £8,269,000. Shortly after the end of the financial year of both these companies, the Ministry of Materials raised its buying price for Rhodesian copper by 20 per cent, so that the current year is likely to have started well.

It is still not clear, however, how much shareholders can expect to get out of this possibly evanescent prosperity. Both companies applied to the Treasury last May for permission to transfer residence to Northern Rhodesia. There has still been no announcement on whether they will be allowed to follow their competitors in the Anglo-American group through the ring fence—to the not inconsiderable political and tax advantages that would await them in Rhodesia, especially now that the Excess Profits Levy is in action here. At best this delay is a sign of Treasury red tape; at worst it is a sign of unwise indecision.

Recovery in Jute

A firmer tone has prevailed in the jute market during the past two weeks. In Pakistan there has been a sudden increase in purchases by continental buyers, who had previously hung back from what had seemed to be a falling market. In the middle of July pressure of supplies had forced the Pakistan Government to lower its minimum price for loose jute by nearly £20 a ton, to the equivalent of about £73 a ton (c. and f. HARB) for export qualities, but many shippers continued to offer supplies below this price. For a time the Pakistan Government was apparently willing to turn a blind eye to this evasion, but they have now made it clear that buyers must pay the minimum price or go without. This firmer attitude has been made possible by the increase in demand; in addition, it has been reported in the last few days that the Pakistan Government may raise its minimum price to about £75 a ton from the middle of September.

Thanks to the fall in prices earlier this year, hessian is again able to compete with cotton as a packing material, and jute seems to be well placed to regain some of the ground lost to substitutes in the United States last year. During the last few weeks increased American buying has helped the price of Indian hessians to recover, and the internal price of raw jute in India has also increased sharply (exports of raw jute from India are not permitted). In Britain, too, there has been a definite improvement in the jute trade since the reduction in the Jute Control's prices at the beginning of this month. Before this reduction, consumers had been living on a hand-to-mouth basis and had run down their stocks to a very low level. But spinners and manufacturers have now received sufficient orders to keep them going during the next few months; in consequence, longer hours are being worked in some mills. But no increase in world demand that threatens a shortage of jute is foreseeable this year. In fact, the Pakistan Government, fearing a large surplus, is restricting next year's crop to 4.5 million bales, or 25 per cent below this year's level.

Steadier Wholesale Prices

The official indices of wholesale prices are beginning to reflect the recent recovery in certain commodity prices. Although the index of basic materials, based on June, 1949, continued to decline in July, the fall of 0.2 per cent on the month was much smaller than the corresponding reductions in May and June. On the other hand increases in the price of metals, principally copper, caused small rises in the indices for materials used in mechanical and electrical engineering and in building and civil engineering.

The price of copper rose by 11 per cent, showing the biggest increase for any commodity during the month, and aluminium prices also rose. Lead, after falling steadily since the beginning of the year, recovered slightly in July. Zinc, on the other hand, dropped for the third month in succession, and the index for August will no doubt reflect the further falls that have taken place in its price during the last two

INDEX NUMBERS OF INDUSTRIAL MATERIALS PRICES
June 30, 1949=100

	Basic Materials (excluding fuel) for non-food manufacturing industry	Materials used in mechanical engineering industry	Materials used in electrical engineering industry	Building and civil engineering materials	House building materials
1951 Mar.	220.4	128.3	143.1	117.8	116.7
1952 Jan.	181.5	143.2	160.0	134.4	130.0
Feb.	177.0	143.6	160.2	134.8	131.4
Mar.	169.6	152.2	165.4	136.8	132.9

or three weeks. With two exceptions, textile prices continued to decline in July; wool, which has been reviving since April, gained a further 8 per cent during the month, and raw silk increased by about 5 per cent. The fall in jute, sisal and cotton prices during July was smaller than in previous months. Among other materials, the prices of rubber and imported softwood remained virtually unchanged, but hardwood prices rose slightly. The recovery in prices of hides and skins that began in June continued in July at a reduced rate, because the fall in domestic hides was partially offset by a rise in the price of imported hides. Woodpulp prices declined by no less than 28 per cent on the month, and at the end of July were 48 per cent below the peak level reached in January.

Company Notes

Tootal Broadhurst Lee.—The reasons for the slump in Tootal's trading profits from £2,105,294 to £783,000 are clearly outlined in the chairman's statement, but the reasons for the increase in equity distribution in the face of this slide in earnings still remain a little obscure. In common with other spokesmen of the cotton industry, Sir Kenneth Lee (who retired from the chairmanship of Tootals last June after 55 years of service to the group) has a gloomy tale to tell of falling raw material prices and slumping sales. When sales began to fall, the group was left with large unsold stocks, and had to cut production; Sir Kenneth agrees that it would have been better if production had been reduced in the spring of 1951, when raw material prices were at their peak. The group's stocks are valued in the balance sheet at £3.2 million, against nearly £3.6 million a year before; if they had been entered at cost or market value, it is estimated that they would have stood at £4.9 million, against £5.3 million a year before. Unfortunately, the company was left with a very considerable quantity of goods on its

hands when the Australian Government imposed its import embargoes last March, and it is clear that the losses on these stocks go a long way towards explaining the steep

Consolidated earnings	1951	1952

decline in profits. An additional explanation lies in the large losses made by the company's American and Canadian subsidiaries.

Shorter Notes

The Treasury has announced that as from Monday next, September 1st, the number of National Savings Certificates of the ninth issue that may be held by any person is to be increased from 500 units (cost price £375) to 700 units (£525), in addition to the permitted holdings of previous issues. The last effective increase in the permitted holdings of National Savings Certificates was in February, 1951, when the ninth issue was launched. September 1st is also the date from which the new 3½ per cent Defence Bonds (described on page 44 of *The Economist* of July 5th) will be on sale.

Indirect exports of steel, in metal goods sent overseas, have increased by 75 per cent since 1947, according to an estimate by the British Iron and Steel Federation. Last year they amounted to some 2,700,000 tons of finished steel. In terms of ingots, this would be about 3,700,000 tons; since direct exports accounted for about 2,700,000 ingot tons, roughly 40 per cent of the year's total output was sold overseas. The estimated volume of exports of the metal goods concerned has in fact doubled since 1947; the tonnage of steel has risen less partly because exports of goods containing a small amount of steel in relation to their value have increased more rapidly than those of goods containing a large amount of steel.

For the second time within a month the price of marine fuel oil was last week reduced by the oil companies. This new reduction is of 7s. per ton for marine fuel oil and of 2s. 6d. per ton for diesel oil. Diesel oil is now nearly £4 per ton dearer than marine fuel oil. This widening of the differential may encourage motor-ship owners to run their main engines on the heavier fuel oil, thus obtaining a considerable saving on their annual fuel bill.

Prices of certain qualities of alloy and stainless steel were altered this week by the Ministry of Supply to take account of the changes in alloying content that have been made to conserve alloying metals, as well as changes in the prices of the alloying metals.

It is against this background of almost unrelieved gloom that the directors decided to raise the ordinary dividend. Sir Kenneth explains that the dividend paid in 1950-51 was smaller than would have been recommended had it not been for the Labour Government's White Paper on dividend limitation; in fact, the payment of a 15 per cent dividend is a return to the rate paid in 1949-50. Since then, however, the prospects for Lancashire have had to be considerably revised. The financial strength of the group provides some justification for the directors' decision—cash resources, for example, have risen from £1.8 million to £2.4 million—but in the current year shareholders would be well advised to consider the course of trade, rather than the strength of the group's balance sheet, as the final arbiter of dividend payments.

Pye.—The radio industry is passing through a difficult period, as three recent company reports—those by Pye, A. C. Cossor and Thorn Electrical—make abundantly clear.

INDEX

The Index to *The Economist* is now published quarterly. Subscription rates are 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXIII (April to June, 1952) is now available from:

ETA REEDS

AN Indian firm making paper from eta reeds found considerable difficulty in bleaching the fibre and in producing paper of satisfactory quality. Experimental manufacture on a full-scale plant was expensive and also meant taking the plant off normal production for a long period. Accordingly, the firm turned to I.C.I. (India) by whom the enquiry was referred to the I.C.I. technical service organisation in England. A quantity of boiled eta pulp was then shipped to this country for trials. It was sent first to I.C.I. General Chemicals Division at Runcorn who developed a successful bleaching process. The bleached pulp was then sent to I.C.I. Dyestuffs Division, who maintain in Manchester a small papermaking machine as part of their normal technical service to the paper industry. Tests showed that the white obtained in bleaching was as stable to light as that of the bleached cotton pulp used in the manufacture of high-grade papers. After a number of trials, using eta fibre alone and in mixtures, samples of paper and details of the way in which the various pulp mixtures behaved on the papermaking machine were sent to India.

As a result, the original difficulties were overcome and the manufacturer in India was able to make paper of the quality required.

CANADA

3rd greatest trading nation

Many British firms are already sharing in Canada's rapidly developing economy. For the fullest information concerning trading conditions, marketing opportunities, import-export regulations, etc., you are cordially invited to consult Canada's oldest bank.

In their full—and it is a commendably full—report the directors of Pye describe the year to March 31st last as “the most difficult we have had for a long time.” The supply position made it necessary for the group to stockpile “vast quantities of materials.” Government contracts did not materialise as promised, and purchase tax and hire purchase restrictions kept down sales of radio receivers. Although turnover as a whole increased, profit margins were cut. “In situations like these,” report the directors of Pye, “a business requires much more capital than it ought, and as we could not see the justification for such capital increase, we have had a most embarrassing and difficult time.”

Despite these complaints, and despite a loss by its Canadian subsidiary, Pye's gross trading profits rose from £666,107 to £783,554 last year; after allowing for increased taxation,

Consolidated earnings:—	Years to Mar. 31, 1951	1952
Trading profit	666,107	783,554
Depreciation	56,641	98,783
Taxation	358,316	448,820
Net profit after taxation	183,614	102,219
Dividend (deferred ordinary)	40,837	18
Dividend (per cent)	18	18
Carry forward	490,104	603,408

net profits fell from £183,614 to £102,219 but the dividend on the deferred ordinary shares was maintained at 18 per cent. The balance sheet shows, however, that stocks and work in progress rose from £1,940,693 to £2,748,174, the group's bank overdraft rose from £108,752 to £444,715, and its cash balance ran down from £234,932 to £36,007. At the current price of 15s. 9d. the 5s. deferred ordinary shares yield £5 14s. 3d. per cent.

A. C. Cossor.—Like Pye, the A. C. Cossor Group showed an increase in its gross trading profit (from £473,549 to £482,876) in the year to March 31st last, but a fall in its net trading profit (from £374,601 to £352,768). As had been expected, however, the profit was sufficient for the group to make its first ordinary dividend payment since 1947, at 10 per cent. In his statement last year, the chairman had held out a reasonable hope of a resumption of ordinary dividends “before very long,” and when, in March of this year, three years of preference dividend arrears were cleared off, it was generally recognised that the patience of ordinary shareholders would soon be rewarded. Nevertheless, the directors' report is not a cheerful one, for Lord Burghley forecasts that last year's downward trend in profits will continue during the current year. There has been a “spectacular fall” in the sales of radio receivers, and this has been only partially offset by a further increase in sales of television receivers. More-

Consolidated earnings:—	Years to Mar. 31, 1951	1952
Trading profit	473,549	482,876

Ordinary capital	600,000	600,000

5s. ordinary share at 10s. 3d. yields £4 17s. 6d. per cent.

over, the group has been “very hardly hit” by the selection of the standard years for EPL, which were years during which the company either incurred heavy losses or made very low profits. One of the alternative

capital standards will have to be adopted, and this will set the group's standard well below present actual performance.

A conspicuous rise in stocks, from £2,010,047 to £2,875,437, has caused the group's bank overdraft to increase by £554,574 to £813,891, and working capital is now inadequate. The directors have not yet decided how this is to be remedied, but as a first step a special resolution is to be submitted at the annual general meeting to increase their borrowing powers from £1,125,000 (the amount of the nominal capital) to £2,200,000. Following the publication of the report, the price of the ordinary shares fell by 2s. to 9s. 9d.

Thorn Electrical.—The main interests of Thorn Electrical are in the consumer goods side of the electrical trade—in lighting equipment as well as in television and radio sets. In the year to March 31st last a record turnover was achieved and group profits before taxation rose from £517,323 to £681,169; net profit increased from £169,514 to £211,819 and the ordinary dividend rate rose from 10 to 12½ per cent. The fact that the rate of advance in profits has slowed down since last year suggests, however, that the rise in costs is eating into profit margins, and the chairman remarks ruefully that “world conditions are certainly not encouraging at the present time.”

As with Pye and A. C. Cossor, there has been a sharp rise in the book value of stocks from £1,196,346 to £2,083,600, and this has been accompanied by a net decline in liquid resources. The slight increase in cash balances, from £62,348 to £142,260, has been completely overshadowed by the increase in loans and bank overdrafts from £107,049 to £988,180. Moreover the continued expansion of business, reflected in this paucity of liquid assets, has led the directors to warn shareholders that “further finance will be

Consolidated earnings:—	Years to Mar. 31, 1951	1952

Cash	62,348	142,260
Loans and bank overdrafts	107,049	988,180
Ordinary capital	528,750	528,750

5s. ordinary share at 8s. 6d. yields £7 7s. 0d. per cent.

required up to a substantial figure within the next two years.” The directors believe that it may be “more advantageous and practicable” to raise the new money required by an issue of loan capital and not by an issue of share capital; shareholders are therefore being asked to agree to an increase in the existing limit put on the company's borrowing powers to £2 million.

Great Universal Stores.—The unexpectedly cheerful results published last week by the retail furniture companies in the Great Universal Stores group has now been followed by the preliminary statement for the group as a whole for the year ended March 31st. This shows that the group's total trading profits reached an all-time record of £10,007,555, or £1,846,405 more than in the previous year. Out of this, tax absorbs £5,365,365 (against £4,489,415), but net consolidated earnings are up by over £600,000, at £2,993,676. A final dividend of 18½ per cent has been declared on the new capital; as the group's capital was increased by a one-for-one scrip bonus last May, the total dividend for the year is the equivalent of 50 per cent on the old capital compared with 40 per cent last year.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 23, 1952, total ordinary revenue was £60,977,000, against ordinary expenditure of £78,453,000, and issues to sinking funds £370,000. Thus, including sinking fund allocations of £10,761,000 the deficit accrued since April 1, 1952, was £242,850,000 compared with a surplus of £42,420,000 for the corresponding period of the previous year.

CONTAINERS LIMITED

The company's holding in our associated company, Colthrop Board and Paper Mills Limited, has increased from 69,193 shares to 103,789 shares of £1 each as a result of the bonus issue of one share for two last autumn. As the dividend paid by that company was maintained at 25 per cent, the dividend received from this source has increased from £17,298 to £25,947.

Apart from the value of this investment, which is considerably in excess of the amount standing in our books, the proximity of the Colthrop Board Mill, which supplies Cropper and Company, Limited, and Containers, Limited, with nearly all the raw materials they require, enables those companies to work on a minimum of stock. This is, of course, very advantageous at a time of falling prices.

APPALLING BURDEN OF TAXATION

Our subsidiary company, Containers Limited, has shown a smaller profit than for the previous year owing to the general recession of trade throughout the country during the last six months. During the last few

CROPPER AND COMPANY

(Carton Manufacturers)

ANOTHER RECORD YEAR

MR FRANK W. J. SMITH'S STATEMENT

The fifty-fifth annual general meeting of Cropper and Company, Limited, was held on August 28th at the registered offices of the company, Thatcham, Berkshire.

Mr Frank W. J. Smith, the chairman and managing director, presided.

The following is his statement which was circulated with the report and accounts for the year ended June 30, 1952:

Once again I am pleased to be able to report that the profit of the parent company for the year just ended has reached a new high record at £478,892, compared with £452,934 for the previous year.

This result is very satisfactory in view of the difficult conditions prevailing during the last six months. Taxation, to which I shall refer later, takes £32,824 more than last year at £294,790, but after adding the amount brought forward from last year and deducting the cost of the preference dividend for the year and the interim dividend of 12½ per cent upon the ordinary shares paid in January last, there remains a disposable balance on the profit and loss account of £204,906.

The directors recommend the payment of a final dividend of 25 per cent, making 37½ per cent for the year on the ordinary share capital as increased by the bonus last autumn of one share for five. It is also proposed to transfer £120,000 to general reserve, making the total of that reserve £325,448, and to carry forward £49,821 to next year's accounts. The directors do not consider it necessary to add to the employees' benefit fund this year, as the amount to the credit of that account is deemed to be adequate.

STRONG FINANCIAL POSITION

The financial position of the company and our subsidiary company, Containers Limited, is very strong. The current assets of the group, including bank balances of £717,163 and tax reserve certificates of £550,000, amount to £1,850,575, against current liabilities of £705,130. The fixed assets have been written down over a period of years to the sum of £345,803 and are worth many times that amount. There are no debentures, loans, bank overdraft, or prior charges of any description.

The company's holding in our associated company, Colthrop Board and Paper Mills Limited, has increased from 69,193 shares to 103,789 shares of £1 each as a result of the bonus issue of one share for two last autumn. As the dividend paid by that company was maintained at 25 per cent, the dividend received from this source has increased from £17,298 to £25,947.

Apart from the value of this investment, which is considerably in excess of the amount standing in our books, the proximity of the Colthrop Board Mill, which supplies Cropper and Company, Limited, and Containers, Limited, with nearly all the raw materials they require, enables those companies to work on a minimum of stock. This is, of course, very advantageous at a time of falling prices.

CONTAINERS LIMITED

Our subsidiary company, Containers Limited, has shown a smaller profit than for the previous year owing to the general recession of trade throughout the country during the last six months. During the last few

weeks, however, there has been a considerable increase in the volume of orders received. After paying the same dividend as before, Containers Limited, has allocated £50,000 to general reserve, increasing that reserve to £250,000.

Taxation, already a heavy burden, has been increased by the Excess Profits Levy, an estimate of which for the six months since January 1st last has been charged in these accounts. The levy will be chargeable for a full year in the next accounts, but the company's standard is favourable and it is unlikely that the possibility of future dividends will be affected by this particular imposition.

The last two years of trading have been abnormal owing to the great activity of business throughout the country, with the result that a lull has occurred while stocks were running down. Already, however, there are signs of improvement, but our business as manufacturers of packing materials is entirely dependent upon the general trade of the country and I hesitate to prophesy the future course of business. I feel, however, that we can face the future with confidence, since our factories are maintained in the highest state of efficiency and since the financial position built up over the long period of 55 years is one of unusual strength.

In conclusion I should like to take this opportunity of thanking my co-directors, the staff, and all our employees for their loyal co-operation during a very difficult period.

WILLIAMS AND WILLIAMS OLDHAM & SON LIMITED LIMITED

CONTINUED PROGRESS

The forty-third annual general meeting of Williams and Williams Limited was held on August 22, 1952, at Reliance Works, Chester.

Mr B. A. Williams, OBE, MIPE, chairman of the company, presided, and in the course of his remarks said:

It has for many years been the directors' policy to finance expansion of the company's business and operations out of accumulated and undistributed profits, the expansion contemplated, however, is such that this is becoming more and more difficult. We have under review an extensive programme, both at home and overseas, which will require considerable capital expenditure partly to catch up with replacements and developments which were held back by the war, and partly to cater for the expansion of our business.

The inadequacy of the present depreciation allowances against taxation continues to operate harshly against progressive companies such as yours. Out of the small balance left after such heavy taxation it is difficult to provide for replacements at a cost three and four times the value allowed for taxation purposes. Moreover it is impossible to reconcile the demand of successive governments for more and more exports with a fiscal policy that discourages expenditure on up-to-date equipment.

Despite this, however, it has been our constant endeavour to increase the volume of our exports, even though progress in this and in our production for essential building programmes at home, has been severely curtailed by shortage of steel. We are led to believe, however, that material allocations will be improving in the latter part of this year and we shall expect to make further progress in the development of our overseas trade in proportion to this improvement.

OVERSEAS VISITS

Your directors, as well as a number of your staff, have visited many of your overseas units during the year under review. We have also received visits from directors of your overseas companies and plans are already in hand for further visits—these are essential for maintaining and increasing your export trade in various parts of the world.

Turning now to the profit and loss account and balance sheet, you will observe that the year's trading shows a consolidated net profit after providing for all chargeable expenditure other than taxation (£210,115) of £412,027 compared with £236,939 (with taxation of £136,585) for the previous year and after adding the sum of £196,006 brought forward from previous years and £49,331 being profit on the sale of property and investments—a balance remains of £657,364 which your directors recommend be dealt with in the manner set forth in their report.

Your directors would like you to note that the total amount invoiced for the year under review was more than eight times that of 1938 indicating the development and progress made by your company since the war.

Your directors recommend that a dividend of 20 per cent be paid on the ordinary share capital of the company.

In making this recommendation for a modest increase, your directors have deferred to the wishes of the government that restraint be exercised.

We would ask you to accord your appreciation of the continued good work of the managements and staffs of our group of companies both at home and abroad.

The report was adopted.

ACTIVE AND SUCCESSFUL YEAR

MR JOHN OLDHAM'S REVIEW

At the thirty-third annual general meeting of Oldham & Son Limited, held on August 29th at the company's head office, Denton, Manchester, the chairman, Mr John Oldham, OBE, JP, reported further steady progress and development of the company's business at home and overseas. The profit for the year was a record one.

This satisfactory result had been achieved by increased sales in all departments, and the installation of new processes and methods of production which had offset substantial rises in costs.

Net profit of the group for the year ended March 31st last, subject only to taxation, amounted to £319,706 as compared with £270,176 in the previous year.

It was proposed to increase the final ordinary dividend to 20 per cent, which, with the interim dividend, made 35 per cent for the year.

Production had increased substantially both in variety and volume. The new tool and engineering department, occupying 10,000 sq ft, which had been completed early in the year, had played a vital part in meeting increasing demands for the company's products by accelerating the re-tooling programme.

Sales had risen in all departments, and a striking feature was the fact that, notwithstanding the operations of the overseas companies, direct exports had exceeded those of the previous year.

"FIBRAK" BATTERY SEPARATOR

Referring to the company's new "Fibrak" battery separator, the chairman recalled his statement last year that a separator had been developed in their laboratories at Denton, after a long period of research and test, and that its manufacture in the USA had been licensed to an important company there. Production of this separator, running into several millions a week, was now under way in the United States. In the company's works, too, large-scale production had commenced. This major development should be a source of considerable profit to the company.

OVERSEAS MANUFACTURING COMPANIES

Oldham & Son Africa Limited, in which they held a 50 per cent interest, had made further progress according to its third annual statement. A considerably increased turnover had resulted in a net profit of over £70,000, an increase of 40 per cent on the preceding year.

The company's French subsidiary, Société Française des Procédés Oldham, continued to increase its business as the leading supplier of self-service miners' lamps and equipment to the French mining industry. Production of batteries by Oldham & Son India Limited, had commenced at the Madras plant during the year.

Concluding, the chairman said that shareholders could rest assured that the efforts of the directors would be continually devoted to the task of widening and strengthening the company's foundations, and adapting its policies and programmes to meet changing conditions.

The report and accounts were adopted, and at an extraordinary general meeting held subsequently, a proposal to distribute part of the Company's reserves in the form of a bonus share issue to ordinary shareholders in the proportion of one 1s. ordinary share for each ordinary share held, was approved.

GOLDEN HOPE RUBBER ESTATE, LIMITED

The annual general meeting of The Golden Hope Rubber Estate, Limited, will be held on September 15th, in London.

The following is an abstract of the address of the chairman, Sir Eric Macfadyen, circulated with the report and accounts:

In the balance sheet, the estates, buildings and trade investments stand at £596,152, and with the balance of rehabilitation expenditure (£7,183) total £603,335. These are more than covered by the issued capital and capital reserves—together £645,704. Revenue reserves, plus current liabilities and the provision for future taxation amount to £573,292, against which we have current assets of £615,661. Output was down, from 5,484,597 lb to 4,586,959 lb, owing to difficulties applicable to Malayan Estates generally during the year.

The net profit, after allowing for export duty on the new scale of £96,627 and Malayan and British taxation of £163,853, is £134,046, compared with £180,256 last year. The cost of the 10 per cent interim dividend paid last March and of the 15 per cent now recommended, making 25 per cent for the year, is £53,856. £82,483 is divided between cultivation reserve and development reserve and the general reserve is augmented by £15,000. The carry forward is £31,250, against £28,315 brought in.

Further planting has proceeded—104 acres of rubber and 468 acres of oil palms. These developments have been partly on jungle and partly on replanted land.

Dealing with the intensification of terrorism during the year and the more hopeful feeling now prevailing, the Chairman said, it would be misleading to imply that life is as yet any easier in most districts.

Binding Cases

Because of increased size, THE ECONOMIST will this year have to be bound in quarterly instead of half-yearly volumes, and RECORDS & STATISTICS in half-yearly instead of yearly volumes. Suitable binding cases are now available in stiff, dark blue cloth covers, with gilt lettering on the spine. These cases provide a firm and effective binding, and the year can also be stamped on the spine if required. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

Trade, Not Isolation

IN Washington and Ottawa, at least, this is the time of year when men remember nostalgically the wartime plans for postwar economic reconstruction. The two institutions born at the Bretton Woods conference—the International Monetary Fund and the International Bank for Reconstruction and Development—are now holding their annual meetings. These twins were to have been the means to a new expansionism, as well as a new security, in the trade of nations. The little interest now taken in them in London can plausibly be presented as realism, but it is not on that account any less regrettable.

It is an accepted commonplace that the world economy cannot be revived unless international capital can be found on a large scale for the underdeveloped areas. And, while the International Bank has disappointed some expectations, it has done enough to ensure that, if ever the revival comes, the Bank will be at least one important channel of investment. The Fund, it is true, has displayed as yet no such promise. But that does not make it any less indispensable. In the past three years, two committees of economists have been asked by the United Nations to report on the international action that might be taken to maintain full employment. The committees embraced a wide range of opinion; Mr Kaldor and Mr MacDougall were, in turn, the British members. But the two reports had one thing conspicuously in common: both would make a changed Monetary Fund—though changed in radically different ways—the main instrument for preventing a recession in one country from spreading uncontrollably to others. The significance of this agreement is surely too plain for the British Treasury to ignore. The sceptics may be right—the Monetary Fund may continue to be of little practical use; but if so, that will be because the sort of world in which Britain might attain solvency and a stable prosperity has not been created. If there is to be effective international co-operation in currency and trading policies, it will have to grow—in part—through the existing Fund.

These are, admittedly, considerations for the longer run. Nothing that can decisively shape the immediate economic future will be done during the present meetings at Mexico City. But the glaring fault of British government since the war is that it has so rarely thought beyond the short run. The Tories had time enough in opposition to prepare themselves to correct this. Yet opinion in Whitehall seems still to remain stolidly indifferent while new approaches to the economic problem are continually being pondered outside. It is true that no approach can come to anything definite while the Presidential election campaign is being fought in the United States. But preliminary talks are not necessarily a waste of time—particularly when the continuity of American foreign policy will be maintained whether Governor Stevenson or General Eisenhower is the next American President.

Mr Butler's shunning of the opportunity for such talks is, to say the least, unfortunate. He alone, among the finance ministers of the leading countries, is not at Mexico City. In any circumstances, this

would be one more count in the indictment of selfish isolationism that the foreigner can draw up—with only a little misunderstanding—against British economic policy. The actual circumstances make it far worse than that. Mr Butler has remained in London in order to prepare for the economic discussions at the conference of Commonwealth Ministers. Whitehall is indeed buzzing with this preparatory work. Much has been done; the preliminary agenda has gone out and been commented on. And while there are, no doubt, many official papers to be written, time is not desperately short. The full conference is still nearly three months ahead. If this must keep Mr Butler in London now, it suggests that the Commonwealth conference is vastly more important, in the British Government's view, than the international financial meeting. This is certainly the inference that has been drawn in North America and Europe. It would be tactless to advertise such a view even if it were entirely sensible. In fact it is nonsensical.

There is nothing to suggest that the London talks will be any less exploratory—though they will be on a narrower front—than those at Mexico City. No doubt the Commonwealth Ministers will discuss the importance of making the sterling area's earnings of dollars steadier—and so the chances of inducing the Americans to alter their buying methods to that end. No doubt they will discuss development policies within the Commonwealth—and so their dependence on attracting American capital. No doubt they will discuss the routes by which sterling might be made convertible—and so the chances of getting the American Treasury to help to provide some stabilisation fund. All this is interesting and important, but it hardly makes the Commonwealth conference decisive while discussions at which the United States is represented are theoretical or preliminary.

★

Why, then, is the British Government making so much fuss about it? There are two possible explanations. It may be no more than a combination of window-dressing and wishful thinking. Before the summer recess, ministers came to the conclusion—rightly enough—that some new initiative in economic policy was needed; but they had no idea, or at least no collective idea, what it should be. Partly from sentiment, but perhaps more because it was conveniently far away, the Commonwealth conference became a means of focusing thought on the long-term problems about which ministers might agree—and an excuse for putting off the immediate decisions.

This is probably the truth, but if so, British blundering is, once more, being mistaken abroad for something more astute. There are plausible reasons for that. The Beaverbrook Press and its odd ideas of an Empire economic policy are always with us. More important, on both the Left and the Right there are fresh outbreaks of defeatism, rationalising the fear of competitive trade by a "realism" that would have Britain stop trying to live by trading; from this it is a short step to say that the sterling economy needs a stouter protective shell to isolate it from the world. Above all, a vocal section of the Tory party continues to press the Government to denounce the General Agreement on Tariffs and Trade in order to raise tariffs against the foreigner and provide wider margins of preference for Commonwealth trade. Every political party has a few such wild ideas, some hallowed paths for emotion and escapism. But although a Govern-

ment with a narrow majority does not openly challenge the wilder interpretations of party faith, it will do nothing whatever to put them into practice.

Imperial preference has reached that status for British Tories. The party's love of it cannot determine the Government's deeds. Ministers have deliberately let it be implied that something may be done about preferences at the Commonwealth conference. In fact such a policy would plainly promise nothing but harm, on balance, to this country; it would infuriate all the Commonwealth's allies; and, whatever Britain wants, several members of the Commonwealth certainly will not touch it. This, presumably, is what ministers are relying on. After the conference they will be able to imply to their supporters that they might have liked to extend Imperial Preference but other members of the Commonwealth were against it. Another possibility has, indeed, been mentioned. The idea of a tighter preferential system might be used as a bluff to show the Americans that they as well as Britain would suffer from a new dollar crisis; a strategy so childish and so unnecessary will not, one must assume, be seriously entertained by any but the most inexperienced policymakers at Westminster. The theory that the cunning British are bound to try to produce some spare aces from their sleeves has already done damage enough. Poker faces at Mexico City, vague hints about important decisions to be taken in November, will do more damage.

★

The annual report of the Monetary Fund shows again that, halting though they have been, Mr Butler's moves towards a more realistic economic policy at home have evoked a ready sympathy abroad. His slogan "trade, not aid" has perhaps been even more encouraging. But doubts about its real significance are growing. It is Mr Butler's task to scotch them promptly. When a Conservative Government talks about living without aid it is not, surely, thinking of the sort of "independence" that the Left-wing of the Labour party loves to dream about—the independence not of earning dollars but of cutting contacts with the dollar world to a minimum.

Isolation cannot be the substitute for aid. And the trade that Mr Butler aspires to is not, surely, trade that is peculiarly concentrated within a fenced sterling area. Ministers should by now have learned enough of the economic facts to know that there is no such easy way for Britain. This is not to say that everything depends solely on stern domestic policies. There is a general dollar problem, there are structural weaknesses in the economy of the free world, that can be put right only by international action. In that action the special arrangements among the sterling countries can play a useful part; but they cannot be either sufficient or exclusive.

The political framework for a closer economic association must be as wide as the western community to which the whole Commonwealth belongs; that is to say, it must for all practical purposes be almost as wide as the free world. Discussions within the Commonwealth are excellent provided only that no one is allowed to regard them as in any way competitive with other talks. It is now too late to make the meetings at Mexico City an important preliminary to anything. But the November Commonwealth conference will be successful precisely to the extent that it is preliminary—preliminary to the next international meeting, which may well have to be, and certainly ought to be, earlier than September, 1953.

Mossadegh: Fanatic or Strategist?

ON Saturday last, Dr. Mossadegh broadcast from Teheran a statement that put an end to a welter of rumours that had been coursing through the capital about negotiation with Britain over oil. Earlier in the day not Britain alone, but Britain and the United States jointly, had published over the signature of President Truman and Mr Churchill an offer which they regarded as meeting him more than half-way. He at once turned it down, taking the decision entirely on his own initiative and giving no reasons for it. He has summoned the two houses of Parliament on September 10th and 13th to decide on a "proper" reply. Persians suspect traps in any wording, however plain, and Mr Acheson has this week done well to try and make the western meaning crystal clear. But Dr Mossadegh has set the tone for a tart answer and, in the position which he has now built for himself, that tone is difficult to gainsay. It is: "Either you negotiate on my terms, or else I cannot be answerable for the rise of Communism in Persia." The western powers now have to decide how to meet this piece of blackmail.

What are his terms? During the long and rambling conversations that he has held with American, British and International Bank visitors in the course of the last year, they have not always been the same. He is out for all he can get and therefore trims them, in oriental fashion, to the audience of the moment. Thus a basis suggested today may be dropped tomorrow. For instance, the basis of the Churchill-Truman offer of August 30th was a conversation with the British chargé d'affaires on August 14th; during this talk, "clarifying" his peremptory Note of August 7th, he said that he was prepared to go to the International Court for arbitration on the subject of compensation to the Anglo-Iranian Oil Company, "though not on the question of the 1933 agreement or the validity of the nationalisation laws." He added that he needed funds, and that he was ready to discuss purchases of oil with the company. The Anglo-American Note therefore proposed, first, arbitration by the Court and, secondly, discussion with the company about getting the flow of oil moving. Subject to these two conditions, it offered to recognise nationalisation by buying the nationalised oil, to ease British restrictions on Persia's use of sterling and to tender an immediate \$10 million gift from the United States, to assist the nation financially until revenue from oil resumed its flow.

The treatment which Dr. Mossadegh instantly meted out to this offer throws two points into prominence. First, the fundamental difference between the parties to the debate lies in their attitude to the 1933 agreement. This the Persians regard as a dead letter, killed by their nationalisation law; they therefore regard themselves as free to handle and sell as they please oil which they once contracted to lease till 1993. The western powers, who have other such contracts in the Middle East, cannot admit the Persian thesis without damaging their position elsewhere. The second point that now clearly emerges is that Dr Mossadegh, believing that he has the West on the run on account of its fear of Communism, will continue to stall and haver in the hope of achieving his maximum demands.

Probably, therefore, Dr Mossadegh is holding out for more money. Possibly he also hopes that Mr Alton Jones—a wise and responsible American oil man, who helped

Mexico with similar problems and who has just, at his invitation, been to Abadan—will magically proffer some means of producing and selling oil that will enable him to snap his fingers at the British and American governments. But, whatever his reasoning it is now clear that there is no hope of any agreement of any kind unless every step towards it takes into account the streak of vanity that is to be found in every national character, but that is unusually marked in the Persian.

Failure to allow for this was the main mistake made by the Anglo-Iranian Oil Company, which paid too much attention to technical efficiency, and too little to Persian susceptibilities; the same failure marked the policy of the British Government during the years when, though a majority shareholder in the company, it never instructed the two government directors who represented it on the board to press for increasing the direct participation of influential Persians in the management. Today any proposition, however gilded with money, will likewise fail if it pays insufficient attention to Persian pride. Persians, excelling as they do in such realms as metaphysics, dialectics and art, cannot believe that they are not proficient in all fields. The accident of their geographical position has increased their belief in their all-round capacity, for it has enabled them to conceal shortcomings behind a screen of dalliance with rival great powers, whose alternating overtures have afforded them an adequate diet of "something to turn down." The combination of their nature, their geographical position and some misadventures at the hands of great powers has bred in them a pathological fear of interference; an infinite capacity of blindness to their own weak spots; and so much mistrust of one another that they are not, except under a dictatorship, capable of efficiently running their own home affairs. There are, therefore, only two methods of approach to them in foreign relations. One is to ride roughshod over them, a technique which suits Moscow but is no longer popular in Britain and is an un-American way of doing things; the other is to bear their foibles constantly in mind.

London and Washington, in devising their retort to Dr Mossadegh's blackmail, have no choice but to do the latter; and this seriously limits their range of bargaining. They are therefore entitled to inquire whether they cannot evade the blackmail. Is there, for instance, no alternative to the Mossadegh regime? To their one-time hopes on this score, the answer "No" was effectively returned on July 28th; on that day the Shah, by refusing to order the army to quell the mob, cut the ground from under his own feet and under those of all possible rivals to the Mossadegh-Kashani alliance. Again, how strong is Tudeh? Is it an immediate menace against which the West must act at all costs? Or is Dr Mossadegh exaggerating its strength and capacity? Opinions are divided. But if its present organisation and support are measured by the published Russian yardsticks that are available, it still seems to be some way from the stage at which it can with assurance assume power. Originally, according to Lenin's theses presented to the Communist International, the "general basic tasks" of Com-

munism in countries such as Persia began with

a shifting of the relationship of forces in favour of the proletariat; emancipation of the country from the yoke of imperialism (nationalisation of foreign concessions, railways, banks, etc.) and the establishment of the national unity of the country where this has not yet been attained; overthrow of the power of the exploiting classes at the back of which imperialism stands; organisation of Soviets of workers and peasants and of a red army; establishment of the dictatorship of the proletariat and peasantry.

For parts of this programme, Tudeh has prepared or is ready. But unfortunate Russian experiences of immature coups in Asia—in North Persia in 1921 and 1946, in China in 1925-27—have led Stalin to make some amendment to the programme. *Pravda* wrote last July

The defeat experienced in the first revolutionary war (in China) "fully confirmed the need for the Communists thoroughly to study the art of war and to gain possession of the army. The army must be both the propagandist for and the carrier out of the party's policy and the people's rule."

The Tudeh coup of the future is likely to depend, therefore, not on the proletariat and the universities, where lie the party's present strongholds, but on the army and the peasantry in which, as far as can be judged, permeation is short of what is required for success. It is possible, therefore, that the western bargainers have more time for preparation than Dr Mossadegh would have them believe.

Thus the western powers, as they think out their next move, have the following data on which to build. They

The Right to Work

AT Margate this week the Trades Union Congress has been vigorously asserting the principle of the closed shop and at the same time expressing fears that the legal rights of trade unions are not all they ought to be. To the outsider, impressed by the enormous power of the unions, this seems an odd doctrine. But it is bound to have at least a sympathetic hearing from a Government anxious to be as friendly as possible with the unions—and grateful for the political moderation of the TUC's General Council. But political expediency is not the only consideration. If the unions want to have one side of the medal reconsidered, it is surely reasonable to look at the other side too. If the legal rights of the unions in relation to other bodies deserve sympathetic examination, so also do the rights of the individual within the union.

If the phrase can be wrung free from all trace of innuendo, trade unions today are the sacred cow of British political life. Everyone, trade unionist included, feels free to explore, comment on and criticise all aspects of Parliament, the public corporations, in fact any organisation whose activities impinge on public affairs. For the trade unionist, however, the process is strictly one-way. Many trade union leaders resemble, in this, the professional soldier; any criticism of the regiment must be made in private, and never by an outsider. But there are more trade unions than regiments, and their influence is immeasurably greater. The critical question has been taking shape for some time, as industry after industry has reached, or come near to, the condition of a "closed shop," in which all workers are union members. Objectionable as this is in liberal principle, it cannot now be quickly altered. And the practical problem of avoiding its worst abuses must, therefore, be faced. Does the

must take into account the mixture of pride and incapacity which has already caused the present Persian regime to jettison most of its bulwarks against Communism and against the menace of Russian domination that it admittedly hates. But they can take heart from the thought that Tudeh's incapacity to run the country is, for the time being, as great as Dr Mossadegh's. They need not, therefore, instantly capitulate to his blackmail. They can tell him that their offer may save him, and remains open; they can leave him, if he insists on a better offer, to propose one that they could accept. They have time in which to match gambit with gambit.

If, on the other hand, his dislike of the West is so great as to blind him to all other dangers, if his fanaticism continues to swamp his political sense, and if he cannot learn in which direction the greatest danger lies, then they must recognise that the Communist advance cannot be stopped even by continually paying him money. The Americans and British must, therefore, continue their present close consultation; indeed, they should extend their present agreement on tactics to the subject of how western interests in the Persian Gulf are to be safeguarded in the event of a Tudeh coup in Teheran. The precautionary decisions that they need to take include consultation with Pakistan and Iraq—both of them deeply affected—about the military movements that might be necessary. They also need to plan support to the many good Persian nationalists who would flee south from Teheran if a Communist regime took over.

approach to the closed shop mean that the right to work has become a union prerogative, for them to grant or withhold? If so, what are the safeguards available to the ordinary member, and are they adequate?

A union does not need to be a part of the Communist machinery of state in order to become tyrannical. The closer it approaches to the closed shop, the greater its opportunity for tyranny. The public becomes entitled to take an interest in the standards of internal union administration that affect the working rights of the ordinary member. Traditionally, the union's organised strength is applied to the employer, who—also by tradition—is assumed to be able to take care of himself. But if ever the union's management claims the right to apply the strength of the union to workpeople, whether members of the union or not, in order to make them conform to the policy of the officials, the result can be tyranny; neither in theory nor in practice has the worker any protection against his union.

The closed shop puts an end to labour's age-old cry for the right to work. The right to work becomes conditional; the applicant for the job must be a member of the prescribed union. In a closed shop, each man starting work must hold a union card. He must never risk the loss of that card, for if it should be taken from him his right to work is gone. Nor is this state of affairs confined to the strictly closed shops. If a man offends his shop stewards, he is likewise in jeopardy. After an unofficial strike earlier this year in an engineering factory the shops stewards compiled a list of union members of whose conduct during the strike they disapproved. Wherever the men on that list may go, they will find shop stewards checking their names against this

list and bringing pressure to bear on every management not to employ them. The unions have the apparatus of tyranny, even though they prefer to label it "working-class solidarity." In a Canadian "closed shop" case, Judge of Appeal O'Halloran put the situation in this way: "A man has a right to work at his trade. If membership of a union is a condition attached to working at his trade, then he has an indefeasible right to belong to that union. It must be so, or else the union can have no right to agitate for a closed shop." But the statement that a man has an indefeasible right to belong to a union is certainly not good law in the United Kingdom.

The trade unionist's stock answer to such criticism is that it is too legalistic. Trade union leaders, he says, are creating and making use of institutions based on common sense, shaped by the exigencies of the industrial situation and governed by the general British sense of fair play. Democracy is not a thing of blue prints and set forms; the details of any democratic procedure, in politics as well as in industry, may be open to criticism. What matters is the final result. Does union leadership in general reflect the views of the mass of the rank and file? Do union leaders work towards an accepted industrial end? The defenders of the unions say yes. The more honest might add: "Of course, there are a few unfortunate cases . . ."—but claim that reform is a matter for the unions to tackle in their own way and in their own time.

★

That attitude is reasonable, up to a point. Trade unions in this country do not deliberately use their powers to drive the mass of the workers along a course which the workers do not want to follow. But the same can be said of most institutions. The majority of magistrates' courts on the majority of occasions behave with innate justice. But some of the most difficult problems of justice are the problems of the exception, of the individual. In the case of the magistrates' courts, for example, there are safeguards for the individual in the shape of the higher courts to which the individual can turn. Even the Civil Service allows appeals to the Minister. What are the safeguards for the individual trade unionist? Suppose he is out of step with the policy of his union, or less militant than his district organiser or his shop stewards think he should be. The trade union spokesman would say he has the protection of his union rules. Are they, really, a protection?

The law reports on this count are by no means reassuring. In the case of *Abbott v. Sullivan* (referred to in *The Economist* of February 16, 1952) the High Court ruled that no part of a man's contract with the union committee that effectively controlled his right to work had been broken when that committee struck his name off the union list. As a result, Mr Abbott, a cornporter, found himself without legal redress and with no possibility of following his trade in London. It is not enough, therefore, to say that the safeguard for each union member lies in the rules of the union. There are many weaknesses in that shield. The rules may be ambiguous, or uncertain. The members of the committee may not operate the rules fairly. In the case of Mr Abbott, the union organiser whom he had assaulted sat with the committee when it considered whether Mr Abbott should be allowed to keep his right to work; in the words of the trial judge, "I would be surprised to learn that this [the committee's decision] was their own

unaided independent decision." In the Canadian case mentioned above, at the general meeting of the union considering a resolution to expel a member—described by the chairman of the meeting as a "friend of the capitalist class"—the names of the few who voted against expulsion were noted down; that at least has the appearance of intimidation.

★

No one wants to make the Courts an appeal tribunal for the domestic affairs of trade unions and trade unionists. Most trade union leaders would be up in arms if this were seriously suggested, and with reason. The feeling of loyalty and comradeship is as important to industrial relations generally as it is to the union itself. But, if unions insist that they shall control so important a right as the right to work, then they have a case to answer when any individual can show that this power is misused—or even that it may be misused—in any way.

This control over the right to work is not, of course, confined to the industrial trade unions. It exists in the majority of the professions; but in the professions it is regulated, partly by statute, partly by recognised custom. Admission to the "union," or professional body, depends upon acquiring a certain level of professional skill; but if the skill is there, admission is automatic. Likewise, a man may be ejected from the profession only if he commits one of a list of reasonably well defined professional crimes, and the authority which judges such cases is required to act in a "judicial" way. For example, the disciplinary committee of the Law Society, which has considerable powers over solicitors, consists of practising lawyers, but they are appointed by the Master of the Rolls and an appeal from its decision lies to the Court.

An exact duplication of this kind of procedure is probably inappropriate to the trade union world. The professions are small in numbers and much more homogeneous in feeling as well as in their work. Yet the essential features of any body with power over the right to work should be the same in industry as in the professions. It should consist of working members, it should have both independence of mind and prestige because it has independence of mind, and it should go out of its way to exclude from its judicial activities anything which is not strictly relevant to the one essential question: Does the individual accused deserve to be deprived of his right to work because of some unfitness for the job?

The case of Mr Abbott does not make pretty reading, even in the law reports. There may be an adequate answer, but no one has yet given it. What is disquieting is the silence that responsible union leaders keep over all aspects of this problem. Perhaps union committees do rack their brains to find ways of ensuring that officials deal with their members on the highest standards of justice and fair play, in this as well as in other matters. If so, they do not breathe a word outside. Mr Goldstein quotes in his recent book the remark made by Mr Ernest Bevin in his trade union days: "Trade union ballots—and I would not say this in public—do not reach the standard of a parliamentary election." Why not say it in public? The public has already made some shrewd enough guesses, and it is certainly interested, in more senses than one. But, no: the sacred cow must not be criticised.

For those trade unionists who live in a world of strict and perpetual class war, the secrecy is understandable.

An army command does not discuss its shortcomings within hearing of the enemy. But the majority of trade union leaders know that, today, the class war description of trade union activity is out of date; its spirit is kept alive by the Communists because it is part of the Soviet war on social democracy, by others only because their thought ossified years ago. To the main political parties, the whole subject of trade union organisation is dynamite, and each fears that it might be the more seriously damaged if the charge ever went off—a state of mind for which union leaders must accept some responsibility. But there is no necessity for the first move to be political

or for it to come from the outside. The unions themselves could appoint an independent commission to make recommendations for a standard code, for a members' charter of rights. It would even be possible for a trade union MP to introduce it in the form of a private member's Bill. It is a pity that union leadership does not see how much its general prestige would be increased by such union initiative. The entire "closed shop" issue could be faced more confidently, and more exclusively on its own merits, if the unions had a cleaner bill of health in their consideration for the freedom of individual members.

Eastern Trade and Western Politics

SEPTEMBER 9th was the day tentatively fixed by the Economic Commission for Europe for renewed consultations on East-West trade. Experts from both sides of the Iron Curtain were to meet and talk over the possibilities of expanding their commercial exchanges. The Western governments agreed. The Soviet Union took no notice whatsoever of the invitation. The talks, therefore, will not take place. Yet at the very time when the Secretary of the ECE was sending his last unavailing telegrams to Moscow, an influential body of Americans—the United States Council of the International Chamber of Commerce—published a memorandum, urging their fellow countrymen to understand the dilemma of other western nations who need to trade with the East and to relax American opposition to certain forms of commerce across the Iron Curtain.

For keen collectors of specimens of political irony, this conjunction provides a museum piece. The year 1952 has been shrill with Communist cries that vast markets lie in the Soviet sphere for the goods Western Europe needs to export, and that its economic health is being directly endangered by such monuments to ideological intolerance as the American Battle Act—the Congressional prohibition on the extension of American aid to any nation trading indiscriminately with the East. At the same time, the Americans have undoubtedly used their influence, particularly since the outbreak of the Korean war, to check East-West trade. The Battle Act is only the most public example of a pressure that has been steadily exercised. Yet now it is the Russians who will not discuss trade and it is the Americans who are having second thoughts.

The sudden change of front is not, however, as confusing as it seems. The Russians have not, in fact, changed their front at all. The reason why they would not discuss East-West trade with competent officials under the umbrella of an impartial organisation is that they prefer to discuss it with the Dean of Canterbury in a general atmosphere of economic ballyhoo in Moscow. Their conference earlier in the summer was intended very largely for propaganda purposes—and may have had one undesired effect, that of making responsible Americans aware of the inconsistencies of the Battle Act. But if the carefully stage-managed economic conference was largely propaganda, it had a serious purpose. There are products which the Soviet zone—and China—urgently need from the West. They want, as does every other relatively backward area, the capital goods

and the raw materials necessary for economic expansion. In return, the Soviet half has primary products to offer—Soviet wheat and fodder and timber, Polish coal and foodstuffs—which Western Europe cannot easily obtain elsewhere.

The Russians have, moreover, political motives for maintaining this trade. In the Soviet system, trade reinforces political policy and it is policy that makes peace, war or cold war. East-West trade, if it can be canalised through single buying and selling agencies—the Soviet ideal in trading technique—can become a strong instrument of political pressure and, at the same time, a steady source of finance for Communist organisation and propaganda in western countries—as the Italians have discovered. The Russians also appear to hope that Chinese trade with the West can be managed through Soviet channels. They have precise and important interests at stake in East-West trade, provided that its content and organisation conform to their pattern.

There is no such clarity on the Western side. Nor is it possible that there should be. The free world made up of free nations, each pursuing its interests more or less freely, cannot oppose a natural uniformity to the imposed conformity of the Soviets. It would be impossible to secure an identical reaction to East-West trade from, say, the United States on the one hand, whose interests in East-West trade are almost nil, and the Scandinavian countries on the other, whose present dependence upon Polish coal is complete. To this natural divergence have been added, moreover, a couple of economic and political twists which in recent years have only served to excite emotion and darken counsel wherever East-West trade has been discussed between the western partners.

The difficulty does not spring from the scale of East-West trade. It is small absolutely—exchanges with Eastern Europe represent only about 3 per cent of Western Europe's total trade—and it is much smaller than before the war. The volume of Western Europe's imports has fallen over two-thirds, its exports by about a half. The problem begins with the nature of the exchanges. The Eastern negotiators have made it increasingly clear that they are interested in capital goods and strategic raw materials, and in not much else besides. Whereas all western exports of consumer goods have fallen off drastically, more machinery is being exported to the East than before the war, transport equipment has maintained a high level and raw material purchases,

above all from the sterling area are also considerable. The Russians thus seek just those goods which the United States would wish to see banned or reduced in order to avoid any strengthening of the Soviet economy. The goods the eastern sphere offers in return are again small in quantity but vital in quality. Polish coal may grow less important to Scandinavia, Italy and Austria as British coal exports increase, but the only alternative sources of supply for wheat, coarse grain and timber lie in the New World and must be paid for in dollars.

★

It is at this point that the political twist begins to affect the economic argument. Confronted by the Battle Act on the one hand and the scale of the American tariff on the other, the exasperated European can say: "I am not to sell to the East. I am not to buy food and fodder and timber in return. But will you tell me how to buy them elsewhere when the only possible supplies are walled in by tariffs? Do not urge me to abandon East-West trade while at the same time you keep up artificial barriers to trade between allies, otherwise your pressure will force up my prices, induce inflation and end in unemployment." This is the mood which Moscow hoped to exploit. It has also undoubtedly helped the United States affiliates of the International Chamber of Commerce to plead for a more flexible American attitude towards East-West trade.

If this were the end of the problem, it would be enough for Western Europe to hope that the sensible attitude of the United States Council would win the day in Congress—the Administration has always taken a more balanced view—and to continue to develop East-West trade wherever benefit promises for both sides. But the issue in fact is deeper. Although one may deplore the crudity of some Congressional interventions and doubt their political honesty, the various amendments designed to check East-West trade have raised a serious point. Is it really in the interests of the West to strengthen the Soviet Union by exporting to it the capital equipment and the primary products needed to expand its economy? The next twenty years will be ones of unprecedented strain if Russia is to raise its industrial production by 80 per cent, its agriculture by 45 per cent, its consumer goods by 65 per cent, and at the same time monopolise the economic development of China and enter the Asian markets as a supplier of capital goods on credit and on a vast scale. All this is implicit in Russia's programme. Is it in the western interest to encourage and help the

trend? It is not rather the relative backwardness of the Soviet economy that is the West's best hope, not only of discouraging Russia from risking war, but of winning the cold war by wooing China into neutrality between East and West and by bolstering Asian independence?

Nor does it seem wise to make Soviet supplies an essential factor in western economies. As past experience has shown, such supplies can be turned on and off for political purposes, whereas alternative sources take a long time to create. Moreover, the whole trend of Communist economies is towards industrialisation and towards the elimination of such surpluses of primary products as the western nations require. To assume a continued flow of Soviet grain and timber is to assume that the gigantic growth planned for the Soviet economy will not create for it the problem of scarce primary supplies forecast for the western world in the Paley Report. A Soviet economy running short will not have much available for would-be western purchasers.

★

These facts suggest the necessity of a new approach to the problem of East-West trade. Hitherto popular American attention has been concentrated upon checking western exports, indifferent to the crucial problem of western imports. The new approach needs to concentrate rather on the vital problem of these supplies. In the short run, such an approach would induce, as the United States Council suggests, a moderate and flexible attitude towards East-West trade, the West importing as much as is economically and strategically important to itself and giving away as little as possible of economically vital supplies in return. In other words, the hardest bargain possible should be struck.

Rightly understood, the problem of East-West trade is therefore simply one facet of the much wider problem of overcoming the dollar gap in an expanding world economy. Hitherto, lack of this understanding has injected impatience and bitterness into western exchanges on the matter, with American public opinion overlooking Western Europe's vital need for imports, the Europeans harping on tariffs and the Battle Act and forgetting the generous American aid which the Battle Act sought only to control. If the western world would face the imperative need for expanding primary supplies and creating sources beyond the influence of the caprices and exigencies of Soviet trading policy, then East-West trade might ultimately become so marginal that its political importance would vanish.

NOTES OF THE WEEK

Three to One for Arms

The Trades Union Congress on Tuesday endorsed rearmament by a bigger majority than anyone had dared to expect. The relevant section of the General Council's report declared firmly that "the greatest possible measure of rearmament must be carried out within the limits of our power to find the means." It was approved by 5,597,000 votes to 1,450,000—a majority of more than three to one.

This, after all the uncertain turns of opinion during the past few months, is a famous victory for the good sense to which the British trade unions almost always come round in the end. The victory is not, admittedly, quite so clear-cut as the voting figures might suggest. Good sense was aided, as usual, by some astute manoeuvring from the leaders. The four separate votes on the rearmament issue took such a form that at no point were all the various critics of rearmament united in opposition to the General Council. The critics seemed, indeed, to be confused. Surprisingly, the first resolution, which came nearest to expressing a Communist view, attracted more votes than any other expression of discontent with rearmament; but it was defeated by 6,041,000 votes to 1,887,000. This represented more or less a full trial of strength. On the fourth vote—the actual endorsement of rearmament as expounded by the TUC—delegates representing nearly a million votes abstained.

Their confusion does not, however, alter the fact that the critics of rearmament among the trade unions have proved to be decisively in a minority. The amendment that seemed to represent Mr Bevan's point of view attracted only 1,272,000 votes—although its weightiest champion, Mr Birch, had been careful to avoid giving any support to Mr Bevan personally; on the contrary, he deprecated a feud that was doing so much obvious harm, and he insisted that the point at issue was merely one of degree. Whatever other conclusions may be drawn, the debate at Margate was a plain rebuff for Mr Bevan; his popularity with the constituency Labour parties must, however great it proves to be, seem rather a hollow consolation. The support of what the *Manchester Guardian* has called "the suburban socialists of Merton and Morden" is probably owed as much to his association with the intellectual malcontents of the Left as to his own powers of leadership. It represents no power within the Labour movement; and it cannot even give much emotional satisfaction to the mystic with roots at Tredegar.

Forward with Wage Claims

The debate on wages at the Trades Union Congress was no worse, from Mr Butler's point of view, than he must have expected. It was, indeed, a little better than might have been feared after the engineering employers had been so tactless in their repetition last weekend of the refusal to consider any increase in pay in response to the claim by the Confederation of Shipbuilding and Engineering Unions. The phrasing of the refusal, which reflected closely the arguments for wage restraint used by Mr Butler, had made the union delegates at Margate think that the employers had asked the Government for advice. All the familiar suspicions of a Tory Government, in league with the bosses against the workers, were thus revived in spite of the trouble that Sir Walter Monckton has taken to be sympathetic to the unions. The Communists were provided with many useful talking-points, and any real insistence on moderation by the General Council of the TUC became impossible.

The formal resolution, advocating some qualified restraint in wage demands, was passed by a large majority. But its supporters included some unions that had voted against the General Council on a resolution opposing any kind of wage

restraint. The majority against this declaration of irresponsibility was less than two to one. Moreover, most of the engineering unions are undoubtedly determined to show their teeth by stopping all overtime working. Though the general unions, with members in the engineering industry, are opposed to such action, they are in a minority in the councils of the confederation.

Few unions are as militant as the engineers, but the debate at Margate left no doubt that all are determined to press their claims until they somehow get the increased pay that seems to them just. The adjective provides no definition of a wages policy. There is only one way to distinguish between wage advances that are "reasonable" or "justifiable" and those that are excessive. That way is to argue out the claims before an independent tribunal. The Margate debate was moderate enough to make it likely that most unions will accept the results of arbitration. And there is no doubt that arbitration tribunals, like the independent members of the wages councils, will continue to think that moderate advances in wages are "justified" by the rise in the cost of living. It is this that makes the engineering employers' stand for the national interest in wage stability seem beside the point. The issue will no doubt go in the end to some sort of arbitration, and the engineering unions will be very foolish—as well as unpatriotic—if in the meantime they threaten so much that they cannot accept the results of arbitration without climbing down further than dignity allows.

In Place of Bevanism?

This week Mr Bevan's friends have professedly brought "up to date" the argument of their declaration last summer—the famous exposition of the "One Way Only." But this new pamphlet—"In Place of Dollars,"* written by Mr Harold Wilson—is in fact more reminiscent of Mr Bevan's own political testament. That is true not only of the title; the pamphlet reflects in miniature the rambling quality of "In Place of Fear." The parallel in the thinking of the Left between fear and dollars might provide fascinating material for the political psychologist.

The pamphlet ranges widely over the causes of the British crisis, the achievements of the Labour Government and the wickedness of the Tories and Mr Gaitskell. As one would expect from Mr Wilson, one or two shrewd points are made. But in general the pamphlet is polemical without being forceful and partisan without being stirring. Rearmament is no longer in itself a sufficient issue to give unity and direction to the pamphlet, and the Bevanite case contains nothing else. Mr Wilson mentions the general need for investment overseas, which he has argued elsewhere, but excludes it from the four principles of his "plan for Britain," presumably because large-scale investment so obviously depends on getting the dollars he wants to replace. The replacement is to be achieved, of course, by developing non-dollar supplies, increasing Imperial Preferences and trading with the East. For the rest, the rearmament programme should be cut (no firm figures are given) and there should be more controls and more nationalisation. The only unfamiliar point in the argument is Mr Wilson's odd belief that unemployment "is spreading inexorably across the country" and Britain is therefore facing "another 1931."

If all this really is the "up to date" argument, Labour's ginger group has indeed run out of ideas. The one meaning that might possibly be read between the lines of the pamphlet is a wish to give up any distinctive doctrine and to make peace with the more orthodox Labour leaders.

Dry-Cleaning the Party?

In the official commentaries on the proposed new statute of the Soviet Communist Party, as in the statute itself, there are striking puritanical refrains. Reference is constantly made to sins of slackness, ostentation, loose morals, nepotism and dishonesty which are apparently prevalent among many party members. Great stress is also laid on the need for criticism and self-criticism. It is declared that whoever cannot tolerate criticism or is guilty of sins cannot remain in the Party.

Such statements seem to foreshadow a thorough cleansing of the ranks. Yet this operation is unlikely to have the political character of the notorious purges in the 1930s. There is no longer an active, nor even a suspected, opposition to be eliminated; what may be intended is rather a sifting of the greatly swollen party membership. At the last party congress, in 1939, it was officially stated that party membership did not exceed 2.5 million. Since then the total membership has risen by at least 4 million.

True, 1939 marked the end of an ebb tide. The purges had left great gaps, but afterwards new members were again admitted. Their numbers grew quickly and the war turned out to be a propitious recruiting period. For the soldier at the front admission to the party was made much easier. Standards of recommendation were lowered, and the period of party novitiate was cut from one year to three months. Total membership was less than 4 million on the eve of the war, but according to Mr Malenkov it had risen in 1947 to about 6.3 million. Such a swelling of the ranks led to a great decline in discipline. A number of "undesirables" must have crept into the party, which is required to be a well organised, obedient and devoted instrument. What it had gained in numerical strength, it must partially have lost in cohesion. The stage now seems to be set for a tightening up. To regain its former discipline, however, the party will require not bloody purges but perhaps a seasonal dry-cleaning.

Instead of the Politbureau

Last week Mr Kruschchev, who will be the official spokesman on changes in the Soviet Communist party's statute at the forthcoming congress, gave an authoritative commentary on the draft amendments which have already been published. Simultaneously the Central Committee instructed party members to discuss and criticise the draft of both the five-year plan and the statute. This sudden appeal for frank criticism may prove to have surprising results, since many party members are too young to remember what penalties may be incurred by too liberal an exercise of critical faculties. For the moment, however, no criticism has been forthcoming or, at least, it has not as yet been sifted by the proper authorities. To interpret the proposed changes in the party structure is still largely guesswork. One thing, however, seems clear: on paper, at least, it looks as if the Central Committee will gain much strength. This committee of over 70 members is elected at each congress to direct the party until the next meeting. Since the maximum interval between congresses has been officially extended from three to four years, the life of the Central Committee is likewise prolonged. All-Union conferences, which were also empowered to change the composition of the Committee, are now abolished. The Party Control Commission ceases to exist as a separate unit and is absorbed by the Central Committee, which will have its own agents, independent of local authorities, to supervise the work done.

All this looks like further centralisation of control. The central authority should see to it that no deviations, no slackening are allowed at the periphery; but into whose hands will the Central Committee delegate its increased power? Hitherto, real control was exercised by the Politbureau, assisted by the Orgbureau and Secretariat. Now the two

former are merged into one new Presidium. This change, Mr Kruschchev asserts, is only nominal since the new Presidium corresponds more closely to the actual functions of its predecessors. Why is this so, and since when? Could this be the sole reason for dropping the notorious name of Politbureau 35 years after it was set up? But according to Mr Kruschchev no significance should be attached either to the dropping of an even more celebrated title—Bolshevik. Stalin, however, clung to the name even when he was wiping out the remnants of the Bolshevik Old Guard. The Soviet Union is probably approaching changes much more profound than Mr Kruschchev would care to admit.

Mr Draper Reports

The first report submitted to the President by Mr Draper, US Special Representative in Europe, is a concise and forthright document. It both summarises, in language for the layman, the progress of the last six months and gives a warning that the economic pillars of the Atlantic alliance still rest on fragile and temporary foundations.

The report does not neglect the remarkable achievements of the period: the creation of the Schuman pool, the progress towards the European Defence Community and the rescue operation performed on the European Payments Union. But it is much more concerned with the shortcomings and the failures: the "stretch-out" in the timing of defence programmes, the American foreign aid cuts, the purely "temporary" answer that the EPU settlement provides, and above all the continued inability to find a cure for Europe's most persistent maladies—financial instability and the dollar gap.

Of the two ailments, Mr Draper considers the balance of payments the more serious. "Unless a balance can be restored there is real danger of a deep and perhaps dis-

ADVERTISING

WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

SAMSON CLARKS

SAMSON CLARK & CO. LTD., Incorporated Practitioners in Advertising

astrous fissure between the economies of Europe and America." He suggests once again that trade not aid is the solution and that "drastic and complementary actions on both sides of the Atlantic" will be required. The nations of western Europe will have to produce at more competitive prices and some of them, it is implied, should take sterner measures against inflation. For its part the United States will have to buy more—a great deal more—and invest energetically overseas.

Hitherto no American official has stated quite so lucidly the thesis that America's allies to be of any real value must be solvent. There have always been men in US government circles who realise how undesirable is the client-patron relationship; but until now none of them has said that the relationship is in the long run an impossible one, that the United States cannot build its military alliances with nations that periodically face economic breakdown.

Houses for Sale

Last week the Minister of Housing took two steps to encourage the private ownership of houses. The first was to give general consent to the sale of council houses by local authorities; ministerial approval for each sale was necessary under the 1936 Act. Sale is only permitted, however, subject to certain conditions which are intended to protect the ratepayers from sales at a loss, and to avoid profiteering on the part of purchasers. No house built before 1945 may be sold at less than twenty times its net annual rent and no postwar house at less than the full cost of building it. No purchaser of a council house may resell it for five years at more than its purchase price, and the first offer of resale must be made to the local authority.

These conditions, however necessary, reduce the attractions of buying a council house so long as money is falling in value. Perhaps the average occupant of a council house does not think along those lines; but he will certainly reckon his weekly outgoings as an owner compared with his rent as a tenant. As owner of a postwar house he would have to pay a building society 4½ per cent on about £1600 (if he borrowed the whole sum, as he perhaps could), repay the capital over 20 years, and meet maintenance costs at, say, £15 a year. He would, therefore, be paying about £2 10s. a week for a house which he formerly occupied at a subsidised rent of perhaps 25s. He may consider this a high price to pay for security of tenure and freedom to paint his front door as he likes; and he may not regard a council house either as a readily saleable asset or as an heirloom that he wants permanently in the family. A prewar house might be a better proposition if it is sold at the minimum price, which would probably be around £500. But people are far more likely to dream of renting a postwar house than of owning a very inferior prewar one.

It seems unlikely, therefore, that local authorities will be able to sell many of their houses; it is, none the less, all to the good that the power to sell has been made more flexible. It will be a pity if that flexibility is offset by rigid ideas, and if the sale of council houses merely becomes an issue of local party politics—which, unfortunately, it may often be.

* * *

More Private Building

The Minister of Housing's other new step towards encouraging house ownership is his request to local authorities to say how many more licences they would grant for private building if these were not at the expense of their own building programmes. At present the local authorities get a batch of licences and decide how many of these to keep for their own housing and how many to give for private building. According to Mr Macmillan's instructions of last December, they may issue private licences up to a ratio of one to one with

council houses; but by June of this year the new housing contracts were showing an actual ratio of only one private licence for every three council houses—the ratio that the Ministry did in fact expect.

Some local authorities have pointed out to the Minister that after they have provided for their own housing programme and issued the rest of the licences for private building, there is still an unsatisfied demand for licences. Building firms have supported their claim that building labour is available, without prejudice to local authority work; some small firms tend to be idle now that the trade in repairs is less brisk. The Ministry's regional officers will weigh up such local conditions and tell the local authority how many additional licences it may grant. Mr Macmillan certainly misses no opportunity to put more houses under construction; it must be particularly disconcerting to his political opponents that the greater emphasis on private building cannot be said to be at the expense of the housing estates.

* * *

The Housing Spiral

Some plain words about housing policy have been voiced at the summer school of the Town Planning Institute. Professor Stephenson declared bluntly that 200,000 houses a year is the most the nation can afford. While the public authorities strain every effort to build more new houses, the older houses are allowed to fall prematurely into decay. Private landlords can do little to stop this until the Rent Restriction Acts are revised. If the Government will not amend the Acts, then the only possible alternative, as Professor Stephenson pointed out, is for local authorities to take over and repair obsolescent house property. So far, only Birmingham has had the powers or energy to pursue this course on an effective scale. Surely the Government cannot let the position deteriorate still further without promoting one of the possible remedies?

Sir George Pepler's criticism cuts even deeper. He brings the weight of a long official experience to his contention that the large housing subsidies are a direct cause of wastefulness and inefficiency in the building industry. The builders have in effect been removed from the normal economic pressures of the market. The Government's desire to build new houses seems to be so strong that it will stretch subsidies indefinitely to cover rising costs, and the low productivity of the building industry goes uncorrected.

The very poor record of the building industry since the war in turn makes the Government's housing programme less economic and less possible to justify. The speakers at the institute's summer school have put their finger on the two weak points in this vicious spiral—the bad effect of indiscriminate subsidies and the absurdity of neglecting all housing but new housing.

* * *

Clash Over Krupp's

For contrary reasons, indignation has been expressed in Britain and Germany about the latest measures to deal with the Krupp family fortune. The clash of opinion in both countries reflects an extremely complicated economic and political situation that it will be hard to disentangle to anybody's satisfaction. The Krupp affair is part of the Allied attempt to break up the Ruhr heavy industrial combines and regroup them into smaller, but still efficient, units. In spite of German complaints about the way in which an integrated production system was being shattered, the record of the Ruhr over the past few years indicates that no lasting damage has been done to the concerns by Allied measures.

The Allies also set out to prevent any future concentration of power in Germany heavy industry and, in particular, to bar the return of industrialists who aided Hitler. According

to their regulations, no individual owner of shares in Ruhr heavy industry is to retain a majority in more than one company and, on paper, care has been taken to prevent evasion of this ban. The Krupp family were singled out for special penalties. Herr Alfred Krupp was imprisoned, and then amnestied. His holdings were not permanently confiscated, but are now to be returned on special conditions. The Krupps are to be prevented from ever again owning interests in iron, crude steel and coal companies, though they can retain steel processing and other plants. At the time the regulation was framed there was no question of the Krupps becoming arms manufacturers again; Essen was destroyed by bombing, dismantling or demolition, and all Germany was supposed to have abandoned armaments production for ever.

If the Allied bans are observed, Herr Krupp and majority shareholders in other Ruhr firms will have to sell a great number of shares. The Krupp empire that is to be dissolved consists in the main of coalmines that produced, even in 1950, about 6½ million tons of coal. Krupp's coal shares are valued at over £12½ million. In addition, the Krupp steel shares are valued at about £30 million. Not all need be sold at once. The greater part of the steel shares are to be converted into bonds or shares without voting rights.

German business circles have been greatly concerned about the effect of a vast flood of sales on the stock market, particularly as heavy industry hopes to revive the market for capital issues. The Allies have, however, granted a period of five years for disposing of the Krupp and other holdings. This respite, combined with German ingenuity, makes it unlikely that forced sales will be allowed to damage the heavy industry, though the ultimate ownership of the Ruhr is likely to remain uncertain for some time to come.

* * *

Contradictions of Western Policy

The whole dilemma of Western policy towards Germany presents itself in the Krupp affair. The indignation felt in Britain at the return of so vast a fortune to a family that has for decades epitomised German militarism is natural. But it is quite out of keeping with the decision to rearm Germans, and to encourage the Ruhr to produce some types of armaments. It is, moreover, unrealistic to expect that the German Government will introduce a new *Lex Krupp*, carrying out the Allied bans, and reversing the measure by which Hitler promised that the Krupp family should remain in possession of its empire. Even the attitude of the trade unions is ambiguous. In earlier years they supported the demand of the Allies that the "Ruhr barons" should be prevented from returning to power; but the working people of Essen by no means share the indignation of British Labour members about the Krupps. On the contrary, the family's paternal rule was popular, and it was the mining trade union that recently indignantly exposed the fact that the Krupp concern was selling its majority holding in the *Constantin* mine to a French firm.

Furthermore, the executive of the German Trade Union Federation is not opposed to arms production. It is Herr Krupp who, with some of his former colleagues, declares that he will have nothing more to do with making guns. The western governments may well find themselves having to offer to the Ruhr inducements to turn its factories back to arms production. In the meantime, however, they stigmatise Herr Krupp *pour encourager les autres* while leaving him one of the richest men in the world.

* * *

Pay at Broadmoor

One wage increase that would have the support of public opinion is an increase for mental nurses at Broadmoor. The pay of a new recruit is at present £5 4s. a week, and it is

hardly surprising that the staff is below strength. The recent committee of inquiry into Broadmoor urged that the existing "lead" of £40 over the salaries paid to student mental nurses in the national health service was not enough to offset the disadvantages of the job; it recommended that salaries should be increased and should no longer be tied automatically to those of other mental nurses.

Fortified by this opinion, Staff at Broadmoor, Rampton and Moss Side, through the Prison Officers' Association, pressed the claim for an 18 per cent pay increase which they originally put forward in February. They were told by the Minister of Health, however, that their claim could not be considered in isolation from the claim now going through the Whitley machinery about the pay of mental nurses in the national health service. The association considered that the Minister had thus gone back on his statement in the House of Commons on June 30th that the Government accepted all the recommendations in principle. The Minister did in fact make a qualification, but in the official report it became separated from his general acceptance by a misplaced full stop. The staffs at the State institutions then decided to withdraw all compulsory overtime; but the Minister of Labour intervened, and separate negotiations on the claim are to begin immediately through the Whitley machinery.

The Minister of Health has said that any agreement reached will be provisional and subject to adjustment when the claim for other mental nurses is settled. In theory, therefore, he clings to the rather fine distinction—which is none the less real—that while there should not be an automatic link between pay in the two types of mental institutions, the one should be considered in relation to the other. In practice, however, this looks like face-saving. It is impossible to imagine that the pay at Broadmoor, having once been raised under the provisional agreement, could be adjusted in the light of the award to other mental nurses—unless the adjustment were upwards. But as the negotiations

British Colour Bar

The racial problem may well be as pressing an issue for the world of the next generation as Communism is for this one, and it is encouraging that the Bow Group—a research society of young Conservatives—has been looking into the British aspect of the problem*. The treatment of coloured people in Britain provides “a unique opportunity of proving that neither class, race nor creed are barriers to the friendship and close co-operation of men of good will.” The pamphlet itself sets an example of good will in the friendly and frank way that it presents its material.

One of two lots usually befalls the coloured man in Britain: he is either a manual labourer or a visiting student. In either case, there is considerable room for improvement of the conditions to which he is subjected. The worker's difficulties are social and professional rather than economic; indeed, he seems to be better satisfied with his economic position than his white counterpart. He is to a great extent the victim of a low level of education and an unsettled life. The coloured student, on the other hand, is likely to find accommodation and examinations his most serious problems. Differences in background and insufficient qualifications account for most of his difficulties. The pamphlet offers some sensible comment and practical suggestions about both the worker and the student; it points out that both are involved in the vicious sequence whereby misunderstandings tend to be regarded—and in turn reacted to—as prejudice and discrimination.

The pamphlet also admits that at bottom the problem of the coloured man is one of contact with his white environment. But by his doggedly reasonable approach, refusing to enter controversy, the author seems content to leave the issue suspended in mid air. His questionable premise is that the problem of the coloured man is not “intrinsically different” from that of any foreign resident, temporary or permanent. Inevitably, then, he does not find much evidence of racial prejudice; for whatever there existed of it would on this assumption reduce itself to accidental and corrigible circumstances. But is not that merely to explain away the problem of racial prejudice altogether? Sensibility and good will are both praiseworthy and even fruitful qualities of the Bow pamphlet, but they do not in the end seem quite sufficient to extinguish the problems of the coloured man in Britain.

Old Roads and New Police

The Metropolitan Police Report for 1951 (HMSO, 3s. 6d.) has two disturbing features: an analysis of the increase in indictable offences and an account of the traffic situation. In the streets of London last year 660 persons were killed and 40,325 injured in road accidents. Sir Harold Scott describes these figures as “not only a challenge to authority but a reproach to the community.” Casualties in 1951, moreover, exceeded those of the previous year by 3,899. The remedy is perfectly clear: a large-scale and imaginative replanning of roads in congested areas. Recommendations to this effect were submitted to the Minister of Transport over a year ago; they would cost some £10 million. Sir Harold Scott betrays justified scepticism about the chances of getting the money, but the work would surely merit some of the energy being devoted with so little qualification to the housing programme.

In 1951 the downward trend of crime, which had, by and large, continued since 1945, was reversed. Compared with

* “Coloured Peoples in Britain.” By Anthony McCowan. Bow Group. 6d.

1950 there was an increase of 10.8 per cent in the number of offences. The sharp rise in the price of metals provoked robberies amounting to £63,800—a suggestive footnote on the sensitivity of the underworld to market trends. The police maintained its strong record by leaving only two murders unsolved, but it is noteworthy that only one out of ten persons charged with murder was sentenced to death.

The report attributes the rise in crime to a shortage of men, which remains acute despite the rise in basic pay from £330 to £400 per year, and despite the successful experiment of employing boy cadets for minor police duties. The report notes that the Festival of Britain and the Danish and Norwegian royal visits imposed a heavy strain on the available constabulary. This should suggest clearly enough the magnitude of the problems to be faced at the Coronation.

General Election in Japan

Mr Yoshida, the Japanese Prime Minister, made a surprise move in dissolving the Diet and fixing a general election for October 1st, considerably earlier than was expected. In going to the country at this time he is in effect asking for a verdict on the record of his party before the memory of Japan's recovery of sovereignty through the San Francisco peace treaty has become too dim to be an electoral asset, and before any measures that may have to be taken for Japan's rearmament have involved the Government in further political complications.

The decision appears to have had something to do also with the internal conflict in the Liberal Party between Mr Yoshida and his embittered rival Mr Hatoyama, who was the original postwar leader of the party, but had the misfortune to be purged by General MacArthur on account of certain pro-Axis utterances he was on record as having made in the period when they were the fashion. Mr Hatoyama's supporters claim that there was a gentleman's agreement whereby Mr Yoshida would take on the leadership of the party, but return it to Mr Hatoyama if and when the latter was depurged. Into the rights and wrongs, if any, of this controversy, it would be impertinent for a foreigner to enter; but in the western democracies there is a natural preference for a leader whose record in relation to the Nazi alliance has been beyond reproach. Mr Yoshida has shown since the war outstanding qualities of statesmanship in bringing his country back to normal relations with the victors of the Pacific war.

It is possible that his decision to hold an early election was also influenced by the dispute which has so seriously marred the good relations between Japan and this country. It is clear that the episode of the conviction of the two British sailors at Kobe by a Japanese court has been extremely embarrassing to Mr Yoshida. He would almost certainly have been willing to give satisfaction to the British Government on this matter; but after the peace treaty had definitely left Japan with jurisdiction in the case, intervention to set aside the verdict of the court on British demand would have exposed him to the charge of weakness in upholding the newly regained national sovereignty. In this country there has inevitably been strong feeling at the idea of British sailors on United Nations service being thrown into a Japanese

Aircraft and Airpower

prison so soon after the end of the Allied occupation, especially when American forces in Japan have an agreement giving them extra-territorial jurisdiction. But the time for obtaining a special jurisdiction for non-American United Nations forces in Japan was before the ratification of the peace treaty, and by neglecting to do so the British Government took the risk of just the kind of incident which has occurred. It is to be hoped, however, that both this particular case and the general question of jurisdiction affecting British and Commonwealth personnel on Korean War service will be quickly settled after the election with whatever government emerges from it; for the rulers of a proud and sensitive people are better able to practise conciliation in such matters on the morrow than on the eve of a poll.

Drought in Yugoslavia

The drought in Yugoslavia is much more serious than was at first believed. The damage to the crops is already estimated at 100 billion dinars (about \$333 million). The maize crop, in particular, is well below average, and it is now clear that there will be a shortage of fats and sugar as well as of cereals. It is thought that the losses will be greater than those suffered after the 1950 drought, but that the consequences will be less serious because last year's excellent harvest allowed the authorities to build up reserves.

The measures necessary to keep the Yugoslav people fed may well cause a serious setback to the government's efforts to restore the balance of payments and to complete the industrialisation plan by the end of the year. It has not, however, hesitated to take prompt action, and has banned the export of all cereals. If the ban has to be maintained, it will have a serious effect on Yugoslav export plans. The increase in exports during the first half of the year was largely due to increased exports of corn, and the government has undertaken to export large quantities in current trade agreements with Austria and other countries. The Yugoslavs are reported to believe, however, that if they can persuade the United States to let them use part of their dollar aid under the 1952-53 tripartite aid programme to buy wheat, it will not be necessary to maintain the ban on corn exports. But to use part of their foreign aid in this way must only seem the lesser of two evils to the Yugoslavs. It is believed that under the 1952-53 agreement, which is not yet signed, they will get rather less than \$100 million; this is much less than they had over-optimistically hoped for.

The State Economic Council has also decided that, while as many of the key industrial projects as possible must be completed, it is necessary to cut capital investment in industry immediately in order to offset the losses caused by the drought; and it is planning next year to increase investment in agriculture up to 30 billion dinars at the expense of industry. These measures were foreshadowed by Marshal Tito in his speech at Glina earlier this month. They are a welcome sign of the increased realism of Yugoslav plans; but there will be nothing but regret for the disastrous drought that may have accelerated them.

Dangers in Nepal

The news that King Tribhuvana of Nepal is flying to Delhi to see Mr Nehru reflects the continuing and dangerous instability of this strategically placed frontier state, lying along the border between India and Chinese Tibet. Nepal has become of special importance to India since the Peking government took over Tibet, as it lies astride one of the main passes through the Himalayas, and the Indian frontier does not at this point extend beyond the plains. Nepal provides a way through the mountain barrier, and in hostile hands could be a dagger pointed at the heart of northern India.

Ever since the end of British paramountcy over the Indian states, the government of Nepal has been on the edge of collapse. Today the country is torn by the quarrels of the Koirala brothers; by the intrigues of the traditional ruling family, the Ranas, trying to protect what remains of their power; and by the plots of Communist-inspired opportunists, who seek to exploit the growing sense of frustration of the Nepalese people, in order to seize power. There are, in addition, a number of genuine Nepalese Communists, including Dr K. I. Singh, who is reported to have gone to Peking and to be preparing for a come-back.

During the past two years the Indian Government, largely through the Indian Congress Party, has achieved a position of considerable influence in Nepal. But Delhi can by no means be certain either that a hostile coup will not be attempted or of being able to thwart it quickly enough if it is. There are, therefore, a number of people in the Indian capital who would like to see Nepal accede to India, and there can be no doubt that this would be in the general interest of free Asia. One result, however, might be to make it impossible for the British to go on recruiting Nepal's Gurkhas for the British army—and for service in Malaya. Difficulties have already arisen over the use of barracks on Indian soil, since Mr Nehru, whatever his attachment to the Commonwealth, cannot any longer afford to give his own political opponents a handle of this kind. Perhaps the only satisfactory solution would be a close, formal alliance which would entitle India to station troops in any part of Nepal without any formal surrender of its sovereignty.

Towards a Decimal Coinage

TO THE EDITOR OF *The Economist*

Sir,—The first step towards a decimal currency has at length been taken: the florin is now a current coin, and it now becomes the duty of the public press by its influence to induce the powers that be to complete the system by the coinage of two other new pieces, to replace our present pence and farthings. As your paper confessedly stands at the head of the press in all currency affairs, I forward you the following remarks on the subject, which you will perhaps give to the public.

In our present monetary system we have four denominations:—£1 equal to 20s., equal to 240d., equal to 960 qrs. or farthings; substitute £1 equal to 10 florins, equal to 100 coppers, equal to 1,000 smaller ones. Here, then, we have the two higher denominations, or the hundreds and thousands place in the decimal system; we require only the tens place and units, or the two lower denominations. Suppose a new copper coin, value 2 2-5d., or 100 coined out of 240 pennies, and a second one, 1-10th of the preceding, or 1,000 out of 960 farthings, viz., 25 out of 24 farthings, a piece imperceptibly less than the present farthing, we should have all we require for the transition. . . . I would suggest four new names to the new denominations:—*gol*, instead of sovereign; *sil*, instead of florin; *cop*, instead of the new large copper piece; and *min*, instead of farthing. These appellations, I contend, could neither be easily miscalled, contracted, nor simplified, each being derived from the metal used in its manufacture, except *min*, which is meant as a contraction from the word "minimum" or least. No foreign coins that I have heard of are at all similar, while there are no less than four European coins of different values denominated "florin." I beg leave, Mr. Editor, to subscribe myself yours, &c., &c., DECIMAL.

Books and Publications

The Strategic Argument, 1943-44

The Second World War, Vol. V: Closing the Ring. By Winston S. Churchill. Cassell. 673 pages. 30s.

The War Speeches of the Rt. Hon. Winston S. Churchill. 3 Vols. Edited by Charles Eade. Cassell. 482, 560 and 578 pages respectively. 21s. each.

Quite apart from their narrative style and unique authority, Mr Churchill's memoirs are an invaluable historical source thanks to the documents they contain. Seldom has such power been so effectively concentrated, in a time of such crisis, in the hands of one man, and of one man who can write so well. His new volume—opportunistically coinciding with a reissue of his wartime speeches—covers the period of one year from the invasion of Sicily in July, 1943, to the invasion of Normandy in June, 1944. If this period, being a period of Allied initiative in war and ascendancy in production, lacks the heroic quality of the days of defence, it is nevertheless of extraordinary interest: for it was the period of the Cairo and Teheran conferences and those great controversies about Allied political and military strategy which even now reverberate across the Atlantic. The documents now published by Mr Churchill, and his commentary on them, are invaluable evidence on this still volcanic subject.

Essentially the problem was where and how hard to strike: for in spite of increased production there were still bottlenecks, especially in landing-craft. It has often been said that Mr Churchill opposed, while the Americans advocated, the main landing in France, demanding, against their resistance, a new "Dardanelles" in the Eastern Mediterranean. Mr Churchill proves that this was not so. In fact he consistently supported the punctual invasion of Normandy ("Overlord"), but wished to use forces already available there for intermediate operations in the Mediterranean—particularly in the Aegean, where firm Allied control might end Turkish neutrality and open the Black Sea route to Russia. "The issue between myself and the Americans was, in fact, a very narrow one. It was not that I was in any way lukewarm about 'Overlord.' I wanted to get what I needed for the Mediterranean and at the same time keep to the date of 'Overlord'." Mr Churchill's failure, against "the dull, deadweight resistance" of Washington, to carry through this policy—which led to "the most acute difference I ever had with General Eisenhower," the loss of Leros ("our first really grievous reverse since Tobruk 1942") and Turkish refusal to enter the war—have obviously left him with bitter memories; but in other respects he obtained American support and can claim success. Expensive diversionary campaigns in the Far East were avoided; Mountbatten and Wingate were sustained against the Chinese enthusiasm of Stilwell; and even in the Mediterranean Mr Churchill's policy in Italy was, in essentials, accepted. In spite of the failure at Anzio (of which there is an interesting

explanation) and the change of strategy dictated by Hitler's decision to fight it out in Italy, Mr Churchill claims that this policy was a success, since it diverted German troops from the imminent battleground in the West.

For this was a period of Hitler's military sclerosis, of that inelastic universal resistance which, by leaving him no reserve, threatened not only defeat but disaster. In 1943, with the battles of Kursk, Orel and Kharkov, he met disaster in the East. In the West it was being prepared. A period of gestation is always uncomfortable—

The genius and the mortal instruments
Are then in council—

and if we are surprised, it should rather be at the harmony than at the differences between Allies at such a time. What with gigantic logistical problems in three elements, reviving politics in Italy, civil war among the Greeks, a major war in Asia, new weapons in Germany, an exasperating alliance with Stalin, and "the preposterous behaviour of General de Gaulle," Allied co-operation might well have come adrift. That the effort was so effectively co-ordinated was largely due to the firm control and diplomatic handling of British resources which characterised the war policy of Mr Churchill.

Little England

Portrait of England. By Laurence Thompson. Gollancz. 254 pages. 10s. 6d.

A "Portrait of England" is an ambitious project. The portraitist must catch a contemporary spirit, while respecting the sweep of history; must eschew prejudice, yet retain the liveliness of a personal approach; must select the significant and representative situation, personality, attitude, without distorting perspective; must do justice both to the trees and to the wood and must—if possible—manage all this while remaining readable and easy-mannered.

Mr Thompson scores high on all these counts. As sheer entertainment, his book rates alpha plus by two severe tests, its earlier chapters proving irresistibly absorbing when read in twenty-minute bursts of rush-hour strap-hanging, its later ones exerting an equal spell under a hot holiday sun. As a serious study, a reliable document? One should know one's England equally well before delivering a confident judgment; but it is reassuring to find Mr Thompson, in two significant chapters, unerringly picking out the crucial topics, and virtually duplicating the conclusions, of expert social research with whose results he could not have been acquainted. Alpha again, for judgment and perspicacity.

Alpha all round? Not quite. Mr Thompson's method—admirable for liveliness, for getting over the ground, for illustrating general principles from particular instances—has its shortcomings. He has travelled round England in sweeping zigzags from Plymouth to Peterlee, choosing at each stopping place some small, easily-envisaged group of people tackling some particular job; beginning and ending with town planners (to whom his attitude is distinctly ambivalent), taking in farmers, fishermen, miners, welfare workers, lorry drivers, and a spiv or two, and a political spectrum ranging from the grand old Tory who used to be his commanding officer to the prospective Communist candidate for Wigan—both of whom he regards with affectionate admiration. He has mastered an almost cinematic technique of deft cutting from close up to long shot; the individual tree seen in close and loving focus, then the sudden illuminating switch to the aerial view of the wood—corrective to sentimentality, facile enthusiasm or facile indignation. Admirable; but is the vivid picture which results a real portrait, a true likeness? There are obvious omissions; London, by design, is a vast blank, so is what one might call Betjemanland; the only University is Redbrick. The single grand old Tory is the only representative of Old England—one misses even a pendant in the shape of a grand old Whig. Business with a capital B is right out of the picture. There are no Servicemen, National or Regular; no deep sea sailors, no one, indeed (unless one excepts one incidental Pakistani) with so much as a toehold overseas; this is Little England with a vengeance, retaining of its wider concerns only a precarious standard of living and an uneasy conscience.

One must select, of course; and a second reading shows the unstated principle of selection. In one way or another, successfully or unsuccessfully, all Mr Thompson's characters and communities are coming to terms with a single problem; the problem of mutual responsibility. This is less an imperfect portrait of England than a superlatively successful portrait of something at once lesser, because it is only a part of England, and greater, because it is also part of the whole human evolution—the Welfare State in the making, an imperfect essay, set in the English scene, towards the brotherhood of man.

Thirty Years of Foreign Exchange

The United States in International Banking. By Siegfried Stern. Oxford University Press. 447 pages. 35s.

For an account of the impact upon American banking of two world wars, no better authority could be found than Siegfried Stern, thirty of whose forty-six years in international finance were spent running foreign departments of New York banks. His grasp of detail is apparent on every page of this large

WHEN IT'S A QUESTION OF TIME...

minutes per man hour...

Too many businesses suffer from three way time losses... time lost through late starting of day or shift; time lost through early knocking off for breaks or leaving and time lost by workers trying to find out what o'clock it is. T.R. Time Control reduces such losses and extracts more productive minutes from every man hour. It improves works relationships and gives Management essential wages and job costing statistics—all especially vital to industry today.

TR SERVICE
speeds production

Today's need for maximum output has an increased demand for T.R. Service—Time Control, Internal Telephone, Staff Location and Internal Broadcasting—that new installations can now be undertaken only in organisations engaged upon work of National Importance.

Iron two feet down

Photo by Canadian National Film Board

THEY FOUND IRON 2 feet below the surface when they tested a new type of drill in the Ugava district of Northern Canada; they had hit on one of the richest deposits in an iron-field covering about 5,000 square miles.

The discovery of this vast iron-rich region means that for decades to come Canada can supply the raw material of steel for Europe and the United Kingdom; and it assures the future of the great American steel mills.

Canadians have only begun to tap their country's great wealth in oil, aluminium, uranium, titanium and other precious materials. In that friendly and profitable Canadian market there is a share waiting for British business. Canada is easily reached nowadays—TCA Skyliners leave daily from London for Montreal, connecting with every important Canadian and U.S. city. The present tourist fare is the lowest ever for a trans-Atlantic flight.

volume, and the wide scope of the records used is shown by 300 references to named individuals and 200 to separate banking institutions. While it is to the latter that this book will have the greatest appeal, all engaged in international transactions should consider it required reading on questions of international credit. It is unfortunate that the title may discourage that wide circle of general readers which the contents justify.

An excellent historical survey of international finance from 1914 to 1945 is followed by an account of the effects on American banking of US wartime controls, especially those applied to foreign assets held in the United States. The relations between American banks and US Government corporations are examined, and there is a fine study of the results of the Silver Purchase Act of 1934.

Quite half the book covers American banking operations in, or connections with, twenty individual countries, of which Germany and China receive the greatest space, while England, France and the USSR get fuller treatment than the remainder. With these five countries Mr Stern had particularly intimate relations, since his final fifteen banking years were spent at the head of the foreign department of a New York institution with branch offices in England, France, Germany and China, which was also the principal US correspondent bank of Soviet Russia. The book closes with a section on the organisation of American foreign banking, past, present and future.

There is a five-page bibliography and an excellent index, although a few names in the latter appear to have been dropped from the published text. On one or two minor points of fact, dates and spelling the author's memory might be questioned, but this book can be highly recommended to those in need of guidance on international banking during the years from Sarajevo to Hiroshima.

Scattered Unity

Survey of British Commonwealth Affairs. Problems of External Policy, 1931-39. By Nicholas Mansergh. Oxford University Press. 481 pages. 42s.

As the first historical analysis of Commonwealth foreign policies since the Dominions began to act independently in world affairs, this book is of unusual interest. At once it can be said that it is worthy of a Chatham House series which includes Professor Hancock's classic volumes on Commonwealth problems of nationality and economic policy. Indeed, Mr Mansergh has carried Mr Hancock's basic conception of the struggle within the Commonwealth between liberty and unity, nationalism and supranational loyalty, into his interpretations of Dominion external policies.

After 1926, and certainly by 1936, the Dominions controlled their own foreign relations. Was this to be the end of united Commonwealth action in the world; or the beginning of a more equal partnership in search of peace?

One thing emerges clearly. In Mr Mansergh's words, "the ideal of an imperial diplomatic unity deriving from an ever expanding measure of joint responsibility for policy on the part of all the self-governing members of the Commonwealth... melted away." The Dominions, except possibly Australia and New Zealand, did not want a single, common policy for the Commonwealth as a whole. Nationalist suspicions of the old imperial power, the prior tasks of fostering the coalescence of British and non-British into single Dominion nations, and the illusion of security in isolation, all restricted the field of Commonwealth co-operation. In Mr Mackenzie King, not General Smuts, Mr Mansergh finds the representative figure of this period—"a solid, unromantic Hamlet... for ever refraining from leaping."

Yet the Commonwealth nations still retained a curious capacity for arriving individually at the same sort of foreign policy. All supported collective security through the League—and abandoned it when force was needed to make it effective; all then agreed at the Commonwealth Conference of 1937 upon the policy of appeasing Germany, then suddenly—with the exception of Eire—decided individually that the only chance of security was war.

Mr Mansergh's explanation of the factors behind this type of unity is, perhaps, not so satisfactory as that of the factors of disunity. Much was due to the fact that while the Dominions were equal in status with the United Kingdom, they were not yet equal in function or power. And the United Kingdom, bearing the predominant responsibility for the defence of the whole, could not but have the predominant influence on foreign policy. Much was due to community of outlook and language and to consultation between governments. Mr Mansergh takes account of these unifying elements. But how exactly the common desires of communities scattered all over the globe came to be translated by six equal sovereign governments into broadly similar and compatible decisions is still something of a mystery. So it will remain until the archives of the Commonwealth Relations Office are opened.

Studies of Society

Structure and Function in Primitive Society. By A. R. Radcliffe-Brown. Cohen and West. 219 pages. 21s.

This slim book is a reprinting of a number of articles published by the author in learned journals during the past thirty years. Each of these papers deals with a subject which was obviously of topical interest to anthropologists at the time it was written. Some are controversial, some purely expository. All are marked by a distinction of style and rigour of thought; the art of saying so much with such precision is rare today. Varied as these papers are, they have some common features. One is the author's preoccupation with the family and kinship customs of primitive peoples. The first paper in the book

discusses the significance of uncles in South African native life. Another paper is concerned with what the author calls "joking relationships," which means the custom by which certain classes of relatives can revile one another for fun. A third paper considers the theoretical study of primitive kinship systems and expounds the author's approach in terms of his concept of "social function." In other papers the subject comes up in one form or another.

The lay reader may think these problems are trivial. He will soon find himself drawn into a subject matter of the utmost complexity and following a method of analysis reminiscent of a mathematical argument. For when Professor Radcliffe-Brown discusses uncles, jokes and matriarchy, what he does is to demonstrate his thesis, which forms the second recurrent theme of these papers, that these customs make sense when they are seen as elements in an interconnected series of social institutions. It is not just a question of blood kinship but of the legal and economic arrangements of the Society. This thesis is stated rather more abstractly in two papers.

Mr Radcliffe-Brown acknowledges his debt to the French sociological school of Durkheim. The strength of his point of view comes from its consistency and clarity. If in some ways it seems too obvious to deserve the high sounding title of sociological theory, this is partly because the author himself makes it seem so simple. And this is the greatest weakness of his point of view. He makes social relationships fit together far too neatly. As he says in one or two essays, he has often been bracketed with Malinowski as one of the founders of functional anthropology. The contrast between them would be illuminating to follow out. For Professor Radcliffe-Brown social relationships seem to be almost disembodied; whereas for Malinowski it was the stress and strain in them that figured most. It is the human quality of resistance to the letter of the law that seems to be left out of many of Mr Radcliffe-Brown's calculations. His interest is in simple societies with static economies and his rather formal method of analysis is perhaps appropriate for them. This does not mean that sociologists concerned with more complex societies cannot learn a great deal from these essays. On the contrary, they raise fundamental problems of method and theory and their publication in a book is a service for which the publishers deserve thanks.

Scientific Biography

British Scientists of the Twentieth Century. By J. G. Crowther. Routledge and Kegan Paul. 320 pages. 25s.

This is the third of Mr J. G. Crowther's collections of serious and informative scientific biographies, the previous two being devoted to nineteenth century scientists, British and American respectively. The six scientists described here are all recently dead, and did the major

part of their work between 1890 and the start of the late war. They are: two experimental physicists—J. J. Thomson and Rutherford; two mathematician-astronomers—Jeans and Eddington; and two biologists—Gowland Hopkins, the discoverer of vitamins, and Bateson, the champion of evolution by variation. It is hard to think of a better selection; all six are Cambridge men, which fairly reflects the character of an era. Jeans, perhaps, judged by the permanent value of his scientific contributions, ranks lower than the others, but his immense popularity and prestige as an expositor make him a figure who cannot be overlooked.

Mr Crowther's biographies are serious to the point of dryness, as he has concentrated on the scientific man largely to the exclusion of the human being. Schoolboy and student days are carefully described and analysed, it is true, but the mature man is seen mainly through his scientific deeds and writings, of which long extracts are quoted in illustration of the character of his work. It is the history of certain scientific developments, as personified in the men chiefly responsible, which Mr Crowther is really writing. Embodied in each biography is an outline of the scientific discoveries and theories concerned, and this part has been done with great care; the reader will be grateful to find that the sensationalism popularly associated with accounts of "great discoveries" is completely lacking. Indeed, these expositions are quite exceptional for their insight and clarity, and Mr Crowther has steeped himself, not only in the work of his subjects themselves, but in the contemporary intellectual atmosphere in which that work was done.

As if to make up for the paucity of usual biographical details, Mr Crowther peppers the text here and there with odd anecdotes and sayings, the gleanings of his card-index, which occasionally makes the style disconcertingly spasmodic. What is really a pleasant surprise, from a writer of Mr J. G. Crowther's well-known political leanings, is that he has, with one exception, almost entirely eschewed political "interpretation" of these most unpolitical of men. True, he has provided each one with a label—Thomson represents the "liberal" era, Rutherford the "imperialist," Jeans is a symbol of bourgeois decadence, and so on—but these are as irrelevant as they are silly, and do not colour the writing. The one exception lies at the end of the chapter on Bateson, and takes the inevitable form of a eulogy of Lysenko (with portrait), whose brilliant discoveries, under the leadership of Stalin and inspired by the Marxist-Leninist theories of Michurin, have broken the shackles of the sterile Mendel-Morgan genetics. Is it wishful thinking, in hopes of the eventual redemption of so careful and discerning a writer, to detect an uneasiness in the style of this dutiful contribution? So objective and rational has been the foregoing account that the replacement of lucid explanation by rhetoric and denunciation in these final pages is very noticeable, and fatally weakens the case. Fortunately, it does not spoil a valuable and interesting book.

Family Quarrel

West and East of Tito. By Harry Hodgkinson. Gollancz. 187 pages. 12s. 6d.

This interesting book does not content itself simply with carrying out another analysis of the significance of Tito's split with the Soviet Union. It also examines the origins and repercussions of the quarrel for any light they may throw on whatever principles guide Stalin in his relations both with other Communist states and with the rest of the world. The examination ranges over a wide field—from the history of the Serbs to a comparison of the Soviet and Yugoslav attitude to the arts and sciences. It is carried out with complete impartiality; the author clearly has no illusions about the gravity of the menace of Soviet imperialism, but this never leads him into any attempt to whitewash either the principles or practices of Tito. Indeed, he is careful to point out the "family affinity of the contestants," which is obscured by the bitterness of their conflict.

The main conclusions of this book contain little that is new. It has, for

instance, long been plain that Tito's successful defiance of Stalin might end in a separation of revolutionary Communism from Soviet military power and that this could have enormously important consequences for the free world. And this is not the first time that the ideological and practical importance of Stalin's famous contributions to the linguistics controversy has been pointed out. But Mr Hodgkinson reaches his conclusions by way of many acute observations and a wealth of interesting—and sometimes amusing—detail. Indeed, he might well have made his points rather more effectively had he been content to elaborate them rather less exuberantly. He might also thereby have had more space in which to discuss more fully the economic and political problems confronting the Yugoslavs in their attempt to build up a new model Communist state. Tito's chances of success or failure, and the extent to which he is forced to compromise his rigid Marxist beliefs, must surely have as significant repercussions on Soviet policy as did his original defiance of Russia.

Chronicling the United States

From Versailles to the New Deal. By Harold U. Faulkner. 388 pages.

The United States in a Chaotic World. By Allan Nevins. 252 pages.

The New Deal and World Affairs. By Allan Nevins. 332 pages.

War for the World. By Fletcher Pratt. 364 pages.

The Struggle for Survival. By Eliot Janeway. 382 pages.

The Chronicles of America Series. Edited by Allan Nevins. Yale University Press. (London: Geoffrey Cumberlege.) 32s. 6d. each.

It is regrettable that the price of these books should be so high for the British reader. Their subject is a period of American history—the quarter-century between Versailles and V-J Day—which was of enormous significance for the United States and Britain. While other treatments of this period exist, the scale and clarity of these volumes in the Yale "Chronicles of America" series makes them particularly well adapted to the requirements of the ordinary, non-specialised reader. Here he will find sensible, fair, lucid and readable accounts of this extraordinary epoch, written from a standpoint which may be roughly described as liberal orthodox.

Professor Nevins narrates the transition from 1918 isolationism to 1945 "bipartisanship" with a frank apportionment of blame (for the first) and praise (for the second). Professor Faulkner, describing the domestic scene during the Harding-Coolidge-Hoover era, is less disposed to sit in judgment, but his implicit appraisals parallel Mr Nevins's. Mr Fletcher Pratt contents himself with telling the straightforward narrative of the military operations of the United States forces in the second World War; he shows a welcome balance, even if he abstains from posing some of the more searching questions about Allied strategy.

Anyone determined to find fault with these four volumes might perhaps complain that they all share something of this tendency to sheer off questioning;

all tend to present rather too smooth a surface to the reader. But if so, Mr Janeway's "Chronicle of Economic Mobilisation in World War II" must be exempted wholesale from this charge. His book is in quite a different category from all the others. Not everyone will find it comprehensible. The author's long apprenticeship to *Fortune* has left certain lasting scars upon a prose style that, one suspects, was never notable for modesty or clearness. He introduces himself with a first chapter which combines slickness and obscurity to a phenomenal degree. As he proceeds, the very intimacy of his experience of wartime Washington sometimes blurs the picture he presents of its intricate manoeuvres. He has his favourites—Knudsen, Douglas, Forrestal—and his villains—Nelson, Wallace and Harry Hopkins. And always there lurks behind the scenes that *eminence grise*, Mr Justice Frankfurter. These valuations are disputable; and one may complain that Mr Janeway's concentration on bureaucratic feuding has led him to skimp a good deal of the less exciting, but perhaps equally important, aspects of the amazing story of American mobilisation. But into his highly personal, combative, conspiratorial pages he has packed a remarkable amount of information and revelation. His book has vigour, provocativeness, bite and vividness. Perhaps wartime Washington was not quite like this, but it was more like it than most future historians will realise or contemporary historians admit.

Letters to the Editor

Reviewing the Rates

Sir,—I am surprised to learn from your issue of August 23rd, that the Society of County Treasurers regards the principle of the Exchequer Equalisation Grant as "fundamentally sound"; in my view it is certainly not that.

Two grants which are based on valuation, either in whole or in part, are the Education Grant and the Exchequer Equalisation Grant. In both cases the formulae adopted mean that the higher the expenditure and the lower the valuation the greater the grant. But the formulae also mean the greater the extravagance and the lower the valuation as a result of inadequate council house rents, the greater the grant. Inadequate council house rents mean a high rate per £1 which is not unduly onerous on tenants of low rented council houses, but is a heavy burden on tenants of substandard houses—admittedly rent controlled—and on owner occupiers. If council house rents are reasonable in relation to earnings, the valuation goes up, the Education and Exchequer Grants go down and even if the total net sum to be raised from the rates is increased, the rate per £ is lowered with a consequent more equitable sharing of the burden amongst all ratepayers.

It is disappointing that the Society of County Treasurers have missed the point about low council house rents and it is hoped that the departmental committee now considering these grants will not overlook it.—Yours faithfully,

COUNTY COUNCILLOR

Sir,—The comments made by the Society of County Treasurers on the Exchequer Equalisation Grant system are disappointing; something more solid was expected.

Your note mentioned that even among those counties which do not qualify for Equalisation Grants there are differences in resources and needs. It is tempting to retort "So what?" For the aim of the 1948 Act was not to equalise resources but to assist the poorer major authorities only. Granted, Hertfordshire and Kent are poorer than Surrey and Middlesex but they are, nevertheless, on a national average standard, rich enough to stand on their own feet. (The poorer district authorities within the counties, including those within counties which do not receive Equalisation Grants, are catered for by the county "capitation" grant system.) In any case, are the "differences" in the resources of these richer counties such as to merit special attention? Of the six administrative counties which did not get any Equalisation Grant in 1951-52, their rateable values per head of population ranged only from £8 to £11. There were also 23 county boroughs which received no Equalisation Grant.

There are surely two main criticisms of the 1948 Equalisation Grant system—

apart, of course, from the separate problem of valuation standards. First, the "sparsity" weighting in the grant formula is inadequate; and, secondly, a minimum average rateable value per head of population is no guarantee that resources are sufficient in the aggregate for the efficient administration of local government services; as the 1947 Report of the Local Government Boundary Commission put it, "The new Grant provides quality of rateable value, but adequate population can alone provide quantity."—Yours faithfully,

SILVAN JONES
University College, Bangor

Polish Elections

Sir,—In the article in your issue of August 23rd you seem to suppose, that the electorate "can still probably show its mood" by boycotting the polls. I think this is unjustified optimism. At a time when practically everybody is state-employed, there will be no difficulties in dragging all able-bodied voters to the polls. In the villages all those working in collective or state farms will be compelled to vote; few of the individual peasants will care to get their names on the registers being marked as "not having done their civic duty." The tax collectors would make them pay too heavily for such a luxury.—Yours faithfully,

A. ROMER
London, S.W.1

"Defiance" in S. Africa

Sir,—In your issue of August 16th your correspondent refers to the squalid native townships of Port Elizabeth and East London. This is not altogether accurate; Port Elizabeth is the model town as far as native housing is concerned. I am also certain that the campaign has been kept to these smaller and quieter cities because of the lack of strong feeling among the Nationalists found there. There are, again, so many varying attractions for native crime in Johannesburg, that a defiance campaign with passivity as its keynote would not attract so much attention as it does in other centres.—Yours faithfully,

Johannesburg J. McDUGALL

The Corporate Sepulchre

Sir,—Your review of Mr D. R. Marsh's "Corporate Trustees" is not just to those bodies. It overlooks that it is the practice of most corporate trustees to examine the documents under which they are appointed before they come into operation and preferably whilst they are still in draft. In this way useful suggestions can be made regarding investment powers and the incidence of duties. It has been the practice of many corporate trustees for some time past to suggest to testators and settlors the advisability of giving their trustees the widest possible investment powers.—Yours faithfully,

R. T. BARTLETT

Tenth
Edition

ELEMENTS OF ECONOMICS

By
S. Evelyn Thomas
B. Com., Ph.D. (Lond.), F.C.I.S.,
F.C.C.S., A.I.B.

This fully up-to-date edition of Dr Evelyn Thomas's standard work gives a clear and interesting presentation of the elementary principles of Economic Science to meet the needs of students preparing for the various professional and academic examinations which call for a basic knowledge of Economics. Particular consideration has been given to problems of modern industrial organization and international currency, and many practical examples have been included. The Tenth Edition of "ELEMENTS OF ECONOMICS" is an indispensable study for all students and teachers of Economics, as well as for laymen and men of affairs.

AMERICAN SURVEY

Tests for Trade

Washington, D.C.

CONSIDERING that in election year in the United States debating points made by foreigners are usually buried beneath the avalanche of political platitudes set in motion by the political campaign, the British Chancellor's remark about "trade, not aid" has had a surprisingly wide circulation. It cropped up again last week in Mr William Draper's report to the President on his first six months as Special Representative in Europe. One of the strongest passages in this report was that in which Mr Draper urged the reaffirmation and extension of the reciprocal trade programme, enactment of the proposed legislation for simplified customs procedures and the progressive lowering of other import restrictions and duties.

These words have, of course, a familiar ring. Probably the vast majority of the American people would accept them, in theory, without question. It is only when Americans are brought face to face with particular cases, cases which affect them personally, that they begin to waver. And no arguments about the wisdom of allowing other nations to pay for their imports rather than obliging the American taxpayer to subsidize his exports make any impression on those stalwart upholders of Adam Smith's free, competitive system, the American manufacturers and food growers, or on their representatives in Congress.

At the present moment there are thirteen applications pending for relief under the escape clause of the Trade Agreements Act, a record number. Many of the goods concerned—the last application was for higher duties on screen-printed silk scarves—are not of vast importance and the amount of trade involved is not great. But the growing tendency to turn to the Tariff Commission, the body which must hear the cases and report to the President, justifies the comment of the *Wall Street Journal* that

we still boast that we are the most efficient producers in the world, but we are becoming fearful of the efficiency of outsiders invading our home markets.

Up to date, except in the case of dried figs, the President has reversed those findings of the Commission which favoured increases in duties; in the case of the Swiss watches he thus discouraged a stream of applicants. They were waiting to see how he received that recommendation from the Tariff Commission; they would have made the present total of thirteen look very small, had he given way to the pressures which were being exerted on him.

★

This is likely to become the test case, at least as long as there is a Democratic Administration. In the letter which Mr Truman wrote to the chairmen of the Senate Finance Committee and of the House Ways and Means Committee explaining his refusal to act on Swiss watches, he speculated on why three of the Tariff Commissioners had found evidence of serious injury to the industry:

The answer seems to lie almost entirely in the significance they attached to the fact that the expansion of domestic watch production has not kept pace with expansion of imports, so that the industry today enjoys a smaller share of the larger

market. Because of the dangerous precedent which would be involved in accepting this share doctrine as the determinant of serious injury, I should like to emphasise its far-reaching implications.

The President went on to say that serious injury, by any definition, meant a loss to someone. Declining production, lower employment, lower wages, lower returns or losses on capital invested—any of these might, in his opinion, indicate some degree of injury. During the week between the two political conventions in Chicago, a number of correspondents, including, naturally enough, some Swiss correspondents, took a trip to Elgin, one of the centres of the American watch industry, expecting to find, on the basis of the tales of woe which had been brought to Washington by the management, a tragic island of unemployment, a new, 1952 Hooverville. They found instead a city which had grown from 38,000 to 44,000 inhabitants in a decade and one as prosperous as other cities which had raised no cry for help to the federal government. The President, they concluded, was right when he rejected the idea that "serious injury exists when the domestic industry fails to gain something it never had," and that he was also right when he said that "it was never intended that the programme be limited by a requirement that domestic production must double whenever imports double."

This requirement was also implicit in the motor-cycle case presented by the Harley-Davidson Company, which was rejected by the Tariff Commission without the necessity of presidential intervention, and explicit in the cheese quota amendment to the Defence Production Act last year. The idea seems to permeate American industry that there is an unexpandable maximum share of the market that foreigners can be allowed to take. This unexpandable share is generally considered to be about ten per cent.

However, there is no reason to think that any American exporter believes that his share of foreign markets should be limited to ten per cent. Indeed, the film industry, which will draw up a new agreement with the Board of Trade next week, would be shocked at any suggestion that its share of the British market should be restricted to five times that amount. Perhaps the American importer and exporter should be encouraged to get together—or rather to get at the other's throat—before the Trade Agreements Act comes up for renewal next spring.

Internal differences of this kind will arise over the new arrangement just concluded with Venezuela, which will have the effect, through the application of the most-favoured-nation clause, of cutting the duty on oil imported into the United States from anywhere in the free world by amounts which go as high as 50 per cent. The agreement has been concluded over the protests of the always vocal independent petroleum companies, who produce and sell their oil in the United States and are most perturbed that the country is now a net importer of oil. But the agreement will be welcomed by the big integrated American oil companies, whose operations are international and who are responsible for most of the Venezuelan production. It will also be welcomed by the steel companies, who are beginning to import iron ore

which will now come in duty free from Venezuela, and by the American growers of fruit and manufacturers of industrial machinery, unassembled motor vehicles and wireless sets, whose products are now to be treated more favourably by the Venezuelan customs.

The real test of the relative strength of exporters and importers will come with the debate on the renewal of the Trade Agreements Act. By then there will be a new Congress and a new President. Mr Stevenson has not yet spoken on the subject of tariffs, but he has said that he will stand on the Democratic platform and that he thought that those who drafted it did a good job. His past record justifies the assumption that he would do nothing to destroy the complex system of reciprocal trade agreements established by Mr Cordell Hull and carried on through the Truman Administration. The Republican platform, on the other hand, not only does not encourage foreign exporters to extend their operations, but warns them to wait and see what happens when Congress starts to debate the Act in April.

General Eisenhower himself has made an unequivocal statement of belief that "trade is a two-way street" and all his experience suggests that he knows the importance of Mr Draper's remark that

if the simple truth were clearly understood and accepted by our people, regardless of party, the next Administration and the next Congress would doubtless find ways and means to . . . greatly increase our imports from Europe and other parts of the world.

Should General Eisenhower be elected, he will, as the first Republican President for more years than most businessmen care to remember, presumably be able to influence Congress for some time at least. He might even get an extension of the Trade Agreements Act through before he is forced to capitulate to Senator Taft and his Congressional allies.

McCarthy Again?

[FROM A CORRESPONDENT IN WISCONSIN]

GENERAL EISENHOWER'S most difficult problem at present is whether he should give active support to those "pre-historic" Republican candidates for Congress who are completely out of sympathy with his international policies and political principles. The practical dilemma is that if these Republicans are defeated, as they may be without the General's endorsement, then, as President, he would be frustrated by having to struggle with a Democratic Congress. On the other hand, if he does endorse them, he may alienate enough independent voters to be defeated himself. The problem has crystallised round Senator McCarthy of Wisconsin, who is running for a second term this year, because it is felt that if the General can swallow such violence and "character assassination," he can swallow anything. Moreover, Wisconsin is an important mid-western State, which is Republican in local politics but was for Mr Truman in 1948, and which has a strong independent vote.

Although revolted by the McCarthy attack on his hero, General Marshall, and making it clear that he deplores the Senator's tactics, General Eisenhower has so far steered a middle road between outright repudiation and wholehearted

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

support of Mr McCarthy. His vice-presidential running mate, Mr Nixon, as well-known an anti-Communist as Mr McCarthy but more reputable, has also avoided committing himself finally. What effect an outright repudiation of Mr McCarthy would have on the Wisconsin result is an interesting speculation; such outside interference in state affairs might rally the voters to him.

Mr McCarthy's first hurdle comes next Tuesday, with the primary election in which the two parties choose their candidates for the state elections. Here he has five opponents for the Republican nomination for Senator, but only one needs to be taken seriously. This is Mr Leonard Schmitt, a lawyer from the city of Merrill, who has stumped the state speaking vigorously against Mr McCarthy, and has introduced the latest American political novelty, the radio "talkathon," on which he answers questions for 25 hours at a stretch. This has frightened Mr McCarthy enough to make him interrupt his convalescence from a serious operation and come back to town to reply to Mr Schmitt.

Mr Schmitt has long been at odds with the Wisconsin Republican party organisation, which supports Mr McCarthy and has accused Mr Schmitt of being a Democrat running on the Republican ticket. However that may be, he will have little chance against Mr McCarthy next week unless thousands of Wisconsin Democrats cross the party line and mark Republican primary ballots for him.

★

This can be done because Wisconsin has the open primary system which is supposed to free the people from the power of the political bosses; in this type of primary, those registered as members of one party can vote in another party's primary election if they prefer, and can thus influence, and perhaps decide, the opposition's choice of candidate. It is a system that was condemned as dishonest and undemocratic over thirty years ago by the late President Taft, a stickler for party responsibility, but it still flourishes in Wisconsin. And it explains in part how Mr McCarthy became a candidate for the Senate in 1946. His opponent in the Republican primary in that year was Senator Robert La Follette, who was defeated by only just over 5,000 votes. They almost certainly came from Democrats who thought that Mr La Follette would be the most formidable opponent for their candidate and who therefore went into the Republican primary to vote for the unknown Mr McCarthy.

Until a few weeks ago it seemed that they would be able to cross the party line again this year in order to defeat the man they helped to elect in 1946. It looked as though Mr Henry Reuss, a Milwaukee lawyer and once a Marshall Plan official, would not have to fight for the Democratic nomination for Senator, so that members of his party, with no great interest in the candidates for other offices who must also be chosen in the primary, would have felt free to take part in the Republican contest. But at the last moment Mr Thomas Fairchild, the Federal District Attorney and former State Attorney General entered the Democratic race.

Last spring most Wisconsin Democrats and many Republicans would have welcomed his candidacy. He had run a good race against the state's senior Senator, Mr Wiley, in 1950 and by winning the election for Attorney General in 1948 he had given the Democrats their first victory for a state office for fourteen years. Although a Democrat, Mr Fairchild is the son of a lifelong Republican who has been a Wisconsin Supreme Court Justice for 22 years, and thus would undoubtedly get votes in November from Republicans

who cannot accept Mr McCarthy. But when Mr Fairchild changed his mind, after refusing to run, the followers of Mr Reuss, who had not expected a contest, were furious and the battle for the nomination is now bitter. This means that most Democrats will stay on their own side of the fence on Tuesday, instead of coming over to the Republicans. Thus Mr Schmitt's chances of the Republican nomination have been damaged and Mr McCarthy's enhanced. And if Mr McCarthy is nominated, as seems probable, the fight in the Democratic primary may leave scars on that party that will make it easier for him to win in November.

But the reason why Mr Fairchild yielded to pressure and decided to run was because he became convinced that neither Mr Schmitt in the Republican primary nor Mr Reuss in the general election had any real chance of defeating Mr McCarthy, whom he loathes. Whether Mr Fairchild himself could do that is still far from certain, but some Wisconsin Democratic leaders and a few Republicans think that he has a good chance—if he gets by Mr Reuss in the primary. These people believe that Mr McCarthy has been losing ground with Wisconsin voters. He was first elected as a war hero, in a year when the Republicans came in on a wave of reaction, but his highly advertised war record in the Marines has now been questioned in documented newspaper articles. His difficulties with income tax authorities, his behaviour as a Wisconsin circuit judge (which drew stinging rebukes from the State Supreme Court and the State Board of Bar Commissioners), the \$10,000 he received from a pre-fabricated housing firm, now bankrupt, for a pamphlet he wrote while serving as chairman of a special Senate committee investigating housing—all these things have been given wide circulation in Wisconsin in recent months. It seems certain also that the tactics used in his campaign against "Communists-in-government" have offended many members of his own party and that his violent attack on General Marshall backfired politically.

★

Those who argue that Mr McCarthy is slipping point to the formation in recent weeks of two citizens' committees opposing the Senator, which cut completely across political party lines as well as economic interests. And it is believed that there will be a substantial "silent" vote against Mr McCarthy by other citizens unwilling or unable to take a public stand against him. Nevertheless Mr McCarthy still has powerful support and many hard-headed political observers who have no use for him personally dismiss all this evidence that he may not win as wishful thinking.

These observers point out, first of all, that Wisconsin is a Republican state and that he has the enthusiastic backing of the strong well-financed state Republican organisation. He won lavish endorsement from the same state convention in June that sharply censured his colleague, Senator Wiley, who had inexcusably referred to Mr Acheson as "the distinguished and able Secretary of State." This party organisation is in a position to bring effective pressure on most Republican leaders who show reluctance to go down the line for Mr McCarthy. This specifically and conspicuously includes Governor Kohler, who has privately condemned Mr McCarthy's behaviour and who even considered opposing the Senator in the primary. Now Mr Kohler, running for a second term as Governor, has not only endorsed Mr McCarthy and campaigned for him, but also declares unblushingly that the "factual foundation" for many of the McCarthy charges against the State Department "has already been demonstrated."

It is doubtful whether Mr McCarthy's charges against the State Department, however unjustified, have hurt him politically in those parts of Wisconsin where isolationist sympathies still survive, and these attacks on "Communism" may have helped him also in traditional Democratic strongholds, such as the Catholic sections of Milwaukee. The Senator has even had some success in equating opposition to himself and his tactics with pro-Communism. Finally, he is by far the best known of any of the candidates. Whatever the other results of his campaign against the State Department, it has put his name in the news with a frequency unparalleled in Wisconsin politics. For all these reasons there are many political observers who are convinced that Senator McCarthy will continue to represent Wisconsin whatever General Eisenhower does.

American Notes

Straight Talk for Labour

The American Legion audience which had to submit to a lecture on the nature of patriotism from Governor Stevenson, and hear that he would resist special privileges, even for veterans, now has the comfort that it was not singled out for plain talk. Labour Day, traditionally the starting-point for political campaigns, is the day when the trade unions are accustomed to have their virtues extolled by politicians, and particularly by those of the Democratic party, which rightly regards the labour vote as the backbone of its strength. But in Detroit Governor Stevenson chose to emphasise labour's responsibilities as well as its rights. Although a few months ago he was criticising the President for not invoking the Taft-Hartley Act in the steel strike, he has now accepted the Democratic position that the Act should be repealed, rather than revised, if only to get rid of an ugly piece of political symbolism. But he insisted that even in that "tangled snarl of legal barbed wire" there was some good. While a new law should recognise the unions as responsible organisations, and do away with the use of the court injunction in labour disputes, it should also make it clear that membership must be open to all, without discrimination, forbid unfair practices by trade unions as well as employers, and provide means of avoiding strikes, such as the recent steel stoppage, which endanger the nation and the whole free world.

This is not the sort of talk which brought out crowds of industrial workers to hear Mr Truman in 1948, and is still bringing them to his whistle-stops. Mr Truman has stepped out of the limelight with good grace, as long as he can continue the hard-hitting tactics he enjoys and pursues so effectively. For example, he is turning the tables on the Republicans' demand for a change by inquiring whether it is a change from full employment which they really seek. This is not Governor Stevenson's style. Even while he was deploring General Eisenhower's reckless sponsoring of a policy of liberating enslaved peoples, he politely hoped that the General was misunderstood.

But if the Governor failed, partly because of his matter, partly because of the inadequacies of outdoor television, to whip up labour enthusiasm at Detroit, he seems to have retrieved the Negro vote, which was in danger of being lost when a Southerner was chosen as his running-mate. It is a feather in Mr Stevenson's cap that Representative Adam Powell, the Negro Congressman who was threatening that his race would stay away from the polls, and Negro leaders from a number of other crucial states now wholeheartedly support him. This conversion took place after Governor Stevenson promised to combat segregation in Washington and explained that he favoured a federal law on Negro rights, though one which would be invoked only in states which did not take action themselves.

Shell Chemicals

The transition from raw material to industrial rubber, both natural and synthetic, is a complex process. Here, as in so many other industrial processes, chemicals from petroleum play their part, and Shell maintain rubber research laboratories at Thornton for this particular study. DUTREX R, a Shell product, is a softener and processing aid, made in Britain. Besides contributing to the tensile

strength of the compound, DUTREX R gives the finished rubber greatest tear resistance with less abrasion loss, less flex cracking and lower crack growth. For the layman who may find such technical terms obscure, this means in plain words, greater durability and better value, whether it be in tyres, tubes, anti-vibration pads or any of the hundred and one other items for which high-quality rubber is essential.

Never-Never on the Up-and-Up

Contrary to the forecasts of the Federal Reserve Board, hire purchase buying has shot up since last May, when the board relaxed the regulations which had fixed both down payments and instalments at a high proportion of the original cost of the article. This had been too high for most people in the low income groups, where this summer's new buyers of automobiles and household appliances on credit apparently come from. However, although in the first burst of enthusiasm some retailers reduced their terms almost to the never-never category of no down-payments, and instalments lasting a life time, shop keepers are now carefully suiting their hire purchase agreements to their customers' financial standing. This is one reason why economists are not yet perturbed at the fact that the amount of consumer credit outstanding is higher than ever before. Another reason is that, with earnings continuing to go up, the relationship between consumer debt and disposable personal income is remaining steady; the total amount owed at present is still under ten per cent of the total amount available for spending.

Consumers are, however, at last actually spending rather more of their incomes; net saving, while still high, has now fallen to only seven per cent of the income left after taxation, compared with nine per cent in the second half of last year. It seems probable that the present rate of saving may become customary as long as incomes remain satisfactory. People seem to be buying again because they can see no prospect of prices dropping any further and some prospect of them rising again. People also seem to be buying because the cupboards

Source: Federal Reserve Board

they filled after the Korean outbreak are empty and the clothes they bought then are wearing out. It is noticeable that the improvement in retail trade which is at last appearing everywhere, except in New York City, is more marked in non-durable goods, such as clothing, than in the durable lines, where the increase in hire purchases has to some extent been cancelled out by a slackening in cash sales.

Many dealers are in fact relieved that the steel strike meant a sharp fall in the output of durable goods in July. This is particularly true of automobile salesmen, who doubt whether they will be able to dispose of the new cars that are now once more being produced at the pre-strike rate of 95,000 a week. Dealers in household appliances, such as refrigerators and cooking stoves, may, however, find their trade improving next month when the terms on which mortgages can be granted will be eased. Estate agents are hoping that the present poor market for houses is only because buyers are waiting until they too can borrow on something approaching never-never terms. But there is evidence that the postwar demand for houses, like that for automobiles and household appliances, may be almost satisfied and that future sales may depend mainly on replacements and on the formation of new families

Storming the South

General Eisenhower made history this week by invading the traditionally Democratic South, which is usually written off by Republicans, and by doing his wooing by air, thus bringing the "whistle-stop" technique up to date. His enthusiastic reception, as he vigorously attacked corruption in Washington, was watched intently by Democratic strategists, although in the past fortnight most of the rebellious southern state organisations have swung, somewhat reluctantly, into line behind the party's national candidates. In South Carolina, Mississippi, and Louisiana, three of the four states which deserted Mr Truman in 1948, Democratic electors have been pledged to deliver their states' electoral votes to Mr Stevenson. In Louisiana, a state with off-shore oil interests, this was too much for six of the ten electors. They resigned, and substitutes are being sought. Democrats in Virginia have grudgingly promised to support the Stevenson-Sparkman ticket.

The consequence is that General Eisenhower will have to stand on his own feet in the South, winning votes under a Republican or independent label. In the long run this is undoubtedly a better foundation for the creation of a vigorous Republican party in the South than the masquerading of the Republican candidates as Democrats at which some dissatisfied and reactionary Southerners were willing to connive. The sole exception may be Texas, where the Democratic organisation, affronted by Governor Stevenson's rebuff over off-shore oil, may next week offer the General and Mr Nixon first places on the Democratic ballot. Republicans in Texas have already placed the local Democratic candidates upon their list in the hope of picking up votes for General Eisenhower.

Both the presidential candidates, after pleasing the South by their moderate positions on Negro rights, have retreated somewhat, under northern pressure, and promised to try to end the filibuster. This right of unlimited debate in the Senate is regarded by the South as the chief defence of minority groups against hateful legislation; so far it has prevented any civil rights legislation from even coming to a vote, for sixty-four of the ninety-six Senators are needed to change this rule may not be curbed at all. The northern liberals who hope early in the session to end the "stranglehold by vocal cords" are seeking a way round this obstacle by arguing that the Senate is no more a "continuous body" than the House and that, like the House, its rules must be voted afresh at the beginning of each session. Only a majority vote would be necessary. The task of handing down a decision on this knotty point will be an unenviable one if a Southerner is in the chair. But even a favourable verdict would not necessarily spell the end of the filibuster. Too many non-southern Senators like it because it relieves them from taking a stand on burning issues.

* * *

Co-operation Against Clothing Competition

In New York City's clothing factories it does not seem as unorthodox as it would in Detroit's automobile shops or Pittsburgh's steel mills for the industry to invoke the help of its trade union to fight its competitors, or for the union to agree to be used in this way. But as a result of giving such a new interpretation to the old labour motto—"In union there is strength"—the International Ladies' Garment Workers' Union now finds itself involved in an anti-trust suit as co-defendant with the clothing firms which employ its members. It has also found itself departing even further from trade union tradition by being picketed by the employers of non-union labour who are bringing the suit.

The Sherman Anti-Trust Act has been called into play by a group of 190 unorganised firms in the women's apparel industry in New York City, about 10 per cent of such businesses there. The suit is their answer to the organising

drive, accompanied by mass picketing, recently started by the ILGWU in order to bring their workers into the union. This drive was urged on the ILGWU by the unionised firms that have been suffering from price cutting indulged in by competitors whose wage bills are not fixed by union contracts. These competitors are now accusing the unionised firms and the union itself of conspiring to restrain the trade in women's clothing.

Making women's clothing is New York's largest industry, with an annual output worth \$600 million and a labour force of 250,000 workers, who have not been involved in a strike for over 25 years. The turbulent days when immigrant seamstresses were organised in East Side sweatshops is a memory preserved only in the turn-of-the-century name of the union and its central body, the Cloak Joint Board. The ILGWU is a veteran in the clothing business compared with most of the firms it has under contract, and its policy is guided by the belief that it must watch the industry's interests, the better to protect itself.

In keeping with this philosophy, the union did not seek wage increases last year because of the depressed condition of the trade, and the continuation of the buyers' market this year has made it especially important to the industry to remove wages and working conditions from competition. The co-operative attempt to organise the non-union firms has included ordering delivery companies with which the industry has contracts to desist from providing lorry transport for non-union shops and, according to the plaintiffs in the suit, attempts to force the independents to join the present employers' associations. The recent picketing dramatised the union's refusal to recognise the newly formed association of the non-union firms, a refusal based on the fact that it duplicates existing associations and the allegation that it is run by firms having unsavoury connections with the underworld.

Expansion's Weak Spots

By offering rapid tax amortisation, the government since December, 1950, has induced private industry to promise to invest over \$22 billion in the expansion of basic materials and facilities needed by the defence programme. By the end of June this expansion was, on the average, about half in place and by the end of next year it should be nine-tenths complete. Some industries are much further ahead than others, and even inside industries the rate of growth is uneven; the blast furnace programme, for example, is lagging far behind the building of steel works and rolling mills which will require pig iron from the furnaces. But even so Mr Fowler, the Defence Production Administrator, considers that the production of most basic materials has been expanded sufficiently to allow the defence programme to be speeded up, if the military authorities so desire, without pinching the civilian consumer. When the Administration decided to stretch out and slow down the defence programme it acted, in part, on the fear that too great a share of the available materials would have to be diverted to the services.

Relatively few additions are being made to the 13,000 "certificates of necessity" already granted, for most of the work of expanding the base of the economy has been eagerly snatched up. But on a few items, some of them essential in time of war, business has proved baulky. The goals set by the planners are at least high enough to provide for full mobilisation readiness. And private businessmen are understandably reluctant to invest their own or their stockholders' money in plants whose products will be needed only in wartime or for which the supply is already equal to civilian demand. For example, although structural steel has been exceedingly short ever since 1950, only one offer to expand production has been made. Big structural steel shapes would be all-important in time of war, but the industry objects that capacity to turn them out is already more than adequate

for peacetime; that the trend is toward lighter forms; and that structural shapes are relatively unprofitable. The same kind of arguments apply to certain sorts of chemicals.

Some government planners, feeling that for the lack of a nail or two the whole preparedness programme may be held up, would like the government itself to fill the gaps, building industrial plants as it did during the last war. At present it is building none, except in the field of atomic energy. Congress, in the original Defence Production Act, invited the planners to ask for more powers if those they had proved inadequate, though it did not promise to grant them. But Mr Fowler apparently considers that direct government construction should only be a last resort, undertaken if richer rewards, offers of compensation, or stockpiling fail to provide the answer.

Shorter Notes

The Senate preparedness committee, in its latest criticism of extravagance and waste by the armed forces, has censured the Army's Chief Engineer, General Pick, for allowing public funds to be squandered on the strategic air bases being built in North Africa. The need for speed, in order that two of the bases might be in operation within six months, was the root cause of the unsatisfactory construction, which means that costly repairs must now be carried out, but the committee also blames "flagrant disregard for sound engineering practices," indecision, confusion, poor administration, loafing and drunkenness. The committee admits that these conditions have been dealt with and that the work is now proceeding satisfactorily and fairly economically, but it is convinced that at least \$120 million has been wasted.

Senator McCarran's perennial problem is the shortage of shepherds in his state, Nevada, one of the chief wool-producing regions. He has sponsored special immigration arrangements for Basque shepherds and special foreign aid funds for Spain, but the Spanish government, annoyed at American criticism of its grandiose demands for military aid, has been delaying the visas for the Basque shepherds. However, it is understood that Spain has now remembered its American fairy godfather and has rewarded Mr McCarran by granting the exit permits.

The Air Defence Command has launched its "Operation Skywatch" in 27 states in spite of the fact that it has only 30 per cent of the civil defence volunteers needed for round-the-clock duty. In order to man the 6,000 stations on both coastlines and along the northern border, an estimated 500,000 volunteers are required to provide two spotters for every two-hour shift. Only 150,000 people have volunteered and only about half the projected stations can be opened for some hours during the day; the Civil Defence Administrator puts part of the blame on Congress which appropriated \$43 million for his agency instead of the \$600 million requested.

Continued sales of the "miracle" drug chloromycetin is to be permitted by the Food and Drug Administration in view of its value in treating such serious illnesses as typhoid fever, but the medicine must now carry a specific warning against its indiscriminate use for minor infections. This is the result of an investigation after reports that severe blood disorders, in some cases followed the use of this powerful antibiotic, which has been administered to about 8 million patients since 1949.

The Newcastle Flying Coach

THE first hint of quicker travel by coach came from Newcastle upon Tyne, where an advertisement of the Flying Coach in 1731 announced that eight horses would be used for it. The journey to London was "to be performed in nine days, three days sooner than any other coach that travels the road."

NEWCASTLE upon Tyne is the administrative centre of the North-Eastern District of the Bank, and has, in common with other districts, its own local Board of Directors and District General Manager.

By this policy of local direction and control the Bank believes it can provide better service for its customers by way of prompt decisions linked with a wide and sympathetic understanding of local developments and needs.

... you see DURALUMIN

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of re-armament are satisfied. Our development department will advise, entirely without obligation.

THE WORLD OVERSEAS

Japan Eyes the China Market

(From Our Tokyo Correspondent)

NO one—least of all, probably, the Government leaders—knows what Japanese policy really is on the long range question of trade with Communist China. It may be suspected that at present no hard-and-fast policy exists. In uneasy theory, the Government is firmly opposed to all trade with Peking which comes within the scope of the western powers' restrictions on exports of "strategic" materials to the Communists. But the sensitive ear can detect a hollow and forced ring in the Government's loud warnings against the perils and futilities of trade with Communist China. Different ministers advocate different courses. The Foreign Office and the Ministry of International Trade and Industry are openly at variance. The Prime Minister directly contradicts his Foreign Minister on Japan's attitude to the Peking Government. And industrial pressure for a resumption of trade grows all the time, not only among the ranks of the businessmen, who support the conservative government, but in trade union circles also. In this conflict of voices and division of authority, the Chinese Communists have an admirable opportunity to make mischief by offering trade concessions to split Japan from the West.

There are two independent and, indeed, opposed Japanese movements now actively negotiating for resumed trade with Communist China. The brisker movement is branded as illegal and invalid by the Foreign Office and is subject to the same charge of involuntary propaganda influence as are the British and French interests which have made similar vague barter agreements with Communist states. Last June three self-appointed Japanese delegates, described as representatives of the China-Japan Trade Enhancement Association, signed a £30 million barter trade "agreement" in Peking with Nan Han-chen, chairman of the Chinese International Trade Enhancement Committee. It was agreed that trade should "in principle" be in barter, and that financial calculations should be in sterling. There were special provisions that, for the discussion of details, Japanese representatives should go to China and that the location of a proposed arbitration committee to discuss any disputes should be "within the boundary of China."

But the real catch was that all barter commodities were classified into three groups, "A," "B" and "C"; that the commodities in each classification were to be exclusively convertible; and that the items which Japan needed most from China (coal, soya beans, iron ore and manganese ore) were interchangeable only for Japanese copper, steel products, railway materials, tinplate, aluminium, metal ingots and other vital commodities almost all of which are prohibited under the western ban on exports to the Communists. Some idea of the circumstances in which the "agreement" was signed may be gauged from the earnest testimony of one of the three Japanese signatories, an elderly lady socialist, Mrs Tomi Kora, that the Chinese had assured her sincerely that any strategic materials supplied by Japan would definitely be used only for civilian, and never for military purposes.

The Foreign Office angrily denounced the "agreement" as "illegal." But Mr Nobuhiko Ushiba, chief of the Bureau of Commerce, speaking on behalf of the Ministry of International Trade and Industry, said blandly that "such barter trade on a sterling basis was not impossible," and that his Ministry might issue permits for such trade, "depending on the nature of the articles involved." The first tentative but

definite barter moves, avoiding controversial strategic materials, have already been initiated between Japan and China. The first modest deal was valued at only £2 million—Chinese lacquer, talc and plaster for Japanese typewriters and bicycles. The second is reputedly valued at £3 million; the exotic but "strategically" harmless exchange includes Japanese bicycles, dried cuttlefish, sewing machines and DDT, and Chinese liquorice, raw cotton (6,000 tons), cow-bones, coking coal (250,000 tons), and pig bristles. Details have not yet been settled, and many cynics are asserting that the deals are only paper propaganda. The Foreign Office has firmly announced that it will refuse visas for Japanese export representatives to go to Communist China, but there is a loud hint reverberating throughout the business world of Osaka that the Government will not stop anyone from visiting Hongkong to hammer out adjustments.

Meantime, on what may be called the official trade front, the Ministry of International Trade and Industry is now diffidently exploring the possibility of expanding exports of weaving machines, dyestuffs, paper and woollen goods to China. The previous barrier against the Japanese export of these items was lifted at the recent five-nation talks at Washington, which finally allowed Japan to join the United States, Britain, France and Canada on the Co-ordinating Committee for Export Control in Paris. To these commodities—which, as Japan knew, the West had been exporting to the Communists while prohibiting Japan from doing so—were finally added under pressure from Japan, such mystical but valuable goods as Japanese agar-agar, DDT, mosquito incense and pyrethrum.

Thin End of the Wedge

Japanese industrialists have not shown excessive enthusiasm over these first trade concessions granted by the West. Conservative estimates place the value of official business with Communist China—as distinct from, and in addition to, the volume of unpredictable business under the unofficial barter "agreement"—at no more than \$28 million for the last four months of this year. This makes a poor showing beside Korean war orders placed by the United States, which averaged \$30 million a month all last year. But it represents the thin end of the honourable wedge, and as such is not being scorned by industrialists who have huge stocks of dyes, textiles, paper and woollen goods ready for immediate export if Communist China will take them.

A further complication has been the spirited attempt by Chiang Kai-shek to present a wider alternative non-Communist Chinese market for Japan. He has sent the amiable General, Chang Chun, former Premier, as a trade emissary to Japan. General Chang argued that Japan's "dream of trade" with Communist China was based on "a hoax," that China needed its raw materials as desperately as the Japanese did. The Japanese listened impassively but sat up and took notice when Chang promised an "interim" arrangement, during "the temporary Red regime," which would "throw open" to the Japanese "the resources and needs of several million Chinese non-Communist businessmen in South-East Asia countries." The Japanese may have their private reservations about the "temporary Red regime," but the prospect of some hard trade in South-East Asia

attracted them at once. There has been growing an uncooled impatience with the glitteringly vague American offers of a vast new trade bonanza in South-East Asia. General Chang's proposition is being followed up with customary Japanese thoroughness and vigour.

Apart from the possibilities of this new proposition for Formosa, Japan expects to sign another trade agreement with Nationalist China, valued at \$72 million a year for exports and imports alike. The present trade agreement is worth only \$50 million. Japan's principal exports will be: fertilisers, textiles, iron and steel goods and machinery; and its imports, rice, sugar, bananas and pineapples. The new trade pact, at General Chang's bland suggestion, will be known as the Japan-China Trade Agreement instead of the present Japan-Formosa Trade Agreement. The next move seems to lie with Communist China.

The Fifth Soviet Five-Year-Plan—II

Bright Prospects for the Russian Consumer

It was argued in a previous article that the pattern of development of Soviet basic production has not been changed radically in the new plan. Yet, if there are no novel departures, there is a certain shift in emphasis: a fuel-saving campaign and the substitution of electricity for other fuels; plans for speeding up the production of timber and building materials; efforts to achieve self-sufficiency in non-ferrous metals through the development of home deposits and of synthetic substitutes; and last but not least great emphasis on the output of the engineering industry. All these were features of the previous plan; but in the new one they receive even greater emphasis.

The important role ascribed to electric power is the more significant, since the planned increase in oil production is the most spectacular target of the plan. Coal is progressing regularly towards its goal of 500 million tons by 1960. This week, it was reported that coal production now runs at a rate 8 per cent higher than last year and hence should top 300 million tons for the first time this year. Oil output, however, is scheduled to reach 70 million tons in 1955; that is, 10 million tons more than its long-term goal. All the same, the planners foresee the progressive introduction into the countryside of electrically driven tractors, a greater electrification of transport and the use of electric power in the development of regions where coal is in short supply. Such ambitious plans of power expansion are made possible by the gradual putting into action of the hydro-electric power stations built as part of the "Great Projects." By 1955 these should account for about one-fifth of the total electric power generated and they should account for about one-third of the planned increase of some 60,000 million kwh.

Industrial expansion makes great demands on the building trade to provide both factories and houses for the workers. The Russians recognise that the timber industry has "failed to keep pace with the growing needs of the national economy." Output of timber is now to be stepped up and that of building materials as a whole is to be at least doubled during the 5-year period. State building should provide some 105 million square metres of floor space in the towns, and private construction should bring it up to over 120 million square metres. Although housing will remain an acute problem for a long time to come, the new planned figures compare favourably with the 85 million square metres planned and over 100 million achieved in the previous five years, particularly as these figures lumped together war damage repairs and new construction. Priority is now apparently to be given to the Urals, Siberia, the Volga area, the Far East and Central Asia.

This is in fact the only direct reference to the eastward shift of industry, which has been a salient feature of postwar Soviet development. An indirect indication is provided by the intended expansion of the production of non-ferrous metals, since the deposits of the latter are located chiefly in the Urals or further east. During the five years of the plan the output of nickel is to rise by one-half, that of tin by over three-quarters; copper production is to be nearly doubled, that of zinc is to increase one and a half times, while the output of lead and aluminium is to be increased even more steeply. With the exception of tin and nickel, the planned rate of expansion is greater than in the previous plan. In addition, the rapidly growing chemical industry is to help by providing Ersatz non-ferrous metals and synthetic rubber.

In its emphasis on steel alloys, the chemical industry and non-ferrous metals the new plan is reminiscent of the third 5-year plan which was interrupted by the war. Then, too, stockpiles were to be increased. Now they are to be doubled, while the national income is to rise by only 60 per cent. Hence, reserves which, partly out of fear and partly to smooth the running of the economy, have always been high in the Soviet Union, may well be increased to nearly 8 per cent of the national income, instead of the usually estimated 6 per cent. The greatest resemblance, however, lies in the stress laid on engineering. In the new plan, to quote a striking example, the output of the machine building and metal processing industries is to be doubled in the five years.

The great difference between the third and fifth plans lies in the production of consumer goods. In 1939 large increases were indeed planned, but there was a great discrepancy between the planned pace of heavy and light industry. The new plan is to close this gap as the following indices show.

PLANNED INDICES OF INDUSTRIAL PRODUCTION
(1950=100)

Producers' Goods	1955	Consumer Goods	1955
Coal	143	Paper	143
Oil	185	Cotton goods	161
Crude steel	162	Leather footwear....	155
Metal-cutting tools (large)	260	Sugar	178
Commercial timber	156	Animal fat	172
Total producers' goods ..	180	Total consumer goods ..	165

The present plan does, in fact, give an idea of what the Russians could achieve if they devoted more thought to the consumer. If the light and food industries are allowed to run according to schedule, the Soviet Union will by 1955 produce twice as many woollen fabrics, and twice as much sugar and fats as in 1940; the output of cotton goods will exceed the pre-war level by three quarters and the output of shoes by a half. Even allowing for the growth of population these are tremendous increases. Yet the Russian consumer is promised still more. The sales to the public of clothing, shoes and sugar should rise during the 5-year period by about 20 per cent more than the domestic output of these articles. This fits in well with the reference in the draft plan to closer co-operation with the countries of the Soviet bloc and to the development of relations "with all countries which wish to develop trade on the basis of equality and mutual benefit." It remains to be seen whether the Russians really intend to buy consumer goods from the West or whether the gap between domestic production and the promised supplies is to be accounted for only by Czech shoes and Polish textiles.

But whatever the source, to the average Russian, the prospects must look dazzling. The planned supply of consumer goods may still fall far short of the promised land of plenty of the Communist millennium or even of the American standard of life. Yet the Russians could make quite favourable comparisons with most European countries and, what is most important, if the targets are reached, it will almost look

like plenty to the Russian who has not yet forgotten the appalling conditions of war and its aftermath.

These prospects must arouse great hopes. They may also evoke bitter memories. The third 5-year-plan promised the Russian consumer a rise in his standard of life which was

PRODUCTION OF CONSUMER GOODS

	Unit	1940	1950	1951	1955 Target
Cotton fabrics ..	mn. metres	3,886	3,815	4,656	6,142
Woollen fabrics ..	"	120	167	189	257
Leather footwear ..	mn. pairs	205	205	240	318
Sugar	'000 tons	2,150	2,515	2,969	4,477
Animal fats	"	207	325	345	559
Vegetable fats ..	"	724	775	868	1,372

substantial, even if it was not as spectacular as the one promised now. He seemed to have it almost within his reach. Then came the spectre of war, rearmament, a shift towards heavy industry and finally war itself. Will the hopes of the ordinary Russian again be doomed or will he—after decades of hard toil, privations and bitter disappointments—at last get his reward? If they do not consider war imminent it may well pay the Russian leaders to carry out these plans. Even if they fall short of completion, an additional pair of shoes, a few extra yards of cotton, a few more ounces of sugar will pay rich dividends in boosting morale and strengthening the regime.

(To be concluded)

Egypt in the Red

[BY A CORRESPONDENT]

IN Cairo, two weeks ago, the Minister of Finance, Abdel Gelil el Emary, told a press conference that the cotton policy of the Wafd "had had a most disastrous effect on the country's economy." It may or may not be good politics to blame the present critical state of Egypt's finances upon the Wafd. But there can be no doubt about the facts. Cotton normally accounts for something like 80 per cent of the country's exports. During the last two seasons the fantastic manipulations of the price of cotton on the Alexandria market, which the Wafd allowed or encouraged, in order to favour its friends and supporters, pushed prices so high that on each occasion a large carry-over had to be taken over by the government instead of being sold to foreign spinners.

Moreover, the Wafd's determination to keep cotton prices high not only reduced the value of the country's exports but actually increased its bill for imports as well. For if he is persuaded that he will get a good price for his cotton, the fellah somewhat naturally plants more cotton and less grain, with the result that more grain must be imported. In 1950 the value of Egypt's imports of wheat was £E13.8 million. Last year it was no less than £E34 million. It is true that stockpiling in the Western world during at any rate the earlier part of 1951 tended to mask the results of this policy, for in that year the value of exports was £E203 million compared with imports amounting to £E242 million if monetary gold is excluded. But the full effect became strikingly plain in the first six months of the present year, when the value of exports was estimated at £E67 million compared with no less than £E124 million in the first six months of 1951; the value of imports amounting to £E120 million and £E113 million in the first half of 1951 and 1952 respectively. The favourable balance of visible trade in the first half of 1951 has thus been replaced by an adverse balance of £E46 million in the first half of 1952.

According to figures published by the National Bank of Egypt, current invisible exports in the first six months of 1951 (the latest figures available), amounted to £E47.7 million, consisting mainly of Suez Canal dues (£E13.3 million); expenditure of British troops in Egypt

(£E6.6 million); the country's gross shipping earnings (£E3.8 million); interest and dividends (£E2.4 million); and no less than £E19.8 million being described as "other receipts." Current invisible imports amounted in all to £E36.7 million, made up mainly of "travel and maintenance" (£E7.4 million); interest and dividends (£E7.4 million); government expenditure abroad (£E4.1 million); and gross shipping disbursements (£E3 million). There was thus a credit balance on current account of invisible items amounting to £E11 million. But even on the somewhat optimistic assumption that in the first half of 1952 invisible items have yielded the same surplus as in the first half of 1951, the gap which has still to be filled is large indeed. It is hardly surprising that the Egyptian authorities should have pressed Whitehall so long and so earnestly to release before it strictly need have done, the £10 million which the Treasury undertook by the 1951 Anglo-Egyptian Payments Agreement to release by the end of each of the ten years for which the agreement runs. Nor is it altogether surprising, in view of the interest which Britain has in preventing a serious worsening of Egypt's position, that Whitehall should have agreed.

Gold Reserve Built Up

When, in the summer of 1947, Egypt cut loose from the sterling area and began its attempt to make the Egyptian pound stand on its own feet, there were many who thought that the experiment would end in failure. As things turned out, a sustained period of high prices for cotton in world markets enabled Egypt to earn the dollars needed to acquire a gold reserve. This gold reserve now stands at £E60.6 million, covering a third of the notes at present in circulation. This is an important consideration in a country of peasants who understand gold but distrust paper. In addition a reserve has been built up of some £E35 million in foreign currencies other than sterling, though there has been a heavy fall since the beginning of this year, when it stood at over £E50 million. Moreover, it has proved possible to transact a substantial proportion of Egypt's foreign trade in the so-called Egyptian export pounds, which in 1951 amounted to £E19 million. It is true that the value of the currency on the free market has fallen in recent months to a discount of 30 per cent, though, as the Minister of Finance pointed out, the discount now stands at only 10 per cent. It is true that in the last four years the restrictions have not prevented a large flight of capital to Zurich, Amsterdam, New York and Buenos Aires. It is true also that the whole experiment has involved a serious reduction in the sterling balances, which now stand at £E173 million compared with £E224 million at the end of 1950. In spite of all this, and in spite of the disastrous six months Egypt's foreign trade has just experienced, it would be premature to assume that the bold decision of 1947 has not proved a success.

But another cotton season like the one just coming to an end would make the assumption unavoidable. Even before the recent upheaval, action had been taken to reduce imports and to economise foreign exchange, for instance, by the restriction of travel allowances. And there is no doubt that the present government is alive to the real danger which faces the country. The Minister of Finance's recent declaration that its policy will be to accelerate the movement of cotton is a sure indication that it considers it to be more in the country's interest to see that the cotton is actually exported than to encourage a bull market at Minet-el-Bassal and to come to the rescue of the speculators when they get into trouble. Indeed, if the government is as good as its word about the drive against corruption, one or two of the better-known names in Alexandria may not be heard of for some little time.

All this will help. But there will still be a long way to go before Egypt's international accounts can be balanced this year unless it succeeds in selling its cotton abroad, and in selling it at a price considerably higher than that ruling

Thousands of duralumin rivets can be heat treated in a single batch to 500°C. and then quickly "quenched" or cooled to room temperature. At this stage they are still pliant enough to form or head, but only for a few hours.

That's where refrigeration steps in. If, after "quenching", the rivets are cooled still further and kept at 0°F., the metal will remain in a workable state for several days. Refrigeration is the answer to this problem and a lot of other people's problems too!

If you've a cooling problem, consult

COLVILLES LTD 195 WEST GEORGE STREET GLASGOW S.1

At home to Mr Robertson

IT IS A FINE THING, someone once said, to have ancestors; but if you have none worth speaking about, it is not a bad plan to set up in the business yourself. There are towns like this. The guide books are terse about them. 'Pop. 18,157; early closing Wednesday; nothing noteworthy to see...' There are many such, not quite new and not very old, whose traditions are still in the making.

★ ★ ★

IT WAS in a town of this kind that Mr. Robertson came to live. As he surveyed it for the first time, it looked commonplace enough; the old weathered cottages, the newer houses and the tarmac road that led along the valley to the ironworks beyond.

★ ★ ★

NOTHING noteworthy—or so it would have seemed to Baedeker. But Mr. Robertson was not a starry-eyed visitor. He had come here because he had a job to do. To him there was one thing very noteworthy about the little town. It was full of people. People and their problems were Mr. Robertson's business.

THEY have been the concern of Mr. Robertson, his colleagues and his predecessors for just over a century—although not always to the same extent as today. Mr. Robertson's business, which is home service insurance, has developed in much the same way as the town in which he came to work. Like cities many times its size, its social pattern reflects in miniature the story of a nation's growth. Every week, from Friday to Thursday, Mr. Robertson cycles through a century of history; from the old farmhouses on the village outskirts, through the 'new' but sooty town to the villas on the windward side of the smoke. There are families in every row, street and crescent who are at home, on one day or another, to Mr. Robertson.

'POP. 18,157...' Most of it is in the 'new' town that Mr. Robertson visits on a Friday evening, for it is reasonable to collect insurance premiums when people find it easiest to pay them. Hereabouts this Friday evening visit has been a custom for as long as there have been local traditions of any kind. No one, save for a few cottagers, lived here before the mineral quarries were opened and the ironworks built. Ever since, the insurance man's regular call has been an accepted feature of domestic routine. Often enough, family problems are stored up during the week for his attention.

THIS valley town, like many others, has had its ups and downs; today it is one of the all-important reservoirs of Britain's productive energy. And Mr. Robertson—like the fitters and foremen and

clerks he visits in their homes and sometimes in the works canteen—is also playing a part in keeping the nation's economy on an even keel; in helping, perhaps, to turn the wheels within the factory gates

FOR MONEY is needed to keep these wheels spinning. Mr. Robertson's policyholders are among the millions of families who help to provide it and who enjoy, in consequence, the security that wisely-spread investments yield. To offer this extra measure of security, a family safeguard for the present and often a provision for the future as well, is the primary purpose of life assurance. But if the intention to save were not constantly refreshed by painstaking personal attention, the nation, no less than the individual policyholder, would be poorer.

THE voluntary effort of countless families throughout the country, aided by the service that Mr. Robertson and his colleagues bring to their homes, enables millions of pounds which would otherwise be 'spending money' to be funnelled off every year to augment the nation's savings. A large part of the funds administered for the policyholders provides capital resources which invigorate vital productive industries.

MR. ROBERTSON may or may not reflect on these affairs as he cycles home to a belated meal. Most likely his thoughts are elsewhere. For his concern is with the people, provident and happy-go-lucky alike, whose needs and problems he has come to understand so well.

HIS interests are intimately linked with theirs. And if he reaches home to find an urgent call to be dealt with before he finally turns in—well, that is just one of the services which play an indispensable part in sustaining this nationwide thrift movement.

Issued by the Industrial Life Offices

today. Otherwise there must be further calls for foreign assistance and further drafts on the reserves. But foreigners can be tough, and the reserves are not inexhaustible, even if the government were strong enough to requisition balances held by Egyptians abroad. The plans for the redistribution of large estates, now being so hotly canvassed by the army, will be more likely, at any rate for the time being, to retard than promote more production and better sales. It may well be that the country will have to consider seriously whether it is wise to rely on one cash crop alone.

Spanish Optimism.

[BY A CORRESPONDENT]

THE doldrums into which the United States' negotiations for bases in Spain have drifted are reported to be due to the stiffness of General Franco's terms. That he is in a position to dictate such terms is in turn largely due to last year's excellent harvest, with the prospect of another almost equally good this year. This situation has given rise to mounting confidence in Spanish official quarters, where it is perhaps felt that if the country managed to pull through the lean years of droughts and scarcity almost without American aid, why should it not now, from a position of relative strength, extract the best possible terms for its bases. But how real is this strength and how far is official optimism justified?

The production last year of approximately 4,150,000 metric tons of wheat as compared with 3,382,000 in 1950 provides the chief source of both strength and optimism. Since the last harvest the gradual abolition of food rationing, which was completed on June 1st, has been a sign of the improved food situation. Prices have fallen; official sources give the foodstuffs index for March, 1952 (basis 1936=100) as 740.4, compared with a monthly average for 1951 of 762.9. People complain, however, that whereas before they were able to buy rationed foods, small in quantity though these were, at controlled prices, now they have to buy everything at the free price, which in most cases has been almost as high as the former black market price; but the prospects of another good harvest are daily causing a salutary downward trend.

The supply of fertilisers, which has been one of General Franco's worst headaches, has recently greatly improved. There have been imports under the United States \$62.5 million credit, but from a long-term point of view the project to manufacture nitrogenous fertilisers in Spain is more important. Already production is well under way. It is hoped that before many years, home production will provide about one-quarter of the country's nitrogenous fertiliser requirements; but the rest has still to be imported, or else foregone.

The favourable trade balance for 1951 of 172.9 million gold pesetas, as compared with an adverse balance in 1950 of 1.2 million gold pesetas, provides further substantial grounds for confidence. The rains which fell in abundance early in 1951 provided the much-needed electric power upon which Spanish industry depends. The Government has undertaken an extensive hydro-electric power scheme which was already yielding results in increased production during 1950 despite the continued drought conditions which forced cuts in the supply of electricity. Provided that conditions of drought do not return, the outlook for the supply of power to industry would seem favourable despite the shortcomings revealed in the recently published Bank of Urquijo report. The large increase in the tourist industry, stimulated by the so far unspoilt charms of Spain, as well as by a rate of exchange fixed at a specially favourable level, has helped substantially to improve the country's foreign exchange position. Last but not least, there is the Franco regime's feeling of restored self-esteem in the international sphere, which has

given it added confidence in dealing with the internal situation and caused its enemies within the country to despair.

These are a few of the more important factors which have given rise to the present optimism in official quarters. But on closer examination, there is also another side to the picture. Although the 4,150,000 metric tons of wheat harvested last year was a bumper crop, it did not reach the average for the years 1931-35 of 4,364,000 metric tons. This is due to the decrease in both the area under cultivation and in the average unitary yield which has taken place since the Civil War. In recent years the official price offered for wheat has been so low that the farmer has preferred to grow other more lucrative crops or to sell his wheat in the black market, while lack of fertilisers has also helped the decrease in production. Meanwhile the population has increased from 23,563,867 in 1930 to nearly 29 million today. Thus, in order to attain the pre-Civil War standard of consumption, production will have to be still further increased, and although the crops are good again this year, there is no guarantee that high yields will continue. The slump in food prices and the removal of many government controls, including official buying with its guaranteed minimum price, has seriously affected growers. It seems likely that next year there may be a shortage of such commodities as potatoes, which the disgusted grower finds today are a glut on the market. Despite the fact that food prices have come down, all other items in the cost of living indices have risen.

Foreign Trade Difficulties

Last year's favourable trade balance has not been continued this year. During the first five months of 1952 there has been an adverse trade balance of 20 million gold pesetas. Spain, like Britain, is faced with the prospect of strong competition from Japan and elsewhere in the export of manufactured cotton goods which now form one of its most valuable exports. The 1952-53 orange crop promises to be so good that a serious slump in prices is feared; so is growing competition from French North Africa and Israel. Spain has probably suffered more than it has benefited from the recent high prices of raw materials. Although its minerals have fetched high prices, its present policy of industrial expansion has made necessary extensive imports of raw materials.

Spain's economy is suffering from a too rapid expansion of secondary industries to the neglect of its basic industries and essential services, such as transport. It is probable that at present the rate of depreciation of capital equipment is greater than the rate of capital investment. General Franco boasted last May of the amount invested in new industries, but it would probably have paid better dividends to have invested some of this money in the railways, which are at present proving a brake on industry as a whole. The new industries require foreign exchange not only to buy capital plant but also to secure raw materials when they first come into production and before they have yet shown any return—provided, of course, that markets can eventually be found. Nor is Spain in a position to squander its foreign exchange because its gold holdings are slender; in April, 1952, they amounted to only \$51 million.

These may, perhaps, seem to be somewhat gloomy remarks in face of the optimism at present radiating from Madrid; and indeed there is no doubt that, compared with March, 1951, the period of the Barcelona strikes, the situation today is transformed. It would be still further transformed were substantial United States aid forthcoming. But even were General Franco not so well placed as he now is, or thinks he is, it is probable that, as a good Galician, he would prefer to do without rather than to compromise on the terms he has laid down. And were hard times, such as a further series of droughts, again to come its way, Spain has shown before that it has the qualities of a good horse faced with a sticky jump that can always manage to find a spare leg.

South Africa Makes Crime Pay

[FROM OUR JOHANNESBURG CORRESPONDENT]

At this time of the year the great plains of the Orange Free State lie flat and yellow in the winter sun under an enormous, tight-stretched canopy of thin blue sky. The roads run straight as rulers from horizon to horizon, lined with tall blue gums. Farms here are about 6,000 acres: some are much larger; they grow maize and wheat and rear cattle and sheep. Despite the difference between the world price of maize (£3 a bag) and the South African price which the farmers get through the state control board (£1 10s. a bag), the farmers are prosperous: incomes of individual farmers of between £40,000 and £60,000 are plausibly mentioned. Part of the reason is cheap black labour. The income of an agricultural worker rarely if ever exceeds £60 a year, and this includes what he can get from the sale of his own maize grown on a few acres which the white farmer may allow him to cultivate. The cash wage of an agricultural labourer is 30s. a month.

But the farmers are running into difficulties. The new goldfields nearby are drawing labour away from the farms; and in any case the Africans are showing an increasing aversion to farm work. Under the Masters and Servants Act, a farmer can still pursue a runaway worker, and have him first fined and then forced back to work. But the Africans, it seems, now resent this.

To overcome their labour difficulties the farmers have adopted what some people might regard as a remarkable plan. Kroonstad, with a white population of 10,000, is now the second largest town in the Free State, after Bloemfontein. The farmers in the Kroonstad district are in the upper income brackets. Kroonstad itself is a pretty town, with a pleasant river frontage, broad streets, and several tall-steepled churches. It also has a prison; and in the gardens and fields of Kroonstad a familiar sight is red-jerseyed African convicts working under the eye of black guards armed with spears. They have been hired out to private employers.

A Private Farm Jail

The South African Government has in the past year or two pursued a deliberate policy of building "outpost" prisons in rural areas, and allowing farmers to hire convict labour from them. There are now 12 such outpost jails in South Africa, but until recently there were none in the Free State. The farmers of the Kroonstad district therefore applied to the Government for an outpost prison in their area. As there was apparently some difficulty in finding the money for it, the farmers hit on an ingenious expedient. A leading Kroonstad farmer, Mr George Verster, organised 22 other farmers into a private company, on a normal shareholding basis. The farmers subscribed £12,000 in £1 shares, and elected Mr Verster their chairman. Mr Verster then approached the Government, with the proposal that the company should build and equip a prison, if the Government would stock it with convicts.

It so happens that Mr Verster's uncle, Mr Victor Verster, is the Director of Prisons. The Government was enthusiastic about the proposal, and it was arranged that when the new prison was built the Government would supply 350 African convicts whom the Kroonstad farmers' company could hire by paying the state 1s. 9d. per head per day (the convicts of course get nothing). Because of rapidly rising building costs, it was found that the £12,000 the farmers had subscribed was insufficient to build and equip a jail of suitable dimensions; the sum needed was £25,000. This difficulty was overcome, however, by the farmers being permitted to

use convict labour from the already existing Kroonstad jail for the building of the new jail. On this basis, it was possible to erect a prison, whose value as property is £25,000, for £12,000. The new prison was called "Geneva"—perhaps in grateful recognition of the fact that the South African Government does not subscribe to the ILO convention against the hiring out of convict labour for private profit.

In the view of Mr George Verster and his fellow-farmers, the farm jail scheme has several merits. There is (they do not deny it) the merit of cheap labour; by getting convicts at 1s. 9d. a day, they are confident that their £12,000 investment will prove a good one. The convict labour will usefully supplement the labour they already have, and will make it unnecessary to raise wages to attract more. A further merit of the scheme is that it is "thoroughly democratic." By this is meant that, under the rules of the company, the farmers will be treated in exactly the same way as far as getting convicts is concerned, whatever the differences in the size of their contributions to the scheme. They also maintain that the plan has merits from the convicts' point of view, because it is, in fact, a "rehabilitation scheme." For the convicts are all to be first offenders. They will be Zulus sent up to the new jail from Natal to serve sentences of from six to fifteen years for slaying or wounding fellow Zulus in tribal fights. Thus they are not ordinary criminals, and by working for Mr Verster and his friends, they will be removed from contamination by hardened, habitual criminals.

At the beginning of August, the new Geneva jail was formally opened by the Minister of Justice, Mr Swart, who was accompanied by the Director of Prisons, Mr Victor Verster. It was a gala day for the district. The farmers turned out wearing their best Sunday suits, and accompanied by their wives and children. Outside the prison, in the centre of an improvised garden, the South African flag flew from a tall white flagpole. It was quite like the opening of a new school or some other interesting addition to a flourishing district's amenities.

Prison Tea Party

Mr Swart arrived, and was cordially greeted by the farmers and their wives. He made a long speech, in which he stoutly defended the farm jail system, trounced the "misinformed critics" both inside and outside South Africa, who professed to be shocked by it, praised Mr Verster and his fellow farmers for their excellent idea (which he frankly confessed would save the State a lot of money), remarked laughingly that the convicts were lucky fellows who would get plenty of fine fresh country air, and finally promised that, as Minister of Justice, he would see to it that "many more" farm jails were built in the shortest possible space of time. After the conclusion of the opening ceremonies, which included the unveiling of a commemorative tablet, some farmers' wives who had tiptoed off during the speeches bustled forward with cups of coffee and plates of cake and with the prison as background, a little tea-party was held.

The Johannesburg *Star* rather spoiled the effect of all this by denouncing the whole farm jail system as "morally reprehensible," and declaring that farm jails are nothing less than an "investment in crime," since it is now in the interests both of farmers who pay for the building of such prisons, and of the State, which gets paid for hiring out the convicts, to keep the farm jails filled. But this criticism will not dissuade, and will certainly not convince, either the farmers or the Minister of Justice. In their view, they are helping the convicts, by "rehabilitating" them; helping the country, by providing cheap labour for the production of valuable food; and helping themselves, by running prisons if not at a profit then at least without too great a loss. What other country, they may well demand, can point to such achievements? When was there ever such a magnificent example of "philanthropy and five per cent"?

Air Power is Military and Civil

THE seventh post-war display of the member companies of the Society of British Aircraft Constructors,* although much restricted by Security considerations, affords stronger evidence of technical advance and ability than any previous display.

Some will criticise the diversity of projects both military and civil, arguing that the present peril cannot be countered except by concentration upon a few essential aircraft and power plants.

The display, however, reflects the design trend, not the present productive effort. It evidences Britain's recognition that the long-term requirement is broader in scope. While concentrating our manufacture upon tactical weapons we dare not neglect the development of the strategic air forces or the future fleets of commercial air traffic. To do so would be to play into the hands of our enemies, leaving the defences of democracy wide open to devastating danger a few years later on.

In design and in manufacture military and civil aviation become increasingly complementary now that both make use of high speed, jet propulsion, pressurisation, refrigeration, power-boost controls and electronics. Efficient factory organisation likewise requires the keying of civil and military production.

de Havilland for their part have pursued the development and manufacture of both military aircraft and commercial vehicles during the recent unstable years. In the tactical category it was export business which enabled a large productive organisation to be built up and preparations to be made for the international production of the versatile Venom and its war-worthy Ghost turbine, unrivalled in their functions. Equipment of this kind can justify the large production runs which up to now European factories have not enjoyed. Civil business has been maintained at a high level with Dove, Heron and Comet, with engines and propellers. A substantial world-wide trade has been accomplished, civil and military programmes both benefiting from the alliance.

The realisation that the two demands are not in conflict but can and must be satisfied together has been perhaps the main process of thought in our industry during the past year. The fact is that to meet the double need we must apply a larger proportion of the total national effort to aircraft and must clearly understand that aviation ranks as one of the greatest industries of the age. Less essential things in our already austere life have to be sacrificed to this end or we shall be eclipsed.

THE BUSINESS WORLD

Issues at Mexico City

THE meetings of governors of the International Monetary Fund and of the International Bank for Reconstruction and Development that opened in Mexico City this week are the first of these annual gatherings to be held after the end of the so-called "transitional period" envisaged in the Articles of Agreement of the Fund. It was recognised at Bretton Woods that there should be a period of three, or at most five, years during which signatories might, if necessary, live according to the exceptions rather than the complete rules and intentions of that agreement. The Fund began operations in the Spring of 1947, and the span allotted for teething troubles has now passed. Yet the latest report of the Fund's executive directors has to admit that "the attainment of a stable international equilibrium still eludes large parts of the world and there has been little secure or sustained progress toward the Fund objectives of unimpeded, multilateral trade and the general convertibility of currencies." The time should thus have arrived for some fundamental rethinking of the basic concepts on which the Bretton Woods institutions were built. Annual meetings of governors, however, are not the best venue for such fundamental thinking, and the current meeting at Mexico City is unlikely to match those of 1947 or 1949 as a source of concrete news and achievement.

The negation that hangs over this year's meeting is in part connected with the imminence of the presidential election in the United States, and with the vacuum in American policy-making that this creates towards the end of each leap year. One issue in particular that depends on American initiative, the problem of the world price of gold, was put into cold storage before the present meeting began. Before departing for Mexico City, Mr John Snyder went out of his way to emphasise that the United States Treasury would remain a buyer and seller of gold at the present price of \$35 per ounce, and that it had no intention of departing from that parity. This statement has not prevented the South African Minister of Finance from raising the issue once again at the Fund meeting, but it has certainly banished any expectation that he will have any more success in his campaign than he has encountered in previous years.

Another dampening circumstance at the Mexico City meeting has been the absence of the British Chancellor of the Exchequer. Mr Butler, obviously with the concurrence of the Prime Minister, considers that he can be more profitably engaged in preparing for the Commonwealth economic conference in London. This decision is in itself a reminder of the dangers that threaten the Fund and other international institutions if they do not adjust themselves to the times in which they have to live.

There is no indication in the annual report of the executive directors of the Fund that such an adjustment is in contemplation. This document gives some unexceptionable, but by now extremely familiar, advice to Fund members, both debtors and creditors, on their duty to

relate their domestic to their external policies. It points out that "when there is excessive demand for all resources, the incentives to undertake the transfer of productive resources that may be necessary if long-term external equilibrium is to be established, are seriously weakened"; and it then goes on to attack all attempts to meet the problems arising from balances of payments by crouching in the shelter of import restrictions or by relying on the assistance afforded by other countries' import discriminations.

★

These, however, are general appeals and earnest exhortations to which it is unlikely that members will respond any more willingly today than they have done in the past five years. In the matter of new techniques, the Fund seems to be as barren of ideas as ever. This, of course, is not entirely—or even mainly—its own fault. The Fund was originally created for two main purposes. The first was to prevent world trade from drying up as a result of the lack of currency reserves by countries that were caught in temporary difficulties on their balance of payments; and the second was to act as an international pressure group—or perhaps even an international governing body—in support of a liberal philosophy of world trade and exchange.

From the outset, the Fund was equipped with insufficient irrigating funds to secure the first of these objectives. There is some recognition of this deficiency in this year's annual report. This explains that the Fund has for some time had under consideration the question of increasing its members' quotas, having in mind such factors as the magnitude of possible balance of payments deficits in a depression and the fall in the purchasing power of money since 1946. It also expresses the hope that the "new procedural arrangements" made in the past year will ensure that the use of the Fund's resources will not be unduly protracted, and will thus facilitate their broader use." All this, however, is mere tinkering with the existing mechanism.

A much more fundamental question, which the report does not discuss, is whether the rigid philosophy conceived at Bretton Woods is equipped to play a permanent and appreciable part in framing the economic structure of the postwar world. It is doubtful, for example, whether the flexibility of the exchange structure provided under the Fund agreement is sufficient to meet the strains that have been and will be put upon it. As at present interpreted, the relevant articles allow changes in exchange rates only in moments of crisis and as a last resort. Those countries that wish to keep any freedom of action in their exchange rates may remain members of the Fund but they are excluded from any access to its facilities. The result is that any country that tried seriously to follow this rigid philosophy of the

An Annuity

will offset reductions in income

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

(For residents in some countries payments are exempt from U.K. tax.)

No shareholders No agents No commission

mid 1940s, and that ran into temporary difficulties on its balance of payments, would find the escape route of exchange adjustment virtually closed to it by the Fund, while the escape route of an increase in tariffs is blocked by the General Agreement on Tariffs and Trade. The only remedy open to it in those circumstances would be one that is all too often adopted in any case—that of applying quotas, and other quantitative restrictions on imports, in a discriminatory fashion. Thus, the rigidities in exchange rates and import duties seem to foster the very remedy that is most basically inimical to an expansion of trade.

It is true that if all countries did their anti-inflationary duty these balance of payments difficulties would not occur with such persistence and severity. The member countries are duly reminded of that fact in the successive chapters of the Fund's report—as in many other documents: But this is 1952; and if this philosophy is to play any significant role in world trade policies the rules may have to be adjusted to a more flexible design than was conceived at Bretton Woods in 1944. For example, the rules may have to provide for a wider tolerance for exchange fluctuations. Countries that decide, for the time being, not to notify specific parities to the Fund may have to be given, nonetheless, access to its facilities, since it is precisely for countries in external difficulties that those facilities are intended.

It may also be asked whether the Fund is not, in any case, too big and too "universal" to tackle the job to which it was supposed to be called in 1944. With the accession of Japan and Western Germany as members, the number of executive directors is once more being raised—from 14 to 16. The sphere of interest of this unwieldy board is so wide and diffuse that it is asking a great deal to expect it to exercise any effective vigilance and influence over member countries. It should be remembered that all successful efforts in monetary co-operation—the sterling area, the European Payments Union, the Bank for International Settlements—have had much more limited frameworks within which to function. Another difficulty lies in the political element in the Fund's organisation. So long as member countries know that information given to the Fund, and the details of advice sought from it, will be automatically disseminated to the four corners of the earth by executive directors (whose duty it is to keep their governments informed of what takes place), the Fund will never be the repository

of confidential information. Its function of guiding exchange policy among member countries must be seriously impeded by this deficiency.

The International Bank, fortunately, does not enter similarly into the sphere of controversy. Its latest report reflects the activity of a sound going concern. In the past year the Bank made nineteen loans in sixteen countries, for an amount equivalent to \$298.6 million. This brought the total of all loans by the Bank to \$1,412 million, distributed over 27 countries; the disbursements actually made on these loans so far amount to just over \$876 million. The International Bank has thus played a not inconsiderable part in spreading scarce dollars across the world. Through its technical assistance programme it has also spread the gospel of self-help, and is gradually teaching would-be borrowers to make better use of their own resources.

So far the Bank has steered clear of defaults, though certain borrowers do not shape too promisingly in the face of commitments that loom immediately ahead. One of the main tasks now before it—and one of the topics that must have been discussed at Mexico City this week—is the need for a strengthening of its resources, especially perhaps in US dollars. The Bank is, however, also seeking to expand the scale of its lending in non-dollar currencies; as its President, Mr Eugene Black, pointed out at Thursday's meeting, nearly 15 per cent of the loans that the Bank made last year are repayable in currencies other than US dollars—and Mr Black made the interesting suggestion that the Bank might be able to provide some of the finance (mostly non-dollar finance) that will be needed for investment under the Schuman Plan. The debate in Mexico City should also give a little more precision to the proposals—made by the United States International Development Advisory Board and tentatively approved by the Bank—for the setting up of an International Finance Corporation as an affiliate of the Bank. The Bank intends to explore this project further, and it recognises in its annual report that such a corporation could stimulate international private investment and contribute significantly to the further development of the Bank's member countries. There is no sign that the International Bank is failing to adjust itself to the times in which it lives. But adjustment to this modern age is, of course, easier for a body that is lending American dollars than for one that is trying to tell other countries how not to spend them.

Defence Runs on Bearings

FEW people ever look at a ball bearing unless something goes wrong with their cycle or car, and in rather the same way Whitehall seldom pays much attention to the industry that makes these bearings unless some emergency interrupts the smooth running of the economy. Some of the authorities concerned began the last war sharing the ordinary man's too simple idea of a ball bearing as a small shiny steel ball that manages to get lost very easily; but they soon had to learn how vital, complex and difficult a component it was to produce. From the beginning of the current rearmament programme, therefore, the Ministry of Supply has been concerned about the strain that defence may place on this industry. Anxiety about bearings for the armaments that

use them—and few do not—is probably justified but can be exaggerated, as some of Whitehall's demands on the industry since the war have been. Ball and roller bearing manufacture, moreover, remains somewhat secluded from common understanding.

Wherever any part of a machine moves in contact with another part, some form of bearing is required to reduce friction and stand wear. Ball and roller bearings convert the sliding contact between the two surfaces into rolling contact by interposing between the two—or in practice generally between inner and outer rings in contact with one and the other—balls or rollers that turn instead of sliding; they reduce the loss of power in friction and almost eliminate wear. Where little of the load exerted

In the Seaports of the East...

from the Arabian Sea to the Pacific Ocean the branches of the Chartered Bank perform a wide range of banking services connected with overseas trade and local industry. Merchants and manufacturers in the United Kingdom who trade into the East are invited to consult the Bank's managers in London, Manchester and Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

West End (London) Branch: 28 Charles II Street, London, S.W.1.

Manchester Branch: 52 Mosley St., Manchester, 2.

Liverpool Branch: 27 Derby House, Liverpool, 2.

New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

The Hungry Hordes of Ghengis Khan

A quarter of a million Usbecks, Kalmucks, Kirghizes, Merkits, Keraites, Naimans, Juriats, Uighurs and Chinese Engineers career across Asia on twelve-hand ponies—such was the Golden Horde of Ghengis Khan.

A problem that has long engaged the attention of military strategists is how exactly the Great Khan managed to feed his hungry hordes of Usbecks, Kalmucks, etc., etc. His commissaries would have found things a great deal easier if they had been able to use Falkirk Heavy Duty Cooking Equipment.

The Great Khan would have been the first to welcome a complete and balanced range of equipment with no weak links in the standard of its component parts.

As an enterprising strategist, he would have welcomed the fact that every installation is specially designed and planned for each individual customer. Modern equipment would have released for massacres, lootings and pillagings many of the eager Mongols on cookhouse fatigue.

The long life of Falkirk equipment is due to its solid cast-iron construction. This quality would have appealed greatly to a man into whose soul that element had entered at an early age. He would also have appreciated the Falkirk Company's versatility in making equipment for gas, electricity, oil, steam and solid fuel.

A hard bargainer, as is shown by his negotiations with the Kin emperor in 1214, the Great Khan would have been most pleasantly surprised at the Falkirk Iron Company's extremely low initial quotation.

**Ever heard
of
Tweed
Heads...**

... a New South Wales town that grows pineapples? Perhaps not, but it is one of many comparatively unknown places which together form the Australian market. Tweed Heads has something particularly its own ... other than a branch of the Commonwealth Bank, that is. Its social and economic conditions are individual. And so are those of all the other towns and cities throughout Australia which the Commonwealth Bank knows as intimately as it knows Tweed Heads. This detailed yet nationwide knowledge is essential to British business houses viewing the Australian market from 12,000 miles away. It can be easily obtained from our Financial Information Service at Australia House which will be glad to assist you in every possible way.

on the bearing is of the "thrust" type, balls or cylindrical rollers are used. Where some thrust is also exerted along the axis of the moving shaft or the bearing—as for example along a car axle when the wheels turn a corner—the roller used is often of tapered section, forming with the inner and outer races the "tapered roller" bearing of which the use has developed considerably with the growth of motor transport.

These bearings are used somewhere in almost every modern machine, from the tiny ball bearing with seven balls, weighing only a tenth of an ounce, that goes into a predictor mechanism, to the huge barrel section or tapered roller bearing weighing three or four tons that may form part of a rolling mill. This ubiquity is officially recognised in the machinery of steel allocation; since these anti-friction bearings go into almost all steel products, the industry receives a bulk "horizontal" allocation of steel, and does not have to collect a vast cloud of sub-authorisations from its myriad customers. Probably the largest consumers among these are the vehicle industry, railway locomotives and rolling stock, machine tools, electric motors, aircraft, textile machinery and general engineering. But it is much easier to count the few exceptions in which they are never used. The most obvious examples are the main bearings of a car crankshaft, which is made in one complex shape over which the one-piece roller bearings could not be slipped, and ship propelling machinery, which relies on plain bearings. One bearing manufacturer, talking of defence, commented recently, "A warship is about the only piece of war equipment that could go into action without us. But that couldn't train its guns."

*

The industry that makes these important components is itself small, highly concentrated, and fairly specialised. About 95 per cent of the output is made in less than ten factories by five concerns—Hoffman, Skefko, Ransome & Marles and Timken, which also controls Fischer. Hoffman has technical associations with America, Timken has 51 per cent American participation in its ownership, and Skefko is connected with the great Swedish bearing combine that owns factories throughout the Continent. Timken concentrates on tapered roller bearings and leaves its ball and parallel roller bearings to Fischer. Skefko makes all types. Hoffman and Ransome & Marles are perhaps more important in the ball and parallel roller bearing field. The two techniques, and the materials they need, vary, but are alike in needing specialised production machinery that usually needs replacing through obsolescence long before it is worn out—such is the pace of technical progress. The industry finances fundamental research at certain universities, and its own research departments play a large part in designing its machine tools. For this reason, the industry is highly capitalised: the five main companies have fixed assets totalling more than £6 million in book value, but worth probably four times that at replacement values. In value the annual output of the industry is perhaps of the order of £35 million a year; since the cost of materials is probably not more than 30-35 per cent of this, its "conversion factor" is high.

It is not security alone that makes it impossible to state the proportion by which defence demands will add to current ball and roller bearing output. The fact is that it is difficult to do more than estimate just how

much that current output continues to be. The five major manufacturers, through the Ball and Roller Bearing Manufacturers' Association, supply the Ministry of Supply with figures of the number and value of bearings they make—but stipulate that these shall remain confidential; the fringe of small fry tell the Ministry only the value of their output. In 1948 the industry stated that employment had grown from 11,868 in 1938 to 17,046 in 1946, and 18,030 in 1947, and the number of bearings produced from 23,650,000 in 1938 to 33,346,000 in 1946, and 40,062,000 in 1947. It then forecast the output for 1948 as fifty million bearings; the Census of Production collected figures for 1948, but has yet to publish them. Postwar demand from the vehicle industries, and in particular the agricultural machinery industry, may have more than equalled the wartime peak—which was partly met by heavy imports. An informed estimate might put employment in the industry today at just over 20,000 factory workers and perhaps 4,000 staff; and output, in terms of numbers of bearings, may be some 70-75 million bearings a year.

Not that such numbers, or the total value tell much; a bearing may cost between a few shillings and a few thousand pounds. One maker has two factories with roughly the same labour force; one turns out about twenty times as many bearings as the other, which makes mainly large and custom-built roller bearings. It is probably fairer to say that the industry as a whole may have spent nearly £10 million on expansion since the war; that its output has probably doubled; and that its productivity has increased, in that while its costs of materials have risen by perhaps 45-100 per cent, and those of labour by some 25 per cent, the price of standard bearings has gone up by no more than about 20 per cent. Its exports—held down in general to about 10 per cent of output—have risen by nearly a third in the past five years. Possibly 70 per cent of its deliveries at home have eventually gone overseas inside engineering products. Since the war the number of tapered roller bearings has probably increased in proportion to that of the other types—over 80 per cent of the field they are competitive—but it is still probably no more than a fifth of the industry's total output.

Defence equipment tends to need more bearings, and in particular more of the larger bearings among standard sizes, than civilian. All combat vehicles now have four-wheel drive, against two-wheel drive in the last war: that doubles the number of tapered roller bearings needed. Tanks, radar equipment, and anti-aircraft equipment call for great numbers of the heavier bearings. On the other hand, there is also a special demand for the very smallest ball bearings, for control mechanisms in electronic equipment. Many specialised bearings of both types are needed; a jet aero-engine requires about the same number of bearings as a piston engine (counting the ancillary drives of both), but certain of them are more intricate—and more vital—than any in a piston engine. For both types of bearings greater precision than usual is necessary; war equipment needs more of the super-accurate bearings that most of the manufacturers make to order—at about four times the ordinary price.

A remaining potential weakness in the British industry, upon which rearmament has once again thrown emphasis, concerns one of the materials used by three of the largest bearing companies—thickwalled steel tubing. This tubing, used for the rings between which the balls or rollers move, came in prewar days almost entirely from

The shares of the Co-operative Permanent earn 2½% with income tax paid by the Society. But that is not all. You enjoy the other advantages of a safe and convenient investment, security for capital, and the right to withdraw at short notice.

To many people these are as important as the rate of interest, and by investing with this Society you can secure them all. Moreover, you have the solid background of a leading national society with nearly 70 years of service to the public.

SOLID BEHIND YOU

Sweden, with a little from America. When German domination of Europe in 1940 cut off the European source of supply—apart from a little desperate blockade-running—and shipping from America became hazardous, the British tube manufacturing industry had to start producing it in Britain. The bearing makers set most exacting specifications for analysis and grain structure of the nickel or chrome alloy steels they use. The automatic machine tools that are used, moreover, require tube that is absolutely straight and of an outer and inner diameter that must be correct within very small tolerances. Over several years, the job was done; and about 90 per cent of the tubes required are now made in Britain on equipment not originally designed for the purpose. But the automatic machines for bearings are developing in precision and speed of operation to an extent that will soon need even better tube. Tube Investments, Ltd., decided in 1950 to install an American "Assel" mill of the latest type to produce this better tube in quantities that will take care of the bearing industry's developing needs; but the £2 million plant will not come into operation for some eighteen months.

Bearings are needed from the beginning of the defence programme, in the machine tools that make the equipment, to its end in the quantity production of tanks, combat vehicles and aircraft; but the main weight of the demands will not begin to be felt for about another twelve months. So far the industry, generally speaking, has been taking the extra defence orders in its stride, aided by the fact that the civilian market at home and overseas is for the moment softening a little. In recent months there have been signs that part of the civilian orderbook may consist of excess orders that customers do not really need. If industrial production in general picks up in coming months, total demand for bearings will increase, particularly as many engineering customers have a habit of leaving their orders for the bearings for a given product to the last possible moment. Even so, the growing demands of defence should not prove beyond the industry's capacity, given some diversion of bearings from civil use. There will need to be an expansion of output of especially precise bearings; and probably some extra capacity will have to be brought into being for the heaviest sizes of bearings. Home production has been supplemented by heavy imports, last year and this. But all the manufacturers are still expanding capacity, and before long it may be possible to reduce imports to a few special sizes.

Co-ordination of Western defence is raising the question of standardisation in bearing sizes—and a good deal of controversy thereon. In the long run it may be likely that ball bearings will be standardised on metric sizes and tapered-roller bearings upon inch sizes—in both following the American bearings industry, which is the largest in the world. In the industry's attitude to estimates of the vast numbers of bearings needed for rearmament, there remains a tinge of reserve: it remembers that at the end of the last war, when bearings had often been considered terribly scarce, the Government had 17 million bearings to dispose of in its stocks. Some similar scepticism is to be found in the manufacturers' reaction to hearing the ball-bearing industry described as a "panacea" target for air attack; nevertheless, it is not easy to think of many equally concentrated industries so vital to the defence of this country.

Business Notes

Back to Dollar Balance

Temporarily, at any rate, the sterling area came back to balance on its dollar accounts in August. Its deficit with countries of the European Payments Union fell dramatically, to only \$4,800,000 compared with \$98.6 million in July. Its gold and dollar account with non-European countries swung round from a net payment of \$7 million in July to net receipts of just under \$10 million in August—both figures including any transfers to London of newly mined sterling area gold. Despite this improvement, the central gold and dollar reserve fell from \$1,716 million to \$1,672 million between July 31st and August 31st. This was because the very heavy July deficit with EPU had to be settled by a gold transfer to Europe in mid-August—just as the small August deficit will have to be settled by a gold transfer in mid-September—and because receipts of American aid, at \$45 million, were the smallest since April. But it will be disappointing if the fall in the reserves in August is not more than recovered during the current month.

In general, therefore, although the gold reserves fell in August for the first time in four months, the story that the Treasury had to tell last week was the most cheerful since the third and worst postwar dollar crisis came off the boil. Receipts of American aid last month were not notably above

middle of September. Very few of the deals authorised last month can have led to payments to the dollar area in August, and practically none of them can yet have led to receipts from Europe. But the anticipatory retention of sterling by European merchants may have imparted a misleading gloss to the published EPU figures.

Even after allowance is made for this factor, however, the sterling area's deficit with Europe last month certainly improved over the deficit of \$99 million shown in July, and probably also improved over the basic strain of around \$50 million shown in each of the preceding five months (excluding the special receipt of \$25 million under the Anglo-Belgian arms contract in June). It seems probable, therefore, that the Government's objective of reaching balance with Europe by the end of the year should at least be achieved and may well be surpassed. But with stocks of imported goods now running down in almost every country of the Commonwealth, with the gold reserve at only \$1,672 million, and with the end-year payment of over \$175 million on the US and Canadian loans looming four months ahead, there is clearly no room for complacency.

Deficit Financing at the Banks

The clearing banks' statement for August reveals a depressingly sharp accentuation of the rather ominous trends that have been apparent for some months past. In the five weeks to August 20th, net bank deposits rose by another £23 million, to £5,867 million, or fully £180 million above the low point touched last March. This movement seems to be contrary to the seasonal trend; not since 1947 has there been any perceptible increase in deposits in the month of August, and last year they dropped by £58 million. The deterioration by comparison with last year is in fact the largest yet shown, and its significance is heightened by the fact that this latest increase in deposits has occurred despite an abnormally large drop in bank advances and a further decline in the banks' holdings of commercial bills. Owing partly to the fact that the final proceeds of the recent BEA loan became available during the month, bank advances are down by £68 million, whereas in the similar period last year they rose by £3 million despite the fact that repayments were then being made from the £37½ million paid up during the month on last year's issue of Gas Stock. It seems evident from these figures that there has been a further notable contraction in advances to the private sector of the economy. The contraction since last March, when total advances reached their peak (at £1,953 million), now amounts to almost £200 million, of which, however, not less than £125 million must have been attributable to repayments of electricity advances; in the corresponding period last year total advances rose by £86 million.

The disinflationary effects that this tight hold upon advances should have exerted upon the credit position as a whole have, however, been entirely obliterated by the rapid expansion of governmental borrowings from the banks. On the usual basis of reckoning, it appears that during the last month alone the central government's demands upon the banking system have expanded by no less than £106 million, a rate of borrowing almost as fast as that indicated by the statement covering the first fortnight in July (when the indicated borrowings totalled £67 million). It is true that, if it could be presumed that the "departments" still hold the whole of their original big take-up of the new BEA loan, nearly £30 million of the month's borrowings by the Treasury could be attributed to the need to finance the latest call on that stock. But even on this rather unlikely hypo-

* Gold payments to EPU in each month are the consequence of deficits incurred in the preceding month.

the average monthly rate that can be expected between now and next June, the sterling area's gap with non-European countries has for the moment been bridged, and the deficit with Europe has fallen to its lowest level for well over a year.

Effects of Commodity Arbitrage

These figures, however—and especially those relating to the sharp fall in the deficit with EPU in August—need to be regarded with some caution. The deficit recorded with EPU each month refers only to payments that have been cleared through the relevant central banks. Last month European merchants may have abstained from turning some of their sterling receipts over to their monetary authorities for conversion into local currency—in anticipation of being able to use that sterling for making purchases under the recent British scheme for commodity arbitrage. As explained in *The Economist* on August 23rd, the Bank of England in the month granted licences to British merchants for some £50 or £60 million of commodity arbitrage business between the dollar area and EPU, and continental merchants are clearly hoping that more licences of this kind will be issued after the Bank has completed its review of this scheme in the

thesis, the net borrowings for other purposes would amount to £76 million, whereas in the similar period last year the Treasury actually repaid some £60 million of its indebtedness to the banking system. The month's borrowings are most clearly visible in the banks' holdings of Treasury bills, which jumped during the month by £117 million, raising them to £1,175 million; an increase in cash was more than offset by a decline in money at call.

Liquidity Ratio Up on the Year

Over the first five months of this current financial year the Government has, indeed, increased its borrowings from the banking system by rather more than £500 million, whereas in the corresponding period of 1951 its use of bank credit was, on balance, virtually unchanged. The reason for this striking contrast is, of course, readily discernible in the disquieting trend of the Treasury's domestic finances. In the period most nearly comparable to that covered by the bank statements for the five months to August 20th, the Treasury incurred an above-line deficit of £243 million and a below-line deficit of virtually the same amount, making a total deficit of £487 million, or over £330 million more than that for the similar period of 1951. Moreover, whereas in that period net receipts from borrowings on tax reserve certificates were much more than sufficient to cover the net deficit on small savings, this year the combined effect of these operations involved the Treasury in net outgoings amounting to nearly £50 million. The total need for domestic finance in these past five months has therefore exceeded £530 million, in contrast with less than £120 million last year.

One striking consequence of the heavy rate of Treasury borrowings from the banking system has been a continued and rapid strengthening of bank liquidity. In the past month, despite the further decline of £17 million in portfolios of commercial bills (which, at £64½ million, are little more than one-third of the peak volume attained early this year), the total liquid assets of the clearing banks rose by £90 million, to £2,265 million. They are now almost £400 million above their level of last March, and only a fraction below that for the corresponding date last year. Hence the liquidity ratio, which has jumped during the month by 1.5 per cent to no less than 37.4 per cent, is now actually higher than it was twelve months ago, and is only a little below the bloated figure of 39 per cent that obtained on the eve of the funding operations of last November. In the circumstances, it is surprising to find that bank advances to the private sector are still declining.

There is, perhaps, some reason to hope that the Treasury's domestic needs for finance will soon begin to drop below the extraordinary rate of recent months; on the other hand, the improvement in the "overall" external balance of payments means that little or no finance will be received on balance from external sources. In the second half of last year, it will be recalled, the Treasury was securing very large sums from the counterpart of a huge external deficit. It seems unlikely, therefore, that the trend of bank deposits during the remainder of this calendar year can be perceptibly better than in the last four months of 1951 (when net deposits rose by £130 million), and it could easily be substantially worse.

Rank's Recovery Continues

Though the continued improvement in the fortunes of the Rank group, as shown in preliminary figures for the year ended on June 28th last, has not progressed quite as far as some prophets had been forecasting, its progress has been substantial. The consolidated trading profit of Odeon Theatres have risen from £5,125,000 to £6,397,000, and

though after provision for depreciation, interest, and taxation, and the share of profits due to minority shareholders in Odeon's subsidiaries, the net profit comes down to £835,000, this compares with £138,000 in 1950-51. In 1951-52, also, £393,000 has been brought in from special profits on the sale of investments and fixed assets, less additional tax provision and amounts written off intangible assets: last year only £138,000 came from this source. The company has therefore been able to reduce the arrears of dividend on its 6 per cent cumulative preference shares by two years' payments during the period under review, bringing payments up to June, 1951. Hopes that it might bring these dividends up to date have been disappointed, but the directors believe that this should be done during the current year. It is still, of course, paying no dividend on the ordinary shares. The directors report, however, that the consolidated balance sheet will show a reduction in bank indebtedness of £2,437,000 during the year, which together with the reductions achieved in the two previous years will have brought this debt down by £9,510,000 in three years—to roughly £6,776,000. Loan capital, too, was reduced during the year by £1,911,000—leaving some £16,733,000. The Gaumont-British group also increased its trading profit, but its net profit, after taking account of certain special credits, was down from £711,181 to £625,384; in spite of this, it has increased the ordinary dividend from 5 per cent last year to 7½ per cent this.

During part of the period under review the Rank organisation was co-operating with the National Film Finance Corporation in producing films under the "group" scheme; and for most of the period the increased "Eady levy" upon cinema box-office receipts was passing a larger share than before of the final revenue of the industry back into production. It seems likely, therefore, that film production on the group's present reduced scale should be a less costly ancillary activity than in recent years; but exhibition, the really profitable side of the film industry, has had to offset the larger levy and the decline in cinema attendance by increased prices.

Caution at the Wool Sales

The Australian and South African wool selling seasons opened this week, with continental demand predominating and with prices at around—but not significantly above—the level at which they closed at the end of the previous season in June. At the opening auction at Sydney on September 1st prices showed some buoyancy and average 64's reached 154d. per lb, but on the second day they weakened again by about 5d. a lb. At Adelaide, where sales began on September 2nd, prices of most counts were bid up by between 2½ and 5 per cent above the June level on the opening day. This initial firmness was broadly in line with expectations. The estimate of the Australian 1952-53 clip to be received into store is 3,375,000 bales, or only about 17,000 bales more than last year, and it is known that manufacturers in all countries have allowed their stocks to run down; it was generally anticipated therefore that there would be a fair demand during the opening of the season to meet firm orders.

Meanwhile, two factors are still causing uncertainty in the wool market. First, United States buying has not yet been significant at the Australian sales; it is expected to influence prices later in the season. Secondly, large unsold stocks are still held in South America, but the South Americans are not likely to be in a hurry to depress wool prices. The presence of more Japanese buyers at the Australian sales has suggested that the wool textile industry may face heightened competition from Japan, but this is unlikely to have any significant effect on raw wool prices. If prices are only maintained at—and not increased above—present levels, it does not seem that Australia's foreign exchange income during the current season will enable it to do much about lifting its rigid import restrictions.

...working a
nine-day week!

With the current and continued call for longer hours, more work, increased productivity, the RADIO TIMES is surely in agreement — being itself a prime example of dogged industry. For each issue of the RADIO TIMES does a nine-day week, working all the time. From the Friday it is delivered, to the following Sunday week, the RADIO TIMES is constantly in commission. And when you consider that nine-day week in conjunction with the RADIO TIMES circulation, you need no readership survey to tell you that the RADIO TIMES is Britain's hardest-worked distributor of the nation's advertised goods.

PRODUCTIVITY, EXPORTS and COAL

are the core of our Balance of Payments problems. Higher productivity in house building sets free labour for other purposes. A reduction in imports, within certain limits, can reduce the strain on the nation's finances. Economies in coal consumption release additional supplies for productive work and export.

We have, in the Building Industry, already contributed greatly to all these factors by adopting solid floors, suitably covered, throughout our building programme.

Information on the various types of Thermo-plastic Floor Tiles is available on request.

Six Months' Production

In the first six months of 1952, industrial production in Britain was slightly lower than in the first half of last year; the revised official index of production puts the margin at 2 per cent, while the London and Cambridge index puts it at only one per cent. The two indices are now calculated on different base years, since the new official index abandoned the 1946 basis upon which the unofficial index is still calculated: Satisfactory comparisons between the two indices have always been most difficult, owing to the different data upon which they are calculated: the alteration in base year now makes useful comparisons almost impossible.

The most important declines in production seem from the London and Cambridge index (which is the more up to date of the two as regards indices for individual industries) to have taken place in textiles, clothing and leather, and the "motors, cycles and aircraft" group. Output in the

Note:—Easter fell in March, 1951 and April, 1952; Whitsun in May, 1951 and June, 1952.

machinery industries continued to be high during the first five months of the year, while the fuel and power industries increased their production in comparison with last year. The official index for all industries in July is so far expected to be 104-105, as holidays begin to have their effect. The variable incidence of Easter and Whitsun has already made comparison of output between four of the first six months of 1951 and 1952 practically impossible, and July and August can seldom be expected to give any indication of a continuing trend. So it will be some time before anyone will be able to judge from these records whether the autumn is bringing the hoped-for industrial recovery or not.

Premier Petrol and the Cat Crackers

Any policy that has been embodied in several pieces of industrial equipment costing about £9 million apiece is apt to prove rather expensive to reverse, as the Government has learned during its latest discussions over premier-grade motor spirit. The Government has accepted the oil companies' argument that such a spirit was the principal product for which the six catalytic cracking units now completed or under

construction at refineries in Britain were designed. But it remains apprehensive of the extra cost, in imported oil, with a dollar element, that such refining might involve. In considering the latest application for permission to sell this first-grade, branded spirit, put forward by Shell-Mex and B.P. Ltd. in June, the Government therefore asked the companies whether these complex cracking units could not be converted into simple distillation units with the object of turning out the maximum quantity of petroleum products of a "utility" quality. Mr C. M. Vignoles, chairman of the Shell-Mex and B.P. group, who disclosed this in a public statement this week, recorded the companies' answer:—

It has been shown that the conversion of the cat crackers in this manner not only would take two years to carry out, cost between £5 million and £10 million, and require many thousands of tons of steel, but would involve a serious dislocation of a major industry with a most undesirable loss in production of a number of products.

Mr Vignoles added that the extra need for foreign exchange through marketing the higher-grade petrol, in the companies' view, would be no more than £250,000 a year for a year or two—for the purchase of ethyl fluid.

Mr Vignoles describes the Government's inquiry about de-grading the cracking units as motivated by "a proper concern for the national fuel position"—which seems studiously moderate. Such a step, apart from condemning the British motorist to interminable reliance upon petrol of pool quality, would also cut down supplies of many of the essential materials that a petroleum chemicals industry has since the war been created to utilise; and it would force the British motor industry to continue to design its engines for fuel of lower quality than is being sold in many of the overseas countries that buy British cars. With two catalytic cracking units already in uneconomic operation—producing high-grade spirit that is then blended with low-grade gasoline to pass as pool—and the other four nearing completion, the issue is becoming increasingly urgent and the Government has still not produced a fully reasoned case for delaying premier-grade petrol.

Rumblings over Fuel

The Ridley report on fuel economy is expected to appear next week, offering presumably an impartial opinion—though not a final judgment—upon some of the controversy in which its subject is now wrenched. But its imminence has not stilled the discussion. Sir Herbert Merrett's recent forecast of the future demand for coal in Britain was a valuable contribution. But it seems doubtful whether the latest rumbling of argument between the gas and electricity experts has added much to earlier expositions of both cases. The defenders of electricity, by leaving by-products of gas manufacture out of the question, and assuming a particular value for the "electrical equivalent of gas" in cooking and heating, have calculated that the thermal efficiency of heating by gas is no higher than that of electrical space heating; they add that electricity provides a better standard of personal warmth, and takes far worse coal. The secretary of the Gas Council considered it necessary this week to contend that the by-products cannot be ignored; that the value quoted for the

Aircraft and Airpower

A special series of articles on the achievements of the British aircraft industry and the challenges that changing conceptions of air defence and expanding opportunities for exports now present to it will be found on pages 592 to 600 of this issue.

"equivalent" in question is wrong; and that electricity is no longer the only consumer that has to accept small coals.

A more hopeful approach by the British Electricity Authority to answering the question of the purposes that the different fuels should serve was mentioned last week in a report from the Anglo-American Council on Productivity, summarising developments in the industry following the productivity report published by its team in October, 1950. The Utilisation Research Committee of BEA, following the report's comments on "selective development" on the part of power supply companies in the United States, has begun to study the relative costs that can be attributed to the various classes of electricity consumer and the contribution of these classes of consumer, and the various types of appliance in use, to the peak load. This is obviously not the first attention that the British supply industry has paid to such questions; but their growing importance deserves more study. Some realistic estimates of the relative cost of various loads, set beside the prices charged for such consumption, would be among the best evidence that the electricity supply industry—together with other fuel industries—could offer in the debate on fuel economy.

Threat to Engineering Exports

A ban on overtime, and a restriction of earnings on piecework to the level earned by a timeworker during a 44-hour week, such as are now threatened by the engineering unions, would require considerable immediate sacrifices from most of their members. The last official estimate, in October last, suggested that 52 per cent of all workers in engineering receive some form of payment by results, and in the manufacture of vehicles of all kinds the proportion is probably higher. Unofficial estimates some time ago put the proportion of pieceworkers as high as 80 per cent for the skilled workers in shipbuilding, and at 60 per cent for skilled engineering operatives; and suggested that these pieceworkers earned perhaps 20 per cent more than time-workers in similar trades.

In October last a 47-hour week was the average worked in engineering. Since pieceworkers generally achieve their higher pay in a somewhat shorter working week, these

averages would suggest that over the year as a whole time-workers were working well over three hours' overtime a week. The most recent records of overtime reported to the Ministry of Labour, for one week in May this year, show about 400,000 of the 1,160,000 workers in engineering, and 160,000 of the 600,000 employed in the vehicle industries, as working overtime; in each case, the average was 8 hours a week. May was a month of fairly high output in both groups of industries; though nearly 7,000 workers in engineering, and 7,700 in the vehicle industries, were on short time. Since that time, short time working has certainly been extended in the vehicle industries. Nevertheless, these figures suggest that a very large proportion of the workers in engineering would share in this sacrifice for bargaining purposes; the more highly skilled men on piecework, indeed, might be giving up some pounds a week. The first signs of reluctance, however, have come from the general workers' unions that supply many of the unskilled workers in engineering; unskilled men on piecework in some cases gain even more from payment by results than skilled men, and in any case the unskilled men's total earnings are obviously much lower.

On the other side of the dispute, the cost to the employers of these union restrictions on work is less easy to illustrate, but it will obviously be considerable. Few of the engineering industries are at present so hampered by shortage of steel, or so apprehensive of a slackening in demand, as to make this threatened check to output any less serious for them. The direct effect upon companies' output and earnings will vary with their pressure of work. But the most serious implications of this development in the wage dispute, for both sides of the engineering industry, would be its effect upon the industry's competitive strength in the world market. British deliveries are already long, and often behind time; no other single factor is so important in securing export orders. Anything that further delays them may have lasting effects on the share that Britain will be able to secure of the world market for engineering products.

Germany's External Commitments

Since agreement was reached in London on the settlement of Germany's prewar external debts, two new commitments have been entered into by the Federal German Government. The first of these is the settlement, reached after five months of negotiations, with the Government of Israel and world Jewish organisations in compensation for German persecution of Jews and expropriation of their property before and during the war. The assessment of the damage was a problem that was bound to baffle the most objective inquiry. In presenting its original claim the Government of Israel contended that 500,000 Jews from Germany and other countries that fell under German domination had to find refuge in Israel, that the cost of receiving, rehabilitating and settling them might be estimated at \$3,000 per person, and that a claim for reparations of \$1,500 million therefore appeared to lie. This figure, equivalent to Deutsche Marks 6,300 million, has now been whittled down to DM 3,500 million. Of this, DM 3,000 million will be paid to Israel, DM 450 million will be allocated to world Jewish organisations, and a further DM 50 million has been earmarked to satisfy the claims of individual Jews who may not be represented by the world organisations. These payments are to be spread over a period of fourteen years and will, for the most part, be made in kind—that is, in exports of capital and consumer goods from Germany. Germany also intends to use some of its credits with EPU to purchase foreign goods that can be shipped to Israel in satisfaction of these claims.

The other new agreement that will add its burden to the German balance of payments is one under which the Federal German Government has undertaken to pay Switzerland the equivalent of about £53 million in settlement of clearing debts originally valued at about £98 million. These debts

Recorded and Indexed

To record, summarise, and index economic documents and events, this is one of the many functions of the *Records & Statistics* supplement to *The Economist*. For example, the issues published during August contained the Annual Report of the Iron & Steel Corporation, information about the Soviet Five Year Plan, details of the new official Index of Industrial Production, the Bank of England's figures of the United Kingdom's overseas investments, and the White Paper on the future of the steel industry.

A monthly cumulative index, published in the first issue of alternate months, enables each item to be found quickly and easily.

Subscription rates: £2 10s. a year, or, together with *The Economist*, £5 a year.

For a specimen copy please apply to:

Records & Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

accrued as the result of Switzerland's favourable balance of payments with Germany during and after the war, and were also swollen by the cost of supporting German soldiers that were interned in Switzerland. A sum equivalent to about £10 million is to be paid within four years and the remainder will be paid in 27 annual instalments. Throughout the German debt negotiations in London, the Swiss representatives made it abundantly clear that they reserved their right to a satisfactory settlement of the clearing debts and this was accepted by the other countries represented at these discussions. The Swiss settlement, therefore, does not necessarily create a precedent for opening the problem of the clearing debts owing to other countries in Europe. The commitments involved in the Israel settlements were also taken into account during the London negotiations. The two new agreements and the burdens on Germany's balance of payments that they involve do not, therefore, invalidate in any way the terms proposed for the settlement of Germany's prewar external debts.

"Tea Cheers . . ."

After a long period of weakness, tea prices have risen slightly during the last three weeks. The improvement has been mainly concentrated on what are known as "good liquoring" teas, but there has also been a small increase in the poorer grades. Two factors probably account for the firmer tone in the market: the removal of restrictions on the re-export of tea from this country at the end of July, and anticipation of an increase in British demand once rationing is ended. As a result of the freeing of the entrepôt trade, British re-exports may double their present rate of 13 million lb a year, but they are unlikely to regain the prewar level of some 60 million lb. Some of the expected increase, of course, is likely to be at the expense of direct exports from the growing areas—particularly those in the Far East—to the importing countries. But the restoration to London of its full status as an international market may also increase the total world trade in tea; London can offer a wider range of blends and growths than any other market, and the tea it sells has time to mature on its journey from the East.

The end of tea rationing in Britain was brought a stage nearer by the announcement last week that the weekly ration of tea is to be increased from 2½ oz to 3 oz in the week

Price Indices of Capital Equipment

The Economist Intelligence Unit, in conjunction with the Association of Certified and Corporate Accountants, has compiled a series of indices showing changes in the cost of replacing industrial and other assets. Indices available are

Plant: chemical, electrical, food processing, machine tools, mechanical handling, printing, tanning, textile, foundry.

Also agricultural machinery, factory buildings, commercial vehicles, and office equipment.

Special Investigations can also be undertaken.

For further particulars, apply to:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1

beginning September 7th. In choosing to increase the ration again rather than remove restrictions altogether, the authorities seem to be erring on the side of caution. Average consumption of tea before the war was about 2.9 oz a week (or less than the new ration) and it has been estimated that average unrationed demand now would still be between 2.75 and 3 oz a week. Estimates of this sort, of course, are always apt to go awry. While tea has been rationed housewives may have tended to buy the more expensive blends in order to make it go further; if so, once they can buy unlimited quantities they may choose to pay less for their tea, but to buy more of it. It is probably this reasoning that has led to the recent slight rise in the price of poorer grade teas on the London market. But the tea trade clearly feels that it will be difficult to get the consumption of tea back to the prewar level—even when rationing is ended. Indeed, one of the big distributors has found it necessary to cut its prices recently, and an intensive campaign is being conducted to get people to drink more; as part of it, posters bearing the slogan "Tea Cheers—3 oz this month" will be displayed in many shops next week.

Special Finance for Ships

Foreign shipowners, and more recently British, appear to have welcomed the opportunity to secure outside finance for their replacement and new construction offered by the setting up last year of the Ship Mortgage Finance Company. This specialised corporation, which was registered on March 27, 1951, has this week published its first accounts, for the period ending June 30th this year. Up to that date it had completed contracts to lend some £1,440,000, and was negotiating further loans amounting to about £1,860,000.

The company actually received proposals for ship mortgages totalling no less than £21 million in its first fifteen months' trading, for finance in building 70 new ships. Its completed loans cover ten ships, and those now being negotiated another ten; it turned down applications on 24 ships, and those regarding 26 others were withdrawn. As was expected, the Norwegian shipowners were among the first to request mortgages from the company, mainly for tanker tonnage; but more recently mortgages have been requested for dry-cargo shipping, mainly by British owners. When the company was formed a year ago, freight rates were high, and some of the dry-cargo tonnage on order represented ships of which owners hoped to be able to write off the cost more rapidly than usual during such profitable operations. Today, the picture has changed. Freight rates have declined steeply, and owners are thinking about laying up ships rather than bringing new ones into operation—though the new vessels actually being delivered may work more profitably. Despite this decline in ships' earnings, and the increase in interest rates, the directors report that "the flow of new applications is not unsatisfactory." The company's advances are generally limited to first mortgages on half the cost or value of the completed ship, and to periods of five or six years. Its present capital is £1 million in £1 shares (10s. paid) subscribed privately by insurance companies and other institutions, and by the Shipbuilding Conference. It has powers to raise up to £10 million of debenture stock to finance its lending; in the first report Sir James Milne, the chairman, says that arrangements are in hand to raise loan capital as and when required, with the consent of the Capital Issues Committee.

Coryton Refinery Prepares

The Vacuum Oil Company's refinery at Coryton on the Thames is expected to come on stream this autumn. Crude oil deliveries are already being made into the storage tanks and the boiler house and power plant is going through its final

tests. The refinery will have an annual throughput of nearly a million tons of crude; it was planned originally for the production of lubricants, with other oil products as ancillary activities. Last year, however, it was decided to build a catalytic cracker in addition.

The foundations for this special unit are now completed, but the cracker itself is not expected to be on stream for another year. Vacuum Oil is jointly owned by Powell Duffryn and Socony-Vacuum, to whose special design the cracker is being built. When it is completed—assuming that branded petrol will by that time, at least, have come back on to the home market—motor spirit will be marketed in this country under the Mobilgas trade mark for the first time.

Surplus of Cocoa?

Cocoa is the latest of the sterling area's dollar-earning commodities of which the price has declined sharply this year. The London price, which was about 34os. a cwt. at the beginning of March, has fallen steadily ever since; there is now little old crop cocoa left, but the new crop is selling at about 247s. per 50 kilos for October/December delivery. The West African Boards will begin to purchase the new season's crop towards the end of this month, and once these supplies reach the market in quantity, prices will probably begin to slide again.

Last year's main and mid crops were both very disappointing. Prospects for the coming season are good at present, but much depends on the weather during the next few weeks. Heavy rain during this period last year delayed harvesting and caused a severe outbreak of black pod disease in the Gold Coast. Semi-official forecasts suggest that there will be a "good normal crop" in the Gold Coast this year; estimates are not precise but generally vary between 250,000 and 270,000 tons. The recent announcement that the marketing board will pay growers only 70s. a load of 60 lb this year, compared with 80s. a load last year is unlikely to reduce harvesting. The Nigerian crop was at first expected to fall short of last year's level of 100,000 tons, but the latest reports are more optimistic. Growing conditions in French West Africa have been favourable so far.

Supplies of cocoa will probably be larger this year than during 1951/52, but there is no sign of any improvement in demand. On the contrary, consumption in most countries is falling. In the United States the seasonal fall in confectionery purchases during the summer was larger than normal and sales so far this year seem to have been even lower than the corresponding period of 1951. In this country consumption of cocoa in the first half of 1952 was at least 10 per cent lower than in the first half of last year. Sweets are still rationed, but there is evidence that a large proportion of coupons are not being used, and the trade associations with the approval of the Ministry of Food, is at present surveying distributors' stocks to make some estimate of the potential "unrationed demand." The German market was expected to take much larger quantities of cocoa this year, but after an early boom purchases have fallen off. High prices have not only reduced the demand for confectionery but have also prompted many countries to economise in the use of cocoa; cheaper fats are being substituted for cocoa butter in the manufacture of chocolate couverture. Even after the fall of the last few months cocoa is still dear compared with other commodities, and prices will probably have to fall a good deal further before there is any general recovery in consumption.

Shorter Notes

In accordance with a promise made by the Chancellor last May, the Treasury has now announced full details of two "general consents" for escape through the ring fence set

up by Section 36 of the 1951 Finance Act. In brief, British-controlled but non-resident companies incorporated after the end of 1951 may now emigrate if they wish to carry on a new industrial activity in any Commonwealth territory, and British businesses abroad may be sold for £50,000 or less to overseas buyers (with certain safeguards designed to prevent any sort of arranged deals that might offend against the spirit of the "consent").

From September 15 the Board of Trade is to revoke the open general licence for imports of certain cooked and uncooked meat products from the sterling Commonwealth and certain other areas. This step is being taken, with the agreement of the Governments principally concerned, to avoid the danger that increasing imports of these products might reduce the supplies of carcase meat that these countries have contracted to send to the United Kingdom. Canned products are not affected by this order; the main sufferers will apparently be luncheon meats from New Zealand and Australia.

The latest Middle East oil company to bring an oil concession agreement into line with the "50-50" basis now established in the area is Petroleum Development (Qatar) Ltd., an associated company of the Iraq Petroleum Company. Under the modified concession, Shaikh Ali bin Abdullah bin Qasim al Thani, whose father made the original 75-year agreement covering this area in 1935, will receive half the profits from company operations there instead of a fixed royalty. Production of oil in the Dukhan sector of the peninsula was 1.7 million tons in 1950; last year it was 2.3 million tons, and it is now running at about 3 million tons a year.

The Bank is fully competent to handle all foreign exchange business, including opening and advising of commercial letters of credit, collection of documentary bills, remittances, etc.

FOREIGN BRANCHES: Bombay, Calcutta and Colombo.

CORRESPONDENTS & AGENTS at all important cities of the world.

Statistical Summary

In his statement to shareholders Mr T. M. Sparkes, the retiring chairman, declares that Australia has proved a "very big disappointment" owing to the collapse of the wool boom and the imposition of drastic import restrictions. Whitworth and Mitchell have also encountered difficulties in New Zealand owing to credit restrictions, and in South Africa, where the market is overstocked; in many other countries in the Middle and Near East government restrictions have resulted in the deferment of shipments and cancellation of orders on hand. Mr Sparkes believes that the recession has been so severe and rapid that the lower level of prices should result in resumed buying, but he warns that this forecast could easily be upset by political considerations. This is a gloomy story indeed. The preference dividend has now been definitely passed, and in the circumstances ordinary shareholders are lucky to have got even the 2½ per cent interim declared in February. The ordinarys are now a nominal market at 16s. 9d.

TATA IRON AND STEEL COMPANY

SHARP REVERSAL OF INFLATIONARY TREND

METHOD OF FINANCING EXPANSION PROGRAMME

EFFECT OF GOVERNMENT'S STEEL PRICE POLICY

ROLE OF THE EQUITY SHAREHOLDER

MR J. R. D. TATA'S SPEECH

The Annual General Meeting of the shareholders of the Tata Iron and Steel Company, Limited, was held on August 28th at Bombay, Mr J. R. D. Tata, Chairman of the company, presiding.

Surveying the economic situation Mr Tata said that "the year under review was marked by a sharp reversal of the inflationary trend which had received accelerated impetus from the Korean war. The cessation of stock-piling and panicky buying for replenishing inventories in the USA and elsewhere was largely responsible for the decline in prices which has occurred throughout the world, particularly in primary commodities. It has been helped also by the measures adopted by governments in India and other countries for curtailing credit facilities. Although the abrupt fall in prices which resulted from these measures caused a temporary dislocation of trade and industry, they have generally had the effect of restoring a more stable and, on the whole, healthier price structure. It is too early, however, to assume that the risk of further inflation is past. Recently there have been again signs of a gradual rise in wholesale prices and if the international situation worsens, the upward trend may acquire fresh momentum and call for vigilant action."

THE FOOD SITUATION

"The fall in wholesale prices," continued Mr Tata, "has not been reflected yet in the cost of living. Food prices which constitute the largest single element in the cost of living have shown an increase in several parts of the country and there are unfortunately areas where conditions amounting almost to famine still prevail. There is some reason, however, for thinking that in spite of these adverse circumstances, the food situation may become easier. The stock position with regard to food-grains is better now than it has been for some years past. This is due mainly to the large shipments of wheat from the USA which have recently arrived in the country, and also to the reduction of the rationing commitments of Government during the year and the lessened incentive for hoarding of food-grains owing to the general decline in prices."

"Fiscal and monetary measures," observed Mr Tata, "are an essential ingredient of an effective programme for fighting inflation. But unless this is supplemented by measures designed to increase production, the problem of inflation will remain largely unsolved. A fall in demand brought about by reduced purchasing power may temporarily alleviate the inflationary pressure but it will not provide a final remedy in a country with a low standard of living. This is a matter to which Government are fully alive as shown by the importance they attach to the draft Plan drawn up by the Planning Commission. The Plan, however, is limited to the public sector of the country's economy consisting mainly of schemes for multi-purpose development, and for transport and social services. Manufac-

turing industries like ours have been left, under the Plan, to private enterprise."

SUBSTANTIAL IMPROVEMENT IN OUTPUTS

Referring to the substantial improvement over the previous year in output of industrial raw materials and manufactured products, Mr Tata said that such progress resulted mostly from the better utilisation of existing capacity and the more plentiful availability of raw materials. If it is to be effective as a means of combating inflation and creating higher standards of living, the annual increase in industrial output must be on a scale which will require a continuous expansion of productive capacity. This is a responsibility which, in normal times, and in a free economy, would lie squarely on private enterprise; but private enterprise cannot fulfil such a responsibility unless it is in a position to raise the requisite finance.

"The lack of finance," continued Mr Tata, "is, today, by far the greatest handicap in the way of our economic development and the rock on which all our economic plans are likely to founder. Unless means are found to stimulate capital formation and to canalise savings into the required channels, no substantial progress can be expected."

CAPITAL FOR ECONOMIC DEVELOPMENT

"The virtual cessation of capital formation, through individual savings, during the last few years, although largely due to external causes not within the control of Government, has undoubtedly been aggravated by recent developments within the country, including Government's industrial and financial policies. To the extent that such policies have benefited the people by transferring earning power and wealth from a limited class of society to a larger number of people, they have achieved a socially desirable end, but we must face the fact that, in the process, capital formation has been seriously affected. A modern, progressive society requires that wealth and earning power be more equitably distributed amongst its members, but capital formation and its use for economic development are equally essential to that society's survival and growth."

Commenting on the expansion from reserves Mr Tata said that "while the disappearance of individual savings amongst classes of society which would normally invest their savings in industry, has curtailed the country's capacity to raise fresh capital for new ventures, existing industries could continue to expand if they were able to make savings of their own and to use them for expansion. Corporate savings of this nature have always been, throughout the world, the principal source of finance for the expansion of established industries."

A DESIRABLE FEATURE

"A study of the balance-sheets of leading, long-established industries in India," said Mr

Tata, "will disclose the preponderant extent to which our own industrial expansion has been financed from internal savings. To my mind, this is a wholly desirable feature which one would expect Government not only to recognise as such, but to encourage by positive measures. The current trend of thought in some official circles, however, appears to be that at least in controlled industries, the creation of reserves to be used for expansion is anti-social as it places the burden on the consumer, instead of the shareholder who should provide the additional capital for expansion."

This view overlooks the fact that even when reserves are used for expansion, it is the shareholder who has provided them over the years from undistributed profits, and that fresh capital investments would, in any case, have to come largely from what the shareholders save from the dividends they receive from industry. There is no difference of principle between paying out a larger dividend to shareholders in the first instance and getting part of it back later by way of fresh investment on the one hand, and paying a lower dividend at source and investing the balance of profit in new plant and machinery on the other. The second method is, however, obviously more effective and practical."

THE GOVERNMENT ATTITUDE

"In any case, in a controlled industry like ours where profits are statutorily limited by Government, the indirect and uncertain method of raising finance for expansion mentioned above could operate only if Government allowed a reasonable return on investments to be made in expanding the industry. The Tariff Board and Government, however, have fixed prices on a basis which gives a net return of only 3½ per cent on the additional block. Some even of that small return must be set aside to reserve to tide over emergencies or periods of depression. Thus, shareholders are assured of a net dividend of only 2½ per cent on any fresh investment that they may care to make in the expansion of steel capacity."

"If regard for the interest of the consumer of steel in India," continued Mr Tata, "is the main reason for the low return provided by Government and the Tariff Board on capital investment in the steel industry, it is, I feel, being carried to a length wholly unjustified by the facts of the case. When we recently pressed for a more reasonable return to the shareholder, we were told that the consumer had borne the burden of protecting the steel industry in the past, and that it is the duty of the shareholders to repay him for his sacrifices by assuring him low prices in the present. This proposition, is unexceptionable if reasonably applied."

COMPARATIVE FIGURES

"The following figures show that it is not. During the fifteen years of effective protection to the steel industry, from 1924 to 1939, the

consumer in India paid your Company, as a result of protection, a total of approximately Rs. 11 crores (£8,250,000) (\$23,099,000) more than he would otherwise have paid. Today the average price that the consumer in India pays for steel, including that imported by Government for sale, is about Rs.400 (£30) (\$84) per ton less than the import price; but the measure of the Indian producers' contribution to the low level of steel prices in India is higher than this, as the retention prices of the steel companies are about Rs.500 (£38) (\$105) less than the price at which foreign steel could be landed in India, without taking the duties into account."

"In other words, whereas the Indian steel industry was subsidised in the past to the extent of a total of approximately Rs.11 crores (£8,250,000) (\$23,099,000) in 15 years, the consumer is now getting his steel at a saving of Rs.40 crores (£30 million) (\$83,998,000) per year. Even if we take as a basis of comparison not the export prices but the present domestic prices in the UK, the value of the industry's contribution to the Indian consumer is over Rs.12 crores (£9 million) (\$25,199,000) per year. In the light of the above figures, and of the fact that steel enters to an imperceptible extent into the cost of living it is evident that the measures taken to protect the consumer of steel are excessive and in disregard of the legitimate claims of the industry and its shareholders."

UNFAIR TREATMENT OF SHAREHOLDERS

"Financial statistics published in our Annual Reports clearly show that in the Steel Company at least, the equity shareholders have not received fair treatment for some years. Taking the last fifteen years, we find that the total amount paid in dividends to the equity shareholders averaged Rs.143 lakhs (£1,072,000) (\$3,003,000) per year during the first five years and Rs.99 lakhs (£742,500) (\$2,079,000) per year in the last five years, reflecting a drop of nearly a third. If we take into account the reduced purchasing power of the rupee since the war, we find that our 17,000 equity shareholders are today worse off in respect of the return on their investment in the Company by nearly 80 per cent, as compared with 1937-38."

"There is a tendency today," Mr Tata observed, "to under-rate the role of the equity shareholder in the industrial economy and to judge his contribution to industry merely by the amount of his original investment, after which he is considered to have served his purpose and to be entitled to nothing more than a modest dividend calculated on that original investment. This view is misleading on many counts. It ignores the fact that, in long-established industries, the great majority of the present shareholders are not the same as the original shareholders, and that they have purchased their shares at the prevailing market prices and not at the original issue price, to which their cost therefore bears no relation. It overlooks the fact that the reserve and other funds built up from that the reserve and other funds built up from undistributed profits, year by year, represent an important contribution by the equity shareholders to the increased value of the assets on which the present profits are earned."

THE ELEMENT OF RISK

"Finally, it fails to appreciate the importance of the element of risk inherent in investments of risk-capital. So long as a mixed economy, in which a large part of industrial development is left to private enterprise, is considered necessary in the country's interest, the investors' willingness to take risks is an essential element in the development of industry."

"It is natural, however, that risk-capital should get a return commensurate with the risks it takes, as well as a long-term chance of

capital appreciation in successful ventures to compensate for the loss incurred on unsuccessful ones. On many occasions in recent years private enterprise has been blamed for the slow pace of industrial expansion in the country. The facts and considerations to which I have drawn attention show that if private enterprise has latterly not been able to achieve all that was expected of it, this was due largely to causes beyond its control, for some of which, at least, Government's own policies have been responsible."

BEARING ON EXPANSION PROGRAMME

"The issues I have just discussed," said Mr Tata, "have a direct bearing on our own problem of financing the expansion programme which we have undertaken at Government's own request. If reasonable retention prices had been allowed to the industry after the war, we would have no such problem to-day, as our reserves would have by now been adequate, together with a modest increase in our borrowings, to finance the whole programme. In the position in which we find ourselves, however, we suggested to Government that retention prices of steel in the country be raised by an average of about Rs.100 (£7) (\$21) a ton, approximately 44 per cent of which would go to Government in taxation. In return, we undertook to apply the whole of the balance of about Rs.56 (£4) (\$12) per ton to the desired expansion of our plant. This proposal would still have left our retention prices at about Rs.400 (£30) (\$84) less than the import prices."

"Government have instead decided to raise steel prices to the consumer by Rs.50 (£4) (\$11) per ton, but to leave untouched the retention prices of the producers at their present low levels, the increase being taken to the Iron and Steel Controller's Equalisation Fund. Out of the accumulations of this Fund we understand that Government contemplate granting a loan to us and to the Steel Corporation of Bengal. This would, in effect, amount to lending us our own money, for it would legitimately be ours if prices were maintained at a more reasonable level."

ADDITIONAL BORROWINGS

It was pointed out by Mr Tata that, "in addition to this special advance by Government, the Company will have to borrow elsewhere the difference between Government's loan plus the amount it will set aside each year to depreciation and reserve, and the total amount to be spent on the capital expenditure programme. It is likely that such additional borrowings will reach a figure of Rs.4 crores (£3 million) (\$8,400,000) or Rs.5 crores (£3,750,000) (\$10,500,000). Thus, at the end of the period, the aggregate borrowings of the company, including those already existing to-day, may be in the neighbourhood of Rs.18 crores (£13,500,000) (\$37,800,000) to Rs.20 crores (£15 million) (\$42 million)."

"Subject to the shareholders' approval, under Article 130 we have agreed in principle to take a loan from Government not because we think it constitutes the best or the fairest solution of the problem, but because, whatever our personal views may be, the country's interests must come first, and these imperatively require that additional steel-making capacity be created."

DETERRENT TO FURTHER INVESTMENT

"We shall continue," assured Mr Tata, "at the same time, to press Government for a revision of their present policy in respect of steel prices, which is not only unfair to the existing shareholders of the Steel Company, but acts as a deterrent to any further investment in the industry."

Mr Tata welcomed Government's announcement for setting up a Committee to investigate the tax structure of the country, and hoped that the question of the general incidence of taxation and its bearing on capital formation and production would engage the attention of the Taxation Enquiry Committee, in addition to the problems which faced trade and industry due to the lack of co-ordination between the various State Governments in the matter of sales taxes."

THE YEAR'S OPERATIONS AND PROFITS

Referring to operations and profits for the year under review, Mr Tata explained that in spite of the increase of about 15,000 tons in the output of finished steel and of a credit to the year's revenues of an item of Rs.123.6 lakhs (£927,000) (\$2,595,000) arising from the operation of previous years, the net profit was about the same as for 1950-51. For a proper comparison, it was necessary to set off against Rs.123.6 lakhs odd (£927,000) (\$2,595,000), amounts of a similar nature totalling Rs.88 lakhs (£660,000) (\$1,848,000) credited to the Profit and Loss Account in respect of previous years. The net accretion on this account for the year under review was only about Rs.35 lakhs (£262,000) (\$735,000). Increased profits on the additional output of steel and pig iron amounted to about Rs.59 lakhs (£442,000) (\$1,239,000), and the price increase of Rs.11 (£1) (\$2.3) per ton granted by Government from July 1, 1951, to compensate for increased costs, amounted to Rs.66 lakhs (£495,000) (\$1,386,000) for nine months of the year. He explained that, thus, other items remaining the same, the year's earnings should have been higher than the previous year's by about Rs.160 lakhs (£1,200,000) (\$3,360,000), but for the fact that against this sum, there had to be set off, a large increase in payments to labour totalling Rs.100 lakhs (£75,000) (\$2,100,000) for the year in respect of normal grade increments, increased dearness allowance, incentive bonus, and new service bonus payable to all employees not in receipt of performance bonus. The profits were also affected by the increased prices paid for raw material and stores."

Attention of the shareholders was drawn to an amount of Rs.75 lakhs (£562,000) (\$1,575,000) which represented for nine months, the first instalment of a special provision for depreciation allowed to the Company by Government and included in the selling prices."

SATISFACTORY LABOUR SITUATION

The labour situation during the year was reported to be satisfactory. Referring to the labour statistics given in the Annual Report, Mr Tata said that it gave a striking picture of the large increase, both in the average income per employee and in the labour cost per ton of finished steel. The latter had now reached a level which left no margin for further increase in earnings per capita, except through increased productivity. In this connection, Mr Tata stressed the need for a reduction in the number of men employed, which, he reiterated, would be achieved gradually by not filling vacancies and by absorbing surplus men in new plants or departments."

Mr Tata pointed out that while the average annual income per employee at Jamshedpur had gone up by 33 per cent, the output of finished steel had increased by only 13 per cent, which was still 6 per cent below the 1939-40 level, and the Directors felt that the time had now come to insist that any further increase in payments and benefits to labour must be accompanied by an increase in the output per capita. While saying this, Mr Tata recognised that one of the chief difficulties in obtaining labour's co-operation was the weak-

ness of the trade union movement in the country as compared to industrially more advanced countries. No lasting improvement was possible unless trade unions were better organised and consolidated so that employers could make with them collective agreements which were equally enforceable on both sides. The tendency of political parties to control trade unions as part of their bid to canvass labour support in elections led to unhealthy multiplication of labour unions, often within the same industry, making conflicting demands on the Management, with the result that the real and constructive aspect of labour organisation often took a second place.

WM. CORY & SON, LIMITED

THE HON. F. A. LEATHERS' STATEMENT

The Hon. F. A. Leathers presided at the fifty-sixth annual general meeting of Wm. Cory & Son, Limited, held on August 28th, at Cory Buildings, Fenchurch Street, London, E.C.3.

The following is an extract from his statement, circulated with the accounts:

Your company has substantially increased the volume of coal distributed during the year.

The oil bunkering side has more than absorbed the gradual reduction in the tonnage of coal provided for ships' use. In recent years the quantity of oil supplied as bunkers or cargo has increased with each twelve months' trading, with the exception of the year under review. The reduction which was comparatively small, was due entirely to the present situation in Persia.

Our coasting colliers have had a year of successful trading. A ship, which has been named *Corfield*, was purchased at the end of 1951. In addition to the three vessels under construction, two new ships, each of 4,600 tons dead-weight, have been ordered.

The company again participated in the importation of coal into this country from the United States of America and was interested in the movement of coal from India to the United Kingdom. While, unfortunately, exports of coal from the United Kingdom did not increase, the company had its full share in the tonnage available. A large part of the increased tonnage of our coal export department has resulted from our participation in the flow of coal from the United States of America to European countries.

The lighterage and wharfage sections have each shown a satisfactory result. Our fleet of barges has been modernised in recent years, and our tugs are in the process of being replaced by more efficient units. For convenience of management, the fleet of tugs and barges was transferred to the lighterage companies within the group from the wholly owned subsidiary, Cory Lighterage, Limited. It is intended that the programme of major repairs, which will soon fall due at our riverside wharves, will be undertaken in the course of the next few years.

Your subsidiary companies in the Union of South Africa have suffered a substantial decline in business during the year, chiefly from the inability of the railways to move coal to the ports of shipment and to inland consumers.

The business of John Kelly, Limited, of Belfast, of which we are joint owners with the Powell Duffryn Group, has increased in tonnage, with satisfactory results during the year. Orders for six ships have been placed.

The reports and accounts were adopted.

FURNESS, WITHY AND COMPANY

RECORD EARNINGS

CONTINUANCE OF HIGH SHIPBUILDING COSTS

INEVITABLE RESULT OF EXCESSIVE TAXATION

SIR ERNEST H. MURRANT'S STATEMENT

The sixty-first annual general meeting of Furness, Withy and Company Limited will be held at the registered office, Furness House, Leadenhall Street, London, E.C.3, on Wednesday, September 24th.

The following is an extract from the statement by the Chairman, Sir Ernest H. Murrant, KCMG, MBE, which has been circulated with the report and accounts for the year ended April 30, 1952:

The combined fleets, comprising a variety of different types—passenger, passenger and cargo, fully refrigerated and partially refrigerated, dry cargo ships and one tanker, stand in the balance sheet at a book value of £19,629,224. That figure includes £2,076,725 paid on account of new tonnage which, of course, has contributed nothing to the earnings of the past year. From the cost of the ships in commission £8,538,690 has been written off during the past five years from profits, and in addition a substantial amount has been written off by transfers from fleet replacement reserves to cover, in some measure, the element of inflation in postwar building costs.

RECORD EARNINGS

The consolidated profit and loss account shows record gross earnings, amounting to £8,476,607. The principal deductions from these gross earnings are £1,875,734 applied to depreciation of fixed assets, and the provision of £3,243,742 (against £774,895 in 1950-51) for taxation here and abroad.

The net profit in the parent company's accounts is £1,011,482, of which £500,000 has been transferred to fleet replacement account. The results for the year under review clearly justify the legitimate expectations of stockholders to a reasonable benefit from a good year, just as they must expect a recession when the reverse applies. The directors therefore recommend the payment of a bonus of 2½ per cent, making a total distribution of 12½ per cent less tax.

If the board's recommendations are approved, there will be a balance carried forward into the current year of £402,336.

PROBLEM OF HIGH SHIPBUILDING COSTS

The very high cost of shipbuilding continues to cause anxious thought for the future. It is a problem which cannot be ignored, and the wartime policy of "mend and make do" cannot be applied indefinitely. Indeed, that policy, forced upon industry by the necessities of war, has added materially to the postwar difficulty of replacing lost and obsolete tonnage and financing the cost of new ships at excessive postwar prices. The estimated balance of shipbuilding expenditure for which contracts had been entered into at April 30th was £6,356,240, representing balance payments to be made in due course in respect of twelve ships under construction or contracted for, delivery of which is anticipated at varying dates between now and 1956. What the actual ultimate cost will be is dependent upon the eventual cost of materials and labour, and is at present incalculable.

EXCESSIVE TAXATION BURDEN

The total provision for taxes of all descriptions amounts to the huge figure of £3,243,742. For many years the shipping industry has laboured under an excessive tax burden, and upon every appropriate occasion, as well as to every appropriate body, strong representations have been made urging the necessity for changes in the method of assessment which will result in some relief. Evidence and suggestions have been submitted in turn to the Millard Tucker Committee and to the Royal Commission, from which it is hoped that some helpful recommendations may emerge. In the meantime, however, it would almost seem that the bleating of the kid has further excited the tiger inasmuch as, in the desire to restrict profits on re-armament, industry generally, including shipping, is to bear an Excess Profits Levy as from January 1, 1952. No doubt there will be many who will applaud the desire to avoid undue profit-making from the national necessity to re-arm; there will certainly be others who feel that if burdens there must be, they should be shared as equally as possible. It should, however, be realised that the shipping industry has very special problems. Not merely is it essentially international in character (and therefore its domestic burdens cannot be shared equally with foreign competitors); not merely is its problem of replacing obsolete tonnage materially different from nearly every other industry, but it is generally admitted that shipping is a key industry in relation to national defence, and is also one of the chief contributors to those all important exports, invisible though they may be. Shipbuilders call for a continuous stream of orders for new ships and governments of all colours and creeds call for the maintenance of an adequate and efficient merchant marine, whilst all agree that merchant ships are as vitally necessary in peace as in war.

DRAIN ON RESERVES

Shipowners know that a period of prosperity has, in the past, and probably will in the future, be followed by a longer period of hard trading—years in which it is difficult to earn even depreciation—and unless in the good years by far the major part of their earnings is reserved for the purpose of maintaining their fleets instead of being drained away by taxation, the inevitable result must be a gradual decline in the number of ships and volume of tonnage-carrying capacity.

In a great many respects we are fortunate that we have been able to achieve so much, both in our own and the Exchequer's behalf, and it is to be hoped that our many thousands of stockholders will be satisfied that the restraint exercised in regard to dividend distributions has played its part in establishing the strong position revealed by the current balance sheet. At the same time stockholders must be prepared for the probability that the next profit and loss statement will reflect a much reduced level of earnings, which in turn will restrict the amount available for allocation to reserves for the maintenance of our capital assets.

ALLIED SUMATRA PLANTATIONS

DOUBLE TAXATION BURDEN

The twenty-sixth annual general meeting of Allied Sumatra Plantations, Limited, was held on September 2nd, in London, Mr A. L. Mathewson, OBE, the chairman, presiding.

The chairman, in the course of his speech, said: The 1951 group rubber crop was 7,541,963 lb., nearly half as much again as for 1950 but still only some 70 per cent of the 1941 crop, our previous highest.

So far in 1952 the improvement in output has been maintained; July yielded over one million lb., bringing the total for January-July up to 6,439,635 lb. Some 5,545,000 lb. of the 1952 rubber crop have been sold at an average price appreciably better than that now obtainable. We are, however, working on a much narrower margin than in 1951.

The profit margin on rubber in 1951 was less than 1d. per lb. more than in 1950, the increase in average selling price being almost offset by higher production costs, particularly in wages and export duty.

The profit of the group for the year after depreciation but before taxation was £300,787, out of which £99,844 has had to be set aside for Indonesian Company Tax and £81,170 (net) for United Kingdom taxation, leaving £119,773. These figures by no means tell the full story of the heavy double burden of taxation. The loss of 1951 gross revenue suffered by the subsidiary companies as a result of the exchange certificates system, together with export and similar duties, is estimated at not less than sixteen million rupiah, equivalent to £500,000. The Indonesian Exchequer benefits to the tune of practically £600,000 and over £81,000 has to be provided for the UK revenue. Thus the taxpayers, as sleeping partners but with no capital at risk, share between them a sum equivalent to almost 50 per cent on the company's issued capital, as against the proposed dividend to shareholders of 5 per cent. This odd interpretation of fair shares in fact reflects a policy, or the lack of one, which is now seen in practice to be destroying capital values, employment, trade and revenue, with implications still wider.

After referring to the prolonged interruption of replanting in Indonesia and enumerating the main factors discouraging the resumption of normal replacement programmes, the chairman continued:

To Indonesia her diversified plantation industries, the mainstay of her economy, are of prime importance. It may with some confidence be assumed that the ablest of her leaders realise how intimately related and vital to each other are the economic and political stability of the Republic on the one hand, and the efficiency and vigour of these industries on the other.

AN IMPORTANT QUESTION

A question of paramount importance therefore is the removal of conditions which at present are so completely discouraging both new planting and replanting; and the substitution of fully adequate incentives.

If, as is understood, Indonesia has in preparation a plan to encourage foreign investment within her territories, it is to be hoped that a realistic view will be taken of the increasing scarcity and difficulty of obtaining risk-bearing capital. The treatment accorded to existing foreign investors, who during the past half century have done so much for the development of Indonesia, is likely to be a decisive factor.

The report was adopted.

ASPRO LIMITED

The seventeenth annual general meeting of Aspro Limited was held on September 2nd at 16, Berkeley Street, London, W.1. In the absence of the chairman, Sir Ian Fraser, CBE, MP, presided.

The following is an extract from the circulated statement by the chairman, Mr Maurice A. Nicholas.

TRADING RESULTS FOR THE YEAR

The trading profit of your group after providing for directors' remuneration and depreciation amounted to £585,321 compared with £793,794 for the previous year. In the parent company's accounts the amount available for appropriation is £173,160, to which must be added the balance of profits brought forward from last year making a total amount of £197,472. After deducting £14,438 for the preference dividend and a further £39,375 for the interim ordinary dividend, already paid, your directors propose (a) to allocate £50,000 to the general reserve of Aspro Limited and (b) to recommend a final dividend of 20 per cent, less income tax, on the ordinary stock, the same rate as for last year. The balance to be carried forward on profit and loss account will therefore be £41,519 as against £24,312 brought in.

ACQUISITION OF MINORITY INTERESTS

The reduction in the group cash position is mainly accounted for by the purchase on behalf of your Parent company of the minority interests in our subsidiary companies in Luxembourg and South Africa at a cost of £300,000. Your directors in their report have referred to my negotiations resulting in the acquisition of these minority interests in our Continental Holding Company (which has since been dissolved) and in Nicholas (South Africa) (Pty.) Limited. This transaction has led to a simplification and consolidation of the group's financial structure and has facilitated the steps being taken by the boards of our overseas companies to improve their financial and administrative position.

TRADING CONDITIONS

Supplies of acid, paper and board have been particularly difficult to obtain, though your directors anticipated this difficulty and deemed it prudent to carry out a certain amount of stock-piling, which is reflected in the accounts presented herewith. The raw materials position is now becoming easier and the whole question of stocks is being kept under continuous review by your board.

While the trading profit for the year at £585,321 is not as high as for the previous year it must be remembered that reflected in the previous year's accounts were the additional sales made as a result of the serious influenza epidemic of January and February, 1951.

EXTENSION OF OVERSEAS INTERESTS

During the year we formed three subsidiary companies in Holland, Pakistan and Northern Ireland. In both Holland and Northern Ireland these companies will take over the promotion of the company's sales from agents who previously handled our business there. Sales promotion in our export markets has continued throughout the year, while on the development front we hope to commence operations in two other large overseas countries during the latter part of 1952. Though the surveys of these two markets are encouraging, it is too early yet to make predictions as to their full potentialities.

THE WOLVERHAMPTON METAL COMPANY

PROPOSED BONUS ISSUE

MR THOMAS C. JAMES ON RECORD TRADING RESULTS

The forty-ninth annual general meeting of The Wolverhampton Metal Company, Limited, was held on August 29th in Birmingham, Mr Thomas C. James (chairman and managing director) presiding.

The following is an extract from his circulated statement:

Since my last report the company has suffered a great loss in the death last November of my brother, Mr Henry S. James. He had been associated with the business even before it became a private company in 1903 and had been chairman since 1946, when the company became a public one. Whilst paying tribute to his work, I should like to express my appreciation of the honour which my colleagues have paid me in appointing me as his successor.

The results of the group's trading for the financial year ended March 31, 1952, will, I am sure, be received by you with as much pleasure and satisfaction as the presentation of them gives to me. There is once again an increased profit position, in fact a new record, the trading profit of the group (before taxation and allocations) being £372,386, against £294,282 as shown for the previous year, an increase of £78,104.

To meet taxation we have set aside £204,000, leaving £168,386, which, when added to the Profit and Loss account balance of £162,226 from the previous year and a credit of £17,500 for Excess Provision for Taxation at March 31, 1951, gives a total balance of £348,112.

Apart from dividends, there is only one appropriation made this year, namely, that of £2,000 to the Employees' Service Fund, to which I refer later. The directors are recommending a final dividend of 2½ per cent, making 45 per cent for the year, as compared with 40 per cent for the previous year. This total dividend absorbs £45,670 net, leaving a total carry-forward balance on Profit and Loss account of £300,442, as compared with £162,226 at the end of the previous financial year.

BONUS ISSUE

Consent was received last May from H.M. Treasury to the making of a bonus issue under which (subject to eventual approval by the stockholders) each stockholder will receive one fully paid stock unit by way of bonus for every unit held at the appropriate date. This will require an appropriation from the Profit and Loss account of £146,142, which, with the items, Share Premium Account, Excess Profits Tax, Post-war Refund and Surplus on Sale of Freehold Property, will thereby increase the issued capital by a further £193,311 up to £386,622.

This proposed bonus issue, if sanctioned by the members, will be carried out after declaration of the recommended final dividend as calculated on the present capital.

In view, therefore, of the appropriation to be made next year from the Profit and Loss account for the purpose of the bonus issue, the directors have not made any further allocations this year to the already substantial reserves.

The group balance-sheet, in line with the increased profit, shows a stronger position than ever before in the company's history. The Fixed Assets, which are very conserva-

AIRCRAFT AND AIRPOWER

Buyers for New Aircraft
Quality or Numbers?

What Sort of Air Force?
Civil Aviation as a Business

Buyers for New Aircraft

THE British aircraft industry has never enjoyed—and has certainly never sought—a comfortable life. It is enured to turbulent change, both in what it produces and in what its customers require of it. In both respects, the challenges now presented to the industry are as dramatic as any it has ever known. In defence policy, emphasis has shifted towards the need for a continual state of preparedness to meet an ever-present risk, and the requirements of the Air Force—the industry's major customer—have changed with it. Current standard types of aircraft are no longer likely to be needed in the numbers in which they have been ordered; on the other hand a regular uninterrupted flow of the newest types has become essential. Such changes of programme are never simple to apply in the aircraft factories themselves; but on this occasion there has been some incidental gain in the easing of pressure on the industry. Shortage of labour no longer threatens to hold up production as it did twelve months ago; supplies of materials or machine tools may not be perfect, but they are not causing pressing difficulties. A marked improvement in the rate of recruitment, which in part arises from slacker conditions in other branches of industry, including engineering, has brought the monthly intake of labour very close to what the industry requires—to provide, say, 225,000 workers by the end of 1953 directly employed in the industry and perhaps the same number in ancillary industries making forgings, castings, and other components for the aircraft manufacturers. The industry is also stretching its labour force by working more overtime than the average for the country.

A change of air policy on a major scale prompts pertinent questions about the size of the industry. The original programme involved big orders for aircraft such as the de Havilland Venom fighter, the Gloster Meteor and the English Electric Canberra bomber; it called for extra production lines in the factories of the three companies that designed the aircraft, and it brought into use assembly space belonging to such companies as Bristol Aeroplane, Handley Page, A. V. Roe and Short Brothers and Harland in Belfast that would otherwise have been without work. To meet the heavy requirements for Rolls Royce Avon engines, Rolls Royce built a completely new factory at Glasgow, and orders for Avons were also given to three other companies—Bristol, Napier and the Standard Motor Company. Except for the Bristol line for Venoms, on which work did not proceed very far, all these new production lines are likely to be kept in

existence, though their capacity now seems to be beyond the RAF's revised requirements for those types of aircraft. This creates difficulties, not least for the Ministry of Supply. If the Air Staff declares that it no longer wants Venoms and Canberras in the numbers first intended, orders must be cut back somewhere. If they are cut on lines belonging to sub-contractors, those companies face unemployment, to the extent that the sub-contracts were awarded to them in the first place because they had no prospect of sufficient military orders to keep them employed. Cuts in orders placed with the companies that designed the aircraft and engines may be less painful, to the extent that they have new versions or completely new designs under active development. The reduction in Canberra orders may be a relief to English Electric, the makers, who will remain burdened with other work. Rolls Royce, who would have made the engines for the cancelled Canberras, must presumably face a slackening of work throughout its factories until new engines are brought into production.

1943 The evolution of the delta can be traced from the straight wing Gloster METEOR and de Havilland VAMPIRE.

The cut in aircraft deliveries during the next eighteen months, before new types are fully in production, should considerably ease the strain on the Exchequer during this year and next. By temporarily relaxing the pressure on the aircraft industry, the cuts may even assist it to make a direct contribution to the country's balance of payments. This is an over-simplification, for export possibilities depend on whether the industry has in production the types of aircraft that other countries wish to buy. Its possible foreign customers fall into three

classes—the civil airlines, the Nato countries, and the military establishments of other foreign governments.

Three companies, Bristol, Vickers and de Havilland, are making a determined effort to build up an export trade in civil aircraft. Bristol's products are its freighter (price £90,000), and its turbo-prop Britannia airliner (£600,000). The freighter, though perhaps on the small side for general freight as compared with American designs, can accommodate special traffic such as cars and livestock that few other aircraft can carry, and for this reason it should command an international market. The Britannia, which is the British industry's answer to the long-range civil airliners of the American

1949 ... through the thin wing de Havilland VENOM...

industry, has only recently flown, and its performance has yet to be proved. Present estimates suggest that it may be an outstanding airliner, but since delivery for foreign customers could hardly be before 1956, its prospects lie beyond the present discussion.

Vickers has in the £200,000 turbo-prop Viscount a medium-range airliner probably without equal in the market today. Lack of orders led to a considerable delay in bringing the Viscount into production, and the company's pre-occupation with the Valiant bomber may limit its output in coming months. Export sales of the Viscount must depend very closely on the resources that Vickers can devote or divert to its production. The company has taken orders for 58 of these attractive aircraft from all over the world; they might be larger if delivery could be improved, and perhaps if the company were to make a forceful effort to push the Viscount in the North American markets that it has not yet visited. It is possible that a jet transport might also be developed on the lines of the Valiant bomber, but Vickers is not to be blamed for any lack of enthusiasm for diverting design or production resources from current military work.

The de Havilland company remains the largest manufacturer of civil aircraft in the country. It is reputed to have the best sales organisation in the industry, and has an established export trade in 6 to 20-seat aircraft like the Dove (£22,000) and Heron (£37,000) that earns far more at present than the Comet (£500,000). So far that matter do companies like Percival and Shorts (with an amphibious design). Foreign orders for the Comet have so far been spasmodic and although the famous Captain Rickenbacker of Eastern Airlines was talking last week of big orders for the Comet III, neither he nor anyone else can have them for five years. De Havilland cannot take the heavy commercial risk of laying down extra production lines for Comets until it has a reasonable flow of firm orders. The company has been rather unkindly criticised for a "slow rate of output" without due allowance being made for these commercial risks. By tooling up at Shorts, de Havilland hopes to have Comets for sale "off the shelf" when airlines become more confident of the future of jet aircraft.

The military market in some ways presents fewer

difficulties. There is still a steady flow abroad of Vampires, Meteors and trainer aircraft of all kinds to the Middle East, Asia and South America, costing between £15,000 to £30,000 apiece. Governments in those countries are prepared to buy fighters that are by western standards obsolete. The Nato countries are not, and the possibility of their placing off-shore orders for which the United States would pay in dollars, depends on the British aircraft industry being able to deliver aircraft that they do want. Swift, Hunter and Javelin fighters would be willingly accepted. But the first Swifts are just coming off the line, and such aircraft could only be sold to Nato countries by taking them from the RAF. If recruitment into the Air Force were slow, it might be possible to divert such modern aircraft to Nato countries without sacrifice. If not, the choice would resolve itself into the strategic question whether such fighters would be better deployed in Europe or in the daylight defence of this country. Delays in getting the Hunter into production (it was ordered at the same time as the Swift) suggest that it will not for some time be available for off-shore purchasers. Again, the Javelin will not come off the lines for a considerable time, and nor will the heavy bombers. On the other hand, the British aircraft industry should be in a position to supply Canberras in some quantity at an estimated cost of £100,000 apiece, and also Venom and Meteor night fighters. Pending a decision on the Swift, these aircraft represent an immediate contribution that the industry could make to Nato defence. There is also a dark horse. The de Havilland 110 night fighter was rejected by the RAF in favour of the Javelin. Had the de Havilland company been able to offer earlier delivery than Gloster, the 110 might well have been ordered since the Javelin, as a production project, is not so far developed as the 110. If the de Havilland company could convince foreign customers that it can, despite its heavy civil and military commitments, give a reasonable delivery date, this impressive new aircraft might find abroad the market that it so far lacks at home.

1951 ... to the swept wing Hawker HUNTER and Supermarine SWIFT...

This survey suggests that there is considerable scope for the export of British aircraft. But the possibilities can easily be exaggerated. At any one time, only a small number of companies out of the total aircraft industry have designs suitable for production and of these even fewer are suitable for sale abroad. While the capacity of the industry as a whole may not be too large for the demands upon it from home and from abroad, it can be argued that some of this capacity is in the wrong places. The policy of standardisation pursued

in the early postwar phase did much to restrict activity to one or two companies, to the discouragement of the rest. If defence policy is in future keyed to continuous modernisation, it will spread work more evenly throughout the industry. Orders will still be irregular, simply because some designs take longer to develop than others. A. V. Roe has been working since the end of the war on its new heavy delta bomber; the outcome is a radical advance in aircraft design, but during its seven years' incubation Avro has had little remunerative production work. The ability that goes to successful design is not monopolised by the commercially successful companies in the industry; it turns up in unlikely places elsewhere. Many people believe that the industry could profitably be concentrated into four or five companies, but even more are convinced that the strength of the British aircraft industry rests upon a large number of independent design units scattered over the country. The Ministry of Supply is for this reason alone resigned to carrying a number of passengers on its defence budget, and to find

Quality or Numbers?

THE unique display at which the British aircraft industry presents the cream of its products flown by the pick of its pilots has done much to bring the prestige of the industry to its present high point. The Farnborough air show is not so much concerned with the present as with a future in which changes are likely to occur of greater violence and wider implication than the industry has yet known. It is an annual commonplace that some of the aircraft that appear at Farnborough have flown for only a few hours and will not be in squadron service in quantity for several years. The test that the industry has continually to apply to itself is whether its designs are abreast of, or better still, ahead of, future military requirements.

In the crudest terms, military requirements today seek weapons with which to launch an atomic attack and other weapons capable of warding off such an attack. This year marks the completion of a development programme initiated along these lines at the end of the war. Its results, in terms of the aircraft appearing at Farnborough, suggest that it has been outstandingly successful within its self-imposed limits. There are, however, signs that those limits may have been too narrowly conceived. The RAF has the promise of fighters and bombers that are for the time without equal in the world, but certain accessories for those aircraft have not been studied with the same care, while certain other subsidiary but nevertheless vital aspects of air power have been sadly neglected.

The nucleus of a striking force is now complete with the emergence of a light, a medium and two heavy bombers. Now that, in the words of the Defence Minister, "the reshaping of our air programme will be based on the principle of concentrating more on quality than on mere numbers," the Air Staff is able to give early production orders for so advanced a design as Avro's delta bomber, without delays for flight testing. A risk of this kind can be taken when permission is

work for them even at the expense of more active companies.

The opportunities open to the industry to develop a civil and military export market are never likely to be better than they are today, for the American industry is prevented by its own production embarrassments from supplying military aircraft, and is handicapped in the civil field by its failure to develop gas turbine airliners. While British designs have been conspicuously successful, the very difficulties that the industry is likely to experience in offering reasonable delivery dates to foreign customers suggests that it has much to learn in the way of putting those designs into production. Some of the disappointments of the past year are directly attributable to deficiencies of management. In the factory too great reliance is still placed on individual skill, and too little on production engineering that would simplify the actual operations. If the aircraft industry is to become, as well it might, one of the country's leading exporters, it must learn new techniques of producing in quantity.

given to order more than one design in the same class. It cannot be taken when equipment has to be standardised on one type.

The progress made in jet engines has changed many of the concepts of bomber design. Using two Rolls-Royce Avon engines, English Electric have been able to give the unarmed Canberra bomber the clean lines, the speed and the manoeuvrability of a fighter, but the

... and so, later in the same year, to the DE HAVILLAND 110 and the Gloster JAVELIN ...

high fuel consumption of these engines probably costs something in terms of range. To give bigger bombers the minimum range of 3,000 to 4,000 miles that they need can only be done by cutting down the drag—that is, the resistance of the air—in a way that has never previously been attempted on big aircraft. The unbroken lines of the Vickers Valiant bomber, with its thin swept wing, represents one way of doing this. The Valiant is a bomber that meets an exacting Air Ministry specification on range and bomb-load, and does so with only four engines—an exercise in restraint that compares favourably with multi-engined American projects. The Avro bomber is intended to have a longer range than the Valiant. To get this increase, drag has been further reduced by sweeping back the wing at an even sharper angle, and eliminating a large part of the tail. The development of low-consumption jet engines will also improve range. The inevitable loss of strength that

results from a sharper sweep of wing is counteracted by filling it into a solid triangle; at the same time, the controls normally housed in the abandoned tail fins are placed along this new surface. A good deal of fuel and equipment can be stored inside the wing, reducing the size and drag of the fuselage. The reason why it is still thought necessary to have more than one bomber of this class in production lies in the problems of handling created by placing the controls along the wing. At Farnborough, flown by a test pilot who has done as much as the designer himself to create confidence in the delta, the bomber appeared surprisingly manoeuvrable; it remains for service pilots to make it behave with the same docility.

The industry has successfully built bombers to fulfil service requirements on range and bomb-load. Whether they fly sufficiently high and sufficiently fast to elude enemy defences can never be foreseen with certainty. But the problems of defence must be broadly similar in all countries. They are being met, here in three ways—by light, fast interceptors such as the Swift and Hunter, by all-purpose, heavier fighters like the Javelin, and by guided missiles. The use of interceptors of the Swift and Hunter class is limited. At heights above 30,000 feet, it becomes difficult to see other objects in the sky; since bombers are likely to fly in at heights of 40,000 feet or more and since they are not likely to come over in swarms, they may well be beyond the human ability of a jet fighter pilot to identify and attack. Air combat in Korea is already providing evidence of the difficulty of visual interception at much lower altitudes.

Fighters capable of intercepting aircraft at such altitudes must carry their own radar. The Javelin, and the supersonic de Havilland 110, both carry such equipment. With twin engines, they have the power to climb with this extra weight to 40,000 feet within the precariously short interval that exists between the detection by ground radar of a jet bomber flying at more than 600 mph and its arrival over the target area. But it is a slow and costly process to build such detection apparatus into an aircraft, and beyond the capacity of any industry to deliver fighters so equipped in number. They must, therefore, be reserved exclusively to meet the risk of the small, high-flying bomber force. Fighters relying on visual interception will continue to form the basis of a defence force against mass raids where there is an even chance that the raiders will fly at a sufficiently low level to make visual interception possible.

Guided missiles may reduce the need for fighters, but only at a heavy cost. Missiles can be built which, fired from the ground, will pick up and "home" on an approaching aircraft. A number of aircraft companies are working on such weapons and several were on show at Farnborough. But their cost alone is likely to prevent

30th August, 1952 ... and ultimately to the perfect triangle, the AVRO 698.

them from replacing fighter aircraft for at least the next decade. On the other hand, it is possible that a smaller type of guided missile which can be released from an aircraft may come into service with less delay, although, if it does, some thorny problems of aircraft identification will arise. For these reasons, continued development in fast-climbing fighter aircraft is likely to be needed, possibly with rocket motors or rocket boost to carry them to altitudes where the air becomes too thin for efficient engine combustion. The high-speed fighter is also the only means, and not a very efficient one, of combating the danger of attack from low-flying aircraft.

With so much attention concentrated on the immediate problems of attack and defence, other aspects of air power have come a poor second. One of

these is armament. Continued reliance upon foreign designs for cannon presents a strange contrast with the resourcefulness shown in other directions. A second deficiency is in radio. The radio industry is handicapped by lack of research facilities on the scale needed to meet special electronic problems at high speeds and altitudes. There has, perhaps, been too long a delay in providing the industry with specifications on which to work, but now that these have been issued, the problems of design are proving more complex than was expected. The equipment of a modern bomber comprises 1,000 or more valves, and cannot be made easily, cheaply or quickly.

A third defect must be laid squarely at the door of the industry. Nearly all British fighters have controls that are manually operated. At speeds at or above Mach 1 (when at any given altitude the aircraft is passing the speed of sound) it becomes almost impossible to control aircraft in this way. One or two companies have for some time past recognised the need for power-operated controls for high speed flight, and have fitted them to their aircraft. It is interesting to note in this context that the de Havilland 110 has frequently and regularly exceeded Mach 1, and that the Hunter has occasionally and more cautiously done so; but no other British fighter yet appears to have been flown at supersonic speed. Reports from test pilots are now leading to the more general fitting of power controls, which should lead to higher performance of the aircraft.

The most neglected branch of the industry has been transport aircraft, whether helicopter or conventional aircraft. At the beginning of the week the long-delayed order for the big Blackburn freighter was announced. This is an aircraft that can carry a tank or a bus or 90 troops and yet land on a grass air-strip in 500 yards. That magnificent conception, the 10-engined Princess flying boat, remains a homeless child. The defence ministries may be relying on requisitioning civil

airliners like the Comet and Britannia, or they may be waiting to see the development of design studies on transports evolved from the Valiant and Avro bombers. But the same absence of suitable designs does not excuse the lack of interest in helicopters. These prehensile machines make strange partners for the jets, but they are a no less necessary part of defence equipment. Yet the Bristol Aeroplane Company, which demonstrated this week the world's first twin-engined helicopter, has been obliged to attempt this difficult feat of design for its first multi-seat helicopter in order to attract the interest of civil operators. There are signs that the Army, which would be the principal user of helicopters, is ceasing to regard them as an expensive form of flying jeep, and beginning to appreciate real tactical possibilities for rapid movement and evacuation of troops and materials over terrain, land, water or beach, that cannot be crossed by other means. The Navy has also done some testing of helicopters on carriers. This interest has not, however, reached a stage where it is leading to any direct sponsorship of suitable designs. Here, perhaps, is one aspect of the rearmament programme that would bear closer investigation.

What Sort of Air Force?

WHEN Mr Churchill last spoke on defence, before the House of Commons in July, two thoughts seemed uppermost in his mind: the need to provide the right kind of forces for "a long cold war," and the foolishness of ordering and producing now large quantities of weapons that will rapidly become obsolescent. It sounded as if he had taken the vital decision that chiefs of staff find it so hard to recommend—the decision that a major war involving Britain is unlikely in the next three or four years.

To take the view that a major war is unlikely in the immediate future is not, of course, to rule it out altogether. It is obvious that the Nato powers must provide the nucleus for expanding rapidly the sort of forces that will be needed if war breaks out in Western Europe before the mid 1950s; in other words they must have—and have quickly—the nucleus of a first-class jet fighter force (both day and night), and of a medium and strategic jet bomber force. But they must also have on hand the rather different weapons needed to deter the outbreak, not of a major war in Western Europe, but of new and localised "Malayan type" or even "Korean type" wars (say in Indo-China or Burma). And they must prepare themselves against the possibility that a major war may break out in Europe after the mid-1950s, that is after the race between jet aircraft and guided missiles (both offensive and defensive) may have been decided in the favour of the latter.

*

The strategic demands are therefore complex and, above all in these days of continuous scientific research and carefully planned industrial development, quite appallingly expensive. Otherwise, they are fairly familiar. The problem of whether to provide for "war tomorrow" or "war ten years hence" is not new; it has harassed Britain's naval designers all through the twentieth

By concentrating the greater part of the industry's design resources on fighters and bombers, the country has been assured of the minimum number of effective designs for attack and defence. It is now necessary to take a wider view if the industry is to fulfil an important role in the country's economy and not simply in its defence. Aircraft design cannot be canalised into types. Civil designs depend on military research and on military engines. Even a company so heavily committed and so successful in civil aircraft as de Havilland has come to the conclusion that it cannot afford to retire from the field of military design, while a military aircraft builder like Vickers looks in turn to the market for air liners to tide over periodic and inevitable fluctuations in military demand. It would be easy to conclude that the British aircraft industry should concentrate its resources on the design and construction of one or two types of aircraft for sale at home and abroad simply because it has at this time one or two outstandingly successful designs in production. But if new designs are to present themselves as attractive research projects, the industry must have some assurance that a potential home market, however limited, does exist for them.

century. The cold war is imperial policing in a new form—without the Indian Army. The differing natures of the threats in Europe and the Middle East are familiar. The danger to industry and the civil population in these islands is that of 1940, with the possibilities of vital damage greatly increased. What are new are the scope

English Electric twin-engined CANBERRA bomber.

and strength of the Atlantic alliance, of which this country is a member and the economic difficulties that limit the exercise of British power.

In practice, these two new factors merge—and should merge—into one. Britain has to limit demands on the engineering industry because of its decisive importance in the export trade; the Government must, therefore, select carefully between alternative weapons and can order large production only when sure that they have a winner, like the Centurion tank or the Canberra bomber. But nowadays, when there is the possibility that some hundreds of millions of American dollars may become available to buy British arms for allies in Nato, it is necessary to get those allies to agree on what is a winner—that is to say, better than something they can produce. Fortunately, this is one case where sound military and sound economic strategy seem to point in the same direction; it has always been intended that Nato should

create integrated and balanced forces of all arms, for the defence of an area spreading from northern Norway to North Africa and from Northern Ireland to the eastern frontiers of Turkey. Britain—like France—has overseas commitments beyond this area and is, therefore, entitled to decide for itself what forces are necessary for tasks outside the Nato area. But within the Nato area it is difficult to see why the various fighting and production roles should not be distributed among allies according to skill, capacity and wealth—as well as according to traditional interests and geographic advantage.

It is against this complex background that the tasks of the RAF may be summarised. First and foremost—both from the point of view of this country and of the whole Atlantic alliance—must come the defence of the British Isles. There lies the seat of British power and there, too, lie ports, bases and airfields vital to the strategy of Nato and the Commonwealth. For the predictable future this task will be entrusted to the Hunters, Swifts, Javelins and D.H. 110's. Within a decade these may give place to the rocket aircraft and radio-guided missiles—how soon and how much is a closely guarded secret. But there are some predictable problems of the robot age for which the RAF should be planning now. The new weapons will tax not only the capacity of industry but also the skill of operators and directing staffs. Training standards will have to be high and there will be little time in war to correct errors in defence organisation. The Dowding of the future will need a perfected early warning system and new tactics against high-flying jet bombers and rocket attack—if the balance of advantage is to switch to the defenders.

Second in RAF calculations must be the watch on the Atlantic and other trade routes. The jobs done against the U-boats by the Hudsons, Sunderlands, and Wellingtons would have to be done again in a world war, probably over even greater ranges. Long-range aircraft like the Shackleton and the Carrier-borne Gannet are therefore as vital as ever. It is far more difficult than it was to detect the long-range submarine, which can now stay submerged for days on end. Therefore Coastal Command will need not only the most intricate and expensive electronic equipment, but also a large reserve of first-class radio engineers—as, indeed, will all the fighting services.

Third might come the function of reconnaissance. To give it this position is to invite bitter controversy, but that is preferable to the virtual neglect of this function of air forces both in the United States and in this country. There was a grave weakness in British air reconnaissance in the early stages of the last war which should not be allowed to occur again. The reconnoitring aircraft not only provides eyes and ears for all arms; it provides weather intelligence indispensable to bomber forces, can secure vital radar intelligence, and is the best means of assessing bomb damage. The Luftwaffe fell down badly on air reconnaissance in the last war, as the commanders responsible for the allied landings in North Africa, Sicily and France will gratefully acknowledge. Soviet intelligence, on the other hand, has always attached high importance to air reconnaissance. Clearly, the RAF cannot afford a large force of specialist squadrons for this work; but it could institute specialist training for picked crews in all types of squadron. And the cold war will offer excellent opportunities for practising their skill.

Fourth—and here again the strategy needed for the

cold war seems to merge into that which would be needed for a hot one—comes the transport aircraft. The cost of moving British troops on their imperial and cold war duties might be considerably reduced by the use of suitable air transports. (At any moment, nowadays, there are between 35,000 and 40,000 men "in the pipe line" between home and station, and between stations.) Moreover, the defensive plans of Nato will increasingly depend on the swift movement of troops and equipment and air squadrons over the vast area of the free world. With a big air lift capacity and with some standardisation of equipment, Nato might well lighten its burden of garrisoning and maintaining big local forces. Here, Britain could make a major and unique contribution to Nato's resources—and earn foreign currencies in the process—if its allies will back its winners. In jet transports British industry could lead the world, with the Comet, the Viscount, and the Britannia. Moreover, for Commonwealth defence, the role of the transport plane could be crucial, provided that Transport Command is not again treated as the Cinderella of the RAF and its crews sacrificed to Bomber Command.

It is true that this country's productive capacity is limited; and it may, therefore, seem absurd to advocate a major effort in transport aircraft when there are so many other things to be done and when foreign orders for civilian air liners can be met only with great difficulty. But it is perhaps time that the choice—if it is a straight choice—between bombers and transport aircraft were faced, or at least publicly discussed. Nobody denies that to achieve air superiority in war, the battle must be taken deep into enemy territory; it is vital to take the initiative

Vickers VALIANT four-engined bomber.

and remain on the offensive. That, however, is the function allotted by the Americans to their strategic bomber forces, and to the atomic bombs that they will carry. Given the existence of the Atlantic alliance, can a good case be made out for a British bomber force that would merely duplicate this role? And, if such a case can be made on such military as well as political grounds, can Britain afford a force large enough to be effective?

It is difficult for the layman to know how large, in fact, a bomber force of modern jet aircraft would need to be for effective strategic attack. The Valiant jet bombers have been conceived as carriers of atomic weapons over great distances and could attack many, if not the most remote, industrial centres in Russia. But they have become by the swift changes of design and standards, medium bombers; perhaps the new Avro Delta bomber, which was flying at Farnborough this week, is the precursor of the heavy bomber of the future. Whether Britain can afford the luxury of a large force of strategic bombers, in addition to its heavy burdens of air defence, is another matter for argument. Better an efficient defen-

sive force than bits of everything is the verdict of some; strategic bombing responsibilities, they argue, must be left with the Americans. But to this there is an important counter-argument. The rate of advance in jet bomber development in Britain leaves no time for nice calculations of integrated forces and equitably shared defence burdens. Such calculations may be essential to the full maturity of the whole Nato conception; but if the British aircraft industry can produce brilliant machines which are in many ways ahead of the best that America can at present offer, how are they to be developed for squadron work unless the Air Ministry orders them for bomber command or unless the United States Air Force is itself prepared to buy them?

There are many other uncertainties in the strategic picture. For example, the role of the tactical air forces may have to be constantly reviewed. Commitments to support the ground forces of the European Army are heavy; fighters and fighter bombers are needed in Malaya; the tactical use of atomic weapons against ground forces presents new problems. The temptation will be to disperse effort, to have a dab at everything, to postpone production in the hope that something better is on the way. And there will always be the natural dis-

position of the air staff to insist on a "balanced force" of bombers, fighters, transport and reconnaissance aircraft. Whether Britain can afford—or must afford—such a force, is a problem on which the layman hesitates to pass judgment without far more information than he is likely to get. But he is at least in a position to ask for wider public discussion. That discussion should be centred on a limited but specific battery of questions. If Britain can best produce jet transports—say with the assistance of Canada—then what are the objections to proposing that American and all other Nato forces buy and use them, leaving to the United States the provision of heavy bombers? If France could produce and sell the right kind of reconnaissance aircraft, then why not let the French use British and American fighters? Against such ideas there may be weighty political, financial and technical arguments to be heard; but the case for the defence has never been fully stated in public. On the face of it an agreement within Nato, which would allow nations to specialise in what they do best and rely on allies for the rest, would seem to offer to this country a way of making the best of its productive resources without a crippling effort to do everything. Air strategy must not be allowed to crash between too many tempting stools.

Civil Aviation as a Business

BRITISH civil aviation is in better shape than it has ever been. The two airways corporations have established themselves on the sound basis that civil aviation is a business—different in technique, but in other ways much like any other industry. Recently independent operators were given opportunities for playing a larger part in the development of an industry which may become as important as the merchant marine has been in the past. The major corporation, British Overseas Airways, suffered much at its inception from the carry-over of ideas from the scale and nature of wartime operations, as well as from the over-enthusiasm of the early postwar years. It was allowed to expand to an excessive size. Its misjudgment was a painful process of reducing its staff by one-third—at a time of general expansion in the industry—and the severe strain on morale that such cuts imposed. British European Airways was more fortunately placed, since it was separated from BOAC in 1946, and started its career with a staff of more appropriate size. Even so, it could not wholly escape the repercussions of events taking place in its sister corporation.

Partly as a result of plans laid some years ago to obtain improved aircraft which are now bearing fruit, BOAC succeeded in its latest financial year to last March in pulling itself out of the red for the first time; preliminary figures issued early in May, showed that it earned an operating surplus of £1,227,000 before paying interest on capital. BEA has not yet worked its way into profitable operation, and sharp rises in its operating costs have pushed its break-even point to 75 per cent of full capacity. But its traffic is rising rapidly, and in July (when summer traffic is always at a peak) BEA made a profit of £108,000. Only four years earlier, the corporations' break-even points were approximately 115 per cent of aircraft capacity, beyond the bounds of physical achievement. Here is evidence of considerable improvement in financial and technical management.

The corporations aim to equip themselves throughout with British aircraft as soon as suitable types are available. Their financial success is therefore closely dependent on the ability of the British aircraft industry to produce aircraft that have good economic characteristics as well as high technical qualities. At present, the British aircraft industry is not abreast of the American industry in this matter. No British aircraft at present in service can compare favourably in the international field with the economics of the latest versions of the Douglas DC class or the Lockheed Constellation. The United States is a vast area, and internal air services have been developed on a scale far exceeding that of American international services. Such coast-to-coast services have naturally encouraged the development of aircraft suitable for the stage lengths common in international and even transatlantic operations. This fact has given American builders an advantage over British aircraft manufacturers, who have had to produce long-range commercial aircraft from scratch, rather than by evolution of types long proved and suitable for intensive domestic services. Despite all this week's enthusiasm, it is still true that

De Havilland COMET jet airliner.

there is no British-built aircraft in service capable of flying the Atlantic non-stop with an economic payload. This is not only a matter of national prestige. It is also an item of importance in the national balance sheet. With the right products to sell, the aircraft industry can build up an export trade of great value. In addition, BOAC's transatlantic services earn considerable amounts of dollars for this country, and are capable of earning more. But until British transatlantic type aircraft are available, many, if not all, of these dollars must be spent again in paying for American aircraft and their spares. These considerations explain the hopes that are placed in the Bristol Britannia and in the later marks of the de Havilland Comet.

The pattern of routes operated by the air corporations throughout the world is settling down into a kind of aerial permanent way. In common with other international carriers, the British corporations are now seeking to extend the market for air travel, by attracting a much wider public to tourist services at fares about 30 per cent below the first-class fare level. Services at cheaper fares take different forms, according to circumstances. On the short European routes, where end-to-end journeys are completed in a few hours, and people normally prefer to travel during the day, aircraft have always been under-used during the night. This fact justifies the offer of cheaper fares at night time. On the longer international routes, aircraft are habitually used day and night because of the length of journey; the introduction of tourist fares on these routes has been achieved by higher density seating and getting more passengers into the aircraft with somewhat less comfort. Even so, because long-range aircraft started by allowing passengers generous space, the comfort and seating density of a long-range tourist aircraft is hardly less than that of a short-range first-class aircraft, as may be seen by comparing the seating of the BOAC tourist Constellation with that of the BEA Ambassador.

*

BOAC's introduction of tourist services across the North Atlantic this summer has been quite as successful as was hoped in tapping a new market—and a dollar market at that. The corporation plans to expand tourist services next year by introducing them on some Eastern and African routes. If this line of development is followed to its logical conclusion, it suggests a route pattern in which the corporation operates both first-class and tourist services on most of its routes. This would seem to involve the operation of two types of aircraft along the same route at the same time, which would mark a departure from existing practice.

Bristol BRITANNIA turbo-prop airliner.

It is the Government's intention to encourage independent operators to put on yet a third class of service, described in the terms of reference of the reconstituted Air Transport Advisory Council as a "Colonial Coach" class. The object is to provide the public with the opportunity to travel by air at fares substantially below the corporations' tourist fare level. But aircraft design is developing so fast that the reductions in operating costs of newer types of aircraft may well offset any advantages to be gained by the use of written-down or second-hand equipment. If the corporations genuinely try to establish tourist fares at the lowest level that new types of aircraft justify, and if operational standards are fully maintained by the independent operators, it may be difficult for the latter to undercut the corporations' fares by the substantial margin required to attract a new class of traffic. On the other hand, if the corporations' level of operating costs were to exceed that of an equally reliable independent operator by a wide margin, there would certainly be cause for concern about the quality of their direction and management.

American domestic operators have developed freight services most successfully in recent years. Although air freight costs are many times higher than surface costs, speed and frequency of delivery by air can permit considerable reduction of dispersed stocks, with savings often sufficiently great to offset the higher cost of air transport. Encouraged, no doubt, by these results, a number of foreign international carriers have placed orders for freighter versions of the newest American aircraft; and it is believed that both British corporations are interested in the possible adaptation of new British aircraft for freight services. But the factors which have contributed to the successful development of air freight services in the United States do not necessarily hold good in other parts of the world, where customs barriers intervene or distances may be much greater. Much freight is already carried by air as fill-up load on passenger aircraft, and indeed is necessary for the successful economic operation of scheduled services. In the development of additional all-freight operations in the international field, either as scheduled or as tramp services, this country should play a leading part; perhaps the independent operators can make their greatest contribution to the development of British civil aviation in this direction.

*

Both corporations need a period of stable and steady leadership, under which they can build up tradition and experience of business management—which their rapid growth and frequent reorganisation have impeded. To describe them as monopolies, and to argue for permanent interference to prevent abuse of alleged monopolistic powers, misunderstands their real position. The corporations are the only designated British operators in the international field—apart from certain private companies who have associate agreements with them for limited operations. But this fact does not make them monopolies. In fact, BOAC and BEA between them do not account for more than about 15 per cent of the world's international airline business. They are the nominated representatives of this country in a fiercely competitive industry in which prices are determined by international cost levels; hence, their financial results, related to those of other operators, provide some indication of relative efficiency. Two corporations give room

for different ideas of management and operating technique to be applied; and they are a safeguard against the drawbacks of undue size. But is it certain that (compared with KLM and Air France, for example) British civil aviation is not handicapped in the all-important matter of commercial traffic rights by the existence of two separate legal entities in the same field? Again, it is highly desirable to give scope for the independent operators to develop. But it is to be hoped that the procedure of the ATAC will not place the British corporations at a disadvantage with their international competitors, by compelling them publicly to disclose their

plans long in advance and by restricting their freedom rapidly to adapt their route patterns to changing world conditions. If the British corporations are to acquit themselves well in the strenuously competitive field of world civil aviation, they ought to be able to make effective response to steps taken by their foreign competitors. They deserve no undue privilege as public corporations, but they ought to be allowed to get on with their business without the constant barrage of criticism that sometimes afflicts public corporations. Their progress in the last year or two certainly justifies the hope of businesslike progress in the future.

PROGRESS OF THE AIR CORPORATIONS

Thriftless Britain

THE annual report on the national income, in its new and greatly expanded form, is reviewed more extensively on a later page. There is, however, one salient fact that is worth picking out and exposing in all its nakedness. This is the fact that the British community is now making hardly any provision at all for its own future. It is true that physical capital is still being created in this country—houses and factories are being built, new plant is being installed. But this new capital is not being provided for out of the nation's earnings; it is being provided by draining the reserves, or on credit from other countries. The country is not saving nearly enough to pay for even the present restricted volume of capital investment.

Among the many excellences of the national income estimates in their new form, there is one defect: nowhere in nearly a hundred pages of statistics is there one comprehensive figure of the net national savings. But it is not difficult to calculate a figure, provided that attention is paid to one statistical catch. In accordance with the conventions of the accounting profession, backed up by Somerset House, companies include in their "profits," and hence in their "savings," any increase during the year in the value of the stocks of raw materials and unfinished work that they hold. But if this increase arises, not from any real addition to stocks, but simply from a rise in prices, it does not constitute saving in any sense that is of value in economic discussion. Crude figures of savings need therefore to have this element of pure price inflation removed from them before they can provide a measure of the real national savings. With this correction made, the fact emerges that companies and private individuals, after making the (usually inadequate) provision that the law permits for the obsolescence of existing capital and setting aside funds to meet their accruing tax liabilities, saved nothing at all in 1951—indeed, less than nothing at all. A positive figure can be put upon the national savings only because the central and local governments had a combined true surplus; they imposed saving on the country. The net total of private and public saving was no more than £261 million.

It is true that 1951 was a difficult and unfortunate year. But the average net savings of the last six years were no more than £463 million, which is, of course, fantastically too small for a nation such as Britain. One comparison should be quite enough to establish this. If the present Government succeeds in building 300,000 houses a year, and if the average cost of each house can be kept down to £1,500, the housing programme alone will cost £450 million a year. The houses actually built in 1951 cost £335 million. The national savings, in short, are barely more than half what is needed to pay for the housing programme, without leaving a penny over for new factories, new schools or hospitals or for any machinery, aircraft, ships or other productive equipment except in bare replacement of what wears out. Still less is there anything left for foreign investment, for the development of the Commonwealth or for participation in Point Four schemes.

Another way of showing the inadequacy of this level of savings is to set it alongside the actual expenditure on capital investment that ought to have been financed out of savings in 1951. This amounted to £1,379 million, in addition to the £870 million that was paid for out of depreciation allowances. All this new capital was badly needed; indeed, it represents only those projects which can make their way through the mesh of the controls. Buses, lorries, railway material, ships, aircraft, plant and machinery, houses, roads, factories, other buildings—there is not one of these categories which could be further cut without the very greatest difficulty, economic or political. Yet the savings of the country covered less than one-fifth of the total.

If they were not met out of savings, how were they financed? The answer is instructive—and alarming. A very large slice of the total capital expenditure of the year, amounting to £542 million, was found by liquidating overseas assets (the gold and dollar reserves) or by going into debt to other countries. As everybody knows, this cannot go on for very long. Most of the rest—£537 million—was financed out of what the official statisticians call “additions to tax reserves.” In more ordinary language, this means that companies and private individuals were using for capital purposes the money they ought to have been setting aside to pay the heavier taxes accruing on their 1951 earnings but not yet payable. These reserves are clearly not “savings” to the individuals and companies that set them aside; if they are used to finance capital expenditure, they are being borrowed from the future and will sooner or later have to be repaid. From the national point of view, however, it can be argued that these are real savings—the money represents real resources produced and not consumed. That is true, so far as the single year 1951 is concerned. But this can be relied upon as a permanent source of savings to finance capital investment only if it can be assumed that each year's revenue collection will always exceed the previous year's. And if these tax reserves are to be added into net savings, then a deduction must be entered on the other side to provide for the fact that the depreciation allowances granted by the Revenue are not nearly large enough to keep existing capital intact. These points penetrate deep into the theory of social accounting; and the ordinary man will do best to apply to the whole nation the rules that he applies to himself: he may, in any year, have some money from his tax reserves that he can invest until it is wanted; but if he includes it in his savings, he is deluding himself. By this test, the British nation spent on new capital investment in 1951 more than five times its real net savings.

*

The miracle is that this sort of profligacy has gone on as long as it has. It is testimony to the great internal reserves built up by the thrift of the past and to the patience of those overseas countries that have been willing to supply goods to Britain without payment, whether they be the Americans who, in their generosity, knew what they were doing or the poor colonial peoples who were never asked whether they wanted to sustain the standards of the British people. Clearly this sort of thing cannot go on very much longer. Equally clearly, no economic policy is deserving of the name unless it propounds measures for bringing the national savings and the national investment expenditure into equality with each other.

One way of doing this, at least in theory, would be to reduce capital expenditure until it was no more than could be financed out of savings. But the present rate of capital expenditure is too small, rather than too large. An instructive set of comparisons can be made with the figures of the national income of the United States in 1951, which have also been released recently. (The definitions on which the figures are compiled differ in the two countries, but not sufficiently to invalidate the broad comparisons.) In the United Kingdom last year, the net expenditure on domestic investment equalled 10.5 per cent of the national income; in the United States it was 12.7 per cent. The total can be broken down into its constituent elements only on a gross basis—that is, including the expenditures that are in replacement of obsolete capital as well as the new investment—but they also give broadly similar results:—

	Britain Per cent	America Per cent
Building—Residential	15	20
Other	17½	19½
Other fixed capital	50	43
Increase in physical volume of stocks	17½	17½
	100	100

It is strange, at first sight, to find housing proportionately higher in the United States and what the Americans call “producers’ durable equipment” lower. But the American population is still rapidly increasing, and moving about. And the 43 per cent going into productive equipment still means that the average American worker was provided last year with nearly three times as much new productive equipment as the average British worker. This comparison in itself is enough to show that (with the exception of housing) the British capital programme is certainly not too large.

If investment expenditures cannot safely be brought down, then—inescapably—savings must be brought up. If the British and American figures show a strange similarity in their capital expenditures, they show the sharpest contrast in the disposal of income. Where last year the British people saved 2 per cent of their income, the Americans saved 12½ per cent. The British saved £261 million; the Americans (on an only slightly less rigorous definition) saved \$38,646 million. So far from running into debt with the rest of the world, their savings were enough to finance the whole of their gigantic investment programme and to leave a small surplus for investment abroad—in addition to all the money their government sent overseas in one way or another, which the American people paid for in taxes before the figure of savings was struck.

In any problem of public policy there are two parts—first, the ascertainment of the facts, which should admit of as little dispute as possible; and secondly, the prescription of what should be done, which may be controversial. This article is restricted to the first part. There will be other occasions for arguing about how the saving of the British community can best be increased. On that, there are many possible points of view. But on the facts there can be no argument. Either the level of British savings—personal, corporate or governmental—will have to be very substantially increased, or else the present rate of expenditure on new capital will have to be very drastically reduced. And to do that would be to bid farewell to any hope of earning the standard of living that the British people already think they have a right to enjoy—let alone of resuming the march towards wealth and welfare for all.

The Soldier's Rule in Egypt

IN Egypt a politician has given place to a soldier at the controls. Last Sunday Aly Maher resigned the premiership under pressure from the army, and General Neguib—the leader, though not the prime instigator, of the coup that disposed of King Farouk—took it over. Many Egyptians, and all foreigners who know Egypt well, are disquieted at this turn of events. The cause of their apprehension is not the display of dictatorship; dictation is, beyond a doubt, the only method whereby that overcrowded and socially unhealthy country can straighten its tangled affairs without resort to violence. They feel anxious because Aly Maher offered an advantage that General Neguib may not possess; he was proficient at choosing and working with technically able and experienced colleagues. Only last Saturday, he had reshuffled his cabinet in order to include in it some of the best minds in Egypt. All those interested in improvement of the bestial conditions of life in rural Egypt lifted up their hearts. By Monday General Neguib had dropped all but one of these promising colleagues. What was worse, he had been pushed into arresting a long list of citizens in which the names of rogues, King's friends, and chatterboxes jostle with those of harmless scholars and honest statesmen. These acts may have been perpetrated on the spur of an anxious moment. They may be redeemed later. But at first sight both give cause for anxiety lest inexperienced men should try to move faster than is compatible with peaceful change.

Broadly speaking, the Neguib-Maher coalition that was, in July, conceived and pushed into power by a *junta* of army officers knew from the start that it must cut two cancers out of Egyptian public life. One was the Palace clique, which it dealt with at once. The other was the old-style professional politician who composes the upper ranks of most of the political parties—demagogic, rich, self-seeking, usually corrupt and paying only lip service to the changes that are needed if the middle and poor classes are to lead a better life. The party with the thickest upper crust of this type is the Wafd, a thorough purge of which was therefore the army's second purpose. The army's conception was and is that if only the heads of such parties can be lopped off, the bodies and tails will join its “sacred movement,” since these naturally share its desire for taxation of the rich and a better deal for the poor.

The July coup had been admirably planned and executed. General Neguib proved an attractive leader, and the Egyptian public seemed pleased to be told with efficiency what to do next. Early in August he proclaimed that he saw “no reason for dictatorship at present.” Elections were promised for the New Year, and both he and Aly Maher instructed the political parties forthwith to purge their upper ranks. Simultaneously they applied themselves to their reform programme. Here there arose the first difference between administrator and soldier—a disagreement over pace. Aly Maher and, it seems, also Neguib personally, realised that operations such as the breaking up of large estates and their redistribution to peasants are complicated processes. The former knew from experience that Egypt's imperfect civil service cannot perform miracles overnight. He publicly spoke of the need for “time to

create an administrative machine” to execute land reform. The *junta* at Neguib's back began pressing for quicker action than Aly Maher felt was feasible. In mid-August another cause of trouble between *junta* and executive began to brew. It developed out of the labour riots at the textile centre of Kafr el Dawar. Neguib, who well realised that at the first sign of violence he must show whether army or mob was master, arrested and tried the ringleaders. Some of the *junta* disapproved of the consequent alienation of organised labour. Finally, towards the end of the month, the Wafd began to rear a jaunt head; it had conducted a token purge of minor malefactors, but refused to liquidate the real offenders, notably Serag ed Din and certain much-enriched members of Nahas's wife's family. It started briskly to whitewash itself in a leading Cairo newspaper. Its hidden hand began to brew trouble for Aly Maher in the provinces. On August 24th, the anniversary of the death of its founder, Zaghlul, Nahas defiantly claimed that time was on its side and that it still held “the leadership of the nation.” When Aly Maher, who has always believed in splitting not steamrolling the Wafd and is always convinced that he can navigate some tortuous course round every difficulty, made no reply to this sally, the *junta* increasingly thought him wanting in aplomb and despatch. Thus when he announced his new and admirable cabinet on September 5th, he did so in unfavourable circumstances.

*

This cabinet lasted only two days and no one seems to have had time to give it the praise it deserves. It included two men of vision and integrity—Ibrahim Madkur and Mirrit Boutros Ghali—who, nearly ten years ago, had the courage to produce an outstanding book on Egypt's economy and its social ills, which was banned by the Wafd. Aly Maher appointed Madkur to head a new ministry of reconstruction, and Mirrit Ghali to a special department for raising the standard of village life. Mahmoud Mohammed Mahmoud, an ex-auditor general who had proved his moral courage by fighting financial scandals, was to run communications. The able banker Abdel Gelil el Emary was retained at the Ministry of Finance. The way towards rural betterment was paved not only with intentions but with men who knew how to execute them. Yet the cabinet lasted only two days.

The causes of its abrupt demise are plain. The need to move fast marks every revolution, whether in 1789, 1917 or 1952. On the very day of the announcement of the cabinet changes, the Wafd had come out into the open with a challenge to the army both on its call for party purges and on its land reform legislation. The *junta* felt that this challenge needed firmer handling than suits a man of Aly Maher's temperament. Almost simultaneously, the two ringleaders in the Kafr el Dawar riot were executed at Alexandria. Some members of the *junta* felt the need to demonstrate to the working classes that speedy reforms were on the way. Aly Maher had to go. Though defeated, he is not disgraced. The sad aspect of his going is the simultaneous departure of all his abler colleagues except Abdel Gelil el Emary.

The new cabinet, though inexperienced, has during

its first meetings revealed that it realises the impossibility of performing immediate miracles. Execution of its decree law on land reform is to be spread over five years. The parties have been given thirty days in which to purge themselves while they conform to a second decree-law on party organisation. Yet it is faced with problems the dimensions of which some of its members, in their inexperience, prefer not to contemplate. Although the land law gives the peasantry many rights that they have never hitherto possessed, the actual extent of the large estates that it will parcel out suffices to give land only to a fraction of the landless peasants. New lands could be reclaimed, but only over years and with the help of foreign loans; yet the new cabinet contains several members who have in the past worked actively against foreign participation in Egypt's development. Again, General Neguib has issued a warning against attempts by impatient or disgruntled peasants to effect seizures. Yet it is doubtful whether the administrative machine in the provinces can handle the many malcontents that are bound to be restless. Further, the Moslem Brotherhood—the only organised body, other than the Wafd, that has

a nationwide following—is represented in the cabinet because it has always shared the healthy views of the *junta* upon such subjects as social services, education and taxation. Yet it has in its composition a fanatical and extremist streak that can become dangerous if moved to harness the ravening mobs of Cairo and Alexandria. Lastly, not all the members of the *junta* are of the same political complexion. Were they to split on political issues, and were General Neguib to prove their puppet rather than their master, Egypt's immediate future would be problematical.

It does not do to be over-pessimistic. Present signs are that General Neguib knows how to curb his team. He has a hold on the nation because he has given it the impression that he knows what to tell it to do, and also because it senses that he will really do something for the poor man. Seen from London, his merits in this respect are great. The problem of Anglo-Egyptian relations may have to wait, and that of Middle Eastern defence with it. But Britain, for one, would greatly prefer to settle them with a government that is sincerely and efficiently grappling with Egypt's poverty.

Four-Fifths Vacuum

“FOUR-FIFTHS of both parties,” the Prime Minister told his constituents at Woodford last Saturday, “agree on four-fifths of what should be done.” This emphasis on an underlying national unity has become a familiar theme of his since the last election. In the House of Commons, in a debate on foreign affairs or defence, it is natural and wholly welcome. In a party speech in his constituency, it may not be less welcome but it is certainly odd. And is it really to be welcomed? Does it provide anything but a spurious air of statesmanship, a vague and misleading impression that all good men are one? If there really is so much agreement, is it not, in hard fact, a disquieting symptom of the emptiness to which British politics have fallen?

It is true that the main political parties must always agree on a wide range of fundamentals or democracy cannot work; in this sense, Mr Churchill's point is platitudinous. But it is not the sense that he meant. The agreed fundamentals have little to do with normal political debate. They pass unspoken, more often than not, precisely because they are outside the party conflict. The margin of disagreement may be narrow, the issues may be superficial, but here none the less lies the whole purpose of the party system; the disputed issues are the bread-and-butter of the politicians. On them depends the enthusiasm of the party organisations, the political interest of the ordinary elector, his willingness to go to the polls. Politics has no substance, democratic decision is a farce, unless people believe that Britain will—gradually, at least—become a different place according to whether Mr Churchill or Mr Attlee is in office.

If that belief is unjustified, it is no matter for rejoicing. There is no virtue in agreement as such; on the contrary, there is always room for two honestly held opinions over a very wide range of government activity. If on four-fifths of what they want to do Mr Churchill and Mr Attlee are agreed, the probability is that it is because neither is in fact facing the difficult issues that need decision. This is the reason for disquiet. In foreign

policy, it is true, Mr Churchill's point is sound enough. Only the minority of the Labour party that follows Mr Bevan seriously challenges the main lines of Government action; otherwise, the national agreement is real and deserves all the emphasis it can be given. But in domestic policy, the facts are quite different. Mr Churchill's motive merits every sympathy. He is concerned about the ferocity of the party dispute in Parliament, which is certainly out of all proportion to the issues under debate. A Labour Government would (probably) restore steel and road transport to nationalisation after the Conservatives have undone it. It would (soon) abolish all charges from the health service. It might be expected (though this is no more than an implication) to restore the 40 per cent that Mr Butler is lopping off the food subsidies; conceivably, it would lower Bank rate again. These are not negligible issues, but plainly they are also not matters of such major principle as would justify the intensity of passion that Labour has been expending in opposition.

Mr Churchill presumably hopes that his arithmetic of agreement may help to deflate this passion. But arithmetic, as he would be the first to recognise, is a small thing in itself. The Labour party will show a better sense of proportion in the next session of Parliament only if the range of issues is so much wider that it has no choice. And this is not Mr Churchill's intention. The Tories are less cocksure and less emotional than their opponents, but the sense of proportion implied in their actions is much the same. The denationalisation of steel and road transport may not merit much either of enthusiasm or of bitterness, but it is the Government that chooses to make them the main business of Parliament next year. A higher Bank rate, small charges for the health service and lower food subsidies may be of little significance in themselves, while Government spending otherwise runs higher than ever, but they are the only distinctive things in Tory economic policy—in

the policy that, Mr Churchill claims, has saved the country from the impending bankruptcy which drove Mr Attlee to face the verdict of the polling booths.

The matters of disagreement are, in short, the stuff of Government action so far. The truth of Mr Churchill's arithmetic lies in the negative form of it that he did not state: the things that arouse the parties' enthusiasms—and are therefore controversial—are only a fifth of what should be done. But the other four-fifths of domestic policy is not agreement; it is a vacuum. The political conflict has to concentrate on inessentials because the greater part of what needs to be done is not on the agenda of either party. If it were, there might well be a surprising measure of agreement. There has rarely been less divergence between the ends, at least in the short run, that the two main parties have set themselves. Both are determined to preserve the welfare state substantially as it has been constructed over the past twelve years, neither more nor less. Most Conservative leaders are sure that they cannot go back on what is, most Labour leaders recognise that for a time the impetus to radical social change is exhausted. Both parties can define their further ends only in such platitudinous terms as Dr Dalton has lately used—a society that is “just, ardent, prosperous and free.”

About means, there is more theoretical but even less practical disagreement. Labour inherited a siege economy in 1945, and, having thought of nothing to replace it during six years of office, is determined to go on believing against all evidence and reason that it will work in a competitive world. The Tories believe in

some—not all—of the methods of the free economy and would like to turn them to the ends of the welfare state; but they are not confident that they can do it, and they are inhibited from substantial experiments by the fear that any tampering with means will be mistaken for a rejection of the ends. Because it has lost positive purpose itself, the Labour party is determined to keep its emotions and hatreds going by believing that the Tories are not merely conservatives but reactionaries. In the words of a party pamphlet published this week, they “will fight the rearguard action of privilege until the end of time.” If this is untrue, the Tories nevertheless pay it the compliment of thinking that a majority of the electors can easily be led to believe it. They therefore do nothing radical, but are less careful in minor matters. In their tenderness towards brewers and the former road haulage firms, they contrive still to give at least an excellent imitation of a party that is a party of privilege whenever it nods.

All this is the log-jam that has to be broken before British politics can revive and the parties can face in honest disagreement the real issues that lie before this country. Moderate Socialism needs a purpose and moderate Conservatism needs a faith in its own policy. If those were found, the area of open disagreement would be wider but politics might be better-tempered as well as more constructive. For the moral obligation on the responsible politician is not to shun squabbling and live quietly; it is to see that the party differences put before the public are the essentials on which the country needs decision.

M. Thorez's Second Coming

NOTHING is more difficult in the life of the active Communist than those moments when he is required by his party not to stand out in the mass of his compatriots but to merge quietly with them. If he has any conscience and independence left in him at all, he resents the order that he should cease being the overt revolutionary and become the colourless associate of all and sundry with a grievance—ex-Fascists and Nazis, cranks of Left and Right, even the hated bourgeois social-democrats. The policy of Moscow and the failures of previous lines may make perfectly clear to Communists the need for what is called the “united front” with other parties; but the truly militant comrade may accept the need with bad grace. There are signs that something of this kind is happening now among Communists of free Europe, something more than the already united fronts of the “peace campaign” and the agitation against “American germ warfare.” And it is in France that the signs can be read most clearly.

Since the fiasco of its campaign in May against General Ridgway, the successor in Europe to General Eisenhower, the French Communist party has undergone a crisis of doubt and embarrassed self-scrutiny. Its long-heralded strikes and demonstrations fizzled out into sporadic violence and ridicule. M. Duclos' failure of nerve on the night of May 28th cost him the prestige of martyrdom and during his partial eclipse French Communists (of varying shades of orthodoxy) had a chance of voicing frank criticism. M. Fajon, an astute veteran of the trade union movement, took over control

of the Communist press and sought to discharge the party's central committee from all blame; but his very advocacy betrayed significant disagreements about tactics within the core of the party. On June 18th, *Les Lettres Françaises*, M. Aragon's brilliant Communist periodical, published an article by Pierre Cot, an extreme left-wing fellow traveller. It spoke of the growing isolation of French Communist workers and described the walls of silence which separated them from the rest of the population. It argued for a united front, for an open alliance with liberal elements in the bourgeoisie. M. Cot pointed out that the apathy and disgust shown towards Communism by neutralist and radical elements of public opinion could be blamed directly on the strategy of terror used in May.

This assessment of the situation won widespread support in the ranks of the central committee and M. Duclos re-emerged as the bearer of glad tidings. He admitted that French Communism had taken too particular a tinge, that it had lost its roots in the tradition of native Jacobinism, and was guilty of the sectarian heresy. The time had come for a “national front” which would attract all right-thinking men and fight a united battle for bread, wages, and peace. M. André Stil, the Stalin prizewinner and editor of *l'Humanité*, joined in the chorus of self-confession. He admitted that he had taken the isolation of the working classes for granted and that the “frenzied tone” of his articles had alienated numerous potential adherents. M. Cot's thesis appeared to have carried the day.

But the simplicity of the new line proved deceptive, and M. Auguste Lecoer, the ever-watchful and tormented conscience of the party, launched a powerful attack on the heresy of "opportunism." M. Lecoer denounced M. Cot for supposing that the exploiter and the exploited could stand on the same side of the barricades. It was all very well to search out partisans of peace in unlikely quarters, but class warfare was and would remain the primary law in the capitalist jungle. M. Stil also came in for severe criticism. Why had he implied that violence of language was a prerogative of the working classes? With an unflinching sense of gravity, M. Lecoer assured the central committee that Communist workers abhorred any sign of frenzy. Both M. Stil and M. Aragon (for whom this must have been an especially trying experience) accepted public rebuke in the proper spirit of humility.

At the end of its sessions, therefore, the central committee now finds itself confronted with a complete paradox. On the one hand French Communists are to strive for a united front, on the other hand, the rigid lines drawn by the class struggle must not be blurred. French Communists are to tread a tight-rope between two abysses of heresy, "sectarianism" and "opportunism." On either side loom the shadows of Bukharin and Trotsky. The only way of staying on such a path seems to be a total lack of forward motion, and there is evidence that the contradictory directives which have emerged from the central committee are spreading bewilderment and torpor in the rank and file of the party.

It is against this background that the return of M. Thorez from his cure in Russia must be interpreted.

'Clydella' lasts longer

Sizes 38 to 44 inches chest. Price 59/6d.

IN EVERY CLASS of goods there is one that sets the standard for the remainder, one that a man is proud to possess.

In men's pyjamas that one is 'Clydella'—it wears for years, never loses its softness, warmth or colour.

There's nothing to equal
'Clydella'
IF IT SHRINKS WE REPLACE

MADE BY THE MAKERS OF
'VIELLA' AND 'DAYELLA'
F2/15

M. Duclos's announcement last week that he was fully restored and would shortly arrive in France provided a note of dramatic certitude in what was, by and large, a scene of weakness and confusion. The Messiah is now returning from the east to clarify all doubts. The announcement of M. Thorez's return seems authentic, although there have been previous false alarms. Well-informed circles, however, wonder whether the reason for his homecoming is that his cure is complete, or that the state of the French Communist party made it imperative.

★

The reappearance of M. Thorez on the French political scene has been adroitly prepared. A warrant for the arrest of his son had been issued at the time of the anti-Ridgway riots. Shortly before Duclos's announcement of the leader's return, young Thorez surrendered to the police and put the family name back on the front pages. The Cominform meeting held early last month in Prague, moreover, and the reshuffling of ideas in preparation for the Party Congress in Moscow, lend substance to the hope that Thorez is returning with a decisive new formula, a key to the dilemma of his followers. In the minds of French Communists his name is linked with the glorious memories of the "popular front" in 1934-36. As a direct emissary from Moscow, he will satisfy M. Lecoer's scruples about orthodoxy; as the embodiment of the "united front" tradition he will strengthen the hand of M. Duclos. In the return of Thorez, the central committee may find the dialectical synthesis of contrary lines of action, while to the ordinary party member M. Thorez will offer a rallying point.

Fundamentally, however, M. Thorez will be facing the same problems and the same bankruptcy of ideas that have beset the French Communist party over the past two years. Each in turn, the favourite Communist lines of attack have proved futile. There is general apathy about Indo-China and the susceptibilities of French jingoism will discourage the Communists from being too militant about the North African problem. By coming out in favour of a German national army, Mr Stalin has disinflated one of the strongest emotional arguments used by the French Communist party. General Ridgway's extremely quiet and careful attitude has taken the edge off the perennial question of American "occupation troops," and M. Joliot-Curie's opinions on bacteriological warfare in Korea now rank with the chopsticks of the Dean of Canterbury.

There would seem to be only two main points on which the French Communists could effectively concentrate: the threat of inflation, and the rather wild indiscretions of some American thinking on foreign policy as advocated by Mr Dulles and occasionally supported by General Eisenhower. But the latter's pronouncements since the Philadelphia speech have done much to clear the air and reassure moderate opinion. As for inflation, the problem is one on which no party has a monopoly of indignation, and M. Pinay's attitude commands the type of respect which the Communists will find hard to counteract. On the whole, therefore, the return of M. Thorez may bring little change. Whatever the "new line" emerging from the Soviet Party Congress, it will have to be adapted to French needs, to the irony and sophistication of the French political mind, and to the present lack of dynamism among French Communists.

NOTES OF THE WEEK

Engineers Ready for Compromise

There seems to be a good chance that production for defence and for exports will not after all be held up by a ban on piece rates and overtime in the engineering and shipbuilding industries. The confederation of the 38 unions concerned resolved on the ban on Wednesday. On Thursday their executive council received a telegram from the Ministry of Labour's chief conciliation officer inviting them to discuss the matter with him. This they lost no time in accepting, and a meeting has been fixed for Monday next.

In the meantime the council of the confederation has decided not to fix a date for bringing the ban into operation. This suggests that they expect a settlement—in spite of what they regard as the provocation of the employers in repeatedly rejecting their claim and refusing to make any offer at all. The employers' attitude, indeed, probably rallied to the cause some in the unions who had at first thought it foolish to forfeit earnings in support of a claim so excessive as £2 a week. But there was more division of opinion in the ranks of the confederation than the president, Mr Brotherton, implied when he said that the decision to ban overtime and piecework was taken by an overwhelming majority; it was actually less than two-thirds. The general unions, representing the unskilled workers, had proposed that the dispute be referred to arbitration; and although Mr Brotherton claimed that the ban on overtime and piecework was an instruction to all the 38 unions of the confederation, Mr Nicholas of the Transport and General Workers Union stoutly maintained that it would be for his union executive to decide whether to implement it.

If the unskilled worker would feel the greatest hardship from lost earnings the skilled worker would have most to lose—in many cases as much as £4 or £5 a week. Many others must have wondered on what basis they would be paid at all if not on piece rates. The workers' sacrifice would be great, and so far the confederation has not decided how to pay compensation. It seems certain, therefore, that many who voted for the resolution did so on the assumption that a ban which would involve the loss of between three and four million man-hours a week could never be allowed to come into force. The Minister of Labour will need all his skill to get a peaceful compromise arranged, but he may well succeed.

★ ★ ★

After Margate

The Trades Union Congress dispersed last Friday having once again demonstrated its remarkable loyalty to its established leaders. Only on two occasions did it override the wishes of its general council, and of those only one affects the future: the council has been ordered to prepare a programme of further nationalisation for presentation to next year's congress. But this is the issue on which the extremists in the Labour movement always get a clear field for argument; the union leaders could not express their objections with any clarity, for none dares publicly to recommend a halt to nationalisation. The case for caution is always put in terms of strategy, not of principle, and the ordinary delegates may be forgiven for feeling that strategy is not their business when Labour is out of office. On other issues the congress cast its vote for moderation, even to the extent of passing one motion and rejecting a very similar one because it was sponsored by the Communist-led Electrical Trades Union.

The net effect of the week's discussions is, however, nebulous. The TUC has accepted the need to rearm as much and as fast as possible, but has affirmed its opposition to

the economic policy—especially the cuts in food subsidies and the imposition of charges in the national health service—that makes rearmament possible. It has accepted the council's view that excessive wage increases could lead to unemployment and national insolvency, but does not think that justifiable increases to meet rises in the cost of living come into this category. Nor will any one union consider its own claim excessive. But, at least, the resolution passed by congress should mean that the weight of trade union opinion as a whole will not be behind extreme measures to enforce the larger claims.

Inconsistencies in moderation were, in any event, the least that could be expected against the present background of rejected wage claims and it says much for the quality of the union leaders that there was any moderation at all. Mr Deakin was a skilful chairman; Mr Lincoln Evans, above all, distinguished himself by his courage as well as his lucid exposition and telling phrases. It has often seemed since the war that the trade unions were no longer producing leaders of the same calibre as they had in the twenties and thirties. The 1952 congress has at least removed that doubt.

Britain and Europe

Work for a European political community is now reaching the drawing board, and it is intended that a blue-print of a constitution and parliamentary machinery should be ready by March 10, 1953. Practical efforts to unite Western Europe around the Franco-German nucleus have thus gained a remarkable impetus of their own. The Foreign Ministers of the six governments joined together in the coal-steel pool, and still to be joined in the defence community, have instructed the common assembly of the pool to turn itself into a constituent organ. Its deliberations will be historic, and very different in character and purpose from the sincere but more rambling debates of the Council of Europe's Assembly.

Mr Eden is to address the latter body on Monday and press his proposals that the so-called restricted communities—for defence and coal and steel—should develop "within the framework of the Council of Europe." He is said to be disturbed at the prospect of a tightly-knit and exclusive community growing up across the Channel. This concern comes a little late in the day and it is not clear that it is in British interests to express it. If the new European policy is to succeed—especially as it affects Franco-German relations—a tight and formal structure is needed. The British, having given good reasons why they cannot take part in something tight are not in a strong position to plead for something loose. It sounds as if Britain is asking to have representation without responsibility. "Within the framework of" is a favourite phrase of the Foreign Office nowadays. It is far from clear, even to the British mind, what it means; to the French in their present mood it means nothing.

If there is the slightest chance of France, Germany and Italy setting up genuine political institutions to control common economic and defence policies, then British attempts to modify them in order to preserve the larger Council of Europe would be ill-advised. The Council has been a useful piece of scaffolding, without which the structure of unity would have taken shape more slowly; but it should not impede the growth of the permanent structure. British co-operation in technical bodies like the coal-steel pool and the defence community can be ensured by special arrangements, but British political interests are best safeguarded by giving thought to the shape of the Atlantic community of which the European confederation will be a part.

German Trouble Makers

Dr Seebohm, Minister of Transport in the Adenauer cabinet, appears to be a trouble maker. He told a large meeting of Germans from the Sudetenland last weekend that their old home could be "won back by peaceful means." Considering that the territory in question was wrenched away from the Czechs in 1938, in circumstances which still make Britons blush, Dr Seebohm's phrase is almost worthy of Goebbels. It can be argued that Dr Adenauer's colleagues must woo the votes of those who were expelled in 1945 from beyond the Oder-Neisse line, and that they cannot afford to let their political rivals monopolise the appeal to nationalist feeling; that is legitimate politics. It can also be argued that something must be done one day about German aspirations to the "lost East"; that is necessary realism. But to go beyond this is foolish and dangerous; and it is to be hoped that some Germans will have the courage publicly to disown any claim to territory other than that held by their government before March, 1938.

It was unfortunate that Bonn Republic Day produced a feast of Seebohmism, in which meetings thousands strong were made to feel the call of the east. Those who have worked for the independence of the Republic and for a new start in German relations with Europe are both embarrassed and disgusted by the manner in which these meetings are conducted. They are also disturbed by the way in which regional organisations of refugees are being linked up in a single body for agitation and action, which might in time play a sinister part in the German political scene. In the long run things can be done to make life easier for the *Entrechteten*; in the short run their leaders seem to be taking them either towards war or towards a deal with the Russians at Poland's expense. They will receive no help or encouragement in either course from American, British or French public opinion.

German Reparations for Israel

After long months of negotiation, agreement has at last been reached on the amount to be paid in reparations to the Jews by the German Federal Republic. The State of Israel is to get \$715 million in goods spread over a period of 12 to 14 years, and the equivalent of a further \$107 million is to be paid in token compensation for unclaimed Jewish assets in Germany; this sum will be spent by Jewish world relief organisations.

The negotiations have been accompanied by a running fire of bitter criticism within Israel; indeed, the agreement has only just managed to win the approval of the Knesset foreign affairs committee. Some of this criticism sprang from the anxiety of the Government's opponents to beat it with whatever stick comes to hand; but by far the greater part was due to the deep unwillingness of the Jews to have anything to do with the Germans. No material restitution can, of course, ever atone for Germany's moral guilt towards the Jews. But it is right and proper that the Germans should pay some compensation for the Jewish property looted by the Nazis and should help to finance the resettlement of the Jews expelled from Germany.

In Israel there are doubts whether the agreement will achieve even this limited aim. It is a good deal less than the \$1,000 million which the Israelis originally demanded from the Federal Republic; and they do not feel that they have any reliable guarantee that the Germans will really keep up the scheduled deliveries over so long a period. But if the agreement is carried out, and if the Israelis use the reparations wisely and well, it is plain that it might make all the difference to their struggling economy. One immediate benefit will be the ability to take out of the German sterling balances 75 million marks immediately and an equal sum next year with which to buy oil. This should cover

two-thirds of Israel's needs, and for the time being will relieve it of a problem which has become acute since the exhaustion of its own sterling balances earlier this year.

How best to use the rest of the annual instalments is still being considered by the Israeli Government. A 10-year development plan, drawn up by an American expert largely on the basis of reparations goods from Germany, is now being considered by the Cabinet. But a good part of the reparations will have to be used to cover the growing trade deficit, which in the first five months of the year was running at over £43 million. There are fears that this may seriously hamper long-term development; it should, however, be remembered that the state of Israel is in its pioneering days, and that a very high proportion of its current imports are indispensable producer goods.

Shrinkage on the Left

It is becoming to look increasingly possible that the annual conference of the Labour party may turn out to be, as so often before, something of an anticlimax. The dispute between Bevanites and others cannot be altogether avoided, but it may once again be considerably muted. Orthodox Labour policy has now made considerable concessions to Left-wing sentiment on such matters as opposition to the health service charges and dislike of German rearmament. Moreover, Mr Churchill's slowing down of the rearmament programme has greatly narrowed the gap on policy between the two wings of the Labour party. At the same time the TUC has made it clear that Mr Bevan cannot hope for adequate union support if he tries to push his dislike of rearmament further. This, combined with the wooliness of the National Executive's policy statements prepared for the conference, is likely to make the debates on policy at the Morecambe conference rambling and inconclusive—the more so as the man round whom the critics revolve, Mr Bevan himself, will appear as a spokesman of the platform, not of the floor.

Even the elections for the seven constituency places on Labour's executive committee may be less significant than has been widely supposed. This is not because Mr Bevan's supporters are likely to do badly. On the contrary, there is a good chance that all their six candidates will win. The chance is, indeed, so good as to cause some anxiety within the Bevanite camp. A wholesale victory of this type, particularly if it were won at the expense of Mr Morrison or Mr James Griffiths, would be such an obviously false reflection of the true state of opinion within the party as to cause a sharp reaction. Left-wing opinion is strong in many constituencies, but no one could pretend that it represents six-sevenths of constituency feeling. A victory in these proportions might well bring a demand for a change in the method of election to the constituency seats, and also a strong swing against Mr Bevan when Labour MPs elect their Parliamentary committee—the Opposition front bench—next session. And it is in the Parliamentary party—and in the unions—rather than in the executive committee, that the real power of the Labour movement rests.

It would be surprising, moreover, if some of Mr Bevan's associates did not think that the time had come to make a genuine peace with the rest of the party. The election of three or four leading members of their sect to seats on the Parliamentary committee would be almost a guarantee of office in the next Labour administration. Some at least of Mr Bevan's followers would be less than human—or less than politicians—if they did not think the time had come to cash their coupons and take the dividends of their period in the semi-wilderness. They are unlikely to be hindered by any feelings of personal loyalty to Mr Bevan. Of the various influences which have brought forty or so Labour MPs into the Bevanite camp, personal adherence to its leader has been of very minor account. Mr Bevan remains very much the

Progress in Electronics

IN the modern laboratories of the Mullard Organisation, many new applications of electronics are being developed to meet the ever-changing needs of industry, communications, and medicine. Bringing the benefits of this research to the community is another Mullard function. In great factories in Lancashire and Surrey, millions of valves, electron tubes, and components are produced for Britain's electronics industry. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

THE LONDON OMNIBUS

is a Public Service . . .

From *The London Assurance*, which has been serving the public for more than 200 years, comes this Vehicle of Information to tell you about our omnibus collection of Insurance Policies.

"How to be Well Assured"
The many different kinds of Life Assurance we provide deserve a volume to themselves — and they have one. Our booklet "How to be Well Assured" has helped many people to find the Life Policy that suits them exactly. Would it help you?

Aftermathematics
After a fire on business premises the reckoning must include not only material losses but also reduced earning power and trading profits. An ordinary Fire Policy plus our Loss of Profits Policy sums up what is needed.

Valuables Advice
"Rings on her fingers and bells on her toes, she shall have cover wherever she goes" if her jewellery, furs and other valuables are safeguarded by our All-Risks Policy.

No harm in asking
If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally, pray make what use of us you wish. Our address is 1, King William Street, Department M.6 London, E.C.4.

THE LONDON ASSURANCE

Very good people to deal with

leading rebel, rather than the leader of the rebels, and if he feels inclined to press his case further, to retain for another session the freedom and irresponsibility of the back benches, the number of his friends is likely to shrink.

The Truth about 1947

Since the war the Labour Party has conducted its private affairs with so much love of publicity that few secrets have been left for future revelation. One important incident is still, however, obscure. It is believed that in July, 1947, there was an attempt to have Mr Attlee replaced as Prime Minister by Mr Ernest Bevin. A corner of the curtain covering these events has been lifted in the controversy about whether or not the Bevanites are "a party within a party." Mr Bevan's journalistic friends have attacked Mr George Brown, the member for Belper, and one of their most forthright opponents inside the Labour Party, on the grounds that he who now accuses them of disloyalty was five years ago active in moves to depose Mr Attlee from the Premiership. The setting of this alleged *putsch* was the run on the pound after sterling had been made convertible during the first postwar crisis. None of the major actors in the events of that time has yet made public what really happened. It seems clear, however, that towards the end of July Labour MPs were sounded for their reactions to the suggestion that Mr Bevin should replace Mr Attlee. At the same time the *Daily Mirror*, which was almost a Labour paper, accused Mr Attlee of having "contracted out of the country's crisis" and demanded that he should resign.

The whole manoeuvre, if such it was, seems to have been defeated the moment word of it reached the ears of Ernest Bevin; he would have nothing to do with any such change. Mr Attlee went before a meeting of the Parliamentary Labour Party and was given what amounted to a vote of confidence. This took the curious form of the approval by the party meeting of a press notice stating that those taking part in the discussion "expressed the complete satisfaction of the party with the Prime Minister's statement and assured him of the united support of the Parliamentary Labour party in all measures which the Government thought it necessary to take."

In the accounts of the incident published at the time, there was no mention of Mr Brown; his alleged activities have been criticised by some of his Parliamentary colleagues only since he emerged as an outspoken critic of the Bevan group. For this reason, it is interesting to examine not so much the views Mr Brown may have held as the post which he occupied. He was the Parliamentary Private Secretary to Dr Dalton, at that time still Chancellor of the Exchequer. If, as it is now alleged, Mr Brown took a leading part in manoeuvres against Mr Attlee, it is hardly likely that he could have done so without the knowledge, and presumably the acquiescence, of his master. Indeed, Mr Brown was far too obscure a member of the Parliamentary Party to have been able himself to stage a plot against the Prime Minister. If the views about Mr Attlee's leadership that people held in 1947 are to be called into the Bevanite dispute, it might be better that the whole story should be told.

* * *

Frontiers and Food

The function of the British Association's annual meeting is essentially to integrate; to maintain and perfect the contact, increasingly threatened by specialisation, between experts in different fields and between experts in general and the layman. A striking example of the interest, and possibly of the fruitfulness, of juxtaposition has been provided this year by the presidential addresses of Dr N. C. Wright to the agricultural section, and Professor Ogilvie Buchanan, to the geographical section. Mr Wright described his task as one of "reviewing the past trends and present position of

the nation's food supplies," discussing the nutritional objectives of the war and postwar period, the decline and recovery in dietetic standards, the part played by British agriculture and by overseas imports, and—in the broadest outline—the prospects of both. Mr. Buchanan, dealing with "Some Aspects of Settlement in the Overseas Dominions," traced the historical phases and geographical and political influences determining the advance of the agricultural "frontier" over the three and a half centuries between Champlain's first permanent settlement in Canada and the present day.

The movements of the frontier are shown to differ from Dominion to Dominion not only for the obvious reasons—the nature of resources and climate, the state of technique, natural communications and transport development—but also according to "the human circumstances of the particular time at which the settlement took place"—the type of settler and the psychological, legal and political background. The two classes of influence naturally interact. Climate, conformation, and markets may favour the extensive settlement of the pastoralist or the closer settlement of the homestead farmer, while policy and preference may pull the other way. "We cannot doubt," said Mr Buchanan, "that if the nineteenth-century colonisation of Australia and New Zealand had been by Chinese instead of by British people, or if the British colonisation had been seventeenth instead of nineteenth century, the rural landscapes of these two Dominions would have been very different from what they are."

One can conclude, with obvious relevance to the food problems of the world in general and of Great Britain in particular, that there is no special inevitability about the present pattern of use of the world's resources. The extensive frontier has indeed virtually ceased to move; but the still-mobile intensive frontier is influenced by the same sort of extra-economic forces (land-tenure, inter-racial relations, social preferences and prejudices) as have been active over the whole period of settlement. The lesson to be learned from the records of that period may be obscure, but that they hold a lesson is beyond doubt.

* * *

The Flatulent Economy

Professor D. T. Jack's presidential address to the economics section of the British Association is also, though in a different sense, a piece of integration. Just as the distress of a sufferer from measles centres now on his sore throat, now on his consuming itch, now on his feverish headache, so public opinion in an inflated economy shifts in comfortless alternation from bottlenecks and shortages to foreign payments crises and on to the cost of living spiral—generally with only the dimmest idea of their common cause and inter-connections. Mr Jack compendiously presented all these symptoms as part of a single malady, the effects of a full employment policy "pushed beyond its natural bounds."

This malady, as he sees it, is in the last resort an intellectual one. It consists, first, in the depression psychosis which has focused postwar precept and policy on "the type of problem which was prominent during the interwar depressions," to the exclusion of the very different type now requiring attention. It consists, secondly, in an exclusive preoccupation with statistical aggregates regardless of the particular economic realities (such as bottlenecks and general distortions and misdirections) which underlie them. The United Nations reports on employment policy come in for some severe handling on both these counts, as also for their assumption that the pace, in matters of international action to preserve full employment, shall always be set at the discretion of the most flatulent member of the world trading community. Attempts to shift responsibility from one national government to another are, in Mr Jack's view, fruitless.

No less so is the attempt to load it off in another direction—from the central national authority on to the parties to the wage bargain, and particularly on to the trade unions. Given an inflationary level of employment, no central wage policy, even were the framing of such a thing politically possible, is likely to stop the familiar cost-price spiral. The only remedy, the inclusive if discouraging remedy, is to lower the sights—how far, Professor Jack did not say. There is more to this omission than modesty and caution; it marks, indeed, the weak point of his diagnosis. While agreeing with all his strictures on the various *éminences grises* of inflationary policy, one may question their practical importance. The determining factor in Britain's failure to achieve stability has been less the inadequate wisdom of experts than the inadequate political courage of governments; inflationary distresses have been the penalty of our sins less of commission than of omission.

University Returns and Accounts

The great expansion of the universities that has taken place since the war was halted in 1950-51. According to the returns of the University Grants Committee the number of full-time students was 85,314—107 lower than in the previous year; the fall was, however, entirely at the expense of Wales and Scotland. There was little change in the pro-

portion of assisted students—amounting to 73 per cent—or in the subjects that were read. Arts subjects still accounted for 43 per cent of the total, although slightly less than the year before. If this seemed to suit the needs of the times,

It is surprising to find that students of technology were some 300 fewer than in 1949-50.

The returns also show again how heavily the universities now depend on state grants. Sixty-five per cent of their income now comes from this source, compared with 34 per cent in 1935-36. This dependence led the Select Committee on Estimates, earlier this year, to recommend that the universities' expenditure should be subject to parliamentary scrutiny—that their books should be open to inspection by the Comptroller and Auditor General. In its reply published this week, the Treasury rejects this proposal. It points out that such an inspection could have two objects: first, to show that the parliamentary grant had been used for the purpose for which it was intended, and, second, to reveal extravagance. The first purpose, as the Treasury maintains, is already served by the existing audit of university accounts; and as to the second, a detailed scrutiny of what was spent on building and equipment would involve questions of academic policy, and is best left to the University Grants Committee. This committee, with the help of experts from its own works and buildings sub-committee and from the Ministry of Works, scrutinises all plans for which aid is sought, and insists that the universities should accept the lowest tender for their work, unless they can show good reason why they should not do so. The safeguards are thus perfectly adequate. To limit the universities' power, subject to these safeguards, to spend their grants as they think fit, would be to interfere with the essentials of academic freedom.

By Broomstick to Teheran

There is something about the Persians that makes people want to stroke them. Over the last 150 years, they have therefore come to think that stroking is their due. Thus Dr Mossadegh has turned, complacently and without surprise, from fatiguing interviews with the joint Anglo-American government front to greet other visitors. These are Dr Schacht from Hamburg, Mr Alton Jones, the American oil distributor who advised Mexico, and a growing band of Italian, Swiss, German and United States firms who are talking of despatching further oil tankers on test runs to Abadan. On the grounds that "certain efforts and negotiations are going on," he has therefore postponed until September 16th the meeting of parliament that was this week to approve his reply to the Truman-Churchill offer. He seeks to give, and in Teheran has given, the impression that new and better offers to help Persia out of its difficulties are coming from many sides.

Dr Schacht plays a considerable role in increasing the Persian illusion that there are still ample and easy opportunities for recovering lost ground. He is a symbol of wealth without tears. No Persian notices the level at which

he is rated at home: that though he has been consulted in Indonesia and Teheran he has so far been refused permission to open a bank in Hamburg. As was shown in Indonesia, his plans for financial reform now tend to be grandiloquent and detached from political reality. Unfortunately, he has a formidable reputation for wizardry in the popular esteem of the United States. It would be a pity were his fans in America to influence Persian thinking, for it is naive to believe that Persia's ills can be solved by a stroke of individual brilliance. A round of visits and a postponement of the meeting of Parliament constitute no advance upon the state of affairs described in *The Economist* of last week.

Bumper Harvest in Turkey

A welcome additional source of non-dollar grain is being provided this year by Turkey's record harvest. The present estimate of just over 11,500,000 metric tons compares very favourably with the prewar average of under 7,500,000 tons and last year's bumper cereal harvest of over 10 million tons. The Turks estimate that they will have an export surplus of between 1,500,000 and 2 million tons.

This success could not have been achieved if the weather had not been kind; but it is also the result of American financial and technical aid, and of the common sense of the Turks who understood in time the folly of neglecting agriculture in favour of grandiose plans for industrial development. Last year the acreage under the main cereal crops was over 45 per cent higher than the prewar average; this year it is higher still. The credits extended by the Agricultural Bank, which in 1937 amounted to only £731 million, have now risen to over £900 million. When ECA assistance started early in 1949 there were only about 2,000 serviceable tractors available; now there are around 25,000, as well as thousands of combine harvesters and other machinery. Yet, in spite of optimistic forecasts in the Turkish press, it would be rash to pin too great hopes just yet on Turkey as a non-dollar, non-Communist bread-basket for the free world. Its harvests have always been subject to large fluctuations. The techniques now being introduced by the Americans, as well as the extensive irrigation and mechanisation programme, can do much, but not everything, to combat the vagaries of the weather.

Communist Strings to Aid

It is not often that Communist cynicism shows up so clearly in Asia as it has in the matter of Soviet and Chinese grain deliveries to India. From the province of Andhra in Madras the local Communist organisation, one of the strongest in India, has lately appealed direct to both Moscow and Peking for aid to meet the lack of food. In reply the Chinese promised a donation of 400,000 rupees; and the Russians, through Mr Kuznetsov, chairman of the All-Union Central Council of Trade Unions, promised 10,000 tons of wheat (the people of Andhra are rice eaters), 5,000 tons of rice, 500,000 cans of condensed milk, and a donation of 250,000 rupees. The Chinese made it a condition that their aid should be distributed by the Communists' famine relief committee in Andhra. Similar strings to the Russian offer are reported to have been cut only on the adamant insistence of the Indian government, which states that it learned of these offers only from press reports. Peking's refusal to allow distribution save as a propaganda operation by a group pledged to overthrow the government has forced Delhi to decline the Chinese offer.

Mr Nehru's government has issued a statement in which it points out that the problem of "relief is not a party or political question," that gifts are welcome wherever they come from, and that they will be used in the areas named by donors. But the practice is to

distribute them through the government or agencies like the Indian Red Cross. Distribution of gifts from abroad by private organisations interferes with the government's own plans for relief and rationing and creates difficulty and unhealthy rivalry between the various private organisations.

Nothing could be fairer than that.

The clumsy impertinence of these Russian and Chinese attempts to gain kudos from relatively small amounts of assistance may be gauged by comparative figures about the grain that has reached India in the form of aid between January 1, 1951, and April 30, 1952. Of a total of 6.7 million tons, 3.8 million tons—over 50 per cent—came from the United States, 2.3 million tons from other non-Communist countries, 500,000 tons from China and 100,000 tons from the Soviet Union.

The Price of Progress

The destruction of the de Havilland 110 last Saturday before 100,000 people is a disaster raised to the plane of tragedy by the circumstances that surrounded it. John Derry was flying the fastest and the most powerful aircraft that has yet been built in this country, and for nearly a year he had been alone in flying at speeds above the speed of sound. The present supremacy of British aircraft design is built on the courage to take such a step into the unknown, to develop aircraft that must fly under conditions yet to be explored. To a great degree, therefore, the ultimate success of the enterprise rests on the men who deliberately fly the aircraft in such a way as to discover whether they can survive those conditions. They do not always return. Last year the pilot of the Hunter prototype was killed; the Swift, the Valiant and the Javelin have all been involved in accidents. The break-up of an aircraft is not counted as a defeat either

To those MAKING and MERCHANDISING

Every day comes news of more effective marketing ideas and methods.

To have the TIME . . . to have the OPPORTUNITY . . . to keep abreast! How easily one could jump ahead! Let us introduce you, then, to

This brilliant new monthly provides that opportunity; its superbly illustrated pages packed with features on every selling angle from factory to counter.

IMPACT wastes not a moment of your time. Lavish in presentation yet shorn of every word superfluous to SELLING. Created especially to help in the harder-selling times ahead.

Good packing is an investment

Proud of your product? Then be critical of the way it is packed! Wise manufacturers use "FIBERITE" packing cases, for "FIBERITE" quality is complementary to good goods. But "FIBERITE" cases are not a luxury, they are as good as good packing can be — yet they are economic in cost and bring packing room savings that are a distinct advantage these days — savings in space, time and trouble.

Scene reconstructed by Roy Carnon.

WHEN IT FIRST OPENED ITS DOORS, in 1894, to post-graduate students from other universities, the Cavendish Laboratory at Cambridge granted them a greater privilege than anyone suspected. Only three years later their brilliant leader, Professor J. J. Thomson, announced that his experiments with cathode rays had revealed "... matter in a new state ... in which the subdivision of matter is carried very much further than in the ordinary gaseous state. ..." With this discovery of the electron, as it is now known, came the dawn of the atomic age — an age which has already transformed science and industry — giving us such wonders as television and the electron microscope — and has provided a vast new source of power. How rich were the closing years of the nineteenth century in great names and great beginnings!

It was also in 1894 that Albert E. Reed took over an almost derelict straw paper mill to make super-calendered newsprint and other printing papers. Acquiring and revitalising other paper mills with remarkable energy and foresight, he founded one of the world's largest paper-making organisations. And at the five mills of the Reed Paper Group — where giant modern machines produce every day hundreds of tons of newsprint, kraft, tissues and other papers — his pioneering spirit is kept alive in ceaseless technological research.

PIONEERS IN MODERN PAPER TECHNOLOGY

by the men who build or the men who fly and die in them. It is the price paid for knowledge that can, so it seems, only be obtained by testing to destruction.

The great surge of public interest in the aircraft industry has manifested itself in what has become a remarkable annual pilgrimage to the air show at Farnborough, which was never planned as a public display. Last Sunday 140,000 people saw another pilot, Mr Neville Duke, take over the mantle of John Derry where nearly 100 people were killed or injured the day before. Spectators at any trial of skill run some risk, whether from horses, cars, motor cycles or aircraft. The real disaster would be the day when men no longer came forward to fly the 110, as Derry flew the aircraft in which Geoffrey de Havilland died, and when the crowds no longer came to cheer them in the flight.

Miss Horsbrugh Against Cranning

The Minister of Education has issued a circular reminding local authorities how the General Certificate of Education should be used. Though it can be adapted to the needs of children leaving school at sixteen or so who want a national qualification, it is primarily intended to be taken at the advanced and scholarship standards, as a qualifying examination for the professions and the universities. It was designed to make the schools as free as possible from examinations, and the children free from the tyranny of a rigid curriculum.

The new certificate has had very little of the effect that was intended. It is being used as if it were the old school certificate. Although it is awarded in individual subjects pupils are taking it, not in the subjects for which they show most interest and aptitude, but in a standard range of sub-

The Permanent Civil Servant

One of the great advantages which we enjoy in this country, and which, perhaps, more than anything else, gives a free scope to the exercise of that great constitutional principle, which requires a change in the *personelle* of the Executive, whenever public opinion, expressed by Parliamentary majorities, demands it, is, that in every department of the Government there are high and responsible officers, who hold their appointments permanently, and who are safe guides to the Ministers of the day, so far as the form and routine of business is concerned. And one of the highest and proudest boasts connected with our public offices is, that whatever may be the private political views of these permanent officers, they are far above party considerations in the discharge of their public duties. There is, perhaps, no one point connected with official life, which has from time to time been more frequently alluded to by Ministers of all political parties with pride and satisfaction, than the great advantages which they had derived from the assistance of those permanent high officers, and the honourable manner in which their duties are performed. It is to this element in the constitution of our departments that we are indebted for that uniformity which characterises, in so remarkable a degree, the public business of this country, which gives the stamp of stability to the routine of our offices and the execution of the law, and which saves the public from a great portion of that inconvenience, to which, at first sight, it would naturally be exposed by a change of Government, and to which those countries are exposed, greatly to their loss and inconvenience, where, with every change of Government, it is customary to change the whole official staff.

The Economist

September 11, 1952

jects. This is not, in the first instance, the fault of the schools. It is due to the insistence of parents and employers on some written evidence of an all-round education; they are not content to rely solely on school reports and headmasters' recommendations. This is largely inevitable; but if the Ministry would address its propaganda to parents and employers, it might have some chance of making their demands on the curriculum less rigid.

In the same circular the Minister puts an end to hopes that she, too, might be less rigid in her attitude to the certificate; she has no intention of instituting a distinction mark at the ordinary level of the examination. It was decided last May to award distinctions at the advanced level, but still not at the ordinary—Miss Horsbrugh for some reason believes that they might "reduce the significance of ... the normal pass standards." The spur of competition, however, is equally desirable at every stage. Another disappointment is that no effort has been made to abolish the minimum age of entry in time for the supplementary examination to be held at Christmas. Now that they know that there will be no minimum age next summer it is harder than ever for clever children to be held up for a full year just because they are not sixteen—and just because it is too much trouble to arrange otherwise.

Spending Per Family

Any speculation about the budget of an average household invites scepticism. Even after all the levelling of recent years, households still vary so much in size, in their incomes and what they do with them, that averages may seem to be merely an arithmetical exercise. No actual household can in fact be labelled "average," since the average works out at 3.2 persons per household. But at least it provides some yardstick by which to reduce the figures

THE AVERAGE HOUSEHOLD BUDGET.

	Expenditure per week	Net Indirect Taxes or Net Subsidies (—)

* Including taxes that cannot be allocated to specific items.

on income and spending in the new national income paper to a more easily digestible form than the hundreds of millions of pounds for the country as a whole. Though there are some statistical snags in the calculations, they suggest that the income coming into the average household in 1951 was about £14 a week. This may seem surprisingly high, but there are some 23 million workers spread among the 15 million households—on the average, therefore, one person working full-time and another half-time in each household. In addition to these earnings, interest and dividends, pensions

and other payments from the welfare state have also to be apportioned out.

The table and chart show how the £14 a week was spent and how much the tax collector took, directly or indirectly, in an "average" family distributing its spending in the same proportions as the nation as a whole. The tax collector

reaped altogether nearly £4 a week, if national insurance contributions are included. Less was spent on rent than on either drink or tobacco. Another striking point is how little purchase tax on clothing cost the average household, while taxes on smoking and drinking yielded nearly three-fifths as much as did income tax. This piece of accounting ends with the slender figure of 2s. 4d.—all that the average household saved each week out of its £14.

Books and Publications

Parliament in Danger

Parliament: A Survey. Edited by Lord Campion. *Allen and Unwin.* 296 pages. 22s. 6d.

This book has issued from the discussions of a group of distinguished parliamentarians, lawyers, historians, and civil servants which was convened by the University of London. It consists of thirteen individual studies of the working of the British parliamentary system under modern conditions. These essays cover a wide field. Some of them (Mr Amery's, for example) throw interesting sidelights on recent political history, while others (such as Lord Campion's discussion of parliamentary procedure) provide valuable material on constitutional developments. What gives cohesion to the whole book, however, is the common reverence for parliamentary traditions shared by all the authors. This approach has precluded complacency, and led a majority of the writers to strike a note of alarm and even of despondency about the status of Parliament today.

"The British Parliament," states Sir Arthur Salter, "has a past of glory, a present of frustration, a future of uncertainty." In similar vein, other authors contrast the perplexities of the present with the glories of the past. Mr G. M. Young finds his golden age in the period between 1840 and 1870, "when Parliament and the Executive seem to have achieved a proper balance, resting largely on the presence in Parliament of

a substantial body of experienced, knowledgeable, independent members." In his view, there are fewer men of sound judgment in Parliament today.

It is not so much the quality of members as their diminishing independence which causes apprehension. Several contributors mention Sir Alan Herbert as an honourable anachronism and wish there were more like him. The professionalisation of politics, fed by the payment of members and the enlargement of Government-dispersed patronage, has increased the rewards for party loyalty and the penalties for even a minor deviation. The resounding defeat of rebels, independents, and the smaller parties at the 1950 and 1951 elections is seen as the forerunner of more sinister possibilities.

The authors of this book are in general agreement that the growth of party discipline is deadening and dangerous. Party discipline feeds, and in turn is fed by, the growing powers of the executive. Then two interlocked developments, which have grown together since 1900, have gathered their real momentum since 1939. Sir Cecil Carr, in the chapter on delegated legislation, points out that the discretionary powers of Ministers have grown well beyond the limits envisaged by the pre-war Committee on Ministers' Powers.

A Lesson from Bedlam

Plutarch narrates how young Spartans were taught sobriety by being confronted with riotously drunken slaves, and in England, during the eighteenth-century, eccentrics were sometimes cured by being taken on a tour of Bedlam. A similar idea seems to have been applied by the Singapore Police in its treatment of students detained under the emergency regulations in January last year for alleged membership or support of the Communist party. The students were placed on St. John's Island, off the coast of Singapore, together with other militant Communists. The compounds were run along strictly Marxist lines, under rigid party discipline and with discussions and lectures on dialectical materialism. It is now announced that all save one of the students have been released and are "cured." The violent aspects of Communist discipline, the stifling intellectual orthodoxy required, seem to have discouraged the young adepts. One of them, in fact, lived in continuous terror of his more hardened companions.

This original scheme raises a number of intriguing issues. It involves considerable risk; for penology suggests that younger criminals are usually made worse by association with experienced jail-mates. Moreover, are certain groups of Communists to be kept in a fiercely ebullient state in order to maintain the stock of vaccine? Many young Communists in western countries would be profoundly shaken if they could witness their creed in action; for there is nothing like a course of continuous lectures and disciplined discussion groups to cool down the average enthusiast.

Professor Wade shows how the conferment of these powers has been (since 1939) drawn in terms too vague and broad to be challenged effectively in the courts. He believes that a solution to the problems posed by administrative justice must be sought in political rather than in legal safeguards. But how can Government powers be curbed and controlled, if its faithful following in Parliament raise no objections?

This is the ugly question which causes Mr J. J. Craik Henderson to dilate on the "dangers of a supreme Parliament." He believes that the very principle of the sovereignty of Parliament, so faithfully secured by the British constitution, may serve the purpose of majority tyranny—of rule by a party élite. Other authors, too, sharing this fear, cast around for remedies; the one most frequently mentioned is the effective deployment of a purged upper house as a check on the possible excesses of an unbridled majority in the Commons. Mr G. M. Young suggests the alternative of a series of advisory councils, composed of affected interests, supervising each main sphere of Government activity—a variant on the older idea of an industrial Parliament. Other writers analyse the possibilities of improved parliamentary supervision over the work of the executive, although Sir Arthur Salter stresses the general view that such supervision will be of very limited effect, unless the powers themselves are reduced.

Clearly, these suggestions are no more than palliatives. To read this book is to get the impression that the only real cure would be to put the clock back—to tame the executive, to release the member from his party chains, to revive that substantial body of experienced, knowledgeable, independent members lauded by Mr. Young. But this is impossible. Politics, for better or worse, has lost its amateur status, and the bloated executive has become immune to all but minor deflations. Are then the forebodings to be found in this book justified? Or are, perhaps, the dangers somewhat exaggerated, and the benefits of firm and effective government too little remembered?

Fish and Fishing

Come and Fish. By Michael Shephard. *Museum Press.* 240 pages. 18s.

The Book of Sea Trout. By Hamish Stuart. *Jonathan Cape.* 286 pages. 16s.

The occupational disease of writers of fishing books is an inability to illustrate points from personal experience without lapsing into esoteric angling autobiography. But Mr Shephard is immune. He has the gift of being able to instruct and yet to keep alive the atmosphere of the waterside, to teach without dogmatism, and to recount experiences which illuminate the reader's mind rather than the writer's prowess. But then few can have such a rich and varied experience to draw on. From roach to salmon, from dry fly to paternoster and maggots, he has done and enjoyed it all; and about all of it he has something fresh to say. It is rare to find a fishing book so free from barren anecdote and from statements of the obvious. It is written with that serene geniality which has informed every really good fishing book from Walton onwards. Not that he will trifle with the widespread illusion that fishing is an inactive sport. "Patience is the last virtue needed by the true angler, unless it is patience when listening to the unfounded opinions of those who have never fished." But fishing goes with a certain geniality of temper—except in well-recognised interludes such as those provided by broken casts, tangles, leaking waders, or occupation with something other than fishing.

Mr Shephard's tastes are catholic, and the nearest he comes to expressing any preference is to refer to the tench as "perhaps my favourite fish." But he concedes that the sea-trout is "the gamest fish of all." And who would not concede it to that silver streak of acrobatic fury? It is right and proper that Hamish Stuart's classic, devoted to sea-trout exclusively, should now be republished; the original edition is hard to come by. Serenity and geniality of temper were not unfailing in Hamish Stuart's writings. A pugnacious and intolerant controversialist, he was almost as venomous about other writers on the salmonidae as was Joseph Pennell about other writers on etching. His opponents in debate are not the only people to whom his contemptuous asperity can be irritating. None the less there is some

quiet fun to be got from it here and there—as for example, from his sallies at the "Scale School," at the confidence with which examiners of a single scale will pronounce on the nicest details of a fish's *vie économique* and *vie amoureuse* of three years before. And really the asperity is but pepper on the meat. Hamish Stuart knew his sea trout through and through, watched their habits and their haunts and noted their every reaction to tide, weather, water, and angler. In his enthusiasm for the study and preservation of the fish, and in his delight in fishing for it and in the places where it is fished, the rough-tongued critic disappears. In his place is the enthusiast, who takes a happy and unresisting reader with him to follow the trout's journeys to and from the estuary, to tend his pools and lochs, and to beguile him with fly and lure in Roag or Howmore.

Reform Diaries

Three Early Nineteenth Century Diaries. Edited by A. Aspinall. *Williams and Norgate.* 402 pages. 45s.

The three diaries which Professor Aspinall has edited were written between 1830 and 1834 by politicians who, although—or perhaps because—they were not of the first rank, were excellently placed to follow at close quarters the bitter struggle which raged around the passage of the Great Reform Bill of 1832, a measure as important as any in the constitutional history of this country. Le Marchant was principal secretary to Lord Brougham, Lord Chancellor in the Reform Ministry of 1830-34; Littleton was a moderate Whig MP who nursed the ambition of succeeding Manners Sutton in the Speakership of the House of Commons, while Ellenborough, the son of the Lord Chief Justice, was a Tory who held office under Wellington and remained his faithful, though not uncritical, supporter throughout the battle against Reform.

The diaries do not materially modify the knowledge we have of the general history of the crisis, at the height of which "people talked very openly of civil war and even of a change of dynasty." But they do provide a detailed and wonderfully intimate view of the political and social life of the years they encompass. The diarists' very lack of distinction makes them admirable chroniclers of the events they witnessed and gives their observations an authenticity seldom attained by men of greater perspicacity and vision. They set down indiscriminately their private preoccupations and their reactions to what they saw and heard, their verdicts on the leaders they followed or opposed, their hopes and fears. They do not, of course, present a full picture of the politics of Reform. The popular agitation in the country—where "the arrival of a coach from London at an unusual hour emptied the workshops in an instant" and "workmen walk about, talking of nothing but the Bill"—has only a marginal place in a chronicle of political events in London. But it does intrude sufficiently in these pages to show how

well Tories and Whigs realised that they were confronted with a power that was a greater threat to both than either could ever be to the other.

Professor Aspinall's editing is remarkably skilful and meticulous; his introduction underlines a number of the most important aspects of Reform. In particular, the section which he devotes to the Tory party organisation after 1830 shows how much research remains to be done on the development and history of party organisation in Britain. This book will be indispensable to the student of early nineteenth-century politics, while the general reader will find much that is interesting and amusing about one of the liveliest periods of British political history.

Analysis of Social Science

Mind and Society. Epistemological Essays on Sociology. By Bart Landheer. *Martinus Nijhoff, The Hague.* 112 pages. 5.50 Guilders.

Perhaps one of man's greatest achievements has been his willingness to decide between competing theories of nature without reference to his own wants and fears. With regard, however, to theories about society he may well be still at that stage of emotional attachment which once characterised his attitude to nature. Professor Landheer puts this kind of point more strongly when he suggests that the social sciences have developed too much as the ideologies of different social groups. He

Ready Shortly PROGRESSIVE TAXATION

A STUDY IN THE DEVELOPMENT OF THE PROGRESSIVE PRINCIPLE IN THE BRITISH INCOME TAX

By F. SHEHAB 30s. net

Progressive taxation is, broadly speaking, a method of taxation by which the rate of tax is graded so that the rich pay proportionately more than the poor: the income tax and death duties provide vivid examples of how firmly it is now bedded in the British fiscal structure. In this book the author sets out to trace the history of the principle which underlies this method of taxation as applied to the British income tax.

First introduced in 1799 by Pitt, the tax has in the course of little more than a century completely changed the face of English society; this book resurveys the course of this silent revolution, shows how at each step in the path of reform the prophets of woe described mighty problems, economic, administrative and social, and tells how some were illusory, some overcome, and some remain.

OXFORD
UNIVERSITY PRESS

maintains, rather surprisingly, that one of the reasons for this is that the social sciences have not had as much contact with philosophy as natural science. His remedy, therefore, for their emotional attachment is a course of philosophical analysis.

The core of the trouble seems to be that in social science we have a changing mind trying to study a changing set of social relationships. The author thinks, therefore, that "only in a stable society with a definite pattern is the formation of social theories with a fairly general validity possible." So he sets out, consciously culture-bound by western civilisation, to follow out his hunch that common factors can be discerned in the mental structures of changing individuals which will be writ large in social development, social organisation, and thought systems. His modernised version of the Platonic soul comprises natural or short-term reactions, rational or long-term reactions, and the reactions which extend beyond the span of individual life. Consequences are deduced from these admittedly abstract concepts of individual mental structure which lead on to the discussion of Max Scheler's philosophical anthropology, "civilisation" as a sociological category, together with its three stages and Dr Toynbee's theories about it.

There are many puzzles about methodology in the social sciences and it is high time that philosophers cleared some of them up. Professor Landheer sees some of the problems, but he cannot be said to give either clear or cogent answers to them. Indeed, his book is the sort that often leads one to reflect that the social sciences suffer from too much rather than too little philosophising about them. And, no doubt, the contemporary impatience with the type of philosophising of which this book is a fair representative is as socially significant as the book itself. There may nevertheless be good reasons for it.

War and Peace in Israel

The New State of Israel. By Gerald de Gaury. Derek Verschoyle. 260 pages. 18s.

Israel. The Establishment of a State. By Harry Sacher. Weidenfeld and Nicholson. 332 pages. 25s.

Among the spate of books now appearing on Israel in Britain and the United States, one by a gentile is—or ought to be—a landmark. Colonel de Gaury has written some vivid and readable books about Arabia; he could justifiably be expected to do the same about Israel. He has not attempted this. His survey, though dressed up as a book, is in fact a handbook. Department by department, he has collected the voluminous reports produced by Israeli ministries (usually for the benefit of American Jewry) on the way in which they run their work. The result is a series of arid summaries useful chiefly to those who need to know exactly how the voter who has not yet learnt Hebrew manages his ballot paper, or that the Negotiable Documents Department prints the stamps, or that

"legal draftsmen follow the development of all draft legislation."

The book is a mere skeleton, containing no drop of the new state's life blood—of the excitement of reconditioning the desert, the frustrations created by controls, the admixture of bullying and benefaction that makes Histadruth policy, or the drawbacks and triumphs of assimilating unpromising immigrants. Only in a financial chapter which is by another hand does it attempt an assessment of pros and cons. An admirable collection of photographs merely emphasises how good a book the author could have written if he had described what he saw, instead of what he read.

Mr Sacher's book is for half its length a repetition of the often-told tale of the last days of the mandate and of the muddled thinking that marked the successive decisions taken by the United Nations. For the other half, it is a history of the Palestine war from the Jewish side—incomplete, in that it cannot yet set out, "for comprehensible reasons," the full story of relations between the government and the Irgun, but interesting in that it conveys, often by direct quotation from hitherto unpublished memoranda, a good idea of the spirit that fired the Jewish nation to win its country.

The sub-title of the book should be its title, for the only point at which space is devoted to Israel today is in a final chapter called The Future. This is temptingly full of all-too-brief references to topics about which everyone is anxious to learn. Why did Mr Sacher thus allocate his space? What purpose does he think he serves, at the present juncture in Anglo-Israeli relations, by looking back over his shoulder at the bitterness of four and five years ago? He does not benefit history, for his text is warped by what used to be contemporary bias, and historians already possess such material in abundance. Criticism of British mandatory rule is well founded, but is no longer valuable unless allowance is made for Mr Bevin's embarrassments created by British dependence on the United States and British relationships with Moslem countries, notably Pakistan. Nor is a portrait of the Jewish community historically valuable when no strictures are uttered on some of the devices it used to get its way. At least half the book will be welcome only to those who enjoy opening old sores.

Word Histories

Concise Etymological Dictionary of Modern English. New Revised Edition. By Ernest Weekley. Secker and Warburg. 480 pages. 35s.

Now in his middle eighties, Professor Ernest Weekley has prematurely become something of a legend, both among generations of French students (at least one of his works is still a textbook) and to the general public ever since, exactly forty years ago, his delightful "Romance of Words" appeared. Fortunately, "The Romance of Words" is still available, although the equally delightful

"Romance of Names" is out of print. As a populariser, always scholarly, yet always immensely readable, of the origin and history of words, Professor Weekley has deserved well of the public. His "Words Ancient and Modern" remains in print; so does the charming "Jack and Jill," a study of Christian or given names; and one hears a rumour that a "modernised" and enlarged edition of "The English Language" is on the way.

Likewise "modernised," enlarged and scrupulously revised is the new edition of the long out of print "Concise Etymological Dictionary of Modern English," first published in 1921. What we have here is, therefore, a virtually new book. How timely it is. Apart from Skeats's large dictionary, last reprinted in 1910, there has since the early 1930s been no reputable etymological dictionary of English, whether here or in America. To have to go to the vast Oxford English Dictionary, or to the by no means small Webster's New International Dictionary, is to ask rather much of anyone not conveniently near some great library nor owning a millionaire's purse. This revised "Weekley" supplies the answer, for not only is he up to date (phoney, spiv, allergy, penicillin), but he is reasonably comprehensive. Although he subscribes to none of the current fads of philology, he knows about them, has investigated what they involve, and deliberately stands aside.

This wise and temperate lexicographer possesses the rare talent of being able to please the general educated reader and to conform to the demands of scholarship. But then, he is a practised writer, with a style of remarkable lucidity and simplicity, and a notable scholar. Hence his ability to render even a dictionary, packed with scholarship, thoroughly acceptable to those who have no philology. He employs few abbreviations and no symbols. Among the many fascinating word-histories to be found in this book, those of the following words are, without being necessarily the best, at least typical: beach, cockney, fret, lounge, penguin, quaff, stride, wee, wood.

In every sense, "The Concise Etymological" is very good value.

Seeing Without Perceiving

The Twelve Republics. By M. Follick. Williams and Norgate. 357 pages. 18s.

In January, 1948, Mr Follick made a brisk tour of the Caribbean, with the praiseworthy aim of arousing interest in the Interparliamentary Union. As a member of Parliament, he was hospitably received wherever he went, and he saw much; but he seems to have perceived little. In this book he has eked out his notes with lengthy historical interpolations which amount to little more than summaries of buccaneering exploits. But on the whole the tales of Drake and Hawkins contrast favourably with the author's own narrative, which abounds in such vivid descriptions as this, of an ambassadorial residence: "The rooms of his house

are large and nicely arranged, with a large garden in front and a still larger one behind."

Mr Follick did not always see so clearly; he was never able to work out why Salvador is more densely peopled than Honduras, or why the Pacific end of the Panama Canal lies east of the Atlantic end, and he thought it "really disgraceful" that Venezuela should have so much less railway than Britain. But his moments of bewilderment are, perhaps, preferable to his numerous incisive judgments. British Honduras, he tells us, has possibly the most strategic position in the whole world. The late Jorge Gaitan was the most promising Latin American politician of the century. Henry VIII (Mr Follick digresses rather far at times) launched England on four centuries of domination of the world. Even geography and spelling must bend to the author's will. The most interesting point on what he calls "Old Man Orinoco" is where "the Portuguese and Apure join to rush madly into the mother stream at San Fernando. Great ocean-going steamers can reach this point." Such strange statements would matter less if the author did not try to write authoritatively on controversial matters; but it is somewhat irresponsible for a member of Parliament to build up a violent attack on the oil companies in Venezuela simply by converting their 50-50 division of profits with the government into one of 80-20.

But if Mr Follick adds little to our knowledge of the Caribbean, he tells us a great deal about Mr Follick. We learn how Lord Beaverbrook waved to him in Nassau, how congenial he has found General Trujillo, Lenin, Franco and Bernard Shaw, how he had a long talk (not described) with Mr Sol Bloom in Washington. Above all, one is grateful for his account of his return to London. "My statement in the House of Commons caused a stir the like of which is seldom experienced. . . . The country was thunderstruck at the truths that I revealed." The pity of it is that Mr Follick is quite right in seeking to arouse British interest in the Caribbean area; but it is to be feared that this book will have a rather different effect.

Shorter Notices

The Perón Era. By Robert J. Alexander. Gollancz. 239 pages. 12s. 6d.

In 1943 a group of Argentine officers issued a manifesto which openly demanded that their country should make itself master of all South America in the same way that Germany was supposedly the final master of all Europe. They called for "an inflexible dictatorship" on the German model, and warned their generation that it must be "sacrificed" for this heroic ideal. The subsequent decade has seen one of the leaders of this group, Colonel Juan Perón, impose both the dictatorship and the sacrifice on the Argentine people; but it has not seen the achievement of the Argentine hegemony which these efforts were meant to bring about.

Mr Alexander has written an admirably succinct and readable account of Colonel Perón's climb to power and of the policies of his régime. Inevitably, his narrative does

not cover the latest developments; but the results of the last elections and the economic difficulties of the first half of this year are foreshadowed, and substantially confirm the book's analysis. The brutal suppression of civil liberties and the nauseating adulation of *El Líder*, which are such prominent features of *Peronismo*, are sufficiently familiar to British readers; but Mr Alexander performs a useful service in bringing out the genuine enthusiasm that the present régime has awakened among the Argentine workers by its lavish use of social and economic benefits. How long this enthusiasm will endure among economic difficulties is, however, doubtful; and, as Mr Alexander makes clear, it is the failure of President Perón's economic policies that has also stultified his efforts to dominate the whole continent.

Case Law on National Insurance. By H. Keast. Thames Bank Publishing Company, Limited. 194 pages. Index and Tables. 10s.

This book is well described by its title. It is a summary of the various lines of decisions given by tribunals set up under the National Insurance Act, 1946, and the National Insurance (Industrial Injuries) Act, 1946, which between them cover the social benefits for sickness, unemployment and maternity, death grants, retirement pensions and compensation for industrial injuries. The result is a most useful working manual for all who have to advise and help the individual in contact with the actual machinery of the welfare state.

The Annual Register, 1951. Edited by Ivion S. Macadam. Longmans Green and Company, Limited. 506 pages. 63s.

When a publication reaches its 193rd year it is perhaps enough to say that it takes its previous form and brings its usual information up to date. This "review of public events" continues to present current history by logical, rather than chronological grouping, so it is not surprising to find the largest section devoted to "Foreign History." But since this logical grouping has been adopted, has the time not come for the Advisory Board to consider incorporating "Finance, Trade and Industry" with the rest of the history of the United Kingdom instead of segregating them in a chapter by themselves after literature, the arts and science?

Willing's Press Guide, 1952. Willing's Press Service Limited. 620 pages. 21s.

The seventy-eighth annual issue of this reference book to the press of the United Kingdom and the Irish Republic has two new sections: one which groups the productions of leading publishers and the other giving references to publications offering "group advertising." The rest of the book follows the familiar pattern and provides alphabetical and classified information about newspapers and other publications. The main foreign publications are also listed.

The Investor's India Year Book, 1952. Compiled by Place, Siddons and Gough. Orient Longmans. Calcutta. 374 pages. Rs 20.

The main part of this reference book gives financial details and a ten-year series of annual results of companies quoted on the Calcutta Stock Exchange. This edition, the thirty-eighth, restores the full section on tea companies last published in 1943-44.

A preface reviews the events of 1951 and their influence on the Indian economy, and deals in some detail with the main industries.

Time Will Run Back. By Henry Hazlitt. Ernest Benn. 256 pages. 15s.

Mr Hazlitt introduces us to Wonworld, the terrible and logical application of Communist ideals projected into a future where the rest of the world has been subject and semi-starving for more than a hundred years. If the scene were more than a painted back-drop for the arguments of two reformers, it would be more frightening, but, unfortunately, we are becoming immune to these oft-repeated warnings, and it will take a more realistic account of the abominations of Communist rule to shake this horror-weary generation out of its apathy.

The author claims that he has merely set down what is happening in Russia today, or has been seriously proposed by contemporary Communist and Socialist writers. From the outset the reader will scarcely expect impartiality in a book about Communism by an ardent capitalist, but, in any case, it is very soon apparent that this flimsy tale is but a peg upon which to hang an ABC of economics. The clarity with which Mr Hazlitt presents the thesis that if capitalism did not exist, it would be necessary to invent it will recommend itself to many, but there is a certain naïveté about the rest of the book which begets impatience.

Underground movements are the ubiquitous corollary of dictatorship. But there is a wild improbability about Mr Hazlitt's unique saviour, brought up on an island Utopia on mathematics, music, chemistry and chess—without ideological bias, and no history, true or false. That any young man, let alone the ruling Dictator's son, should be allowed this education in such a world, is incredible, but that he should have escaped assassination once back in Moscow beggars belief. To rely on such a god from such a machine would remove all hope of redemption.

Letters to the Editor

Freezing Pensions

Sir,—In your issue of August 30th you rightly call attention to the prospective rapid rise in the cost of old age pensions. But to my thinking the trouble is due not solely, or perhaps even mainly, to the fact that the span of human life is being increased, but to our misguided method of reckoning the years of dependence of old people.

The ratio that really matters is not that between those below and those above a certain fixed age (60, 65, or 70) but between those capable and those incapable by their work of paying their way. Greater longevity for the average man and woman should be, and in fact is, accompanied by a simultaneous expansion of the average years of potential activity. There are wide differences between one individual and another. Some become infirm in their fifties, others do their best work in their sixties and even seventies—notably our present Prime Minister in his leadership of the nation during the war.

Yet we continue with our rigid rules about retirement. I know, for instance, two women, one in public and one in private employ, who have been compulsorily retired at 65 when, so far as I can judge, they were at the height of their efficiency. They are now searching for some inferior job to enable them to remain independent. Cannot some way be found of dealing with this absurd waste of the nation's human resources?—Yours faithfully,

PETHICK-LAWRENCE
London, W.C.2

Champions of European Unity

Sir,—I was rather surprised when I read in your issue of August 16th the statement: "In the crucial area of parliamentary action they (the creators of European union) are only three (Schuman, Adenauer and de Gasperi)," followed by another statement: "Only the Catholic parties of the Centre which these three men lead are committed unequivocally to the federal ideal."

In my view, while it is true that it is only "a small force" which is trying a "great change," you overstate your case. In the first place, the statements are not materially correct, if one considers the contribution, which was or is being given by men like Plevin, Sforza, Spaak, Carandini, Blum, Reynaud, etc., etc.; and, in Italy, for instance, republicans, social democrats and liberals are officially committed to the support of European union.

In the second place, even if it is true that the stronger force is formed today by the Catholic parties, your editorial seemed to me to convey also the idea that federalism is an essentially Catholic ideal. This does not appear to be fair to the Italian lay tradition (to stick again to the Italian case), which is indeed mainly responsible for the creation and the propagation of that ideal. As a matter of fact, what Signor de Gasperi

is doing both in his foreign and domestic policy (and this is high-skilled liberal statesmanship) is to absorb and adopt the ideas and ideals of the men and parties which led Italy on the morrow of the *Risorgimento*. This is no surprise, if one considers the substantial lack of modern political traditions of the Catholics and bears in mind de Gasperi's great effort to strengthen the democratic coalition to hold off the threat from the Catholic right wing.

The minor democratic parties, however small, count in our politics much more than is revealed by statistics and electoral returns. This statement surely ought to be understandable in a country, like England, where one has witnessed for 40 years the changing role of the Liberal party and its impact on the British party struggle.—Your faithfully,
Naples RENATO GIORDANO

Reviewing the Rates

Sir,—Your necessarily brief review of a seven-page report prepared by the Society of County Treasurers has produced two letters of criticism in your issue of September 6th.

"County Councillor" does not agree with the view of the Society that the principle of the Exchequer Equalisation Grant is fundamentally sound. He bases this belief on the grounds that deliberately reduced council house rents would result in lowered assessments for rates and a consequent increase in the Exchequer Equalisation and Education Grants. Even if "County Councillor" could prove by figures that this device would assist a county borough council—and I very much doubt if this could be shown—it would certainly not be true of the county areas. The loss of rents would be met by the ratepayers of the district concerned, but any benefit of the Equalisation and Education Grants would be shared by the ratepayers of the whole of the county. In any event, "County Councillor" appears to have forgotten that since 1950 all valuation for rating has been the function of the Inland Revenue and not of the district councils. The County Treasurers' report makes it abundantly clear that the Equalisation and Education Grant systems can work fairly only if they are based upon uniform standards of valuation throughout the country.

Mr Silvan Jones is disappointed with the report and expected something more solid, but he appears to select one out of the twelve points in the summary of conclusions as apparently being of prime importance. There are over 16,000,000 people living in areas above the national average, for which and for whom there is no system of equalisation of rates at Exchequer expense. Would the report have been more solid if it had ignored this?

Mr Jones says that there are two main criticisms of the 1948 Equalisation Grant system:—(a) the inadequacy of the sparsity weighting in the Grant formula, and (b) the minimum average rateable value per head is no guarantee that resources are sufficient. Both these

points were in fact dealt with in the report.—Yours faithfully,

R. S. McDOUGALL
President,
Society of County Treasurers.
Hertford

Austrian Jewry

Sir,—The article from your Vienna correspondent in your issue of August 23rd appears in certain respects to be based on misunderstanding. He writes, "the question of Jewish compensation is an extremely complicated one bound up with the negotiations at The Hague between West German and Israeli representatives, with Austria's general financial situation, with the fact that some of the Jewish assets in Austria are in the hands of the Russians and that many Jews who have migrated from Austria are now perfectly free to return to live here, but prefer not to do so."

This statement is in many respects misleading:

1. The negotiations at The Hague are between Israeli and West German representatives and deal only with the claim for the cost of re-settlement in Israel of those who fled from Hitler's persecutions; they hardly touch the Austrian "government's" responsibility for restitution.

2. If Austria's general financial situation is strong enough to enable her to recompense former Nazis (which is the intention of the Bill vetoed by the Americans) it should surely enable her to afford some form of indemnification to their victims. The question of compensation is "bound up" with Austria's financial situation only to the extent that a bundle of miscellaneous pamphlets on different subjects are "bound up" together in the British Museum.

3. The fact that some Jewish assets are in the hands of the Russians will cause delay in their restitution to their rightful owners, but has no connection whatever with the question of compensation for those who suffered damage in health and liberty and through deprivation of their chattels.

4. I find it hard to fathom the degree of insensibility which allows your correspondent to write of the Jews who "migrated" from Austria and who though free to return prefer not to do so. The "migration" of the Jews from Austria was an enforced exile to which the only alternatives were torture and death. Their natural unwillingness to return to the country where they suffered so outrageously is not material to their claim for compensation.

It is idle for the present Austrian government, in the face of all the evidence, which is now available, to claim that the persecution of the Jews was an activity which their predecessors did anything to oppose and that Austrians neither took part in nor benefited from it. The West German government has shown its willingness to make such restitution for Hitlerism as is possible: the Austrian government might well do the same instead of confining its measures to the handful of Jews who have returned to its frontiers.—Yours faithfully,

H. J. D'AVIGDOR-GOLDSMID

Prudential Home Service covers the United Kingdom

Because people prefer to do their insurance business in their own homes, the Man from the Prudential is a welcome visitor in millions of British homes. For more than a century, countless families have relied on his friendly counsel. His advice is often sought on problems other than insurance. His work takes him along country lanes and crowded streets . . . a familiar figure, a man respected in his community for the service he brings.

The man from the Prudential

AMERICAN SURVEY

No War of Liberation

Washington, D.C.

THE notion that the Republicans could give glamour to their foreign policy with a campaign promise to liberate the "enslaved peoples" under Russian rule has turned out to be less bright than it must have looked some weeks ago to Mr John Foster Dulles, its principal instigator. It is now generally perceived to have been an error of judgment. The proposal might have been regarded by the voters, or by a considerable section of them, as a stirring appeal to all that is finest in American idealism; it might have stirred up a crusade. But it did not. Even before Governor Stevenson had denounced it as "the reckless suggestion of a war of liberation in Europe which has frightened everyone except the Russians," the decorous interment of the idea was in progress on the Republican side. General Eisenhower himself performed recognisable obsequies in his foreign policy speech at Philadelphia; and, although several days later Senator Nixon, the Republican Vice-Presidential candidate, was still soliciting the votes of minority groups in Massachusetts with the assertion that his chief had pledged himself to try to liberate the iron-curtain nations, several newspapers committed to the General and his cause had by then made reasonably plain their view that it would be prudent to forget the whole thing.

The life and early death of this, the first campaign issue in the realm of foreign policy, is an interesting story with a hopeful moral. This is that a politician in America who continues to comfort himself with the conviction that anything is permissible in a presidential election is badly out of date. The dialectical exuberance which once was expected and enjoyed during an election campaign must now be damped down in deference to the national sense of danger.

Under the old campaign rules, a sound case might have been made for a carefully worded undertaking to hasten a liberation devoutly desired — and especially one known to be desired by minority groups with substantial voting power. The case Mr Dulles made in early July, when the Republican Platform Committee was composing its foreign plank, must have looked particularly attractive. The weight of opinion in the Republican councils was that the party must protect itself against repetitions this year of the "Me Too" charges flung at Mr Dewey in 1948 and 1944. Everyone saw that the need of the hour was a Republican foreign policy that would have a new and dynamic look. So the Republican platform said that, when the party came to power, the United States would repudiate such agreements as those reached at Yalta because they "aid Communist enslavements"; and went on:

It will be made clear on the highest authority of the President and the Congress that US policy looks happily forward to the genuine independence of those captive peoples. . . . [The Republican programme] will mark the end of the negative, futile and immoral policy of "containment" which abandons countless human beings to a despotism and godless terrorism which in turn enables the rulers to forge the captives into a weapon for our destruction. . . . The policies . . . will inevitably set up strains and stresses within the captive world which will make the rulers impotent to continue in their monstrous ways and mark the beginning of the end.

These sentences were new and dynamic enough to attract the fugitive attention of commentators, even though they were well aware that it is what the candidate says rather than what the platform says that counts. Doubts about how the liberation trick was to be done were expressed; but no answers were forthcoming and the subject was more or less shelved. It was not until General Eisenhower gave the matter a once-over-lightly treatment in his speech to the American Legion at the end of last month that the Dulles idea was hauled out and examined.

★

There were those who then described it as "vague" and "dangerous"; but none performed so thorough a job of peering and prodding as did President Truman at Parkersburg. What he asked, did "these Republican masterminds" mean when they talked about liberating the enslaved peoples of Eastern Europe? He recited the "means short of war" taken by his Administration, and he said that there was no way to do more than this without using force. America's allies had signed up for combined defence of freedom, but not for a warlike crusade. The President went on:

I am perfectly convinced — and I hope our Allies will understand — that the Republicans do not intend by what they say to pledge this country to a frightful atomic war in order to roll back the Iron Curtain by force. Yet . . . all Europeans know quite well that insurrection in the Soviet borderland these days could only be successful with armed support from the outside world. If the Republicans don't mean to give that armed support — and I feel sure they don't — then they are trying to deceive their fellow citizens at home and playing cruel, gutter politics with the lives of countless good men and women behind the Iron Curtain.

Governor Stevenson, on one of his tours, found himself at Hamtramck, Michigan, a suburb of Detroit whose population is largely of Polish descent. He warned an audience, which cheered him warmly and appeared to agree with his thesis, that

the cruel grip of Soviet tyranny upon your friends and relatives cannot be loosened by loose talk or idle threats . . . by awakening false hopes which might stimulate intemperate action that would only lead your brothers to the execution squads.

Here, as in other places, Mr Stevenson said a little piece about Mr Eisenhower, whom he usually calls "my opponent" or "the General." He is very scrupulous and earnest about these references and, though he occasionally permits himself a jest, delicately barbed (he mentioned at Denver a Republican propensity for "generalities — and I don't mean a pun"), he is careful to leave nobody in doubt that he respects General Eisenhower as a man of integrity and admires his military attainments. He told the Polish-Americans at Hamtramck: "My opponent is an honourable man." But he went on:

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

We are dealing here with something more than the awful abstractions of power politics: we are dealing with the lives of millions of our fellow men.

The idea that had looked so promising to the Republican Platform Committee in Chicago was now wearing a very different aspect. It was too late to point out that in the speech to the American Legion which had caused all the fuss General Eisenhower had said little more than had been said by, among others, President Truman himself. In his Parkersburg speech Mr Truman agreed that the "permanent Soviet enslavement of these nations" could not be accepted, and that the United States must seek "to keep alive the culture, spirit and hopes of once-free people." All the General had said to the American Legion was that "the conscience of America shall never be free until these people have the opportunity to choose their own paths" and that "we shall never desist in our aid to every man and woman of those shackled lands who seek refuge with us." But as someone some time ago pointed out, it is not so much what you are saying as what they think you are saying; and the General himself put ideas in people's minds by distributing in advance a text of his speech rather more forthright than anything he actually said.

★

Mr Dulles issued a statement in reply to the President. He said there were "countless peaceful ways by which the task of the Russian despots can be made so unbearably difficult that they will renounce their rule," and he added, somewhat obscurely: "That was shown in Yugoslavia." But three days later, when General Eisenhower arrived in Philadelphia for his well-advertised speech on foreign policy, none of the countless ways had been delineated and nobody had explained how Yugoslavia's internal situation was to be reproduced, by external pressure, in Poland or anywhere else.

In the Eisenhower speech the Dulles idea was reduced to a pale and unexceptionable fifth point in a ten-point foreign policy programme:

The fifth step in this programme is to aid by every peaceful means, but only by peaceful means, the right to live in freedom. The containing of Communism is largely physical and by itself an inadequate approach to our task. There is also need to bring hope and every peaceful aid to the world's enslaved peoples. We shall never be truculent—but we shall never appease.

This was not what the Republican platform had said—not by a long chalk. As to the other nine points in the Eisenhower programme for winning the peace, they could be regarded either as "vigorous" and "positive" (as the pro-Eisenhower leader writers said) or as virtually indistinguishable from those espoused and pursued by Mr Truman and Mr Acheson (as the pro-Stevenson newspapers claimed).

But as the *Washington Post*, which endorsed General Eisenhower many weeks ago, also observed:

Whatever misunderstanding arose from a few unfortunate passages of Ike's speech to the American Legion should be swept away by his unequivocal statement that only peaceful means should be used in giving aid to "the world's enslaved peoples." The Republican candidate has thus definitely turned back from the limb of a crusade for early liberation offered him by John Foster Dulles.

The *Washington Post* sounded relieved, and the relief was echoed elsewhere. The country and the candidate have brushed off a risky idea, and the implication is that the country is sober enough and the candidate honest and wise enough to let it go at that.

Whose Tidelands?

[FROM A CORRESPONDENT IN TEXAS]

THE theoretical argument over the growing encroachment of the federal government on the powers of the states only makes political sparks fly when it rubs against practical issues such as whose duty it is to protect the civil rights of Negroes or who owns the oil off state shores. The argument over whether this tidelands oil belongs to the federal government or the states concerned affects most directly California, Louisiana and Texas, and two of these three are southern states which, like the rest of the South, are particularly conscious of threats to states' rights. Largely for this reason, they are also states which the Republicans have hopes of winning from the Democrats in this year's presidential election; this applies especially to Texas, where General Eisenhower was born and which has an important number of votes.

Both the Republican platform and the General himself favour state ownership of the tidelands. The Democrats, unable to agree, refrained from mentioning the matter in their platform, but Governor Stevenson has refused to equivocate. He left Mr Shivers, the Governor of Texas, in no doubt that he believed the tidelands belonged to the federal government and that, if elected, he would do all he could to prevent Congress handing them over to the states. As a result, Governor Shivers, like Governor Kennon of Louisiana, has withdrawn his support from Mr Stevenson and is encouraging his followers in Texas to vote for General Eisenhower.

★

The political smoke which envelops the tidelands controversy has obscured the legal and economic implications of this complicated and much misunderstood issue. The ownership of the tidelands (an inaccurate name for underwater land which actually begins at the low-tide mark and runs seawards) was of little interest until it was found that the oil-fields of California, Texas and Louisiana extended under their coastal waters. It had been generally presumed, however, that the tidelands belonged to the states and state laws prevailed in such matters as the regulation and conservation of fisheries and oyster beds, the production of sand and shell and in the granting of rights for construction of wharves, pleasure piers and "made land" on the water front. In accordance with this presumption, California granted oil leases, and was followed by Texas and Louisiana. However, as early as 1933 individual Californians were applying for leases from the federal government, only to be refused by the Secretary of the Interior, Mr Harold Ickes, who at that time held that, in the opinion of Supreme Court Justices, it was "the settled law" that the states had title to the off-shore oil.

By 1944 the increase of oil drilling in tidal waters brought a new attempt to assert federal ownership, which this time was supported by Mr Ickes. A resolution was introduced in Congress to establish this right of the federal government, but Congress turned it down. Then suit was brought against the State of California and in June, 1947, the Supreme Court decided in favour of the federal government. The decision implied that the federal government also owned the tidelands in other states, except, possibly, in Texas. The case of Texas, which on several occasions has been declared by President Truman to be "in a class by itself," rested upon the sovereign claim to the tidelands during the

period of the independent Republic of Texas, from 1836 to 1845, and upon the agreement by which, when Texas was admitted to the Union, there was reserved to the new state all of the public domain of the former republic.

However, suit was brought against Texas, and the Supreme Court again decided in favour of the federal government in June, 1950. A similar decision was rendered at the same time against Louisiana. The Supreme Court held that though the Republic of Texas had legal possession of its tideland waters, the tidelands could not properly be interpreted as part of the public domain which had been retained by the State of Texas, since the Republic's fortifications, harbours and docks had been ceded to the federal government. The court contended that "most of these properties lie side by side with, and shade into, the marginal sea," and that therefore cession of the marginal sea to the federal government had been intended. The decision also emphasised that Texas entered the Union on an "equal footing" with the other states, and denied that this referred only to governmental and political prerogatives. The decision of the court was four-to-three, with two justices not voting. In his dissenting opinion, Mr Justice Reed differed from the majority on the application of "equal footing" to the Texas tidelands, and Mr Justice Frankfurter concurred, stating that to him it was clear that the submerged lands were part of the public domain of Texas.

The decision of the court in the three cases did not give absolute title over the tidelands to the federal government, but asserted the "paramount right" of the federal government to exercise ownership and control. It declared:

The crucial question . . . is not merely who owns the bare legal title to the lands. . . . The United States here asserts rights . . . transcending those of a mere property owner.

Thus the court left Congress with the responsibility of exercising the paramount right of the federal government to take the land or of relinquishing this right in favour of the states. While the case was still before the Supreme Court, in 1946, Congress passed a resolution which handed the tidelands over to the states. This was vetoed by President Truman and an attempt to over-ride the veto failed to obtain the necessary two-thirds majority in the Senate. After the Texas decision a similar resolution was passed and again vetoed, last May. No attempt was made to reverse the veto this time, presumably because advocates of the Bill did not think they could get the necessary two-thirds majority in the Senate, and preferred to let the matter ride through the presidential campaign.

★

There has been much confused thinking on this issue, especially about the distinction between the tidelands and the continental shelf, and the kind and value of the property involved. The tidelands of the United States are construed as those beginning at the low-water mark on the beach and extending three miles to sea. (In the case of Texas and part of the coast of Florida approximately ten miles or three leagues is claimed by the state, under the old Spanish statute, and was recognised by Congress in its Bill.) The continental shelf extends something like 100 miles out to sea along both the Atlantic and Gulf coasts; in California it extends only a relatively short distance beyond the three miles of tidelands. The states are making no claim to the continental shelf which has been put under United States sovereignty by an Act of Congress.

By appealing to selfish interests, both sides in this controversy have succeeded in giving the public an exaggerated idea of the amount of oil available. There has frequently

been talk of \$40 billion worth, but it is difficult to see how this figure is arrived at. Presumably most of the amount would come from Texas, since it has the longest coastline bordering on oil-bearing dry land. Yet Texas has produced only about 14 billion barrels of oil since the first commercial production in 1897. Less than one per cent of this has come from the ten miles of land stretching inland from tidewater. On the assumption that eventual output from the area stretching ten miles out to sea would be the same, over a period of years Texas tidelands might produce 100 million barrels at about \$2.50 a barrel, of which about 20 per cent might accrue to the federal government, through lease and royalty revenues. A similar calculation could be applied to the other states with oil-bearing tidelands.

The State Constitution of Texas ceded practically all the public domain to the state school system and the \$7 million received for tidelands oil leases, before the Supreme Court decision, went into the public school endowment fund. It has been argued in Congress that the revenue from offshore oil should benefit all American children, not just those in the states concerned, but Texans contend that the future addition of oil earnings to their present school fund of about \$160 million would be worth a lot to the state, while to the federal government it would merely be a drop in the budget.

It has also been argued that the Supreme Court decision has set a precedent for federal claims to underwater lands in all the states—those under the Hudson River or Lake Michigan, for example. About a third of the city of Long Beach in California, built on twenty square miles of land reclaimed from the sea, is said to have been jeopardised by the court's ruling. The Justice Department has answered reassuringly that it does not intend to move against property owners who have an established right through having con-

structed filled-in lands, docks or other tidelands facilities. It has also been contended that the establishment of the paramount right of the federal government to possess the tidelands would set a new precedent for federal seizure of property, an opinion which was supported by Mr Justice Frankfurter in his dissent in the California case.

These arguments have, of course, been made much of by those who oppose the federal government's claim. The whole question will undoubtedly be debated again in the next Congress and will almost certainly end up in the lap of the next President. Meanwhile, the underwater oilfields remain undeveloped.

American Notes

Campaigns in Collision

General Eisenhower seemed to find his feet and his tongue in the South, where large Democratic audiences turned out last week to see the famous war hero and the unaccustomed spectacle of a Republican presidential candidate, and to applaud him as he lashed out at the "top to bottom mess" in Washington. The stock answer to those who have been asking plaintively, "When do we start, Ike?" has been that the General wanted to conserve his strength for the last critical weeks. Now a flood of eloquent denunciation has swept down upon those who were grumbling a week ago that the General was "running like a dry creek."

One Republican, however, has not been swept off his feet by the General's onslaught on corruption. Senator Taft, who has just returned to Washington after seven weeks in his Canadian tent, is in no hurry to do battle for the man who snatched the nomination from him at Chicago. His coldness, the ominous interest he expressed in General Eisenhower's possible Cabinet appointments and in the stand the General meant to take on foreign policy, labour relations, and other controversial issues, his coyness about arranging a meeting, all lend substance to the story that Senator Taft may sulk in Ohio if the General does not hew to a conservative line, particularly on the Taft-Hartley Act.

This unhealed wound in the Republican party is one into which it is Governor Stevenson's strategy and delight to pour salt. At Kasson, Minnesota, he accused General Eisenhower, with perfect accuracy, of ploughing under the Republican farm platform and making off with the Democratic one in broad daylight; he welcomed the "distinguished hitch-hiker," while expressing some anxiety about the Republican pirates climbing aboard in his wake. In fact, both candidates stood firmly on the prudent principle of giving the farmer what he wants. Even Governor Stevenson, who has gambled on other audiences being adult enough to be told unpleasant home truths, played safe with the politically foot-loose farmers. He never mentioned the flexible price support system, which is still law, though in deference to farm fears Congress has postponed putting it into effect. The measure is designed to encourage diversification by lowering price supports on staple crops. The middle-western farm states which Mr Truman carried in 1948 are once more a vital battleground; the President himself is apparently to be asked to do more campaigning in this area than Mr Stevenson at first thought necessary.

It is the Governor's strategy to outline his views on major issues before engaging in any rough and tumble. This has the advantage of making the Governor better known; it shows a respect for the voter's intelligence; and it also leaves General Eisenhower, whose constructive speeches are yet to come, in the position of following the furrow the Governor has already ploughed. If, in the interests of Republican unity, which have already led to some strange embraces, the General is going to move right to placate Senator Taft, and increase the risk of alienating independent

voters, this will not matter. But if he does not, the General may find he has inherited the "Mc Too" label which damaged Mr Dewey in 1948.

Alcoa on the Way to Alaska

Alcoa, the Aluminum Company of America, has announced a project which, if carried out, will give America's northern territory, Alaska, a mouthful of what its economy needs most—industrialisation. Alcoa is planning a huge aluminium undertaking in the Taiya Valley, near Skagway on Alaska's southern tail; the plant would have an initial capacity of 200,000 tons a year, which might be doubled later, and would provide work for 4,000 or more people, to be housed in a new all-electric town with room for 20,000 inhabitants, nearly one-sixth of the present population of the territory. Bauxite would be brought by sea from the Caribbean and the last thousand miles of the journey, from Seattle, would be by the inland passage which is protected by islands from submarine attack.

The reason why Alcoa is going to Alaska is that nowhere nearer home can the company find enough hydro-electricity, which is almost the only economic source for the huge quantities of power needed for aluminium production.

such competition for their own aluminium company; it has been hoping to capture a large share of the American aluminium market, which is expected to triple in size in the next twenty years.

There is not enough aluminium in prospect for even the immediate future, in the opinion of American defence officials who have the needs of the strategic stockpile in mind, even though about 1 million tons of primary aluminium will be produced in the United States this year and by 1954 annual capacity will have reached 1.5 million tons; a further increase in capacity of about 180,000 tons a year is likely to be recommended. This does not, however, necessarily mean that Alcoa's Alaskan project will be encouraged, even though the company is prepared to find the \$400 million it will cost with little or no government help. Apart from the fact that the project will take at least four years to complete, neither Congress nor the Administration is anxious to increase Alcoa's share of American aluminium production, which has been reduced from 50 to under 40 per cent by the expansion of other firms since the Korean outbreak. If there is any further expansion, it is hoped that entirely new firms may be induced

to compete in the aluminium market. For this reason Alcoa may have difficulty in getting Congress to authorise the purchase of the 20,000 acres of Alaskan land which are needed for the plant and the new town; under the Homestead Act individual holdings are at present limited to 160 acres.

Hammering at the Quotas

Mr Truman, who failed to persuade Congress a few months ago to uphold his veto of the McCarran-Walter immigration and naturalisation Bill, has not given up the fight. He will leave for his successor an analysis of the new law, and recommendations for changes in it, to be drawn up in the next four months by a seven-man commission he has just appointed. Its head is Mr Philip Perlman, the former Solicitor-General, whose critical view of the Act is no secret. The reminder that the Administration, if not Senator McCarran, stands for a more liberal immigration policy will not be lost on foreign-born voters who want to help their friends and relations in Europe, but are frightened by Republican suggestions of a war of liberation.

The commission's attention is directed toward two aspects of the law which Mr Truman finds particularly objectionable: the continued weighting of the immigration quotas, through the national origins device, against applicants from Southern and Eastern Europe and Asia, and the failure to provide any hope of haven for the millions uprooted by the Russians. The first, with all its distasteful implications of racial superiority, makes the American devotion to democracy and equality sound hollow; it also makes it impossible to relieve overpopulation in Greece and Italy. The second means that America cannot take in any of the millions expelled from Eastern Germany or reward the 20,000 or so courageous souls who break through into free Europe every month. Congress refused to consider extending the emergency programme administered by the Displaced Persons Commission, which has just been disbanded. Under the DP Act, over 300,000 refugees were settled in the United States; some 50,000 less lucky ones were stranded in the commission's pipeline when it closed down.

Unless the new Congress is very different from the old, or Mr Perlman is exceptionally persuasive, it is not likely to scrap the McCarran Act before giving it a trial. But the Administration at least can set its own house in order. Under prodding from the courts, the State Department at last has set up a board of appeals to hear the cases of American citizens denied passports. Applicants who are turned down must now be told why, within the limits of national security; they can be represented by counsel and can appeal to the new board from the decisions of the visa and passport sections. Hearsay evidence may not be wholly ruled out, but Mr Acheson's insistence that the passport section and the appeals board must be governed by the preponderance of the evidence, as though they were trial courts, should discourage the spirit of McCarthyism and McCarranism which seems to have infected some officials. It should also save the Department from further humiliations such as that which it suffered in the Lattimore incident.

Choosing Congressional Candidates

Another, and almost the last, of Congress's ancient southern demagogues has lost the confidence of his constituents: even in spite of his extravagant efforts on behalf of ex-servicemen, Representative John Rankin of Mississippi was beaten in the primary election in his district by Mr Thomas Abernethy, who in the last Congress represented the neighbouring constituency, now consolidated with Mr Rankin's. Mr Rankin had not kept up with changes in local opinion, but what defeated him was his age—70—rather than revulsion against the outworn ideas he stood for. In

Nevada, however, there has been a genuine revolt against another reactionary Democrat, Senator McCarran. He himself is not up for re-election this year, but his hand-picked candidate for Nevada's other Senatorial seat, now held by a Republican, was most surprisingly defeated in the Democratic primary by Mr Thomas Mechling, an unknown young newspaperman.

Unfortunately Republicans are showing less good sense than Democrats in choosing their candidates for next November. There was never much hope that Senator McCarthy would lose the Republican nomination in Wisconsin, but it was not expected that he would get far more votes than all the other candidates of both parties combined, which means that his victory in the general election is almost certain. It may be that the voters of Wisconsin, constantly exhorted by the national press to get rid of this blot on their state, reacted to outside interference by doing just the opposite; in Mississippi Mr Rankin might also have won if his old enemies amongst the newspaper columnists had not refrained from campaigning on Mr Abernethy's behalf.

The most outspoken critic of Mr McCarthy's alleged lack of personal integrity, Senator Benton, faces a hard fight for re-election in Connecticut. He is being opposed by Mr William Purtell, who, in order that he may store up seniority for himself in Washington, has been temporarily appointed by the Republican Governor to occupy, until January, Connecticut's other seat in the Senate, which was left vacant by the death of Senator McMahon, and which is therefore also up for election this year. Mrs Clare Boothe Luce had hoped to be the Republican contender for this seat in November, but the candidate finally chosen is Mr Prescott Bush, who nearly defeated Senator Benton in 1950. The Democratic choice is Representative Ribicoff of Hartford. In neighbouring New York it looks as if the liberal Republi-

NEWS FROM THE FISHING INDUSTRY

Britain's trawler fleet gains strength

At the end of the war, our trawler fleet was in very poor shape. At least three-quarters of the vessels had 'joined the navy' as mine-sweepers and submarine chasers and, of these, many had been lost in action. As a result, those trawlers still available for fishing were heavily overworked and consequently in grave need of overhaul and repair.

Since then, however, great things have happened. No less than 116 fine new trawlers have been launched and another 42 are under order. Today, Britain's trawler fleet, though still smaller in numbers than in 1939, has actually a bigger catching potential than it has ever had before.

This achievement reflects the energy and determination which our great Fishing Industry brings to bear on every problem that it meets. Any measure that might conceivably result in the landing of more and better fish is most carefully studied and tested. During the last 3 years, great strides have been made, and there can scarcely be a housewife who has not noticed the improvement... and tasted the difference.

British trawlers know their job!

Issued by the British Trawlers' Federation Limited

THE WORLD OVERSEAS

Dutch Lessons for British Chancellors

THOSE who believe that Britain failed to take adequate steps to correct its balance of payments are prone to look beyond these shores for models of economic behaviour. Their eyes turn to Holland where the change over the past eighteen months has been spectacular. In the first quarter of 1951, Dutch exports paid for only 68 per cent of the goods purchased from abroad; during the same period in 1952 the percentage reached 93. There have even been occasions in recent months when Dutch foreign trade has shown a surplus. Nothing comparable has taken place in Britain and therefore it may be worth examining what lessons—if any—can be drawn from the Dutch experience.

Ever since the end of the war Holland has faced an uphill struggle to make ends meet. Like Britain, it had been forced to liquidate many of its overseas investments; in addition it was compelled to finance a big reconstruction programme, and to make good the loss of Indonesia. In spite of these burdens the Dutch balance of payments showed a fairly steady improvement until 1950, the year of the Communist invasion of Korea. In the space of a year the deficit in the total balance of payments increased nearly 40 per cent—from 984 million guilders in 1949 to 1,362 million in 1950. This deterioration continued throughout the first seven months of 1951 and also showed itself in a mounting deficit with the European Payments Union. Total gold and foreign exchange holdings by the Netherlands Bank sank to 894 million guilders—the lowest point in postwar years.

Part of the story behind this crisis is revealed in Table I. It shows how from October, 1950, until July, 1951, Dutch exports, though constantly expanding, failed to keep pace with rising imports. This was true both in value and in volume. The explanation is by now a familiar one—a substantial portion of the swollen imports was due to the scramble for raw materials that followed the Korean war.

TABLE I
INDEX NUMBERS OF FOREIGN TRADE
(1948=100)

	Quantity				Value			
	Imports		Exports		Imports		Exports	
	1950	1951	1950	1951	1950	1951	1950	1951
January	142	165	175	224	100	116	102	106
February	125	152	140	237	102	124	101	108
March	144	167	185	230	104	127	98	108
April	151	154	168	228	104	130	99	115
May	153	169	174	223	106	136	98	116
June	154	172	199	238	110	135	97	115
July	142	165	219	225	108	134	91	115
August	143	140	214	228	107	139	92	116
September	149	131	226	266	107	132	93	117
October	164	140	263	300	110	135	96	117
November	149	123	246	270	115	134	102	123
December	145	123	235	232	118	135	104	120

In addition, the deterioration in Holland's external trading accounts was accompanied at the outset by a rise in the volume of consumer expenditure, which jumped 8 per cent in the third quarter of 1950. Inflationary expenditure, both in the private and public sector, was not something new. Since the end of the war, Holland, like a number of its European partners, had been living beyond its means. As Table II shows, this over-spending had almost ceased in 1949, but events of 1950 once again put the economy in the

red. The figures point to an enormous rise in stocks of raw materials accompanied by a persistent increase in consumption on the part of the general public, the State, and industry.

TABLE II
NATIONAL INCOME AND EXPENDITURE
(In 1,000 m. guilders)

	1949	1950	1951
National income at market value	15.96	17.72	19.35
Consumption—			
By the public	11.60	12.50	13.55
By the State	2.48	2.69	3.00
Total consumption	14.08	15.19	16.55
National savings	1.88	2.53	2.80
National investments in mfg. industries	1.56	1.90	2.00
Stock replacement	0.69	1.68	0.80
Total net investments	2.15	3.42	2.80
Surplus or deficit	-0.27	-0.89	...

In September, 1950, the Government first responded to the new threat to economic stability by raising the bank rate from 2½ to 3 per cent. It soon, however, became obvious that by itself this move was not enough, and in the first quarter of the following year the Government took a whole series of measures designed to cut spending both for investment purposes and for private use.

The initial step was to reinforce the new bank rate by the introduction of specific credit restrictions. Operated with the help of the commercial banks, these restrictions aimed at checking the expansion of stocks and reducing bank loans for internal investment. Business profits were taxed more heavily and the turnover tax on luxury goods was increased. It was announced that the annual rate of house building would be reduced from 50,000 to 40,000. Once again the Government cut its subsidies on imported commodities—primarily food—from an annual rate of 450 million guilders to 175 million. As compensation for the price increase that ensued, wage rates were raised by 5 per cent, but at this level they still lagged behind prices by about 7 per cent. Wage rates have remained stable at this point ever since—largely owing to the moderation of the Dutch trade unions and also to the recent narrowing of the gap by a small decline in prices. In April the bank rate was raised still further to 4 per cent. The sole increase in physical controls over trade throughout the entire period took place in August when Holland cut the percentage of "liberalised" trade with the other Marshall countries from 65 to 60 per cent.

Turning the Corner

The turning point came suddenly. In August, 1951, imports dropped abruptly in volume, and shortly afterwards began to decline in value as well; exports continued to expand both by value and volume. Holland also started to run a substantial surplus in the European Payments Union, and since that time has amassed a total credit with EPU of 1,106 million guilders. Gold and foreign exchange holdings grew steadily and now stand at 3,229 million guilders—a rise of 2,293 million in just over a year. In recent months the Government has dismantled most of the apparatus erected to deal with the emergency. The bank rate has been lowered at intervals to 3 per cent and numerous measures are now being taken to offset a reverse movement in the Dutch economy—the tendency for demand and production to

stagnate. Since the beginning of this year government efforts to stimulate demand plus seasonal trends have combined to reduce unemployment from a peak of slightly more than 4 per cent to a current figure of 3 per cent. By British standards this is large, but the Dutch do not regard it with alarm.

For those who would draw morals from Holland, the crucial question is whether any connection exists between the restrictive measures applied by the Government and the dramatic turn in the Dutch balance of payments. Part of the answer seems to lie in a closer inspection of the changes that have occurred in the Dutch foreign exchange accounts for the years 1949-51. Table III lists these changes for the currency areas with which Holland conducts the bulk of its trade.

The picture it gives is not one of general, balanced improvement. Indeed, the deficit with Belgium in 1951, though falling, was still very high. Moreover a previous surplus with Western Germany had become a deficit and the dollar balance was also worse. The only notable surpluses that Holland had achieved were with Argentina, France, and most striking of all, with the sterling area. The one feature common to all three customers is inflation, coupled with balance of payments difficulties.

The phenomenal surplus of sterling in 1951 (1,097.6 million guilders as compared with a deficit of 25 million for the previous year) can be explained only partially by visible trade movements. Larger exports to the sterling area and declining imports from it account for at most one half of the increase. The remainder consists—in what proportions it is impossible to say—of such items as sterling acquired from Indonesia and transfers from Royal Dutch Shell; another portion probably represents a normal balance which disappeared in 1950 because of abnormal demands for sterling both in order to acquire stockpiles of raw materials and to conduct "commodity shunting" operations.

TABLE III
CURRENT ACCOUNT BALANCES BY MAJOR EXCHANGE AREAS
(In millions of guilders)

Foreign Exchange	1949	1950	1951
Belgium.....	- 250.6	- 755.7	- 704.6

TOTAL all areas.....	- 253.3	- 1,090.9	- 252.0

Dutch officials themselves are less ready than some pundits abroad to assert that they have found a magic formula for balance of payments ills. They are inclined to minimise the role played by the measures of domestic control. The fact that imports fell from their exaggerated levels is due, they say, less to government action at home than to external causes—the abatement of the Korean crisis, a buyers' strike and, more recently, a decline in world prices. At the same time they largely attribute Holland's export gains to the fact that Dutch prices have risen less rapidly than those of other countries; in other words, "Holland's inflation is less than its customers' inflation."

This last explanation understates the credit due to the Dutch Government. It took steps to control inflation much earlier and more drastically than did many other world traders. Herein lies the real lesson for Britain of the Dutch experience. The relative success of the measures taken underlines the importance of speedily adjusting financial and fiscal policies to meet external change and the danger of waiting for months on end before breaking to the public the news that something ought to be done. The Dutch experience suggests, too, that the time to make stockpiling purchases is when prices begin to rise and not when they have reached a peak.

Gaul is Divided

M. PINAY has valiantly held his thumb in the dike, but the waters are threatening to come over the top. After enjoying an EPU surplus of \$21 million in June, France suffered a deficit of \$23 million in August. Its adverse balance of trade in the first half of the year totals 329 billion francs as against 155 billion over the same period of 1951. Despite a 6½ per cent increase in industrial output (as compared with the first half of 1951), France's dollar exports declined by 24 per cent from May to June, and because of the crippling effect of high prices its over-all exports declined a further 7 per cent in July. Owing to heavy imports of grain and metals France's balance of trade over the summer deteriorated even further.

The downward trend of prices which had lasted since February was reversed in the latter part of June. The retail price index now stands at 144.8. If it reaches 149, the sliding wage-scale law will make acutely inflationary developments nearly inevitable. This index figure, moreover, is not above suspicion as it fails to include the price for food and vegetables. The latter have skyrocketed: as compared with July, 1951, salads and peas are up by some 70 per cent and citrus fruit by 80 per cent. Meat and dairy products have shown a similar trend; the price of veal, for example, has risen by 25 per cent since June alone. The critical importance of these figures can be gauged from the fact that 60 per cent of the average consumer's bill is spent on foodstuffs.

Fears About the Franc

Despite M. Pinay's firm attitude and the 2 billion francs in "new money" raised by the gold-backed loan, the currency is by no means in a reassuring state. In early August, the fears created by drought, foot-and-mouth disease and the fact that off-shore procurements were less than had been hoped for, depressed the black market rate of the franc to 418 to the dollar. The large margin between this and the official rate cut sharply into the revenues expected from the tourist trade. Since April, 1950, moreover, bank credits have risen by 63 per cent and the inflation of the franc has not only been absolute but also relative when compared to the inflationary movements registered in other currencies. The tendency to invest (in metallurgical industries, for example) has led to activities which could be financed only by inflationary developments.

In his efforts to stem the rising tide, M. Pinay is backed by a rather disunited army. The federation of agricultural workers has declared that it would demand tax exemptions unless price reductions were obtained from industry before September 15th. In a very significant speech in Poitiers on September 3rd, M. Blondell, president of the national federation of agricultural workers, described agriculture as engaged in an open war against industry. He claimed that no more than 7½ per cent of aggregate capital investment was devoted to aiding the farmers and urged his listeners to fight the industrial interests with every means at their command. The CGT on the other hand, demanded an immediate 15 per cent wage increase in order to meet the ever-rising cost of food for which it blamed the farmers and agricultural distributors. Though Communist-inspired, this agitation for higher wages is gradually spreading among all unions. Industrialists are arguing, with a great deal of justice, that the peasants are hoarding gold, and the peasants are countering by pointing to the high margin of industrial profits. The price reductions which M. Pinay has obtained from industry, simply are not reaching the consumers.

What is M. Pinay proposing to do before Parliament reconvenes on October 7th? He appears to be concentrating on price monopolies, cartel agreements and trade associations with the help of decrees conceived under the Vichy regime. In France there is one small retail business for every 32 inhabitants (as compared with a 1:80 ratio in the United States). Since the war 200,000 new retail stores dealing in

consumer goods have been set up. These are frequently run by inexperienced owners who operate at great cost and without a rational price policy. The margin of profit above gross cost often reaches 30 per cent and drives prices well above the demand and supply level. There is, moreover, little doubt that there are speculative interests active in the meat market. But such measures as pilot-shops, a double-price tag (indicating the margin between wholesale and retail) and the breaking up of certain monopolies do not come to grips with the central problems.

M. Pinay would have to move boldly against the excessive profits being registered in the armament and automotive industries, and against inflationary premiums, such as those in the nationalised accident insurance policies. He would have to be prepared to liberalise the formidable import restrictions, but his balance of payments problem stands in the way. Above all, M. Pinay would have to impose credit restrictions all along the line. But these measures, as well as the various plans concerned with the elimination of small retail businesses which cannot survive economically, raise profound political and social problems. M. Pinay's coalition in Parliament still depends on traders, middlemen, the "small bourgeois" and the farmers. These groups want hoarded gold, high prices and protected markets. Their shortness of vision is the main obstacle in the path of a sane economic policy. Unless it can be surmounted, the old adage that both cabinets and leaves tend to fall in autumn may come true.

Britain Puzzles Canada

[FROM OUR OTTAWA CORRESPONDENT]

EVERY time Canada approaches talks about the sterling balance of payments, as it is now doing in preparation for the forthcoming Commonwealth conference in London, there comes to the surface here an uncomfortable mixture of irritation and anxiety. Both are intensified by the very deep-seated Canadian instinct to preserve the link with Britain and the link with the United States in the closest possible balance. Canada never wants to be forced to choose between the two links. It instinctively dreads and tries to avert the collapse of either; and at the present time the only serious danger is the collapse of the sterling counter-balance to the United States.

But the Canadian approach to Britain can never be understood without an appreciation of the irritation which unhappily accompanies the anxiety and desire to help. The root cause of the irritation is the contrast between British statements about the link with Canada and British performance. Two examples from different fields illustrate the sort of thing which lends such an air of futility to British professions about Canada. There was a flurry here last month about Canadian defence purchases in the United Kingdom. An unfortunate press story indicated that Mr Howe, the Minister of Defence Production, was claiming to be helping Britain by buying British arms. Actually no one here would claim that any defence purchases have been made in Britain for the sake of helping Britain; a substantial number of orders are being placed because Britain is the best source of supply, which means that it has either the best available types or the most favourable prices or the best delivery dates.

British officials have, nevertheless, indicated here that they hope Canada will increase these orders as much as possible. "We hope you'll give us all the help you can," they say. Yet the fact is that not a single representative of the British Government has ever visited the Department of Defence production here to try to sell British defence goods. The Canadian office of the Federation of British Industries, so far as senior officials know, has been just as inactive. Such orders as have been placed in Britain—for example, a large one for Rolls-Royce "Nene" engines, and one of about

£1 million for "flight-simulators"—have been obtained by individual firms sending out aggressive and well-informed representatives who made sure that the appropriate officials in the Canadian Government knew exactly what they had to offer. The relatively few cases of business-like initiative have paid off, but there has been nothing in the way of a concerted effort by the British Government or British business to promote the sale of British defence equipment. Instead, the Department of Defence Production has received lengthy circulars sent out to all the possible purchasing governments asking for an immediate statement of their purchases for the year and warning them that additional orders should be kept to a minimum. It is very hard for Canadians to reconcile such an approach with the repeated statements of Britain's urgent desire to get dollar orders.

Nor can Canadians help noting the contrast between British passivity in this whole field and the problem Canada itself had to tackle with the United States. When the rearmament drive started after Korea, Canada was placing large orders in the United States and getting practically no American orders. At a time when the balance of payments was very much less satisfactory than it is now, this unfavourable exchange was a cause for concern. But a formidable array of obstacles headed by the Buy American Act stood in the way of American purchases in Canada. All the pressures of American business and the prejudice of the armed forces in favour of keeping defence purchases at home were fortified by a definite legislative enactment. Canada faced obstacles which had no remote counterpart in Canadian attitudes to Britain.

Yet American purchases in Canada are now running far ahead of Canadian purchases in the United States. Ways have been found to make the Buy American Act very much less of an obstacle, and all the American services are now, in varying degrees, favourably impressed with the possibilities of Canadian production. Part of this was achieved, of

course, by high level policy decisions, and part by the near-saturation of American capacity which has reduced the opposition to purchases outside the United States. But it is still perfectly certain that the result would not have been achieved if Canada had not sent its ablest official salesmen to Washington, paid them at rates which are high for government posts, and established close personal ties with procurement officers all over the United States. The Canadian representatives are now on such terms with all the services that they can ensure that Canadian firms get a look in whenever a new procurement problem arises. If British spokesmen mean what they say about wanting Canadian orders, it appears incomprehensible that Britain has not made a comparable effort to get them.

Vain Appeals to the BBC

The other example comes from a very different field. The Canadian Broadcasting Corporation has just opened a television service in the two biggest centres of population, Montreal and Toronto. Private interests wanting to establish a commercial television service have, for the present, been refused licences. The Government's policy is at least to get the national service firmly established before allowing rival commercial programmes. Behind this decision, clearly enough, lies the determination to make something distinctively Canadian out of Canadian television and not to allow it to be a mere overflow from the American networks.

It is a courageous decision but a very costly one. No one yet knows how the television service is to be financed. There are no concentrations of population comparable with London out of which large sums can be collected in licence fees. The capital costs have all been borne out of government advances. Maintenance costs may have to be met in the same way; but it is difficult to tax the whole of Canada for a service which is available only to people in Montreal and Toronto. These two considerations combine to establish an urgent demand for television programmes from Britain. Canada wants to vary the available American programmes with more material than it can afford to produce itself. In the early stages of the service, until a chain of relay stations is established between Montreal, Toronto and Buffalo, a large part of the service must take the form of "kinescope" recordings. Even the programmes produced in Montreal will have to be recorded to be shown in Toronto. Canada had hoped for a substantial flow of such recordings from the BBC. Yet it can get little except a few newsreel programmes. Canadians inevitably ask what value they can attach to all the British professions about desiring to improve Britain's intellectual contacts with Canada. Nothing is more familiar than the British people who loudly deplore the increasing influence of American publications, radio and books in Canada. Yet in television Canada not only presents an opportunity, it forcefully requests British programmes.

The BBC is getting an appropriation of £250,000 to make half a dozen elaborate films for television. It hopes to sell them in the United States, and they will be available to Canada. But Canada does not want half a dozen expensive special productions. It wants a regular flow week by week of recordings of some of the best of Britain's domestic service, a regular flow which would give British material a day-by-day acceptance that occasional special presentations can never achieve. The fact that they have to be recordings is merely the accident of geography. There is no television relay beam across the Atlantic: recording is a substitute for it.

According to the traditional pattern which has been established in sound radio, any material that is recorded immediately requires a fee of two or three times the original performance. This is the stand the artists' unions have always taken; and if the recording is to be available for use in perpetuity it is an understandable position. But nothing of this kind is involved in Canada's request. It wants the use

of a recording on one occasion only as an alternative to direct retransmission. Again it is difficult to conceive that Britain is in earnest about maintaining its influence in Canada if the broadcasting authorities and the artists' unions cannot arrange reasonable terms to meet the Canadian need.

In face of British performances such as these in the different fields of information and defence procurement, it is not surprising that Canadians get irritated at the high-sounding British professions about maintaining Anglo-Canadian relations, and the repeated requests that Canada should do something to help. Performance and profession are too far apart.

The Fifth Soviet Five Year Plan—III

High Hopes of the Farmers

THE ambitious projects of the Soviet light and food industries are largely dependent on the fulfilment of the very stiff targets set for agriculture. Planning finds less scope in the countryside than in the towns and in the Soviet Union its task has been rendered even more arduous by both man-made and natural calamities. Hence, agricultural production has hitherto been the relatively unsuccessful partner in Soviet economic development and has failed to keep pace with the rapidly growing heavy industry. While after the war the latter advanced with great strides and soon left the 1940 level far behind, agriculture was scheduled to exceed the prewar level only slightly by 1950, and even so, with the exception of cotton, failed to reach its modest objectives. In spite of this, the targets assigned to agriculture have been comparable in their magnitude to those usually set for basic industry. The Soviet planners must consider that obstacles to agricultural progress were incidental or that they can now be overcome, and that they will finally be able to impose their will in the countryside.

SOVIET AGRICULTURAL PRODUCTION
(million tons)

	1940	1950	1955 target	% increase 1955 over 1950
Grain	119.0	124.5	174.5-186.5	40-50
Cotton	2.7	3.75	5.8-6.2	55-65
Sugar-beet	21.0	23.5	38.8-40.0	65-70

There were many causes contributing to the lag in Soviet agricultural development. Scarcely had the countryside recovered from the wounds of war and civil war, than it was mutilated by forcible collectivisation. Then as soon as it again got into its stride in the late thirties, it was ravaged by German invasion. Grain output picked up progressively after the war and roughly recovered in 1948. But since 1949 no progress has been made. Bad weather conditions, in fact, brought grain output down by some 3.5 million tons in 1951. Another possible drawback was the lack of co-operation by the farmers because of the suspicions aroused by the amalgamation of collective farms into larger units. The planners must hope that the bad effects of this supplementary collectivisation have now been spent; its benefits in higher productivity should be reaped in the near future.

They probably expect that their other investment in the countryside should also mature by now. The tractor park has been more than restored to its prewar level, since during the last six years over 670,000 tractors, in units of 15 horse power, and 147,000 combines have been supplied to rural areas. Expert guidance is now also more readily available as there are about 50,000 qualified agronomists in the 8,000 or so tractor stations and out of the 120,000 amalgamated farms about 90,000 are headed by men with special agricultural education. Progress has also been made with the

Consider your Advertising Media in terms of *Receptive Readership!*

Just as one volunteer is better than ten pressed men, so one receptive reader is of more advertising value than a dozen with idle minds. And receptive readers are what The Listener offers appropriate advertisers—receptive in the sense that The Listener's readers are people of enquiring and serious mind. Drawn from the highest levels of culture, intellect, education and position, The Listener readership provides a rich and compact market for cultivation by advertisers of first-quality products and services.

OUR FARMS CAN PRODUCE MORE— WITH THE RIGHT MACHINERY

1913

In 1913, basic crop production in Britain was 7 tons per man per year. By 1950, with increased mechanisation this output had risen to 26 tons—in spite of shorter working hours. Milk production had doubled—due in no small way to the replacement of 1,000,000 horses by tractors, allowing 2,000,000 cows to be added to our dairy herds.

Financially, the benefits of mechanisation are no less marked. An analysis of 300 farm accounts by Reading University showed that a machinery investment of £3.10.0. per acre produced an output of £13.11.0. per acre and an output per man-year of £555. With an investment in machinery of £6.10.0. per acre, outputs rose to £18.13.0. per acre and £743 per man-year. From the national point of view, the replacement of 70,000 horses by tractors between 1949 and 1950 alone produced an extra £4,200,000 worth of food a year.

Remarkable as this evidence is, more can still be done—and must be done, if we are to solve our national problems. Although most of the farms of this country are mechanised to a certain degree, too many are uneconomically equipped with heavy, costly machinery whose running costs eat away at any savings of time and labour. Horses still feed off too much land which could be turned over to dairy produce. And the small farms need profitable mechanisation urgently, for they cannot afford to lose acreage for the upkeep of horses or to pay out large sums in wages.

The land is there—millions of acres which can be brought into cultivation and millions more which can be more profitably farmed. Choice of the right machinery to do the job will help to produce from it the cheaper food which is the basis of a sound economy.

Harry Ferguson Ltd.

1950

GROW MORE FOOD IN BRITAIN

electrification of the countryside. If before the war only 4 per cent of the collective farms were provided with electric power, now the proportion has risen to over 15 per cent. Actually, it is really even higher since the largest farms have usually been the ones to be electrified. A counter-offensive has also been launched against Nature and its periodical calamities by a special anti-drought campaign. A 15-year plan of afforestation was announced in 1948. In addition to protective forest belts it envisaged the mass building of snow reservoirs and ponds. The major part, however, in the reclamation and improvement of land should be played by the irrigation side of the so-called "Great Projects."

Increasing Yields

All these, and other, undertakings should be proceeded with and, in most cases, greatly speeded up in the new planning period. Progress in tractor production will probably be least marked since the supply in 1955 (216,000 in 15 hp units) should be only 20 per cent higher than in 1950. The increase in the supply of combines may be greater as 80 to 90 per cent of the grain is scheduled to be harvested mechanically at the end of the plan compared with just over one half at the beginning. Over 30,000 ponds are to be built and 2.5 million hectares of protective belts are to be laid during the five years, almost twice the area covered in the previous plan. Work on the "Great Projects" should proceed at full steam. Of the more ambitious ones only the Kuybyshev scheme—which is to irrigate an area of 1 million hectares—should be finished by 1955, most others being scheduled for completion one or two years later. Some may be finished ahead of time and in any case several irrigation systems may have already started work. Assuming that half of the work will then be done—on the basis of official figures—about 14 million hectares will be irrigated. Water power provided by these stations is also to form the basis of further electrification in the countryside and the planners strongly recommend both the use of electrical appliances and a shift to electrically driven tractors, particularly in the neighbouring areas.

Yet, even if the projects are completed ahead of schedule, the new sown areas will raise output, particularly of grain, by only a fraction of the vast planned increase. True, irrigation should also raise substantially the average yield and this increase of yield per hectare looks like the basic premiss of the agricultural plan. Some progress has already been made in this direction, though it has not yet been equal to the sacrifices and investment involved. The average yield of grain per hectare is estimated at 1.21 tons in 1950 compared with 1.07 tons in 1940. No country-wide figures are given in the present plan, but from the regional data available it appears that a much quicker development is expected. The yield of grain is probably scheduled to rise by at least one third to some 1.6 tons per hectare in 1955. This will still be much less than the level of the intensive agriculture in Western Europe, but it should exceed the average of Eastern Europe and Mediterranean countries. (All Soviet figures are based on the standing crop and are therefore inflated. This affects comparisons with other countries, but not comparisons within Russia since 1933). The yield of sugar-beet is probably also expected to increase by about one third, while that of cotton in Central Asia, where the bulk is grown, is scheduled to reach about 2.6 tons per hectare compared with about 2 tons now.

Livestock Lag Behind

If they succeed in raising substantially the average yield of grain the Russians should be able to reinforce two lines of their policy. They could further increase the share of industrial crops in the total sown area and carry on crop rotation on a larger scale. The latter is a most important part of the general campaign for more intensive cultivation and the plan foresees in fact at least the trebling of the output of root crops. Yet, it is in grain production that the greatest

doubts arise. Cotton, for example, has vast scope in Central Asia and should profit from the irrigation of the Turkmen Canal. Both for cotton and sugar beet the target does not seem divorced from recent progress. But grain output is now probably less than 130 million tons and would require annual increases of not less than 15 million tons to reach its objective.

By contrast the plan for livestock is rather cautious. All the calamities mentioned earlier hit livestock harder than the other branches of agriculture. By 1950 it had only just recovered the prewar level and fell far short of its targets. In fact with the exception of sheep and goats the new objectives are not much higher than was planned for 1950 and substantially lower than was planned for 1942. The relatively modest increase in cattle numbers casts some shadow on the prospects for greatly increasing the supply of foodstuffs. Since, however, numbers in collective farms are to be raised more than total stock, the authorities will find it easier to obtain a large share for the towns.

LIVESTOCK NUMBERS
(Million head)

	1940	1950	1955 target	% Inc. 1955 over 1950	
				Total	Collectives
Cattle	54.5	57.2	67.2-68.6	18-20	36-38
Pigs	27.5	24.1	34.9-36.2	45-50	85-90
Sheep & goats	91.6	99.0	158.4-160.4	60-62	75-80
Horses	20.5	13.7	18.1-15.3	10-12	14-16

Generally, for agriculture as well as for industry, the success of the plan will depend on how much previous policies have really prepared the ground for rapid rises in productivity. In agriculture Soviet planners are particularly justified in trying to get higher yields, since the whole collectivisation programme really had the twofold aim of obtaining a much greater output with a reduced labour force. It has succeeded in freeing manpower for industry; it has failed hitherto to increase output substantially. Now, the planners have decided that output, too, should forge ahead. They seem to have drawn their targets in a rather optimistic mood. After years of relative stagnation Soviet agriculture is to accomplish very much in very little time.

Norway in Nato—I.

The Scale of Rearmament

[FROM OUR SCANDINAVIAN CORRESPONDENT]

NORWAY'S staunch allegiance to Nato and its almost automatic assumption of the resultant burdens (the use of bases by allied forces in peacetime excepted) tend to obscure both the scale and the peculiar difficulties of Norwegian rearmament. There are no strikes of conscripts or sensational but unrealistic calculations of future American aid to make news. But since the war, and, more particularly, since joining Nato, Norway has embarked on a rearmament programme which compares well with those of its allies and which, having regard to the special conditions in postwar Norway, is a remarkable effort. The war cost Norway about seven years' national income at the 1939 level. It also left it with quite large armed forces, which, however, were too mixed in experience and equipment to have anything like the efficiency their size suggested. But two other legacies of the war more than compensated for such difficulties: first, the knowledge that

Norway was now irretrievably implicated in world events and must rebuild its national defence accordingly and, secondly, the fact that this knowledge was shared by all major political parties. It is the large measure of national unity resulting from these factors that has enabled Norway to go so far and so steadily forward with its defence plans.

In 1946 a three year defence plan was put into operation as an interim measure. Its chief aim was to lay a sound foundation for rebuilding the country's defences on whatever lines were suggested by the report of the Defence Commission established at the same time. The report of this Commission was published in December, 1949.* It proposed a thorough reorganisation of the armed services during the six years, 1950 to 1955. And it is this report, modified particularly by the Harriman Committee and the Lisbon meeting of Nato, which forms the basis of present plans.

Enthusiastic Home Guard

The position now is that Norway aims to have by July, 1954, a somewhat smaller Army than envisaged in the Commission's report (11 "combined regiments" or brigades instead of 12). These forces, however, will be better trained. The period of conscription will be 18 instead of 12 months and there will be more frequent exercises at brigade strength, or over. The Army will also contain more regulars—about 8,000 compared with about 4,500 as at present. Early in 1953 the Norwegian Brigade will return home from Germany and add its quota of trained men. The Navy will concentrate on small units—MTBs, minesweepers and escort destroyers—and forgo the new submarines it originally expected. Its period of conscripted service has already been increased from 15 to 18 months: and it may be reckoned that about 75 per cent of its ships are now manned with reasonably efficient crews. The Air Force is to have more airfields than proposed by the Commission. Most of these will be in the North, and their construction is proceeding swiftly. By mid-1954 each important region of Norway should have one or more fields equipped to handle modern fighters. The first operational jet squadron, of US Thunderjets, has just been formed, and by mid-1954 all fighter squadrons will be equipped with jet aircraft. For practical purposes the Air Force is already up to establishment.

These changes will involve a certain reorganisation in Command areas; and it is probable that the various military districts of Norway, at present controlled by inter-service

committees will eventually each have a local Commander-in-Chief on the pattern now prevailing in North Norway. There is also much work being done on building communications and accommodation of all sorts and on the training of "nucleus" formations. Nor is Civil Defence neglected; under a four-year plan, started in August, 1949, 60,000 air raid wardens and 40,000 industrial defence wardens are being trained. Deep shelters have been blasted into rock at many places and plans prepared to evacuate the larger towns.

The strength of the Home Guard in Norway illustrates how widespread and deep is the Norwegians' determination to defend themselves. They are a pacific people and stoutly (sometimes exasperatingly) impervious to official exhortation or to anything smacking of propaganda. Over 165,000 of them, out of a total population of only 3,240,000 and excluding men subject to military training, are volunteer members of the Home Guard. They must pay all their own expenses, including travel to courses and exercises. The minimum obligatory training period is 50 hours a year. Last year the average attendance was nearly 360 hours and this year it will probably be over 400. The cost of the Home Guard in the 1951-52 financial year was 25 million kroner, as against a total military expenditure of Kr. 868 million.

The cost of all this defence effort has been heavy and is increasing. So, happily, is the national income, although export difficulties are likely to keep it below present estimates this year.

Source: Norwegian National Budget, 1952. Annexe I. Table 1.1.

With the aim of achieving the agreed programme by July 1, 1954, the Storting has approved an expenditure of Kr. 3,400 million, of which Kr. 2,750 million will be met by Norway, Kr. 300 million by counterpart funds and Kr. 350 million by allied contributions to Nato's "infrastructure" programme. On the basis of the relevant financial years this will be divided as follows (in million kroner):—

	1951-52	1952-53	1953-54
Total	980	1,290	1,130
Norwegian contribution ..	868	972	910

Based on: Norwegian Official Paper: *Statsproposisjon nr. 111* (1952) p. 43.

On present form, Norway is unlikely to scale down its defence contribution for three reasons. First, it represents, statistically speaking, a smaller part of the national income than, for example, in Britain; but in Norwegian conditions, this statistical yardstick underrates the country's contribution in terms of national effort. Second, the major part of Norway's contribution deals with human and material resources already to hand and is not affected by engineering bottlenecks and time-lags in tooling up. It has quite a different emphasis and thus brings different problems from the British plans. Third, there is no doubt that the presence in Oslo of the North European Regional Command of Nato, under Admiral Brind, has a most important psychological effect. The wisdom of the local commander's advice and the high regard, one might almost say affection, in which he is held by leading Norwegians, undoubtedly consolidate their resolve to do their utmost to make their full contribution to the common cause. In doing so, of course, they are well aware that they have economic and political difficulties to contend with, as well as military. These will be discussed in a concluding article.

THE CASE OF THE SAVILE ROW TAILOR

**He was never
kept waiting . . .**

JOHN G. HARDY LIMITED, the London woollen merchants, are helping the tailor serve the public. Once the private customer has made his choice from the "bunches" of Hardy Suitings at his tailor's, or at Hardy's own showroom (where upwards of 1600 cloths are displayed and stocked), the transaction is made at wholesale level.

This novel merchandising method means obviously that sales records and agents' commission statements for a huge yardage of small lengths of cloth must be kept scrupulously up to date. Anxious to avoid a great deal of complicated paper work—and a consequent increase in office staff—Hardy's went for advice to machine accounting specialists of Burroughs Adding Machine Limited.

After a full investigation, Burroughs suggested that the firm could take care of all its accounting problems with the help of one Burroughs Typewriter Accounting Machine and a Desk Book-keeping Machine.

Result: Hardy's office system is now as smoothly up to date as their showroom. Sales and commission statements go out on the dot to tailors and agents in 46 countries. Profit and loss figures (previously produced only twice a year) are available daily. In addition, the payroll for the firm's employees, which used to take the office a full day, is now produced in an hour and a half.

WHAT ABOUT YOU? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Micro-film Equipment.

THE BUSINESS WORLD

The Anatomy of Crisis

THE British public has been presented this week with the clearest statistical analysis yet of its economic behaviour since the war. The revised estimates of national income and expenditure in 1951, published as a blue book by the Stationery Office*, do much more than bring up to date the preliminary estimates that appeared in Cmd. 8486 last March. There are, as usual, amendments in profusion to the previous calculations—for example, the estimate of gross national product in 1951 is now reduced by £160 million to £12,254 million and that for 1950 by £460 million to £11,447 million. But these amendments—and the obvious implication that even the new figures must be subject to a wide margin of error—should not obscure the fact that the new blue book is a very valuable document. It contains much more detailed information than any previous paper in the series, and, in particular, three very enterprising innovations. The first of these innovations is a tentative official estimate of how far recent changes in income and outlay have been due to changes in the real volume of production, as distinct from changes in prices; the second is an analysis of the sources of funds from which gross capital formation and stock appreciation have been financed since 1948, divided according to the sector (governmental, corporate or personal) undertaking the capital expenditure; and the third is a summary of the transactions between the several industrial groups, showing from which sources each industry secured its raw materials and to whom it sold its final product in 1948. With these three new tools—imprecise and inaccurate though they necessarily are—it is possible to trace more closely than before the estimated movement of funds and real resources within and between different sectors of the national economy. Here, in short, is the best official guess at the anatomy of Britain's economic experience in the past four years—which means, unfortunately, that here is the anatomy of crisis.

The immediate reasons for last year's crisis emerge simply—perhaps too simply—from Chart I and Table I, which are culled from the blue book's estimate of real income. In terms of constant (1950) prices, gross domestic production rose by £203 million last year, or by about £80 million less than in each of the two previous years. But out of this £203 million Britain had to try to find £480 million for increased stock-building and £152 million for increased spending by public authorities (at least four-fifths of it for defence). In consequence, although real personal consumption declined for the first time since the war, and although fixed capital formation also fell, the gap between domestic demands on resources and gross domestic product rose by nearly £300 million, to £445 million. Table I shows the relationship between this inflationary gap of £445 million and last year's balance of payments deficit of £521 million; it is unfortunate that this gap should have widened at a time when

the terms of trade were deteriorating for the second successive year and when income from overseas property was declining from its 1950 peak—but then bad luck often does follow upon bad judgment.

The first lesson that emerges from these new figures is, therefore, that the balance of payments crisis of 1951 was the inevitable consequence of the way in which stability had been attained on the balance of payments in 1949 and 1950. In 1949 stocks increased by less than was needed to support the concurrent increase in production, while in 1950 they actually fell (with the consequence, as is shown in Chart I, that gross domestic demands upon

CHART I

resources also fell in that year); by the end of 1950, therefore, stocks had to be increased again unless production was to be gravely impeded—but, even if the unfavourable swing in the terms of trade in 1951 had not taken place, Britain would have been in no position to finance such an increase. In these matters, history is apt to repeat itself. Today, in the second half of 1952, stocks are again running down and the external account is again being snatched back into balance; but, unless advantage is taken of the breathing spell to put British industry back into better shape to meet foreign competition, the way in which balance is being attained now must carry the seeds of a new crisis for 1953 or 1954.

How should the breathing space be used? The answer that emerges from the blue book seems as obvious as it

* "National Income and Expenditure 1946-51" (H.M.S.O. 91 pages. 6s.).

is likely to be neglected. It should be used for repairing the ravages to Britain's fixed capital. Between the end of 1948 and the end of 1951, £775 millions of new resources (in terms of constant 1950 prices) became available as a result of the increase in real production. Some £145 million of this had to be used for stock building, partly because Government policy allowed stocks to run

† Burden (-) or benefit (+) resulting from difference in terms of trade compared with 1950.

down when prices were falling (and thus meant that new purchases of stocks had to be made at or near the top of the market). Of the remaining £630 million, £245 million was absorbed by an increase in expenditure by public authorities, £220 million went in additional domestic consumption, £90 million was devoted to improving the external balance and only £75 million to increasing the rate of fixed capital formation. Furthermore, over 10 per cent of the increase in fixed capital formation in this period took place in the relatively unproductive central government sector, over 15 per cent in the sector of the local authorities, and nearly 45 per cent in that of the nationalised industries. Private enterprise accounted for less than 30 per cent of the increase in fixed investment in these four years. It is true that in this period there was a substantial transfer of industries from the private to the nationalised sector; but some misdirection of Britain's investment effort is certainly suggested by the fact that fixed capital formation by the gas, electricity and water industries in 1951 was equivalent to over 82 per cent of their gross annual product, while that in manufacturing industry was only 11 per cent of its gross annual product. Except in such favoured fields as oil refining and other chemicals, it seems clear from these statistics that the fixed capital of British manufacturing industry is now wasting away more quickly than it is being replaced—and this on top of the very heavy disinvestment in this field during the war.

This policy of living first off stocks (until the next balance of payments crisis comes along) and then off fixed capital (thus ensuring that the vicious circle of recurrent crises is not broken by an increase in British competitive efficiency) has been the undeliberate but unsurprising result of the social pressures of the last seven years. Successive national income white papers have shown that each year wages and salaries have risen by far too much, and profits and other funds available for the finance of investment by far too little, for the good of the national economy. The new blue book reinforces this view for 1951, and makes some marginal amendments to previous estimates for other years. It is now estimated that 1951 was the second successive year in which wage and salary earners secured more than the whole of the year's increase in money incomes. While total national income

(excluding depreciation) rose by £709 million in 1951, wages and salaries rose by £742 million. Among the other recipients, whose income suffered consequentially, the biggest proportionate fall, by £135 million to £215 million, was shown in net investment income from abroad (this, incidentally, was largely responsible for the unexpected fall of £80 million in rent, dividends and interest received by persons); as Chart II shows, gross profits (including farming and professional earnings) rose by some £58 million—but this was much more than offset by an increase of £369 million in the tax provisions that had to be made out of corporate profits alone.

*

This pattern is depressingly familiar, even though politicians continue to choose to ignore it. But the national income blue book also contains some new and unfamiliar figures that show the effect that these pressures have wrought in the capital market. The evidence of these figures, summarised in Table II, is extraordinary. They confirm—and more than confirm—previous unofficial prognoses that the private individual is ceasing to be a source of net investible funds for the capital market. Indeed, if the figures in the blue book are even approximately right, this is a gross understatement. In the four years 1948-51 capital formation in the personal sector (including house purchases and capital formation in small businesses or partnerships) is estimated to have been some £804 million in excess of the growth of investible funds in that sector (including the growth of life assurance funds). Even allowing for the large element of guesswork that must be contained in

CHART II

Stock appreciation has been deducted from profits although a very small proportion should strictly be ascribed to professional and farming income.

these figures, there seems to be little doubt that the private individual must have been a heavy net seller of stock exchange securities since the war in order to raise funds on this scale. Other heavy borrowers on the capital market have been the nationalised industries (whose dis-

proportionate share of the fixed investment programme emerges from this table, too) and local authorities. Companies, including banks and the non-life funds of insurance offices, had £370 million net available for outside investment in these four years, although they relapsed into the role of net borrowers (by £33 million) in 1951 itself; since this net borrowing of £33 million took place after the assumed use in industry of £456 million that should have been required to provide for this year's increased tax liabilities, the real drain on industry's capital in 1951 was much bigger than these figures suggest. The sole source of net investible funds in 1951, and the sole major source in each of the past four years, was the central government—which in this context includes the national insurance authorities. These are figures of which the stock markets would do well to take note. But, much more important, they are also

Competition in Fuel

NO sector of the civil economy offers a more attractive *prima facie* case to the advocate of what is called "high-level planning" than the fuel and power industries. Some 96 per cent of the fuel consumed in this country comes from one source, coal. This reaches the consumer by way of three industrial monopolies, two of which make secondary fuels—electricity, coke and gas—from the coal produced by the other, and sell them in direct competition with that primary fuel. These three monopolies also compete for shares of the resources that the country is able to set aside for investment. In doing so, their ownership by the state gives them certain advantages. Both the obligation to balance revenue with outgoings only "taking one year with the other," and the ability to raise new capital at gilt-edged rates either from public funds or with Treasury backing, tend to free their bids for scarce investment resources from the discipline of ordinary capital market forces. Add to these complexities of structure the present urgencies: today not enough of the primary fuel is produced to meet

figures that the country as a whole can ignore only at its peril.

The new style national income statistics contain at least one other enterprising innovation, in addition to the estimates of real product and of the sources of investible funds. This is the table of inter-industry transactions in 1948, which shows whence each main industrial group bought its raw materials (from other domestic industries or abroad) and whither it sold its final product. These estimates (which are reproduced, together with other tables from the blue book, in this week's *Records and Statistics* supplement) provide useful material for those engaged in industrial analysis and market research; they may also, if misused, offer some new temptations to those who believe that the British economy can be poked into shape by a few more import cuts here and a little more raw material allocation there, with each control discriminatorily tightened for those industries that the blue book's figures suggest to be "less essential."

It would be a grave misfortune if preoccupation with this new and interesting—but dangerous—tool were to divert attention from the two main lessons of the national income statistics. Those two main lessons are quite clear. The first is that Britain has never really recovered since the war; it has merely oscillated between periods when it was running down (or adding insufficiently to) its stocks of raw materials, and periods when it was incurring a heavy deficit on its balance of payments. The second lesson is that the country must be in grave danger of slipping back further, as a result of the stunting and misdirection of its fixed investment programme. That stunting and misdirection is the inevitable consequence of the policy of eating into industrial profits and, in particular, of the fact that stock appreciation (£1,100 million of it in 1951) is grouped with genuine trading profits as taxable income. There is no sign that the Conservative Government, any more than its Labour predecessor, is willing to take this lesson to heart. The country must, therefore, derive what satisfaction it can from the knowledge that, thanks to the labours of the Central Statistical Office, it is now marching down a better-mapped and more clearly illuminated road to ruin.

demand, raw coal is allocated or rationed while electricity and gas go free, and there are doubts whether fuel prices properly reflect costs.

It is not surprising, therefore, that the Trades Union Congress, one of the bodies on whose suggestion the Labour Government last year set up a committee on national fuel policy, should feel that a Fuel and Power Council is needed to help the Minister of Fuel and Power in supervising these industries. Nor, perhaps, that the succeeding Conservative Government should feel an overlord is needed with "the co-ordination of fuel and power" as one of his major responsibilities. What is rather surprising, but refreshing, is that the committee appointed last year, under the chairmanship of Viscount Ridley, should have decided that such extra co-ordination or supervision is not really necessary, and that competition in fuel—given certain measures to make it more genuinely effective—can be relied on to bring about the best pattern of use of Britain's fuel and power resources.

Logically, the Ridley Committee began by examining

the present and prospective demand for fuel. Today, that demand is artificially restrained. Coal for domestic consumers is rationed; industrial and commercial consumers probably get as much as they need, but not necessarily the grades they would prefer; and the National Coal Board is not exporting all that it could. The committee estimates, therefore, that at present, at ruling prices, British coal output is some 15-20 million tons below demand. At the same time, shortage of generating capacity necessitates electricity load-spreading and power cuts, and some gas undertakings are unable to supply industrial firms that want gas. The committee, though little better equipped than other forecasters to estimate the demand for coal in ten years' time, has had to do so—with more qualifications, and with a more modest answer, than most of the other volunteer prophets. It suggests very tentatively that in ten years' time the inland demand for coal might be some 230 million tons a year—but says quite candidly that this forecast might be 20 million tons too high or too low. Its estimates are shown in Table I. To this inland consumption it

TABLE I—POSSIBLE ANNUAL FUEL AND POWER CONSUMPTION IN THE UNITED KINGDOM IN THE PERIOD 1959-63

* Including 1.9 million tons of coal equivalent of hydro-electric power (1.1 million tons 1951) and 1.6 million tons of coal equivalent of oil (0.7 million tons 1951) used at gasworks.

adds the Coal Board's estimate that 25-35 million tons a year might be saleable overseas in the early sixties; which makes a total demand of 257-267 million tons of coal in 1959-63. Demand for fuel oil, excluding road transport fuels, it believes might nearly double in this period, reaching 9.3 million tons (the equivalent of 14 million tons of coal); while 3,500 million kilowatts of hydro-electricity (equal to nearly 2 million tons of coal) might be available and could certainly be used.

What are the prospects of supply? The committee has left questions of coal production outside its scope, but it remarks of the Coal Board's planned output of some 230-250 million tons a year by 1961-65, that

It may be desirable that the Board should plan for a greater reserve of mining capacity than might correspond to normal commercial practice, since a shortage of coal supplies at any time can easily mean very heavy losses to the country as a whole.

The Coal Board itself, in evidence, told the committee that its long-term production plans were based on estimates of demand, but remained flexible; in the long run coal output could be raised by delaying the closure of the least economic collieries and adding to capital investment—at correspondingly higher cost. The estimate of future fuel oil demand is based upon what the committee thinks should be available—though the price will depend upon the trends of demand for the other more profitable

petroleum products. The committee expects little—in the next ten years—from other sources of power such as peat, wind, the tides or atomic energy. In the long run it is therefore expecting a serious, though perhaps not unmanageable, gap between fuel supplies and demand. In any case, alterations in the Board's long-term plans could not contribute much coal in the next few years; in the meantime, therefore, the committee does not foresee "any prospect of meeting house coal and export demand in full in this period."

These seem sensible guesses. This year the shortage even of coal has abated, as consumption, after two years of steep increase, has actually fallen. But if production in general is to recover and begin to increase once more, the committee's conclusion looks reasonable:

... measures to improve the efficiency of fuel use in the next few years are essential if the fuel needs of the country are to be satisfied, and in the longer run will always be important as a means to economise the country's resources.

In the most important field for economy, these measures are mainly uncontroversial. Industry consumes the equivalent of about 110 million tons of coal a year. In common with most other authorities, the committee feels that, given sufficient incentive, industry might improve its efficiency of consumption of solid fuels (49 million tons of coal and 27 million tons of coke in 1951) by some 15-20 per cent.

What incentives should be offered to industrialists? The present system of coal allocation, based largely upon "topping up" stocks, gives no advantage to the efficient user; Sir Claude Gibb believed, but failed to convince the other members of the committee, that a practical scheme based on fuel efficiency could be worked out. The committee's eventual conclusions are that industry should be offered much more information about fuel efficiency—partly, perhaps, by an independent, non-Governmental body financed by a levy on industrial coals; and that it should be offered a financial incentive—the existing Government loans for fuel-saving equipment, made more attractive by favourable rates of interest.

In considering the domestic uses of fuel, the committee had to enter a field obscured by controversy. Ever since it was set up, individual fuel experts have been attempting to outflank each other's favourite form of fuel with ever more intricate calculations of "thermal, room, and comfort efficiency" in heating. The voluminous appendix of evidence from the nationalised industries shows that their official views have been no less conflicting—and offer the student a rich example of the level of argument in which such bodies indulge. The committee was, perforce, obliged to do the sums over again for itself; it has produced certainly the most carefully-reasoned impartial calculations ever made on the subject. It finds that the advantages it can establish, and the margins of error they incorporate, would not justify the selection of any one fuel or any combination of fuels as the best for domestic use in all or even "normal" conditions. Its calculation of comparative heating efficiencies enables it to make certain tentative estimates of the real cost of different forms of space-heating, compared with the prices at which they are sold; these appear in Table II. In terms of coal consumed, it does not believe that the advantages that gas in most cases does possess over electricity are sufficient to justify any general policy of transferring demand. But it does conclude that the use of electricity for domestic services is expensive in capital

TRADE and TRAVEL Australia and New Zealand

Whether your activities entail long distance travelling or concentrated investigations, we can assist you in AUSTRALIA and NEW ZEALAND

Our TRADE INTRODUCTION SERVICE and TRAVEL DEPARTMENTS will gladly:

1. Make a SURVEY to meet your trade requirements.
2. Prepare a suitable ITINERARY.
3. Book TRANSPORT by air, rail, road or sea.
4. Secure Hotel ACCOMMODATION.
5. Arrange business INTRODUCTIONS.
6. Issue TRAVELLERS CHEQUES and TRAVELLERS LETTERS OF CREDIT.

Inquiries welcomed either through your own Bankers or direct.

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand gold-field alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

STAFF TURNOVER CUT IN HALF

One value of a pension scheme

MANY business executives are worried by the high rate of staff turnover. The directors of one motor manufacturer tackled this problem by putting in a pension scheme. In two years, the rate of staff turnover was reduced from 24% to just under 10% and furthermore, it was found that the security offered by the pension scheme had made it easier to recruit new staff of good calibre. Married employees, particularly, welcomed the knowledge that in the event of their own death before retirement age, their wives and families would be well provided for.

This scheme was only one of many handled by Robt. Bradford (Pensions) Ltd., who have specialised in pension schemes for many years. Independent of all insurance companies, they have free choice of the entire insurance market. They design individual schemes to suit each client's requirements and arrange for policies to be specially written.

This independent specialist consultancy service costs you nothing. One of the directors will be glad to discuss cases and possibilities with you.

resources at peak hours, while inexpensive off the peak; a distinction that does not apply to gas or solid fuel.

It does, moreover, agree with most experts that, for continuous room-heating, improved solid fuel appliances are so much more economical than gas or electricity as to deserve special encouragement. It recommends that credit restrictions should be eased to encourage hire purchase of these improved stoves and grates, and that tax and rent concessions should be made to owner-occupiers and landlords to enable them to instal them and to insulate houses better. Subsidies and licences for house-building, it thinks, should be granted only on condition that prescribed insulation and heating standards are met.

★

The Ridley report, in fact, cannot be said to lack specific recommendations; it has in all 40 to make, ranging as wide, for example, as support for the provision of better grades of petrol, and the abolition of purchase tax on fluorescent lighting. But it steadfastly declines to formulate a national fuel policy on the grandiose and arbitrary scale that some—including the National Coal Board—would suggest. It believes that the best pattern of fuel use

will be promoted not by the direct intervention of the Government, but by the exercise of the consumer's free choice of his fuel services—provided that competition between the fuel industries is based on prices, tariffs, and terms of supply which closely correspond to the relevant costs of supply, and that the consumer is enabled to make an informed choice.

But it does not rejoice in the illusion that those essential conditions of free competition exist at the moment.

One of the two central bodies that it believes should be set up to advise the Minister of Fuel and Power, indeed, is a small Tariffs Advisory Committee to keep the tariff policies of the nationalised fuel industries under constant scrutiny (the other is a joint committee of the nationalised fuel industries to study projects on which they may have to work together). Perhaps the most important, and controversial, of the recommendations that it considers particularly important concern electricity tariffs. It con-

cludes from a comparison of electricity prices and real costs (conducted with difficulty) that electricity tariffs should discriminate in charges between peak and off-peak hours; and that immediate steps should be taken to make extensive practical trials of the various methods of measuring or controlling the consumption of electricity at "system" peak hours. These decisive recommendations, from an impartial inquiry, are important and valuable; the British Electricity Authority, which may well count the committee's treatment of it in the matter of space-heating efficiency to have been rather merciful, has been unable to obscure this real issue of tariff policy. The committee examined but rejects "tariff-tilting," the increasing of "follow-on" rates for electricity in two-part or variable-block tariffs, though it suggests that the proposed tariff committee might investigate this. Such alterations are certainly not easy to justify on grounds of relation to real costs; they might serve some indirect purpose in restraining the peak demand of minor consumers for whom tariffs related to peak and off-peak hours are impracticable. But no case has been fully made out for the main argument put forward in advocating them; that electricity consumption in the home should be penalised at all times.

In preferring to use the price mechanism rather than physical controls on fuel consumption, the committee shows good sense. But it has not managed to be consistent. Its discussion of costs and prices for the different fuels is based, in the main, upon the marginal principle; its examination of electricity and gas prices, and indeed its criticism of electricity tariffs, derive from the comparison of price and marginal cost. But this principle has been too much for half of the committee—the chairman and the industrial members—to swallow when it is applied to coal. Professor W. Arthur Lewis and three other members of the committee would apply the marginal cost principle to the price of all fuel: a view that has often been put forward in these columns. Since some 7 million tons of coal today are produced at a loss of about 15s. a ton, and supply is insufficient to meet demand, they propose an increase in the price of coal by £1 a ton (to be levied, perhaps, as an Excise duty); this would add

TABLE II
ESTIMATED HOURLY REAL COSTS OF "CONTINUOUS" ROOM-HEATING IN A NEW HOUSE (a)
(Pence)

	Electricity		Gas		Coke		Coal			
	Peak (a)	Off-peak	Radiant fire	Convective radiant fire	Openable stove	Improved open fire	Openable stove	Improved open fire	Improved convective open fire with restricted throat	Stool-bottomed grate
1. Coal cost (wholesale).....	0.75	0.75	0.73	0.61	0.50	0.63	0.56	0.75	0.56	0.90
2. Capital cost	2.74	0.10	0.43	0.36	...	...	...	...	...	...
(i) Production	0.03	0.01	0.02	0.02	0.01	0.01	0.01	0.01	0.01	0.01
(ii) Distribution	0.06	0.05	0.27	0.27	0.72	0.47	0.72	0.47	0.45	0.34
(iii) Household installation ..	...	...	...	...	...	...	...	...	...	...
3. Running cost	0.84	0.84	0.89	0.74	0.11	0.15	0.13	0.16	0.13	0.22
(i) Of supplying the fuel..	...	...	0.02	0.02	0.25	0.25	0.25	0.25	0.25	0.88
(ii) Of housework, etc.	...	...	...	...	...	...	...	...	...	...
TOTAL	4.41	1.75	2.36	2.02	1.59	1.51	1.67	1.64	1.40	2.35
4. Costs incurred by supplier (1+2(i)+2(ii)+3(i))	4.36	1.70	2.07	1.73	Not applicable. The costs of distribution and the running costs have been deducted from the retail price, so that there can be no distinction between price and the cost shown above.					
5. Price to consumer at 0.875d. a unit of electricity (b) and 15.5d. a therm of gas	1.75	1.75	2.10	1.75						

(a) Assuming that the service is required throughout system "planning peak" hours on winter working days. (b) It is assumed that for the electricity block tariff the initial high rate block has been exceeded by the consumption of electricity for lighting and minor appliances and that these uses bear the whole of the excess charge for the first block.

some £210 million to expenditure on coal. This would not cover short-run marginal cost, which they think might require an extra £3, but it would cover the gap that they expect to persist between average and marginal costs. Viscount Ridley and three other members of the Committee, however, hold staunchly to the belief that coal prices should be based on average cost; in their opinion coal is so important to the economy that it should be sold at the lowest price at which the Coal Board can cover its costs. Marginal pricing is not perhaps consistently used in industry; and there is one school of economists that might perhaps support Lord Ridley against Professor Lewis. Nevertheless, it is a pity, from the point of consistency, that the committee as a whole having brought itself to accept the marginal principle almost throughout the remainder of the report, was unable to do so on this major point. But its importance may be less in practice; even had this case been made acceptable to industrial experts, it might seem almost impossible to bring politicians who are confident of a fall in the cost of living to accept it.

The Ridley report, then, is a moderate and sensible document on a subject over which controversy has often displayed neither quality. Its rejection of the plea for additional co-ordination is certainly justified on practical

grounds. It is true that the corrective measures to restore competition cannot of themselves guarantee that the fuel industries will obtain the "right" share of investment resources, while these resources remain scarce and subject to allocation; and this point might have seemed more important to the committee had they concerned themselves with questions of coal production. But in practice some new co-ordinator or committee would not be an effective substitute for market discipline upon investment; his "co-ordination" would be reduced to the present attempts to lop off a little here and a little there, with the same jealous watch by each industry upon the projects that their competitors have been able to retain inviolate. Control of the investment policies of public organisations that are guaranteed a privileged position to raise money is a technique that has yet to be mastered by any government; but it is the technique, not the power, that is lacking. In a somewhat acid reference to this question of co-ordinating bodies, the committee says of the Ministry that appointed them

To the extent that co-ordination measures have to be imposed on the Boards, that, in our view, is a matter for the Minister. In fact we look upon this function of co-ordination and control of policy as the main reason for the existence of a Minister of Fuel and Power.

There is not much that needs to be added to that.

Business Notes

Fall in Exports

In August both exports and imports were some £27 million less than in July; since re-exports also fell, the adverse balance shown in the trade returns for the month rose by over £4 million to £73.7 million. These bare figures, however, are somewhat misleading, and for two reasons. In the first place, there were only 25 working days in August compared with 27 in July; this factor might account for as much as £15 million of the month's fall in exports and a substantial slice of the fall in imports. Secondly, about one-eighth of the value of imports recorded in the trade returns—and therefore of any monthly fall in it—is normally represented by freight and insurance payments, many of which are made by British importers to other residents of this country. If allowance is made for this factor, it seems likely that the true adverse balance of visible trade may have risen from somewhere between £30 and £35 million in July to rather over £40 million in August. It is unlikely that net invisible receipts can have been much—if at all—above £30 million in either month, so that last month's figures do seem to indicate some setback to Britain's previous progress towards balance.

It would, no doubt, be a mistake to draw any firm conclusions from a single month's experience, but the accompanying table shows up fairly clearly the trend of Britain's trade problem. Thanks to the brute force of Mr Butler's axe, imports have fallen according to schedule; the August total of £263.4 million was nearly 23 per cent below the monthly average in the second half of last year—and it was fairly well in line with the target that Mr Thorneycroft has set for the second half of this. Against this, however, the August total of exports was some 24 per cent below the monthly average just before the Australian and other import cuts last spring. Moreover, and this is perhaps the most disturbing feature of the latest figures, the fall in exports last month did not occur only in these restriction-ridden soft currency markets. Exports to the United States and Canada in August were only £21.5 million; this is rather above the fairly steady monthly average

between October of last year and June of this, but it is in disappointing contrast to the figure of £25.4 million achieved in July. Some part of this deterioration is accounted for by the lower number of working days, but it should be noted that the month's drop in the daily rate of exports to North

TREND OF BRITISH OVERSEAS TRADE (£ million—monthly averages or calendar months)				
	Imports c.i.f.	Exports f.o.b.	Re-exports f.o.b.	Excess of imports over total exports
1951—				
1st half.....	309.4	206.7	10.6	92.0
2nd ".....	343.0	223.3	10.4	109.2
1952—				
1st quarter.....	328.1	239.5	18.3	70.4
2nd ".....	306.3	209.3	10.1	86.8
July.....	290.0	207.8	12.9	69.3
August.....	263.4	180.7	9.0	73.7

America (8 per cent) was rather greater than the drop in the daily rate of exports as a whole (6 per cent). There is an evident danger that the decline in British imports, unaccompanied by a decline in British money incomes, may encourage the diversion of British manufactures from the export drive to the hungry domestic market. This is a trend against which the Government must be even more persistently on its guard.

Sterling and Commodity Arbitrage

The Bank of England announced on Thursday that it does not propose to reopen the facilities for purchase of dollar commodities for re-export to EPU territory, since the applications approved during last month's brief spell of freedom

"...has decided on a scheme
to modernize the docks
at a cost of..."

With the brief news announcement that an important scheme of works is to be put in hand, there begins a period of intense activity for those who are to carry out the task. Frequently Vickers are called in, for they have been supplying equipment for docks, harbours, railways and other large-scale projects since before the memory of this generation. These are not, by any means their only activities, for the engineering skill and resources of the Vickers Group also contribute to progress in many secondary industries, including soap, paint, brewing, printing, and plastics.

Among the products and services of the Vickers Group are: SHIPS
SHIP REPAIR SERVICE • MARINE ENGINES • DOCK GATES AND
MACHINERY • AIRCRAFT • RAILWAY ROLLING STOCK •
INDUSTRIAL, MINING AND POWER STATION EQUIPMENT

THE BANK THAT CONDUCTS THE LARGEST BANKING BUSINESS IN NEW ZEALAND

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 300 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or projected interests in the Dominion.

You are invited to contact the London Office
or the Head Office.

BANK OF NEW ZEALAND

(Incorporated with limited liability in New Zealand)

London Office:
1 Queen Victoria Street,
E.C.4.

Head Office:
Wellington,
New Zealand

Branches also in
Melbourne and Sydney (Australia); Suva, Lautoka
and Labasa (Fiji); Apia (Samoa).

In the tradition
of things well done

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

NATIONAL BANK OF INDIA LIMITED

ZANZIBAR, UGANDA, ADEN AND SOMALILAND PROTECTORATE.
Bankers to the Government in ADEN, KENYA COLONY, ZANZIBAR AND UGANDA.
Head Office: 26, BISHOPSGATE, LONDON, E.C.2.

LIMPET INK

A LARGE printing house had difficulty in producing an ink that would print satisfactorily on cellulose film and other non-absorbent materials used for food wrapping. Believing that the problem could be solved by using a synthetic resin to bind the ink to the printing surface, the firm asked advice from I.C.I. Dyestuffs Division. They required a pale-coloured, quick drying resin that would be completely soluble in alcohol. In addition, it had to be free from objectionable smell and from any tendency to deteriorate in storage. No available synthetic resin had all these properties. Accordingly, the Division put in hand a series of experiments, but the first two samples produced became unstable during storage. This difficulty was not overcome until the research department had made fifty-two different resins, each of which had to undergo storage tests lasting two months. The final sample sent to the ink manufacturer proved completely satisfactory.

The oldest inhabitant

Somehow, he seems always to have been part of the village. None can remember it without recalling him, for his wise advice and local knowledge have helped both young and old.

For many businessmen, it is equally hard to think of Australia and New Zealand without recalling the Bank of New South Wales. For, as the oldest public company in the South-West Pacific, its experience and knowledge of local conditions are unrivalled. And as the largest commercial bank there, with over 850 branches and agencies, it can give every assistance to its customers.

For your ventures in Australia and New Zealand, consult and use—

for arbitrage had proved large enough to achieve the "limited objective." Most of these permits have now either lapsed or have been utilised, since they were valid only for one month. The evidence of the foreign exchange market and of the traders concerned suggests that a fairly large proportion of them have in fact been converted into firm business. The result has been a steady pressure on sterling in the exchange market during this period, to cover dollar commitments involved in the commodity deals placed before the licences lapsed. The sterling-dollar rate thus fell to a level barely above the lower "gold" point of \$2.78. It is generally believed that the authorities have had to intervene on a fair scale in order to prevent the rate from dipping to the figure at which the market would have bought its dollars direct from the Bank of England. The converse of this pressure on the dollar reserve should be a considerable alleviation of Britain's deficit with EPU—possibly even to the extent of converting the small August deficit into a surplus for September.

By the second half of last week it became known that a number of authorisations had lapsed without being used. The sterling rate on New York then recovered to around \$2.784—still within the danger area, but not so near the extreme margin of fluctuation as to require official support—but it has since shown signs of slipping back again. Now, perhaps, it may gain some stiffening from the knowledge that there will not be a renewed bout of strain from additional arbitrage transactions. But the Bank's decision has caused real disappointment among those traders whose previous applications were returned with the advice to re-apply.

Steel Output Grows

Since May this year steel output has been steadily higher than a year before, and in August it has finally made good the amount by which output in the first four months of 1952 was lower than in the same months of 1951. As a result, output in the year so far exceeds that in the first eight months of 1951; from now on any increases over 1951 output can be counted as a direct gain on that year's total. The industry is now fairly hopeful of exceeding the 16 million tons it has been aiming at; the earlier, more cautious estimate of 15½-15¾ million tons this year seems to have been abandoned.

Output in August amounted to a weekly average of 279,500 tons of steel, compared with 273,800 tons a week in July and 266,400 tons in August, 1951. Production of pig iron, however, reached 201,900 tons a week: comparable weekly figures are 201,600 tons in July and 180,900 tons in August, 1951. This extra iron output, from the new blast furnaces, has combined with that the industry has been bringing in, has combined with the lack of imported scrap to bring about a considerable shift in the basis of British steel production. The years of abundant scrap for steelmaking, 1949 and 1950, were years of steadily rising steel output; but based on a pattern of material supplies, that could not last. The shift towards steel made from pig iron has been substantial this year; in addition, much more of this pig has been made from home ores, though recently imports of the higher-grade imported ore have also increased. The whole development has caused some anxieties about the coke to smelt the additional ore; but at the moment lack of coke does not seem to be holding up iron production.

With the American steel and steel-making materials still arriving at an encouraging rate, the gap between steel supply and demand in Britain must already have narrowed considerably, though some industrial consumers are still complaining that it is seriously handicapping their production. It would be interesting to know whether consumers' stocks as a whole have greatly diminished this year; the method of steel allocation used by the Government is not likely to adjust supplies with regard to these stocks, and may even lead to further

accumulation. The real extent of steel shortage during the last twelve months will probably never be measured; some of the relevant figures will have been collected, on behalf of the Ministry of Supply, but since the re-imposition of steel allocation they are no longer being published.

Echoes from Mexico City

The meeting of Governors of the International Monetary Fund and the International Bank have run their expected unsensational course. Most of the work at these gatherings is done in closed sessions and it may therefore be unfair to judge the whole meeting by the material that has been allowed to see the light of day. The evidence of the published reports suggests that the meetings dealing with the affairs of the IMF provided the main issues of conflict and points of interest. The gold problem was raised by the South African representative, Mr Havenga, who based his case less on the supposed injustice done to gold producers by the twenty year stability of the dollar price for gold, than on the argument that an increase in the gold price would make it easier to achieve worldwide convertibility of currencies. Convertibility, he argued, would continue to elude the world as long as countries did not have the external discipline of a gold standard imposed on them, and there could be no question of a restoration of the gold standard without a more realistic price for gold than exists today. The current price, he said, not only makes the existing gold reserves too small to perform the work expected of them; it also diverts to private hoards gold that should be fortifying the monetary reserves and, in so far as it is bought by the United States, should be creating new dollars for a dollar-hungry world. The dialectic is improving and got wider support than has been given to the cause in previous years. But Mr John Snyder remains unconvinced.

Debate on the use of the IMF's resources no doubt played a considerable part in the proceedings, but it was held behind closed doors through which no audible echoes have so far penetrated. On the problem of exchange policy, however, there appears to have been a widespread attack against the policy of certain members to offer dollar export incentives, by allowing their exporters to dollar markets to retain a part of the proceeds of their sales. This practice has been spreading in Europe of late. It runs against the basic object of the IMF because markets have inevitably developed in the dollars created by these incentive schemes and, needless to say, the local currencies concerned have been quoted in these markets at substantial discounts under the official rates. One of the main perpetrators of this system is the Netherlands and one of the victims has been its neighbour, Belgium, which has been robbed of direct dollar exports because Dutch traders have been able to buy Belgium goods, re-export them to the United States and still make a profit by disposing of their dollar "bonus" at a substantial premium. The matter was raised at the IMF meeting by the Governor of the Belgian National Bank, and the board of governors has unanimously approved a resolution ordering the executive directors to make a special study of the system—the first step to taking the necessary action.

The British delegation at the meetings has again played its familiar but very necessary role of "Scrooge" urging the need for maximum economy in the expenditure of the Bank and Fund and suggesting their closer collaboration and the sharing of common services. This demand is not inappropriate in a year in which the IMF budget shows a deficit of \$1,400,000. The matter has been referred to a committee, which is not the best augury for those who hope that something may be done to hold in check the trend towards megalomania, of which the Bretton Woods twins have shown expensive evidence.

Is Coal Too Cheap?

Whether or not the Ridley Committee may feel an excise tax on coal is necessary to make consumers use it more economically, it looks as if the price will soon have to go up. Quite apart from the large wage claim that the National Coal Board has rejected once but will soon have to face again, the Board so far this year has been running into the red. Its second quarterly statement of coal costs and proceeds, published this week, shows that it sustained a deficit—after providing for its interest payments—of £727,000 compared with a surplus of £3,105,000 in the corresponding spring months of 1951. For the whole of the first half of 1952 it has been in deficit to the tune of nearly half a million pounds. The Board's costs during the second quarter of 1952 rose by 1s. 11d. a ton to 56s. 3d.; over the six months they have risen by 4s. 2d. a ton. Labour costs, which rose after last winter's wage increase by about 3s. 4d. a ton, increased by about 6d. a ton in the second quarter: this may reflect the recruiting of new miners, who have yet to make much effective contribution to coal-getting, but it is a disquieting increase that will require scrutiny in future. The major cost increase, however, came in purchases of roof supports, general stores and repairs, where rising prices were largely responsible for an increase of about a shilling a ton. At the same time the average price obtained by the Board for a ton of coal remained steady at about 57s. 6d.

The Board made a gross profit of just over £3 million on the coal, and about £800,000 on ancillary activities, but it had to provide £3.9 million for interest payable to the Ministry of Fuel and Power, and £700,000 for tax provision. This falls due despite the deficit; three-quarters of the coal stock upon which the NCB pays interest is treated as equity capital. The conditions under which these nationalised industries are engaged in paying fixed interest on capital that is taxed partly as an equity and paying that capital back (apart from ordinary provision for depreciation) are part of their facts of life and offer no room for complaint. There would seem no way of avoiding the conclusion, therefore, that coal is too cheap; since some premium is probably still being earned on the larger amounts being exported, the home consumer is probably getting it well below average cost, let alone the marginal cost that half the Ridley Committee have failed to persuade the other half should be covered in the price. With the miners' claim looming ahead—and little real prospect that coal can remain as abundant as it temporarily is now—some increase may be inevitable.

Textiles on the Mend

Now that there is no longer any doubt about the upward turn of textile sales, the principal point of interest lies in how far and how fast the improvement will carry the industry back towards the production level of 1951. In July, rayon yarn output began to rise again with the partial reopening of several of the plants that were closed in June. The improvement of 3.7 million pounds of yarn still left the month's output, at 15.4 million, at considerably less than half the level of which the industry is capable, but the rising trend is likely to have continued during August. More recently producers have begun to take back workers as a preliminary move towards bringing more plant into commission and spinners appear to have run down their stocks of rayon staple to the point at which they are obliged to re-order for immediate delivery; but there is no reason to suppose that the rayon industry will need to raise output to its capacity of 36 to 40 million pounds of yarn monthly in the immediate future.

In Lancashire, the newly-introduced two weeks' holiday has reduced production of cotton yarn and of cotton and rayon cloth even more drastically—but much less painfully—than the widespread short-time working to which the mills

resorted earlier in the year. The holiday season runs from Whitsun (this year early in June) until the end of August and cloth production in July was down to an average of 27 million yards a week, compared with 36 million in June, 42 million yards in May and 63 million last winter. If production proves to have continued at this low level throughout August, as seems probable, the mills' heavy stocks should be cleared by the time the new season starts in September.

Employment in the spinning mills began to rise slightly at the end of July for the first time this year even though, because of the holidays, yarn output is still falling. This trend has since received a check and the extent to which output will recover in the autumn may now depend not only on the combined level of home and export demand, but also on the willingness of workers to return to the mills. Rayon producers do not expect any difficulty here. The cotton industry, however, has experienced a decline in the number of workers on its books from 317,750 to 262,800 since last December. Many of these workers, especially the women workers, will no doubt return; but it may be found that there has been a permanent shift of individual key workers from the mills to the armament industries—or even to "safe" jobs on the railways. Plant will perform remain idle if these men do not come back. Some are certainly lost to the industry for good, and the question before cotton managements now is whether enough of them can be attracted back to meet the new level of demand. This, when it stabilises, is expected to do so about a level well below the 1951 peaks.

Buyers Return

The improvement in both home and export sales of textiles in July—a month in which they would normally have been expected to decline—is the most convincing indication yet of a genuine recovery in the textile markets. Export shipments of wool and cotton piece goods were only a little below the levels reached last July, but those of rayon piece goods, although higher than in June, were still some 30 per cent down on the year. Each industry has been exporting a significant proportion of its output since the war—in the rayon industry, about half the production of piece goods—so the current level of exports has an important bearing on future levels of activity.

It is not easy to relate the figures for wholesale and retail sales of textiles at home to production at the mills, since these figures are expressed only in values of sales; as prices have certainly fallen further in the past year than the value of total sales, the figures evidently conceal an appreciable expansion in physical turnover. During July, however, the wholesale trade in textiles was maintained in value, the index (1947=100) remaining at the June level of 83, compared with a drop of from 117 to 94 in the same month last year. Wholesale stocks continued to decline—from 174 to 162. This time last year their persistent rise was causing widespread disquiet. Between June and July, 1951, the index of stocks rose by 31 points, to 209, and it continued to rise until much later in the year. The trade, which takes a traditionally gloomy view of any drop in money turnover, however caused, now admits that "hope for revival." There is no doubt that the reduction in stocks, some of which were bought at peak prices, has not been made without sacrifice; and there are complaints that reductions in retail prices have not matched those in wholesale prices. To this many retailers can properly retort that falling turnover called for more substantial margins if over-heads were to be covered. The marked improvement in sales at the retail level suggests, however, that this argument may have lost its force. The retail sales index (adjusted to a new base, 1950=100) rose from 114 to 117 during July,

Sales and Service throughout Great Britain

It took 159 years

A blueprint is studied. Youth is guided by experience in the preparation of engineering templates, as it is guided in every other field of activity at Newton Chambers. For seven generations men have passed on their skill and recorded their knowledge, and in this way have helped to make Newton Chambers the thriving industrial community it is today. At Newton Chambers every present-day development rests on the sure foundation of hard-won experience.

Newton Chambers

HOW MUCH STEEL

from this ship's cargo?

Specially designed for the transport of iron ore from new fields in West Africa and other overseas sources, the M.V. "Orelia" will carry an average cargo of 8,400 tons of this valuable steel-making, fuel-saving material.

This is one of fifteen ore ships to be ordered as part of the steel industry's post-war development plans begun in 1946. Their cargoes will help to feed the six new blast furnaces which British firms are bringing into operation during the year in this great expansion programme.

The extra pig iron produced in these new furnaces will increase Britain's annual output of steel by three-quarters of a million tons.

"KEEP ME MOVING!"

says

JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

compared with 106 last July, when the recession was getting under way. Moreover, the recovery was concentrated into the "non-food" category of merchandise. This section of the index rose from 104 to 110 between June and July and stands 8 points higher than it did a year ago. The improvement was apparent not only in sales of clothing and shoes, but in the durable household goods (such as furniture, household textiles and hardware) and the semi-luxuries (such as leather goods, radio and electrical equipment) that are the first to feel the effects of a buyers' strike and the last to share in recovery. Impervious to boom or slump, the trade in chemists' goods continues to expand—sales by large retailers were 7 per cent higher than in the similar month last year.

* * *

Where Manpower is Going

Since April, though hard-pressed industries such as aircraft have been able to obtain a steady trickle of workers, employment in the engineering industries as a whole has been falling; in July it went down by 15,000. The Treasury, in its latest industrial bulletin, is confident that manpower—and overtime—was still growing, at least up to June, in "the engineering industries which produce for a buoyant overseas market, manufacture armaments, and equip home industry." It is to be hoped that it is right, and that these vital industries are still increasing their labour force—though their extra effort will soon be curtailed if the engineering unions' restrictions on piecework and ban on overtime come into effect. Employment in civil work fell by 13,000 in July; and total unemployment rose again, by 10,100, reaching a total of 403,600 (77,700 of these being temporarily stopped). The number of textile workers registering as unemployed fell by 15,600; but employment in textiles also continued to fall, by 5,000 during the month.

The recovery in textile sales on the home market, therefore, had not made itself felt in the textile industries as a whole by July; and the fact that unemployment and employment in these industries was falling at the same time implies that a certain proportion of the dismissed workers are leaving the industry. At the moment, they do not seem to be adding appreciably to employment in any of the other manufacturing groups; it is in agriculture, distribution, professional and financial services, and mining that the latest Ministry of Labour figures show some increase. The Ministry has recently revised its statistics to get rid of a piece of double counting. Employers usually show their labour force as including workers temporarily stopped, which necessarily means that these figures do not accurately measure actual employment in different industries and services. This cannot conveniently be altered; but the Ministry has now begun to reduce the figure for the total working population, obtained from adding such estimates, by the number registered as temporarily stopped, so that this aggregate will mean more precisely what it says.

Japanese Debt Negotiations

The negotiations in New York for a settlement on the external debts of Japan prove to have duly followed the trail cut by the earlier German debt negotiations, and so have run headlong into the obstacle of exchange clauses. Difficulties between the American and the other groups of creditors have once again provided the main stumbling block. Two types of exchange clauses are involved. On the one hand, there are the fixed exchange clauses such as those embodied in the 5½ per cent 1930 Bonds and the Tokyo Electric 6 per cent Bonds; these clauses follow the normal pattern of post-1918 dollar clauses and were introduced to give a specific guarantee against the risk of depreciation of the currencies in which

the original issues were made. On the other hand, there are the "due-date" clauses, such as those of the 1907 issue, that merely grant an option to receive dollars, instead of the currency of issue, at the rate ruling when payment becomes due. These "due-date" clauses were incorporated in the bonds primarily as a convenience to the holders, and not with any original intention to provide a safeguard against the risk of serious depreciation of the currencies in which the bonds were issued. During the discussions in New York, the representatives of the American bondholders have shown some readiness to recognise the fixed exchange clauses, just as they did, after first putting up a considerable resistance, in the German debt negotiations; but they have so far been unwilling to concede the same validity to the "due-date" clauses.

The dollar clauses have also led to difficulties because of the standpoint naturally adopted by the British Treasury; the British representatives, acting under instructions from the Treasury, have demanded not merely that payments on their bonds should be adjusted to allow for the depreciation of sterling in terms of dollars, but that the payment shall be made in dollars. The British Exchange Control is, needless to say, intent upon purchasing from the bondholders the maximum amount of dollars that can be squeezed out of the debtors. It can exert pressure on the bondholders because, under exchange control regulations, they have no right to waive any of their rights to receive foreign exchange unless the Control authorises them to do so. This is therefore a matter in which the interests of the bondholders clash with those of the Control. If payment has to be made in dollars, the Japanese Government may be unable to accept as generous a settlement as that which would be possible if payment on each bond could be made in the currency in which it was issued. Whether the bondholder is paid in sterling or in dollars is immaterial to him, *qua* bondholder, since he will in any case have to hand the dollars over to the exchange control in exchange for sterling at the official rate; his only interest is to get the maximum sum in his own currency.

A way out of this deadlock may, however, have been opened by proposals made this week on behalf of the British delegation. It has been proposed that the question of the actual currency of payment should be taken out of the agenda of the conference and referred to discussions between the British, American, French and Japanese Governments. This would leave the way open to an arrangement such as that reached in the German debt negotiations. It was agreed there that, for instance, British holders of German sterling bonds, which had a dollar clause attached to them, should receive payment in sterling—but that the actual currency that would pass from the German central bank to the Bank of England should be left to later inter-governmental negotiations. As for the "due-date" exchange clauses, though it is clear that it was no part of the original intention to give them the status of a guarantee against exchange depreciation, there seems to be no way in which its interpretation can be made to vary from that of a fixed exchange clause.

* * *

Decontrolling Timber

This year the importation of softwood from non-dollar sources was once again permitted to private traders. Next year they will be allowed to import from dollar sources as well. Since about half of Britain's softwood imports come from dollar countries, this experiment in freedom would be widely welcomed in the trade—were it not for some justifiable criticism of the mechanism of decontrol. Although the quota system for importers (based on past trading) is to end, import licensing will continue. Many timber importers believe that this is unnecessary, and argue that they should be left free to decide when and how much to buy; the balance of payments position would then be sufficiently

protected by the Government's control of internal consumer demand, through its rigid system of acquisition licensing.

The real trouble, however, is that the Ministry of Materials has announced that, as a first instalment, licences up to only 500,000 standards will be granted against requirements for 1953; this compares with a present annual rate of imports of about 1,000,000 standards (or about £100 million worth at present prices). The fixing of this low and specific—though admittedly only provisional—import total may lead the bigger firms, with larger financial resources, to scramble for most of the import licences. This would leave anything but fair shares for the smaller firms, and the scramble might even force up prices. Importers' fears on this score have been little allayed by the Ministry of Materials' statement that although the level of 1953 softwood imports has not yet been decided, it will be sufficient to maintain stocks adequate for a level of consumption that is not expected to be less than for 1952. This statement obviously does not exclude the possibility that the Government might require stocks, estimated at 5 million standards, to be drawn upon. As far as importers are concerned, the total licensing for 1953 is therefore anybody's guess; in fact it will be the Treasury's guess—and it may not be made until after the next review of the balance of payments.

* * *

Freedom for Linseed

The progressive freeing of the commodity markets was also carried a stage further this week by the Ministry of Food. The Ministry has been the sole importer of linseed and linseed oil since 1939, but it now states that it is to give up buying these commodities on Government account. Full details will be announced later of the arrangements that will permit private imports to be resumed under licence. In preparation for the start of private imports, the Ministry has reduced its selling price of crude linseed oil by £5 to £18p per ton "naked ex works"; this figure, however, is still about £45 above world prices and the Ministry is likely to be confronted with a difficult task in selling its not inconsiderable stocks that were bought before prices declined.

The United Kingdom's chief source of linseed oil is Argentina, which accounted for £18 million out of total British imports of just over £22 million in 1951; British imports of flax or linseed in 1951 amounted to another £2 million. State trading between the United Kingdom and Argentina,

THE NATIONAL FINANCES

MORE DETAILS NOW AVAILABLE

Supplementary information on the National Finances is published in this week's issue of the Records & Statistics supplement to *The Economist*. This completes the annual review of the National Finances that was started in special sections of the issues dated March 15th and April 12th.

Subscription rates: £2.10.0 a year, or together with *The Economist* £5 a year. For a specimen copy please apply to: Records and Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

in which linseed has played an import part, has been far from harmonious in recent years, and private traders are going to have to search for their oil in troubled waters. Trade in linseed is not, however, a dollar trade; with Argentina—as with Uruguay, the second largest supplier—business is done on a sterling basis. The return of importing to private hands was therefore overdue and the chief users of linseed oil, the paint and linoleum industries, will certainly welcome the prospect of a scaling down of prices to the lower levels prevailing outside this country.

Four Years of Productivity

When the Anglo-American Council on Productivity was set up in autumn 1948 by Mr Hoffman and the late Sir Stafford Cripps, its newly appointed members were clear enough about its broad purpose—to make American technical information and experience available to British industry. But none of them knew quite how this purpose was going to be carried out. They decided to investigate five different methods; at the time, they did not foresee that the success of one of them, the arrangement of visits by teams from British industries to their American counterparts, would immensely overshadow the rest. In the Council's final report, issued this week, it outlines for the first time what became of the other four.

One committee of the Council, dealing with the maintenance of productive plant and the supply of power for British plant, began to examine the question whether too large a proportion of British machine-tool output and power generation plant was being exported. It produced a report, but decided the full task of making comparisons between investment and output in Britain and the United States was beyond it; in the meantime, the British Government had reduced the export quota of machine tools. Another committee investigated methods of measuring productivity; here again the Council had to conclude that the development of objective bases for comparison was beyond it. A third committee sent a special mission to the United States to report on simplification in industry, and followed this up with a second report on simplification in British industries. The fourth reviewed the two countries' different methods of making economic information available, and made one special study of the trade and technical press (which probably fulfils slightly different purposes in Britain and the United States).

It was clear by 1949, however, that the Council had backed its winner in the productivity team visits. Over the whole period, until the Council was wound up on June 30th this year, 66 teams made up of 911 individuals, visited American industries; some of the reports are still to come. The value of the reports will never be properly measurable; but the Council has probably had a continuing effect upon the younger generation of British managers that will be felt for many years, and has showed many British workpeople a glimpse of American life and work that they could never otherwise have gained. In all, the work of the Council cost £844,500, or \$2,364,000 at the current rate of exchange. Of this, £320,400 was contributed by Britain, some £180,000 by the Government, the British Employers Confederation, the Federation of British Industries and the TUC, and the remainder by firms supplying members for the teams. The Americans contributed \$1,467,480 from ECA and later MSA funds. For both countries, it may in the long run have been cheap at the price.

* * *

The Council's Future

This final report of the Anglo-American council mentions the decision to set up a British Productivity Council

to succeed it in this country, and states that a standby organisation in America with the job of answering queries about productivity from here or other countries is being considered. Not much emerges of the British council's plans; it is to hold a conference of interested organisations and to publish a book on the general experience of the teams. The major justifications for a continuing body in this country are that the trades unions and employers' organisations that set it up are prepared to go on co-operating—and spending their own money—on furthering the progress of British production as a whole, and that the need for higher productivity cannot be urged too often. Nevertheless, it must not be allowed to lapse into one of those estimable, vague "stage armies," overlapping and trying to co-ordinate the field of other bodies, that sometimes exist among industrial organisations. It may need to reach some clear agreements soon defining its scope in relation to those of other institutes in the field of production.

For instance, it might have been expected at first glance that a separate series of "Productivity and Factory Performance Reports," now being offered to industries in this country, would be coming from the British Productivity Council. In fact, they are published in this country by the British Institute of Management. These reports, prepared by the Bureau of Labour Statistics in Washington after consultation with industrial organisations in Britain and other West European countries, offer comparisons in terms of man and machine hours of the actual performance of companies in American industries. They are less interesting to the outsider—and perhaps to the trade unionist—than the general Anglo-American reports; but they may be of considerable value to the production manager, particularly if financial operating ratios are included, as they may be in some of the coming reports. The BIM is duplicating these reports, in the fairly small numbers required (no single "edition" has yet exceeded 50 copies) and selling them at £1 each. They originated from a visit by European statisticians to the Bureau of Labour Statistics in 1950; special case studies have been made, financed under the Technical Assistance Programme, covering the sizes of firm and the particular processes in which European industries said they would be interested. More than a dozen industries have been covered in studies now available from BIM, and many more are on the stocks.

There is no dispute on spheres of influence here: the British Section of the Anglo-American Productivity Council knew at the time that these special reports were being produced, and being heavily engaged itself in arranging industrial visits, was content to leave them to what it calls "other agencies, mainly governmental." The arrangements at this end—which have been quite elaborate—have been carried through by BIM, working with trade associations; the whole field of productivity comparisons between firms is one with which it has long been concerned. But this is an example of the way in which the study of production and productivity is already fairly amply covered by existing bodies. It is to be hoped that from its coming conference the British Productivity Council can evolve, through experience, a new technique as useful in assisting British industry as its Anglo-American predecessor found in the team visit.

Too Many Cooks in the BRM

There are some fields of enterprise that are not suitable for co-operative venture, and last week's decision to put British Racing Motors Ltd up for sale after eight years have been spent in developing the 16-cylinder BRMs suggests that the design of racing cars is one of them. Towards the end of the war, a trust was formed to sponsor the design of grand-prix racing cars, the cost of which had become too heavy to be borne by any of the small companies previously building them. The trust was from the start generously supported by sections of the motor industry, and in all about

We've solved some problems in our time!

In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.

That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

Our answer was to produce the Exide self-priming battery. Its plates were dry charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

Thousands of these batteries were supplied; and many a seaman owed his life to them.

We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem.

CHLORIDE

BATTERIES LIMITED

Makers of Exide Batteries

EXIDE WORKS · CLIFTON JUNCTION · NR. MANCHESTER

£300,000 has been spent on the project, not counting the value of the fixed assets. The subscribers of this sum, and the lenders of much of the machinery, decided to remain anonymous; the industry as a whole did not take any part in the scheme.

That there was much good in the cars eventually produced by the BRM company is proved by the calibre of the men who accepted commissions to drive them—they included some of the most successful drivers now racing. But the repeated failure of the cars to complete a race—and sometimes to get away at all—by reason of a succession of major and minor faults, also suggests that there was a serious weakness in the organisation of the company that somehow prevented it from learning from these bitter experiences. It suffered most of all, perhaps, from a division of responsibility. Those who directed—or at least advised on—policy did not have the responsibility for putting it into effect, and the very complexity of the design chosen suggested that too many fruitful brains had been brought to bear on a venture that cried out for single-minded direction. The British motor industry is not congenitally incapable of building racing cars; during the BRM era several successful companies have been started and have produced world-beating cars of their class. Other established motor manufacturers, such as Jaguar and—with their gas-turbine—Rover, have produced high-speed cars that might be the forerunners of a new era in British motor racing. A change in the Grand Prix formula means that it may never be known whether the BRM would have eventually proved the success that was once hoped. But whether the company is sold or wound up at the end of the month, it is to be hoped that the team that worked so long on the cars will not be discouraged from starting afresh—even though on a more modest scale.

Stock Exchange Statistics

The initial impact of dearer money on the London stock market can be readily discerned, but cannot, of course, be precisely measured in the latest annual batch of statistics published by the Stock Exchange Council. In the year to March 31st last the market value of all the securities quoted on the London Stock Exchange, the number of which remained practically unchanged at 9,708, fell by £1,548 million to £25,443 million; this fall occurred despite the fact that new capital issues (including bonus issues) and the granting of new stock exchange quotations raised the nominal value of all quoted securities by over £1,271 million to £24,894 million. As might be expected after the two successive increases in Bank rate, the decline in market valuations was particularly marked in gilt-edged stocks and in British commercial and industrial securities. The market value of British government securities fell by £301 million to £11,840 million in spite of an increase in their nominal value (springing directly from the Serial Funding issues of last November), by £1,036 million to £13,771 million; in the same period the market value of nationalisation and other guaranteed stocks fell by £221 million to £2,040 million. Similarly, despite an increase in both the number of securities quoted in the commercial and industrial list and in the nominal value of these securities (from £2,156 to £2,323 million), the market value of British commercial and industrial shares fell by £384 million to £4,304 million. Only seven of the forty groups of securities listed by the council show an appreciation in capital value over the year. These groups were electric lighting and power, diamonds, nitrate, oil, shipping, American railways and Dominion and Colonial railways—a clear indication that British investors have sought shelter abroad from the keen winds that have been blowing at home.

More applications for stock exchange quotations were granted by the council in the year to March 24th last than in the previous year but the total nominal amount of money

involved was smaller; the number of fresh quotations (including all new issues and some issues that were merely made in exchange for existing securities) increased from 896 to 1,033, but their total nominal value was only £1,534 million, against £1,724 million in 1950-51. Once again issues of gilt-edged stocks accounted for by far the greater part of the monetary addition to the volume of quoted securities; in 1951-52, £1,164 million, as compared with £1,388 million the year before, was added to the nominal value of the Funds. Only a very slight amount more therefore went into the tills of the issuing houses from commission and underwriting fees. The number of markings received rose by less than 4 per cent, from 2,004,410 to 2,077,421—which suggests that stockbrokers earned very little more in gross receipts and, as costs were mounting, probably made smaller profits. Clearly if prosperity is to return to Throgmorton Street the Stock Exchange Council will have to attract more investors into the market; one way to do this might be by adopting a more forthright policy upon publicity than it has so far revealed in publishing these rather bare annual statistics.

Canada and American Accounts

The sterling accounts held for Canadian residents will in future be treated as American accounts. Hitherto transactions between Canada and the sterling area have been governed by bilateral arrangements, which gave currently acquired Canadian sterling full rights of convertibility into Canadian dollars. These rights have now been extended so as to give Canadian sterling rights of transferability and convertibility identical in every respect with those held by American account sterling. Sterling held in Canadian accounts is thus now available to make payments to residents in the scheduled territories, to any other Canadian account, to an American account, to transferable accounts and to all other accounts where administrative transferability obtains. Authorised banks may sell Canadian or US dollars spot against sterling held on Canadian account. Such purchases and sales must be effected at market rates and no forms are required. These changes will have little practical effect since Canadian and US dollars have been freely interchangeable since the re-opening of the London foreign exchange market in December of last year. They will, however, simplify exchange control procedure in London.

Shorter Notes

It was reported this week that a revised agreement had tentatively been reached in Washington between representatives of the Board of Trade and of the American motion picture industry upon the amount of their earnings in British cinemas that the American companies are to be allowed to remit in dollars, and the other methods by which they can spend their "frozen" sterling. Both delegations are taking the agreed proposals back—the British representatives are flying home—and a communiqué setting out the agreement will be published later.

The London Metal Exchange reopens for dealings in lead on October 1st, and the Board of Trade have now announced the relevant import and export arrangements. For the import of unwrought lead in pig, ingots, blocks, bars, slabs or cake (but not for lead alloys) members of the London Metal Exchange who participate in the Bank of England exchange control scheme will be granted open individual licences valid for purchases from any source. Consumers who wish regularly to import substantial quantities will be granted open individual licences for appropriate sources of supply, but other traders will have to apply for a licence for each transaction. Exports will be resumed in refined lead in pig or ingots.

Two ears of corn where none grew before

VAST TRACTS of the earth's surface are barren for lack of water. For lack of water immense populations are semi-starved... and an obvious prey to those who preach the unholy war against which the free world now arms. Irrigation is the most effective method of increasing food production. Well-fed people are more likely to be contented people. High among British exports is the means to ensure this objective. In the diesel engine, exported by THE BRUSH ABOE GROUP, Britain is bringing fertility to the barren lands of the East. More than 20,000 BRUSH ABOE diesel engines are now helping to provide

water and light in the arid areas of India. Irrigation in the Ganges valley will be increased by means of BRUSH ABOE Tube Wells. To India, to Pakistan, to Saudi Arabia, to all countries needing power for better living THE BRUSH ABOE GROUP is more than a commercial concern. It is the promise of corn in the desert, of the electrification of poverty-stricken rural areas. Exporting diesel engines and diesel-electric power plant, ranging from 3 to 3,000 h.p., to over 150 leading markets throughout the 5 continents BRUSH ABOE are upholding the great tradition of Britain's service to mankind.

Company Notes

Coast Lines.—Recent addresses by chairmen of the Lines companies have all pointed to the same conclusion: the shipping boom is now past its peak. Captain A. R. S. Nutting, the chairman of Coast Lines, now joins the other spokesmen of the industry in warning shareholders that future receipts and profits cannot be expected to be as buoyant as in 1951. In that year the improvement in the group's freight and passenger receipts more than offset the all-round increase in its costs, so that trading profits rose from £1,741,874 to £2,065,693. By far the greater part of this increase was swallowed up by heavier taxation, but the directors felt able to recommend an increase in the ordinary dividend for the first time in seven years—from 5 per cent to 6½ per cent.

The strengthening of the group's financial resources during last year's boom was impressive. A bank overdraft of £505,425 was paid off and the group's cash holdings rose from £572,750 to £772,019. This money will not lie idle for long, for at the end of last year the group was already committed to spend some £1,683,000 on building six new ships. The purchases of these new ships—though necessary if the company is to maintain an efficient service—are not being made in the happiest of environments. Shipbuilding costs are high, the depreciation allowances by the tax authorities are even more inadequate to meet real replacement costs in shipping than in other industries, and

nearly all shipping companies now face the threat of a decline in earnings. Operating costs continue to mount while, in the chairman's words "the limitation of imports, the diversion of materials to the rearmament programme and the recession in trade" are having their effect on freight carryings.

John Brown.—In spite of the shadow over the shipping industry, most major shipbuilding yards are now fully employed; in the immediate future labour problems, not lack of demand, seem likely to be the yard's main headache. Certainly, the long list of ships completed by the John Brown group last year, ranging from a train ferry for the Railway Executive to a destroyer for the Admiralty, is impressive evidence of continuing high demand for the products of the group's shipbuilding and engineering works at Clydebank. The group's accounts, which exclude the figures relating to Wickman Ltd. and its subsidiaries confirm and strengthen this evidence. In the year to March 31st last the group's total income (including dividends paid by Wickman Ltd.) rose from just under £1.7 million to over £1.9 million.

This advance was made possible by further investment in fixed and working capital. The gross book value of fixed assets has risen by about £210,000 to £4,456,657, while the net value of stocks and work in progress has risen from just under £2.1 million to over £2.7 million; the latter figure is written into the balance sheet after deducting over £7 million received from the group's customers on account of work in progress. This practice of instalment payments, a common one

in the shipbuilding industry, eases the financial strain that has to be borne by the group. Unlike many other companies, John Brown is therefore able to boast of very ample liquid resources and the group should have no difficulty in meeting its outstanding capital commitments of £1.1 million. Some inroads into the group's liquid funds were made last year by the repayment of a debenture stock of £431,203 and of loans of £648,363; there was a reduction from £5,829,393 to £3,710,206 in the book value of the quoted investments held by the group, but this was

partially offset by a growth in cash balances from £1,141,799 (including £438,203 earmarked for the repayment of the debenture stock) to £1,730,771. The strength of the group's liquid resources, however, does not necessarily imply that shareholders can expect faster dividend warrants in the current year. Whatever happens on the wages front, the company is likely to attempt to expand productive capacity further in order to complete—in the words of the directors—"a considerable number of valuable contracts for the Admiralty and for British and foreign clients."

Neepsend Steel and Tool.—Neepsend Steel and Tool has shared to the full in the prosperity in the engineering industry, and the recent acquisition of new subsidiaries, closely associated with the parent company's own interests in the manufacture of steel and steel products, has clearly stood the group in good stead. These subsidiaries must have made their contribution to the advance in group trading profits from £833,519 to £1,236,901 in the year to March 31st last. The improvement in profits has been followed by its necessary corollary, an increase in the provision for taxation from £417,944 to £701,571. Nevertheless, net profits have risen by almost exactly £100,000 to £446,700, and this has enabled the directors to reinforce the group's reserves on a bigger scale than before and to increase quite substantially the distribution on equity capital. The ordinary dividend has been left unchanged at 15 per cent, but the bonus has been raised from 12½ to 22½ per cent. As last year's white paper on dividend limitation forced the directors to cut back the total equity distribution for 1950-51 from 30 to 27½ per cent, 2½ per cent of the latest total distribution of 37½ per cent represents a payment to make this reduction good; in a sense, therefore, the true increase in equity payments is from 30 to 35 per cent. This increase was better than the market had expected, and immediately after the dividend announcement the 5s. ordinary stock units were marked up 1s. 6d. to 27s. 6d.; later the price rose still further to 28s. 9d., to offer a yield of 6½ per cent. This advance suggests that hopes are already being entertained that the company will be at least able to make a total equity distribution of 37½ per cent for the current year. Apart from the labour problem in the engineering industry, the only obvious snag is the company's liability for EPL; it has already had to make an EPL provision of £57,500 in respect of profits earned in the first three months of this year.

"but that suggestion of yours is progress!"

Protested the chairman to the chief accountant.

"What's going to happen to our accounting routine of hard labour punctuated by panic handed down by Grandfather? You're destroying a tradition". 'Not at all, sir. Issue an announcement that a new tradition will come into force as soon as the new system is ready'. "A capital solution. Let's have those Powers-Samas machines installed, even if it takes the suffering out of work".

There is a Powers-Samas System of accounting for every type of business

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 6, 1952, the ordinary revenue was £66,743,000, against ordinary expenditure of £102,181,000, and issues to sinking funds £4,013,000. Thus, including sinking fund allocations of £15,285,000 the deficit accrued since April 1, 1952, was £266,803,000 compared with a surplus of £21,764,000 for the corresponding period of the previous year.

FINANCE CORPORATION FOR INDUSTRY

SATISFACTORY OPERATING RESULTS

SERIOUSNESS OF COUNTRY'S FINANCIAL AND ECONOMIC POSITION

REALISTIC PROGRAMME OF RAW MATERIAL PRODUCTION ESSENTIAL

DEVELOPMENT OF LATENT EMPIRE RESOURCES

LORD BRUCE ON AN INSPIRING TASK

The seventh annual general meeting of Finance Corporation for Industry Limited was held on September 11th in the Conference Hall of The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The Rt. Hon. Viscount Bruce of Melbourne, PC, CH, MC, FRs, the chairman, who presided, said:

In presenting the accounts for the past year, it is desirable I should say a few words by way of explanation.

Dealing first with the balance sheet, the principal item is that of investments, which at March 31, 1952, had a book value of £52,836,076. This represents the cost of loans and participations at that date, less amounts written off. During the year there have been substantial repayments of some advances outstanding at March 31, 1951, and other new advances have been made.

The principal repayments have been from the Ultramar Company (where only £350,000 now remains outstanding and this is due to be repaid this month) and from F. Perkins Limited.

New business entered into during the year involves a total commitment of £5,050,000, of which £1,525,000 had been advanced at March 31, 1952, and is included under investments and the balance of £3,525,000 is included in the commitments at that date of £17,125,000.

ADVANCES TO STEEL INDUSTRY

The investments at March 31, 1952, include advances to steel companies, the securities of which became vested in the Iron and Steel Corporation under the Iron and Steel Act (1949), amounting to £39,775,000.

The position with regard to the outstanding £39,775,000 is that under Section 49 of the Iron and Steel Act, 1949, the ultimate responsibility for repayment is imposed upon the Iron and Steel Corporation of Great Britain. Although the Act also provides for the repayment under six months' notice after the expiry of a year from vesting date, your board has not considered it necessary to give such notice up to the present time.

Shareholders will remember that at our meeting last year I informed them that in respect to our advances to the steel industry we were entitled to compensation for conversion rights into the equity of certain of the companies concerned, notably of the Steel Company of Wales.

The question of the amount of compensation due to us for the loss of these valuable conversion rights has been under active negotiation during the past months. I had hoped that a settlement would have been reached and that I would have been able to announce the result at this meeting. For that reason we postponed our annual meeting until this somewhat later date. Unfortunately, the negotiations are not yet completed, but I reiterate to you what I said twelve months ago, namely, that we anticipate that the result will be the payment to FCI of a substantial amount for compensation.

I also repeat what I then said, namely, that the amounts accruing to FCI in respect to our equity conversion rights in the iron and steel industry and the profits we will derive from the transfer to the market of our remaining investment in F. Perkins Limited, will constitute a buffer against any loss that may arise in respect to our existing commitments.

INVESTMENT IN PETROCHEMICALS

The amount of our investments and commitments, apart from advances to the steel industry, at the date of the balance sheet amounted to £30,186,076.

While adhering to the rule which I indicated last year that it was undesirable that we, a Finance Corporation, should discuss the affairs of our clients and give detailed information with regard to our advances at a public meeting, I think it is desirable that I should say a word with regard to Petrochemicals, in which as you all know we have a substantial investment.

Twelve months ago I dealt with this investment specifically and gave to the shareholders an appreciation of the position. During the twelve months that have passed the basic plant has been completed. The capital cost has been higher than was estimated and the period of construction longer than was originally contemplated. This I understand is not a unique experience in relation to chemical ventures.

The company having now passed from the constructional stage to the operational, it has been deemed desirable to make considerable alterations in the management. During the constructional period Drs Kind and Tugendhat were the managing directors and their task was to bring the plant to the operational stage. That having been accomplished, Drs Kind and Tugendhat have retired from their positions as managing directors and the company has appointed Mr. G. H. Owtram to that position.

It is disappointing that a recession in trade in sections of the chemical industry should have occurred at precisely this stage. Although not yet out of the teething period we are hopeful that the company will shortly reach the stage of profitable operation.

Recently, Mr. J. W. Livingston, a well-known Chemical Consultant, was invited to report upon the plant and future prospects. This report indicates that the project is technically sound, that it is a valuable contribution to development in the petroleum chemical field and with efficient management should operate satisfactorily as a commercial venture.

So much for our balance sheet.

PROFIT AND LOSS ACCOUNT

In the profit and loss account you will observe we have this year adopted a somewhat different form.

Last year we showed the interest and dividends from investments and other income, less interest on advances from bankers and

amounts written off investments. This year we have shown the other income and amount written off investments as separate items. We have also included the comparable figures for last year, taken on the same basis.

From these figures you will see that this year we have written off £489,540. Last year we wrote off £418,959, making for the two years £908,499.

The reason for this writing down is the impossibility of assessing the ultimate value of our interests in companies in the development stage—to which attention is drawn in the directors' report.

Having regard to the function for which the Corporation was formed, namely,

successive occasions given to shareholders my impression of the economic position. I have even ventured from time to time to make suggestions as to the policies which I considered should be pursued to meet the increasing difficulties with which we have progressively been faced.

Looking back at the speeches I have addressed to you over the past five years, I find the theme running through them all is that Britain since the war has been facing the most serious financial and economic crisis in her history, the gravity of which has not been recognised by the general mass of the people, and that all the political parties have failed in their duty to bring it home to them.

I also find the view constantly reiterated that once the people realise how dire is our position it will be possible to recreate the national unity of the war years and the way will be open, under wise leadership, to bring about the increased production and lowered costs, on which the maintenance of our standard of living and our very existence depend. These views I still hold.

This, however, is not enough. Assuming for the moment that the people were made to realise the seriousness of our financial and economic position and as a result were stirred to the unity and effort I have suggested, where are we going to obtain the food and raw material that we will require and where are we going to sell the increased exports resulting from our greater production?

FOOD AND RAW MATERIAL

First dealing with food and raw material.

Food. The world's production of major food crops in 1951 was only 11 per cent above the 1934-38 level. During the past fifteen years the world's population has increased by 14 to 15 per cent. It is well known that either through increased internal consumption or reduced production the sources of supply for Britain, the great food importing country, are progressively drying up. Without a spectacular and determined effort to increase food production, particularly within the sterling area, the question of providing for Britain's food needs must cause the gravest anxiety.

Raw Materials. While there have been some spectacular rises in the production of raw materials, the outstanding example being crude oil, the raw material situation, in face of the tremendous increase in industrial production in the world—to which I will refer later—presents a problem of the first magnitude. This is brought out in the report of the US President's Materials Policy Commission (known as the Paley Report) which was made to the President of the United States and published as recently as June of this year. It states that:

"There is a materials problem of considerable severity affecting the United States and the industrialised nations of Western Europe. Unless the problem is effectively met, the long range security and economic growth of this and other free nations will be seriously impaired. The Commission's report is primarily concerned with the United States' problem, which cannot, however, be isolated from the rest of the free world problem."

It then goes on to show:

(a) the astronomical growth of the United States' consumption of raw materials over the past half century and particularly during recent years;

(b) that this growth must go on, whether peace or war is to be the world's portion, if the standard of living of her people and the financial and economic position of the United States is to be maintained;

(c) that the United States has outgrown its "domestic resources base" and has

ceased to be a raw materials surplus nation and has become a raw materials deficit nation;

(d) that the United States must import increasing quantities of raw materials, with the proviso that—

"Where import conditions are unattractive we can always raise domestic output (at a higher cost), develop substitutes or, if need be, do without";

(e) that the demand of the other free nations will be even larger in its percentage increase than the United States demand;

(f) that in the interests of the industrial countries production of raw materials in the underdeveloped countries must be stimulated;

(g) "The resource-rich but relatively undeveloped nations of South America, Africa, South Asia and the Middle East will also profit, for by exporting to us they can obtain the dollar exchange with which to acquire more of the capital goods they need to assist their own economic growth."

Clearly, the world faces a serious shortage of raw materials. New sources of production must be developed, and by doing so the new markets which are essential to the industrial countries—and to which I will refer in a minute—will be progressively provided.

The outstanding facts emerging from this report which we, the British peoples—and in fact the whole sterling area—must realise are—

(1) we must immediately undertake an imaginative but realistic programme of raw material production in our own area and territories;

(2) by so doing we will not only meet our own needs, reduce our dollar purchases and by meeting the ever-growing requirements of the United States for raw materials earn dollars, but at the same time we will be—

(3) increasing the purchasing power of the countries in which the production takes place which, as I now propose to indicate, is so vital to the industrial countries.

MARKETS FOR INDUSTRIAL PRODUCTION

Since 1937 the world's industrial production has increased by at least 80 per cent. In 1951, however, the volume of international trade was only about one-third higher than in 1937. Furthermore, the expansion in capacity and output is continuing, especially under the stimulus of rearmament. The United States alone is increasing its steel capacity by 22 per cent over the tremendous 1950 level and its aluminium capacity by 115 per cent. These increases will be completed by 1954 or 1955. For Western Europe, the OEEC is aiming at a 25 per cent expansion in total production over the period 1951-56. This tremendous growth in production cannot be sustained unless international trade also expands more rapidly than hitherto.

It is true that part of the great increase in industrial production is being consumed internally as a result of greater employment and higher standards. But in spite of this the volume seeking entry into world trade shows a tremendous expansion.

Prewar the United States only exported to the extent of 3,000 million dollars annually. During the immediate postwar period her yearly exports reached the astronomical figure of 15,000 million dollars.

The best opinion that I have been able to find estimates that if the United States is to avoid serious unemployment she must export to a minimum of 10,000 million dollars. This represents a 65 per cent increase in volume compared with the prewar level.

Great Britain has already expanded the volume of her exports over the prewar level by 60 per cent, and must further increase her

exports if she is to maintain her financial and economic stability.

Practically all the other industrial nations are seeking a greater outlet in the world's markets. Added to all this, Germany and Japan—two of the great industrial nations of prewar days—are again returning to the field. Germany's exports recovered their prewar volume in 1950 and are now some 20 per cent higher. Japan's exports have doubled in volume since 1949, and have made great inroads in our overseas textile markets.

In face of these ever-growing supplies flowing into the export market, we have to realise that without a great expansion of world trade there is not room for all.

GREAT OPPORTUNITY FOR BRITISH NATIONS

The vital question today is how world trade can be expanded. The answer is by creating new real wealth and creating it in such a way that impediments to the free flow of world trade can be overcome. There can be no doubt that one of the most effective ways of creating that new wealth is by the development of the latent resources, particularly of the backward countries and, above all, of the countries of the British Empire.

The need for the development of the latent resources of the backward countries is now widely recognised. This is shown by the technical aid activities of the United Nations and the Specialised Agencies, by the Colombo Plan and by the bilateral assistance that is being given to backward countries, particularly by the United States and the UK in her Colonial Development Policy.

All these moves are in the right direction. They must, however, go very much farther and faster if the world is to solve the economic problems that confront it. I believe this constitutes a great opportunity for the British nations. They have already achieved for themselves higher standards of living. They have also in the main accepted the ideal of each man's responsibility for his neighbour as part of their settled political philosophy. The gap, however, between their comparative prosperity and the backwardness of large parts of the Commonwealth in which they are members constitutes a challenge.

Individual effort by each Commonwealth country acting separately is, however, only part of the answer. Joint action will prove far more effective, and I suggest that up to date all the British nations have been acting as isolated units, apart from the Colombo Plan, and acting individually in co-operation with the United Nations efforts. At the forthcoming Economic Conference I trust that real co-operation will be brought about among all the British nations. By this they will help themselves, and through the strength gained be better able to help in the international effort.

This co-operation must be directed to meeting the needs of the industrial countries, as well as furthering the ideal of the Colombo Plan for the assistance of the less fortunate nations to raise their standards of food and of living.

THE REALISTIC WAY

I suggest the realistic way to face this problem at the Conference will be to analyse the basic raw materials entering into industrial production in relation to—

- World requirements;
- Sterling Area requirements;
- British Empire requirements.

Having done this, I suggest the next step would be to examine the resources and production potential of the Empire in relation to demands for these basic materials.

Then the policy to be pursued should be determined in the light of the fundamental problem of today—the Dollar Gap. By this I mean, without going into wearisome detail, we should determine whether our increased production should be directed to meeting our own requirements—thus saving dollars—or by meeting the US demand—thus earning dollars. The programme of dollar saving and dollar earning should be, and I am certain can be, worked out in co-operation with the Americans.

Increasingly it is being recognised in the United States that a prosperous British Empire is of vital interest to their people. A programme which co-ordinates the needs of the Sterling and Dollar Areas and designed to secure balance and expanding trade is the best hope of solving the dollar problem and is a precondition of convertibility.

To enable the Economic Conference in November next to carry out its task in the manner I have suggested, the most complete documentation will be necessary. I would I could feel confident that this was being done as thoroughly as it should be.

HUGE FUNDS NEEDED FOR EMPIRE DEVELOPMENT

If the unparalleled effort to develop the latent resources of the Empire—which is imperative—is to succeed, finance on a scale never previously contemplated will be required and ways and means have to be found of making such huge funds available. In facing this need we have to recognise that if it is to be met additional saving must be stimulated. Additional investment without additional savings spells inflation.

I will not weary you with a repetition of what I have said on previous occasions as to how I believe these savings could be brought about. If these necessary savings can be obtained we have to ensure that our overseas investment is in respect to essential wealth-creating projects.

VITAL STANDARD OF PRIORITY

The tremendous industrial expansion in America is based on an unprecedented increase in the output of basic products—steel, minerals and electric power.

The Russians too, in their successive Five Year Plans, have put so complete an emphasis on basic development that the consumer has been left as a very pinched residuary legatee.

In Australia secondary and tertiary production has so outrun the expansion of the base economy that exports of primary products have fallen away to the disastrous detriment of the import programme and industrial production is hampered at every turn by lack of power.

It is essential that this vital standard of priority should be recognised.

THE CITY'S ROLE

It seems to me that in this gigantic but inspiring task of Commonwealth development the City has an immense part to play and that it should in particular give a lead to the forthcoming Commonwealth Conference.

Already, without any new great policy of expansion, I am convinced from the applications I have received to provide overseas finance for valuable developments, or to protect existing British interests, that there is a gap in the financial facilities, which the City of London can provide.

FCI was an imaginative creation, to meet a gap in our internal financial facilities. It has, I believe, done good work but it is not constituted to cope with the problem I am now envisaging.

If the results of the forthcoming Economic Conference are as fruitful as we all hope

they will be, some new machinery must be created. The International Bank for Reconstruction and Development has reported favourably on the suggestion for the creation of an International Finance Corporation.

I suggest that consideration should be given to the lines on which a Commonwealth Finance Corporation, adapted to the particular requirements of the Empire, could be created.

The steps that are, I understand, being taken by the Colonial Development Corporation increasingly to bring commercial and industrial interests experienced in the operations concerned in association with them, appear to me admirable. I am, however, envisaging something much wider than that. I believe a Commonwealth Finance Corporation should be constituted to assist in the financing of development projects, undertaken and managed by individual firms and associations over the widest field, including of course those that have their origin in other parts of the Commonwealth.

The report and accounts were adopted.

The retiring directors, Sir Charles D. Ellis, FRS, and Sir Ronald M. Weeks, KCB, DSO, were re-elected, the remuneration of the auditors was duly fixed, and the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

NYASALAND RAILWAYS, LIMITED

BENEFITS FROM PROGRAMME OF MODERNISATION

MR W. M. CODRINGTON ON A SUCCESSFUL COLONIAL DEVELOPMENT SCHEME

The twenty-first annual general meeting of Nyasaland Railways, Limited was held on September 4th in London, Mr W. M. Codrington, CMG, MC (chairman and managing director), presiding.

The following is an extract from his circulated statement:

During 1951 our operating receipts were £583,594, compared with £473,499 in 1950, an increase of over 23 per cent.

The steady annual increase in tonnages carried by the railways continued: 228,671 tons were carried in the year under review, compared with 208,394 tons in 1950, and gross earnings from this source rose from £375,000 to £446,000.

Expenditure, on the other hand, also continued to rise and amounted to £458,240, compared with £400,027 in 1950. The ratio of expenditure to receipts, however, was lower at 78.52 per cent compared with 84.48 per cent in the previous year.

PROVISION FOR RENEWALS

In the revenue account you will see that the provision for renewals this year is £77,273 compared with last year's figure of £63,843. As our new rolling-stock and other equipment, acquired at present-day high prices, is brought into service, so must this provision grow, based as it is on historical cost and estimated life of the equipment. At the same time we must, whenever possible, make some provision for the increased cost of replacing those of our assets acquired at the very much lower prices which obtained before the war. For this purpose we are glad to say it has been possible this year to provide the sum of £27,885 as against last year's provision of £3,757.

After paying the interest on the 34 per cent first debenture stock, the sum of £63,775

remains for interest on the new 5 per cent consolidated income debenture stock which is equivalent to a payment of 2 per cent.

The bulk of the money represented by these consolidated debentures was lent to the company by the Government some twenty years ago to pay for the construction of the Zambesi Bridge and Northern Extension. Neither of these works, so essential to the progress of Nyasaland, could have been financed on their commercial merits, and represented one of the few considerable "developmental" schemes financed by the Government in the period between the two wars. It would have been easy to buy out the then existing private owners of the railway, and entrust the execution, and subsequent administration, of these improvements either to the Government of Nyasaland, or to some specially created Government controlled corporation, after the manner which has become so fashionable in recent years. The alternative, deliberately chosen, was to utilise our company, under suitable safeguards, as the vehicle or agency, through which public money should be directed to the realisation of these schemes, so that the railway route which they created might subsequently be managed on commercial lines.

INCREASED ECONOMIC ACTIVITY

In spite of the difficulties caused by the last war, and of enormously increased costs only partly offset by increased rates, this money is now earning 2 per cent; and, thanks partly to the through rail route which it created, Nyasaland's economic activity has very greatly increased. As a result, our earnings enabled us, four years ago, to raise new money on the market, at no cost to the taxpayer, to finance further improvements to the line. This is surely a case in which success can be claimed for a partnership between public and private investment under commercial management.

LAKE SERVICE DEVELOPMENT

Development of the lake service has continued: our new vessel, *Ilala II*, sailed on her maiden voyage in June, 1951, and is now making regular fortnightly trips round the lake. This service meets a long-felt need of the lake shore community and the ship shows every sign of being a popular and worthy vessel. I must, however, point out that the provision of our lake services, on which nearly £350,000 of capital has been expended, must be regarded as a long-term development project which cannot be expected to become remunerative for some years to come. The future of this service depends on the intensification of production in the districts surrounding the lake and in our view it is unreasonable to saddle the railway with the heavy loss entailed in providing and maintaining unremunerative services required by the Nyasaland Government for the development of the Protectorate. Representations to this effect have been made to the Governor.

IMPROVED OPERATING EFFICIENCY

In general the programme of re-equipment and modernisation which we planned after the war, though not yet completed, has already reached the stage at which we are deriving considerable benefits, in terms of operating economies, from the money we have invested. It is only by the increased operating efficiency made possible by the new locomotives and other plant now available that we have been able to absorb some of the effects of constantly rising costs of labour and material. At the same time we can justifiably claim that the service we are rendering to our customers is progressively improving as the means at our disposal increase. It is interesting to recall that during the year we moved about three and a half times the tonnage of traffic which we carried in 1939.

The report and accounts were adopted.

GEORGE NEWNES LIMITED

EARNINGS MAINTAINED IN A DIFFICULT YEAR

SIR FRANK NEWNES'S STATEMENT

The fifty-fifth ordinary general meeting was held on September 4th at the company's offices, Sir Frank Newnes (chairman) presiding. The following is an extract from his statement circulated with the report and accounts.

The company is able to report well-maintained earnings notwithstanding a difficult trading year. The gross profits of the group amount to £969,329 as against £928,918 for the previous year. Higher taxation at £462,657 (an increase of approximately £85,000) reduces the net figure to £506,672 as against £551,164.

The earnings of most of the periodicals have been adversely affected by ever increasing costs in general, and in particular by the excessively high paper prices which mounted steeply during the trading year. At short notice the single item of paper used by our businesses rose by over £12,000 per week, or in other words at the rate of more than £600,000 per year. This gives some indication of the problems that had to be faced, and although we were able to meet the new pressures to some extent by increasing selling prices and advertisement rates of certain of the publications, such measures could not wholly bridge the gap, and earnings had to be sacrificed rather than risk losing the support and goodwill of readers. Paper prices are now moving downwards and supplies becoming easier—a timely and essential trend if publishing is to maintain its time-honoured role of enterprise and development.

Our largest subsidiary, C. Arthur Pearson Limited, has had to face an unusually severe setback in the earnings of its publications, mainly due to the heavy rise in costs referred to. Its periodicals are large users of paper in relation to their selling prices and in consequence the abnormal increase in the price of that commodity bore particularly harshly on them. With a lower paper cost already effective and with the promise of further reductions in the near future the company's trading position should begin to regain lost ground.

Due to the policy laid down some years ago, the organisation, to use a well understood term, has "Swings and Roundabouts" in its widely spread interests, so that where we have had to face a recession in one direction we have been able to make good in another. Our book interests have done well; Chambers's Encyclopædia, upon which a vast amount of money and time was expended in providing a totally new post-war edition, is now bringing in suitable rewards for the effort and expenditure; the new Australia company makes good progress. Another factor has helped this year's figures in comparison with those of last year. Temple Press, one of the leaders in the field of trade and technical journals, has had a normal trading year whereas in the previous year their earnings were severely reduced as a result of a dispute in the printing industry. These same circumstances apply also to other of our publications.

THE ACCOUNTS

The results of Newnes, the parent company, show net profits of £346,893 as compared with £320,606 for the previous year. Adding the amount brought forward, and after deducting dividends on the preference shares and interim dividend on the

ordinary shares, there is a disposable balance of £366,151. The directors propose to transfer to general reserve £100,000; to development and reconstruction reserve £50,000; to pension funds £41,500, and to declare a final dividend of 10 per cent on the ordinary shares, plus a bonus of 5 per cent, making in all 20 per cent for the year. With the downward trend of paper prices a previously created reserve of £80,000 in respect of paper cost equalisation has now been transferred to general reserve, bringing that figure to a total of £605,000.

The group accounts show a position of considerable strength. There is a large surplus of assets as against issued capital, even without taking into account the item of goodwill which obviously has a very high value. Capital reserves and general reserves exceed £1,500,000. In addition there is a reserve of over £600,000 created for the development of existing publications and for launching new enterprises, or for acquiring other publishing properties as and when opportunities occur. Stocks at £1,085,199 show an increase of about £150,000 due mainly to higher costs rather than larger quantity. Undistributed profits reach the impressive total of £340,730. Cash stands at £1,183,952. Although substantial, this amount is by no means excessive for the needs of the organisation. Over a period of time considerable sums have to be paid to the new pension funds, an obligation the directors are anxious to meet as quickly as circumstances permit both in the interests of the staff and of the various companies; stocks are likely to rise still higher notwithstanding recent substantial increases; and the large reserves set aside for development can only perform their proper function if they are made available in liquid form as the need arises—a need already arising in plans now being made. Clearly, therefore, adequate liquid resources are of prime importance.

THE SALES POSITION

During the year under review circulations of the publications, more particularly the mass circulations, were subjected to the economic pressures bearing on the family purse—the result being that there was a general falling away in sales. In recent months the downward trend has not only been arrested but with many of the periodicals has turned upwards again, and some have even regained all the lost ground.

Woman's Own, which has proved such a tremendous favourite with the public, still has a circulation well in excess of one and three-quarter millions weekly, and is recognised by advertisers as one of the most powerful media in the women's field. *Tit-Bits*, that old campaigner upon which the Newnes' business was founded, has again passed the half-million mark in its weekly circulation—a remarkable achievement when it is remembered that this old favourite is now in its seventy-first year. *Home Notes*, another long-established family favourite, continues to hold a large readership, and our magazines *Homes & Gardens* and *Modern Woman* steadily expand their already wide circle of readers. *Amateur Gardening* and *Smallholder* maintain their pre-eminent position in their respective fields, and our popular technical papers *Practical Engineering*, *Practical Mechanics*, *Practical Wireless* and *Practical Television* make a wide appeal to those interested in the subjects. These are just a few of the titles in our general

periodical list: there are other important and vigorous members.

Our subsidiary, *Country Life*, Limited, although showing somewhat lower profits, has done well in the face of steeply rising costs. The prestige of *Country Life* itself increases, if that be possible. This beautiful and unique publication has continued to pursue its traditional policy of maintaining the highest standard of content and production whatever may be the adverse factors. It can be said without challenge that in a long and distinguished history there has never been a time when the esteem of both reader and advertiser stood higher.

TRADE AND TECHNICAL PERIODICALS

In the trade and technical publishing field we are powerfully represented through our Associated companies, Temple Press Limited and The National Trade Press Limited.

Temple Press Limited has a long-established reputation as publishers of specialised journals unsurpassed in their respective fields. Their thirteen periodicals are together representative of the wide range of leading industries and special interests indicated by their titles. Five are weekly journals, *The Motor*, *The Commercial Motor*, *The Aeroplane*, *Motor Cycling* and *Cycling*. Monthly journals are *The Motor Ship*, probably the most influential shipping journal of its kind in the world, *Plastics*, *Light Metals*, *The Light Car*, *The Oil Engine and Gas Turbine*, *The Overseas Engineer*, *The Motor Boat and Yachting* and, finally, *Farm Mechanization*, started since the war and already established with a world-wide reputation. *Cycling*, the founder publication of the business, celebrated its Diamond Jubilee last year. This year *Motor Cycling* has achieved its 50th anniversary, and early next year *The Motor* will also be celebrating 50 years of continuous weekly publication. It is indicative of the authority of these journals that the majority have substantial readerships abroad, ranging from 20 per cent to as much as 50 per cent of their total circulations. The international character and extent of their circulations thus prove of the highest value to the export-seeking industries with which they are associated.

The National Trade Press Limited have sixteen journals covering a wide field of trade and industry, six of them having been established for more than fifty years. The monthly magazines, a field of publishing in which the company is particularly experienced, are mainly concerned with the interests of important distributive trades, as indicated by their titles—*Fashions & Fabrics*; *Footwear*; *Style for Men*; *Furnishing*; *Watchmaker*, *Jeweller & Silversmith*; and *Tobacco World*. Two others, *The British Shoeman* and *Laundry Journal* deal with semi-technical services while *The Dyer* and *Laundry Record* are wholly concerned with the technical development of their respective industries. A new quarterly, *Household Textiles & Domestic Linens*, launched by the company during the year, is the first magazine published in Europe specifically devoted to this section of the textile trade. The company also has active interests in the export field and is particularly proud of its four outstanding journals, *Fashions & Fabrics Overseas*; *Style for Men Overseas*; *Furnishings From Britain*; and *Overseas Watchmaker, Jeweller & Silversmith*.

The report and accounts were adopted.

PINCHIN, JOHNSON & ASSOCIATES

RECORD PROFIT AND VOLUME OF SALES

FURTHER EXPANSION HOME AND ABROAD

MR G. R. T. TAYLOR'S STATEMENT

The annual general meeting of Pinchin, Johnson & Associates, Limited, was held on September 10, at the Connaught Rooms, Kingsway, W.C.2, Mr G. R. T. Taylor (the chairman) presiding. The following is the chairman's statement circulated with the report and accounts for the year ending March 31, 1952.

The report of the directors has referred to many of the salient figures for the year ending March 31, 1952, and there are few other matters affecting the past year's accounts which require further comment.

I draw your attention, however, to the parent company's balance sheet which reveals an increase of approximately £670,000 in stocks and debtors and a reduction of approximately £480,000 in cash, Government securities and tax reserve certificates, including a bank loan of £150,000, at March 31, 1952, compared with March 31, 1951. The figures reflect the continued expansion of the company's business during the past year.

THE BURDEN OF TAXATION

The heavy burden of taxation on undertakings domiciled in the United Kingdom is well illustrated by a study of the parent company's results for the past three years.

For 1949-50, the net profit amounted to £933,167, the appropriation for taxation in that year being £490,000, that is, 53 per cent of the net profit.

The corresponding figures for 1950-51 were net profit £1,087,843—taxation £610,000 (56 per cent).

Further development of your company's activities at home and overseas during the past year was responsible for profits increasing by £119,088 over 1950-51 to the record level of £1,206,931. Additional taxation on the past year's profits has appropriated more than the whole of the profit increase, the total tax liability being estimated at £790,000, or 65 per cent of the parent company's net profit for the year.

Thus, over the three-year period, net profits of the parent company have increased by £273,764 and taxation by £300,000, leaving less available for distribution to shareholders and for reserves in 1951-52 than was available in 1949-50.

ISSUE OF 5½ PER CENT UNSECURED LOAN STOCK, 1959-64

In the circumstances referred to above, it became impossible for your company to finance from its own resources the additional working capital necessitated by the progressive increase of sales or to meet from liquid funds the capital expenditures of further acquisitions at home and overseas. It has therefore been necessary to raise further capital.

Your directors considered that in present circumstances the most satisfactory course would be to offer £1,250,000—5½ per cent unsecured loan stock, 1959-64, at £98 per cent, to holders of the company's ordinary and preference shares. The stock was duly allotted in July, 1952.

It is the confident belief of your directors that shareholders will obtain considerable

benefits from the utilisation of the additional finances.

EXPANSION OVERSEAS

Part of the proceeds from the issue of loan stock is being used to acquire a controlling interest, as from September 1, 1952, in the Roxalin Company of Canada, Limited, a progressive and well managed business. The company mainly produces industrial surface coatings, its products having achieved a high reputation in the Canadian market.

Our association with the Roxalin Company will also provide facilities for the manufacture and marketing in Canada of your company's own brands; these are esteemed throughout the world but their exportation to Canada has been restricted by high Canadian import duties.

Canada promises to become one of the foremost markets of the world. It has been the missing link in our world chain of supply.

Since the close of our financial year we have increased our holding, on favourable terms, in *Etablissements Lory*, our French associated company.

During the past year I again visited the plants of our subsidiary companies in Australia, where our group of companies has been reconstructed. I am pleased to record that the progress of our companies in that Continent has been substantially maintained.

EXPANSION IN THE UNITED KINGDOM

We have recently negotiated an acquisition of a substantial interest in *Styrene Co. Polymers, Limited*, a company producing certain types of synthetic resins used in some of your company's products and by other industries.

We believe that our participation will bring considerable benefits to your company.

The replanning of our factories is constantly under consideration with a view to obtaining maximum efficiency. Further installations completed during the past year should lead to increased productivity in the future.

THE PAST AND FUTURE OUTLOOK

During the past year we again achieved a record volume and value of sales; but for the continued shortage of some raw materials your company would probably have established even better results. Cost of raw materials and other expenses of production again increased substantially during the year, while the margin of profit per unit of output further declined.

The record net profits of 1951-52 were created by small returns on a high volume of output, but it is probable that demand was to some extent encouraged in the earlier months of the year by the inflationary conditions then prevailing.

The report of the directors has referred to the decline in the volume of sales which has occurred since the close of the financial year. This decline at the time of writing is so far of modest proportions.

Your company, with its subsidiary and associated companies, provides a vital service to industry, transport and the building trade;

the wide spread of the group's activities, both geographically and commercially, assures a high degree of stability.

We believe that our undertaking will continue to be successful despite temporary setbacks, and reaffirm our confidence in our ultimate future.

In conclusion, I extend our thanks to the management, members of the staff and all other workers throughout the world for their continued co-operation and loyalty.

The report and accounts for the year ending March 31, 1952, were adopted and a final dividend of 17½ per cent (less tax), was declared on the ordinary shares, making 25 per cent (less tax) for the year. The retiring directors were re-elected and the auditors' remuneration was fixed.

A cordial vote of thanks to the Chairman terminated the proceedings.

At a subsequent extraordinary general meeting the proposed alterations to the Articles of Association were unanimously approved.

A. LEWIS & CO. (WESTMINSTER) LIMITED

MULTIPLE TOBACCONISTS

The twenty-third annual general meeting of the company was held on September 10th, and the following are extracts from the statement of the chairman, Mr P. L. Fleming, circulated with the accounts for the year ending March 31, 1952.

During the year the manufacturers were obliged by rising costs to increase the retail prices of cigarettes and tobaccos. This has had an effect on the consumption of all tobacco goods so that, while the individual price of a packet of cigarettes or tobacco is greater, the turnover of the trade has become less. Notwithstanding this, turnover actually increased. The trading profit of the group, however, declined from £225,000 to £197,000. This fall in trading profit is due to further increases in wages, other charges, and to certain expenditure incurred during the year which was exceptional and is unlikely to recur.

In consequence of the fall in trading profit and the fact that we do not benefit by a like reduction in taxation there is no alternative but to recommend a reduced dividend of 25 per cent making, with the interim, 40 per cent in all against 45 per cent last year.

To combat the present slight recession in smoking and in general retail trade, we have lately embarked upon a policy of increasing the range of goods sold in our branches. We serve roughly a quarter of a million customers every day and, judging from the sales made, we feel that this additional service of being able to buy other articles in daily demand is being appreciated by them.

The capital of the company was increased from £350,000 to £399,000 by the issue last October of 49,000 5½ per cent cumulative preference shares of £1 each at 20s. 3d. per share, and the directors are proposing to raise a further £50,000 this autumn, probably in the shape of preference shares.

Shareholders will appreciate that while our attempts to maintain turnover have been successful we are finding, as most other retailers are finding, that the limiting factor is cash. This problem is having our close attention and we anticipate finding ourselves in an easier situation before very long. On the longer view, we are more fortunate than most retailers in suffering very little indeed from violent fluctuations, from changes in fashion or from bad stock.

The report and accounts were adopted.

GOLD MINES OF KALGOORLIE (AUST.)

ENCOURAGING DRILLING RESULTS

The first annual ordinary general meeting of Gold Mines of Kalgoorlie (Aust.) Limited was held on September 3rd in Melbourne. (The figures quoted are in Australian currency.)

Sir Walter Massy-Greene, KCMG (the chairman), in the course of his speech said: Since the formation of this company in October, 1951, to the end of the financial year, the tonnage treated was 77,901 for a recovery of 21,427 fine ounces of gold, equivalent to a grade of 5.5 dwts per ton. The resultant net profit was £79,181.

As the mining operations carried out by the old and present companies were continuous over the year, the report of the directors sets out the results of the financial years ended in 1951 and 1952, respectively. In 1952, as compared with 1951, the tonnage treated shows an increase of 7,003 tons and the gold recovered an increase of 4,069 ozs. The recovered grade in 1952 was 5.5 dwts per ton, as against 5.23 dwts in 1951.

Net gold proceeds at the official price of £15 9s. 10d. per ounce less realisation charges show an increase of £66,416 and in addition the amount of £21,436 has been brought to account in respect of anticipated premium on gold sales. The actual amount which the company received as the premium on the gold deposited in the period November, 1951, to March, 1952, was £24,036. The increased revenue, however, was insufficient to offset the increase in operating expenditure with the result that the net profit for the year was down by £24,194.

Dividend No. 1 of 6d. per unit of stock was paid on April 4, 1952, and the directors on August 29th declared a dividend No. 2 of 9d. per stock unit payable on October 10, 1952.

A NOTABLE YEAR

As you know, we have over many years, in association with our general managers, been endeavouring to increase our understanding of ore depositions in the Kalgoorlie district, and so suggest new areas for exploration.

As a result of these efforts Kalgoorlie Southern Gold Mines NL was formed to drill for a repetition of the Kalgoorlie fields to the south of the productive area. At date only the Northern section of the extensive area of possible interest has been drilled, and the results to date give every encouragement for continuance.

A further consequence was the expectation that a second layer of quartz dolerite under-

lies the calc schist in the producing part of the field. If so, then this layer would be within mineable depth along the eastern side of the field, much of it within Gold Mines of Kalgoorlie's leases.

Drilling was begun some time ago and the first hole has now been completed at a depth of 3,367 feet and has located the second layer of quartz dolerite. This opens a new area for exploration in Kalgoorlie.

The review by the geologists of the operating leases has also shed new light on the prospects in the upper part of the calc schist immediately below the outcropping quartz dolerite, suggesting that the calc schist carries more ore than previously expected in its margins adjacent to the upper quartz dolerite. In consequence of these developments we can take a more optimistic view of our prospects of developing new ore in the upper part of the calc schist.

An important feature has been the consistently high grade of ore which we have been developing in these areas for some time past.

Since the close of the year, 4,095 feet of development have been completed, of which 1,211 feet were in ore averaging 11.8 dwts over 62 ins.

The report was adopted.

WESTERN MINING CORPORATION

PROGRESS OF OPERATING COMPANIES

The nineteenth annual ordinary general meeting of Western Mining Corporation, Limited, was held on September 4th in Melbourne. (The figures quoted are in Australian currency.)

Mr Frank F. Espie, BE, presided in the absence through indisposition of the chairman, Sir Walter Massy-Greene, KCMG, and read the speech prepared by the latter, in the course of which it was stated:

The profit for the year under review was £73,906, as compared with £101,611. Income from dividends at £61,679 was £45,243 less, receipts from Central Norseman Gold Corporation NL being down by £16,406 and from Gold Mines of Kalgoorlie Ltd. down by £28,837. Income from sources other than dividends totalled £24,365 against a comparable figure of £15,893.

The balance brought forward at April 1, 1951, was £487,296. The profit for the year ended March 31, 1952, of £73,906, less appropriation for taxation £2,467, gives a total of £558,735. Deduct dividend No. 9 of 6d. per

unit paid on August 17, 1951, absorbing £69,859, leaves a balance to carry forward of £488,876. Since the close of the financial year dividend No. 10 of 6d. per unit of stock was paid on August 22, 1952.

OPERATING COMPANIES' PROGRESS

At the last annual meeting I informed you that it was hoped that Central Victoria Dredging Company NL would, by way of dividends, contribute to our income during the year under review. Whilst the dredge operating on the Jim Crow area had a satisfactory year, unfortunately the company experienced two setbacks with the dredge at Amphitheatre, which, together with power restrictions, severely curtailed operations, and these facts, together with expenditure of a capital nature, precluded the payment of dividends. These mechanical difficulties have now been overcome, and we anticipate that this company will in future show a substantial margin of profit.

I also informed you at the last annual meeting that it appeared that, subject to delays in the delivery of equipment, Great Western Consolidated NL would be in production in the latter part of 1952. The schedule for construction and mine development has been maintained in the face of many difficulties, and subject to delivery of several major items of plant, the objective is to start operations in October, 1952.

An encouraging feature in the recent report by Gold Mines of Kalgoorlie (Aust.) Ltd. is the prospect of developing new ore in the upper part of the calc schist immediately below the outcropping quartz dolerite. It is now thought that the calc schist carries more ore than previously expected in its margins adjacent to the upper quartz dolerite. An important feature is the consistently high grade of ore which the company has been developing in these areas for some time past.

Kalgoorlie Southern Gold Mines NL is conducting a drilling campaign to investigate the possibility of the repetition of the Kalgoorlie system of ore veins to the southwards along the line of the Kalgoorlie syncline. The results so far obtained give every encouragement to continue the campaign.

The reports from Central Norseman Gold Corporation NL show highly satisfactory results, both from the operating and development angle, and the future of this company appears to be extremely favourable.

PROBLEM OF RISING COSTS

Since I last addressed you the gold industry has been subjected to another twist of the screw of rising costs, which if permitted to go on unchecked, so long as the price of gold remains fixed at the present level, must result in creating serious problems for many mines.

The report was adopted.

The Public Service

THE London railway stations are full of children going back to school. Even in the South of France, the season is getting late, and the Prime Minister will be back from his vacation early next week. The holidays are over. Last year a real effort was made to see that the servants of the state, both the elected and the permanent, got their full meed of rest. This year, circumstances have prevented, and many ministers and civil servants have had a busy summer. Public affairs, indeed, have been going at very nearly full speed. In foreign policy, it is true, the myth of a summer lull died many years ago, and this summer, which has at least produced no August crisis, has perhaps been quieter than most, though hardly less active. But there has been little relaxation in the home departments either. The Cabinet has met regularly; the industrial front has been active; and several departments have been working hard getting ready for the meetings of Commonwealth officials next week, which are to prepare the way for the conference of Prime Ministers at the end of November.

It is therefore perhaps an appropriate moment to ask whether something cannot be done—whether something does not urgently need to be done—to relieve the unbearable strain in which the higher servants of the state live their lives. To say that the condition of the senior civil service is alarming is not to criticise a body of men to whose devotion the community owes a great deal. Indeed, the guess can be hazarded that there is not anywhere else in the world (save perhaps at Ottawa) a body of public servants who, with such slender resources, could have accomplished so much in sheer slogging administration as the Home Civil Service has to its credit over the past fourteen years. But the plain truth is that the administrative class of the civil service has been taxed beyond its capacity for a decade and a half. Not only has the volume of work multiplied itself over and over again as the state has assumed duties that nobody ever dreamed of before. The nature of the work of the higher civil servant has changed. Though in form every decision is still the Minister's, in fact it is very often the civil servant's—and must be, for reasons of sheer volume of business. This means that the higher civil servant nowadays has to take a large share of the responsibility from which, in theory, he is excused. And if he is a conscientious man (and the typical higher civil servant is conscientious almost to a fault), that means that he has to worry as well as to work.

Long ago, these conditions clearly began to affect the quality of the work done by the civil service. Everybody who has business with a government department (and who today has not?) knows how long it takes to get even a simple, low-level decision. Anything important enough to have to compete for the attention of a Permanent Secretary, or to require inter-departmental consultation, can sometimes drag on most harmfully. Overload gives birth to the breed of No-men to whom the Duke of Edinburgh made reference the other day, the men who say no to anything new and different. The no bias in our

The Economist, 22 Ryder Street, London, S.W.1

present civilisation is strong enough as it is. Far too many decisions now fall to men who stand to gain nothing if a new idea works and to be pilloried if it fails. That creates bias enough; but when the decider is a very tired man, who is consciously or unconsciously aware that to say yes is to open the gate to a whole vast new field of consequential puzzles and dilemmas—then the wonder is that anyone is ever given permission to stray from the paths for whose every grade and angle precedents exist and procedures have been laid down.

Further, overstrain leads men to take refuge in the *ad hoc* expedient when they ought to have a policy. They can see what ought to be done in the next week or two—or, more often, what cannot be avoided—but they have a troubled feeling that it does not point in the direction that policy, if only they had a little time to think it out, ought to be leading. So the decision is given *ad hoc* and all the positions of principle are reserved, so that nobody can guess what will happen next time and the successive steps of a new policy have to be extracted one by one like teeth, not because there is necessarily any opposition to the new line, but because inability to find time to think it through creates timidity. The history of Britain's relations with Europe since the war provides some clear examples of this process at work.

Too gloomy a picture must not be painted; it is extraordinary how much imagination and vigour are left. But probably all those who, not being civil servants themselves, have frequent dealings with them would agree that the country would be better governed if the men at the top were not so tired and so hard driven. Moreover, there is reason to fear that there may be further deterioration. For reasons that probably go back to the first war, there is an unusual uniformity of age in the highest ranks of the service and far too many of the heads of departments will reach retiring age at substantially the same time. There have been two or three resignations of senior men in recent years to take posts in the business world that are probably better paid and certainly provide the boon of leisure. These examples are likely to be followed, especially now that recent changes in the rules enable civil servants to retire while still relatively young without losing all their pension rights. Vacancies at the top mean quick promotion, which can be very good for a service. But they also mean a loss of experience and ability, and vacancies on the scale that is possible in the next few years may be more than the service can stand.

★

The only possible short-term remedy for this state of affairs is a deliberate and determined recourse to the wartime expedient of the temporary civil servant—not, or at least not only, at the lower levels of the administrative grade but in the higher ranks. The very highest rank would, no doubt, have to be immune: a Temporary Permanent Secretary (though examples of the species have been known to exist) is a contradiction in more than terms. But an incursion of Temporary Principals and Under-Secretaries would not only share the load; it might even enable some of the best permanents to take sabbatical leaves long enough to recharge their intellectual batteries. The American Government—not previously too well served by British standards—has profited enormously in recent years from its willingness and ability, in peacetime as in war, to call on business-

men, lawyers and university teachers for spells of government service that sometimes extend over several years.

That is what should be done here. But before it can be done, several obstacles will have to be overcome. That of scales of pay is not as severe as is often thought. It is true that the business man of competence who is invited to enter a government department is likely to be deterred, not so much perhaps by the actual rates of pay in the civil service as by the absence of expense allowances and of the tax-free services that private industry has come to provide for its higher salariat. But, as a generalisation, it was not the businessman who adapted himself most successfully to government service during the war but the professional man, the don, the lawyer, the accountant, the surveyor, the consulting engineer. And for the professional man, the salary hurdle is not nearly so difficult to get over. Another obstacle is the fact that many men who leave their present posts for temporary government service do not know whether they will be able to make the reverse journey, and in any case may endanger their pensions. But these are matters that could be overcome if there were a more general recognition of the desirability of a free interchange of persons between the ranks of the governors and the governed.

The greatest obstacle, however, is the attitude of the Civil Service itself. All organised services which are proud of their high standards tend to be close corporations, and by no means all the motives for these instincts of exclusiveness are unworthy. But the Civil Service has seemed to become a closer corporation in proportion to the need for it to be more open. Higher civil servants have become dedicated men and a combination of choice and circumstance has cut many of them off from their fellow-men beyond the pale. They work long hours in their offices; they dine only with their colleagues; and the dreadful wartime habit of sleeping in the office has not entirely disappeared. Some of the Permanent Secretaries and Under-Secretaries live in an invisible Kremlin. The hours they keep have killed their outside interests. The decline in living standards, which they share, though in an acute degree, with the rest of the professional class, has impoverished their social life. The burden of secret knowledge they carry—or, in some cases, the even heavier burden of knowing that they alone really understand the complex issues with which the public besports itself—inhibits the freedom of conversation with the layman. If there ever were country house parties nowadays, and if a senior civil servant were ever invited to one, and if he could find the time to go, he would still (unless he were one of the rare and refreshing exceptions) find it difficult to achieve a meeting of minds with his lay fellow-guests.

Is there an element of caricature in this picture? But caricature is only an exaggeration of recognisable lineaments. It is not good for civil servants to be cut off from the community they serve; nor is it good for the community, especially for one that has no tradition of reverence for the bureaucrat. It has become an urgent matter to establish a circulation between the civil service and the other professions. In much the same way as the change in the nature of war has forced the armed forces—once even closer corporations—to remodel themselves so that they can use the temporary services of amateurs, the civil functions of the state have come to play too large and too intensive a part in the life of the community for it to be possible or wise to leave their execution solely to a small detached elite. The new conception of the state requires a new conception of the public service.

Strasbourg and Luxembourg

THE Council of Ministers and the Assembly set up to oversee the working of the Schuman Plan have decided to race ahead with the work of setting up a central political authority to which France, Italy, Germany and the Low Countries will, presumably, allot specific federal powers and thus establish themselves formally as a federation. A committee has been set up to produce a draft constitution and will report by March next year. Then, unless there are major upheavals in the political life of the six countries, ratification by the parliaments is at least possible in the course of 1953. The fact that M. Spaak, a Socialist, has been elected chairman of the Schuman Plan Assembly and hence of the drafting authority considerably increases the chances of ultimate ratification, since, in the eyes of the French and German Socialists, it may remove some of the taint of excessive conservatism and clericalism from the whole movement towards federation.

If this rapid advance towards federation is maintained, the British people have every reason to welcome the process. The days are past when Britain's historical bugbear—the political union of Europe under one hegemony—could threaten the balance of power in the world. The strength of the Soviet Union will before very long be equal to that of Britain and Western Europe put together, and to maintain a preponderance of power on the side of the peaceful nations, the new world of American strength has to be called in to redress the balance of the old. So long as America plays a role in Europe, Britain has little to fear from Western European federation.

There are, moreover, more immediate reasons for welcoming the fact that the six federalising governments have gone ahead on their own. Hitherto, the political fumbblings of Europe towards unity have all taken place within the Council of Europe, and there the inevitable division between the six nations whose leaders were prepared for federal experiments and the remaining countries whose leaders were not has led to bickering, misunderstanding and a prevailing atmosphere of thick confusion, in which real divergences of ultimate objective masqueraded as differences of opinion on procedure.

★

But if the federalists press ahead on their own, there is still the question of working out relations between them and their European neighbours outside the federation. As Mr Eden pointed out in his speech last Monday to the Assembly of the Council of Europe, the federation of six of the Council's members into a single political authority must modify their relations with their non-federating partners. They will forge special links the others do not share. Yet the states outside the federation—the new penumbra of free Europe, fringing a hard central core—will certainly be not less, but probably even more vitally interested than they were before in the doings of the Six. The federation will, after all, represent a formidable concentration of power and influence.

It should be repeated again that, so far as Britain is concerned, this is not a question of "find out what Tommy is doing and tell him not to." If the peoples and parliaments of the six nations conclude that their

prosperity, security and self-confidence require a federal structure, there should be no British quarrel with the conclusion, for prosperity, security and self-confidence in Western Europe are as much a British as a European interest. But the decisions of the new federation in economic and strategic matters so closely affect Britain's own interests and those of the proposed federation's other immediate neighbours that forms of contact and consultation cannot be less intimate than they were before federation began to gather momentum; they should rather be closer still.

For some months past, two distinct lines of approach to this problem of creating suitable forms of consultation have been ardently advocated. Six months ago, Mr Eden proposed that the joint assemblies set up to oversee the work of the various European communities—the coal and steel community and the defence community—should be drawn from the representatives chosen for service on the Assembly of the Council of Europe, who would thus have a double role. It would naturally follow that they should meet at Strasbourg.

To the more ardent federalists, this proposal—which has become known, according to the fashion of the day, as the Eden plan—appeared to limit the speed of federal development to the pace set by the most timid member of the Council of Europe. Some of them professed to doubt the honesty of Britain's intentions and to suspect that insistence on keeping the negotiations for federation "within the framework" of Strasbourg was merely another move in the tactics of delay. They have therefore pursued the idea of separate assemblies, representing the six nations only, and it is a fact that in the Assembly set up to supervise the Schuman Plan—and now also responsible for the work of federal constitution making—only about half the members are at the same time members of the Assembly of the Council of Europe. Moreover, the Schuman Plan assembly has chosen as its chairman, in M. Spaak, one who, since he resigned from the presidency of the Council of Europe last year in protest at the delays in achieving closer union, has been an outspoken critic of British policy. Last week there seemed to be the prospect of a real conflict between the Strasbourg method—which the federalising six suspected to be designed to secure delay and dilution—and the Luxembourg method (or it may eventually be the Saarbrücken method) which the British and some of those who think with them might result in their being pushed further away from European affairs than they desire.

Fortunately, the speeches made this week by Mr Eden, by Signor De Gasperi and by M. Spaak seem to have averted the danger of an open disagreement. The choice of method has still to be made, but the suspicions on both sides have been allayed. There is, indeed, no inevitable clash between these two ways of proceeding. In his speech, Mr Eden denied strongly that he wished the Council of Europe to control in any way the development of the separate communities or indeed of the proposed federation. He made it clear that when the delegates of the Six met to consider their federal projects, others could be present only if they were invited. At the same time, the assembly of the Coal and Steel

Community has voted to invite 13 members of the non-participating nations to attend its deliberations as observers. In principle, both the federalists and the non-federalists agree that observers should observe and that close contact should be maintained. The point at issue has lost most of its real substance, and seems to have become procedural in reality as well as in appearance.

This is the point at which the public might be content to leave it to the experts and the tacticians. It is, in any case, difficult at this stage to make any final judgment. Mr Eden did well to point out the experimental nature of the new communities and while the experiments are still fluid, it would no doubt be a pity to dismantle a framework for consultation which already has its secretariat, its buildings and the beginnings of a tradition. Yet it may be doubted whether, in the longer run, the Council of Europe can be maintained as the instrument of contact between the federating and non-federating states of Europe. In the first place, the creation of a political authority—that is, of a federal Government—will bring into being the apparatus of a central administration, always in session, with full departmental and secretarial assistance and supervised by regular meetings of the federal assembly into which all the separate “assemblies” now planned to supervise separate functional communities will eventually fuse. It is clear that if this imposing edifice is built on the foundations of the Council, the

Council will change out of all recognition and its non-federating members will have virtually nothing to do save consider the acts of the federation, in which the federators might consider them to be interlopers.

Another difficulty lies in the variety of interest and approach which divides the non-federating governments. Western Europe without the Six is not a homogeneous area. It consists of Britain, Scandinavia, Turkey and Greece, Ireland and Portugal. The interests of these countries in the central mass of the Continent are either national—in which case, separate national delegations can do the work—or else they are as wide as the free world. The umbrella of Europe is in reality too small for Britain; that is the chief reason why it has not joined the inner federal group. It follows that if an umbrella is to be given to the new federal group, it should be at least as wide as the Atlantic. Between the prospective federation of the Six and the institutions—still incomplete and imperfect—of the North Atlantic Community, there would be no reality in the functions of a Council of Europe. The Council has done its work by helping forward the work of federation between the six nations and by maintaining the links between them and their immediate neighbours. Once federation begins in earnest, an Atlantic and not a purely European framework will be needed to keep the policies and development of the new federal unit in line with the interests of the free world.

Sheets in the Wind

WASHING dirty linen—the real, not the metaphorical kind—is a universal, tiresome and repetitive necessity whether it be done in public or in private. According to English folk-lore, “dashing away with a smoothing iron” once took a whole week, even though the fair laundress stole someone’s heart away in the process. Nowadays modern methods of washing are needed to match modern standards of hygiene and the desire to wear lighter and brighter clothes. It may be that a fortune is waiting for the Woolworth or the Ford who can contrive to commercialise this necessity more adequately than it is done at present.

There are some 2,250 laundries in Great Britain, employing roughly speaking 142,000 workers, who are mainly women. No laundry is very large, since all are tied to serving homes in a limited geographical area. A turnover of £100,000 a year represents a very big laundry indeed, while there are only a handful of chains with as many as twenty plants each. As factories, the laundries’ distinction is the size of their wages bill. Something like fifty per cent of costs is taken up in wages and salaries, both in big laundries and in small. Yet the industry has always paid low wages, and although subject to a compulsory wages council since the mid-thirties it still ranks as one of the lowest payers among employers of unskilled labour. Part of the explanation is that laundries have been slow to adopt mechanical methods of handling and to rationalise their layout, and this may be beginning to change. There is a good deal of talk now about scientific management and the need to mechanise more operations; through the work of an active trade association and the Laundry Research Association, laundries are beginning to catch up with modern ideas of productivity. Behind all this, however, there remains the plain fact of a couple of thousand separate little concerns—family businesses in many cases,

or one-man firms. They have little financial margin for costly improvements, and they believe in their hearts that they know more about running their own business than any outsider can possibly tell them.

But small-scale organisation and a legacy of once-cheap labour are only two of the reasons why laundries’ labour costs are heavy. The main reason is the nature of the work itself. Laundering, for all its factory organisation and costly machinery, remains a service industry, and as such is bound to be labour-intensive rather than capital-intensive. Production is not organised, as it is in manufacturing industry, about an article under the producers’ control. It must adapt itself to cope with whatever the housewife sends in; no two bundles are alike in size, content or regularity. About one-third of the employees of any laundry plant are therefore engaged not in the business of washing and ironing, but in sorting, checking, marking, classifying, re-sorting, re-checking and re-packing. Again, since the service is an individual one, a laundry is planned to deal simultaneously with sheets which can be ironed at the rate of several hundreds an hour through hot rollers, frilly children’s frocks which need individual hand-ironing by a skilled ironer, and men’s shirts which need something like a combination of the two.

These last, incidentally, are one of the most important, if most troublesome, items in any family wash. In the United States the typical laundry deals with them cheaply and well, a team of three girls using a machine which irons a hundred shirts an hour. But there the coat-shaped collar-attached shirt is highly standardised. In Britain, on the other hand, the closed shirt with loose collars still holds the field; who can afford to wear collar-attached shirts at the rate of one a day when laundering costs so much? Mechanical methods of shirt finishing are therefore expensive and unsatisfactory here—as every

housewife knows who pays well over a shilling to have shirts finished by hand, plus threepence each for the collars—a nice example of the costliness of conservative habits which the individual is powerless to influence. Compared with sorting and ironing, the actual washing process in the laundry uses very little labour. It is, however, costly in fuel; the industry is reckoned to be the third largest user of factory coal in the country. A cold-water washing process is thus the launderer’s dream of heaven, but nothing so far invented looks like becoming a commercial proposition in the near future.

A laundry’s chief competitor is not another laundry, but the housewife herself. Only something like 15 per cent of the country’s family washing is estimated to find its way to laundries at present, although the industry claims that 50 per cent of households send them some washing. In a majority of households, to send out the washing is not seen as a necessity, in the sense in which factory bread or factory dressmaking are deemed necessary. It is an extra which can be expanded or contracted to suit changes in the family budget. Although the number of laundry customers remains fairly constant throughout good years and bad, the size of the bundles they send fluctuates widely with spending power; and the contents vary with the size of the bundles, the unwieldy sheets and tablecloths continuing to come to the laundry even when the “smalls” and shirts are kept back to be washed at home.

*

This variability in the proportions of different articles sent to the laundry was one of the less obvious reasons for the industry’s desire to be rid of price control, which had been in force since the outbreak of war. The Board of Trade this summer released laundry prices from any form of regulation, but trade has been so poor for the last two years that laundries have not, in fact, been able to increase their charges, while they have lost, in the public eye, a useful guarantee of fair pricing. Many laundries were nevertheless glad to see the end of this particular control. It was common in 1939, when bigger bundles of washing were being received, to encourage customers to send their household linen, which was mass-ironed on expensive roller-machines, by undercharging for such work and making up the price by overcharging for personal and hand-finished items. The personal “smalls” were the first things to be withdrawn from the laundry bundles, and control has prevented until now any readjustment in prices to accord with true costs.

The general decline in laundry business has brought it back in the past few years from a postwar boom to about the prewar level. As other things in the shops have become plentiful, and as the purse-strings of the middle class have tightened, they have taken to washing who never washed before; who washed before now wash the more. But it is significant that the public seems readier to dispense with laundry service than with most things. It has become a commonplace of social improvement that, with every rise in the standard of living, more and more tasks have been taken out of the home and done better and more cheaply by wholesale mechanical methods. But washing has never been effectively mechanised, and the economies gained by its wholesale factory performance have only slightly outweighed all the incidental disadvantages that come from working on materials of a varied character and mixed ownership. Laundry service

is therefore for many people very much on the margin; as soon as competitive ways of spending the house-keeping money expand, or as the real standard of living begins to fall, factory-washing ceases to hold its own against the unpaid labour of the housewife.

But the choice is no longer between complete factory service and the kitchen washtub. All sorts of compromises are appearing. Washing machines are one case in point. Some 2,500,000 of them have been sold in Great Britain since the war and as they cost anything from £40 to £120 they probably represent 2,500,000 customers lost to the laundries, in whole or in part. Self-service launderettes are another example. These are shops where for 2s. 9d. a woman “posts” her washing into an individual machine which delivers it half an hour later, washed and semi-dried. So far, there are less than two hundred such shops, but they are still a new experiment in this country, every feature of whose operation is closely controlled by the only firm manufacturing a suitably automatic washing machine. Their popularity shows that they meet a real demand; there is a long waiting list of would-be proprietors of these establishments, who have signified their willingness to lay out the necessary three to five thousand pounds and to comply with the requirements of the manufacturers.

In these “cub laundries,” as they are called, labour charges for cashiers and cleaners are a mere fifteen per cent of turnover; there is no difficulty about finding workers for unpopular jobs and there are no arguments with customers about garments lost or torn by careless employees. It is basically the old “bagwash” idea, in a more respectable guise, and with the washing more quickly done. A few orthodox laundries have taken the lesson to heart, and remodelled themselves to concentrate simply on a washing service, with each customer’s bundle washed separately in a large net and returned without ironing, at prices comparable with those of a self-service laundry and roughly a third of those of a “finished” service.

Is this to be the trend of popular laundering in the future—highly mechanised washing services with the drying and ironing work thrown back into the domestic kitchen? Is the recession in ordinary laundry business a hint that the service of sorting, ironing and finishing a mixed family bundle is becoming too expensive for a nation in which full employment has raised the relative cost of services requiring a great deal of labour? Or has the time come to distinguish between the two kinds of weekly washing and to exploit them separately? There is, on the one hand, personal clothing which will always need individual handling, but which year by year is made easier to wash by synthetic detergents, permanent stiffenings in place of starch, and above all by improvements in nylon and other fabrics which need no ironing.

On the other hand, there is flat domestic linen which is bulky but fairly standardised and lends itself readily to large-scale mechanised treatment. Hotels with bulk orders already get this service cheaply; a specialised linen service for the domestic user would still have to meet the cost of identifying and sorting out each his little bundle. It is hard to believe, however, that popular prejudice would hold out for long against an efficient weekly hiring-out service for standard household linen, whose laundering would present no problems of individual ownership. But to bring to life a potential demand of this sort would need business enterprise of a high order.

Comrade Marshal

MR EDEN was well-advised to visit Marshal Tito this week and make the acquaintance of an outstandingly skilful and courageous political leader. It was time that the Foreign Secretary should assess for himself the casual and undocumented alliance that has grown up between Yugoslavia and this country under the eyes of his predecessors. It was also time that the Marshal and his advisers took the measure of a Conservative statesman and heard British views expounded without the sentimental bonhomie that sometimes seizes Labour politicians visiting the land of Titoism—a sentiment that is the more surprising because there is, in fact, little in common between their ideas of parliamentary democracy and the “democratic centralism” of the Yugoslav Communist, or between Belgrade’s headlong retreat from Stalinist planning and Labour’s cautious disillusionment with Socialism. The claim of the Yugoslav state on the attention and sympathy of Englishmen of any party has little to do with political doctrines; it is rather to be based on Marshal Tito’s success in holding together Croats, Slovenes, Serbs and Montenegrins; in reconstructing a sadly devastated country; and in maintaining its independence of the Soviet empire which adjoins it on three frontiers. The threat that has held the republics together and consolidated Marshal Tito’s position as a national leader—bullying by the Soviet Union and the satellites—is also the factor that has brought him with cautious and sometimes ponderous steps into the purlieu of the free world. The roots of the Anglo-Yugoslav relationship lie in hard facts rather than easy sentiments, and no harm is done by being frank about it.

That is not to say that no other roots are possible or desirable; if that were so, Mr Eden would probably not have visited Belgrade. Many prominent Yugoslavs have grateful memories of the British help, in men and supplies, that helped them to beat the Germans and gain power at the end of the war; although some who have failed to combine discretion with gratitude are still in prison or working in obscurity under official supervision. British aid is eagerly sought and British advice is listened to in private, even if it is sometimes disavowed in public. The British visitor can travel and speak and inquire with a freedom that is withheld behind the iron curtain from all save fellow-travellers. In the conversation of officials and party members he will find scraps of Stalinism that have survived four years of bitter hostility to the Russians and some strange and tattered versions of Marxism; but the idiom of the West is still alive. Among simpler people in the countryside he will find respect for Marshal Tito combined with the traditions of a more liberal age. The conviction that industrialisation is the be-all and end-all of policy for a country rich in grain and raw materials is fading, and few Yugoslavs now believe that to sell maize and metals in exchange for machinery and aircraft is to fall victim to old-fashioned colonialism. There is a growing desire to learn English, study British textbooks, and to allow British ideas to make a gentle and limited impact on the minds of the young. These are all promising if tentative trends, well worth fostering. If the relationship with the Yugoslav government began as a marriage of convenience, that is no reason why cordiality should not break in.

For all practical purposes it must be assumed that Marshal Tito is there to stay; indeed, western calcula-

tions of Yugoslavia’s role as a buffer between the Soviet empire and the Mediterranean must be based on the assumption that he is the only man in sight who can hold the federal state together and carry the people along in a simultaneous effort of economic improvement and costly rearmament. The Marshal probably sees this situation more realistically than his speeches sometimes suggest. He understands, for example, that his methods of exercising power disqualify him for membership of the Atlantic club. For he could not—even if he wanted to—accept all its rules in practice. There are men in the party and in the armed forces—how many no one knows—who resent his retreat from the true faith of Moscow and distrust the West. Many a party boss in town and village has had, in the last four years, to find ways of publicly changing his position on matters of policy without loss of prestige and self-respect. This embarrassing process cannot be hurried. Leading personalities find it necessary from time to time to sound a note of defiance towards the West while accepting from it over £250 million worth of loans, credits, grants or materials. The transition from the doctrinaire to the practical in economic matters is still made by Ministers under cover of pedantic and complicated speeches, from which bewildered peasants learn that the “principle of profitability” has somehow returned to favour with the Communist Party. The western visitor is sorely tempted to smile knowingly at the transition; but he may be brought up smartly by the reminder that his own government has gone through a similar process in the matter of German rearmament—with Russia providing very much the same reason.

It is beyond the power of any western government to hasten the transition directly. With all the decentralisation of planning, the running of factories by workers’ committees, the ousting of party zealots by administrators or technical experts, the growing toleration of discussion and grumbling—with all this, the Communist Party is and intends to remain supreme. From the revised statutes that will be adopted next month it is clear that the party will retain its monopoly of political power and is still guided by “the theory of scientific socialism.” It is to be a highly disciplined élite, rendering all things unto Caesar; for example, membership is “incompatible with the practice of religion and the performance of religious rites.” To pretend that Marshal Tito is leading the way towards parliamentary democracy, personal freedom and the rule of law as those things are understood in this country is to talk nonsense. If Mr Eden decides that Marshal Tito’s Yugoslavia is, to put it bluntly, a good bet, then British policy will be supporting a group of men who are, it is true, indomitably hostile to Soviet imperialism, but who are no less dedicated to the creation of total socialism.

It is through economic and military policy that western influence has been and can be exercised; not through conditions attached to aid—Marshal Tito can have no serious complaints on this score—but through the problems that have to be resolved in common. Yugoslavia wants jet aircraft as badly as Britain needs feeding stuffs; and by planning now increased exports of grain and metals it could in time correct the deficit in its balance

of payments which is now covered by western aid and loans. It is clearly in the Yugoslav interest to increase exports by every possible means; and if that means retreating from collectivisation, restoring some freedom to the economy and seeing to it that doctrinaire ideas and methods do not provoke resistance to the government—then life is made that much easier for people at both ends of the bargain. Likewise, if Yugoslavia is to be treated as a serious associate of the south-eastern partners in the Atlantic Pact, that means that officers and men and officials must increasingly rub shoulders with Americans, British, Greeks and Turks; technicians and generals must travel, read foreign books, and entertain foreign visitors. In fact, implicit in Marshal Tito’s policy of defence against the Russians, trade with the West, and development of his country’s wealth is the increasing cooperation of individual Yugoslavs with colleagues of the free world.

Where this process will lead no one can tell, probably not even Marshal Tito himself. Much will depend on the intensity of pressure from the Soviet Union and the Cominform. Nothing does more to maintain the Communist Party’s hold and to keep the partisan tradition alive than the belief that the country is in danger; and nothing does more to smooth the path for American and British military and economic aid. Should the pressure slacken it would be in Marshal Tito’s interest to conceal

the fact as long as possible. For a revolution conceived and born in war has to be reared in an atmosphere of drama and peril. That is one reason—but not the only one—for the Marshal’s defiant tone over Trieste, for the savage propaganda campaign against the Catholic church, for the ill-tempered manner in which foreign criticism is treated by such papers as *Borba*.
