Outlook for Inflation

THIS used to be the time when the hearts of hard-faced men were moved and they foresaw better things. Trade, said Cabinet ministers with their ears to the ground, was definitely on the turn. Captains of industry had advance intelligence that the army of unemployed would soon be dwindling. Now it is the problems of inflation, not the unemployed, that are always with us; and the more or less of inflation is still a subject rather too abstract and remote for most New Year messages. The habit of economic forecasting has shifted from the board room to Whitehall, from the politician's bromide to the planner's statistics. The seasonal pattern has changed in the process, yet it has retained the old emotional colouring. From January [illegible] it is now the period when politicians and civil servants decide [illegible] be as bad as they feared. [illegible] in fact it is worse. [illegible] that Mr Churchill [illegible] was established in [illegible]ments were complete. [illegible] United States made [illegible] economic blizzard" [illegible] to start fighting the [illegible]nd Budget was con- [illegible] that in the summer [illegible]d this country was powerless to meet the devaluation crisis. Last year Mr Gaitskell over-estimated the extent to which price increases, running ahead of wages because of the rise in raw material costs, would restrict consumer spending and so check inflation without higher taxes or cuts in Government spending. The Budget policy was inadequate for essentially the same reason as in 1949 and, to a lesser extent, 1950; at the beginning of the year, the inflationary pressure to be combated looked less formidable than it afterwards proved to be.

It would be easy to make the mistake again in 1952. The buyers' resistance to high prices, which began last autumn after the stock-building of the spring and early summer, shows no signs of weakening. The probability is that retailers and manufacturers will give way first, and that there will have to be some substantial price-cuts, particularly for clothing, before trade picks up. Meanwhile, a little unemployment and short-time working may continue in the textile and clothing industries. The evidence that a few things really are getting cheaper will probably encourage people to put off buying other things, even though those are in fact likely to become dearer in consequence of recent wage increases. The approach of the Budget itself generally helps to make people cautious. At the same time, spending power will be reduced in real terms by the higher prices of food, fuel and transport. It will take the unions a few months to formulate fresh wage claims to meet this latest rise in the cost of living. And the new monetary policy will be beginning to exert a direct influence.

The present tightening of credit, taken alone, will not *put any* significant number of people out of business; it will not free resources that cannot quickly be absorbed for other purposes many times over. But it will stop some spending, both business and personal; and, if only because monetary discipline had become so unfamiliar, it probably will for a time have a sharp effect on business psychology; people may think that Mr Butler has changed the beer even if in fact he has merely blown a little of the froth off the old brew.

For all these reasons, there may during the next few months be some stay to the progress of inflation. For different reasons, the balance of payments may look less weak than it did before Christmas. Conservative politicians, like any others, will be tempted to think that arresting inflation and restoring confidence in sterling is a less difficult task than they feared. If so, they will be wrong; they will be allowing themselves to be deceived by seasonal and temporary circumstances, as Sir Stafford Cripps and Mr Gaitskell were, and their policies will fail.

A passing lull to inflation will, unfortunately, make the new Chancellor's political task more difficult. If he fails in that, the following storm will be inevitable and may well be worse than the storms of 1949 and 1951. Rearmament will soon be out of the preparatory stage. The Ministry of Supply placed its orders in large volume last spring and, for all the delays, the work of tooling-up in many factories is now nearly complete. Within a few months, the diversion of men and materials to arms production —as yet almost negligible—will become swift. Earnings will increase, labour will become scarcer, supplies to the civilian market will decline. And at the same time, unless some means of preventing it are found soon, the unions will be making fresh claims and wages will again be chasing the rise in prices that they have just caused.

It is too soon to try to estimate the strength of the inflationary pressure that lies ahead, but no one should let present appearances be an excuse for hoping that it may be slight. In the current financial year the Government is spending, presumably, about £1,100 million on defence. In the next Budget the bill should rise to something near £1,800 million. The estimates of every other government department will reflect the rise in prices since last April. All this will far outweigh the buoyancy of revenue that is the fruit of the past year's inflation. In real terms, large economies in the state's spending for civilian purposes would be needed merely in order to maintain the present budget surplus. And that is a wholly inadequate objective. It would fail to combat the extra inflationary pressure that must be expected to develop, as certainly as anything can be, by the summer. If further inflation is to be prevented, if the British economy is to be given the room to manoeuvre on which its efficiency depends, if confidence in sterling is to be restored, the cuts in other government spending ought to get near to offsetting the increase of some £700 million in defence expenditure. They cannot be achieved solely by administrative pruning, which might save 5 to 10 per cent on the estimates, and they cannot be imposed uniformly on the departments. But the food subsidies of £410 million are 17 per cent of the present cost of all government services other than defence and the consolidated fund, and the more heavily the subsidies are cut the less will be the need to pare down the more important social services.

The country has now some sense of urgency; it expects changes, for good or ill. This is an opportunity that ministers cannot afford to miss. A crisis can quickly grow stale, as happened several times under Mr Attlee's government. If little is done until April people will believe that the dire talk of unpleasant remedies again means nothing and that either providence or the Americans will after all allow this country to go on as it is. The Government's economic policy for 1952 can be given final shape—if need be, it can be reshaped—in the Budget; but the main measures of retrenchment ought to be decided, and to be made known, when Parliament reassembles at the end of this month. That was the implied promise Mr Churchill gave in his broadcast a fortnight ago, and it should be promptly fulfilled. If the policy is at all adequate to its purpose, it will be bitterly criticised. But its announcement in a month's time will require a little less political courage than it would need in three months' time. And the demand is only for boldness in self-preservation. If the British electorate wants continuous inflation, it can be sure of getting it from the Labour party. The one chance of success for this Government is to show quickly that there is another path, which it has the courage and ability to take.

The Six Power Army

IT is not an unmixed blessing that the gradualists have triumphed in the latest agreement about a European army. The six governments concerned, it is true, have followed the advice so often given from Whitehall and have got down to brass tacks; but the result has been a sharp and rapid deflation of the Pleven Plan to which French policy was anchored. A stage-by-stage programme, which may take over five years to carry out, has been substituted for a spectacular and single sacrifice of national control over defence policies and budgets. Unity and federal institutions lie at the end, not at the beginning, of the journey that it is proposed the West Germans should make with their neighbours. What was to have been tight and ambitious has become loose and tentative.

We may see the beginnings of a European army shortly; but we shall not see the European defence community for many a long day. When the first German division appears—if it does appear—it will have been raised and paid for by the government of Western Germany, will be under that government's control, and will be supplemented by further divisions recruited, organised and paid for in Germany. And when it comes to 1954, the year in which European rearmament should be completed and Germany's 12 divisions ready, then—and only then—will Germany and its five associates be obliged to enter what is called the pre-federal stage of their partnership. Only then will a European commission produce European defence estimates and submit them to a Council of Ministers. And even then it will be national parliaments that will vote moneys to be raised by national governments. It looks as if Europe will have to wait until the late 'fifties for the real defence community, controlled by ministers responsible to an

elected European assembly. This may not be the best solution, though it may be the only possible one in the circumstances of the moment. But it is most emphatically not what the American, British and French Foreign Ministers meant last September when they said that Western Germany would be "integrated in a European defence community as part of a wider Atlantic community." Nor is it what Dr. Adenauer has been working for, in the hope that the stripling Federal Republic would not have to face alone the dangers from a reconstituted national military machine.

There are several points about the new plan that are good, and that will commend it to the Atlantic Council *when it meets in Lisbon on February 2nd.* It should produce European divisions in the field by next autumn, learning to work and train together, and building up a common supply system. It gives the electors of the Continent time to think about the consequences of surrendering sovereignty to a federal or—what is more likely—a confederate European authority. It is more likely than the original plan to get through the French parliament and less likely to be thrown out by the Bundestag. It faces the facts that the main difficulties ahead are political and that only agreement on ways of financing this common army will go to the root of these difficulties. It makes British co-operation easier in the preparatory stage, which may last till June, 1954; indeed, most British objections to participation at this stage no longer hold good. In short, the project is realistic and has been shaped by a real down-to-earth argument between ministers afraid of losing power at home by agreeing to something too idealistic and drastic.

*

There the catalogue of congratulations ends and second thoughts begin. For the British there is the unpleasant reflection that their grip on developments in Germany is fast slipping. During the Paris talks last week-end the conditions on which Germany may rearm were drastically revised without the British Government being able to influence the decisions directly. Some of the main assumptions about Germany on which Foreign Office thinking has been based collapsed overnight. Moreover, the new regime which is being substituted has no reliable stability. Dr Adenauer's government—or, worse still, a Schumacher government of nationalist Social Democrats—will be bound in defence matters to their neighbours by nothing more than a treaty and some ties of confidence and respect between political personalities. It will be easier for the Germans to refuse a defence contribution; but it will also be easier for them to make it, if they choose, in their own fashion. If their intention is secretly to regard the first division they raise for Europe as providing the *cadres* for a future independent *Wehrmacht*, there is little in the revised Pleven Plan to stop them. Dr Adenauer certainly has no such thing in mind; but Dr Adenauer's tenure of office is uncertain. That great body of German opinion which wants national sovereignty and unity with Eastern Germany before partnership with the West will be encouraged to think that France and its allies are yielding on this point. Dr Schumacher and his ill-chosen allies are pledged to a policy of "German welfare and union first."

These possibilities, admittedly, always existed; the change in the Pleven Plan has merely strengthened them. It has put off integration to an unpredictable future and it has raised a new possibility which is the nightmare of French—and Russian—statesmen. Suppose that a beginning is made this year with the raising of German units. Suppose that the appearance of a defence ministry in Bonn, of uniformed Germans in the streets, of staff officers in ministerial ante-rooms, causes a reversal of the present anti-military trend in Western Germany. And suppose that a new German desire for a national army coincides with a change of administration in the United States and a desire there to reduce army commitments in Europe. What would be more natural than for some Germans and Americans to propose solving the whole defence problem by a German-American agreement to recreate the *Wehrmacht* and equip it with American arms and money? The power of the United States would then be behind the only government in Western Europe with a territorial grievance, that is to say with a motive for an aggressive policy towards Soviet Russia and its satellites in Eastern Europe. And that fact would corrupt the essentially defensive purposes of the Atlantic alliance and Supreme Allied Command in Europe. Under the original Pleven Plan such an outcome would not, indeed, have been impossible; but it would have been difficult, since it would have involved not merely tearing up a scrap of paper, but destroying an integrated army and setting out to create the organs and administration of a national army. Under the revised plan, those organs will soon exist, under German control; they could be nationalised overnight if, when the time comes for one of the later stages of the Plan, the Germans (or, indeed, any other of the six participants) refuse to agree.

Such things are unlikely, in fact, to happen; but they cannot be entirely ruled out. The optimist will argue, quite correctly, that Germany is too poor to make a defence effort on a dangerous scale. It is known that Dr Adenauer's financial advisers are aghast at the figures they have seen for the cost of equipping modern forces. Moreover, powerful sections of German opinion are still anti-militarist, clamant though they are for the eventual restoration of the "lost territories." It can be argued, too, that so long as American, British and French divisions are on the spot in Germany, dangerous tendencies can be held in check by the German Government. In short, the prospects are that, in the two or three years that must pass before the European defence community can take shape, Germany will be too weak and diffident to be dangerous; and that the western powers, both in and outside Europe, will be so strong at the end of two or three years that no German Government will see any profit in refusing the privileges and advantages of European integration within an Atlantic community.

*

The argument is sound enough; and if the genuine Europeans at the head of affairs in Germany are not to be discouraged it is essential that British policy should be inspired by optimism rather than suspicious pessimism. But it is no use ignoring the fact that Britain's power to influence these events has been dangerously reduced by its standing aside from the European defence planning and by its lack of clear understanding of what it wants of Germany. If, for instance, it is British policy that in no circumstances should the Germans leave the European defence community or obstruct its full development, then it should not be beyond the wit of Whitehall and Washington to find some way of guaran-

teeing that the proposed six-power defence treaty should be honourably observed. It may seem fantastic to make such a suggestion before the treaty has been even drawn up; but the prospect of such a guarantee would deeply influence its drafting. Moreover, it must not be forgotten that the Opposition in Bonn has threatened to denounce as unconstitutional any arrangement for rearmament not approved by the German voters.

This proposed treaty and gradual advance towards integrated European defence is clearly the best that can be done in present circumstances. It is more than was expected by the realists—those whom General Eisenhower accused of "choking themselves with gradualism"—and less than was hoped for by the enthusiasts. It represents a big modification of French policy and omits many features of the Pleven Plan that provoked scorn among British military experts and professional diplomatists. The need and the duty for British policy is therefore clear. To do everything in its power to make sure—and to persuade the Americans to make sure—that this first advance towards unity in Europe is pressed on to the end. If it is not, then within a measurable time the choice will be between a complete revision of western strategy in Europe and the emergence of a new *Wehrmacht*, trained, controlled, paid for and equipped by a bitterly independent German government.

Egypt's Defence Policy

AMID the present loud exchange of intransigent statements that is taking place between the Egyptians and the British at cabinet level, it is easy to lose sight of the real cause of their quarrel, which is the immense gulf that separates Egyptian from western thinking on the subject of adequate defence. The size of the gap was well illustrated at a press conference given by the Egyptian Foreign Minister in Rome last week. Asked, by a European, if a Russian threat could be said to menace the Canal Zone, he answered that "Egypt has no dispute with Russia; if Russia were to attack, it would not be because of any differences with Egypt." This is true, but begs the question in a way that is dear to Egyptian hearts and meets with approval inside Egypt, though nowhere else in the Mediterranean. For it insinuates that if the western powers were not there, the Russians would stay away. Once this piece of false reasoning is accepted, the rest of Egyptian defence policy is easily built upon it. Any menace is due to the presence of the British; thus, if the British could be ejected, the menace would vanish; remembering the success of the Jewish terrorists in Palestine, the Egyptians go on to calculate that if, by violence, they can make the Canal zone really uncomfortable, the British are sure to go.

It is difficult to argue most Egyptians out of this train of thought. The chief merit of General Sir Brian Robertson's statement of Monday last was that it made a stern attempt to do so with its sonorous announcement (not for nothing had Sir Brian just seen Mr Churchill) that "no one should be misled into thinking that we shall be turned from our policy by the passage of time or murderous episodes." Nevertheless Egyptian illusions are likely to persist. To the average Egyptian's mind foreign policy consists of three topics only—relations with Britain, the existence of Israel and loyalty to the Arab League. Minds accustomed to fill themselves to the brim on these limited subjects have no room for broad conceptions of world policy or strategy. That is why most Egyptians draw no distinction between the offer to evacuate the Canal Zone that the British made in 1946, and the implications of such an offer if it were to be repeated now.

Of course the Egyptian theory that if there were no British there would be no attack does not for a moment hold water. It is as illusory as were Belgium's one-time arguments against extension of the Maginot line. The canal itself is not a prize; it can easily be rendered useless to shipping. But the Egyptian soil through which it cuts happens to be a land bridge, possession of which, in a global war, each side must immediately endeavour to deny to its adversary. The Egyptians have derived some immense advantages from their position astride this bridge; among them can be numbered rescue from debt in the last century and huge earnings in the course of the two world wars. But such gains are always offset by drawbacks, and the chief of these—about which an easy-going people prefers not to think—is the need to take thought for efficient national defence. Egypt's difference with Britain is not one of whether or no the Canal Zone will be attacked, for this will happen come what may. The topic to which the Egyptians need to be pinned down is whether or no an attack is rendered less likely if a good defence is provided in advance, and what that defence should be.

Naturally the ideal arrangement would be an initial holding force that was Egyptian. Everyone, from the British taxpayer up, would prefer that this were so. The Anglo-Egyptian Treaty of 1936 envisaged that it should happen, and provided that if, at the end of twenty years, there were any dispute as to the Egyptian army's fitness for the job, the Council of the League of Nations or "such other person or body of persons" as Britain and Egypt might agree, should decide the issue. The Egyptians, of course, hold that they are already fitted for the task, but, in Egypt's present state of internal difficulty and insecurity, no other state concerned with Mediterranean security would agree.

The present Egyptian government, therefore—the Wafd Government of Nahas Pasha—is concealing from its people the acute nature of the practical problem of defending a highly vulnerable country. It is masking the issue because, since it came to power two years ago, it has greatly disappointed its once nation-wide band of supporters. Its record in internal politics is one of unfulfilled promises, of unparalleled preoccupation with graft, and of almost total failure to narrow the gap between the country's few rich and teeming poor. It has thankfully seized upon popular dislike of the defence treaty with Britain in order to distract attention from these shortcomings. Hence its unilateral denunciation of that treaty in October, its out-of-hand dismissal of the Four-Power proposals for a Middle East Command, and its constant reiterations—another has been made by Nahas Pasha this week—that its unshakeable aims are "complete evacuation of the Canal Zone and the unity of the Nile Valley under the Egyptian crown." During the last two months, its servants in the Canal Zone towns

have intermittently co-operated with the British in the exercise of moderation, but a survey of all the government's acts suggests that the more precarious its term of office grows, the more it must pander to extremism. For reasons that are entirely political, and not at all practical, it has therefore withdrawn 60 of its best young army officers from training courses in Britain; it has done little to curb incitements to violence and it has proposed a draft law imposing penalties on all who "collaborate" with foreign troops and, in particular, on those who sell them foodstuffs.

But there are signs that this distortion of defence policy is now being questioned in several quarters from which Nahas Pasha had been accustomed to derive unquestioning support. The other members of the Arab League, for instance, have not backed Egypt in rejecting the Four Power defence proposal. King Farouk, also, has shown his dissatisfaction by appointing to political posts in the Palace two men who make no secret of their broader view; one is Hafiz Afifi Pasha, who is almost the only Egyptian lately to have had the moral courage to point out in public certain of the advantages of the British treaty, and the other Amr Pasha, who was until a few weeks ago Egyptian ambassador in London. Next, more responsible Egyptian newspapers are showing interest in the current private visit of the Iraqi premier, Nuri Pasha, to Ankara, Cairo and London, bearing, it is said, some constructive ideas on the affiliation of a unified Arab military command to the Atlantic Pact and its Mediterranean appendage. Lastly, the Egyptian Government's defence policy has been publicly questioned in an interesting article in the *Journal d'Egypte* by Rifaat Bey, legal adviser to the cabinet and Foreign Ministry. In this he expressed the view, "shared by a great number of thinking Egyptians," that even if Egypt and all the Arab states were to declare their neutrality, they could not maintain it. "It is beyond doubt," he wrote, "that Egypt's geographical position in relation to world communications and agricultural resources would make it one of the first targets for an aggressor."

Once a division of this nature has revealed itself in a country with which Britain is anxious to negotiate, the classic role of diplomacy is to maintain or throw out bridges towards the moderate sector of that country's opinion. Yet it is over-sanguine to think that such an operation will be easy. Even the "moderate" Egyptian ideas of compromise include recognition of King Farouk's title to the Sudan and total British military evacuation. To British minds, it is repugnant to purchase Egyptian goodwill at the price of a deal which impairs the Sudan's right to self-determination (a right which is the stronger now that Egypt's own foolishly extravagant claims to control Sudanese defence and foreign policy have driven many once pro-Egyptian Sudanese into the ranks that favour independence). To British minds, also, there is no guarantee that unconditional evacuation will make Egyptian hearts grow fonder; some recent experiences in the Middle East suggest that departure promotes not friendship but a volley of insults, that can be hurled with impunity after the retreating figure. The key to a serious deadlock seems to lie in placing emphasis upon defence arrangements that match a very patent threat of attack. The British should surely be ready to meet half-way the Egyptians who are now beginning to expound the need for such plans. But no start can be made until these innovators set down their concrete proposals for the defence of Egypt—which, if they are to be realistic, must make some provision for outside participation.

London's Future

OF all the local authorities preparing development plans for the next twenty years, the London County Council has had the hardest task. London is not only the seat of government and the centre of commerce, but the largest port and industrial town in Britain. Its layout is tangled and confused in the extreme. Even the well-defined functions of the West End, the City, and the docks disguise such disharmonies as the recent invasion of Mayfair and Belgravia by light industry; elsewhere, factories, warehouses, offices, and dwellings jostle each other in a seemingly patternless and endless maze. London's traffic problems are the despair of experts. Its vulnerability to air attack is the Achilles' heel of Britain. Its social problems are extraordinarily complex.

The LCC is the largest local authority in Britain, but it governs no more than the inner core of present-day London. Fifty years ago, its population was 4,500,000 and its boundaries roughly coincided with the limits of urban development. Today, its area is unchanged and its population, owing to prewar migration and wartime destruction, has shrunk to 3,300,000; another 5,000,000 Londoners now live outside the county but within the built-up area of the metropolitan police district—that is, in Greater London. Thus defined, the metropolis now contains, as it did before the war, a fifth of England's population. To limit its further expansion has become an accepted aim of Government policy. But it is far from certain that this aim will be realised, save in the sense that a still growing population will be spread over a still wider area. Developments such as the new towns will involve large increases in the population of the outer parts of the London region; they suggest that, despite the nominal barrier of the "green belt," the centrifugal growth of the capital is not yet exhausted.

The LCC has had to shape its plan on assumptions about the future of London which are wholly beyond its control. Evidence of the resulting uncertainties, and also of the inadequacy of Government guidance on crucial issues, crops up frequently in the 325 pages of the official analysis which accompanies the development plan published recently. The cruellest dilemma is presented by the acute scarcity of vacant land for development, a scarcity which at the end of the next five years "may in general terms be said to amount to land bankruptcy." Even minimum standards of good planning require that additional land should be found for schools, roads and public open spaces, as well as for new housing, which will involve an increasing displacement of existing property and population. This is naturally a distasteful prospect to a council which must cope with an estimated number of 250,000 families on the combined waiting list for dwellings in London; 75,000 of these applications are classed as urgent.

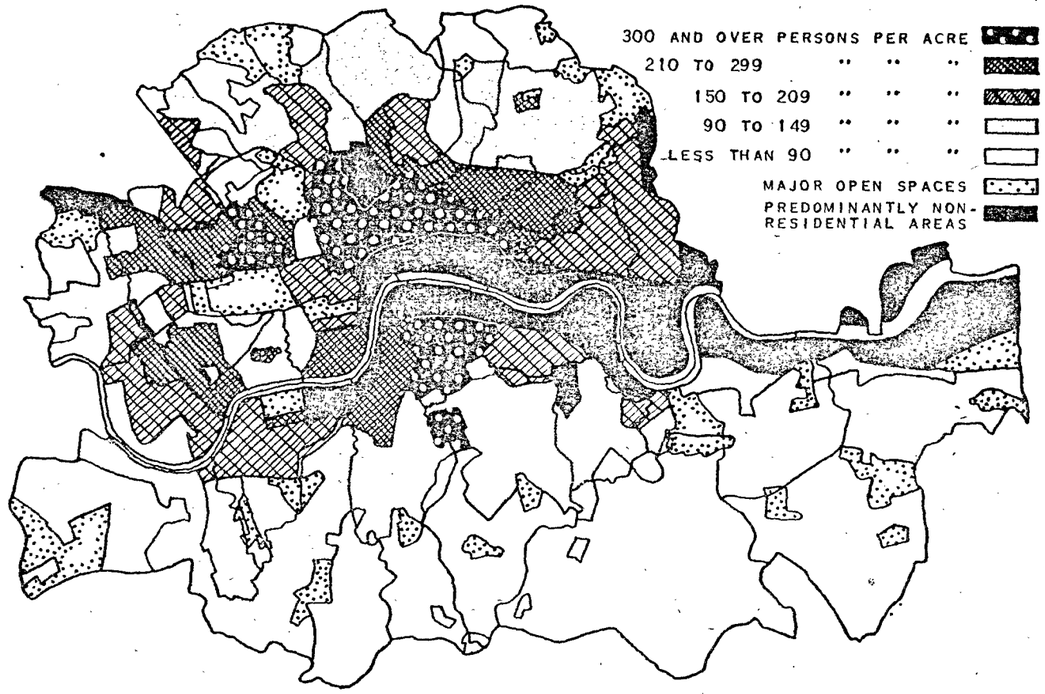
Since the war the LCC has built about 30,000 dwellings in large "out-county" estates, mostly in the green belt and more than ten miles from Charing Cross. It has

agreed, with obvious doubts, to the winding up of this programme after a further 19,000 dwellings have been completed. Thereafter, further development in the London region will be limited to the new towns and other places at a distance from the "great wen," and the LCC will be confined to the much more costly and difficult task of redeveloping built-up areas. The LCC, therefore, faces a standing temptation to cut down its space standards and to cram as many people as possible on to its redeveloped sites. Cost as well as the housing shortage points in this direction; yet to yield to the pressure would be to abandon good planning and the Abercrombie design for London. And it might be unnecessary. If the new towns are effective magnets for Londoners, the waiting list for houses could dwindle very quickly.

It is important, yet very difficult, for the LCC to look beyond its present pressing embarrassments. The problem is complicated by the fact that the LCC, overburdened with too much population at present, is yet anxious not to lose too many people lest rateable values suffer severely. This conflict runs through the plan. The proposed residential densities follow the general design of the original plan of 1943. Their eventual attainment will involve considerable thinning out of the population in some central areas, which may be partly offset by redeveloping some suburbs at higher densities. The striking difference in residential pattern between the north and south sides of the river will be preserved. But the fact that these densities are to be averaged out over considerable areas restricts their significance. It would be possible to do a great deal contrary to the spirit of these principles of good planning without for a long time infringing their letter.

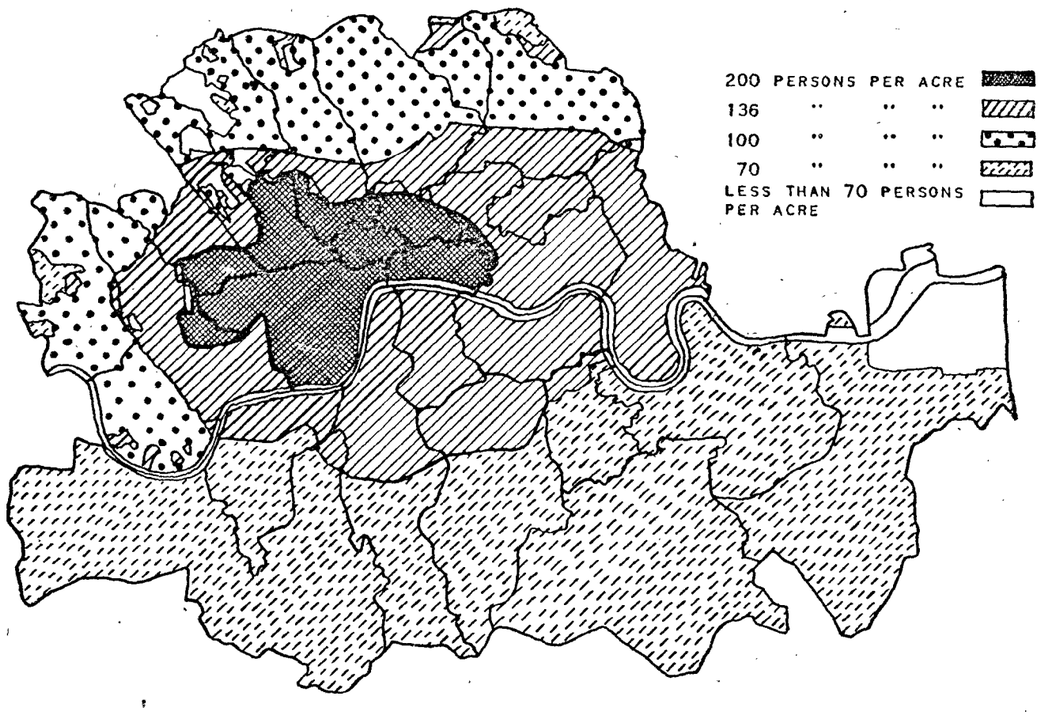
★

The core of the plan is contained in the development proposals for the next five years, which are reasonably certain, and those for the following fifteen years, which are more tentative. They are a compromise between the ideals of 1943 and the realities of 1951. On balance, the ideals are still powerful, though the real test will come five years hence, when the plan must be revised. The council plans to spend £9 million during the twenty years on clearing over 1,000 acres of land for public open space in areas where it is notably lacking, and an impressive start has been made with the purchase of Holland Park. For schools, the council has had to seek some reduction in the space standards laid down by the Ministry, and to arrange for the provision of playing-fields outside the county. A reasonable programme is outlined for slum clearance; 17,300 families are to be rehoused in the first five years and 43,000 families in the next fifteen. The nature of the London problem can be clearly seen from the housing figures. In the first five years, the development of public services will involve the displacement of 84,000 people but 240,000 will be rehoused. For the following fifteen years, these figures are put at 400,000 and 339,000 respectively—that is to say, there will in the longer period be a net reduction in the number of houses in the county. It is in this period that the pinch will come and that the density standards of the plan will be threatened.



These are figures for the county as a whole. It is in the central areas of the county and in the East End where employment is strongly concentrated; where a multiplicity of land uses conflict; and where the pressure on land is generally so great that decent social facilities cannot be provided without enormous cost and displacement of population. The location of employment is the real meat of the planning problems of London. It is significant that, since the end of the first world war, employment within the county has declined at a much slower rate than has the population. Nearly 2½ million people were estimated to work in the county in 1948, while its resident working population was about 1,600,000—indicating an enormous daily influx. But employment is also heavily concentrated in the City and the West End. Peak hour traffic by public transport into the central area is still growing rapidly; 1,139,000 people were travelling on a typical weekday in 1950.

It is clear that questions of population, employment, and transport in the London region should be taken together, and that only the Government itself can formulate an effective policy for all three. The LCC, in planning for a somewhat smaller population—estimated at 3,150,000 after 20 years and 3,250,000 eventually—is complying with the official policy of decentralisation. Yet the other parts of the programme, for industry and transport, are already plainly out of step. The effect may in the long run be very dangerous. The Board of Trade has not been sympathetic to the case for moving factories out of London, and has licensed an appreciable amount of new factory building inside the county. Economic exigencies certainly preclude any big dispersal of industry at present. But at least the reverse movement ought not to be allowed. If the Board's policies are not changed, two results are likely. One is that the new towns will be a failure—unless, indeed, they draw their industry from other parts of the country and add (at Government expense) to the congestion of the London region. The other is that traffic inside London will become chaotic.



The improvement of London traffic and communications is, in general, a task beyond the capacity of the LCC. In these matters, the original London plan has been drastically pruned. The LCC will not be allowed to construct the proposed ring road round the central area, and its expenditure on road improvements will be limited to about £4 million a year. No decision has yet been reached about the decentralisation of Covent Garden and the large wholesale markets which cause so much congestion. The schemes for removing the railway bridges over the Thames have been shelved. The only major relief will be the probable provision of several new passenger tube lines and further electrification of suburban railways. These arrangements will not suffice if the daily influx into central London is allowed to go on growing. On the other hand, if an effective decentralisation of industry is begun, major transport improvements may come too late to do much good.

The conclusion must be that there is a sad lack of co-ordination among Government departments in their policy for London. An effective strategy for dealing with its manifold problems has still to be applied. Meanwhile, the LCC—for all the weaknesses of its development plan, which are considerable—deserves some commiseration in its present difficulties. On the whole, it has kept its vision, although with many doubts about the financial consequences. The plan involves an average annual expenditure of £27 million for all forms of development; at the peak, this will put an extra 3s. to 4s. on the rates. But the council can argue with some force that the present basis of Government grants is unfair to London; certainly it needs revision.

EXISTING RESIDENTIAL DENSITY

PROPOSED RESIDENTIAL DENSITY

Last Act of the Marshall Plan

THE Marshall Plan is drawing to its close. Officially it ends next June, but already this week the American counterpart organisation—the Economic Co-operation Administration—has changed its name to the Mutual Security Administration. This change will not affect the Organisation for European Economic Co-operation, which is a permanent body. But it is an indication of the design of things to come. The concept of economic co-operation, in which the emphasis has been on Europe, is being transformed into the wider concept of mutual security, with the emphasis on the North Atlantic community.

It is ironical that Europe, after four years of co-operation, should find itself in what seems to be the same position as in 1947. Europe is still hungry for dollars; the overseas payment accounts of most countries are again markedly in the red; countries are still trying vainly to combat inflation, while the need to increase productivity is just as great as it was four years ago. Was, then, this generous gesture of the United States to no purpose? Has Europe achieved nothing under the Marshall Plan?

Europe's recovery programme was based on four aims. First, an expansion in output, particularly in agriculture, fuel and power, transport and modernisation of equipment. Secondly, the creation and maintenance of internal financial stability. Thirdly, the development of economic co-operation between the participating countries and, fourthly, reducing Europe's deficit with the American continent particularly by increased exports. The committee of co-operation, which prepared the initial report in September, 1947, was under no illusions about the dollar problem. It maintained that the purpose of the recovery programme was to reduce the dollar deficit as fast as possible. The report went on:

> There will be some deficit in 1951. . . . But by the end of 1951, given reasonably favourable external conditions, the deficit should be of dimensions which will be manageable through normal means without special aid.

Looking back on the events of 1950 and 1951, the architects of that report can be justifiably proud of their far-sightedness; for 1950 seemed to herald the fulfilment of recovery, a fulfilment that was frustrated by the scramble for commodities and the dramatic rise and fall in prices in late 1950 and early 1951.

Any assessment of Europe's achievement must be related to these four aims. Production has increased and most of the objectives have been reached. Four years ago the need to expand agricultural output was great. Food supplies were limited; most countries of Western Europe had rationing schemes in force, while the poor harvest of 1947, coupled with the lack of dollars, raised the spectre of starvation. At the time the agricultural objectives were set, many people considered them unattainable. But only two have not been reached. Cereal production in 1950-51 amounted to 64.1 million metric tons compared with its objective of 65.8 million tons; it had, however, regained its prewar level. The production of bread grains was slightly above its objective while the output of potatoes, sugar, meat, milk and oils and fats were well above theirs. And in each case the prewar level was exceeded. Cattle numbers are close to their objective, while pig numbers have already passed theirs. The only other deficiency is in sheep numbers.

In industry, too, most of the objectives have already been achieved. The only blot on the record is coal, the production of which in 1951 (based on the first nine months) reached 460 million metric tons against the objective of 511 million tons. The main deficiency has occurred in Britain whose output was only 223 million tons compared with its goal of 249 million tons, though Germany, France and Belgium have also failed to reach their planned output for 1951. Europe's total coal production is still below its prewar level. Electricity production in 1951 amounted to 246 billion kwh compared with the objective of 237 billion kwh and a prewar level of 130.5 billion kwh. All the major countries except France and Italy have more or less passed their goals. Steel production is also up to schedule and German output well above it. France, again, is the exception; its output in 1951 was still well below its objective.

TABLE I—EUROPE'S ACHIEVEMENT IN AGRICULTURE

	Prewar	1950–51	*Objective 1950–51*
	(Million Metric Tons)

★

In 1947 the shortage of locomotives and rolling stock was a major difficulty. Although no comparable figures are available to prove that this problem has been overcome, Europe is no longer beset with transport difficulties. The increase in motor vehicle production in Britain, France and Germany during the past four years has been almost phenomenal, while tractor production has also been maintained at a high

level. Among the consumer goods, textile production has expanded, and the problem at the moment is not to find clothes for the people but to find people to buy the clothes.

Modernisation of industry has also gone on apace, though again it is difficult to show the progress in specific figures. Total industrial production of Western Europe in 1949 was 13 per cent higher than in 1948; in 1950 it was 25 per cent higher and in 1951 35 per cent higher—a very significant increase. On the other hand, the working population increased by 1½ per cent in 1949 and by almost 1 per cent in each of the two succeeding years:—

	Index of Industrial Production	Index of Working Population
1948	100	100
1949	113	101½
1950	125	102½
1951	135	103½

It is fair to conclude from the comparison of these two trends that productivity per man-year has increased so rapidly in Western Europe during the past four years, that improved equipment must have played a major role, even though a significant part of the increase in output was due both to the revival of Germany and to the use of previously unemployed resources.

On production, then, Europe has done well enough with the single exception of coal, adequate supplies of which are vital to European recovery. The fight against inflation, however, has been less successful. Most countries have experienced an almost continuous rise in prices since 1946, though until 1950 the rise has been generally moderate. But as was shown in an article on page 1380 in *The Economist* of December 8, 1951, even the sharp rise in the latter part of 1950 and in 1951 was helped by too ample credit facilities granted to manufacturers and traders to build up stocks. In all countries retail prices have increased more sharply than they would have done if higher import prices had been the sole cause, while in most countries wage-rates have kept pace with the rise in the cost of living. Europe has certainly warded off the dangers of "hyper-inflation" but it has remained a victim of "creeping inflation."

The progress on co-operation has not been very spectacular but it has been none the less real. The intra-European payments scheme followed by the European Payments Union are only two examples. The freeing of intra-European trade from quantitative restrictions is another and by the middle of 1951 most countries had freed at least 75 per cent of their private trade and had also adopted a common list of goods on which restrictions were abolished. This was a new step in economic co-operation. Previously countries were allowed to choose independently which goods they would free. This same technique of a common list has been employed in the prohibition of the use of certain scarce materials in the production of consumer goods. Again, the Schuman Plan for an integrated European coal and steel industry is at last coming to fruition.

Even on its foreign trade Europe can record achievement. Its total trade deficit was reduced from $5.3 billion in 1948 to $2.1 billion in 1950. In 1951, owing to the sharp rise in the value of imports, it rose once more to $3.8 billion. But Europe's exports have increased at a surprising rate from $16.8 billion in 1948 to $26.3 billion in 1951. In volume, exports rose by 75 per cent during this period. Of more immediate concern for the dollar problem is Europe's expansion in exports to the United States and Canada. This was to be Europe's main method of reducing its dollar deficit. In 1948 exports to these two countries amounted to $1.3 billion; by 1950 they had reached $1.7 billion and in 1951 $2.4 billion. If the value of imports from the dollar area in 1951 had not been so large, Europe would, indeed, have reduced its dollar deficit to more manageable proportions.

TABLE III—TRADE OF WESTERN EUROPE
(Million Dollars)

Year	Imports (*a*)	Exports	Balance	Exports to USA and Canada
1948	22,163·6	16,835·5	— 5,328·1	1,289·3
1949	22,352·5	18,822·5	— 3,530·0	1,171·2
1950	21,788·1	19,736·2	— 2,051·9	1,655·8
1951*	30,095·4	26,297·3	— 3,798·1	2,380·8

* Annual rate based on 9 months. (*a*) Adjusted to f.o.b.

The similarity between 1947 and 1951 is, therefore, only superficial. Europe has not squandered America's generous gift. It has increased output; it has re-equipped its industry, it has worked as a unit in certain fields and it has expanded both its total exports and its exports to the United States and Canada. Its major deficiency has been its failure to bring under control its internal inflation. Without rearmament even this would not have had very serious consequences. From the United States' point of view the disbursement of $12 billion of aid under the Marshall Plan has been a successful investment, and it is worth remembering that the sum is only half of what was originally considered necessary.

Better or Worse?

The condition of Europe at the close of 1851 is by most public writers asserted to be worse than at its commencement. The various schemes that were then in agitation for the political improvement of Germany have all been ruthlessly put an end to, and stark despotism is there the universal lord. In France, a too-nicely-balanced Constitution, nominally based on *popular support* and called a Republic, has sunk, overwhelmed by the old military power, and only the name of freedom is left. Over Italy, superstition, pinned on the people by the united bayonets of the two great nations which formerly by their rivalry nourished in her hopes of freedom, weighs heavier, and seems more secure than ever. Everywhere on the Continent military despotism is apparently triumphant; the voice of reason and of freedom, speaking through the press, is hushed and stifled, and terror seems established as the principle of all government. The people, tired apparently of seeking what is called political improvement, ask protection against it, and supplicate the military power to secure property, prevent labour from being interrupted, and preserve public tranquillity. The previous progress, however, forbids us now to suppose that this seeming is the actual truth, and that society has retrograded or will retrograde. It is quite certain that within the year very considerable material progress has been made. It is equally certain that no such progress is ever unaccompanied by moral and intellectual improvement; and we may be quite sure, though we cannot exactly see how the results are to be brought about in detail, that the use and extension of the electric wire, like the invention of gunpowder, intended to destroy, will, in some manner, improve the condition of mankind. . . . Society may be momentarily diseased; but, though crimsoned with blood and convulsed with anguish, its glorious life is not for ever to be extinguished under the hoof of armed despotism.

The Economist
January 3, 1852

West, and for some time it looked as if he would succeed. He secured recognition even by the United States. He won a permanent seat on the League of Nations, and himself became one of the League's most popular statesmen during its last phase. His slogans, such as "peace is indivisible," became international currency. He tried to form an anti-Nazi coalition, and it was not his fault that the attempt failed. In fact, the failure brought about his first eclipse. As a Jew and a westerner, Litvinov was not suitable to parley with Hitler; he was dismissed on the eve of the Molotov-Ribbentrop Pact.

With the Nazi attack on Russia the wind was again blowing into Litvinov's sails. He was appointed ambassador to Washington and then returned to Moscow as deputy foreign minister. The postwar deterioration of Moscow's relations with the West brought a second eclipse. He ceased to be vice-minister in 1946 and after that disappeared from the limelight. His disgrace has apparently outlasted his life, for members of the government and the Politburo did not flock to the funeral of this remnant of the Bolshevik old guard.

Soviet foreign ministers do not shape the policy of their country, and the pro-western trends were not of Litvinov's own making. Yet the ups and downs of his career were usually considered reliable signs of the Kremlin's intentions. Likewise, Mr Vyshinsky simply says and does what Moscow tells him; but if it wished to open serious negotiations one would expect him to be dropped. In that case the Kremlin would not find it easy to produce another Litvinov who could talk the same language as Mr Kennan, the new American Ambassador to Moscow.

Freedom for the Schools

"The English tradition of the independence of the school holds firm," said the headmaster of Eton in his presidential address to the conference of Educational Associations last week; but he made it appear that it was against fearful odds. The schools, said Mr Birley, must keep "free of the dogma, which is the bane of any state which provides services for the community . . . that he who pays the piper calls the tune." Some interference by the "piper" is unavoidable; the Ministry and the local authorities have to account to taxpayers and ratepayers for the way their money is spent. Thus expenditure on repairs and decorations, or the charge to be made for school meals, are not left to headmasters' discretion. Mr Birley's "forms to be filled in" and bureaucratic "pinpricks" are an inevitable part of this financial responsibility. But he was right to remind the schools that the price of freedom is vigilance; the closed shop dispute in Durham was proof of that.

The doctrine that the piper should call the tune would be pernicious if it extended to the curriculum. The only state directive is the provision of the 1944 Act that schools should open with religious worship, and it is rarely, if ever, that a local education authority would interfere with the curriculum in one of its secondary schools. This is freedom indeed compared with the extent to which the state controls the school curriculum in some continental countries. But this freedom is subject to an unwarrantable indirect limitation. That is the requirement that candidates for the General Certificate of Education must be at least 16 years old, which delays specialisation by bright children who wish to obtain the certificate in several subjects. On the other hand, as the certificate is awarded in individual subjects, it is arguable that teachers have more freedom to fit the curriculum to the child than they had when it was necessary to obtain a school certificate in specified groups of subjects.

The regulations for the new examination were made by the Ministry on the advice of the Secondary Schools' Examination Council, which consists of educationists—representatives of the teaching profession, the education authorities and the examining bodies. But few of their colleagues would agree with all of the council's conclusions, and several educational bodies, including the London County Council, have asked them to revise their recommendations. The Incorporated Association of Head Masters has this week demanded an immediate and thorough revision. Now that the General Certificate has been in force for a year, the material is available to make the thorough review of the subject that the Minister of Education has agreed is necessary. There ought to be no delay at least in removing the age limit—as the Conservative party implied that it would do.

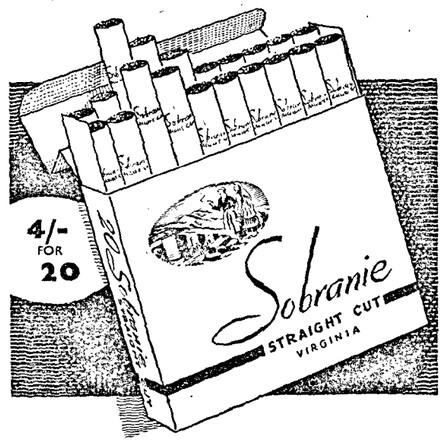
Punishments in Approved Schools

The second report of the committee set up to review punishments in prisons, borstals, approved schools and remand homes has now been published (Cmd. 8429). The first report, dealing with prisons and borstals, was discussed in *The Economist* of June 30, 1951 (page 1553). The new report is likely to be less criticised than its predecessor, which in some respects appeared to favour a return to a stricter and more formal discipline and severer punishments.

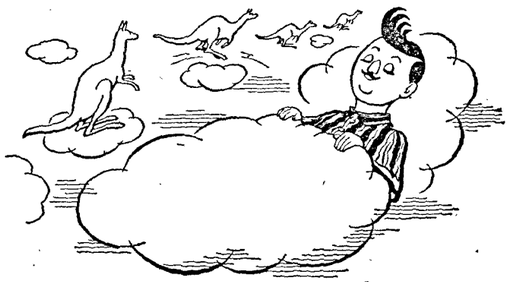


On the whole, the committee recommends few important changes in the system of punishments in approved schools and remand homes. Its two chief proposals concern absconding and the peculiar disciplinary difficulties of the approved schools for older girls, who often combine a low average intelligence with sexual precocity and a tendency to violent hysterical outbursts. The committee recognises that the principle behind the approved schools implies that they should be open institutions. But it puts forward a strong case for proposing that the experiment of a closed school, or an open school with a closed block, for persistent absconders should be tried out as soon as possible. Similarly, there should be general approval for the recommendation that the Home Office should agree to set up special closed punishment blocks in senior girls' schools.

But the committee, rightly, does not keep its recommendations strictly within its terms of reference. Punishments in approved schools cannot be regarded separately from the general maintenance of discipline and the whole purpose of the schools. The distinguishing feature of approved schools and remand homes is that many of the children and young people in them may not have committed any offence. The principle governing the schools is that the children should be treated according to their needs rather than their misdeeds and that the needs of the ill-treated or neglected child and of the young offender are basically the same. But this principle sometimes involves awkward problems of discipline, which leads the committee to recommend further classification of schools for special types of children. There is a good case for more schools exclusively for the very dull, as these children usually make more progress when educated on their own. But doubts may be felt about the wisdom of special schools for the emotionally unstable. Their removal would help the maintenance of discipline in the ordinary approved school. That might, however, be achieved at the expense of the unstable children themselves, who may suffer more than they gain from being herded together.

* * *

After Prison



In spite of the undoubted success of the approved schools, there is still a minority of children who, as they grow up, progress from them to borstals and from borstals to prisons. Yet even when they have served their sentences society may still exercise a watch over them. The discharged prisoners' aid societies have for over a hundred years existed to help prisoners to adjust themselves to a normal life on

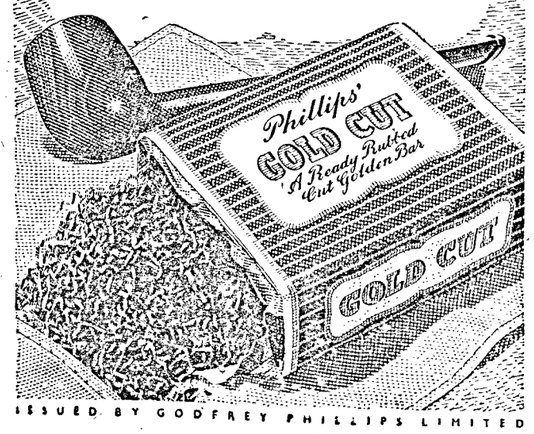
Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.



The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

A NEW old-style pipe tobacco at 4/- an ounce

ISSUED BY GODFREY PHILLIPS LIMITED

WINDOW ON THE FUTURE

A great new oil refinery with a projected capacity of 4,000,000 tons a year is being erected by Anglo-Iranian on the coast of Kent, at a cost of some £40,000,000.

Their three existing refineries in the United Kingdom already have a combined annual capacity of over 6,000,000 tons.

In many other countries the refineries operated by Anglo-Iranian and its associated companies are increasingly contributing to the world's supply of petroleum products.

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

LIMITED

their release. This help may consist of grants of money and clothing or simply of advice and friendship. But it exists for the prisoner who wishes to take advantage of it. He is not obliged to.

After-care is more positive. When the borstal system was set up, it was made a condition of a boy's release on licence that for a certain period he should be supervised by a society concerned with after-care, whose directions and advice he could disregard only at the risk of forfeiting his licence. By 1948, when the latest Criminal Justice Act was passed, there were three bodies concerned with after-care: the Borstal Association, the Aylesbury Association for women and girls, and the Central Association for the Aid of Discharged Convicts, which combined statutory after-care for certain categories of offenders with the same function for discharged convicts as is exercised by the aid societies for men and women discharged from local prisons. The Act of 1948 greatly extended the categories of offenders to be released under a licence requiring positive supervision and after-care. Because of this, and to ensure that after-care is dealt with on common principles, the Home Secretary set up the Central After-Care Association, which absorbed the three existing after-care organisations. These, however, retain their separate identities and staff.

The central association has just produced its first report (which is not for sale, but can be obtained on application to the Prison Commissioners). Inevitably, the report is mainly concerned with the setting up and organisation of the association. It is much too soon for any opinion to be formed on the success or failure of the extended system of after-care. But the accounts of their work given by the three constituent organisations show a humanity tempered by good sense and detachment that would appear to make them well fitted for their heavier responsibilities.

* * *

How Much Can Germany Pay?

The Germans, unenthusiastic though they are about western defence, are far more willing to raise an army than to pay for it. In this they are not alone; but they have more grievances than any of their future partners. They not only condemn as intolerably high their present taxes, which are slightly lower and less progressive than in Britain, but they bitterly resent the occupation costs. If there is one point on which they are united, it is that their welfare must come before rearmament.

Allied financial experts disagree with these views. The Americans propose that Germany should increase its defence contribution fairly soon to about DM 13 billion (£1,083 million) a year, or about 10 per cent of the estimated gross national product. As production should rise steeply, they argue that this expenditure would still allow a slightly continued rise in the standard of living. The German dollar deficit would be covered in the main, if Mr Harriman were satisfied with the country's efforts. The United States will be making one day large offshore purchases in Germany for delivery to the Nato powers; and a part of France's recent dollar grant should be spent in the same quarter. Moreover, the Germans will benefit from expenditure by the American troops. This new-style "tourist traffic" has yet to develop, but may bring in some $200 million a year.

As for the deficit in the Federal budget, Germany's foreign critics have long held that its taxation system badly needs overhauling and could bring in more revenue without undue strain. The possibilities of fresh government borrowing are still very limited but may improve. The latest figures of public savings suggest that confidence is rising, with higher production and real wages.

The Bonn Minister of Economics, Dr Erhard, is inclined to agree that rising production will enable Germany to meet increased demands for defence. But his colleagues in the Ministry of Finance think this prospect is too distant to be relied upon. About a third of the current year's occupation costs have already had to be placed to an extraordinary budget, where they remain uncovered. Germany, the Minister argues, cannot afford much more than DM 7 billion (£583 million) a year for its share in the European army. That is roughly the sum due for the current year's occupation costs. Further, the Finance Minister, Dr Schaeffer, claims that money spent on refugees, the support of Berlin, and pensions to war victims all represent a contribution to defence—a claim that is naturally resented abroad. State pensions and relief at present cost more than the occupation, or as much as the proposed German contribution to a European army. The deficit in the army's finances should, in Dr Schaeffer's view, be covered by a loan from the International Bank to the common budget, which the Germans advocated in vain at last week's Paris conference. There is no denying the fact that "inflation" in the German public mind means "disaster" and not simply a rise in prices; for this reason it is understandable that deficit financing is anathema to the officials responsible for the currency.

For Britain even a compromise in the dispute opens up a serious prospect. If Germany stops paying for the maintenance of troops (under a treaty after the occupation statute is ended), the British Treasury will be burdened with an additional £180 million a year. It is not likely that the Germans would immediately spend DM 7 billion on their own army, and something would remain over in the first year for foreign troops. But even so, the British taxpayer is faced with the intolerable prospect of finding more money because there is to be a new German army.

* * *

Prague's Watch on the Peasants

The New Year begins for the Czech and Slovak countryside with the Communist authorities taking steps to strengthen their control over the farmers through he local national committees. Some such move was to be expected. President Gottwald's New Year message confirmed that the present food shortage is causing serious concern. It is driving the government to adopt a tougher policy towards the peasants, who will find that the reorganised rationing system (as was described in *The Economist* of last week) can press them hard to fulfil their delivery quotas, however exorbitant, and even to join the collectives.

The men in Prague can obviously do little in the countryside without the unqualified support of local officials. This they still do not enjoy, in spite of a fairly drastic reorganisation of the national committees about eighteen months ago; and many unpopular Prague orders—such as those stepping up delivery quotas and restricting the issue of ration cards—have been honoured more in the breach than in the observance. Local committees cannot ignore local feeling. Now a serious attempt will be made to remedy this by appointing very carefully chosen local secretaries to each committee. They will replace the travelling circuit secretaries whose supervision could only be scanty, and will be responsible for the uninterrupted execution of all government orders. They will, in short, in the words of the Minister of the Interior, Mr Nosek, "see to it that the National Committees do fulfil their duties." He deceives nobody when he represents this action as a kind gesture, designed to relieve the local committee members of a growing multiplicity of duties. There will also be a thorough overhaul of committee members, weeding out all who have "disregarded the principles of socialist construction." At the same time the Prime Minister, Mr Zapotocky, has emphasised that the new secretaries must not become "omnipotent commissars," and that the national committees must no longer fail in their duty to explain policy and convince the people. His words were perhaps another indication of the present conviction among the leaders of

Czechoslovakia that if Moscow's demands are to be met, they must somehow get greater popular support and make a greater national appeal.

The Dinar Devalued

Last week the Jugoslav Finance Minister, Mr Popovic, announced the devaluation of the dinar. The size of the devaluation suggests that it is not just a minor concession to the international monetary authorities—the Fund and the Bank—who have both had active representatives in Belgrade for several months, but part of a revolution in the internal economic system of the country. The old dinar was, theoretically, worth just under 1¾d.; the new dinar is fixed at just over one farthing, or 840 instead of 140 to the £. The old value certainly bore no relation whatever to world prices; it was in fact little more than a symbol, an attempt to disguise the degree of inflation which had occurred inside the country. Its unreality did not hinder trade as much as might have been expected, as there were heavy subsidies to the export industries and price reductions for tourists.

The six-fold devaluation is significant therefore in two ways. First it brings Jugoslav prices within range of (though not really competitive with) world prices, and it provides a national fillip to exports and to the tourist trade. Second, it is in tune with the movement within the country which has been tentatively gaining ground for the last year—a movement of decentralisation, back to something like a free and competitive economy. Simultaneously with the devaluation, subsidies to exporters and the tourist trade are abolished. Exporters will still gain, as the scale of devaluation is greater than was the scale of the subsidies. For tourists, though free price concessions have been abolished, the Dalmatian coast will be cheaper this year than last.

Profit and loss is gradually resuming its proper role at the expense of central control in the economy of Jugoslavia. This is the main reason for the enthusiasm with which the latest move has been greeted by the International Fund and Bank. But the virtue of the present step lies more in a promise of things to come than in its own adequacy. The hope in Jugoslavia and outside was to make revolutionary changes in the economic system; but there are signs that the Government has decided, for the moment, that discretion is the better part of valour. The black market price for the dinar in Trieste is about 1,500 to the £, and in Jugoslavia about 1,200. There is good reason to believe that the latter rate is far nearer its true value than the new official rate of 840. The same timidity appears in other parts of the Government's ambitious programme of liberalisation.

Analysing Family Budgets

In a recent paper to the Royal Statistical Society, Mr Houthakker gave a foretaste of the results of some new research into family budgets which is being carried out at the Department of Applied Economics at Cambridge. The raw data necessarily come from the pre-war inquiries—the 1937-38 working-class and the 1938-39 middle-class surveys. Quantitatively, therefore, the results are very out of date, and at first sight it might seem that this work is of only academic interest. But, at a time when detailed plans for a new official budget inquiry are being discussed, it is important to try to decide just what information it is desirable and possible to extract. There is still much to be learned on both these points.

No satisfactory way of allowing for differences in the size of families has yet been devised. Mr Houthakker has made some calculations on a sample of the 1937-38 budgets, previously studied by Mr Nicholson, to show how expenditure on different items varied with the size of family. On the average, for instance, it is estimated that the addition of one child in the family increased the total expenditure on food by 6 per cent and on clothing by 5 per cent. But such figures are rather unrealistic when no account is taken of the ages of the children. The author favours the "equivalent adult" or "unit consumer" scales for eliminating family size, but detailed work on these lines has only just been started. On the same 1937-38 budgets, it was found that London families spent 40 per cent more on housing than comparable families elsewhere and 210 per cent more on rail travel to and from work—but only 18 per cent more on bus travel to work. Other points that are being studied include the effect of income on the qualities of goods bought and the differences in consumption between working-class and middle-class families. If factors such as these can be isolated satisfactorily, family budgets will become a much more useful source of information.

But no amount of refinement in the technique of analysis will remove unreliability in the original material. Some rather alarming discrepancies in the prewar budgets lead to the conclusion that a continuous inquiry over a longer period—instead of in four isolated weeks during the year—is certainly desirable for many items, and essential for some.

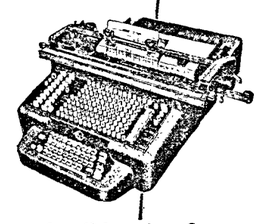
Freedom for Parrots

"Far back, through creeks and inlets making," the tides of economic liberalism are—perhaps—beginning to flow. For the first time in twenty-one years, it is now permissible to import into Great Britain parrots, cockatoos, parrakeets and budgerigars or love-birds. It is true that the original ban was not imposed in the interests of the balance of payments, of the vital British industries of parrot, cockatoo, parrakeet and budgerigar-breeding, or of the harmony of a national plan; it was designed to eliminate the danger of psittacosis, an unpleasant complaint carried by parrots and their cousins, transmittable to man, and occasionally fatal. The removal of the ban corresponds accordingly not to any economic or ideological change but to two technical discoveries: that pencillin has reduced psittacosis to a minor hazard and, rather disconcertingly, that the opprobrium hitherto concentrated on the psittacids should really have been shared all along by that uncontrollable, unexcludable, and indeed overwhelmingly native bird, the common seagull.

Still, every little helps. Protectionists and controllers for control's sake have always found the public health a useful excuse for excluding this, limiting that, and holding up the other until it has deteriorated safely into unsaleability. The American customs official ordering importers of fruit trees and flowering shrubs to boil their roots lest the native strain be contaminated, his British counterpart throwing tourists' hams into a dustbin lest, somewhere between Dover and the dinner-table, they should convey foot-and-mouth disease to a British herd, the Scottish coastguards building, in the interests of good forestry, a bonfire of the Christmas trees washed ashore, can all cite chapter and verse in justification. But the propensity to strain at foreign gnats while the most insanitary native camels are swallowed cannot be entirely separated from the view that imports are a bad thing. Indeed, were there an official Parrot-Purchasing Mission, a powerful Parrot-Breeders' Association, a United Brotherhood of Brood-Parrot Tenders, or any other vested interest dependent for prosperity and prestige on the maintenance of the ban, how confidently would authority have relied on the scientists' reassurances?



However, one should not look a gift parrot too closely in the beak. A whole new generation of potential psittacid-fanciers now sees opening before it an unexpected vista of economic liberty. For them at least, if not for others by implication, the New Year opens with what can be described, with a nicer accuracy than usual, as favourable auspices.

The Manchester Guardian

REVIEW OF INDUSTRY

Commerce and Finance

to be published on 22nd JANUARY 1952

. . . . . is not just a history of the problems of the past year, but a forum of views on the difficulties and hopes ahead in 1952.

The costs of State ownership of vital industries will be examined by a Manchester Guardian correspondent familiar with the operation of nationalised industry.

The Fuel and Power crisis will be analysed by three experts.

The problems facing the British businessman in the factories, in the City and in the Home and Foreign markets will be reviewed in some 35 special articles.

The number will include as its main feature a *Manchester Guardian Survey of Industry*—a reporters' survey of how the strains of rearmament are being met, based on interviews with managements in the industrial cities of Britain.

128 pages

on fine quality paper, well bound in a coloured cover

A MARKET for progressive people

There is no doubt at all that The Listener readership offers a first-class market for a wide range of goods and services. Here you have a market of educated men and women from trade, industry and commerce, from the professions and the arts, from public services and private life. They include some of the most influential people in almost every sphere of activity. Listener readers are, naturally, people of more than average discrimination and taste, and their confidence in the journal extends to the very sound advertisements it carries and the products they offer.

If you have a first-class product or service appealing to substantial people, you will do well to consider advertising in The Listener.

The Inevitability of Goodness

The New Society. By E. H. Carr. *Macmillan.* 119 pages. 7s. 6d.

This book consists of six lectures which Mr E. H. Carr broadcast last summer, and which attracted deservedly wide attention. They will repay more careful study in print. For, in addition to his special skills, Mr Carr is nowadays the most proficient general practitioner in what may broadly be called the ideas of the Left. He has no more inclination than the ordinary country doctor to question the current dogmas of his discipline. He is, for example, as guilty as any backbench politician of the emotional confusion between motive and result—the assumption that what is done for private profit almost inevitably conflicts with the public good. Again, in his belief that small firms do not count and that industry is effectively monopolised, he identifies size with power as naïvely as any sixth-form essayist. And so on through most of the stock presuppositions of the Left. Mr Carr's distinctive achievement is that from such raw material he builds a coherent attitude and applies it with great skill to some current issues.

Many people will be comforted by his conclusions. Their main implication is that the future lies with the British Labour party, moved somewhat to the Left. The world has passed from competition to planning, from the night-watchman state to the welfare state, from the liberalism of an elite to mass democracy, from colonial exploitation to national equality. In these stirring times the course of duty is plain. There is for the individual an "obligation to accept and complete the revolution on which we have willy-nilly embarked." At this point (near the end of the last lecture) even those who would most like to agree with Mr Carr must surely be made to wonder. If the old society is so certainly dead, if the nature of the new society is so plain, as Mr Carr professes to demonstrate, then what does this talk of "obligation" really signify?

A brief and lucid discussion of the theory of history leads him to deny that "there is any predetermined pattern in history or prearranged destiny which condemns us to despair." The value of the argument is reduced by its patent irrelevance to Mr Carr's own scheme of things. The real basis of almost all his judgments is an equation of the good with the new. "The one absolute in history is change." And since Mr Carr's response to any change is to welcome it—or, rather, to believe that he ought to welcome it—clearly there cannot be reason to despair. Mr Carr never argues the merits of anything: some things have ceased, or are ceasing, to be, and those are bad; other things have just happened, or are in process of happening (he is never quite sure which), and those things are good. No Victorian philosophy approached this in comfortableness. Nineteenth-century capitalism has ended, so socialism must be desirable; the new society seems to require direction of labour, so qualms about it are unnecessary—except for people guilty of a conception of democracy "still rooted in the derelict philosophy of *laisser-faire*."

All that is novel in Mr Carr's attitude is that he is unusually consistent in it. It is a sensible rule-of-thumb that in politics one should generally make the best of what is happening. But if such a rule is to be elevated into the basic principle of a political philosophy, then at least the philosopher has an obligation to be quite clear about what it is that is happening and should therefore be carried further. It is here that Mr Carr fails. A "process of historical evolution" has made state intervention and state planning "imperative." In establishing this proposition Mr Carr says cautiously that what is "inevitable" is "some kind" of planning authority, "whatever its name and purposes." But the caution is soon forgotten. It is the purpose of planning that matters, and, Mr Carr declares, "You cannot in these days plan for inequality." Thus socialism is what in ordinary language would be called "both desirable and inevitable," though for Mr Carr one adjective is redundant.

This argument evades all the stuff of contemporary politics by the simple device of leaving concepts like planning and inequality undefined. When Mr Carr talks of "planning" as an "imperative" he is presumably talking about the sort of thing that British governments do. But when he declares the impossibility of "planning for inequality" he is plausible only because he is now talking about an entirely different degree of economic regimentation; he now means not state intervention but a state control that sets all the operations of the market aside. The practical part of Mr Carr's doctrine is rooted in such flimsy confusions. He is not just describing the historical processes occurring round him; more often, he is describing what he wants to happen. One must admire the puritan-like determination with which he convinces himself that the two are one, by seeing only what he wants to see. If capitalism is dead, then the apparent vigour of American capitalism must be artificial; and so the difference between the United States and Europe is, for Mr Carr, that in America government intervention in the economy is less efficient and less frankly admitted.

In the last of these lectures Mr Carr laments that even the Left in Britain will be found "to have died with 'Safety first' graven on their hearts." Or is the point that the practical politicians of the Left have been compelled to notice what has happened in the last six years of history? There is much that Mr Carr has not noticed.

Working Class Documents

British Working Class Movements. Select Documents, 1789-1875. By G. D. H. Cole and A. W. Filson. *Macmillan.* 629 pages. 45s.

The title of this massive compilation does not do full justice to its scope. In addition to documents on the Labour movement in the hundred years that began with the Industrial Revolution and ended with the labour legislation of 1875-76, Professor Cole and Mr Filson have included a great deal of material on the Radical movement between 1789 and 1832, much of it only indirectly connected with the working classes; they have also found room for extracts from some of the legislative measures which affected labour and were, in part, the result of working class pressure, such as the various Factory and Reform Acts of the period. The authors have in fact aimed at presenting a comprehensive selection of documents to serve as a companion to Mr Cole's and Mr Postgate's "The Common People" and the former's "Short History of the British Working Class Movement."

These documents have been arranged so as to tell the story of the Labour movement in its own words. They illustrate the multitude of ways in which hopes and grievances were made articulate and the variety of means by which the unprivileged sought to make effective their efforts to escape from the political, social and economic limitations imposed upon them. They show the emergence of the working classes from a position of helpless subordination at the end of the eighteenth century to one of growing power and organisation at the end of the Golden Age of Victorian expansion. They help us to understand the significant change of mood and tactics that followed the final collapse of Chartism, a change which caused the Labour movement, after 1848, to substitute a policy of reform within the existing order for the earlier attempts to bring about its downfall by co-operative gradualism or revolutionary action. The imaginative scholarship with which the authors have brought together these extracts from trade union documents, co-operative reports, Chartist manifestoes, socialist tracts, books, pamphlets and other sources provides an illuminating commentary on a vital part of British history.

It was perhaps inevitable that a book of this kind should not be free of shortcomings. Some of the introductions to the documents are not wholly satisfactory. Neither Julian Harney nor Ernest Jones has been given the place that their thought and work deserve. That no passage from Bray's remarkable "Labour's Wrongs and Labour's Remedy" should have been included is regrettable; not even to have mentioned his name is unpardonable. More generally, the important internationalist trend of thought of the early Chartists is very inadequately represented.

These weaknesses do not, however, seriously detract from the real value of a book which should prove of great help to all students of the Labour movement. The promised second volume bringing the record up to date will be awaited with an eagerness tempered by fear that its price will be even more prohibitive than that of this one.

Phantom Tales

Phantom was There. By R. J. T. Hills. *Arnold.* 344 pages. 21s.

Diagrammatic representation of the communications services of modern armies almost resembles in complexity attempts by physiologists to map the activities of the cerebral cortex. In its perfected form in the campaign in north-west Europe, Phantom provided a uniquely swift, strong and sensitive battle intelligence link with formation headquarters in the field, and the ubiquitous black beret and "P" armflash became a respected passport to all command vehicles and "Ops" tents in the theatre. Colonel Hills, a Phantom squadron commander with personal experience of the Arnhem campaign, has written an enthusiastic but balanced history of Phantom from its curious origins under Major-General Hopkinson to its eventual triumphs in Germany and Italy.

Despite the author's avowed attempt to render his necessarily technical material comprehensible to non-military readers, it is doubtful whether he has succeeded. On the other hand, the book has some extremely attractive features for the fireside recreator of battles long ago. We have recently had a plethora of reminiscences from high-ranking commanders. For lesser men it is a pleasure merely to see in print many familiar names of small-scale battles and less exalted heroes. There are some brilliant descriptions of the rigours and disappointments of the long and frustrating training period during the years of build-up; the British private soldier receives the attention which the strategic historian can never find space to accord him; and the high spirits which accompany the "private army" conception make much of the book attractively light-hearted. No studiously professional army like that of Germany is ultimately likely to outwit the spirit which informed the most famous of Phantom situation reports: "Reliable report tanks crossing bridge at Avignon. Local population dancing at Western end."

It is a notorious weakness of the human memory to expunge the unhappy and to retain the fortunate. Colonel Hills strikes a fair balance between triumph and disaster in Africa. But once launched on the full tide of "Overlord" his narrative tends to slur over operations like "Goodwood" and "Aintree" which in the event rather belied the sporting associations of their code-names. His chapter on the Ardennes counter-offensive is good military writing, which carries real conviction—all the more since his consistently generous appraisal of the Americans throughout his book absolves him from any charge of bias. Phantom's many friends will be glad to learn that the unit has survived the war and now forms part of the Territorial Army.

Scandinavian Encyclopædia

The Scandinavian States and Finland: A Political and Economic Survey. *Royal Institute of International Affairs.* 312 pages. 21s.

This will be a useful reference book, although the publishers are wrong in claiming that it "provides, for the first time in English, a broad factual survey of the countries in Northern Europe," and it does not reach the very high standard which they have set in similar works in the past. Although on a bigger scale and in more elaborate form, it compares obviously and unfavourably with the Chatham House handbooks on "The Baltic States" and on "South-Eastern Europe." Where are the good maps which graced those earlier volumes? Where is the careful editor? Perhaps the present compilation did not have an editor—one never knows with these group reports—but someone should have taken care to iron out the repetitions and contradictions, to fill in the omissions (in "a broad, factual survey" one would like to be told, for example, what casualties the Finns suffered during their last two wars) and to take care of the present tense (it is annoying to be informed about "the latest elections" and "the present time" if one has no means of knowing that the elections are those of 1948 and the time is before the elections of July, 1951).

The book reads like a set of encyclopædia articles, the sections under each of the six nation-headings being itemised as Land and People, Social Structure, Foreign Relations, Industry, and the like. The sections are inevitably uneven. That on Denmark sounds perfunctory and second-hand; no one could gather from it what, for instance, has happened to the Folk High Schools in recent years or what the Danish people really went through under German occupation. The section on Finland, on the other hand, is vivid and fresh, particularly in the pages headed Parties and Policies. The section on Iceland is flat as a flounder and dull as cod, while much of that on Norway gleams like mackerel. The section on Sweden, though apparently written by the same hand as that on Iceland, is thorough and lively and will probably be the most useful in the book.

Letters to the Editor

Programme for Security

Sir,—The comments in your issue of December 22nd, on Nato's future organisation for economic purposes, and your choice of efficiency in "the old problem of efficiency *versus* democracy," must have shocked other people than me.

Even if efficiency is to be paramount, I wonder why, in the case of the report of the "three wise men," public opinion in all Nato countries should readily accept, as the most equitable and best technical advice, recommendations made in two-thirds part by Sir Edwin Plowden and M. Jean Monnet, the two chief planners of countries whose economic situation is in such a plight that further injections of 300 and 600 million dollars are necessary to keep them afloat.

It is indeed admirable that the "three wise men" have found that the defence effort of their three countries is economically and politically what is expected of them (except for a mere 5 per cent for France), but that all the others fall short and should increase their effort.

I think the question should be put bluntly why, if Nato is a real community, the three great powers should always claim representation in every committee of substance; in Ottawa, a suggestion by the Belgian Minister of Finance that the committee of the three wise men should be composed of nationals of the United States as the only "giver-country" and the two smaller partners was met as a derisive absurdity by Britain and France. Among the committees of Nato where the 12 are not all represented, only the Atlantic Community Committee (Canada, Belgium, Italy, Netherlands, Norway) has been found sufficiently harmless not to work under the great powers' supervision. More and more, it seems to be taken for granted that the junior partners of the alliance have just to follow suit; it is an open secret that, at the Ottawa council, the northern countries of Nato were pushed into accepting the extension of the Atlantic Treaty to Greece and Turkey; the three great powers were already committed in this area and, in fact, were losing nothing.

The weakness of Nato is a lack of confidence on all sides and the report of the "three wise men" has only made it worse.—Yours faithfully,

JEAN MET-DEN ANCKX

Manpower Control

Sir,—The answer to Mr Vaizey is that in my letter, which he criticises in your issue of December 22nd, I was not addressing my mind to the questions whether actors would make good or bad aircraft workers but whether actors playing to half-empty houses, and forced to "rest" for long periods between parts, as a result of deflation, would not constitute a wasteful use of the nation's resources. Incidentally, I was—as you were in your own original note—discussing control of engagements, which is a purely negative form of control, and not positive "direction," still less "industrial conscription."—Yours faithfully,

R. F. KAHN

King's College, Cambridge

Mobs without Masters

Sir,—I studied the article in your issue of December 15th. May I be permitted to state that, as far as my country is concerned, you have allowed yourself to make some unjustified remarks which do not appear to come within the scope of free and impartial criticism. I even feel compelled to ask myself whether it does not imply some sort of interference in the internal affairs of Iran.

In my country's case what you call "a Frankenstein monster" is not nationalism but rather the Anglo-Iranian Oil Company's attitude towards the Iranian people as demonstrated, for example, by the company's last balance sheet. It is such demoralising interests that have created a nemesis in the form of the national movement, and have been responsible for gradually bringing the latent social discontent to the present climax.

The second method which you prescribe is "seizing more of the controls." This was experienced after the first World War as the result of the 1919 agreement, which aroused the anger and hatred of the whole Iranian nation and consequently had to be cancelled. Iranians would resist such controls to the bitter end.

Your third antidote is "that adopted by the British Government in Persia—to remove the irritant and to leave social discontent to work the change." In practice this would mean more foreign interference and I hope this will never come about. In case, however, this "antidote" of yours is adopted, all of us, without exception, will find ourselves in the same boat.

As regards your further choice—"to begin kingmaking—to select, groom and discreetly help into power a local dictator"—it is extremely difficult to reconcile this surprising suggestion with the principles professed by various British Governments, with the concepts of the Atlantic Charter, and with the existence of the United Nations, the foundations of which were laid by Britain and to which the people of Britain have wholeheartedly subscribed. If direct and indirect interference in the affairs of Iran is envisaged, then let us stop beating about the bush, scrap all this talk of international justice, and morality, and revert to the law of the jungle. Incidentally, I can assure you that the gravamen of the Iranian charge in the oil dispute is this very interference which you advocate. No better way to forfeit Iranian friendship could be suggested.—Yours faithfully,

M. MALAYERY,
First Secretary in Charge of Press Affairs

Iranian Embassy

The Economist Abroad

Sir,—Three days ago I was travelling by bus in eastern Khorasan between Meshed and Herat. At one of those stops when fares are decided upon by mutual and lengthy discussion and police have to be given their pound of flesh I was reading the November 10th copy of *The Economist*.

Suddenly, with a graciousness which must be experienced to be believed, the paper was removed from my hands and a group consisting of one Iranian postman, one Afghan, and one Uzbeg began to study it.

As a result of their keen interest a question has come to my mind: is the moment ripe for *The Economist* to publish a Uzbegi edition?—Yours faithfully,

C. MURRAY ROGERS

Herat, Western Afghanistan

The Value of Scholarships

Sir,—The article in your issue of December 22nd was interesting and timely. I should be glad if I might contribute this addendum.

The present assessment of the cost of university education was made by the Ministry of Education after consultation with the universities alone. It includes an allowance for maintenance in the vacations. There are many who consider that at least a portion of the vacations could be devoted by an undergraduate to earning enough to maintain himself while absent from the university. Some local education authorities which adopt this policy have consulted their scholars and have received little or no evidence that their grants are inadequate.

The last Minister agreed to take the local education authorities into consultation, and an inquiry has been addressed to the universities asking them to specify in certain detail what they regard as the present needs of an undergraduate. The replies may disclose considerable variation between not only colleges at Oxford and Cambridge but also between the other universities. It may be that some colleges and universities should then be asked whether in the present difficulties they should not attempt economies in university life.

A choice may have to be made between economies that will reduce the total amount of grant distributed among the present number of students and reducing the number of students receiving grants. Would it be either wise or equitable to choose the latter?

Before the war a "scholarship," whether granted by university, state or local education authority, implied that the recipient was expected to get a first class or a good second class degree. Although it is believed that many of the universities have found that the present distribution of grants has produced more firsts and good seconds than before the war, many freshmen since the war have entered the university without prospects of such high degrees. As the university and state scholarships skim the cream, these come mainly with grants from local education authorities and there will be fewer of them if the local grants are reduced in number.

I suggest that two questions have to be decided:—

1. *Ought people who are not likely to get high degrees to go to the university?*

There are at least three arguments in favour. First, neither a university full of "clever fellows" nor a university where the "clever fellows" come with grants and the less clever ones come wholly supported by their parents is nowadays at all a perfect place. Secondly, the "clever fellows" do not always stay the course even at the university, much less so in after-life. Thirdly, our professions need many people of good character and moderate university degrees.

2. *Can the universities' selection of their students be improved?*

I believe that many universities have to accept a 10 per cent wastage rate and that the failures come as much from the middle as from the border-line group of freshmen. If a local education authority finds that the rate of failure among its scholars is not greater than that of the universities, a reduction in the number of its scholars would probably have the result of excluding from a university people who would benefit and give the community good service afterwards.

I am inclined to think that future policy should be based upon a compromise, namely, that the needs of certain Oxford and Cambridge colleges—not all the small colleges are so expensive—should not be too greatly stressed; but that there could be a small saving, probably not more than 5 per cent, based upon economies by the universities and upon improved selection of students. In the latter process it should be remembered that it is the university which decides whether to admit and the local education authority whether to make a grant.—Yours faithfully,

C.E.O.

★

Sir,—In the article in your issue of December 22nd you state that "All county education authorities pay full fees to winners of their major scholarships." This is not quite exact. I can quote two examples of the award of an "honorary" major scholarship, i.e. without emolument.—Yours faithfully,

E. M. HUGH-JONES

Keble College, Oxford

To School at Six

Sir,—In the article in your issue of November 24th you say that in Ontario "children do not begin school until the age of eight." You cite as your authority "a recent study published by Unesco." If this is a sample of Unesco's accuracy, its reports leave a good deal to be desired. The age at which children must begin school in Ontario is, and has been for some time, six. I have two children myself, aged six and nine, and both of them were obliged by law to start their regular schooling at the age of six. In this city, kindergarten classes are available at the age of four, and kindergarten primary at the age of five; but these are not compulsory. Grade I is compulsory at the age of six.—Yours truly,

Ottawa EUGENE FORSEY

[The sentence in Unesco's report is as follows:—"In Ontario, although the majority of children enter school at six, they are not obliged to do so before the age of eight." The section on Canada in this report is said to be based on the reply sent by the Canadian Education Association.—EDITOR.]

Drawn by A. R. THOMSON, R.A.

Such stuff as paper is made of

It is the right "stuff", in humans and in material, that determines the quality of paper. Take Frank Johnson*, the beaterman, for example. Superintending the beater floor (where the giant breakers churn wood-pulp, and other necessary materials into a watery mixture technically known as the "stuff"), Johnson it is who interprets the laboratory reports and decides on the blend of pulps which will give him the right "stuff" for a particular quality of paper. It is his skill and experience that must then gauge precisely the degree and duration of the preparation treatment on which depends the uniformity of the fibrous mixture delivered to the paper-machines.

Johnson came to Bowaters Thames Mill twenty-four years ago, as a young man. Apart from war service ("finished as a sergeant in the gunners") he's been there ever since. When you watch him as he keenly scrutinises the mixture and runs it through his fingers before giving the signal for it to go on its way to the paper-making machines, there's no need to ask how he got his present job or whether he likes it. Both he and the mixture are the "stuff" good quality paper is made of . . . whether it be for the many hundreds of newspapers, books and magazines that are printed on Bowaters paper in all parts of the world, or for the packaging of almost everything from soap to cement.

The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper—the 'know-how' in short—is free to your service.

LEAD LASTS

LEAD SHEET AND PIPE CAN BE DELIVERED IMMEDIATELY FOR ALL BUILDING WORK

The Technical Information Bureau of the Lead Industries Development Council exists to give assistance on problems relating to the use of lead sheet and pipe in building work. Details of its application are given in a series of information sheets. These sheets are available to architects, surveyors, builders, plumbers and other technicians interested upon application to the Council. "Students" applications should be endorsed by an instructor or master of a technical school.

AMERICAN SURVEY

What Next in Korea?

Washington, D.C.

DECEMBER 27th has come and gone and nothing has been settled, nothing changed. The temporary truce in Korea continues, with the obvious implication that the battle-line of November 27th will still be an acceptable basis for an armistice if ever an armistice becomes possible. It could hardly be otherwise from the point of view of the United Nations Command, which fought and argued for weeks to get the line accepted and which, since no action to alter it materially has been undertaken, is presumably now fully satisfied. But there does not seem to be any very clear notion in Washington how long the negotiations will go on, or how long they should be allowed to go on, if they continue to make as little progress as they have so far.

What to do next, and the related problem of what to do after that, must be the most important item on the agenda for the Truman-Churchill talks. Perhaps it is as well that December 27th passed without any change in the pace or the method of the negotiations. Urgent and immediate decisions will not be needed ; had they been, they might have occasioned urgent and immediate disagreements. As the fateful day approached, the mood of the United States became almost truculent and support grew for the policy of coupling agreement to an armistice on the present line with formal threats of what would be done to the Chinese mainland if the armistice line were crossed.

Through all the discussion there has run a thread of irritation with the United Nations, and particularly with those members who have forces in Korea. In some unexplained way, it is felt, they are impeding the United States from achieving a clear-cut decision. This irritation takes no account of the fact that, again and again, during the Congressional hearings on the dismissal of General MacArthur, the Secretary of State and the Joint Chiefs of Staff gave warnings that this was not a situation in which a clear-cut decision was possible and that the only proposal for achieving one—that offered by General MacArthur—had been weighed and found too risky. A people which is irritated and beginning to feel truculent, however, is also one which is beginning to feel like taking risks.

Some ten days before the December 27th deadline, and when nobody knew what it would bring, Mr Ludwell Denny, the tame thinker of the Scripps-Howard newspaper chain, wrote that

> whether an armistice is unexpectedly achieved or all-out fighting is resumed, there will have to be a United Nations policy agreement. No such agreement is in sight. If there is a military truce, the Allies are split over negotiations for the political settlement to follow. If there is no truce, the Allies are split on the kind of war to wage. . . . Whichever way it goes, the only hope of a United Nations agreement on peace terms or on war strategy is that Prime Minister Winston Churchill will shift British policy over toward the American position. That might swing a UN majority. Otherwise the United States will be virtually isolated.

That was a disarmingly affable statement of the imperialist philosophy—everybody had better get into step with Sam—but it was also an accurate reflection of the Washington mood. And the mood is not hard to understand. Although the Allied forces may not be quite as "token" as some Senators make out, the United States is carrying most of the burden and suffering most of the casualties.

Now that 1952 is here it is important, from the point of view of domestic politics, not only to put an end to the casualties—the truce has largely done that—but also to start bringing the boys back home victorious before long. Otherwise the Republicans will have a splendid case against a Democratic party which knows how to get the country into war but does not know how to get it out again. The policy of patience, which has been followed up to now, except when General MacArthur was allowed to make his excursion up to the Yalu River, has produced profits but they have, unfortunately, had to be put to reserve instead of being distributed as dividends. The dividend of victory is something the public can understand and spend, the reserve is less tangible ; it is the weakening of the Chinese forces, the discouragement or at least, if present fears are realised, the postponement of excursions into Burma or south-east Asia, the demonstration that aggression will be met with force and the proof that containment is a real policy.

★

In an election year something tangible is wanted, as it probably always is in the United States. General MacArthur knew quite well which gong he was striking when he said that there was no substitute for victory. He was striking the emotional gong and not the reasoning one. The Republicans, under his urging, are trying to persuade the public that nothing short of the unification of Korea will be a victory, because that is the expressed objective of the United Nations. The Administration has not yet capitulated to this theory, but it is unable to accept any suggestion that enough has been done to demonstrate that acts of aggression cannot be committed with impunity, and that the United Nations troops should be removed from Korea and events left to take their course, even if that course is the immediate over-running of South Korea. Such a suggestion would be regarded as a betrayal of the American dead and wounded and it would have the dangerous after-effect of turning popular opinion away from the United Nations and the whole concept of mutual security.

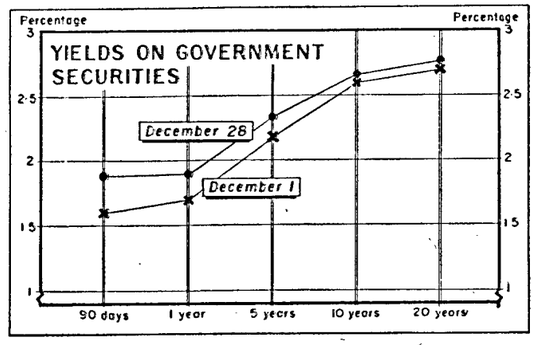
The Administration is, therefore, left to follow a middle road, of the kind it has followed up to date, but one which shows no sign of getting anywhere before the darkness of next November's election falls, and every sign of petering out into the wilderness. The continuation of the negotiations after December 27th has allowed the Administration to follow this road a little longer, but there are plenty of voices advising it to plunge into the MacArthur country and take

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect ; all others are the work of the editorial staff in London.

the risks of naval blockade and air bombardment. If it ever wanted to do that, however, the forthright adoption of such a policy was made almost impossible by the statements of the various government spokesmen before the Senate inquiry when General MacArthur came home.

What the Administration must get for domestic reasons is some form of armistice agreement which will allow the bulk of the American, and Allied, forces in Korea to leave, although it is contemplated that some small force will have to stay. That is, presumably, also the desire of the other members of the United Nations which have contributed to the Command. It is also, presumably, exactly what the Communists want to prevent, and are successfully preventing by prolonging the negotiations and by appearing to be prepared to prolong them indefinitely. As long as the talks go on a large United Nations army, for which there are plenty of uses in other parts of the world, is tied down. The stalemate does not, however, have such evil effects on the Chinese. The Korean war has cost them dearly in trained troops, but the truce gives them time to train more and their supply of manpower is so vast that they can afford to have the forces at present in Korea immobilised permanently.

It is these considerations that make the idea of threatening to carry the war to China if the armistice line is crossed so attractive. This threat would make it unnecessary to continue protracted negotiations or to evaluate any guarantees that may be given in the course of negotiations. It would make it unnecessary to keep more than a thin screen of troops other than South Koreans in Korea, and it provides a nicely defined *casus belli* for the future—the crossing of a line which both sides now understand thoroughly—and a description of the consequences of crossing the line. It would not commit American troops to the mainland of Asia but would merely give warning of naval and air raids. But the threat has some grave disadvantages. The United States might announce the ground rules for its threatened action, but the Chinese might not agree. In that case American troops would have to be committed to the Asiatic mainland ; and since so many people in Washington have pointed out the strategic dangers of extending the war, the Chinese might be glad to have a chance of forcing the United States to extend it. It is therefore to be hoped that the British visitors are bringing a better alternative.



Bankers' Overdraft

[FROM A CORRESPONDENT IN NEW YORK]

A LARGE and unexpected increase in business borrowings from the banks during December helped to raise interest rates on Treasury bills and bank loans to levels unknown during seventeen years of easy money. It seems that many companies which had previously been able to finance their conversion and expansion programmes or their normal seasonal needs out of their own resources suddenly found themselves forced to go to the banks for funds. The weekly reporting member banks of the Federal Reserve System, which account for almost three-quarters of all bank loans to business, increased their business credits by almost $600 million during the first three weeks of December. In the previous nine weeks they had extended only $700 million of new credit to business. There was another indication of small corporate holdings of cash in the difficulty the banks experienced in selling Treasury tax anticipation bills (equivalent to the British tax reserve certificates).

The first signs of the tight position of the banks, generally unheeded at the time, were apparent in the bank statements of November 28th. On that day member banks were borrowing $483 million from the Federal Reserve, and their excess reserves (the balances at the Federal Reserve Banks above the cash required to be on deposit there) amounted to only $439 million. In effect, the banks as a group were $44 million short of being able to meet the legal reserve requirements. Bankers generally consider that excess reserves should not fall below $700 or $800 million. In succeeding weeks, the banks were $197 million short, $32 million over, $667 million over and $166 million short. The banks then tried to find new reserve funds by selling government securities in a market in which banks were under pressure to maintain their reserves and in which corporations were not able to buy. Dealers were also reluctant to add to their holdings of Treasury issues because, even when credit was available, it was at rates substantially above those yielded by the securities the dealers were carrying.

In these circumstances, it was not surprising that interest rates should rise. On the first of the month 90-day Treasury

bills were yielding about 1⅝ per cent ; by Christmas Eve it was difficult to find buyers at yields closely approaching 2 per cent. Until almost the end of this period the Federal Reserve Open Market Committee abstained from dealings in the market. Through the week ended December 19th it had neither increased nor diminished its holdings of government securities by even $1,000,000. For the week ended December 26th, however, it showed an increase of $264 million, apparently as a result of efforts to prevent panicky selling and to provide the banks with reserves.

An outsider may well be pardoned for asking why banks insisted on selling at a loss Treasury bills yielding more than 1.9 per cent when they could easily borrow from the central bank at 1.75 per cent. The answer seems to lie in tradition, which must be stronger in banking than in any other American business. Bankers are taught from the cradle that there is something almost shameful in being in debt to the central bank, and they find it unthinkable to show any indebtedness in their year-end statements.

The price decline in the short-term market also affected the long-term market, for when banks found it difficult to dispose of Treasury bills they tried to find buyers for short notes and bonds and then for intermediate maturities. They had as little success here, however, as they had had with the bills. Moreover, the rising trend of yields on both short-term and long-term government securities, and the obviously tight reserve positions of most banks, led one large New York City bank to raise its minimum rate on short-term loans to business from 2¾ to 3 per cent. Other large banks in New York City, Chicago and other financial centres promptly followed suit. This development made yields on

government securities suffer by comparison and there was a tendency to value these issues even lower. It was apparently shortly after this move, when the inter-effect of tight money and rising interest rates seemed to be developing into a close cousin of the wage and price spiral, feeding on itself, that the central bank stepped in.

★

One blow to the banks' reserves was the requirement that a higher proportion than usual of corporation tax receipts should be paid over to the Treasury account with the Federal Reserve. This will be only temporary, since the Treasury will soon be spending the money. Furthermore, the banks will probably regain the funds they lost when money in circulation climbed to an all-time peak at Christmas, for this currency will almost certainly flow back into the banks in January after the holiday shopping demand has been satisfied. There also seems little reason to believe the movement of gold to the United States will be halted in the near future, and the banks will gain reserves from foreign spending. Even so, there can be little doubt that bankers had an expensive and effective lesson in the need for caution in their lending and investing operations. Long accustomed to having the central bank ready to furnish them with reserves at little or no cost, in exchange for some of their Treasury issues, they have probably not been sufficiently concerned with the risks of overinvesting or overcommitting their funds to borrowers.

It is too early to be sure that interest rates will not move back toward the levels that prevailed a month ago. Much will, of course, depend on the demand for additional bank credit from business. Some seasonal downturn during the first half of the year, especially during the second quarter, is normal ; how much this usual trend will be offset by business needs arising out of the defence programme is impossible to determine.

The clear evidence of low holdings of cash by corporations suggests that some of them have been using money put aside for taxes in their operations and may therefore have to borrow from the banks in order to meet tax payments on March and June 15th. These will be unusually heavy, and if bank loans continue to rise, and if the banks must pay what they will consider an expensive price for the reserves that they need in order to make the loans, there seems a good chance that rates will remain at about present levels. On the other hand, although banks pushed up their rates on bankers' bills, commercial paper, and loans to brokers and dealers shortly after the "prime" rate was increased, there are signs that these rates are not quite as secure at the higher points.

The more important question of whether the market is in the process of setting higher rates which the Treasury will have to pay the next time it must borrow is also difficult to answer as yet. The first major piece of financing will be the refunding of almost $10 billion of certificates maturing on April 1st. It is likely that the Treasury will not have to look for "new" money until mid-year ; the large tax payments due in March and June will see to that. Indeed, it now appears that the Treasury, despite a cash deficit of about $5 billion in the first six months of the fiscal year, will have a cash surplus of $1 billion or more on June 30th. Under these conditions and if the pressure just exerted proves to have been enough, the cost of the Treasury's next issue need not be much above the 1⅞ per cent of the certificates maturing on April 1st.

American Notes

Sitting on the Budget

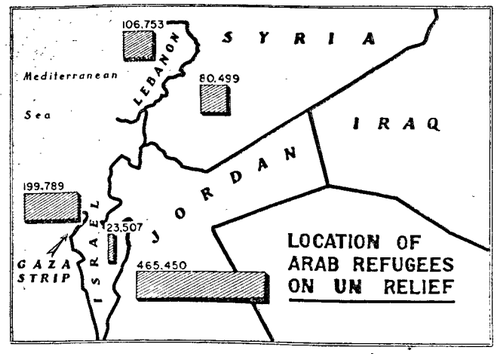
Congress may have to wait until late in January for its first look at the President's budget, which normally follows close on the State of the Union message at the beginning of the session. The White House is believed to be sitting on it, waiting for the services to abandon their hopes of $60 billion in the year beginning next July, and to agree on a division among themselves of the $45 to $50 billion, which is all the President is said to think they should have. In insisting on a cut from last year's request of $57 billion, Mr Truman is supported by Mr Lovett, the Secretary of Defence, who appreciates that any really large economies can be achieved only at the expense of his own department. If, however, the Air Force is to have the largest share of the cake for its expansion programme, there will be comparatively lean pickings for the Army and Navy. This may be what is causing the delay.

A reduction even of $12 billion in new money for the services, who are well supplied with funds from earlier appropriations, would not affect military spending in 1952-53 ; this will continue to rise. But even though this year's economies may be a long time bearing fruit, they will be welcome to Democratic election candidates anxious to show that the long-promised tapering off in military spending is at last in sight. Whether businessmen, nervous of a recession, will be so enthusiastic is another matter.

The budget is expected to call for the Federal government to spend more than $80 billion in the next financial year, that is, more than has ever been spent except in the two peak war years. With revenues put at $70 billion, a deficit of over $10 billion seems probable, though the continual revision of the expected book-keeping deficit this year—now put at $6 billion—shows how risky such calculations are.

Faced with so large a deficit, and forced to admit that Congress is unlikely to fill it with taxes in an election year, the Administration apparently has decided that foreign aid must come to the rescue. The President is not expected to ask for much more than $7 billion for foreign programmes and only $1.4 billion of it for economic aid ; this is about what Congress eventually granted last year, and more than $1 billion under the President's original request. Congressmen who visited Europe this summer no doubt will applaud—and perhaps cut and come again. Travel does not always broaden the sympathies, and though most Congressmen did not make the sensational discoveries of Senator Ellender—who has returned full of scandals and waste in the administration of foreign aid and has most unkindly asked the Austrian Chancellor to substantiate his charges—many came back with the conviction that Europe was failing dismally to come up to scratch.

★ ★ ★



Held Up to Ransom

Hungary is the first nation, since the days of the Barbary pirates, successfully to hold the United States up to ransom, and Americans do not care for the sensation. Most of them, however, could not endure the thought of the four American airmen languishing in a Hungarian jail after their conviction on charges of violating the frontier, and the government's decision to pay the "fines" is generally approved, though it is hoped the story will not end there. Indeed, many individuals and private groups—among them Americans of Hungarian descent themselves—stood ready to pay the ransom of $120,000, but under the law this probably would not have been permitted. Mr Robert Vogeler, who less than a year ago was still in a Hungarian prison himself, and issued an appeal for the four, received over $200,000 in voluntary donations.

THE WORLD OVERSEAS

The Arab Refugees; 1952

THE deadliest aspect of a refugee problem is the gradual decrease of its impact upon human sympathy. Next week, the United Nations Assembly will, for the fourth year in succession, debate the problem of succour for the Arab refugees. These still number 875,000 without counting some 127,000 further indigent souls living on the Israel frontier who do not qualify for UN relief because, though a frontier now separates them from the lands and markets that were their livelihood, they have still got their houses. Over three quarters of a million people, therefore, still moulder in distressing, depressing camps, provided with enough food to live on and enough medical care to keep them healthy, but without sufficient clothing, with no privacy, with schooling for under half of their teeming children they live in idleness, dependence, insecurity and a sour conviction of injustice done to them by the nations and United Nations that made the Palestine settlement. The total number of refugees, who are today distributed as shown in the accompanying map, is approximately static because the proportion of people that either die or else find jobs and quit the breadline is more than offset by a combination of 30,000 new births per

year and of fresh mouths to feed as the better-to-do families exhaust assets that they contrived to bring out of Palestine.

Each year, the Assembly has voted one year's succour; last year, this was to consist of contributions amounting to $20 million for a relief fund and $30 million for a reintegration fund. But each year, its servants have contrived little permanent settlement of families, partly because, owing to rising world prices, the money they handle will not buy the relief it was meant to buy, and partly because contributions to the funds have not come up to expectations. It is clear that, unless the Assembly drastically departs from a policy of help given in small doses, it must leave the Middle East with a perennial sore.

Happily this year there are some signs of new ideas that will, if adopted, enable the Assembly to throw over an annual policy that threatens to become a habit. The United Nations Relief and Works Agency (UNRWA)—the body which, from a headquarters at Beirut, has since 1950 made do with such funds as are available—has under the influence of a new and robust American director, put up a programme for a $250 million assistance plan to be spread over three years—the sums to be expended in the first year to be $18 million on relief and $100 million on reintegration respectively. It has rightly judged that a lump sum and a longer programme-period can be far more effective in producing settlement schemes than could the same amount of money dribbled forth in three annual instalments. One considerable contribution towards the programme is already in the till thanks to the inclusion in the American Mutual Security Programme for 1951-52, approved by the President on October 10th, of the sum of $50 million specially earmarked for the Arab refugees. How many other nations will follow this example? A contribution of corresponding proportion from the British Government (which would be about £6 million and which could reasonably include the £1,500,000 loan to Jordan now before Parliament) would be a small price to pay for a great gain in Middle East tranquillity.

But money alone is useless. There are two parallel requirements without which resettlement plans are of no avail. One is co-operation from certain Middle Eastern governments in promoting settlement schemes. The other is a move by Israel in the matter of unfreezing Arab assets and paying compensation for Arab properties of which Israelis are now freely making use. A step taken in this second matter would produce the double advantage of proving the genuineness of Israel's assertions that it wishes for better relations with its neighbours, and of showing the refugees that there is now no hope of fulfilling the Assembly resolution of 1949 which proclaimed their right to return home—a misguided declaration on which far too many have pinned their faith.

Hitherto the attitude of the Arab governments has constituted a curious mixture of compassion and political calculation. Confront an Arab with a case deserving of charity and he is far more generous than his counterpart in Europe. Individual Arabs and even the Arab governments have performed prodigies of charity for the individual refugees that sought their aid. But transfer the plight of the refugee from the concrete realm of bread and shelter into the abstract one of politics and an Arab cabinet tends to be swept away by emotional conceptions of national justice. In discussing attitudes to Israel, one Arab statesman remarked of the refugees, in the hearing of your correspondent, that it would be better that they should die than that his government should abandon its claim that they must go home. Yet, there have for the past year been signs that Arab co-operation in resettlement—which was at first sidestepped by most of the states out of political emotion, will now be forthcoming.

Nevertheless problems still abound. It is difficult to settle newcomers in conditions that—if they conform to UN standards—will be better than those of many of the local inhabitants. All the refugees in the Gaza strip, and a large part of those in Lebanon and Jordan must find their opportunities in countries of greater economic possibilities. Egypt can offer nothing in the overcrowded Nile Valley, but is helping to plan for the settlement of 50,000 people in Sinai. Iraq and Syria are the countries which possess the room; the former will need manpower once its new oil wealth puts into effect the huge development plans it now envisages, and Syria's growing industry will also—if the Syrians are provident—within measurable time require additional skilled labour of a kind that a good many ex-Palestinians could supply. Yet, at present, few refugees want to go so far from their native hills and sea as Iraq seems to them to be, and the attitude of Syria to foreign aid for resettlement schemes has hitherto been unpromising.

Only the Assembly can administer the jolt to all parties that is needed in order to bring about a real change in a situation that is disastrous both for the Arab world and the west. And only if it is generous in the matter of money will the jolt be effective. Should it be so, the Arab states would be well advised to move fast in making known the efforts they are prepared to make, for they would do well to bear in mind one unavoidable feature of 1952. It is the year of an American presidential election. Congress, therefore, will be doing its level best to finish all business by June. The United States is far and away the biggest contributor to Arab refugee resettlement projects. Yet if by June few or no results are forthcoming from its last year's vote, what inducements will Congressmen see to repeat their generosity? On the score of financial expediency as well as of compassion, the Arab governments need to be more resolute in doing their share towards cutting out the core of unrest which the refugees have come to constitute in their midst.

Belgium uses the Brake

[BY A CORRESPONDENT]

IN the counsels of the European army, Belgium has assumed the role of the reluctant widow. Its critics suggest that there is no such thing as a Belgian European policy. All is confusion and, apparently, obstruction. Yet the Foreign Minister, M. van Zeeland, stands at the centre of Belgian opinion. Because he is in a position of political responsibility, he has felt obliged to reject a completely negative attitude towards the French policy of trying to integrate Germany into a European community. He is honestly searching for a compromise between the extremes of Belgian nationalism and French internationalism. And he is, for different and sometimes extraneous reasons, not unrepresentative of the bulk of Belgian opinion on the left and right.

But this is only a broad generalisation. On one side of him stands the majority of the Socialist party, which flatly declared at a recent congress that German military integration, in a European army or otherwise, was premature. Simultaneously the same party, for reasons of internal politics, was far more enthusiastic for the coal-steel pool than were the parties of the right. On the other side of the Foreign Minister, cutting across all divisions of party, stand the prophets of a European paradise through complete federation—M. Spaak, the Socialist leader and ex-president of the European Assembly; M. Roger Motz, chairman of the liberal party; M. Fernand Dehousse, one of the few outstanding international politicians in the Belgian Parliament. Each, in his own style, has deplored the approach of the Foreign Minister to European problems.

The conflict and confusion are such that no one is surprised at the sight of a leading Socialist MP and one of the promoters of the new International, M. Larock, condemning as "excessive" the measures which M. Spaak at Strasbourg was dismissing as mere "weaklings." At the same time, the liberal, M. Motz, was heatedly giving his full support of M. Spaak, and denouncing M. van Zeeland's speech to the Strasbourg Assembly as a sign of a return to a policy of independence. The kindest student of Belgian politics must conclude that there is, in Belgium today, no common thinking about "Europe."

What is behind these negative positions? In M. Spaak's case, his distress culminated in his resignation from the presidency of the European Assembly. In his resignation, frustrated idealism undoubtedly played its part. He may also have felt that a spectacular move, when American eyes were focused on Strasbourg, would yield tactical advantages for himself, restoring his prestige with the United States, with Europe, and with his own countrymen. But the major factor was certainly his conviction that a new impulse must be given to the Assembly, if Europe was to forestall a threatened *volte-face* in American policy in Europe.

It is in their fear of the power of a rearmed Germany that MM. Spaak and van Zeeland are on common ground, though their solutions have nothing in common. Strange as it may sound, this fear was one of the factors which led M. van Zeeland to make his proposals at Strasbourg for toning down the European army plan. The Foreign Minister knew that Germany's rearmament was a source of utmost concern to all his compatriots without exception. He knew that if Europe itself did not take the initiative in integrating German contingents in a European force, there was a serious danger that the Americans would restart a national *Wehrmacht* without further delay. Therefore he was in sympathy with the idea of a European army. But he felt, together with many Belgians of all political creeds, that a European army as originally conceived by M. Pleven, or as developed by M. Alphand in the meetings of experts in Paris, would in the end produce an army in which Germany predominated. M. Alphand's recipe—one force, one uniform, one budget, one policy—was the logically perfect way of preventing a German national army. But if the other members, in following it, sacrificed so much of their sovereignty and their independent strength, what would they have left with which to resist the growing influence of a resurgent Germany in the international army? M. van Zeeland's answer was that a European force must be acceptable to "as many European nations as possible"—including Britain and the Scandinavian countries. At all costs the adopted formulae must leave the door open to Britain. On this score alone the Pleven Plan would have been thrown out by the Belgian Parliament.

Constitutional Difficulties

But there were other reasons just as potent for the Foreign Minister's reluctance. Belgian public opinion is not prepared for a far-reaching vesting of sovereignty. M. van Zeeland was clear about it: "As I said just now, our hearts still lie with our own fatherlands, and European organisation must therefore respect the national states." This is certainly true of the Flemish majority in the country; the Walloon section has recently been more receptive to federalist ideas—if only because many of them were advocating a federal constitution for Belgium itself. But there would certainly be a general outcry if the military expenditure to be borne by the country were to be decided by an irresponsible supra-national authority. To those who were puzzled by the fact that, while ratifying the Schuman Plan, Belgium fought shy of the European army, M. van Zeeland said: "It is possible to make great concessions to views one does not share when it is a matter of coal and steel . . . the same does not apply when it is a question of human lives."

This psychology is reinforced by a more material difficulty. A European army on the Pleven pattern would mean revising the Belgian constitution. Because of the Royal question, which has been the central controversy in postwar Belgian politics, this is far more than a merely technical evasion. If Belgium was to adopt the form of the European army, envisaged by France until the last few weeks, the Belgian Parliament would have to revise—by a two-thirds majority, article by article—all the five articles of Chapter V of the constitution, several articles in the chapter devoted to the rights and privileges of the King, and some important sections in the chapters dealing with the constitutional powers of parliament. It is almost inconceivable that a two-thirds majority could be found to modify (in the sense of curtailing) the rights of the King. The constitutional battle had blazed most fiercely on just those privileges now at stake—the King's position as Commander-in-Chief and as arbiter of war and peace. Even if a majority were found, it could only be at the cost of overthrowing the precarious balance that had been established with so much time and grief, and, incidentally, of destroying the Social Christian majority (the Foreign Minister's own party). The poor chances of his own party in an immediate dissolution and referendum must have

weighed with M. van Zeeland; but he had other, less parochial, grounds for gloom, and for his claim that it would take two or three years to complete the constitutional revisions.

The Cost of Indo-China

[FROM OUR PARIS CORRESPONDENT]

LAST week the French National Assembly debated the credits for the war in Indo-China. Out of the record 1952 budget of 3,370,000 million francs, 326,000 million go to France's Far Eastern effort; and it is almost certain that, as in 1951, supplementary credits will be called for during the year. The Indo-Chinese credits were approved by 510 votes to 109, the Communists alone opposing.

The debate was, however, intense since the Government spokesmen could offer no very cheerful prospects of an Indo-Chinese solution. M. Daladier (Radical) began by asking that the finance committee should review the proposals for so huge an expenditure. He reiterated the argument which many Frenchmen have stated during the last five years; that, by spending lives and money in a seemingly endless campaign at the other end of the earth, France is crippling itself as a European and African power—to the benefit of Germany. M. Daladier suggested that France should bring the Indo-Chinese conflict before the United Nations and ask them to arrange an armistice, a truce and finally a plebiscite.

M. Pleven (UDSR), in reply, insisted that the time was not yet ripe for an appeal to the United Nations. Great military progress had been made since the autumn of 1950; the attack last May by ninety fully trained and equipped battalions of the Vietminh had been repelled with great loss to the enemy. The Vietnamese army was weekly growing in strength and efficiency. Since the signature of the Pau convention in December, 1950, the loyalty to the French Union of the three associated states, Vietnam, Cambodia and Laos, had been steadily confirmed. The Prime Minister gave it as the opinion of the commander-in-chief, General de Lattre de Tassigny, that, unless Chinese volunteers invaded Tonkin "present plans promised results in fifteen or eighteen months." In any case the French Government had hopes of a settlement of the Indo-Chinese problem by improving its relations with Peking. An armistice in Korea would create a favourable climate for talks with the Chinese Communists. This was the first time that M. Pleven had publicly expressed what had long been known to be the coalition government's wish—to follow Britain in its recognition of Mao Tse-tung. M. Daladier's motion was finally defeated by 406 to 206.

After the Communists had proposed a reduction of the Indo-Chinese credits from 326 to 50,000 million francs (the latter figure represented the cost of repatriating the expeditionary force), M. Gaston Palewski (RPF) took up a different position to any previous speaker. He declared that the Chinese were already in the war against France and that it was absurd to speak of negotiations with Mao or with Ho Chi Minh. There was only one way out of the present impasse—the transformation of the Indo-Chinese theatre of operations into an inter-allied theatre. "It is shocking and monstrous," said M. Palewski, "that inter-allied co-operation exists in Europe where there is no fighting, and not in Indo-China where for five years Frenchmen have been dying for the world's freedom." (Total French losses in Indo-China up to the end of 1951 are 1,014 officers and 28,711 men killed or missing.) The time had come for an inter-allied Far Eastern strategy under a unified command.

M. Letourneau, Minister for the Associated States, said that the question of the co-ordination of allied strategy was being studied. In answer to a Socialist objection that the United States was not automatically engaged to come to France's help in case of a Chinese invasion, he stated simply that he could not reveal secret diplomatic conversations. What could be said was that for the period mid-1950 to mid-1951 Franco-Vietnamese forces had received arms and equipment to the value of 60,000 million francs under the Military Aid Programme. For the last half of 1951 another 55,000 million francs worth was due; and for the year 1952

FRENCH FORCES IN INDO-CHINA

	1951	1952
French expeditionary corps	170,000	173,000
Auxiliary troops (Indo-Chinese)	50,000	60,000
Vietnamese	50,000	106,000

COMPOSITION OF THE EXPEDITIONARY CORPS BY NATIONALITY

French citizens*	71,110
Non-Vietnamese native troops†	43,115
Vietnamese	59,075

* A French citizen is either a metropolitan or an Algerian.
† Africans, Madagascans, Hindus.

a further 45,000 million francs would probably be forthcoming. The Government would continue to build up the political and military strength of Vietnam, and although France would certainly seek an end to the war, this could never be by betrayal of the French Union.

The sense of M. Pleven and M. Letourneau's utterances seems to be that French policy in Indo-China will for the present be unchanged. Most of the deputies are aware of the slow creation of a situation of strength. They feel, nevertheless, that the financial burden on France is far too great and that more dollars should bolster up the budget; exclusive of end-item aid (MAP) and of off-shore purchases of undetermined volume, American aid to France written into the 1952 budget amounts to 70,000 million francs. As will be seen from the table the non-Vietnamese part of the expeditionary force is still being reinforced and half of France's regular officers and NCO's are, therefore, pinned down in Indo-China at a time when they are vitally needed in Europe. The doubling of Vietnamese forces during the last year has been a good beginning. But there can be no transfer to Europe of French forces while the Vietminh is being continually reinforced by China.

Mr Lyttelton in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

THE recent visit of Mr Oliver Lyttelton, the Secretary of State for the Colonies, has given much satisfaction in Hongkong. The initiative was most welcome, since a personal tour of inspection or consultation by the minister is a step almost unprecedented in the Crown Colony's affairs, and Mr Lyttelton clearly has the personality to win success. Solidity and assurance are what people in the Far East most earnestly desire. Moreover, in a place like Hongkong, it is widely felt that in present-day conditions there is much overlapping between the three great fields of foreign affairs, Dominion affairs and colonial affairs, which necessitates a new type of co-ordination. The Minister, who had travelled in Malaya in an armoured car, guarded on some occasions by thousands of men, must have felt a sense of freedom in Hongkong, where little more was necessary than traffic arrangements and the marshalling of the genial crowds that came to see him open an Exhibition of Hongkong's industrial products.

Mr. Lyttelton gave the much-desired assurance that it was the British intention to hold and maintain the colony of Hongkong. This was naturally interpreted primarily in the strategic sense; and the phrasing duly contained such qualifications as "to the best of our ability." But many doubts were dispelled when Mr Lyttelton added that the British intention was also to "safeguard Hongkong's welfare," and went on to show that he knew from personal experience what the practical problems were. First among

them is that of the refugees in Hongkong. Mr Lyttelton wondered whether many western cities, for all their superior endowment of civic and social services, could have coped so well with a sudden doubling of their population. There are, in fact, a million or more refugees in Hongkong who prefer to live there rather than on the mainland of China or in Formosa, and have managed to find a livelihood in this outpost of freedom.

Mr Lyttelton did not, of course, refer specifically to the United States embargo, which for one year now has weighed heavily on Hongkong's trade, and therefore on the economic prospects of the whole of South-East Asia without apparently having any vital effect on China's war capacity. He promised, however, that Britain would try to supply everything that Hongkong needed for its own consumption which was not obtainable elsewhere. This must refer in particular to essential raw materials and consumer goods which, despite several nominal "relaxations" of the American ban, are still not forthcoming from that quarter. He did refer to the prospects of Japanese competition, approved and aided by United States policy, which is seen as threatening the final ruin of a prosperity already weakened by the embargo. From Hongkong's point of view, a better understanding and collaboration in such matters between the United States and Britain is vital.

Another feature of the visit was the special attention given to the constitutional and administrative questions of the Colony. Mr Lyttelton received deputations from the local Reform Clubs and other associations and interests, and gave a welcome statement to the effect that measures of constitutional reform or progress were under serious and active consideration. The major question is that of granting some degree of representative government. This is a very difficult matter; Hongkong's population is so largely a "floating" or transient one, in all classes and walks of life, that the greatest problem of "self-government" is to determine who the "self" might be. In practical terms it is like suggesting self-government for a railway station. For the most part, Hongkong people are inclined to put practical measures of material and commercial improvement first.

That is, at any rate, the view in matters of internal concern. But there is much preoccupation with the need for external measures of co-ordination, on what must now be called the South-East Asian front. Three British territories are involved: Malaya, Hongkong and North Borneo. Malaya —quantitatively and qualitatively the most important—is a base area, comparatively well developed as a primary producer, now under direct Communist attack. The internal struggle in that country is comparable in scale and kind with events in Indo-China, and even with those in Korea. Hongkong, in contrast, displays an internal tranquillity hardly excelled in any Asian country; but it is subject to external pressures which threaten to ruin its position as a great *entrepôt*, a pivot of commercial organisation, and a centre of free communications. North Borneo, on the other hand, is a minor or merely potential factor; but it should not be left out of account. This typically "undeveloped" area is today giving an example of just that rate and kind of fundamental economic development which is, to Asian minds, essential.

In the sphere of co-ordination, especially where politics and economics overlap, British leadership in South-East Asia is better established and respected than may sometimes be realised by the Western public. A notable contribution, in the postwar period, was the Special Commission for South-East Asia. This pioneer effort in regional consultation and executive planning took a large part of the credit for the first restoration of economic order after the war, and the subsequent revival of trade. The other main British contribution has been simply the existence of Hongkong, which has shown a degree of postwar reconstruction and progress unrivalled elsewhere, and has become an *entrepôt* centre serving a whole hemisphere. The present hope is that these achievements in particular will be maintained and extended. In addition, concrete progress in North Borneo, and the air of restraint, practicality and flexibility shown in the Colombo Plan, have created a strong confidence that much is to be expected from Britain in the important matter of economic development.

Indians in Ceylon

[FROM A SPECIAL CORRESPONDENT]

INDIA, the first Asian country except Japan to saturate its easily cultivable land, exported its excess population to Ceylon, Burma, Malaya, Indonesia and Indo-China over a period beginning in the 1820s and ending only recently, when it found all doors shut. Indian immigrants have the habit of remaining parochially Indian. They neither learn the language of their new country nor do they intermarry or settle down; instead they remit money to India where their families live, they marry back into India and they retire to their native villages. They refuse even to give up their food habits and import Indian servants to look after them. This being so, it is not surprising that they should be disliked in direct proportion to their success.

The main friction arises in Ceylon where, until 1935, indentured labourers were imported on a large scale to work on tea and rubber plantations and where, in addition, as many as 200,000 Chettiars (traders from the south) opened shops and held, together with the British, all the trade worth holding on the island. The Sinhalese, who are lazy, spurned the activities of the Indians until, with the advent of independence in 1948, they suddenly realised that Ceylon is the natural destination of India's surplus, despite the fact that their own rate of increase of population—3 per cent—is the highest

and PLEASE—do send us any books and magazines that you can spare for the fishermen—they are badly needed. Address them, please, to R.N.M.D.S.F. Stores, QUAYSIDE, GORLESTON, Gt. Yarmouth

in the world. This, added to the fact that they hate the industrious Indian, made them issue rather drastic legislation aimed at discouraging Indians from staying in Ceylon.

Of the 700,000 Indians in Ceylon, 500,000 are estate labourers who cannot prove that they have been on the island for generations because they are illiterate and because no records have been kept. Thus the citizenship act, which requires that in order to be a Ceylonese citizen it must be established that both parents were born on the island, makes it almost impossible for them to become citizens. Applications for registration have been received from 200,000 of these Indians, but only 7,500 have so far been screened by the Home Department, partly from ill will, partly from inefficiency and partly because of the coming elections—the tea labourers are all leftist and would vote for the opposition.

Citizenship can also be obtained if uninterrupted residence can be established for five years; but since a citizen is not allowed to remit money to a foreign country, only the better off business men avail themselves of this opportunity to settle in Ceylon. Another, almost equally serious grievance amongst Indians in Ceylon is that if an Indian living in Ceylon wishes to go to India on a visit, he must get a re-entry permit, valid for two months only, before he can leave; without such a permit he cannot return. This regulation has been misunderstood by many illiterate and frightened Indians who think that it is the final proof that they are not wanted.

Ceylonisation has become part of the Government's official policy—there is a Minister for Ceylonisation—and all government jobs have to be held by Ceylonese if there are persons capable of holding them. Firms which employ only Ceylonese in all posts worth Rs. 400 and under, are rated as Ceylonese firms and they only are entitled to get import licences for the newly reopened trade with Japan and Germany. This act is hitting British just as much as Indian business; both had traditional contacts with Japan and Germany before the war, and all that the government is achieving is to increase the price of the imported articles covered by the Act, since Sinhalese traders have neither the necessary contacts nor the know-how and merely act as go-betweens on commission for the old customers.

The problem of Indians in Ceylon is a temporary one which is bound to resolve itself in time, since no new legal immigration is possible after the 1949 Act. The government of India has shown commendable patience in dealing with the government of Ceylon, especially since in the old days the indentured labourers were exported at the instigation of the then government of Ceylon, and since even today the work of the estate labourers is at the very core of Ceylon's prosperity. Considering that the Indians in Ceylon have been there for a long time and until now have had full citizenship rights, it is unfair both to deprive them of these rights on the plea that they are not nationals and to make naturalisation by registration so difficult that only a few can fulfil the requirements on paper. Before independence it was not necessary for a citizen of the British Commonwealth to be a national of a particular Commonwealth country.

Canada Abolishes Exchange Control

[FROM OUR OTTAWA CORRESPONDENT]

THE abolition of Canadian exchange controls three weeks ago was a move of psychological rather than practical importance. The control had been in operation since the beginning of the war, but it had been progressively relaxed in recent years. Few of the remaining restrictions were onerous, and they had not apparently been affecting the course of the exchange with the US dollar. It was still necessary for Canadian residents to obtain a permit to take currency out of the country, but the limits were wide and permits were granted freely. Even purchase of American securities by Canadians was usually permitted, though it could be controlled. Non-resident investors buying Canadian securities for cash could have them registered with the Foreign Exchange Control Board, and permission was freely given for such registered securities to be sold for cash in Canada. But Canadian securities purchased by non-residents before September, 1939, could not be converted into cash in Canada. They had to be sold to other non-residents or exchanged for other Canadian securities. Thus the New York market for Canadian securities was generally a few points out of line with the prices in Canada.

Now all of this is done away with and dealings in foreign exchange are open to banks and dealers without restriction. When the Canadian dollar was unpegged in October, 1950, the Government seriously considered abolishing exchange controls at the same time; but it decided to play safe. It did, however, allow a period of ninety days during which Canadian banks and individuals might hold their foreign exchange before turning it over to the Government. Now they may hold foreign currency as long as they like; but it is not expected that there will be much temptation to hoard US dollars, since the Canadian dollar appears just as likely to appreciate as to depreciate.

The abolition of exchange control happened to come on the heels of a sharp spurt in the Canadian dollar quotation. After being freed last year the Canadian dollar settled down pretty steadily around 94-95 cents (US). But in early December a rush of foreign buying sent it up to 98¼ cents, and it seemed content to stay around that point. Needless to say the Canadian Government was moved by the long-term steadiness rather than the sudden spurt. In the first nine months of the year—without artificial protection—the official reserves of gold and US dollars dropped by only $160 million. In the later months the losses were apparently even smaller. The remarkable thing about this is that the deficit on commodity trade has been rising steadily, and so probably has the deficit on the invisible factors in the current account.

The year 1950 ended with a current account deficit of $316 million of which only $17 million was on commodity trade. This year's trade deficit in the first nine months was $323 million compared with $11 million last year. Dividend payments, tourist expenditures and other invisibles have almost certainly run up a higher invisible deficit. So the total current account deficit for 1951 cannot well be less than $700 million and may be substantially more. This has produced no strain on the exchange rate, because it has been offset by the capital inflow that has been taking place. Canadian provinces and municipalities alone have floated more than $300 million worth of bonds in New York this year. Redemptions offset $100 million of this. Direct investment in Canadian stocks and private borrowings must have been very substantial; and there has been little sign of "hot money" pouring in.

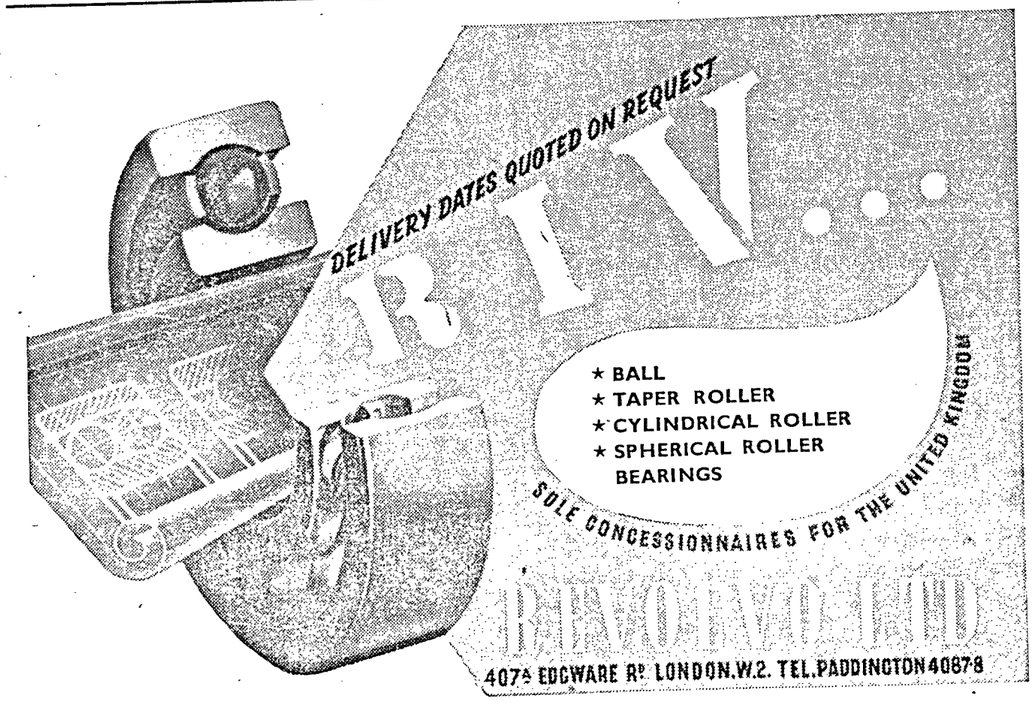
The Canadian Government's move has been interpreted as a gesture of confidence in the soundness of the economy. More particularly it is a sign of confidence that the present current account deficit represents an investment in productive enterprise which will leave Canada richer; and it is the case that Canadians are paying for a much larger proportion of their own capital development than they did in the last great period of expansion in the years just before 1930. Mr Douglas Abbott, the Finance Minister, and his financial advisers believe that Canada is so widely recognised as a country of assured growth that their own gesture of confidence can only increase the confidence of investors. They have announced that they intend to keep the legislative authority to use the official reserves as an "exchange fund," but they have also indicated that they do not intend to use it as any sort of peg for the dollar. It will be used merely to smooth out the more violent day-to-day fluctuations.

WHAT'S TRUE OF THE FACTORY IS TRUE OF THE HOME

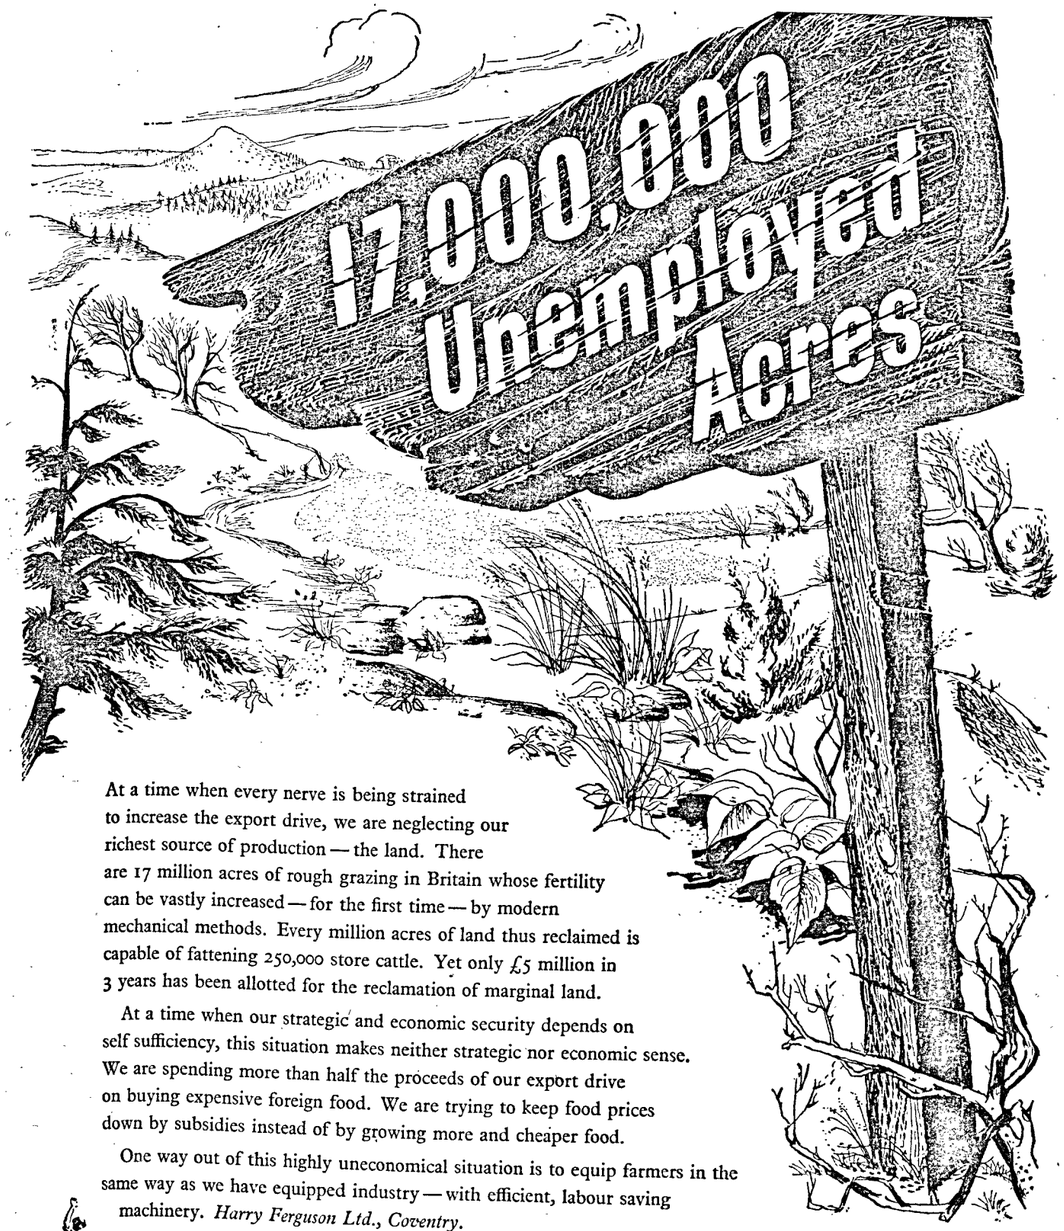
EVERY factory manager will agree that to run a factory properly with out-of-date, inefficient equipment is quite impossible. But — as any housewife will tell you — exactly the same thing is true when it comes to running a home.

Today, with the extra difficulties of rationing, rising prices and shortages all round, every British housewife fully deserves any help that she can possibly get.

It is, therefore, a source of great satisfaction to us at Hoover Limited that our electric cleaners and washing machines are doing so much to relieve unnecessary domestic drudgery.



There are, however, large numbers of homes where the mother of the family still has to do the cleaning and washing by hard manual labour — often at the expense of her health and other duties. This is a social evil which we believe should no longer exist in this country.

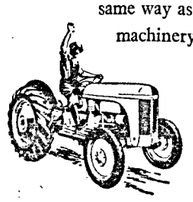


We look forward, therefore, to the day, when with purchase tax abolished and free supplies of raw materials available, we shall be able to maintain maximum production of both cleaners and washing machines and supply these essential pieces of equipment to all sections of the community at the lowest possible prices.

HOOVER LIMITED

Makers of Electric Cleaners, Washing Machines, F.H.P. Motors, Commutators, etc.

Factories at: PERIVALE, GREENFORD, MIDDLESEX · MERTHYR TYDFIL, SOUTH WALES · CAMBUSLANG, SCOTLAND · HIGH WYCOMBE, BUCKS.



At a time when every nerve is being strained to increase the export drive, we are neglecting our richest source of production — the land. There are 17 million acres of rough grazing in Britain whose fertility can be vastly increased — for the first time — by modern mechanical methods. Every million acres of land thus reclaimed is capable of fattening 250,000 store cattle. Yet only £5 million in 3 years has been allotted for the reclamation of marginal land.

At a time when our strategic and economic security depends on self sufficiency, this situation makes neither strategic nor economic sense. We are spending more than half the proceeds of our export drive on buying expensive foreign food. We are trying to keep food prices down by subsidies instead of by growing more and cheaper food.

One way out of this highly uneconomical situation is to equip farmers in the same way as we have equipped industry — with efficient, labour saving machinery. *Harry Ferguson Ltd., Coventry.*

THE BUSINESS WORLD

The Sterling Talks

ON Tuesday next week representatives of the Commonwealth will begin another of the periodical meetings at which the ways and means of the sterling area are considered. For the first few days, the officials will survey the field among themselves. A week later, on January 15th, the Commonwealth Finance Ministers will take up the discussion and carry the work of the experts to the point at which decisions may be taken. The scope of these talks and the attitude to be taken by the convening government are matters on which no official guidance can be obtained in London. This reticence is not surprising. The discussions of the next fortnight involve the future financial and economic policies of independent and sovereign states, and nothing could do more to prejudice their prospects than any suggestion that London intends to take a given line, or that any preconceived plan is about to be imposed on or even proposed to the countries represented.

There can, however, be no doubt about the circumstances that led to the convening of this meeting. Once again, a balance of payments crisis has provided the occasion for calling together the highest financial authorities in the Commonwealth. But on this occasion, unlike the autumn crises in 1947 and 1949, when similar meetings were convened in response to balance of payments difficulties, the crisis is not limited to the common problem of dollar shortage for the sterling area as a whole ; it is also concerned with the frightening balance of payments deficit of the United Kingdom itself, which the Prime Minister recently suggested might amount to as much as £500 million for 1951. As the Chancellor of the Exchequer showed during the debate on the Address, there is not now so sharp a distinction as there was in previous years between hard and soft currencies. " Indeed, all foreign currencies are alas now hard." And Mr Butler might have added that even some of the currencies within the sterling area came during the course of 1951 to acquire the promise of hardness—a point emphasised by the Prime Minister's recent broadcast warning against the temptation and danger of falling increasingly into debt to the colonies.

Mr Butler gave a general indication of the broad agenda of the coming discussions in the House of Commons during the course of the debate on the Address. Having described the steps taken to meet the balance of payments emergency in Britain, he pointed out that the next stage would be the discussions with Britain's colleagues in the Commonwealth whose interests, he said,

> are as closely bound up in the strength of sterling as ours. I am informing the Commonwealth Finance Ministers of the action which we are taking and arrangements are well in train for a meeting with them in January. I am sure that we shall then be able, having taken here what immediate action is appropriate, to agree about common policy for the strengthening of sterling and the development of the most effective joint plans for its defence.

Much of the factual material which will be presented to the Commonwealth Conference was also provided in the same speech. Mr Butler then pointed out that the gold reserve had fallen by the end of October below £1,100 million compared with the total of £1,381 million reached at June 30th. Since the end of October further substantial gold losses have been incurred to the European Payments Union, while the payment of the first instalment on the US and Canadian loans will have involved a further draft on the reserves. There may, no doubt, have been some benefit from the swing of the speculative pendulum following the Conservative victory at the polls and the resurrection of credit policy in Britain. On the other hand, some of the underlying causes of the fall in the reserves, namely the lower level of sterling area commodity prices, the absence of American buying of tin and the loss of Abadan, continue to operate. It should, therefore, be safe to assume that the gold and dollar figures for the end of 1951, which should be published within the next few days, will show a further appreciable decline from the already inadequate total for the end of October.

Given this situation, some curtailment in non-sterling imports will undoubtedly be discussed. The size of the economies may in part depend on the civilian aid that Britain may hope to obtain from the United States in the near future and on this it would be dangerous to count. It is unlikely in prevailing circumstances that the necessary economies can be secured by the simple process of an " across the board " uniform cut, such as the 25 per cent reduction in dollar imports ordained at the time of the devaluation of sterling in 1949. The position then justified a simple uniform prescription of this kind because it was the over-valuation of sterling and all its ancillary currencies that was directly responsible for the balance-of-payments difficulties. Today there is no such single explanation of the dollar gap. Each country represented at the sterling talks will present a special problem in its payments with the dollar world and the solutions to be devised will necessarily have to be tailor-made for each and not mass-produced for all.

Another subject that will loom large in the coming talks is the growth of the United Kingdom's sterling liabilities to the rest of the sterling area. The movement of these balances since the end of 1947 is shown overleaf. The rise in these sterling liabilities of the United Kingdom is unlikely to have maintained in the second half of 1951 the abnormal pace of the preceding six months. Some balances, notably those of certain dependent overseas territories, will have continued to rise ; indeed, the latter may be approaching the £1,000 million mark—an invidious ten-figure record for Britain, the trustee for these territories and custodian of their external assets. These balances have virtually doubled in terms of sterling since the end of 1947, though the real value that they represent has not

risen commensurately. It is certainly proper that the Prime Minister should have demanded that a halt be called to this process of incurring debts to territories for whose monetary and reserve policies Britain is ultimately responsible. It is something that the balances of other countries in the sterling area are likely to have been

U.K. STERLING LIABILITIES TO STERLING AREA COUNTRIES
(in £ million)

	Dec. 31, 1947	Dec. 31, 1948	Dec. 31, 1949	June 30, 1950	Dec. 31, 1950	June 30, 1951
Dependent Overseas Territories	510	556	583	645	754	903
Other Sterling Area Countries	1,787	1,807	1,769	1,924	1,976	2,190

reduced, among them those of Australia whose earlier accumulation of London funds played so important a part in the exceptional rise of the sterling liabilities to sterling area countries during the twelve months to June, 1951.

★

On the two main issues—access by members of the sterling area to the gold and dollar pool that Britain holds in custody for them and access to the purchasing power represented by the sterling balances that Britain owes them—the Commonwealth talks will provide the customary exhortations for restraint on the part of all concerned. The gold and dollar reserve must be strengthened and dollar imports must therefore be reduced. At the same time the holders of sterling balances will be asked to show reasonable moderation in exercising the purchasing power that they represent. If some of the Dominions carried a more adequate share of the rearmament burden there would be less likelihood of an undesirably rapid running down of these sterling balances. This particular issue is one of the most controversial that could be raised in the course of the discussions; but that is no reason why it should be avoided.

As host and leader in these talks the British Government will have a fair tale of accomplishment to show to the other countries represented, and will be in a position to give a lead. The common malady that affects the whole sterling area is that of inflation in more or less suppressed forms. Britain cannot dictate how that is to be tackled throughout the sterling area but it can at long last point to certain specific, constructive and promising measures which, if pursued with vigour and courage, should go a long way to correct inflation here. The position of sterling is the key to the whole range of problems which will be before the Commonwealth finance ministers. When the Chancellor of the Exchange outlined his financial proposals to the House of Commons he declared that if any further measures were required in order to re-establish Britain's position and maintain the strength of sterling as an international currency, the Government would not hesitate to take them; and he added, "let no one doubt our intention to make and keep sterling strong." That, however, is a problem for which the responsibility does not lie entirely on Great Britain. The whole sterling area must take the necessary disinflationary medicine. Swallowing the dose will inevitably be made more difficult by the fact that so many countries within the sterling area, and particularly the dependent territories, have little autonomy in monetary or credit policy. If they suffer from inflation it is largely because they import it either in the form of artificial prices received for their basic products or of equally artificial prices for essential imports of foodstuffs. The discussions may, therefore, take in their stride such subjects as commodity control schemes, though after the recent Commonwealth Materials Conference in London it would require boundless optimism to expect any specific results from this particular debate.

★

What should emerge from the discussions is a two-part programme, rather on the lines of that launched by the British Government for dealing with the situation in this country. In the first place, short-term measures are needed to deal effectively with the emergency of the payments deficit itself and with the persistent drain on the gold and dollar reserve. These measures must in the main be restrictive. Positive solutions are preferable but they take longer to apply. At present, time is of the essence of the sterling area's problem and if only for that reason more cuts must be expected. In accordance with the present mood of the government, the lash is likely to fall upon the British consumer and tourist. In the matter of emergency measures, Britain is likely to provide a lead.

In the second place the outcome of the talks should produce a series of integrated but not necessarily uniform anti-inflationary programmes. These should provide the means by which, given time, the present disequilibrium of the sterling area as a whole can be corrected. The common enemy of inflation, whether home produced or imported, must be overcome if the solvency of the sterling area in its payments with the rest of the world is to be assured. Such a longer term policy implies no "rush for freedom" in the near future, either towards convertibility of sterling and its allied currencies or to complete non-discrimination in international trade. These ultimate objects will, however, have their spokesmen at the conference table. The Canadians will be there to give the non-sterling point of view, to point to the danger of the sterling system reposing as no more than a protective mechanism. This will be a necessary voice expounding basic truths which if they are too long ignored could lead to the disintegration of the sterling monetary club. But the members will also be made to realise by the figures put before them that the imminent danger to the club is insolvency. It is a danger that, in the first instance, can only be averted by drastic joint action of a largely restrictive and therefore painful kind.

But this is merely a short-run specific. If the conference is to succeed in preserving the sterling area, it will have to examine all the constructive and expansionist means whereby the sterling club can pay its way with the outside world and raise its entire potential of production and trade. There are individual members of the sterling area to which this precept applies with especial force—not least to this country whose predicament may now mercifully have been recognised. The opportunity for effective remedies may not recur.

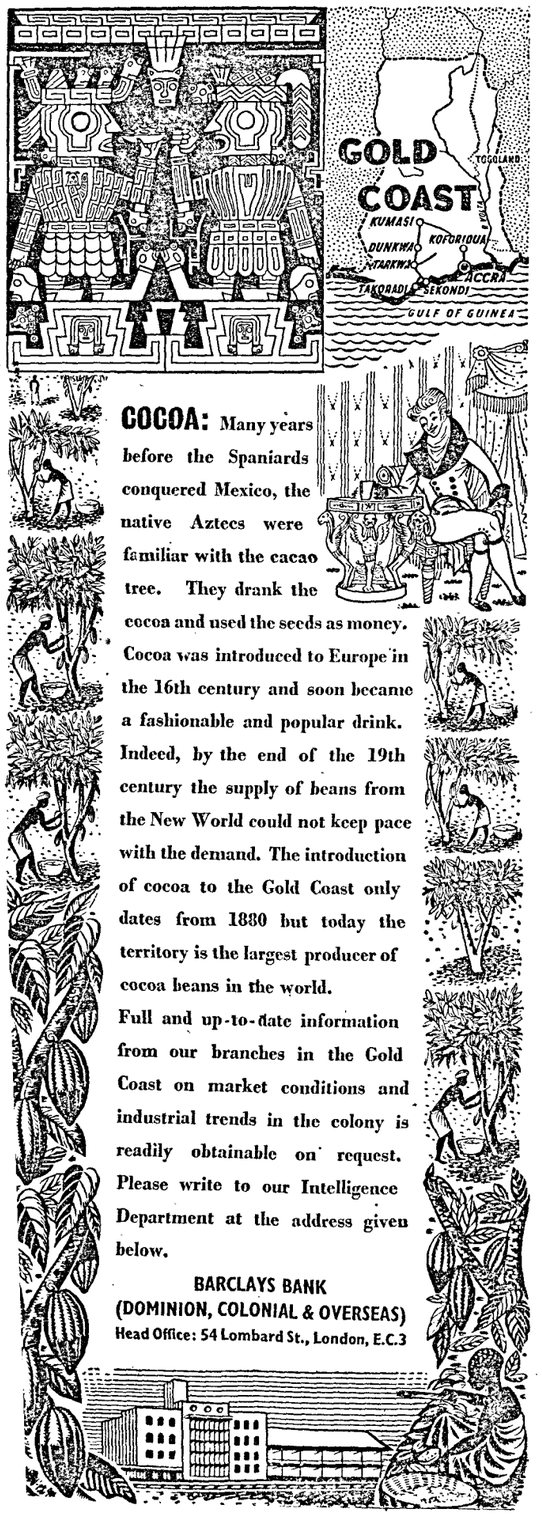
Industry and the Three S's—II

The Way to Simplify

(By a Correspondent)

AN earlier article summarised the substantial advantages to be gained from a policy of simplification and described some of the obstacles that prevent the wider adoption of such a policy in British industry. The purpose of this second article is to set out a practical course of action to put simplification into effect. There is nothing dramatically new in these proposals; they have been fully endorsed by the experience of numerous companies, and many more firms could adopt them.

The first step to be taken by a firm that wants to simplify the range of its products is to analyse its existing sales. Such an analysis will reveal the distribution of the volume of sales of each of the items in the whole range of the firm's catalogue, and will sharply reveal those lines that sell persistently in low volume. This may sound elementary advice, but in practice it is surprising how many companies continue to sell small quantities of a product year after year without re-examining the wisdom of such a course and the dissipation of effort that it can involve.



The second step is to attempt an analysis of the effort involved in producing and selling such a variety of products. A material obstacle now arises, for the costing systems employed by many British factories do not reveal the detailed cost information that is necessary before logical decisions about simplification can be taken. Many firms use haphazard and approximate methods of booking the labour and material cost to a given item of production, while the allocation of overheads is in many cases even more approximate. It is common to find overhead costs allocated as a percentage addition to direct costs—often as a fixed percentage for the whole of the factory and one applied indiscriminately to the various departments and products. The allotment of separately computed overhead costs to each department or product is an improvement, although all too frequently it still fails to bring out the true cost of producing a small selling line. It is generally recognised that a small order entails a far greater proportion of overhead cost, including additional clerical and administrative work, than a product made in volume. But the methods of costing commonly employed do not generally show up these differences with sufficient prominence to ensure action. It may therefore be necessary to institute some inquiry or spot check in the factory to establish the facts.

Such an examination of sales and costs may well reveal that the selling prices of many items in the catalogue do not reflect their true costs of production. It must then be decided whether to drop unprofitable lines from the catalogue or whether to increase their selling price. Often this second step will be sufficient to eliminate the item from the list in a short time. The overhaul of costing systems will frequently reveal unsuspected cases of wasteful and costly production that could be eliminated. Such action, more generally adopted, would be the most powerful stimulus that British industry could receive towards eliminating superfluous variety.

The sales organisation of a company may vehemently oppose such elimination, particularly where the company has had a long tradition of wide variety in its products. There is an alternative course that, firmly followed, will achieve the same object, though at a slower pace. That course is to steer consumer demand away from the uneconomic products to the nearest acceptable alternative. In many industries it is possible to produce a sales catalogue giving an indication of the items that are preferred by the maker; these can be indicated by such printing techniques as the use of heavy type and by giving less prominence to items that it is intended ultimately to drop. Advertising policy can be co-ordinated and used to steer demand into the same channels. The producer may also find that his customer resists the change on the grounds that it would involve re-designing his own product; this objection is likely to be met particularly by the producer of components. In such cases the component maker should be prepared to offer technical assistance to his customer in incorporating the component that will be cheaper to produce in volume, as well as some incentive in costs and prices. There is considerable opportunity for this kind of co-operation between manufacturer and user in many sections of British industry.

★

In the British motor car industry, recent years have seen the steady amalgamation of many separate companies into a smaller number of large groupings; and the new Austin-Nuffield merger is a most significant step. Great opportunities have arisen for simplification in components and parts: the enterprising way in which these opportunities have been grasped provides an outstanding example of simplification in this country. The principal manufacturer of electrical equipment for cars has achieved a remarkable degree of simplification and standardisation. In prewar days the range of dynamos consisted of 48 separate types; this number is being reduced to 3. Starters are to be reduced from 38 to 5; distributors from 68 to 3; headlamps from 133 to 2 basic types. This concern first carried out a survey on the lines described and adjusted its costs and prices to reflect factory costs. They then made estimates of the further savings in costs and reductions in selling prices that could be achieved by various stages of simplification. The analysis was followed by a careful reconsideration of the design of the components in collaboration with the motor car manufacturers. This consultation revealed many difficulties and also many needless differences. For example, one car manufacturer attached the dynamo to the engine with a flange, another with a bracket, some with three or four bolts, others with two. Again, one manufacturer wished to have the dynamo rotating clockwise; another, anti-clockwise. Between them the teams of designers were able to work out a systematic programme of simplification in carefully planned inter-

COCOA: Many years before the Spaniards conquered Mexico, the native Aztecs were familiar with the cacao tree. They drank the cocoa and used the seeds as money. Cocoa was introduced to Europe in the 16th century and soon became a fashionable and popular drink. Indeed, by the end of the 19th century the supply of beans from the New World could not keep pace with the demand. The introduction of cocoa to the Gold Coast only dates from 1880 but today the territory is the largest producer of cocoa beans in the world.

Full and up-to-date information from our branches in the Gold Coast on market conditions and industrial trends in the colony is readily obtainable on request. Please write to our Intelligence Department at the address given below.

BARCLAYS BANK
(DOMINION, COLONIAL & OVERSEAS)
Head Office: 54 Lombard St., London, E.C.3

mediary stages. The component makers and the car manufacturers were then able to agree upon modifications of design that could be readily carried out to make further simplification possible.

An important feature in all these discussions was the emphasis upon the savings in cost of manufacture of the components, the increase in output, and the reduction in selling prices that would result from concentration on a narrower range. In this case the circumstances were perhaps particularly favourable, but the principle holds good far more widely. In many industries a superficial examination would suggest that opportunities for simplification are less promising than in the engineering and component-using industries; but there are few where some improvement in productivity cannot be brought about by study with a view to simplification. At the opposite end of the range from engineering, for example, the textile industries produce a very considerable range of products. Here variety in the finished article is essential; but there is opportunity for simplification of the range of threads, twists and other factors, without sharply perceptible alteration of the final textile product.

The introduction of a new product into the selling range can often be made the occasion for a review of the whole range of products. Some companies adopt the practice of insisting on dropping one item from the list for each new item added; this practice may be regarded as too rigid for general adoption, although it has its virtues. But there are certain steps that should always be taken when considering the introduction of a new product. The question whether such a new design will render some other current item superfluous should be faced at the same time that the final decision whether or not to produce is being taken. Once it has been decided to produce and sell a given item or range of items the sales staff should be instructed that their task is to promote sales of that range for a given period and not to demand new items during that period.

Specialisation, in the sense of concentration upon a very narrow range of products, is generally less developed in Britain than in the United States: but the trend is in that direction, particularly in the field of components. One obstacle holding up this development is the reluctance of firms to call in the specialist manufacturer for consultation. A product is designed; then the manufacturer of components is asked to supply particular items to a design already "frozen." In this way many opportunities of simplification of components may be missed. If the specialist manufacturer is called in when the design is still on the drawing board, he will often have modifications to suggest that will enable him to increase productivity and reduce the prices both of the component and of the main product. Over a period the specialist producer may in this way be able to steer the demands of his various customers towards an increasingly narrow range of standardised items. Only by full access to the factories of his customers and full consultation at the right time with his customers' designers can he achieve this desirable objective.

To sum up, simplification, specialisation and standardisation are valuable policies for raising productivity and lowering costs in many sectors of British industry. Prejudices and obstacles have to be surmounted, but there are recognised ways to do this. Any firm that embarks on such a course takes risks: but the rewards are high.

Business Notes

La Ronde

A five-shilling rise in the price of each ton of coal may do no more to accelerate the merry-go-round of rising prices through the British economy than any other increase involving a million pounds a week; but the way that it percolates through from top to bottom can be traced, in outline, rather more clearly. Last week's rise in coal prices, which will bring the National Coal Board some £52 million a year, was an average increase of 5s. a ton on the pithead prices of domestic coals, and a range of increases on the pithead prices of industrial coals varying with quality, but also averaging 5s. a ton. This does not include the 10 per cent increase in freight charges that all consumers are now paying; the effect of this adds as much as 3s. 6d. a ton to the "zone-delivered" prices for some domestic consumers remote from mining areas but probably averages just over a shilling a ton, since the railways in 1950-51 received about 9s. 4d. a ton for all coal transported, irrespective of distance, and last month's was the second 10 per cent increase since then.

Apart from transport charges, the effects of rises in coal prices upon other basic materials and services can broadly be seen. The railways, who this week are to pay more than 5s. a ton more, will have their fuel bill increased by nearly £4 million a year: the increase in direct coal costs may add about 4 per cent to the operating costs of steam trains, exerting inevitable pressure towards a further rise in freight rates. The steel industry, which will be paying an average of nearly 6s. a ton more for coking coals and an average 5s. for the other coals it consumes will have its annual fuel bill increased by some £5 million: that means roughly 9s. a ton on steel, which even before this fuel rise and the rise in rail freights was not fully reflecting other items of increased cost, such as imported ore, in its prices. A rise in the price of coal to the gas industry averaging about 6s. a ton, but which in certain areas and for certain coals may reach 8s. or 9s. a ton, will probably cost the industry as a whole some £8 million a year: after allowing for an automatic rise in the price of coke, that rise, apart from the increased rail freights, would represent about ½d. a therm extra on the price of gas. The British Electricity Authority comes off more lightly, owing to the fact that the new prices, which take quality into account, mean a rise of only about 3s. a ton on its lower-grade fuels: its total bill for coal may rise by £5 million apart from freight charges, representing only about 5 per cent, or .02d. a unit, on its generating works costs.

Industry as a whole will pay a wide range of prices, averaging perhaps 4s. a ton; its total fuel bill will rise by about £7 million a year. For the final consumer these effects are not cumulative. Domestic coal consumers will pay some £7·5 million more for their coal, plus increased transport prices. In the long run they will largely meet in the price of goods they buy the remainder of the £52 million for coal and perhaps £8 million for coal transport that fall directly on various sections of industry. In most industries coal is a small item of cost, and the increase will hardly be passed on immediately: but for each company that absorbs the increase in a lower unit profit there may be one for which the rise in coal tips the balance and leads to a rise in the price of its own product.

* * *

Coal Prices and Finances

In the long run, moreover, the coal industry feels the effect of its own rise in price. Transport is not an important cost for the Coal Board: but transport enters even more directly than does fuel into the prices of many products that the coal industry buys. The National Coal Board is one of the larger consumers of steel in Britain; and all the products it buys have to be carried on railway trains that are costing more to haul because coal costs more. In announcing last week's price increases, the board's spokesmen said that wages—recently raised by some £26 million a year—and other costs had put its total costs a ton up by 5s. 2d.; it was passing on only 5s. of this (coal prices cannot rise by steps of less than 10d. a ton without getting into farthings a hundredweight) and therefore budgeting for a small deficit on next year's operations. It had surpluses to falling about £4,000,000 in the first two quarters of this year and a deficit of nearly £1,000,000 in the third quarter. The fourth quarter is ordinarily a profitable period, and during part of it the board has been contracting for what exports it could promise at nearly £2 a ton more than the home price. But for five weeks it paid the increased wages costing about £2,500,000 before raising prices, so that over the whole year it is not likely to do much better than break even.

The varying increases for different industries estimated above are the results of a change in the board's pricing system that was introduced at the same time as the increase. This, like the domestic price structure introduced earlier in the year, is now based upon a ranking of coals into grades according to their scientific and commercial qualities, and the various increases were designed to bring the prices of industrial coals more into line with their thermal value and physical qualities than the former prices were. It may also bring the price of high-grade coals from some uneconomic mines, such as those in Durham and South Wales, considerably closer to their actual costs, which is welcome, however incidental. The new industrial coal prices, however, do not as yet follow the domestic price structure in equalising delivered prices, though this remains a principle towards which the board would like to move. But it is still a matter of study within the board's commercial department; its implications have still to be examined fully, and a draft scheme formulated, before the department makes any suggestions to its industrial consumers. In preliminary discussions the latter have been somewhat chary of accepting the principle.

Gilt-edged and Reserves

The significance of Martins Bank statement—first, as usual among the larger banks—lies not in the maintenance of the dividend at 15 per cent, nor in the fall in disclosed profits from £732,895 to £725,107. The latter provides visible evidence of harder times, with expenses overtaking the rise in gross income, that Martins, in common with other banks, now faces. But the City had awaited with unusual interest the wording of this first bank statement about allocations to reserves. It follows the conventional formula "after . . . making transfers to inner reserves, out of which reserves provisions have been made for all bad and doubtful debts and other contingencies." In other words, there has been no call on any part of the published reserves to make good the investment depreciation of the past year.

This disclosure is the first confirmation of the City's broad guess that inner reserves might suffice to cover the book losses on bank and institutional portfolios. Whether they will be sufficient in every case remains to be disclosed; in some cases, at any rate, the margin is likely to be small. Given the condition of the gilt-edged market, the decision of the Martins Bank board to put virtually the whole of the past year's surplus to contingencies reserve follows automatically and inevitably. The sum of £375,000 has been so provided, whereas for 1950, contingencies received £250,000 and premises redemption £125,000. The announcement happened to coincide with another poor day

for the gilt-edged market. Despite attempts in some quarters to talk prices higher with suggestions that gilt-edged levels had fallen as low as the Chancellor could conceivably wish for the purposes of his disinflationary policy, the market still refuses to behave as though it had seen its worst days.

* * *

Dollar Rate Dips

Turnover in the liberated foreign exchange market remains impressive and gratifying. The feature of dealings this week has been the persistent commercial demand for dollars—United States and Canadian. The Canadian rate has now appreciated to $2.81 from the figure of $2.86 when Canada shed all exchange control just before the reopening of the London foreign exchange market. The demand for United States dollars has been widespread, the biggest orders on the market being on behalf of oil and tobacco companies. The middle rate has hardened to $2.78½, and is thus hovering near the lower point of the Bank of England's new range of official rates—$2.78-82. The fact that the market rate has not touched $2.78 must not be taken to imply that the balance of supply and demand in the market has been maintained hitherto without official intervention. A large proportion of the dollar import bill has to be met by Government departments—payments for cotton, wheat, sulphur and United States loan service, for example—whose dollar requirements are presumably provided direct by the Exchange Equalisation Account and not through the machinery of the market. But even without having to carry this burden of official operations, the market has found that the commercial demand for dollars has been outstripping the supply, with the rate pressing hard against the Bank of England's selling rate for dollars. Arbitrage between United States and Canadian dollars has again been active, the strength of the Canadian dollar providing a trend which the more venturesome operators have hitherto been able to follow with profit. As in previous weeks, some of this arbitrage business has been done by London firms via foreign centres such as Zurich—the rates prevailing there offering the required inducement; but operations on the part of London banks have involved the two dollars only. There is still no permission from the authorities in London for the market to arbitrage freely between dollars and Swiss francs—or, indeed, to deal freely in Swiss francs; the rates for Swiss francs in London diverge appreciably from the rates simultaneously quoted for sterling in Zurich.

Some banks in London have reached the authorised limits for holding certain foreign currencies. The banks have been given two kinds of limits for each currency—the first being the extent of the long or short position they run in their spot operations and the second the amount of spot currencies they can hold against forward sales. In certain currencies such as Swiss and Belgian francs there has been little development of a two-way forward market. The bulk of the business in London has taken the form of forward commercial purchases of such currencies which the selling banks have then covered by buying spot. This procedure has rapidly exhausted the limits for such spot holdings ordained by the Bank of England. Most of the accumulation of spot foreign currencies by London banks has been of this character. There appears to have been very little interest arbitrage involving short-term investment in foreign markets with appropriate forward exchange covering operations. The limits under which London banks operate have been the only brake on such a development, as the prevailing relations of discount rates in London on the one hand and New York, Brussels and other centres on the other hand, would justify a discount on forward dollars and Belgian francs. In fact, these currencies are standing at a premium. These disparities cannot exert their full weight as long as rigid limits on spot positions exist; but they are none the less an indication of the pull which is being exerted towards higher short-term money rates in London.

Belgium's Export Glut

Belgium's paradoxical anti-export drive has acquired new force since the turn of the year. From January 1st all Belgian licenses for exports to European Payments Union countries carry a warning that the exporter may be refused permission to convert the proceeds of his sales into Belgian francs. Indications from Brussels suggest that in December Belgium again failed to contain its surplus with EPU countries to the gold quota of $20 million authorised by the special agreement of last October. The surplus exceeded this figure by about $30 million and to that extent Belgium had to extend further credits to EPU.

New deterrents to this flood of exports are being thought out in Brussels. One of them is a proposal to increase the proportion—now 5 per cent—of the proceeds of exports to EPU countries which remain blocked. Another is to increase the period of six months for which blocking is effective. Another is a return to the system of free market dealings for converting into Belgian currency the proceeds of exports to EPU countries. The earlier attempt to canalise such business to a free market was defeated by the fact that Belgian importers satisfied their foreign exchange requirements in that market, leaving Belgium with correspondingly smaller payments to make via EPU. This made matters even worse and importers were thereupon compelled to obtain their exchange from official sources with the result that the free market closed down. There have, however, been some dealings in sterling at low rates in Brussels. Belgian holders of sterling, unable to obtain exchange conversion permits, have sold their sterling for investment in sterling securities at prices giving a Belgian franc equivalent of 120 francs to the £. as against the official rate of 140.

These events raise the question whether the time is approaching when Belgium, relying as it tends to do on orthodox monetary policies, may consider revaluing its currency. Another step might be the acceptance of the findings of the "Three Wise Men" on the inadequacy of Belgium's contribution to the economic effort of rearmament. The expedient of a selective battle against exports is unsatisfactory to all concerned. Not least does it offend the United States, which is now "discriminated against" in Belgian import policy and "dumped against" in Belgian export policy.

New Design for Cinema Duty

The proposals for revision of Entertainments Duty that have now been submitted to the Customs and Excise by the Cinema Exhibitors' Association primarily concern the way the duty is collected, not the total amount it takes. They arise out of an agreement by the former Chancellor of the Exchequer, at the close of negotiations with the trade last summer, to consider changes in the incidence of the duty. Mr Gaitskell put on the trade the onus of suggesting exactly what changes should be made, if any. This the industry has now done, and its proposals, on first examination, do appear to improve the incidence of the duty. But nobody with any knowledge of the cinema trade will find it surprising that the redesigned scale of duty submitted by the association would incidentally give to the exhibitors—and take from the Exchequer—an additional share of perhaps £5,500,000 a year from the gross box-office receipts.

Whatever may be the justification of the trade's hopes for a reduction in the total burden of Entertainments Duty, its complaint about the awkward incidence of the present scale of duty was entirely reasonable. The duty, payable on all seats costing over 7d., rises fairly steeply as seat prices approach 2s., and for seats above that price changes less frequently but mainly by rather larger amounts. This is the result of successive changes upon an original range of duty, and the result is restrictive as well as hap-

In the tradition of things well done

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

NATIONAL BANK OF INDIA LIMITED

ALUMINIUM

ADORNED with rubies and sapphires from the Mogôk mines of Burma this Shan woman prepares her food. These jewels and the common clay of her ornate bowl are but a few of the many minerals containing aluminium. Though first isolated in 1826, it was not until 1886 that its production became commercially practicable. Most of the world's aluminium is now produced by dissolving an ore named bauxite in molten cryolite, a mineral obtained from Greenland, and passing an electric current through the solution. In combination with other metals such as magnesium or copper, aluminium forms light alloys, some of which, though only about one third of the weight of steel, are just as strong and do not rust. The famous statue of Eros in Piccadilly Circus, one of the earliest large aluminium castings, shows no signs of corrosion after 40 years' exposure to London smoke.

One of the largest factories producing wrought aluminium and its alloys in the form of sheet, strip and extrusions is the I.C.I. works at Waunarlwydd in South Wales. These go to help in the production of all manner of finished articles from saucepans to aeroplanes, scaffolding poles to ashtrays, motor car parts to egg cups.

hazard. Owing to the abrupt steps by which the duty rises in the middle range of seats, there are some prices that the exhibitor would not find it worthwhile to charge, since to increase the gross seat price would yield him no net increase. With the added complication of the "Eady levy" on seat prices to assist producers of films, cases arise where to put up the total price of a seat would bring the exhibitor a smaller return. The scale of duty, by diminishing the possible flexibility of price, thus operates to some extent as a crude price control; and some of the seats that it makes virtually unusable are "traditional" prices that the exhibitor and the public prefer.

The trade's new proposals would substitute a fairly clear system for the present haphazard structure. It advocates a percentage duty levied upon the amount by which gross seat prices exceed a given "rebate": the percentage, in British coinage, must obviously be 25, 50, or 75, and the association has proposed a percentage of 50 on the seat price less a rebate of 7d. (though leaving the scale of duty on seats cheaper than a shilling as at present, in order to keep the distribution of the duty on different seat prices and different classes of cinemas roughly as at present). This scheme would allow complete flexibility of seat pricing, and would be easy to understand and administer. The association asserts that it might effect savings in administrative cost not only for the cinemas but also for the Customs and Excise itself. But the cinema trade may find that the Customs and Excise can muster sufficient ingenuity to shape an improved system that does at least some of the other things without costing the Exchequer quite as much.

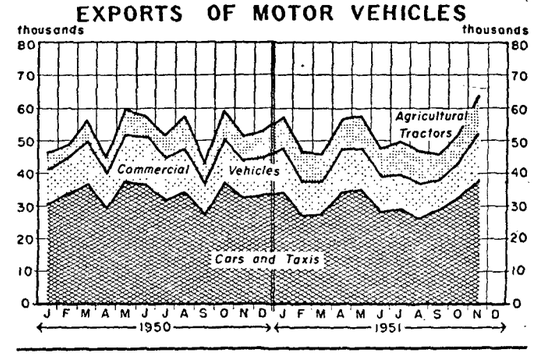
* * *

Coal According to Plan

Not nearly enough coal was produced in Britain last year to supply all the country's various and vital needs. That fact overshadows the creditable achievement of the miners, who produced 211,131,800 tons from the mines, 7,000,000 tons more than in 1950. Opencast output was 1,000,000 tons or more below the 1950 output, largely owing to wet weather; in total 222,117,500 tons of coal were won from all sources during the year. This fulfilled the forecast of the 1951 Economic Survey; it is a pity that consumers in Europe and critics in America will not appreciate this triumph of plan achieved.

Detailed coal figures are not yet ready for the full year even in provisional form. But from the trends of the first 50 weeks of the year it seems that the increase in output per manshift from 1.19 tons to 1.21 tons and in shifts worked a week by each wage earner (4.83 against 4.74) may have contributed about equally towards most of the extra 7,000,000 tons of coal raised. Manpower, which over the year as a whole was about 1,000 more than the average number in 1950, would probably have contributed less than half a million tons to the additional output. Nevertheless, perhaps the most encouraging achievement of the industry during 1951 was to have ended the year with about 9,000 more men in the industry, and some 1,500 more at the coal-face, than it had at the end of 1950. There may be certain special reasons, such as the call-up of military reservists, for the upward turn in the industry's manpower during the year; but there are special circumstances to be found, in retrospect, in any year, and to have gained a respite from the steady decline of manpower experienced during 1949 and 1950 is something of an achievement.

The rise in output, unfortunately, failed to keep pace with the rise in coal consumption. Since 1949 inland consumption has been rising proportionately faster than output, and during 1951 it, too, seems likely to have risen by 6,000,000 or 7,000,000 tons. Up to December 15th, inland consumption totalled just under 200 million tons; assuming that consumption during the last fortnight of the year was no higher than in 1950, another 8,000,000 tons would have been consumed in the last two weeks of 1951, making between 208 and 209 million tons compared with 202 million tons last year. Stock figures, again, are not yet available; but they were probably more than 1,000,000 tons higher at the end of 1951 than a year ago. None of the American coal ordered in the 1951 winter import programme arrived during December; the first Liberty ship, carrying 9,000 tons, docked in the Mersey on Wednesday this week, and another is expected this weekend.



* * *

Car Exports Rise Again

Car exports in November reached their highest figure of 37,837 cars and car chassis. Throughout most of the year reports have been running at a lower rate than they did in 1950 because shortage of suitable cargo space on routes to Australia, New Zealand and South Africa held up shipments of cars earlier this year; this shortage explains the comparatively high rate of deliveries to the home market in 1951. To prevent cars from piling up at the docks and factories, two companies, Standard and Austin, started the experiment of chartering their own ships. The success of the initial voyages during the summer has led to a programme of co-operative chartering by the motor industry. This has taken time to organise so that its influence on the rate of shipments was only partly apparent in October, when exports totalled 32,300 cars and its full effect was not felt until November. The backlog of export orders is large enough to keep shipments at this rate for a few months; the future is less certain.

Exports for the first eleven months of the year total 339,596 cars compared with 365,093 in the same period of 1950. Car exports in 1950 reached 398,300. The final figure for 1951 may reach between 370,000 and 380,000.

EXPORTS OF MOTOR VEHICLES

Output of cars has been falling and will continue to fall. In 1950, 522,000 cars were produced; the total for 1951 will be about 460,000 and for this year perhaps 440,000. The home market's quota of cars for 1952 stands at present at 80,000, but it is likely to be reduced, at least on paper, in order to keep export shipments at the highest possible level. Now that the industry has overcome shipping delays, a halving of the home market quota would mean that, despite falling output, shipments during 1952 could be maintained at the high 1950 level. Presumably the export markets could absorb this number of new cars. The setback in Canada was not unexpected since it was preceded by many months of exceptionally high sales that could not continue indefinitely. Until dealers start ordering cars for delivery in the spring, the season for buying new cars, it will not be possible to measure the ground lost in this market. In Australia and New Zealand there is no evidence of any setback in demand. More serious for British exporters is the cessation of shipments of sheet steel for car bodies from the

United States to Australia. Many British manufacturers have been exporting chassis to Australia and fitting them with locally-built bodies; now the Australian body-builders face a cut in output in the order of 40 per cent. Quotas may bar British cars in 1952 from good export markets like Sweden, but the commonwealth markets continue to prosper. The falling output of American cars is also bound to help British exports in those markets, including South Africa, where British and American cars are selling in competition.

* * *

Home Car Prices

It may not be long before the price increases announced this week by the Austin and Nuffield groups are followed by the other big producers. Nine months ago the price of the Morris Minor was increased from £299 to £333 (without tax). It now goes up a further £40 to £373. Prices for the larger versions go up by £60 to £80, those of the Riley by as much as £110. The price of Nuffield commercial vehicles so far remains unchanged. For some Austin cars this is the third increase within twelve months. Last February the A.40 went up from £392 to £420. In August it rose a further £20; this week the price goes up by another £17 to £457. Prices of other cars, compared with those ruling last July, are raised by £50 for the larger A.70, £74 for the A.90 sports car, and from £40 to £70 for commercial vehicles.

The increases are the result of rising costs in recent months, and in particular of the wage award to the engineers. It is unlikely that the industry will make any attempt at this stage to pass on these increases to the export markets. Too few cars are sold on the home market to cover all rises in costs simply by raising home selling prices, but there has been a comfortable margin on sales in the past twelve months. A revival of competitive selling abroad or, at a later stage, at home would give companies that have carried out major re-equipment schemes since the war an obvious advantage over their less efficient competitors.

* * *

Power Today and Tomorrow

The announcement of the first successful trials in Idaho of an atomic power plant shows that nuclear power is moving into the realms of practical experiment. Both in this country and in America, atomic power plants are being designed for submarines and aircraft. The Idaho experiments are presumably the first of many such trial runs which will provide the designers with essential data on the techniques of handling the liquid—and highly radio-active—metal that draws heat from the pile and uses that heat to raise steam for the turbines. Very little is known about this method of heat transfer, and even less about the behaviour of the materials used in the piles and in the steam-raising equipment under intense radiation. The atomic piles that produce plutonium for the bomb run at much lower temperatures than would generate a useful amount of heat; accurate knowledge of the behaviour of materials under the far more arduous conditions of power generation may take three to four years of experiments to acquire.

British scientists have developed a cosy method of keeping themselves warm with atomic power until these experiments are complete. About six weeks ago, the Ministry of Supply announced that the central heating system at Harwell was being run off the experimental piles. These piles are air-cooled, and before the air was discharged through the tall chimneys that are the one architectural feature of atomic engineering, it is used to heat water for the radiators and taps of eighty offices. According to reports, the Atomic Energy Commission in the United States has said that cost is not an essential criterion in the Idaho tests, and the experiment is not intended to show that electric power can be produced economically from nuclear sources. The Ministry of Supply gets down to fundamentals. The Harwell radiators cut coal consumption by "at least" 1,000 tons a year. The installation cost £15,000, and taking all expenses into account, should show a clear saving of £2,650 a year. This figure will presumably be higher when the piping of other buildings is completed. It is something that the British, whose disregard of the simple facts of domestic heating is notorious, should have given the Americans, who love their thermostats and set them high, a lead so admirably combining economy and comfort.

Higher Building Society Rates?

The Temperance Permanent Building Society, which with assets amounting to £26 million ranks as the eighth largest society in the country, announced last week that its advance rate to holders of variable-interest mortgages will be raised from 4 per cent to 4½ per cent from April 1st next. The monthly repayments on these mortgages will remain unchanged, and will be spread over a longer period. Borrowers under the society's fixed-interest mortgages are already paying 4½ per cent. Some of the smaller societies have raised their mortgage rates in recent months, but the Temperance Permanent is the first of the "Big Ten" to do so.

It remains to be seen whether the other leading societies will follow suit. Almost immediately after Bank Rate was increased last November, the Council of the Building Societies Association stated that it was not recommending any alteration in rates to members for the time being, although it would "obviously be guided by future trends." Outwardly the attitude of the societies remains the same, despite the hardening in interest rates on all sides over the past three months. Within the societies, however, the question of future policy in the changing monetary climate is being discussed. Some societies are not anxious to see a general rise in lending rates because of the probable repercussions on their borrowing rates. These societies are apparently confident that they can continue to attract sufficient funds at existing rates; and, indeed, there is evidence that the inflow of savings to societies has increased again after some decline earlier last year. Furthermore, there is a strong tradition of stable rates throughout the building society movement. This tradition was voiced last month by the chairman of the powerful Woolwich Equitable Society, who said that despite the rise in interest rates this society intends to maintain its mortgage rate at 4 per cent "as long as may be practicable." It may be that the initiative of the Temperance Permanent will soon bring matters to a head.

* * *

Nine Months' Revenue

The Exchequer return for the first three quarters of the financial year suggests that the outcome of the full twelve months' figures will prove rather better than that envisaged in the estimates. The return is summarised below:—

	in £ million		
	Results for first nine months		Estimates for full year
	1950-51	1951-52	1951-52
Ordinary Revenue	2,373.6	2,682.2	4,236.4
Ordinary Expenditure*	2,319.6	2,908.0	4,196.9
Surplus or deficit	+54.0	−225.8	+39.5
Net capital expenditure	343.0	380.0	496.0
Overall deficit	289.0	605.8	466.5

* including sinking fund.

Expenditure is running below the estimates, though it is well up on the corresponding figure for the previous year. Defence expenditure during the present financial year may fall £100 million short of the estimate. The buoyancy of revenue is again a consequence of further inflation since Mr Gaitskell's budget nine months ago. The impact of higher

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

prices and earnings is clearly apparent in the yield of income tax which is £101.9 million up compared with the 1950-51 period and also in the yield of customs and excise which are £81.5 million and £36.2 million higher, respectively. Much can happen to disturb the course of the figures in the next three months, but on present indications the "above the line" surplus promises to be well over £200 million as against the estimate of £39.5 million and the over-all deficit correspondingly below the figure of £466.5 million estimated nine months ago.

The latest exchequer return reveals the first payments of interest and principal on the United States and Canadian loans. The interest on these payments, amounting to £39.4 million, has been charged to ordinary expenditure while the capital portion amounting to £23.2 million is shown as a "below the line" outgoing for repayment of external debt.

American Mining and British

When the National Coal Board late in 1950 sent a productivity team to study mining in America, it was fair to ask not "What can the British coal industry learn from the United States?" but "What more can it learn?" Ever since the Reid report upon the technical efficiency of British mining, the industry has been sending representatives to America to study American technique, and it has imported a number of American machines for test under the different conditions in British mines. It was asked at the time of its appointment whether the coal productivity team's journey was really necessary. After studying the impressively detailed chapters upon mining machinery and technique, in the team's recently published report, a reader may conclude that most of this should be known to the Coal Board in any case, and probably is. The account of American mining conditions, too, leads to reluctant acceptance of the British experts' general conclusion that they differ so widely from those here that only a limited number of improvements can be transplanted. What is less expected, and perhaps justifies the report by not having been said before — certainly not to as many mine managers as this report ought to reach—is that the British industry can learn from the American in its human problems.

Essentially, it seems, a mine in America is regarded by everyone in it much in the way as any other factory. Like most other businesses, its management follows the familiar "line and staff" pattern, with production executives at all levels able and willing to call upon the services of specialists in various aspects of engineering without feeling any detraction from their dignity. Nobody expects to know it all, as some British managers feel they should. This liaison exists not only with technicians, but with accountants, who form a part of the team, and direct their own activities mainly towards assembling the financial and statistical information needed for the planning of production. Technical specialists in America are themselves generally recruited from practical mining men: there seems none of the suspicion and jealousy between the mine managers and the specialists from "on top" that pervades some British mining districts. Within the mine, the section foreman, who is a salaried official and part of the management team, and not a member of any union, is a key production official to whom no comparable supervisor exists in British mines.

The American industry, judged by the present age composition of its miners, may have a manpower problem comparable to the British not so many decades away; but American management is confident that new machines will be developed and installed faster than is necessary to keep pace with any drift from mining. Much of the confidence that the British team found may be based upon easy seams, apparently inexhaustible reserves of which a far smaller proportion is extracted than in Britain, and on the general industrial climate of which so many other productivity teams have spoken. What is remarkable about this report, indeed, is that it portrays an industry so close in general industrial approach and morale to normal manufacturing industry. That is the feature of American mining that the British industry needs to develop.

* * *

Deadlock in Tin

No fresh developments have occurred in the tin market and the London price during the past two weeks has hovered between £900 and £910 a ton. The United States—or rather Mr Stuart Symington, the head of the Reconstruction Finance Corporation—has not increased its offer of 112 cents a lb. (£896 a ton) for Bolivian ore, though Mr Symington has admitted that the RFC has been buying small quantities from other sources. The American mission which recently visited the tin-producing areas of Malaya and Indonesia has not yet submitted its report. But from recent statements made by Mr Symington, it would seem that the RFC policy is to buy tin at different prices from different sources according to the variations in the costs of production. In that case, Bolivia, which has the highest costs, would receive the highest price. As Mr Symington recently announced that 112 cents a lb. would provide Bolivian producers with a margin of 50 per cent for taxes and profits, Malaya and Indonesia would presumably be expected to accept a lower price.

This tin tangle has reached the stage when it is likely to be lifted from the commercial to the diplomatic level. Tin is a vital export for both Malaya and Indonesia. The cost of producing tin in South-east Asia has risen during the past eighteen months, though the present price no doubt allows a profitable margin to most producers. But that is not the whole point. If production is to be encouraged there must be the prospect of a reasonable return over a period of years, sufficient inducement for the marginal producer to stay in production, and an incentive towards mining lower grades of ore.

Mr G. W. Simms, chairman of the Ayer Hitam Tin Dredging Company, has reminded shareholders that the old international tin control scheme prevented prospecting and that the full effects of that policy are only now being felt. Immediately after the war tin producers were fully occupied with the problems of rehabilitation and now it is impossible to prospect in remote areas and difficult enough in developed areas. Malaya is in fact using up its capital resources and output is likely to fall, while costs rise further. Some American spokesmen frequently claim that tin producers seek to maintain an artificially high price. Could it be that the United States, by its own controls on the domestic use of tin, is trying to maintain an artificially low price?

* * *

Bigger Metal Allocations

The International Materials Conference's machinery for allocating scarce metals is getting into its stride and quotas for the first three months of 1952 for copper, zinc, tungsten and molybdenum have been announced. Both the copper and zinc allocations refer only to primary metal; exports of semi-manufactures are to be maintained at a level commensurate with the exporting country's allocation of metal, but the actual quantities are not specified. As before, the allocation is a "total entitlement for consumption" and participating governments are responsible for seeing that consumption is restricted to this level. Only 80 per cent of the production of Chile's large copper mines is allocated; the remaining 20 per cent and the entire output of its smaller mines will be sold outside the allocation scheme. The allocation of copper for the quarter has been increased from 677,160 metric tons to 744,680 tons, so that most of the major countries should receive 10 per cent more; the Benelux countries, however, have been allotted nearly 25 per cent more. The zinc allocation has been increased from 419,260 tons to 487,650 tons; Benelux, Canada, Germany, Japan and Britain obtain the largest share of the additional quantity.

Production of tungsten and molybdenum is increasing and the allocations of tungsten to each country are increased by 12½ per cent above those of the fourth quarter of 1951. Britain, France and Sweden have been allotted larger quantities of molybdenum. In future it is hoped that both these metals will be allocated every six months. Provisional allocations for cobalt for the first quarter of 1951 and for nickel for the month of January have also been published. Here, too, a six months' quota will be introduced shortly. For both metals, the allocations are larger than in the fourth quarter though Britain's cobalt quota is slightly lower than for the last three months of 1951. Britain appears to be faring quite well under the IMC. Its copper quota is at an annual rate of 400,000 tons against an annual rate last year of 365,000 tons ; its zinc quota represents an annual rate of 256,000 tons against 240,000 tons last year. Such quantities, if maintained throughout the year, should satisfy civilian consumption at the current level and provide for increased defence requirements, including a small amount for stock. The allocation of tungsten is increased from an annual rate of 2,720 tons to the equivalent of 3,100 tons and of molybdenum from 2,150 tons to 2,200 tons.

* * *

Devaluation of the Dinar

Last week's devaluation of the Jugoslav dinar must be counted as one of the most important symbols so far of the transition of the Jugoslav economy from the Soviet to the "western" pattern. It marks a departure from the common practice of all Soviet countries to sever all connection between the external and internal values of their currencies and to use their exchange rates purely as weapons of economic policy—not least the extraction from foreign countries which have to make remittances to the Soviet bloc of the maximum price in foreign currencies for the privilege of maintaining diplomatic or commercial representation in those countries. The fact that the dinar was grossly overvalued at its previous official parity of 17.7734 milligrams of fine gold or 50 dinars to the dollar was admitted in the concessions made to tourists whereby they acquired dinars at about one-third of the official price. No such concessions will be needed now that the official rate of the dinar has been devalued to 2.96223 milligrams of gold, giving it a dollar equivalent of 300 dinars. The corresponding adjustments have been made in the sterling rate, which has moved from 140 to 840. This adjustment to more realistic exchange rates will have little effect on Jugoslav foreign trade, which is almost exclusively transacted in terms of sterling and dollars. It will, however, have a direct impact on tourist traffic, which should be attracted by what, on the basis of current prices and exchange rates, should be one of the cheapest countries in Europe. But the main significance of the devaluation is its indication of another move by Jugoslavia towards a freer economy. The new dinar parity has been approved by the International Monetary Fund.

* * *

Rayon Price Cut

A cut of 20 per cent in the price of spun rayon yarn is of considerable interest at this moment. In the past two years there have been five separate increases in spun rayon yarn prices compared with only two increases in the price of rayon staple, the spinners' raw material. At the beginning of 1950 spun yarn prices were 37.5d. a pound for 32s. In April yarn went up 2d. a pound and by a further 3d. in November after staple prices had risen from 18d. to 21d. a pound. At the beginning of 1951 staple prices rose again by another 4d. and have since remained unchanged at 25d. a pound. But the price of spun yarn rose in January by 7d. to 50d. a pound and then by two further stages in February and August to 60d. a pound. This price is now being reduced by approximately 12d. a pound, bringing spun yarn to a little below the level of twelve months ago. So big a fall in selling prices without a compensating drop in raw material prices must involve a big cut in the spinners' own margins.

The cut is certainly timely, for although there has been no falling off in the demand for rayon yarn either at home or abroad, sales of spun rayon cloth have suffered most in the current slump in textiles. There has been considerable resistance in Lancashire, particularly among the spinners, to the idea of meeting retail price resistance by cutting profit margins, but no other way has yet been discovered of reducing selling prices to levels that domestic and foreign consumers are prepared to pay. The steady expansion in the output of rayon staple doubtless gives the rayon spinners a little more room to cut their margins, since they can expect that turnover will continue to increase. Staple output before the war was less than 1,000,000 pounds a month. Last January it had risen to 13,400,000 pounds a month, and although for want of sulphur output fell to 11,700,000 pounds in March it recovered during the summer, and the total for November, 16,700,000 pounds, was the highest yet recorded. Staple now accounts for nearly half the industry's output of rayon. The combined output of continuous filament and staple fibre (including a small quantity of synthetic yarns such as nylon and terylene) reached 36 million pounds in November.

* * *

Premier Petrol Again?

Discussion of the possibility of a return of branded petrols has revived, and it seems virtually certain that sometime this year, though perhaps not so soon as some prophets have suggested, branded petrols will again be on sale, after an interval of 13 years, on the British market. Branded petrols mean first-grade petrols ("premier" rather than "premium" as they are usually known in the United States). Petrol is, in fact, the only petroleum product that the oil companies have not been permitted to sell in more than one grade of uniform pool quality. As in the case of the return of premier grade kerosene two years ago, one good reason for the marketing of a better quality petrol is the need of an important section of consumers. Complaints by farmers of the harmful effects of pool kerosene speeded up the sanction for the marketing of the full range of kerosene qualities in 1949 ; similarly the requirements of British motor manufacturers for the home use of first-grade petrols in their cars to provide adequate proving ground for the performance of their vehicles and the desirability of a further advance in engine compression ratios provides a powerful argument for the return of premier grade petrols.

But there are equally strong technical reasons for their return. With the completion of six catalytic crackers next year, all the required supplies can be produced in this country. All but one of the major companies in the British market will have "cat crackers" next year, with the Shell and Anglo-Iranian (whose products are marketed through Shell-B.P.) groups leading with four out of the six. Even more than on the occasion of de-rationing, it will be the British groups' ability, with their dominating position on the supply side, to provide the required products which will be the determining factor in the decision.

If and when branded petrol returns, it will be possible to assess the competitive strength of the different chains of service stations associated with the major oil companies. If premier grades are restored, the major companies' spirits will probably be of the order of 80 octane (Motor Method) as against the present pool rating of 70. In few countries in Europe is petrol sold at the pump with an octane rating as low as this. Since the refinery programmes in this country

Ascot produce first BALANCED FLUE GAS WATER HEATER

ASCOT 715
Balanced Flue
Multipoint
Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.

The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating down-draughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.

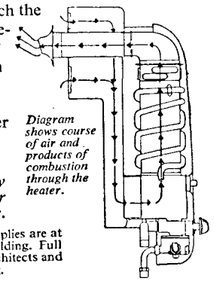

Diagram shows course of air and products of combustion through the heater.

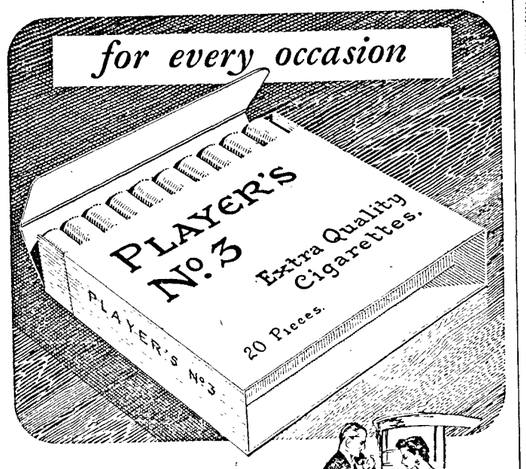

Ten local authorities have already specified the Ascot 715 for their housing schemes.

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

New Life Records in 1951

The first announcements of new ordinary life assurance business completed in 1951 are given below; the remainder (which includes the Prudential) will appear in a further note next week. It is clear, from the figures already published, that the trend is strongly upwards and the 1950 record total new business, which was well in excess of £600 million, will almost certainly be considerably exceeded. The figures of different offices are not always comparable because of lack of uniformity in reporting new business in certain types of contract and in particular in group life assurances (which accounted for nearly 13 per cent. of the total new ordinary business in 1950) and deferred annuities. In 1950, new business was 10 per cent higher than in 1949; the results to date indicate that last year's new business was running at 19 per cent above the 1950 level.

The rapidly growing contribution made by staff life assurance and pension schemes to the new life assurance figures continued unabated last year. "Top hat" pension schemes for executives in the higher salary groups have attained considerable popularity in the last year or two. Under such schemes an endowment assurance is usually effected which provides a capital sum on retirement followed by a pension; provided the requirements of the Inland Revenue are met, the benefits are secured at a relatively small net cost to the employee. "Income benefits," which provide cheap life assurance cover at the time when it is most needed, continue to be effected in a considerable volume. The ordinary life and annuity funds of United Kingdom registered insurance companies increased by £77.3 million in 1947, £87.6 million in 1948 and £80.5 million in 1949 (the latest year for which official returns are available). The growth of the funds in 1950 was probably at about the 1949 rate. In addition industrial life assurance funds have been expanding since the war by rather more than £30 million per annum.

Shorter Notes

The Board of Trade's announcement of a change in methods of price control for utility textiles will benefit manufacturers, retailers and the public alike, even though it comes too late to provide much relief for the hard-hit winter clothing trade. Under the old system retailers were given a fixed percentage margin based on the wholesale price. Now they are simply given a maximum selling price. This makes it possible to even out differences in the price of old and new stock whereas before, if a retailer were to buy a job lot at reduced prices before his original stock was exhausted, he was faced with the prospect of selling almost identical garments at widely varying prices. Wholesalers and manufacturers are known to have large stocks of garments that retailers have refused to buy for this reason.

*

The Bankers' Clearing House returns for 1951 pass another inflationary milestone: for the first time, total clearings exceeded £100,000 million. The actual total for the year was £108,773 million, an increase of 15.4 per cent on 1950. The Clearing Bank figures for the first eleven months of this year show that the average of bank deposits was about 2 per cent higher last year than in 1950; comparison of deposits and clearings suggests that the velocity of circulation of credit increased appreciably last year. The ratio of clearings to bank deposits in 1951 was 17.7 as against 15.7 in 1950.

*

The future of development councils has been under discussion in recent weeks and so far all have been reprieved. These councils come up for review at the end of their first three years. In November, Parliament approved an order renewing the life of the Cotton Board, and at the end of last week the Board of Trade announced that the Furniture Development Council would continue in being. A similar announcement is expected about the council for the jewellery industry which is also three years old. The Clothing Industry Development Council would not normally come up for review before 1953, but since it was set up in face of strong opposition from the industry—an attitude that has not greatly altered in the subsequent eighteen months—its immediate abolition is being considered. The members of this council are appointed annually, and their term of office has been extended for a further six months only, "to give time," according to the Board of Trade, "for fuller consideration of the future of the Council."

*

In his statement accompanying the annual accounts of Turner and Newall, Mr W. W. F. Shepherd offers an explanation of the directors' much-criticised decision merely to maintain the ordinary dividend at 20 per cent in the face of an advance in net profits from under £3,000,000 to over £4,500,000. The directors, he remarks, felt justified in consolidating the special bonus of 2½ per cent, paid in 1950, into the final dividend, "but, notwithstanding the record earnings, they cannot go further so long as they feel, as they do, that such record earnings are due partly to temporary conditions which are beyond their control." Demand for the group's products both at home and abroad is running at a high level and production is at or near its peak. In such circumstances, this general statement will not enable disappointed shareholders to measure the force of the word "partly."

Company Notes

Hawker Siddeley.—Last June, when the ordinary capital of Hawker Siddeley was increased to £5,822,350 by the 300 per cent scrip bonus, the directors took the unusual step of announcing that a total distribution of 10 per cent on the new capital would be made for the year ending July 31, 1951. In the recently published accounts, this dividend has been duly recommended; it is equivalent to a payment of 40 per cent on the old capital on which a dividend of 32½ per cent was paid for the twelfth successive year in 1949-50. In the past, the justification of such conservatism was to be found in the group's policy of financing fresh developments from retained profits. The directors now add another strand to this argument by emphasising that "traditional methods of computing profits take account of historical costs only, whereas industry is faced with the economic reality of having to replace assets, consumed in earning profits, at progressively increasing prices."

On the conventional "true and fair view" of trading profits the advance from £4,798,717 to £6,493,408 is striking. The recovery in earnings from the 1949-50 recession is due to an expansion of turnover both in volume and value—perhaps an indication that the first phase of the defence programme, the production of Meteor aircraft, has opened satisfactorily. The board's preoccupation with the replacement problem is to be found in the appropriation of £1,000,000, against £750,000, to subsidiaries' reserves for the replacement of fixed assets and development.

	Years to July 31, 1950	1951
Consolidated Earnings:—	£	£
Trading profit	4,798,717	6,493,203
Total income	5,310,935	7,196,629

Stocks	15,938,797	16,563,984
Cash	2,392,128	4,067,409
Reserves	13,256,554	12,610,150
Ordinary capital	1,455,587	5,822,350

£1 ordinary stock at 36s.xd. yields £5 11s. per cent.

With cash resources at £4,067,409, against £2,392,128, the group should be able to cover in relative comfort its outstanding capital commitments, estimated on July 31st at £1,446,000. But in the last five months the "financial implications of the rearmament programme" will have made their mark in the accounts. The slow recruitment of labour and delays in machine tool deliveries will not lighten the group's production and financial problems; in these circumstances, equity shareholders might be ill-advised to expect too much too quickly.

★

Raleigh Industries.—An improvement in group trading profits from £1,681,984 to £1,851,498 by Raleigh Industries marks the achievement of a new record—a million bicycles produced in the year to August 25th. In common with many other industrial concerns, Raleigh have tackled the replacement problem (ignored by the tax collector in his assessment of the group's liability at £885,008, against £764,041) by creating a fixed assets replacement reserve. Last year this reserve was increased from £953,792 to £2,700,000. Sir Harold Bowden points out that this sum roughly equals "the total amount required at the present time to replace fixed assets at current high prices, taking into account the life still remaining in them." When this shortfall between depreciation allowances and actual replacement costs has been made good, there will remain the financial needs to cover increased stock values and book debts. On these arguments, the maintenance of the ordinary dividend at 25 per cent. to which it was raised from 20 per cent in 1950, was as much as could be expected.

Steel and other material shortages seriously threaten bicycle production this year. As the spokesman of a group that exported more than 70 per cent of its output, Sir Harold urges that the bicycle industry should receive a high priority in any allocation scheme. He fears that if material shortages reduce output, overseas markets may be lost to German and Japanese competition. The first fruits of the programme of capital extensions will be affected by material scarcities and rising costs in the rearmament period.

	Years ended Aug. 26, 1950	Aug. 25, 1951

£1 ordinary stock at 91s. 10½d. yields £5 9s. per cent.

Lancashire Cotton.—The corporation's policy of re-equipment paid handsomely in 1951. Production rose to a new post-war record and trading profits advanced from £3,808,816 to £6,819,018. Sir John Grey, the chairman, comments that "in every case where re-equipment has been carried out the object—a reduction in the cost of production—has been obtained." Once the present programme is completed—and with outstanding commitments at £720,000 there is presumably still some way to go—another scheme will be started. The overriding importance of capital re-equipment and concern with the high cost of maintenance and replacement may have prompted Sir John's statement that a policy of dividend restraint will still be followed. Coupled with Sir John's refusal to prophesy a repetition of last year's "splendid profit record," this remark suggests little more than the maintenance of the ordinary dividend at 15 per cent, to which it has been raised from 12½ per cent.

The strength of liquid resources, with cash balances up from £2,479,288 to £4,469,176, at the end of financial year followed a considerable reduction in the quantity of raw cotton stocks, "owing to the price premium attached to raw cotton bought for delivery in October." About £2,000,000 will be absorbed in building up raw cotton stocks to their normal essential weight. Sir John insists that the spinner must be given an immediate and adequate cover against his yarn sales if a more or less free raw cotton market is re-established.

Statistical Summary

EXCHEQUER RETURNS

For the 16 days ended December 31, 1951, total ordinary revenue was £145,105,000 against ordinary expenditure of £232,690,000 and issues to sinking funds £640,000. Thus, including sinking fund allocations of £16,637,000 the deficit accrued since April 1, 1951, is £225,787,000 compared with a surplus of £54,019,000 for the corresponding period of the previous year.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

ANNUAL GENERAL MEETING

The twenty-sixth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held on December 28th, at 29, Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the chairman) presided.

The secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors' report to the stockholders.

With the concurrence of the stockholders present, the report and accounts and statement by the chairman, which had been previously circulated, were taken as read.

The chairman referred with regret to the death of Sir William Goodenough who was chairman of the bank prior to his election as chairman of Barclays Bank Limited, and, on behalf of stockholders, extended their sympathy to Lady Goodenough and family.

CHANGES IN DIRECTORATE

Mr Crossley referred also to Mr A. W. Tuke's resignation from the board on his succeeding Sir William Goodenough as chairman of Barclays Bank Limited, and to the election of Mr A. C. Barnes as a vice-chairman of that bank. Mr Crossley added that Mr Barnes had attained pensionable age in October but would, he was pleased to say, continue to serve in the same capacity as hitherto.

The chairman welcomed Mr F. Seebohm, who had joined the board since the last meeting and said that Mr A. S. Aiken, the chairman of the South African board, had been elected a vice-chairman of the bank.

He paid tribute to Mr W. W. Milne, M.C., who had retired from the position of senior general manager earlier in the month and recorded the appointment of two new general managers, Mr J. F. Cade and Mr B. F. Macdona, formerly assistant general managers.

The chairman then moved the adoption of the report of the directors and the statement of accounts and the payment of a final dividend of 4 per cent. on the "A" stock and "B" shares, less income tax at the standard rate of 9s. 6d. in the £ in each case.

The motion was seconded by Mr A. C. Barnes, deputy-chairman and carried.

The retiring directors, the Rt. Hon. Viscount Portal of Hungerford, K.G., G.C.B., O.M., D.S.O., M.C., Captain Derek Fitzgerald and Mr Frederic Seebohm, were re-elected.

On the motion of Sir Frank Newson-Smith, Bart., seconded by Mr O. R. Hobson, the auditors, Messrs Deloitte, Plender, Griffiths and Company, Price Waterhouse and Company, Peat, Marwick, Mitchell and Company, and Cooper Brothers and Company, were reappointed.

BONUS ISSUE APPROVED

Resolutions approving an increase in the bank's capital to £15 million by the creation of 5 million new "A" shares of £1 each and authorising a bonus issue of fully paid "A" shares (to be converted into "A" stock when issued) in the proportion of one share for each £4 stock held, were proposed by the chairman, seconded by Mr A. C. Barnes, and carried.

A vote of thanks to the staff, proposed by Mr C. Fitzherbert, a director, and seconded by Mr L. E. D. Bevan, was carried unanimously and responded to by Mr D. Carter, general manager (staff).

A vote of thanks to the chairman for presiding at the meeting was proposed by Mr H. T. Egerton, and was unanimously accorded.

McDOUGALLS TRUST LIMITED

MR KENNETH MOORE'S REVIEW

The eighteenth annual general meeting of McDougalls Trust Limited was held on December 31st at Thames House, Queen Street, London, E.C.4.

Mr Kenneth A. E. Moore (the chairman), who presided, said:—

In preparation for this meeting, I have been taking a broad look at our affairs in the hope of adding a measure of perspective to the purely formal report before you today.

In the course of this mental process two matters have struck me very forcibly, namely:—

(1) That it is now more than 12 years since the milling industry was put on a war footing, and now, more than six years after the cessation of hostilities, it still remains under Government control on a basis virtually unchanged since 1939.

(2) That the state now takes by way of taxation nearly two-thirds of our profits and takes it all in hard cash.

On the first point it really is astonishing that a system of control which was perhaps unavoidable for the siege conditions expected and, indeed, experienced in time of war, should still persist years after the successful conclusion of hostilities. Under that system the milling industry has been remunerated roughly on the basis of its prewar earnings from its actual milling operations; all foreign wheat has been purchased by the Government against a background of strategic, political and exchange considerations rather than on a commercial basis; home-grown wheat has been purchased by individual millers, but at a price fixed from time to time by the Government instead of at a market price based on type, quality and demand; finally, the selling price of bulk flour from mill to baker and other trade users has been fixed by the Government, while the retail price, both of plain and self-raising flour, has been governed by statutory maximum retail selling prices.

This strange uncommercial, unselective and uncompetitive set-up has persisted for over 12 years. It is to be hoped that, in spite of the fact that the price of bread and flour to the public is still highly subsidised, something can be done to give the milling industry some measure of freedom, some chance to use its skill in the selection, buying and milling of wheat, and thus freedom, under the tonic of competition, to give the public the quality and efficient service for which the British milling industry was famous before the war.

On the second point, namely, taxation, it is equally astonishing, perhaps, that today the Government share of our profits is roughly twice that of our shareholders, the more so because out of the shareholders' portion has to come any money ploughed in to maintain and develop the business. It follows that, in an inflationary world where the mere maintenance of business continually requires more and more capital, either capital resources or dividends must suffer.

To look at the matter from a purely domestic standpoint, in spite of substantially increased profit we have maintained our dividend unchanged for the last 15 years and, in the course of those years, out of the shareholders' taxed portion as a Group, we have ploughed back nearly £600,000. This year, owing partly to some falling off in profits and partly to a rise in the effective rate of taxation, the amount ploughed in is little more than £20,000 reflected by the increase in the Group carry forward.

The fall in profits is due, as I foreshadowed at last year's meeting, to the fact that our selling prices for self-raising flour remained frozen by statutory maximum retail prices while our costs for packing materials, wages, transport and the rest were all going up. This "squeeze" persisted until December 17, 1951, when a partial measure of relief was given by the raising of the statutory maximum retail selling price of self-raising flour.

Our sales of self-raising flour in the past year were an all-time record—that means the highest for over 75 years—but one other record was broken, namely, the margin of profit on self-raising flour, per unit of sale, fell to the lowest since records have been kept.

Apart from those derived from self-raising flour, our profits include the more or less static remuneration from our controlled milling operations and profits earned by subsidiaries. The latter, I am glad to say, showed a gratifying increase, which has gone some way to making good the falling off in the profits from self-raising flour.

I have already mentioned that we have not raised or reduced our dividend for 15 years. In that period our production and sales have more than doubled. Fuel and power, wages, transport and most other costs have also more than doubled; while the Government's share of profits in the form of taxation has increased from 27½ per cent. in 1939 to over 60 per cent. in 1951.

By contrast, not only does our rate of dividend remain at the prewar level, but the net amount receivable by our shareholders is smaller by reason of the rise in the standard rate of income tax from 5s. 6d. to 9s. 6d. To put it crudely, our shareholders' cash income from the business is much smaller today than it was when the business was half its present size and, moreover, in the meantime, the capital employed has been increased by nearly £600,000 as the result of profits ploughed in, and thus withheld from distribution.

This sort of thing, however, is the common lot, but perhaps on occasion, it is worth drawing attention to it as a reminder that if the taxation of industry continues at the present penal level, existing industry will show increasing signs of pernicious financial anæmia and new industrial ventures will be stifled at birth for lack of incentive to the risk capital involved.

The fact that we have in the past pursued a stable and conservative dividend policy has enabled us so far to keep the financial position remarkably strong, as you will have noticed from the balance sheet. If inflation goes on, however, at the pace of the last year or two, we are bound, as has been the general experience, to be faced with the need for additional capital. That time has not yet arrived, and let us hope that the efforts now being made by the Government to stop the inflationary spiral will bear fruit and so make our present resources suffice for a further period of active development.

I take this opportunity of expressing our thanks to management, staff and workpeople throughout the Group for work well done in what has been a troublesome year owing to rising costs and shortages of packing material. The fact that, in spite of all the difficulties, a record output and turnover was achieved, is a tribute to their efficiency.

Finally, I should not like this occasion to pass without referring to the loss we have sustained through the death of Mr T. H. Fairbrother, for many years a director and our chief chemist.

The report and accounts were unanimously adopted.

WANKIE COLLIERY COMPANY, LIMITED

INCREASED PRODUCTION BUT LOWER PROFIT

SERIOUS RISE IN COSTS

MR ROBERT FOOT'S SPEECH

The twenty-eighth annual general meeting of the Wankie Colliery Company, Limited, was held on December 31st in London, Mr Robert Foot, O.B.E., M.C., the chairman presiding.

The chairman, in the course of his speech, said:

You will have seen from the accounts that the results of our operations during the year resulted in a profit before taxation of £283,396 which in spite of an increased coal production shows a drop of £54,473 compared with last year.

ALLOCATIONS FROM PROFITS

Taxation absorbs an amount of £100,000, leaving a balance of £183,396 after taxation, as compared with £181,869 in the previous year. The very substantial additions to plant, machinery and buildings and the initial tax allowances arising from this have had the effect of eliminating any liability this year for United Kingdom income tax. The board has, however, considered it necessary to transfer to the taxation equalisation reserve the sum of £95,000, which represents the approximate taxation benefit arising from the excess of the initial and annual allowances on plant and machinery over the depreciation charged in the accounts.

Of the balance of £88,396 the board recommend a final dividend of 5 per cent., which will absorb £86,871, thus leaving £1,525 to be added to the carry forward which now stands at £41,965, as compared with £40,440 in the previous year.

Although the year's saleable coal output of 2,342,133 tons was the highest ever yet produced at Wankie and represented an increase of 199,778 tons, or 9.32 per cent., over the previous year, at the same time we fell substantially below our estimate. It is this shortfall which has been the greatest disappointment to us and to the customers who depend upon us and which has also had an over-riding effect upon the final profitability of the year's working.

FACTORS AFFECTING RESULTS

The relatively disappointing results have been due to three main causes.

First, the serious difficulty of maintaining an adequate supply of good African labour. The shortage has been most serious in the type of labour required for the actual production of coal—viz., the workers at the coal-face, or lashing boys as they are called: it is in this category that the deficiency has been the most damaging in its direct effect upon production.

There is no doubt that the demand for good African labour in Central and Southern Africa has become highly competitive, and I have also no doubt that so far as Wankie is concerned we have got to do two things—both are expensive and both must be done at the same time:—

(*a*) To improve all the conditions surrounding the employment of Africans, and

(*b*) To proceed, as fast as the power of absorption and common sense allow, with the most thorough mechanisation of our underground operations as will be consistent with the physical conditions.

URGENCY OF PRODUCTION PROBLEM

Secondly, because of the urgency of the production problem and of the difficulty in maintaining an adequate supply of really good underground labour, we have proceeded to mechanise the production faster than would have been wise if conditions had been more normal.

The speed at which complete underground mechanisation has been introduced has brought with it the following practical difficulties:—

(*a*) The time available for giving adequate training both to the European staff and to the African operators of the mechanised units has been too short.

(*b*) We have been compelled to put the units into production before we had been able to recruit sufficient skilled European personnel.

The joint effect of the insufficiently trained African crews and the shortage of trained European supervisors and maintenance men has been to restrict the output per mechanised unit below its optimum capacity and has for the time being, at any rate, thrown the cost per ton of the mechanised output very substantially above the cost of the handgot production.

MECHANISATION POLICY JUSTIFIED

I am satisfied, however, that in view of the difficulty and the urgency of the whole position the policy of rapid mechanisation has been justified. It is interesting to note that in the financial year 1949-50, we produced in this way 84,000 tons or 3.92 per cent. of the total production, and in the present year we produced 422,621 tons or 18.04 per cent. of the total production. During the same years the handgot production decreased from 2,023,351 tons in 1949-1950 to 1,877,363 tons in the present year.

The third cause for the disappointing production results has been a recent serious, but we hope temporary, deterioration in the underground geological conditions and there is no doubt that during the last twelve months the mining conditions at both collieries have had a serious effect upon both the volume and cost of production.

The costs of production have been rising progressively throughout the year. Many different factors have contributed to this rise, the present high costs of mechanised mining, the increased cost of salaries and wages both European and African and of all stores and materials being the principal.

There are no signs at the present time of any reducing trends in the level of any of the major items of cost—indeed the signs would appear to point in the opposite direction.

MEASURES TO INCREASE REVENUE

In view of the whole of the circumstances surrounding the operations of the company at the present time, the board has come to the conclusion that the only sensible business course to take is to increase our revenue to meet the position which has now been disclosed.

In the directors' report reference was made to the price arrangement under which the company is operating for sales of coal other than those made under certain fixed price contracts. Under this arrangement, while the price of coal can be reduced at any time, it can only be increased on or after January 1st in the year following the completion of the company's financial year on the previous August 31st.

The auditors' certificate based upon the results of the year now under review support an increase of 2s. 3d. a ton, and under the circumstances the directors have, therefore, decided to increase the price by that amount as from February 1, 1952.

The directors much regret the necessity to reduce the dividend for the year from 7½ per cent. to 5 per cent. It will, however, be obvious from the report and accounts that a dividend higher than 5 per cent. could not have been justified as a result of the year's working. I think that what I have already said sufficiently explains the circumstances, and I would only like to add first that it will be generally accepted by all those with experience in the control and administration of mining companies, as it is by your board, that a dividend of 5 per cent. is totally inadequate as a return to the shareholders having regard to the risks and hazards which every mining enterprise must involve; and, secondly, that during the last two years a very great deal has been achieved at Wankie and that, in spite of all the present difficulties, the way ahead is much-clearer and the future can be faced with much greater confidence than was the case even a year ago.

CAPITAL EXPENDITURE

Turning now to our programme of capital expenditure, during the last two years the company has actually spent nearly £2 million on capital projects and at the present time we have outstanding commitments amounting to approximately £1 million.

The magnitude of these figures, in relation both to what has been spent at Wankie for capital purposes over the last 20 or 30 years, and in relation also to the sense of urgency under which all the important projects included in this programme have been carried out, are sufficient evidence both of what has been accomplished and what also is now nearing completion. Broadly speaking, this expenditure and the current commitments to which I have referred will provide all the technical equipment which is necessary to support the increasing output of coal up to 1954, but at the same time during the next two or three years further capital will have to be spent at Wankie upon improvements which are desirable in the interests of the well-being of the community, both European and African.

CHAIRMAN'S VISIT

I should refer to the visit which I paid to Wankie last August. I am glad to say that on this occasion my wife came with me, at the special request of the board, for the purpose of studying at first hand the conditions at Wankie, as they affect particularly the wives and mothers and children, and of making suggestions and recommendations.

So far as I am personally concerned, my second visit to Wankie gave me a further opportunity of studying on the spot the various problems which I have already sufficiently indicated, and of consulting directly with the general manager and the principal officials as to the proper steps to be taken for their solution.

I am quite satisfied that while we must continue to strengthen the staff at various

levels of responsibility, we owe a great debt of gratitude to those who are carrying the present burden from the general manager downwards.

Some measure of the accomplishment which has so far been achieved is the fact that the saleable output of coal has been raised from 1,579,568 tons in 1947 to 2,342,133 tons in the year under review, an increase of 48.28 per cent.

I have been asked by the board to refer in my speech especially to the contribution which has been made by Powell Duffryn, Limited, as managers of the company. The board are convinced that the appointment has added immensely to the strength of the company and that the contribution made by Powell Duffryn to the planning and progress of the company in every direction has been of the greatest possible value.

PROPOSED TRANSFER OF CONTROL

I must close my general review and come to a special matter, of great importance to the company.

At my meeting with Sir Godfrey Huggins, the Prime Minister of Southern Rhodesia, on my arrival in Salisbury at the beginning of last August, Sir Godfrey told me that his government had come to the conclusion that, owing to the great importance of the Wankie Coalfield to Southern Rhodesia and to Central Africa in general, coupled with the many difficulties that have to be overcome from time to time, it was highly desirable that the control and management of the company should be transferred to Southern Rhodesia.

On my return, the board gave full consideration to the Prime Minister's request and resolved unanimously that (subject to the approval of the British Government) proposals should be placed before the shareholders to carry out the Prime Minister's request. The board passed this resolution after having requested and received an assurance from Powell Duffryn, Limited, that if the control and management of the company was transferred to Southern Rhodesia, they would not only ensure that all necessary changes in their organisation were made to make certain that the efficiency of the management contract would be maintained, but would also, with my agreement and subject to the retention of my association with the Powell Duffryn Group, make all necessary arrangements to enable me to act as chairman of the company, with my own residence and domicile in Southern Rhodesia.

I have been informed that following the board's minute, direct representations have been made on the subject by the Southern Rhodesian Government to the British Government. The company has also submitted an application to the Treasury.

FORMATION OF SUBSIDIARY COMPANY

If the transfer of control and management is approved by the British Government, the board of Powell Duffryn will be willing to form a subsidiary company in Southern Rhodesia to which would be transferred the management contract, together with the necessary senior personnel to enable this important responsibility to be efficiently and thoroughly carried in Salisbury.

If the change of the control and management of the company is approved by the British Government, an extraordinary general meeting of the shareholders will be summoned, at which the necessary alterations in the memorandum and articles of association will be brought forward for consideration by the shareholders, and at the same time other matters connected with the proposed transfer will be explained.

Mr Leo d'Erlanger said that he had listened with interest and approval to the observations the chairman had made with regard to the transfer of the company to Rhodesia and he was particularly struck by the readiness with which the chairman seemed to have accepted the suggestion that he should go out and live there.

The chairman, acknowledging with appreciation the remarks of Mr d'Erlanger, said that if the move was made he and his family had promised to go out because they believed it to be right to do so. It was a big move for the company, for his family, for himself and for those senior personnel from the Powell Duffryn Group who would be going there to support him; but he personally felt it was right. When one was convinced about a thing being right it had to be done one way or another. Therefore, if the move was made they would do their best to ensure that Wankie served those great territories in the future even better than in the past and also became, he hoped, more lastingly profitable to the owners of the property—the shareholders.

The report was adopted.

TURNER AND NEWALL LIMITED

VOLUME OF EXPORTS WELL MAINTAINED

STRONG DEMAND FOR ASBESTOS AND MAGNESIA PRODUCTS

MR W. W. F. SHEPHERD'S STATEMENT

The annual general meeting of Turner and Newall Limited, will be held on January 24, 1952, at the Chartered Accountants' Hall, Manchester, when it is expected that Mr W. W. F. Shepherd, the chairman of the company, will preside.

Mr Shepherd's statement to the stockholders has been circulated to them with the report and accounts, and, after dealing with the accounts of the company, it contains a detailed review of the company's operations during the year to September 30, 1951, both at home and abroad.

MINING COMPANIES OPERATING TO CAPACITY

The following are extracts from the statement as regards certain matters referred to therein:—

Our mining companies in Africa have continued to operate to the capacity of their respective plants, but still under difficulties arising from shortages of all kinds. During the year a small mine, the Croft Mine at Filabusi, Southern Rhodesia, has again been brought into production, but it is a low grade and low yield property, and can only make a small additional contribution to our needs.

A new milling plant at Mashaba, Southern Rhodesia, is now effectively completed and is in operation. We expect, as a result, to be able to increase the production of graded fibre from this area, but the increase, while welcome, will by no means bridge the gap between available supplies and current needs.

Our Canadian mining company, Bell Asbestos Mines, Limited, has operated to capacity in the past year, and the difficulties caused by shortages have not been so acute as in Africa. From the end of 1951 quarrying ceases at the Bell mine, and in future all ore will be recovered by the "block-caving" method of underground mining. This change, which is inevitable, as we proceed to recover ore from lower levels, will somewhat increase our costs, but is not expected to reduce the total tonnage of fibre produced at the mine.

PROGRESSIVE INCREASE IN DEMAND

Turner Brothers Asbestos Company Limited, has experienced during the year under review a progressive increase in demand for asbestos textile and allied products, leading to heavy pressure on the manufacturing capacity of its Rochdale factory, where a high level of activity has been maintained despite an acute local shortage of labour. The large new factory at Hindley Green has also worked up to a high rate of output, particularly in conveyor belting for the coal mining industry, and has become fully established as a productive and efficient unit.

Good progress has been made with large-scale development plans, which include an additional factory at Hindley Green (to be mainly concerned with asbestos textile processes) and an extensive programme of reconstruction and modernisation at Rochdale. It is hoped that actual construction work in accordance with these schemes can be commenced during 1952.

EXPANDING SALES OF "FERODO" MATERIALS

The sales of "Ferodo" brake and clutch linings and of the other materials manufactured by Ferodo Limited, are continuing to expand both at home and abroad. During the past year intensive efforts have been devoted to export markets, and they have resulted in a remarkable trading increase. At home, two new service depots have been opened—one in Nottingham and the other in Southampton. It is proposed further to extend the list of service depots as suitable premises become available.

During the past financial year a considerable quantity of new plant has been brought into operation, and the company has been fortunate in securing a reasonably adequate amount of additional labour. In consequence, the production for the period easily constituted a record, although, partly owing to limitations on basic materials, it was not possible fully to keep pace with demand.

INCREASED PRODUCTION OF BUILDING PRODUCTS

A year ago I had to report that Turners Asbestos Cement Company Limited had been hampered to some extent by a lack of suitable grades of asbestos fibre. In this connection I am glad to say that the position improved considerably during the past year, so that it became possible to operate all plant to the maximum, and in fact an extra Sunday shift was introduced during the year on all sheeting and pipe machines.

The demand both from the home and export markets has remained at a very high level, substantially in excess of the increased production. This applies not only to general building products but equally to "Everite" asbestos cement pressure pipes.

OUTPUT OF CHEMICAL PRODUCTS MAINTAINED

Although the demand for the products of The Washington Chemical Company Limited, has remained at a high level, we have contrived during the year to maintain production on a basis reasonably satisfactory to our customers. This has been achieved by an increased efficiency from existing plant and by additions to the plant where this has been necessary and possible. This policy of keeping pace with demand will be continued.

The work of Newalls Insulation Company Limited during the year in heat, cold and sound insulation has been at its usual high level; in fact, the amount of contract work during the year has reached record figures. Outstanding contracts of importance comprise marine insulation in connection with oil tankers and other vessels, together with extensive work on power stations and general industrial installations.

SHIPMENTS TO "HARD CURRENCY" COUNTRIES

The volume of our export business has been well maintained during the year. Dominion and Colonial markets naturally figure largely in our export programmes, but I am glad to say that our shipments to "hard currency" countries are by no means negligible and, in certain of our products, have been increased during the past year.

The Turner and Newall Limited Pension Scheme has now completed its fifteenth year, and increases in strength and usefulness. The third quinquennial valuation recently received from our actuary shows a surplus, and a generally healthy financial condition. As mentioned in the directors' report, it is proposed as from January 1, 1952, to increase the benefits payable in the Male Workpeople's Section of the scheme, by substituting a sliding scale of pension rates, based on actual length of service at age 65, instead of the present flat rate pension. Your Board again recommend the allocation of £20,000 from the year's profits to Turner and Newall Welfare Trust Limited, for account of the Trustees of the Robert Turner Fund.

DIVIDEND RECOMMENDATION

This year your Board recommend a final dividend of 15 per cent. on the ordinary stock, making, with the interim dividend of 5 per cent. already paid, a total dividend of 20 per cent. for the year. This is the same rate of total distribution as last year, but on that occasion 17½ per cent. was declared as ordinary dividend and 2½ per cent. as special bonus.

This year your directors feel justified in recommending that an amount corresponding to last year's special bonus be included in the dividend, but, notwithstanding the record earnings, they cannot go further so long as they feel, as they do, that such record earnings are due partly to temporary conditions which are beyond their control.

CURRENT YEAR'S OUTLOOK

My short-term forecast of last year has been duly fulfilled, but present conditions in this country and throughout a large portion of the remainder of the world make long-term forecasting just as impossible as it was a year ago.

Again on a short-term basis, your Board anticipate the continuance of strong demand during the current year, and, with production at or near the maximum possible with available plant and raw asbestos, expect to be able again to report a satisfactory year's trading, but costs will continue to rise, and we can hardly expect indefinitely to achieve new profit records year by year. Competition is strong and increasing, but we remain confident of our ability to retain and, if possible, increase our share of the market in asbestos and magnesia products throughout the world.

AGAR, CROSS AND COMPANY, LIMITED

PESO SALES REACH NEW RECORD LEVEL

EXPANSION OF ACTIVITIES

MR VAL. C. FISHER ON CURRENCY PROBLEMS

The forty-fifth annual general meeting of Agar, Cross and Company, Limited, was held on December 28th at Armourers' Hall, 81, Coleman Street, London, E.C.

Mr Val. C. Fisher, C.A., chairman and managing director, presided.

The following is his statement, which had been circulated to stockholders with the report and accounts, and which was taken as read:—

The two most notable events in your company's year ended June 30, 1951, were the further devaluation of the Argentine Peso on August 28, 1950, and the receipt of a very substantial financial services remittance from Argentina in terms of the Protocol to the Anglo-Argentine Trade and Payments Agreement, 1949, at the earlier promised rate of 19.36 pesos to £1.

The effect of the former was greatly to reduce the sterling value of the net balance of Argentine current assets and reduce the sterling value of the year's trading results in Argentina.

The effect of the latter was to enable the company to recover some of the exchange differences provided in earlier years, to pay off a substantial part of the balance due for U.K. taxation, and to pay a dividend on the ordinary stock for the year to June 30, 1950, and the preferred and second preferred dividends for the year to June 30, 1951.

SALES AND PROFIT

Sales for the year in Argentine currency were an all-time record. Gross profit percentages were down, but in spite of this, and a heavy increase in expenses, the currency profits were substantially greater than last year. However, when converted at 39.42 (last year 25.26), the sterling profit on trading was down from £815,361 to £680,635, or by £134,726. Other currency credits and charges have been affected similarly—notably Argentine taxation which this year takes £161,866 ($6,380,738 %) as against last year £178,972 $(4,520,823 %).

No provision is necessary this year for U.K. income tax, since exchange losses are more than sufficient to cover profits.

I am glad to report that the balance of "U.S. dollars purchased from the Argentine Central Bank pending transfer" has been reduced from US$4,318,919 to US$311,446, and we have been able to pay our U.S. deferred creditors accordingly.

The accounts, when read with the directors' report, call for no further comment other than the balance sheet heading "Investments in Subsidiary Companies."

In May of this year the board were able to purchase the entire share capital of a private company called Nielson and Maxwell, Limited, which, founded in 1857, has been active ever since. Nielson and Maxwell, Limited, whose style is "Iron and Steel and General Merchants," operate in a similar way to your own company—their area of trade being Australia, New Zealand and the Far East.

Further, we have entered into a small limited partnership in Argentina to ensure supplies of one of the many locally produced articles we sell.

REMITTANCES

Following receipt of the remittance of profits under Article 10 (a) of the Protocol to the Anglo-Argentine Trade and Payments Agreement, 1949, application was made for a further remittance under 10 (b) (i) of this Protocol, but at the time of writing this statement our claim has not been agreed. When this remittance is forthcoming the rate will be the official free market rate of the day.

Until our claim under 10 (b) (i) has been agreed, it is impossible to say what will be our expectations of remittances under 10 (b) (ii).

On receipt of an adequate remittance under 10 (b) (i), the company will be able to make payment of an interim dividend on the ordinary stock for the year to June, 30, 1951, as mentioned in the directors' report.

THE CURRENT YEAR

The results of the current year are difficult to forecast.

The drought in Argentina, following hard on that of 1950, is having grievous effects. There is already an apparent shortage of buying power and a great deal will depend on whether or not there is a continuation of the present money policy of meeting the internal needs of the country.

Present policy is to increase the mechanisation of agriculture, and in this your company is taking a large part. Agricultural implements and repairs have been extensively imported and permits at present held should ensure future supplies, although it is unfortunate that, due to armament needs, the U.S.A. factories will be unable to ship the quantities we had earlier expected. Similarly, we have permits and fully expect to receive importations from other countries, with the exception of Great Britain. Here, I regret to report, that last year and in the current year, in spite of the Anglo-Argentine Trade and Payments Agreement and the Protocol thereto, such U.K. importation permits as we have managed to obtain have been quite inadequate for our needs. There are hopes that as a result of efforts presently being made permits for U.K. importations may be soon forthcoming, but with U.K. deliveries as extended as they are today, no benefits can be expected from this source in the current year. Local industry continues on a substantial level and the sale of locally produced products forms a very important part of our trade. Our considerable stocks of merchandise, expected imports and local supplies should enable us to achieve a high volume of sales, always provided that there is sufficient currency in circulation.

CONSTANTLY INCREASING EXPENSES

Expenses are constantly on the increase. Salaries and wages have had to be substantially raised to meet the rapidly increasing cost of living. Other prices are moving steadily upwards and there is no sign that a peak has been reached. Argentine taxes will be up. In particular, a new tax, in substitution of inheritance tax, will be levied on all limited liability companies. This new tax will be 1 per cent. on the effective capital of your company in Argentina.

The financing of your Argentine business is a matter of grave concern. Increasing costs mean increasing sales to cover those costs, stock merchandise sold has to be replaced at ever-increasing prices and there is the heavy drain on our resources to meet the burden of past U.K. taxation. Every effort is being made to keep our money turning over as rapidly as possible, but, due to the reasons given above, we have had to have heavy recourse to our Argentine bankers.

Finally, we have the uncertainty of the exchange rate. In two years the value of the

Argentine peso has been halved in terms of sterling. A substantial Argentine local profit can, by a change in the exchange rate, be turned into a sterling loss. In the last two years your company has had to absorb exchange losses totalling £1,387,436 on the net balance of current assets in Argentina.

Last year I reported that the board had under consideration plans for entering new markets. This policy has been actively pursued and surveys have been made and visits paid to several territories. Already your new subsidiary company, Nielson and Maxwell, Limited, is making progress, and while little can be expected from these new ventures for some time, since there is much to be done, we are hopeful that they may make a useful contribution to your company's profits in the future.

I tender the thanks of the board to the managers and staffs of your company in London, Argentina and New York.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: To date, peso sales have been maintained at last year's high level, but now customers' demand for general merchandise is falling off perceptibly, this being the reflection of tightening money conditions and resistance to more stringent credit terms. Sales of farm machinery should, however, compensate appreciably and we are hopeful that, in spite of increased expenses and taxation, the peso results for the year to June 30, 1952, will be reasonably good.

I regret to say that the hoped for financial services remittance has yet to materialise.

The report and accounts were unanimously adopted and the other formal business was transacted.

The proceedings terminated with a tribute to the staffs of the company in London, Buenos Aires and New York and a vote of thanks to the chairman and directors.

AVON INDIA RUBBER

INCREASED TURNOVER

The sixty-second ordinary general meeting of The Avon India Rubber Company, Limited, was held on January 3rd in Melksham, Wilts, Major R. F. Fuller, D.L. (chairman), presiding.

The following are extracts from his circulated statement:

The net profit before providing for taxation amounts to £358,974, compared with £222,045. After making provision for all requirements, including taxation, the net profit is £160,796, which compares with £102,045 in the previous year.

Once again our turnover has increased both in volume and in value and this applies to both the home and export markets.

The cost of raw materials continued on the same high level and under present world conditions there seems to be no strong indication of any downward trend.

We have had to seek additional financial resources to cover the increased value of the stocks we have to carry and to provide funds for expansion. The margin of profit left free after payment of taxation and the very modest ordinary dividend was inadequate for these purposes. Therefore your directors arranged for the provision of additional funds by the issue of £300,000 of loan stock.

We have taken a lease of a modern factory on the Bridgend Trading Estate. A fair amount of plant has been installed and is in production.

Our current assets exceed liabilities by £985,025. Additions to capital assets to the value of £155,622 have been made during the year. Installations in progress amount to £107,245, while our future capital commitments are £217,957.

The report was adopted.

THE INDIAN IRON AND STEEL COMPANY LIMITED

SELLING PRICES AND DEPRECIATION

SIR BIREN MOOKERJEE'S VIEWS

The thirty-fourth ordinary general meeting of The Indian Iron and Steel Company, Limited, was held on December 21st in Calcutta.

Sir Biren Mookerjee, the chairman, presided and in the course of his speech, said:—

Production of pig-iron in the year ended March 31, 1951, shows a drop of 83,333 tons compared with the previous year, due mainly to the fact that the No. 1 blast furnace at the Hirapur works was off production for some four months in the earlier part of the year for relining. Relining of each of the company's four furnaces every three or four years or so is, of course, a necessity and must cause variations in the total output of the plant at varying intervals. This year's accounts are affected not only by the loss of production, but also by the very greatly increased cost of the materials and labour for relining, which has necessitated an increase in the provision for repairs and renewals by some Rs.5 lakhs.

PIG-IRON PRICES

As a result of a fresh investigation by the Tariff Board earlier in the year, new selling prices were fixed for pig-iron for a period of three years beginning from August 1, 1951. As regards foundry iron, there has been an average increase of about Rs.20/- per ton over the previous prices, but you must not be misled into believing that this increase is intended to provide any higher profit. About Rs.12/- of this amount represents the full increase in works costs, which the board was satisfied was due to reasons beyond the control of the company, and, allowing for certain small items, the remaining Rs.8/- mainly represents an extra depreciation allowance of about Rs.13 lakhs gross, or Rs.6/- per ton, over and above Rs.11 lakhs allowed as normal depreciation.

Assuming that the estimates of the Tariff Board are realised in full, this Rs.13 lakhs additional sales realisation will be partially offset by the amount of tax chargeable thereon, the resultant net amount being appropriated as an extra allotment for depreciation according to the orders of the Government, who have stipulated that the amount must be so set aside and not utilised in or towards the payment of dividend or profit sharing bonus. Other things being equal, this means that if there is no further increase in costs during the next three years, the position so far as pig-iron for sale is concerned will remain the same as at present.

AN INJUSTICE

There has been obvious, if probably inadvertent, injustice done to your company. The old prices had been fixed after an investigation by the Tariff Board of 1948, with effect from November 1, 1949, and were to be reviewed at the end of a year—that is, after October 31, 1950. As in the case of the retention prices for steel, the new prices for pig-iron should have been applied with retroactive effect from November 1, 1950. It was found by the Tariff Board that there had been an increase of about Rs.12/- per ton in our Kulti works costs for reasons beyond our control since the investigation in 1948.

No reason has been given as to why this company should have been deprived of all compensation whatsoever, in respect of despatches from November 1, 1950, up to July 31, 1951. We intend to put forward a claim to compensation at an early date which it is hoped the Government will without much delay or difficulty entertain favourably. No further investigation is involved, as the excluded period substantially corresponds with the sample period on the costs of which the future estimates have been made.

DEPRECIATION ALLOWANCE

This and every other industry must recognise the importance of the step taken by the Tariff Board towards liberalising the allowance for depreciation which hitherto was normally based on income tax rates. The grant of depreciation over and above the income tax level by the board and its acceptance by the Government marks the introduction of a principle which industry generally has been demanding for many a year and we hope that its application will be extended wherever possible. But scrupulous care should be taken in applying this principle that, where as in the present instance there are several producing units, their claims receive not necessarily a uniform but definitely an equitable treatment.

Their claims must be determined with reference to their own as much as the national needs they are required to meet. The investigating authority should take into account the assistance, if any, they might have previously received from the Government, the consumer or the taxpayer, the use they have made of such assistance, or of the additional profits they might have earned thereby, and the manner in which they have built up and utilised their depreciation and other reserves. It is of the utmost importance that such authority and the Government should be satisfied, before laying a further heavy burden on the consumer, whether the need for special depreciation has arisen for reasons beyond the producer's control.

If the amount of extra depreciation had been determined by the application of such tests, your company would have received a more equitable treatment in this respect than has been actually accorded. The question of depreciation in a case in which a key unit which serves the national interest during a period of its critical need cannot be regarded as one affecting only yourselves as shareholders, but as affecting the nation and the industry as a whole.

REQUEST TURNED DOWN

Your company had a very sound case on the merits for being granted an allowance for depreciation over and above the amount provided under the agreement with the Steel Corporation of Bengal, Limited. The company asked for special additional depreciation. This request was turned down. Here is one of the several ways in which the fortunate consumer of Indian pig-iron is subsidised at the expense of the producer.

The Tariff Board has strongly recommended that the Government should give the most serious consideration to the problem of ensuring the availability of an adequate supply of foundry pig-iron. In response the Government have stated that they have been taking steps to interest private parties to put up one or more new plants to produce 375,000 to 500,000 tons of pig-iron. This statement must remain as the expression of a pious wish rather than become a reality, if private parties have no better inducement to look forward to than a precarious existence, such as that we have known for the last few years.

Considering the magnitude of the capital

and the risk involved from the investor's point of view, and the national importance of the industry itself, if the Government are serious in their desire to encourage private parties they must lay down the precise terms on which the private parties would be expected to undertake the task, and give them an assurance that they would be adhered to until the new enterprises are able to stand without assistance against foreign or internal competition. A repeated insistence on the creation of a classless society as the declared goal of the Government's policy is hardly necessary to its eventual accomplishment and cannot be reasonably reconciled with a simultaneous exhortation to private capital to invest in industry.

The report was adopted.

NEW ZEALAND LOAN AND MERCANTILE AGENCY

MR W. H. TATHAM'S REVIEW

The fifty-seventh annual general meeting of the New Zealand Loan and Mercantile Agency Company, Limited, was held on December 28th in London, Mr W. H. Tatham, O.B.E., T.D., the chairman, presiding.

The following is an extract from the chairman's circulated review:—

The results of the past year constitute a record in the history of the company.

The profit for the year shows a large increase to the figure of £1,135,338 which, although in part due to exceptional factors arising from the very high wool prices, is nevertheless also largely due to the continuing expansion of the company's business by the opening of new offices, development of existing offices and widening of the variety of business handled.

Although the gross profit for the past year was over £518,000 larger than for the one before, the dreadful burden of taxation has reduced this increase to only £116,000. The board feel that it is necessary to retain the whole of this increase in the business, not only to finance the higher price structure of the present day, but also to enable development and expansion to be continued. This consideration influenced the board in their decision not to recommend any increase in the distribution to ordinary stockholders this year.

AUSTRALIA

In Australia the company's figures easily constitute an all-time record, and the management and staff are much to be complimented on this.

The past season's average wool values were more than double those of the previous season, the average price per bale of wool sold by the company having risen from £A79 in 1949-50 to £A178 in 1950-51. The company and its subsidiary, Schute Bell Badgery Lumby, Limited, handled nearly 13 per cent. of the total clip of the three States in which we operate—Victoria, New South Wales and Queensland.

NEW ZEALAND

The serious and prolonged Waterside Workers' strike, which commenced in February, paralysed commerce and industry. As a result, all the remaining wool sales for the season were cancelled and over one-third of the clip remained unsold. This carry-over was sold at special auctions arranged after the close of the company's financial year, and at prices far below those that would have been obtained if the usual sales had not been cancelled.

In spite of the many difficulties arising from the long strike, the company had a record year, for which the management and staff must be complimented.

THE FUTURE

Statistically the demand for the whole of the wool clip in Australia and New Zealand should be secure. The carry-over from the 1950-51 clip in New Zealand has mostly been cleared, and there is less likelihood of extravagant bidding for stock-piling and defence.

Since the war, world wool consumption has been at a level considerably in excess of actual current production, and only the war stock reserves have filled the gap. These reserves have now been disposed of, and there are no prospects of any substantial increase in the world's wool clip. Even if, owing to high clothing prices, there should be some fall in civilian demand, military demand everywhere seems likely to be maintained.

Last year's profits, which enabled us to strengthen our internal provisions and make a large appropriation to reserve, were undoubtedly exceptional, and it would be unrealistic to assume a repetition. However, so far as can at present be judged and subject to climatic conditions, the board are satisfied that, for the current year, the outlook remains favourable and that, with its expanding business, the company should continue to earn satisfactory profits.

The report was adopted.

HEENAN AND FROUDE, LIMITED

ORDERS REACH £5 MILLION

The forty-ninth annual general meeting of Heenan and Froude, Limited, was held on December 21st at Worcester, Mr Alan P. Good, the chairman, presiding.

The following is an extract from the chairman's circulated statement for the year ended September 1, 1951:

The past financial year sets yet a higher record of profits, and orders outstanding on the books of the group have reached the £5 million mark for the first time.

Your directors recommend a final dividend of 10 per cent., making 15 per cent. for the year on the ordinary capital as increased by the bonus issue in December, 1950. Your directors also recommend a one-for-eleven bonus issue to the ordinary shareholders.

Turning to a review of the Company's departments and subsidiaries, the engine test plant section is very fully engaged and the development of the high-speed internal combustion turbine is leading to notable changes in the design and type of dynamometers.

Heenan eddy-current couplings are now well established as a most effective method of transmitting power at controlled speeds and orders are more than double those of the previous year.

The demand in the Industrial Cooler section continues unabated, but the acute shortage of steel plates is limiting output. Water coolers are in unprecedented demand, and many installations have been started up during the year.

In the automatic machine section new designs continue to be introduced with success. The municipal engineering department has had a good year, both in orders and deliveries of refuse disposal and utilisation plants.

Fielding and Platt, Limited, had its most successful year since acquisition by your company in 1939. It produces a very wide range of hydraulic presses, pumps, accumulators and other ancillary equipment, and has maintained improved output. Very considerable orders have been booked recently which have brought the outstanding order position to the same satisfactory level which maintained at this time last year. The company is in the process of producing two more powerful additions of the Bofec/Fielding slush pump, which it is anticipated will be of considerable interest to the oilfield equipment industry.

Court Works Limited has again achieved a high rate of output of malleable and grey iron castings. It is gratifying to be able to record that our long-term policy of modernisation and expansion, coupled with active local management, has amply justified itself in recent years.

W. G. Bagnall Limited:—The extension of this subsidiary's activities to the diesel electric locomotive market is progressing satisfactorily, and two shunters have been delivered and are in service.

The spare capacity at the Wishaw Works of Morton Machine Company, Limited, has been fully taken up, and whilst the output is predominantly of bakery machinery and equipment, this subsidiary has entered a wider field in engineering to good purpose.

The demand for the abattoir equipment of Industrial Waste Eliminators Limited continues at a high level. The balance of orders was 45 per cent. greater at the close than at the start of the year. The order book for valve gear for locomotives designed and supplied by Associated Locomotive Equipment Limited represents more than a year's work and profits are at a satisfactory level.

The report was adopted and at a subsequent extraordinary general meeting and a separate general meeting of preference shareholders, resolutions were passed (a) to capitalise £42,640 15s. and distribute a share bonus of one ordinary share for every eleven held among ordinary shareholders, and (b) to alter the conversion rights attached to the preference shares.

TENNAMARAM PALM OIL COMPANY, LIMITED

HIGHER PRICES

The twenty-eighth annual general meeting of the Tennamaram Palm Oil Company, Limited, was held on December 28th in London, Mr J. Bligh Orr, the chairman, presiding.

The following is an extract from his circulated statement:—

The trading profits are lower than those of last year by £6,503. This state of affairs was brought about by the steep rise in wages over the past 12 months, while increased costs of all materials and articles in general use have also contributed. Actually, labourers' wages are some 36 per cent. higher than in the early part of 1950.

The output of palm oil was 955 tons, against 1,084 tons, and of palm kernels 196 tons, against 238 tons in the previous financial year, but the average net f.o.b. prices realised were higher, the value of palm oil being £85 18s. per ton, as compared with £76 1s., and that of palm kernels £65 18s. 4d., as against £46 13s. 8d.

For the calendar year 1952 the Ministry of Food has again agreed to buy the whole palm oil output at the average c.i.f. market price, worked out quarterly, less £8 per ton to bring it to f.o.b., less a discount of 4 per cent., but subject to a minimum price of £115 per ton f.o.b. The estimated crop for the new season is again rather lower.

Many rubber companies are now receiving from the Malayan Government a proportion of their claims under the war damage compensation agreement, and it is hoped our turn will come soon. Your directors now recommend a final dividend of 6 per cent. on both classes of shares (making 10 per cent., less tax, for the year).

The report was adopted.

THE PLESSEY COMPANY

(Manufacturers of Components for the Electrical and Mechanical Engineering Trades)

ENCOURAGING RECOVERY

IMPROVEMENT IN CONDITIONS MAINTAINED

EXTENSION OF MANUFACTURING ACTIVITIES

MR A. G. CLARK'S STATEMENT

The twenty-seventh annual general meeting of The Plessey Company, Limited, was held on December 31st in London, Mr A. G. Clark (the chairman) presiding.

The secretary (Mr H. L. Jarvis) read the notice convening the meeting and the report of the auditors.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts:

We submit to you today the accounts to June 30, 1951. When we met a year ago I told you that a considerable improvement was apparent in the conditions under which we were operating, and I am glad to say that the improvement which I was then able to report has been maintained down to the present time.

Conditions are, of course, still troublesome in some respects, but the difficulties we are experiencing have been less intense than was the case two and three years ago. In consequence there has been a recovery in our profit as per the consolidated accounts to £597,467, and while this figure is still materially below the profits we were at one time making, the recovery is encouraging and will, I hope, be maintained.

DIVIDEND INCREASED

Taxation absorbs £392,945, which deducted from the £597,467, above mentioned, leaves an available profit of £204,522. We are transferring £50,000 to general reserve and are proposing a final dividend of 12½ per cent. against the 10 per cent. final of a year ago. You will remember that we reduced our dividend when we experienced a deterioration in business four years ago, and with the return to easier conditions we have felt it right to propose the increase I have mentioned.

In view of much of the discussion which takes place in these days with regard to dividends, and although our decision to make a higher payment needs, in my view, no defence, it may not be inappropriate to put the increase into proper perspective. The increase in the net dividend is the equivalent of about 6s. 8d. per annum per employee. In other words, if the amount involved were paid out as wages, instead of as dividend, it would mean that each of our employees would receive about three-halfpence a week more.

During the year under review national awards were made which in the case of adult male workers amounted to 8s. to 11s. a week. Adult male workers are now to get a further increase of 11s. per week and corresponding increases have been made or are in process of negotiation with reference to other classes of workers. I am not questioning these increases, but they should be considered in relation to the three-halfpence a week I have just mentioned.

FINANCING DEVELOPMENT AND GROWTH

Since during the year we have ploughed back into the business approximately £300,000 (if the reserve for the enhanced replacement cost of fixed assets be included) the increase in the dividend represents only a fraction over 1 per cent. on the profits which have been ploughed back. For the moment, and in view of the difficult times through which the world is passing, such a situation may be tolerable, for on the short view it may be worth ploughing money back into the business today in the hope that tomorrow the proprietors will derive some benefit. If, however, on the long view, the proprietors will not so benefit it seems to me that, quite inevitably, a situation will come about in which the financing of development and growth will just not be worthwhile—in fact will become impossible.

If and when it becomes clear that, in general, it will pay better to restrict the growth of a business rather than devote heart, mind and money to fostering its efficiency and to pressing its expansion, it will have become equally clear that we have progressed very far towards the industrial extinction of this country.

For in such circumstances we should be working obsolete and inefficient plant, because there would be neither the incentive nor the opportunity to modernise it. Our costs would become steadily less competitive and our hold on world trade would as steadily decline. The poor conditions under which people would work and the out-of-date tools which they would be forced to employ would depress those by whom our factories are operated and, losing the incentive of pride, the quality of their effort would decline.

There is no exaggeration in this statement. The underlying facts are well appreciated by many of our workpeople. Although our own plant is well maintained and, in general, modern, we are nowadays from time to time forced to retain particular machine tools far beyond the time when, by our usual practice, they would have been replaced. When this happens I am interested—indeed encouraged, because I can see that they understand and appreciate the problem involved—to find that operatives and foremen will complain to me that I cannot expect first-class work from them if they must use worn machine tools. They are, of course, right. They know it, we all know it, but it is not always remembered that new tools have to be paid for, and that the capital employed in buying them as necessarily requires and deserves its reward as does the operator by whom the machine tool is to be used.

PRODUCTION

Our business is, by its nature, one in which it is necessary to make very full use of our productive facilities if we are to earn an adequate return on our capital investment, and any interruption in the normal flow of the production on which we are engaged can be very costly.

Over the last few years, we have had to adjust ourselves to various problems, such as limitations in electrical power obtainable and the maintenance of a balanced labour force. Between 1945 and 1951 the number of our employees fell to under 6,000, but by June, 1951, we had been able to build up again to some 8,900, and at the present time the total is over 10,000.

At this level our output is running at well in excess of £10 million per annum, and we are today producing a greater volume and a greater variety of products than ever before in our history. We have narrowed our profit margins in one or two directions, however, in order to obtain more volume, and interruptions to smooth production are still unhappily numerous.

For many years Government work has formed an important part of our business. Although our commercial work has steadily expanded during the last few years, Government contract work has increased recently at an even greater pace, so that our outstanding order position at the moment shows a good balance between commercial and Government commitments.

It is often thought that the company is engaged almost entirely in the production of radio components. In fact, only about one-quarter of our output is in this field, the balance being represented by a wide variety of domestic and Service receivers, aircraft equipment and other electrical and mechanical production.

NEW FACTORY OPENED

During the year the company has extended its manufacturing activities based on development and research in relation to electro-chemical products. This expansion of the company's activities has justified our opening a new factory in Northamptonshire, which will come into production during the current year. After certain production units have been transferred this will provide us with additional space in our Swindon factory, which is now fully employed.

EXPORT TRADE

The proportion of our output which is ultimately exported is much higher than shown by our own direct exports, considerable though these direct exports are, because many of our products are incorporated into assemblies which are made for export by our customers. We have in recent years been giving greater attention to the export side of our business and four years ago we formed a subsidiary, Plessey International, Limited, to deal specifically with sales abroad. This subsidiary has shown a useful profit. We are giving close attention to this aspect of our affairs and during the last 12 months some of your directors and senior executives have made extensive journeys abroad to explore new fields for those products of which the company are specialist manufacturers.

As to the future, the radio industry is having a far-from-easy time, due to the heavy incidence of purchase tax, which is evidently resulting in a greatly reduced demand on the part of the public. We are, however, experiencing considerable pressure to increase production in relation to aircraft work. Results for the first half of the current year are encouraging and I hope that the ensuing six months will prove equally satisfactory. Beyond this point, it is difficult in these days to offer any opinion on the conditions which lie ahead of us.

The report and accounts were adopted and the dividend as recommended was approved.

The retiring director, Mr J. A. Smith, was re-elected and the remuneration of the auditors, Messrs Deloitte Plender Griffiths and Co., having been fixed, the proceedings terminated.

RALEIGH INDUSTRIES LIMITED

FURTHER RECORDS

WORLD-WIDE DEMAND STILL UNSATISFIED

The eighteenth ordinary general meeting of Raleigh Industries, Limited, will be held on January 21, 1952, at 177, Lenton Boulevard, Nottingham.

The following is an extract from the statement of the chairman, Sir Harold Bowden, Bt., G.B.E., which has been circulated with the report and accounts:—

I think you will agree that the result of the group trading is satisfactory in that the net profit of £1,560,184 shows an increase of £107,379 over the profits earned during the fifty-three weeks ended on August 26, 1950. This extra profit is the result of increased turnover, but the rate of profit on turnover was lower than previously, owing to the burden of increased costs of material and labour which we have largely absorbed.

On the year's profit the liability to taxation, at the increased rates, is £885,008, so that the balance left for reserves and distribution is £675,176, which is actually £13,588 less than the net balance available from the smaller profit last year. Out of this balance the amount to be distributed to shareholders is £195,563, the remaining £479,613 being retained in the business under the head of reserves and increased carry-forward on the profit and loss account.

STEADILY INCREASED OUTPUT

Since our last annual general meeting our output of bicycles, tri-cycles, and Sturmey-Archer variable geared and brake hubs, and Dyno-hub lighting sets has steadily increased, and we have now added to our list of records the production of no less than one million bicycles and tricycles during a single financial year, which marks a milestone, and a memorable one, too, in the history of the company. This figure has been achieved in spite of the uncertainty in the supply of essential materials, and therefore reflects all the more credit upon those responsible.

The demand at home and abroad for Raleigh, Rudge-Whitworth, Humber and Robin Hood bicycles continues unabated, and the same applies to our Sturmey-Archer products. Despite the fact that export absorbs from 70 per cent. to 75 per cent. of our output, making it extremely difficult to cater adequately for the home market which has suffered considerable restrictions in consequence, our products remain rationed in all the markets of the world.

At this point, I find it most necessary to sound a warning. The realisation of all our plans for the future, and indeed our ability even to hold our present position, depends entirely upon the supply of raw materials made available to our industry.

Of all our shortages, that of steel is certainly the most acute to-day. When you consider the substantial and sustained contribution which the cycle industry is making to the country's export drive in answer to the government's call, and the very high convertibility value per ton of steel when applied to the manufacture of bicycles, the case of the industry for a higher priority in the allocation of this essential material would seem to be unanswerable. Your own company has established a vast export business since the war in all the worlds' markets, and it would be a tragedy if we were forced, through our inability to produce, to surrender them to our foreign competitors among whom Germany and Japan are playing an ever increasing role.

KENNINGS, LIMITED

SIR GEORGE KENNING'S REVIEW

The twenty-first annual general meeting of Kennings, Limited, was held at Sheffield on December 31, 1951, Sir George Kenning, J.P., the chairman, presiding. The following are extracts from his speech:—

RECORD RESULTS

I have to report a record group trading profit for the year ended June 30, 1951, of £356,996 compared with £303,254 last year. The total shows an increase of £48,484 and, after all provisions, the net profit is £2,036 higher than last year at £135,264.

Taxation amounted to £201,299, an increase of £46,448, absorbing nearly 60 per cent. of the net profits of the group and the increase in the charge for the year represents over 95 per cent. of the increase in profits.

DIVIDEND MAINTAINED

The directors propose a final dividend of 20 per cent., less tax, making 32½ per cent. for the year. The proposed and declared dividends of £40,038 are well covered by the net earnings of £94,617 after the provision of £15,547 for outside shareholders' interests in the group and the payment of £20,600 to the pensions fund. The total assets of the group amount to £2,258,955, out of which current assets of £1,281,731 exceed current liabilities by £455,853. Reserves now total £448,948.

NEW SHARE ISSUE

To enable the company to continue its policy of improvement and expansion, the directors decided to issue for cash a further 200,000 ordinary shares. Full details have already been sent to members.

CONTRIBUTION TO DEFENCE PROGRAMME

The maintenance of our trading position must come to an appreciable degree from our contribution to the country's defences and it is your directors' intention to make the maximum contribution within the limits of your company's resources. To balance a programme of armament production and the overhaul of military vehicles, and at the same time maintain our services to the public is a difficult task.

EFFECT OF RISING COSTS ON PROFITS

Contrary to the popular belief in some quarters, the motor trade operates on comparatively slender margins of profit, and we are reaching the limit where it is no longer practicable to pass increased costs on to the public in the shape of higher labour charges.

APPEAL FOR GOVERNMENT ASSISTANCE TO ROAD TRANSPORT

I appeal to the government to review the allocation of commercial vehicles to the home market. The retention of an increasingly large proportion of old vehicles is not in the best interests of this country's transport economy or road safety and there is a good case for the revision of the allocation of steel to assist commercial vehicle production. The nation's transport should not be sacrificed on the altar of export figures and statistics.

CO-OPERATION OF MANUFACTURERS

I would like to take this opportunity of expressing our appreciation for the support given the company by the manufacturers during the year. Although achieving such great success in the export market, they have always done their utmost to help the company on all occasions, and our relations with them remain both close and cordial.

G. K. TYRE SERVICES

G. K. Tyre Services is now firmly established in the forefront of the leading tyre distributors and retreaders, and our retreading factories are working to capacity.

SHARE ISSUE—NEW ACTIVITIES

The issue of new capital of approximately £200,000 is to be used for the expansion of our business, particularly arms contracts, engineering, tyres and the marketing of bearings.

Very substantial arms contracts have been placed with the company. Our subsidiary Revolvo, Limited, has obtained considerable orders for bearings and deliveries should be substantial during 1952.

BONUS ISSUE

A free bonus issue of one new ordinary share for each one held has been sanctioned by the C.I.C. and will capitalise £250,000 of the share premium account and reserves, if approved at the meeting to be held in January.

THANKS TO DIRECTORS AND STAFF

These developments, maintenance of our position in the trade, and surmounting of difficulties, have placed a heavy burden on my co-directors and staff. I am sure you would wish me to place on record our appreciation of their loyal and untiring services and not less those of our workpeople. With such a good team I look towards the future with cautious optimism.

The report and accounts were adopted and the dividend approved.

HILLS (WEST BROMWICH)

The eighteenth annual general meeting of Hills (West Bromwich) Limited, was held on December 28th at West Bromwich, Mr Manley Cooper (the chairman) presiding.

The following is an extract from his circulated statement:

The accounts show a continuing improvement over the previous two years in spite of various difficulties which have been encountered. The profit, before tax, amounts to £65,933, compared with £60,571. The provision for taxation this year is £33,487, and the net profit after tax is £32,446 against £27,547 last year. It is proposed to maintain the same dividend of 12½ per cent. on the ordinary shares as last year and carry forward £34,461, against £25,969 brought in.

The results are not unsatisfactory considering the adverse factors with which we have had to contend; I refer chiefly to the great difficulties in the supply of steel. In addition there has been the general rise in all material and operational costs at such a pace that it has been impossible entirely to recover them in our selling prices.

The "Presweld" system of construction, which hitherto has been confined to single storey buildings, is now being recognised as suitable for multi-storied structures, requiring only two-thirds of the weight of steel and half the erection time as compared with traditional building. We have in addition a range of other products, including patent glazing, lantern lights, metal windows, doors and screens, roof ventilating shutters and window blinds, all, or some of which, will be required in the various parts of the rearmament programme, but which again are bound up with the steel situation. The present state of the order book is eminently satisfactory.

The report was adopted.

JOSHUA TETLEY AND SON, LIMITED

SATISFACTORY RESULTS

The fifty-fifth annual general meeting of Joshua Tetley and Son, Limited, was held on December 31st at the registered office of the company in Leeds, Mr C. H. Tetley (chairman of the company) presiding.

The chairman in the course of his speech said: I do not think it is necessary for me, in view of the chairman's statement circulated with the accounts, to go into any great detail as regards our trading results; but I should like to remark that our bottled ale trade, although it increases substantially each year, still only represents about 10 per cent. of our total trade. We hope to continue to find our principal market in cask ale, which in these days of financial stringency, forms, we think, a cheaper and more satisfactory drink than bottled beer.

RISING COSTS

You will have seen in the chairman's statement that the taxation on profits this year amounts to no less than 12s. 6d. in the £, and we must remember that the increased rate of the punishing profits tax has been effective for only nine months of the year to September 30th; I hope that stockholders will realise that costs and expenses which the directors cannot control also continue to rise and represent an ever increasing burden. Not only does the cost of materials and operation increase persistently, but so does the cost of replacement of assets.

Our gross income for the year was £6,010,761, and this amount expressed in percentages was absorbed in the following manner:—

	%
Beer duty	64.0
Taxation	5.4
Materials and production costs, excluding wages ...	10.0
Wages and salaries	5.0
General trade expenses	9.9
Depreciation and reserves ...	3.2
Interest	.6
Dividends (net)	1.9
	100.0

This year we have thought it right to transfer £70,000 to general reserve as against £100,000 last year, and this reserve now stands at £950,000 after the transfer to it of a general taxation reserve of £20,000, which is no longer required. Property improvements reserve has not received any allocation this year, as we think that the balance of this reserve at present is likely to be sufficient to cover the probable spendings on improvements for several years.

DIVIDEND AND BONUS

We propose this year to recommend a final dividend on the ordinary stock of 1s. 3d. per £ of stock, which is equal to the interim dividend already paid, and in addition a bonus of 9d. per £ of stock, less tax, the total distribution for the year being therefore at the rate of 3s. 3d. per £ of stock as against 3s. 2 2/5d. a year ago. I hope that stockholders will consider the results of the year to be reasonably satisfactory in view of the difficulties in trading at the present time.

You may be interested to know that since September 30th sales have kept up well as compared with a year ago; but, as I have pointed out, we are experiencing a continuous rise in our costs, particularly in the case of barley (and therefore malt) and all transport charges, while the amounts paid in wages and salaries are also increasing. I will not indulge in any prophecies, but you may be assured that your directors will continue to do their best to obtain as good results as is possible.

The report and accounts were adopted.

KUALA MUDA RUBBER ESTATES, LIMITED

CROP ESTIMATE EXCEEDED

The twenty-sixth annual general meeting of this company was held on December 31st in London, Mr L. I. Simpson, A.C.A., the chairman, presiding.

The following is an extract from his circulated statement:—

The crop for the year at 3,520,305 lb. exceeded the estimate of 3,400,000 lb. in spite of the exceptional rainfall at the beginning of this year. Approximately 80 per cent. of the crop was produced in the form of centrifuged latex and sold under the company's "Lacentex" trade mark, the remainder of the crop being sold as off-grade solid rubber of various qualities. During the year we had, in addition, the benefit of a full year's deliveries of "unprocessed field latex" under our contract with a neighbouring estate. This "field latex" is processed in our centrifuging plant and blended with our production for sale as "Lacentex," the additional through-put enabling our plant to be operated on a more economic basis, and increasing the importance of our trade mark.

Purchases of field latex cost us an average of 4s. 2.11d. per pound, whereas the net sales average for the whole crop including purchased latex and low grades was 2s. 9.64d. Our contract for purchased latex was based on the average price for sheet rubber during each month of delivery, less certain costs not incurred in latex production, and sales of processed "Lacentex" for an equivalent quantity were made on the monthly average prices for sheet rubber plus a fixed premium more than sufficient to cover the cost of processing and shipment.

The report was adopted.

RIM (MALACCA) RUBBER

MR E. G. ESTALL ON CONDITIONS

The forty-first annual general meeting of Rim (Malacca) Rubber Estates, Limited, was held in London on December 31st, Mr E. G. Estall (chairman) presiding.

The chairman, in the course of his speech, said that the crop from both estates amounted to 2,202,800 lb. which, considering the difficulties, was a good result. It was 187,200 lb. below the estimate and 283,200 lb. less than the crop for the previous year.

The selling price of all grades averaged approximately 2s. 10d. per lb. net, or say double that of the previous year. Against this estate expenditure was 14.20d. as compared with 8d. the previous year.

Since the reoccupation of the estates a total of 521 acres had been replanted, and 112 acres planted as an addition.

Due to vigilance of the managers and staff damage to the property had been averted, but there had been several minor clashes with groups of bandits. The visit of Mr Oliver Lyttelton to Malaya had focused public attention on the seriousness of the situation. It was to be hoped that the result of his meetings in Malaya would enable steps to be planned to bring about a return to peaceful conditions there. Mr Lyttelton had, however, warned that the situation might well become worse before it was better.

Forward sales over 1952 at prices ranging from 36d. to 41d. per lb. had been made covering approximately one-seventh of the expected crop. Sales from July 1st last to date of all grades amounted to 469,868 lb. at an average price of 31.44d. per lb. gross.

The report was unanimously adopted and the proposed final dividend of 10 per cent., making 40 per cent., was approved.

ALLIED RETAIL TRADES

LARGER TURNOVER

The fourth annual general meeting of Allied Retail Trades (London), Limited, was held on December 28th in London, Mr W. H. Martin, chairman and managing director, presiding.

The following is an extract from his circulated statement:—

The trading profits from our branches amounted to £113,943 (£101,337), and the net profit to £73,694 (£62,973). This has been appropriated as to £49,600 (£40,000) for taxation; £5,913 (£6,050) for the net preference dividend and £14,451 (£15,139) for the net ordinary dividend of 15 per cent.

In the Newspaper and Tobacco Group trade has been satisfactory. Our endeavour, by the use of new display fittings, to increase the sale of the more lucrative lines has borne fruit. We have again carried out a number of major improvements to our shops. The expenditure has met with increased trade and the total branch profits for the year of this group have advanced from £96,705 to £110,823.

During the year, there have been a number of price increases in newspapers and cigarettes, but, although there were slight recessions at the time, the trade soon recovered. Unless something unexpected occurs, we can see no reason why the present level of trade should not continue.

Our turnover for the year was £1,639,201 and, when compared with £1,511,366 for the previous year, shows an increase of £127,835, or 8.4 per cent. With regard to the prospects for the coming year, as far as can be seen at the moment, we should again show a small improvement on the results recorded for the past year.

The report was adopted.

EBONITE CONTAINER

ANOTHER YEAR OF PROGRESS

The twenty-seventh annual general meeting of Ebonite Container Company, Limited, was held on December 31st in London, Mr W. E. Smith (chairman and managing director) presiding.

The following are extracts from his circulated statement:—

I am pleased to report another year of progress in the history of your companies. Not only is the group profit at a higher level, but each individual company has exceeded any previous figures. A considerable amount of additional plant has been installed in our Manchester works, and the results of this expansion are already apparent in the accounts. Several new processes have also been brought into successful operation.

Appreciable expansion in our London works has not been possible for some years due to lack of space. We have now been able to acquire the lease of an adjoining factory. This can be merged into our present works very satisfactorily, and will be of great assistance.

The net profit of the parent company for the year amounted to £47,843, and in view of the steady progress of your companies and the fact that we have succeeded in maintaining an annual total of 17½ per cent. for many years, your directors have decided to recommend a final dividend of 13 per cent., making the usual total of 17½ per cent., less tax, on the capital increased in October, 1950.

Many raw materials are not easy to acquire. Labour is difficult to obtain, and the world is generally in a very disturbed condition. Great changes, both political and economic, are taking place. Manufacturing costs continue to rise and inflation is still very much with us.

The report was adopted.

DOMINION OF CANADA

FOUR PER CENT. REGISTERED STOCK, 1953-58

For the purpose of preparing the Interest Warrants due March 1, 1952, the BALANCES will be STRUCK at the close of business on February 1, 1952, after which date the Stock will be transferred ex-dividend.

For the Bank of Montreal, Financial Agents of the Government of Canada in London.

A. D. HARPER, Manager.

47 Threadneedle Street, E.C.2.

HUDSON'S BAY SCHOLARSHIPS

Applications are invited for two Scholarships to be awarded by the Trustees of the Hudson's Bay Company Scholarship Fund for study in Canada in 1952. The Scholarships are awarded to encourage the study of business administration, to contribute to the higher education of business executives, and to strengthen the links between the business communities in Canada and the United Kingdom.

The value of the Scholarships will be $1,800 (Can.) per annum, plus return transportation expenses between the United Kingdom and Canada, and the normal tenure will be one year, but in exceptional cases this may be extended to two years.

The Scholarships are open to University Graduates, and candidates must be British born subjects ordinarily resident in the United Kingdom who at the date of applying are over 23 years of age and have not passed their 30th birthday.

Candidates will be selected by a Committee sitting in London, and no scholar will be elected without a personal interview.

In exceptional cases the Selection Committee may recommend awards to candidates who are not University Graduates but who, in the opinion of the Committee have other qualifications fitting them for the kind of study for which the Scholarships are designed.

Full particulars and form of application, which should be submitted not later than February 19, 1952, may be obtained on application to the Secretary, Hudson's Bay Scholarships, Beaver House, Great Trinity Lane, London, E.C.4.

Beaver House, January 1, 1952.

UNIVERSITY OF SYDNEY

The Senate will shortly proceed to the appointment to the CHAIR OF GOVERNMENT AND PUBLIC ADMINISTRATION which becomes vacant on the resignation of the present occupant, Professor P. H. Partridge, who has accepted the Chair of Social Philosophy recently created at the Australian National University.

Salary will be at the rate of £2,000 (Australian) per annum, plus cost of living adjustment. There is a normal retirement provision under the Professorial Superannuation Scheme, and in addition, a pension of £400 (Australian) per annum upon retirement after the age of sixty years.

The Senate reserves the right to fill the Chair by invitation.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is March 3, 1952.

MAKERERE COLLEGE, THE UNIVERSITY COLLEGE OF EAST AFRICA

Applications are invited for the post of Lecturer or Assistant Lecturer in Economics. Experience or interest in the economics of tropical agriculture desirable.

Salaries on the scale £695 x £25—£770 x £30—£890 p.a. (lecturers); £620 x £25—£670 p.a. (Assistant Lecturers). Point of entry in scale and status according to qualifications and experience. Temporary cost of living allowance 20 per cent of salary. Child allowance £50 p.a. per child (maximum £150 p.a.) F.S.S.U. Part furnished quarters at rent not more than 10 per cent basic salary. Passages paid (including family) on appointment, termination and leave (three months every two years).

Applications (six copies), giving full particulars of qualifications and experience, and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1. Closing date January 31, 1952.

MAKERERE COLLEGE, THE UNIVERSITY COLLEGE OF EAST AFRICA

HEADSHIP OF DEPARTMENT OF SOCIAL STUDIES

Applications are invited for the above post. Status and salary will depend upon qualifications and experience of the person appointed, but may be a Readership (£1,100 x £50—£1,300 p.a.) or a Professorship (£1,320 x £50—£1,430 p.a.). F.S.S.U. child allowance £50 p.a. per child (maximum £150 p.a.). Temporary cost of living allowance 20 per cent of salary (maximum £200 p.a.). Part-furnished quarters at rent not more than 10 per cent of basic salary. Passages paid (including family) on appointment, termination and leave (three months every two years).

Applications (six copies), giving full particulars of qualifications and experience and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further information may be obtained.

Closing date January 31, 1952.

SALES ASSISTANT, age about 25, required for Service Parts Department of Manufacturers of Automobile Accessories. Must be able to deal with customers' enquiries, correspondence, quotations, etc., knowledge of Production Programme procedures an advantage. Good education preferably B.Com. or similar qualifications.—Give full particulars, age and salary to Box 818.

Postal Tuition for B.Sc. ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 760 Successes at Lond. B.Sc. Econ. Final Examinations, 1925-51.

Action this Day

THE storm signals were put out for the British economy last summer. They are distress signals that are flying now. November and December proved to be little better than the catastrophic month before the election. The implications of the dollar deficit are discussed more fully in an article on page 99. The essential fact is that even if the repayments on the American and Canadian loans are left out of the reckoning, the gold reserve has been reduced by nearly one quarter in three months. At this pace the low point of September 18, 1949, the point at which a drastic devaluation of the pound was unavoidable, would be reached again on April 30, 1952.

In fact, there is probably a little more time in which to change direction. The present direction is straight and plain enough, though the measures the Government has already taken may reduce the pace. It is towards bankruptcy for this country and the end of sterling as an international currency. That would disrupt a large part of world trade. And in the consequent disruption of British industry there would be heavy unemployment and little chance of curing it. These dangers are not merely real; they are close.

Salvation does not lie in the hands of this country alone. The rest of the sterling area has an almost equal part to play, and an almost equal interest in playing it. That is the business of the conference of Commonwealth finance ministers. But the task of leadership is Britain's. Whatever the rest of the sterling area does, whatever kinds of help—the total cannot be large—may come from the United States and Canada, full employment and a high standard of living in these islands cannot be maintained unless they sell more goods and services to other countries than they buy from them. The United Kingdom's own payments deficit is the crux. The Government must accept the fact that the shocks of an uncertain world will have to be directly reflected in the living standards of the British people. The alternative is crisis followed by worse shocks. There is now only one way in which this country can quickly export more, and that is to consume a lot less itself.

The need is tolerably well understood. The lessons taught by Sir Stafford Cripps and Mr Gaitskell did not make so little impression that people will be misled by the cruder Labour propaganda which now denies the connection between cuts at home and dollar-earning. The Government has nothing to fear from such criticism by a disorganised Opposition. It has to fear catastrophe if its policies are inadequate to Britain's worst postwar crisis; that is what would ensure the return of Labour certainly enough. Mr Churchill has not become His Majesty's first minister in order to preside over the dissolution of the sterling area, any more than of the empire in 1940. But if his Government is to avoid failure, it needs all the wartime boldness and determination in, for the politicians, more difficult circumstances; and the decisions must be made, there must be "action this day," as soon as he returns from

How to Export Coal—I

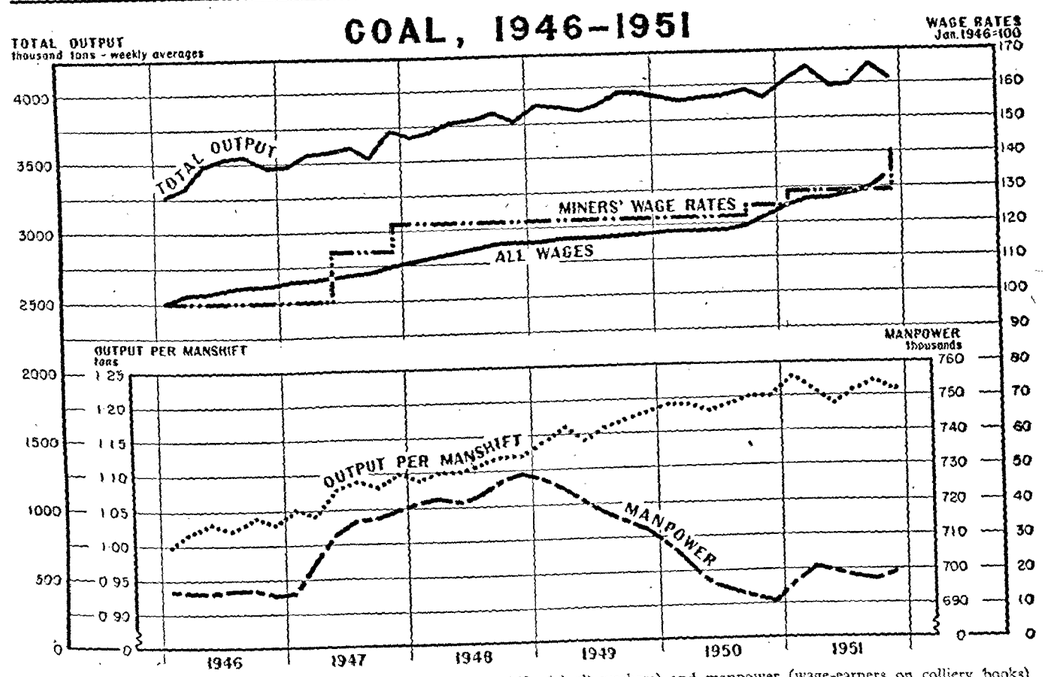
More Work or More Miners

IT is five years since the fuel crisis impressed on the British people the economic importance of their coal. The new Government is now learning, if it needed to learn, its political importance. Mr Churchill has assuredly heard the Americans re-emphasising it in Washington. Britain's failure to export coal to Europe is not only an important cause of this country's economic weakness; it is also a serious failure to make Britain's proper contribution to the security and solvency of Europe. Impatience abroad is justified. For six years this country has made unprecedented efforts to sell to foreign countries all the *bric-à-brac* of industrial civilisation. There would be a large gain in international good will if Britain at last became able to supply the coal that is its chief natural endowment and that its European customers really need. One may assume that Mr Churchill will return to Whitehall impressed by nothing so much as the urgency of exporting coal.

What, then, can his Government do? How can it succeed where Labour failed? The unsolved problems of coal in 1952 are in many ways more difficult than the immediate postwar problem of 1946, when at least there was the natural impetus of demobilisation and recovery to help. The new demand for exports must be made when the policies of the past six years have spent their force. Those policies have been, in essence, to keep the price of coal in Britain as low as possible; to increase the output of coal by whatever expedients could conveniently be adopted in a state of full employment and inflation; to ration household coal supplies as tightly as possible; to let industry have its fill of—relatively—cheap coal; and to export whatever small surplus was produced. This approach has so far had some success. Output has risen by an average of 3 per cent a year. In 1951 the mines raised 30 million tons more than in 1946. The consumption of coal in Britain was 22 million tons bigger, and stocks were increased instead of being run down. But in 1951 a mere 12 million tons of coal went to exports and bunkers, compared with 9 million tons even in 1946 and 46 million tons in the prewar depression year of 1938.

Meagre as this rate of progress has been, there is at present little ground for hope that it will even be maintained this year. Of the increase of output by 7 million tons in 1951, fully 5 million tons must be attributed to the more widespread working of Saturday shifts—though some of this gain was offset by poorer attendance during the ordinary five working days. It would be quite unrealistic to expect the miners to work still more overtime this year; the purpose of exhortation must be rather to dissuade them from working less. And if he does not work longer hours, the average miner is unlikely to produce more coal. The accompanying chart shows how output per manshift, which increased fairly steadily from 1946 to 1950, has lately been levelling off. In the last two months of 1951 it was actually a little lower than in the first two months; in every other year since the war it had been from 2 to 6 per cent higher at the end of the year than at the beginning. The explanation may be, in part, that more green labour was recruited last year. But even among workers at the coal face, output per manshift improved very little.

There is probably a more important reason why productivity has recently been stagnant. Almost all the easy gains from mechanisation have now been obtained. By comparison with the supply of new machinery to other industries, coal-cutters and conveyors were poured into the mines during and after the war. Although there are still places where some more machinery could be used, in general this conventional mechanisation is now near saturation point. The mining engineers are in something like the position of the aircraft designer faced with the sonic barrier. They can advance only by a big jump. Further mechanisation depends chiefly on the installation of new machines such as cutter-loaders and strippers and on large reorganisations of underground haulage. Such equipment is scarce and its use raises difficult technical problems which the mining engineers of this country are unlikely to solve except by trial and error. The bigger schemes, particularly for improving underground haulage, are bound to take a long time to carry out. To say this is in no way to underrate the importance of further mechanisation, particularly to an industry whose labour force is ageing. But it is for the most part a long-term investment, which will show important results in five to ten years' time, not in 1952.



It is true that if further mechanisation will not quickly bring more coal, there is still plenty of scope for raising productivity in the mines overnight. In many places the miners could use existing machinery more efficiently. In many areas stints could reasonably be increased. Everywhere the miners could work harder and more regularly. Better management could both get more effort out of the men and enable them to produce more coal with the same effort. All these things are certainly true—and of other industries besides coal—but their relevance to the needs of 1952 is highly doubtful. The human resources of the mining industry still carry the marks of its long depression. The prewar decline in coal not only embittered the workers but also prevented the mines from recruiting their share of ability in managers. It is entirely unrealistic now to ask of the coal industry all that could in theory be achieved by good management. It is almost as unrealistic to expect any quickening change in the miner's attitude to his job. In all the circumstances, the miners probably deserve more praise than blame for what they have done in the past five years; they are unlikely to respond at all to yet more exhortation, and they will certainly respond badly to verbal castigation or sermonising.

The country cannot expect to get much more coal per miner this year. Can it expect to have more miners? It certainly cannot expect again the recruitment of foreign workers that contributed 17,000 to the postwar expansion of the labour force in 1947-49. The miners' refusal to accept Italian workers is in every way regrettable, but only the men's own leaders can overcome it; their work of education will be, at best, painfully slow.

The chances of recruiting more British miners are little better. The National Coal Board is rightly proud of having arrested the sharp decline in manpower of 1949-50. At the end of last year the mines had 9,000 more workers than at the beginning. But probably a half of this improvement occurred because old men were postponing their retirement until the miners' pension scheme came into force at the beginning of this year. There may now be a corresponding increase in retirements. Moreover, the rising demands of the rearmament industries are likely to make labour scarcer in just those areas—notably the Midlands—where output per manshift is high and more miners would, therefore, be most valuable. On the other hand, some workers may be attracted by the recent wage increase in the mines. As the chart shows, the miners in 1947 made a large advance in the postwar wage scale, but by last October other workers had caught up. Now the miners are again, for a time, ahead. The wage increases of both 1947 and 1950 seem to have encouraged recruitment, though the connection is hardly as close as the chart indicates; special circumstances such as the entry of foreign workers must be taken into account. The evidence suggests, for what it is worth, that the latest wage increase will encourage some men to go down the mines, but it can hardly be enough to have any dramatic effect.

The signs are, therefore, that none of the familiar measures and exhortations of the past six years is likely to yield much extra coal in 1952. The improvement in 1951, compared with 1950, has masked the stagnation in coal that began last spring. The improvement was in fact made last winter; in the past few months production has seemed to be increasing fairly well only because it had fallen, even after allowance for the normal seasonal drop, last summer. This may prove to have been fortuitous and temporary; many things influence the output of the mines. But the probability is that existing policies for getting more coal have lost what effectiveness they had; certainly they will not become miraculously more effective, and yield this year an increase not of 7 but of 20 million tons.

There can be little doubt about the lines on which a Conservative Government's thinking should run. If this were a free economy, the scarcity of coal would drive up its price. In a state of full employment the miners would insist on a large share of the proceeds. Wages would rise, more workers would come into the industry, production would rise, and a new balance between supply and demand—including foreign demand—would be reached. This Government is not going to restore a free economy. But in its planning it surely should look for devices that will subject the economy to pulls and pushes of the same sort, and in the same direction, as free markets would do. No practical politician could be persuaded to tell the Coal Board to put up its prices and try to make a large profit. But it is practicable to suggest that the Board should take the initiative in offering the miners another, and substantial, wage increase, and should then raise its prices accordingly. If that seems an outrageous idea, such is the measure of how far politicians of all parties have forgotten the way the economic system used to work. It is at least an alternative worth examining when the policy of cheap coal—cheap by comparison with many less essential things—has plainly failed. A second article will examine the effects and the broader implications of such a policy.

The figures for total output of mined coal, output per manshift (of all workers) and manpower (wage-earners on colliery books) are weekly averages for two-monthly periods, roughly adjusted to eliminate seasonal fluctuations. The indices of all wage rates and of miners' wages are those of the London and Cambridge Economic Service, adjusted to the base January, 1946=100. The index figure after the miners' wage increase at the end of 1951 has not yet been published and has here been roughly estimated.

The Eisenhower Candidacy

GENERAL EISENHOWER'S hat is in the ring. He has not put it there himself. Indeed, he confines himself to recognising that it is his hat; that it is the right colour; and that if others have put it there he will not attempt to remove it. In other words, if his friends succeed in getting him the Republican Party's nomination for the Presidency in July, he will accept it; but he will himself say or do nothing to secure it. But that is enough. It makes him definitely a candidate, and definitely a Republican, and thereby removes the double uncertainty that has been hanging over the American public scene. His friends can go ahead with their campaign and his supporters can put the badges reading "I Like Ike" in their buttonholes without any fear that their avowal will be unrequited.

It does not by any means follow that the General is already as good as elected. On the contrary, it looks like being a hard fight. It is true that, to judge by any of the available signs, he has a greater popularity—it may be a far greater popularity—with the American electorate than any other public figure. But before his name can go before the whole electorate he must first be nominated, and the Republican convention is likely to be his stiffest hurdle. A party nominating convention consists, not of a cross-section of the electorate, but of professional politicians. Senator Taft, the professionals' ideal of a candidate, may not be sure how he would fare against General Eisenhower in a popularity contest. But he claims to be confident that he can round up more delegates at the convention. The claim may be justified at the moment. Whether it will be so in July depends on the success that General Eisenhower's supporters have in making the popular choice so plain that it is forced on the professionals.

There is thus no certainty, hardly even a probability, about the identity of the next President of the United States. But this week's events do make it as nearly a certainty as anything can be in politics that the next President will be one of three men—he will be Harry S. Truman or Robert A. Taft or Dwight D. Eisenhower.

Passions always run high in America in presidential years and there would be quick resentment of anything that looked like an attempt at interference from outside. This is entirely right and proper. But at the same time it must be quite clear to everybody that, with so much throughout the world hanging on the course of American domestic politics, the outside world cannot be expected to preserve unbroken silence. Especially is this so when one of the main contestants is such an international figure as General Eisenhower has become, at once the servant and the inspiring leader of the greatest effort in international co-operation that has ever been seen in time of peace. If only because of its possible effects upon that effort, the Eisenhower candidacy will certainly be discussed throughout the world. Those who are not American citizens can only be spectators at this grand quadrennial contest, and they will be wise not to try to exercise influence or bring pressure on any of the players (even if they possessed any means of so doing, which they do not). But the players, in their turn, cannot but be aware that the grandstands are crowded—and not with Trappist monks.

America's European allies might be forgiven if they regarded with apprehension the prospect of any change from the Democratic administrations with which they have worked for so long. To a far greater extent than has ever really been true, the accidents of history have presented the Democrats to the European view as the co-operating internationalists and the Republicans as the retreating isolationists. The Democrats have the advantages of familiarity, and the foreign policy they have pursued has, in foreign eyes, seemed commendably strong and sound. It has never been possible, on this side of the Atlantic, to understand the bitterness with which Mr Truman's and Mr Acheson's foreign policy has been assailed at home, for it has seemed, when seen from a distance, to have been articulate, coherent and successful above the average. In Mr Roosevelt's time, European opinion—particularly British opinion—held its breath every four years lest he be defeated and his policy overthrown, and something of the same emotion has remained attached to his successor. The preliminary assumption of every European observer is likely to be that, if a change in Washington can be avoided, it is right to hope that there will not be one.

*

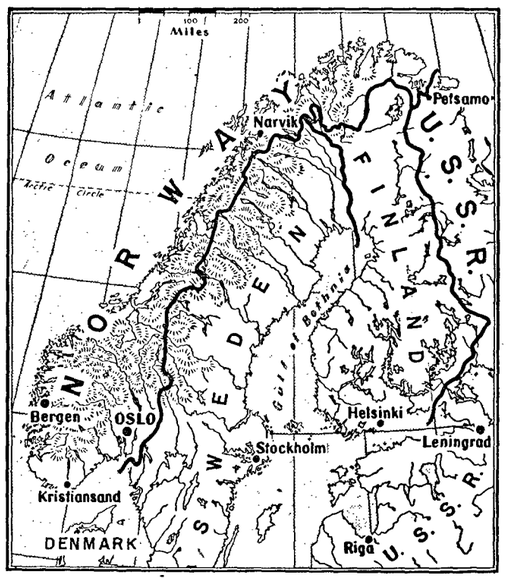
But a foreign observer who looked a little more closely into the American scene might reach a different conclusion. He might say that another four years of Mr Truman and Mr Acheson, since it would mean the exclusion of the Republicans from the executive branch of the American government for another four years (which would make twenty-four years in all) would in the end do much more harm than good to the strength and continuity of the foreign policy that the Democrats have sponsored. The Republicans, after all, include many of the finest elements of the American people; their resources in individual talent are certainly not inferior to those that Mr Truman has at his command. Their long exclusion from office, it could be held, has not only been infuriating to them, it has now created a situation that is positively dangerous to the stability of American policy—which is the same thing as saying that it should be of concern to all of America's allies. For exclusion from responsibility for so long has had its inevitable result; it has bred irresponsibility.

Just how far the irresponsibility among the Republicans has gone has been amply demonstrated in the past twelve months. It has been shown in the willingness of otherwise sober and reasonable men, not indeed to believe in Senator McCarthy's ridiculous insinuations, but to refrain from denouncing them (though they threaten to cover Washington in slime) and even to draw political profit from them. It has been shown in the wide extent and the hysterical nature of the acclaim that General MacArthur's views have received—the smaller part of which arose from genuine agreement with him and much the larger from a desperate willingness to snatch at anything, however dangerous, which might discredit the Democrats. If this Republican opposition could simply be ignored or overridden, it might not be dangerous. But the Republicans are too strong for that, and if Mr Truman were re-elected it is overwhelmingly probable that he and his Secretary of State would face four more years of the merciless Congressional attack they have suffered in the past eighteen months, which would have the effect (as it already has done) of forcing them back upon a rigid, uncompromising and increasingly bellicose position, in which they could indeed cling to the formal outline of their policy, but without any freedom of manœuvre, any room for statesmanship, within it. The thought that this might continue through 1953 and 1954 and 1955 and 1956 is not a reassuring one. The only cure for irresponsibility is responsibility. Whatever happens, the Republican party is going to provide a large slice of the next Congress. Whether or not American policy would be better (within the European definition of the term) with the Republicans in a majority, there is at least a good chance that it would be less dangerous than if there continues to be a Republican minority determined to bind a Democratic President with the toils of its own desperate irresponsibility.

Unfortunately, though it may be true that only a Republican in the White House can hope to bring about a measure of reconciliation of policy between the parties, it does not follow that any Republican could, or would, do it. It would take an extraordinary degree of faith in the argument of the last few paragraphs to be sure that a Taft administration would have the desired effect. It might; Senator Taft's recent book showed that he has moved a very long way since his isolationist days. He is a very remarkable man who has never in his life been responsible—in the literal sense of being answerable for the consequences of his words—and if he were placed under the awful pressure of responsibility that bears upon the man in the White House, his conversion might be completed. Unfortunately, it is equally possible that his instincts—which remain basically isolationist, however much the logic of events or his own sense of political expediency may try to convert him—would lead him to react the other way. And in any case the experiment would have to be carried out in the crucial year 1953.

This is the historical importance and (let it be added, for those American readers who may be getting restless under this analysis of their domestic politics) the vital importance to America's allies of the Eisenhower candidacy. The world hopes of this year's election that it will provide the means of consolidating the policy of international co-operation upon the broadest possible base of bipartisan support among the American people. Neither Mr Truman nor Mr Taft seems likely to be able to do that—Mr Truman because he can no longer secure bipartisan support for the policy, Mr Taft because no one can foresee whether he would continue the policy. If the third man with a chance to be elected could achieve this purpose, then no amount of concern for the propriety of not interfering in other people's concerns will prevent the outside world from wishing him well. It does not matter to the world alliance whether he is General Eisenhower or another, whether he is a Republican or a Democrat. What does matter is that his election presents the best hope of keeping the alliance firm and effective.

General Eisenhower's candidacy brings to an end a period of uncertainty in America; it starts one in Europe. As supreme Commander in Europe he is irreplaceable, and no one should attempt to minimise the very damaging effect that his departure will have on the progress of the combined effort for European defence. Those who have seen his work at closest range are those who will regard his departure as most disastrous. But human affairs are always presenting a choice of evils. Which would be the better for Europe, that General Eisenhower should stay in Paris, but with a progressive disintegration of American policy in Washington, or that he should go home in order to ensure that some other American general gets firm support from across the Atlantic? Europeans should realise that, so far as can now be foreseen, these are in fact the alternatives that are presented. If they realise that, they will not only have no difficulty in making their choice; they will ardently hope to be spared the worst of both worlds—to lose General Eisenhower from Paris without gaining him in Washington.



Northern Ally

TO be sane and steadfast in a world full of alarms is, unfortunately, to be ignored by the world press. This has been the fate of Norway in recent years. Britain has no stauncher friend among the smaller nations, but the friendship tends to be taken for granted even when it is ruffled by such an event as the recently adjudicated Anglo-Norwegian fisheries dispute. Norway's very success in dealing with its problems competently and quietly has contributed to its friends' failure to realise that it no longer lies in a quiet geographical backwater, but in the front line of the cold war. In the past three months, three things have happened in Norway which, had they taken place in almost any other country belonging to the Atlantic alliance, would have awakened wide interest and some anxiety abroad. Russia has singled Norway out as the target for a series of truculent Notes; Norway has undertaken a strenuous expansion of its defences; and the Norwegian Prime Minister, Defence Minister and Finance Minister have been replaced. The fact that these events have passed almost without comment in this country can be explained only by the general belief among Norway's friends that this ally can always be relied upon to overcome its difficulties and to fulfil its promises.

There are solid foundations for this belief; but there are also reasons why Norway deserves the closer attention of public opinion in other western countries. In the first place, it is—pending Turkey's admission—the only Nato country that has a common frontier with the Soviet Union. This frontier lies north of the Arctic Circle, but its military significance was made plain during the Second World War, when German and Russian forces fought a sizeable campaign on Norwegian soil. Its political importance is even more relevant, for it has been the basis of repeated Soviet demands that Norway should take no action that might be construed as hostile to its great neighbour. In 1949 Norway quietly but firmly rejected a Russian demand for a non-aggression pact, abandoned plans for a neutral Scandinavian bloc, and signed the Atlantic Pact, in spite of a barrage of Soviet Notes warning the Norwegians of the Pact's "aggressive" aims. The Russian pressure was, however, strong enough to elicit a declaration that Norway would allow no foreign forces to be based on its soil unless it was threatened with an attack—an undertaking which has an obvious bearing on Norway's role in the Atlantic defence system. In October and November last the Soviet diplomatic offensive was renewed, Mr Vyshinksy pre-

senting two more Notes which alleged that Norway had placed its forces and its territory, and particularly the Spitsbergen and Bear Islands, at the disposal of the Nato command for anti-Soviet purposes. The Notes also expressed dissatisfaction with the fact that defence bases were being built in northern Norway, near the frontier. The Norwegian response to these charges was as restrained and firm as that of 1949 ; and a similar reply was given to the recent Soviet complaints about the removal of the remains of Russian soldiers killed in the Norwegian campaign of 1944-45 to new cemeteries. The Russians, however, show no inclination to abandon their verbal offensive. In the last week of 1951 *Pravda* devoted half a page to an account of "feverish preparations" in Norway for a war against the USSR.

It is not only its proximity to Russia that makes Norway unique among the Atlantic allies. It is also—since last October—the only Nato country governed by its Labour party. Moreover, the Norwegian Labour Party had in its early days a reputation for strong pro-Soviet tendencies, while in the 1930s, when it came to power, its foreign policy was marked by aversion from all forms of collective security, including even the League's system of economic sanctions. Norwegian Labour's startling reversal of attitude in both these respects may be partly attributed to the disaster which befell the neutrality policy in 1940 and to the disillusioning effect of Russian actions since 1945. But it is also in part a matter of personalities, for Hr Halvard Lange, who has been Foreign Minister since 1946, and others of like mind, were trying to convert the party to a collective security policy as early as 1936. On domestic issues, however, the Norwegian socialists have maintained a more consistent policy. No western country has made greater use of economic controls as a means of dealing with postwar problems. The devastation left behind by the Germans has not led the Labour Party to abandon the standards of social welfare to which it had committed the country before the war ; and if this has meant a longer period of "austerity" than any other European people has had to accept, it has apparently been accepted by the majority of Norwegians. Over the past three years both national and local elections have shown a trend favourable to the governing party.

Norwegian social discipline will, however, be subjected to a severe strain when the effects of the new defence effort make themselves felt. Since the Rome meeting of the Nato Council, Ministers have informed the Norwegian Parliament that in the next three years the defence programme will cost £125 million, an increase of 38 per cent above the present level. For a by no means wealthy nation of only 3,300,000 people, this is a considerable effort, and it will not be made easier by the existing conditions of full employment and rapid inflation—the latter being partly due to the statutory linking of wage levels to the price index. Since Norway produces very little military equipment, the mere purchase of such equipment from abroad is bound to upset the country's balance of payments, which has only lately been restored to a healthy state. The burden must, however, be shouldered if Norway is to fulfil its undertaking to maintain one full division always in readiness, and to strengthen its naval and air forces to a corresponding extent. The period of military service, which was raised from nine to twelve months in 1951, will also have to be increased to eighteen months if obligations to Nato are to be met ; but according to the late Minister of Defence, Hr Hauge, lack of both officers and accommodation will make it impossible to do this before the second half of 1953.

Yet Norwegians have the consolation that, while the new programme will involve devoting between four and six per cent of their national income to defence, their "neutral" neighbour, Sweden, is already spending nearly eight per cent of its income for the same end—a fact which does not encourage the casting of any wistful backward glances at the idea of a Scandinavian defence group. The late Prime Minister, Hr Gerhardsen, recently pointed out that for Norway to develop its defensive strength in association with only Denmark and Sweden to the same extent that it is now doing through Nato would cost the country three times as much—that it would, in fact, be unthinkable. It was the emergence of this fact during the Scandinavian discussions on joint defence in 1948 that finally decided Norway to join the Atlantic alliance in spite of all Sweden's arguments. That decision has never involved any breach in the natural solidarity of the Scandinavian nations in all fields where their joint action is possible. Economic and cultural collaboration between the northern neighbours has, indeed, developed even further since Norway and Denmark joined Nato. But the Norwegians' cautious attitude to Scandinavian unity has recently been exemplified in their widespread criticism of the new project for an inter-parliamentary Nordic Council. The country's approach to all vital issues is essentially on a western, not a Scandinavian, basis.

Norway is, in a very real sense, the most Atlantic of the Atlantic nations. It is not mere sentiment that makes this maritime country look to the ocean rather than to the Continent. The third largest merchant fleet in the world (2,200 ships of over 100 tons, totalling 5,800,000 tons) is Norway's biggest single economic asset ; it contributed greatly to the Allied war effort between 1940 and 1945, although its home ports were in enemy hands,

and in the past year it has played the lion's role in restoring Norway's foreign trade balance. Moreover, Norway resembles Britain more than any other European country in its dependence on food imported from overseas, and on an overseas trade, the annual scale of which amounts to about £100 per head of the whole population. Every major European war has shown Norwegians how much they must suffer whenever the sea is barred to them.

Norway can, indeed, stake a claim to the original idea of an Atlantic Pact. In November 1940 such a pact was proposed by Dr Raestad, Governor of the Bank of Norway, and the idea was endorsed by Mr Trygve Lie, then Foreign Minister of the exiled Norwegian Government. In 1944 Mr Lie specifically declared that Norway's interests would be best served by "an agreement comprising the countries adjacent to the North Atlantic ocean." Today, it is keener than any other country, with the possible exception of Canada, about the development of Nato into an Atlantic community, and it has played a leading part in the discussions on this subject that were initiated at Ottawa.

As a natural consequence, the Norwegian attitude to all projects for purely European unity is as reserved as that of Britain. Indeed, when the American delegates who visited Strasbourg in November criticised Britain for holding back from union with Europe, Hr Finn Moe, who represented Norway at the joint session, defended the British case more passionately than any of the three British spokesmen who were present. But Anglo-Norwegian identity of view on this particular point should not be allowed to obscure the real differences of opinion which exist between the two countries. The most important of these concerns the future organisation of Nato. The idea of a tripartite structure, which would make it possible to replace Nato's unwieldy twelve-member committees by small executive groups comprising only one American, one British and one European representative, finds no favour in Norwegian eyes. If compelled to choose, Norway might prefer to be represented by an Englishman rather than a Frenchman in such a group ; but it would very much rather avoid the choice. It is a point of view that Mr Eden should treat with respect.

NOTES OF THE WEEK

Mr Churchill in Washington

The speed with which the President and the Prime Minister issued their communiqué, fully as much as its contents, shows that the visit has not been unsuccessful. It is six years since Mr Truman and Mr Churchill last officially met—at Potsdam—and much has happened to alter their relationship and standing in the years between. Then Mr Churchill was the architect of victory ; now the colleagues he left behind in London have just had to announce the dimensions of Britain's failure to pay its way. Nevertheless, and in spite of the forebodings in official Washington—or perhaps because they were so fully exposed beforehand—Mr Churchill's corporeal presence has had the effect it usually produces in America, where, it should never be forgotten, he is still almost as much of a hero as Franklin Roosevelt ever was in Britain.

It is obvious that not many of the large subjects mentioned in the communiqué can have been very thoroughly discussed in a few days when the President had many other preoccupations. Indeed, the purpose of the visit was, from the start, to create an atmosphere and establish a relationship "on an intimate and personal basis" rather than to secure detailed agreements. It would therefore be a mistake to try to read too much into the exact wording of the communiqué. It is nevertheless worth listing the points of agreement:

The use in an emergency of American air bases in the United Kingdom would be a matter for joint decision.

Full support to the efforts . . . to establish a European defence community . . . as an element in a constantly developing Atlantic community.

The Middle East.—Complete identity of aims, and the two Secretaries of State to work out together agreed policies (the words "together" and "agreed" are most significant). Approval of the International Bank's plan for resolving the Iranian oil dispute (which presumably means that Dr Mossadegh will not get American help except on the International Bank's conditions).

The Far East.—A broad harmony of view and a recognition that resistance to Communist aggression transcends divergences in policies towards China.

Scarce Materials (i.e. steel for Britain and aluminium, tin and other materials for America)—it is hoped that agreement may be announced shortly.

We are resolved to build an Atlantic community, not only for immediate defence, but for enduring progress.

It is admitted that two problems—the arguments over rifles and the Atlantic naval command—were not solved, and there are silences—for example, on atomic co-operation—which can be interpreted either way. But the list is good value for four meetings.

* * *

Vyshinsky Dabbles in Korea

Mr Vyshinsky's sudden proposal at the end of last week, that the Security Council should take up the question of a truce in Korea, was bound, as the Russians must have intended, to transfer the main centre of interest to Paris and to bring the talks at Panmunjom itself to a temporary standstill. During the past few days these talks have been drifting, and the atmosphere across the conference table has been more tense than at almost any time since the meetings began six months ago. Mr Vyshinsky's initiative does not, however, change any of the realities in Korea itself. There, the Chinese could have an armistice at any moment by agreeing to drop their claims to the right to build airfields in North Korea and by accepting exchange of prisoners on humane terms. And, while they are no doubt bargaining with Communist intensity for objectives to which they attach importance, it seems logical to suppose that, having already made as many concessions as they have over other things, they may agree to another compromise in the end. But, whether the Chinese really are edging towards a truce or not, Mr Vyshinsky's move at Uno manifestly suited the Russian attempt to throw a spanner into the American machinery for getting round their veto on the Security Council. It may well be, therefore, that Mr Vyshinsky spoke without telling Peking and that the Chinese have merely been stalling at Panmunjom for the past few days until they know where they stand.

The Russian proposal to discuss Korea in the Security Council or at a meeting of the big four should be carefully considered—but not yet. A military truce in Korea must come first. That can only be achieved at Panmunjom. It certainly cannot be brought about by the Security Council, which is in no way suited to deal with local military details, and which the Russians would unquestionably seek to switch on to wider political problems. Of these, the chief are the withdrawal of foreign troops from Korea and the re-establishment of one or more governments in Korea ; in the wider

field there are also the hardy annuals of a seat at Uno for Mao Tse-tung and the return of Formosa to the rest of China. A political settlement in Korea after a military armistice will be extremely difficult to arrange in any case and may take months. To attempt it now would be to postpone the end of the actual fighting almost indefinitely. That might suit Mr Vyshinsky. But it is the Chinese, the North Koreans and the United Nations who would have to pay the price in terms of men and money.

* * *

Sticking to Collective Security

Mr Vyshinsky's diversionist activities did not prevent the mustering of a surprisingly big majority for the new UN resolution on collective security. On Tuesday the resolution got 51 votes out of 60 in the Assembly's Political and Security Committee, whose members thereby showed that, despite Mr Vyshinsky's preference for playing politics, they were more interested in security. Only the Soviet *bloc* opposed the resolution, and only India, Argentina and Indonesia abstained. The vote was in part an endorsement of the "Uniting for Peace" plan adopted by the last Assembly, which enables the UN to take collective action against any new aggression even if the Security Council is hamstrung by a veto, and in part a request to governments to study the detailed suggestions for making this plan effective worked out during 1951 by a fourteen-nation Collective Measures Committee. The three western Powers and the eight other sponsors of the new resolution had taken pains to meet the points of view of various regional groups, and their success in this respect was revealed when the Arab members put forward an amendment nullifying the Soviet demand for the abolition of the committee.

The remarkable solidarity of Asian and other nations behind the resolution may have been to some extent a reaction to the curious definition of aggression which the Russians had earlier placed before the Legal Committee. This stated that armed action was not justifiable against a nation which violated international agreements, created frontier incidents, or concentrated large forces near a frontier; but it was justifiable if a nation kept armed forces in another country without that country's consent or supported rebel forces sent into a country from outside. If this extraordinary jumble of dogmas were accepted, it would mean that the UN could take no action against Russia if it were found to be producing atom bombs in defiance of any control system; but, on the other hand, Russia would be branded as an aggressor for its action in Persia in 1946, and Bulgaria and Albania for their support for the Greek rebels, while China would have no justification for taking up arms against the UN forces in Korea. The Soviet definition, in fact, revealed both the gulf which yawns between Russian theory and Russian practice, and the neurotic preoccupation with untrammelled national sovereignty which makes the Soviet attitude to all collective security plans so negative.

* * *

Labour's New Beginning

The reassembly of Parliament on January 29th will be not so much the resumption of an adjourned session as the beginning of a new period in the political life of the country. The first few weeks of Mr Churchill's government were to some extent makeshift, and the House of Commons did little more than settle down after the election. Neither Conservatism in power nor Labour in opposition has yet made its postwar character plain. When Parliament meets again the Government must reveal its major policies, and that will in itself do much to shape Labour's new outlook. Other influences will, of course, be at work on the Labour party. The tactical demands imposed on any party in opposition will certainly have their effect. Already the Conservative party's "Weekly News Letter" is warning its readers that during the three years' period which Mr Churchill considers to be the shortest time in which a fair judgment of his government can be formed, "there will certainly be no lack of grievances on which our opponents will be able to concentrate."

But Labour's general attitude will in the long run be more radically affected by the results of the inquiries into policy which have just been started and by decisions upon the conditions in which Labour could most successfully appeal for power. Are Mr Churchill's three years just long enough to earn the Conservatives a second term? Will Labour need five or seven years to revise its policy and recruit its leadership? Some tentative answers to these questions will have to be in the policy-makers' minds. Much work has also to be done on policy itself. Forecasts have been cautious and sketchy so far, except that the Fabians and the Co-operatives agree that the route must lie "forward towards Socialism." Mr John Strachey has advised the Fabians to consider turning joint stock companies into bodies "effectively responsible both to the community and to the whole body of those engaged in their activities." The Co-operative party proposes the development of "social ownership" as a "complement" to state ownership. The Co-operatives are preening themselves on their "greatly improved relationship" (since 1945) with the Labour party, and no doubt "social ownership" will be studied more closely than it was when nationalisation provided a sufficient battle cry. But no one yet has much idea of what it might mean in practice.

* * *

Mr Gaitskell's Apologia

It is not often given to the organ of a local party machine to serve as a substitute for the majestic official megaphone of the Treasury. Such is the privilege of the current *Leeds Weekly Citizen*, in whose columns Mr Hugh Gaitskell gives an ex-Chancellor's survey of the economic developments and problems of 1951 and 1952.

Mr Gaitskell's aim is, one may infer, threefold: to enlighten his constituents and other readers (he has always, unlike some of his ex-colleagues, preferred an enlightened to a bamboozled electorate), to justify his own past actions, and to counter Conservative claims that all present and foreseeable discomforts are the fruit of Socialist ineptitude. He attains the first and third of these aims more successfully than the second. It is one thing to isolate and evaluate those outside influences—higher import prices, the loss of revenue from Persian oil, and the reduction in other "invisible" earnings—which had such a damaging effect during 1951 on the British balance of payments, and to point out that these were largely outside the power of any government to control; but it is quite another thing to lay upon these outside influences the whole blame for starting the internal inflationary spiral and to regard the continuation of the spiral, now that the rise in import prices has spent its main force, as evidence of Tory incompetence. That accusation would, of course, be more telling had Mr Gaitskell and his colleagues ever themselves shown any signs of being able to reverse, arrest, or even slow down the spiral.

The fact is that while balance-of-payment troubles and inflation are closely linked, to import more than the country exports is—while it lasts—a mitigation, not an aggravation, to inflation. It means a closer equivalence between the supply of goods and the supply of purchasing power; it relieves inflationary pressure and, by that very fact, the pressure towards higher prices. Mr Gaitskell can justifiably claim that events forced upon Great Britain, during his party's tenure of office, an import surplus for which the government could not be held entirely responsible; he cannot at the same time exonerate himself from the charge of having budgeted too softly, left too much purchasing power loose, and so made it inevitable that the rise in import prices should

set off an inflationary spiral which continues without further external impetus. On the home front, the import surplus was his ally; he cannot lay upon it, as upon an enemy, the blame for those consequences inherited by his successor in office.

Civil Servants Follow After

Officially, the increase in civil service pay that was announced last week has nothing whatever to do with the cost of living. That would have been quite against the deflationary principles that the last government applied with unusual firmness in dealing with its own servants. But while to give a lead to industry in compensatory wage increases is still the last thing the civil service should do, the point had come where it had to start following industry.

The Government rightly and firmly resisted the staff negotiators' proposal for a cost of living bonus, to be adjusted automatically with every five points that the cost of living index moved. But according to the "Tomlin formula" evolved by a Royal Commission in 1929, civil service pay should be related to the long-term trend of earnings in other comparable work. While it was inadmissible to look at the index of retail prices, it was quite in order to study the index of wage rates, which rose by about 10 per cent during 1951. It was with this figure in mind that the award was made. The increases are not enough, even at the lowest level, to offset the rise in prices, which was about 12 per cent in 1951. The first £500 of income is to be increased by 10 per cent, the amount between £500 and £1,000 by 5 per cent, and between £1,000 and £1,500 by 2½ per cent. This discrimination against the more highly paid officials is monstrously unfair. Their costs of living have risen at least as much as other people's, and in industry salaries of all kinds are tending to rise. It is wrong to let higher prices push still farther the redistribution of incomes that is already effected by direct taxation.

This is the second increase for civil servants since the Government decided, at the end of 1950, that the wage freeze was over and that it was time to implement the Chorley report's recommendations about civil service pay. The new rates will cost the Exchequer an extra £30 million, and more is to follow, since negotiations about salaries over £1,500 a year are not yet completed. Some courage was needed to agree to negotiate with the civil service unions acting together for the first time since the war, through the National Whitley Council; a single big award looks worse in the headlines than a trickle of awards to the separate unions, even if their final total were more than the £30 million. But the general settlement has the advantage of administrative economy. Some of its extra cost will be offset by the reduction in staff that has been ordered by the Chancellor. But as the Supply and Service departments are inevitably expanding, controls are being extended and none of the present tasks of the Ministries is being shed, the total amount to be saved in this way is unlikely to be large.

* * *

France without a Government

After five months of service, M. Pleven's post-election cabinet has fallen as the result of a budget crisis which is described in an article on page 93. The authors of his defeat were the Socialists, but when their refusal to support powers to enact economies is set against last September's refusal by the Gaullists (RPF) to support expenditures (they refused to vote for the Socialist Bill for the sliding wage-scale), the puzzled foreigner is left to conclude that the last French elections yielded a *Chambre ingouvernable* that cannot reconcile the country's requirements with the means at its disposal.

What is to happen next? In setting out to find a successor to M. Pleven, the President, M. Vincent Auriol, dispensed with the device of the *mission d'information* whereby a potential prime minister sounds the different parties before risking the ordeal of investiture with office. He did so partly to save time, but perhaps also partly to force the Gaullists publicly to demonstrate their inability to command a majority. For after first calling upon M. Christian Pineau (Socialist), who was due to leave the same afternoon for Indo-China, and who declined, M. Auriol next invited M. Jacques Soustelle, the parliamentary leader of the RPF. This act put the RPF on the spot; for had M. Soustelle accepted he risked a fiasco at his investiture, since there is no possible majority for the RPF without the MRP, and M. de Menthon of MRP had said that he would not oblige. The next to decline was M. Reynaud (Conservative Independent); then M. Bidault (MRP). Once again perhaps all roads lead to M. Queuille, the champion conciliator.

Everyone expects delay, for no agreement is likely until time has worn the edge off party tempers. Delay may be welcome to the Gaullists, who hope for a crisis so prolonged that it will lead to a revision of the constitution, which they regard as the sole remedy for France's political instability. Being opposed also to the Schuman Plan and the European army, they do not mind if a prolonged spell in charge of a caretaker government hampers these projects. But most people feel that delay will be a tragedy on account of its international implications. For it will affect the position of General Juin, just now joining the Washington conversations to discuss Indo-China; it will leave the Chamber without a leader fit to introduce the topic of a European army which is due to be debated at the end of this month; and it will suggest just at the moment when Bonn is embarking upon ratification of the Schuman Plan, that France is a somewhat unstable ally. If really prolonged it will also affect French participation in the Lisbon conference of Nato.

* * *

Danger South of China

Among the topics stated to have been discussed in Washington between Mr Churchill and President Truman is the possibility of a new aggression in South East Asia—concretely, of a reinforcement of the Vietminh army in Indo-China by Chinese "volunteers." The Vietminh is already receiving considerable aid in the form of supplies from China, and there have been military preparations on the other side of the frontier which would facilitate a formidable intervention if the Chinese Communists were to decide on it. It is well that this danger is now receiving due consideration in the highest quarters among France's allies, for the problem has become too big for France to face alone, and British and American as well as French interests would be involved if there were to be a collapse in Indo-China. As was pointed out in an article in *The Economist* last week, the Pleven Government, which obtained a substantial majority in the National Assembly for the credits required for the Indo-China war, was confident that a "situation of strength" can in time be built up in Indo-China if there is no increase of Chinese intervention. But will this condition be fulfilled, and what is to be done if it is not? There appear to be hopes in Paris that an armistice in Korea might provide an opportunity for negotiating some general agreement with China which would avert the entry of Chinese "volunteers" into Vietnam. But an armistice in Korea without a definite change of mood in Peking might have just the opposite effect; it might free China for concentration to the south instead of to the east. If the French, in their desperate desire to extricate their army from Indo-China without acceptance of defeat there, were to press for concessions to Peking in Korea and in Uno in order to get some sort of Chinese undertaking over Vietnam, the effect could only be to produce tension between France and the United States and to increase the diplomatic disarray of the western powers in Far Eastern affairs. On the other hand,

a situation in which France is left indefinitely responsible in isolation for the crucial Indo-China sector in the containment of Communism is one which might at any time produce a crack in French morale if the hostile pressure were to be increased. Already two French lieutenant-colonels, who are prisoners of the Vietminh, are broadcasting on the enemy radio, and whatever the explanation of their conduct, such treason in high-ranking officers cannot but be regarded as a serious and disquieting symptom.

The hazards of a Presidential election year may make the Truman Administration cautious in undertaking any further extension of American commitments in the Far East. But it is essential somehow to close the gap which at present exists between the American involvement in Japan, the Philippines and Australia and the detached British and French commitments in Malaya and Indo-China. If the Churchill-Truman talks bring any progress towards real co-ordination of policies in this region, they will have been worth while for that alone.

* * *

Persia Stays Neutral

Dr Mossadegh's secret weapon is an instrument for cutting the ground from under other people's feet. Last week many of his opponents believed that they had cornered him, when he sent off a letter to Washington condemning the proposal for selling Persia's oil that was proffered by two visiting representatives of the World Bank. Since the National Oil Company is making a net profit of only 35 million rials as against expenses of 200 million, the Bank's offer was thought by many people to be a godsend, and the Shah is said to have twice sent an emissary to Dr Mossadegh asking him not to jeopardise friendship with the United States.

For some weeks before this incident, Dr Mossadegh had been bargaining with the American Ambassador on whether or no he could take the $23.4 million for advisers, trainees and materials that are available to him under the economic section of this year's Mutual Security Programme for "Point IV" aid. The project had been hanging fire because he would accept it only if he could have it without committing himself to contributing to the "defensive strength of the free world"—a commitment which the act requires of nations who are to receive military aid under its terms. Apparently this condition is not to apply; he has not accepted military aid, but will take economic advice, in regard to which the two countries have agreed that no obligations other than technical ones are necessary between fellow-members of the United Nations.

A gift of $23.4 million makes good headline news for a country in Persia's financial straits. The Persian public need not be told that none of the money comes into the exchequer, nor that such programmes, for successful completion, require first that the foreign advisers' advice be taken, and, secondly, that the receiving country shall spend money and effort upon carrying it out. It is the experience of earlier advisers that neither of these two conditions is easily fulfilled by Persian governments. For the moment, however, Dr Mossadegh has brought off another coup and political opposition is silenced. One deduction to be drawn from the incident is that the Americans, despite some daunting experiences with Dr Mossadegh, still feel that he is worth supporting because a successor might be even less satisfactory to deal with.

* * *

Utility Schooling

The local education authorities are providing plenty of support for the people who doubted whether the Government's attempt to save money by cutting mere frills from the education services was practicable. One authority after another has declared that it cannot save as much as 5 per cent on this year's estimates without damaging the essential services that the Ministry of Education said were to be left intact. Manchester, Leeds and Newcastle are among the larger authorities that find the Ministry's circular self-contradictory.

One authority has reacted by closing its nursery schools, another by reducing the number of teachers, another by cutting estimates for the dental service, which was one of the things Miss Horsbrugh thought should be untouched. As the Secretary of the Association of Education Committees has pointed out, the items that the Minister regards as sacred account for something like 80 per cent of local authorities' expenditure, leaving the cuts to fall on services that probably do not cost more than £30 million in all; and on these things alone the cuts would amount to not 5 but nearer 50 per cent. As administration accounted for 4.45 per cent of gross expenditure in 1951-52, compared with an average percentage—for a much smaller education service—of 4.3 before the war, Dr Alexander is probably right in thinking that not more than £1 million or so could be saved on this item; school transport has been cut already, but might produce £500,000; another £1 million might be saved by charging fees for further education and by other economies. But that adds up to only £2,500,000, against £15 million or so that it was intended to save.

Protests that the circular is unworkable have also come from the teachers' associations. A personal flavour will have been added to their opposition by the local authorities' refusal, last week, to agree to any change in teachers' basic salaries. The National Union of Teachers will hear none of the practical suggestion that if economies must be made in education, the children would lose least if compulsory schooling started at six years old instead of five. But in an open letter to both Houses of Parliament it contrasts expenditure on, among other things, the food subsidies with the relatively modest expenditure on education. Certainly it would be a pity greatly to cut education, which is of undoubted benefit to all its recipients, and leave untouched the subsidies which many do not really need.

* * *

Federation Doldrums

Prospects for the federation of the Rhodesias and Nyasaland have not improved since Mr Lyttelton gave it the Conservative government's blessing in November. Early in December a specially convened meeting of the African Representative Council in Northern Rhodesia turned down the Governor's request that the council should take part, along with Europeans, in defining partnership between the races. The Victoria Falls conference of last September adjourned on the note that a definition should be drawn up and partnership "as so defined, put into progressive operation." The Northern Rhodesian Africans, through their representatives at the conference, agreed to consider the federation of the three territories after this elucidation of partnership had taken place

Unlike an earlier, unofficial, meeting of Africans on the copperbelt, the African Representative Council did not reject the whole policy of partnership. It passed a motion asking for a government definition to be submitted to the Africans through their various representative bodies. But by refusing to take part in the preliminary discussions the council is able to evade all responsibility for the definition and is thereby robbing it of any usefulness in preparing the ground for federation that it might otherwise have had.

This action of the Africans is being described by the Europeans as irresponsible and as evidence of how little fitted they are for more political responsibility. There is even an attempt to blame it on to agitators. Yet the Africans' attitude, though it may be deplored as most unhelpful to

Gentlemen... we must have more and more Crossleys!

At the outbreak of the first Great War in 1914 the name of Crossley stood so high in official opinion that a fleet of more than fifty of their vehicles were already on military service, and the Government immediately took over every other Crossley which was available. Such sterling service did the Crossley tenders, ambulances, armoured cars, staff cars and the rest give in the next few years that the Company were continually asked to increase production . . . and by the time of the Armistice in 1918 nearly ten thousand vehicles had been supplied to the Services.
The fame they earned for their performance was even further enhanced during the 1920's by the superb Crossley roadster of that period, the long tradition of engineering craftsmanship never being allowed to fade. When mass-production methods became general in the industry, the Company made the bold decision to change-over completely to the making of commercial vehicles, in order to retain a more individual manufacturing approach: and this pride of achievement is embodied in the fine buses and coaches that bear the Crossley name today.

CROSSLEY

FOUNDED IN THE TRUE TRADITION OF BRITISH CRAFTSMANSHIP

Crossley Motors Ltd., Errwood Park, Stockport, is a member of the Group of Companies controlled by Associated Commercial Vehicles Ltd., of which the selling organisation is

the cause of better race relations, is understandable. They have every reason for thinking that the Europeans are insincere about partnership. In Northern Rhodesia, four years after the Dalgleish Commission recommended that more skilled jobs should be open to Africans, the European trade union on the copperbelt still imposes an economic colour bar. In Southern Rhodesia recently, an attempt was made to segregate the coloured members of a delegation from the confederation of free trade unions, the white members being offered accommodation in Salisbury's best hotel. The British delegate refused, and all the members stayed at a coloured hostel. Sir Godfrey Huggins is shortly coming to London to see whether Southern Rhodesia's objections to the proposed federal constitution can be met. He should reflect that public opinion in Great Britain could never agree to any modification of the safeguards for African interests so long as incidents of this sort can take place.

The Race for Germany

The partisans of "German Union Now" have entered the field in fresh strength against the backers of "Western Union First." The Social-Democrat Party has repeated its demand for sovereignty, unity and social welfare and denied outright that the European defence community will help unity to be achieved in freedom. The Social-Democrats are all too confident that the democratic powers can induce the Soviet Union to retreat without Germany having to pay any price for a bargain; they fail to realise that their slogans are weakening the chances of such a victory.

The national-pacifists have also been exceptionally active. Pastor Niemöller, who is head of the Evangelical Church's Foreign Affairs Committee, has visited Moscow at the invitation of the head of the Russian Orthodox Church. He has discussed the welfare of Germans in the Soviet Union. If he has returned with the news that some of the hundreds of thousands of missing prisoners of war are alive and will be released, a particularly bitter German grievance against the Russians will have been assuaged. The Protestant Church has always taken a lead in the campaign for unity and against rearmament. Recently, however, the head of the Catholic Centre Party, Frau Helene Wessel, has formed an anti-rearmament group in the company of a prominent Evangelical leader, Herr Heinemann.

The scene has now been enlivened by the appearance of Dr Joseph Wirth, the ex-chancellor who signed the Russo-German Treaty of Rapallo in 1922. Dr Wirth has announced that he has seen the Soviet leaders in Germany, and is impressed by their goodwill; he has attacked the Schuman Plan and intends to continue his propaganda in a lecture tour.

For its part, the East German government has published a draft electoral law, which is superficially very similar to the Bonn Government's version. Herr Grotewohl's government is ready to open up the frontier and allow freedom to all political parties three months before elections. This would certainly mean a serious risk for the Communists, though they intend to safeguard themselves against disaster by various devices.

It cannot be too often stressed that the primary aim of the Soviet campaign is evidently to draw Western Germans to a conference table, where they would be induced to demand a peace treaty and the withdrawal of the occupation forces. Herr Grotewohl would doubtless be willing to talk about elections, endlessly. Such negotiations could drag on for months or even years, during which time progress in the Western defence community would be at a standstill. If for no other reason, the Soviet authorities will want to postpone elections until living conditions in their zone offer a less disgraceful contrast to Federal Germany; in the meantime, they clearly do not want a United Nations commission to enter their territory. The day of reunion may therefore still be far off according to the time-scale of the Western world. But the events of the last few days are a useful reminder that it will inevitably come, one way or another. The West is ahead on the first lap but it cannot count on keeping its lead.

* * *

Israel and Germany

After profound soul-searching, the Israel Parliament (Knesset) has, by 61 votes to 50, with five abstentions, authorised Mr Ben Gurion's government to take such steps as it thinks fit to secure reparations from Germany. The vote was painful to all who participated in it, for it amounted to authorising direct negotiation with the Bonn government, an act repugnant to the whole of Israel. During the debate violent demonstrations took place outside the Knesset, entailing broken heads, broken windows and the use of tear gas. The principal authors of the demonstration were members of the extreme Right (Heruth) party of Mr Menachim Beigin, who was himself orating inside the house; Heruth, which as the 1950 elections proved, has lost ground, has become a shirt movement without a cause, and Mr Beigin seems to have hoped to recover support by championing so moving an issue. But his terrorist technique has been condemned even by opponents of negotiation with Germany, and will do him far more harm than good. Some Left-wingers also participated in his demonstration, but they did so without a chance of capturing popular support, since everyone knows that they think nothing of attending meetings in East Germany.

For some years, private negotiation over restitution of community property, of private property where heirs can be traced, and of compensation for victims of atrocity has been proceeding on the basis of the edicts governing compensation for all victims of Nazism. Last March the Israel government sent an identical note to the four occupying powers claiming national reparations. The sum claimed was $1,500 million based on the expenditure incurred and anticipated in connection with the resettlement of Jewish victims of Nazi rule in Europe. The note held that the sum was not beyond Germany's capacity to pay if spread over years and paid partly in goods. Eastern Germany of course has done nothing, the Soviet Union did not even acknowledge the note; but the bulk of German Jewry lived in Berlin and the West. The Western German government passed in September a resolution accepting the moral liability, but has since done nothing to put compensation into effect. Mr Ben Gurion is probably right in judging that only direct negotiation with it will produce results. To many of his supporters the issue of whether or not to negotiate is not wholly a moral one: why should a murderer also retain the spoils? This argument, coupled with the immensity of Israel's need of both goods and cash, has by a bare margin carried the day.

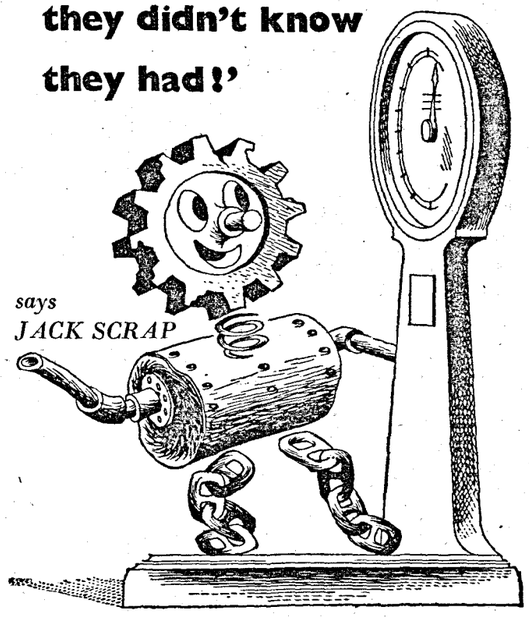
Not Sold on the Sales



The London shops do not seem to be having great success in their efforts to coax out the customer's reluctant pounds by their January sales. At least one West End store provided the conventional first-day scenes. When the doors were opened women rushed in like a football crowd, assaulting the counters and besieging the saleswomen. Other stores also reported very good business in the first two or three days of the sale. But it did not last. Oxford Street was full of milling crowds but they were looking, not shopping; they were hunting for bargains that they did not find.

Many retailers seem to have misjudged the market. The news of the slump in the clothing trade and of heavy stocks had led people to expect big cuts in prices. But retailers, still conditioned to the sellers' market, have been reluctant to accept big losses. Though the clothing shops have sold very little for several months, much of their stock is not out of fashion; and under the new scheme now sanctioned by the Board of Trade they will be able to sell their old stock alongside the new at prices somewhere between the old high

'They found 1,200 tons of me....'

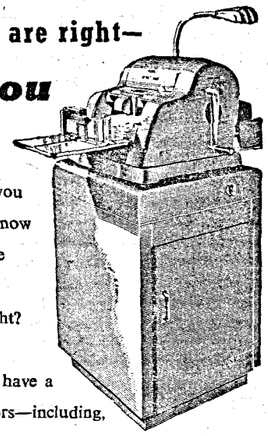
they didn't know they had!'

says JACK SCRAP

The director of a South Wales firm that takes a pride in its good "housekeeping" made a personal tour of his works in search of scrap shortly after his colleagues had made what they thought was a clean sweep.

He found 1,200 tons of good scrap in the form of obsolete machinery, surplus stores, unused sidings, and miscellaneous equipment that hadn't been thought of as scrap at all.

See what you can find. If we don't turn our scrap into steel we shan't get the steel our industries need.



Speed the SCRAP Speed the Steel

Scrap Merchants will help with dismantling and collection.

You may think you are right— but have you proved it?

If your business uses duplicating, you are probably convinced that you know which duplicator will give you the best service — but have you *proved* that your conviction is right? Roneo believe that the only way to arrive at a true answer is to have a comparative test of all duplicators—including, of course, Roneo '500.' We know that a side by side test will prove beyond doubt the great advantages of Roneo '500'

● Considerable saving in running costs. ● Really automatic inking, giving continuously even work without stopping to re-ink. ● Interleaving, with blotting or other paper to prevent smudging, is unnecessary. ● No proofing. The very first copy is usable. ● 16,000 copies from a lb. of ink ● Quick clean colour change in 25 seconds. ● Better standard of work with greater speed.

Write for booklet "Let's take a back seat", which gives users' reports on Roneo '500' that may help you to economise.

he's a CRAVEN TOBACCO man

CRAVEN TOBACCO gives a smooth, rich flavourful smoke. Fresh and fragrant, it burns evenly—slowly, and a deep satisfied feeling stays with you long after the last draw.

Obtainable in three blends, *Craven Mixture 4/6 an oz.; Craven Empire de luxe Mixture 4/2 an oz.; Craven Empire Curly Cut 4/3 an oz.*

FOR MEN WHO KNOW GOOD TOBACCOS

prices and the new, much lower ones. Some expensive non-utility clothes have been reduced to half price or less because these normally sell to people who know last year's clothes at a glance. But on the whole the reductions have been of the order of only about 20 per cent. That is to say, they merely brought prices down to their new market level. This still seems expensive to people who have bought little since they laid in stocks at the prices ruling twelve months ago. The sales will, therefore, have only partially fulfilled their function of clearing the heavy stocks in the hands of retailers and of releasing the capital for their spring buying, which they are doing very cautiously indeed. The buyers' resistance is not ended yet, and some clothing manufacturers are likely to go on experiencing hard times.

Reading Meters at Leisure

A shocking indictment has been drawn up by the London Electricity Board against some of its meter readers. For some years, according to the board, it has been difficult to get an honest day's work from all its readers, and since appeals and exhortations have had little response, an investigation was carried out to see just how much work they were doing. This showed that many readers finish their day's work at lunchtime and then go home, while many spend several hours over lunch or waste time in other ways. Even more serious is the allegation that in certain districts organised efforts have been made to restrict the amount of work done by each man.

As a result, the board decided to appoint supervisors who would periodically accompany meter readers on their rounds in order to arrive at and maintain fair standards of work. This system has long been used by the Post Office in settling postmen's rounds; but about half the board's 700 meter readers have gone on strike or been suspended for refusing to go out with the supervisors.

The readers' main grievance seems to be, not that the charges were unfounded, but that the truth was obtained unfairly. Before carrying out the investigation, the board, so the meter readers assert, ought to have consulted the men through the proper channels. In other words, they ought to have been given a chance to conceal their shortcomings and hide the fact that if all readers worked reasonably the board would save about £100,000 a year in working costs and the services of many readers would be released for more important work in other industries. This is a small strike, but it raises several principles. One is that, in the board's own words,

> a nationalised board must be conducted on sound business lines and cannot be expected to harbour employees whose services are not really needed.

It is also a reminder that the waste of labour through under-employment is not confined to industries where raw materials are short or orders have temporarily fallen off.

* * *

South Africa and Mr Scott

There is more truth than might appear at first sight in the South African Government's statement this week that its prohibition of any return to the Union by the Reverend Michael Scott was unconnected with his campaign at the United Nations Assembly over South West Africa. Apart from the fact that the order declaring Mr Scott a prohibited immigrant appears to have been issued as soon as he had forfeited, by three years' absence, the right to return to South Africa to qualify for citizenship, it cannot be disputed that in regard to South West Africa Mr Scott is a sharper thorn in the side of the Nationalist Government when he is outside the Union than when he is inside it. It is not South West Africa, but the racial tension in the Union itself, which has made Dr Dönges chary of letting him return. Legally, the Union has as much right as any other nation to decide whether or not to admit any individual alien to its territory; but that does not make the ban on Mr Scott any less regrettable, particularly in view of the circumstances in which it was made.

South Africa's handling of its relations with the Assembly has been no less maladroit. However irresponsible the conduct of some delegates in the Fourth Committee may have been, it was scarcely politic for Dr Dönges first to demand that the President of the Assembly should publicly chastise that committee, and then to withdraw his delegation from both the committee and the plenary sessions of the Assembly. Nor was it surprising, in view of South Africa's refusal to take advantage of the opening given by the 1950 Assembly for the discussion of the Indian problem in a less public arena than the United Nations, that another Assembly committee last week endorsed India's condemnation of the Union's policy of racial segregation. One daily newspaper reporting this defeat for Dr Dönges printed on another page the headline "South Africa's Narrow Win—Scrummaging Superiority Decisive." In future South African delegates to the United Nations might do well to study the tactics used by their victorious team at Twickenham, and particularly their "concerted and sustained shoving." In the Assembly a steady, patient repetition of a nation's case is more likely to improve its reputation than outraged demands for satisfaction and withdrawals into unsplendid isolation.

Combination of Engineers

We mentioned last week that the [engineers] did not intend to strike, but before our journal appeared the Executive Committees of the combined masters, both at Manchester and London, had come to the resolution to close their workshops on the 10th inst. . . . The reason they allege is, that "a formidable and widespread combination of mechanics, organised by the Amalgamated Society of Engineers, by overt acts of refusal to conform to the ordinary arrangements of various engineering establishments, has forced on the event." . . . Combination cannot . . . give the men one single advantage they cannot individually secure to themselves. They cannot by their combination exclude competition. Just in proportion as their wages are higher than wages in other occupations will be the tendency to a flow of labour into their trade; and there is nothing to prevent carpenters, smiths, and even common labourers from becoming, in a very short time, very respectable engineers. They are already driven out of some work, it appears, by common labourers, and make it one of their stipulations that these shall be excluded. The influx of other workmen into their trade is now the source of their complaint. . . . It is plainly impossible for the engineers to form a close corporation. They cannot shut out their body from the general competition which prevails amongst labourers in relation to employers, and cannot by combination get more from the masters than they already get. . . . By individual exertions there is no height in the social scale the whole body may not attain, but by combination they only check enterprise, destroy employment, and degrade themselves. . . All history convinces us that men are too easily persuaded to submit voluntarily to restrictions ruinous to themselves; but in general they have had the excuse that the authority they revered was time-honoured, and founded in many virtues: it is left for the working engineers—men who claim to be above their fellows for intelligence—to submit to ruinous restrictions, imposed by an authority which possesses no claim, either from time or good deeds, to their respect.

chooses "ELECTRO-MATIC" for the most intricate traffic control system in the North

At a complicated seven-road junction in Halifax, the "Electro-matic" system of traffic control is seen at its best. Congestion and delay are virtually eliminated for road users and pedestrians proceed safely.
"Electro-matic" signals are in use all over the world. Being vehicle actuated, they enable traffic to control itself. No matter how dense the traffic or how complicated the junction, "Electro-matic" will keep all streams of vehicles moving smoothly and rapidly. Let us send you information and literature.

A junction of seven roads all safely and efficiently controlled without the aid of the police.
One of the greatest advantages afforded by "Electro-matic" is the saving in police personnel. When "Electro-matic" controls the traffic the police are released to do their rightful job—the prevention and detection of crime.

Letters to the Editor

The Sterling Talks

Sir,—The suggestion in the article in your issue of January 5th that some of the Dominions should carry a more adequate share of the rearmament burden seems to require some elaboration—especially as the present sterling area talks and subsequent measures are unlikely to succeed without a very wide understanding of other members' problems.

It would seem that only Australia, New Zealand and, in respect of her white population, South Africa could justifiably be saddled with a burden of defence expenditure per head comparable with that of the United Kingdom in view of the low standard of living of the other sterling Dominions. But though the countries mentioned might well increase their defence expenditure without suffering material privations such as the United Kingdom is facing, we should beware of making crude comparisons of defence expenditure (either per head or as a percentage of national product) without also taking into account certain other factors.

First, the willingness of Australia and New Zealand to sell us food at less than world prices constitutes a very real contribution towards the bearing of the common burden. Moreover, it is unlikely that it will be politically practicable for such contributions to continue unless public opinion in all three countries becomes more fully aware of this fact and believes it to be the best way of securing the end in view. More open acknowledgment of this by the United Kingdom might make the policy more palatable to electorates in the Dominions.

Secondly, the quite exceptional rate of investment in Australia, on which its immigration programme depends, would make it very difficult for it to increase its defence expenditure greatly without an intolerable degree of inflation. If we believe that the peopling and development of Australia is a necessary long-term defence objective of the Commonwealth, this fact must surely be taken into account.

Thirdly, if the food-exporting countries are to assume a larger share of the common burden it seems certain that greater expenditure by them upon increasing their food production (if necessary by subsidising it) is likely to do more towards strengthening the defence of the Commonwealth than the increase in their armed forces or munitions production which would be achieved for the same expenditure of resources.—Yours faithfully,

J. O. N. PERKINS

St. Catharine's College, Cambridge

Two Courses in Korea

Sir,—In a letter dated July 18, 1950, General MacArthur declared that the arrangement whereby the South Korean army was placed under his command "cannot fail to increase the co-ordinated power of the United Nations' forces operating in Korea." When the General Assembly met on October 7th, General MacArthur had already sent that army across the 38th parallel to invade and occupy North Korea. The resolution adopted on that day did not authorise the invasion of North Korea. It was a disingenuous attempt to lend to General MacArthur's war the appearance of a United Nations' war.

The attack upon North Korea and the use of Formosa as a base from which to attack the Communists in China were both parts of the MacArthur-Foster Dulles policy, the details of which were settled at the conference in Tokyo on June 20th to June 23rd. The victims of American aggression—the North Koreans and China—have each in turn been branded aggressor, but it is becoming increasingly difficult to persuade the people of this country to follow America any further down this path of humiliation and dishonour.—Yours faithfully,

J. T. PRATT

London, S.W.5

[No American, British or other United Nations expeditionary troops had crossed the 38th parallel at the time of the Assembly resolution of October 7th, and it was entirely within the power of the Assembly and the principal governments concerned to have halted at the parallel if they had seen fit to do so. As was pointed out in the comment on Sir John Pratt's letter in *The Economist*, the resolution of October 7th plainly did authorise the occupation of North Korea.—EDITOR.]

Mobs without Masters

Sir,—Mr Malayery is mis-stating the case for Persian nationalism when he asserts

> It is such demoralising interests that have created a nemesis in the form of the national movement, and have been responsible for gradually bringing the latent social discontent to the present climax.

Undoubtedly the predatory exploitation of Persia's oil resources by foreign capital stimulated the national movement; but it is a complete misunderstanding of the nature of Persian nationalism to attribute its birth and growth to the "demoralising interests" of the Anglo-Iranian Oil Company. Nor is it true to say that the social discontent, by no means latent, was brought to a head by the activities—or the lack of activities—of the company.

The fact, however, remains that Persian nationalism could not assert itself, and the necessary reforms to deal with the shameful social conditions could not be carried out, without first getting rid of the "foreign tutelage," "the alien rulers."

Finally, I do not pretend to understand Mr Malayery's contention in the fourth paragraph of his letter. However, I think we can take it for granted that he is not inviting foreign intervention under any guise. He has already strongly rejected it in the third, and rejects it again in the final, paragraph of his letter. It is perhaps his apprehension of the nature and extent of the change demanded by the deep and universal racial discontent that drives him to conjure up fearful storms where "all of us, without exception, will find ourselves in the same boat." I do not believe that the Persian people share his fears or entertain any such misgivings.—Yours faithfully,

PERSIAN.

Soviet Forced Labour

Sir,—I am afraid that one statement in your article may be misunderstood by many western readers of *The Economist*. You say:

> It is indeed quite true that persons sent to "correctional labour camps" in the Soviet Union are formally sentenced for some offence under Soviet law—though no sentence is necessary for so-called "free exile."

To many readers, naturally, a sentence is formulated by a judge or judges who have heard not only the prosecution and its witnesses, but also the accused, a defending counsel, and, if they can be produced, witnesses for the defence.

No procedure of this kind took place when I was sentenced to a "corrective labour camp" for three years. I never saw my judges, nor did they see me. There was no defence, and, at any rate in my presence, not even a case was made for the prosecution. There was no shadow of a trial, judicial or other.

In the early hours of February 26, 1941, I was taken from my cell in Lomza prison (after being there for eleven months) to the basement of the same building, where I found some thirty other prisoners who had been brought there for the same purpose. After a while it came to my turn to be called through the door and taken into an adjoining long and dark hall, where a young, athletic-looking officer of the NKVD held ready a small piece of paper which he allowed me to read before signing. It had one sentence typed on it announcing that "the prisoner . . . has been sentenced by the Special Council (Osoboie Sovestchenie) of the NKVD in Moscow to be sent for three years to a corrective labour camp." I was not allowed by the impatient officer to say a word. There is no appeal against a decision of the NKVD.

As far as I could make out when in the Onega camps, the people committed for murder, thefts and laziness at work were tried in courts. Very few among the thousands of so called political prisoners there could boast of receiving such a privilege. The overwhelming majority were sent to the camps with sentences ranging from three to eight years by an arbitrary decision of the dreaded "trojka" of the secret police.—Yours faithfully,

LUCJAN BLIT

London, N.10

EPT Again

Sir,—In his letter published in your issue of December 15th Mr Hogarth refers to a matter which has lately been given considerable publicity—the suggestion that industrial concerns should be allowed to write off for taxation purposes sums in excess of the cost to them of the plant and machinery and buildings used in production. The ordinary citizen taxed on the whole of his income will find it difficult to accept such a proposal. If I need to replace my carpet at, say, three times the prewar cost, I am obliged to do so out of my taxed income, restricting expenditure on other things. Industrial concerns ought to do the same so far as they can, and if that means that nothing will be available for the shareholders they must put up with it. I see no reason why the general body of taxpayers should make good their losses from inflation.

If, however, it is decided on grounds of public policy that allowances in computing profits should be made on present replacement cost, I suggest the following solution in which an average rate of tax of 10s. in the £ is assumed.

If cost "X" is to be written up to 3X, shares to the value of "X," i.e. tax on the additional 2X which is to be allowed free of tax to the company, should be issued to the Government.

Although a number of speeches by company chairmen claim as a matter of justice tax allowances on inflated values instead of on cost, I do not recall any offers to repay, on a basis which similarly takes inflation into account, debentures, etc., borrowed in prewar days. Apparently the shareholder is to benefit both ways.—Yours faithfully,

Uxbridge F. W. JOHNSON

The Value of Scholarships

Sir,—The article in your issue of December 22nd concluded with the question "whether or not the country really needs to provide university education for all the people who at present just reach scholarship standard, a considerable proportion of whom subsequently fail to get degrees." If, as the context suggests, your comment covers all receiving awards of any kind from any source, it is certainly not in accordance with our experience in Magdalen, nor do I think it is true elsewhere in Oxford. We would describe the number of holders of scholarships (in this wide sense) who have gone down from Magdalen since the war after their first public examination, or failed at the final examination, as negligible. Statistics about this are very hard to extract: there is no published source to which one can refer. The situation may well differ between colleges and also between universities. As it stands your statement is so much at variance with our experience that one is compelled to ask on what evidence it is based.

In his letter of January 5th, C.E.O. suggests that money might be saved on scholarships by encouraging students to earn during vacations. This would be a very short-sighted policy. Of course, if the object of university education were simply to acquire a label B.A., perhaps no harm would be done. But if the object is a wider one of encouraging students not merely to learn but to think for themselves, the use of vacations to read widely, to travel (however cheaply) and to think about what they are doing free from continuous pressure to attend lectures and write essays, is as important a part of their education as the terms themselves.—Yours faithfully,

G. D. N. WORSWICK

Magdalen College, Oxford

Books and Publications

Banking Mechanics

The British Banking Mechanism. By W. Manning Dacey. *Hutchinsons University Library.* 203 pages. 8s. 6d.

In this book Mr Manning Dacey does something that has often been done before. He describes the mechanism (as distinguished from the practical arts) of the money market, analysing its various parts and components and their interactions. But he does it more acutely, more penetratingly and more subtly than it has yet been done, and this makes his book a valuable addition to the literature of banking. His method is a mixture of the historical and the analytical. On the historical side his account of the development of the "tap" and "tender" *modes of issuing* Treasury bills, of the evolution of the Treasury deposit receipt and of the working of the banknote issue under the 1939 Act are particularly useful. On the analytical side, the chapters on liquidity of banking assets, the working of the Bank rate, "cheap" and "ultra-cheap" money, and "deficit finance" are outstanding, although the last one suffers from undue compression.

Mr Dacey's book was, of course, written before the recent raising of the Bank rate and his readers are consequently deprived of the benefit of his comments on the new monetary policy. That is a pity but Mr Dacey has little need for regrets, for much that he says is highly relevant to the events of the past few weeks. His exposure of the fallacies of ultra-cheap money policy which "could if it were persisted in have only two outcomes: rampant inflation or the indefinite maintenance of totalitarian controls" leaves his readers in no doubt about where he stands in this particular controversy. And when he argues emphatically that "open market operations . . . are no more than an adjunct to Bank rate as a means of rendering Bank rate 'effective'" the reader (reflecting that the recent £1,000 million Funding Stock issue represented no more than a gigantic open market operation) may without much risk infer that Mr Dacey would share other authorities' doubts whether a 2½ per cent Bank rate and a 1 per cent market rate will prove adequate to the present emergency.

Mr Dacey's treatment is for the most part mechanistic or formalistic. As a bank official himself he is, of course, perfectly well aware of the limitations of his method. One feels, nevertheless, that once or twice he comes near to luring incautious readers into a pitfall. Take these two passages in particular. The first on page 93 runs: "In the absence of a cheap money policy the chief implication of these conventions"—i.e., the cash ratio and liquid assets ratio—"is that the volume of credit is completely under the control of the monetary authorities, not in the least under the control of the public nor, except within very narrow limits and over exceedingly short periods, under that of the commercial banks." The second on page 168 reads: "Before the invention of cheap money policies"—which gave the public the option of converting from bank deposits into Government "tap" issues—"it was axiomatic . . . that the actions of the public could in no way affect the volume of credit. Once a given volume of deposits had been created an attempt by the public to exchange out of deposits into goods would *merely* (reviewer's italics) drive up prices without in fact reducing the *volume* (Mr Dacey's italics) of credit."

Formally these statements are correct, if the word "volume" is interpreted to mean simply "number of pounds." But their implication is most misleading. It is that whatever the public may do or want, it cannot get its money out of the clutches of the banking system. That is untrue. The proportion of its wealth which the public chooses to keep in the form of money, whether currency or bank deposits, is (as yet) entirely within its own choice. In Germany in 1923 bank deposits were numbered in trillions of marks but so successfully had the public disengaged its real resources from the banking system that in value they represented only a few tens of millions of pounds sterling. The word "merely" shirks the crucial issue. For the sake of the university and other students to whom this book should be so useful, it would be well to make it clear in a future edition that in no true sense can the public be regarded as "prisoners of the banks."

Source Book on the Second World War

Documents on German Foreign Policy, 1918-1945, Series D, Vol. IV. *His Majesty's Stationery Office.* 731 pages. 21s.

This further instalment in the publication of the German Foreign Office archives that were captured at the end of the war is, like its predecessors, offered by its editors to the public as a source-book for the study of history, and not as a finished interpretation of history. It would be premature to base opinions on it or announce findings from it before its contents have been collated with those of other collections appearing at the same time, notably the collection of

"Documents on British Foreign Policy" which is also being published by the Stationery Office. This is especially the case because, as we are warned by the editors, the German Foreign Office was not always representative of Germany's Nazi Government, not often in Hitler's confidence and not ever in a position to be a direct and adequate guide to Hitler's real policy and intentions. But some things can be said on the basis of the four volumes already produced. This collection will probably be the most important single source for the eventual history of the inter-war years, dominated as they were by the German problem. The labour of selecting, arranging and editing the material, which is obviously formidable, is being carried out most admirably; the Anglo-French-American Board of Editors is putting historians of today and tomorrow under a heavy debt. The Stationery Office is also to be congratulated on issuing such large, clearly printed and well-produced volumes at so low a price.

The present volume—"The Aftermath of Munich"—covers the relations between Germany and Czechoslovakia and Germany and the major powers from October, 1938, to March, 1939. The bulk of it deals with Czech-German and Anglo-German relations, and the most summary reading of these chapters confirms that they supplement in important directions the material already available in the "Documents on British Foreign policy" and in other sources, voluminous though that material is already. It emerges, for example, that Mr Chamberlain realised that he was acting unconstitutionally in monopolising British foreign policy. In a smaller matter, the German Ambassador's report of a talk by Lord Halifax to the "notorious" cartoonist Low, in an attempt to dissuade him from lampooning the Fuehrer, opens up exciting vistas and makes one wish one had been under the table.

The remaining chapters will be no less important for the history of the outbreak of the Second World War when the time has come to write it. They cover German relations with France, Italy, the Soviet Union, the United States, Japan and the Papacy. They are less substantial than those just referred to. But this is not because they are less complete; there are few important gaps in the archives before 1940.

Brief Sketch of a Long Reign

Queen Victoria. By Roger Fulford. *Collins.* 144 pages. 7s. 6d.

According to the publishers the series to which this book belongs is designed for younger readers, presumably for those under twenty. In a limited space, about 35,000 words, each author has to sketch the life and character of some important historical figure.

Mr Fulford has done his work well, so well in fact that his book deserves a public wider than that for which it was originally intended. As a piece of fine writing it cannot stand beside Lytton Strachey's brilliant life of Victoria, but in other ways it is much superior. Strachey was an expert caricaturist masquerading as an historian, but Mr Fulford has endeavoured to show the Queen as she was; he has manfully resisted the temptation to provoke the titters of posterity.

He has not written a biography in the ordinary sense. Instead he has drawn Victoria as she was at four different periods in her life. First she appears as a girl exchanging the constraints of childhood for the ties of monarchy almost with relief; next in the exacting, but for her the satisfying, part of Albert's wife; then alone, voluntarily secluded for nearly twenty years, and generally unpopular; finally, as the almost legendary widow of Windsor acclaimed by the trumpets of jubilee.

The pictures blend because, through eighty years, so much remained unchanged. Victoria was always straightforward and direct; she cherished her prejudices; and Albert's influence was tenacious. While, obviously, there can be no systematic treatment of public affairs, Mr Fulford has contrived to give a just impression of the Queen's political influence at home and abroad, of that watchful and often critical interest she took in politics. Moreover, Melbourne, Palmerston, Gladstone and Disraeli are all deftly fitted into their customary places. In short this brief sketch is life-like, fair but not flattering.

Exchange Stability

The Exchange Stability Problem. By G. Stuvel. *Basil Blackwell.* 242 pages. 21s.

One of the most important problems in international economics concerns the conditions under which exchange depreciation will improve the balance of trade—alternatively, the conditions required for stability in the foreign exchange market. Dr Stuvel brings to this problem the mathematical ability that it demands, as well as an econometric orientation (strongly influenced by the work of Tinbergen) which keeps in the forefront the ultimate necessity of applying the theoretical results to the real world. Further, while it cannot be said that the non-mathematician can read the book with pleasure, the style is clear and straightforward and the conclusions important enough to merit the effort.

The virtue of Dr Stuvel's analysis is his attention to the indirect effects on the balance of trade of changes in exchange rates—that is, effects other than the immediate results of changes in the internal prices of exports and imports. While he simplifies his problem by assuming that the indirect effects on the outside world are negligible, so that the prices of foreign-produced goods are unaffected by depreciation, this simplification permits him to deal with such complications as the import-content of home production, "money illusion" on the part of home consumers, and the reaction of money wages to changes in the cost of living.

The consequence of all these complications is that exchange stability depends on an extremely complicated formula. Dr Stuvel reduces this formula to comprehensibility by introducing various simplifying assumptions, and illustrates the resulting special cases by statistical examples drawn largely from the work of Dr Chang. The most important general conclusion which emerges is that, in many apparently realistic cases, exchange stability depends more on the marginal propensity to spend of home consumers, and on their reactions to changes in the cost of living, than on the elasticities of international demand and supply on which English economists particularly have laid so much stress.

While this particular conclusion has been reached independently by other writers since Dr Stuvel sent his book to press, the study as a whole constitutes an important contribution to the theory of the subject. The emphasis on practical application is also welcome, although Dr Stuvel is perhaps too sanguine about the possibilities of multiple correlation analysis. There is, however, a related problem to which he gives insufficient attention; for policy purposes, one wants to know not only whether depreciation will improve the balance of trade, but also what the social cost of a given degree of improvement will be.

Neglected Colony

British Honduras, Past and Present. By Stephen L. Caiger. *Allen & Unwin.* 240 pages. 18s.

No British colony has been so neglected by its rulers as British Honduras, and none is so little known to the British public. The Newfoundlanders used to complain that governments of any political colour regarded their rights and interests merely as the small change of diplomatic bargaining, something to be sacrificed for the sake of a greater advantage elsewhere. The equally loyal Hondurans were worse off; they could never persuade Whitehall that they had any rights or interests worth maintaining. If the Guatemalan imperialists can raise the ghost of a case, it consists only of debating points given away by British diplomats who were too languid to assert their own claim.

British Honduras has been so long a British dependency that its origin is forgotten. No Spaniards were settled there in the great age of Spain. Neither Habsburgs nor Bourbons, or any of their successor states have any juridical claim to this territory which does not equally apply to Manhattan Island; that, too, is west of the line drawn by the Pope in 1493. But the British have been in actual possession since some period well before the Treaty of 1670. It does not seem likely that even the buccaneer Wallis, who gave his name to the settlement of Belise about the year 1638, was the first Englishman on the coast, and about that date the first treaties of friendship, never broken by the British, were made with neighbouring Indian kings.

A new book about British Honduras is, therefore, welcome, though it does not make pleasant reading. The story is one of unrewarded, thankless, struggle. The "Baymen" repeatedly defended

You save money if you fly TWA to the USA during "Thrift Season." Ask your Travel Agent about these special TWA reductions.

To fly TWA means swift *trouble-free* travel with friendly, individual attention. Superb cuisine and comfort, above-weather travel, and the "on time" arrival of TWA 4-engined Constellations—all these are reasons why some 2,000,000 passengers bought TWA tickets last year. And remember—*only* TWA flies from London not just *to* the United States but *through* to any one of the 60 important U.S. centres, one ticket one airline all the way.

Exclusive all-sleeper service

TWA offers the only **all-sleeper** service to New York. The luxurious TWA "New York Ambassador" leaves London every Sunday and Paris every Monday. In addition to the all-sleeper flights TWA offers you a daily service from London to the U.S.A., including combination sleeper-lounge flights on Tuesdays and Thursdays.

AUSTRALIA & NEW ZEALAND via the USA

See and enjoy beautiful San Francisco, Hawaii, Fiji, on your way "down under." Fly by TWA–BCPA de luxe sleeper service.

themselves against Spanish aggression, repeatedly reorganised their society, and rarely persuaded the Colonial Office to lend a hand. Nothing would put them down, not even the successive collapses in the market for their few products, logwood, mahogany, chicle. Even their archives, damaged by flood, are sadly deficient. In re-telling this story, Mr Caiger has not much to offer that the serious student cannot find in Sir John Burden's books. Indeed his general history is a little shaky. But this is a settler's book written from the inside, not an external student's thesis, and therefore the more valuable.

Malthus and His Adversaries

The Malthusian Controversy. By Kenneth Smith. *Routledge and Kegan Paul.* 350 pages. 30s.

At a time when population problems, and particularly the problem of world overpopulation, are increasingly prominent in the public consciousness, there is a special interest in recalling the forms in which they presented themselves a century and a half ago under the first impact of demographic expansion. This study of Malthus's long-drawn-out controversy with Godwin and other critics is fascinating in more ways than one. It is, though only incidentally, something of a character study, offering tantalising psychological glimpses of a complex and—in the author's view—tortuous-minded individual. It presents, too, a peculiarly interesting picture of acute intellects at work in a field where the concepts, techniques and factual raw material, familiar to students of a later age, were all lacking. One does not know whether more to admire the virtuosity with which both Malthus and his antagonists contrived bricks without either the straw of adequate statistics or such useful tools as the net reproduction rate, or to shudder at the over-confidence which was ready to use results so attained as the unquestionable basis of policy.

To the reader whose chief interest lies neither in the personalities and ideas of the early nineteenth century nor in the development of methodology, but in the population problems of today, the chief appeal of "The Malthusian Controversy" must necessarily lie in the modern parallel. Malthus was unscientific as an analyst and crashingly wrong as a prophet; changes on the one hand in accepted morality and on the other in technique have between them overwhelmingly justified his contemporary critics. Can similar developments be trusted to justify the optimists of today? Dr Smith, it appears from his "Conclusion," trusts them implicitly. He is completely unalarmed either by prospective food shortages (the more mouths, the more hands, and let science take care of the law of diminishing returns as it has done in the past), by the social consequences of overpopulation (growing numbers can only be a symptom of improved conditions, so why worry?), or even by the prospect of standing room only (a rapidly growing population is most probably passing, like a rapidly growing baby, through a transitory phase, and is similarly bound to slow up some time. The contrast is indeed striking between the careful scholarship of the main body of the book and the slapdash polemics of its closing pages.

Dr Smith achieves his primary aim of rehabilitating Malthus's critics as men who judged more justly than did Malthus the trends and potentialities of their time. His story is a well-documented warning against cut-and-dried demographic prophecy, especially when based on grossly inadequate evidence. The attempt, however, to exorcise the twentieth-century Malthusian devil by the arguments not unfairly summarised above would have been better left unmade.

Political Research

A Breviate of Parliamentary Papers, 1917-1939. By P. and G. Ford. *Basil Blackwell.* 571 pages. £2 12s. 6d.

Professor Ford has taken his title from the Catalogue and Breviate of Parliamentary Papers published by Hansard, who was responsible for the daily official report of Parliament's affairs which still bears his name. The reports dealt with are those of "committees, royal commissions and similar bodies on matters which have been, or might have been, the subject of legislation" but since there is no consistency about whether such papers are issued in the Parliamentary or non-Parliamentary group, Professor Ford, like his predecessor, has taken "public policy" as his criterion.

The papers included are broadly those dealing with economic, social and constitutional questions and matters of legal administration. The book contains a subject classification, a subject list of documents and a summary of the reports with references to other relevant papers, an alphabetical index and an index of chairmen. It is thus a useful guide to the searcher among historical raw material, but the reader who needs no more than the summaries might welcome some indication of what, if any, action was taken on the recommendations. Probably only a research student using the Breviate as a starting point for his studies could assess its true value; to a reviewer it has the insidious fascination of a dictionary which keeps him reading about subjects in which he had had no previous interest but which, thanks to their arrangement, follow logically within groups.

The American Story

The Growth of the American Republic. By S. E. Morison and H. S. Commager. Fourth Edition. Two Volumes. *Oxford University Press.* 1800 pages. 70s.

For the third time Professor Morison and Professor Commager have brought up to date what is unquestionably the best and the most readable general history of the United States. The last edition, published in 1942, concluded with a sympathetic assessment of the New Deal, and America's entry into the war. The new chapters, completed early in 1950, carry domestic events up to President Truman's surprising triumph in 1948, but they concentrate upon America's role on the world stage: the fighting of the war in Europe and the Pacific, the winning of the victory, and the responsibilities of leadership forced upon the United States with the return of peace or half-peace.

The growth of the American republic, in the last fifteen years, becomes inextricably entangled with the whole march of world affairs; inevitably, on such a large canvas, the treatment must be more general, and many details must be suppressed. A few of the verdicts, handed down at such close quarters, may have to be revised; after the end of the Hiss case, for example, it would no longer have been possible, unfortunately, to dismiss the Un-American Activities Committee with the assurance that, in its long and shabby career, it had turned up nothing not already known to the Department of Justice. It remains remarkable that the authors, in dealing with a period which seems to end only yesterday, are able to maintain their high standards of scrupulous scholarship, enlightened judgment and lively exposition. Of particular interest are the sections dealing with the war in the Pacific, presumably the special concern of Professor Morison, the author of an exhaustive account of American naval operations during the war.

AMERICAN SURVEY

President and Prime Minister

Washington, D.C.

THE moment just after even such a distinguished visitor as Mr Winston Churchill has pulled out of the Washington railway station is not the best one for assessing the permanent value of his coming. The smiles have hardly left his face, or those of the officials who have grown used to being photographed with him, the resolve to "harmonise" policies which are inherently dissonant is still strong, and mutual expressions of good will are still warm. Ahead lies the realisation that fundamentally differing points of view cannot always be reconciled by mere recognition that they ought to be. For American officials, there also lies ahead the strain of long hours before Congressional committees, during which they must prove conclusively that they were able to persuade the visitor to change his policies, without themselves retreating an inch from whatever positions various groups of Senators believe they should have been holding before the conference began.

The formal talks between President Truman and Mr Churchill have finished and the Prime Minister is on his way to Canada. But he is coming back again next week for what may be the most important single event of his whole trip, his chance to make a direct impact on Congress and on a large section of the American people through their television sets. It may be some time before it will be known whether, in the words of Mr Walter Lippmann, "the enormous preponderance of our material power can be made consistent with true and equal friendship." But however much anyone tries to read into the communiqué, it is not too early to suggest that something which falls far short of "true and equal friendship" has been achieved, something which bears the more pedestrian name of "complete understanding." That may be enough for the moment, but it is less than the imagination of Mr Churchill had envisaged.

Something pedestrian is probably, however, all that could be expected from an Administration which is exhausted, on the defensive, and more inclined to harmonise its policies with those of its internal enemies than of its international friends. Before Mr Churchill's periodic descents on Washington during the war, there were always plenty of people scurrying for cover and building defences for their favourite policies against him. But during the war Mr Churchill's comings and goings were kept secret, so these people had no opportunity, as they had this time, to enlist the services of the press or to air their opinions at parties. And during the war there were also other defences on which considerable reliance could be placed.

One important defence was President Roosevelt himself. Another, and valuable, psychological one was the relative ideological positions of the two countries. In purely physical terms the relative strengths of the United States and Britain have changed greatly since the war in favour of the United States; in ideological terms they have changed in favour of Britain. Then the United States was secure in its liberalism. It was not so long since Chamberlain had referred to Roosevelt as "that Red in the White House" and there was a warm feeling of superiority to Mr Churchill as an eighteenth century, almost feudal, reactionary. Today it is the United States which has a string of decaying albatrosses round its neck. It is Mr Acheson, not Mr Eden, who has to explain why he is supporting General Chiang Kai-shek, Mr Quirino and Mr Synghman Rhee and what he intends to do about supporting General Franco. The realisation of this made for uneasiness in Washington.

But despite all the bad omens before the meeting began and the failure, unless the official spokesmen have been unnecessarily secretive, to achieve the kind of partnership which Mr Lippman, amongst others, thinks must be achieved before there can be any security for the western world, much was done to recover the ground lost during Mr Morrison's tenure of the Foreign Office. If co-operation between the two countries is not yet back to the level of 1945, inadequate for the present crisis though that may seem to some, it has climbed out of the trough of 1951.

*

Until the elections have cleared the air in the United States not much more can be expected. No Administration with only ten months of rickety life left to it could do much more and the Eighty-second Congress, riven by internal feuds and factional, as well as party, bitterness, would not support it if it tried. On the day the Anglo-American talks began Senator Connally, who as chairman of the Senate Foreign Relations Committee must be the spokesman for the Administration's foreign policy, came back from Texas where he faces a hard fight to get renominated this year and announced that "it was time for Europeans to stand alone economically" and that he was "not very strong for any additional aid to the British." This statement is accepted as an accurate report of what the grass roots are saying.

Under the circumstances the President's decision to devote more than half of his State of the Union Message on Wednesday to foreign affairs might seem courageous. But in truth they are the only kind of affairs on which he can hope for even limited co-operation from Congress. The catalogue of domestic matters on which he asked for legislation in the last part of his speech has no hope of passage, but some of those in the foreign field can be approved; for instance, the Japanese peace treaty and the Pacific security pacts can be ratified and so can the agreement bringing Greece and Turkey into the North Atlantic Treaty Organisation.

How successful the Administration will be in getting money for the mutual security programme is another matter. Its prospects will probably depend on what cannot at the moment be assessed, the estimates made by a number of Republicans of General Eisenhower's chances of getting their party's presidential nomination. They would look foolish if they had destroyed two years' work on the part of their candidate, and they would not be very popular in the White

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

House if he got elected. If, on the other hand, they feel reasonably certain that Senator Taft's professional machine will defeat the General's rather amateur one, they can vote without anxiety to cut foreign aid in order to aid their own election campaigns.

Mr Truman's review of 1951 is useful in putting that year into perspective, even if he exaggerated a little in calling it "a year of great achievement." The virtues of the Japanese peace treaty as a document are probably over-estimated by the American Government and so are those of the disarmament proposals presented to the United Nations. But the President was right, at a moment when the difficulties in Korea are being used for party advantage, to point out strongly that the United Nations action "has been a powerful deterrent to a third world war." He was also right to remind Congress that "in Europe combined defence has become a reality," that "a real fighting force" has been created, even if it is not yet as strong as it ought to be, that "our allies are essential to us, just as we are to them" and that they want to be "freed from dependence on our aid" just as much as the United States wants to see them independent. None of these points is part of the creed of the ordinary member of Congress.

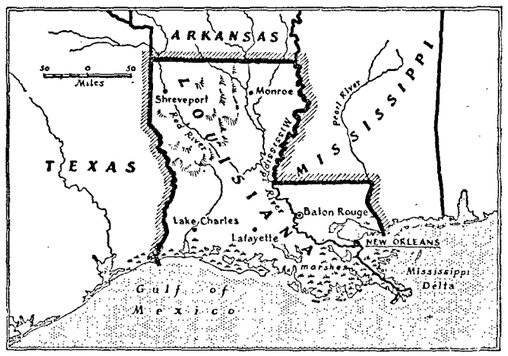
*

What is part of the creed of most congressmen is that Communism is a bogy which can be used, and is at the moment most useful, for internal political purposes. There was something pathetic about the urgency with which President Truman said that

> this will be a presidential election year—the kind of year in which politics plays a larger part in our lives than usual. That is perfectly proper, but we have a great responsibility to conduct our political fights in a manner that does not harm the national interest. We can find plenty of things to differ about without destroying our free institutions and without abandoning our bipartisan foreign policy for peace.

The first and most noticeable thing about this passage is that it is a statement of a man who does not intend to be—or at least hopes not to be—a candidate again. The second thing about it is that it appears to be the statement of a man who wishes that domestic politics had not interfered with the conversations he had been having for the last three days with Mr Churchill. There is little doubt that, whatever the joint statement omitted to say, or whatever desirable arrangements were found impossible to reach, the personal relationship between the President and the Prime Minister, which has always been good, got better. There is a sympathy between the two men which can be sensed more easily than it can be explained.

One explanation is perhaps that both feel somewhat isolated by the burden of responsibility they bear. But more important is probably that each knows how slim is his margin of power and how dependent he is on domestic political situations which vitally affect the future of the world without taking any responsibility for it. There were many passages in the statement which were only too obviously there to help one or the other over some hurdle in the next few months. Perhaps the moral of the last few days was best drawn by Mr George Kennan in his recent book when he said that



> history does not forgive us our national mistakes because they are explicable in terms of domestic politics. If you say that the mistakes of the past were unavoidable because of our domestic predilections and habits of thought, you are saying that what stopped us from being more effective than we were was democracy as practised in this country. And if that is true, let us recognise it, and measure the full seriousness of it—and find something to do about it.

Pelican State Primary

[FROM A CORRESPONDENT IN LOUISIANA]

On January 15th Louisiana, the Pelican State, will be picking its next Governor from a flock of Democratic candidates. Here, as throughout the country, November 4th will be the official election day, but in southern States, of which Louisiana is a typical example, with only 400 Republicans registered as voters, the real fights are in the primary elections in which the Democrats choose their candidates. If none of the eleven candidates for the governorship gets a clear majority next week, there will be a run-off election between the two leaders a month later.

Four years ago the Democrats in Louisiana settled on Mr Earl Long, brother of the late Huey Long who after a tempestuous career had been assassinated in 1935. Huey Long was the dictator of Louisiana, and in those days of depression there were many who feared he might become dictator of the whole country. His demagogic progress was unique in the history of local American politics, although hardly in that of dictatorships, for, in a State notorious for political corruption, his campaigns were based as much on the exploitation of economic issues as on the pay-offs and nepotism from which political machines usually draw their

strength. With catch-phrases such as "Share the Wealth" and "Every Man a King," which were later translated into practice to a certain extent, Huey Long appealed to the under-privileged and ignorant in a State where there were plenty of both.

Louisiana is far from being poor; its marshes yield fish, especially shell-fish, and furs, its farmlands rich crops of sugar, rice and tobacco as well as cotton; New Orleans is one of the world's great ports; above all, the State is a leading producer of sulphur and petroleum. But in the main this wealth is in the hands of a few large companies and the annual income of the average Louisianian is amongst the lowest in the country; so is the standard of education. Spanish and French traditions are still strong in the State: it is divided into parishes, relics of Catholic rule, instead of counties, and its civil law is derived from the *Code Napoleon*. New Orleans is a Roman Catholic city, but Protestants dominate the northern part of Louisiana.

Less than half of the State's inhabitants live in the cities and it was the poor people in rural districts that gave Huey Long the votes that enabled him to control the State. In 1948, after a period during which New Orleans businessmen tried to run the State administration, Mr Earl Long won the governorship by offering the same economic cure-alls as

his brother had done. His extravagant plans included old-age pensions of $50 a month for anyone over 65; today there are nearly 120,000 people receiving these pensions from the state government. To pay for this, and his other costly social measures, Governor Long was forced to increase the tax burden on those who were supposed to benefit from his welfare plans; he imposed sales taxes and increased the levies on such commodities as beer, cigarettes and petrol. The State's tax rate is the highest in the country, and in Louisiana $1 out of every $10 a man earns is taken by the State, apart from federal taxes. Yet at $226 million the State debt per head is also the highest in the United States, and is rising rapidly.

Governor Long has neither the personality nor the ability of his famous brother, but in his election campaign he was helped by Huey Long's son, Mr Russell Long, a young man who resembles his father in looks and other ways, but shows no sign of wishing to copy him as a demagogue or dictator. The revival of the Long dynasty was confirmed when Mr Russell Long was elected to the United States Senate in 1948 and re-elected for a full six-year term in 1950. In Washington he has won praise for his restraint and circumspection and has shown himself to be as progressive as could be expected of a southern Democrat. In Louisiana Senator Long has now, however, broken with his uncle on the grounds that Governor Long, by trying to extend his term of office, was attempting to follow Huey Long's undemocratic tendencies.

*

Governor Long cannot succeed himself, since the State constitution does not permit it, so in the current primary election he is supporting Judge Carlos Spaht as his chosen successor. But Senator Russell Long is campaigning on behalf of US Representative T. Hale Boggs, a young lawyer whose political career began before the war in an attempt to root out the last traces of the Long regime. If Mr Boggs wins the governorship, he will break the tradition that no Roman Catholic from New Orleans can become Governor of Louisiana. Mr Boggs is said to be a liberal and to have the tacit backing of President Truman. However, the political climate in Louisiana is so unfavourable to the President that Mr Boggs has felt it desirable to deny the connection.

It is noticeable that, while to some of the candidates for the governorship nothing is too bad to be said of Mr Truman's Fair Deal, none of them, however conservative they may be, have dared to criticise Governor Long's even more liberal economic programme in the same outspoken terms. The political sagacity of the Long family has mapped a road from which no candidate in Louisiana ventures to stray far. A Socialist label is indeed being tied to Mr Boggs, and apparently doing him harm, but only because the simple and uneducated rural voters do not recognise that this fancy foreign name could more correctly be applied to the Long policies they have favoured in the past. The candidates that oppose the present administration of the state do so only on the grounds that it is inefficient, unbusinesslike, wasteful and corrupt.

Amongst the candidates for the Democratic nomination is a Negro, the first to stand for election in Louisiana since shortly after the Civil War. But, apart from Judge Spaht and Representative Boggs, only four of the contestants are given serious consideration. One of these is the Lieutenant Governor, Mr William Dodd, who was elected as Mr Earl Long's partner but has since separated from him. Mr Dodd has the open support of the State's flourishing gambling community, which has suffered from the recent crime investigation in Washington. Judge Robert Kennon is an independent who has for some time led the forces opposed to the Long dynasty. Mr James McLemore, a cattle farmer new to politics, is regarded as the businessmen's candidate. Finally there is Miss Lucille May Grace, of importance not so much because she is the first woman to run for the governorship in Louisiana as because she is backed by Mr Leander Perez.

Mr Perez, who entered politics as one of Huey Long's henchmen, has ever since been the boss of two large parishes near New Orleans. In 1948 he was one of the leaders of the reactionary States' Rights, or Dixiecrat, Democrats who deserted Mr Truman and ran their own candidate for the Presidency. This group drew much of its support from Louisianians interested in oil, who were incensed at the Federal Government's claim to ownership of the so-called tidelands oil under the waters of the Gulf of Mexico. Louisiana was one of the four states carried by the Dixiecrats, largely because Governor Long failed to come to Mr Truman's rescue. It is this situation which gives national importance to the outcome of the present political confusion in Louisiana. Mr Perez is fighting a vicious red-baiting campaign, probably not so much to get his own candidate in as to keep Mr Boggs out. For it is thought that if Mr Boggs wins next Tuesday's election, he may be able to prevent the Louisiana delegation deserting the Administration at the Democratic Party's national convention next July.

American Notes

Eisenhower on the Brink

Senator Lodge's highly spotlit announcement from his Eisenhower-for-President headquarters turned out to be only that he was certain that General Eisenhower was a Republican and that the General's name would be entered in the Republican primary election in New Hampshire in March. This was expected, but the unexpected followed. The next day the spotlight swung to Paris, and revealed where the General himself stood—on the brink of the presidential campaign, resolved not to take the plunge himself, yet ready to be pulled into the water by the Republicans, in July but not before.

General Eisenhower announced that it had been correctly stated that he was a Republican, but that in no circumstances would he ask for relief from his important assignment in Europe in order to seek nomination to political office. However, he recognised the right of Senator Lodge and his associates to organise an attempt, in which he himself would not participate before the presidential nominating convention in July, to place before him a clear-cut call to political duty which would transcend his present responsibilities. This statement snuffed out the last hopes of those Democrats who still hankered after General Eisenhower, and it presumably means that he will not withdraw his name from the Republican ballot in New Hampshire. But for it to appear on the ballot in the more important primaries in such states as Wisconsin and Ohio, which the other Republican candidates are entering, the General would have to take the positive step of giving his consent.

General Eisenhower has removed some of the doubts that were making it difficult, if not impossible, for his supporters to continue working on behalf of his candidacy. He has made it clear that he is a Republican and that he is "available." But he is not prepared to give the active help, the promises of office and patronage, that they need to oil the party machine and ensure that it does not fall into Senator Taft's hands

Once nominated, General Eisenhower seems a sure winner, in so far as anything can be sure ten months before the election. According to Dr Gallup, he is the favourite of all voters, with or without party affiliations, whoever is his opponent, and the influential and independent *New York Times* has already promised its support. The paper is sure that the General could lead even the laggards amongst his fellow Republicans towards world responsibility. Few people argue about that, but the other directions in which he would lead his country are not so obvious, and seem unlikely to be clarified until after he is nominated. His views on the Far East are not known; such views as he has expressed on domestic matters have in some cases been so conservative that they have alienated the labour organisations and endeared him to the southern Democrats. It must be remembered that as a serving soldier the General has been precluded from offering his opinions on questions of domestic politics.

* * *

Congress—Short and Sour?

The Eighty-second Congress reassembled in Washington this week determined to finish its second and last session by the beginning of July, so that its members can relax at the presidential nominating conventions in Chicago and then have three carefree months for campaigning; it is not only a President but also 435 Representatives and at least 34 Senators who are to be elected next November. But Congressmen's tongues have a way of running away with their determinations, and it seems a fairly safe bet that they will have to return to Washington, after a recess, for the conventions.

The actual timetable will in effect be set by the coalition of Republicans and conservative Democrats which controls Congress. In these circumstances prospects are worse than they have ever been for the Fair Deal social legislation which President Truman once more requested in his State of the Union Message, although with a little less conviction than usual. The need for speed gives the Republicans an excuse for refusing to bring up the question of civil rights for Negroes, since it would inevitably mean that all other business would be delayed by a southern filibuster. The authority for price, wage and credit control which expires on June 30th will probably be renewed, but it is most unlikely to be strengthened as the President wishes, unless inflationary pressure suddenly climbs again; indeed, if peace comes in Korea, the stabilisation legislation may be weakened. Nor is Congress disposed even to consider higher taxation, for voters are already complaining about the increases made in the last session. Appropriations must of course be provided, especially for defence; in principle cuts in expenditure will be as welcome as ever, but in practice they always hurt somebody and, except in the case of foreign aid, that somebody is an American voter.

There is at least a chance that the session will be short, but none at all that it will be sweet. Investigations have become a habit with this Congress and will probably take up as much of its time as legislation, for they are thought to pay better electoral dividends. The Democrats will once again hurry to drag the skeletons out of their cupboards in order to keep the Republicans from doing it for them. And within the parties there will be a constant jockeying for position round possible presidential candidates and platforms. The reason why Senator Styles Bridges of New Hampshire has been elected to succeed the late Senator Wherry as Republican leader in the Senate is that he bridges the gap between Senator Taft and General Eisenhower. He is said to be committed to neither as a candidate, but is more ready to support the Senator's views on economy than he is the General's on international co-operation.

Detroit on the Dole

The "battle for production" which Mr Wilson, the defence mobiliser, describes in his latest report is not being won, as it was during the war, on the assembly lines of Detroit. Then, after a brief period of retooling, the entire resources of the automobile industry were turned over to war production, and, as the chart shows, employment rose sharply. Under today's guns and cars economy, supplies for passenger cars of steel, aluminium, and copper, particularly copper, have been cut, but defence contracts have been slow to take up the slack, and relatively few have gone to Detroit. The industry has $6 billion of war goods contracts, but most of them are being filled elsewhere. By the middle of December there were 120,000 idle in the former "arsenal of freedom."

The news that further cuts in materials would reduce the production of passenger automobiles and lorries to about a million in the second quarter of this year, from two million a quarter in 1950, brought a militant deputation to Mr Wilson, consisting of Governor Williams of Michigan, Senator Moody, and representatives of the industry and the automobile workers. Such a cut would mean unemployment of 160,000 in Detroit by next June, and all are agreed that further cuts should be postponed until the autumn, when defence employment will be rising and it may be possible to stretch copper supplies farther.

Source: US Department of Commerce.

The view that the industry has been discriminated against hardly holds water. Its supplies have been cut much less drastically than those of other industries producing non-essential consumers' durable goods. There is more truth in the charge that too great a share of scarce materials has been going into expansion of facilities, and, perhaps, in the view that the military could make do with less copper.

Faced with the danger that Detroit might appeal over their heads to Congress, the planners have promised first aid. A commission is to study the possibilities of combining war work with civilian production in Detroit, and the Comptroller General is to be asked to rule that contracts need not necessarily go to the lowest bidder, a decision which would make it easier to relieve unemployment. It is, however, late in the defence programme to divert contracts, and doubtful whether they would materialise in time. Mr Wilson has promised, therefore, to see what can be done to find more copper for automobiles at the expense of defence-supporting industries; military demands are also to be reviewed. Temporarily, automobile production may be saved from the last stage of the precipitous decline marked on the chart. But even if it could get more materials, it is not certain that many more cars could be sold. Over 17 million have been turned out in the past three years, and 1951, for all its restrictions, remains the second best year on record; dealers report that sales are slow at the new higher prices.

Truman's Hoover

Most of the really controversial recommendations of the Hoover Commission on government reorganisation have been allowed to gather dust. But its suggestions on the reform of the Bureau of Internal Revenue were given new life when the President, determined to show that he would not tolerate corruption and disappointed, at least temporarily, of his new commission to track down the scandals, submitted a plan for reorganising the bureau from top to bottom. Under this scheme, the sixty-four Collectors of Internal Revenue, of whom all but fifteen are political appointees, are to be swept away and replaced by twenty-five commissioners, who would have to take civil service examinations. Only one political appointment would remain, that of the head of the bureau; he would be chosen by the President and confirmed by the Senate. A strong and independent inspection unit would be created and, to attract more able men, salaries would be raised.

Mr Truman promised that this was only the first of many measures to ensure that all government servants reach a "blue ribbon" standard of honesty, and to prevent the sins of the few from being visited on the many whose integrity is unquestioned. However, the new programme does not seem to include the replacement of the Attorney-General. His failure to keep even his own department in order made him seem, to many Democrats, a very suitable sacrifice to public indignation.

The advantage of submitting the changes as a government reorganisation plan is that they must be accepted or rejected as a whole within 60 days. Few Congressmen would want to preserve their own patronage privileges at the expense of an efficient and honest tax system, but many are likely to have ideas on the carving out of the new districts. In addition there is certain to be some Republican grumbling at the "freezing into civil service" of Democrats just as the Republicans seem likely, for the first time in 20 years, to be able to reward the deserving in their own party.

The reforms proposed by the President are overdue. Whether they will solve the problem of integrity in tax collection is another matter. The civil service mantle is not, unfortunately, always a guarantee of honesty, and in any case it must be years before the reorganisation is complete. Whether Mr Truman's hoover turns out to be more lasting in its effects than most new brooms, depends on the willingness of the President himself to concentrate on the need for the highest standards and to make it plainer than he has in the past that he will tolerate nothing less.

* * *

Profit and Loss at the RFC

The departure of Mr Stuart Symington is an undoubted loss to the Reconstruction Finance Corporation, the great government lending agency whose tarnished reputation he has refurbished. Mr Symington, long a government trouble-shooter at the highest levels, was made administrator eight months ago in place of a board of five directors, three of whom were involved in charges of favouritism and improper influence. He has rigorously conducted RFC operations in a gold-fish bowl. Full publicity has been given to all loans, competitive sales have been introduced for the sale of all RFC property, and responsibility has been centralised.

Under Mr Symington's stewardship, luxury hotels and such enterprises have had to go elsewhere for aid. Instead, in addition to standing ready to supplement private credit for small business, a function Mr Symington believes may become much more important when the defence programme ends, the RFC in seven months has granted $203 million in loans to expand military production; money has also been advanced to stimulate domestic production of copper. Mr Symington himself cannot claim credit for the RFC's profits, for the most recent figures are six months old, but it should be recorded that the controversial agency in its last fiscal year earned $7.6 million for the Treasury on its loans, and turned over $75 million from its tin and synthetic rubber programmes and from liquidation of war assets.

The RFC's loss of Mr Symington may be counted a gain elsewhere. The RFC has been the sole importer of tin, and Mr Symington's efforts to depress the world price, by refusing to buy Malayan and Bolivian tin except at prices he considered fair, have alarmed both the National Production Authority and the State Department. The former has had to stretch the dwindling supply for domestic consumers; the State Department has had to reckon with the effects upon friendly nations. Malayan tin is an important source of dollars for the sterling area, while Bolivia has been brought to the verge of an economic and political crisis by Mr Symington's refusal to pay more than $1.12 a pound when the Bolivians felt they were entitled to $1.50. There was a noticeable cooling off of Latin American delegations towards the United States at the United Nations, and there are stories that Bolivia has been sounding out other Latin American countries about the possibility of bringing a charge of economic aggression against the United States under the Bogota Charter. Mr Truman insists that Mr Symington's resignation means no change of policy. But if there is one, it will not be so embarrassing for his successor, Mr Harry MacDonald, to accept.

Shorter Notes

After hearing in silence a plea from President Truman that any halt in the steel industry would have an "immediate and crippling" effect on defence, the special convention of the United Steel Workers decided to delay its nationwide strike for at least 45 days, until February 21st. In the meantime the Wage Stabilisation Board will try to settle the dispute, or to induce the union and the employers to reach a settlement by bargaining, before the deadline is reached.

*

The temporary franchise awarded in 1945 for transatlantic flights to American airlines expires on July 4th and the Civil Aeronautics Board has now opened hearings on the future of these flights. Pan American Airways, seven years ago the advocate of the "chosen instrument" theory, which would have eliminated competition among American airlines on overseas flights, is now in favour of the direct competition which was forced upon it at that time. Its only remaining American competitor on transatlantic flights, Trans-World Airlines, with a much less assured position than Pan American Airways, is asking for "area competition." Under this system the two lines would compete as far as London and then follow separate routes to Europe and beyond.

*

The US Merchant Marine, with a total fleet of 2,000 vessels, is larger now than at any time since the war's end; 752 ships were added last year. Steel shortages are cutting into the plans for further construction of urgently needed oil tankers and dry-cargo ships, and have made it necessary to halt work on fourteen new craft.

*

Next month "Operation Vagabond," a fleet of permanent floating radio stations for the Voice of America, will get under way with its first unit, the *Courier*. The 5,800-ton Coast Guard cutter, being refitted for its new job, will be ready on February 15th and is to be a relay point for American broadcasts to eastern Europe.

THE WORLD OVERSEAS

Aid from Canada?

(From Our Ottawa Correspondent)

DESPITE the continuing drain on the sterling area's gold and dollar reserves, no formal request has been made for Canadian help to solve Britain's dollar problem, except within the context of the North Atlantic Treaty Organisation's studies on "burden sharing." Indeed, the prevailing atmosphere in Canada is far from favourable for further loans or grants. There is a strong conviction that grants, whether to Britain or to Western Europe, would only help to turn these countries into permanent pensioners of North America. The Canadian Government, particularly in the light of the "Three Wise Men's" report, insists that Britain and Europe must tackle their own economic problems much more resolutely before further help from across the Atlantic can have any constructive effect.

Two specific instances of what is felt to be Britain's failure are the food subsidies and coal. The case against food subsidies is argued in Canada in much the same terms as those with which readers of *The Economist* are familiar. But the argument appears even more strongly in the eyes of an overseas Finance Minister when it is suggested that he should tax his own people to help Britain. Subsidised food, it is argued, conceals the harsh facts of life from the British people. It may protect them from the higher food prices that everyone else—including Canadians—are having to pay, but only by keeping taxation at a level that destroys the incentive to increase production. And it is only by increased production that Britain can bridge the gap in its balance of payments.

A somewhat similar argument is advanced about coal. Because British coal output is insufficient, Europe is spending nearly a billion dollars a year on American coal. Dollar grants may keep that coal moving; but, many Canadians claim, they do nothing to make Britain and Europe increase their coal output, which is the only permanent solution. The political difficulties confronting Mr Butler and the other finance ministers of Western Europe arouse sympathetic understanding. But it is questioned whether those difficulties can be removed by any means short of hardship. To go on living on North American aid would merely continue to conceal from coal miners, and everybody else, the fact that they cannot have softer living until they produce more. These are all things that many responsible British people have been saying for a long time; it should be no surprise that the same things are also being said by responsible Canadians.

Nato's Request

It is this attitude that is likely to determine Canada's answer to the Nato "suggestions" for increased help. Various proposals for an increased Canadian military contribution have already been considered and found unacceptable, and are apparently no longer being pressed. The most important suggestion still under consideration is for Canadian help in the form of raw materials. It has been proposed that Canada should make free grants not only of strategic materials such as aluminium, but also of wheat. The first Canadian reaction was definitely unsympathetic. The extension of Nato into this field of economic aid is new, and in Canada, at any rate, it is not considered altogether desirable. Canada has no surpluses of which to dispose. Its raw materials are either used domestically or sold to the United States and Britain. Despite the bumper wheat crop this season, there is little fear that the exportable surplus of over 500 million bushels will not be sold. Britain has already undertaken to buy 113 million bushels. Of the other foods, there is no bacon available for export and only a few eggs. Britain could buy Canadian cheese, tinned salmon and apples, though it is extremely doubtful whether these items could be put on a mutual aid programme. It would, of course, be theoretically possible for Canada to accept sterling in payment for some of the raw materials and wheat it sends to Britain. But Canada still has to buy much of its requirements from the United States and for those purchases it needs dollars.

Canada's Mutual Aid

In the fiscal year 1952-53, Canada intends to spend $228 million on specific defence projects for mutual aid. This sum would cover the cost of the Nato air training scheme and the transfer of arms and equipment both new and old. In addition Canada expects to pay between $100 million and $150 million for airfields and barracks for its own forces in Europe. The Canadian Government has so far not agreed to any increase in this figure. But it will be re-examined before the Nato meeting in Lisbon next month. One possibility still to be discussed is an increase in funds for mutual aid within Canada's present total expenditure on defence. Canada could, if Nato so directed, reduce its expenditure on its own defence forces in order to increase its aid to other countries. But at the moment this manœuvre is still highly speculative.

It was ironical that after the Canadian Finance Minister, Mr Douglas Abbott, in his negotiations with the Three Wise Men, had made much of Canada's balance of payments as the limiting factor to what Canada could do, he should have abolished the last remaining foreign exchange controls almost immediately on his return. But Canada has two unique distinctions among the Nato countries. It is the only one paying for the whole of its own defence programme, including some mutual aid, without any help from the United States. It is also the only country, not excepting the United States, that has made good, in detail and in total, on every single commitment.

There is no intention of changing Canadian policy in either respect. But since Canada has a large deficit on its current account which is matched only by its surplus on capital account, and since exchange restrictions of all kinds have been removed, its first care is clearly going to be the preservation of its own economy on a basis that will inspire full confidence.

Mr Churchill, during his visit to Ottawa this weekend, is expected to restrict his talks to political matters. But North Atlantic co-operation is bound to get more than a passing reference, and in this context economic issues can hardly be ignored. Although the question of direct dollar aid is unlikely to be raised, the talks will undoubtedly include a discussion of whether Canada can play a fuller part in Nato than it has done so far.

France's Budget Crisis

[FROM OUR PARIS CORRESPONDENT]

LAST Monday M. Pleven's government was defeated by 341 votes to 243 with 37 abstentions on a vote of confidence on the budget. But although the government which drew it up has fallen, the budget itself is only in a state of suspended animation. The expenditure side of M. Mayer's *projet de loi* had already been voted. It was over the question of finding additional revenue to balance the extra expenditure that the Pleven government came to grief. M. Mayer asked for 165,000 million francs of new taxes, including a 10 per cent increase in income tax. The conservative deputies of M. Pleven's majority would not swallow this unless the government were given the authority to cut the pay roll of the state railways and the social security system. But M. Pleven's request for this authority cost him the indispensable support of the Socialists.

The great leap in French public expenditure is due, as the table below shows, to the obligations assumed by France as a member of the Atlantic Pact. The French military budget would not in any case have been finally settled until the Nato conference in Lisbon next month. But the estimated figure in the *projet de loi* is 1,045,000 million francs.

FRANCE'S BUDGET EXPENDITURE
(Thousand Million Francs)

	1950	%	1952	%
Ordinary civil expenditure	949	42	1,365	39
Reconstruction equipment of state property	141	7	170	5
Military expenditure	420	19	1,045	30
Renewal of war damage & building	278	12	400	12
Investment	449	20	477*	14
	2,237	100	3,457	100

* Of which 85,000 million are to be financed by loans.

In last year's budget military expenditure stood at 740,000 million francs, of which 520,000 million was allocated to metropolitan France and, of the latter figure, 212,000 million to French arms production. Although no accurate figures are yet available, it appears that a considerable slice of the arms credit was not spent during 1951, partly because of delayed tooling-up of factories with American machinery, partly through fear of exacerbating the rise in internal prices which threatened in the late summer. (In the introduction to the draft budget for 1952 it is stated that the budget deficit for 1951 is indirectly eased by the carrying forward of 54,000 million francs unexpended "on account of the difficulty of starting up the armament programme.") In the 1951 budget 255,000 million francs were due to come from American aid (Marshall Aid counterpart funds—115,000 million; US military aid—140,000 million). In the event no more than about 158,000 million arrived, with the result that the French government asked for, and received, interim aid amounting to 210,000 million francs to bridge the gap until Congress could vote the aid for the period July, 1952-June, 1953. In the 1952 French budget American aid is estimated at 160,000 million francs—(economic aid, 70,000 million; military aid, 90,000 million).

The 1952 budget is over a third larger than last year's. Ordinary civil expenditure, although it contains no additional items, is swollen by the increase in pensions enacted during 1951 and by increased maintenance costs. M. René Mayer has, however, proposed under this head two important economies which in the event stuck in the throats of many deputies: a reduction of the subsidy to the state railways from their estimated need of 140,000 million to 80,000 million francs (a measure which implies a drastic administrative reform and the extension of the working life of employees); and a severe limitation of state aid to the social security system, which must also be cut down.

FRENCH BUDGET: 1952
(Thousand million Francs)

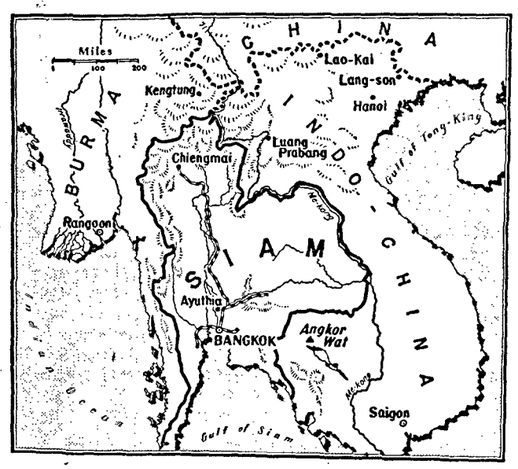
Expenditure		Receipts	
Ordinary civil expenditure	1,365	All previous taxes as at December 31, 1951	2,640
Reconstruction and equipment of state property	170		44*
Military expenditure	1,045	American aid (economic and military)	160
Renewal of war damage and new building	400	Economies: new taxes	190
Investment	477†	Loans	400
	3,457		3,434

* Yield of increase of taxes on petrol and tobacco voted September, 1951. † Of which 85,000 million to be financed by loans.

Every effort has been made to push on with industrial investment. The lion's share goes to fuel and power (140,000 million) with the avowed object of putting France in as strong a position as possible before the Schuman Plan comes into force. Thus 73,000 million and 38,000 million francs are given to *Electricité de France* and *Charbonnages de France* respectively and 20,000 million to the *Compagnie Nationale du Rhône* which is responsible for the huge hydro-electric power system between Geneva and Marseilles. Other important items under the *Fonds de Modernisation et d'Equipement* which feeds both public and private enterprise, are agriculture, the steel and chemical industries and investment in overseas territories (89,500 million). Reconstruction of the merchant navy and fishing fleet, administered directly by the state, amounts to 34,000 million francs.

The building of houses, a desperate necessity in France, is a good way behind the position in most European countries. The bulk of the 400,000 million franc credit is allotted to the state controlled building fund, but a sizeable sum goes in loans to building societies towards houses of low rent. The main trouble over building has, of course, been the lack of capital available to private enterprise. State guaranteed loans and fiscal exemptions have at last contrived to stimulate private building, which, however, remains technically backward. The Minister's preamble admitted, moreover, that too great a financial allocation to building would lead to a disastrous rise in prices—an indication of the incapacity of a totally free economy to remedy a vital scarcity.

The Enigma of Siam



[FROM A CORRESPONDENT IN SOUTH EAST ASIA]

A CONFUSED situation exists on the northern frontiers of Siam's two neighbours, Indo-China and Burma. On the one frontier, a Chinese build-up of military forces has intensified French fears that, if there is a truce in Korea, Peking's aid to the Vietminh may soon take the form of an open Chinese invasion, only faintly camouflaged by the claim that the troops are volunteers. On the other, the Burmese are again passing through a period of more acute embarrassment than usual about the activities of General Li Mi's Chinese Nationalist forces, which retreated into Burma against the wishes of the Burmese at the end of the civil war. Peking now accuses the Americans of building up General Li Mi's army by helping to transport troops from Formosa.

Siam itself has no common frontier with China. But it occupies a critical central position in South East Asia, and it is already involved in the activities of General Li Mi, whose troops sometimes make use of Siamese territory and whose communications with the outside world are believed to lie through Bangkok. If the Chinese attacked Indo-China, the Siamese would have to think very seriously about their own position, and in Bangkok itself there now seems to be a growing apprehension that aggression may in fact come their way. What Siam would do in such a case depends largely on the fortunes of those in power.

The *coup d'état* of last November puzzled most foreign observers. For a country that is becoming fairly practised in such upheavals, it was rather crudely done. The revolution was bloodless, which implies good preliminary staff work, but it brought about a situation so unconstitutional that even Siamese ingenuity found it difficult to find a means of cloaking it in legality. After some delay a solution was found in acceptance of the *fait accompli* by the young king and by his reappointment of Marshal Pibul as Premier.

The facts about the coup were drastic and simple. A committee of nine, three each from the Army, Navy and Air Force, assumed power, dismissed the government and replaced the 1948 constitution by the less democratic one set up in 1932 after the original coup against the absolute monarchy. This 1932 constitution provides for a single-chamber parliament consisting of an Assembly with one-half of its members nominated by the government and the other half elected. At present this Assembly consists only of its nominated members, but even after the election of the other half, which will probably take place in February, the present government is in no danger of being voted out of office. It seems that the committee of nine were unwilling to run the risk of a completely democratically-elected Assembly.

It is also likely that there was a good deal of fear lest the king, then in the last stages of his journey back from Switzerland, should seek to rule in his own right. The official excuse for the coup, that Communism was spreading in the government and had infected some of the Ministers, is not taken too seriously in Bangkok. It is fashionable these days to call opponents of the government Communists. It is known, however, that the members of the former Senate, many of whom had royal connections, had opposed and delayed a number of government measures and had been openly critical of corruption.

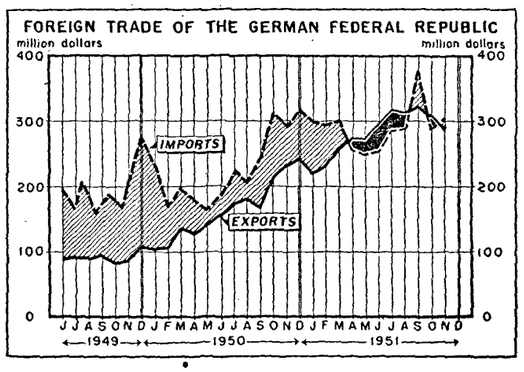
The position of the young king is difficult. He is now of age and takes the place of his elder brother who was shot during the Pridi regime. There is undoubtedly a great veneration for the person of the monarch throughout all classes in Siam. His return now, with a young and charming bride could, and probably will, greatly add to this respect for royalty. It is possible that, if the coup had not taken place, the king would have received a good deal of support from the Senate and the Assembly, and that traditional feelings might have gone a long way towards restoring absolute royal power.

As things are, the seat of real power is probably now to be found with Generals Phin and Pao, and probably also with General Srit, who appears to have come to terms with his colleagues. It is likely that, although Marshal Pibul still heads the government and still has a considerable measure of personal prestige, he is no longer the dominating figure that he used to be. In the immediate future, Siam's foreign relations are likely to remain unchanged; the country is still receiving American economic aid and military supplies, and it is still officially pro-West. So long as there is no dramatic change in the relations between East and West, this state of things will probably continue. Internally, there will also be little immediate change, and such corruption as has existed will probably continue.

On the economic front, Siam is still well placed, and many are making good money. If the end of the Korean war were to ease world tension and to be followed by a more general settlement in the Far East, however, there would sooner or later be a fall in the price of rice. This might knock the bottom out of Siam's present rather unstable prosperity. On the other hand, while the current rice crop is quite good, the entry of Japan into the market as a free nation may absorb a much greater part of the exportable surplus than hitherto. In this respect much will depend on Japan's supply of dollars and on the mounting flow of Japanese goods now coming back into Siam in increasing quantities—at prices which do not seem, however, to be anything like as low as before the war. Already high premiums are being paid over the official price for rice, and it may be expected that British buyers this year will meet with some stiff bargaining.

Looking to the future, the position of Siam is not easily predictable. Although the large Chinese minority is a source of danger, Communism holds little attraction for the Siamese people who are still by nature profoundly royalist. On the whole, the recent change of government should not be viewed in any alarmist way. It was principally a domestic matter. All the same the weakening of Marshal Pibul has probably made it easier for Siam to change its attitude towards America and the West if it chooses to do so. Those who have edged their way to power may well prefer to resume the traditional Siamese role of sitting on the fence. Nor should it be entirely overlooked that Luang Pridi, Siam's leftish elder statesman, whose whereabouts are not at present known but who has spent some time in China since the Communists took over in Peking, was also one of the key leaders of the original revolt which was responsible for the 1932 constitution.

German Exports Soar



FEDERAL Germany's exports for 1951 were nearly double the figure estimated in the long-term plan of the Organisation for European Economic Co-operation. The final figures, it is evident, will show that exports at $3,380 million were almost 70 per cent higher than in 1950. Total exports in 1950 were nearly double those in 1949. At the year's end, however, it appeared that this spectacular rate of increase was not being maintained.

Comparisons with the prewar period are difficult owing to the present division of Germany. But according to the OEEC, the volume of exports from the Federal Republic is already considerably higher than in 1938. During the third quarter of this year the index of exports by volume was 670 against 530 in 1938 (1948=100). The prewar pattern of Germany's foreign trade has been swiftly regained. Engineering products are again the most important group of exports. Sales of heavy machinery, machine tools and cars have soared in the last three years.

German industry has been quickly catching up on Britain in overseas markets. But it has still a long way to go. Total German exports were only one-sixth of the British figure at the time the OEEC was formed, and they are still only about one-half. Moreover, it cannot be said that the Germans have secured their place in export markets by unfair methods. On the contrary, they have been handicapped in many ways, such as their late start, the seizure of their assets abroad and, until recently, the ban on setting up foreign branches and consulates. On the other hand, they have been the largest beneficiaries from Marshall aid, and have been guided back into the dollar market by energetic American experts.

The rise in German exports to the United States has been particularly remarkable. In the third quarter of 1949 they were only $3 million a month; in the same period of 1950 they were three times as much, and during the third quarter of 1951 they were $22.6 million. Nevertheless, the Federal Republic has been running a deficit of about $30 million a month in trade with the United States, and has been drawing on the reserves which it has built up largely through the money spent in Germany by Americans.

German foreign trade as a whole will show a surplus for 1951 when the final figures are issued. This, too, is a remarkable improvement on 1950. It was in part due to the cut in imports which the OEEC imposed early in 1951, when

Germany ran into a payments crisis with the European Payments Union. Germany now has a large surplus with the Union. German exports to the EPU area will, however, be reduced by the restrictions which Britain has imposed, and German purchases from the EPU area will be increased now that imports have again been liberalised (though only to the extent of 62 per cent) as from January 1st.

The most intensive export drive is being made by the German engineering industry, with Latin America, North Africa, the Middle East and other under-developed countries as the main targets. To the South American countries, for example, exports in the third quarter of 1951 were $31.6 million, compared with only $10.3 million in the same period of 1950. With facilities for cheaper and more extensive long-term credits it is believed many more contracts might be secured.

German bankers are giving much thought to the problem of financing foreign trade. The Federal Republic is not yet accepted back into the network of international commercial finance. Bankers estimate that, if they had normal international credit facilities at their disposal, Germany's foreign exchange working capital would show a saving of at least $400 million a year in the import trade alone. So far, the Central Bank has been the sole source of export credit, and, as a stern guardian of the currency, it does not intend to go beyond its present, fully exhausted, quota for medium and long-term financing. As an interim solution, it is proposed that the commercial banks should themselves set up an export bank which would provide medium and long-term credit facilities up to a total of DM 400 million. But credit would remain insufficient and dear. Hence, German bankers hope that the Republic will soon be able to join the Bretton Woods organisations and that doors will then be opened to the world of American finance. They look for extensive aid from the Export-Import Bank. In the meantime, the experience of the last few years has shown that the Germans are capable of extraordinary feats by way of self-help.

Egypt Toys with Boycott

WHEN the Egyptian Foreign Minister lately said, in a speech in the Ruhr, that Egypt was going to reorientate its foreign trade, he can only have been hinting at the possibility of forcibly restricting trade with Britain. For the reasons that are outlined in the preceding article, Germany was an appropriate place in which to say this. Whether he was expressing a serious intention of his government is problematical. The topic is one that goes down well on the home front, but many prominent Egyptians—the King's two new advisers among them—are known to be loth to go to the lengths of embargo. Yet, as events in Persia have proved, emotion often transcends self-interest in the Middle East. A commercial boycott against Britain is therefore a possibility that British traders cannot afford to ignore.

The attitude of Egyptian Cabinet ministers to the question is in keeping with the rest of their policy. Behind loud words and angry gestures there is still a plaintive note of realism. British forces in the Canal Zone are manifestly too powerful to permit the luxury of declaring open war, but the encouragement of civilian guerrilla sniping provides a vent for spleen. To appease vociferous elements in the press and elsewhere, the Wafd Cabinet has dismissed a handful of British technicians from government service, and has let it be known that tenders from Britain will no longer be considered for government supplies. The inspired strikes of dockers in Port Said and Alexandria are being used as a brake. But British trade with Egypt is, as yet, practically unaffected.

The temptation for Egypt to interfere with it must be enormous. Compared with action in the military sphere, the consequences to Egypt of a trade boycott, although no less far-reaching, would be less immediately catastrophic and must for that reason commend the idea to a temporising Cabinet. There remain one or two measures of nuisance value still open to the government, such as interference with the still-flourishing British-owned banks in Egypt; but only an uncompromising ban on all things British would have the necessary propaganda value in the country. That it has not yet been tried is a measure of the importance to Egypt of Britain as a market and as a source of supply.

Britain's position is not entirely inviolable. Nahas Pasha can turn in several directions; to the USSR and its satellites on the one hand and to Japan and Germany on the other. Egypt's greatest weakness is its dependence on Lancashire for the sale of its major export—raw cotton. During the crop year 1950-51 Britain alone took 30 per cent of the Egyptian crop. During the same period, raw cotton accounted for over 85 per cent of Egypt's total exports. Egypt cannot hope to dispense with the Lancashire market without acute hardship, yet there are two factors in its favour. As Japan returns to its prewar position in the textile markets of the world, its consumption of raw cotton is expanding. It has been taking an increasing amount of cotton from Egypt in the last few years. At the same time technical facilities in the Japanese industry limit the amount of Egyptian (as opposed to American) cotton that Japan can absorb. In the second place, the demands of the Russian market mean that textile capacity in Czechoslovakia is increasing. The USSR itself would not be averse to stock-piling cotton on favourable terms, though, like Japan, American rather than Egyptian cotton is its staple need. Even the most optimistic Egyptian cannot get away from the fact that Japan and Czechoslovakia each took little more than 4 per cent of Egyptian exports during the last crop year. They cannot boost their consumption by nearly five times, which would be necessary if they were to replace Lancashire.

Cotton, however, is by no means the only reason why reasonable Egyptians might think twice before they pre-

cipitated a trade war with the United Kingdom. A very large proportion of Egyptian imports of equipment, electrical goods and vehicles, come from British factories. Again, Egypt is not powerless to soften the effect of losing these sources of supply. Germany has always been Britain's main competitor in this trade. The Germans are at this moment busily engaged in recapturing from Britain as many of the overseas markets for these commodities as they can secure. Germany, indeed, would certainly profit if British goods were boycotted by Egypt. But Egypt would still lose. German makes could not replace British makes for some time to come.

Egypt's largest single import is wheat, and most of its wheat has come in the past from Australia. A boycott against Britain would undoubtedly mean no wheat from Australia, as Britain is Australia's largest customer. Under the International Wheat Agreement, Egyptian requirements are guaranteed though not from any particular source. Egypt could easily make up the loss of Australian supplies from the United States or Canada—indeed, it may have to do this in any case in view of the shrinking export surplus in Australia—but only by spending dollars. Here, too, the Russians could slightly ease the situation. They have regularly sent wheat to Egypt; and they have recently concluded a new and bigger wheat-rice deal. They could not, at the present rate, begin to meet Egypt's full needs. But if they chose to be only a little more accommodating, they might give another fillip to the Egyptian government's dutch courage.

Dependence on Sterling

Finally, there is Egypt's present dependence on the use of sterling, not just in its trade with Britain and the sterling area, but with the countries of western, and even eastern Europe. These transferable facilities would presumably come to an end in the event of a boycott on British trade. Egypt could, to some extent, get by with a series of improvised barter deals. But trading outside the sterling area would become very much more difficult at a time when it was vital to expand it. This, if nothing else, might put a brake on the development of German-Egyptian trade. Capital equipment is expensive; and Egypt could not send Germany enough of the cotton which would otherwise have gone to Lancashire to cover a greatly inflated import bill; and German traders could not export on credit.

At present, also, Egypt pays for its oil with sterling, under the terms of the agreement on sterling releases made in July, 1951. In conditions of economic war, between itself and Britain, Egypt might find it difficult to buy oil from any oil company, even for dollars. A great deal would depend on the attitude of the United States and the American companies. But even if the oil were forthcoming, it might cost the Egyptians an additional £E10 million worth of dollars per annum. The sum of these drawbacks adds up to a formidable figure. Yet the issue is likely to be decided regardless of the material cost by what the government believes to be politically expedient inside its own country.

Leaving out the great bulk of the peasant masses, who toil without wonder and without voice, there remains a considerable body swayed by demagogy whose noise is influential. On this section depends the success or otherwise of any popular movement for a consumer boycott on British goods, less by the personal action of individuals than by the degree of fear inspired in other classes by the mass movement. Most important among the other classes are the small businessmen, traders and shopkeepers, large numbers of whom belong not to the Moslem core, but to minorities. That many of these are by origin non-Egyptian has less bearing than might be thought; the group as a whole remains Levantine, with a high degree of assimilation into Egyptian life. It is not difficult to persuade a far from wealthy Levantine that he detests Western Europeans; even when an identity of material interests is obvious, a sense of envious inferiority is there to be exploited.

Yet doubts are legitimate, for if the poorer half of the Egyptian professional and business middle class were to join the mob, their richer and more comfortable colleagues would not be on their side. And big business would be ranged against them. Anyone who has seen the Egyptian business magnate at work in Cairo or Alexandria knows how far-reaching are his ties with the west. They spring from motives as various as close personal friendships and dislike of the Soviet Union. In Alexandria in particular, Levantine families have for generations given their children British schooling and intermarried with local British families. Such ties would only be broken if men feared for their skins. Anglo-Egyptian commercial relations hang on a slender thread, but it is a tough one and, just now, it seems to be holding.

Why No All-Union Congress?

There was a spate of party meetings in the Soviet Union towards the close of 1951. Party congresses were held in the Republics of Kazakhstan and Latvia, and in the Chita region (Far East); regional meetings of party cadres took place in Moscow, Leningrad and Kuibyshev; earlier in the year congresses had been held in other republics. Before the war such an outbreak was the prelude to the All-Union Party Congress in Moscow. Yet though the Party statute stipulates that this congress shall be summoned at least once every three years, none has been held since 1939. Local congresses, therefore, seem to have ceased to be dress rehearsals, and have rather become a substitute for the All-Union Congress.

Obviously no one in the Soviet Union dares to complain about this breach of the Party statute, nor does the Russian press give any explanation of it. Yet reasons are discernible. All-Union Congresses were important meetings. During the proceedings the economic situation of the country was reviewed in detail and plans for the future were outlined; the international situation was also analysed and the headlines of Soviet policy were sketched. During the last Congress both Stalin and Molotov made speeches lasting several hours, and were fully reported in the press.

In the present tense international situation, when Soviet leaders do not want to disclose even the 5-Year Plan, they are reluctant to show their whole hand. Yet the Party machine must be kept going, the enthusiasm and discipline of the members must be fostered and grievances vented. This purpose is partly fulfilled by regional meetings, reports of which need not be ample, and need give only fragmentary evidence of Soviet achievements and failures.

As far as can be gathered these regional meetings deal less with general policy than with boosting up local production. On the "ideological plane" there are repeated accusations of nationalism in the non-Russian republics, which have in both Kazakhstan and Latvia led to purges in the Party secretariat. In general, exaggerated bureaucracy, political apathy and poor attendance of Party educational courses are being attacked. In the economic sphere, while there are reports on the successful fulfilment of the annual plan, the Congresses reveal two interesting shortcomings. Complaints about falling productivity in Karaganda—a region which was greatly developed during the war—may indicate that the Soviet eastern regions find it difficult to keep up the hot pace introduced during years of crisis; and various reports on livestock seem to indicate that the 3-Year Plan for livestock development (1948-51) has not been wholly successful.

Aspects of Enterprise No. 21

SIMON ENGINEERING GROUP

Doing it pneumatically is often the best and sometimes the only way to handle bulk materials, especially when it is important to prevent contamination, dust nuisance or the escape of noxious fumes. Simon Handling Engineers have developed the pneumatic conveying system for forty years and have applied it extensively to grain, coal and dozens of other industrial materials. Pneumatic disposal of fine flue dust is increasingly used at power stations. A special pneumatic technique is being successfully applied in flour mills. Improvements, refinements and new applications of pneumatic handling are constantly studied in the Simon research and development organisation.

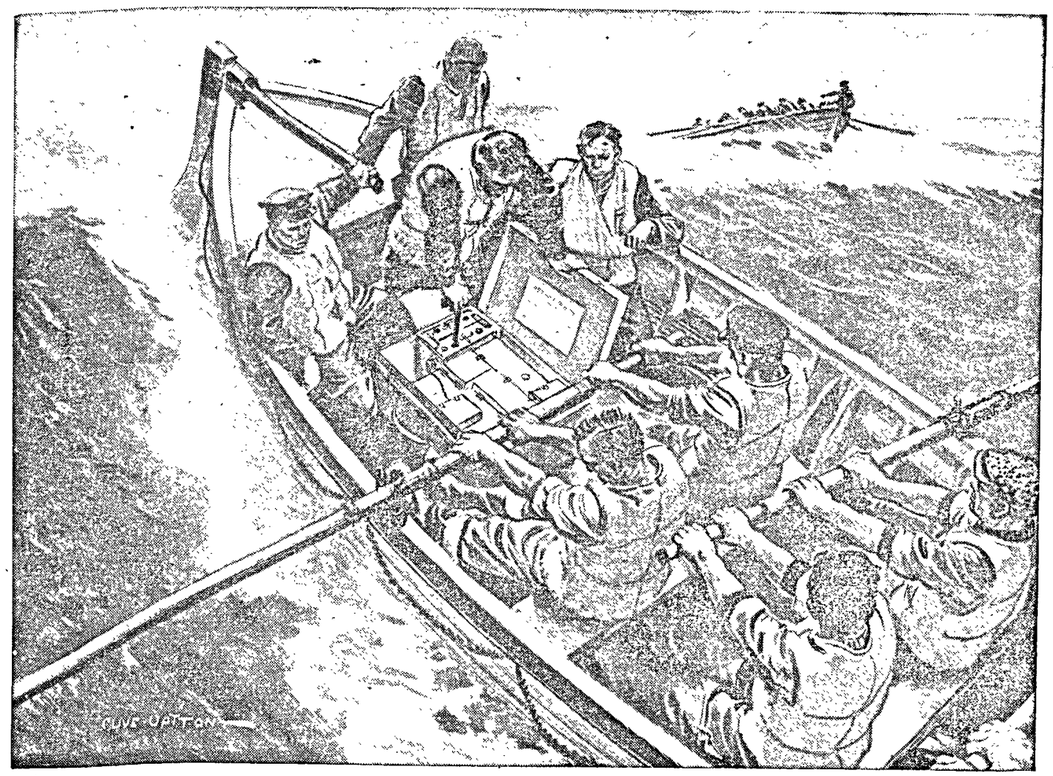
Glenfield Control



IN HYDRO-ELECTRIC POWER PLANTS

After the dam is built there remains the need to control the impounded waters at the points where scour and compensation water are required to be discharged.

"Glenfield" Needle Valves combined with Jet Dispersers are performing this function on dams throughout the world.

We've solved some problems in our time!

In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.

¶That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

¶Our answer was to produce the Exide self-priming battery. Its plates were *dry* charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

¶Thousands of these batteries were supplied; and many a seaman owed his life to them.

¶We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem.

THE BUSINESS WORLD

The Gold Drain

BRITAIN'S loss of gold and dollars from the central reserves during the past three months has reached, if not surpassed, the worst expectations. The figures disclosed by the Chancellor last Monday seem to have been received with relative calm by a general public lulled into false security by sheer familiarity with recurrent crises; but they have rudely shocked every competent observer. The gold and dollar deficit of the sterling area in the final quarter of 1951 amounted to $940 million, or £336 million, a frightening rate of drain that was exceeded only in the catastrophic year 1947, when Britain was running rapidly through the American credits. In the third quarter of 1951, when the second quarter's surplus of $54 million was converted into a deficit of $638 million, Mr Gaitskell estimated that less than half the drain was attributable to what he called underlying factors, and implied that the fourth quarter would show a perceptible improvement. This still seemed to be a possibility even after Mr Butler had revealed, in his opening speech as Chancellor last November, that in the month of October the rate of deficit had mounted to $320 million. But in fact the moderate improvement that occurred in November and December still leaves the deficit for those months at a monthly rate above that for the previous quarter—before counting in the $176 million that was paid at the year-end in service on the US and Canadian postwar loans.

The quarter's deficit thus comprises $320 million for October and $444 million for November and December, plus the loan service; and it surpasses the third quarter deficit by $302 million. In these two quarters the aggregate drain has been no less than $1,578 million (£564 million), or fully $400 million more than that for the two worst quarters of 1949, the drain that precipitated the devaluation of sterling. In every past phase of major strain, moreover, the impact of the deficit upon the gold reserves has been heavily cushioned by special forms of dollar aid, by way of loans, gifts or drafts on the International Monetary Fund. Now, instead of securing substantial relief, Britain has had to pay in loan service much more than it has received from the vestiges of Marshall aid; these provided $40 million in the third quarter of last year and $6 million in the fourth. Hence the deficit falls with dead weight upon the gold and dollar reserves. In the past quarter the reserves have fallen by $934 million (£334 million); this is by far the biggest quarterly loss that has ever been experienced. Indeed, the loss in these three months has been very little less than the whole loss in the three worst years of postwar deficits: the loss of reserves in 1947 was $618 million, in 1948 $223 million and in 1949 $168 million, a three-year aggregate of $1,008 million.

If these stark comparisons are not enough to shake the general public into awareness of the national danger, one further calculation should surely do so. The drain of the past six months has reduced the total reserves of gold and dollars to $2,335 million (£834 million), the lowest figure since early 1950. No comfort can be drawn from the fact that appreciably lower levels were reached during 1948 and 1949. The relevant comparison is not with these earlier years, in which substantial special aid was available, but with the current rate of deficit. The level of the reserves at the year-end exceeds the deficit actually incurred in the preceding six months by less than 50 per cent. In other words, if this rate of deficit were to continue, and if no external aid were forthcoming, the reserves would be totally exhausted before the end of September next. The breathing space that Mr Gaitskell thought was available for the devising of remedies is now seen to be desperately brief—and he is doubtless thankful that it is not he who has to devise and impose them.

*

The intensification of the strain in the past quarter is officially attributed to three groups of factors each of which had previously been expected to afford some relief. In the first place, there has been a further reduction in the earnings from sterling area exports to the dollar area, both from the United Kingdom and from the overseas members of the sterling area. The slackening of American and Canadian demand for Britain's exports of manufactured goods has aggravated the effects of the virtual suspension of American governmental purchases of certain primary commodities, notably tin and rubber. Secondly, the abnormally high purchases of dollar imports by the sterling area in the third quarter have persisted. Indeed, while the rate of Britain's expenditure has been approximately maintained—partly in consequence of continued purchases for official stocks—the dollar purchases of the rest of the sterling area appear to have risen further. Thirdly, both the United Kingdom and the rest of the sterling area have continued to run heavy deficits with OEEC countries. Mr Gaitskell had assumed that the strain under this head would be reduced during the fourth quarter of 1951; but in fact the quarter's loss of gold to the European Payments Union proved to be only $8 million less than the $106 million lost in the third quarter—despite the fact that Britain received substantial credits from EPU under the terms of the agreement. Moreover, the quarter's gold loss is computed after crediting $39.2 million received from ECA under its guarantee to refund to Britain any gold lost to EPU on account of drafts on "old" sterling balances made by net debtors to the Union.

It should be emphasised that the gold and dollar accounts are not yet reflecting the effects of the import cuts and other measures of economy in overseas expendi-

ture announced by the Chancellor in early November. The first fruits of these measures may be felt next month, and increasingly thereafter. The knowledge that these steps have been taken, and the confidence of foreigners that the new Government will implement its promise to take such further steps as are necessary, perhaps explain why the continuance of this critical rate of deficit was not, apparently, accompanied by any renewal of speculative pressure against sterling. Such pressure certainly accounted for a large part of the increase in the deficit during October; conversely, the moderate diminution in the deficit during the ensuing two months must have been partly caused by the cessation of this pressure and by some covering of the *short positions* opened previously—covering that was stimulated by the reopening of the foreign exchange market.

It is apparent, however, that the steps taken so far cannot make any decisive contribution to the solution of the problem. The Chancellor hoped to save £350 million over the period of a year, by miscellaneous economies, by cutting down official purchases for stock, and by reductions in private imports mainly from the OEEC group of countries. None of these measures was specifically directed towards economy in dollar imports, though much of the reduction projected in stockpiling may have this effect, while the cuts in imports from the OEEC area should reduce the gold payments that have to be made to EPU. It is impossible to say, however, how much of the £350 million programme, when fully operative, will give dollar relief. There will naturally be some relief; and Britain also expects to benefit "in time" from the Nato studies of the burden-sharing exercise. But it is apparent that a substantial gap will still remain.

*

Since the deficit results from the transactions of the sterling area as a whole, the burden of meeting it has to be shared among the family. The problem, moreover, is very far from being exclusively—or even mainly—a dollar problem. Britain is running a very heavy deficit on its current trading with the rest of the world; and most other members of the sterling area are likewise in deficit on their international transactions as a whole. Neither the aggregate deficit of the sterling area nor its dollar deficit will ever be bridged unless a policy of stern retrenchment is practised throughout. This aspect of the problem was discussed in detail in *The Economist* last week; and since then the representatives of the governments concerned have begun their preliminary approach to it—by the opening of the London conference of officials who are preparing for next week's conference of ministers. Although the British Government evidently hopes that restraint by overseas members of the sterling system will substantially alleviate the strain, and although it has itself made the first moves towards economy, it freely admits that Britain's own contribution is still not large enough. The emphasis so far has been upon cuts in imports, and doubtless they will be cut further; but in the second phase of Britain's programme the emphasis is expected to shift to the task of expanding exports. The earlier hopes that the industries producing consumption goods could shoulder most of the burden have now been shown to have been misplaced; and the new Government has recognised the unpalatable fact that any appreciable further expansion of British exports at this stage depends upon the release of capital goods and of other products of the metal-using industries.

From this it follows that the second wave of cuts, when it comes, will be felt by the British public in shortages of home-produced goods rather than of imported goods. But it remains to be seen whether the Government will be as tough in dealing with the British consumer as it now seems likely to be when dealing with demands for investment goods. Obviously, there is a case for economy in this sphere as in all others, and it is one of the primary functions of the new monetary policy to ensure it. But it would be disastrous if the Government were to cut deeply into necessary industrial re-equipment merely in order to minimise the politically *unpalatable tasks* of squeezing personal consumption and of pruning the portion of consumption that is provided by the state. Mr Butler has this week reaffirmed the Government's determination to take all necessary steps

"to make and keep sterling strong," and has stated that upon the reassembly of Parliament a new series of measures will be announced "to enable the economy to concentrate on its essential tasks, especially the expansion of exports, and to perform them with growing efficiency." These measures will be the first real test of the Government's courage and understanding. But they will not be the ultimate test; that will come in two stages, when the Civil estimates are presented and when the budget is introduced. The impending measures seem likely to seek restraint by "physical" measures—especially of investment control and allocation of raw materials. But if the Government relies mainly upon such devices, it will be making, in principle, the same cardinal mistake as its predecessor. Its financial policy, working through budgetary retrenchment, taxation and monetary pressure, must be at least as tough as the intentions of its "physical" measures and ought to be a good deal tougher. To make them so will require real courage, but if the Government can summon the necessary resolution, it has in these latest gold figures the clearest possible means of demonstrating to the public why unpalatable measures have become imperative.

Steel and Green Paper

ALL forms of steel allocation are probably inefficient; some are more inefficient than others. But the volume of protest that an allocation scheme may arouse when first it is invoked to share out scarce steel is not necessarily an accurate measure of its inefficiency. Given the sufficient gap between supply and inelastic demand that alone justifies resort to physical controls, and given an inevitable lack of knowledge among consumers of the exact degree and pattern of the shortage, it might paradoxically be argued that the more complaints an allocation scheme provoked at the outset the more effectively was it doing its job. He would be a brave man who would argue this point in support of the allocations of steel to individual consumers that have now been made for the two months from February 4th. These allocations are unlikely to approach very closely to the ideal distribution of steel that the changing tasks of the metal using industries now require. But they do at least strive to bring some principle of comparison between the more and the less essential needs of the economy into the sharing of steel supplies, and if consumers complain now, at least they agreed that this was necessary when the shortage of steel began to be felt early last year. It has since been sharply accentuated. The second quarter's allocations, which should be announced in mid-February, may remove some of the more glaring anomalies that the first allocations contain. By the time that the scheme has been running for six months or so the paper allocations, at least, may be more or less accurately adjusted to essential needs—which does not necessarily mean that individual industries or companies may not still be full of complaint.

So far the Government has said little to amplify the original estimate of the 1952 steel shortage that Mr Butler made at the beginning of November: "We need some 1,500,000 tons of finished steel more than we have been able to produce or import in 1951 to meet home and essential export needs." An official estimate of steel production in 1952—between 15¾ million and 16 million tons—has been announced, but the estimates of probable supply and requirements on which, presumably, the estimated shortage was calculated remain undisclosed. In present circumstances, to venture into private estimates might be premature. If the gentlemen in Whitehall know best what the facts are, they have not published them, save as round figures that suggest a deficiency of supplies of finished steel of no less than 15 per cent. This is a serious prospect, though the interim communiqué from Washington gives some reason to hope that it may be partly alleviated. It challenges the Government's hopes of a considerable increase in the output of the metal using industries for defence and for exports. Given sufficient steel, those aims might have been achieved largely by an expansion of the total output of metal using industries. But in 1952 they will mean corresponding reductions in steel for consumers' goods sold on the home market—reductions that in some cases will have to be drastic—and to some extent in steel for capital investment within British industry.

The principles, rather than priorities, according to which steel allocations have been made are straightforward enough. Coal, defence production and metal exports are as far as possible to be assured all the steel they require. The steel needs of transport, electricity, steel-making itself, the oil industry and shipbuilding are also to be "protected." In other industries, steel supplies are as far as possible to be related to their importance to the economy as a whole and to their export performance. There are no over-riding priorities—which is sensible—but some of the basic industries and services are to receive up to 20 per cent more steel than they were using a year ago. This means, inevitably, some sharp cuts—reaching perhaps 25 per cent or more—in the steel allotted to some of the less important industries. In general, the supplies allotted to these will depend upon their export performance, and cuts are not to be greater than could reasonably be made in their production for the home market.

164797

These principles, and the growing experience of the working of the allocation scheme, will, it has been said, eventually fit the allocations to essential needs. No doubt the scheme will only work tolerably if every factor in it —including the principles—"gives," when the strains threaten to become too great. Whether the steel itself will be so nicely distributed as the green "IS" forms which give a title to it is, on past experience, open to doubt. The allocation scheme that the present Government inherited from its predecessors, hastily inspected, and postponed for two months is essentially the same as the wartime scheme that came to an end in mid-1950; this plain fact does not inspire confidence in its efficacy. The total amount of steel likely to be available is shared between the Government's "production" departments by an inter-departmental materials committee. Each department divides its share among the industries for which it is responsible in accordance with the basic principles, and thence between the individual producers in those industries. Steel consumers obtain an authorisation for the total steel that may be used in their products; this they may sub-allocate in order to ensure that their subcontractors and component producers can obtain the steel they require to make sub-assemblies or components. For certain components supplied in standard grades to a wide variety of industries, such as ball-bearings, bulk allocations of steel are made to the producers and no subauthorisations by consumers are required; there is a special scheme that covers small consumers of steel, and very small quantities will continue to be obtainable without authorisation. But so far as the great bulk of general and alloy steel is concerned, producers will not, after February 4th, be entitled to supply steel, nor will stockholders be entitled to draw upon their stocks, except against authorisations granted under this "vertical" allocation scheme. For sheet steel a scheme of this same vertical kind has been in operation continuously since the war, and control of tinplate, also, has continued.

Some of the complaints recently voiced about the allocations for individual industries and companies may have been partly caused by the fact that records of the steel used in products authorised by particular depart-

ments ceased to be collected in 1950, when the control of general steel came to an end. In order to check consumers' applications for steel—which in total were inevitably often based on optimistic assumptions about output, if not deliberately inflated to offset an expected cut—the departments have been using those 1950 statistics, adjusted as far as possible to take account of the subsequent changes in the volume of output that they know or believe have taken place within particular industries. These have been used as a basis for estimating "requirements" upon which the departments have then proceeded to make percentage increases or cuts. The difference between these "requirements" and the figures of consumption at the end of 1951 or hopes for early 1952 with which consumers have been comparing their first allocations may explain some of the discrepancies between published statements of complaint and defence. There would seem no reason why the departments' estimates of requirements should not have been brought reasonably up to date. Since 1950 vastly improved statistics of consumption by industries, though not necessarily by products, have in fact been collected by the steel industry itself; these would surely have assisted the departments concerned to bring their records up to date in many cases. It is one of the incidental consequences of the clumsy instrument of allocation that these improved industrial statistics of steel deliveries to industries are no longer to be collected; records will now be collected only under the categories of groups of products authorised by particular departments, which may class differently some of the products of the same engineering firm. Such a basis of recording is far less generally valuable: but it may eventually enable the departments concerned to adjust their allocations towards greater accuracy and equity.

This scheme, it is only fair to say, was chosen not only by the two Governments concerned but by the representatives of industrial steel consumers. The main reason, perhaps, was that it was familiar to industrialists and civil servants; it has also certain advantages of administrative convenience, compared with other systems. Moreover, it had been delayed pending the result of the election, and was thereafter hastily adopted by the Conservatives as the scheme that could be brought in most quickly. Whether this hurry, and the somewhat shortened scrutiny of individual allocations that it compelled, will quickly improve the distribution of steel remains to be proved. More fundamental criticisms of this type of scheme have often been voiced, notably by the steel industry itself, which favoured a "horizontal" scheme under which bulk allocations of steel would have been made by the Government to all consumers, without sub-allocation. Such a scheme would have had its inconveniences for Government departments, and it would have deprived principal contractors of their power to ensure that their sub-contractors hold authorisations for given supplies of steel. But the present scheme, with its thousands of sub-authorisations filtering through the channels of the steel trade, is dangerously open to abuse. It can take no real account of the steel stocks held by the consumers to whom a sub-authorisation of steel may descend; and consumers' stocks might still be a fairly important potential source of steel in the 1952 balance of supplies. And while there may be no logical reason why such a scheme must inevitably bring about an inflation of paper claims compared with the steel actually available, its predecessor and blood brother always did, up to the time that it was abandoned in 1950. Now that the vertical scheme is in being, no doubt every effort will be made to work it successfully, with better experience of the weaknesses to which it is prone. But those weaknesses only re-emphasise the much greater importance of action by the Government and the steel industry on the other side of the steel equation: towards producing and importing from all sources all the steel that the economy really needs.

Business Notes

Bank Profits and Gilt-edged Depreciation

So far as may be judged from profits statements that are always severely conditioned by inner reserve policy, the experience of the big banks in this past year of good current earnings but large depreciation of investments appears to have been uniform and not unsatisfactory. Among the "Big Seven" banks, all of whose statements are now available, the extreme range of variation in published profits by comparison with 1950 is from an increase of 3.1 per cent reported by Lloyds Bank to a decrease of 4.5 per cent reported by the Westminster. As will be seen from the accompanying table, the aggregate profits of the seven banks dropped from £9,892,662 to £9,758,153, or by 1.4 per cent, compared with an increase of 2.3 per cent in 1950. This is the first decline in aggregate profits since 1946, but this small movement is fully accounted for by the year's increase in income tax alone. The fact that, in a year such as this, published profits have shown so tiny a fluctuation and so little variation from bank to bank demonstrates more strikingly than usual that the real story of the year's experience is concealed rather than revealed by the accounts, a concealment that is in line with the traditions of bank accounting and is, of course, sanctioned by the exemption accorded to the banks by the Companies Act.

There is no doubt that, if the factor of investment depreciation could be ignored, 1951 would have ranked as a bumper year for the banks. Their worries about rising costs have certainly been intensified, and the period in which they must shoulder the full burden of additional salary and pension costs caused by the "bulge" in the age-distribution of their staffs draws steadily nearer. The pressure of immediate costs, as distinct from these impending burdens, has, however, probably been comfortably met during the past year by the rise in current earnings. Net deposits of the clearing banks as a whole have averaged during the eleven months January/November 2¼ per cent more than in the similar period of 1950. The whole of these additional resources has in effect been employed in the most remunerative form of bank assets, and in addition the average ratio of advances to total deposits has risen sharply—from 26.7 per cent to 29.5 per cent. The average level of advances rose from £1,599 million to £1,812 million, an increase of 13.3 per cent compared with one of 11.3 per cent in the previous year. Average investments also rose substantially, from £1,503 million to £1,593 million, but half this increase resulted from the big increase in short-dated (and therefore lowest-yielding) investments caused by the November exchange of Treasury bills for the new Funding stocks; the average for the ten months to October showed a rise of £45 million. Even so, the reinforcement of gross earnings in consequence of these changes must have been substantial. In addition the banks have benefited from the revision of charges for advances that began last summer, as well as from the increase in commercial bill rates also made then. The more general increase in rates that is resulting from the new monetary policy has not, of course, yet had time to have had much effect on profit and loss accounts; in any case the increased return from call money and bills is largely offset by the increase in rates paid on deposit accounts. Finally, revenues from miscellaneous commissions and from overseas business must have continued to expand.

BANK PROFITS, 1948–51

Bank and Dividend	1948	1949	1950	1951	Change in 1951

* * *

Inner Reserves and Contingencies

All the strictly current factors, therefore, have combined to raise gross earnings to a new high level. The rub comes in the valuation of assets. Not only have the banks had to face a year of gilt-edged depreciation comparable to that of 1949, but, in addition, they now face for the first time for many years the possibility that they may have to sell investments in order to maintain their liquidity ratios. The long tradition, which now is also a legal requirement, that depreciation of investments by comparison with book values must be fully provided for, so that investments are shown in the balance sheets at or under market worth, thus acquires a sharper relevance and a more practical justification than were present, for example, in 1949. There had in fact been some doubts whether, given the strains imposed on such reserves in earlier post-war years, the banks would all be able this year to meet the depreciation without following the 1931 precedent of drawing upon published reserves. By far the most satisfactory feature of this past year's experience is that all seven banks have in fact been able to do this.

The formula used to define published profits varies slightly from bank to bank, though its general import is the same; but the significant point is that each bank's 1951 formula is identical with that for 1950—except that the Midland Bank has added the commonly used phrase, "diminution in the value of assets," when defining the provisions that have been made from contingency accounts. The meaning of the statements, taken as a whole, is that each bank has fully provided for investment depreciation by one or more of three processes combined in undisclosed proportions (*a*) by drafts on previously existing inner reserves (*b*) by undisclosed allocations from the past year's profits (*c*) by disclosed appropriations from the year's profits to contingency accounts. These last appropriations have this year wholly displaced the customary disclosed appropriations to published general reserve or other specific reserves; they aggregate £4,500,000, or 50 per cent more than the similar appropriations made after the 1949 slump in gilt-edged, and it is noteworthy that in most of the banks they have involved a draft on the carry forward. It is impossible to know, however, how far these provisions have been dictated strictly by the book depreciation already incurred and how far by prudent provision for the risks that lie ahead—risks that now include a rising strain from bad debts. In principle, this same comment is applicable to the Provincial Bank of Ireland, the one bank whose recently issued annual statement shows any draft on published reserves. The statement says that in order to provide for the "very severe decline" in investment values "it has been necessary to utilise, in addition to an appropriation from the year's profits and from reserves, a sum of £300,000 from the Reserve Fund," reducing it to £340,000. This bank, it should be noted, carries a much larger proportion of its resources in investments than do the English banks; its ratio of investments to deposits at end-1950 was almost exactly 50 per cent.

Settlement in Sight for Tin?

Shortly before Mr Churchill arrived in Washington, President Truman announced that he would accept the resignation of Mr Stuart Symington, the head of the Reconstruction Finance Corporation, later this month. In fact, the resignation was accepted earlier this week and Mr Harry A. McDonald, chairman of the Securities and Exchange Commission, was appointed as successor. This news brought relief to the tin market, and the London spot price which on Wednesday of last week stood at £928¼ a ton, rose to £958¾ a ton on Wednesday of this week, despite the American President's statement that the change of person would not mean a change of policy. Much depends on what is meant by the word "policy." If it signifies that the RFC will continue to be the sole importer for tin, that is one thing. But it does not necessarily mean that Mr Symington's tactics of beating down prices will continue.

No purchasing body likes to pay prices that it considers excessive, especially when its operations have to be reviewed by Congress. On the other hand, the State Department was acutely aware of the feeling that Mr Symington's remarks and actions had created in friendly countries. Malaya was not the only country to suffer. Bolivia was another of Mr Symington's targets, and the State Department was probably as much concerned about the United States' good relations with that country as with Malaya. Meanwhile American consumers have been almost starved of tin and stocks have been run down to a dangerously low level.

The official communiqué on the Churchill-Truman talks is not explicit about the decisions on vital materials. Britain's need for additional steel from the United States is linked to America's need for supplies of other materials, including aluminium and tin. The communiqué notes that the discussions will be continued and it is hoped that agreement may be announced shortly. Two points are fairly clear. First, the United States must resume its imports of tin. Secondly, the United States will not risk forcing prices up against itself. If America sells steel to this country it will be at a fixed price, and the United States will presumably expect similar treatment when it buys tin. Malaya dislikes special contracts at fixed prices. But the solution might lie in bringing tin within the orbit of the International Materials Conference and sharing out available supplies among consuming countries, so that there would be no undue pressure on prices either upwards or downwards. It would still be necessary to agree upon a "reasonable" price.

* * *

Unhappy New Year for Wholesalers

The prospect for the wholesale textile trade in the New Year is full of uncertainties. Recovery during the winter was written off long ago, but the belief has been current in the textile industry that buying would revive in the spring. The extent of the revival may be determined by the amount of cash that retailers have on hand during the next few weeks. Both they and the wholesalers have large sums tied up in stocks, and they now find that restrictions on credit are preventing them from ordering new goods on any great scale. New orders have come to depend, therefore, upon the successful disposal of existing stocks, and these are heavy. The November figures for the wholesale trade show that stocks at

the wholesalers stood at 228 (1947=100) compared with 144 a year ago, and they are probably not much lower today. There was a fall between October and November of about seven points, whereas wholesale textile sales fell by eleven points, from 145 to 134. In November of the previous year, when prices were lower, the index of wholesale sales stood at 158.

Some recent figures prepared by the Treasury measure the fall in clothing purchases in real terms, discounting the price changes that took place during 1951. These calculations show that, compared with the corresponding quarter of 1950, personal consumption of clothing was 12 per cent higher in the first quarter, 5 per cent lower in the second quarter and 21 per cent lower in the third quarter of 1951 than it was a year earlier. The similar reduction in the sale of household goods (which includes furniture and hardware) resulted almost wholly from the fall in sales of household textiles such as carpets and blankets. Sales are estimated to have been 15 per cent above 1950 levels in the first quarter of the year, only 3 per cent higher in the second and 15 per cent lower in the third. It is unlikely that the trend of textile sales has shown any marked change between the third and fourth quarters of the year.

The sharp drop in turnover explains why retailers and wholesalers now have big stocks despite the caution that they exercised in buying winter goods. Current wholesale business is reported to be idle while retailers are trying to reduce their stocks in the January sales. The changes made last week by which the old system of a fixed retailer's margin on each price-controlled item is replaced by a maximum price without a specified margin should assist the movement of stocks, both wholesale and retail, but it is too soon to say whether traders will be able to clear their shelves in time for the spring. Some of the goods that they are now trying to sell have been in stock since last spring. To sell these lines may involve heavy price cuts which themselves will leave less cash available for re-stocking in the spring.

* * *

The Coal Record

Revised figures of coal output in 1951 show that the deep mines produced 211,195,600 tons during the year and the opencast sites 10,985,900 tons, making a total production of 222,181,400. Mined output was thus 7 million tons higher than the 204,123,500 tons produced in 1950, and opencast more than a million tons lower. Of the 7 million ton increase achieved by the miners, 5 million tons came from the increase in Saturday working (which yielded in all 12 million tons during the year). Since little extra can be expected from this source during 1952, the figures imply that, with the present labour force, this year's increase might be no more than half as great as last year's. Saturday shifts inevitably have an adverse effect upon attendance during the five-day week, which contributed little more than a third of last year's increase in mined output.

Inland consumption of coal during the year reached 207,855,000 tons, compared with 206,165,000 tons in 1950; and exports and bunkers together amounted to 11,653,000 tons, against 17,082,000 tons during 1950. It is worth noting, however, that inland consumption of coal has moderated considerably during the first two months of the coal winter. As a result stocks during this period fell by only about 550,000 tons, and amounted to 16,256,000 tons at the end of the year, compared with 12,423,000 tons at the end of 1950. In former years stocks have often declined by nearly 2 million tons between the beginning of November and the end of December. This slackening of consumption —which has recently been matched in the use of gas and of electricity—is probably largely due to mild weather that will have affected all consumers, while industrial consumption has presumably been affected in addition by the slackening of the rise in output caused by shortages of metals. The effect upon coal stocks, it may be noted, is that the country has begun 1952 with more coal in hand than at any time since the beginning of 1948. The total amounts now held, upon normal calculations, are more than the equivalent of the various "minimum" figures set by succeeding Ministers of Fuel this autumn, though house coal is not yet ample; and American imports, which may have been necessary as a form of insurance, may in fact become little more than an expensive addition to stocks.

* * *

Barcelona Traction

When giants contend for the possession of property, the ordinary spectator is best advised to watch the battle from a distance. That maxim has for some time been true of the affairs of Barcelona Traction, in which the direct British interest is now negligible. The struggle between the contestant, however, now appears to be reaching a climax, and it is being accompanied by rising cries of battle, in the form of statement and counter statement. To assess the significance of each point made by the opposing parties is virtually impossible save for those who are prepared to make a full-time study of the affair—in other words, those who are already *partis pris*.

Put shortly, the latest developments include the sale in Spain of the "assets of Barcelona Traction" under the much publicised bankruptcy proceedings. Those who speak for the company condemn the validity of these proceedings and assert that the "assets" are securities of the subsidiaries of Barcelona Traction that have been "created" in Spain within the last six months, whereas the genuine shares and bonds are held in Toronto. The opposing side, speaking for the interests of Sr. Juan March, offer to the shareholders of Barcelona Traction the securities that they have acquired at the auction (for which they appear to have paid the equivalent of £91,000) subject to the settlement of creditors' claims that would apparently involve the raising of £9½ million by the Belgian company that controls Barcelona Traction. This offer holds for nine days only from January 4th, and it is clear that the Belgian company, Société Internationale d'Energie Hydro-Electrique (SIDRO), will not entertain it. Meanwhile, the sterling bonds of Barcelona Traction continue to be held in London on behalf of the March interests, which control 85 per cent of the total issues. The company evidently has in mind the possibility of preventing the transfer of these bonds to a foreign holder and the next stage in the struggle may well be carried to the Treasury which alone has power to permit or refuse the transfer.

Two general points remain to be made. The direct interest of the British investor in this affair is now, fortunately, almost non-existent. But the indirect consequences of the struggle are of crucial importance for the future of overseas investment. This has received so many hard knocks and has been treated so lightly by British authorities—including at least one past Chancellor of the Exchequer—that the restoration of probity in all international investment, supported to the full by all British Governments, has become absolutely vital. The time appears to have come for the Treasury to clarify its own position in this business. Nothing further has been heard of the proposal, which was under consideration some months ago, of publishing reports of an expert investigation into the case. Secondly, the affair has clearly become a matter for governments, and any hope of settlement would seem to rest on negotiation between the governments of the United Kingdom, Canada, Belgium and Spain, which are directly concerned together with the United States, which should have a lively interest in the questions that are at stake. It is certainly time that a truce was called on this particular financial battlefield.

NEWS FROM THE FISHING INDUSTRY

How the general improvement in fish has come about

During the war years and for some time afterwards, trawlers were ordered to stay out on the fishing *grounds until their holds were full.* The result was heavy landings of rather tired — and sometimes quite exhausted — fish.

There was justification for this practice at the time as, not only was there a general food shortage, but a high percentage of trawlers were still on loan to the Admiralty. People were thankful to eke out their rations with even poor quality fish: witness the fish queues!

However the policy of fishing for quantity rather than quality was only one of desperation and has been abandoned, it is to be hoped, for ever. Since this happened, it is significant that the tonnage condemned at distribution centres has dropped dramatically, despite more rigorous inspections. At the present time, a trawler's voyage is, on the average, 3 days shorter than previously. This sometimes means smaller catches, but it ensures fresher fish for your table and greater food-value for your money.

British Trawlers know their job!

Policy for Engineering Exports

Mr Butler's statement that "We are now rapidly shaping our policies so as to enable a large part of the United Kingdom's metal-using industry to increase its exports still further" is the first blunt avowal of a change in export policy that has been hinted at—and indeed overdue—for some months past. The previous government originally held that as rearmament developed a consequent decline in the exports of the metal-using industries must be accepted, and that exports of consumer goods could be expected to rise sufficiently to offset this decline. The first assumption seemed at the time plausible, the second optimistic; but events have borne out neither. During the first eleven months of last year, engineering and metal exports were at a considerably higher rate, both in value and in quantity, than during the whole of 1950; and the rise was generally steady throughout the eleven months, with November exports exceeding those in October and the average for the third quarter. Exports of textiles and other consumer goods, over the same period, also rose considerably in value, but this was largely due to rises in prices.

The new policy is therefore an adjustment to present realities, and involves an effort to continue the current trend of exports. The main reason why engineering exports did not fall last year, without doubt, was that rearmament began at a considerably slower pace than had been hoped. Output rose in most of the metal-using industries, though production of some metal items began to slacken towards the end of the year; deliveries to the home market, both of capital equipment and of consumers' goods, seem to have remained much the same; and presumably, therefore, the bulk of the increase went to exports rather than to defence. To continue or increase this level of exports this year, with a defence effort that must become more substantial, and reduced supplies of metals, means inevitably that home consumption of metal goods must shrink. And Mr Butler has declared that it shall shrink drastically.

For particular engineering industries these aims will impose difficulties in marketing, and for all of them difficulties over supplies. During the third quarter of 1951, for example, exports of cars, wagons and trucks, and a few types of machinery were lower than in the corresponding period of 1950, apart from items like machine tools and generating plant where exports declined presumably as a result of a deliberate increase in home deliveries. Exports of other types of machinery, particularly of agricultural equipment, were however markedly higher, as were exports of agricultural tractors, and of motor and pedal cycles. Manufacturers of cycles, it may be noted, have been among the most vociferous in complaint about cuts in their steel supplies under the imminent allocation scheme. Whatever the justice of particular cases, their experience emphasises that even excellent performance in exporting may not save manufacturers from drastic reductions in their metal supplies—and therefore in their deliveries to the home market. Mr Butler is already armed with considerable powers of direct and indirect control over the supplies of metal goods to the home consumer; but there are some hints that he may have decided to reinforce them.

* * * *

Production in the Autumn

Upon the evidence of the official index of industrial production, industrial output towards the end of last year was no higher than at the same period of 1950. For all industries the index in October was 151, compared with 146 in September but with 152 in October, 1950. On the basis of information so far received the index for all industries in November is expected to be 152-153; in November, 1950, it was 153. During October, it should be noted, the official index, which in former years has tended to show a greater rise in output than the unofficial London and Cambridge index, appeared to be varying in the opposite direc-

BARCELONA TRACTION, LIGHT & POWER CO. LTD.

Statement issued by the Board of Directors.

(1) There has taken place on January 4th in the small town of Reus, Spain, a purported sale of the "assets" of Barcelona Traction, Light & Power Co. Ltd. to a Spanish Company which has been incorporated for that purpose within the last few weeks by the Spanish Group which has been acquiring the sterling Bonds of our Company. The "assets" which have been sold are so-called Shares and Bonds of our Subsidiaries—mainly Canadian Companies—which have been created in Spain within the last six months. The genuine Shares and Bonds continue to be held in Toronto.

(2) This sale has taken place in the "bankruptcy" of Barcelona Traction, which was declared four years ago by the Court of Reus, without any notice to the Company and based upon the non-payment of the interest on its sterling Bonds. In fact, apart from the years 1936 to 1939 when, during the Spanish Civil War, the installations in Spain were seized by Workers' Committees, our Company's revenues from its subsidiaries in Spain have for the last 25 years been greatly in excess of the financial charges on its bonded indebtedness. The failure to pay the interest on the sterling Bonds after the Spanish Civil War was due exclusively to the refusal of the Spanish Government to allow transfers. The Company, despite the efforts made by itself and its Subsidiaries, has not so far succeeded in obtaining even a hearing in the Spanish Courts: and the "assets" are being sold notwithstanding that the validity of the bankruptcy has not yet been decided.

(3) This great Canadian enterprise, built up largely by British and Belgian capital, supplies more than one-fifth of the electric power produced in Spain. Its net foreign investment in Spain at December 31st, 1949, was established by the U.K. and Canadian Accountants appointed by their respective Governments, as amounting on book figures alone to over £19¼ million, without allowing for the change in the value of money in the forty years of our Company's existence. The price paid at the sale for all the assets was 10 million pesetas (£91,000), the buyer undertaking, in addition, to pay off the principal and arrears of interest of the sterling bonds of those holders who do not agree with the buyer to waive their right to be paid off in sterling.

(4) During the last five years 85 per cent. of the total issue of Prior Lien Bonds has been purchased by the above-mentioned Spanish Group from their previous holders—mainly U.K. residents—at an average price (inclusive of arrears of interest since 1936) of about par, viz., £2,300,000. These Bonds are, however, still held in the name of a company registered in England. A large proportion of the First Mortgage Bonds has also been acquired by the same Spanish Group, £2,640,000 of these within the last few months at a price of about 75 million pesetas, *i.e.*, less than £700,000.

(5) The much advertised option to the Company to nominate someone to bid for its own "assets" is nothing but a mockery in the light of the treatment which it has been accorded in Spain. By accepting this offer not only would it approbate the creation of Spanish scrip of Canadian Companies, of which the genuine scrip exists in Canada, but in order to bid it would be required to raise some £9½ million on the security of an investment which, while of immense value on the basis of its assets and earnings in Spain, had already been frozen by the Spanish Government for almost 12 years, even before the Company was deprived of its control by the Spanish "bankruptcy" which has ruined the Company's credit abroad.

(6) If, by the sale at Reus, the buyer can effectively acquire the enterprises of the Barcelona Traction Group in Spain, it would mean that, as a direct result of the refusal of the Spanish Government to allow transfers of exchange to service the sterling debt of our company, the above-mentioned Spanish Group would have acquired, for the equivalent of about £5½ million, assets of which the book value exceeds £19½ million and the present replacement value is estimated at £55 million. If steps are not taken to obtain justice, the bulk of this great loss will ultimately fall upon a large number of small Shareholders, mainly Belgian.

(7) The Board have taken and will continue to take every step within their power to avoid this spoliation. They have been and remain in communication with the Belgian, Canadian and U.K. Governments as to the steps which they can respectively take to counter this threat to foreign investment and, in particular, as regards such Exchange Control permits as would be required from H.M. Treasury to enable the buyer to consummate the sale.

tion: the London and Cambridge "B" index showed production in October at 147, compared with 143 in September and 145 in October, 1950.

Nevertheless, both suggest a flattening of the upward curve in industrial output, and suggest also that the 4 per cent rise during 1951 predicted in that year's Economic Survey will probably not have been quite achieved. So far as the component indices of the official index for October, 1951, are concerned, the slackening was most marked in manufacturing; "mining and quarrying" and "gas, electricity and water" both show rises on October, 1950.

Factory Power

Official interest in the private generation of electric power on factory premises appears once again to be increasing. The Ministry of Fuel and Power is considering a study of the potential facilities—perhaps on behalf of its Ridley Committee on fuel economy; and it has been reported that the British Electricity Authority is viewing projects from certain industrialists with greater benevolence than before. Unofficial advocates of private generation of power have never been lacking—not all of them equally disinterested.

Projects for factory power generation are of two distinct types. The first type involves the fitting of a small turbine through which steam used in industrial processes may be passed to generate power before it is dissipated or fed into a heating system. Almost any such turbine fitted in a steam system is far more efficient thermodynamically than the large BEA power station, simply because much more of the heat in the steam can be utilised within the factory. But fuel efficiency of itself does not necessarily make the small turbines economically attractive. They generally require steam at a higher pressure, and this often involves the reconstruction of the factory boiler; installation costs may thus tend to be heavy. But during the present period of fuel shortage, their additional efficiency from fuel already being consumed often makes them worth while; and BEA might well encourage their installation in many cases.

The case for small diesel generating sets inside factories is probably not so strong. These involve the use of extra fuel, in a fairly costly generating process; and here the normal economies of size are more relevant. In proportion to its output, a small generating set takes far more steel than do the big stations; and it has not often been suggested that its capital cost per kilowatt is remotely comparable. With the use of exhaust gases and cooling water in heat exchangers it may be possible to obtain a high thermodynamic efficiency with such small sets; but they would seem a more doubtful commercial proposition, and certainly not a generally applicable alternative to generation in large-scale power stations. Deliveries for some of these smaller generating sets, it may be noted, are already held up for two to three years; any general increase in demand during the present steel shortage might well lengthen these delays. Diesel generation of power on a larger scale is already being developed by the BEA in some power stations where the extra sets can be accommodated; they give relief, albeit at some cost, at the peak and their possibilities may have to be explored further if the shortage of coal enforces greater dependence on oil.

* * *

New Names in Petrol

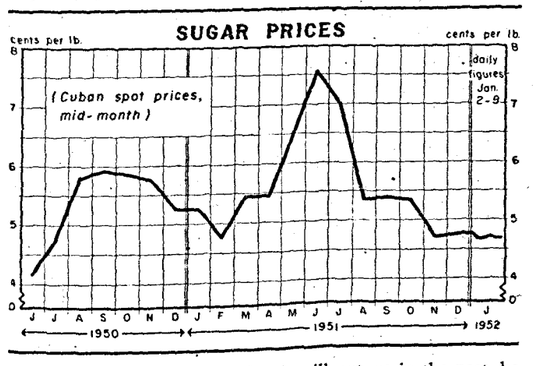
The two leading petrol distributors, Esso and Shell-Mex and BP have made a formal approach this week to the Ministry of Fuel and Power for authority to re-introduce branded petrol on the home market. There seems to be no sound reason why permission should not be given but it may take the oil companies until June to complete their plans for marketing a premier grade of 80 octane petrol in addition to the standard pool spirit of about 70 octane. This premier grade will cost a few pence more per gallon than the standard spirit but should improve the performance of new cars, most of which have relatively high compression ratios that range up to 7.25 to 1. These engines do not give their best on pool petrol; in fact most engines with ratios exceeding 6.5 to 1 need a better fuel than this. Private cars account for about 38 per cent of the motor spirit consumed in this country and goods vehicles, which are less likely to be consumers of premier petrol, for roughly the same proportion. The immediate potential market for 80 octane spirit is, therefore, likely to be limited to about two million tons a year out of a total consumption of between 5 and 6 million tons.

When branded petrol returns to the British market, Socony-Vacuum's "Mobilgas" will be competing for the first time with established names like Shell, B.P., Esso and Regent. The American Vacuum Oil Company has not previously marketed petrol in Britain under its brand name; its British selling agency, Socony-Vacuum, has an important trade in lubricants. Socony is now partly owned by Powell Duffryn, which has become a partner with Vacuum Oil in the new refinery now under construction on the site of Powell Duffryn's old Coryton storage plant. The two companies have recently provided an extra £500,000 for this project which was previously expected to need a total of £10 million. The Coryton plant was first intended to provide lubricating oils only; a catalytic cracker was later incorporated and the refinery will now work up the light petrol and diesel oil fractions of the crude as well as producing lubricants from the heavier residual fractions. The throughput of the plant is 18,000 barrels a day compared with 80,000 at Stanlow and 110,000 at Fawley. Production of petrol will, therefore, be on a much smaller scale than that of other leading companies, but may be supplemented by imports from Vacuum's other refineries.

Socony-Vacuum, the marketing organisation, must now overcome the handicap of having no established distribution facilities. A limited organisation is being built up in an area of about 40 miles radius around London, where the first "Mobilgas" pump started working last week. Until the Coryton cracker is in operation, about a year hence, Socony must depend on what petrol is imported by Vacuum Oil.

* * *

Commonwealth Sugar Agreement



The Ministry of Food last week signed a formal long-term agreement with Commonwealth sugar producers. It is retrospective to January 1, 1950, and is to run for 10 years. The new agreement is, in fact, a revised version of the long-term contract offered to the Commonwealth two years ago which caused such a stir in the West Indies at the time. Since then, Britain has signed a three-year contract with Cuba, and although Britain undertook to guarantee a market for the entire exportable surplus of Commonwealth sugar throughout the life of the Cuban contract it was clear that some form of revised agreement with both colonial and dominion producers would be necessary. The new agreement supersedes that undertaking.

The document embodying the agreement is long and complicated. It contains twenty-nine articles and a number of appendices, but its basic terms differ only slightly from the contract of two years ago. Commonwealth producers have agreed to restrict their exports to a total of 2,375,000 tons in any one calendar year and Britain has agreed to buy, at the annually negotiated price, 1,643,000 tons, of which 75,000 tons are on behalf of New Zealand. These quantities are the same as in 1950. Until a new international sugar agreement is negotiated and accepted, exporters can increase their exports beyond the agreed limits, but they will have to sell such additional quantities at the world price. Producers can thus obtain three separate prices: the negotiated price on their agreed sales to Britain and New Zealand; the world price plus preference on additional sales to Britain and Canada up to the agreed export limits; and the world price without preference for any sales beyond that limit. If a country cannot meet its export quota the unfulfilled portion may be transferred to any other signatory. All the parties have agreed not to enter an international agreement unless it accepts the total export quota of 2,375,000 tons for Commonwealth countries as an irreducible minimum.

* * *

Price of Concord

A novel feature of the new agreement is the method of fixing the price each year. A single Commonwealth price will apply to all Commonwealth exporters for sugar sold to Britain and New Zealand. In the terms of the contract, the price "is to be reasonably remunerative to efficient producers" which may mean widely different things. For 1952 the price has been fixed at £38 10s. a ton compared with £32 17s. 6d. a ton in 1951 and £30 10s. a ton in 1950; this year's price is in fact at parity with the current world price. Last year's price was well below the world level. The important point is that in future it will be calculated each year

according to a special formula; it will not, as in the past, be subject to bargaining between Britain and the producing countries. The 1950 price has been taken as the basis of calculation and this will be increased according to weighted increase in the cost of wages and salaries, supplies and other charges in the current year. This will determine the price for the following year. The price for 1952 was worked by this distinctly complicated method and both Britain and the exporters consider the result reasonable.

Any long-term agreement necessarily spells rigidity and this certainly is no exception. But the sugar market has not been subject to the free play of supply and demand for many years, and if assurance to sugar producers is necessary for political reasons, perhaps this new agreement is no more obnoxious than many other forms. Certainly, the exporting countries have welcomed it, and it remains for the future to put it to real test. The introduction of a price formula should remove one cause of dissension in Commonwealth relations. But at what cost to the British consumer? The adoption of a single Commonwealth price will leave room for competition between the various producers who range from the highly mechanised plantations of Australia to the negro plantations of the Caribbean.

At the moment, Britain may not be paying excessively for Commonwealth sugar; last year it certainly paid too little if the so-called world price (which is really the Cuban free market price) is any guide. What are the prospects of a much lower price in the world sugar market? This season's world production is estimated at 35,900,000 tons, nearly 800,000 tons larger than last year's record of 35,100,000 tons. On this comparison, it would seem that the price of sugar is unlikely to rise. At present it is around 4.7 cents a lb and since the turn of the year the market has been steady. If the price should fall below 4½ cents, Cuba and other producers will certainly press for an international agreement which would presumably peg the price at around this level. If this appreciation is correct, the cost of the Commonwealth agreement, so far as the consumer is concerned, need not be high.

* * *

Electric Shock for Whales

Science is being introduced to the art of whaling and in the current whaling season, which started a week ago, experiments will be carried out in the Antarctic with a new electric harpoon. The ordinary harpoon carries an explosive charge in its nose; the whale is thereby severely wounded, and may not die for an hour after it is hit. When the electric harpoon strikes, the whale dies in a very short time and its valuable blubber and flesh are not damaged in the process. Further, the whale remains afloat. The new device can be used with existing harpoon guns (although a lighter version with a higher muzzle velocity is being developed) and it will reduce the catching time. The shorter catching season this year, however, is not a consequence of the electric harpoon. The postponement of the opening of the season from December 22nd to January 2nd was decided upon because the whaling fleets are more or less back to their prewar capacity.

The number of whales that can be caught in any one season is still restricted under international agreement to 16,000 blue whale "units" and this limit is unlikely to be affected by the introduction of more efficient and more seemly methods of catching. A late start to the catching season should give whales more time to get fat and thus increase their yield of oil. The advantages of the electric harpoon should, therefore, be twofold. A larger output of oil may be obtained from a given number of whales caught when they are mature; and operating costs should be lowered. The two main items in cost are fuel and wages, and although the latter will almost certainly not decline—at least not because of the electric harpoon—considerable economy could be effected in the use of fuel.

The new harpoon is still at an experimental stage and certain technical difficulties remain to be overcome. Even when these are solved, two or three seasons are likely to elapse before the new method is universally adopted. Meanwhile, the Ministry of Food has had to increase its purchase price of whale oil. This season it has so far bought at £110 a ton compared with £100 a ton last season and £80 in the season before. Now that scientific aids are being introduced into whaling, it may not be long before somebody invents a "homing" device to attach to the harpoon or even, perhaps, a radio controlled harpoon.

Radio Industry's Exports

Exports are coming to play an increasingly important part in the total market for radio products. Last year, when the combined output of all sections of the industry was valued at £75 million, more than £18 million was exported compared with a prewar figure not much beyond £2 million. This year the Radio Industry Council has provisionally estimated that total exports have exceeded £22 million. Less than one-quarter of this total consists of radio receivers, although the number sent abroad is very nearly double what it was in 1950. Most of these sets go to the Middle East and to the Commonwealth countries, although a small export trade in television receivers is being built up in South America.

At least half the total value of radio exports today consists of sales of valves and other components. Many of these are going to countries developing their own receiver assembling industries, but rearmament has brought a marked increase in the volume of orders for components coming from all parts of the world, not all of which are accepted by British manufacturers. Most component manufacturers now acknowledge the fact that rearmament will affect the production of domestic radio and television receivers, and look to defence orders and export business to maintain their level of output. Although present defence contracts placed with the industry have been valued at £76 million, this does not mean as much employment to the industry as £76 million worth of domestic receivers. Current defence orders are weighted heavily in favour of capital equipment that uses relatively fewer components and other radio accessories for every pound of cost, compared with civilian orders. Moreover, defence orders in many cases displace export orders for radio transmitters and communications equipment and do not necessarily increase total employment in the industry. Exports of this type of equipment have, in fact, fallen during the year, and the total is likely to be lower than in 1950.

In spite of short time in some factories, the production of radio and television sets is still remarkably high. In October, 200,000 radio and 74,500 television sets were produced compared with an average of 150,000 radio and 45,000 television sets a month in 1950. But much of this must be production for stock against impending shortages, for sales have been falling since the budget last April, and if the industry lacked the continued stimulus to television sales given by the opening of new transmitters, it would be going through a difficult period.

* * *

Dearer Cocoa ?

The cocoa market, which has been in the doldrums since last March, is beginning to revive and since November the price has risen from 226s. 9d. per 50 kilos to 266s. 9d. Bumper crops were expected but they have not materialised. Three months ago world output for 1951-52 was put at 793,000 tons compared with 780,000 tons in 1950-51. But this estimate has been steadily reduced and is now put at no more than 710,000 tons. The Gold Coast crop, which accounts for one third of the world's total, has suffered a serious fall from 262,000 tons to 235,000 tons because of heavy rainfall and black pod disease. Swollen shoot is still a major problem but steps have been taken to limit its spread. Both Nigeria and Brazil have also suffered from black pod, though the fall in output in these two countries has been less severe.

The prospect of a smaller crop has undoubtedly helped to strengthen the market. In the United States, confectionery manufacturers used up their stocks during the summer months and although they began to buy again in November, their purchases have been small. Having learned a painful lesson a year ago, they are carrying small stocks. British imports of cocoa are also declining. In the eleven months to November, imports totalled 98,600 tons compared with 120,000 tons in the same period of 1950. American consumption of confectionery this year is expected to be a little above last year's total, which was high, but European consumption is expected to fall. British consumption of raw cocoa is restricted by the sugar ration to confectionery manufacturers. The cuts on confectionery imports to this country might have seriously curtailed the Dutch demand for cocoa beans, but the Netherlands have an alternative

outlet for confectionery in Germany, where the demand for cocoa and cocoa products is expanding rapidly. Before the war, Germany was the third largest market for raw cocoa and if German import restrictions are relaxed next April—as the cocoa trade confidently hopes—German demand for raw cocoa may be a powerful support for the market. Thus prospects this year suggest higher rather than lower prices for cocoa; demand is likely to equal that of 1951 and perhaps slightly exceed it, while supplies are much smaller.

Life Assurance Records

A further eighteen offices have published their figures of new ordinary life assurance secured in 1951. The net new sums assured by the fifty-six offices whose results have now appeared were £686.4 million last year compared with £575.8 million in 1950, £525.0 million in 1949, £511.8 million in 1948 and £243.0 million in 1938. Last year's total of new life business, including that transacted in the United Kingdom by Commonwealth offices, will undoubtedly exceed £700 million and set up a new record. The 1951 total to date is 19.2 per cent higher than that for 1950. These figures include the overseas business of the British insurance companies (transacted mainly in the Commonwealth) which has been expanding since the war faster than home business. The overseas new business of the Prudential represents nearly half of that of all British offices, and last year was £37.5 million compared with £32.1 million in 1950 and £28.8 million in 1949.

Business underwritten by the different types of offices has varied considerably during the last two years. In 1950 the new business transacted by the life departments of the composite insurance companies was some 15 per cent greater than in 1949, and that secured by the mutual and proprietary life offices 10 per cent greater but the increase shown by the industrial-ordinary offices was less than 1 per cent; the average increase in new business was just under 10 per cent. Last year, when the average increase was about 19 per cent, both the mutual and proprietary offices and the composite insurance companies showed increases of 20 per cent over the 1950 level, whilst the industrial-ordinary offices greatly improved their performance with an expansion of over 16 per cent. The rise in the total new business secured by this

group last year is especially welcome as it suggests a material increase in the volume of individual as opposed to staff scheme new life assurance being taken up by people of moderate means. From the results so far available, it seems probable that new industrial life assurance business com-

Notes: (*a*) Including overseas business. (*b*) Approximation. (*c*) Excluding group life and pension business. The total new business was: 1948, £91·3 million, 1949, £88·4 million, 1950, £94·4 million, 1951 not yet available.

pleted last year will show a modest improvement on the 1950 total.

It would seem almost too much to expect even higher new life assurance figures this year, but unless much more of the inflationary steam is let out of the economy during the coming months than at present seems likely, there is no apparent reason why last year's level should not be roughly maintained.

Shorter Notes

The British Export Trade Research Organisation, a co-operative attempt by a section of British industry to carry out market research in importing countries, is to close down after seven years' work. The organisation, which has been partially financed by government subsidy, has not obtained sufficient work to pay its way.

*

Three open hearth furnaces at the Port Talbot works of the Steel Company of Wales, each with an output of about 1,000 tons a week, have been closed through lack of scrap steel to charge them. This announcement, which followed a warning the week before by the company's managing director, Mr Julien Pode, is an indication of the severity of the shortage of raw materials now affecting the British steel industry. Margam, the industry's newest plant, has fairly or unfairly been considered by other steel producers as receiving special favour, and materials have been diverted from other works to feed it during recent months, while it has gradually been building up its output.

*

The latest subject of inquiry for which the Anglo-American Council on Productivity is sponsoring the visit of a team to the United States appears somewhat remarkable. The team is to study "fuel conservation," and its subsequent report is expected to "formulate recommendations on the immediately pressing problem of economising existing resources, and also on a comprehensive long-term policy of fuel utilisation in this country." Both aims are admirable, and justify study of foreign experience; but the United States does not seem the obvious place for it. The higher productivity other teams have often studied there is based partly upon a lavish use of vast resources of power, and in some areas of the country at least saving fuel is the last thing most industrialists study. A visit to some countries in Europe, perhaps, might be more useful.

RE BARCELONA TRACTION, LIGHT AND POWER COMPANY LIMITED

Following upon the auction sale of the assets of Barcelona Traction, Light & Power Co. Ltd. held in Spain on the 4th January before the Special Court for the bankruptcy of the said company, the successful bidder, the Spanish company Fuerzas Electricas de Cataluna has sent the following telegram to the Société Internationale d'Energie Hydro-Electrique S/A (SIDRO) of Brussels, owner of the majority of the shares of the bankrupt company:

"The advertised auction sale of the assets of Barcelona Traction held to-day results in the adjudication being made to Fuerzas Electricas de Cataluna, a limited company domiciled at Calle Serrano 12, Madrid, subject to the reservation that Barcelona Traction may make use of the right it already possesses, and which was notified at the actual auction to Barcelona Traction's legal representative present thereat, to put up any bidder to replace Fuerzas Electricas de Cataluna within the period of nine days under the same conditions as have been accepted by that company. If, as is alleged in the publicity campaign, Sidro believes that the assets auctioned represent a much greater value than the bonds issued and owing by Barcelona Traction, Fuerzas Electricas de Cataluna offers to the shareholders of the said Barcelona Traction Company a new opportunity, additional to that prescribed in the Conditions of Sale in favour of Barcelona Traction, to acquire the said assets for the value of the bonds plus interest (which has been unpaid for sixteen years) of the said Barcelona Traction Company, payment of which is guaranteed by the auctioned assets themselves. To this end Fuerzas Electricas offers to the shareholders of Barcelona Traction the opportunity of acquiring those assets without having to pay to Fuerzas Electricas de Cataluna any price for the assignment which it is prepared to make to them. Fuerzas Electricas de Cataluna is willing to consider a proposal from Sidro to the effect of assigning thereto in the interests of all the shareholders of Barcelona Traction all its rights acquired and its obligations incurred at the said auction subject to the liquidation and payment on behalf of Sidro to the full satisfaction of Fuerzas Electricas de Cataluna before the 31st of the present month of all the amounts included under the headings detailed in the second condition of the Conditions of Sale of the said auction. All of this in accordance with the Spanish law applicable to this case. This is communicated pursuant to a resolution of the Board of Administration of Fuerzas Electricas de Cataluna passed on the 31st December last. I am confirming this cable by mail and am sending you a copy of the Conditions of Sale.

Rodriguez Sastre
Director and Secretary."

Fuerzas Electricas de Cataluna.
Madrid, 4th January, 1952.

Company Notes

Turner and Newall.—In the past year, demand in almost all the markets for Turner and Newall's products outstripped even the increase in production, and it seems that only labour and material shortages prevented all plant from being worked at full capacity. Group trading profits jumped from £9,366,998 to £13,069,825 and distributable earnings from £965,000 to nearly £1,675,000. Yet the ordinary dividend was left unchanged at 20 per cent. The directors were not willing to be more generous as record earnings were due "partly to temporary conditions" beyond their control. In his statement accompanying the full accounts, the chairman does not clinch this argument by explaining what exactly were these "temporary conditions" to which he referred in justifying an ultra-conservative dividend policy.

The directors' concern with the problem of replacement is evident in the year's reserve appropriations, but so strong is the consolidated balance sheet that it could hardly be pleaded that the need to plough back profits was so imperative that nothing more could be spared for equity shareholders. A fall in cash balances from £10,753,301 to £8,080,130 has been more than offset by an increase in quoted investments from £2,404,504 to £5,160,240 and in tax reserve certificates from £3,694,713 to £5,649,786. Higher prices and "the increased level of trading activity" led to an increase in stocks from £10,250,497 to £12,693,256.

Ordinary capital	5,338,609	5,338,609

£1 ordinary stock at 88s. 9d.xd yields £4 10s. per cent.

Peak production of Ferodo brake and clutch linings was made possible by "a considerable quantity of new plant" brought into operation last year. Despite an acute local shortage of labour a high level of activity was maintained in the asbestos textiles division, and a high rate of output, particularly in coal conveyor belting, was achieved in the new factory at Hindley Green. All plant in the asbestos cement division has been operated to the maximum following an improvement in supplies of suitable grades of asbestos fibres. A new milling plant in Southern Rhodesia, now in operation, will help to increase the production of graded fibres from this area but the gap between available supplies and current needs has still to be closed. Underground mining, instead of quarrying, at the Bell asbestos mine in Canada, will add to costs but is not expected to reduce production. Further plans to extend capacity, especially in the asbestos textile division, are already in hand.

Mr Shepherd is not the first chairman to refuse to make long-term forecasts but he admits that the directors "anticipate the continuance of strong demand during the current year" and that production will be "at or near the maximum possible with available plant and raw asbestos." Costs will almost certainly rise in the rearmament period and shareholders will not disagree with the chairman's comment that yearly profit records cannot be achieved indefinitely. But they will still wonder if that is sufficient reason for ignoring their claim for a bigger slice of the cake in a year when a new record was established.

★

Carreras.—By drawing upon stocks of leaf tobacco purchased before devaluation, the Carreras group were able in 1949-50 to stave off the full impact of higher exchange cost, as well as increased market price, upon earnings. In fact, these advanced to a new record level. Last year, by contrast, group profits, before tax, fell by nearly 6½ per cent from the 1949-50 figure of £3,062,000 to £2,866,000. The decline in profits was not unexpected as the company, using dollar leaf stocks purchased at full devaluation cost, was confronted with a rise in manufacturing and distributive costs. Together with the other leading tobacco manufacturers, the group was forced to increase the price of cigarettes, but as this increase was only effective in the last two months of the financial year it can have made only a small contribution to the year's earnings. Despite the decline in gross profits, the taxation bill was higher at £1,579,446, against £1,536,166, and group net profits fell quite sharply from £1,428,504 to £1,165,066. The company, however, were able to maintain the ordinary dividend at 35 per cent, a rate that has been paid since 1944-45. No appropriation has been made to general reserves, which received £100,000 in 1949-50, but £211,200 has been added to a fixed assets reserve.

	Years to October 31, 1950	1951
Consolidated earnings :—	£	£
Profit, before tax	3,062,190	2,865,696
Taxation	1,536,116	1,579,446
Group earnings for ordinary stock	*1,395,410*	*874,075*
Ordinary dividends	716,158	683,605
Ordinary dividends (per cent)	100,000	...
Fixed assets reserve	...	211,200
Added to group carry forward	579,252	190,470

£1 "A" ordinary stock at 95s. yields £7 8s. per cent.

Increased cigarette prices have had little effect upon sales and the heavy purchases of leaf tobacco at the recent auctions suggest that production will be maintained in the current year at the 1951 level. But as the yield of 7⅛ per cent on the Carreras "A" ordinary shares at the current price of 95s. suggests, investors are taking a cautious view of trading prospects in the tobacco industry. The biggest fear is that the additional penny on a 3s. 6d. packet of cigarettes will not cover the whole of the increase in costs.

★

Apex (Trinidad).—At first sight it appears that in the year to September 30th last, profits accruing to Apex (Trinidad) at £1,995,245 were lower than in 1950 when profits were shown at £2,098,931. If, however, profits of £408,022 relating to earlier years are excluded from the 1950 figure, it is evident that revenue from the year's trading actually advanced from £1,690,909 to £1,995,245. Similarly, if distributable earnings are calculated to exclude earlier years' profits, ordinary earnings have risen from £261,000 to over £530,000—an increase that amply justifies the decision to raise the tax free dividend from 35 to 40 per cent. The improvement in profits stems from an increase in production and delivery of crude oil and casing head gasolene.

For its drilling programme the company has ample resources, as the directors resisted a suggestion that a distribution of part of its large cash balances might be made. Nearly £2,390,000, against £1,395,000, is held in cash, a further £610,000, against £425,000, in tax reserve certificates and about £1,004,000, against £1,094,000, is invested in government securities. At the current price of 48s. 9d.xd. the 5s. stock units yield £7 16s. gross.

Statistical Summary

EXCHEQUER RETURNS

For the 5 days ended January 5, 1952, total ordinary revenue was £89,510,000 against ordinary expenditure of £63,163,000 and issues to sinking funds £216,000. Thus, including sinking fund allocations of £16,853,000, the deficit accrued since April 1, 1951, is £199,656,000 compared with a surplus of £104,041,000 for the corresponding period of the previous year.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

MARTINS BANK LIMITED

MEASURES TOWARDS RESTORING SOUND ECONOMY

STATEMENT OF MR A. HAROLD BIBBY, D.S.O., D.L.

The one hundred and twenty-first annual general meeting of members of Martins Bank Limited will be held at head office, Liverpool, on February 12th. In his statement, circulated to members, the chairman, Mr A. Harold Bibby, D.S.O., D.L., writes:—

First may I deal with the balance sheet and accounts which include the figures of the absorbed British Mutual Bank Limited; I feel sure that the shareholders, in the light of existing conditions, will express their satisfaction as do my colleagues on the board.

The net profit for the year is £725,107 which compares with £732,895 last year. The result reflects larger demands for taxation, higher overheads (the peak of which has not yet been reached), and prudent reservations facing as we now do conditions under which industry will find it less easy to make profits and the no less important changing values in British Government securities. Fortunately, an investment reserve built up in past years has, with allocations out of the year's profits, enabled the carry forward of a surplus in that particular reserve.

After payment of the dividend, it is proposed to make an allocation of £375,000 to reserve for contingencies.

Total assets amount to £347,336,244, against £342,053,859.

Customers' funds and other accounts are £314,582,055 against £303,348,987 last year and advances are £88,603,419 as compared with £74,809,980.

Changes in other assets will be observed in the comparative balance sheet; the ratio to deposits of our more liquid resources, including Treasury deposit receipts stands at 35.73 per cent.; the fall from the high figure of a year ago is accounted for mainly by the translation of £24,000,000 of Treasury bills into the new 1¾ per cent. Serial Funding stocks, being a reflection of the Government's early steps towards monetary stability.

CHANGES IN DIRECTORATE

The past year has again seen changes in the directorate of the bank and in the local boards. I have to record with deep sorrow that Sir William Clare Lees, Bart., O.B.E., LL.D., passed away in May. He had rendered great service to the bank during the eighteen years of his close association, first as a member of the Manchester Board, where he had served as chairman for over nine years, and later as a member of the General Board, where he acted as a deputy chairman from 1945 onwards.

During the year we welcomed to our deliberations Sir Wilfrid Martineau, M.C., T.D., M.A., a partner in the firm of Messrs Ryland, Martineau and Company, Solicitors, of Birmingham. We are indeed fortunate in having his co-operation both on the General Board and also as chairman of the newly constituted Midland District Board to which I refer later. Mr P. J. D. Toosey, D.S.O., O.B.E., T.D., who has wide commercial interests in the North West, has, I am pleased to say, also joined the General Board.

Mr Myles N. Kenyon, D.L., whose valued counsel has been available for many years both to the General and Manchester Boards, has been elected as chairman of the Manchester Board, and Mr R. Cary Reynolds, O.B.E., has joined that Board. From the North Eastern Board Sir John S. Barwick, Bart., has retired owing to advancing years, and we record our appreciation of the services he rendered over the long period of 35 years. To fill the vacancy Mr Peter Wrightson, O.B.E., has accepted a seat on that Board. In Mr Reynolds and Mr Wrightson we have colleagues with wide knowledge and experience in their respective spheres of textiles and engineering whose advice will be invaluable.

In May last Mr Herbert Holt relinquished his seat on the Leeds Board to which he was appointed in 1941 following notable service in an executive capacity. His total service with the bank and its predecessor extended over sixty years, and we acknowledge his valued co-operation.

EXTENSION OF DECENTRALISATION

Once again may I stress the advantages which accrue both to the bank and customers generally in our policy of decentralisation through our local boards and district head offices. During the year we have put into effect a further extension of this system, for it was decided that the growth and control of our business in the Midlands would be greatly facilitated by establishing a local board with district general management at Birmingham: this new arrangement will prove, I am sure, a considerable source of strength to our organisation. As I have already mentioned, we are fortunate in securing the services of Sir Wilfrid Martineau on the general board, and he it is who will be the first chairman of the Midland district board. He is a prominent figure in the civic life of Birmingham and has filled the high office of Lord Mayor; his counsel and his breadth of knowledge of that area will be of great help as also will the assistance of Mr P. H. Jones, M.C., T.D., D.L., M.I.Mech.E., a well-known Midlands industrialist who has joined him as a member of the Midland district board.

PROMOTING OVERSEAS RELATIONS

Mr C. J. Verity, chief general manager, made an extensive tour of Australia and New Zealand during part of last year making numerous calls on Australasian banks and commercial houses, and I know that his visit has been of real value in cementing and promoting business relations with that steadily growing continent. Other executive officers have also visited and kept in touch with our connections abroad.

You will remember that a while ago, in order to meet our expanding needs for office accommodation, we acquired premises at 80 Gracechurch Street, London. I am now able to tell you that after much frustration in the process completion of the alterations there is imminent and our chief foreign branch, the London Trustee Department and some other internal departments are to be housed in these premises (to the relief of space at 68 Lombard Street) and in addition we are opening a new branch there.

Amongst several new branches opened during the year it is notable to record that an office is now functioning in St. Helier, Jersey, and a subsidiary company to meet local regulations has been formed for the purpose of carrying on trustee business there.

Before leaving the domestic sphere it is appropriate that I should make reference to the valuable service rendered by the staff and reflected in the annual report. The results are witness to the untiring efforts and constant attention of the chief general manager and his deputy, his colleagues of the general management, the district general management and branch managers and also to the zeal and efficiency of the staff as a whole, for which we offer them our sincere thanks and appreciation.

The past year has been difficult for everyone and not the least for bankers. All the uncertainties of a troubled world, the precarious and unstable foundations of our domestic economy, the financing of stocks at high prices, the difficulty of obtaining risk capital, have added to the perplexities of the problems with which bankers are called upon to deal.

However, beyond trying to profit from the lessons, there is little merit in dwelling on the difficulties in too much detail when one's thoughts and energies should be directed to the future rather than to a post-mortem on the past.

CREDIT TO BE USED TO NATIONAL ADVANTAGE

The government have announced their programme to curb inflation by the restriction of credit and, as an aid to this, by higher interest rates.

Bankers are asked to examine most carefully all applications for fresh loans and the renewal of old ones. The yardstick will be whether the money is required for projects which are essentially and positively related to the rearmament programme, to the stimulation of exports to desirable markets, to the saving of imports, particularly from dollar sources, and to the relief of basic deficiencies, especially of raw materials; if these tests are not passed the banks are asked to be much more restrictive however credit-worthy the applicant may be.

The truth is that credit is in short supply and it is only by using the amount available to the best national advantage that the essential business of the country can be kept running. To achieve this there may have to be some re-orientation of trade, but it is not proposed that there should be disorganisation of trade by the sudden withdrawal of banking facilities: it must be recognised, however, that everyone will have to reduce their credit requirements to the minimum and not embark on unessential expansion.

The home consumption trades will suffer most and no doubt the hire purchase business, which runs from Rolls Royce cars to electric kettles, will be among these. Government-owned industries, like gas and electricity, are among the most prominent promoters of hire purchase and the reaction in these nationalised businesses will be a sound indication of the pressure the Government wish applied.

It is to be hoped that wholehearted support will be forthcoming from every industry and every individual in this strenuous attempt to deal with a situation which might well cripple our whole economy.

MAXIMUM INDIVIDUAL EFFORT NEEDED

Ever rising costs are the nightmare which today haunts everyone. This problem presents itself to each individual in a different way; to the industrialist it is the increasing cost of raw materials and wages making his product too dear; to the widow it is the rising cost of the food and clothing to maintain existence at all; to the nation it is being able to sell abroad our exports to pay for the food and raw materials we must import if employment and the necessities of life are to be available to us.

The one factor common to everyone is just that the £ has ceased to purchase what it formerly did. On this subject so much has been said and written both by the learned and the ignorant that the ordinary man in the street becomes utterly confused and bewildered and he clings to the fixed though mistaken belief that if he is to maintain anything approaching his present standard of living he must have higher wages or a higher margin of profit (whichever applies to his particular case).

The general bewilderment obscures what is surely the fundamental fact, namely, if each and all expect to receive £1 for 10s. worth of work or goods it cannot be long before the £ generally becomes worth only 10s.

So long as this present day attitude continues, the purchasing price of the £ must decline, and the only way to arrest the trend and make the purchasing price of the £ increase is to give something of more value than £1 for the £1 reward which we demand for our individual effort, be it of brain or muscle.

Rearmament, which we all agree is necessary for our very existence, must absorb a large portion of that extra effort, and it is only what we are willing and ready to give over and above the rearmament requisite that is going to make our earnings worth more.

We all pay lip service to the need for higher production, but most of us think that that is a matter for the other man and has little concern with ourselves. Till each and everyone of us is determined and resolute to give the maximum of his or her effort each day and every day, no fall in the cost of living or appreciation in the real value of the £ can possibly take place.

We, in this generation, are having to pay the cost of winning two world wars and trying to prevent a third, and that can only be done by giving in effort something over and above our living requirements. No section of the community can or should expect to be shielded from this.

The choice is quite clear—either to contribute a higher degree of effort or to accept without complaint a lower standard of living.

REARMAMENT'S PRIOR CLAIM ON EARNINGS

Without falsifying reality it is only possible to spend £1 once. This is equally true in the national as in the individual sense. If this is accepted, the question is "How much is there in the national purse and how can it best be spent?"

To use a business simile, the position can be compared with the rights or claims of three types of capital in a big industrial company.

Debenture interest has priority of charge against income and then preference shares and ordinary shares get their rewards in that order. The vast majority of people have come reluctantly to the conclusion that for the safety of our country, our homes, our families and our way of life, rearmament must, like debenture interest, have priority of charge upon the income of our national community; the rewards for the preference shares must go to maintenance and improvement of our present equipment and the provision of new. This only leaves the rewards of the equity, that is, the surplus of income left after meeting all prior claims, to provide for private and public spending; in other words, this surplus is reflected in our standard of living, individually by our private spending in normal living expenses and in those extras such as a television set or a seaside holiday, and collectively through the taxes, paid by the community at large, used either by the local or national authorities on the maintenance of roads, hospitals, education and other social amenities.

Having met the fixed debenture and preference charges, the sum we can spend on the rest depends entirely on what surplus, if any, there is for the ordinary shareholders who are in this allegory the public at large. We all know that this depends on the prosperity of the concern as a whole.

Under careful and wise management with everyone pulling his full weight, with incentives to do so, there should be good dividends for the ordinary shareholder but, given extravagant, inefficient management at the top and slack disinterested workmanship below there can be little or nothing for the holder of the ordinary shares except, perhaps, during a short-lived international sellers' market.

SOCIAL SECURITY AND WELFARE STATE MUST BE WORKED FOR

Social security and the welfare state which depend on the dividends from the ordinary shares are, therefore, not things that like manna drop from heaven, but have to be worked for here on earth.

Unless this is fully appreciated, the whole idea of social security is false and misleading and tends to an unreal sense of well-being which breeds indolence and lack of any sense of drive and sustained effort.

Would we not be wiser to build up our collective security on a foundation of individual security?

Each one of us, by striving to become a master of his profession, craft or trade, by refusing to be content with the second rate or shoddy, be it at the desk, the bench or in the field, would recapture a sense of individual self-reliance and a pride and happiness in our diversified occupations. With encouragement and reward for good honest work, sloth and dodging the column would disappear.

It could be argued that this was all very well for the able-minded and able-bodied and that the weak, aged and feeble would be driven to the wall. In these enlightened days no one is, or should be, allowed to fall below a reasonable standard; society from the top to the bottom would revolt against any individual or section of the community living, by no fault of their own, below decent standards of life.

Given that surge forward in effort, that striving and pride in doing a job well, the dividends for what in my simile I have called the ordinary shareholders would rise to such heights as to provide comfort for the old and sick and added incentive to the adventurous, hard-working and self-reliant.

PROFICIENCY BONUSES AS INCENTIVES

Everyone agrees consciously or unconsciously that incentives are good; even the most hard-boiled trade unionist of the old school concurs or, if he has any doubts, his wife certainly hasn't.

From infancy we have been brought up on incentives and rewards; the small child is offered a sweet; the school child is offered a prize; in sport it is universal. In fact, after centuries of trial and error, it emerges as the logical and best method of urging humans to give of their best.

There are many ways of offering incentives, the difficulty is in selecting the best.

At first sight, profit-sharing seems the easiest and fairest way, but this may defeat its own object.

First of all, it presumes that there are profits to share but, supposing there are when the scheme is inaugurated and that they continue for a number of years, then the happy recipients in the first year or so accept the bonus as something over and above the standard wage but, very soon, it is regarded as a regular part of their remuneration and is absorbed into a revised standard of living, be it a larger house, a better school for the children, or any of the things we all hope and strive for.

Sooner or later the cycle of trade results in lower profits, or in no profits at all. If there is a loss, those who participated in the profits are economically unable to share in the loss. However, if the bonus disappears, or is even diminished, then unless it has been regarded entirely as savings, which is rare, financial hardship at once confronts the family and the feeling of encouragement that the scheme first produced is turned into one of frustration and insolvency.

To avoid this, bonuses could be invested in the individual names of employees in some form of Government stock, or in the business itself, in such a way that they could not be cashed for current expenditure but the interest paid half-yearly to the holder. This has the disadvantage that a £1 a week bonus becomes an uncashable saving of £52 per annum, with an interest payment of only £2 to £3 a year before deduction of tax. Human nature being what it is nearly all the incentive would disappear. Is there any other method that avoids these two disadvantages and is direct and sufficiently immediate?

With the co-operation of the trade unions who, in general, accept the principle of incentives in piece-work and differentials, a comparatively simple scheme of proficiency bonuses could be given individually and, among the clerical staffs the inducement to give a full best could be with the emphasis on proficiency rather than on a graded basis of age or years of service.

These bonuses, though smaller than profit sharing in boom times, would be permanent so long as they were merited by the efficiency of the individuals concerned and would be divorced from trade cycles and other matters beyond the employees' control.

I believe some such scheme, which would differ from business to business, would meet the aspirations of those who wished to better their circumstances by their own endeavours—that, surely, is the essence of incentives.

BANQUE BELGE D'AFRIQUE

INCREASE OF CAPITAL

At an extraordinary general meeting of shareholders held on December 28, 1951, it was decided to increase the capital from 72 to 144 million Congolese francs, by the issue of 72,000 new shares with a nominal value of 1,000 Congolese francs each, of the same type as the existing shares and conferring the same rights and privileges as from January 1, 1952, except that they will bear no dividend in respect of the financial year 1951.

These new shares have been taken up by the Banque de Bruxelles at the price of 1,500 francs per share, fully paid, that Bank undertaking to re-transfer the new shares, at the same price plus the costs of issue, giving preference to holders of the old shares.

Subject to any unforeseen occurrence, the issue to the public of the new shares will take place during February, 1952.

During the meeting, M. Lehembre, a director and vice-chairman of the Management Committee, acting on behalf of M. Max-Leo Gérard, the chairman, who had been delayed abroad for a few days, stated that the results for the financial year just ending were far better than those for preceding years. He added that the increase in th Bank's business had affected all branches of its activities, both in the Belgian Congo and in French Equatorial Africa.

BASS, RATCLIFF AND GRETTON, LIMITED

RESULTS OF A DIFFICULT YEAR

The sixty-fifth annual general meeting of the ordinary stockholders of Bass, Ratcliff and Gretton, Limited, was held on the 7th January, at the registered offices of the company, High Street, Burton-on-Trent.

The chairman, Mr Arthur Manners, presided and was supported by the following members of the board: Mr C. A. Ball (deputy chairman), the Right Hon. Lord Gretton, O.B.E., Mr A. G. Manners, Mr W. P. Manners, Mr P. D. Manners, Mr F. F. Toone, and Mr W. R. Soper, with Mr I. D. Pugh (secretary), and Mr I. M. Taylor, representing Messrs Whinney, Smith and Whinney (auditors).

The secretary read the notice convening the meeting, and the auditors' report.

The chairman said:—

Gentlemen,—We are submitting for your approval the sixty-fifth annual balance sheet and accounts, which, as in the past, you will no doubt agree to take as read.

The report of the directors, which is before you, deals fully with the assets of the company, and its activities during the past year.

It has been a difficult year, and it is with regret that your board considered it advisable to reduce the distribution on the ordinary stock, the reasons for which are explained in the directors' report.

During the year we have appointed to the board, Mr F. F. Toone and Mr W. R. Soper, who have been in the service of the group for over 40 and 43 years respectively. We feel that their experience and knowledge of the company's business justifies such appointments, and we hope it will be an incentive to the ambitions of other executives.

I would like to express on your behalf and on behalf of my colleagues our appreciation and thanks to all those employees of the group who, in their various occupations, have continued to render loyal, faithful and efficient service.

I now beg to move that the report of the directors and the balance sheet for the year ended September 30th last be adopted; that the half-yearly dividends paid on December 31, 1950, and June 30th last on the 5 per cent. preference stock of the company, and the interim dividend of 5 per cent. on the ordinary stock paid on June 23rd last, be approved; and that a final dividend be and is hereby declared of 15 per cent. and a bonus of 2½ per cent. on the ordinary stock, making with the interim dividend of 5 per cent. paid on June 23rd last a total dividend of 22½ per cent. for the year, all free of tax, such final dividend and bonus to be payable on or after January 17, 1952.

Mr C. A. Ball seconded the resolution, which was carried unanimously.

Mr F. F. Toone and Mr W. R. Soper, elected directors during the year, were re-elected—Mr F. F. Toone on the motion of Mr S. C. Robotham, seconded by Mr E. C. Walters; Mr W. R. Soper on the proposition of Mr R. I. Tooby, seconded by Mr F. Hanson.

The retiring directors were re-elected—The Right Hon. Lord Gretton, O.B.E., on the proposition of Mr M. F. R. Moreton, seconded by Mr S. C. Robotham; Mr A. G. Manners on the motion of Mr E. C. Walters, seconded by Mr R. I. Tooby.

The remuneration of the auditors, Messrs Whinney, Smith and Whinney was voted on the proposal of Mr F. Hanson, seconded by Mr M. F. R. Moreton.

JOSHUA HOYLE AND SONS

The annual meeting of Joshua Hoyle and Sons, Limited, was held on January 10th at Bacup, Mr H. A. Enright, chairman and managing director, presiding.

The following are extracts from his circulated statement:—

New high levels of turnover and profit have been achieved during the year under review. Our export trade was further extended and our home trade maintained. With conditions both at home and abroad so uncertain, it would be difficult to attempt to forecast the trend of trade for the next year. An encouraging factor is that our products are put to a diversity of uses and are sold in a wide range of markets.

The trading profits of the group, including investment income, amount to £2,245,428. To this is added £70,000 from the provision for deferred repairs. This has been appropriated as follows:—

	£	Percentage of total profits
Taxation	1,166,506	50.39
Dividends—net	206,112	8.89
Retained profits	942,810	40.72
	£2,315,428	100.00

The above appropriation for taxation out of current earnings brings our total reserves and provisions on profits to date to a figure in excess of £2 million, which is some indication of the burden of taxation, at a time when we are employing so much of our resources in re-equipment and modernisation.

Considerable sums have been expended during the year on new machinery and on the maintenance of our existing plant at a high degree of efficiency.

The total capital employed by the group based on the depreciated value of fixed assets is now £6,438,635.

The report was adopted.

LONDON AND RHODESIAN MINING AND LAND

The annual general meeting of London and Rhodesian Mining and Land Company, Limited, was held on January 9th in London.

Sir Joseph Ball, K.B.E. (the chairman), who presided, in the course of his speech, said: The strengthening of the balance sheet has been carried a stage further during the year under review, by the transfer of a further £15,000 to general reserve. This transfer increases the general reserve to £100,000.

Despite necessary and unavoidable increases of expenditure in many directions, the board have nevertheless found it possible to maintain the dividend at the increased rate of 6 per cent. paid last year.

It falls to me to add some information recently to hand respecting the Pickstone Mine—information which I hope and believe stockholders will regard as satisfactory.

As you know, the development of this mine was undertaken by London and Rhodesian on behalf of a syndicate. For some time past developments have been of a satisfactory nature.

Pickstone is situated within 17 miles of the very successful Cam and Motor mine, which is already equipped with a plant of a capacity amply sufficient to take the Pickstone production in its stride. It seemed obvious that by far the best course from the point of view of the syndicate was to offer the Pickstone Mine to Cam and Motor.

Cam has requested, and has been granted, an option to purchase the Pickstone Mine for the sum of £200,000 cash, exercisable on or before the 31st of this month, and I have very little doubt that the option will be exercised.

The report was adopted.

HOULDER LINE, LIMITED

INCREASED PROFITS

The annual general meeting of Houlder Line, Limited, will be held on January 28th, in London.

The following is an extract from the statement by the chairman, Mr Walter C. Warwick, circulated with the report and accounts:—

Shareholders will be gratified to note the increase in profits, but I should mention that the trading profit of £756,799 is before providing £196,196 for fleet depreciation and the provision for taxation, which requires no less than £545,000, as against the comparatively modest sum of £126,000 a year ago. The increased liability is, of course, partially due to increased profits, but also largely owing to the fact that on this occasion we have no considerable credit for initial allowances which proved a substantial, though temporary, help last year. The other items on the profit and loss account call for no explanation or comment, and, with the distribution of our customary dividend of 7½ per cent., less tax, the carry forward is increased by some £3,982 to £56,627.

The dividend distribution of this company has remained stable at the modest level of 7½ per cent. for the past 20 years, but the actual benefit to individual recipients has diminished each year by reason of the incidence of taxation, which is now so serious a problem for us all.

The increase of trading profits of the company, I think, entitles the shareholders to some increased return, and your directors felt, and I feel sure shareholders will readily agree, the most acceptable form of increased participation is by way of a special return out of capital profits of 5 per cent., which will absorb £27,500 and leave us with a balance on realisation account of £65,372.

FIRST GARDEN CITY, LIMITED

SIR ERIC MACFADYEN'S ADDRESS

At the forty-eighth annual general meeting of First Garden City, Limited, held on January 10th in London, Sir Eric Macfadyen, chairman, said:—

Fixed assets stand at £777,416. Cash and current assets exceed liabilities by £167,778 and the net book value of all assets is £945,794.

To account for these assets we have £400,000 of preference and ordinary capital in issue together with the balances of various reserves, etc., amounting to £545,194. These balances have been built up out of surpluses in previous years "ploughed back" into the business. The total stockholders' funds are thus over double the issued capital which ranks for dividend and our traditional 5 per cent. represents a return to them of only 2.12 per cent. on their investments: a rate below that at which our friends of the Urban Council can borrow from the Public Works Loan Board (our own dividend is paid less income-tax).

The profit from our various activities was £35,952 (against £34,616 the previous year), and interest on loans and investments and sundry receipts add up to £5,003; a gross figure of £40,955. Then the Inland Revenue comes along and takes no less than £22,200 (income tax £11,500 and profits tax £10,700). We recommend the usual dividend, calling for £6,563, and transfers of £1,000 only this year to general reserve and of £500 to the common good fund (a token of goodwill merely compared with last year's £2,500). We shall then carry forward £8,653.

The report was adopted.

CHARTERHOUSE INVESTMENT TRUST

IMPORTANT LANDMARK IN GROUP'S HISTORY

The twenty-seventh annual general meeting of the Charterhouse Investment Trust, Limited, will be held on January 30th in London.

The following is an extract from the review circulated with the accounts by the chairman, Mr H. Nutcombe Hume, C.B.E., M.C.

The board is very glad to be able to present a satisfactory account of last year's trading of the Charterhouse Group. For the first time in the Trust's history its overheads and the interest and dividends it pays to its stockholders are covered by its own investment income and the dividend from Charterhouse Industrial Development Company, Limited. In other words we have reached the time to which we looked forward, when the Trust's ordinary dividend at the current rate of 8 per cent. is earned independently of profits made by the Finance Corporation. The margin is small and I cannot assure you that this goal has been permanently reached, but to those of us who manage the Group's affairs this is an important landmark in our history. Our job now is to go on strengthening the finances until we can safely advance our dividend and reward the holders of Ordinary Stock for their confidence in us.

Now at last we have a Government which believes in the capitalistic system which has done so much for Great Britain and the Empire for 150 years, and we can only hope that they will be able during their term of office to carry into effect those major and perhaps painful and unpopular readjustments vital to the maintenance of our standard of living.

CITY'S IMPORTANT ROLE

The City has a great part to play and I welcome the steps already taken to bring the machinery of the money market back into use. The accumulated experience of the City is far greater than that of any Government or planning department and is in the hands of men of practical as opposed to theoretical experience. The effect will be that inefficiency will suffer instead of being bolstered up and that skill and integrity will be rewarded; by this process the productive raw materials and the factories of this country will gradually be used to greater advantage. It is very unfortunate that there persists such ignorance of the services the City renders to the whole economic life of the country. The Stock Exchange, and the New Issue and Commodity Markets all make a vital contribution to the well-being of this country and the Commonwealth.

The strongest plea the City makes to the Government of the day is to remove uncertainty so far as lies within its power. The intended application of the vaguely threatened Excess Profits Tax is completely damming the flow of equity or risk-bearing capital into industry. It looks as if industry will be driven to seek its capital largely through the medium of fixed interest-bearing capital, and I am convinced that in the long run this will prove to be wrong, but who is going to risk what is left of his diminishing capital in taking a chance on the present "heads you win, tails I lose" basis of taxation?

Last year our investment income together with the dividend from the Industrial Development Company covered the outgoings and all interest and dividends on the Trust's capital. I think it reasonable to suggest that this will be the case again this year.

CHAMPION REEF GOLD MINES OF INDIA

RECORD OPERATING RESULTS

The annual general meeting of the Champion Reef Gold Mines of India, Limited, was held on December 28th at Oorgaum, Mysore State, South India.

Mr Arthur H. E. Taylor (vice-chairman) presided, and, in the course of his speech, said: The sale of the assets in Mysore to the Champion Reef Gold Mines of India (KGF) Limited, the new operating company which was incorporated in this State, took effect from April 1, 1951. The accounting period which normally ends on December 31st was extended to March 31, 1951, to cover a 15-month period.

The gold and silver sale proceeds at £1,840,605 represent an all-time high record. The same remarks unfortunately apply to the total costs. While these record figures to some extent reflect the higher output of ounces which proportionately is the highest since 1943, they are to a large extent a measure of the inflationary trend of today. It is with regret that I have to report that the tendency for costs to rise continues without any sign of abatement, while the price of gold has during the last few months shown some signs of falling.

The Colombo plan and the draft report of the Planning Commission which recognised the hard realities of Indian economic problems, are favourable indications that better times may be in sight.

As to the future of your company, so far as the mine is concerned developments continue to be satisfactory and output is likely to be maintained.

The report was adopted.

NUNDYDROOG MINES

SATISFACTORY DEVELOPMENTS

The annual general meeting of the Nundydroog Mines, Limited, was held on December 27th at Oorgaum, Mysore State, South India.

Mr Arthur H. E. Taylor (vice-chairman) presided, and in the course of his speech, said: The arrangements for the sale of the assets and undertaking in Mysore to Nundydroog Mines (KGF), Limited, were completed in March. During the fifteen-month period, 218,556 tons of ore were milled, resulting in the production of 56,915 ounces of gold, while 1,447 ounces were obtained from the treatment of old tailings. This satisfactory tonnage was obtained in spite of stoppages due to power cuts, and largely by reason of the excellent tonnages obtained from development.

The regrettable outbreaks of fire which have occurred in the mine since the close of the period under review has cast a shadow over this year's working. Fortunately, however, development results have been so satisfactory as to permit the loss due to the fires to be met, with the result that it can be anticipated that some small distribution by way of dividend will be paid to this company by the Rupee Operating Company, which will enable a small dividend to be paid to this company's shareholders.

The very considerable increase in the ore reserves at March 31, 1951, is evidence of the remarkably satisfactory results of developments on the Western Reefs. If there should be no substantial change in the price of gold or working conditions, we should be reasonably assured of profitable working over a number of years, on a scale which is likely to increase annually.

The report was adopted.

MYSORE GOLD MINING

The annual general meeting of the Mysore Gold Mining Company, Limited, was held on December 27th at Oorgaum, Mysore State, South India.

Mr Arthur H. E. Taylor, vice-chairman, presided, and, in the course of his speech, said: The arrangements for the sale of the assets and undertaking of this company in Mysore to the Mysore Gold Mining Company (KGF), Limited, was completed in March last. The accounting period, which normally ends on December 31st, was extended by three months to March 31, 1951, to cover a fifteen-month period.

The milled tonnage of 201,780 resulting in the production of 65,153 ounces of gold compares favourably with the previous year, after allowing for the longer period. The total gold proceeds amounted to £1,478,064, to which was added £1,493 in respect of the sale of silver. Since the introduction of the Indian Income Tax Act to the Mysore State, income tax is payable in advance. As a result of this, almost two years' tax will become payable in one year. For this reason, it is regretted that it has not been possible to make a distribution to the stockholders out of the profits earned during the 15 months to March 31, 1951.

If it had not been for the serious fire which broke out in the mine on November 7, 1950, which interrupted mining operations until January 16, 1951, also the serious power cuts which occurred in April and May, 1950, the results of the company's operations during the period under review would have been very satisfactory. The mine continues to prove that, given normal conditions, it has many years ahead during which profitable mining operations can be continued.

The report was adopted.

THE OOREGUM GOLD MINING COMPANY OF INDIA

The annual general meeting of the Ooregum Gold Mining Company of India, Limited, was held on December 28th at Oorgaum, Mysore State, South India.

Mr Arthur H. E. Taylor (vice-chairman) presided, and, in the course of his speech, said: The completion of the arrangements for the sale of the assets and undertaking of the company in Mysore to the Ooregum Gold Mining Company of India (KGF) Limited took place in March last. The accounting period was extended by three months beyond the normal 12 months' period to March 31, 1951. The tonnage milled was 117,349 resulting in the production of 32,527 ounces of gold compared with 65,209 tons and 21,734 ounces for the year ended December 31, 1949. There was a total net credit to the revenue account of £735,942.

Once again, serious setbacks have been encountered which have restricted operations in the mine and it was not until March, 1950, that production even on a limited scale could be resumed after the fire of the previous year, and the work of repairing the damaged lining and equipment of auxiliary shaft could be restarted. In the result there was unfortunately no balance of disposable profit from which to make a distribution to the share and stock holders.

Every effort is being made to find the means whereby a balance of distributable profit may be obtained from the company's operations, and it is to be hoped that the indications of substantial improvements in development in depth will materialise.

The report was adopted.

KOLOK MANUFACTURING COMPANY

SALES, OUTPUT AND NET PROFIT AN ALL-TIME RECORD

MR E. S. DUMONT'S REVIEW

The forty-third annual general meeting of the Kolok Manufacturing Company, Limited (manufacturers of Carbon Papers and Typewriter Ribbons), was held on January 4th at Rochester Works, Tariff Road, Tottenham, London, N., Mr E. S Dumont, the chairman and managing director of the company, presiding.

The following is his statement, circulated with the report and accounts for the year ended August 31, 1951:—

Ladies and gentlemen,—I am very pleased to report that the sales, output and net profit are an all-time record. The net profit of the company is £129,700, as compared with £84,162 for the preceding year, and of the group £156,784, as compared with £92,717.

While this result is extremely satisfactory and to some extent reflects the benefit derived from the additional plant and machinery installed during recent years and also the excellent progress made by our subsidiaries, in particular our latest acquisition, I think it necessary to mention that it must be looked upon as exceptional, bearing in mind that the demand for our products has been abnormal and, further, we have not yet felt the full effect of the increases in costs generally. As a measure of precaution, your directors recommend an appropriation of £25,000 to meet contingencies.

The factory extension, to which I made reference last year, is proceeding satisfactorily with little disturbance to the output, and should be completed in the course of the next two to three months. You will observe that the group value of the stock in trade now stands at £231,507, as compared with £161,483 for the preceding year. Relative to the volume of business, this is satisfactory and to some extent is due to the considerable increase in the cost of raw materials.

IMPROVED FINANCIAL STRENGTH

The financial strength of the group has been much improved, as shown by the consolidated balance sheet, in which current assets, less current liabilities, stand at £279,994, as compared with £233,114 for the preceding year.

As part of the scheme for the reorganisation of capital, the dividends which would normally have been recommended at this meeting were paid immediately prior to the reorganisation, making the total distribution for the year exactly the same as for the preceding year and, accordingly, and as already announced, no further dividend is being recommended for the year under review.

Finally, I take the opportunity of expressing my thanks and appreciation to all our executives, staff and employees for excellent services rendered during a difficult year, and to the members of the board for their valued help and co-operation.

The report and accounts were adopted.

ASSOCIATED BRITISH MALTSTERS

PROBLEMS CREATED BY COMBINE HARVESTER

ADEQUATE GRAIN STORAGE ESSENTIAL

The thirtieth annual general meeting of Associated British Maltsters Limited, will be held on January 28th in London.

The following are extracts from the statement by the chairman, Mr H. Nutcombe Hume, C.B.E., M.C., circulated with the report for the year ended August 31, 1951:

Last year's trading resulted in a sharp drop in profits. Brewers were anxious to cover requirements as soon as possible after the 1950 harvest before maltsters could fully assess the volume of malting barley available, and owing to the short supply there was a steady rise in price throughout the season. There was also a rise in production costs of all kinds. Prices for 1951 season's barley opened and have remained much over the 1950 level. We are in all the circumstances very pleased to be able to recommend our usual dividend of 10 per cent. on the enlarged ordinary capital, to place £100,000 to contingencies reserve and to carry forward £67,630 against £71,891 brought in.

The harvest of 1951, gathered in appalling weather, was one of the most difficult since 1912 when it was not finished until Christmas. That might have happened this year but for the combine harvester which literally poured very wet grain on to the market in August and September at prices which have severely strained the Malting Industry's finances.

The greatly enhanced prices for every grade of barley is only a part of the tremendous problem with which the malting industry is confronted. The factors which seem to have brought about the present situation are:

1. Shortage of foreign exchange and high prices which have made it difficult for this country to import adequate supplies of animal feeding stuffs. This has made it worthwhile for British farmers to use the barley they grow for animal food unless they can sell it at a price exceeding 160s. per quarter (448 lb.). Malting barley prices, therefore, now start at some price above that figure and may advance up to, say, 200s. to 210s. per quarter.

2. The annually increasing use by British farmers of the combine harvester. It is vitally important that farmers, brewers, maltsters and corn merchants should come to an agreement without delay as to who should provide the necessary storage, drying equipment and finance to handle the vast flow of grain from the combine harvester with as little waste as possible and so that it does not deteriorate before it is dealt with.

The maltster must buy and take delivery at harvest time of as much barley as his premises can possibly dry and store and in the mutual interest of both maltsters and brewers most of the latter are good enough to tell the maltsters from whom they buy the extent of their year's requirements of malt in advance. It is to be hoped that all brewers will realise the advantage of adopting this practice.

Amongst the many problems brought by the combine harvester, the difficulties associated with moisture have been emphasised this year as a result of the bad weather throughout harvest time. Fortunately your company has done a great deal to meet this problem and continues to do so.

Three years ago I ventured to point out the risks attendant upon the introduction of the combine harvester without providing the corresponding storage and drying facilities. The fact that we have built a great deal of storage capacity in many parts of the country despite the lack of financial incentive may be claimed as a material factor in saving so much of the 1951 barley crop.

So far this year our sales are slightly ahead of last year in volume and substantially ahead in value. Capital expenditure of nearly £400,000 in addition to the heavy costs of repairs and maintenance must dictate a continued conservative financial policy. The future prosperity of your company is dependent upon our having modern equipment under able and progressive management; even so we cannot expect to do more than maintain a reasonable profit-earning capacity when the element of inflation is removed from industrial profits.

RHODESIA-KATANGA COMPANY LIMITED

An extraordinary general meeting of Rhodesia-Katanga Company Limited was held on January 9, 1952, at 20 Aldermanbury, E.C.2, the managing director, Mr G. C. Hutchinson, presiding in the absence overseas of the chairman, Sir Ulick Alexander, at which it was unanimously resolved that the provisional agreement entered into by the company with the Anglo-American Corporation of South Africa Limited and others, particulars whereof are set out in the company's circular to the members dated December 19, 1951, be approved and ratified, and that the directors be authorised to carry such agreement into effect with such modifications thereto as they may think fit and to make such provision as they think proper for any matters not expressly dealt with by the said agreement.

Mr Hutchinson, in his address to the meeting, pointed out that the agreement recommended to the shareholders for ratification provided that an option over the Kansanshi Mine and the surrounding farm area would be granted for a period of four years to December 31, 1955, to a new company formed to undertake further exploration of the mine. If the option were exercised, the Rhodesia-Katanga Company Limited would receive £250,000 in cash and a 32 per cent. interest in the new company free of cost.

The arrangement now made with the Anglo-American Corporation of South Africa Limited and its associates, appeared to be very strongly in the company's interests, and ensured that the mine would receive the highest technical direction and financial assistance.

NOTICES

"THE ECONOMIST" INTELLIGENCE UNIT requires senior staff and assistants for research work. Senior staff starting salary according to qualifications. Assistants: age 20-24; starting salary in range £375—£450 per annum.—Please send full particulars of qualifications and experience to "Research," 22, Ryder Street, St. James's, S.W.1.

BRANDY SNAPS—but not J.V.R. 3 Star Brandy. It's smooth. 37s. 6d. per bottle, 19s. 3d. per half-bottle.

TRANSLATIONS from and into French (Technical and Commercial). Julian Jacobs, B.Sc., and Germaine Courtiau, New House, Worminghall, Aylesbury, Bucks. Tel.: Ickford 227.

UNIVERSITY OF QUEENSLAND, AUSTRALIA

Applications are invited for the position of *Senior Lecturer in Economics*.

Salary range £A1,191—£A1,391 p.a. (including cost of living allowance).

Further particulars and information as to the method of application may be obtained from The Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is February 23, 1952.

UNIVERSITY GRADUATE (Woman), extensive research background, seeks position in Market Research and/or Statistical Department.—Box 811.

UNIVERSITY OF NOTTINGHAM

DEPARTMENT OF AGRICULTURAL ECONOMICS

Immediate applications are invited for appointment as Head of the Department and Provincial Agricultural Economist. The appointment will be made in the grade of Reader, salary £1,300—£1,600 per annum, or in that of Lecturer, £1,100—£1,500, according to the qualifications and experience of the candidate appointed.

Candidates should be graduates in Agricultural Economics or Economics with some experience of problems relating to Agriculture.

Form of application and conditions of appointment may be obtained from the undersigned.

H. PICKBOURNE,
Registrar.

DARTFORD COLLEGE OF PHYSICAL EDUCATION
DARTFORD, KENT

Applications are invited for the post of part-time Lecturer (Woman) for the Social Studies Course comprising Social Economics, Principles and Machinery of Government, and Social Administration, which will become vacant in May, 1952. Applicants should be experienced Social Workers with university qualifications.

Further particulars can be obtained from the Principal, to whom applications (no form) should be sent as soon as possible.

THE Timber Development Association invites applications for the appointment of Regional Officer for South-Eastern England. The appointment will be subject to the provisions of the Association's Superannuation Scheme.

Applicants should have had experience in office administration, committee procedure, public speaking and lecturing. A knowledge of timber and the timber trade and the possession of a car are desirable.

The candidate appointed will be responsible for the control of the Association's South-Eastern Regional Office, the exact situation of which, outside London, is to be decided. He will be required to reside within reasonable distance of the office.

The Region is bounded by the counties of Oxfordshire, Bucks, Herts and part of Essex in the north and Berks, Hants and Dorset in the west.

Duties will include establishing and maintaining relations with Members of the Association, local authorities and the timber using industries, and the extension of the services available from Headquarters in London.

Salary scale £600-£850 per annum; starting salary according to age, qualifications and experience.

Applications, addressed to the Director, should be forwarded to the Association at 21, College Hill, London, E.C.4, not later than January 26, 1952.

CITY MERCHANTS (staff 25) require Manager/Personal Assistant to Managing Director, with following qualifications: Fluent French, German, knowledge credits, banking, finance, import-export procedure, and preferably connections and experience either produce markets or steel export, and able take entire charge for considerable periods. Good salary and prospects.—Box 831.

IMPORTANT organisation handling Colonial Primary Produce requires Senior Executive aged 30 to 40. Position calls for a man of good education and proved ability preferably in commodity markets. Suitable salary for right man and participation in pension scheme.—Write full particulars to Box 8726, c/o Whites' Ltd., 72/78 Fleet Street, E.C.4.

EVANS MEDICAL SUPPLIES, LTD. have vacancies overseas for positions with both parent and subsidiary companies; chemical, pharmaceutical or other scientific background essential; prospects of rapid advancement to senior administrative posts.—Apply giving full particulars of age, education and career to date, to Overseas Trade Director, Speke, Liverpool, 19.

GIRL student (21), Final B.Sc. (Econ.), seeks position. Statistics preferred. French, German.—Box 833.

BLOCK DISCOUNTING FACILITIES are required by a Hire Purchase Finance Company for an additional £17,000 worth of business per month in minimum units of £1,000 per month. Blocks of individual Agreements and Promissory Notes are lodged and repayment is by monthly Bills of Exchange secured by a collateral guarantee from a well-known firm of retailers. Attractive terms. Of particular interest to institutional investors or companies with large liquid resources. Particulars from the Company's Accountants.—Box 834.

B.Sc. (Econ.), 28, seeks post; considerable experience collecting and analysing data, drafting reports, articles, etc.; sound knowledge of statistics.—Box 843.

The Economists' Bookshop Ltd.

caters for specialists and students in

Economics and the Political and Social Sciences

THE HISTORY OF ZINC

The Ancient Greeks knew ZINC

Bracelets, rings and other forms of personal adornment containing zinc were made and worn by early Grecians

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last thirty years a great zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal, include the production of sulphuric acid, zinc pigments, fluorine and fluorine compounds, and ancillary products.

Eden and Vyshinsky

MR EDEN may not yet have changed very much in the substance of British foreign policy; but he has clearly brought to an end the period of inarticulateness in expounding it. Indeed, it is only by observing how much effect can be produced by a single good speech, saying the right things in the right place, such as the speech he made in New York on Friday of last week, that one can fully realise the harm that was done by the long period when no one would speak clearly for His Majesty's Government.

Mr Eden's speech touched on a number of topics, some of them quite specifically addressed to his American audience. But it was what he had to say on the most important issue of the day that excites most interest. That issue, of course, is how the world is to get out of the mess it is in. The more it seems likely that the resolution and the rearmament of the free nations in the last eighteen months have staved off the threat of another world war, the more clear it becomes that the strains of this same period cannot be allowed to continue indefinitely. It is not surprising that men's minds turn to the search for a quick way out. Some seek it along General MacArthur's road of making war to end war. Others seek it along the road that Mr Churchill has more than once indicated (though it would be surprising if his thinking about it were as simple-minded as that of some of his followers): the road of a comprehensive conference with the Russians "at the highest level"—in short, another Teheran-style conference.

Mr Eden made it clear in his speech last week—and not for the first time—that he is not of either of these schools. He counsels realism and patience. He sees peace being, not created wholly from the top, but built up gradually, "agreement by agreement," from the basis. His programme was specific:

> There is reason to hope that it will eventually be possible to establish gradually, agreement by agreement, a basis for existence free from the constant fear of war. This may well be something less than true peace and understanding—for Soviet methods and doctrine offer little prospect of that—but it would be far better than the present atmosphere in which we live. We might then advance through a period of lessening tension. During this phase the West would continue firmly and patiently to restore *equilibrium* of force; seek to conclude local and limited settlements of outstanding issues; avoid provocation; and work towards a general agreement to live and let live, based on mutually recognised positions of strength. Thus the world might move forward towards stability and settled relations.

The obvious objection to this "step by step" doctrine is that it looks like taking so long—even, that is, if it is possible to be sure that the steps taken are not one forward and two back, as for example if a truce in Korea were followed by renewed Communist aggressions in Indo-China and Malaya or Burma. Experience shows, it can be argued, that very little progress can be made with the Communist men on the spot unless Stalin himself has first been induced to make one of his celebrated pacifying interventions—which is tantamount

to saying that "local and limited settlements" can seldom be achieved unless the atmosphere at the highest levels is propitious.

But experience can also be quoted to show that no reliance can be placed on Stalin's smiles; they never last very long. Moreover any agreement reached on the highest level must necessarily be couched in generalities, and after the memory of Stalin's co-operative geniality has faded, the words in the document turn out to mean whatever the Kremlin wishes them to mean. Yalta is the classical example of substantial western concessions sincerely offered at the highest level in return for fine phrases that signified nothing. This time, it will be said, the high-level conference would not be called with the object of offering concessions but, as the Americans say, of "laying it on the line." That might come very close to being an ultimatum, and there is no reason to suppose that the Russians have any less stubborn, and even desperate, patriotism in the face of ultimata as any other people. On the record, the high-level approach has not had any outstanding successes to its credit, whereas there are one or two limited local settlements that have been successfully negotiated and thereafter observed; Berlin provides the chief example.

*

As if by express design to provide an object lesson in the difference between the "high-level" and the "step by step" approaches to peace, Mr Vyshinsky, speaking on the day after Mr Eden, offered what might be meant to be an olive branch on the subject of atomic disarmament. He stated that Soviet Russia was now prepared to accept the principle of a "continuing," and not merely "periodic" inspection of atomic production as part of a scheme of international control. Furthermore, he now agreed that the total prohibition of atomic weapons should come into force only at the same time as international control and inspection, not in advance as has been the Soviet contention up to now. It is true that these concessions were coupled with several other points which are totally unacceptable, such as the abandonment of the North Atlantic Treaty, and that the whole was wrapped up in the usual bitterly vituperative speech. It it also true that the explicit condition remains that the international inspection "shall not be entitled to interfere in the domestic affairs of states," which might cover almost anything. Nevertheless, on the face of them, the two concessions are of real substance; they appear to loosen, if not wholly to remove, the major obstacles to agreement on international control of atomic energy, which is in its turn the key to a general disarmament convention.

What, then, should be the western governments' reaction? The "step by step" school will be tempted to say that the Russian olive branch should be treated seriously, whatever suspicions there may be of the motives behind it, that it should be examined with all care, but also with all sincerity, lest perchance there should be in it the germ of a real agreement. But the other school will be tempted to ask what is the use of wasting time, hope and energy on a proposal which would not have been put forward by the Russians unless they thought it was to their advantage, which must be to the West's disadvantage. Until there is convincing evidence of a change of heart at the top, Russians bearing concessions are best treated like Greeks bearing gifts.

It is, indeed, very difficult to believe that agreement could ever be reached on the specific subject of atomic control in the present atmosphere of deep suspicion and open hostility. The American offer to agree to international control of atomic production, including their own, was made as long ago as 1946. It was, even then, an almost unprecedented sacrifice, since it would have involved the abandonment by the Americans of a master weapon of which they then had a complete monopoly. Much has changed since 1946. American policy was then still based on Roosevelt's conviction that the Russians might be awkward but were not hostile; the "enemy," in whose favour the American atomic monopoly was to be surrendered, was still the vague impersonal hypothetical enemy of the undefined future. Moreover, atomic weapons themselves are changing their character; the emphasis is now on atomic artillery, which would by definition be almost entirely defensive in its action, since its major effect would be to prevent an opposing army from advancing. The possession of atomic shells of this kind by the United States does not, to any significant extent, increase the aggressive potential of the United States; but it does improve the possibility of stopping a Russian advance by land in Europe. Conversely, the banning of such weapons would seriously weaken a defender and confer an advantage on any potential aggressor whose main strength lies in a large land army. Indeed, as these atomic developments proceed, it becomes more and more difficult to single out atomic weapons as being something peculiar in their horror and aggressiveness. One must not pursue the argument to the point of wishing that the Americans would withdraw the Baruch plan, in which their offer is embodied—indeed, the Baruch plan is to be the basis of discussion of the new Disarmament Commission of the United Nations. But if the Americans were now to insist that they would surrender their great atomic lead not as the first but as the last step in general disarmament, and only after proofs were forthcoming of a genuine desire for peace and reconciliation in the Kremlin, it would be hard to criticise them.

*

Where, then, does this leave the matter? Surely not in the sterile position that no Russian proposal must be taken seriously unless it covers every problem in the world and is offered by Stalin in person. There is seldom any harm in talking, at any length—preferably in private—and there is always the possibility of good resulting. Now that the West's rearmament effort is so firmly based, a willingness to discuss and examine proposals is not a sign of weakness. But the Russians will have to understand, if or when they seriously want to build a bridge to the West, that they will have to do something more than yield a point or two with a snarl; they will have to provide the most convincing evidence of good faith that they can contrive. The Vyshinsky method will not work.

The difference between the "high level" and the "step by step" schools is therefore not so large after all. It is the difference between a condition and a method. Willingness on both sides to compromise rather than to fight is the essential pre-condition, and proof of it may have to be sought at the highest level. But even if it is forthcoming, it is very unlikely that an enduring peace can be achieved by a single formula, struck off in a single meeting. It will have to be built from the bottom brick by brick.

How to Export Coal—II

The Case for Dearer Coal

THE first of these articles discussed the reasons why the average miner is unlikely to produce much more coal this year. The most hopeful way of increasing output is, therefore, to try to attract more miners by paying them more. In the second quarter of last year, the average weekly earnings of adult miners were £10 10s. a week, compared with the national average in all industries of £8. It is still customary to marvel at this evidence of the great social and economic transformation of the coalfields since 1938. It is more to the point to ask whether social inertia, economic planning and political timidity have not unduly inhibited the real economic transformation. Established ideas about the relative values of different jobs die hard. But it is as long as ten years since miners were over-plentiful, and they are likely for some time to remain scarce; there is no doubt that in a free economy their very scarcity would have pushed their wages even higher in the scale.

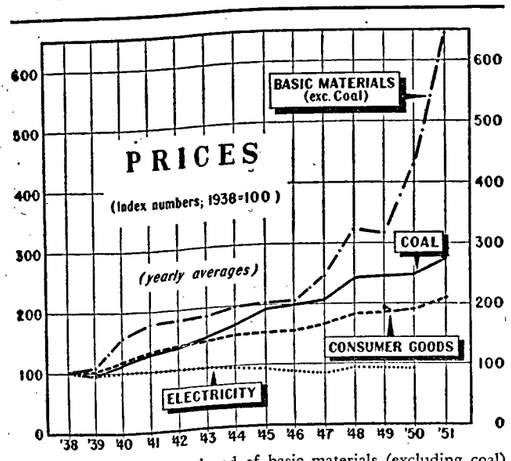
The miners have just gained a substantial wage advance of about 15s. a week. But that has done no more than keep them in line with the general rise in wages and prices during 1951. As was shown in the chart published last week, they are still not so far ahead of wages in general as they were in 1947, when the mines were securing their considerable (though inadequate) postwar increase in manpower.

There is little hope of expanding the labour force unless the miners are again put well ahead, and a worthwhile further increase would have to be at least another pound a week. Just what the effect of such an increase would be on net recruitment is difficult to say. Obviously it would be greater if more could be done at the same time to improve housing and other amenities in the coalfields. But, fortunately, these are least needed in the Midland coalfields, where mining productivity is high and the competition of other industries for labour is strongest. On the evidence of the past, another pound a week might in itself make quite a difference. The mines at present have vacancies for 15,000 workers. Further recruitment would depend on opening up new faces, and it is unlikely that, after the initial burst, new workers could be taken on at a rate of more than 500 a week. It may not be too much to hope that a wage increase of a pound a week would, during this year, attract as many men—say, 30,000—as the industry could absorb, even with vigorous measures of training and placement.

The purpose of such an increase in wages would, of course, be to increase recruitment to the mines or reduce departures from them. Its purpose would not primarily be to increase the output of the men already in the mines. But it is obvious that it would be entirely frustrated if the effect on the existing labour force were actually to reduce their output. It is often said that the average miner's reaction to higher rates of pay is to do less work. The evidence for this view is slight, and though higher wage rates would enable the miner to enjoy his conventional standard of living with less work, they would also increase his loss when he took a day off. In any case, the way to guard against this danger is to offer the wage increase in the form of a large bonus payable only to men who do a full week's work. It is true that most of the attempts that have been made in the past to link wage advances to increases in productivity or the relaxation of restrictive practices have been unsuccessful, in coal as in other industries. But it is one thing to attach strings to advances that would have had to be granted in any case. It is quite another when the National Coal Board makes a spontaneous offer before the union gets round to another claim.

*

The average miner produces 300 tons of coal a year. If they could be recruited in the more productive coalfields, the new men might contribute a little more than this. But the most that can be hoped for is that recruitment during 1952 would raise the rate of coal output by 10 million tons. That is the rate possible by the end of the year. It might mean that output during the calendar year would be 6 million tons bigger than last year. Even with some improvement in productivity, the most that it is reasonable to hope for, if every effort is made, is that an extra 8 or 9 million tons of British coal will be produced in 1952. If the present winter remains mild, it may be possible also to draw some 2 million tons or so from stock. Thus, provided that no more coal at all is used in Britain, exports and bunkers might conceivably rise from 12 million tons last year to something over 20 million tons in 1952.



That would be quite inadequate. It would not satisfy Europe. It would not make a sufficient contribution to Britain's balance of payments. When the last Government submitted its four-year plan to its partners in Marshall aid, British coal exports in 1952-53 were put down as 40 million tons. That is now an impossibility. But if the new Government is in earnest about closing the trade gap, its policy for coal certainly ought to be aimed at exporting 30 million tons this year—50 per cent more than the postwar peak in 1949 and two-thirds of the 1938 exports.

That can be done only if the maximum efforts to recruit more miners are combined with a cut of about 10 million tons in Britain's own consumption of coal. Consumption is now rising less quickly than in the earlier postwar years, but it is still rising. It can and should be reduced. The claims made by advocates of fuel efficiency are often exaggerated. Little saving can be expected from the household consumer whose coal supplies are already so tightly restricted. If he instals more economical grates and stoves he should be allowed to get more warmth from the present coal ration, which absorbs less than a fifth of the country's coal production. The saving that can reasonably be expected is that the domestic consumer should use less electricity for heating. That would both reduce the peak load and save some coal at the power stations. But most of the economy will have to come from industry, not the domestic consumer.

Industry gets all the coal it wants, and there is no doubt that many factories use it wastefully. The habits

of British industry are still based on the cheapness of coal on which it grew up. There has been little reason for it to change. In spite of the scarcity of coal, it has remained relatively cheap. As the accompanying graph shows, the average price of coal in 1951 was 275 per cent of the 1938 price; for other basic materials, the comparable average was 648 per cent. By December, when the prices of many imports had fallen, basic materials were still six times as expensive as in 1938, while coal was only three times as expensive; relatively to other material costs, British factories are paying much less for their coal than they paid in 1938. The graph shows that this comparison is even more striking when coal is consumed indirectly, as electricity. The price per unit has been increased very little, and with rising demand many consumers have switched to tariffs carying a lower average charge. The effect is that, until 1950 at least, electricity was actually cheaper than in 1938, while consumer goods in general were 90 per cent dearer.

This relative cheapness of coal and electricity is a plain invitation to waste. Stern efforts to get existing heating plants used more efficiently are rarely worth the management's trouble, while much modern fuel-saving

Price movements of coal and of basic materials (excluding coal) are measured by the wholesale price index numbers of the Board of Trade. Those of electricity and of all consumer goods and services are derived from the national income statistics covering the whole of personal expenditure at retail prices; 1951 figures are not yet published and the index for all consumer goods is, therefore, estimated. The fact that the average price of electricity to domestic consumers has fallen since 1938 reflects changes in the proportions of consumers using the different tariffs and the increased use of electricity, rather than a decrease in the price per unit of electricity on the same tariff.

equipment has a high capital cost. The way to make its installation more profitable, as well as to encourage day-to-day economy in the use of coal, is to make coal dearer.

On the average, the Coal Board's prices for exports are still more than 30s. a ton higher than the prices charged for the same grades of coal in this country. A government determined to balance overseas trade and make sterling a strong curency would tell the Board that no ton of coal ought to be consumed in this country at a lower price than it would fetch for export. That demands more political heroism than can be expected. But domestic prices certainly ought to be moved nearer to present export prices. The average pithead price has just been raised by 5s. to 56s. a ton, and at this level the Board expects barely to balance its accounts next year. An increase of £1 a week in the average miner's wages would raise costs by nearly 3s. 6d. a ton. And in these times the Board ought to be doing more than cover its costs; it should be accumulating reserves. It would be wise to raise coal prices by at least another 10 per cent—5s. a ton—as a first step, and if that did not quickly show results, in reduced consumption, another 10 per cent increase should follow.

*

The logic of such a policy, so far as coal itself is concerned, is perfectly clear, however unpalatable it may be. But what of the effect on the national economy as a whole? Would it not run directly counter to the whole policy of stopping inflation? Would it not deliberately touch off another twist of the vicious spiral?

It is undeniable that the price of coal is one of the strategic factors in the national economy and any increase will have far-reaching effects. Not all of them will be bad. The consequential rise in the price of steel, for example, would in the present scarcity of steel be almost wholly good. But the same cannot be said of railway charges, which would also have to go up again, or of the wider effects. There is a fundamental point of economic policy at stake here. The political philosophy of the past ten years has been that the more essential a thing is, the more strictly its price should be kept down—with the result that it is precisely the basic industries in which labour is most scarce, in which output cannot be increased, in which wasteful consumption is encouraged and artificial scarcity is stimulated. This is the damaging distortion that a decade of inflation and price control has produced. If the stopping of inflation is to mean simply that these distortions are to be permanently built into the national economy, there will never be any real recovery. On the contrary, the main purpose of bringing inflation to an end is to make it safe to set the economy free and let the price system do its job by making scarce things dear and therefore worth while producing.

A deliberate increase in the price of coal will seem to many people to be, at best, a paradoxical and desperate remedy. The situation is desperate. As for the paradox, it is quite true that such a policy does not fit the popular fashion of thought on economic policy. It is that fashion that has helped to make Britain's position so desperate. An effective policy for coal must be based on the assumption that there is going to be real disinflation, that the Government's Budget and monetary policies will adequately reduce the general pressure of demand. There is no point in raising miners' wages and the price of coal if other wages and prices quickly follow. But if incomes and prices in general can be kept down—and for the first time in twelve years there is now some hope that they can be—then a sharp relative rise in miners' wages and the price of coal might have a large and immediate result. In any event, the need for larger exports of coal is great, and the prospect of being able to secure them by any other means is small. It is not enough, in these circumstances, to urge against the policy here outlined that it would have some incidental disadvantages.

The Recession of 1954

IN Britain adequate thought cannot be given to the economic dangers that may succeed inflation. The problems of the moment are too pressing. But in the strategy of the free world as a whole it is essential that people should already be looking beyond the period of rearmament. If rearmament succeeds in its purpose, if war is avoided, that period will end—or at least should end—in 1954. When it ends, the armed forces of the West will be put on a maintenance basis, and the munition and tank and aircraft factories will be dismissing workers. That could easily provoke a serious recession. In the United States, at least, the main engine of the boom that succeeded the end of the war in 1945 will be absent. Rearmament is not there being accompanied by shortages of wartime severity, and therefore it will not be followed by the heavy deferred demand, both for new industrial equipment and for durable consumer goods, that stimulated the American economy so readily in 1946. In this situation even a levelling off in the arms programme, a stop to investment without a fall in current production, could cause appreciable unemployment.

The West will not make itself secure if its people are haunted by such fears. In particular, the primary-producing countries, whose political allegiance between Communism and the free world is in the balance, will not devote themselves enthusiastically to expanding their output if they fear that in two years' time the effort will be reflected in burdensome surpluses of materials that no one wants at a remunerative price. Continuing thought about the international problems of maintaining full employment is therefore of the utmost practical importance, and the latest report from the United Nations, published this week, deserves a warm welcome and close attention.

"Measures for International Economic Stability"* is the work of five economists; the chairman was Mr J. W. Angell of Columbia University and the British representative Mr G. D. A. MacDougall. It will inevitably be compared with the earlier report by another group of five which provoked so much controversy two years ago and to which this report is to some extent an answer. It would be a pity to make too much of the differences. The earlier report had serious weaknesses. It assumed too readily that unemployment can always be cured by expansionist fiscal policies on the Keynesian pattern. It ignored the dangers of continuing inflation. It urged remedies for the problems of the fifties as if they were still those of the great depression. But it should be remembered that the report was prepared when many people feared that the American recession of 1949 was the beginning of the postwar slump. The nature of the new economy was far less plain to everyone then, and the mistakes of the report are no reason for rejecting the main lines of its analysis—with which Mr Angell and his colleagues have no quarrel.

The differences are in practical recommendations. The new report is more important precisely because it is less ambitious. Its predecessor sought to establish an automatic mechanism that would give the rest of the world the fullest possible protection against the spread of a slump, however large, from the United States. Briefly, it proposed that the United States should promise to provide to other countries, through the International Monetary Fund, any dollars that it stopped spending on imports from them because the American level of activity had fallen. The economic and technical weaknesses of such a scheme do not need repetition; above all, it asked too much—too large and indefinite a commitment—from the American Congress.

The Angell report asks less because it starts by defining the need more closely. It assumes, realistically, that international action will not have to cope with an American slump on the scale of 1931. Future recessions will be comparatively slight and they will be corrected within a year or two. The loss of foreign exchange to which they subject other countries will not be prolonged. Reserves exist to cover precisely such temporary fluctuations. The first problem of international full employment policy is that the reserves held by most non-dollar countries are now far too small for this purpose. In the recession of 1937-38, employment in the United States fell by 4 per cent. A disturbance of similar size may easily follow rearmament. The five economists calculate that, if it had the same proportionate effect on America's foreign payments as was experienced in 1937-38, the dollar income of the outside world would be reduced, during two years of recession and recovery, by $10,000 million—that is, by a quarter.

The gold and dollar reserves of many countries besides Britain could provide no cushion against such a shock. In 1937, countries other than the United States held on the average reserves equal to 50 per cent of the annual value of their imports; the proportion now is only 25 per cent, and it does not need a major slump to drain away reserves of that size within a year.

*

The planners of the postwar world recognised this problem long ago. They set up the International Monetary Fund, whose essential purpose was to make a once-for-all increase in the reserves effectively available to meet a trade recession. But the fund's resources are too small to make any practical difference. On an average, its members' quotas are now—after the postwar rise in prices—equal to only 10 per cent of their annual imports, and the foreign currency they may get from the fund in one year is limited to 25 per cent of their quotas. But, for all its present inadequacy, here at least is a familiar method of approach. The Angell report is the most important attempt to exploit it more fully that has yet been made. The authors suggest that the subscriptions to the fund, and particularly the United States' subscription, should be increased. There is also a more delicate suggestion that the United States might indicate well in advance its willingness to lend dollars to the fund if a recession occurs. Such increases in the fund's resources would, however, serve little purpose if its policies remained as cautious as, in the admittedly difficult circumstances of the past five years, they have generally appeared. It is now urged, rightly, always to give its members the benefit of the doubt when their need for assistance may or may not be of the temporary sort that the fund exists to meet. It should also be willing during a recession freely to waive the 25 per cent limitation on drawings of foreign currency. Its rules about the repay-

* Published by the United Nations. 48 pages. 40c. The sales agent in the United Kingdom is H.M. Stationery Office.

ment of currency borrowed from it should be made at once more variable and, in certain cases, more definite. That is surely an understatement of the need. If most of the dollars provided through the fund have to be repaid, then it may stop one recession but it will be able to deal with a second recession only if the United States in the interval incurs a large deficit in its balance of payments. That is highly unlikely, and the report's proposals are therefore quite incomplete.

Politically, however, it is probably wise to take one obstacle at a time, and as far as it goes the scheme is eminently sensible. The question is whether, even as a way of dealing with one recession, it is ambitious enough. Certainly the reform of the International Monetary Fund on such lines would do no more than establish the protections against an international recession that many people believed to have been established in 1945. But, after all the postwar strains, the consolidation of those fairly brave plans is not a bad first objective. Any preparation to fight the spread of unemployment from one country to another is in the last analysis a matter of persuading the United States to promise to provide other countries with dollars. At this stage, it is wise to ask American opinion to recognise a small, definite commitment rather than a large, indefinite one. This is combined in the Angell report with two other major proposals. First, the International Bank should have larger resources and should be willing to lend more in bad times than in good: that demands a considerable change in its ideas and its methods. Secondly, commodity agreements of various kinds should be used to make the prices of primary products less unstable—without attempting, on the average of a period of years, to raise prices by restricting supplies; in particular, the International Bank should help to finance buffer stocks.

These would be useful supplements to the strengthening of the International Monetary Fund. The scheme as a whole provides a reasonable hope of preventing a small recession in one large country from spreading in multiplied force to small and weaker countries. But no gold reserves, however they are supplemented by the monetary fund, can guarantee full employment if international payments are unbalanced even when there is full employment, if any major currency is chronically too weak to look the dollar in the face. The world economy must be fairly healthy in its parts before international action can help to keep it so. But if that condition is met, the United Nations report does indicate, broadly, the path that international action ought to take. It is the way to make sure of falsifying the Communist hope that the West will destroy itself either in the boom of rearmament or in the bust that could otherwise follow.

Arms from Italy

NO adequate attempt has yet been made to harness Italy's latent industrial capacity to the defence of the west. This continues to be a weakness of the plans devised by the North Atlantic Treaty Organisation to share the burden of rearmament and to step up production in Europe. It is bound to reflect on the value of some of the tentative conclusions drawn at the Council meeting at Ottawa last September as well as on the recent findings in the report of the Temporary Council Committee (TCC). And if the most is really to be made of Europe's own resources, more will have to be done to make better use of Italy's spare productive capacity. Even now this amounts to some 30 per cent of the nation's industry.

The problem of Italian association with Nato has two distinct aspects, one political and the other economic. Both rest, however, on the same central fact, that Italy still has the largest national Communist party outside Russia and China. In the political field, this promotes an unusually lukewarm attitude which makes the Italian government's task even harder than most. Least of all can Signor De Gasperi readily afford to ask or impose any real economic sacrifices for purely political reasons, particularly those which can be made by his opponents to appear to be the dictates of the British or Americans. While there are, therefore, many Italians both in and outside the government who would welcome Nato armament orders, so long as they set the wheels of industry spinning and lead to greater employment, the inflationary problems which would accompany such orders encourage the government to hold back. There are several different views about the priorities of economic needs and the only point on which there is any agreement at all is that limited orders for munitions from Italian factories, to be paid for in dollars, would be welcome—in Italy as everywhere else in the world. Mr Lovett, the American Secretary of Defence, encouraged Italians last month when he indicated in Washington that military "offshore" purchases in Europe would exceed $500 million by the end of June.

To understand the arguments, it must be said at once in Italy's favour that its economy has reached an apparent plateau of stability, which no government in Rome could be expected lightly to abandon after the tragic experiences of chaotic inflation at the end of the war. It is true that, in spite of favourable balances with the European Payments Union and the sterling area, there is a deficit on foreign trade only made good by American aid; that, if capital expenditure is included, current budget estimates predict a deficit of 396 billion lire (about £200 million); and that reserves of gold and foreign exchange show a tendency to fall. But almost alone of European countries, Italy is not at present experiencing any serious inflationary pressure, and there has been a pronounced rise during 1951 in the levels of industrial production and of national income. It is also true that, since the early summer, internal demand has eased off and there has been a moderate industrial recession with a slight increase in unemployment. If these tendencies continued, they would help the Communists to gather strength; but they are probably short-term by nature and, like the similar movements in other countries, due in part to a reaction from the world-wide overstocking in the early stages of the Korean war. Italy in short is by no means in a state of boom. And the relative stability has been obtained at a level far too low to give every Italian an adequate standard of living. But it would be asking too much of any economic policy in Italy to turn it into a rich country overnight or even, in view of the patent over-population, to find work for all. For every European country in the postwar years, the dilemma of economic policy has been whether or not to confer upon the great majority of the people the great boon of economic stability at the cost of some suffering for a minority; or to impose inflation on the majority in the attempt to get rid of unemployment. The perils of the second course are likely to be greater, and the chances of its success less, in Italy than in other countries. It was therefore clearly right to choose the first—to some extent.

The main split on economic policy is on the length to which the policy should be pushed. It lies between the deflationists and those who favour an easier monetary policy, based on what they regard as realities rather than theories. In the cabinet, the deflationist school is led by the Minister of the Treasury, Signor Pella, who has inherited the mantle of President Einaudi, and the Minister of Finance, Signor Vanoni. The opposition comes from the Ministers of Industry and Agriculture, Signor Campili and Signor Fanfani. Outside the cabinet, industrialists differ in the degree of support they give to Signor Campili—who is in effect their very able spokesman—while in the wings stands the American ECA mission, led by Mr Dayton who wants above all to see Italian industrial production change up to a higher gear. This tug of war is by no means new in principle to the Italian economic scene. It has, however, reached a particularly critical point because the deflationary policy, initiated by President Einaudi when he was Minister of the Budget, has been so strikingly successful in putting Italy on an even keel, at a time when many other countries in a potentially stronger position have continued to suffer a great deal from the menace of inflation. The question now is whether the time has come to modify the present strict policy, if Italy is to avoid an unnecessary economic slump and if Italians are to bear their fair share of Europe's rearmament burden.

The deflationists lost a little ground during the cabinet reshuffle last July, which was partly due to the existence of this struggle about economic policy. But they still have the upper hand, and the government has in fact only recently renewed its pressure on the banks to review and possibly curtail some of their more marginal loans. When seen against the wider background of the European problem, there is clearly a great deal to be said for this attitude of mind. Compared with France, Italy is almost certainly in a stronger position at the moment to bear the shocks of rearmament. And the deflationists undoubtedly have every right not only to take the credit for rebuilding the basis of the national economy by strengthening the lira, but for sticking to a point of view for which there is now increasing support in America and in other European capitals. There, it is being realised more and more that high military expenditure will fail in its purpose if it is only achieved at the expense of the political unrest which may follow from economic dislocation and the decline of living standards. Somewhere down that road lies the victory of Communism.

In Italy itself there is indeed a special political case to be made out for Signor De Gasperi's need to avoid any step which would weaken the Christian Democrat party before the general election that must now take place within fifteen months and is quite likely to be held in 1952. Although too strict a deflation carries its own dangers in terms of lower business activity and the growth of unemployment, there is no more certain way of losing the position, so carefully and painstakingly built up during the last three years, than by letting the lira slide. That would undermine the whole structure of the present democratic regime, with disastrous consequences to the rest of Western Europe. As it is, Signor De Gasperi finds himself further and further to the left centre of a party which is moving inexorably to the right. Although there is still a good chance of a coalition being re-elected under the leadership of the present type of Christian Democrat party, this central core of moderates is already being pared away at a depressing pace by the extreme nationalists on one side and by the Communists on the other.

★

All that being said, there is now a strong case for urging a less cautious monetary policy. This can be made, as the ECA mission and some members of the cabinet make it, on the ground that Italy will never be able to raise its standard of living without a new approach to the problems of industry; small markets and high prices are no longer politically acceptable. But the same policy is also being pressed for the more urgent reason that, until the northern factories are turning out more armaments both for Italy itself and for its western neighbours, the resources of the west are not being properly used. Nor indeed is Italy making a big enough contribution towards the collective security from which it derives very considerable benefits. Clearly, for the moment the second line of argument displaces the first. If Italy is to make armaments, it cannot simultaneously expand production for home consumption, however heavily the deflationists may be defeated in the cabinet.

During the past few months a good deal of information has been collected by the North Atlantic Treaty Organisation about Italy's unused industrial capacity. But one of the main arguments against using it is that, even if Italy is paid in dollars for rearmament orders, considerable extra imports of food and consumer goods would also be needed to offset the inflationary effects of higher wage payments. Such purchases would in turn be inflationary because they could only be made at the expense of other imports—or Italy would run into a heavy deficit in its balance of payments—and because they could only be obtained at prices higher than those now ruling in Italy. Hence, it is argued, even granted that the capacity is there and ought to be used, its use would need to be accompanied by additional American non-military aid and as part of a cautiously balanced government credit policy.

These problems and arguments in Italy reflect in miniature many which apply in some measure and in varying mixtures to every country in the Atlantic Pact. By themselves many of them are insurmountable and incontrovertible. There is, however, no right or easy way to rearm. Whatever is done must be done at the expense of something else. For Italians as for others it is a question of guns or butter, and if there is to be any butter later there must be some guns now. Italy has not been the most severely criticised of the countries whose rearmament efforts are held by the TCC to be falling behind those of its neighbours. But it is the country where, by virtue of its possible contribution in relation to present size, position and capacity, the greatest difference could probably be achieved most quickly by a change of attitude and a change of policy. To bring this about depends as much on more efficient and determined planning by Italy's colleagues in Nato as on a clearer understanding by the Italian people of the real issues facing the west.

NOTES OF THE WEEK

Washington and Westminster

Parliament reassembles in ten days' time, and the House of Commons as a whole will be pleased with the results of Mr Churchill's visit to the United States. The Opposition may make one or two flourishes of indignation ; in particular, Mr Shinwell can be expected to criticise the mission for failing to get the Americans to agree that the .280 rifle is the finest in the world. But all parties will agree that the broad effect of Mr Churchill's visit has been to advance British interests a little, and perhaps rather more than his preliminary caution had encouraged the politicians to expect.

The Government has thus done something, at least, to justify the belief that Mr Churchill could get on with the Americans better than Mr Attlee, which in the election campaign was one of the points made in reply to the "warmongering" charge. The written understanding about the use of American bombers based in Britain is particularly important for this party purpose. No doubt it merely states publicly what had been agreed in private. But Mr Churchill seems to have agreed with Mr Bevan that it was not enough to have an understanding which Mr Attlee asked the House of Commons, and the electorate, to take on trust from him. The Conservatives will certainly claim the written statement as evidence that Mr Churchill can restrain any mistaken ambitions in American policy more effectively than Mr Attlee could. And they have the more reason for such a claim now that a few American politicians have protested against the agreement, apparently in the belief that the United States sacrifices some of its autonomy if it agrees to consult Britain before using aircraft based in this country.

The agreement on metals will give more immediate and even warmer satisfaction at Westminster. There seems to be no doubt that Britain's case for getting considerable supplies of American steel was skilfully presented by Mr Churchill and his colleagues. That will be properly appreciated by a Parliament apprehensive of the effect of steel shortage on employment, production and exports. Though in essence they are no less a temporary expedient than the offer of American steel to Britain, the arrangements about tin and aluminium are of the kind to appeal to Labour members no less than Mr Churchill's own party. They will be taken as evidence that international allocation of raw materials may be put on a more lasting and comprehensive basis, and the Conservative party will not scorn the opportunity of wearing clothes that Labour likes to claim as its own exclusive model.

* * *

Mr Churchill in Ottawa

Mr Churchill went to Ottawa with three main purposes in mind. The first was to create the same sort of intimate relationship with Mr St. Laurent as with President Truman. The second was to talk with Lord Alexander and, it is said, to invite him to become Minister of Defence when his term as Governor-General expires. The third, buried deep in the only public speech he made in Canada, had to do with the North Atlantic Treaty. "So far this solemn compact," he said, "has been regarded only in its military aspect, but now we all feel, especially since our visit to Washington, that it is broadening out into a community . . . acting together not only for defence but for the welfare, happiness and progress of the peoples of the free world."

"Welfare" and "progress" are nowadays synonymous with greater economic integration. Mr Churchill's hope was that, coming fresh from Washington, he would arrive at a relatively propitious moment, and serve as the best available mouthpiece, for delivering the message that Canada's contribution to natural aid needed to be given with greater willingness than hitherto. He was obviously prompted to speak as he did by the Canadian reaction to the Three Wise Men's report, which was conservative, to say the least. He made it clear that he was asking for this effort not in order to secure dollars or goods for Britain ("We do not want to live on our friends and relatives") but to get some Canadian priming, both moral and material, for the western effort as a whole.

If the "complete agreement" that is mentioned in the Ottawa communiqué covers concurrence on this point, the visit can be called a success. The other points that Mr Churchill made in public amount to generalities to which even his happy vocabulary could not give the charm of novelty. But it is difficult to make two great speeches in one week to the same audience—in this case the many millions of North American listeners who can tune in both to Ottawa and to the Capitol in Washington.

* * *

A Head for Nato

The change in the concept of the North Atlantic Treaty, which the Canadians seem to have accepted, is inherent in the plans on foot to overhaul the treaty's organisation. The object, which Mr Churchill has been discussing in Washington and Ottawa, is to instal a new centre of authority at the top, whose functions would extend over the economic and the military as well as the strictly political issues at stake. Nato has for a long time been sprouting legs and arms in a vain attempt to make up for the fact that it had no effective head. The Atlantic Council does not sit more than two or three times a year and its official Deputies have been severely handicapped. They could take very few decisions on their own authority and then only in limited fields. Their relations with the economic board and the military standing group were obscure to a degree, and they were in no position to perform the job which was ultimately done by the temporary committee of the council in Paris—to relate and equate military requirements with economic possibilities.

The decision has now been taken to fill this gap on a permanent basis and at the same time to reduce—perhaps even to abolish—the research and preparation which have been done so laboriously by the subsidiary organs. The Deputies are to disappear ; a full-time, twelve-powered committee will be created to act, in the absence of the Atlantic Council, with the authority of the Council itself on all aspects of the treaty. It will be the head, the brain power and the nerve centre of an organisation which has so far collaborated over facts, but been remarkably slow to co-operate over acts. A secretary-general is also to be appointed to direct an international staff of officials, which, it is hoped, will be kept small.

This is the importance of Mr William H. Draper's appointment as Mr Harriman's special representative in Europe. He is not to replace the American chairman of the Deputies, Mr Spofford, who has simultaneously resigned in an attempt to get back at last to his law practice in the United States. Mr Draper is to represent the United States on this new organ of authority ; he will take on a job which has not existed during Mr Spofford's tenancy but the need for which Mr Spofford was the first to see.

The success of the new authority will not be automatically assured by its constitution. It will have, from the start, a better chance than its predecessor, but it will depend very largely on two factors: first, whether the other eleven members of Nato are willing to appoint men of the requisite calibre and with real authority ; second, whether they are prepared to accept the kind of recommendations which have been made by the Three Wise Men. Indeed, the first task of the new committee of twelve must be to implement the recommendations of the three.

Assistance for Subsistence

Some of the younger Tory MPs are keeping up their efforts to make the party leaders face the consequences of recent economic and social policies. The debates last spring arising out of the health service charges stimulated fresh thinking on both sides of the House of Commons, and two Conservatives have now published their thoughts in a pamphlet,* in which they give a brief but lucid account of the growth of the social services and the application of means tests within them. Their main point is that the function of national assistance, derived from outdoor poor relief, is to provide a minimum income just high enough to cover the cost of subsistence. In other social services, on the other hand, different, less rigorous, means tests were introduced before 1948 and remain more appropriate. It was not reasonable, they argue, for a man to have to reduce himself to the subsistence level before he became entitled to free education for his children, free treatment in sickness, and so on. They therefore maintain that it was wrong in principle for the Assistance Board's means test to be used for assessing ability to pay the charges for false teeth and spectacles. In this particular case, the Government's action was probably justified on administrative grounds. But if more charges are to be introduced in the health service —and Mr Macleod and Mr Powell show that there is no reason in principle why the service should be entirely free—their plea for a separate, more generous, means test should be carefully considered.

They are on less firm ground in their recommendations on national insurance. They give a striking analysis of its present plight, pointing out that for a man and wife the basic insurance benefit is now 22s. below the Assistance Board's minimum of 64s. inclusive of rent. Even the higher rate of retirement pension is 14s. below this subsistence level. They therefore argue that the only way of preventing benefits from becoming derisory is to put them up with a corresponding increase in contributions.

Unfortunately, they give no indication of how big the increase in contributions would have to be to provide for this large increase in benefits. Only in a footnote do they refer to the effect on employers' costs. Nowhere do they discuss the effect on the lowest paid workers of an increase in what is, after all, a direct and regressive tax. In two years' time the insurance scheme will have to be reviewed and will probably have to be revised. But no stability in the value of benefits can be looked for until stability has been given to the pound. Mr Macleod's and Mr Powell's proposal is, therefore, yet another cart that must wait for the Government's disinflationary horse.

* * *

Nationalised Efficiency

The Conservative party now has the opportunity to apply some necessary new thinking to the problems of the nationalised industries. As a first step, a select committee of the House of Commons was appointed in December to review the methods by which the public corporations are made accountable to Parliament. It may be stimulated to a new approach by a paper read last week to the Manchester Statistical Society by Mr D. N. Chester.

The public corporations were established on the assumption that if they were free from day to day interference, they would be able to operate with the vigorous efficiency of independent commercial management. But the analogy between the corporation and a joint stock company, between Parliament and shareholders, is, as Mr Chester said, a false one. The shareholder is interested in financial results, and he has a simple test, the dividend. The nationalised industries are expected to pay their way but, even if they do, that does not necessarily mean that all is well. As they are monopolies they can "break even" by charging consumers a price that covers gross inefficiency. The profit and loss account proves nothing. The nationalised industries are expected to pursue something called the public good, which, as Mr Chester said, may be quite incompatible with the principles of sound business management, and of which there is no simple test.

It is easy to say, in general terms, that the Minister should determine social and economic aims, while the corporation's task should be to achieve those aims as efficiently as possible. That does not help to define the practical working relations between the corporation and the government department. But at least it can be generally agreed that some check on efficiency is needed, and that the annual reports, months out of date, do not provide enough information for this. It does not follow that the ban on parliamentary questions concerned with detailed management should be lifted. Members of Parliament are already too inclined to try to discuss points of detail and to neglect their opportunities to deal with broader policy. Parliament has neither the time nor the technical knowledge to make detailed investigations. One part of the solution would be to submit the nationalised industries to a regular efficiency audit. But if every wrong decision—and there are bound to be some—is to be noted and publicised, there should be no illusion that public corporations will show the same initiative as managers in private industry, whose mistakes are passed over if the final result is broadly satisfactory.

* * *

The Liberals Say it First

The Liberal party's statement on iron and steel comes a little too late to make it appear, when the Bill is published next month, that the Government is following the Liberals' advice. But it is hard to detect any other purpose.

The statement declares that "mere denationalisation, with the simple restoration of the industry to private ownership, will not be approved by the Liberals." How much the Ministry of Supply must wish that so straightforward a possibility as "mere denationalisation" existed. The Liberals propose that there should be an Iron and Steel Board appointed by the Minister of Supply, and representing management, labour and consumers. It should include some independent persons, one of whom should be the chairman. It should keep the whole industry under review, and should have power to fix maximum prices and to call on firms to submit plans for development. All this has, of course, a familiar sound. It is what the Iron and Steel Federation, the Conservative party and many others were proposing as an alternative to nationalisation three years ago. The one new point offered by the Liberals is that if no steel firm is willing to take up some particular production that the proposed board thinks desirable, it should have power to set up an independent unit for the purpose ; since the method of financing such a project is not made clear, the idea does not take the discussion far.

The Government probably has not yet made up its mind about the details of steel denationalisation, though there is no doubt that it will adopt the well-tried model of an Iron and Steel Board. But, although they advocated the return of steel to private ownership vigorously enough in their election programme two years ago, the Liberals appear to have given no thought at all to the problems of denationalisation, as distinct from finding an alternative to nationalisation before it happened. That is a pity. When the ideas of the major parties are so fluid the Liberals could still exercise an important and valuable influence—provided what they have to say sticks close to the practical points at issue.

A New Team for Malaya

General Sir Gerald Templer, appointed this week as the new High Commissioner for Malaya, will possess powers which no one has ever had before. He is being given complete executive authority over all three elements in the fight against the Communist guerrillas—the police, the troops and the civilian administration. He will have a Deputy High Commissioner to deal with routine administrative matters, and General Sir Rob Lockhart will become in effect the deputy Director of Operations under him. A Deputy High Commissioner has yet to be appointed, since there is some opposition to the idea in Malaya; but there can be no question of failing to create such a post if General Templer is to be left free enough to concentrate on the wider aspects of policy; at the present stage, it cannot go to anyone but a Briton. A new chief of police is also required, following the resignation this week of Colonel W. N. Grey; he had made special contributions to administration, but a new hand is needed to inject a new spirit and a greater uniformity of organisation into the police.

Comparison can justifiably be made with the appointment a year ago of another soldier to another South East Asian territory. Marshal Jean de Lattre de Tassigny died after reversing the whole trend of his country's fortunes in Indo-China within a matter of weeks of his arrival. His richly deserved epitaph must be that he achieved alone, by the sheer force of his own spirit, what almost no living military leader could have accomplished. He was a true friend of Great Britain, and, whether or not his work in Indo-China is destined to endure, both the French and British peoples owe him a debt of gratitude.

General Templer goes out to Malaya in circumstances hardly less grave than those which faced Marshal de Lattre in Indo-China a year ago, though their character is entirely different. He has been appointed not only because he is an able military commander but because he is a talented general with experience of political affairs. He will justify the choice only if he proves himself able to make some impact on the most elusive but fundamental political problem before him, namely how to associate the Malayan Chinese more closely with his government without alienating the Malays. General Templer carries with him the heartfelt good wishes of his country in approaching a task in which he has a chance to make his mark on history. But it would be only fair to him, and to those whose destinies will lie in his hands, that the appointment should come up for review at the end of a year.

* * *

The Schuman Plan Ratified

The ratification of the Schuman Plan by the German *Bundestag* by the large majority of 89 is an historic event. M. Monnet cabled to Dr Adenauer "Europe is born! Long live Europe!" and his enthusiasm is justified. Though Belgium, Luxemburg and Italy have still to ratify the plan, the European coal-steel community has now been brought into existence.

The vote was a triumph for Dr Adenauer. It is really remarkable that a defeated nation should have produced a statesman with not only the wisdom to seek the closest co-operation with his country's ex-enemies but the political skill to put his policy through. Dr Adenauer himself has been fortunate in his second, Professor Hallstein. What might have been is clearly shown by the German Social-Democrats. By sheer nationalist rancour and a mistaken belief in their own cleverness, the Socialists have been led into the foolishness of denouncing the Plan as another French attempt to occupy the Ruhr and the stupidity of voting with the Communists and the neo-Nazis as the last-ditch defenders of the trusts and cartels of the Ruhr. Dr Adenauer won the day by his conversion of the German industrialists. On behalf of the Ruhr he fought the Allied High Commission to secure the

removal of the restrictions which prevent the German steel industry from starting the Plan on equal terms. He did not wholly succeed; the ban on additional capacity is to go only when the High Authority of the Plan is in operation, and the Allies still retain the right to supervise the break-up of the Ruhr trusts. The German steel industry, however, has already built up its production to 15 million tons a year, so that it starts the Plan as the largest member. Moreover, even the suspicious industrialists find an appeal in the idea of European union and have been wise enough to see that equal partnership in a European community is preferable to subjection to the occupying powers.

That the European coal-steel community (a less cumbrous name is badly needed) exists at all is a great achievement. But it exists only on paper and it remains to be seen whether its governing bodies will be able to make headway with real unification against the national jealousies which will not now disappear because the Schuman Plan has been ratified. It will be as well not to entertain any expectations of perfection; there will doubtless be many compromises and delays. But even imperfect success will have a clear balance of advantage over the alternative—a rapidly recovering Ruhr in the unfettered control (as it inevitably would be before long) of a German government which may not always show Dr Adenauer's sense of European solidarity.

* * *

Farmers' Complaints

The National Farmers' Union will be in a sombre mood for its annual general meeting next week. A spate of resolutions deplores what is regarded as the failure of prices to keep pace with rising costs; there is even a suggestion that the union should retire from the price negotiations with the Government if its claims are not met. One resolution suggests that additional payments should be made to that group of farmers who "are compelled in the national interest to farm at higher proportionate costs for lower than average yields."

This proposal gets nearest to the basic problem of raising agricultural production. The period of agricultural expansion seems to have come to an end, and the farmers will argue that only a substantial rise in prices can "restore confidence" to the industry. The nation certainly needs more home-grown food, but equally certainly it cannot afford the cost of paying higher prices all round, to farmers who are already making good profits as well as to those who are not.

If the union wishes its conference to be constructive, it should surely concentrate its discussions as much as possible towards working out methods for raising the output of the many backward farms in Britain. The problems involved are considerable and there can be no question of squandering public money on inefficient farmers, but there is a case for selective aid to those farmers who lack sufficient capital of their own to expand production.

* * *

The State's Poor Land

The chief functions of the Agricultural Land Commission are to manage agricultural land in public ownership and to advise the Minister of Agriculture in cases where public acquisition may be a way of getting land used more efficiently. The commission's latest report* shows that the properties under its control, or under that of its Welsh sub-commission, have grown rapidly to 147,000 acres. Its difficulty is that most of this land consists of "problem estates" in dilapidated condition, which can be made to produce much food only after heavy expenditure on repairs

* For year ended March 31, 1951. HMSO. 1s. 3d.

and improvements. Indeed, this is usually the reason why the land has been publicly acquired.

The commission is pursuing, as it was intended to do, a vigorous policy of rehabilitation. The cost is inevitably high. Its policy is to let all the land it can, and only a small area, consisting mainly of airfields in course of reclamation, is being farmed directly. Rents are being raised as improvements are made, but last year the average rent from its properties was no more than 9s. 10d. per acre in England and 4s. 6d. in Wales. By contrast, the commission's programme of new investment, which for the one year averaged almost 10s. an acre on its English and Welsh properties, is much heavier than is possible for most private landowners. The commission hopes in the future to earn a small return on capital invested, but this will not be sufficient to cover interest charged at 3 per cent, so that a continuing loss to the taxpayer appears inevitable.

The commission's losses must be regarded as part of the cost of getting more food from Britain's large area of marginal land. The alternative way of doing this—to give large subsidies to private owners—is also being vigorously pursued at present. It has the disadvantage that the taxpayer then has no chance of getting any return on the assets he is helping to create. If national food requirements justify this sort of unremunerative expenditure at all, there is much to be said for its being undertaken by a public body. But in that case there seems no reason why the state should be saddled exclusively with the poorest soils. The commission's advice to the Minister generally seeks to limit public acquisition to the worst parts of the various problem areas referred to it. It might be better to widen its scope if it must continue.

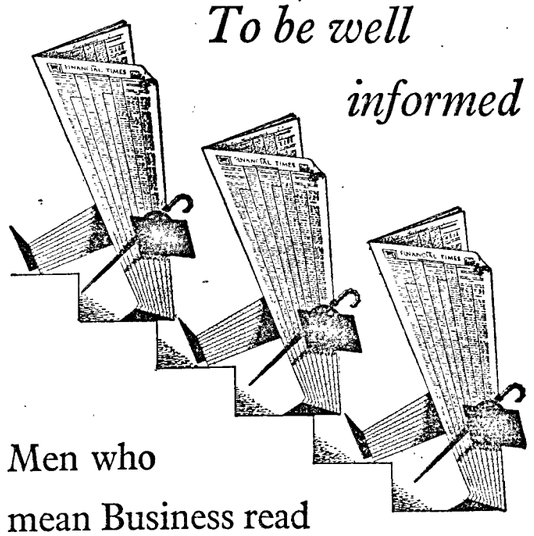
Deadlock in Egypt

Military events in and near the Canal Zone are rapidly reducing any prospect of compromise between Britain and Egypt. From the Egyptian side, official encouragement to "commandos" is increasing. The British search of an Egyptian police station this week revealed that they are getting help from the police; their standard of armament, marksmanship and tactics has risen considerably. The British have countered by using heavier weapons against them, including 25-pounder field-guns, and by arresting some Egyptian police in two Egyptian villages used as cover for the attacks. This quickening of effort on both sides emphasizes a fallacy under which both the Wafd government and the British military authorities are labouring, which is that tough behaviour will bring about a change of heart in the adversary. The Egyptians believe—on the evidence of events in Palestine and Persia—that the Englishman of today quits places that are made too hot for his comfort; the British know that the Wafd government has been much criticised and is shaky, and believe that it must, if firmly handled, fall and be replaced by a more moderate faction. In fact, each fresh blow struck by either side heightens, on the one hand, British determination to stick to treaty rights, and on the other the Wafd's chances of retaining office in the role of defender of national rights.



If this deadlock is ever to be resolved, only two courses are open to the British Government. One is to curb military action in order to temper it with the political sagacity that might produce a change of government in Egypt. The decision is a difficult one to take when troops are under fire; but withdrawal of those British outposts which are near the edge of the Delta, and some way from the Canal, would reduce the cover for guerillas and therefore Egyptian firepower. The other is to listen more seriously than they have been doing to the propositions now being advanced by a series of would-be mediators, who include King Ibn Saud and the American State Department.

Uno and the Truth

Protests from a number of governments have led the UN Assembly's committee on social affairs to order the withdrawal, at least for the time being, of a new report on the treatment of refugees in seventeen west European and Arab countries. Egypt and Syria were the strongest critics of the report, but France and Belgium were also among those who complained of its "inaccuracies." Yet this report has the appearance of a fair and objective piece of work. It was prepared, at the request of the UN High Commissioner for Refugees, by an international team of experts headed by M. Vernant, secretary of the French *Centre d'Etudes de Politique Etrangère*, with the aid of a grant from the Rockefeller Foundation. M. Vernant points out in a foreword that, in view of the difficulty of assessing certain psychological and other factors, the experts' findings should be treated as provisional; in any case, the present report is only a preliminary to the issue of a final survey, covering the Latin American and Commonwealth countries and the United States as well as Europe and the Middle East, which is to appear in the summer. But these reservations have not appeased the critics. The report is to vanish from sight, apparently because it tells such unpalatable truths as that beggars abound in Syria, that Egyptian naturalisation papers are sometimes obtained by the greasing of palms or that the mishandling of a scheme for the employment of refugees in the Belgian coalmines led many of these men to return to the frustrations of camp life in Germany.

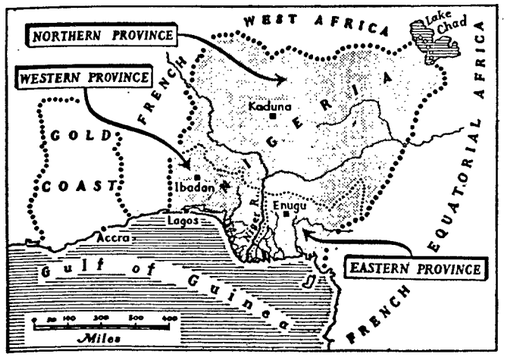
The withdrawal of this report raises an important point of principle. If an objective, independent piece of research is to be suppressed whenever it offends the feelings of any of the sixty governments represented in the United Nations, how is the world organisation to obtain the facts on which to base its decisions? M. Vernant's experts have not set out to discover scandals; on the contrary, they pay full and

To be well informed

Men who mean Business read

THE FINANCIAL TIMES

—every day



generous tribute to the good work done by many governments and organisations for refugees, and direct criticism occurs seldom in the 400 pages of their report. The least the complaining governments can do is to substantiate their charges of inaccuracy in public; but for this they have hitherto shown no enthusiasm.

When the full and final report appears during the summer, its editors might do well to indicate any points on which governments take a different view from that of the experts, but it will be wholly regrettable if verifiable facts cited in the preliminary report are eventually suppressed altogether at the behest of the governments concerned. Several consequences—some of them lamentable—would spring from such an act. The High Commissioner and his staff would be hampered in their efforts to help the remaining refugees (who are the subject of an article on page 150). Experts of integrity would become reluctant to work for the United Nations; UN reports would cease to count as reliable evidence of world conditions; and the burden of responsibility for telling truth without bias would pass to a mere handful of independent charitable foundations. The principle involved extends far beyond the refugee question itself.

* * *

Nigeria's Election

The results of Nigeria's first general election under its new constitution are neither so striking nor so easy to grasp as those of the election a year ago in the Gold Coast. There, the extreme nationalist party was returned to power, and its leader, Dr Nkrumah, has since been brought face to face with the realities of responsible government. In Nigeria, under a federal constitution, the election process itself has been spread over many months. First, the three regional Houses of Assembly had to be elected—indirectly, through electoral colleges. Then the regional Houses had to meet to choose their representatives for the central legislature—the House of Representatives in Lagos.

This selection for the central legislature has just been completed, and it has produced some odd results. Nigeria's counterpart to Dr Nkrumah is Dr Azikiwe, leader of the National Council for Nigeria and the Cameroons—the extreme nationalist party. The National Council has a somewhat precarious majority in the eastern region, but big enough to secure that only its supporters will represent the region in the central legislature. Dr Azikiwe, however, has been returned, together with four other National Council supporters, as a member for Lagos, which is included in the western region. In the western House of Assembly as a whole, a majority has been won by the Action Group, a more moderate nationalist party whose support at present comes mainly from the Yoruba people. The western House has to return two of the Lagos representatives to the central House, but the Action Group has not chosen Dr Azikiwe as one of them. He will therefore be outside the central House in spite of his own prominence in Nigeria as a whole and his party's success in Lagos and in the eastern region.

The chief politician in the central House will thus be Mr Awolowo, leader of the Action Group. But even he will not lead a majority party. Both the Action Group and the National Council have to face a solid conservative bloc from the northern region, to which is allotted half the seats in the central House. The north favours considerable regional autonomy and a continuance of Britain's control. The Action Group wants self-government, but strong regional rather than central government. The National Council wants self-government and centralisation. Just how all these conflicting and overlapping elements will combine to form a national administration will be made clearer when the central legislature meets on January 27th and the Council of Ministers is chosen.

Orchids for Mr Malenkov

Mr Malenkov—vice premier and member of the Politbureau—recently had a birthday. He was 50, and the pomp with which this event was celebrated once more raises the question of the succession to Stalin. In speculations about the succession his name is usually placed next to Molotov's, and this emphasises the fact that a new generation is to the fore and is bound to clamour for a share of the rule once Stalin has surrendered the reins.

There are three generations of Soviet leaders. Of Stalin's own—those over 70—only Voroshilov, now a mere figurehead, remains; the ablest were eliminated by Stalin himself, and the others are dead. The next generation, about ten years younger, is headed by Molotov and includes President Shvernik and Vice Premier Kaganovich. Malenkov belongs to the third, which became prominent in the late thirties and forties and of which his personal rival, the slightly older Zhdanov, used to be the most prominent member. The deaths of Zhdanov and Shcherbekov, and the mysterious disgrace of Voznessensky leave Malenkov in undisputed possession of the field.

His background is that of all the new bureaucrats who gained power under Stalin and modelled themselves on their master. His strength lies not in his thoughts or pen but in his organising capacity; he knows how to control and direct a machine. He started, in the 1920s, in the party secretariat and in 1930 went as organiser to its Moscow section. In 1941 he was nominated a Politbureau candidate and, more important, as a member of the Orgbureau, the committee dealing with the control of the local party cadres. Immediately after the war he became a full member of the Politbureau. Later, he was sent, together with Zhdanov, to the first session of the Cominform; finally, he became vice premier.

Neither in seniority nor in the role he has played in Soviet policy-making can Malenkov be compared with Molotov. Yet his potentialities should not be underestimated, particularly as he now appears to be the controlling member of the Orgbureau and as it was from such a position, with its ample opportunities to manipulate the strings of the party machine, that Stalin came to the top.

Still miles ahead...

THE A40 DEVON SALOON

With its new steering column gear control and four-wheel hydraulic braking, the A40 Saloon still keeps right at the top of its class. Small wonder, for this is the car which holds 62 International, National and other speed and endurance records.

Take a look at it on the road and see for yourself. Notice its graceful lines and comfortable roominess ... its brilliant acceleration and split-second braking ... its surging O.H.V. power and easy driver control. All these make the A40 Devon a family saloon that is without equal.

AUSTIN
—you can depend on it!

THE AUSTIN MOTOR COMPANY LIMITED • LONGBRIDGE • BIRMINGHAM

bought for £2,400. The purchasers found half the money themselves. For the remainder they needed a mortgage. One of the partners in the firm of estate agents with which they were dealing was the local surveyor to a building society and, on the basis of his valuation, an advance of £1,200 was made.

Within two months of the new owners moving into the bungalow it had collapsed beyond repair, because of subsidence in the clay soil on which it was built. For their outlay of £1,200, plus expenses, the owners were left possessed of a piece of land, the remains of a bungalow and a mortgage debt of £1,200. They sued the previous owner and the estate agents for damages. Their action failed, and the Court of Appeal has now upheld the decision. The collapse of the house was an exceptional misfortune, attributable to a very dry summer, though the building had been underpinned on at least four occasions previously. But the agents knew of only one underpinning operation, the last, carried out earlier in the same year. This was at the basis of the court's decision. The owner had not been guilty of fraud; the selling agent had not been guilty of concealing any fact of which he had knowledge. The buyers had been unlucky, and misfortune is not a good legal cause of action.

But this special case does illustrate a wider point. The evidence at the original hearing was that the agent selling the property secured a bid of £2,400 for a building which he later advised a building society was worth no more than £2,000, less an estimated liability of £200 for road charges, a net figure of £1,800. The agent of a selling owner may, both in law and under professional practice, act also as expert valuer for a building society. He is not compelled to give to the borrower any hint of the advice he is giving to the building society, although it is the borrower who is paying his fee. In his judgment on the original hearing, Mr Justice Devlin said: ". . . Building societies might perhaps consider whether the great help which they give to people . . . who want to own their own houses might not be extended by giving them the benefit of the expert advice for which the prospective owner is himself paying." There is no reason to think that the purchaser often suffers. But it would be wise for the building societies to make it quite plain that only in the most exceptional circumstances do they regard as a "competent and prudent person" (whose report they must obtain, under the Building Societies Act of 1939, before they make an advance) anyone with a financial interest in the sale of the property he is valuing.

* * *

Oligopoly and All That

One of the most infuriating things about economics (an infuriating subject both to its practitioners and to others) is its lack of an agreed technical vocabulary, coupled with its reliance on terms whose use in non-technical contexts has loaded them with irrelevant associations or inappropriate emotive force. A Dictionary of Economic Terms which provided an entirely agreed technical vocabulary, or even disentangled the different senses in which identical terms are used by different writers, would be no mere dictionary but a particularly massive encyclopaedia; and its compilation could, incidentally, be relied on to keep almost the entire corpus of academic and practising economists out of mischief (other than mutual mayhem) for a good many years.

Failing this ideal, the mystified general reader can find a good deal of enlightenment in a short, unpretentious but carefully compiled glossary* which has been brought up to date by Mr J. R. Winton. It now includes a selection not only of the new terms evolved in the advance of theory but also of the current technicalities and jargon of economic journalism and of the nomenclature of the postwar alphabetical agencies. It will be a godsend to those unfortunate examinees who are requested to "write brief notes on not more than three of the following expressions" and a useful safeguard to theorists inadequately versed in the precise legal content of city terms. Journalists addicted to ironing out inflationary bottlenecks may find here less barbarous alternatives; future historians may sigh over the stark entry "Liberalisation of Trade: see Quotas," and wonder whether sheer alphabetical necessity or personal mischief led Mr Winton to place "Empire Free Trade" between "Embezzlement" and "Enclosures." Mr Winton's dictionary is by no means exhaustive, even of terms in comparatively common use; among his omissions are *bulk buying, closed shop, development charge, econometrics,* and *wage council.* On the other hand, some archaisms survive, and one would willingly have sacrificed them for a frontispiece reproducing Low's poignant delineation of an Unrequited Export serenading an Offshore Purchase. Lack of such light relief, is, however, atoned for by the dust-jacket, which in advertising another of the publishers' long-standing successes offers the reminder that *The Economist* once described Mr Dalton as "a profound student of economic theory. . . ." Another good definition gone west.

* A Dictionary of Economic Terms. Edited by J. R. Winton. *Routledge & Kegan Paul.* 85 pages. 5s.

Absolute Power in France

We have been anxious to abstain as long as possible from any decided criticism upon the proceedings of the new Government in France, partly from a strong feeling with regard to the uncertain accuracy and certain incompleteness of the accounts which reach us through the ordinary medium of "correspondents'" letters and newspaper reports. . . . As long as we had only *rumours* of arbitrary and oppressive acts to deal with, we were willing to postpone comment; but this week the *Moniteur* presents us with ordinances dissolving the National Guard throughout France; pronouncing sentence of *transportation* to Cayenne of five ex-representatives . . . charged with having borne a part in the armed opposition to the late *coup d'etat*; banishing from France and all her dependencies of sixty-seven other members of the Chamber known as extreme Republicans; and exiling, till the present crisis has been replaced by a permanent and safe order of things (that is, during the good pleasure of the President), eighteen other gentlemen, also representatives, and all men of eminence. . . . It is true that if France had clearly and voluntarily conferred this *absolute* power upon the President, we should be unable to condemn these harsh decrees, except they struck the innocent and the innocuous. It is true that if a clear case for martial law had been made out by the circumstances and was sanctioned by the nation . . . these proceedings might in the case of France be just and right. But Louis Napoleon has shown none of those lofty moral qualities which can induce us to believe that the power which he wields thus arbitrarily has been exercised with deliberate justice. . . . The forms of law and the recognised rights of citizens are the only barriers against tyranny and terror. If once these are wholly set aside, the *security* of innocence is gone. . . . Louis Napoleon *may* intend to act justly: he *may* purpose, when the actual crisis shall be overpast, to respect the legal and righteous liberties of the people; *but it lies in his own breast whether he shall do so*;—the people have lost, or left in abeyance, all means of MAKING these liberties respected,—all, at least, save that last means of which no despotism can deprive them, but which it is a grief to virtue, and a stain and reproach to civilisation, to be reduced to resort to.

The Economist
January 17, 1852

Letters to the Editor

Civil Servants Follow After

Sir,—There is one amendment of fact necessary to your otherwise excellent note on the increases in civil service pay that have recently been announced. It is not the fact that civil service organisations asked for a cost-of-living bonus to be adjusted automatically with every five points that the cost-of-living index moved. The proposals put forward by the staff side of the civil service National Whitley Council were certainly for a continuing series of adjustments, but those adjustments were not related to the cost-of-living index but to the wage rates index figure published monthly by the Ministry of Labour. You will see, therefore, that the staff organisations have themselves been extremely modest in their proposals and related their claims to the Tomlin formula laid down by the Royal Commission of 1929 to 1931.

This Institution and other organisations representing the officers in the higher salary ranges share the great concern expressed in your paragraph against this continued discrimination against the more highly paid officers. There is much too little appreciation of the very ill effects that must result from not allowing the pursuit of higher qualifications to be a worthwhile effort.—Yours faithfully, STANLEY MAYNE
General Secretary
The Institution of Professional Civil Servants,
London, S.W.1

Northern Ally

Sir,—I can confirm, from personal experience, almost everything said in the article on Norway in your issue of January 12th. I venture, however, to question the statement that "Russian pressure was strong enough to elicit a declaration that Norway would allow no foreign forces to be based on its soil"—or rather the implication which that statement seems to bear, that foreign bases might have been allowed but for Russian pressure.

My impression (derived from sources very close to "the horse's mouth," if not the mouth itself) is that acceptance of foreign bases was always out of the question, if only because of the principles—or prejudices, if you will—of the Norwegian Labour Party.—Yours faithfully, LAURENCE COLLIER
London, S.W.1

Arab Refugees

Sir,—The article in your issue of January 5th once more draws attention to this unfortunate running sore in the Middle East. But recent events in Egypt have put Britain in a position to make some contribution to the problem.

It is the present policy of the Egyptian Government to deprive the Suez Canal Zone of its normal sources of labour from Egypt. Some of the skilled labour can be replaced by sources from Malta and Cyprus, but lack of unskilled labour leaves a large gap that must be filled. Our late Government began to look for this labour in East Africa. On whose instructions was this done? The obvious source for filling a shortage of labour in a Moslem country is in the teeming camps of Arab refugees in neighbouring states.

An intensive campaign of recruitment for the Canal Zone should be started among the Arab refugees. The Egyptian and other Moslem Arab governments would be hard put to it to demur at such positive assistance to the Arab refugees.—Yours faithfully,
GEOFFREY D. M. BLOCK
London, N.W.3.

[Many people, including some of the refugees, in their need, have made this suggestion. But to travel to Egypt they would need exit visas granted by the countries in which they have taken refuge. Since the Arab States are sufficiently loyal to Egypt to be averse to granting these, no one has pressed the point.—EDITOR].

Students from the Colonies

Sir,—The article in your issue of December 29th is an important contribution to a subject of which too little is known. I would add two comments.

The Church of England hostel, to which your correspondent refers, was opened in November last and is not yet full. It was initiated by the Church Assembly Overseas Council and the capital cost was provided by the two leading missionary bodies, the Church Missionary Society and the Society for the Propagation of the Gospel. It is not proposed to limit students accommodated to members of the Church of England, but no doubt any sponsored by the diocese of origin would obtain some preference.

Your correspondent does not specifically refer to the reports of persistent Communist attempts to approach all colonial students as soon as they arrive in England. Any authoritative information on this aspect of the higher training of colonial people would be useful. It is not always realised that such proselytisation has gone on for some years. When some suspected heads of underground Communist organisations in Singapore were arrested about a year ago, it was a shock to discover that some of them had received a university education in England by means of scholarships provided by the colonial government.

All will warmly agree that hostels specially provided for colonial students are only temporary substitutes for university hostels housing all sorts of university students. It should be borne in mind that many of the students studying in English and Scottish universities will be required to take much wider responsibility politically in their own countries, and the importance of proper background and conditions for study cannot be overestimated.—Yours faithfully, G. A. POTTS
Chinnor Hill, Oxon.

Mr. Lyttelton in Hongkong

Sir,—In an article in your issue of January 5th, your correspondent said that a proposal for representative government for Hongkong was "like suggesting self-government for a railway station."

This is nonsense. There is a perfectly clear distinction between passengers in transit through a railway station, and the station's responsible staff and workers.

In Hongkong, distinctions of a similar nature are already made—e.g., for purposes of taxation, military service, jury duty, etc. No doubt there are serious difficulties in the way of truly representative government in this colony, but the "reason" cited by your correspondent is bogus.—Yours faithfully,
A. K. MURRAY
Hongkong

Credit Restriction

Sir,—The recent restrictions on credit, particularly in respect of loans for capital outlay, will certainly do a lot to cut down the aggregate demand for goods; and this will operate both to redress the balance of payments and to arrest the upward course of prices. But it is important for us to have an adequate idea of the nature and magnitude of the task to be faced.

Thanks to the spending of overseas investments and to generous help from abroad, the capital outlay and general expenditure of the country have for years been altogether excessive. The new rearmament programme involves further heavy Government expenditure. In order to make available enough labour and materials for this purpose, the aggregate capital outlay and general expenditure of the public will have to be cut down by an amount that I would estimate as approaching £1,000 million a year.

The following questions, therefore, arise: Will the capital outlay of the public be reduced enough to obviate reduced expenditure on consumption? If not, will the reduced consumption take effect (a) voluntarily, (b) through lower money wages and lower money earnings, or (c) through higher prices and currency debasement? — Yours faithfully, A. H. ABBATI
Cardiff

Zebras, not Gazelles

Sir,—With reference to your Note in your issue of December 15th, and with particular reference to the problem of the school crossings, I wonder if you know about the system in vogue in the city of San Francisco and perhaps other cities here, whereby schoolboys from the age of 11 receive training in traffic control from the local police department, are furnished with arm badges and

uring the periods immediately prior to ening of school and immediately after osing, act as traffic control officers at propriate crossings.

The boys are not endowed with police owers; but they are instructed with ference to traffic laws and regulations d how to report infringements thereof r vehicular traffic, and they also report the school authorities disobedience on e part of children at crossings.

Membership in the patrol is keenly mpeted for by the boys and is usually ven as a merit award for good conduct, c.

This system has been eminently suc-ssful in San Francisco. It gives a aining to the boys, who, of course, are t paid, and avoids the necessity of ving to establish police control at odd urs over these particular crossings.—ours faithfully,
GEO. E. H. SATCHELL

Trade with Madras

Sir,—I am visiting Madras in order to llect material to write the history of essrs Parry and Co., Ltd., of that city. lthough during 164 years of continuous ading the firm accumulated a large uantity of records, the ravages of the imate and of white ants, silver fish and e other insects, have not spared these chives.

May I therefore ask for the hospitality your columns to inquire whether any ader of *The Economist* could supply e with any letters, memoranda, news-aper cuttings or other material dealing ith trade between the United Kingdom d the Madras Presidency particularly uring the last decade of the eighteenth ntury and the first 50 years of the neteenth. During a large proportion that period Parry's agents in London ere Messrs Bazett, Farquhar, Craw-rd and Co., of 71, Broad Street. ocuments dealing specifically with arry and Co.'s activities would, of ourse, be particularly valuable, but any aterial would be welcome, and would e most carefully treated and returned romptly to the sender. It would not e necessary to forward documents to dia as I shall be returning to England the spring, but any letters sent to is address would be most gratefully knowledged.—Yours faithfully,
EWAN BUTLER
Parry and Co., Ltd.,

Monstrous Regiment of Words

Sir,—I was interested in the article in e American Survey in your issue of ecember 22nd. The second paragraph, owever, is somewhat misleading ecause it suggests that the modern merican habit of searching for a Latin ord to take the place of an English one in striking contrast to the style of the ettysburg Address. May I point out at the Gettysburg Address contains an tonishing number of words which are rived directly from Latin.—Yours ithfully, GERALD MANN
Chigwell

Books and Publications

General Washington

George Washington. By Douglas Southall Freeman. Vols. III and IV. *Eyre and Spottiswoode.* 1,336 pages. 30s. each.

The Washington whom Dr Freeman's monumental biography left with us at the end of his second volume was a young colonel and planter of 27—"moral, just, patient, amiable . . . but at the same time humorless, ambitious, persistent to positive obstinacy, acquisitive, suspicious of rivals and extraordinarily sensitive," as his biographer describes him. The primary purpose of these two succeeding volumes is to trace the development of this young sapling into the oak of Valley Forge, to explain how this not very remarkable young Virginia gentleman becomes, in Dr Freeman's words, "the moral cement of the loose union" of 1776-78.

It is doubtful if Dr Freeman, intrepid biographer as he is, has ever faced a harder task. Lee and his lieutenants, the young Washington of the plantation and the frontier—these are easily explicable figures compared with the paradox of the run-of-the-mill Virginia burgess of 1775 who within two years becomes the sheet-anchor of the revolution. As Dr Freeman, with patient honesty, lays bare the hero's failures along with his successes, the bungling at Brooklyn Heights, the hesitancy that marked the retreat from White Plains to the Delaware, the misreading of intelligence at the Brandywine, one is momentarily tempted to agree with the summary conclusion of John Adams that his contemporaries were idolising "an image which their own hands have molden." Or, as the narrative unfolds the harrowing tale of inefficient and corrupt officering, of inadequate recruitment and short-term service and, worst of all, of persistent intrigue and petty rivalries in the command, Washington appears to acquire his stature mainly by contrast with the swarm of pigmies he is fated to lead, like those mountain peaks which acquire their eminence by the erosion of surrounding, softer formations.

In part, the plausibility of such explanations proceeds from our lack of knowledge. Virginia Woolf wrote an essay on "Not Knowing Greek"; a testament of comparable poignancy might be composed on Not Knowing Washington. Occasionally a corner of the curtain lifts, as when a colonel's lady on his staff writes that he has "thrown off the hero and taken on the chatty, agreeable companion—he can be downright impudent sometimes—such impudence, Fanny, as you and I like." But though Dr Freeman's researches have uncovered much that is new they take us very little further into the company of the other, unbuttoned, George Washington.

But even if we could recapture all the impudences that General Washington imparted to his colonels' ladies, how close would we be to the historical man himself, the figure, that is, who left his mark on his age? A latter-day narrator, John P. Marquand, seeking to create a fictional Washington *de nos jours* in the person of General Melville Goodwin, USA, depicts a *Life* "researcher" retiring baffled at the essential simplicity of his subject; his character is so disciplined, so proportioned that it presents no distinctive angle from which it can be summarily assessed. As one reads the careful, leisurely narrative of Dr Freeman's two volumes, from which all hindsight has been scrupulously excluded, one is driven to the conclusion that this is the truth about Washington. There is no single key to his comprehension, no short cut to an understanding of what he meant to his contemporaries. A generation which has watched an Eisenhower organising the defence of Europe through a jungle of national sovereignties is in a better position than most to appreciate Washington's problems, but to assess the validity of his solutions there is no substitute for studying them in detail.

This is the fundamental justification for what might otherwise appear the excessive length of Dr Freeman's narrative—four volumes to take us to the spring of 1778. Only by inspecting at close quarters a performance which by its very nature was undramatic, of which continuity and persistence were the very essence, can the magnitude of Washington's achievement possibly be grasped. But we are also enormously in Dr Freeman's debt for a freshness and a clarity in his presentation of a highly complex narrative that makes such close quarter inspection easy and indeed delightful. He has told us the story as if for the first time—concealing with a modest grace the enormous effort of assimilation and organisation which his subject imposed. These two volumes fully confirm the promise of their predecessors and leave us impatient for those which are to come after.

Military Tradition

Panzer Leader. By Heinz Guderian. Translated from the German by Constantine Fitzgibbon. *Michael Joseph.* 528 pages. 35s.

Colonel General Heinz Guderian, the creator of the Nazi panzer forces and one of the ablest of the enemy generals, has also been one of the lucky ones. He was born of a military father at Kulm on the Vistula in 1888, and the military tradition has preserved him safe and sound through two world wars and the ruin of his country. Where so many of his contemporaries went mad, died, turned traitor or committed suicide, he marched imperturbably ahead. He is indestructible. Not even Hitler was able to penetrate that moral armour-plating. He was a soldier and a gentleman with an enthusiasm for tank warfare; all the rest lay with the state and with God and was none of his business. And now, at the age of 63, General Guderian has

written a very long, very technical, and rather frightening book describing how it all happened.

Hitler throughout is the noble villain of the piece, wrong-headed but omnipotent. It was Hitler who prevented Guderian from attacking Dunkirk on May 17, 1940. It was Hitler who blocked the direct thrust on Moscow; and when that first appalling winter of the Russian campaign set in, it was Hitler who let the soldiers die of frostbite rather than retreat. Many of the men were still wearing denim uniforms with the temperature at eight degrees below zero. Telescopic sights in the tanks became useless, the oil froze and machine-guns refused to fire. Tank engines would not start unless fires were lit under them. At Christmas Guderian flew back from his ice-bound headquarters—on Tolstoy's estate, Yasnaya Polyana—to confront Hitler with the facts. Patiently he explained that the only thing to do was to shorten the line. Never, said Hitler; if German soldiers were prepared to die for Frederick the Great, then they must die for me. And he sacked Guderian a week later.

While he was in retirement several attempts were made to draw Guderian into the bomb plot. He refused, he says, partly because he disliked murder in any form, and partly because he did not think much of the abilities of the conspirators. So Hitler reluctantly brought him back into high command when the Normandy landing had already been made and the war for Germany was already lost—and then sacked him again a few weeks before the end.

Goering, "a ruthless and very informal man," Guderian frankly deplored, and there are no good words for the Luftwaffe in this book. Himmler was an ascetic filled with fantastic visions. He was like a man from another planet. Goebbels was "a dangerous demagogue." Bormann "a sinister guttersnipe." He was "a thick-set, heavy jowled, disagreeable, conceited and bad tempered man. He hated the army."

These, then, were the men whom Guderian served patiently and pertinaciously, enduring all insults for the love of Germany and his duty. He tried to argue with Hitler but always in vain. Keitel and Jodl, the other two generals at the top, simply became resigned. Only a few others like Speer, "a man with a sensitive heart," his old comrades in the regular army, and the soldiers themselves, seem to have kept Guderian's respect by the time the debacle came.

General Guderian seems to have no real doubts about the rightness of Germany's cause. Hitler, in his eyes, did much for the German people by abolishing unemployment and reviving their hopes again. Only in the end did he fail and not so much by bad policy as by bad management. That is the frightening thing about this book. It is the work of an honourable man who sidesteps all responsibility for politics and who is willing to fight for dishonourable men provided they have the power and the titles. At its worst this is the autobiography of a well-meaning mercenary and a tool. At its best it is, as Captain Liddell Hart describes it in his foreword: "The fullest, most factual, and most revealing account of the war from the German side that has yet emerged."

Wisdom for Teachers

Education and the Democratic Ideal. By A. G. Hughes. *Longmans.* 138 pages. 10s. 6d.

However strong the inclination to the contrary, this collection of talks to teachers by the Chief Inspector of the London County Council must not be cast aside after the first chapter. The inchoate attempts at elementary political philosophy and rather odd theology of his first lecture are more than compensated for by the practical wisdom and sensitive understanding revealed in the succeeding chapters. When Dr Hughes writes of the things he has seen and the people he has met during his long experience of education, there are few to match him in his particular field; and his lectures, here printed, on "Authoritarianism in Schools," "Children and the Creative Spirit," "What do we mean by Backwardness" and, most effective of all, "What do we mean by Discipline," are masterly expositions. On these subjects he has got to the heart of the matter and excludes any discussion of inessentials; his thought is as clear as his exposition, and both are wholly admirable. If he is a little less successful in his lectures on the comprehensive school and the problems of transfer from one type of education to another, he may be forgiven because both subjects are controversial and in both the evidence which should lead to judgment is fragmentary.

The great and oft-quoted Dr Arnold once wrote of the "mischief of subjecting schools to the ignorance and party feeling of persons wholly unacquainted with the theory and practice of education." How to educate those who today ultimately control the national system of education is one of the most difficult and obstinate problems facing teachers and administrators. Dr Hughes has supplied them with a welcome reinforcement, and his book should be made compulsory reading for all councillors who serve on education committees.

Questioning Employment Policy

Vollbeschäftigung Inflation und Planwirtschaft. Edited by Albert Hunold. *Eugen Rentsch Zurich.* 362 pages.

The Economic Department of the Swiss Institute for Foreign Affairs has organised, since the summer of 1950, a series of lectures, some of which are now published in this volume. The contributors include C. Bresciani-Turroni (on Italian economic policy), F. A. Hayek (on "Full Employment, Planning and Inflation"), F. A. Lutz (on "Unemployment and Credit Expansion"), W. Röpke (on the German experiment and its lessons), and Jacob Viner (on "Full Employment at what Price?").

Some of these essays handle trenchantly the doctrines underlying the unholy trinity of full employment, inflation and coercive planning, which dominates the United Nations' report on "International Measures for Full Employment." Others deal with the impact of these doctrines on particular countries, and show why they are unworkable there. The policies of Britain and the United States, though frequently alluded to, are not described at length. Professor Jewkes limits himself to a spirited discussion of "Nationalisation in Britain," from which one can conclude that nationalisation can succeed when carried out by the bourgeoisie with an eye on profits, but must fail when attempted by socialists dominated by the principle of the welfare state. By running the risks of a chronic gap in production, temporarily filled by the United States, Britain has achieved full employment through shorter working hours, restrictive practices, open or veiled subsidies and low productivity in many industries, the mixture being seasoned liberally with inflation.

All contributors take exception to the optimism towards inflation of the United Nations' report, which recommends it as the unfailing remedy for mass unemployment. They criticise its comfortable belief that the creation of additional effective demand does no harm, since its full impact on prices can either be stopped by physical controls or at least be hidden. Since, however, labour has discovered by now that static money wages are useless when real wages fall, the trick on which some of Keynes's original propositions were based no longer works. The wages-costs-prices spiral cannot be permanently repressed,

"I've got two excellent secretaries!"

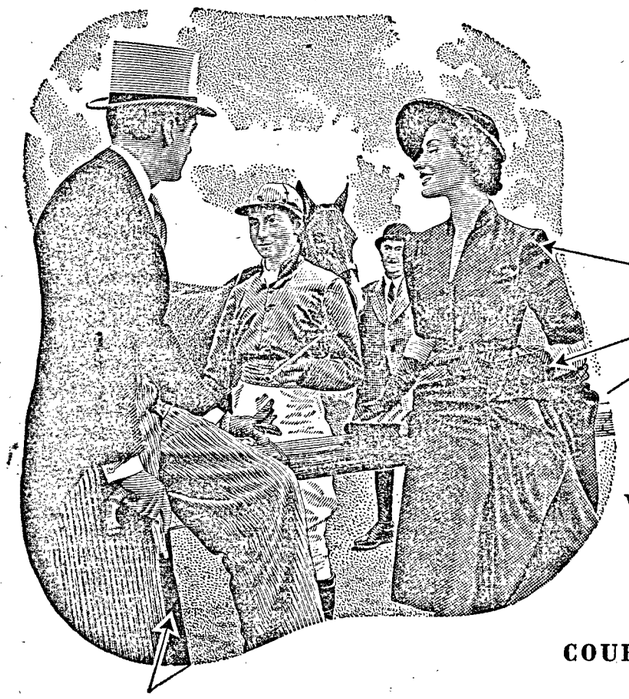
The one, an efficient organiser, typist, assistant... the other, a Dictaphone Time-Master dictating machine.

There is no dictating machine to touch the Dictaphone Time-Master for either sheer dictating efficiency or compact smartness. 4¼ ins. high and only slightly larger than a letterhead, it is a real credit to your desk.

A NEW RECORDING METHOD

Time-Master uses a recording method that is quite revolutionary, yet based on well-proved principles. It records on Memobelts, little plastic belts which retain all the advantages of cylindrical recording — uniform speed, constant quality recording and uniform backspacing. At the same time, Memobelts are small and expendable and can be folded flat for compact filing or mailing.

Every word you dictate — even a whisper — is picked up by the sensitive microphone and recorded clearly and permanently on Memobelts, ready for your secretary to transcribe at the most convenient moment.



LOOK WHAT THE TIME-MASTER OFFERS

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Memobelts. 6. Nationwide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co., Ltd., Dept. O, Kingsway, London, W.C.2.

The Manchester Guardian

REVIEW OF INDUSTRY

Commerce and Finance

to be published on 22nd JANUARY 1952

..... is not just a history of the problems of the past year, but a forum of views on the difficulties and hopes ahead in 1952.

Among the contributors are Sir Theodore Gregory, D. N. Chester, Lord Piercy, Harold Wincott, David Clark, A. K. Cairncross, M. H. L. Pryce, S. R. Dennison. The Fuel and Power crisis will be analysed by experts.

The problems facing the British businessman in the factories, in the City and in the Home and Foreign markets will be reviewed in some 35 special articles.

The number will include as its main feature a *Manchester Guardian Survey of Industry*—a reporters' survey of how the strains of rearmament are being met, based on interviews with managements in the industrial cities of Britain

128 pages

on fine quality paper, well bound in a coloured cover

for no reliable contraceptive against inflation has yet been discovered.

It is a pity that this very important publication will only reach a German-speaking public which is not enamoured of inflation, having twice had its fill of it, like Germany, or like Switzerland, enjoying prosperity and over-full employment by ignoring most of the full employment nostrums. But the Zürich Institute is to be congratulated on a very valuable publication.

Popular Statistics

Facts from Figures. By M. J. Moroney. *Penguin Books.* 472 pages. 5s.

To attempt to introduce the theory of statistics in a readable and popular form in the Pelican series is an ambitious task. Mr Moroney tackles it in a brisk style, which is enlivening for the most part although there are moments when his individuality intrudes too much into the text. He is an industrial consultant, and his interest in statistics tends to be concentrated on their importance in technology and science. What little he has to say about statistics for the economist is somewhat deprecatory and suggests an impatient and superficial approach to the subject. He reserves some particularly harsh words for index numbers, without attempting to strike a balance-sheet between their faults and their advantages. But for the man in industry or in the research laboratory who wants to know something about sampling, quality control and the general statistical tests and measures, there is much to recommend in this book.

There is a useful chapter on the right and wrong way of charting information, and the diagrams throughout the book are excellent. While the theoretical treatment is rather disjointed, it leads from the elementary laws of chance to the basic ideas of correlation and the analysis of variance. The mathematical notation is kept down to a minimum, but the various formulae are set out clearly and numerous examples are worked out for the reader to follow. It is, therefore, very much a practical guide.

Here, however, a criticism must be made. It is inevitable that a few errors should slip into a book of this kind, but too many are apparent in the model calculations. This only tends to defeat the very object of this book, which is to inspire confidence in statistics in the sceptical layman. Given that these errors are corrected in later editions, the ordinary reader can learn a great deal about statistical techniques from this small book—provided he responds to the "now see if you can do this" treatment.

Text and Reference Books

The World Diplomatic Directory, 1951. Edited by R. A. E. Hefter. *Drury Press.* 970 pages. £4 4s.

This volume is the second in a series which is intended to appear annually. Like the 1950 edition, it lists the diplomatic and consular representatives maintained by governments in each other's capitals and principal cities, and provides short notes on the careers of most of the senior diplomats. Inevitably a few changes have occurred since the directory went to press, and the publishers, recognising this difficulty, offer to provide periodic supplements without charge to subscribers. The 1951 edition includes, in addition to the sections which appeared last year, a thirty-page summary of procedural points, diplomatic privileges, and forms of correspondence. The number of biographical notes has been greatly increased, and the staffs of High Commissioners' offices and of British trade commissioners and trade correspondents throughout the Commonwealth are listed.

Whitaker's Almanack, 1952. 1,188 pages. 15s.

The eighty-fourth annual edition of Whitaker's Almanack follows the general lines of its predecessors but contains several new sections as well. A special supplement deals with the general election and gives the lists of members of the new government and Parliament. For the first time since the war the sections on professional fees and local taxation licences have been restored, while the trade tables have been recast and include figures of world trade. Several other new sections appear and the annual review of events of the year in Great Britain and abroad is continued.

The Carpet Annual, 1951. *British Continental Trade Press, Limited.* 264 pages. £1.

Directory and Handbook of the Scientific Instrument Manufacturers Association, 1951. 251 pages. No price.

Both these year-books provide background information about their industries and directories of the firms engaged in them.

The Municipal Year Book, 1951-52. *The Municipal Journal Limited.* 1,680 pages. £3 15s.

In addition to a review of the administration of local government the fifty-fifth edition of this year-book gives reference data for individual local government and public utility services, and a directory of government departments and local authorities in the United Kingdom.

The creation of the Ministry of Local Government and Planning in January, 1951, was important to local authorities and the work and organisation of the department is described in some detail.

General Statistical Bulletin. *Organisation for European Economic Co-operation, Paris.* Obtainable from HMSO. 150 pages. 10s.

This new bulletin, of which the first issue appeared in September and the second in November, contains a series of tables on production, employment, trade, prices and finance for OEEC countries, Canada and the United States. Figures mainly cover 1937 and 1938 and the postwar period. While much of the information is already available in one or other of the international publications, it is helpful to have these main economic statistics under one cover—and very clearly set out. There are also some new features—totals and index numbers of combined production of various commodities in member countries and, in particular, some provisional figures of OEEC index numbers of agricultural production. The statistics are said to be presented on a comparable basis throughout, and a volume of explanatory notes on their compilation is promised shortly. The Bulletin will be published every two months.

STALIN'S GREATEST VICTORIES

Teheran where, playing on American suspicions of British imperialist designs, he ensured that the Anglo-American forces in the Mediterranean were not used in the area of Russian ambitions, the Balkans.

Yalta where, having defeated his enemies on the battlefield, he proceeded to outmanœuvre his allies round the conference table; where, having by the success of his armies made Russia the dominant power in Europe, he exacted concessions from his allies which made Russia the dominant power in Asia.

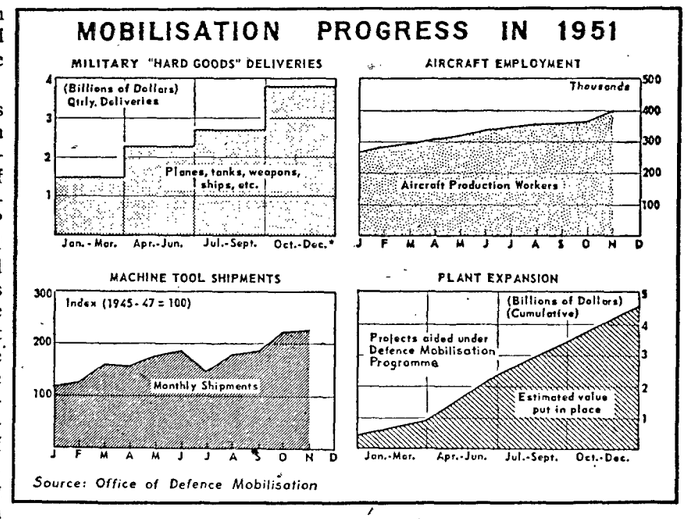
AMERICAN SURVEY

Miracles Taken for Granted

Washington, D.C.

IT is the practice of reporters who are in attendance when a President delivers his State of the Union message to a joint session of Congress to descend from the press gallery to the floor of the House as soon as the speech is over, and there to invite the immediate comment upon it of Senators and Congressmen who are drifting out of the chamber on the way to lunch. The custom was followed when Mr Truman finished reading last week's message, but more than ever there entered into these observations a dreamlike divorcement from what in fact had occurred. More than ever they suggested that, by some extraordinary mix-up, many of the company on the floor of the House were commenting on an entirely different speech from the one that had been heard in the press gallery.



Several members said it had been an election speech — "the opening gun of the Democratic national campaign." Others indicated that it had revealed appalling weaknesses and deficiencies in the Government. "It looks like the tow line has parted and the ship of state is foundering," said Representative Arends of Illinois, drawing upon the saga of the *Flying Enterprise* for a highly topical metaphor. Representative Martin of Massachusetts, the Republican leader of the House, in co-operation with five Republican colleagues, had sent up to the press gallery, while the speech was still being delivered, a statement which said:

> It is evident that the Administration, trapped between its own lack of statesmanship and its record of blunders, is without policies for solution of either our international or domestic problems.

None of this bore any relation to what was in the State of the Union message. The Congress—virtually all the Republicans and a substantial proportion of the Democrats too—were already embarked upon the over-riding business of an election year, which is the search for whatever looks as though it can be employed to secure the approving attention of the American voter. In general, though there were some exceptions, Mr Truman was addressing men in whose minds the idea of electoral success was pacing backwards and forwards like a lion before feeding-time.

The chief significance of Mr Truman's report was "real progress this last year on the road to peace." The language in which he was offering the proofs of this important achievement was a good deal less than inspired, and some of the proofs were themselves a good deal less than complete. What he called "the debit side of the ledger"—continued Soviet military expansion, inadequate civil defence preparations in the United States, difficulties and delays in producing the latest types of airplanes and tanks, and economic and political tensions abroad—was set forth in distinctly sketchy terms; and on the credit side of the ledger some big question marks were treated as little ones, or passed over entirely.

But there was enough to sustain the claim that real progress had been made, and in one very vital particular the President was recording a series of momentous successes. The figures on the development of the American rearmament programme during the past twelve months were remarkable; if the last war had not taken most of the surprise out of demonstrations of the speed and scale on which the United States can operate, they would be staggering.

As it is, the progress which the President noted in his State of the Union address and later in his economic message, and which Mr Charles Wilson, his Director of Defence Mobilisation, had also described in a comprehensive report to the White House, will be observed with very considerable respect in other capitals. It has been passed over in Washington almost as though the President and Mr Wilson were dispensing bromides and platitudes. But no such error of emphasis is likely to be made in Moscow. The President told Congress:

> During this past year we added more than 1 million men and women to our armed forces. The total is now nearly 3,500,000. We have made rapid progress in the field of atomic weapons. We have turned out $16 billion worth of military supplies and equipment, three times as much as the year before. . . .
>
> We are now in the second year of a three-year programme which will double our output of aluminium, increase our electric power supply by 40 per cent, and increase our steel-making capacity by 15 per cent.

The days when the United States could enter a period of international danger with 150,000 men in its armed forces are so far away now as to have been forgotten. Nobody now considers it remarkable that the United States should be spending, as Mr Wilson notes, more than $1.5 billion a year on the development of atomic energy. There is a tendency to yawn over the revelation that deliveries of military supplies and construction have now reached a rate of $2 billion a month. Production of aircraft, tanks, artillery and so on is already five times what it was during the first three months of the Korean war; but that is taken for granted, too.

Mr Truman suggested that the way in which the basic capacity of the United States to produce has increased is "perhaps the most amazing thing about our economic progress." The word amazing should no doubt be used carefully and infrequently, but the President seems to be well entitled to employ it here even though almost nobody in America shows much outward sign of amazement at what is going on.

Aluminium production is now 860,000 tons a year. It was 750,000 tons only eighteen months ago. If all goes well, it will be 1,500,000 tons a year or more by 1954. The booming rearmament programme has caused no power cuts in American cities. In one year—last year—the United States added 7 million kilowatts to its capacity to produce electricity. There never has been, either here or anywhere else on earth, such an increase in twelve months in electric power capacity. The steel industry has added 8 million ingot tons a year to its production since the Korean war began. The planned peak of 120 million tons a year is due in 1954.

★

There are some other figures from Mr Wilson's report. In 1950 about $7 billion was put into the building of industrial plant in the United States. Last year the total rose to $11 billion. As the chart shows, over a third of the new facilities qualified for tax concessions. Completed factory construction last year was 90 per cent higher than it had been in 1950. The aircraft industry, by no means a dwarf before all the trouble began, expanded by 67 per cent last year, increasing its payroll in the process from 239,000 in November, 1950, to more than 400,000. Employment in ordnance plants, which was 24,000 before the Korean war began, is now about 60,000. In the later stages of the war Mr Henry Wallace wrote a book called "Sixty Million Jobs," which was widely regarded at the time as wildly visionary. Last week President Truman almost casually mentioned that at the moment "there are 61 million people on the job."

Barring unforeseen events, this mammoth, glacier-like progress of American production will go on in the background, though the foreground be filled with political fisticuffs. It will go on and, unless it should falter, it will receive only perfunctory attention from Congress. It is merely expected of the President that he should make suitable reference to this miracle in an address which, as Senator Morse of Oregon thoughtfully pointed out last week, "will be received better in the light of history than in the confusion of the present."

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Aid in Election Year

[FROM A CORRESPONDENT IN WASHINGTON]

THE new foreign aid Bill will not be submitted to Congress until after the Atlantic Council meets at Lisbon in February and perhaps not until the middle of March, but much thought is already being given to the best way to frame it in an election year. During the recent recess, an exceptionally large number of Senators and Representatives made trips abroad, and returned with the assurance of those who have seen with their own eyes. They have since compared their impressions with those of their constituents and discovered a strong desire for a cut in the budget, particularly for one which the voters themselves will not feel too keenly. The final vote on this year's foreign aid Bill, therefore, will reflect the need of Congressmen for re-election, as well as the needs of foreign countries and of the alliance.

What are the legislators likely to favour, judged by their statements? They are for a rearmament effort on the part of allied nations proportionate to that of the United States; the more military the form of the aid proposed, the better its Congressional prospects. Congressmen also support increased unification in Europe and increased productivity all over the world, whether or not it is related to the allied defence effort.

Of these three main Congressional preferences, the first will give the Administration the most trouble, but the trouble will be largely of its own making. Last year the Administration's witnesses drew a sharp distinction between economic and military aid, and planted in Congress the conviction that the two can be separated. This conviction has already been proved ill-founded, and apparently full use will be made of the power, granted in the Mutual Security Act, to transfer up to 10 per cent of the military funds to economic purposes. The report of the Temporary Council Committee has shown that more weight must be given to economic considerations in Europe if the right balance is to be struck. Mr Truman's insistence that military demands be reduced in his new budget suggests that a similar concern for the American economy may be needed.

It seems unlikely, however, that the mood of Congress on this issue can be changed in time to affect the new appropriation. So off-shore purchasing, reimbursement for facilities and the maintenance of American forces abroad, and other such devices will be used to the utmost to supplement economic aid. And in presenting the Administration's new requests, the close connection between the economic assistance proposed and the armament efforts of the recipients will be underlined.

The links between the military and the Mutual Security Agency, which is to handle economic aid, will be strengthened by the expected appointment of Mr John Kenny, a former Assistant Secretary of the Navy, to succeed Mr Richard Bissell as deputy administrator of MSA. But he will come to an agency where the morale is steadily sinking. The Economic Co-operation Administration under Mr Paul Hoffman was a spirited organisation; its offices were permeated with a sense of mission. But the Mutual Security Act deflated this high spirit by arranging that the major decisions should be made elsewhere, by Mr Harriman, the co-ordinator of the whole foreign aid programme. At the same time, Congress made clear its intention that economic aid under the mutual assistance programme was to be temporary, and that both staff and funds should be cut. Under such circumstances, the loss of many of the more vigorous spirits is inevitable.

The insistence of Congress on greater unification in Europe presents the Administration both with opportunities to seize and pitfalls to avoid. Senator Green, when he returned from Europe, urged the Administration to consider refusing aid to nations not co-operating in efforts at unification. This was a warning from a very consistent supporter of the Administration's international policies. Many of his colleagues would like to attach strings to economic aid with which the recipients could be bound together. A sympathetic hearing is also assured for the Administration's proposals to strengthen the North Atlantic Treaty Organisation. The many Congressional visitors to General Eisenhower's headquarters this autumn came away with the conviction that much was being accomplished there. They were more doubtful of the rest of the Nato structure, and inclined to repeat the story that, while two years ago nothing stood between the Russians and the Channel, now they would have to struggle past committee after committee.

*

When President Truman reported to Congress on the state of the union, one of the few paragraphs to win more than a thin round of applause was the section on Point Four. For at least two reasons, Point Four is the government programme most capable of capturing the American imagination. It is founded on the principle of productivity, which guarantees a favourable response all the way through American society, from the National Association of Manufacturers to the United Mine Workers. Technical aid to the underdeveloped countries also recalls the neighbourly things Americans liked to do before the days of world power, such as sending medical missions and Hoover relief to distressed areas; it has the flavour of an early American "barn raising" at which all the neighbours voluntarily gave their services.

Under the Marshall plan, Europe's productivity increased by glowing percentages, but the impression now is that the increase was due more to the revival of a former pattern of production than to the kind of streamlining that would take production much beyond earlier figures. Without radical changes which would be resisted by trade unions, by management, and by cartels, the upsurge of productivity in Europe is thought to have reached a point of diminishing returns. This belief is likely to be reflected in similarly diminishing returns from Congressional committees and in attempts to attach conditions to economic aid.

In the underdeveloped areas, such considerations do not apply. Believers in productivity as the evidence of efficiency and the advocates of aid to the under dog can agree on technical assistance. And there is a general understanding, in Congress and outside it, that the Point Four programmes are long range and must be supported over a period of years.

The carrying out of Point Four has suffered, however, from a lack of adequate study on the part of the government. One underlying question which might well be considered is the truth or falsity of the fairly prevalent assumption that technology alone is enough, and that underdeveloped countries, as their economies blossom, will automatically develop a devotion to the democratic ideal. In the days of the Chinese missionaries, the phrase "rice Christian" diagnosed an interest which was not of the spirit. Today the West is perhaps too inclined to assume that "stomach Communism" is something for which technology is a complete cure, and to disregard the possibility that the Communists might continue to supply the ideas, while technology filled the empty stomachs.

American Notes

Consent of the Senate

High on the Senate calendar this session is the ratification of the Japanese peace treaty and the security pact providing for the retention of American forces in Japan, submitted together with the agreement to admit Greece and Turkey into the Atlantic Treaty Organisation and the mutual security pacts concluded with the Philippines and with New Zealand and Australia. It is not very likely that the Senate, by refusing its consent, would jeopardise the careful work of Mr John Foster Dulles, the Republican expert. But Mr Dulles, who must steer the Japanese treaty through the Senate, would be shielded from brickbats, particularly those of members of his own party, if he brought with him a promise that once the treaty is ratified the Japanese will conclude another with the Chinese Nationalists. Without such an assurance there might have been an effort to write a tactless requirement into the treaty itself.

This assurance Mr Dulles now seems to possess, at least as it relates to the territories held today or to be held in the future by the Nationalists. But it is not so clear that the Japanese have given up hope of resuming full trade with the Chinese mainland. There have been suspicions in the United States that the British reluctance to put pressure on the Japanese to recognise General Chiang Kai-shek was based on anxiety to preserve British markets in South East Asia, which, it is suggested, the British consider more important than the interests of the anti-Communist alliance. Mr Dulles, in an article in *Foreign Affairs*, makes no secret of his hope that the Japanese will be compensated for the loss of their China trade by a share, perhaps on a quota basis, of markets further south, which it is believed will expand with American technical assistance. This would help Japan to pay for its own food and raw materials and shoulder a larger share of its own defence burden.

Since the end of the war, American aid totalling $2 billion has covered the Japanese trade deficit and, recently, expenditures in Japan for the support of the Korean fighting and for Korean rehabilitation have met the heavy dollar drain. Mr Dodge, the economic adviser to the occupation authorities, has warned the Japanese that these windfalls will not continue, and they must consume less and export more. New steps are now contemplated to stimulate exports to the dollar area, and technical aid and loans are being energetically sought in the United States to modernise Japanese industry. American investors are interested, but, before the money flows across the Pacific in substantial amounts, further assurances are required that it will be allowed to flow out again, and the priorities the Japanese are going to assign to their various external obligations must be established. This must await ratification of the Treaty.

Freedom for the Capital?

It is almost as incredible that residents in the capital of the free world should not have the democratic freedom of the right to vote as it is that residents in the capital of a nation founded on a revolt against taxation without representation are in fact taxed without being represented. Yet this is the position of residents in the District of Columbia as a result of the Founding Fathers' fear that the national capital would be dominated by local interests, and of Congress's reluctance to delegate any of its constitutional authority over Washington.

Why it is so reluctant is hard to understand, for such details as salaries of city employees and licences for sightseeing buses are to national legislators both uninteresting and time wasting. In fact, Congress seldom, if ever, has enough leisure even to consider District legislation that might be controversial. Washington is administered by three appointed Commissioners, who have under them an unwieldy confusion of over eighty agencies badly in need of reorganisation. At least this unsatisfactory system does not cost the nation much directly. Although about half the land in the District is owned, free of taxes, by the federal government, it contributes less than 10 per cent of the city's budget; the rest comes from local taxpayers.

In 1948 both parties had home rule for Washington on their election platforms, and in 1949 a Bill passed the Senate with bipartisan sponsorship, only to die in the House of Representatives. A similar Bill with even more influential backing is before the Senate this week, as its first business in the new session, and seems sure to be approved, although Senator Olin Johnson of South Carolina may indulge in a little filibustering. He is apparently afraid that in a self-governing capital Negro citizens might be given the same opportunities and privileges as white; at present Washington is notorious for racial discrimination. Similar fears in the reactionary House District Committee are one reason why the Home Rule Bill never reached the floor of the House in 1949, and why a great deal of pressure will be needed to force it out for debate this year.

Even if they do get home rule, Washington residents will have no real say in national affairs, nor will they be complete masters in their own city. Like Alaskans and Puerto Ricans, they would only be second-class citizens of the United States, able to choose a non-voting delegate to Congress, but not to vote for a President. They would be allowed to elect a school board and a city council, but its ordinances would be subject to Congressional supervision and the mayor would be appointed by the President.

Gamblers Lay Off

The New Year began with nationwide attacks on two fronts in the federal government's war against crime; a sustained offensive is expected, perhaps to demonstrate that the Attorney General is not so unfit for his job as the tax scandals have suggested. Some 500 sellers of narcotic drugs —many of them specialists in the "teen-age trade"—were arrested in cities all across the country. And in each of the 93 federal judicial districts, special grand juries are being summoned to enquire into organised crime. In New York, Washington and other cities, local groups were already looking into gambling and corruption on the water-front, amongst the police and elsewhere.

An ordinary New York jury has been unable to decide whether the elegant Mr Frank Costello, believed to be the head of a nationwide gambling syndicate, was guilty of contempt of Congress when he refused to testify, on grounds of health, before the Senate investigating committee which revealed the existence of these syndicates. But Mr "Greasy Thumb" Guzik has been acquitted on the same charge, for he was held to be justified in refusing to testify for fear of incriminating himself, even though he only learnt of his constitutional right by watching others being examined on television. So far the government's own drive against organised gambling has been on lines that should be familiar to Mr Guzik as a survivor of Al Capone's gang. Treasury agents have been scrutinising the income tax returns of all suspected racketeers, and in eight months have collected over $27 million in unpaid taxes and penalties.

This drive came at the same time as the new federal tax on bookmaking and other forms of betting, which requires gamblers to register, at a cost of $50, keep records and pay a 10 per cent tax on their gross takings. Since betting, except at race tracks, is forbidden by law in every state but Nevada, this means that a gambler is damned by the state if he registers and by the federal government if he does not. As a result the government is being saved from the embarrassment—to which many people believed Congress should not have exposed it—of drawing substantial revenues from illegal earnings. The yield from the tax is so far reported to be disappointing, only about $200,000 a month instead of the $30 million that was hoped for. In the whole of the country, only 7,706 gamblers have registered, rather than the 18,000 that were expected. Gamblers do not seem to be working without registering, but to have laid off work altogether, for the time being, at least. Arrests for illegal bookmaking in New York, in spite of a police drive against it, have declined sharply; in Boston 18,000 people are unemployed because gambling concerns have closed; even in Nevada, where bookmaking is legal, it is no longer found profitable.

New Prescription for Health

The Commission on the Health Needs of the Nation appointed by the President at the turn of the year represents a genuine effort to find a new answer to the embittered question of how satisfactory medical care is to be brought to Americans who cannot afford heavy fees and hospital bills. For a long time the stock reply of the Administration has been the Ewing plan for compulsory health insurance, but this has been fought tooth and nail by the American Medical Association as "socialised medicine." The AMA has been challenged by the President to produce a better scheme, but it refuses to admit that a problem exists, and the most it will concede is that federal money might be given to the states to help pay the medical bills of the poor.

To find a way out of the deadlock, Mr Truman has called in the distinguished Dr Magnuson, who was so successful in raising the quality of medical care given to ex-servicemen. Dr Magnuson was allowed to name his own fourteen-man commission and is free to write his own prescription. He is a Republican, and an outspoken critic of the Ewing plan, and red tape of every kind; the commission need not report

Located in the heart of the City, the London office of this old established bank offers its services to those interested in trade with countries in the Americas and throughout the world.

NEW YORK . . . 70 Broadway

until after the election; and a member of the board of trustees of the AMA was invited to join.

None of these pledges of a disinterested approach to a great national problem has lessened the Association's incurable hostility to what it regards as federal interference. The association's president denounced the creation of the commission as a political move to influence the elections; Dr Gundersen, an AMA trustee who at first seemed willing to serve, has withdrawn his name. It becomes more and more doubtful how far the stand-pat leadership of the association speaks for the doctors it professes to represent.

"Watch That Blood Pressure, Doc"

Herblock in the *Washington Post*

Among the problems to which the commission's attention is directed are the supply and distribution of doctors, dentists, and nurses (some areas have 450 people to each doctor, others 2,500); the adequacy of medical facilities, particularly in view of civil defence needs; how far private insurance schemes solve the problem of medical and hospital costs; and the proper role of the federal government in matters affecting health. The commission's writ runs further, therefore, than merely finding a palatable substitute for health insurance, though this will be its most controversial task. Dr Magnuson's own preference is for a network of clinics, sustained by the federal and state governments, which would provide a first-rate diagnostic service, with bills adjusted to the patient's capacity to pay, but would leave treatment in private hands at present.

Hollywood's Fever Chart

After three years of a wasting illness, Hollywood seems to be, if not on the mend, at least getting no worse. The number of weekly admissions to cinemas stood recently at about 57 million, about 3,000,000 higher than it was at the bottom of the trough last year. But it is still far below attendances during and just after the war, which, at 80 million or better, nourished the fatal illusion that any picture, no matter how bad, would make money. Owners of cinemas today are no longer deceived; they know that if they are to stay in business they will have to struggle hard to hold their audiences. Higher taxes, payments on hire purchases, and higher food prices make it more difficult to squeeze out the price of a cinema ticket; it is, in some cases, a choice between bread and circuses. The winter seasons, too, always bring better television shows. More attractive pictures at lower prices are Hollywood's own specific for its disease, but it is never very easy for producers to keep their resolutions of economy.

Many film companies and theatre owners are also well on the road to turning television, their old enemy, into a profitable partner. None of the big companies is yet willing to sell films to TV stations, but many of the small ones are devoting all their resources to the new market; it is a remarkable fact that more hours of film entertainment are now being turned out for television use than for exhibition in cinemas. The larger companies are beginning, also, to show signs of interest. Paramount Pictures Incorporated has invested a substantial amount of money in television research, and owns an interest not only in the DuMont Television Laboratories, but also in the Telemeter Corporation, which is perfecting a coin device that will allow owners of television sets to pay for films and have them piped into their homes. The Republic Picture Corporation has come to an agreement with the Musicians' Union permitting it to release its old and new films to television. Fifteen theatres are now equipped for large screen television and two hundred more will be soon, if the necessary copper can be found.

Hollywood's hopes that television may be just what the doctor ordered still have obstacles to conquer. The union between the American Broadcasting Company and United Paramount Theatres has yet to receive the blessing of the Federal Communications Commission. And actors, as well as musicians, will have to be placated before the producers can turn their old films into television money-makers. Mr Roy Rogers and his horse Trigger, familiar figures of the sagebrush, have secured an injunction against Republic Pictures forbidding the company to sell any of their old films for commercial telecasting, on the grounds that this would injure an endorsement business they have built up, and would imperil the success of the films they are now about to produce for television. The Screen Actors' Guild also proposes to enforce a clause in its basic contract which restricts the sale or licensing for television of films made since August, 1948.

Socialism in Washington

When it comes to a choice between profits and socialism, the presidents of the Puget Sound and American Power and Light Companies have no difficulty in forgetting their devotion to free enterprise. These are the two largest private electricity companies in the State of Washington and both of them are fighting not to escape from public ownership but to be allowed to surrender to it. If they succeed in selling their properties to Public Utility Districts, electric power in Washington, already to a great extent generated by government-owned plants, will also be distributed almost entirely through publicly owned facilities, as it already is in Nebraska.

These are the two states in which the PUDs have found most favour, although their establishment is permitted in about 18 others. They enable people living in the country to set up electricity undertakings so that they may have better and cheaper service than private companies are prepared to offer in rural districts. The PUD is a political subdivision with a special purpose; its directors are elected, or appointed by the State Governor, and it usually has power to tax and to issue tax-free bonds, without being liable to taxes on its own operations.

These privileges enable PUDs to compete very favourably with private companies. It is because it thinks it will sooner or later be driven out of business that the Puget Sound Company, which last year sold about one-fifth of its properties to the City of Seattle, is now prepared to sell the rest at an agreed price of nearly $100 million to a group of seven Washington PUDs. The sale has long been under discussion, but the company insisted that its integrated system must be bought as a single unit and permission for PUDs to co-operate in the purchase of utilities outside their own boundaries was only recently granted. The transaction is now held up because the bankers' voluntary credit restraint committee has refused permission for the necessary bonds to be issued, on the grounds that they would be inflationary.

The comfortable financial position of PUDs also explains why another group of three of them is prepared to pay about $65 million for the Washington Water Power Company, a profitable concern which has, however, a book value of only $37 million. This would seem to be a very satisfactory proposition for the American Power and Light Company, which is required to divest itself immediately of this, its last important subsidiary, under the Public Utilities Holding Companies Act. But the sale is being fought by stockholders, who want the company's shares distributed amongst themselves, and by opponents of public power in the state.

JUNGLE IN RETREAT!

The Story of a United Nations Mission in S.E. Asia led by Ritchie Calder, News Chronicle Science Editor.

Beginning on Monday January 21, as an exclusive series of articles in the News Chronicle, is Ritchie Calder's remarkable account of his journey through Borneo, Java, Thailand, Burma, Pakistan, India and Afghanistan. "Jungle in Retreat!" tells the story of 800 million people in S.E. Asia, of the constant struggle for life amid poverty and ignorance and above all of the fight of Men Against Disease. It is a brilliant eye witness account of how new influences are being brought to bear on living conditions, occupations, habits and religions and of how modern science is slowly winning against reaction and prejudice.

THE FIRST ARTICLE WILL APPEAR IN THE NEWS CHRONICLE ON MONDAY, JANUARY 21

Also on January 21 the News Chronicle will begin the issue of a special group of publications in the "Background to the News" service, to cover the Calder mission and amplify the newspaper articles. This group will consist of:—

a. **Map of S.E. Asia, 35" x 22", in four colours.**
b. **Dawn Over Asia**
c. **West Meets East**
} by Ritchie Calder, C.B.E.

These three publications will be available to subscribers for 3/- post paid. For this sum, schools subscribers will receive also a copy of "Teaching Notes" and a booklet in the "Background to the News" service on the British Commonwealth.

Please order through your newsagent. INQUIRIES to: **NEWS CHRONICLE** 12/22, BOUVERIE STREET, LONDON, E.C.4

Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

But a vast Plant now handles 25,000 tons of ore a day

It was in 1751 that Axel Cronstedt, a Swedish mineralogist, first discovered the metal he called nickel. The science of chemistry was only just emerging from the dark ages of alchemy and, even on a tiny scale, his methods were laborious. Today, in the great mines and smelters of Ontario, the source of most of the world's nickel, modern knowledge and equipment have brought the process to a high pitch of efficiency. But still the search goes on for even better methods of production, to meet an ever-growing demand.

THE WORLD OVERSEAS

The Fight for Indo-China

THE most crucial decision on which the future of South East Asia may shortly depend is how far the Americans would go in supporting the French and Vietnamese if the Chinese invaded Indo-China. Little has emerged publicly on this question from the staff talks which took place in Washington last week between the American, British and French chiefs of staff, with Canadian, Australian and New Zealand observers. But it must be assumed that these discussions have at least thrown a good deal of fresh light on the latest technical possibilities of executing a political decision about American military aid, if and when it is made.

In spite of the difficulty of defining the American position, there are considerable disadvantages in not making it clearer at this stage. Suggestions for a Pacific defence pact of all the nations in the area have so far fallen through in the face of many obvious difficulties. But it is another matter to give an American guarantee in advance for what American forces may well be driven to defend in the end. The Chinese have so far shown little sign of understanding the springs of American public opinion about the Far Eastern war. They have, on the other hand, been forced to recognise facts like the impossibility of attacking Formosa while the American Seventh Fleet patrols the China Seas. If the Chinese invaded Indo-China both the Americans and the British would find it very difficult in practice not to be drawn into providing the French and Vietnamese with all the help that lay in their power. And, since this fact may be lost on the Chinese, it ought to be made clear now.

The problem of the American commitment in South East Asia is by no means new. In the early days of the struggle, soon after the Communists had decided at their Calcutta conference of 1948 to launch armed insurrections in Burma, Malaya and Indonesia, the American view was that South East Asia could not in the end be held. Since then this view has changed, under the pressure of political need and with the growth of American power as a result of the partial mobilisation which followed the Communist aggression in Korea. Today, the Americans have long since accepted the task of supplying the French and Vietnamese forces in Indo-China with arms, on a scale which has probably already made the difference between a fighting withdrawal and an aggressive defence.

The first time a contribution in terms of American military forces was formally discussed was during the tripartite staff talks in Singapore last May. These were held at the insistence of the late Marshal de Lattre de Tassigny. He had just won a crucial round with the Vietminh, and a new confidence had surged up in Hanoi and Saigon that the civil war could be brought under control. But he wanted to know how he stood with his British and American allies, if Chinese aid to the Vietminh grew in such scope and volume that the war became in fact, if not in name, the repelling of a Chinese invasion.

As the months have passed, although fear of this invasion has grown, it has become clearer that the staff talks in Singapore had yielded no decisive result. However, Marshal de Lattre made a journey to Washington during the autumn to discuss the flow of American military equipment for Indo-China; this flow had not come up to expectations owing to the diversion of supplies to Korea after General Ridgway had succeeded General MacArthur. He also took the opportunity of raising the question of an American guarantee at the highest level with both Mr Acheson, the Secretary of State, and General Bradley, the Chief of Staff. But, again, though the military supplies were increased, particularly in the vital category of more transport aircraft, the Marshal made little headway on the broadest issue of all, a firm and public American commitment to help to defend Indo-China against aggression.

During the past few weeks the Chinese have been strengthening their forces very considerably in the southern province of Yunnan. Road and rail communications were improved earlier in the year and troops have now been disposed nearer the frontier. At the same time, inside Indo-China the Vietminh have been fighting a determined battle for the key town of Hoa Binh. In the words of General Salan, the new French commander, the Vietminh have been using three divisions, the 304th, 308th and 312th, "equipped by China with a luxury unknown till now." French aircraft have also lately been fired on for the first time by guns clearly directed with the aid of radar, which could only have come from Soviet sources. Whether all these factors portend a Chinese offensive is a matter of guesswork. But it seems optimistic to believe that the new measures can be solely defensive and taken solely through fear of a Nationalist raid on Hainan.

Need for a Common Strategy

There was hope in Paris that decisions on Indo-China might be discussed at the Rome meeting of the Atlantic Council. But in the event they were left till the recent Washington talks. There the French again asked for a formal undertaking about American military support. They failed, however, to get all they wanted. It is true that they can, according to General Juin, count on air and naval help; that, in referring to the Far East, the joint communique issued by President Truman and Mr Churchill spoke of recognising "the overriding need to counter the Communist threat in that area" as transcending "such divergences as there are in our policies towards China"; and that reports from Paris, as well as Mr Eden's speech at Columbia University, suggest that American and British action might be taken through the medium of the United Nations, as it was in Korea. Yet the fact remains that there is no specific commitment for sending ground troops quickly enough to hold back a Chinese army already numbering between 160,000 and 350,000 men. The lack of it may well provide some measure of incentive to the Chinese to attack, and the United Nations cannot in any case be counted upon to act as it did in Korea since the Russian veto would be exercised in the Security Council. There is, moreover, a strong body of American opinion which says, in the words of the *Washington Post*, that it would be impossible and intolerable for the United States to commit a land army to the jungles of Indo-China.

President Truman and Mr Churchill spoke of "a broad harmony of view" in the Far East. Unfortunately there is little enough evidence of it. The Americans are most understandably concerned to bring the Korean war to an end and not to take on new commitments elsewhere; even if they were willing to send forces to other parts of the Far East, they might only be able to do so by dangerously denuding Korea. On the other hand, the outstanding need in the Far East is for a common strategy of resistance. The three western powers dispose of the only military forces capable of effective resistance to the Soviet-supplied Chinese armies. If they cannot agree on a uniform policy of containment, they run a very serious risk of winning one particular battle at the expense of losing the campaign as a whole.

Technical Aid's Troubles

LAST week the United Nations Assembly recommended the drawing up of a plan to provide a large fund from which backward countries could obtain grants or low-interest loans for development. Not one of the thirty countries which voted in support of this plan is likely to provide any substantial sum to make it a reality, and in view of the opposition of all the major western nations it is doomed to remain indefinitely in the blueprint stage. This was the clearest example yet of the unreality of so many UN debates on economic aid for backward countries. A more realistic tone would be given to these debates if a fuller hearing was granted to the men most directly concerned—the UN experts who go out to Asian, African and Latin American countries to run the technical aid programmes on the spot. After a year's experience of what technical aid involves in practice, they could provide the Assembly with an enlightening, and enlivening, account of the situations with which they have been faced.

A year in the field has convinced several of these experts that none of their work, not even the purely technical projects, can make much progress unless most of the recipient countries can be persuaded to overhaul their administrative methods drastically. They have come up against some fantastic examples of rigid and over-centralised bureaucracy. In one country receiving UN technical aid they found that petrol could only be obtained by applying to the Prime Minister, while the issue of official pencils and paper also required the personal sanction of a cabinet minister. In another client country a big investment in a plan to produce seed potatoes, a project on which UN experts had lavished much time and energy, was sacrificed because, when a drought occurred, no local official could be found who had the authority to buy water. An even more extraordinary situation was revealed in the case of a UN health project which involved the local production of serum. The serum-making plant was already in full operation, when it was found that its stock of coal was getting low. An application for a modest amount of coal was at once sent to the appropriate department, where it was held up because the only official authorised to grant it was ill. When he finally returned, the form was forwarded to the Minister, whose consent was also needed; but he had just gone up-country and could not be found. Nobody else dared to sign the form, so the coal ran out and the serum froze.

Displaced Dams

Corruption is as familiar an obstacle to UN technical aid men as is bureaucracy. In several client countries they have found a classic example of this fault—the displaced dam. This phenomenon occurs where governments have conscientiously raised funds for water conservancy, but certain high officials have seen to it that the dams were built on their own or their relatives' land, regardless of geography. The dams, therefore, stand high and dry, with no prospect that any water will ever accumulate behind them. There are eighteen such dams in one country alone.

Procrastination is another bugbear. Members of cabinets are often loth to take a decision that will exact some unpopular sacrifices—notably new and direct taxation—from their families, their colleagues or their adversaries. They prefer to take no decision rather than a decision that will entail criticism and disfavour. Again, technical aid is, unfortunately, available from several sources, the co-ordination between which is often faulty. It can come directly from the United Nations, or through the specialised agencies, or even directly from individual countries such as the United States (under mutual aid) or—in the Middle East—Britain. A statesmen who wants to look busy but to postpone action can and does call in a succession of these authorities, and they fall for the bait. Many under-developed countries are over, not under, advised.

A rapid turnover in governments, however, is perhaps the most fatal obstacle to any practical assistance on the part of the United Nations, for most technical aid projects take time to mature. Recently a government which had embarked on an ambitious development programme with UN aid was overthrown by a military coup, and the new rulers assumed, without bothering to inquire, that all their predecessors' actions had been in the wrong direction. The whole programme, which had been running successfully for over a year, was therefore scrapped. Crops specially raised from new imported seeds rotted in the fields; mosquitoes swarmed back into areas half cleared of malaria; and rural trainees were abandoned, to their bewilderment, halfway through their courses. In Bolivia, the classic example of this kind of trouble—it has had eight revolutions in the last ten years, and eight finance ministers in eighteen months—Uno has taken the bull by the horns and secured the appointment of ten technical aid experts to high posts in the Bolivian civil service for terms of three to five years. Their presence may provide continuity in administration and planning—provided that no future coup unseats them in a body.

There is, of course, another side to the picture—that of the under-developed countries themselves. More than once a mission from the International Bank or some other international body has presented a small, impoverished country with a magnificent development blueprint far beyond that country's means. Some months ago the recommendations of an International Bank mission to Colombia drew some trenchant criticisms on these lines from the Bogota press. One columnist contrasted the methods of the American expert, who, he said, usually began by telling his client to scrap all his equipment and invest billions in new machinery, with the way in which Italian industrialists squeezed the last ounce of work out of endlessly repaired machines. "Why not get some Italians over to advise us?" he asked. But it is to the credit of the UN technical aid men in the field that they are far more concerned to get something moving on a "two bamboos and a bootlace" basis than with such vast and unrealistic schemes.

The Refugees: An Unsolved Problem

LAST November the General Council of the International Refugee Organisation reported that although the refugee problem was not now of sufficient magnitude to justify extending the life of the IRO, it was, "in terms of human suffering," grave enough to demand the urgent consideration of the United Nations. But neither the valedictory warnings of the IRO nor the new High Commissioner's sombre appraisals of his task have stirred the Social Committee of the General Assembly into making more than half-hearted provision for dealing with the problem. Yet it remains pressing, however tedious and unrewarding it may have come to seem in the course of years.

The United Nations have always regarded the refugees as a temporary problem which repatriation, emigration or the passage of time would cause gradually to disappear. In fact, in spite of magnificent work by the IRO, they have come to constitute a more or less permanent problem. There are those who because of sickness, age or disability can never fend for themselves and who have not been lucky enough to benefit from the generous but limited offers of permanent asylum which many governments have made. There are those able-bodied refugees who have neither become assimilated in their country of "first asylum" nor been able to emigrate from it. Finally, there are the new refugees from beyond the iron curtain who are arriving at a rate conservatively estimated at between 15,000 and 20,000 a year. Dr van Heuven Goedhart, the newly appointed High Commissioner, does not know the exact number of human beings

falling under his mandate, but he has told the Social Committee that he already knows of 1,500,000 who could look to him for legal protection. But so limited are his powers and so small are the funds at his disposal, that even the most needy amongst them can look directly to him for little more.

His first care must naturally be to do what he can for those who were completely dependent on the IRO for care and maintenance and for whom no adequate alternative provision has been made. It is primarily for these people that he has requested and received permission to launch an appeal for a $3 million fund. The most unfortunate of them are in the Far and Middle East. In Shanghai the IRO has been responsible for 5,000 refugees of European origin; 2,000 of them have actually been supported by it and about 400 need institutional care. The number of those requiring aid increases steadily as the refugees' private resources run out. No authority or private agency has agreed to take over responsibility for them from the IRO, and their situation has been described as "most desperate." There are various smaller groups of a few hundred or less, especially in the Middle East, who are also entirely dependent either on international charity or on the efforts of voluntary agencies.

Barriers to Emigration

In addition, several governments, particularly those of Greece and Italy, which are overburdened with domestic economic and social problems, need outside help if they are to be able to fulfil their good intentions towards the destitute refugees whom the demise of the IRO has thrown on to their hands. In Trieste, for example, there are 7,000 refugees, 900 of whom are seriously ill, many with active tuberculosis, living in military government camps and overcrowded private houses. While the Allied military authorities are responsible for their administration, it is the Italian Government, already responsible for about 24,000 refugees in Italy itself, which is footing the bill.

For the able-bodied refugees remaining in western Europe emigration, which seems the obvious solution, has in practice serious limitations. Most of these people have already been interviewed by one or more of the foreign selection missions which have visited the DP camps, and have for one reason or another been turned down. Moreover, some of those who have been accepted have refused to go when they found that it meant leaving some old or sick member of their family behind.

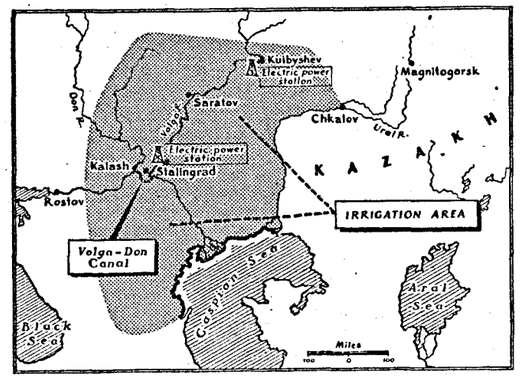
Dr Goedhart has recognised that an essential part of his task is to make sure that these people receive their fair share of the new opportunities for emigration which will be provided by the new migration agency set up by the recent Brussels conference. Until emigration is made easier for these people their only hope seems to lie in finding work in their present countries of asylum. But their chances of success are not great. Many of them are living in countries where unemployment, the presence of other refugees, or acute domestic economic difficulties provide serious obstacles to their assimilation. It is difficult, for instance, to blame the Italian Government for refusing to offer permanent asylum and employment to more than 9,300 of the 24,000 refugees in Italy. Nor can the Greek Government be condemned if it can do little towards resettling the 4,500 IRO refugees left on its hands. Greece's economy is particularly meagre, it is inundated with thousands of Greek refugees from Eastern Europe, and it is receiving more than its fair share of the new non-Greek refugees fleeing across the iron curtain. Austria again, with limited economic resources, has 300,000 *Volksdeutsche* on its hands in addition to 24,000 former IRO refugees.

Western Germany has already assimilated 60,000 former IRO refugees, but here also the difficulties facing the 80,000 who remain are formidable. The Federal Republic is already overcrowded with the 9 million German refugees. The DP law adopted by the Federal Government in February, 1950, adequately defines the civil and political rights of the non-German refugees but withholds from them the economic and social rights accorded to the German expellees. It would be wishful thinking to believe that any increase in the Federal Republic's economic prosperity will necessarily be reflected in the position of the non-German refugees. Nevertheless, it is encouraging to find that North-Rhine Westphalia is making a determined effort to deal with its quota of refugees. With most of the cost borne by the Federal Government, it plans to settle 6,000 refugees in special settlements built in areas where work is easy to come by. Already five of these, containing 850 flats and about 2,800 people, have been built and are on the whole proving a success.

It is clear that it is not enough to provide even the able-bodied refugees merely with legal protection. Their principal hope must lie in emigration overseas; otherwise they must be helped to find jobs where they are—and to this end Dr van Heuven Goedhart hopes to persuade governments and international agencies to collaborate on long-term projects of economic reconstruction which will absorb the refugees. His task, in all its aspects, is made the more urgent by the steady flow of new refugees from eastern Europe. Many of these have received a most indifferent welcome, and their temporary needs are certain to make serious inroads into the $3 million fund which Dr Goedhart is hoping to raise. Since his administrative budget for 1952 has already been pared to its basic minimum ($752,000), many people regret that the Assembly has not seen fit to make him a definite grant. To fail to make sure that those fleeing from Soviet domination get a fair deal is not only callous but in the end benefits only Russia. The refugee problem will not be solved by pretending that it is not there.

Soviet Electricity Plans

HAD an innocent outsider been looking at the Russian economy during the last year or so through the Soviet press and radio, he might well have got the impression that all the productive forces of the country were harnessed exclusively to produce canals, dams and hydroelectric stations. The ballyhoo surrounding the "Great Projects" launched just over a year ago and the simultaneous withholding of information about a new five-year-plan has led many people to dismiss all the "Projects" as merely a smoke-screen to hide from outsiders the real changes in the Soviet economy.



There is certainly an element of bluff in the emphasis laid on the programme of electrification and irrigation. Soviet industry is certainly not as keyed up for this purpose as the Soviet press would lead one to believe. On the other hand, these projects seem to fit into the pattern of Soviet economic development and it is worth while to examine, from the evidence available, what the Russians intend to do—or at least claim they will do—in this direction in the immediate future. The aim of the projects is three-fold: to save fuel and power through a rapid development of hydroelectric power; to improve or reclaim land through vast irrigation schemes; and to reduce transport costs by improving navigation and rendering many regions more self-sufficient.

Preoccupation with electricity is not a new thing for Soviet leaders. General and regional shortages of fuel have always put a premium on the development of electric power. Lenin, in a slogan, which for him was exceptionally naive, asserted that "Soviets plus electricity = Communism" and as soon as the Bolsheviks came to power they tried to foster electricity generation as one of the important roads to progress for their backward economy. The achievements have been tremendous: from less than 2,000 million kwh generated in 1913 to 104,000 million kwh apparently generated in the current year. Yet in per caput production Russia is still lagging behind the industrialised western countries. Before

the war, Stalin and Molotov—referring to 1936 per caput output—admitted that it was still nearly 3·times less than in the United Kingdom and between 4 and 5 times less than in the United States. Despite the expansion of Soviet generation the per caput relationship has not altered appreciably ; against the American 2,200 kwh per head and the British 1,100, the Russian figure was only 450 in 1950.

The balance is somewhat restored by the fact that in Russia only 25 per cent of electricity generated goes into private use, compared with roughly 35 per cent in Britain and in the United States. But the Soviet planners are not satisfied with the present state of affairs and have drawn up vast plans of expansion. After the war when Stalin set the long-term targets for Soviet industry—to be achieved somewhere towards the end of this decade—of 500 million tons of coal, 60 million tons of steel, etc., he did not mention electric power ; but from later Soviet statements it appears that the corresponding target is 250,000 million kwh.

In view of the shortage of fuel (20 per cent of the electricity generated is obtained with the aid of peat) water power must play an increasing role in this gigantic develop-

ment. In 1940 water power stations provided 13 per cent of total electricity. By 1950 their output increased by nearly one half and their share of the total rose to over 18 per cent. It is one of the tasks of the "Projects" to raise still further the proportion of electricity produced through water power. It was, therefore, decided to harness the Volga, the Dnieper and other rivers for the production of electric current. The main emphasis was laid on the Volga, since Russian experts consider that this river, together with its tributaries, should, when fully exploited, provide 65,000 million kwh annually. The power-stations included in the present projects, scheduled to be completed by 1956, are to supply over 23,000 million kwh per annum. Many new stations are to spring up during the period, such as the Gorki station on the Upper Volga, which is to supply the local heavy engineering and motor-car industry, the Khakovka station on the Dnieper and many smaller ones on the Turkmen Canal.

By far the most important, however, should be the Stalingrad and Kuibyshev stations on the Volga. According to Russian plans, even the Dnoproges—once the pride of the Soviet regime—will look insignificant by the side of these giants. The Kuibyshev station is to have a capacity of 2,000,000 kw, that of Stalingrad 1,700,000 kw. Each is to produce 10,000 million kwh. More than half of their combined output is to be transmitted to the Moscow region, over a quarter is to be used industrially on the Volga region and more than one-sixth for irrigation.

The objectives and advantages of such an electrification drive are obvious. Soviet planners now aim at regional self-sufficiency and try to cut down transport costs. The economic development of the Volga region has been hindered by lack of fuel, and for the growing engineering industry the supplies of brown coal from the sub-Moscow basin are not sufficient. Great importance is now attached to the Volga region, to which numerous machinery factories were evacuated during the war. The exploitation of the second Baku, it is argued, has settled the local problem of oil, but that of coal still remains and before the war roughly one-fifth of Russia's coal was consumed in the Volga region. The electrification drive should, it is hoped, reduce these shipments drastically.

The Russians expect to kill two birds with one stone. The Volga region contains roughly one-fourth of the population of Russia, but its southern part includes much semi-steppe land and is always threatened with drought. It is, therefore, proposed to use electric power to assist in the irrigation schemes. The south Ukrainian power station is to be used for the same purpose in the southern Ukraine and north Crimea, and the stations on the Amur for the irrigation of the Kara-Kum desert. Thus, it seems that more electric power is now going to be used to help agriculture and the countryside. Hitherto, industry and the towns have been the main beneficiaries.

Hongkong's Declining Trade

[FROM OUR HONGKONG CORRESPONDENT]

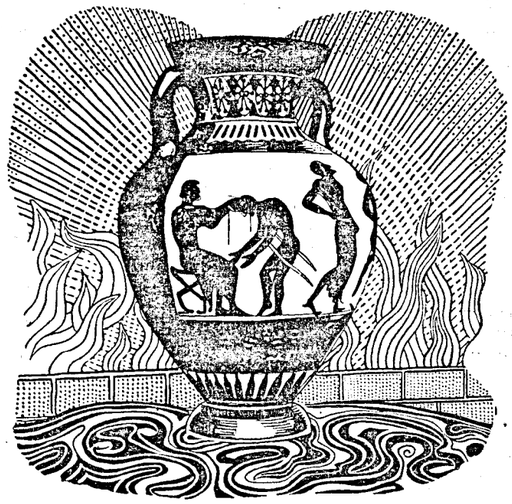
THE spectacular progress and prosperity achieved by Hongkong since the war may now be brought more or less to a stop through the operation of the United Nations ban, now a year old, on the export of strategic goods to Communist China. Despite some nominal relaxations of the ban, the Colony is labouring under growing difficulties, and for various reasons resentment has increased rather than diminished with the passage of time. It is widely believed that the blockade has had no perceptible effect on China's material capacity to make war ; on the contrary, it has actually helped to raise internal morale in China by appearing to substantiate the accusations of foreign hostility and encirclement. At the same time, it has severely injured the prospects of trade and development not only of Hongkong but of the whole area around the China Seas.

The effects of the embargo must be considered in qualitative as well as in quantitative terms. The trade position of Hongkong worsened gradually after March, 1951, but only partly because of the decline in world trade. Until then the rise in prices fully offset the decline in trade and stocks were drawn upon. Since then the decline in trade has much more than counterbalanced the great rise in prices.

HONGKONG'S TRADE
(In HK $ Million)

	Oct., 1950	Mar., 1951	June, 1951	Oct., 1951
Imports	369	535	404	418
Exports	433	557	374	274
Total	**802**	**1,092**	**778**	**692**

Shipping has declined correspondingly:



SHIPPING AT HONGKONG
(Monthly Averages, in '000 Tons)

	1949–50	1950–51	Oct., 1951
Net tonnage of	820	748	650
Vessels entering	305	298	242
Cargo discharged	145	193	104
Cargo loaded			

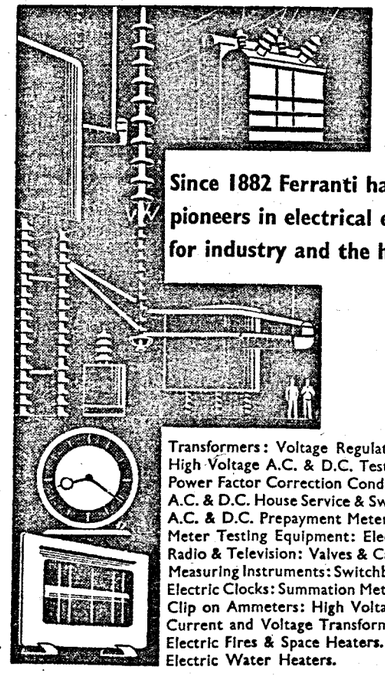
The decline in the nominal value of trade is only about 15 per cent, because of high prices ; but the real decline, in quantity terms, is over 30 per cent.

The reduction of trade with Communist China and Macao is mainly due to the Colony's own measures of control of strategic materials, which were in operation well before the

CHROMIUM

THE only workable source of the element chromium is chromite, a compound of chromium, iron and oxygen mined in Russia, Africa and Turkey. Chromium is known everywhere as the plating on taps, hardware and motor fittings, but it has other and more important applications. Alloyed with steel, for example, it imparts superior strength and surface hardness, and it is from chromium that stainless steel derives its resistance to corrosion. As well as being the source of chromium, crude chromite ore is used to make heat-resisting firebricks and cements for the construction of furnaces. Chromium derives its name from the Greek "χρῶμα", meaning colour, because its compounds are almost always coloured. Known as chrome pigments, some of these — the chromates of lead, zinc and barium for example — are used extensively for colouring paints, linoleum, rubber and ceramics. Chromium sulphate is important in tanning, and potassium dichromate in the dyeing of wool, silk and leather. Other chromium compounds are used in photography and in the manufacture of safety matches.

I.C.I. makes a complete range of chrome pigments for the paint, linoleum and rubber industries, besides employing chromium compounds as catalysts in the manufacture of aviation petrol and methanol, an industrial alcohol.



ICI

LEAD LASTS

LEAD SHEET AND PIPE CAN BE DELIVERED IMMEDIATELY FOR ALL BUILDING WORK

The Technical Information Bureau of the Lead Industries Development Council exists to give assistance on problems relating to the use of lead sheet and pipe in building work. Details of its application are given in a series of information sheets. These sheets are available to architects, surveyors, builders, plumbers and other technicians interested upon application to the Council. "Students" applications should be endorsed by an instructor or master of a technical school.

BULMER'S (CALCULATORS) LTD.,
7 & 8 POULTRY, LONDON, E.C.2.
Telephone: Central 3611.
Sales and Service throughout Great Britain

7.30 for 8.0

THIS IS THE HALF-HOUR when the day ends and the evening begins. It is a time for adjustment—for changing gear, as it were. The hustle and bustle of a business day give place to the more leisured, measured pace of evening. One becomes pleasurably aware of the good fellowship about one, the excellent dinner not far off, the fine wine and the impeccable attention . . . On most evenings at the Connaught Rooms, these are the feelings of as many as 2,500 people. For, at the Connaught Rooms, no fewer than twenty of the most sumptuous banqueting halls are gathered together under one roof. In this, London has an amenity without equal anywhere on earth.

Catesbys LINOLEUM
and CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

We invite your enquiries to our Linoleum Contract Division:

United Nations decree, and have been much less clumsy in action.

HONGKONG'S TRADE WITH COMMUNIST CHINA AND MACAO
(In $ HK Million)

	Oct., 1950	Jan., 1951	June, 1951	Oct., 1951
Imports	119	87	93	75
Exports	209	277	179	88

In terms of quantity, Hongkong's exports to mainland China fell from 84,000 tons in October, 1950, to 14,400 tons a year later.

In short, Hongkong's trade with China has been cut by as much as 80 per cent. But this only represents about one-third of its total trade. The other two-thirds has also suffered from the embargo, to a lesser but still heavy extent. One reason for this has been the false publicity about Hongkong, in America and elsewhere, which has caused traders in distant markets to turn their attention elsewhere. Another is that Hongkong, which is an important centre for the manufacture of various goods for Asian markets, has been deprived, by the embargo, of essential supplies and materials of all kinds. There have been repeated "relaxations" of the embargo, but these have had no practical effect, because they have so seldom been followed by any allocation of the scarce materials in question.

At present the US Government allows the export of American-made consumer goods to Hongkong, though in smaller quantities than hitherto. There has also been a relaxation of the ban on American automobiles for Hongkong. Tinplate and cotton were "freed"—but none has been available in practice, and lubricating oil has been held up for some months. A quantity of black plate has, however, recently been released. Last August the US Government banned the import into the United States of any goods which, though prepared and processed in Hongkong, contain materials emanating from China. This has severely affected such local manufactures as furs, canned foods, rattans, fruits, ginger and toys. A petition for relaxation of this ruling was rejected although exceptions were made for special American needs obtainable only from China, for example bristles, duck feathers and tung oil.

There is acute mistrust in Hongkong of Japan and a growing fear that Japanese trade competition, encouraged by the United States, may deal a heavy blow to the Colony's interests. It is felt to be unfair that the Americans should strongly condemn British or other Allied interests suspected of trading with Communist areas; but if the Japanese do the same thing, it is always considered a necessity, and even sometimes a virtue. Recently, for instance, $HK1 million worth of Japanese grey sheeting was sold to Communist China—and the deal was financed through Hongkong.

Unemployment in the Colony is rising rapidly. The latest official estimate of 40,000 in October is admittedly incomplete, and must since have been greatly exceeded. The main incidence is in the lower middle-class, among clerical workers, and in the fringes of industry. The effects of the embargo, in this connection, are perhaps inseparable from those of Japanese competition. Dealers and general merchants are badly hit. The Chinese New Year (late in January) is customarily the general settling day for all debts and obligations; it is feared that this year there will be many closures at that time.

Already the embargo has caused a large migration of skilled and intelligent manpower to Communist China; their rice-bowls broken in Hongkong, these men are forced to move to the mainland. On the other hand, refugees continue to arrive in Hongkong, swelling the ever-increasing population, which now approaches three million. There is still a large number of persons who would rather be in Hongkong than in China or Formosa. But the technical and general value of these refugees to the community is less than that of the departing emigrants, particularly as economic opportunities grow even more restricted.

Ceylon, England and the Commonwealth

[FROM A SPECIAL CORRESPONDENT]

CEYLON'S affection for Great Britain can be measured by the bristling fever which is preceding Princess Elizabeth's forthcoming visit. Far more than the Colombo Plan Exhibition her announced visit fills every conversation and is causing an advanced feeling of contentment to spread over the island. The Commonwealth idea, however, is still so new that it has not yet had time fully to sink in. On the one hand, most people distrust the implications of the Commonwealth bond; on the other, even the Communists have nothing but good to say about England. Ceylon's awareness of the outside world goes back only to 1948 when, finding itself a sovereign independent state, it had to count its friends and, for the first time, to think in terms extending beyond the tip of its nose: that is, beyond India.

What attracts Ceylon to the Commonwealth is only England. About the other members the Ceylonese are not enthusiastic. Pakistan and Canada are too remote; the Ceylonese do not quite see how they and South Africa can both be full members of the same club; they are convinced that India will become expansionist the moment Nehru dies—however ridiculous this fear may seem to those who know India. Finally, Australia they see only as the weak link in their own defence: as the country for whose benefit they are expected to expose themselves as a staging-post and a base, and no Ceylonese wants to run extra risks for "white" Australia's safety. Many in Ceylon, indeed, do not see why they should not be content with a bilateral treaty with Great Britain rather than involve themselves in a Commonwealth which may mean danger.

Whether or not to stay in the Commonwealth has now become a major political issue. Being a small Asian country, Ceylon looks on the Korean war as a terrible warning—a warning to stay neutral—and though the Government wishes to remain in the Commonwealth, all the Opposition parties want to leave it. The controversy is made more bitter by the existence of the British naval base at Trincomalee. To the Opposition this appears merely as an invitation to Communist attack, to another Pearl Harbour; even to many on the Government's side, Trincomalee is a base for peace time only, to be brought to an end as soon as war becomes imminent.

Great though Ceylonese goodwill to Britain is, it is not always helped by the behaviour of the British on the spot, who sometimes find it difficult to remember that, in Asian countries, every resident British citizen is always and everywhere an ambassador of his country. The officers at the Trincomalee base are occasionally over-enthusiastic in reminding Ceylonese that the base is British territory; it is said that the Prime Minister himself has been painfully reminded of this. The local mercantile community has trodden upon every Ceylonese corn, and where there was no corn to tread upon, they have succeeded in creating one.

Whether Ceylon will stay in the Commonwealth depends upon whether the United National Party (UNP) which now forms the Government, remains in power. It is a common jest that the UNP is neither united, nor national nor a party; it is a loose coalition held together by the force of personality of the generally popular Prime Minister, Mr Senanayake. Parliament has 101 members in all, and, in a way typical of the island, it is practically impossible to get an accurate picture of the relative strength of the parties. But those members who do not belong to the UNP appear to be distributed as follows: 11 independents; 4 Lanka Sama Samaj Party (Stalinist Communists); 15 New Lanka Sama Samaj Party (Trotskyists)—the only Trotskyist party in the world; 2 or 3 Federalists; 6 Ceylon India Congress

who represent Indian labour ; 6 Tamil Congress ; 1 Ceylon Labour party ; 6 appointed members ; 6 Freedom party led by Bandarnayake, the ex-UNP leader.

New Party's Programme

The creation last October of the Freedom party has introduced an important new factor into Ceylon's already unstable politics. This new party may well turn out to be the Government's main opposition ; it is gradually rallying round it the leftish elements of the UNP, the other more reasonable leftish members of parliament and the independents. Its programme is calculated to exercise an immediate attraction. Its three tenets are: quit the Commonwealth ; fair play for Buddhism (for example, they want Buddhist priests to be given the same weight as witnesses to documents as Catholic priests); and the national languages, Tamil and Sinhalese. This last is a very live issue, especially as 60,000 young people who have just graduated in those languages now find themselves without jobs because they do not know enough English.

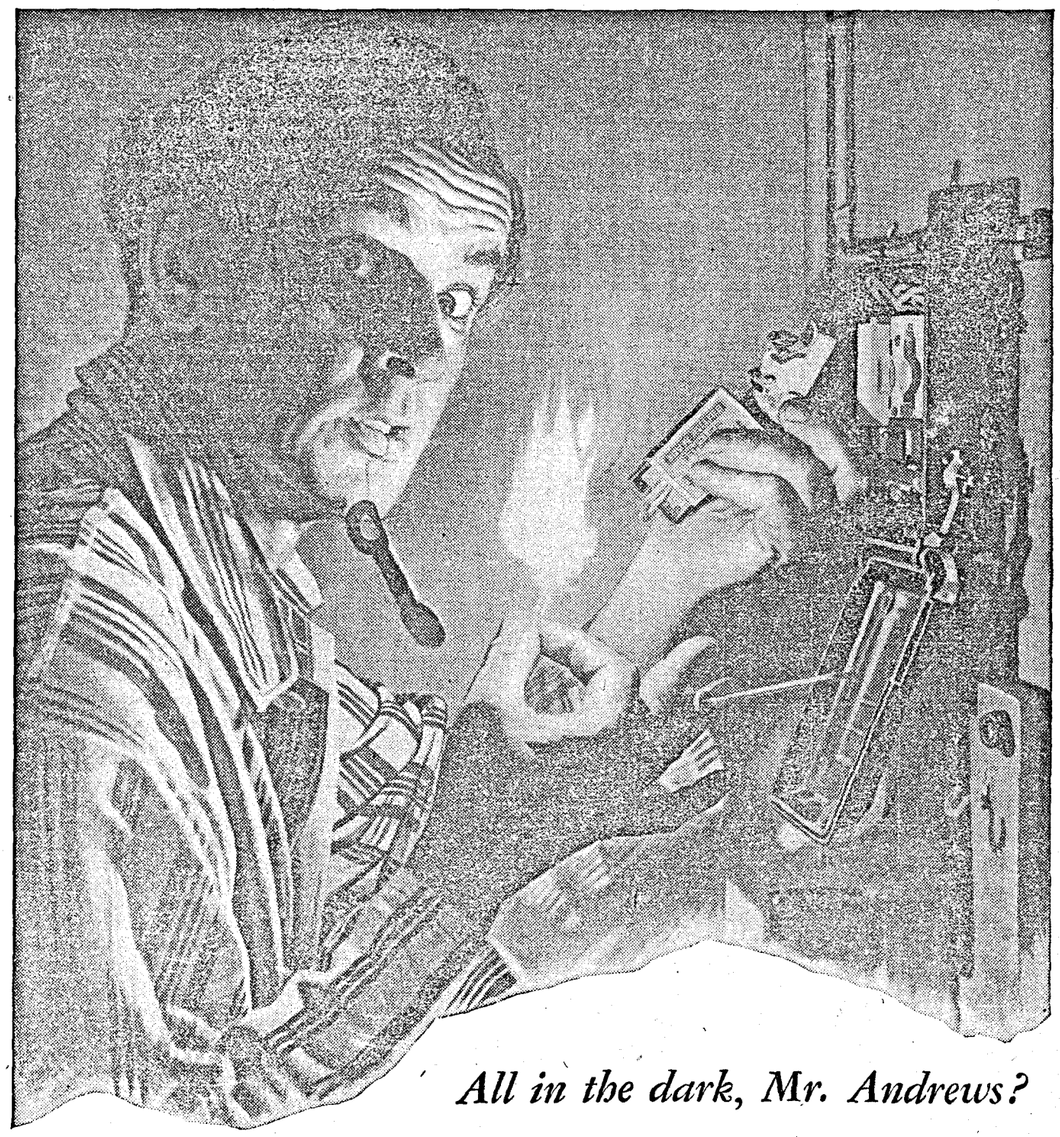
In order to amend the constitution and leave the Commonwealth it is necessary to get 68 votes—two-thirds of the house. It is not certain that any party will get that much support in the coming elections, though the present Government may ; but if it does not, it is just possible that the leftist group, including Mr Bandarnayake, might win the 68 votes. If so, it is likely that Ceylon will leave the Commonwealth, although it would probably still be willing to sign a treaty with Great Britain and perhaps an economic agreement with America. It will, however, at the same time tighten its ties with China, for, even in democratic Ceylon, many are looking to China for a possible short cut to prosperity ; and meanwhile no one wants to alienate what they feel may yet be the buoy to which all may have to cling.

State Discipline in Rumania

[BY A CORRESPONDENT]

DURING recent weeks the Rumanian Press has been presenting a glowing picture of the highly productive industrial machine which has been built up in Rumania. According to these articles the first year of the state Five-Year Plan was, to all intents and purposes, completed one month ahead of schedule. The names of those enterprises which have contributed to this achievement, and even of individual workers who have overfulfilled the norms allocated to them, have figured prominently in the pages of *Scanteia, Viatsa Sindicala* and other official papers. There have been proud claims that some workers, notably in the textile industry, have already started on the 1952 and even 1953 output programmes.

It is therefore significant that during this period of self-congratulation the Rumanian Government should have found it necessary to impose a further and more stringent measure of industrial discipline. On November 21st the Praesidium of the Republic issued a decree which makes it difficult, if not impossible, for most workers to leave their place of employment or choose another job without the consent of the director of the enterprise to which they are attached. The decree insists once more on the unquestionable right of the state to transfer its employees from place to place as it sees fit, and underlines the compulsory nature of such transfers.



The preamble to the decree justifies the severity of these measures by declaring that they have been taken to further the "state discipline" which would appear to have supplanted the old-fashioned conception of "Socialist discipline." In general, state discipline is defined as the total subordination of personal interests to those of the state. In the field of industry, it appears to impose the strict fulfilment and over-fulfilment of all economic plans.

Past measures designed to control the movement of workers (such as collective contracts, the grant of priority claims to accommodation, holiday and insurance benefits) have been ignored by many workers who have attempted to better their lot by changing their jobs. The result has been a serious disorganisation of production in many branches of the national economy, not excluding one of the most cherished governmental schemes in Rumania. In an article dealing with certain shortcomings on the Black Sea-Danube Canal, *Viatsa Sindicala* complained of a tendency amongst the workers to move from place to place several times a month with complete disregard for the detrimental effects of such undisciplined habits upon production. But what really infuriated the paper was the complacency of the foremen about this situation. Rather than denounce the culprits, they have preferred to resort to a wage competition to attract the necessary complement of workmen to their own sites. In this case, not only is state discipline infringed, but the Government's policy of reducing costs and effecting economies is directly, if not deliberately, challenged.

Examples of Bad Workmanship

Moreover, despite the laudatory comments of the Rumanian press, certain papers such as *Scanteia* and *Viatsa Sindicala*, the official trade union paper, make no attempt to hide the fact that the quality of industrial products leaves much to be desired, and that bad craftsmanship and lack of experience and skill are serious obstacles in the way of industrial expansion. For example, the reaper-binders produced by the 21 December works have shown serious deficiencies, and broke down in the very first days of last year's harvesting campaign. This, in turn, was due to the inferior quality of the cast iron parts supplied by the Brainer Bela and Unirea enterprises. The tractor ploughs manufactured by the Ilie Pintile works showed many faults, such as insufficient polishing of shares and mouldboards. These defects were attributed to the fact that the prototype of these machines, which should have been ready for testing in June, 1950, was not actually produced until the November of that year, when tests were practically impossible. Equipment furnished by various factories to the Jiu valley mines, especially electrical installations, was so unsatisfactory that a special conference was convened at the Petrosani offices of the Sovrocarbune—the Rumano-Soviet state mining monopoly—to discuss a report on their deficiencies. The Strungul works of Stalin Town (Brasov) had supplied a number of elevators for pumping rods to the oil industry, which because of their shoddy quality had to be replaced before their time. In one case, they caused the blocking of a well, and the damage was estimated at 400 times the value of the elevator.

The decree of November 21st is a blunt admission that the Rumanian Government is seriously perturbed by the situation, and proposes to remedy it by a ruthless application of the principle of direction of labour. The compulsory transfers which it authorises will enable the authorities to move skilled workers to those enterprises where the qualitative standard of goods is considered unsatisfactory. In the Government's view, this may prove an effective way of ensuring an all-round improvement in the quality of finished products, and of avoiding the necessity of leaving the fulfilment of this aspect of state planning to certain leading enterprises, such as the Rumano-Soviet companies, as has often been the case in the past. Whether the decree will eventually have the desired results will depend, to a great extent, on the willing collaboration of the enterprises which it is designed to help. But, as *Scanteia* confessed recently, "unfortunately it must be mentioned that a number of concerns are still guilty of serious lapses and infringements of state discipline."

All in the dark, Mr. Andrews?

When the fuses have blown, when the key-hole can't be found, when the lighter runs out of petrol we turn, almost without thinking, to the sure aid of the match. The match is one example among many hundreds in which chemicals by Albright & Wilson, usually anonymously, but so often importantly, serve the world at large. *Every match made in Britain and countless millions of others besides rely on Albright & Wilson's phosphorus products for the light they give.*

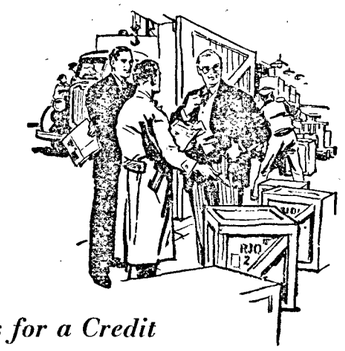
IT BEGAN WITH THE CRUSADES



We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Bombay
asks for a Credit

It is a simple matter for the Westminster Bank to establish local credits anywhere in the world, for there is no town of commercial importance in which it is not represented. Equally, the collection of funds due to you from foreign buyers presents no difficulties. The comprehensive service of information and advice which the Bank provides for those who trade abroad is fully described in a booklet called 'The Foreign Business Service of the Westminster Bank'. We shall be glad to send you a copy on request.

WESTMINSTER BANK LIMITED

Foreign Branch Office: 41 Lothbury, London, E.C.2

Lace and Licences

A large lace manufacturer had been notified by his Chilean Agent that an import licence had been obtained for a quantity of "lace for the embellishment of ladies' apparel". Aware that Chile prohibited the import of many luxury goods, the manufacturer asked us if such a contract would be in order.
On-the-spot information from our own Chilean branches enabled us to tell him that lace was one of several luxuries that might then be imported, but only against shipments of Chilean wine. From no other source would this vital information have been obtained so promptly.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

THE BUSINESS WORLD

German Debt Questions

IT was announced last Tuesday that the long-awaited negotiations for a settlement of German prewar external debts will open in London on February 28th. The approach to these discussions has been cleared by the recent agreement between the governments of the United Kingdom, France and the United States and the German Federal Government, in which the three creditor governments (as noted in *The Economist* on December 15th) offered concessions in the settlement of their claims in respect of postwar economic assistance to Germany. These concessions were conditional upon the reaching of an equitable settlement of the prewar debts. The coming conference will seek such a settlement, and will be under the direction of the Tripartite Commission on German Debts, which has extended invitations to representatives of twenty-seven of the interested governments, and to the Bank for International Settlements. It will attempt to settle on an international scale both the public and private indebtedness of Germany—indebtedness comprising the direct obligations of the Reich, the Potash loans, standstill credits, some municipal loans, and a small amount of private and commercial claims. The principal public interest—as distinct from the interest of the banks and other institutions in the standstill debts—relates to the direct obligations of the Reich, with which this article is mainly concerned.

The proceedings of the conference will be simplified in some respects and complicated in others by the fact that two of Germany's major liabilities are loans that were issued on international markets. The German Reich external bonds of interest to the British holder comprise the Dawes and Young loans, issued in various countries and currencies in 1924 and 1930 respectively, and the Konversionskasse bonds that originated from the funding of interest and dividends on German debts and shares owed to non-German nationals between 1933 and 1939. Germany has been in default on all these bonds since 1939. In March, 1951, Herr Adenauer, the Chancellor of Federal Germany, recognised responsibility for these liabilities, subject to certain reservations. It is assumed that the negotiations will adopt the fundamental principle of equality of treatment for bondholders irrespective of nationality without regard to any prewar concessions made under Nazi pressure.

Herr Adenauer's main reservation records the fact that Federal Germany consists only of the western zones, and he will ask for temporary concessions in the service of these bonds corresponding with the loss of the eastern territories, as well as for sympathetic consideration of Germany's ability to raise, and to transfer, the service on the bonds. On the creditors' side, there are now more than twelve years' interest outstanding. Germany will, no doubt, wish to fund this interest and may also try to obtain some reduction of the coupon rates. It is also expected that Germany will seek some temporary concession with regard to the transfer of service in foreign currency during the next two or three years, and, in the case of the Dawes and Konversionskasse bonds, which have already become due, for a prolongation of redemption. There should be little difficulty in achieving a compromise on these points acceptable to both sides.

One fundamental factor affecting the Dawes loan should be kept well in mind in the forthcoming negotiations. The total of this loan was equivalent to 800 million gold marks, issued in *tranches* of various currencies. The American *tranche* of $110 million is in US dollars; of the sterling *tranche* of £21,680,000 some £12 million was issued in London, and the rest in Belgium, France, Holland, and Switzerland, all in sterling. Issues were also made in Swiss francs, in Swedish kroner, and in lire. It is clear that bondholders can claim only in terms of the currency of the *tranche* they hold. So far as the sterling bonds are concerned, the devaluation of the pound has already favoured Germany to the extent of 40 per cent or more compared with issues in currencies that have not been devalued to the same extent as sterling. British bondholders may therefore surely expect that the British negotiators will adopt the standpoint that, so far as the sterling bonds are concerned, there is no room for any departure from the original terms of the loan, apart from some of the general concessions mentioned above. If any major concession has to be granted to the Germans in connection with the Dawes loan, it should be sought in the first place from bonds issued in currencies that have not suffered such heavy depreciation as sterling. It would be inequitable if countries that have been forced to depreciate their currencies and have thus already greatly assisted the debtor, were to be asked for material sacrifices before the stronger countries had made corresponding concessions.

The standing of the Young loan in respect of currency obligations is different. The total loan was authorised to yield $300 million, or 1,259 million gold marks. Although the Young loan was issued in the currency of the various countries of issue—sterling, American dollars, Belgian francs, French francs, Dutch guilders, Swedish kroner and Swiss francs—holders of bonds in these currencies were safeguarded against the risk of currency depreciation by the fact that the whole loan was based on gold. This is evident from the wording of paragraph VIa of the Young loan agreement between Germany and the Bank for International Settlements as trustee for the bondholders:

> The principal and interest of each bond shall be payable at such banks or other financial institute or institutions as shall from time to time be named by the Bank situated in the country where the bonds shall respectively be issued, in the currency of the country in which it is issued, the unit of such currency being defined for the purpose of these presents in all circumstances by the weight of fine gold determined by law as at present in force. The bondholder

is entitled to receive the equivalent at the due date of the same gold value in the currency of the place of payment, but not less than the nominal amount of the principal and interest specified in each bond.

In terms of gold Germany's indebtedness is the same today in respect of each *tranche* of the Young loan as it was at the time of issue. Any concessions that may be granted for the Young loan should, therefore, be the same for each country.

It is known that the US Government does not like gold clauses in contracts and it may well be that in the course of the negotiations the American authorities will encourage holders of the dollar *tranche* to forgo the gold clause, with the result that their bonds would become a dollar liability only. It would hardly be fair if holders of the Young loan expressed in other currencies were to forgo the gold clause unless they were allowed at least to maintain the US dollar value (as the Americans will do) or the Swiss franc value (as the Swiss will do). On the basis of the 1930 dollar or Swiss franc, Germany would in this way still benefit to the extent of about 40 per cent or 30 per cent respectively, since the loan was issued in 1930 and the US dollar was devalued by 40 per cent in terms of gold in 1933 and the Swiss franc by 30 per cent in 1936.

*

Since the Konversionskasse bonds were guaranteed by the Reich, they come under the same heading as German Reich loans; in point of service they follow the Dawes and Young loans, each of which has specific securities. But, with the exception of bonds issued in other currencies, such as Reichsmarks, which were issued to creditors in the countries concerned, these Konversionskasse bonds represent the funding of sterling liabilities for interest and dividends due but unpaid. Thus the British creditors, apart from suffering pre-war delays in current payments, have already suffered considerable losses through the devaluation of the pound. This fact ought to make the German negotiators shy of seeking more than a temporary concession to mark the loss of the eastern territories, a funding of outstanding interest, and a tolerable postponement of redemption. The central point in this as in the direct Reich loans is that the depreciation of sterling, together with the great rise in world prices since the bonds were issued, will greatly reduce the real burden of the service on these debts. Germany will need to export only a fraction of the quantity of goods that would have been necessary to pay the service of the loans when they were issued. Britain can hardly afford to be quixotic, given Germany's rapid recovery since 1948 and her improving ability to earn foreign currency. The sums required to service the whole of Germany's foreign debt are small in relation to the capacity of the German economy.

An assessment of the merits of the German Reich bonds must not overlook the Distribution of German Enemy Property Act of 1949. This Act makes specific reference to British-owned Dawes, Young and Konversionskasse bonds and makes its clear that all present holders of the so-called "enfaced" bonds of these issues are entitled to participate in the distribution of the ex-German assets. The Germans have protested against the seizure and confiscation of private property of German citizens as being contrary to international law.

But the Paris Agreement on Reparations of January 14, 1946, declared that the participating countries would retain such assets as reparations—and since no direct reparations were claimed by the victors, the participating countries seemed to be letting Germany off lightly. There was at first an understandable intention on the part of the British Government to retain these assets as reparations and to pay their proceeds into the public purse. At this stage, the British creditors began to protest. In many cases, their relations with German debtors were based on the fact that the borrowers had assets in the United Kingdom and were acquiring sterling assets by means of exports. Ultimately, the Government decided to distribute the assets to the British creditors in proportion to their claims. This was welcomed in Germany as a step in the right direction, but the subsequent declaration by the Lord Chancellor in the House of Lords in December, 1949, that under the Paris Agreement the assets had become reparations and that the distribution was *ex gratia* by the Crown—and hence did not legally affect the amounts owed—led to some disappointment on the German side.

Dawes Loan :—Secured by a general bond as (*a*) a direct and unconditional obligation of the German Government on all its assets and reserves; (*b*) a specific first charge on all reparation and other treaty payments by Germany; and (*c*) a first charge by way of collateral security on the gross revenues from the customs and from taxes on tobacco, beer and sugar, on the net revenue from the spirits monopoly and on any other taxes which may be assigned for assuring the payment of reparations.

The final redemption date was originally fixed at October 15, 1949.

Young Loan :—Secured by a general bond as a direct and unconditional obligation of the German Government. Subject to the charge in favour of the trustees of the Dawes Loan, the German Government by way of collateral security assigned the proceeds of (*a*) the customs and of the taxes on tobacco, beer and spirits; and (*b*) the annual direct tax of RM 660,000,000,000 payable by the German Railway Co for 37 years as a contribution to reparation payments.

The final redemption date was originally fixed at June 1, 1965.

Konversionskasse :—Secured by general bonds and guaranteed unconditionally as to principal and interest by the German Reich.

The final redemption dates were January 1, 1946, for the 1st and 2nd series, and January 1, 1948, for the 3rd, 4th and 5th series.

It may be expected that Germany will, at the forthcoming conference, put forward a serious effort to arrive at a settlement with its creditors that will re-establish its international credit. As a consequence of the Nazi regime and the war that it brought about, and of the various currency devaluations, Germany's creditors have suffered great losses. Most of them, presumably, would be prepared to consider sympathetically the actual capacity of Germany to make payments and transfers. Indeed, some of the more important creditors have already declared their willingness to apply whatever sums they receive from the German Assets Pool towards extinguishing the last instalments of the debt. Equally it is to be expected that the Reich will ask that the loss of the eastern territories of Germany should absolve it from a part of the prewar Reich obligations. Any concession made under this heading should be regarded as temporary, leaving the claims to be reopened when Germany is again united. From the viewpoint of the Reich bondholders, the distribution from the assets pool might best be applied to satisfying that part of Germany's private debts that will not be assumed by the Federal Government of Germany until Germany is reunited.

It is evident that some formidable negotiations are in prospect—and not the least of the heavy responsibilities that have to be shouldered by the conference will be to ensure that the settlement is not only reasonable and equitable as between the German debtors and the creditors considered as a whole but that it maintains a due balance between the several categories of claimants. The Tripartite Commission, in a detailed memorandum issued this week, declares that the settlement should not place such a burden upon Germany as would cause economic dislocation and risk of renewed default. But it also emphasises that, if sacrifices have to be made by creditors, the debtors must make a real effort to ensure a fair and reasonable settlement. The Commission is satisfied that an adequate economic and financial basis for such a settlement does exist. In the early years, it is remarked, the amount of German debt transfers may have to be fixed with due regard to Germany's contribution to the joint defence effort (and to her continued receipt of external economic aid). But it is emphasised that the transfers in these years should be "as large as possible." There is perhaps now some ground for hoping that the German representatives recognise the importance, from their own standpoint, of a settlement that the creditors can accept as reasonable—for such a settlement is a prerequisite of the re-establishment of normal commercial and financial relationships between Germany and the creditor countries.

Approach of the Comet

THE first completely furnished Comet jet airliner has this week been handed over at London Airport to the British Overseas Airways Corporation. When BOAC ordered a fleet of Comets before the aircraft had left the drawing board, it took a risk that has no precedent in civil aviation. The order was signed five years ago, when most airline operators and the majority of manufacturers were still rejecting outright the idea that a jet aircraft would ever be used for civil flying. Now they are about to see the first regular jet passenger service; in April or May the Comet will be flying to Johannesburg via Rome and Cairo and before the end of the year from Cairo on through India, Pakistan and Singapore. The fortunes of BOAC during the next two decades will be closely linked with the Comet. The corporation has twenty on order for delivery at intervals up to 1954; at least half as many again may be bought for later delivery. If the two prototype aircraft delivered to the Ministry of Supply are included, the de Havilland Company has thirty-eight Comets on firm order for BOAC and various other airlines.

So long as international agreements on fares prevent price competition between airlines, air transport will continue to be sold largely on its speed and comfort. Travel by air over long distances is perforce cramped or tedious by comparison with first-class travel by sea over similar distances. But a fast jet airliner can halve the time at present required in the air, and the journey is free from the exhausting vibration set up by four 3,500 horsepower piston engines. There has, inevitably, been room for serious argument about the wisdom of BOAC's policy in relying so directly on new jet aircraft as yet untried in commercial service. Two serious problems arise in operating civil jet aircraft. The first is economic; fuel consumption is heavier and the payload per flight not much greater than that of a piston-engined aircraft designed for the same route. The relative cheapness of the kerosene used by jet engines does not offset this difference in consumption, although, because of the jet aircraft's speed, consumption in terms of miles per gallon is not so excessive. The second problem is concerned with operating procedure. If traffic congestion should occur at some airports, aircraft may be kept in the air for an hour or more waiting for permission to land. A piston-engined aircraft can circle the airfield at lower power and its fuel consumption is reduced in proportion, but the fuel consumption of a jet engine is little different at low power than at full throttle, and indeed it actually rises as the aircraft loses height. Thus any delay in bringing a jet aircraft to land, or that prevents it from climbing rapidly after take-off to cruising altitude, could lead to a serious depletion of fuel reserves, allowance for which would entail big reductions in payload to give the necessary safety margin.

These two factors constitute an impediment to the use of jet engines for passenger transport that is not to be ignored but can be overcome. They explain why no other manufacturer in the world has put down a production line for a civil jet airliner and why no other airline has given a hostage to fortune by ordering a whole fleet of such aircraft. Many aircraft builders and operators now have reason to regret their caution, not perhaps because their own inner convictions have changed but because de Havilland has built an aircraft that will pay its way in open competition with piston-engined aircraft in spite of the particular factors that affect jet engines and because individuals inside BOAC believed from the start that this would be so.

The Comet has been flying for two and a half years. Pilots declare that it is easier to handle than the big airliners now in service, and, in spite of the height and speed at which it flies, there has been no need to design special instruments. Only navigating techniques have to be worked out afresh. The Comet flies too fast for

dependence on conventional methods that pinpoint an aircraft's position to within one nautical mile. The new methods will give position accurate to within ten miles only, which gives perfectly satisfactory results in flight. In other respects, successful operation of the Comet will call for greater, and not less accuracy. This is particularly true of its handling from the ground; operating costs can be influenced to an unusual degree by the efficiency of the ground staff. In take-off and climb, the engines burn more than twice the weight of fuel used in level flight. Take-off with a piston-engined aircraft follows a long-established procedure of starts and stops beginning anything up to 45 minutes before the aircraft leaves the ground. There is no preliminary revving of jet engines. —an omission that ought to be greatly appreciated by those who live near airports. In normal service, the Comet engines will not be started until a minute before take-off, and then not until the runway and the route through the airport's control zone have been declared clear so that the aircraft can make an uninterrupted take-off and climb to cruising altitude. Any deviation from this pattern could cause a big increase in fuel consumption and an exorbitant rise in operating costs.

Control at take-off gives the airport authorities some latitude because the Comet need not move until its route has been declared clear. This cannot be done when it comes in to land, and if fuel consumption is to be kept within bounds, the aircraft cannot be delayed above the airport for a period longer than 30 minutes. Of all the airports on the route between London and Australia only London carries a volume of traffic heavy enough to create the risk of such serious delay; and the aircraft will land at London once only in each round trip. It is also the best equipped of the big airports to deal with heavy traffic, and development flying of Comets in and out of London has demonstrated that the problems of handling the machine in mixed traffic can be solved. On other routes where these difficulties have to be overcome, they could still be the limiting factor against operating the Comet. For example, BOAC has plans for flying the machine next year on the fashionable New York-Bahamas routes, but significant improvement in traffic handling at New York may be necessary before the Comet can be brought in and out of the New York airport without the handicap of excessive fuel reserves. Traffic control within the United States is a major factor that may decide whether jet aircraft are to be used on internal routes for which, in all other respects, they are well suited.

*

Present methods of traffic control do not need to be changed, but only used more effectively; it should then become possible to fit an aircraft like the Comet without difficulty into the established procedure of traffic control. There remains the effect on operating costs of the aircraft's heavy fuel consumption. In this matter the Comet has to be considered as an individual aircraft rather than an archetype for all jet aircraft; what is true of the Comet may not hold for others. Since it has greater speed, it should cover more miles in a year than a comparable piston-engined machine; there should be a margin of about 50 per cent in its favour over a full year's operations. On this basis the actual cost per mile for each ton of payload might work out at between 15d. and 17d., a figure that does not compare unfavourably with those of other aircraft in spite of the fact that the high fuel bill represents 50 per cent of total operating costs. These estimates, which are based on methods recommended by the Society of British Aircraft Constructors, include an allowance for maintenance and depreciation. In other respects they are unreal because they are based on assumptions of distance flown that most favour the particular type of aircraft and may not hold good for the actual services on which the aircraft are flown. For example, the figures above are put forward for both types of Comet, the series I with de Havilland Ghost engines, and the series II with Rolls-Royce Avon engines. In fact, the first is less economic than the second simply because its maximum range is smaller and the proportion of the total flight taken up with climbing to and coming down from cruising altitude is higher and leaves less margin in which to offset high fuel consumption during those periods by economies in consumption at cruising height.

Apart from fuel consumption, the present Comet is under the handicap of a short life of its engines between overhauls—400 to 500 hours. The cost of overhaul is also likely to be high. But against this, the Ghost is a new engine; the only other aircraft that it powers is the Venom fighter, just coming into service. Its life between overhauls is likely to increase as experience is gained and may eventually equal that of fully developed piston engines, which is about 1,000 hours. Moreover, freedom from vibration should reduce maintenance charges on the airframe, particularly of accessories and costly instruments. Clearly a year's operation will be required to test the present assumptions about costs of overhaul and to see whether economies are possible.

The insufficiency of data about weather conditions at high altitudes means that generous safety margins at this stage are obviously desirable. For this reason BOAC may find the Comet an expensive aircraft to operate during its first year. Fuel reserves are on the high side, and the generous allowances on all planning operations for the first few months will put up operating costs. There are wide variations in the operating costs of different aircraft. The International Air Transport Association has adopted a basis for estimating costs that includes more items than that used by the British manufacturers' organisation, so the figures are not truly comparable. The IATA method shows that the cost of operating four-engined aircraft today lies within a margin of about 3d. on either side of an average of 2s. per ton mile. Even in its first year, the Comet might possibly show a saving of about 5 per cent on today's highest costs. When the development period is over next year, there is fair reason to expect that costs should fall further, say by 10 per cent, in which case they would be well below the average. On paper, the costs of the Avon-Comet (which is expected to fly before the end of the month) should be below today's lowest figure; this has yet to be confirmed by flying experience and then may not hold good on all routes.

*

These estimates are made in the light of data now available, and these do not include operating experience. They are rough and ready, but should they be reasonably near the mark they would suggest that de Havilland with its new aircraft is fully competitive with other manufacturers. The Comet should show a satisfactory, if not spectacular, margin of profit on a straight cost per ton mile assessment, without making allowance for its ability to attract passengers or to do more work in a given time. There are four actual or potential competitors. At present, competition is limited to the piston-engined Lockheed super-Constellation and Douglas DC-6B. If the jet engine improves the speed and comfort of travel as expected, then competition from piston-engined aircraft for first-class traffic need not be taken too seriously. Thirdly, it may be significant that Lockheed is reported to have revived the project for a jet airliner. With the Comet, de Havilland has so big a lead over other manufacturers that it is pointless to start designing now an aircraft with equal performance. But to increase speeds much above the Comet's 500 miles an hour introduces aerodynamic complications that may not be open to conventional solutions. There remains, fourthly, the turbo-prop Britannia (Bristol 175), now on order for BOAC. This should be an impressive aircraft, with the advantages of a gas turbine engine without the high fuel consumption of the pure jet. The Britannia will be slower, but may show lower costs over long ranges than the Comet. But it has not yet flown, the engines are not ready, and it will be a hopeful project rather than a commercial aircraft for some time.

BOAC and de Havilland have therefore a clear advantage in jet operation for four or five years. During that period there should be no difficulty in filling the aircraft to capacity on whatever routes they fly, which, for the Avon-Comet, may include the North Atlantic. Eventually all interested operators are likely to be equipped with similar aircraft. But, for a time at least, the established postwar pattern of air transport will be reversed; it will no longer be the British airlines or the British aircraft industry that are handicapped competitively for want of the right aircraft.

Business Notes

The Washington Barter Deal

Some surprise was expressed in the City this week at the optimistic tone of references to sterling area prospects shown in Mr Truman's economic message to Congress. The President is reported to have said that the decline in the sterling area's dollar earnings through reduction of American imports showed signs already of being reversed; that the terms of trade had begun to swing in its favour; and that the speculative outflow of capital and other "temporary adverse" influences upon the drain of gold and dollars may disappear or be reversed. This optimistic speculation was qualified by the phrase "as remedial measures become effective," which may mean that the President has heard hints of stiffer remedial measures in store for Britain. But if his optimism has any sufficient foundation at all, most people in Britain would deduce that it must rest on the assumption that a large-scale resumption of American buying is in prospect. There is no sign of any resumption on any such scale as yet—though the new steel-tin-aluminium deal is heartening.

Beyond the fact that this deal involves large exports of steel by America to Britain, in return for supplies of aluminium and tin guaranteed by the British Government, little information was available concerning it at the time *The Economist* went to press But it is clear that its main importance to Britain, as distinct from the sterling area, lies in the assurance of greatly increased steel imports from America this year. These are reported to amount to a million tons or more of steel or its equivalent steel-making materials: forbearance by American buyers in the world markets for rich ore may be of direct benefit to British steel output, though relinquishment of rights to purchase German scrap may not mean much, since the Germans are making little scrap available for export. The sooner these additional imports can reach Britain, the greater their value, for the shortage of steel will probably be most stringent in the first half of the year. No quantity of aluminium has been specified. Presumably Britain will take only part of the annual quantity it is guaranteed by Canada under last year's long-term contract, and the remainder will be sold to the United States. For tin the amount has been publicly stated as 20,000 tons and the price 118 cents a lb (equivalent to £944 a ton), but no other details have been released, though the British Government has made it clear that it will not interfere with the normal operation of the market. The Government's tin stocks will undoubtedly play a role in this deal by enabling Britain to meet its obligation to America without having to buy from the market immediately, particularly as the Chancellor of the Exchequer announced last November that further stockpiling was to be reduced.

Towards Sufficiency in Steel?

American imports of the dimensions reported should go a long way towards bridging the gap between shortage and sufficiency of steel in Britain this year. Estimates of steel output and supplies in 1952, at present, are even more than usually tentative. Even to maintain output at the 1951 level of 15,640,000 tons would require an extra 570,000 tons of steelmaking pig iron and scrap, since stocks were drawn upon to this extent during the last twelve months. Imported scrap supplies may decline further, below the 550,000 tons brought in last year, and there seems little prospect of any considerable increases in supplies from steelworks or bought within Britain. In total, scrap supplies during 1952 may be 100,000 tons less than the 9,140,000 tons used last year: so that a steel output of 16 million tons depends upon an increase in pig iron output of at least a million tons. Blast furnace capacity will be available for this increase; but the furnaces will need more than 10 million tons of imported ore and further increases in coke supplies. Contracts had been made for some 9.6 million tons of ore from abroad, before the Washington talks, so that this total of 10 million tons should be practicable.

Source : British Iron and Steel Federation.

The British Iron and Steel Federation, therefore, is cautiously hopeful that 16 million tons of steel can be pro-

duced in Britain this year. It has produced estimates on the basis of 1,500,000 ingot tons of steel imports (half from America and the rest from France, Belgium, Germany and Japan) which, as the Washington reports suggest, may be conservative. But even this would imply total supplies of some 18 million ingot tons of steel. Presuming that steel exports are held down to about 2,500,000 tons—which is a slightly higher rate of export than took place during the last six months of 1951—that would ensure to British steel consumers a total of some 15,500,000 ingot tons of steel.

* * *

Steel Consumption and Prices

If 15,500,000 ingot tons of steel, or even more, can be delivered to consuming industries in Britain this year, supplies may be greater than at any time since the war. If some shortage is held to remain in an economy receiving at least 15,500,000 tons of crude steel, or some 11,200,000 tons of finished steel, that is an indication of the heroic tasks the Government is expecting the industries that use steel to perform in the coming months. Estimates of steel consumption are liable to considerable error, because changes in consumers' stocks are not easy to trace. But in 1950, according to the Treasury, about 10,500,000 tons of finished steel were used; the British Iron and Steel Federation, in one detailed estimate that may in aggregate have been slightly high, put consumption at 10,725,000 tons for that year. According to the Treasury, a 4 per cent rise in industrial production, such as was expected last year, would "cost" about 200,000 to 250,000 tons more steel. On that basis, steel consumption in industry in 1951 might have been 10,750,000 tons of finished steel, which roughly accords with some estimates within the industry; but consumers do appear to have drawn fairly heavily on their stocks, and some estimates in Whitehall put steel consumption last year not much below 10,900,000 tons of finished steel.

How much steel will be needed in 1952? In a year of rearmament, the Treasury estimates on somewhat debatable grounds, a given increase in industrial production will require a rather higher ingredient of extra steel: assuming perhaps 500,000 tons instead of 200,000, that might indicate requirements of some 11,400,000 tons of finished steel. On this reckoning, not even the promised supplies of American steel would quite close the gap. The amount of steel that British industry could usefully consume, of course, is not limited by any specific defence plan or any export target: its only limit will be the engineering capacity and labour that can be brought to bear. The original estimates from which a 1,500,000 ton shortage of finished steel was derived have never been published: they will necessarily have been based upon the gloomiest expectations regarding output and imports, and conversely upon the most hopeful prophecies of steel consumption in defence, exports and essential home uses. But the promises of imports and hopes of output that have now somewhat eased the situation will not be followed by any change of policy regarding steel allocations, though industries may receive more steel in perhaps the third period of allocation on account of these extra supplies. The Government is eschewing overconfidence about relieving this shortage: moreover, steel allocation appeals to it as a slightly less clumsy lever than most physical controls for changing the pattern of output of metal goods towards the one that it considers the country will need in 1952.

Fairly considerable increases in the price of steel must soon be expected. Rises in the prices of scrap, coal, transport, and fuel oil, and in wages tied to the cost of living have taken place in Britain since the last rise in price was announced in August; the price of imported ore has mounted to an extremely high figure; and the steel imports will be very costly. With American steel costing about £26 a ton more than the British price at which it will presumably be sold, and other prices of foreign steel imports nearly as much, 1,500,000 tons of imports next year may cost some £35 million more than steel consumers here will pay for it. This loss, which used to be borne by the Government, will now presumably be borne upon British steel prices. It seems rather questionable whether, in a period of acute shortage, with steel shared out by an elaborate and complex rationing system, consumption of marginal foreign steel should be encouraged by selling it at roughly half its world price.

* * *

New Issues Hit the Markets

The 1952 offensive upon the new issue market, some sectors of which have lately been licking their wounds after the recent shocks, opened with a bang this week, when Imperial Chemical Industries and Associated Electrical Industries announced "rights" issues to ordinary shareholders involving together over £27 million of new money. Previously, the new season had been marked chiefly by the evading tactics of English Electric, which, after the lesson of the Unilever debenture issue, placed its own £3 million of 4½ per cent debenture stock, 1972-1977, privately with the Prudential Assurance Company and its nominees (though it also raised some £3,250,000 more by an offer to equity shareholders). Now comes a frontal assault by the big battalions, in face of which the equity markets retreated further (the Ordinary share index of the *Financial Times* has this week fallen from 118.8 to 116.0), and the timid advance of gilt-edged was reversed. Wednesday's fall in industrial "blue chips" was, indeed, the heaviest for more than a month.

Ordinary shareholders in ICI are being offered 10,093,023 new £1 ordinary shares at 40s. 6d. a share in the proportion of one new share for every £6 of stock held, so that the rights calculated on Tuesday's price were worth only 6d. a share. This slender turn has to be weighed, however, against the extent of the yield of nearly 5½ per cent on the eve of the announcement; the yield has since widened to nearly 5¾ per cent. The issue has been underwritten The AEI issue consists of 2,217,649 new £1 ordinary shares to be offered to ordinary shareholders at 60s. each in the ratio of one new share for every £3 of stock held. The directors expect that the dividend of 20 per cent, offering a yield of £5 3s. per cent, will be maintained on the increased capital. With fears of monetary pressures to come, the market took due note of the fact that £2 million of the issue proceeds of £6,652,947 will be used to repay outstanding bank loans. Nor was this all. British Insulated Callender's Cables, as the first step towards a rights issue "at a suitable time and place," is asking its shareholders to agree to an increase in authorised capital to £17,500,000 by the creation of five million additional £1 ordinary shares. Plainly, this first assault on the new issue market is large; but the pressure is likely to build up still further.

Frankness from Bankers

The annual statements from the bank chairmen that have so far appeared shed little additional light upon the workings of the new monetary policy, but they show, as expected, a general approval of what is being done. Only one of the "Big Five" statements is yet available, that from Mr A. W. Tuke, of Barclays, whose maiden address as chairman reveals a frankness and an ironic humour that clearly mark him as a most notable addition to the authors of these annual broadsides from the banks. Glancing back in critical mood over the postwar years, he remarks that "one cannot imagine a more opportune period" for the application of monetary discipline; and he has "great hope that its adoption at the eleventh hour may yet put our economy on a sound basis." The direction of the wind, he remarks, has now changed; the banks are "within sight of the time when liquidity may once again be a serious factor" in the conduct of day-to-day bank-

ing. Sir Walrond Sinclair, of Williams Deacon's Bank, makes the same point, though with different emphasis. After pointing out that the sharp decline in bank liquidity brought about by the funding issue was bound to make the banks "cease to be willing lenders," he describes this and the other monetary measures as important steps "on the road to deflation," whereas Mr Tuke speaks of taking "some" of the inflation out of the system. Two other bankers also put the emphasis on moderation in objectives. Sir Thomas Barlow, of the District Bank, describes the purpose as "gradual disinflation," not "drastic deflation," while Mr A. H. Bibby, of Martins, emphasises that there is no intention to cause "disorganisation of trade by the sudden withdrawal of banking facilities." Because of the false comparisons that the public is prone to make with 1931, the last year in which orthodox discipline was being used (or abused), it is doubtless wise to give reassurances of this kind; but it is important not to reopen the door for the wishful thinking and specious argument that have proved so dangerous in recent years.

It is difficult, too, to accept, save in small measure, two pleas from Sir Thomas Barlow—first, that the domestic markets for consumer goods should be handled "judiciously," lest their narrowing should injure export markets by raising costs; and, secondly, that Japan should "in her own long-term interests" moderate the re-expansion of her textile capacity. In contrast with such familiar hints of the desire that still lurks for further planning in particular spheres, Mr Tuke's frank attack on the planning of the past five years comes as a breath of fresh air. Among many telling points that he makes, one passage is perhaps typical of his line of approach:

> I have no belief in the efficacy of any central control of all the manifold wants of 50 million people by means of mass permits, coupons and licences, no longer considered merely as necessary evils to be tolerated in time of war and other grave crisis and to be abolished as soon as possible when the crisis is over, but as weapons with which to repress the antisocial tendencies of those who are so eccentric as to wish to spend their own money in their own way.

Mr Tuke's address deserves a wide audience. It is not only among politicians of the Left that the principles and techniques of economic freedom need to be re-learnt.

* * *

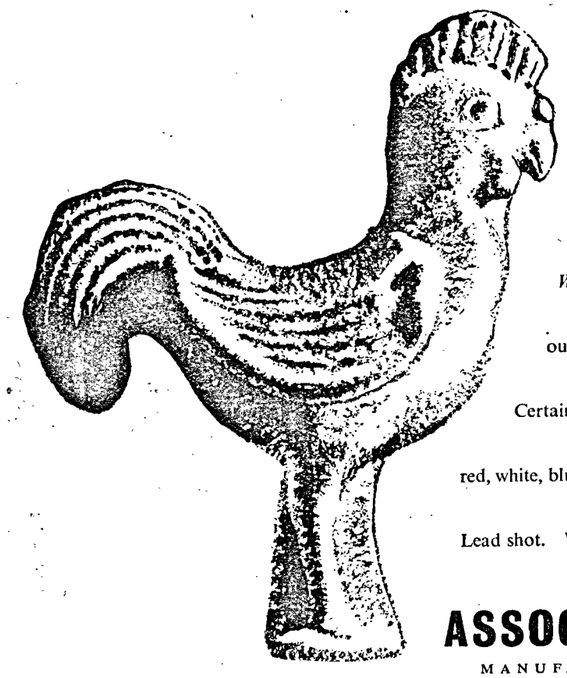
Exports and the Deficit

Britain's export industries have recorded a magnificent achievement in 1951 despite the difficulties they experienced in certain markets. When the Economic Survey last April suggested that total exports and re-exports ought to reach £2,750 million, nobody expected this figure, which represented an increase of 27 per cent on 1950, to be attained. Even the architects of the survey covered themselves with the phrase: "This will call for a strenuous effort." In fact, however, total exports and re-exports amounted to £2,707 million, according to the provisional figures published last week-end—not much below that hardly attainable objective. Exports alone amounted to £2,580 million or 19 per cent more than in 1950, and re-exports to £127 million or 49 per cent more. The import bill was forecast nine months ago at £3,200 million (f.o.b.) after allowing £600 million for a rise in prices. In fact, imports in 1951 amounted to £3,917 million (valued c.i.f.) or roughly £3,500 million (f.o.b.).

These figures suggest that the worst fears about the deficit have not materialised. Without the details published in a balance of payments white paper, it is possible to make only an approximate estimate. But from the provisional figures for 1951, the deficit on visible trade appears to have been of the order of £800 million, compared with £338 million for the first half of the year. An important unknown factor is invisible earnings. In the first six months of 1951 they yielded a net surplus of £216 million, but they are known to have decreased in the second six months, firstly because of the smaller overseas earnings and secondly because of the cost of the Persian oil dispute. If net invisibles for the year are put at £350 million the total deficit would be of the order of £450 million.

But the most enlightening fact to be gleaned from these figures is that Britain's deficit last year was almost entirely due to the deterioration in the terms of trade. Admittedly the volume of exports increased by only 3 per cent compared with an increase of almost 4 per cent in industrial output. If less had gone on to the home market the gap would have been smaller. On the other hand, the volume of imports rose by 15 per cent and their value by 50 per cent. If the terms of trade had remained at the same level as in 1950, Britain's visible deficit would have been only £375 million and the total deficit (assuming, again, a net surplus on invisibles of £350 million) would have been only £25 million. Deterioration in the terms of trade, therefore, cost Britain some £400-£500 million. If, as seems likely, the terms of trade are again moving in Britain's favour, less difficulty might be experienced this year in balancing the overseas accounts.

* * *



More Trade with the Dollar Area

Exports to North America also increased last year. They amounted to £274 million, or 15 per cent above the 1950 figure. This was less than the average rise in exports to all areas partly because trade with Canada increased less than with the United States. Shipments to the United States increased by 21 per cent, as against an increase in total exports of 19 per cent. The total, £136 million, was only slightly below the total value of shipments to Canada, which amounted to £137 million, only 9 per cent more than in 1950. The success of the dollar drive was the more impressive in that sales resistance was experienced in both the United States and Canada throughout the greater part of 1951. Again, both countries curbed instalment credit, a policy that had a direct impact on the sales of British cars.

But the declining trend in dollar exports in the last half of the year is a none too welcome sign. Exports fell slightly in the third quarter and dropped sharply in the fourth. Britain's actual dollar receipts will be slightly smaller than these figures suggest, because a few thousand British motor-cars that were exported to Canada had to be brought back to this country. But in the trade figures they are still recorded as exports. If, as seems likely, the American public returns to its normal spending pattern later this year, British exports might well recover. This dollar drive has, of course, important implications for the sterling area as a whole. Britain is the sterling area's largest dollar spender. It is now not only the largest dollar earner, but it has also increased its dollar earnings more steadily than any other member of the sterling area during the past three or four years. Even so, it still has a sizeable dollar deficit.

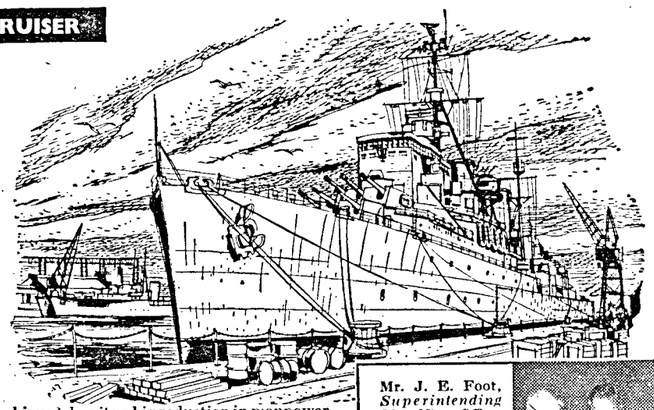
THE CASE OF THE CAPTIVE CRUISER

Was there a "secret weapon" to set her free?

HIS MAJESTY'S Dockyards, serving one of the largest naval forces in the world, were faced with a serious problem.



World War II had suddenly increased their inventory of ships' supplies to almost 300,000 items. Handling this increase with hand accounting methods had become almost impossible despite extra manpower and overtime.

As a result, the movement of stock to keep ships supplied was held up by paperwork.

To free these ships, a new accounting system was needed at once. The Admiralty directed an immediate investigation of all methods and systems. Machine accounting specialists of Burroughs Adding Machine Ltd. were called in.

After investigation, Burroughs specialists suggested a simplified system for handling stock cards and ledgers. They specified Burroughs High Speed Accounting Machines, Duplex Adding Machines and Adding-Subtracting Machines for the job. The authorities acted on these recommendations.

Today, the issue of supplies in the Royal Dockyards is never held up by paperwork. Increased speed of inventory accounting has been achieved despite a big reduction in manpower.

Mr. J. E. Foot, *Superintending Naval Store Officer of one of H.M. Dockyards, examines one of his Burroughs High Speed Accounting Machines.*

With him on the right is Mr. S. F. Harmer-Elliott, *one of the Burroughs men who helped solve the Case of the Captive Cruiser.*

WHAT ABOUT YOU? If you think your business could benefit from faster figuring, call in Burroughs. They can advise you on all the latest machines and systems, for Burroughs make the world's broadest line of modern record-keeping machines; Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm equipment.

Freer Exchange Facilities

New exchange facilities for authorised dealers introduced by the Bank of England during this past week will appreciably help to ease one of the more serious of the frictions experienced on the foreign exchange market since its re-opening in mid-December. Under the arrangements then introduced, the only overseas banks outside the sterling area with which the London banks were authorised to deal in exchange were those of the American account countries—in the two dollars only. In other currencies, therefore, the only means open to a London bank of finding a counterpart for its spot sales or of covering its spot or forward positions was by dealings with other banks in London or the overseas sterling area or with the Bank of England. This isolation of the London market from the markets in whose currencies the banks were dealing produced some odd results. Apart from many other resultant frictions, it left the balance of supply and demand arising from trade transactions in each currency to be settled—or at least strongly influenced—by practice in commercial invoicing. If, for example, Swedish exporters to Britain invoiced mainly in kroner, while British exporters to Sweden invoiced mainly in sterling, the trade demand for kroner on the London market was bound to exceed the London trade supply even if exports and imports were in balance. Frictions arising from such fortuitous factors as these largely explained the anomaly that many continental currencies, though obviously over-valued in terms of sterling, persistently stood in the London market at or near the lower of the official rates, since almost the only source of supply of exchange in London was the Bank of England. In currencies that are basically strong (such as the Belgian franc) the technical shortage in London has been very acute indeed.

The Bank of England's efforts to ease these technical difficulties have not yet extended so far as had at first been hoped, but the changes now made will aid the markets in French and Swiss francs and the three Scandinavian crowns—as well as in the so-called "unspecified" currencies (notably those of Germany and Italy). British authorised dealers, when operating in these currencies, may seek cover not only in the ways previously permitted but also by dealings with banks in the monetary area of the currency concerned. In the Scandinavian currencies, however, this facility at present extends to spot transactions only. It should also be emphasised that in no instance may a London bank cover by dealings with an overseas bank in a currency of a "third" country: there is no scope for three-point arbitrage.

The arrangement with the Scandinavian area, though it still excludes forward dealings between London and the overseas markets, has enabled the Bank of England to widen the spread of its buying and selling rates in each case so as to bring it roughly into line with the pattern set by the dollar quotations introduced on December 17th. Until the end of last week, the official rates for the three crowns had remained at the same narrow spread as before, and market dealings had continued to take place on this basis. The immediate effect of the new facilities for bilateral international dealings, since they implied a freer supply of these currencies, was to drive the forward quotations from a premium to a small discount, but a subsequent slight recovery has carried the middle forward quotation to par. The spot rates now quoted by the market are of course much narrower than the old official rates, but each of the currencies stands a shade above par, though below the maximum value set by the Bank's official selling rate. In the market for French francs, the new freedom provoked an immediate and sharp depreciation, from 973 fr. to 986½ fr., compared with the (unchanged) official limits of 972-88 fr., while the forward discount for one month widened from 6 to 7 fr.

* * *

Manpower Last Year

Between August and November of last year, manpower was moving into the "metals, engineering and vehicles" section of industry at the rate of about 22,000 workers a month. It is too soon to judge whether this represents a continuing trend, and it must be noted that in the same four months of 1950 this group of industry increased its manpower even more (by some 28,000 a month). But the increase in 1950 did take place during a period while the output of those industries as a whole was rising much less than a year before. It may be, therefore, that the industries within the group most busy on defence work may have gained proportionately more labour. No detailed figures of employment within different sections of engineering are as yet available for November last. But the total influx of workers into engineering, considering the slow buildup of rearmament production, may not in general have been seriously insufficient, though serious shortages remain in aircraft manufacture and there is a continued shortage of skilled workers in machine tool factories.

Over the first eleven months of 1951 the changes in distribution of the working population can hardly be considered as particularly suited to a rearming economy. Employment in mining and in transport rose slightly, but both remained short of workers. The metals group gained 86,000 workers: despite the quickening of its increase in the last half of the year, this was insufficient. The building labour force grew by 42,000, which in a period of almost stable output may indicate some drop in productivity: and the distributive trades, professional and financial services, and public administration all made minor gains in manpower. Some regulation of engagements, by requiring employers to take on workers through labour exchanges, can be expected. This is being advocated partly to prevent "poaching" of workers by employers ready to offer special inducements. That can be reprehensible: but in the cases of some of the essential industries most short of labour, such as aircraft and machine tools, some encouragement of economic incentives to attract workers might not be amiss.

EPU in December

The sterling area's balance of payments with Europe again improved slightly in December. The United Kingdom was saddled with a deficit of just over £53 million at the month's EPU accounting or some £8 million less than in November and £36 million less than in October. Unfortunately, however, Britain's cumulative accounting

deficit with the Union, now at over £254 million, has plunged well into the fourth "tranche" of its quota, where 60 per cent of the current deficit has to be met in gold. Gold transfers to the Union in December, at $75 million (or £26.8 million), were therefore some $13 million higher than in November, despite the drop in the current deficit.

France, Britain's EPU partner-in-distress, had an even gloomier December; its current deficit rose from $48 million to $69 million, and its gold payments from $2 million to nearly $14 million. The Belgian surplus, at $57 million, was $23 million less than in November, but it was still ballooning well above the $20 million that Belgium can take from the Union in gold. For the rest, Denmark, the Netherlands and Germany—three problem children in the early days of EPU—all improved their positions further, while the gold payments by Britain and France increased the Union's liquid resources from the dangerously low level of $180 million to $210 million. For the moment, therefore, fears of imminent insolvency for the Union will be partly allayed.

Egypt Asks for More

Egypt's currently available sterling has now fallen below £45 million. Under the terms of the agreement reached with Britain last July, it has therefore been able to request a release of £5 million from its blocked sterling balance of about £205 million. This request has been granted. It may be, however, that this is all that Egypt will get until December 31st. It was agreed last July that Egypt could draw another £10 million (making £15 million in all) during the calendar year 1952. Egypt recently asked for all of this straightaway, in January. The Treasury announced last week that it would have to wait. It would probably be a mistake to suppose that Egypt's financial position will be so severely affected by this decision that it will be diverted one whit from its present political escapades, but the British Government clearly has every right to refuse to go beyond the strict letter of its past pledges; those pledges were, in any case, overgenerous in the first place.

Retail Trade

It has become difficult to draw any long-term conclusions from the month to month variations in retail trade. The Board of Trade index for retail sales in November (1947=100) shows a rise of 11 points, from 146 in October to 157 in November. The index is ten points higher than it was twelve months before; but by all accounts trade last November was disappointing. This is largely because October sales failed to show the recovery normal at that time of year; thus the subsequent improvement in November was not sufficient to make up for the ground lost. The total sales index rose as much as it did largely because of the increase in food prices. The index of food sales rose from 147 in October to 156 in November. In November, 1950, it stood at only 138.

The retail slump, serious though it may be, is confined to clothing, textiles and furniture. The clothing sales index rose nine points in November to 176; a year before, when prices were on average 30 per cent lower, the value of sales was two points higher. Sales of furniture and furnishings, which include household textiles, hardly changed during the two months but the November index, at 148, showed that sales have fallen 18 points compared with a year earlier. But these comparisons with a year ago can be misleading. From September, 1950, to April, 1951, retail trade experienced one of its biggest booms, and in November, for example, there was a good deal of panic buying in addition to normal seasonal purchases of winter goods. Taken over the retail year, these few weeks of high sales may well have offset the disappointing experiences of recent months. The price levels of the heavily advertised winter sales show that retailers themselves are not prepared to stand any appreciable losses simply in order to convert stocks into cash with which to buy new merchandise. Although the value of stocks of all kinds of clothing was considerably higher last November than in November, 1950, retailers are not disturbed by their present size. Many believe that the fall in textile sales can be written off as the inevitable reaction to the high level at the beginning of 1951, a reaction aggravated by the unseasonable summer and winter weather that followed. When rearmament production is under way, it is expected to release more purchasing power for consumer goods, particularly in the Midlands. Retailers are, however, refraining wherever possible from placing firm orders for new goods until they have actual evidence that such a revival has taken place.

"No Substitute for Wool"

The news of a recent prosecution in the Great Marlborough Street Police Court appears to have taken some time to travel from London to Yorkshire, where it has profoundly disturbed sections of the wool industry. In mid-December a London mail order firm was summoned under the Merchandising Marks Act for advertising as "woollen," dresses that were made up of cloth containing in one case 74 per cent of rayon and only 26 per cent of wool, and in the second case 49 per cent of rayon and 51 per cent of wool. The summons was brought by the Retail Trading Standards Association, a body whose membership includes most of the big department stores and a number of textile manufacturers. The chief function of the RTSA is to keep watch for the deliberate or unintentional mis-description of goods. An excess of enthusiasm has, for example, led a reputable London store and an equally reputable cloth manufacturer to describe as "silk jersey" and "silk tweed" goods which were in fact made wholly of rayon. But the case of wool cloth is an extremely difficult one. There is no standard definition, as there is for cloth made from any other fibre, and in spite of several years' work on one the British Standards Institution has made little headway, in face of the apparently irreconcilable views of the RTSA and the wool industry.

The RTSA takes the view that a cloth ought not to be described to the public as "wool" unless it contains at least 97 per cent of wool. Otherwise it should be described as "wool/rayon" or "rayon/wool" according to the predominating fibre. Sections of the wool industry accept this definition; the greater part rejects it on the grounds that it cuts across accepted trade practice. At the lowest end of the scale, this "trade practice" derived some official sanction from price control orders introduced by the Board of Trade during the war. It was laid down then that any cloth containing more than 15 per cent of wool came under the wool orders, otherwise it was classed with cotton or rayon. With the increasing use of mixture cloths Yorkshire likes to be free to think of wool cloth in terms of a wool content of 15 per cent or more as against the RTSA's 97 per cent "wool."

Discussions under the aegis of British Standards Institution over the past three or four years have convinced the more responsible members of the wool industry that nothing but harm can come from clinging to what has become an indefensible position, and the official view of most bodies in the industry is probably closer now to that of the RTSA than it has ever been before. The chances of an early agreement are in fact excellent if the industry's backwoodsmen can be converted to this way of thinking. Comments on the recent case in the local and trade press have loudly questioned the competence of a London magistrate to arbitrate on such a highly technical question, arguing that the term "woollen," (applied incidentally) to dresses advertised

YOUR FIRM needs this car...

A works or office car is an essential to the well run modern business. Austin build this special car which is exactly right for the job. With its two folding seats, it takes six in comfort and there is room for two more on occasions. Its 68 b.h.p. O.H.V. engine and great manoeuvrability ensure that it is always on time. This Austin is more impressive—more efficient at its job—than an ordinary saloon. Delivery is better, too. See your dealer today. This Austin is also the perfect Hire Car, for dependable day and night service.

Bringing it home to us

COAL! 180 million tons carried each year — for heavy industries, lighting, cooking and heating, fuel for the manufacture of countless articles for the export drive and domestic use.

To cope with the gigantic and urgent task of transporting fuel and other freight, amounting to some 300 million tons annually, British Railways are having to divert train crews from passenger to freight services. Yet nearly 1,000 million passengers a year must also be served — and this despite a severe staff shortage.

under the slogan "There is no substitute for wool") was merely an indication that the yarn was spun on a "woollen" and not a "worsted" system. The success of the prosecution must, however, have greatly strengthened the hand of the moderate wool men in convincing their colleagues of the need for a settlement, and there is a good chance that the industry will be able to put forward proposals for a standard definition of "wool" cloth and of the terms "woollen" and "worsted" that will at long last be acceptable to all sides.

* * *

Less Wheat for Export

The wheat market has been rather unbalanced by a poor crop in Australia and a bumper crop in Canada, and this at a time when a number of importing countries are afflicted with their recurring anxieties about dollars. Under the international agreement, Australia is the main supplier of sterling wheat. The first official estimate for 1951-52 put the crop at 166¾ million bushels, a figure at least 20 million bushels above the previous unofficial forecasts but some 17 million bushels lower than in 1950-51. The yield per acre was the second highest of the postwar period; the main cause for the smaller output has been the decline in acreage. The area under wheat in Australia has fallen steadily from 13,880,000 acres in 1947-48 to 10,240,000 acres this year and this apparent long-term trend can hardly fail to raise doubts in the minds of those who look to Australia as a source from which dollar wheat might be replaced. There are several reasons for this trend but the most important ones are apparently the relatively high price for wool—the price rose almost steadily from 1946 to last March, while wheat is now lower than it was in 1947—and the shortage of machinery and fertilisers.

Despite this season's small crop, Australia should be able to meet its obligations under the wheat agreement, though with no margin. Domestic requirements usually account for about 80 million bushels, leaving 86¾ million bushels for export. Australia's export quota under the agreement is 88 million bushels a year; the small balance would have to come from stock, and the carry-over from last season amounted to 60 million bushels. But that would leave nothing for sale in the "free market" which pays a higher price than the agreement maximum of US $1.80 a bushel, unless the Australian Wheat Board decides to run down its stocks. The real problem will arise next year if the Australian acreage continues to decline and if it is not offset by any improvement in yield.

For the current season any shortage in Australia could be made good by Canada, where the wheat crop this season reached 562 million bushels, some 100 million bushels more than in 1950-51. Allowing for changes in stock and domestic requirements, Canada's exportable surplus is estimated at 524 million bushels against 378 million bushels twelve months ago. Only 40 per cent of this amount is committed under the international agreement. To complete the picture of world supplies of wheat, the American crop at 991 million bushels is 36 million bushels less than in 1950-51 but domestic requirements are expected to increase by nearly 50 million bushels, so that the United States might have up to 100 million bushels less for export. Supplies from Argentina will also be much smaller this season and the exportable surplus is at present estimated at a little over 30 million bushels compared with 120 million bushels in 1950-51. According to George Broomhall's *Corn Trade News* Russia, is expected to be able to export 40 million bushels against 22½ million bushels twelve months ago. In total, exports may be some 110 million bushels smaller than last season.

The main problem will be to find dollars to buy Canadian wheat and during the coming months there might be a marked divergence between dollar and sterling prices for wheat on the free market. As for Britain, it has already undertaken to buy 113 million bushels from Canada under the agreement—its total import quota is 177 million bushels—and the remainder will presumably come from Australia.

* * *

Oil Output Record

Despite the suspension of oil operations in Persia since last July, world crude oil output in 1951 once again established a new record—nearly 594 million metric tons, more than double the 1938 figure and 70 million tons more than in 1950. The Persian stoppage held down the rate of increase in the Middle East, but a remarkable expansion in output from Saudi Arabia (from 26 million tons to 38 million tons) and in Kuwait (from 17 million tons to 28½ million tons) virtually made good the loss of Abadan. Both of these countries have now achieved a rate of output greater than was ever attained in Persia; Saudi Arabia is running at about 44 million tons a year and Kuwait at about 36 million tons a year.

North American production still amounts to more than half the world total, and in 1951 it rose by 14.6 per cent, slightly more than the rate by which output rose in the remainder of the world. This was partly due to the largest annual increase that the United States has ever achieved;

ESTIMATED WORLD CRUDE OIL PRODUCTION
(Thousand Metric Tons)

Area	1950	1951	1951 % Increase Over 1950	1951 % of World Total
North America ...	274,819	315,500	14·6	53·2
Latin America....	102,361	114,575	11·9	19·3
Middle East.....	87,727	97,467	11·1	16·4
Far East.....	11,908	13,820	16·0	2·3
Western Europe ..	2,053	2,520	22·8	0·4
Eastern Europe...	44,719	49,815	11·4	8·4
World Total.....	**523,587**	**593,697**	**13·4**	**100·0**

Source: Petroleum Press Service.

but also to the fact that with the opening of the pipeline from Edmonton in the Alberta oilfield to Lake Superior, Canadian output rose by 74 per cent to 6½ million tons. Last year output in the Middle East and the Caribbean area each amounted to about a sixth of world production, in the Soviet Union and Eastern Europe together to some 8½ per cent, and in the remainder of the world to less than 7 per cent.

* * *

Freights in 1951

The Chamber of Shipping index of tramp freight rates in sterling during December was 168.5 (1948 = 100), showing a slight decline from the previous month. The average for the year 1951 was 173.7, more than double that in 1950, when the average was 84. It was only in the last three months of

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

The Economist Intelligence Unit
22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

1950, when the index was in the region of 100, that there came the first signs of a marked upward trend in freight rates, but in January, 1951, the index soared to 151.9. Only in one month (August) did the index return to anything like this figure; it rose to a peak of 203.8 in May, with a subsidiary peak of 190.4 in October. In November there was a substantial fall, and this decline continued until the end of the year.

Several markets displayed weakness during December. Reduced demand in the Mediterranean trades enabled charterers to secure a reduction from 112s. 6d. to 100s. for grain from the Black Sea to the United Kingdom. Australian grain charterers were inactive, but were able to secure vessels homeward at as low as 117s. 6d. per ton, compared with 120s. earlier, by waiting to pick up odd vessels that offered. This rate is in marked contrast to the 26s. 3d. per quarter (about 122s. 6d. per ton) that was paid throughout the month for the trans-Atlantic voyage, despite the release of grain ships through the closing of the St. Lawrence. Tonnage homewards from the North Pacific continued to be scarce, and grain charterers in this market were obliged to raise their rates from 147s. 6d. to 152s. 6d.; while Timber Control had to pay as much as £34 per standard, and that figure has since been exceeded. The opportunity of outward cargoes from India, however, had the effect of reducing rates for grain from the United States to India by as much as 7s. 6d. per ton.

Although dollar fixtures are not taken into consideration in compiling the freight index, the release of further ships from the American laid-up fleet, and the pegging of freight rates for ECA grain and coal exports, have had their effect on the sterling market, which otherwise might have become much firmer, as it always tends to do during the winter months, even without the pressure of American coal exports. Meanwhile operating costs have gone up considerably during the year, as well as building and maintenance costs, and the freight index would not have to go back as far as the 1950 level before large numbers of ships would begin to be laid up. Undoubtedly the release of ships by the American Government from the reserve fleet has had a dampening effect on the upward surge of freight rates.

* * *

The Air Charter Business

The annual air charter review prepared by E. A. Gibson and Co., leading aircraft brokers, reports that "the charter companies on the whole have had an extremely good year, and the type of business they have done or have been asked to do should give them a high degree of confidence in the future of commercial aviation." Much of this business involved flying troops to the Mediterranean and Far East. several of the contracts having been renewed for 1952. Freight carried consisted mainly of machinery and manufactured goods. Perishable fruit and flowers, which once formed the mainstay of air freight traffic, are now carried almost exclusively by the railways, which can provide a fast service with refrigerated vans at rates far below those that the air companies can offer. It is an indication of the growth of the charter business that whereas in 1946 the brokers probably fixed about five per cent of the inquiries received, today they fix 60 per cent. But not more than seven or eight British charter operators were still in business at the end of the year. Several small companies were sufficiently discouraged to sell their aircraft to American buyers in the spring, when their second-hand Dakotas first doubled and then trebled in price.

Charter companies operate under two big handicaps. The first is the fact that they cannot afford to replace their aircraft. The majority were bought from the services at the end of the war; their operating costs are high, but at present the scheduled airlines are not selling off any aircraft with which they could be replaced. The second is competition from the scheduled airlines. Since it is not always possible to arrange for a return cargo, the charter fee often has to cover the costs both of the outgoing and the return journey. When scheduled operators cancel a flight for want of traffic, they frequently offer the aircraft for one-way charter at rates well below those likely to be asked by the charter companies. The scheduled operators have captured a good deal of the charter business in this way. They cannot, however, compete for traffic that requires a special type of aircraft, such as the car ferry business developed by Silver Cities (the only British charter company that has equipped its fleet with new and not second-hand aircraft) or the growing traffic in live cattle and horses. Among the scheduled operators, only KLM has aircraft fitted to carry live animals of this size. The rates for livestock must, however, be low: and it needs careful planning to arrange each time for a full charter on the return journey.

Shorter Notes

A new coal mine to be sunk south of Alva, in Clackmannanshire, is expected to bring about the subsidence, and therefore the flooding, of about 700 acres of land in the area over the 50 years for which it is likely to be worked. Alva itself, and Tillicoultry, another small town in the area, will not be affected; and the Secretary of State for Scotland, after investigation with the National Coal Board, has decided to leave the question of remedial measures for the land that will be flooded until mining operations develop. The new pit, to be called Glenochil, is an important feature of the board's plan for increasing output in the east of Scotland; but the loss of coal involved in ensuring adequate support for the surface of the land above it would make mining uneconomic.

*

It is regretted that in a note last week the names of two companies were reversed. The company that is to sell "Mobilgas" in Britain is the Vacuum Oil Company; it is jointly owned by the American company Socony-Vacuum and the British company Powell-Duffryn Ltd.

Company Notes

F. W. Woolworth.—Yet another giant company has announced a record increase in profits in 1951. Woolworth's earnings before tax rose by nearly 25 per cent., from nearly £11,770,000 to £14,580,000. In 1950, the directors decided to build up a reserve of merchandise that should be readily saleable at a lower ratio of profit mark-up; at that time the late chairman, Mr B. E. Uffindell, described an increase in turnover as "an absolute necessity in view of continually rising expenses." This policy seems to have paid handsomely in 1951; the organisation almost certainly achieved an expansion in sales—no mean achievement in what has proved to be a difficult year for the retail trade.

Earnings :—	Years to December 31, 1950	1951
	£	£
Profit before tax	11,763,410	14,543,339
Taxation	6,384,385	8,611,241
Earnings for ordinary stock	*4,469,025*	*4,965,149*
Ordinary dividends	3,506,250	3,346,875
Ordinary dividends (per cent)	42½	42½
Development reserve	500,000	500,000
Pension fund	250,000	350,000
General reserve	750,000	750,000
Added to carry forward	212,775	853,273

5s. ordinary stock at 41s. 9d. yields £5 2s. per cent.

It is the government, however, rather than the shareholders, that has benefited from the improvement in profits. Taxation at £8,611,241, against £6,384,385, cut deeply into earnings, so that net profits advanced by only £600,000, from £5,384,025 to £5,972,648. The directors have decided to plough back the whole of this increase, mainly as an addition to the carry forward, and the ordinary dividend has been left unchanged at 42½ per cent. This cautious policy has no doubt been adopted because of the gloomier prospect for the current year—costs are still rising, the sellers' market in certain consumer's goods has contracted sharply, and the pressure of defence orders on available supplies, may limit the range of goods that the stores can offer.

West Riding Worsted and Woollen Mills.—The sharp fall in wool prices from their "golden fleece" level of last March has forced another company, West Riding Worsted and Woollen Mills, to write down the value of its stocks. As the directors have decided to leave intact the specific reserves created in earlier years against just such an eventuality, the losses on stocks have had to be met from the year's earnings. In consequence group trading profits in the year to August 31st were only £805,111—less than one half the previous year's record of £1,827,828. Despite the recession in profits a dividend rate of 22½ per cent has been maintained on the ordinary capital, as increased by last year's one for sixteen scrip bonus.

Even after revaluation the book value of stocks on August 31st was exceptionally large; it is entered at £5,505,069, or £923,086 higher than a year before—despite the fact that the volume, though not the monetary value, of turnover was lower than in 1949-50. There was also a startling change in the company's liquid position during the year. On August 31, 1950, cash balances at £393,259 and quoted investments at £40,467 had exceeded bank overdrafts at £160,882 by £272,844. By August 31, 1951, the bank overdraft had increased to £2,791,621 and the cash balance had dropped to £52,890, while the marketable securities had been sold. Against this, secured trade creditors, representing wool purchased, had fallen from £1,293,344 to £104,284—evidence, as the chairman puts it, of how the company "was trimming its sails to meet the storm." In these circumstances it is not surprising that the directors were reluctant to weaken financial resources by drawing upon specific reserves when writing down stocks. Fortunately these figures, in the chairman's words, are "now mainly of historical interest" as at the end of last December the group's net indebtedness to the banks had been reduced to £45,540.

Consolidated earnings :—	Years to August 31, 1950	1951
	£	£
Trading profit	1,827,828	805,111
Total income	1,829,369	806,940
Depreciation	66,459	89,820
Taxation	903,371	376,195
Group earnings for ordinary stock	*710,927*	*286,772*
Ordinary dividends	94,335	95,675
Ordinary dividends (per cent)	22½	22½
Retained by subsidiaries	552,565	176,363
Added to carry forward	64,268	15,293
Cons. balance sheet analysis :—		
Fixed assets, *less* depreciation	1,003,975	1,208,545
Net current assets	3,025,878	2,745,139
Stocks	4,581,983	5,505,069
Cash	393,259	52,890
Reserves	2,089,638	2,223,562
Ordinary capital	762,300	809,944

£1 ordinary stock at 51s. 10½d xd yields £8 14s. per cent.

The balance sheet provides plenty of evidence to support the chairman's contention that "during the past nine months the wool textile industry has been passing through a storm at least comparable in magnitude to that which was encountered after the first world war." Wool purchase commitments were kept to the minimum consistent with full employment; and although overtime working had to be cut and the working week of some employees had to be shortened, the labour force was kept "for all practical purposes intact." Here perhaps is another example of a company that was anxious to hold on to its labour force in a period of overfull employment at the risk of heavy short-term losses. The chairman believes that trading conditions will continue to be difficult for the next few months but will then become more normal, though also more competitive. But few shareholders will doubt his wisdom in refusing to forecast the future level of earnings.

*

The Hollins Mill.—Lancashire cotton spinners may face the present and immediate future with some concern, but they can certainly look back with satisfaction on their trading results in the immediate past. Almost without exception those spinners whose accounts have been published recently have reported an advance in trading profits to a new record level. The Hollins Mill proves to be no exception. Group trading profits in the year to November 30th have risen from £370,320 to £631,069. At the same time the loss made by its Australian subsidiary has been reduced from nearly £71,000 to just under £7,000. Therefore, in spite of a heavier tax provision of £314,649, against £204,617, net profits have increased from £110,132 to £238,325, so that the maintained ordinary dividend of 15 per cent is more comfortably covered by net earnings.

Consolidated earnings :—	Years to Nov. 30, 1950	1951
	£	£
Trading profit	370,320	631,069
Total income	418,213	646,735
Depreciation	31,254	26,169

The year's appropriations from profits, which included £50,000 transferred to a general reserve and another £50,000 to a stock reserve, usefully reinforced the company's financial resources; the group's reserves have been raised from £396,974 to £567,989. But the burden of stocks at £1,234,287, against £913,401, was more onerous, and at the year-end £94,569, against £47,804, was owing to the banks and £36,402, against £30,742, had been borrowed from members of the company; against this, however, cash balances were up from £120,914 to £188,111 and tax reserve certificates from £180,475 to £200,000. Since the end of the Australian subsidiary's financial year on June 30th last, the loan made to that company has been reduced by £12,718.

At the moment the company's order book remains high, but as demand for cotton textiles, both at home and overseas, has fallen sharply in recent months shareholders will certainly heed the chairman's warning that "a continuance of the present recession is bound to have an adverse effect on the current year's earnings." The yield on the 5s. ordinary shares of £13 at the price of 5s. 9d. quoted on the Manchester exchange makes it clear that investors are well aware of the dangers and risks that lie ahead.

*

Arthur Guinness.—By agreeing to the capitalisation of £5 million from Guinness's reserves to enable the company to make a bonus issue, the Capital Issues Committee has at last recognised that the group's issued capital bore no relation to the real capital employed in the business. At the annual general meeting Lord Iveagh once more emphasised that such an issue did not add to the equity of the business, nor did it mean that there would be an increase in either total or distributed profits.

Last May, the rise in costs forced the company to raise the wholesale price of stout by 12s. a barrel. The whole of this increase has already been swallowed up in the higher prices that the company has had to pay for malt and hops. Although this further increase in costs will affect profits in the current year, the directors hope to keep selling prices unchanged. Lord Iveagh adds another warning that if the end of the period of inflation is in sight, "then there must be difficulties of readjustment which may well involve temporary setbacks."

Statistical Summary

EXCHEQUER RETURNS

For the week ended January 12, 1952, total ordinary revenue was £177,231,000 against ordinary expenditure of £71,524,000 and issues to sinking funds £1,240,000. Thus, including sinking fund allocations of £18,093,000, the deficit accrued since April 1, 1951, is £95,189,000 compared with a surplus of £220,660,000 for the corresponding period of the previous year.

COMPANY MEETINGS

BARCLAYS BANK LIMITED

RECORD GROUP FIGURES

FAILURE OF PLANNING EXPERIMENT

MONETARY DISCIPLINE RE-APPLIED

MR A. W. TUKE'S SURVEY OF POSTWAR EVENTS

The annual general meeting of Barclays Bank Limited will be held on February 8th at the head office, 54, Lombard Street, London, E.C.

The following is the statement of the chairman, Mr A. W. Tuke, which has been circulated with the report and accounts for the year ended December 31, 1951:—

THE LATE SIR WILLIAM GOODENOUGH

Since our meeting last year the outstanding event in the affairs of the bank has been the withdrawal from the chairmanship of Sir William Goodenough in February last owing to ill-health, which was followed three months later by his untimely death. Others should speak of his services to charitable causes, such as London House and the Nuffield Foundation, which absorbed so great a share of his time and energy and which will always bear the mark of his statesmanship. I am qualified rather to estimate his services to the bank, first and always at Oxford, but later and more fully in London where he watched over the fortunes of all the companies in the Barclays Group, in particular while serving successively as chairman of Barclays Bank (Dominion, Colonial and Overseas) and of Barclays Bank Limited. In all his activities he appeared to be inspired by a vision of which the unity and greatness of the British Empire was the predominant theme.

Without doubt he inherited this inspiration, as he inherited many other characteristics, from his distinguished father, Frederick Craufurd Goodenough, who came to the bank on its incorporation as a limited company in 1896 and guided its destinies throughout the formative years until his death in 1934 after seventeen years as its chairman. At this time William Goodenough, who was already a director of the bank, was elected a vice-chairman; he became chairman of our principal subsidiary in 1943, and it was only in 1947 that he became chairman of the parent bank. It is sad and frustrating to think that, having succeeded at so young an age to this highest office, which gave such great scope to his outstanding abilities, he held it for so short a time.

LIFETIME OF SERVICE

Measured by length of days, his life has indeed been a short one. Measured by its achievement he may truly be said to have rendered a full lifetime of service to the bank and to the community. It is early yet for any historian to give a true picture of his greatness, but we who remain behind have no doubt that we have lost a great leader and a good friend and it is strange to think of the bank without a Goodenough either holding the helm or standing at the helmsman's elbow.

We have also suffered a grievous loss in the death of Sir William Wiggin, who was elected a director in 1931, and who has rendered exceptional services to the bank as chairman of its local board in Birmingham and in our councils in London.

RESIGNATIONS

We also regret that, having reached the age of 70, Mr Grimwade has decided on principle not to offer himself for re-election, with the result that he will retire from the board at the close of the annual meeting. As branch manager, as district manager and as local director, Mr Grimwade has, over a period of years, made a great contribution to country banking in East Anglia and the Midlands, and I am glad to say that he is willing to continue for a time in the office of local director at Peterborough and Leicester. It is fitting that his last act as a director of the bank will be to propose the vote of thanks to the staff at our annual meeting. In doing so, he will speak for all the directors, and there is no need for me to add any words of my own on this subject.

We shall miss Colonel Astor who has decided to give up his directorship at the end of the annual meeting, after being a member of our board for nearly ten years. With his record of service in public life and his distinguished place in the sphere of business it was natural that he should serve the bank well, and it has given us great pleasure to have him as a colleague.

CHANGES IN DIRECTORATE

My fellow directors did me the great honour of electing me chairman when Sir William Goodenough was obliged to retire, and thus I present myself to you for the first time in that capacity. I will only say that I shall do my utmost to be faithful to the traditions of our bank, which are in some respects peculiar to itself by reason of our maintenance with suitable adaptations of the policies of the old private banks from which we sprang. On assuming this appointment I have thought it right to resign the directorships which I held on the Boards of most of our subsidiaries, in order that I may concentrate the whole of my attention on the affairs of the parent company, but this of necessity involves my being ready when required to apply myself to the co-ordination of the policy of the whole group, and it will be a great advantage to me to have personally participated in the direction of these companies in recent years, and to have visited some of the territories in which they operate.

The Board have elected Mr Ellerton to take my place as deputy chairman, a choice which gives me the greatest possible satisfaction, not only because of my faith in his high qualities but also because he has in his armoury many weapons lacking in my own, with which he is always ready to defend me and to do battle for the bank or for causes even more important.

We have also asked Mr Barnes, who is deputy chairman of Barclays Bank (Dominion, Colonial and Overseas) to accept the appointment of vice-chairman of the parent bank, although the greater part of his time will still be given to the affairs of the subsidiary. We shall greatly value in our councils the wide experience of Mr Barnes, not only in our associated bank, where he has spent most of his career, but also as a local director at Norwich and Birmingham before he went to Egypt in 1927.

With Mr Fitzherbert, who was already a vice-chairman, and whose support and friendship I have long since learned to value, we have thus completed the number of our executive directors who work in head office.

DECENTRALISATION OF CONTROL

I have referred to our maintenance of the methods of the old private banks, and it is of some interest to me to observe that considerable emphasis is being laid to-day on the necessity for the decentralisation of the control in large units of business, especially those conducted directly or indirectly by the Government. This is the method which we have adopted in running our bank since the limited company was formed in 1896, and we have applied it successfully to all our subsequent acquisitions (with the exception of part of our London business), including our subsidiaries overseas. I therefore applaud the critics who give this advice, but in doing so I must warn them that it will not produce instant miracles. My experience leads me to believe that this system works with us largely because it has always worked. It is far from easy to start it anew with personnel who do not really know from experience what they are trying to do, and who may be obsessed with the need to ensure that the same question, however unimportant, always receives the same answer, even if it takes six months to give it.

Turning to the figures of the balance-sheet, stockholders will observe that our current, deposit and other accounts at £1,284,691,537 show a small decrease on last year's figures, in spite of the fact that there was a very steep rise in the cost of living during 1951 which would normally be reflected in higher deposits in the clearing banks. An inflationary increase in deposits undoubtedly took place during the year but, just as in 1950 our deposits were augmented in part by an inward movement of foreign money, so the deterioration of our position overseas during 1951 has enabled the Government to repay debt and reduce bank money.

LIQUID ASSETS

During the last few weeks of the year the pattern of our assets was considerably changed by the conversion of a large block of the outstanding Treasury Bills into the new issues of short-dated Funding Bonds, of which we took up over £100 million. Even so, 38 per cent. of our liabilities to the public are represented by cash and other very liquid assets without including Treasury deposit receipts and this, although still high by prewar standards, brings us within sight of the time when liquidity may once again be a serious factor in the conduct of our day-to-day business.

This considerable reduction of the floating debt is one of the monetary measures designed to supplement the action undertaken by the new Government to force some of the inflation out of the economic system. After so many years in which the climate was almost continually favourable to those who were inclined to carry stocks on borrowed money, whether of raw materials, manufactured goods or securities, the direction of the wind has now changed. I do not suggest that it has settled permanently in the East, nor would it be at all desirable that it should do so. But if it is recognised by the community that it is possible for prices to fall as well as to rise, they will adjust their operations to the normal fluctuations of the market, instead of buying any goods that may be offered at any price today in case they may be more expensive tomorrow.

Our whole economy will then assume a very different and much more healthy character. Apart from the new Funding Bonds, we have, since the end of 1950, added somewhat to our investments in Government securities, but it will be readily understood by stockholders that we have not been able to insulate ourselves against last year's considerable fall in the market value of these securities, which, apart from what we were able to provide from the profit of the year, has had to be absorbed by our investment reserve and by a transfer from our general contingency account. The whole of this fall is bound to be recovered sooner or later, on the assumption that we hold to maturity the stocks concerned, which all have definite dates of redemption, and we can at least feel satisfied that the present prices are not so unrealistic as those which obtained four or five years ago.

INCREASE IN ADVANCES

The advances, our most important if not now our largest asset, show another substantial increase on the year, which is the inevitable outcome of rising prices, in spite of our continued efforts to carry out the wishes of the Government that we should discourage borrowing which might aggravate the inflationary trends present in the economy.

Our fixed assets call for no special comment except in regard to our holding of stock in Barclays Bank (Dominion, Colonial and Overseas), where in connection with the recent increase in the capital of that bank by an issue of bonus shares we have paid up another pound on each of our 500,000 "B" shares of £5 each, making them now £2 paid. We waived our right to the allotment of bonus shares in respect of this holding, but we have, of course, been allotted our due proportion of those shares in respect of our considerable holding of "A" stock. The continued prosperity of this important Empire bank, which has now completed the first twenty-five years of trading since it was reincorporated under our banner, is a source of great satisfaction to us, as I am sure it is to our stockholders.

PROFIT FOR THE YEAR

The profit for the year, after making the necessary provisions, is about £60,000 less than a year ago. Stockholders will understand that many factors, some favourable and some unfavourable, go to produce this final figure, one of the unfavourable ones being the extra sixpence which was added to the income tax in the last Budget. Again, the new arrangement whereby the Money Market rates have been increased and a large section of the Treasury Bills has been converted into Funding Bonds has actually caused a reduction in income in the current year, though it may tend somewhat to increase gross profits in future years. If, however, the new policy succeeds in its aim, our earning assets are likely to be reduced so that in the long run we may not derive any benefit from the increased rates.

The profit for the year has enabled us to recommend the usual dividends and, with the help of a draft on the carry-forward, to set aside £1 million, compared with £750,000 last year. On this occasion the whole amount is being carried to contingency account, where it will help to fill the gap caused by the recent fall in the value of Government securities.

On the consolidated balance sheet I need only call your attention to the aggregate of the current deposit and other accounts of the group, which at £1,818,231,403 is higher than ever before and reflects in particular a large increase in the figures of Barclays Bank (Dominion, Colonial and Overseas).

PLANNERS DISILLUSIONED

I now turn to the consideration of matters of wider import and, at this moment of serious economic difficulty, I feel that it may be useful if instead of limiting myself to the past year I attempt a survey of some of the events in the economic field during the whole of the postwar period, which now extends to six and a half years, approximately the time which elapsed between the end of the 1914-1918 War and the restoration of the pound sterling to its old parity in terms of gold.

During this present period the country has been subjected to an experiment in planning. The initial period of this experiment is clearly at an end, but no one knows when it may be renewed, and meanwhile we have an opportunity of standing back from the picture and seeing how it looks. Not all of us expected a masterpiece, but even the most optimistic partisans must be a little disillusioned by what they see at the present moment.

At this stage I may be told that I am treading on dangerous ground; that I am infringing one of the articles of the banker's faith, that he should at all costs avoid becoming involved in party politics. I fully acknowledge the validity of this doctrine at the time when it was enunciated and also at the much later date when I was taught it by my father, himself a private banker in his early days. Indeed, I should still regard it as most undesirable, so far as I personally am concerned, that I should take an active part in the affairs of any political party. But times change, and we may have to change with them. In olden days when the choice was between Whig and Tory, it mattered little to the banker which party was for the moment in power; indeed, the banker might possibly, as a Free Trader, favour privately the policies of the progressive party, and if he failed to observe the reticence enjoined upon him, it might well have been "the squire and his relations" who would have been scandalised.

TEST OF NEW POLICY

But in the process of political evolution, which has proceeded more and more rapidly during this twentieth century, we have arrived at a stage when an entirely new economic policy has been put to the test by the progressive party of the day. In these circumstances if a business man, who is required or at least allowed by custom once a year to make public comment on the affairs of the nation, feels that the results of this policy have been and are likely to be disastrous not only to private enterprise, to which he pins his faith, but also to the true interests of the whole nation, from which all else depends, then it is surely his duty, even though he be a banker, to give expression to his views to the best of his ability. He should, however, express himself in no partisan spirit, but soberly and objectively and with a due sense of his responsibility.

Let us consider then what we mean by planning. In dealing with everyday affairs we all try to benefit from past experience and nobody would deny that we should also look ahead. In this sense, everyone is a planner. But this is not the meaning given to the term by the supporters of a planned society. Not content to set up a broad framework of justice and order within which everyone would be free to plan for himself, they preach that all economic activity should be the expression of authoritative inspiration directed to serve certain ends by certain means. This is bad enough, but it is worse still if the means come to be regarded as more important than the end, as they have appeared to do sometimes during the last six years.

AUTHORITY'S ROLE

Certain forms of State intervention in our economic life are, of course, inevitable. Clearly there are cases where it would be impossible to levy payment on, or even to identify, the users of the service, and the only convenient course in such instances is to provide the service "free" and to make the community as a whole bear the cost. But I have no belief in the efficacy of any central control of all the manifold wants of fifty million people by means of a mass of permits, coupons and licences, no longer considered merely as necessary evils to be tolerated in time of war and other grave crisis and to be abolished as soon as possible when the crisis is over, but as weapons with which to repress the antisocial tendencies of those who are so eccentric as to wish to spend their own money in their own way.

For my part I am convinced that in these matters it is better for authority to confine itself to avoiding the creation of conditions in which it pays a man to break the law. Human nature being what it is, it is quite useless to depend on regulations which can be evaded and on appeals to the social conscience which can be ignored. I may be told that to say this is to take a low view of human nature, but I would reply that it is at least a realistic one. It is a regrettable fact that in the period since the end of the war there has been in many directions a distinct deterioration in the moral standards of the people of this country, for which overplanning and over-taxation must share a large part of the blame.

Planning manifests itself in two forms, which I will call the retail and the wholesale, and their adjoining edges are somewhat blurred, as are the edges of retail and wholesale business. On the one hand we have the vast mass of statutory rules and orders regulating almost every diverse activity of our daily lives, and on the other hand we have the large and comprehensive acts such as the nationalisation of whole industries; it is by the handling of these latter that the planner must be content in the main to be judged, counting himself perhaps fortunate to escape challenge on many individual petty edicts issued under authority delegated to him by legislation, which has given him the power and indeed the duty to issue any order that he may think fit in order to give effect to what he presumes to be the general intention of the Act, having in mind the known prejudices of those who made it.

THE UNEMPLOYMENT PROBLEM

Let us now examine the picture of this postwar era as a whole to see what we can find in it that is good, and to what extent it may be due to planning. Few will, I think, disagree with me when I say that the outstanding difference between this and the corresponding earlier period is in the matter of unemployment. After the first world war there was a short-lived boom in trade while depleted stocks were being replaced, and this was followed by a period of falling prices and restricted credit, culminating in 1925 in the restoration of the pound to its pre-war value in terms of gold. This was a notable achievement, but it carried with it almost inevitably

a contraction in trade and employment, and so has come to be regarded as having been a grave error of political judgment. Looking back in the light of the lessons of the intervening twenty-five years, I should say that the error lay in returning to gold at the pre-war price. If we had been content to adopt a new price which recognised the loss of wealth which the war had involved, we might have been spared some, at least, of the pains which marked the inter-war period. But anyone who criticises the decision taken in 1925 should remember that the world had not then become accustomed to the devaluation of currencies, and it was still considered incumbent upon an honest man to pay his debts in the coin in which they had been incurred.

Between the wars, economic and political thought was dominated by the need to find a means of countering unemployment, always within the ambit of orthodox finance, which broadly speaking applied to the nation's affairs the principles which an individual who was facing the prospect of bankruptcy ought to apply to his own. In 1933, however, the newly elected President of the United States of America introduced in his famous New Deal an entirely novel and heretical remedy, for which, since it owed much to the teachings of the late Lord Keynes, England may claim a share of the praise, or must accept a share of the blame. President Roosevelt's cure for a depression was not to spend less but to spend more: not to make money dear but to make it cheap. This bold experiment did not perhaps achieve all that was expected of it, but it did succeed in setting the wheels of American industry once more in motion, and with its great natural recuperative power that country was soon prosperous again. This momentous event gave encouragement and respectability to the exponents of the new doctrine that a trade depression could be cured by a budget deficit, and the old orthodoxy has since tended to fall into oblivion.

THE 1944 WHITE PAPER

Towards the end of the second war, responsible people in this country began to turn their attention to a consideration of the problems likely to arise after the end of the fighting. One of these was unemployment, but in a White Paper published in 1944 the Government of the day expressed the view that there would be no problem of general unemployment in this country in the years immediately after the end of the war in Europe. The available manpower, it was recognised, would be insufficient to satisfy the total demand for goods and services, and some time was likely to elapse before the need would arise to put into operation any long-term policy for averting mass unemployment by stimulating the demand for goods and services.

Despite this, after 1945, the new Government, impressed no doubt with the fact that the war had been financed on terms progressively more satisfactory to the State, eagerly gave another turn to the screw, although there was no sign of any decline in business activity. Instead of keeping the stimulant in reserve in case the patient should show signs of collapse, they plied him with successive doses of alcohol when he was already slightly intoxicated. Realising, however, that he could not be allowed out and about in that condition, they called in the planners to set up an elaborate system of controls with which to check, thwart and generally infuriate the unfortunate victim. And then they gave him another glass of champagne.

ATTEMPTS TO HALT INFLATION

Attempts have been made, though until recently within narrowly restricted limits, to bring this inflation to a halt, and in this connection the extra expense of rearmament is a most disturbing factor, but until the last few weeks it seems to have been hardly realised that, whereas the new technique may be properly applicable in a time of depression, the old orthodox remedies may still be appropriate when inflation is rampant. There has been a heavy price to pay for this ever-increasing inflation and no one can say that there will not one day be an awful reckoning to be met, but for six years the fear of unemployment, which was a nightmare to many in the inter-war period, has been virtually removed, and there is no denying the comfort and reassurance that the existence of a sellers' market for labour has brought to many homes. But as a general principle neither the seller nor the buyer ought to have the whip hand in commerce.

The ideal of permanent equilibrium is doubtless unattainable, and when thinking of buyers' and sellers' markets we should not forget that each one of us is both a seller and a buyer: a seller of the fruits of his own labour, and a buyer of the fruits of the labour of others. In present conditions a man finds it comparatively easy to earn a high wage but very difficult to buy with it the goods and services that he requires. It would be even worse to go to the other extreme, but he would almost certainly be better off if he had rather less money to spend but goods were more plentiful and therefore cheaper.

In retrospect one cannot imagine a more opportune period than the years since 1945 for the application of monetary discipline and I have great hope that its adoption at the eleventh hour may yet put our economy on a sound basis. An expansionist policy, if under proper control, may well be the answer to the problem of mass unemployment in this country: that, however, does not justify its adoption in circumstances to which it was inappropriate.

This comparison between the two postwar periods is on balance favourable to the era of planning, though opinions would differ as to the contribution made to it by the planners. Let us now consider some of the apparent failures of planning, and try to ascertain their cause.

NATIONALISATION OF RAILWAYS

The railways provide a good opportunity for the public to weigh in the balance the fruits of the nationalisation of an existing industry. In the past, conditions of semi-monopoly had prevailed, and there was little effective competition, even under private enterprise, between one railway and another, because they served in the main different areas. Nevertheless they were in competition with other forms of transport and, although the service was by no means perfect, a reasonably high degree of efficiency was maintained in spite of their being hampered by restrictive legislation.

When the railways were nationalised an immediate eruption of paint on the engines led one to hope that the service would perhaps be smartened up in other ways also, but this hope has proved groundless. In spite of increased wages, staffing difficulties have become acute, and from the point of view of the passengers, though they have seen the completion of improvements, postponed owing to the war, on some of the suburban lines, the service generally compares most unfavourably with that given when the industry was in private hands. The fares, though several times increased, are inadequate to meet the growing costs, and the management is faced with the operation of an economic law to which the planners appear to have no answer. Their usual remedy of raising the price, which they can apply with impunity when they have a monopoly of some goods or services which the public must buy, fails them when the public can travel by road, or even stay at home; if they find the railways too expensive, in addition to being dirty and unpunctual.

EMPIRE DEVELOPMENT ORGANISATIONS

Another form in which the State has entered into business on a large scale in recent years is by means of the setting up of agricultural organisations of various kinds in undeveloped parts of the Empire. The conception of these projects was meritorious, both for the production of much needed food for the growing population of the world and also for the development of the latent resources of the territories concerned. Given the urgent need for the foodstuffs, the Government may well have been right to attack the problem as they did, but the fact remains that major failures and only minor successes have emerged. Private enterprise would, of course, have proceeded quite differently, testing its theories by means of one or more small pilot schemes and would, probably have been content to wait ten years for a return on its investment, but private enterprise does not bear the responsibility for feeding the nation.

Perhaps the lesson to be learned from these unhappy experiences is that pioneering is inevitably a very slow job, and that the method adopted by private enterprise is not easily improved upon by the most carefully laid plans, even when the planning is backed by the almost unlimited financial resources of the State. In one way or another probably £50 million of the taxpayers' money has been wasted, or I will say spent in learning this lesson. This is a large sum even to-day, but it represents only about 1 per cent. of the country's annual budget, and if that was all that unsuccessful planning had cost us in five years we should not have much to complain of: it would be a very well-run business and a very lucky one which was able to keep its annual wastage owing to managerial and directorial shortcomings as low as 1 per cent. of its gross expenditure.

Such wastage can, of course, never be measured accurately, but whatever it is in private industry it must in the very nature of things be higher in a Government business. And it seems reasonable to assume that if wastage of this kind affects business enterprises run by the State it must also permeate the whole field of Government expenditure. That is where the pruning knife should be applied.

HOMES FOR THE PEOPLE

Perhaps the most important of all the nation's internal activities since the war has been the effort to provide homes for the people who are in need of them, and up till now this activity has been kept almost entirely in the hands of the Government and Local Authorities. It was announced in the middle of last year that a million new post-war dwellings had been completed, and besides this a large number of bomb-damaged houses had been restored to habitable condition. But nearly half a million houses were destroyed in the war, and it is computed that before the war 200,000 new houses were required every year to replace normal wastage. On this basis it would appear that we have actually fallen behind since the war ended. The slow progress has resulted in an excessive premium being created and maintained for the vacant possession of prewar houses, and this has served in some degree to mask the high cost of the new house.

Personally I feel certain that the insistence of the late Government on retaining this activity so largely in public hands has caused quite needless inflation of the price of these new houses. I believe that, if private enter-

prise had been allowed to operate freely in this field, subject only to control of design and construction and to a ceiling price, the result, given the co-operation of the trade unions concerned, would have been a lowering of the cost of the finished article. It is true that different considerations would have governed the allocation of new houses, and that the ability to put up a small margin of security for the necessary loan would have become an important factor.

This would perhaps have been rather displeasing to the planners, but let them consider that not all of these wicked capitalists would have inherited their wealth; some of them might have themselves responded over the years to the Savings Campaigns, and surely no responsible Government would have been so cynical as to deny these meritorious people the opportunity of deriving some personal benefit from their past abstinence. Let them consider also that housing need and financial need are not synonymous terms.

NEW GOVERNMENT'S DECISION ON HOME-OWNERSHIP

I am very glad to see that the new Government has decided to encourage home-ownership, and that the local authorities may now, subject to conditions, sell individual houses to those of their tenants who are able and willing to buy them. Every pound that is repaid to the Government by this means will enable it to wipe out a pound of inflationary debt, just as every pound that has been borrowed by the Government in recent years to finance local authorities for this and other purposes has increased the inflationary pressure.

It is true that the tenants themselves will have to borrow, but if they go, as they should, to building societies and insurance companies and draw on the existing resources of these institutions, no additional credit will be created. It must be added that if this presages a return of the main responsibility for housing to private enterprise, it will be necessary for the land to be freed from the stranglehold of the Town and Country Planning Act, but this typical example of the planners' art is surely destined in any case soon to collapse in complicated ruin.

COAL DISAPPOINTMENT

Instances of the failure of nationalisation and other planning activities to achieve what their protagonists expected of them could be multiplied. Even in the coal mines, where it was generally conceded that some major change was necessary, the results are most disappointing. There has been some progress since 1946, but this was from an output level abnormally depressed through the effects of the war. The best technical opinion contemplated that with the help of modern mining methods, we should by now have a much greater output with the present personnel, and it is certainly most unsatisfactory that total output is still below the 1938 figure, which was in its turn smaller than in 1913 when mechanisation as we now understand it had not begun.

The widely propagated belief that the mines would produce enough coal when the miner knew that he was working for the community has proved to be no more than wishful thinking, and we have lately had to face the humiliating necessity of importing coal from abroad to meet our needs. The miner, like many other people, looks at his pay packet, and when it contains as much as he requires for his immediate needs he seems to be inclined towards additional leisure or recreation, especially if further earnings would involve a heavy liability to income-tax, to the payment of which he has a strong though by no means peculiar objection.

THE HUMAN FACTOR

Is there then some constant factor in all these plans which causes such unrelieved failure? They are, I am sure, prepared with the greatest care by men of outstanding ability and of the highest intellectual integrity. Mathematically and statistically they are without doubt beyond the reach of criticism. But, unhappily, the cleverest men often seem to be somewhat lacking in common sense and wordly wisdom. Working as they do in a vacuum, in back rooms in Whitehall, or it may be in Bloomsbury, they may never have been in intimate contact with the rough realities of life.

Such people may well think that if it is true that two and two make four in the lecture-room, it must also be true at the coal-face and in the African bush. In fact they do not and cannot make allowance for the reactions to be expected from human beings and from the forces of nature, which will beat them every time. The Latin poet Horace told the world two thousand years ago that you could not eradicate nature with a pitch-fork. *Naturam expellas furca, tamen usque recurret.* We have now learned that for that purpose a statutory rule and order is an equally ineffective implement. The pitch-fork may, however, be good enough for a planner.

THE MIDLAND BRIGHT DRAWN STEEL AND ENGINEERING

EXPANSION OF SALES

The fifth annual general meeting of The Midland Bright Drawn Steel and Engineering Company, Limited, was held on January 14th in Birmingham, Mr Arthur H. Johnson, O.B.E. (the chairman), presiding.

The following is the statement by the chairman circulated with the report and accounts for the year ended October 31, 1951: It will be observed that the form of accounts has been modified by the incorporation of the profit and loss account of the parent company in the consolidated profit and loss account which gives the results of the group as a whole. The total sales of your companies have been considerably expanded during the year under review by the installation of new machinery and the energy of the executive and works staff, only a small percentage of the increased sales are attributable to the rearmament programme and consequently the expansion in profits has been mainly derived from the normal products of the group.

Shareholders may recall that at our last annual general meeting I made reference to the fact that your board had acquired the valuable leasehold factory premises of Wilcox and Lines, Limited, with a term of 84 years expiring in the year 2035 for the sum of £14,146 including all legal charges; the advantages obtained have been many, not the least being the cessation from March, 1951, of the rental of £1,250 per annum. In addition, as I have already mentioned, new machinery, in some cases involving new processes, has been installed and, of particular importance, the addition of two ten-ton lorries to the vehicle fleet has resulted in a considerable saving in the ever-increasing charge for road haulage.

In conformity with my statement accompanying the 1950 accounts your board have written down the figures appearing in the consolidated balance sheet under the heading of goodwill by £3,764; it is hoped that the balance of £16,000 will be eliminated over a period of years out of future profits.

After incurring capital expenditure of £30,333 during the year under review the difference between current assets and current liabilities has increased from £28,611 to £74,885. In this connection I would draw shareholders' attention to a point which by the effluxion of time may tend to become overlooked, namely, the total cost of the subsidiary companies amounted to £272,499, of which only £128,370 was provided by additional ordinary and preference share capital, leaving a difference of £144,129 representing a net movement from current to fixed assets to be provided out of profits; this, if not wholly, has to a considerable extent been achieved.

As shareholders know, both subsidiary companies were new companies incorporated in the middle of 1949 and were therefore subject to the complex rules of taxation relating to new companies which, in simple language and to comply with prudent accounting policy of reservation for taxation up to and including the profits of any year, meant that at October 31, 1950, approximately 33 months' taxation had to be provided out of approximately 16 months' profits; this, of course, with taxation at its present level, was an impossibility, but it is gratifying to state that, at October 31, 1951, the position has been achieved by a transfer to taxation equalisation account of £19,430; no similar transfer will be required in future, and after provision for current taxation the whole of future profits will be available for dividend or reserves.

The current year has opened with a substantial weight of orders on the books of all three companies, but raw material supplies during the past year have been extremely difficult, and will continue to be short for some considerable time, and this may be the limiting factor in our progress.

The report was adopted.

GOLD COAST SELECTION TRUST

The twenty-second annual general meeting of the Gold Coast Selection Trust, Limited, was held on January 15th in London, Major-General W. W. Richards, C.B., C.B.E., M.C. (the chairman) presiding.

The following are extracts from his circulated statement:—

For the year ended September 30, 1951, the profit which accrued to the company from realisation of investments was £19,449. We received £86,628 by way of dividends, etc., on investments. The aggregate market value of the company's investments is above the book cost—in particular, large shareholdings in Amalgamated Banket Areas, Ariston Gold Mines, Bremang Gold, Marlu Gold and Gold Coast Main Reef.

In the past Gold Coast Selection Trust has confined its activities to West African interests, and although the scope for future activities in the Colony is by no means exhausted, your board has decided to widen the field of interests if and when favourable opportunities present themselves.

We have already paid an interim dividend of 3d. per unit of stock (5 per cent.), and the board recommend the payment of a further dividend of 4½d. per unit of stock (7½ per cent.) for the year ended September 30, 1951.

A resolution for increasing the company's authorised capital by £250,000 is being put forward in order that the directors may be in a position to accept any opportunities which present themselves for improving and extending the company's interests. Existing members will be given the opportunity of subscribing to any new issue of capital.

The report was adopted and the proposed increase of capital was approved.

WILLIAMS DEACON'S BANK, LIMITED

RECORD DEPOSITS EXCEED £139 MILLION

UNFAVOURABLE SWING IN NATIONAL BALANCE OF PAYMENTS

CREDITS RESTRICTED TO AID DEFLATION

SIR WALROND SINCLAIR ON STERLING'S FUTURE

The annual general meeting of Williams Deacon's Bank, Limited, will be held in Manchester on Thursday, February 14, 1952. The following is the statement by the chairman, Sir Walrond A. F. Sinclair, K.B.E., on the report and accounts for the year ended December 31, 1951.

The proceedings at the annual general meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the bank's affairs in advance of the meeting.

During the past year there have been no changes to report either on the board of the bank or on its executive, so that the only domestic subject I need to enlarge upon is that the residential training establishment at Cheadle has been in operation for the bulk of the year. It has been, I am satisfied, an unqualified success and will, I am sure, prove of inestimable value in the future. The courses there have been much appreciated by the managers, officials and other members of the staff who have attended. This, indeed, was obvious while the courses were in progress but has been amply confirmed by the number of letters which have been received from members of the staff expressing their appreciation and the sense of the benefits they have derived from their stay at Cheadle, not the least of which has been, in their opinion, the opportunity of making contact with their colleagues from distant parts of the service.

I feel I must take this opportunity of thanking, in your name, all those officials of the bank whose keenness and co-operation have been necessary to make the project a success. It has, I know, entailed much unflagging effort.

THE ACCOUNTS

I now turn to the accounts, from which you will see that deposits at £139,495,367 are nearly £9 million above last year's figures and are once more a record for the bank.

They are again, as in December, 1950, somewhat swollen by several large balances which are expected to be of a temporary nature.

On the assets side, the liquid items, namely cash, balances with other banks, money at call, discounts and Treasury deposit receipts, amount in total to £61,905,655, which exceeds 44 per cent. of our deposits. As you will be aware, official policy during the year has been to continue to reduce the total of Treasury deposit receipts and to increase the issue of Treasury bills in their place. But a radical development occurred in November when an issue of £1,000 million serial funding stock replaced an equal amount of Treasury bills. I shall refer to this operation later.

British Government securities, which stand under current market price at £41,778,194, have in consequence again increased.

Advances at £36,937,283 show an increase of £5,840,363. An increase in advances has, of course, been the common experience of the clearing banks, occasioned in many cases by the steady rise of prices largely due to the inflationary trend which has persisted during the whole of the year.

Our net profit, after making the usual provisions (which include contributions to staff pension and widows' and orphans' funds and appropriations to contingencies account) is £258,520, that is a decrease of £1,864 on the year. This with the balance of £127,163, brought forward, gives a total of £385,683 to be dealt with. After transferring £125,000 to contingencies account, we propose to pay dividends at the rate of 12½ per cent. on the "A" shares and on the "B" shares and to carry forward to next year £137,637. I am sure you will feel that these results may be regarded as quite satisfactory.

During the year the business at Downholland has been transferred to a neighbouring site at Lydiate, by which name the branch is now known. In addition, a new trustee branch has been opened at Preston. A new branch at Birmingham will be opened very shortly.

IMMENSE GOLD LOSSES

At this time last year I prefaced my remarks on the general situation by pointing out that the most satisfactory feature of 1950 had been the re-establishment of world confidence in sterling, and it is therefore doubly disappointing to have to state now that 1951 has seen an abrupt unfavourable swing in the balance of payments and a heavy drain since the middle of the year on our gold and dollar assets. The effect of this development was that confidence in the future of sterling became undermined throughout the trading world. The situation, accordingly, in which we find ourselves is grave and its gravity has been both psychologically, and indeed practically, intensified by the speed with which the crisis has come upon us. The immense gold losses sustained in the last quarter of 1951 are such that, were they to continue at the same rate, the whole of the gold and dollar reserves of the sterling area would be used up in nine months. From a position earlier in the year when a revaluation of sterling in an upward direction was being canvassed by monetary centres overseas—and not unreasonably—we are now faced with a situation in which people abroad have been delaying sterling payments and speculating in sterling, actuated, of course, by their opinion that a further devaluation was possible.

The year has also seen a relentless rise in internal prices, principally due to the inflationary trend. We must realise that the rise would have been greater but for the deterioration in the balance of payments position.

BASIC COMMODITY PRICES

The situation in Korea, coupled with quite a moderate amount of American stockpiling, pushed prices of some basic commodities up to unheard of levels. Unfortunately for us in this country, export prices did not rise immediately, nor indeed have they since, by a proportionate amount.

The increase in prices of basic commodities, notably wool, rubber and tin, did however benefit other members of the sterling area and whilst the proceeds of their exports helped to swell our gold and dollar reserves, they also increased the sterling balances of these countries here. This was, of course, not abnormal and was before the war the usual pattern of trade whereby British Commonwealth countries sold their raw materials to the dollar area, from which area we, in turn, bought raw materials and other goods and completed the circle by ourselves exporting manufactured goods to our Dominions and Colonies.

But now, however, there are important differences, some of which cannot but be regarded as unfortunate for the United Kingdom. The rise in the prices of the raw materials and the food we have to import was rapid, whereas the rise in export prices has been much less and much slower. The resultant large funds at the disposal of the other sterling area countries have meant that they could make big demands on our products which we could not meet within any reasonable period of time owing to our overburdened economy and our pre-occupation with rearmament. As a consequence the other sterling area countries turned to Western Europe and their imports, together with our own increased imports from that area, turned us from being a major creditor of Europe to being a major debtor and we have had to pay out large sums in gold through the European Payments Union: thus all currencies have, so to speak, become hard.

The 1951 crisis is similar to its predecessors in 1947 and 1949, in that it arises from inflation, from trying to do too much with the resources at our disposal and failing to limit the claims on those resources.

In 1947, with the help of large American and Canadian loans, we attempted full convertibility for current transactions. We did so in the hope that these dollar loans would provide sufficient reserve to iron out temporary fluctuations but it was against a background of inflation here and a deficit in our balance of payments, arising partly from an effort to maintain a very low rate of interest and delays in speeding up production after the war. This, coupled with indirect demands of foreign holders on our dollar reserves, rapidly used up most of the American loan and made it impossible to maintain convertibility. As we know, we had then to reduce imports, restrict foreign travel and private motoring, make a drive for exports and encourage greater productivity. In 1947 the United Kingdom had a heavy dollar deficit and also an overall deficit.

CAUSES OF FINANCIAL CRISES

The 1949 crisis was largely due to the continued rise in prices here at a time when prices abroad had begun to show signs of falling, added to an over-generous attitude to releases of sterling balances producing unrequited exports, and devaluation, with its adverse effect on the terms of trade, was the outcome. At that time, of course, this country was in balance with the rest of the world as a whole, though we still had a dollar deficit.

Our position today is worse in some respects that it was even in 1947. In the first place we have no large American and Canadian loans on which we can call, nor is Marshall Aid available any longer. Indeed, the time has arrived to make the first payment of interest and repayment of capital on the loans and the decision to make these payments, whilst it is of course in accord with the traditions of this country, must, in the light of the current figures of the trade balance, be regarded as courageous in regard to the instalments of interest for which waiver might have been legally and reasonably claimed. These amount to $87 million U.S. and $24 million Canadian or nearly 16 per cent. of our exports to Canada and the United States in 1950: a good year.

DIFFICULTIES CONFRONTING STERLING AREA

Secondly, the possibility of strains within the sterling area can no longer be overlooked. After all, it would be perhaps quite understandable (though regrettable) if those countries of the area which are not in deficit with the dollar area felt a measure of reluctance to curtail indefinitely their dollar purchases for the general good. It has already been agreed that Ceylon shall hold some gold and India is directing more of its trade through non-sterling channels. Nevertheless, I do not for one moment impugn the loyalty of the other members of the sterling area and although it would be imprudent to forget that difficulties like the present can constitute a solvent for many ancient loyalties I affirm my confidence that, under proper leadership, sterling and the sterling area can overcome all the difficulties which now seem to beset them. I shall content myself by saying that a high degree of national unity is an essential prerequisite to so desirable a state of affairs.

The fact remains, however, as I have already said, that, for us and for the sterling area generally, all other currencies are now hard currencies, with dollars heading the list followed by the currencies of the European Payments Union.

In the third place, the United Kingdom balance of payments is once more in deficit at a time when rearmament will reduce the goods available for export and be a cause of further imports. It is thought, rightly in my opinion, that a further devaluation would not make any contribution to the solution of the problem.

ANTI-INFLATIONARY MEASURES

Against these unfavourable factors must be set the measures which the Government has already taken to meet the situation. Imports, particularly of inessential goods, are to be reduced to the extent of £350 million and steps are being taken to restrict credit. These measures are bound, to put it mildly, to be irksome to many but they are very necessary. In the long run there is only one way to deal with inflation and that is, at a given price level, to reduce the monetary claims on the available goods and services. If it has to be decided that a larger share of those goods and services must go to rearmament, then the share left for private consumption must be so much less. If, then, the total of money incomes exceeds the reduced total of goods and services available as measured by current prices, and the individual recipients will not refrain from spending a portion, in other words save it, the incomes will have to be reduced. This again is bound to be irksome. The alternative is rising prices and eventually a runaway inflation with wages always trying to catch up with prices. The need for savings and restraint in wage claims is as great as it was in 1947.

The Government is therefore to be commended in the steps it has taken and is taking to deal with the situation. The changes made in the 1951 Budget are now seen to have been inadequate and sterner measures are needed. The restriction of imports, particularly some of those consumption goods which add to the amenities of life, cannot be popular. It is certainly not pleasant to restrict credit and to make it more expensive, as the Government wish, but in this the banks are carrying out official policy in the interests of the whole community as part of the measures necessary to rid us of inflation.

CREDIT RESTRICTIONS

It is well that the actions of the Government in the financial sphere should be clearly understood. By raising bank rate, curtailing the cheap rediscount facilities enjoyed by the money market, funding a part of the floating debt and calling upon the banks to restrict credit, they have taken important steps on the road to deflation. Every repayment of a loan or advance is deflationary and by the funding operation to which I referred earlier the Government have actually reduced the credit base. By way of illustration, let me refer to the banks' applications for the Serial Funding Stocks (which largely accounts for the increase in our investments in 1951 of £4,883,935). The change from Treasury bills to Government stock has meant that the average liquidity ratio of all the Clearing Banks has fallen to 32.1 per cent. as against 40.2 per cent. at this time last year. The liquidity ratio is merely the percentage which the total of cash, bills discounted and money at call or short notice bears to deposits. It is, however, obvious that the banks themselves, after a shrinkage of liquidity of those dimensions are bound, quite apart from Treasury directives, to tend to cease to be willing lenders.

If I may, I should like here to add a word on the internal aspect of the restriction of credit so far as it affects the banks. It is true that an increase in interest rates charged on advances increases the banks' remuneration but, on the other hand, they have increased the rate allowed on deposits and if total advances should be reduced then total remuneration may well be less. In addition, their expenses have been steadily increasing for some time. More than this, however, higher rates have meant a fall in the value of gilt-edged, which has already hit the banks since they are so heavily interested in these stocks.

FOREIGN EXCHANGE MARKET

A welcome development at the end of the year has been the decision to reopen the London Foreign Exchange Market for dealings both in spot and forward currencies. The Exchange Control is retained and spot transactions must take place within narrow limits but the fact that the commercial banks will be free to cover their transactions at the best rates they can has a significance for the future which cannot be overestimated. The Forward Exchange Market will also be a pointer and, indeed, a slight help in dealing with the balance of payments position. In other words, sterling is once again on a more realistic basis and the eventual return to full convertibility will be made much easier.

The end of the year saw the prospect of some alleviating factors in several directions. Due in part to the weather, we have managed to avoid serious power cuts and production has not suffered as much as was feared. The raw material outlook in most commodities is better than was at one time thought possible and, though difficulties remain, apart from steel they should not be insuperable.

The general level of import prices, too, has moved in our favour and big falls have occurred from the peak prices of basic materials reached early in the year. These, coupled with the steady rise in our export prices, have produced a considerable improvement in the terms of trade.

This is a matter for satisfaction, as also are the export figures. Not only have export prices improved steadily during the year, but the total volume of exports has increased in a most satisfactory manner. The deficit in the balance of payments does not at present arise from falling exports but from a heavy increase in imports, hence the need, uncomfortable though it may be, to reduce imports.

IMPERATIVE EXPORT NEEDS

We have, however, no room for complacency. Though exports have been satisfactory in 1951 it by no means follows that they will be equally satisfactory in 1952. At the end of the year we were experiencing a falling off in demand and it is likely that competition will become fiercer as others who have the same difficulties as ourselves take similar measures. The day of easy profits, particularly in the export trades, may well be over, yet our need to export is greater than ever. We must deploy our forces, both of capital and labour, in such a way that, subject only to rearmament, the export industries receive priority. They must achieve the maximum output with the maximum efficiency to enable them to face all comers in the markets of the world. If this be done I am sure we shall pull through the present crisis in our affairs. We can no longer afford, indeed it would be suicidal, to use our precious resources of capital and labour in providing goods and services for the home market on the scale we have been doing and the Government should lead the way by seeing that the utmost economy is practised in the public services. If some of the pleasant things we have become used to, have, we hope temporarily, to go, it is because our very livelihood is at stake.

I referred last year and the year before to the need for changes in the taxation system, particularly the taxation of profits ploughed back into the business. During the year the British Bankers' Association have presented their views to the Royal Commission, which is now sitting, and there is little that I can usefully add except the hope that out of their deliberations will come changes making for a less rigid system and one which allows greater flexibility, provides more incentive and cares for the creation of reserves. Such considerations should apply with equal force to the new Excess Profits Tax which is to be imposed in the New Year.

INDUSTRIAL PRODUCTION

In the midst of the troubles which beset us in our external payments and in the adjustments we have yet to make to accommodate a greatly accelerating rearmament programme, it is pleasant to record that industrial production continues to rise. The rate of increase is small and is no doubt due to more equipment and a growing labour force. It will be by no means sufficient of itself to take care of rearmament, but it is to be hoped it can be maintained in spite of present anxieties about material shortages.

The end of the year saw some welcome improvement in the coal situation and the highest weekly production for 10 years. Total production is up on the year in spite of a fall in manpower, and the output per manshift has improved slightly, due in part to increased mechanisation. This improvement is of the utmost importance. It cannot be too widely known and realised that coal is the one raw material we have in plenty, the one commodity which is as valuable as gold in international trade, and the one commodity which could solve all our problems. It is a great pity, therefore, that because of memories of pre-war unemployment the miners will not agree to accept more substantial numbers of Italian labourers to do the less skilled jobs.

In iron and steel, unfortunately, the post-war fashion of new records each year has come to an end. Pig-iron is likely just to exceed last year's figure, but in steel, due to shortage of scrap, coke and imported ore, production is less than last year. We have in consequence been compelled to seek steel in Belgium and even the U.S.A. This is a most serious position since steel plays so large a part in rearmament and its use for that purpose in large quantities must seriously reduce the amount available for the motor vehicles and multifarious engineering products which figure so largely in our exports, to say nothing of goods for the home market. The new Government have stated their intention of undoing the steps already taken to nationalise the industry.

The export of cotton goods shows an increase on the year both in quantity and, particularly, in value, but the trend in recent months has been in a downward direction, and the industry is facing a trying time. Buyers, both at home and abroad, are holding off, no doubt in the hope of lower prices. In the meantime, production continues to be satisfactory, and both yarn and cloth output have reached new high levels for the postwar period. Some of this has had to go into stock, a process which cannot go on for long.

FORMIDABLE JAPANESE COMPETITION

With the signing of the Japanese Peace Treaty and the swift increase in the installation of machinery in that country, competition from Japanese cloth will soon be a formidable factor—how soon may be judged from the fact that already their exports of cloth exceed our own.

This has again been a year of great activity throughout the country, and, as you would expect, favourable reports have reached us from all those areas served by the bank. So far as the bank itself is concerned, I am pleased to tell you that the business continues to expand, and, consequent upon the increase in external trade, our foreign departments in Manchester and London have passed another active and successful year.

In conclusion, I would like to take the opportunity, both for myself and on behalf of all the members of the board, of expressing to Mr King, our general manager, to the assistant general managers and to all members of the bank's staff, wherever they may be serving, our best thanks for their efforts during the year and our warm appreciation of their enthusiasm and keenness.

DISTRICT BANK LIMITED

GOVERNMENT DIRECTIVES ON INDUSTRIAL CREDIT

BANK'S INFLUENCE TO REDUCE INFLATION

GROWING DEMAND FOR ACCOMMODATION

SIR THOMAS D. BARLOW'S SURVEY

The chairman, Sir Thomas D. Barlow, G.B.E., has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the hundred and twenty-second annual general meeting to be held on February 8th at the Head Office, Spring Gardens, Manchester.

Before turning to the accounts and trading results for the past year I should like to mention the honour which is to be conferred on our deputy chairman, Sir Robert A. Burrows. You will, I know, join with me in expressing much pleasure that his valuable public services have received this further recognition. Early last year Colonel Brooks was appointed a deputy chairman and I greatly appreciate having the benefit of his wide and valuable experience.

BALANCE SHEET ITEMS

Compared with a year ago the balance sheet shows variations which, to some extent, have been brought about by the monetary measures taken by the government in the autumn. The liabilities side calls for little comment. Our deposits show only a small variation and stand at £238 million.

On the assets side cash and money at call and short notice have increased by £3 million, but, largely as a result of the government's funding of a substantial part of the floating debt last November, our holdings of Treasury bills, now shown separately, are reduced and figure at £31 million. Notwithstanding this change, our liquid position remains satisfactory.

The serial funding stocks we acquired in exchange for Treasury bills have increased our investments in British Government securities, which, you will be interested to know, continue to be mainly short-dated.

Following the change in monetary policy there has been a decline in the value of gilt-edged securities. We have not escaped some measure of depreciation, but our inner reserves are well able to take care of the position and, as hitherto, the investments appear in the balance sheet at less than their market value.

The fact that the government now depends less upon Treasury deposit receipts for its finance provides an explanation why, after a persistent decline since 1948, this asset has been reduced to £5 million and compares with £17 million at the end of 1950.

ADVANCES

Last year our Advances increased by over £8 million. These additional facilities were required chiefly by customers engaged in exports or other work of urgent national importance. The rise in prices of raw materials, heavy taxation and the increased wages paid in industry largely explain the growing demand for accommodation. In the course of this year it is more than likely that we shall be called upon for further assistance, especially from those engaged in all the ramifications of the rearmament programme.

One way or another there is no doubt about industry's needs for temporary finance. As there is also an overriding injunction to restrain bank lendings for the non-essential industries so as to combat inflation, our duty as bankers is plain, but this does not make the execution of our task any easier. By increasing the bank rate and at the same time calling upon the banks "to continue and intensify their efforts to restrict credit to essential purposes" the Chancellor wishes it to be understood that requests for advances will be more critically examined. In what we are called upon to do no drastic deflation is contemplated. On the contrary we are to exert an influence in support of a gradual disinflationary policy.

RESTRAINT UPON LENDINGS

It is, of course, impossible to know exactly how tight banking restraint upon lendings will have to be. That will be effectively determined by the Treasury through its control over the cash and liquid resources made available to the banks—the credit-base itself. In the meantime our task of interpreting official policy will be made less difficult if customers will not seek accommodation without first carefully considering the validity of the purpose for which it is required. I should also like to point out that a curtailment of an important function of banking, prudent lending, is not conducive to increasing our earnings. If those who look to us for financial assistance will only appreciate this aspect, they will more readily understand that now, as in the past, it is because of urgent and important government directives that we have to refuse credit-worthy applications which we would have no hesitation in sanctioning in normal times.

Our bank property item shows a small increase since, during the past year, we have bought premises in one or two towns where our business is out-growing the present accommodation.

THE YEAR'S PROFIT

The net profit for the year, after the usual provisions have been made, amounts to £508,217 and compares with £513,168 for 1950. With the amount brought in from that year there is for disposal £799,001. As mentioned in the report, we have allocated £225,000 to reserve for contingencies. After this deduction, and allowing for dividend payments at the same rate as formerly, there remains a sum of £301,345 to be carried forward.

The results, I think you will agree, are highly satisfactory bearing in mind the increase in running costs and the higher rates of taxation which industry in general continues to experience.

SPECIALIST ACTIVITIES

The foreign department has established a new record both in the number and value of its transactions. This growth, which has been fostered by the overseas visits of the department's representatives, is reflected in the increasing number of foreign banks for whom we act as correspondents.

During the year extensive use has again been made of the department's consultative service on overseas trading and financial conditions. In connection with this work the bank's "Digest of the United Kingdom Exchange Control Regulations" has been in such great demand that reprints have already been necessary of the recently published ninth edition.

A partial restoration of the London Foreign Exchange Market after an interval of twelve years will, it is hoped, increase confidence in sterling and make easier the re-opening of our important commodity markets. Since each move towards freedom makes the next less difficult, the step that has been taken should also facilitate further exchange flexibility as and when this should prove feasible.

Apart from the return to more normal exchange and trading conditions, the recent development is extremely welcome, as the new freedom should once more give to the banks the opportunity to exercise that skill and technique which, in former days, helped to augment the country's invisible income and to make London the world's premier foreign exchange market.

Our trustee department has, during the past forty-five years, been accepting trusteeships at an ever-increasing rate and has therefore adequately proved the great usefulness of this service.

The day may be fast approaching when Parliament will further facilitate this useful work by giving corporate trustees statutory powers to charge fees. The safeguards imposed by law in relation to custodian trusteeships might here serve as a useful precedent. Incidentally, in the matter of granting such powers, this country lags behind the United States of America and certain of our own Dominions.

DOMESTIC AFFAIRS

Restrictions on planning and licensing are still holding up our programme of development and expansion. Despite the intensification of these difficulties, we have obtained permission for the necessary structural alterations to premises in Swansea and

Cambridge, where we hope to open branches during the present year.

The managers' conferences and the special courses for officials continue to provide an extremely valuable means for ensuring efficient co-ordination between the administration at Head Office and the branches. In the interests of both customers and staff we attach very great importance to the matter of training, and as much opportunity as possible is given to our employees for broadening their practical experience. In addition special inducements are offered to encourage the staff to study for appropriate diplomas and degrees.

Bearing in mind the many difficulties encountered in an exacting year, the results are a proof in themselves of the excellence of the work done during the twelve months by all concerned, and I wish to express my full appreciation and to thank the management and staff for their loyal and unremitting service.

THE ECONOMIC SITUATION

The economic difficulties accumulating in this country over the last few years have now been intensified by the rearmament programme. As a consequence we are confronted with a dollar deficit when the repayment of previous dollar loans has begun and when foreign competition, together with the import and credit restrictions imposed by other countries, is interfering with the sale of our goods abroad.

This situation is, of course, partly responsible for the present gap in our balance of payments but, as with previous deficits, our real weakness lies in the fact that we have so persistently failed to adjust the country's internal economy to the limits of what it can afford. Instead, we have continued physical controls and penal taxation and resorted to devaluation and to the running down of stocks of raw materials and food.

The inadequacy of these measures having at length been proved, we are this time attempting more far-reaching correctives and they must be applied vigorously however unpleasant the process may be.

INFLATION AND DEMAND

With home consumption, investment and defence monopolising so much of our industrial resources the amount available for exports is hardly sufficient to pay for even indispensable imports. The chief cause of the trouble is still excessive internal expenditure. The deficit in our external trade is now, as in the past, but a symptom of our domestic inflation.

This can no longer be ascribed entirely to the war or immediate postwar periods. Devaluation and the conflict in Korea greatly increased the cost of our imports, as did belated purchases of these in 1951. The effects, having worked their way through productive and distributive costs, have brought in their train demands for increased wages. With wages chasing prices at a time when defence expenditure is mounting the country is in danger of a worse phase of inflation and one which, expressed in terms of increasing demand, can only lead to most critical shortages of both materials and labour, thereby retarding essential production at the very time it should be greatly increased.

If we are to prevent such a serious situation it is clear that inflation is the first evil to subdue. This will be no easy battle, since it has to be fought on many fronts, but is much more likely to be won now that the forces marshalled against it have been strengthened and concentrated in a unified plan of campaign.

A RETURN TO ORTHODOXY

In the past exhortations have proved an ineffective check on wasteful spending. Physical controls, however necessary for scarce and indispensable raw materials, have failed in so far as they have deflected rather than curbed spending. Heavy taxation, which can hardly be reduced under present conditions, has done harm since, by drawing off funds needed for development, it has tended to limit production and destroy incentive.

These measures, being insufficiently co-ordinated, have not performed the function assigned to them, and, pushed to extremes, have constrained rather than liberated our economy. Now all are to work to the same end under the more orthodox monetary discipline which has been reinstated after a period of twenty years.

With the new mechanism attacking inflation from so many angles we should be able to look for satisfactory results. Much the biggest and most speedy relief will, however, be obtained through the elimination of unnecessary spending by Government departments and the curtailment of unproductive capital outlay not only by the Government but by local authorities and the nationalised industries. To use budgetary action and restricted credit too sparingly in the public sector of our economy, and concentrate too much on retrenchment within the private sector, would do little to reduce the spate of avoidable spending.

But that is not to say that the business community will be untouched by these new measures. Indeed the whole of our economy must be tightened up, since only by a transfer of labour and materials can we expand our production of armaments and exports.

THE VALUE OF THE HOME MARKET

In striving towards our objective, however, it is possible to go too fast and too far. The urgency of the task we have on hand naturally tempts us to disregard all but the needs of essential industries and to underestimate the effects of dislocation in other branches of production. But, before taking any irretrievable steps towards altering the balance of our industrial structure, we should be well advised to make sure that what we are about to do is really in the national interest.

In pursuit of effective deflation it is logical to point out that a curtailment of civilian output can be balanced by a reduction in private spending. Monetary measures and taxation are quite capable of seeing to that. But, if this should imply an undue restriction of domestic consumption, there is less solid ground for believing such action would be beneficial either to the country or to essential industries.

Although perhaps not apparent at first sight, domestic consumption has its importance, since it is excessively difficult to maintain and develop an export trade in many types of goods—particularly those of high quality—unless there is an adequate home market to provide ample opportunity for research and an outlet for experimental work. To constrict this market inordinately at any time would most regrettably narrow the field of activity for such excellent organisations as the Council of Industrial Design, the quality of whose contribution to the Festival of Britain Exhibition has been universally acclaimed. To limit the home market excessively now would be to deprive our manufacturers of a pioneer service for improving the functional and æsthetic qualities of their products just when exports are most needed.

For another and no less important reason it will be necessary to act judiciously in the reorientation of our industrial output. With the armaments programme now getting near quantity production, the engineering industries are likely to be increasingly diverted from the export task. The breach, therefore, must be filled by other types of goods. Since, for many of these, production costs cannot be kept sufficiently low without a substantial offtake by the home market, too great a constriction of domestic trade would tend to make them dearer at a time when foreign competition dictates that they must be cheaper.

Obviously there is bound to be a marked degree of empiricism in the application of the new emergency measures. There will, however, be less necessity to change the pattern of industry if the measures already taken, and those yet to be introduced, increase the volume of production and at the same time keep down costs so that we can sell more goods abroad and thus pay for the highest possible supply of imported raw materials. Indeed how much more readily should we meet the growing needs of defence and the demands of our home trade if our greatest single asset, coal, as well as manufactures of high conversion value, could be exported in sufficient quantity.

JAPAN AND THE COTTON INDUSTRY

Sustained endeavour and enterprise are specially important for the cotton trade, since it has to compete in markets which are becoming particularly keen. A more specific problem for Lancashire, and much depends on its solution, has been resuscitated by the Japanese Peace Treaty. This was signed last year and Japan may be expected to be in charge of her own destiny before long. The spindleage of her cotton industry has increased at an alarming rate in recent months until it is now dangerously near the number of spindles she had in operation before the war.

The big issue now, therefore, is whether she will of her own accord decide to act with moderation and with due regard to the interests of other countries whose economies compel them to depend heavily upon the export of cotton goods, or whether she will behave without restraint and thereby force other countries to protect themselves, as they did in prewar days, by tariffs and quotas. The first course will serve her long-term interests best. Possibly, she may be induced to recognise the fact. Certainly the problem is one which must claim the closest attention of leaders of the British cotton trade in the coming months. The rayon and pottery industries will no doubt also give any developments their keen attention.

In the hard fight which lies ahead it is more than ever essential for the cotton trade to be assured of a plentiful supply of carefully selected raw material. It is, therefore, encouraging that the Government has set up a Cotton Import Committee to inquire "how in the current foreign exchange position cotton can best be supplied to the United Kingdom cotton industry on the most advantageous terms as to quality and price." As matters stand this is a most useful task to perform, for the Government's ultimate objective, the restoration of a free market for raw cotton, is at present impossible of achievement.

THE BROADER ISSUES

It remains to be seen how long it will take orthodox monetary control, with all possible economy in administration and in private and public expenditure, to halt the inflationary spiral and restore our national prosperity. Past experience has shown that we have been able to count on the utmost endeavour when our national needs are most pressing. Nevertheless the sacrifices which these emergency measures entail will be felt by all sections of the community in varying degree and it would be idle to pretend that the general experience will not be both painful and severe.

History, if we enlarge sufficiently our perspective and are content with broad generalisations, develops by successive stages and provides a salutary lesson for us today. The great Emperor Diocletian not only reorganised the administration of the Empire but endeavoured to combat inflation by his edict of A.D. 303 fixing the prices of commodities. This, however, completely failed in its purpose and the Empire in the west steadily disintegrated. A hundred years later the Goth Alaric assaulted and plundered Rome. The slavery of the ancient world developed into the serfdom of feudalism and the slaves and serfs were the capital equivalent of the machine age. The machine age built up its capital with no adequate consciousness of the consequences of what it was doing, and the monetary rewards which it provided were a poor substitute for the loss of the earlier balanced economy. If this also provided meagre monetary rewards it did not disrupt the social structure nor impair the dignity and self-respect of the individual. But the gradual and increasing pressure of the community, working not by revolution but within traditional political policies, has secured the more equitable distribution of the fruits of industry.

CAPITAL ESSENTIAL

It remains to be seen whether this redistribution has gone too far. The stored up capital of the past is being dissipated as income and new capital is not being adequately accumulated. In strong contrast the latest and alternative contemporary phase is being witnessed in Russia, where it would appear that a privileged oligarchy is imposing on her nationals heavy sacrifices to build up capital with the concurrent assurance that there awaits them a future condition of prosperity and bliss.

A constant factor which runs through all historical experience is that the creation and accumulation of capital are essential conditions of a country's survival whatever its form of government. We may perhaps be permitted to believe that ours is the more excellent way. But if we continue to draw too freely on such reserves as we still retain, and if we are not willing to make the necessary sacrifices, it is very certain that our way of life cannot be preserved and that we can only look forward to a situation in which it will be difficult to support fifty million people and maintain their present standard of life.

ARTHUR GUINNESS SON AND COMPANY, LIMITED

SALES AGAIN CONSTITUTE A RECORD

GROWING OVERSEAS BUSINESS

LORD IVEAGH ON PROBLEM OF RISING COSTS

The annual general meeting of Arthur Guinness Son and Company, Limited, was held on January 15th at Park Royal Brewery, London, N.W.10.

The Earl of Iveagh, C.B., C.M.G. (chairman of the company), who presided, said: Ladies and gentlemen,—The annual report and accounts for the year ended September 30, 1951, have been circulated and are in your hands. There is nothing to add to what I have written there in regard to the accounts, except that, as you will have seen already in the Press, we have at last received approval of the application which we first made two years ago for permission to recognise as share capital some part of our reserves, created from the profits of past years and now represented by buildings and plant or otherwise used in the development of our business. This does not mean any increase in the value of your equity, nor does it mean that there will be any increase either in total profits or in the amount of distributed profits. The necessary resolutions will be submitted in due course to a special meeting.

ALL SALES RECORDS BROKEN

Sales of Guinness again broke all previous records in spite of the fact that a number of famous brewers are busy producing beverages designed to capture some part of that field which we have made so peculiarly our own. It is not for me to attempt to discriminate between so many excellent brews of their type, but so long as it remains our practice by all means and in every way to give the very best value that money can buy, I do not doubt that we shall maintain and extend that support which we have enjoyed for so many years. We spare neither thought, time nor money in perfecting our technique and our scientific control; and since the brewing is not the whole story, we have given much thought to the development and inculcation of the best methods of bottling both in Great Britain and in Ireland. There are, after all, four parties concerned in the perfect Guinness: we who brew it, the many hundreds of bottlers, the tens of thousands who serve it, and the millions who ask for it. It has always been our desire and our policy that all four should benefit from the connection, and we have no doubt that they do. Guinness continues pre-eminently to be good for everyone concerned.

RISING COSTS AND PRICE LEVEL

Unfortunately though sales have risen, so have costs, and once again our margin is threatened. In England we were forced in May of last year to raise the wholesale price of Guinness to our bottlers by 12s. a barrel. In Ireland, since the financial year closed, we have received Government permission to raise the price, and allowing for higher gravity (which was below that in England) this will result in practically the same increased margin, namely, approximately 12s. a barrel. The whole of this increase has, in fact, been swallowed up in both countries by the increased price we have to pay for malt and hops this year. That must affect profits, but we hope to be able to maintain prices without further charge.

Through all this period of rising costs, we have, indeed, largely, owing to increased sales, kept the price of Guinness (except for Excise duties) consistently and considerably below the general price level, and below the levels of prices of the materials that we use. I would like to give you a few comparative figures. This last year, compared with the last prewar year, the cost of our materials has been about 2½ times what it was; the cost of fuel over 2½ times what it was; the wholesale price indices in Great Britain and Ireland about three times what they were; the net selling price of Guinness, excluding duty, only two-thirds more than it was, and the profit margin only one-eighth more. We shall, incidentally, this year have directly contributed in the two countries well over six million pounds to the growers of barley and hops—no small item in the farmers' budget.

EXPORTS: A SUCCESSFUL YEAR

In exports, we have had a successful year, largely owing to the vigour with which our recently created subsidiary—Guinness Exports Limited—has been directed. Including our continental sales, which are sent out in bulk and are bottled on the Continent, but excluding our sales to N.A.A.F.I. for overseas troops, our exports have doubled in the last two years, and are more than three times what they were in 1938. It is nearly forty years since they stood so high as they do now. They must inevitably always be a comparatively small part of our total output, but in 1951 our exports brought in over £1½ million, and were it not for difficulties of shipping space, shortage of bottles, etc., could have produced more.

With regard to our interests in the U.S.A., we are in the stage, which we always envisaged, of the slow and steady building of foundations. We have good allies over there whose confidence and determination are as great as our own.

At home we have still to complete the programme of modernisation and replacement of plant and equipment in our two large breweries. Progress is governed by circumstances, particularly supplies of materials, and it will take some years yet to complete the whole programme in Ireland. Of the ultimate benefit in costs and in quality we have already had considerable evidence.

The growing size and complexity of our business, and the fact that we are operating throughout the world and brewing in three different countries, make it desirable also to introduce some administrative reorganisation, so as to secure the maximum devolution and flexibility and greater efficiency in respect of the day-to-day working of the machine. There are obviously many problems involved, and these are having the board's most careful thought.

As to the future, who can speak with assurance? If, as we all hope, we are within sight of the end of the period of inflation, then there must be difficulties of readjustment which may well involve temporary setbacks. I can only say that in technique and in personnel we are, I believe, better equipped than ever.

THE DIRECTORATE

The board has suffered a severe loss this year in the resignation of Mr Alan Lennox-Boyd on his accepting office in the Government. Mr Lennox-Boyd is a person of inexhaustible energy, as I can personally testify, and he gave no small measure of his activity to the company and its concerns. Mr Webster, who has been on the board for over fourteen years, has decided to relinquish the executive position of assistant managing director. He played a very special part in the transformation of Park Royal into something more than a mass of bricks and plant; and everyone at Park Royal—in particular his colleagues— will miss his experience, his wisdom and above all his humanity.

Finally, I would say that in both countries, and abroad too, our staff and labour have every reason to be gratified with the year's results, and the thanks of the board are due to them.

The report and accounts were unanimously adopted and the recommendation of the directors approved for the payment of final dividends on January 16th of 3 per cent. on the preference stock and 17 per cent. on the ordinary stock, both less income tax.

The retiring directors, the Rt Hon. Lord Moyne, Captain Ronald Nutting and Dr A. H. Hughes were re-elected directors of the company. The remuneration of the auditors, Messrs Turquand, Youngs and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

HAWKER SIDDELEY GROUP LIMITED

CRITICAL POSITION ON RAW MATERIALS AND MANPOWER

MR T. O. M. SOPWITH REVIEWS U.K. REARMAMENT

The sixteenth annual general meeting of Hawker Siddeley Group Limited was held on January 16th in London.

Mr T. O. M. Sopwith, C.B.E. (the chairman) said that the accounts showed that the group has had a satisfactory year, with an increase in profits due to an expansion in turnover both in quantity and value and he was pleased to report that the export trade had played an important part.

It had to be fully recognised, however, that present-day trading was considerably influenced by inflation and high taxation. Traditional methods of computing profits took account of historical costs only, whereas industry was having to replace, at progressively increasing prices, assets consumed in earning profit. The existing taxation code made inadequate allowances for depreciation and replacement of capital assets; insufficient margin was left for replacement and expansion of trading stocks. The efforts of the F.B.I. in seeking to redress the anomalies of the present system were receiving the group's fullest support.

RESERVES INCREASED

The board had set aside a sum of £1,000,000 to reserve for replacement of fixed assets and development, increasing that reserve to £3,750,000. They had also set aside £500,000 to other revenue reserves, bringing these to £2,248,161. The profit figure of £695,661 relating to prior years resulted largely from the settlement of contracts, some of which went back over a number of years. These settlements had been made on a more favourable basis than could have been anticipated with reliance. The figures for the past two years had been exceptional.

During 1951-52 the group's considerable financial resources would be fully extended to meet the needs of national defence.

Although the group's research and experimental prototypes had led the world for years, the R.A.F. was still flying with obsolescent aeroplanes. Orders for more modern aircraft were not placed in time. Now the group had some of the orders required, but it was late in the day.

TIME IS ALL-IMPORTANT

Design and development; manpower; raw materials; machine tools—these were all vital factors governing production of aircraft and aero engines. Time was all-important since building aeroplanes took years. A modern fighter like the Hawker P 1067 absorbed nearly three times as much manpower as did the Hurricane. Raw materials took from three to eight times as long to obtain. Substantial orders for machine tools had been placed, but deliveries were running late.

Co-operation and understanding between the R.A.F., the Ministry of Supply and the aircraft industry in general continued on the same high level as in previous years. Britain's commanding lead in the new jet age was largely due to the talent and hard work of the people who had produced such exceptional aircraft. Now these machines must be translated into thousands available on the airfields of the Western world. Therein lay our future strength and our present weakness.

The report and accounts were adopted.

LAKE GEORGE MINING CORPORATION, LIMITED

LARGER GROUP PROFIT

The fifteenth annual general meeting of this company was held on January 15th in London, Sir Godfrey Fell, K.C.I.E., C.S.I., O.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1951:

The report of the acting general manager of Lake George Mines Pty. Limited, Mr Ireland, which has been in your hands for some days, gives detailed information regarding output, etc., and I need not recapitulate the figures. In broad outline, the year's operations resulted in a marked increase in the tonnage of ore raised, while the mill, operating for 49 more days than in the previous year and at a higher daily milling rate, turned out a considerably larger tonnage of saleable products in the form of lead, zinc and copper concentrates, with higher recoveries also of gold and silver.

On the other hand, operating costs per ton milled again rose, from a total of £A4 1.04s. to £A5 0.58s. As explained in the report, this rise is mainly due to increases of £A2 2s. per week in the State basic wage, which had the further effect of making the cost of equipment and mine stores much higher. But these figures exclude production bonus, which rose from £A3 11s. 4d. per week to £A8 2s. 2d. The basic wage is adjusted quarterly throughout Australia in accordance with variations in the cost index of clothing, rents, etc.

INCREASED SHIPMENTS

Shipments of concentrates rose, in the case of lead by 3,300 tons, of zinc by 9,452 tons, and of pyrites by no less than 12,652 tons. At the close of the year stocks of concentrates were higher than at the beginning by 1,826 tons and 55 tons respectively in the case of lead and copper but lower by 336 tons and 1,803 tons in the case of zinc and pyrites.

The group profit, which furnishes the best indication of the progress of the undertaking, rose from £498,813 to £977,339. The rise reflects not only the larger output but also the higher prices obtaining for the company's products.

As regards geological examination, the mine has quite recently had a brief visit from Mr Conolly, an eminent geologist, who is reported to have expressed himself as optimistic in the matter of finding additional ore. His engagements unfortunately prevented him making a longer stay, but the directors of the operating company hope to secure his services for a longer period when he is again free.

THE CURRENT YEAR

You will wish to receive some information about the progress of the operating company during the current financial year. This continues satisfactory. For the 16 weeks ended October 21, 1951, 63,107 tons of ore were milled, an average of 15,777 tons for each four-weekly period. The output of concentrates for the same 16 weeks' period amounted to 5,102 tons of lead concentrates, 8,952 tons of zinc concentrates and 1,339 tons of copper concentrates. Shipments continue to be made as rapidly as vessels are available. The operating company has recently entered into satisfactory agreements for the sale of its products for the year 1952.

Conditions in Australia have not been by any means easy; and the measure of success which the operating company achieved reflects credit not only on the management and staff, but also on Mr Owen, the chairman of that company, and his colleagues.

The report was adopted.

HECHT, LEVIS & KAHN, LIMITED

(Merchants in Raw Rubber and other Commodities)

STEADY INCREASE OF BUSINESS

PROPOSED BONUS ISSUE

The twenty-sixth annual general meeting of Hecht, Levis & Kahn, Limited, was held on January 14th, in London, Mr Walter Fletcher, C.B.E., M.P. (the chairman), presiding.

The following is an extract from his circulated speech:—

The change for the better in this company's fortunes continued uninterruptedly throughout the period under review, and the result is a set of figures that we consider exceptionally satisfactory. In the minds of the public we are classified as a rubber-producing company, and they appear to think that the rise and fall of raw rubber prices affect our profit in the same way that they do those of rubber estate owners; this is quite wrong, and I wish to repeat again that as merchants and traders it is not primarily the level of rubber which affects us, but the degree of activity.

PROFIT AND ALLOCATIONS

The profit of the group for the year was £511,137. The profit of the parent company is £347,619. We propose a final dividend of 10 per cent., making 30 per cent. for the year. We propose to allocate to general reserve £128,515, to dividend equalisation £50,000, to the proposed bonus issue £99,050 and to profit and loss account £13,815. The totals of the revenue reserves will then be—general reserve £250,000, dividend equalisation account £100,000, and profit and loss account £200,223, which is after allowing for capitalisation of £100,000 by issuing free to holders of ordinary stock appearing in the Register of Members on January 14, 1952, two shares for every five ordinary stock units held.

Application to the Stock Exchange for dealing in the new shares is being made, and it is anticipated that a period of one month for dealing in the new shares on letters of allotment will be permitted. At the expiration of that period the new shares will be converted into stock units. At that date the register of members will then be written up and we shall pay an interim dividend of 10 per cent. for the year ending March 31, 1952, to those members appearing therein. The said dividend will therefore apply equally to both the existing ordinary stock units and those about to be created.

GROUP'S FAVOURABLE POSITION MAINTAINED

In spite of the consequences of the wartime occupation of Malaya, which are nearing their end without noticeable damage to this group of companies, I am impressed by the great progress and expansion that has taken place. We are naturally subject to the normal trading risks of any merchanting business, but these have not prevented the steady increase in volume of our business, the opening-up of new branches and new lines, and the retaining of our very favourable position in the world's rubber markets. It is not only the very large increase in the figures shown in the balance sheet which indicates the volume of our business, but the world-wide organisation that has been created, and the trained and experienced staff, which together form the vital core of any business, that justify my faith in this merchanting company's future.

The report was adopted, and the proposed bonus issue approved.

STAFF PROBLEMS **SOLVED!**

Let us shoulder *your* staff difficulties as we have already done for ¼ million other employers!

EFFICIENT OFFICE STAFF
Permanent and temporary—always available.

HIGHER APPOINTMENTS SECTION
Supplies all executive (non-technical) personnel—male and female.

GROUP STAFFING—in and out of town! From time to time we handle the complete staffing of new organisations.

In every case pre-selection by FINE'S saves time. Please write for a copy of our 4-page brochure which gives full details of our unique service.

UNIVERSITY OF LONDON

A course of six lectures entitled "An Introduction to the Economic and Social History of the first half of the Seventeenth Century," will be delivered by Professor R. H. Tawney at 5 p.m. on January 29th, February 5th, 12th, 19th and 26th, and March 4th, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.

Admission Free, Without Ticket.

JAMES HENDERSON, Academic Registrar.

UNIVERSITY OF LONDON

DEPARTMENT OF EXTRA-MURAL STUDIES

Course of eight evening lectures on India, Pakistan and Ceylon, Mondays, January 28th-March 31st (excluding February 11th and March 10th), 6.15-7.45. London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street.

Speakers: Sir John Russell, Dr Percival Spear, Professor C. H. Philips, Professor Nicholas Mansergh, Sir Percival Griffiths. Fee: Complete course, 12s. 6d.

Applications and enquiries to Director, Department of Extra-Mural Studies, Senate House, W.C.1.

SECRETARY AND EXECUTIVE OFFICER—CO-OPERATIVE WHOLESALE SOCIETY, LIMITED

The directors invite applications for the position of Secretary and Executive Officer, Designate.

The person appointed will be expected to assume the position in April, 1952, which will be six months previous to the retirement of the present officer.

The C.W.S. manufactures a wide range of commodities; undertakes a variety of wholesaling and merchanting operations and performs many services on behalf of the Co-operative Movement in England and Wales. It has considerable trading interests overseas. The annual turnover is approximately £350,000,000, and the personnel employed number 55,000.

The officer is responsible for the secretarial and administrative function within the Society, in the discharge of which he is the liaison between the directors and management.

The vacancy is being made known simultaneously to the Society's staff, but, having regard to the importance of the appointment, the directors wish to consider the widest possible field of applicants.

A form of application with a description of the duties involved and the information required of applicants is available on request from the Chairman of the Directors at the registered office of the C.W.S., Limited, 1, Balloon Street, Manchester, 4.

T.U.C. PRODUCTION DEPARTMENT.—Applications are invited for a post of Assistant in the T.U.C. Production Department. Experience in industrial and trade union developments essential. Knowledge of applied economics and of production problems desirable.—Further particulars can be obtained from General Secretary, Trades Union Congress, Smith Square, London, S.W.1, before January 31, 1952.

Postal Tuition for **B.Sc. ECON.**

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 760 Successes at Lond. B.Sc. Econ. Final Examinations, 1925-51.

Prospectus from the Director of Studies, Department P17 **WOLSEY HALL, OXFORD**

ECONOMICS—Postal Tuition

● Founded in 1887, U.C.C. provides tuition for the B.Sc. Econ. Degree of the University of London, *open to all without residence or attendance at lectures.* The College is an Educational Trust, with a staff of highly qualified specialist Tutors. Moderate fees; instalments. SELF-EDUCATION COURSES are available in Economics, Economic History, Statistics, Foreign Languages, etc.

★ PROSPECTUS, giving full particulars, free from the Registrar,

ROYAL BANK OF CANADA

DIVIDEND No. 258

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2½ per cent, being at the rate of 10 per cent per annum, upon the paid-up Capital Stock of the Bank, has been declared for the three months ending February 29, 1952, and will be PAYABLE at the Bank and its branches on and after March 1, 1952, to Shareholders of record January 31, 1952.

By Order of the Board,
T. H. ATKINSON, General Manager.

January 17, 1952.

DARTFORD COLLEGE OF PHYSICAL EDUCATION DARTFORD, KENT

Applications are invited for the post of part-time Lecturer (Woman) for the Social Studies Course comprising Social Economics, Principles and Machinery of Government, and Social Administration, which will become vacant in May, 1952. Applicants should be experienced Social Workers with university qualifications.

Further particulars can be obtained from the Principal, to whom applications (no form) should be sent as soon as possible.

CITY OF JOHANNESBURG

THREE AND A HALF PER CENT INSCRIBED STOCK, 1952

NOTICE IS HEREBY GIVEN in order to prepare the Warrants for interest due March 1, 1952, the BALANCES of the several accounts in the above-mentioned stock will be struck on the night of February 1st, and that on and after February 2nd the stock will be transferable ex dividend.

For BARCLAYS BANK (DOMINION, COLONIAL & OVERSEAS)
(Registrars of the above stock).
Circus Place, London Wall, E.C.2. G. A. D. HARRISON,
January 8, 1952. Manager.

"WITHIN these four walls" at 57/61, Mortimer Street, W.1, you can see all your advertising devised and produced, from plan to print, without loss of that all-important "security." 'Phone SAMSON CLARK & CO. LTD., at MUSeum 5050.

LORD LAYTON, on "European Unity," at Sunday Service, January 27th, at 11 a.m., at the Liberal Jewish Synagogue, 28, St. John's Wood Road, N.W.8 (opposite Lord's Cricket Ground). All welcome.

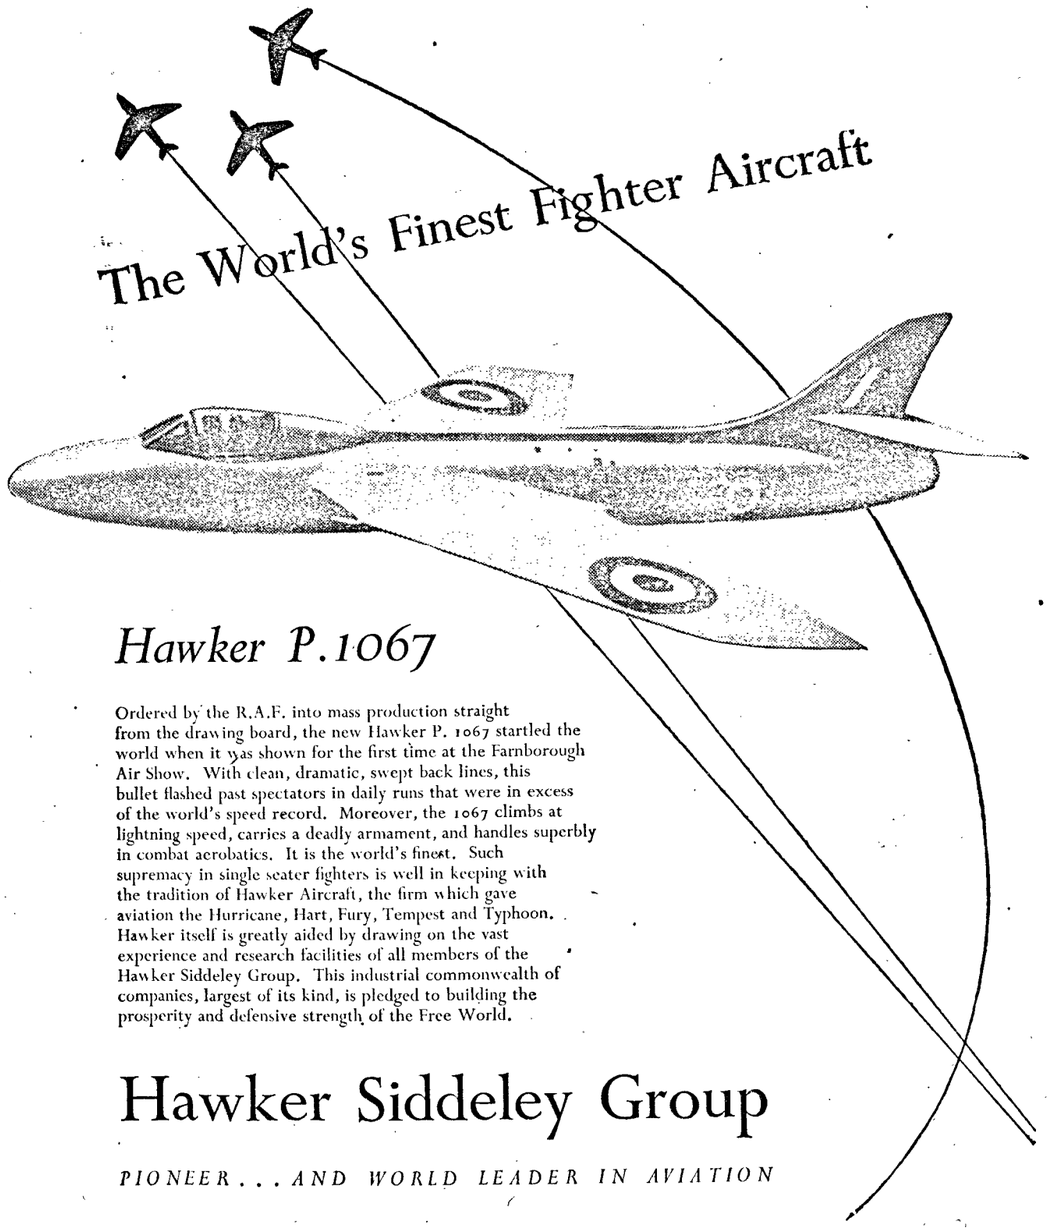
EXPORT MARKET RESEARCH. Senior Executive, wide experience in planning and undertaking of consumer and trade surveys and export market investigations, seeks new appointment. First-class references.—Box 839.

BERTOLA is the Cream of Sherries.—Ask for BERTOLA CREAM.

ADVERTISER, early thirties, seeks appointment on Sales Executive with progressive National Company. Wide experience Home and Export marketing. First-class contacts Grocery and Chemist trade. Fluent 3 European languages. Impeccable references.—Box 822.

MANUFACTURERS selling world-famous brand of Men's Clothing require experienced Sales Manager to take charge of their large and expanding Export Department. It will be an advantage to have knowledge of the trade and one or more foreign languages. Salary commensurate with this important position.—Write, in confidence, giving full details of previous experience, to Box 838.

YOUNG ECONOMIST (30), B.Sc.(Econ.) Hons., M.Sc.(Econ.), sound investment knowledge, writing, lecturing and research experience, seeks interesting position.—Box 845.



MONSANTO CHEMICALS, LIMITED, have vacancies in their London organisation for young men, aged 20-22 years, of good education, who have completed their period of National Service training. Successful applications will be required to serve in a junior capacity for up to two years, with the prospect of promotion to sales division if satisfactory. Staff Pension Fund. Apply, giving age, education, and fullest details of experience, to the Office Manager, Monsanto Chemicals, Limited, Allington House, Allington Street, London, S.W.1.

In Defence of the Realm

NUMBER 1 IN A SERIES

Hawker P.1067

Ordered by the R.A.F. into mass production straight from the drawing board, the new Hawker P. 1067 startled the world when it was shown for the first time at the Farnborough Air Show. With clean, dramatic, swept back lines, this bullet flashed past spectators in daily runs that were in excess of the world's speed record. Moreover, the 1067 climbs at lightning speed, carries a deadly armament, and handles superbly in combat aerobatics. It is the world's finest. Such supremacy in single seater fighters is well in keeping with the tradition of Hawker Aircraft, the firm which gave aviation the Hurricane, Hart, Fury, Tempest and Typhoon. Hawker itself is greatly aided by drawing on the vast experience and research facilities of all members of the Hawker Siddeley Group. This industrial commonwealth of companies, largest of its kind, is pledged to building the prosperity and defensive strength of the Free World.

Far Eastern Fears

THE Far East is clearly moving into another time of troubles. By this weekend the truce negotiations at Panmunjom in Korea will have lasted a full month beyond what was supposed to be their deadline, and there seems to be less chance than ever of a genuine truce resulting—though, Communist methods of negotiation being what they are, the reservation must always be made that appearances may be deceptive. Farther south, there are ominous reports of strategic railway building and troop movements by the Chinese on the border of Viet Nam. It should not be taken for granted, even with these sinister indications, that Mao Tse-tung is bent on war. His intentions may fall into any one of a large variety of possible combinations. He may sign a truce in Korea and keep it. Or he may sign a truce and break it when the winter is over. Or he may refuse to sign and start large-scale fighting again. Or he may break off negotiations for a formal truce but continue to observe an informal one. And any one of these possibilities might or might not be combined with aggression either in Indo-China or in Burma. The policy of the western alliance has to be drawn to cover any one of these manifold possibilities.

Against these gloomy reflections can be set the great gain to the solidarity of western policy that was accomplished by Mr Churchill and Mr Eden in Washington. It is true that complete unanimity of view was not achieved, nor even claimed. It may even be true that, when Mr Churchill and Mr Eden say they will do all they can to harmonise British and American policies, they are not in fact promising more than Mr Attlee and Mr Morrison would have been willing to perform if it came to the point. But it is none the less an important step forward to have removed the appearance of a fundamental divergence of view between the two leading powers of the western world. It can, of course, be said that this new harmony was only purchased by British concessions. Mr Churchill praised the American decision to keep the Communists out of Formosa, and both he and Mr Eden uttered words of warning to the Chinese of the consequences that would follow from any further aggressions. All of these sound like British concessions ; they say more than the Labour Government was ever ready to say ; and they therefore lay Mr Churchill open to the criticism of being more subservient to Washington than Mr Attlee. Moreover, so far from there being any visible concessions from the American side to the European point of view—which has certainly been in the past the majority view in the United Nations—circumstantial reports have been coming from Washington of American plans to take the war into China if it flares up again. All this is naturally disturbing, and Mr Churchill will hear about it in the House of Commons. He can, however, with full justification make the defence that if he has succeeded in convincing the Americans that he is a trustworthy ally in the Far East as elsewhere, he will have far more opportunity of influencing American policy towards moderation than ever Mr Attlee did.

The formulation of a Far Eastern policy is, in fact, quite extraordinarily difficult. It is true that those who take the extreme views see no difficulty. Those who still find it possible to believe (as the British Foreign Office did for a scandalously long time) that Mao and his friends are not really Communists and if treated well will not misbehave, can be happy in advocating a policy of conciliation and trustfulness. But it is already clear that this is a complete misreading of the character of the Chinese Communist regime, which may indeed differ in some of its characteristics from Russian Communism, but would seem, on the record, to be even more openly aggressive and careless of the consequences. And the policy of turning the other cheek to the Chinese would certainly split the western alliance, since the cheek to be turned would inevitably be an American one. At the other extreme from this, which may be called the Nehru view, is the MacArthur view which, finding the situation in Korea intolerable, would abandon the pretence that the United Nations are not at war with China, and carry the war by all possible means to the Chinese homeland. To the Europeans, this seems to be playing with fire, and any attempt by the Americans to pursue this policy simply because of impatience with the Korean stalemate would split the western alliance no less infallibly than an adoption by the Europeans of the Nehru policy.

Far Eastern policy has to balance between these extremes, and it cannot be very logical or consistent in doing so. The problem has been solved hitherto by the wholly illogical compromise of being willing to fight the Chinese (and the Russians) in Korea but not to seek them out elsewhere—indeed not even to bomb the bases they are using for the Korean war itself. If they cannot get a truce, the State Department and the Foreign Office would dearly like to keep up this convenient pretence, since they see all the dangers and difficulties of any of the alternatives. Even in the absence of a truce, it may still be possible to confine the war in Korea, provided that large-scale fighting does not flare up again. But even that is doubtful in the present state of American public opinion, and if the Chinese attack again, either in Korea or elsewhere, it will be impossible to prevent the war spreading. If that happens, there will be no option but to conclude that the Chinese Communists deliberately desire to be at war with the western powers.

This is the dreadful possibility that is looming black on the horizon. It is very important that the decisive step should be taken—if it is to be taken at all—by the Chinese and not by the Americans. That is a point which America's allies should make with all force in Washington: however illogical the present position may seem to the American people, they would only put themselves in the wrong in the eyes of the free world—and possibly break the United Nations—if they let their impatience lead them into taking the first step to extend the war. But the corollary of this is that if it is the Chinese who unmistakably throw down the challenge, then Britain and France, in self-interest no less than in loyalty, must stand by America's side.

What form allied action should take in such an appalling contingency is itself a puzzle within a puzzle. The basic principle to cling to is that, if the Communists start a war in the Far East, they will do it as an integral part of their worldwide plans, and the western defence must therefore also be part of a worldwide plan. There is no doubt that, second only to an American-European quarrel over Far Eastern policy, the thing that would best suit Stalin's book would be for the western allies to commit more ground troops in the Far East. On the other hand, is it possible to conduct an effective war in the Far East from the sea and in the air—without committing the atrocious mistake of bombing Chinese cities ?

Few people would be bold enough to claim to know the answers to these questions. Quite possibly the answers will never be needed ; certainly it would be very foolish to assume the worst on no stronger basis of evidence than the ambiguous signs that can alone be seen today. But it would be still more foolish to deny the possibilities or, by failing to prepare against them, to invite them to happen.

Making Prices Work—I.

The Scarce Resources

FOR five years, prescriptions for strengthening the British economy have had to concentrate on a single remedy: on the disinflation that would restore monetary stability and give the pulls and pushes of a competitive desirable in themselves had to be rejected for fear that nothing else could do much good ; indeed, many devices desirable in themselves had to be rejected from fear that under the pervasive pressure of inflation their fruits would be misshapen. But now, after three months in office, Mr Churchill's government has finished preparing the ground for a disinflationary policy. The statement issued this week, at the end of the conference of Commonwealth finance ministers, was refreshingly firm and plain in laying down the objectives. How strongly and resolutely they will be pursued is still another thing. But at least it is now certain that the policies of the sterling countries, and of this country in particular, are being set in the right direction.

By that very fact, disinflation loses its exclusive importance. It becomes possible and necessary to look for other policies that will work in the same direction. Disinflation alone cannot be enough. It is a matter for academic speculation whether a rigorous deflation, bankrupting thousands of firms and putting hundreds of thousands of men out of work for a considerable time, would iron out all the distortions that inflation has built into the British economy. It is quite certain that such a deflation is as unlikely as it is undesirable. The weakness that monetary policy shares with all "blind" economic forces is that, in order to press hard enough at some points, it would have to press unnecessarily hard at others ; and this amounts to saying that politicians will never be willing to push purely monetary policy far enough for it to do the job by itself. The great advantage of the change of policy since the election is that it restores some freedom of movement to the general forces of the price mechanism. But they are not likely to be so strong that they will not need reinforcing. There should be a search for specific devices that will strengthen the impact of economic forces at strategic points in the national economy.

Such devices are, broadly, of two kinds. They are pulls and pushes. They are special incentives to do what particularly needs doing and special deterrents against doing what the economy can least afford. They are rewards for people who produce particularly scarce resources and penalties for people who use them. An effective economic policy requires both. But there are two reasons why the search for special devices should turn its attention to the possible deterrents before the possible incentives. The first reason is precisely that it is easier and more pleasant to think of rewards than of penalties, which therefore tend to be neglected. The other is that nearly every incentive is a device for enabling some one to get, and therefore presumably to spend, more money in return for more output of particularly valuable kinds. The output may take months to mature in benefit to the country, while the extra spending usually takes place at once. It follows that the immediate effect of incentives—though, if they achieve their purpose, not their ultimate effect—may well be inflationary. The first object of the search should therefore be for special methods of deterring the use of scarce resources.

★

The case for one such device was argued in the last two issues of *The Economist*. The consumption of coal and electricity should be reduced by making them dearer. For coal, this should be done by a straightforward increase in price, the proceeds being passed on to the industry and especially to the miners in the form of higher wages ; the deterrent to the community at large can usefully be balanced by an incentive to the miners because there is reason to think it would quickly increase production. There is no such elasticity in the case of electricity. A higher price would not stimulate the power stations to generate one more unit. It is arguable that the British Electricity Authority should make considerable profits to help in financing its investment programme, but it would be wrong to push up the price of power very far for this reason alone. The right way to raise the price is, therefore, to put a tax on electricity consumption. The extra money that the community pays for its scarce electricity should be saved, in the form of a larger budget surplus, not distributed to the staffs of the power stations. The economic case for such a tax is overwhelming. The social objection is that it would fall particularly heavily on people with modern, all-electric homes. But there is no measure that affects everyone absolutely equally, and it is to lose all sense of proportion to argue that there would be more than a minor degree of hardship and injustice in an electricity tax. The people with modern, all-electric homes are those who are using the largest amounts of a scarce resource ; and that is the justification for taxing them.

To reduce the domestic consumption of coal and to take the pressure off the electric supply industry are not the only objectives of economic policy that could be served by such devices. For example, the whole country has become familiar with the harm done to the British economy by the shift in the terms of trade —that is, by the fact that British exports have become very cheap relative to the prices of British imports. Strict logic would suggest that, if British exports are too cheap, a duty should be levied on them to increase their selling price. Or, again, steel is as scarce as coal—indeed, at the moment, it is scarcer. Why not a special tax on steel to enforce economy in its use ? Or the argument can be still further broadened. What is, at present, the most important scarcity, the comprehensive limiting factor in British production ? Clearly, the answer is manpower. And it is no less clear that manpower is being both hoarded and wasted. Should there not, therefore, be a tax on the use of manpower—what is more often called a payroll tax ? These are examples of the sort of special device that might be suggested to help prod the British economy back into shape. To say this is to put no more than a *prima facie* theoretical case for such devices ; it remains to examine how each of them would work out in practice.

An export tax falls, strictly speaking, into a special category. It would be designed to deter not British exporters but foreign buyers. The terms of trade have moved sharply against this country, while the demand for its exports remains very strong ; the argument is that in these circumstances Britain should exploit the market to get larger earnings from export than will be charged by individual traders, who fix prices chiefly according to costs. Essentially, the case is the same as was put last spring by those who advocated raising the exchange value of the pound. One of the objections to revaluation is that it would reduce the sterling value of imported goods and, therefore, encourage consumption that the country cannot afford. An export tax avoids this. On the other hand, either an export tax or revaluation might now reduce the volume of British exports. Those fall into two distinct types. As a general rule, the demand for capital goods is as strong as ever, and many firms have order books filled for three years and more ; but the export markets for many consumer goods are beginning to weaken markedly.

An export tax that was not to kill some important sections of British trade would have, therefore, to be discriminating, at least as between classes of goods and possibly also between countries. Such a tax would carry a heavy risk of retaliation. Because of its dependence on imports, Britain is particularly vulnerable to export taxes imposed by other countries—and particularly by the primary producing countries whose governments have already shown an unwelcome liking for the device. In more general terms, it would be unfortunate, in the present state of Britain's overseas payments, to adopt policies discouraging to world trade as a whole ; the other signatories of the General Agreement on Tariffs and Trade would certainly have grounds for objection.

★

The danger of retaliation can be exaggerated, and the case for an export tax would be worth further examination if there were no other way of getting more foreign exchange for the British manufactures that are particularly scarce. A better way readily suggests itself. The exports that are being sold cheaper than they need be are almost all engineering products. They use steel, and steel is particularly scarce for every purpose. But British steel is cheap. The American steel—of which one million tons are to be imported for dollars—will be roughly twice as expensive. If, as no one doubts, it is good economics to take such imports, there can be no doubt that in a free economy the price of all steel would

be bid up to the cost of these marginal supplies. A considerable increase in steel prices is in any event certain in the near future, to meet increases in production costs. There is no reason why a monopolised industry, whether private or public, should be allowed to take in addition the profits of charging all that an abnormal market will bear. But there is the strongest reason why the Exchequer should exact a profit of its own. A tax on steel would raise the export prices that can safely be raised. It would choke off some home demand for non-essential purposes. And, above all, it would discourage the wasteful holding of large stocks by some firms, which exaggerates the real shortage of steel.

The main argument against a steel tax seems to be that the need for it might be short-lived. By this time next year, steel may be fairly plentiful. The British fiscal system has grown up with a strong bias against special taxes of any kind, on anything but luxuries and (latterly) foreign goods, and particularly against taxes that are clamped on and lifted off at short intervals. While in principle this attitude is sound enough, it surely must be modified to suit the modern degree of state intervention in the economy. A tax per ton of crude steel, collected from the first seller, would be easy to levy and correspondingly easy to alter or remove as soon as the situation changed. This is the kind of flexible device that new ministers with fresh minds ought to be able to welcome.

These three cases are fairly clear. There are strong arguments for taxes on steel and electricity, and against an export tax. The effects of a payroll tax—a levy on every firm of so much per employee per week—are harder to assess and raise more important questions of principle. They will be discussed in a second article. It would be foolish, however, to make completely confident judgments on any of these devices. They are suggested because more thought broadly along such lines is plainly going to be needed. The politicians will be tempted to reject any deterrent devices almost out of hand. But before they are dismissed as "politically impossible," it would be wise to reflect that the less scope is allowed to them, the more rigorous the direct measures of disinflation will have to be—and those are unlikely to be more popular.

Belgium Answers Back

BY the twists of chance rather than bad management, Belgium and its western partners have come very near to getting seriously annoyed with one another. They do not see eye to eye in Nato either on economic or on military matters ; and the new government formed last week by M. Van Houtte is likely to be no less obstinate in defence of national interests than its predecessors. Indeed, not only the new Prime Minister but also the new Finance Minister, M. Janssen, are strong supporters of monetary stability and orthodox finance, and will resist any efforts by Nato or the European Payments Union to force on them policies they regard as dangerous.

To put the matter at its crudest, Western Europe feels that Belgium has no right to have such a large trade surplus with the EPU but, having that surplus, Belgium should increase its contribution to western rearmament. It is no secret that the Temporary Council Committee of Nato—the Three Wise Men—have recommended to Brussels an increase in defence expenditure of 50 per cent. The Belgians for their part feel that a creditor has a right to expect debtors at least to share responsibility for reducing their debts, and that no one has tried to understand their difficulties about rearmament. The wise men have glibly assumed that the Belgians, because they are keeping up appearances more successfully than anyone else, can afford to increase their commitments. But, the Belgians argue, keeping up appearances has not been easy ; that they have been able to do so has been a good thing for Europe as well as for themselves. And now they are being asked to risk losing it all. What is more—though this is a matter of political pique rather than economic policy—they deeply resent the manner in which they have been asked.

The root of the dispute lies in the difficulty of fitting a country which believes in big business and free enterprise into the corset of a collective international enterprise like Nato. Belgium is a business man's country ; the official title of its ministry for economic affairs is *Ministère de l'Economie et de la Classe Moyenne*. The importance of the business man is believed to be the secret of national success, and it is this success which is the cause of the trouble now. Because of the comparative equilibrium in its domestic economy, Belgium is expected to contribute more to rearmament ; because of its trade surplus in Europe (and, in 1951, with the world as a whole) it is expected to finance, at the moment, more than half the deficits of its co-members in EPU. If it does both these things at the same time, and at the rate now demanded of it, it is bound to rock, if not to kick away, the ladder up which it has clambered to prosperity from the austerity of 1944.

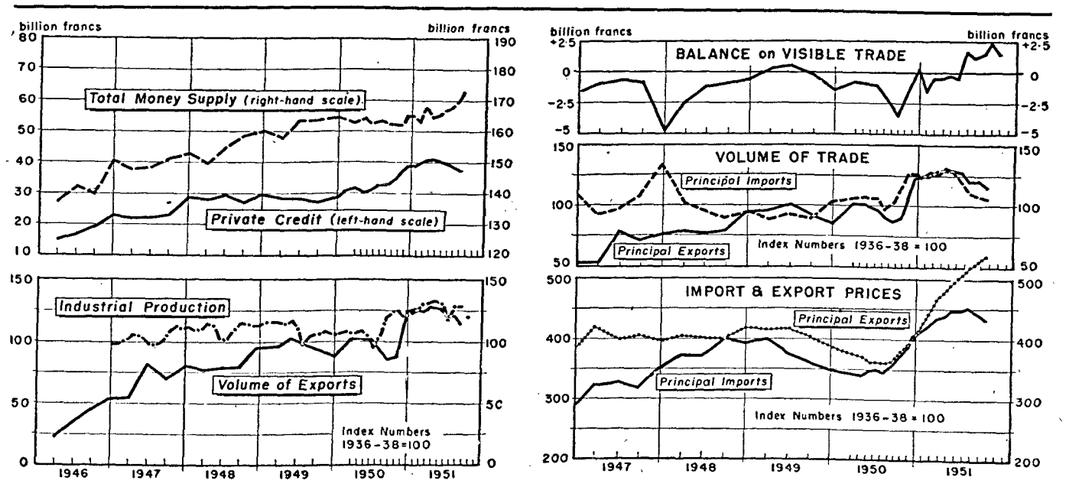
*

This is a lot to ask of any country. To argue whether it is in fact being asked of Belgium is less important than to realise that the Belgians believe that it is. Only a little history will explain why.

At the end of the war, Belgium had two unique advantages over all other countries in Western Europe. First, in spite of the normal afflictions of wear and tear and obsolescence, exaggerated by the war, Belgian industry was by and large intact. So were Belgium's overseas possessions and its overseas investments. Secondly, by the accident of lying across the lines of communication, it received from the Allies, particularly from the Americans, very large sums of foreign exchange during and after the liberation. It is impossible to say how much these advantages were responsible for the fact that Belgium became solvent when the rest of Europe did not. Perhaps they contributed very little on the long term ; but they gave the Belgian government the confidence that was necessary before it could embark on its chosen policies. The Belgians were thus able to adopt a policy which was not open to the rest of Western Europe. They decided that the way to deal with inflation, shortages and social injustices was not to control the short supplies and the surplus purchasing power, but to eliminate them. So they aimed at a high level of

production and imports on the one hand, and at a tight monetary policy on the other.

If production was to increase, workers had to be well fed and factories well supplied. Since nearly all the raw materials and 20 per cent of the consumer goods had to come from abroad, this policy meant imports on a scale that no other country could then afford. In 1945, Belgium imported B. Frs 22 billion worth of goods, of which only 18 per cent were covered by exports, and in 1946 B. Frs 56 billion worth, of which 52 per cent were covered by exports. In order to restrict credit, the short-term rate of interest was raised to 3½ per cent and the long-term rate reached 5½ per cent. The discount rate rose to 3¾ per cent in September, 1950, and is now standing at 3¼ per cent. By 1948, the budget was balanced and has stayed balanced ever since. Until 1948, there were some direct controls over profits, wages and prices, and some subsidies. Thereafter, prices and wages were allowed to find their own level. Both have risen very steeply, particularly during the last year ; but by one method or another, including an elaborate system of social benefits, real wages have more than held their own.



The theory and, as it has turned out, the practice of this policy was that, if equilibrium could only be established at home, an equilibrium in overseas trade would follow as night follows day. By a combination of economic skill, some political courage and luck, it worked. In the first ten months of 1951, Belgium had a trade surplus of about B. Frs 5½ billion ; in 1948, the deficit had fallen from the B. Frs 23 million level of 1945 and 1946 to B. Frs 13 million, then to B. Frs 2 million in 1949 and B. Frs 15 million in 1950. Apart from conditional aid—US aid given to Belgium in proportion to Belgium's own aid to the rest of Western Europe—Belgium has received no dollar aid. And, from the beginning of EPU in July, 1950, to the end of 1951, it has lent to Western Europe, in all, some B. Frs 17 billion, of which B. Frs 7 billion was credit granted over and above the original quota in the Union.

The Belgians, therefore, can fairly claim to have healed themselves. They have done it by a regime of free enterprise and good living, with a strong dose of fiscally administered deflation. The trouble is that they dare not and, understandably, do not want to apply free enterprise and deflation without the good living. The lack of industrial strife and the incentive to work that good living has generated are proven parts of the cure. If the Belgians do everything that is now asked of them, they will certainly have to live less well. And there is another, more serious, difficulty. The monetary mechanism through which their fiscal policy has been administered is delicate. It costs something in the using and can easily be upset. What it costs is a low level of investment. Belgians have had every luxury but the luxury of easy money. Industrialists have been able to do a certain amount of self-financing ; but capital in the market has been scarce. There has not, therefore, been enough investment in the right kind of industries to meet the overwhelming demand for Belgian heavy products—coal, steel, zinc and engineering goods—which the rearmament drive set in train. Export prices, rather than production, went soaring during the end of 1950 and 1951, at least partly because production was held down by the restriction of credit. This, as much as anything else, was what swept Belgium into the position of permanent creditor that it now holds in EPU.

*

In these circumstances, it is not unreasonable for Belgians to feel, in the midst of their prosperity, that they are in danger of being cornered. On the one hand, they are being asked to give more to the rearmament of Nato ; on the other, they are expected indefinitely to go on lending to finance Europe's trade with them. Both these requirements amount to asking that Belgium shall export without being able to spend the proceeds on imports. Both requirements are in themselves inflationary. Yet if the Belgians are to meet their rearmament obligations they will have to expand their investment in heavy industries—and that, too, may be inflationary. The monetary mechanism, they argue, cannot possibly cope with all three pressures. Nor, as it is at present constructed, can their economy.

The case against Belgium is founded more on moral than on economic grounds. First, there is no doubt that

Monthly figures plotted once a quarter up to March, 1950, and each month afterwards.
Source. Bulletin de L'Institut de Recherches Economiques et Sociales.

the Belgians, whatever they may say about the sensibilities of their economic system, are living much better than anyone else in Western Europe. As they are getting the benefit of collective defence through Nato, they can and ought to put more into the pool. This is the doctrine of fair shares—that is, the doctrine of "from each according to his ability to pay"—on which the wise men's recommendations were based. Secondly, there is a strong suspicion that, until the last few months, Belgium has been actively stimulating its surplus with EPU. It has been short of dollars. Alone in Western Europe, it has not controlled its imports from the dollar area. It is all very well to claim this as a virtue; but it becomes a vice when it is made possible only by the gold secured from Western Europe by the Belgian surplus in EPU. Europe has difficulty enough finding dollars for American coal, let alone for Cadillacs for successful Belgian private enterprisers. Thirdly, there is some spare capacity and unemployment in Belgium—309,000 in January, 1950, and an average of 198,000 (between 9 and 10 per cent of working population) in 1951, though in fairness it must be admitted that unemployment in Belgium since the end of 1950 has been frictional rather than structural. It has been induced more by the relative comfort of being unemployed (the unemployment benefit starts at 9s. 6d. a day and is usually much more) or by geography and politics than by a genuine surplus of labour.

These, then, are the causes of friction. They are serious not only because Belgium is an important member of the Atlantic community, but because they represent the kind of muddle to which the neither-one-thing-nor-the-other type of international co-operation can lead. Real co-operation means some real modification of national policies, in fact if not in name. Belgium now sees threatened its freedom to adopt and follow the economic policy in which it believes. Here is a conflict of interests in which Belgium's neighbours cannot just lay down the law. Both sides must compromise. For the Belgians argue that at least part of the reason for the present payments crisis lies in the insane monetary policies pursued by other European governments. Some of the demand that has driven up Belgian prices is due—inevitably—to rearmament; but the pressure need not have been nearly so strong had other countries restricted credit as Belgium has.

There are signs that if the debtors in EPU moved some way to meet the creditor, he would find it less irksome to go on lending. There are even signs of this beginning to happen. Belgium recognises that Britain, and to a lesser extent other countries, is making a new attempt to set its financial house in order. And the other members of EPU should recognise, in the latest Belgian export regulations, the beginnings of a new attempt to direct inessential exports across the Atlantic to earn dollars direct. But Europeans will not be convinced of their ally's good faith until they see something better than a sulky refusal to increase its rearmament effort. There is very little doubt that the Belgian defence effort could be increased—though perhaps not as much as the wise men asked—without really damaging the standard of living in Belgium. But before it is done, the Belgian government has a fair claim to ask that what it has lent to the EPU be recognised; that its economic difficulties and arguments be understood; and that the other countries of Western Europe, who have been comparatively abstemious in their standards of living, should end the wild extravagance of their domestic inflations.

Honourable Members

POLITICS is one of the few careers for which no training of any kind is required; and, on the whole, the democratic system is indifferent to the return of able men to Parliament. Political theorists are usually complacent about this. Some seem to identify mediocrity with that quality of special virtue, the plain man's common sense; some have even written as if a democratic government ought to be representative in the sense that a market research sample is representative—as if Parliament should reflect the composition of the population, and should not be cleverer or better educated or higher in the social scale than the people as a whole. But it is clearly nonsense to suppose that one kind of experience is as good as another in qualifying men for a political career; the background from which MPs have emerged is of great importance in determining the quality of the House of Commons.

The composition of the House was analysed several times before the war, but it seems worth while to make a new analysis now that the two major parties so completely dominate Parliament and are so nearly equal in strength, and when the ideas of both have changed sharply since the war. What sort of men do these parties, one just in office and the other just out of office, choose to speak for them in the House of Commons? An analysis cannot be exact, because full information about MPs is hard to get. But there is enough to show the kind of change that is taking place. One such change is the improvement in the educational background of MPs, especially in the Labour party. Sir Ivor Jennings, in his study of Parliament, found that in 1936 approximately one sixth of 154 Labour members had been to a university. In this Parliament the proportion has risen to one third. Nearly 60 per cent of Conservative members are university trained—but this proportion is scarcely higher than in 1936. (For the purposes of this article "Conservatives" includes their associates.) Most of these Tories come from Oxford or Cambridge, and less than a fifth of them from the newer universities. Thirty-one were at Trinity College, Cambridge, and 24 at Christ Church, Oxford; Balliol and New College are also well represented. Of Labour members who went to a university, less than half went to Oxford or Cambridge. The London School of Economics contributes less to active left wing politics than is commonly supposed; only 5 Labour members attended it—and so did one Conservative.

It is important to remember that formal qualifications are not synonymous with education; many MPs who had only an elementary schooling have since made good use of opportunities for adult education. And in weighing up the change in Labour members' educational background, one must also remember that in 1936 the Parliamentary party was smaller, and therefore contained a higher proportion of trade union members from the "safe" constituencies; the party membership was also still somewhat out of its normal balance in consequence of the MacDonald secession in 1931.

In 1936 half the Labour membership had had an elementary education only; in 1952 that proportion has sunk to one quarter. Thirty-two Labour members went to public schools compared—in so far as the difficulty of defining a public school makes comparison possible—with only nine in 1936. Mr Attlee drew heavily on his supply of public schoolmen; his last government contained no less than 12. A notable quartet went to Winchester and New College—Messrs Crossman, Gaitskell, Jay and Younger; but there are only two Old Etonians, Dr Dalton and Mr Strachey.

If the education of the Labour members has become more bourgeois, that of the Conservatives certainly has not become more proletarian. Two thirds of them went to a public school—a higher proportion than in 1936. Old Etonians swarm: they remain as large a section of Conservative MPs as in 1936. They could still form a party, as Sir Charles Buckhurst suggested they should in his disgust at "sham" Conservatism and the "worn-out" Whigs. In the Parliament between the wars, one quarter, on an average, of all Conservative members came from Eton; and the school has since lost none of its grip on British politics. This appears to be largely a matter of tradition. It is not simply that Eton produces rich young men who can afford to enter a not very lucrative career; for Winchester, almost equally expensive, contributed only 10 Conservatives and 4 Labour members to the present House. Harrow also carries on its political tradition and has provided the Prime Minister. There are still a number of Tories who enjoyed the multiple education of the rich young Edwardian—Eton, Oxford or Cambridge, then Sandhurst, followed by a commission in the Guards, and later perhaps by reading for the Bar.

* Percentage of total in each party in the House.

But, though the Royal Military College is still important as a background for legislators, the regular services are not. The House of Commons used to receive many a retired officer. In 1936, 63 Tories were drawn from the services; in 1951 only 25. Another change that has overtaken the Conservative party is that small businessmen—MPs who describe themselves as manufacturers, merchants, retailers and contractors—are less numerous than they used to be. A dozen or so Conservatives now put themselves in this category. Probably there are more, but not as many as the 64 who were in the House in 1936. Company directors, on the other hand, are as numerous as ever; in the Conservative party there are at least 100. But this may be one of the fruits of election, rather than the background to it. Many firms are glad to have an MP on the board, and nearly every new MP is in search of a suitable way of supplementing his modest parliamentary income. Labour members are less likely to find niches in boardrooms, and if they do, they are shy of admitting to a capitalist role that has been pilloried in so many left wing cartoons. But at least seven of them do admit to it. One would expect to find the "City men" in the Conservative party, and in fact there are some 24 who are either bankers, stockbrokers, accountants or insurance brokers. The farmers, too, are nearly all Conservatives—about 30 of them.

★

These are occupations that can be dovetailed fairly easily with the life of a Member of Parliament. But the two professions that are most frequently carried on by MPs are journalism and the law. The House was always full of lawyers, but until 1945 they were almost a monopoly of the Conservative party. The Labour party now has 30 of them, compared with the Conservatives' 65. Most are barristers, though not all of them practise. The Labour party has a higher proportion of KCs—14 out of its 23 barristers—whereas the Conservatives have 17 KCs out of 58 barristers. Journalism, the perfect by-product of political work, has gained ground since the war, especially in the Labour party, where there are 42 journalists and authors, while the Conservatives have 32. This again is one of the fruits of election; articles are sometimes published which would not see the light of day if they did not come from the pen of an MP. Members' claims to be journalists are sometimes based on a very

little published work. But the third and fourth estates have certainly become rather more closely entwined.

One strength of the Labour party has always been that so many of its members—in the present Parliament, 114—have experience of local government. A more doubtful advantage is its high proportion of trade union officials. Unions have a way of rewarding their elderly officials for a lifetime of service by sponsoring their parliamentary candidature; and their chances of being accepted by constituency parties are enhanced by the fact that the unions may contribute 80 per cent of the legal maximum for election expenses. The elderly trade union official, for all his virtues, is unlikely to be distinguished

by breadth of experience or flexibility of mind, and it is therefore encouraging to find that union officials are becoming less numerous. There are 58 of them in this Parliament; according to Mr J. F. S. Ross*, the average number of union officials in the parliaments between the wars was 79, and the highest was 115 in 1929. The proportion has fallen from nearly half the Parliamentary Labour party between the wars to about one fifth today. This is a reflection chiefly of the expansion of the party outside its old strongholds, rather than a deliberate change of policy. But it is interesting that union support is now given to many others besides officials; in all 104 members benefited from it at the last election.

Although the number of elderly trade union officials has fallen, the Opposition is older than the Conservative side of the House. Nearly one-third of the Parliamentary Labour party is over 60 years old, whereas only 11 per cent of the Tories are. The Conservatives have many more people between the ages of 30 and 50. They also have more young men—9 of the Tories were born since 1920, compared with 3 in the Labour party. But Labour has the youngest member, Mr Anthony Wedgwood Benn. It also has the oldest, Mr David Logan; the Conservatives have the runner-up, Mr Churchill.

The changes that have emerged from this analysis are more striking in the Labour than in the Conservative party. The Tories have fewer land owners, merchants and manufacturers, and rather more journalists than they used to have; but otherwise they are much the same. The Parliamentary Labour party is better educated than it was; it is very well versed in local government; it has fewer trade union officials and has acquired a large number of lawyers and journalists. It would be fair to say that the composition of both parliamentary parties has become more favourable to the flowering of ideas, and that this is particularly true of the Labour party. But the main change occurred in 1945; and it is precisely in the years since 1945 that Labour has run through its stock of ideas with little adaptation and less replenishment. Just because its doctrine has been more sharply defined, the Labour party is more hidebound by its past thought than is the Conservative party. It has to make more effort to produce the same result; in order that the Labour party as a whole may be as adaptable as its rival, its individual MPs have to be bolder in thinking afresh. Perhaps the latent ability for such thinking will emerge, in a responsible form, now that the party's ablest members have been freed from the day-to-day duties of ministerial office.

NOTES OF THE WEEK

The Party Battle

The remarkable lull in political warfare which has distinguished the Christmas recess—despite the fuss which the Opposition made about the length of the recess—is certain to be broken as soon as Parliament reassembles on Tuesday.

Mr Butler, in his speech to Indian journalists in London this week, tried to secure in advance a non-partisan approach to the economic remedies he is to propose, but that is too much to hope for. Senior members of the late Government, aware of the economic dangers which were accumulating when they left office, have been compelled to acknowledge that the country faces grave difficulties which cannot be dodged. At the same time, they have tried to peg out a corner which they could use as a base for attacking the Government if it proposes remedies that do not suit the Labour party; and savings on the social services will not suit the bulk of the party. It will be particularly galling to most Labour Members—and gratifying to Mr Bevan—if the Conservatives justify economies in part by reference to the precedents set up by the late Government. "Are you next year going to take this stand on the upper denture?" Mr Bevan asked in his resignation speech last April.

Labour's attitude to economic policy will be more sharply influenced than in the past by the party's views on foreign affairs. The less reason Labour members find to quarrel with the raw materials agreement concluded in Washington, the more ready they will be to pick a quarrel on foreign affairs; Mr Churchill must not be allowed to have done better in Washington than Mr Attlee did a year ago. There is much evidence that the left wing of the Labour movement, if it is not gaining ground within the party, is at least preparing to be combative. Dr Dalton's broadcast before Christmas was intended to stimulate opposition to the rearming of Germany. Mr Anthony Greenwood, a newly elected member of the Opposition's front bench, is trying to rally opinion against the Government's Far Eastern policy (although Parliament has not been told much about it yet), and a familiar band of left-wingers has given notice of a motion for the repeal of the Japanese Treaty of Peace Act because of Japan's intention to establish relations with Chiang Kai-shek. And now the Labour party's executive committee is to prepare "a comprehensive document" expressing party policy on current international issues. Such a document would not be needed if there were no shifts in opinion to accommodate.

* * *

Not the Worst Crisis?

Mr Attlee's attempt to play down the balance-of-payments crisis falls deplorably short of his usual standards of responsibility. He told an audience at Manchester last

weekend that Labour had faced worse emergencies with far less fuss; the sterling area's gold and dollar reserve was lower in 1945 than today, the general trading deficit as grave, the industrial fabric of the country dislocated and run down. Labour coped with this emergency without whining and patiently rebuilt the national wealth. The Tories, confronted with a lesser job, were deliberately creating an atmosphere of scare. Fortunately, this is unlikely to be quite the case that Mr Gaitskell puts for the Opposition in Parliament. But the lead given to Labour propaganda in the country is obvious; the Tories will be accused of using the crisis as an excuse for running amok with an axe.

It is true that the sterling area's reserve stands even now higher than it did from mid-1947 to mid-1950 (though lower, in fact, than in 1945). It is true—it would be strange otherwise—that Britain's productive apparatus has been considerably "built up" from the empty and exhausted economy of 1945. But this building up was achieved with the indispensable aid first of $5,500 million worth of American and Canadian credit and then of $2,800 million worth of Marshall Aid. Indeed, during 1949 alone, receipts from Marshall Aid were equal to nearly half the present gold reserve.

In a sense, these considerations do put the present crisis in a more cheerful light. Past crises arose in spite of generous external aid; the present crisis, arising in its absence and under the additional stress of rearmament, offers accordingly less evidence of fundamental insolvency. That does not, however, make it less acutely dangerous than its predecessors. One simple test is the comparison between the size of the reserves and that of the drain upon them at each of the crisis periods. The loss of reserves during the last quarter of 1947, after the American loan was almost gone, would have exhausted the reserve in twenty-one months; in the summer of 1949 the comparable period was thirteen months; today it is eight. Moreover, there is no question today either of massive overseas aid or of the unrepeatable stimulant of devaluation. Mr Attlee knows all this. He surely will not continue to use his great influence to foster the belief that the crisis is a bogus crisis played up for purposes of party advantage. If he sticks to his Manchester form the omen for the new Parliamentary session is not good.

* * *

Britannia Rules Some Waves

Mr Churchill was right to have second thoughts and agree to an American Supreme Commander in the North Atlantic. In war the chief purpose of Atlantic operations would be to get American power to Europe, and that would be far more than a matter of keeping submarines away from convoys. It would be an immense task of organisation and direction for which Washington is ready to nominate Admiral McCormick, who has war experience with big ships and has distinguished himself as a staff officer dealing with logistics—which means delivering the goods by sea. To have insisted on a British officer for this post, or to have left the supreme authority undefined, would have been to run the risk of provoking the kind of surly mood in which Admiral King obstructed the allied effort in Europe ten years ago.

The Royal Navy and Coastal Command are left, in all conscience, plenty to control. They have unrestricted control of the approaches to this country out to the 100-fathom line, which includes the main areas of U-boat operations in the last war and runs well west of Ireland and Ushant. The Admiralty has to look after the Channel and Europe's coastal waters, as well as the waters around Norway and the vital part of the North Sea that is under General Eisenhower's command. And the problem of watching and blocking submarine exits around North Cape and the Danish narrows seems to fall mainly within the scope of British forces. The Atlantic approaches to the Mediterranean, on the other hand, appear to come under American command.

It should not be forgotten, either here or in the United States, that the new Supreme Commander will be the servant of Nato, an international and not a national officer. He will be expected to refer on occasions as sharply to "those Americans" as Field Marshal Montgomery, in his role of deputy to General Eisenhower, refers to "those British." Much national pique and ill-informed comment will be avoided in future if all holders of Nato appointments make a point of stressing their wider loyalty. It is disturbing, for example, to see General Juin, who is commander of Nato's land forces in Europe, spending so much time on purely French affairs. And the preponderance of American officers in the Supreme Headquarters is still too conspicuous. If Americans and British are to urge convincingly that their European service colleagues—especially the Germans—should produce an integrated defence community, then they must set a firm example. Mr Churchill appears to have done so for the first time in this matter of the Atlantic command.

* * *

Solutions in Egypt?

Each day's events in the Canal Zone demonstrate how easily Egypt's present leaders can tempt General Erskine to act in matters that ought to be purely their concern. By failing to curb their terrorists, and then by refusing to join with him in doing so, they force him to take measures—of which this week's search of a section of Ismailia might be only the first—which are distasteful to his troops and to the British public. If this continued it would have two consequences. It would be bound to swell the numbers of actively hostile Egyptians and expose his men to an increased danger of incidents; and such incidents, piled one on another, would in time snap the bonds even of British restraint. There would be, as there were in Palestine and in Ireland, outbursts of retaliation the memory of which would become a permanent bar to alliance.

In such a grave situation there are two methods of carrying on from day to day, and the choice between them can be made only by those in London who have authority. The first is to accept the military argument that responsibility cannot be shouldered and the lives of British troops protected unless the Canal Zone towns are combed or manned, and to take a chance—a slender one—of cowing the terrorists. The second is to reduce to a minimum the chances of friction with the Egyptian people. This would mean spending money now on new lines of communication, which would by-pass, to a maximum that has not yet been reached, the Egyptian towns, ports and roads on the west bank of the canal. How much, for example, would it cost to build a "Mulberry" on the Great Bitter Lake?

The second course, which might not in the end be the more expensive, is the less distasteful. At certain points on the Canal the British are entitled by treaty to their positions. By taking a stand upon these rights and on no others, they could be until 1956 in an impregnable legal position even if the quarrel with Egypt were to come before the United Nations. Indeed, the British could then afford to provoke such a discussion by asking the Peace Observation Committee to send a corps of observers to the Canal Zone. They would quickly find out the truth about the fantastic stories of British atrocities which appear in the Cairo press and make a bad outlook daily more dangerous.

* * *

Cracking the Whip

Once again the American whip has been cracked at the Europeans who take their time over achieving unity. General Eisenhower has used it to make much the same encouraging sound as before; but now Senators who visited Europe and debated at Strasbourg are making it hiss. And the

intention clearly still is that the British, too, should feel the sting. To continue like this is to surround this grave question with false expectations and dishonest thinking.

The fact is that progress towards integration is dictated by the precarious state of national governments. In no European country directly concerned with the idea is it now politically and constitutionally possible to make a dramatic surrender of sovereignty, save perhaps in Italy. It is true that there is a general, though not universal, desire of peoples to see free Europe take on a new shape; but whenever responsible men in power get down to the brass tacks of integration, they have to pause for thought because electors would not accept the consequences. In these circumstances the progress made in preparing the defence community and the coal and steel pool is quite remarkable and has obviously not been understood by American critics. Each practical, properly negotiated step of this kind makes the next easier; but there will be no long jumping.

It would be useful, too, if some American and European advocates of union would reflect on the possibility that its form may be one so far unknown to political science. The problem is surely to give permanent shape to the remarkable inter-governmental co-operation that is already taking place. And the role of Britain and the United States is to provide the protection, the wider framework within which free Europe can find this form. No one has ever heard of national states forming a federation under direct danger of war and economic stringency. The Strasbourg plant needs to be brought in under glass—and unbreakable glass. To do this it is necessary that the Americans and the British should clear their own minds about the "Atlantic community" to which they are pledged. There will be persistent—and quite justifiable—hesitation about "integrated Europe" until it is known what its relation will be to Nato. And it is on this question that British policy should show imagination and initiative.

* * *

Housing Forward!

The Government seems determined that its record in the social services shall stand or fall with its success in producing more new houses. With so many cuts in prospect elsewhere, it is perhaps understandable that Mr Macmillan should try to capture the popular imagination with a glowing vision of an output of houses for which "there is no restriction, no rigid ceiling, no artificial limit."

This vision is to be pursued by two main roads. One is the study and enforcement of all forms of economy—economy of design, simplification of production, the use of substitute materials, and so on. So long as these devices are used with discretion and good sense, and are not allowed to degenerate into jerrybuilding, there is everything to be said for them. They should succeed in conjuring a larger number of houses out of what looks like remaining—despite the new device of creating regional production boards to break bottlenecks—a strictly limited supply of building materials.

The other intended route to higher output was summarised by Mr Macmillan this week in the slogan, "the quicker you build, the more houses you will get to build." Some papers have treated this policy as if it meant the abandonment of central controls and the freeing of the building industry. What it really means is that building licences will in future be allocated on a more flexible basis, according to local enterprise and performance, instead of on the present quota system, which was certainly too rigid. The new system provides an obvious, and up to a point a welcome, incentive to the more efficient councils and builders. But it has snags. It may mean that the houses go up where the builders want to put them instead of where people need to live or where planning schemes intend them to go. Mr Macmillan, as the Minister responsible also for local development plans, will have to watch this point carefully.

Much of what has been said this week may be just elaborate window dressing. If new housing is pressed very vigorously the effect may be to withdraw labour from repair and maintenance work of equal or greater value in providing homes. There is also the danger that more houses will again be started than there are materials to complete. There is, finally, the wider and graver danger that a higher volume of resources may be drawn into housebuilding than the nation can at the present time afford. The Government's approach to the housing problem is one-sided. There are other, if less popular, ways of easing the shortage; in particular, housing rents and subsidies ought not to escape the deflationary remedies that are being adopted in other branches of the economy. People will not be impressed by the gravity of the economic crisis if the Government cannot refrain from demagogic tactics in a field which yields itself only too easily to their employment.

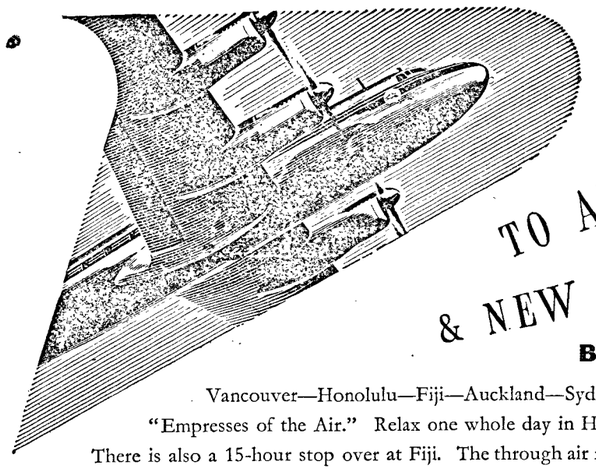
* * *

The "People's House"

The Ministry of Housing and Local Government has issued a handbook* showing how some of the promised economies in house design might be realised. Two of the new designs follow orthodox lines; they reduce the circulation space taken up by hall, passages and lobby, while retaining the previous minimum sizes of rooms. One council has already built three-bedroomed houses of this type for under £1,000, and the average saving is expected to be at least £150 a house. Terrace blocks, for which designs are also included, should show larger savings.

The other two designs suggested break new ground in this country, although they are said to be popular in Canada and the United States. Both the "dining hall" and the "large living room" houses save space by having the staircase rise from the main room instead of from the entrance hall. This device also enables better than average heating to be provided (at higher than average cost) through the use of radiators downstairs which warm the bedrooms via the staircase. In the one design, the ground floor consists of a single large room and small kitchen. This is, by English standards, an unconventional arrangement, but the Ministry has hopes that it will appeal to the younger generation. Certainly their elders may fight shy of it.

Local authorities have complete discretion whether to adopt any of these designs. Other ways of making economies will be dealt with in subsequent handbooks from the Ministry. But certainly one of the greatest weaknesses of postwar housing has been that families of widely differing means and requirements have been put in the same sort of houses at uniform rents. The proposed reduction of standards will enable local authorities to provide a greater variety of houses, suited to different incomes, and to reduce the ills of excessive subsidisation.



* * *

The Rifle After Washington

Mr Churchill must expect Parliament to question him closely about his discussions in Washington on the new rifle. It would be a pity to rake over last year's controversy again, but it is important to know how the British army is to be supplied during the next few years with the automatic weapon that it badly needs.

The statement issued after the talks with President Truman left this point entirely undefined. It was agreed that, for the sake of economy, both the United States and

UNICORN LEATHER CO., LTD., (Dept. ET.4) Woodhill Works, Bury, Lancs.

Britain "will continue to rely upon rifles and ammunition now in stock and currently being produced." In Britain's case, this means that the plans for producing the new .280 rifle on a considerable scale, which were well advanced, have been abandoned. In theory, both countries will continue to experiment "while a common effort is made to devise a rifle and ammunition suitable for future standardisation." In practice, such an effort cannot mean devising another new weapon, which both sides would agree to be the best of all, from scratch. That would take too long. The real meaning of the Washington statement must be that the Americans have confirmed their refusal to have the British .280, and that Mr Churchill has decided to conform. If the British infantryman gets a new, rapid-firing weapon at all in the next few years it will be an American .300.

That is probably, in all the circumstances, the best decision. The Chief of the Imperial General Staff agreed, on his return from Washington, that at ranges under 500 yards the new American rifle is better than the British .280; it has more "knock-down" power, and that is an advantage particularly important to the morale of the men who use it. It seems to be true, nevertheless, that in all-round performance the British weapon is the better, but the superiority is not great enough to outweigh the advantages of standardisation in the only practicable form—that is, the adoption of the American weapon. Mr Churchill has no need to be ashamed of yielding; indeed, he will only be returning to the position he took up when the matter first arose. The right course now is to take the decision with good grace and to see that as soon as possible the British army gets some American rapid-firing weapons. If any definite arrangements to that end have been made, Parliament would be reassured to hear about them; if it would speed up the supply at all soon, there would be a strong case for manufacturing the American rifle here.

Near Success in Kashmir?

The Kashmir dispute is now nearer settlement than it has ever been. This is the outcome of many months of intense work by the UN mediator, Dr Graham. It is also largely due to the remarkable and ingenious details of the demilitarisation plan put forward for Kashmir by General Jacob L. Devers, Dr Graham's military adviser. The plan appears to be entirely acceptable to Pakistan, and there is no inherent reason why the Indians should not also accept it, even though they have so far only provisionally accepted its earlier stages. When the Security Council discusses the plan, probably in a few days' time, there can be little excuse for not giving it the full backing of the United Nations. Such a position has never been reached before in the Kashmir dispute. If the plan is adopted, General Devers's proposed date—July 15th—for making Kashmir ready for a plebiscite could prove a turning point for the free world in southern Asia.

Apart from the proposal of a date, the plan has two novel merits. It aims at reducing the forces before the plebiscite to 10,000 on the Pakistani side and 13,000 on the Indian; this would be the same proportional relationship that they bore to each other at the cease-fire. Developing in carefully graduated stages, it embodies a principle to which India has always clung: that Pakistan should reduce its forces first, while Indian reductions are kept in step only a few days behind the Pakistani.

It is in the clearest interest of peace in Asia that the Security Council should back this plan. That is probably the reason why Mr Malik, the Soviet spokesman, has chosen this moment, of all moments, to intervene for the first time in the Kashmir dispute by making a strongly partisan speech in India's favour. He may hope to postpone the settlement which is at last on the horizon. The Russians patently regard it as in their interest to keep India and Pakistan divided and weak. And they doubtless hope to encourage the Indian Communist Party, which has lately secured considerable and unexpected successes in the elections in south India. For Mr Nehru this support from Moscow must be acutely embarrassing.

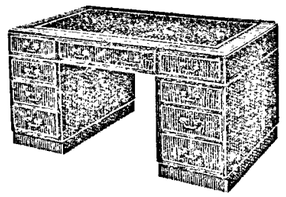
Bonn Appeals to Nato

The West German Government has asked the Three Wise Men of the North Atlantic Treaty Organisation to take up its dispute with the High Commission over Germany's financial contribution to European defence. The High Commission will probably make the sensible decision to agree to this request and break a deadlock that has lasted too long already.



The dispute revolves round these two questions:—How much can the Germans afford for defence? and should they pay anything towards the maintenance of British and American troops in Germany once the European army comes into existence? The Ministry of Finance in Bonn claims that the Germans must make one single payment, preferably to the common treasury of a European defence community; it will not undertake any separate obligation to pay occupation costs under another name. It estimates the total amount that the country can afford at hardly more than the present occupation costs; and this, after a short period, would be entirely absorbed by the European Army. It persistently claims that the burden of refugees, Berlin and war pensions should be included in the German contribution to defence. To the argument that the gross national product is constantly rising, the reply is that these social relief payments will have to be increased. The German Government, moreover, objects to dealing on these matters with the High Commission now that it is a partner in negotiations on the European defence community.

The High Commission rejects the very modest German estimates of the country's capacity to pay; it insists that a contract covering the Government's financial liabilities for troops on German soil must be part of the treaties that are to replace the Occupation Statute. Should the German contention be accepted, the British defence budget would find itself burdened with an additional £180 million a year, which is quite unacceptable; but to continue arguing on these lines is to allow Britain to be manœuvred into a position where it appears to be obstructing the formation of a European army. For a number of reasons, therefore, it will be a good thing if Germany's estimates are put through the mangle in Paris that has already squeezed the water out of the statistics of Nato Governments; and if the verdict is that Germany can pay more than the present occupation costs, the chief obstacle to a compromise with the High Commission will have been cleared away. Germany is, of course, not a member of Nato; but in this, and in other matters, formal objections should not prevent the Western powers from satisfying its claims to equality. The country is on the brink of great decisions and confidence in it must be shown wherever possible.

* * *

A Citizen Army for Germany

For the first time, the German public have realised that the European army is a real project, and have been given some hard facts about their share in it. Hitherto the subject has been treated academically, with a great deal of vague talk about "the European idea." Very belatedly Herr Blank, Dr Adenauer's defence commissioner, has broadcast an outline of the treaty which he has been negotiating on behalf of Germany. He has broken the news that conscription will have to be introduced, as every member of the European Defence Community is pledged to adopt the same military

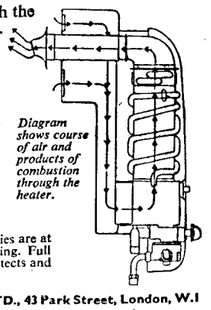
Ascot produce first
BALANCED FLUE
GAS WATER HEATER

ASCOT 715
Balanced Flue
Multipoint
Gas Water Heater

This is a significant achievement, for the difficulties of applying the "balanced flue" principle to instantaneous gas water heaters had hitherto defied solution.
The important advantage of the new Ascot 715 is that the air intake and flue circuit are sealed off from the room in which the heater is installed, thereby eliminating downdraughts and vitiation of the indoor atmosphere. There are no visible flue-pipes either inside or outside the building.



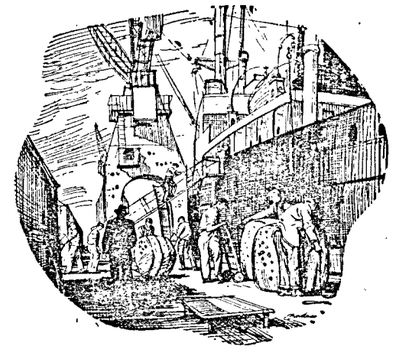


Diagram shows course of air and products of combustion through the heater.

Ten local authorities have already specified the Ascot 715 for their housing schemes.

ASCOT

As production is limited, supplies are at present restricted to new building. Full co-operation is offered to architects and all interested in new housing.

ASCOT GAS WATER HEATERS LTD., 43 Park Street, London, W.1

system. The German force will number from 300,000 to 400,000 men, selected from the age groups 18 to 21. There will have to be recourse to the experienced older ex-officers and NCO's for training the recruits, and it is proposed that they shall be allowed to volunteer.

Herr Blank's information was a shock to the public. It had been assumed that the army would consist of volunteers, and the professional military men in Germany had strongly advocated this system. The Social-Democrat Party has taken steps to carry out its threat to appeal to the Supreme Court, on the grounds that the Government will be breaking the constitution if it tries to introduce conscription by a simple majority vote. The question is being raised whether the Federal Government has the right to allow a supra-national body to decide an internal measure of this nature. Herr Blank has made it clear that the European Defence Community treaty itself will commit Germany to conscription, and will have to be ratified or rejected in full by the *Bundestag*.

In face of the storm Dr Adenauer has made another effort to win the Social-Democrats over to a bi-partisan policy. He has been told that the Socialist point of view will have to be considered; it is not enough for them to be informed of the Government's policy. This will be difficult in view of the extreme nature of the Socialist demands. The Chancellor's hand has, however, been greatly strengthened in dealings with the opposition by a declaration from the trade union federation in support of the European Army.

Herr Blank also gave the German public the first real indication that the new army is to mark a complete break with Prussian tradition. It is not only to be part of an international force, but is to be a "citizen's army." Its members will not lose their civilian rights and will be expected to take off their uniforms when they go on leave. This conception will be very welcome to Germany's future allies; but it is one which Germans themselves need time to digest. The Bonn government, instead of maintaining silence so long, should have been carrying out an intensive campaign of propaganda for this novel idea of a German army without militarism.

Federation Talks

There is likely to be a debate on the proposed federation of the Rhodesias and Nyasaland soon after Parliament reassembles, and presumably the Government will then make some statement on the talks that began this week with Sir Godfrey Huggins, Prime Minister of Southern Rhodesia. Party attitudes, and particularly the views of Labour backbenchers, have not been defined. Mr Griffiths, Secretary of State for the Colonies when the scheme was drawn up, was still in favour of it last September when he returned from the Victoria Falls conference and had seen for himself the Africans' opposition. Since then their opposition has hardened and Mr Griffiths's own attitude at the conference has been criticised by Sir Godfrey Huggins.

The Labour party's official attitude to the federation proposals may therefore be somewhat cooler than it was. The party is certainly likely to, and indeed ought to, scrutinise very carefully any modification of the proposals that may be agreed between the present Government and Sir Godfrey Huggins. Doubts were always expressed whether, even if the scheme were acceptable to the Africans, it would be accepted in its entirety by the Europeans of Southern Rhodesia. Sir Godfrey has, for instance, expressed strong objection to the proposed Minister for African Interests in the federal cabinet, who would be nominated by the Governor-General. If the Government agrees to drop this proposal, it is important that African interests should be safeguarded in some other way.

Discussions on details, however, seem academic in the face of the Africans' uncompromising hostility to the whole idea. The debate ought to be an opportunity for the Government's attitude to be made clear. An article on page 215 shows how increasingly distrustful the African has become both of the federation proposals and of the European's sincerity about partnership. Does the Government intend to go on trying to win the Africans over, and, if so, what steps will it take to do so? Or does it intend to proceed with federation in spite of the African's opposition?

* * *

The Steak's Off

Lord Woolton's election fantasies about red meat must have embarrassed the Minister of Food when he announced the cut in the meat ration from 1s. 5d. to 1s. 2d.; and they will be an embarrassment for a long time to come. In nine months Argentina has delivered little more than half of the 200,000 tons of carcass meat and offal that were to have been shipped in the twelve months ending in April. Australia contributed to the ration only 42,000 tons of beef in 1951, compared with 54,000 tons in 1950, and only 15,000 tons of mutton and lamb, compared with 59,000 tons in 1950. The lower price of wool may this year make farmers in these countries less ready to keep sheep for an extra clip before slaughtering them, as many did last year. But raising meat takes three years, and it is too early to judge the effect on production of the fifteen-year contract with Australia that was signed last year. Neither the Minister of Food nor—if they were allowed to operate—the private traders can stop these prosperous countries, with growing populations, from consuming more of their own meat, except by offering much higher prices. And that, if it were effective, would still further unbalance external payments.

* * *

M. Faure Seeks a Budget

It is not often given to a newly elected Prime Minister of France to bring the National Assembly to its feet with the opening sentences of his first speech. M. Edgar Faure achieved this feat on Tuesday by beginning with an announcement of the tragic events of the previous day in Tunisia. The debate which followed dealt with Tunisian affairs rather than those of metropolitan France, and the majority of 396 to 220 with which the Assembly supported M. Faure was a tribute to his skilful presentation of a new policy towards Tunisia rather than an expression of confidence in his government. As an article on page 216 shows, the new Prime Minister has been particularly successful in securing Socialist support for this policy; it remains to be seen whether he can obtain the same support for his budget. If he cannot, his government, the sixteenth since 1944, must go the same way as that of M. Pleven.

M. Faure has, in fact, taken over the Pleven government virtually as it stood. His Ministers are drawn from the same parties and groups—Radicals, MRP, Peasant party, right-wing independents and UDSR—and in the same proportions. Only M. Pleven himself and M. René Mayer go out of office, and 21 of the 26 members of the new government were in the old. M. Robert Schuman and M. Maurice Schumann remain in charge of foreign and Tunisian affairs, and M. Bidault is the "overlord" responsible for defence. M. Pflimlin leaves the Ministry of Commerce to handle relations with the Council of Europe, which may in consequence hear rather more of his "green plan" for an agricultural pool.

The new Prime Minister is himself replacing M. Mayer as Minister of Finance; like M. Queuille in 1948, he undoubtedly hopes to shake off this additional burden as soon as the looming budget problem is solved. A Radical himself, he has done his best to ensure unity on this crucial

issue by assigning economic affairs—a newly revived portfolio—to M. Buron of the MRP and the Ministry of the Budget to an independent, M. Courant. The fact that the delay in voting taxes is costing the Treasury a billion francs a day certainly helped to make last week's governmental hiatus one of the shortest France has known since the war. The same fact must compel M. Faure to grasp the financial nettle swiftly and firmly; but no new factor has appeared to make his chances in this respect any better than were those of M. Pleven and M. Mayer.

Trouble on the Burma Border

While the Japanese Prime Minister has been making a gesture in favour of the Chinese Nationalist Government in Formosa, and the British Prime Minister in his address to Congress has gone further than any previous British official pronouncement in approval of the American naval protection of Formosa, Chiang Kai-shek's supporters on another front have been creating a situation that may lead to far-reaching international complications. Ever since the Communists overran South China, a Kuomintang force under a certain General Li Mi has been playing hide-and-seek with the victors of the civil war in the mountainous border region between China and Burma. He has used Kengtung, one of the Burmese Shan states, as a base of operations. The Burmese Government, which has recognised the Chinese Communist regime and is in diplomatic relations with it, would like to disarm and intern this refugee army, as its obligations in international law require; but it is incapable of doing so owing to the weakness of its authority within Burma.

On the other hand, General Li Mi's force in Kengtung is in contact across another frontier of Burma with Siam, whose government continues to recognise the Nationalists in Formosa as constituting the legal government of China—a policy in which it has had the support of American official and semi-official representatives in Bangkok. It has now been reported that the Siamese have not only been forwarding supplies to General Li Mi, but have allowed a unit of Nationalist troops sent from Formosa to pass through Siam to reinforce him.

There is at present a sharp divergence between the policies of Burma and Siam owing to their different attitudes towards China. In any case there is no love lost between the two countries, for during the last war the Japanese allowed Siam to annex two of the Burmese Shan states, and though these had to be restored at the end of the war, latent irredentist claims remain on the Siamese side. Further, whereas the Chinese minority in Burma is numerically small, that in Siam is so large as to threaten the integrity of the nation if brought under control from Peking. On the principle that it is not possible to beat something with nothing, the Siamese see in active support of the Kuomintang the only check on the formation of a Chinese Communist fifth column within their country. But giving help to Li Mi for operations across the Chinese frontier is a very dangerous course of action; it provides the Chinese Communists with a strong case for military intervention in both Burma and Siam, if they want an excuse for moving into South East Asia. So far, indeed, Peking has been cautious and conciliatory in its relations with Burma; Indian reactions have to be taken into account, and in present circumstances Indian friendship is valuable to China. But this is all the more reason why China should not be unnecessarily provoked on the Burma border. Mr Acheson's denial on Wednesday that American agencies are involved in these matters is very welcome; for it is most undesirable that cloak and dagger activities should be entrenched in areas where American policy accepts no direct responsibility.

Trouble in Hungarian Factories

Mr Rakosi, the Hungarian vice-premier, is seriously worried about the state of discipline and morale in Hungarian factories. He has complained that there is a great deal of talk about bad labour discipline, but nobody appears to be willing to do anything constructive about it. He is concerned not so much with those who are idle simply because they have a natural aversion to hard work, but with "certain hostile elements against whom mere agitation and persuasion is about as effective as holy water." It was with an eye on these people that the Hungarian Supreme Court recently declared that offences against discipline were crimes against the "people's economy," to be punished with "corrective educational labour." Mr Rakosi may well have had reason to be satisfied with the "salutary effect" of this decision, but it can hardly create an atmosphere of harmony and willingness in Hungarian factories.

Potentially even more dangerous to the Communist regime is, perhaps, what Mr Rakosi calls the "liberal attitude of the managers." Too many of them condone the slack practices of the workers and fail to make the best possible use of the new recruits that the party and the government are making every effort to send into the factories. He obviously feels that the managers and the technical experts are seriously neglecting that close co-operation with the local party organisations which, to the Communists, is a decisive factor in increasing production. But it is not just quantitative increases in production that are needed. Mr. Rakosi admitted that "it has become customary" for factories to over-fulfil their plan by producing bulky articles that require little processing, while neglecting the smaller articles that need more time and skill. There have also been a great many complaints about the quality of the articles produced; and when this has reached the point where it is seriously affecting Hungary's export trade, it is not surprising that Mr Rakosi is worried. It is typical of the man—indeed of most Communists—that his remedy should be to give greater power in the factory to the local party bosses.

* * *

Doctors for Dockers

The conditions under which dockers work are, even now, notoriously bad. It is only a few months since Sir Frederick Leggett's committee of inquiry drew a most unattractive picture of squalid lavatories and inadequate washing facilities at the London docks, and concluded that such conditions were one of the causes of labour unrest. No minimum standards of amenity are laid down by law, as they are in the factories. Legislation was expected to follow the survey that the National Dock Labour Board made in 1948, at the request of the Minister of Labour. But there have been three Ministers of Labour since then, and little has been done—apart from the fact that the Ministry's factory inspectors now pay an occasional visit to the docks, in a strictly advisory capacity.

The Dock Labour Board does what it can, as it shows in a recent booklet on "Welfare Among Dock Workers," to improve amenities. It has built covered call-stands and, in two or three ports, wash places. But with a limited amount of money to spend on welfare—some £600,000 in the current year—it devotes the greater part of it to the medical service. This is a proper priority, in view of the hazards of work in the docks and the frequency of minor injuries. It leaves the responsibility for other amenities still squarely on the port authorities and the employers, and, ideally, this responsibility should be defined. This is not the time, obviously, to devise new claims on the national resources. Canteens and call-stands for dockers must rank below homes in the list of priorities. But there should be an effort to introduce legislation about working conditions in the docks as soon, in the time worn phrase, as circumstances permit.

Schoolchildren's Health

In spite of the belated appearance of the Ministry of Education's report on the health of the schoolchild in 1948 and 1949, it is worth reading; for besides giving some interesting general information, it shows the effect of the national health service on the school health service. The improvement in children's physique is apparent to any layman. Impressions are confirmed by extracts from the reports of various school medical officers. In Manchester, for instance, the proportion of children in "poor general condition" was assessed at only 2.8 per cent in 1949, compared with 4.7 per cent in 1947. In the same years the number of children whose general condition was good went up from 16.6 per cent to 25.8 per cent. The average height of London schoolchildren increased by about three-quarters of an inch between 1938 and 1949, and their average weight by 1¾ lb. The Wolverhampton school medical officer comments that weighing machines in the senior schools are no longer adequate for weighing pupils in their last year at school. The chief disappointment seems to be that the number of verminous children is as large as ever. Individual children found infested in 1949 numbered 443,016—8 per cent of the total on the school registers. In 1938 the number was 444,967. There is some interesting information on tonsil operations, which show a surprising variation in rates from the area of one education authority to another. Another chapter discusses the problems of the diabetic child; but it is a pity that no mention is made of the far more numerous epileptics, whose disability may preclude them from attending school even when they are of normal or high intelligence.

The account of the health service's impact on the schools gives a much less satisfactory picture than the account of the children's health. In spite of the efforts described in the report, co-operation between the family doctor, the hospital and the school health service is far from complete. In the years covered by the report the adult demand for spectacles caused long delays in the supply of glasses for schoolchildren. In the last eighteen months this delay has been overcome, but there is still no improvement in the school dental service, which was seriously affected by the attraction of dentists to general practice. The few remaining school dentists, the report comments, must now be highly selective in the fillings they undertake, and first teeth are perforce neglected—a state of affairs that is particularly deplorable now that the wartime improvement in children's teeth has been reversed.

Shorter Notes

At the annual meeting of the National League of Hospital Friends this week, Mr Crookshank partially lifted Mr Bevan's ban on members of hospital boards and management committees associating themselves with appeals for voluntary funds for "amenities." The ban was never easy to understand, especially as official encouragement was given to the maintenance of local pride and interest in hospitals, and Mr Crookshank might well have lifted it altogether. Collecting boxes may be placed in hospitals "on special occasions," but not as a general rule. Why not? What simpler method is there of enabling patients and their relatives to express their gratitude to a hospital and its staff? Hospital appeals should be neither importunate nor undignified; but, provided they fulfil this criterion, the question of the hospitals' own association with them should be left to the good sense of the authorities themselves.

★

The two weeks' strike of London electricity meter readers ended on Wednesday with what was certainly a moral victory for the London Electricity Board. It has agreed to give the trade unions concerned the information which led to the conclusion that all meter readers were not doing a full day's work, and it will discuss with the unions the amount of redundancy and the question of alternative employment for the readers discharged. But the board has not given way over the supervisors, the original cause of the strike. These will continue to accompany meter readers in order to determine what should be a fair day's work.

★

Major-General Guy P. Dawnay, who died on Saturday last, was a director of The Economist Newspaper Limited from 1929 to 1947. He was a soldier whose gallantry was rewarded with the DSO as long as fifty years ago, and a much respected investment banker and company chairman. Neither description, however, exactly fitted him. There was a poetry in him that is not often found in the barrack and a gaiety that is still more rarely released in the board-room. All who knew him will feel a sense of personal loss.

The French Constitution

When, after the Revolution of 1830, the veteran diplomatist Talleyrand went up along with the other Ministers of State, to take the oath of allegiance to the new Constitution, he was heard to mutter in a sort of audible *aside*—"The THIRTEENTH: I hope it will be the last!" Since then—to say nothing of a number of minor changes—two other constitutions have been adopted and proclaimed; and the present production of Louis Napoleon is, therefore, the *fifteenth* under which France has suffered since Louis XVI. Fifteen in little more than sixty years, or about an average duration of four years to each! We do not think that our contemporaries have done justice to the new scheme, or to the remarkable ability of the proclamation by which it was ushered in. . . . The first thing that strikes us in it is this: it is not, and makes no pretension to being, *a system of Parliamentary Government*. . . . without going so far as to say that the French are unfit for Parliamentary Government, and will probably remain so, we have on several occasions expressed and justified our conviction that such a form of polity is wholly incompatible with the existence of the centralised administration and despotic bureaucracy which the French not only endure but cherish. . . . What then is, at the bottom, the real defect of this Constitution? In what is it so inferior to our own? We reply in a single sentence—*It wants those guarantees which no Constitution can supply; it wants virtue and principle in the men who are to work it.* Ably and honourably carried out, it might secure the tranquillity, the prosperity, and a steady augmentation of the liberties of France; *but where lies the security—whence can we draw the hope—that it* WILL *be ably and honourably carried out?* . . . there is wanting that, *with* which no Constitution, however bad, can be practically oppressive or unjust—*without* which no Constitution, however perfect, can be worth the skin it is engrossed upon—viz., a love of freedom on the one side, and a love of justice on the other: on the part of the people a resolution to maintain their rights; on the part of rulers a sense of honour to respect them; public spirit in the many—public virtue in the few; in all ranks and classes . . . the saving and redeeming SENTIMENT OF DUTY.

The Economist

January 24, 1852

Hesitation can mean disaster

Whether it's Mutiny or Heavy Duty Cooking

On May 12th, 1857, the rebels captured Delhi and there was a great Ball in Lahore. Quite an eventful day: the local troops were planning to revolt as well. Next morning, they were summoned to a general parade. Taken completely unawares, four Regiments obediently piled their arms and marched safely away. So it was—simply, heroically, and at the eleventh hour—that the entire Punjab was saved from Mutiny.

Just as procrastination in those days would have been a thief of Empire, so in our own time it can be a thief of money. For instance, if you order Falkirk cooking equipment *now*, you will get it now—and at a very competitive price. If you delay, the opportunity won't wait for you.

HARD FACTS ABOUT FALKIRK

- Equipment for Gas, Electricity, Oil, Steam and Solid Fuel
- Really tough cast-iron construction—will last for years
- Efficient modern equipment means less work for small staffs
- Price most competitive
- No weak links, a complete and balanced range of equipment
- Specially designed installation and plans for each customer
- If you need new kitchen equipment, *now* is the time to buy.

Find out NOW *about*

FALKIRK HEAVY DUTY COOKING EQUIPMENT

for Hotels, Restaurants & Canteens

Please write for illustrated leaflet to **The Falkirk Iron Co. Ltd. Falkirk, Scotland** *or* Mortimer House, 37/41 Mortimer St., London, W.1. *or* 40 Hanover Street, Leeds, 3. *or* 18 Leigh Street, Liverpool, 1.

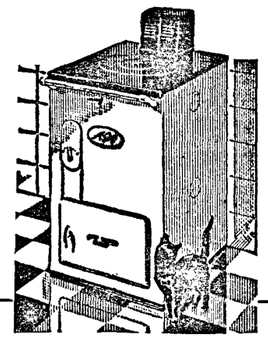
(Proprietors: Allied Ironfounders Limited)

Have you a ☹★!!! of a boiler?

Peace of mind and plenty of hot water without effort if you have an

AGAMATIC

THE GREAT THING about the Agamatic is that it always *works*. It is automatic; it is really clean; it need never go out. It just heats water — quickly, cheaply, constantly.



It has a thermostat to give you hot water whenever you need it and to damp the fire down when you don't.

The circular grate makes riddling a clean job, over in a moment. It is as dustless as can be; the ashpit door fits like the breech block in a gun.

The whole casing is heavily insulated: no heat is wasted.

It will burn any kind of solid fuel and most kitchen refuse.

Price £45 . 0 . 0 ex works, and that is very reasonable indeed.

We are all short of every kind of fuel — solid fuel, electricity and gas. But official opinion favours solid fuel for water heating and space heating. The Agamatic runs best on smokeless fuels, but if you are stuck it will give you more hot water more easily on any fuel you can lay hands on — coal, wood, peat or old boots. Even if you do have to let your boiler out, the Agamatic is still easier to relight, gives you hot water more quickly and never wastes a single nugget of fuel.

It's a gentleman's life for the stoker of an Agamatic

For full information, please call on any of the 130 out-of-Town Aga Agents, visit the London Showrooms, or write for the illustrated Agamatic leaflets to:

AGA HEAT LTD.

SHOWROOMS: 18/20 NORTH AUDLEY STREET, LONDON, W.1.

The Agamatic is another splendid fuel-economy appliance from the Allied Ironfounders Group.

The word 'Agamatic' is a registered trade mark of Aga Heat Ltd.

Letters to the Editor

The Sterling Crisis

Sir,—The crisis in the country's balance of payments, of the prospects of which *The Economist* of January 12th gives so grave a warning, is fundamentally monetary in character. We are spending too much. Spending requires money, and spending in excess of income and therefore of output is only possible if people have the money to spend.

When controls prevent prices from being forced up, a demand in excess of productive capacity can only be met by supplies of goods either from stocks or from abroad. Stocks are a limited resource, and an excess of imports results. The only immediate remedy available is a restriction of imports, by prohibitions, licensing and rationing.

We are spending too much because the excess of loose money bequeathed from the profusion of war finance is still with us and provides the means of spending. Till 1951 budget surpluses and American aid were providing surplus resources which might have been used to effect a substantial reduction in the excess money, but, as fast as money was extinguished by redemption of floating debt, it was replaced by bank advances to customers. A renewal of the series of budget surpluses cannot be hoped for. The country is heavily overtaxed, and very little can be expected from reductions of government expenditure. The Chancellor of the Exchequer has wisely turned towards credit measures.

But the rise of bank rate two months ago was only a gesture. Is the restriction of overdrafts and advances promised by the bankers anything more? I fear it is not.

What is needed is to reduce the pressure of the excess demand on producers. The bankers' endeavour will be "to restrict credit to essential purposes," but surely that is the wrong criterion.

A refusal of overdrafts to private customers would accomplish something, but the main problem is in the borrowing for business purposes. Some short-term borrowing is for capital outlay, the purpose of which, it is true, can be distinguished as essential or non-essential. But capital outlay is anyhow controlled through licensing, allocations of materials and capital issues, and the long-term rate of interest is already high.

The main part of short-term borrowing is for carrying stocks of goods, and the virtue of a high bank rate, "dear money," is that it induces traders to be content with smaller stocks for a given turnover of purchases and sales. To reduce stocks, the orders they give the producers must be less than their sales. The proposed credit restriction is not likely to affect the orders given to replace sales of goods of any kind. An advance will not be refused to a trader who needs it to pay for a supply of the goods he regularly deals in, ordered long before, however non-essential the goods. Traders will go on ordering goods and the pressure on producers will continue practically unabated.

In regulating the flow of money by credit measures, prompt action is vital. Delay in action was the fatal defect of credit policy in the interwar years. Are we to expect nothing better now?

There is another aspect of the balance of payments, which is not less important than credit policy. The most emphatic statement of the disastrous effect of devaluation on the balance of payments was contained in the Conservative party's election manifesto: "We have now to give from one-quarter to one-third more of our life's strength, skill and output . . . to get the same intake as we did before devaluation." Prompt action is as necessary here as in credit measures. If nothing is done, the ruinous loss we suffer by selling our exports too cheap will eventually be rectified by a rise of wages, and therefore of costs, which will after all nullify the competitive advantage which was anticipated from devaluation.

An up-valuation of the pound would interrupt that tendency. It would raise costs in terms of dollars, but in that respect would be no worse than the rise of wages which is now being accelerated. Incidentally, by reducing the sterling cost of imported food supplies, it would make possible the only really substantial budget saving open to us—a reduction of subsidies.

Perhaps it will be argued that the crisis is too deep-seated to be coped with by monetary devices. And it is true that the burden of defence, added to other demands on our resources, subjects the economic life of the country to a severe strain. But it is impossible to say just what effort is necessary to stand the strain unless the monetary weaknesses are remedied. It may be that the austerity we have been undergoing is after all sufficient.—Yours faithfully,

R. G. HAWTREY

London, W.8

How to Export Coal

Sir,—You make no reference in your article on coal to the fuel efficiency branch of the Ministry of Fuel and Power. This service provides excellent advice and information on fuel saving methods. This advice seems only to have been accepted to a minor extent, if at all, by the majority of domestic or industrial consumers. The following facts may indicate how important the failure to accept this valuable advice can be: a well insulated roof can save up to eight times as much heat as an uninsulated one. A well run boiler plant can produce the same heat with 20-30 per cent less fuel than a badly run one will need. The weatherproofing of buildings, use of thermostatic controls and the right heating appliances will all yield substantial savings of heat. The use of these methods may mean a total saving of 60-70 per cent in fuel consumption in the efficient factory. Apart from fuel saving, heating efficiency may mean an earlier start and more productive day during cold weather and more effective heat processes all the year round.

I suggest that the allocation of steel and other scarce material for fuel saving purposes will be at least as valuable as its allocation to mining, and that the wholehearted effort on the part of all concerned to save fuel will satisfy this country's real need and yield a satisfactory surplus for export without having to make further disproportionate increases in miners' wages.—Yours faithfully,

DENIS FOYLE

Birmingham

A Belated Compliment

Sir,—You may be interested to know of an incident that has been buried in an old minute book for 105 years and recently excavated.

In 1846 the committee of Lloyd's in an economy campaign instructed one of their employees to go through all the papers taken in at Lloyd's and recommend what should be stopped.

Amongst other things he reported:

> The Economist Newspaper is now supplied gratis by the Editor, therefore the copy supplied by . . . should be stopped. This being a most valuable paper for reference, I would respectfully request that it be bound.

The committee cut off a number of papers on the employee's advice, but as regards *The Economist* they went counter to his advice and continued to subscribe in spite of the free copy.

Did you know that your paper had achieved such a reputation when it was three years old, or that your distinguished Scottish predecessor scattered copies about free?—Yours faithfully,

D. W.

The Film in Education

Sir,—Your reviewer's comments on my book, in your issue of December 15, 1951, contain a number of statements about the place of the film in education which are questionable. Whether it is "fortunate" that the progress of the classroom film "has been impeded by its formidable cost . . . and the obstinacy of teachers" is perhaps a matter of opinion. I am concerned here with certain misstatements about my own attitude to the subject.

Your reviewer says "Andrew Buchanan has written of the new techniques untroubled by any fears that they may not be the medium of the future." He asserts that I proclaim "direct appeal and easy assimilation as the solvent of stupidity"; that I consider the film to be "the answer to the problems which have tormented mankind for three thousand years"; he suggests that I advise teachers "to burn the books, crush the chalk and pen, cease to speak or to encourage speech. . . ."

If your reviewer had read the book with proper care, he would have discovered that I proclaim none of these things. I give many examples of how film *aids* the spoken and written lesson, but never do I suggest it lessens the need for study or supersedes the teacher. If your reviewer had turned to my index he would have found an entry headed "Film in education" and sub-headed "Not a substitute for other teaching methods," with numerous references to that as being my firm conviction. Perhaps I can quote the *Times Educational Supplement* as saying, in its review, that I give a "clear assessment of the possibilities and limitations of a complex medium of communication."—Yours faithfully,

ANDREW BUCHANAN

London, S.W.15

Utility Schooling

Sir,—The statement in your issue of last week that it would be a pity greatly to cut education and leave the food subsidies untouched is a welcome confirmation of the comment you made on the priority which "One Nation" gave to education second only to housing—i.e. that you were not certain whether the order should not be reversed. In fact, the inflation of other services has been so gross since the end of the war that there is hardly any case on financial grounds for including education as a serious candidate for the axe.

The real threat lies in the danger of a restricted building programme. Unless school building can be maintained there will be insufficient accommodation for all children between the ages of 5 and 15. The building programme depends largely on the supply of steel.

One cannot be satisfied with an *ipse dixit* that because there is insufficient steel the school building programme must be cut and the length of the school life reduced. Accurate figures are not easy to obtain, but the crux of the case rests on a broad basis. The total national output of steel in 1951 was in the neighbourhood of 14½ million tons, and there are prospects of increasing on this figure for 1952. During the first 11 months of 1951 approximately 309,000 tons were allocated under WBL licences for building and construction. The schools' share of this was roughly 30,000 tons. How far is this microscopic proportion relevant to the rearmament and export programmes?—Yours faithfully,

MAGNUS WECHSLER

Books and Publications

Simple Soldier

A Soldier's Story. By Omar N. Bradley. *Eyre and Spottiswoode.* 618 pages. 25s.

General Bradley did not intend this book to appear while he was still on active service, but the Korean war postponed the date of his retirement and it has been published while he is still chairman of the Joint Chiefs of Staff. This was, as he himself has said, unfortunate, as it gave an official air to judgments of individuals which were meant to be personal. And as the book did not contain any startling revelations of fact, it was upon his judgments of individuals, and particularly of one individual, Lord Montgomery, that attention in the United States was concentrated.

General Bradley told the committee investigating General MacArthur's dismissal that he had "tried to write a book which would be helpful to future commanders" and that he had written it in "the vein of a critique" and had admitted that he was wrong in some cases. This method, which is necessarily somewhat Olympian in tone, is successful as long as he is criticising his own subordinate officers, and his estimates of his army, corps, and divisional commanders are shrewd, incisive and always sympathetic. But a Director of Manœuvres, when delivering his critique, is not usually called upon to pass judgment on his own performances or on those of his equals or superiors. And the cases in which he admits to errors are so unimportant that it is hard to recognise them in the company of the larger mistakes of which he finds Patton, Anderson, Montgomery and even, at times, Eisenhower, guilty.

"A Soldier's Story" is long and detailed and will be of considerable value to the student and the historian. Its author, who was a Lieutenant-Colonel in the War Department at the beginning of 1941, went to North Africa to be the "eyes and ears" of General Eisenhower and commanded a corps in the latter part of that campaign and in Sicily. He then went to England to command an army and to organise the Army Group which he himself led after the first weeks in Normandy. His career has been only less spectacular than that of General Eisenhower himself. His book is certainly a soldier's story; it is written from the point of view of his own particular headquarters of the moment and displays the good soldier's habitual loyalty to his immediate staff, his firm belief in the supremacy of the troops under him, his fierce resentment of higher formations, and his perennial suspicion of armies over which he has no control.

It is, indeed, when nationalism is involved that his objectivity retreats farthest into the background. General Bradley is, after all, the son of a Midwestern schoolteacher and he reached his fiftieth birthday without knowing, or caring, about the rest of the world. Since then he has learned much. His evidence on the MacArthur issue proved that he now understands the value of allies and the importance of political objectives in warfare. He is to be thanked for recollecting his earlier emotions so vividly and putting them down so honestly. Yet it is nevertheless impossible not to wonder why he still accepts so unreservedly the rightness of American decisions taken in opposition to the "British inclination to complicate the war with political foresight"—an inclination upon which he admits "as soldiers we looked naively." He records with satisfaction that Stalin put an end, at Teheran, to British attempts to continue the "Mediterranean sideshows" after they had "successfully wiggled through another loophole" at Quebec—without ever considering whether Russian motives might not have been as "complicated with political foresight" as British ones.

It is also obviously impossible for him to be fair to Montgomery. Nationalism is involved, but also something more than nationalism, as his unrestrained admiration for Alexander shows; there is a deep incompatibility of temperament. A similar incompatibility would, no doubt, have also clouded his relations with Patton, had Patton not belonged to the West Point club, the members of which stick together because, until they proved themselves during the war, they were outcasts in a successful industrial society. So he treats Patton as would an indulgent uncle, while Montgomery is always suspected of loitering with intent.

Despite these evidences of human weakness, which will sell more copies of his book than will the account of his campaign, General Bradley's character does not emerge at all distinctly. As a field commander he lacked the genius for the *mot juste* of Eisenhower, the histrionic ability of MacArthur, the weakness for causing incidents of Patton or the ability to create controversy of Montgomery. But, as Chairman of the Joint Chiefs of Staff, he has vindicated those who always believed that he was consequently underrated. His speeches and his statements before Congressional committees since the beginning of the Korean war have been more consistently statesmanlike than those of anyone else in Washington. They give more of the flavour of the man than this story of the period when he was only a soldier—and, at times, a very simple one.

Incomplete Portrait

Marshal Without Glory. By Ewan Butler and Gordon Young. *Hodder and Stoughton.* 287 pages. 15s.

This is the second life of Goering to be published in England within a year, while at least two other books about him have recently appeared in Germany. It is evident that in the *chronique scandaleuse* of the Third Reich Goering will occupy a place by himself. Nor is this surprising, for his was a career which might have been invented by some shrewd journalist or scenario writer to amaze and delight the

astonished eyes of the Saturday-night picturegoer and the Sunday newspaper reader. All the classic formulae are illustrated. War: here is the crack fighter pilot, decorated with the *Pour le Mérite*, who rose to command the Luftwaffe. Romance: he built a shrine, in the best Hollywood manner, to keep alive the memory of the beautiful Karia. Crime: he was a murderer at least by proxy and a racketeer who organised looting on an international scale. Luxury and High Life; drugs and political intrigue; secret diplomacy; a taste for decorations, flashy rings and the bizarre in dress; even a sense of humour and a defiant ending to a misspent life—all these are there, combined with a personality "large as life and twice as natural." At the station, wrote Ciano,

> he wore a great sable coat, something between what motorists wore in 1906 and what a high-grade prostitute wears to the Opera. If any of us tried a thing like that, we would be stoned in the streets. He on the contrary is not only accepted in Germany, but loved for it. That is because he has a dash of humanity.

To this side of Goering his latest biographies do ample justice. But it is a superficial portrait which nowhere goes beneath the surface either of politics or psychology. In 1933 and 1934 Goering played a role second only to Hitler's in the establishment of the Nazi dictatorship; in 1938 he was still Hitler's chief lieutenant, as the part he played in the Blomberg-Fritsch affair shows; by 1945 he was a discredited blusterer. Only with his trial after the war did he reveal something of the cunning and energy he had once displayed as Minister-President of Prussia and Plenipotentiary for the Four-Year Plan in the 1930s. The history of Goering's decline, his eclipse by Himmler and Bormann, could be used to illuminate much of the politics of the Third Reich; the present account is disappointing and slight.

No less interesting would be a psychological study of a man who in his prime was one of the most ruthless and able of the Nazi gangsters, but whose lust for power and action dwindled to the petty satisfactions of a theatrical vanity, showing off his rings and boasting of his art collection to Frau Rommel while Africa was being lost. Where was the real man behind the exhibitionist; what had happened to him? Was there nothing behind it all? If so, how is one to account for the performance at Nuremburg? Unfortunately, the authors are content with the conventional psychological cliches of popular biography.

As a book, it is competently put together, written in an easy style, pleasant to read and well illustrated. But it remains a volume for the railway bookstall rather than for a library shelf.

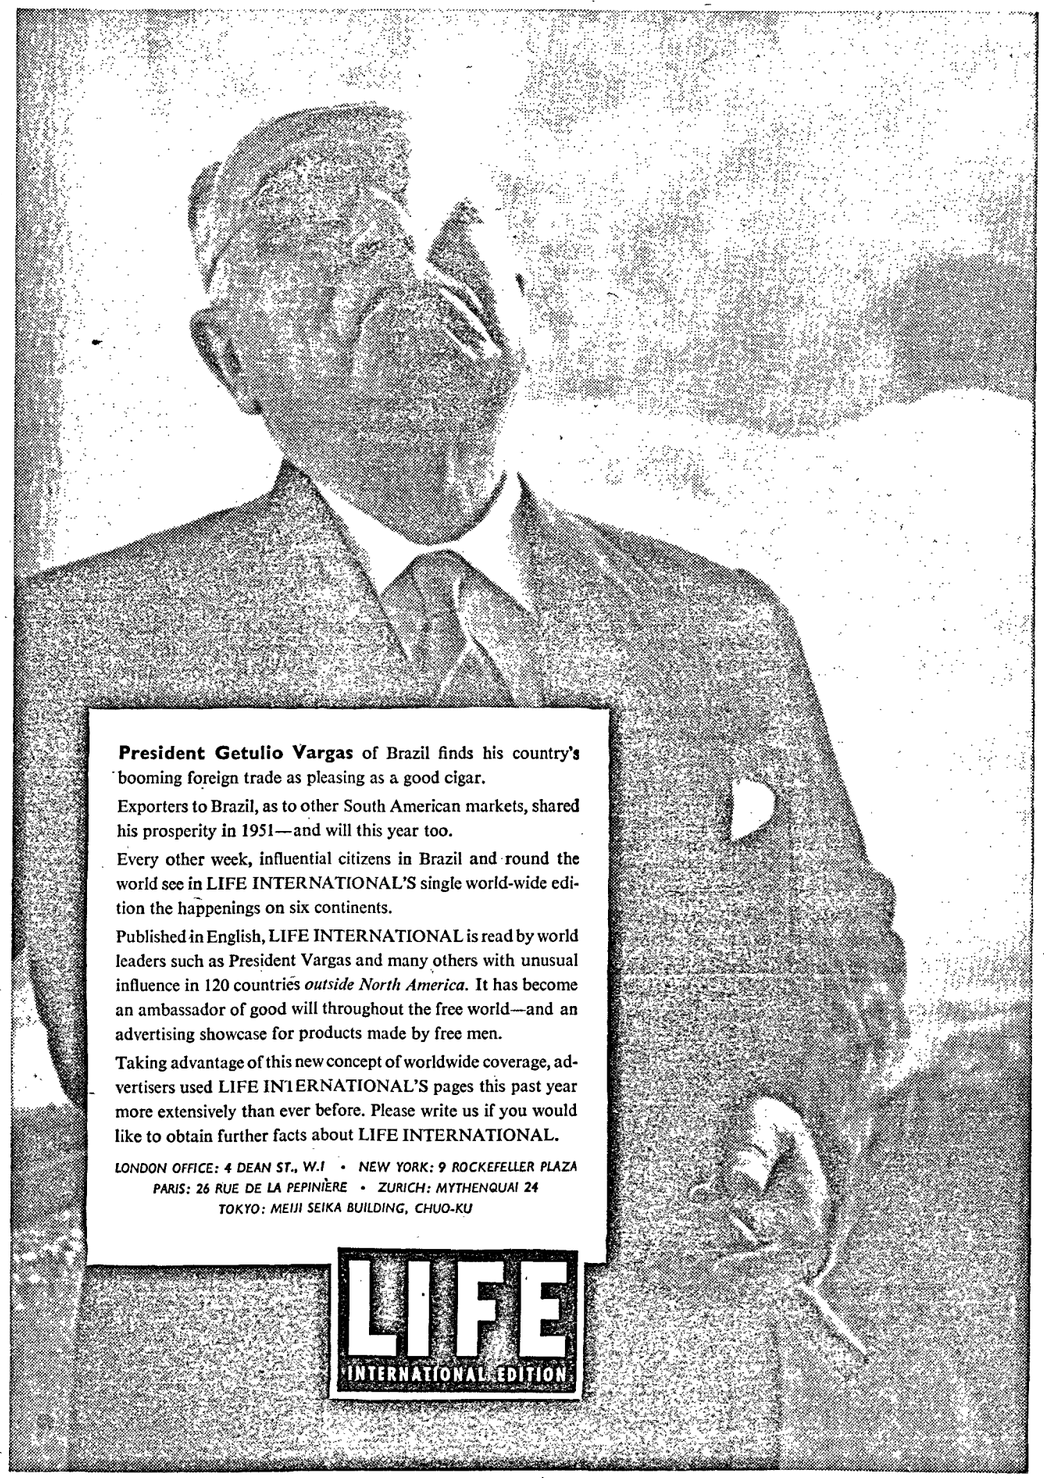
Trade and Temperance

Drink: An Economic and Social Study. By Hermann Levy. Edited by R. P. Lynton. *Routledge and Kegan Paul.* 256 pages. 21s.

The economic aspects of drinking have received scant attention, and a new work by an economist arouses expectations. Professor Levy's posthumous book is a comprehensive and lucid survey. But of economic analysis of the changing market status of drink and the public house there is disappointingly little. And the conclusion that restrictions on the sale of drink need to be intensified rests on evidence that is mostly out of date; there is little effort to consider the present or future effects of recent social changes, and the redistribution of income since 1939 is ignored. Drunkenness has been replaced by "excessive" spending on drink as the main indictment. But the technical and philosophical difficulties—how to measure "excess" (and why only in drink?) and how to prevent it—are not resolved.

Social conditions and the degree of monopoly in the trade jointly determine the size of the drink problem. In the 1950s the arguments for further licensing restrictions are not obviously more convincing than those for relaxation. The new amenities for leisure (television, now installed in perhaps 750,000 homes in the pub-going classes and spreading fast, is not even mentioned) mean that drink sells in a highly competitive market; the public house is contending with other retail outlets; and the brewing industry faces a period of adjustment to new market conditions.

In these circumstances the political and economic power of "the Trade" loses its terror. "Pushing" drink becomes less fearsome when the public comprises educated self-respecting citizens who have plenty of alternatives. That Mr Levy can quote trade support for his views on the effectiveness of drink advertising does not mean that he is right; it may sometimes fail, as is suggested by the experience since 1946 of the revival of "Beer is Best." The concern with brewers' and publicans' motives is likewise misplaced; what matters is not what they would like to do or why, but what they can do. Competition is impelling the public houses to offer food and general refreshment in wholesome surroundings, and Mr Levy recognises that this is "a not altogether unfavourable line of development." The dilution of drink by food and social amenities is an objective that unites the far-sighted in both trade and temperance.



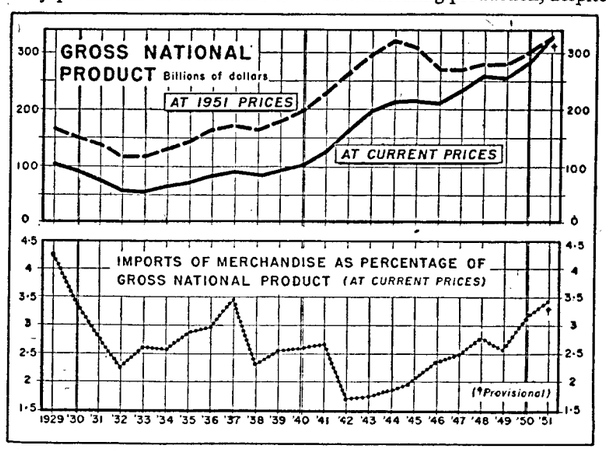
If Mr Levy draws profusely on temperance writings, the brewers themselves are partly to blame. They must emerge from the shell into which they were driven by past political battles. Only then will they be seen not as "the Trade," but as an industry contending with its own problems in its efforts to serve the public.

Tribal Tradition

The Mende of Sierra Leone. By K. L. Little. *London: Routledge and Kegan Paul.* 307 pages. 28s.

The transfer of power in the African colonies is being made easier by the large amount of reliable information that is now available about the life and conditions of their native peoples. Constitution making in Nigeria, for example, has been able to take cognisance of the realities of tribal pride and cultural prejudice to an extent never before attempted. Anthropologists have made a valuable contribution to this knowledge of African peoples. Dr Little's contribution deals with the Mende of Sierra Leone, a tribe of over half a million people well known for their vigour and industry. Like many tribes of this area they were skilful and courageous warriors until their subjugation by the usual combination of treaties of friendship and punitive expeditions in the nineties. They are now capable rice farmers and craftsmen, who have successfully converted a former slave economy into one based on the large family household. But what they were always most famous for was their secret societies, which were the real powers behind the chiefs and traditional law and custom.

What is the state of Mende social life today after fifty years of missions, trade, government and peace? This is the main question Dr Little sets out to answer. After a short outline of what is known of Mende history he describes the main features of the traditional political and social life of the people, giving particular attention to the secret societies. He then discusses the reaction of the Mende to modern conditions. He notes the usual symptoms of the breakdown of tribal society under *laisser faire* rule, such as the insecurity of chiefs, who often earn less than clerks, and the revolt of the literate class. Dr Little is particularly interesting on the class system based on distinctions between the European, the Creole and the "bush" native. On the whole, however, though the information he records is mostly new, it is superficial and too general.



AMERICAN SURVEY

Self-Sufficient Giant

Washington, D.C.

THE figures in the President's Economic Report to Congress and in his Budget message this week had, as Mr Marquis Childs said, "an Alice-in-Wonderland quality" because what Mr Truman asked for had little or no relation to what Congress might ultimately grant. But there are certain important lessons to be drawn from this review of the past and the estimates of what will happen, regardless of a wayward Congress, in the future. In terms of 1951 prices, the gross national product of the United States, which was about the same in 1939 as it had been in 1929, rose by $90 billion between 1939 and 1947 and has risen by a further $60 billion since then. It is expected to rise another $20 billion by the end of 1952. Up to now, this increase has been more than the total cost of the security programme. Since 1939, moreover, steel production and electric power capacity have doubled; primary production of aluminium is more than five times what it was before the war. And, since the attack in Korea, private investment in "producers' equipment and non-residential construction" has averaged $37 billion a year. Yet in 1950 and 1951 imports had risen to only 3 to 3.5 per cent of the gross national product, and the proportion was lower than it had been in 1929.

A gigantic machine for the consumption of raw materials has been built and its appetite is growing at a fantastic rate; but, nevertheless, an increasing proportion of what it consumes is being produced at home. With a few exceptions, the primary materials needed for American industry are available in adequate quantities within the country and it is evident, and understandable, that private capital is more easily found to develop domestic supplies than to open up new sources in countries with underdeveloped economies and overdeveloped national corns. At the same time there is a determination not to remain dependent on foreigners any longer than is necessary for those few raw materials which have to be imported.

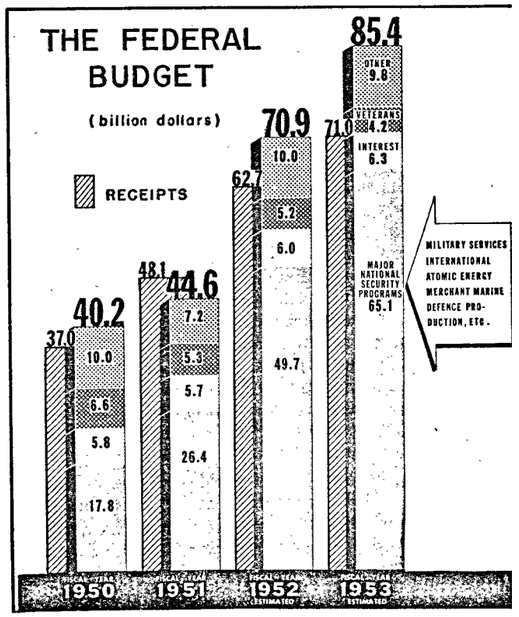
The report of the committee set up by the President to study the problem of raw materials will be published shortly, but it would be a surprise if it were in any way alarming. Mr Harold Ickes regularly prophesies the imminent end of the oil reserves but, though they are probably wasting faster than anything else in North America, this is hardly an immediate problem. A few more inventions, a few more discoveries in the technique of substituting one material for another and the United States would be, economically, free of the rest of the world and able to snap its fingers at it. And behind Senator Taft are any number of men who would like to try. But there remains the problem that it is a country of 150 million people on a planet with more than 2,500 million. And should the overwhelming majority of the other 2,350 million be driven to bitter hostility by American economic policies, all the productivity of North America would count for very little. So the President must make his greatest effort this spring to persuade a reluctant Congress to provide "both military and economic aid to free nations" and must also try again to make them accept the necessity for supporting "the efforts which underdeveloped countries are making to further their own economic development."

In the September issue of the *District Bank Review* Professor Arthur Lewis discussed the results of the failure of world primary production to match the growth of world manufacturing production, despite the fact that manufacturing production, even in the United States, had not grown as fast between 1913 and 1950 as it had in the forty previous years. But the figures he uses are deceptive because they do not take separate account of the change that has come over the American economy since 1939. In contrast to the nineteen-thirties the rate of increase in manufacturing production during the last twelve years has been more than 6 per cent, which is one-third greater than it was from 1870 until the first war, and there is no sign that this rate of growth will slacken in the near future. The United States must, therefore, be taken out of all statistics of manufacturing production lest it distort their general meaning.

The same is true of statistics of primary production. The rate of growth of world primary production, which kept roughly abreast of that of world manufacturing production until 1913, has, since then, been only half of it. But again the United States (and Canada) distort the picture. They account for what rate of growth there has been and the shortage which the rest of the world now feels is the reflection of the failure of its primary production to keep pace with the comparatively modest rate of growth of its manufacturing production. It is this factor, rather than the supreme power of the dollar, which has made necessary the International Materials Conference and last week's agreement to find a million tons of steel for Britain.

When the President made his inaugural address in 1949 and spoke of a "bold, new programme" he sensed, and some of his advisers knew, what was needed. But all that has come of it is a little fiddling with Point Four because there was a complete failure to realise that private capitalists would always invest at home first if the yield was at all comparable, and that the risks in underdeveloped countries had increased, while the chance of a killing had almost disappeared. The only place from which development capital can now come is governments—which means in practice the United States Government—or the International Bank. No amount of exhortation to "invest but not exploit" will today persuade the private investor to take the chance of big losses when the chance of big profits is denied to him. And at present it is thought that although most countries are able to find the dollars to meet the cost of government loans, they could not always find the amounts needed to transfer the profits venture capital would expect.

As the American gross national product increases, the total of imports presumably will increase too, and even if this cannot be held above three per cent or so of the gross national product, the rest of the world will probably be all right in a few years. What is needed to ensure this are schemes of development which, although they might not attract venture capital, would appeal to an American government prepared to look a little way ahead. At present, any large programme of American foreign investment would, as far as American requirements are concerned, be providing for the generation after the next, not the kind of enlightened self-interest which a government would think of proposing at a time like this. But such a programme of investment—not of grants—which would provide a non-dollar source of raw materials for the non-dollar part of the free world and a source of some important ones even for the United States itself, would offer the best long-term solution of the problem of making allies independent and giving them that steady increase in their standards of living which, it is believed, is the best antidote to Communism.



The kind of schemes which were discussed by the Commonwealth Finance Ministers should be ready for a new Administration next year. Now all the President can say is that "we shall continue to encourage production and equitable distribution of scarce raw materials in the free world." But the need for "equitable distribution" should be a temporary phenomenon and encouragement of production should be the main goal, which it is not at the moment. If that were done on the scale which the rest of the free world needs, not only would the present generation of Americans see their allies becoming independent, but they might also earn the undying gratitude of their own great-grandchildren who may well, otherwise, curse them in posterity for squandering the assets of their country.

The Price of Preparedness

IN the fiscal year 1952-53 which begins next July (and which is known in American official parlance simply as fiscal 1953), the government of the United States is hoping to spend $85.4 billion, more than it ever has before, except in two wartime years, 1944 and 1945, and more than double the amount spent in the 1950 fiscal year which finished as the Korean war began. In the budget message which President Truman sent to Congress this week there are, however, signs that the end of the climb towards military preparedness, if not yet in sight, is at least round the corner.

The estimated expenditure for 1952-53 is only $14.5 billion above that for the present fiscal year, while estimated expenditure in 1951-52, at $70.9 billion, is $26.4 billion above the amount actually spent in 1950-51. More important, for 1952-53 the President is asking for new "obligational authority"—permission to make new commitments, most of which will be paid for in later years—of only $84.3 billion, less than he is expecting to spend next year and much less than the $90.5 billion in new obligational authority available this year. A further decline in future commitments is expected in 1953-54, although expenditure will remain high in that year, for that is when production of most types of armaments will reach its peak, many months later and a good deal higher than was originally planned. After that military output should level off and the President hopes that it will be possible to budget for lower expenditures for preparedness in the 1955 fiscal year.

This prospect, and the increase in the yield of the tax system that will come from the growth in the national economy, make it probable that the budget can then be balanced. Meanwhile, however, Mr Truman is resigned to

Source: US Bureau of the Budget.

the deficit that Congress has forced upon him; for the present fiscal year he puts it at $8.2 billion, but it is possible that he may be overestimating, as he did last year, when an expected deficit of $2.7 billion at this time turned into a surplus of $3.5 billion in June. For 1953, the deficit is calculated at $14.4 billion, which would bring the public debt to its statutory limit of $275 billion by the middle of the calendar year.

Government receipts in the present fiscal year are expected to be $62.5 billion, and $71 billion next year, unless the law are changed; in 1953, according to present calculations, $5 billion will come from personal income taxes, $28 billion from corporation taxes and nearly $10 billion from excise taxes. The President has decided that it is now too late to put the country on a pay-as-it-goes basis, but he is once more asking Congress to eliminate injustices in the tax law and to give him the $5 billion in new revenue by which last year's Tax Bill fell short of his recommendations.

Congress had made it quite clear, even before the Budget was sent to it, that it had no intention whatsoever of increasing taxation at this session, but that does not mean that it is ready to condone a deficit. All this week members of Congress from both parties have been competing to see who could propose the deepest cuts in expenditure. But when they have to give practical demonstrations on Appropriations Bills that affect their constituents they will, as always, become squeamish. They would, in fact, have real difficulty in finding many cuts that could be made without going to the bone. The President insists that he has already rooted out inefficiency and economised wherever possible ; in any case less than $10 billion is being spent altogether on running government departments, farm price supports, flood control, highway development and other domestic programmes, many of which are being held below authorised levels. Interest on the government debt is going up, but that cannot be avoided ; aid to ex-servicemen of the last war is going down, but Congress neither can, nor wants, to speed it on its way.

*

What is left is the $65.1 billion—over three-quarters of 1953's estimated expenditure and nearly 30 per cent of its anticipated national income—that is to be spent on international security programmes. And Congress will probably want to add to expenditures on atomic energy which, at $1.8 billion, are only slightly above this year. The President has already announced that he will be asking for new obligational authority, not included in the Budget, for at least $5 billion, which will begin to be spent late in 1953, to develop the atomic weapons which it is hoped will eventually reduce the cost of conventional armaments. Congress's chance will come, however, with funds for foreign assistance. The actual amount to be spent on it in the 1953 year is $10.5 billion, an increase of $3.7 billion over 1952, which is explained by the sharp acceleration coming in deliveries of military equipment to the overseas allies of the United States. The President will be asking for $7.9 billion in new authority for the mutual security programme, more than he got this year, although less than he requested, a pattern which Congress seems sure to follow again.

It is conceivable, although very unlikely, that reductions of the type already mentioned might add up to the $4 billion some members of Congress are promising to cut, but they would certainly not come anywhere near the $14 billion that has been mentioned by the more imaginative members. This figure could only be approached by drastic pruning of military spending, which is put at $51.2 billion for 1953, compared with $39.8 billion during the present fiscal year. Only $52.4 billion in new obligational authority is being asked, while this year $61.7 billion was provided, a sum which the Department of Defence had hoped to get again but which the President, it is understood, refused to consider. These figures allow for building up the country's military strength rather more than was planned last year, towards an Air Force of 143 wings, an Army of 21 divisions, a Navy with 408 combat ships and 16 large carrier air groups, and a Marine Corps of 3 divisions. More than half the spending for military procurement in 1953 will be for aircraft, which will cost $11 billion.

Most of these increases, officially confirmed for the first time in this message, have been urged on the President b Congress, and it will not want to refuse to pay for then but it is certain to scrutinise all military programmes mor meticulously than usual for waste and extravagance. Further more, if the Soviet Union does not once more come to th aid of the President by reviving a sense of urgency in th United States, Congress may decide that the peak of th military build-up can be postponed again, and that the pro curement agencies, which have already been authorised t spend $112.4 billion since the Korean outbreak and wil have spent only $60.2 billion by next July, should be mad to use up more of their surplus spending power before the are given all the new obligational authority they want. Bu that would not mean that any less would be spent in th 1952-53 fiscal year.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes

Bandwagons at San Francisco

Members of the Republican National Committee fough their way to San Francisco, through the worst snow-storm ever experienced in the Sierras, to lay their plans for th nominating convention in July, and to look over the band wagons of the rival candidates. Some were snow-bound fo three days near the Donner Pass, of gruesome memory, bu they were rewarded for their endurance by a preview of th Republican campaigns. For the first time candidates were invited to speak, or to send their representatives, to what has usually been a business meeting. Mr Ingalls, Senator Taft's campaign manager, evidently alarmed lest the Eisenhower bandwagon, now officially on the road, should leave the Senator far behind, took the offensive at once. He warned the party against the risks of succumbing to "glamour and sex appeal," and of confessing that the party was dead by calling in a "good-looking mortician," when it could have for the asking the tried and true orthodoxy of Senator Taft. Mr Stassen and Governor Warren, who were there in person, and who may hold the deciding tricks at Chicago, can hardly have been impressed by this intemperate broadside, and the insistence of the Taft forces that their candidate has a monopoly of the true Republican faith.

Senator Lodge, speaking for General Eisenhower, was content to rub it in that the Republicans, as the minority party, must, if they are ever to win power again, find a leader who will appeal, not only to the orthodox, but also to the independents and to the dissatisfied Democrats. Not only the Presidency, but the control of the Senate, may hinge upon setting in motion an anti-Democratic groundswell. Otherwise a number of threatened Republican seats may be lost.

The virtual certainty that General Eisenhower, if nominated, can win handsomely, is the only argument respected by the professional politicians, who lean toward Senator Taft. And it is the professionals who influence the choice of delegates to the nominating conventions, particularly in the 32 states where they are chosen at local conventions, rather than through party primary elections. It is thus of particular importance to the General's managers that he should make an impressive showing in the primaries ; several overwhelming victories in these trial heats might, moreover, provide that "clear call to political duty" which would bring General Eisenhower home in the early spring. Then he could speak for himself and spike the Taft charge that the party is being asked to buy a President in a poke—a man whose foreign policy is President Truman's and whose domestic stand is unknown.

A direct encounter between the Senator and the General in the primaries seems unlikely, though the insistence of General MacArthur that he is not a candidate may encourage Senator Taft to invade the Eisenhower stronghold of New Hampshire. Senator Taft seems inclined to demonstrate his prowess more safely by crushing Mr Stassen, who is willing to fight in almost any state and is suspected of being a stalking-horse for General Eisenhower. One of the difficulties of General Eisenhower's friends is that to enter a number of the primaries he must give his express consent, something that so far he has not been willing to do.

Mutual Security Gets Organised

With the appointment of Mr William Draper to be special Presidential representative in Europe, Mr Averell Harriman's task as Mutual Security Director has been reduced to something approaching a manageable size. Mr Draper has taken over the European end of Mr Harriman's job and, like him, is directly responsible to the President for co-ordinating the three types of aid—economic, military and technical—as well as for his work as senior American civilian official in the North Atlantic Treaty Organisation. Now that Mr Harriman's team of deputies is complete, he will be free to devote his attention to Congress, soon to open hearings on next year's appropriations for mutual security, and to integrating the three branches of the programme. The Mutual Security Agency, to be headed by Mr John Kenney, is responsible for economic aid, but military aid is managed by the Department of Defence while the State Department is in charge of the technical and development schemes known as Point Four.

*

By January 8th nations seeking aid under this year's $7.5 billion programme were supposed to accept the conditions set by the Mutual Security Act. If a country wants military aid it must consent to six provisions which, in effect, amount to an undertaking to make its full contribution to the "defensive strength of the free world." The conditions for economic and technical aid only are less specific ; the recipient need only help to further peace and eliminate world tension. But even this was too much for Iran's neutrality and American officials, feeling that here more than anywhere Point Four aid was needed to counter Communist influence, were forced to accept, instead of the official agreement, a letter affirming Iran's support of the principles of the United Nations. However, it was impossible to avoid the suspension of military aid to Iran for the present ; all other recipients of military aid have been able to comply with the conditions.

Eire is finding even the conditions for economic aid incompatible with its neutrality, but the other four countries, Afghanistan, Burma, Iraq and Egypt, which have not yet signed and are therefore having to do without technical aid for the moment, are expected to agree eventually. India, one of the first recipients of large-scale economic aid under the new programme, is to get a $50 million grant for technical assistance for improving food production, and is to match this sum itself. This joint effort to raise Indian living standards is felt in Washington to be of key importance in preventing the spread of Communism in Asia. Pakistan, on the other hand, is to receive only what one official there terms the "paltry" sum of about $10 million, and is said to feel that a little hesitation before it gave its allegiance to the west might have paid better.

Spain does seem at last to be on its way into the mutual security programme—a development encouraged by the emphasis on the military aspect of the programme. General Franco, his fears of American interference in Spain's internal affairs apparently overcome, is reported to be ready to let the United States have naval and air bases in return for military and economic aid.

President on the Shelf

Just as Mr Churchill's presence in the gallery of the House of Representatives took the limelight from President Truman when he delivered his State of the Union message, so Mr Churchill's address to Congress, sandwiched between the President's Economic and Budget messages, made a much greater and more positive impression than did anything in Mr Truman's programme for the present session of Congress. Mr Churchill's popularity in the United States is as high as ever, Mr Truman's, according to the Gallup poll, has never been lower. The general opinion in Congress is that he is already on the shelf and can safely be ignored. This opinion was encouraged by the tone of his three messages ; nowhere was there any suggestion that he regarded his requests as more than routine—nor were they—or that he was building a platform in Congress, as he had in 1948, from which to campaign in next November's election.

In international and military matters, Congress is prepared of its own accord to do many of the things the President wants. The Senate is already getting ready to admit Greece and Turkey to the Atlantic pact and to ratify the network of Pacific treaties. The House has approved an increase of ten per cent in pay for the armed forces, but it will be difficult to get confirmation in an election year for the universal military training scheme which is already accepted in principle. Appropriations for the mutual security programme (which must also be reauthorised), for the armed forces and for the rest of the government, will make up most of the remaining business done by a Congress that is anxious to knock off work early in July.

However, there is one other piece of controversial legislation that must be renewed, the Defence Production Act, which provides for the allocation of raw materials to industry and for price and wage controls. The President asked once again for the strengthening of this Act, pointing out that, while the economy had stood the strain of the heavy increase in government spending better than had been expected, the strain was certain to grow in the coming year. No one doubts that, but Congress is likely to reply that the economy has proved itself strong enough to withstand almost any strain and that it is hindered, rather than helped, by direct controls on inflation.

The President's other recommendations—for changes in the labour laws, the farm price support system and so on —had all been heard before, but this time they were tied to the need for strengthening the national economy. This will not make them any more acceptable to Congress, and few of Mr Truman's requests for legislation are likely to receive serious consideration. The only one of the traditional "Fair Deal" measures for which he seems ready to make a fight is that of aid for education.

* * *

Information Comes of Age

The information programme has been given a little more rope, and a little more prestige, by its elevation to an International Information Administration, a semi-independent agency inside the State Department. Its new director, Mr Wilson Compton, will be responsible for all operations, policy decisions alone remaining in the hands of the Assistant Secretary of State for Public Affairs. Thus Mr Howland, Mr Barrett's successor in that post, will not inherit the whole-burden of deciding on policy while running the 8,000 man, $100 million programme, and keeping relations with Congress sweet.

This measure of freedom may make information work more attractive, as will the new methods of increasing the range of the radio Voice of America, such as the floating wireless station, first of several, which goes into service next month. But what was more decisive was the hope of satisfy-

ing the critics inside and outside Congress who feel that the dissemination of information and propaganda will never be effective as long as it is in the kid-gloved hands of the State Department. These critics—ranging from Senator Taft to Senator Benton—would like information to have a separate establishment of its own; Mr Celler has already offered a Bill to create a new Department of Overseas Information. Many Congressmen who returned from trips abroad puzzled and angry at the unpopularity of the United States will be sympathetic to these efforts.

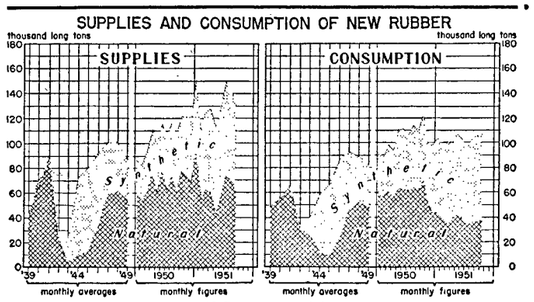
The State Department has always, and understandably, been reluctant to let information and propaganda work be divorced from those who are responsible for foreign policy. It was the State Department which defeated Mr Harriman's and Mr Hoffman's hopes that the new Psychological Strategy Board would be able to carry out its own ideas. Instead, it remains a committee subordinate to the National Security Council, dependent on other agencies, particularly the Information Administration, to put its views into practice. The Board seems likely to be further weakened by rapid turnover. Mr Gordon Gray, who did the spade-work, has now returned to the University of North Carolina, and his successor, Dr Raymond Allen, does not propose to make a much longer stay. Next summer he expects to go as chancellor to the University of California at Los Angeles. Under such a shifting command, no single tune is likely to emerge from the competing sopranos and tenors of a highly vocal nation, even if this were desirable. A number of responsible columnists are now putting forward a much more modest view of what an information programme can achieve than the high-flown hopes, which abounded last year, that high-powered propagandists could "sell" the United States abroad and thus make a decisive contribution to the winning of the cold war.

* * *

Hollywood Fights the Red Charge

Hollywood seems at last to have mustered enough courage to fight at least some of the attacks that are always being made upon the cinema industry by pressure groups, instead of submissively cutting its films and choosing its employees to fit the prejudices of its critics. For the industry is supporting Mr Stanley Kramer in the $1 million libel suit which he is bringing against an extremely right-wing group called the Wage Earners Committee of the USA. Mr Kramer, an independent producer who was responsible for such highly praised films as "Cyrano de Bergerac" and "The Men," brought his action after the committee picketed showings of his latest picture, "Death of a Salesman," and handed out leaflets describing him as "notorious for his red-slanted, red-starred films." Leaders of the industry immediately rallied to Mr Kramer's side, stating they will no longer allow such action by "irresponsible pressure groups" to go unchallenged. They cannot afford to, for it is reported that the Wage Earners are planning a campaign against fifty Hollywood films they consider subversive. While the film industry is to be congratulated for its stand, it remains to be seen whether it will be as firm in resisting pressure from better known organisations, the American Legion, for example.

Hollywood is at the moment paying for having given way to pressure some time ago. In 1947 the studios discharged a number of script writers and directors—the "Hollywood Ten"— who refused to give evidence on their alleged Communist connections to the House Un-American Activities Committee and were later sent to jail for contempt of Congress. Nine of this group brought suits for amounts totalling over $61 million against eight film companies, individually for breach of contract and collectively for conspiracy to deny them their livelihoods. Four of the defendant companies have now contributed to a fund of $107,500 as an initial payment toward settlement of the suits. In these cases, however, the issue is more delicate than in that of Mr Kramer, and some film executives consider the attempt to settle, out of court, suits brought by the "unfriendly witnesses" to be a major blunder in public relations.



The Un-American Activities Committee has not been resting on its film laurels since 1947, and last year it spent a further six months investigating Hollywood. However, in all the years of Congressional inquiry not a single example of Communist "infiltration propaganda" has ever been found in any film. The industry seems to have taken courage from this failure of the self-appointed censors to prove their case, and has decided that films with ideas can be made.

Rubber to Spare

The government's authority to operate the only nationalised industry in the United States—synthetic rubber—expires next June, but Congress is expected to renew it for another two years. Congress may not even take advantage of the President's request that he be allowed to hand over to private industry the two plants making butyl rubber. Mr Truman is anxious that output of this type of synthetic, which is in great demand, should be expanded; at present it is running at 80,000 tons a year and little more can be expected from existing plants. He would like private firms to build new facilities, but fears that they will not do so if they have to compete with the government.

The remainder of the 28 government-owned plants are all producing the raw materials for, or actually synthesising, either GR-S or "cold rubber," which is proving more satisfactory for many purposes and is gradually replacing GR-S. The President feels that if this integrated system of plants was broken up and sold, output would be adversely affected for some time and he is anxious to avoid this until the international situation is clearer. Output of GR-S is now running at 770,000 tons a year and is expected to rise to 860,000 by

Source: US Department of Commerce

the autumn. But there is already enough available for exports of 10,000 tons of synthetic to have been permitted for the first quarter of this year and for all curbs on its use to have been removed.

Manufacturers are now allowed to use as much new rubber as they like, although butyl is still allocated and the percentage of natural rubber going into tyres is still restricted. It is intended, for the present, to keep consumption of natural rubber down to 105,000 tons a quarter in order to leave enough for the stockpile. The President has, however, forecast that the minimum objectives of the stockpile for natural rubber will soon be met and that it will then be possible to reduce purchases for that purpose. At the same time, probably in April, the government is expected to give up being the sole buyer of rubber from abroad. The government has recently again cut the price at which it sells natural rubber to American consumers to 50.5 cents a pound. But synthetic costs only 26 cents; the government can make a profit at that price as long as production remains at a high rate.

THE WORLD OVERSEAS

Partnership or White Supremacy?—I

(From a Special Correspondent)

LAST November, at Kitwe in Northern Rhodesia, a meeting of African leaders sharply criticised not only the idea of federation of the two Rhodesias and Nyasaland but also the idea of white-black partnership on a "senior and junior" basis as defined by white Rhodesians. The Africans said they prefered to retain their British-protected status until such time as they could form their own government, in which they would "allow other races to take part." This attitude has since been substantially confirmed by the Northern Rhodesian African Representative Council. The Broken Hill branch of the African National Congress proposed a new constitution for Northern Rhodesia under which there would be 12 Africans and 10 Europeans on the Legislative Council (of the present 22 members, two only are Africans).

The senior European representative of African interests on "Legco," Mr John Moffat, said that "the Kitwe conference was attended by Africans who normally show exceptional intelligence. The only explanation I can think of is that the resolutions were passed in a moment of mental aberration, or that they have been got at by extremists." Mr Moffat is the great-grandson of the famous missionary, Robert Moffat, who was David Livingstone's father-in-law. Other European comments were harsher. The Ndola *Northern News* said that "the Bantu remain immature and stupid . . . for the Africans to demand parity at this stage would be tantamount to a junior schoolboy demanding equality with his headmaster."

Mr Moffat feared that the Africans had thrown away an important card. They should have insisted on "partnership" as a condition of federation. Having rejected "partnership" they might find themselves compelled to accept federation anyway. Such an outcome would certainly accord with the views of the majority of the whites in both the Rhodesias. Thus the *Rhodesian Graphic* had already blamed the United Kingdom Government for "presenting the [federation] proposals in a spirit of lofty disinterest, as if the Africans could possibly have any views on a constitutional concept far beyond their understanding." Sir Godfrey Huggins, the Prime Minister of Southern Rhodesia, who this week began discussions on federation with the British Government, has blamed the British approach for making the Africans "swollen-headed" and no doubt regarded the Kitwe resolutions as proof of this. The Africans' rejection of "partnership" has not entirely displeased the whites. Before the war, at the time of the Bledisloe Commission, white opinion in the Rhodesias was almost unanimous that consulting Africans was foolish. It is now felt that the Africans' latest attitude should convince even the British Government of the truth of this prewar assessment.

In fact, the Africans' attitude cannot be understood without knowledge of the background of white-black relations in both the Rhodesias and to a lesser extent in Nyasaland; nor can the whites' offer of "partnership," which the Africans have rejected but which the Governor of Northern Rhodesia, Sir Gilbert Rennie, declares is "the only workable policy." The whites' desire for federation is understandable. Here are three essentially primary-producing territories whose political boundaries are highly artificial. They depend on the same system of communications and have the same transport difficulties. The frontiers have no economic significance at all and the way of life of all the people, both white and black, is much the same. Federation would create an economic tripod far securer than Northern Rhodesia's present utter dependence on copper and Nyasaland's on tea and tobacco, while Southern Rhodesia's growing secondary industries would have a bigger market. Development schemes could be considered from the common point of view, instead of (as in the hydro-electric field) rival schemes being put forward.

Unfortunately the economic argument is not the only motive for federation. If it were, it is doubtful if the present white-black friction would ever have been generated. For if economic arguments were in the ascendancy it is probable that an agreement on what "partnership" really means could easily be achieved. Those "intelligent" Africans who assembled at Kitwe distrust "partnership" precisely because it seems to them that the whites begin by evading its economic obligations and proceed thereafter by other actions to widen the gulf.

African Ideas of Equality

To these Africans true partnership would mean first of all equality of economic opportunity. Probably only a minority of Africans in all three territories would be able at this stage to take advantage of it if it existed. But it is to that minority that the "intelligent" Africans belong. They themselves are a small rising middle class. Behind them and backing them are the growing black industrial proletariat in both the Rhodesias. When these people reject "partnership" it is because what is being offered them appears to them to contain none of the things they really want.

On the North Rhodesian copperbelt there are some 40,000 black and some 5,000 white miners. The mines are very well run and are highly mechanised. But, despite the high degree of mechanisation, a black miner's cash wage may not exceed 2s. a day, while the average white worker earns £100 a month. The white workers have secured an agreement with the mining companies which debars Africans as such from all skilled and much semi-skilled work. The Dalgleish Report, which recommended the training of Africans for a much wider range of jobs, has never been implemented. The Africans say that if "partnership" meant anything at all, a beginning would be made with the implementation of the Dalgleish Report. No one who knows anything of the political climate of Northern Rhodesia believes that the whites will consent to this. Yet the whites call the Africans "immature and stupid" because they distrust the whites' offer of "partnership."

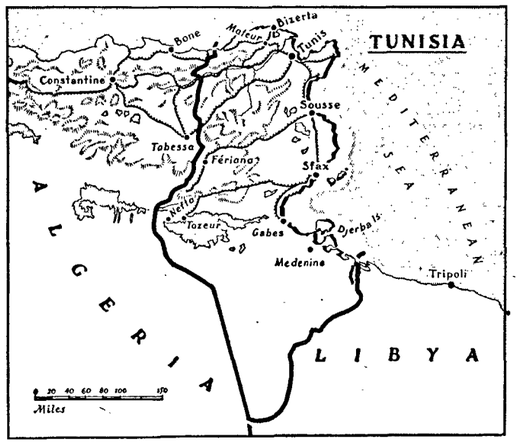
In Southern Rhodesia the Europeans, especially Sir Godfrey Huggins, insist that the Africans must advance economically before they can hope to advance politically. Yet in Southern Rhodesia Africans, because they are Africans, cannot occupy business premises in the towns, and their trade unions are not recognised, though white unions are. The Africans will continue to distrust talk of "partnership" until a real beginning is made with the

removal of such artificial restraints and discriminations. At present there is no sign of it.

But the chief reason why Africans distrust "partnership" is the white attitude they encounter all the time in their daily lives. Whatever politicians may say, the African is made painfully aware that almost every European he meets regards him as an inferior—and that it does not make the slightest difference whether he is an "educated" African or an "uneducated" one. It is of course the intelligent and educated African who resents this most. But when he registers his protest, he is told that, just because he is "educated," he is not truly representative of the "real" African opinion and that therefore his protests need not be heeded. He is merely an "intellectual." If he persists, then he is "immature and stupid."

From this evasion of the challenge which he embodies he concludes that all talk of "partnership" is mere hypocrisy, and that in fact what is intended is to achieve by means of federation a strengthening and perpetuation of a system of "white supremacy" in which even the most intelligent African, merely because of the colour of his skin, will always be the underdog. To this he reacts by rejecting "partnership" as a sham and defiantly proclaiming his own brand of "black supremacy." After all, in Africa there are far more Africans than Europeans: if there cannot be genuine partnership, then let numbers alone count.

(To be concluded.)



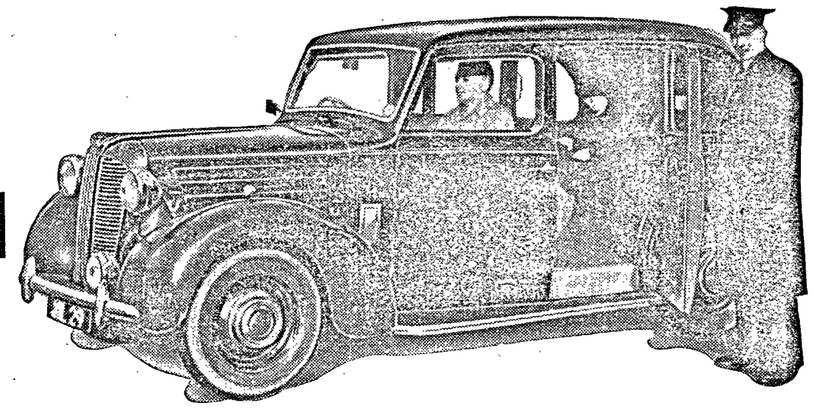
Troubles Over Tunisia—I.

M. FAURE has faced and won his first vote of confidence in the French National Assembly on an unusual and an awkward subject—Tunisia. The root of the trouble there is the climax lately reached in the perennial tug-of-war between the Tunisian nationalists, who want full self-government without further delay, and the French settlers in Tunisia, who fear for their position if the nationalists secure home rule. The point in M. Faure's speech which carried the day was: "We have never demanded and we do not now demand co-sovereignty." This statement will incense the French settlers (whose attitude amounts to an argument that their handiwork has earned them some sovereign rights), but it succeeded in winning M. Faure the vote of the French Socialists, proverbially the friends of the Tunisian nationalists and their trade unions.

M. Faure was firmly opposed to recent Tunisian tactics —to the rioting and bloodshed of the last ten days, and to the Tunisians' move to communicate their grievances directly to the Secretary-General of the United Nations. Both these, he implied, he would handle firmly. But his strictures on these acts were offset by the statement quoted above, a declaration that amounts to rectifying a mistake made by the Pleven cabinet in December. That body, in its weakness and its desire for compromise within its ranks, then drafted a communication to the Tunisians which, whatever its intentions, reads like a capitulation to the settlers; a claim for their permanent representation in the Tunisian government; an assertion that Tunisia's bond with France is *définitif* (a word which, in French, conveys a sense of finality), and tacitly, therefore, a declaration of France's right to a share in sovereignty. Though the Faure government is very like its predecessor in composition, it obviously wishes to rectify this impression and to reopen a door that only the die-hards meant to slam—the door to negotiation.

Deadlocks between excited nationalists and a protecting power have been common for a generation, and, at first sight, the Tunisian affair looks much like the struggle for self-government that took place in Iraq in the twenties or Syria in the thirties. But, in fact, it is different for two basic reasons. The first is the existence of the local French population, amounting to only one-twentieth of the whole but possessing an economic importance out of all proportion to its size. The French element is further strengthened by the self-interested support of more than a million Frenchmen settled in next-door Algeria, who are well represented by members and lobbies in Paris. This first factor greatly aggravates the French government's problem.

But the second factor is less daunting. The Tunisian's character is different from that of most other Arabic speaking peoples. The blood that runs in his veins is a mixture of Carthaginian and Berber as well as Arab, and is dashed with that of countless invaders including Greeks and Byzantines. The yield of so many ingredients is a quick wit and a receptiveness to the best in western culture. Whenever Frenchmen are tolerant, therefore, Tunisians tend to display a genuine feeling for France and a corresponding tolerance in return. In contrast to all other nationalist movements in the Arabic speaking states, the Tunisian nationalists have in the last eighteen months sought to gain their ends by working from inside their government—that is, in collaboration with Frenchmen—instead of from irresponsible points of vantage outside it. The deadlock is not hopeless. But the

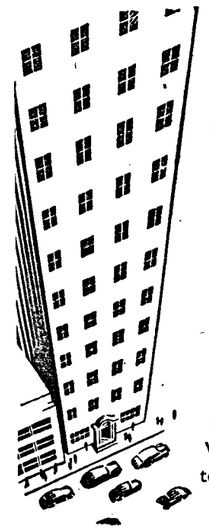


history of the protectorate shows that it could easily become so, with grave strategic repercussions for the Nato powers.

For fifty years, after a bloodless occupation in 1881, a happy land had no history. The Bey—the hereditary ruler —continued to reign but did not govern. In theory he retained absolute sovereignty except in matters of defence and representation abroad, and administered central and local government through Tunisian representatives. But in practice the legislation, the administration and the judiciary were all controlled by Frenchmen, and beylical decrees required a French counter-signature before they were valid. Meanwhile, a start was made with the building of Bizerta into a Mediterranean naval base of consequence; the economic situation vastly improved, the French were not numerous, and nobody grumbled at his lot.

The social and political repercussions of World War I altered this situation. Under the influence of President Wilson's fourteen points, an independence movement started and the Destour (Constitution) party took shape. Simultaneously, in order to counter the influence of increasing numbers of Italian immigrants who became, as Mussolini's ambitions swelled, a fifth column of Fascists, the French government started systematically to increase the French population of officials and small settlers. The political parties in France began to take sides as between the aspirations of the go-ahead, left-wing element known as the Néo-Destour, and the settlers.

The pattern into which Tunisian politics fall today was already discernible in the years 1936-38. During that



YOUR FIRM needs this car...

A works or office car is an essential to the well run modern business. Austin build this special car which is exactly right for the job. With its two folding seats, it takes six in comfort and there is room for two more on occasions. Its 68 b.h.p. O.H.V. engine and great manoeuvrability ensure that it is always on time. This Austin is more impressive—more efficient at its job—than an ordinary saloon. Delivery is better, too. See your dealer today. This Austin is also the perfect Hire Car, for dependable day and night service.

AUSTIN
—you can depend on it!

Controlled combustion, eh?

Yes! Between the two obvious extremes of candle alight-and-burning and candle snuffed-right-out there is a halfway stage . . . 'burning' without flame. That's controlled *combustion . . . important because it is the principle behind a method discovered some thirty years ago for making a vital substance called phthalic anhydride.*

Phthalic anhydride was used in those days as an intermediate for dyestuffs. The new method not only produced phthalic anhydride, but produced it at a much lower price. Process research—in which Monsanto were prominent—greatly improved the process; and in a short time a wide new field of application had opened.

Today, phthalic anhydride is the base for alkyd resins (used in modern paints and varnishes); the base for the plasticizers used with polyvinyl chloride (plastic material for waterproofs, bathroom curtains, floor coverings, cable coatings); the base for the chief plasticizer in cellulose acetate (used for non-flam film). The production of low priced plasticizers, made possible by low priced phthalic anhydride, contributed greatly to the expansion of the plastics industry. So, the application of an old principle evolved a new method for producing a valuable chemical . . . made still more valuable and more widely available by Monsanto's process research. The growth of many important British industries was largely stimulated by these developments.

MONSANTO'S BASIC RAW MATERIALS FOR INDUSTRY INCLUDE:

MONSANTO CHEMICALS – PLASTICS

PHTHALIC ANHYDRIDE
PHENOL
CRESOL
CRESYLIC ACID

MONSANTO CHEMICALS LIMITED, 8 WATERLOO PLACE, LONDON, S.W.1.

period, the accession of the Popular Front to power in Paris put heart into the nationalists who began to discuss their aspirations with the French Foreign Office. But the return to power of M. Chautemps (Radical-Socialist) caused a quickening of the settlers' hopes and a rupture of the discussions. By 1938 the Néo-Destour had decided to resort to violence. A state of seige was proclaimed. About a thousand nationalists were imprisoned. The ensuing stalemate was only brought to an end by the outbreak of the Second World War.

Even after the collapse of France, Tunisian affections survived and it was from Vichy that a new, tough and ambitious Bey, Moncef, sought changes that would reduce the element of direct rule, and bring about "a return to the spirit of the protectorate." He was subsequently banished by the French for "collaborationist" tendencies, and they installed the present Bey, Sidi Lamine, in his stead. The incident is mentioned only because, until Moncef died in exile in 1948, his very existence created a creed known as "Moncefisme" which afforded a spur to postwar nationalism. Other elements contributed to it: the birth of the Arab League in Cairo, the Atlantic Charter, the propositions advanced by self-interested powers — Britain among them — for an independent Libya. Simultaneously, there were blossoming in France the conceptions that caused the Fourth Republic to write into its new Constitution a plan for a French Union, including a niche for Tunisia as an "associated state" with a government of its own.

Already, by 1946, it was clear that the old relationship needed revision. The reasons why, by 1952, only partial changes have occurred and Tunisia has never taken its seat on the *Haut Conseil* of the French Union will be set out in a second article.

(To be concluded.)

The Legacy of Gandhi

[FROM OUR CORRESPONDENT IN INDIA]

It is only three years next Wednesday since Gandhi was murdered. Yet, it is already long enough to see his achievement in perspective, for, already, like Queen Victoria, he has become more a symbol than a man. Politically, with the present elections the independent and democratic India, so much more his creation than anybody else's, has now finally become a fact. Morally, neither India nor its politicians can quite live up to the absolute standard Gandhi set for them. Socially, Gandhi is deeply missed. He was the greatest protestant reformer in Hindu history, and he died when his reformation was but begun. The reformation continues slowly and irreversibly; but its course has lost the remorseless certainty given it by the Mahatma's unwavering refusal to permit custom to sanctify evil.

Mr Gandhi in politics can be best compared to the Christian Radicals who have been so important in English history, to Gladstone, or Cripps. He had no respect for the temporal past. The pomp of Viceroys meant nothing to him. Riches he considered only as a trust for the poor. Yet he was no iconoclast, and class-war to him was sin. He never allowed political expediency to stand in the way of the ideas of truth, love, duty, and the worth of the individual human soul. He called off civil disobedience when the mob burnt the policemen in the Chauri Chaura station when Lenin would have hailed it as the herald of revolution. Because he thought in such simple, religious terms he made politics simple. He was a democrat and a nationalist because he believed that it was bad for men's self-respect, for the development of their souls, to be governed by others. Whether government by others was or was not better for them in any material sense was to him fundamentally irrelevant. For him it was simply wrong.

From this two consequences followed. He had to bring the people into politics, for it was their self-respect and their development with which he was concerned; and he was able to do this successfully because he alone was able to translate politics into the people's terms. For centuries the Indian villager has found his consolation and mainstay in religion, and Gandhi talked to him in religious terms. Before him Indian nationalist politicians had argued about Indianisation of the civil service, or seats in Assemblies. Gandhi talked of *Ahimsa* (non-violence) and *RamRajya* (the government of right) and truth. Gandhi conducted the world's biggest nationalist movement for thirty years, without the "Satanic Government" losing as many lives as have been lost in a few weeks in Suez, and without ever wavering from the position that the British should be loved, not hated. Gandhi made the people, the ordinary villager, the dominant factor in Indian politics. He also taught the other Indian classes to see India as he did, not as a land of civil servants and High Court lawyers, but as a country whose heart was in its 700,000 villages, and whose problems were to find food and clothing and occupation for the inhabitants of these villages. He was more interested in power for the village and its *panchayat* than in Assemblies. Since the villages, moreover, were deeply Indian, he insisted on the worth of Indian, as against Western, values, for he regarded the West's ways as too expensive for a poor country. His very Hindu insistence on the moral worth of poverty and renunciation and the overcoming of desire, however maddening it might be to those brought up to believe in raising the standard of living, restored self-respect to a people history had made poor, and who had been driven into a feeling of inferiority by the British claim that their material superiority was a sign of moral superiority.

Popular Interest in Politics

These attitudes of Gandhi's have become the very stuff of Indian politics. Independence was achieved before he died; and, despite the shock of partition, it was an independence without bitterness. That India stayed in the Commonwealth was as much a legacy of Gandhi as the result of Nehru's ability to decide without rancour. In the Constituent Assembly, despite some doubts, adult franchise for men and women alike went through with hardly a dissenting voice, and the electorate has now shown how thoroughly thirty years of Gandhi has interested it in politics by voting in its millions. Despite all the difficulties of communications, of organisation and of illiteracy, the percentage of voting in current Indian elections has been higher than in an average American presidential election. Mr Gandhi was, however, no economist as he showed when he forced decontrol in 1948. Handspinning was a wonderful political symbol; it was a poor remedy for under-employment in a country whose population increases by 4 million every year. Gandhian economics are, therefore, slowly being rejected almost as completely as Gandhian politics have been accepted. Not all the help of Congress governments has made an economic reality out of hand-spinning; and the draft five-year plan gives its priorities, not to cottage industries, but to electric power and high dams, irrigation and fertilisers.

In morality Mr Gandhi's particular contribution was his insistence that there could be only one code. What was right for the individual was right for the state. Violence was wrong and truth was right, therefore he himself did not want armed forces for India, though he never attempted to enforce his view, and for the ordinary evasions of diplomacy he had little patience. Here his success was as limited as that of all such reformers has always been. India keeps armed forces and, in an appropriate cause, has shown itself willing to use them. India argues about the crossing of the 38th parallel or the declaration of China as an aggressor in terms of expediency as well as of morals. It is influenced in its attitude to its friends, not only by the rightness of their

behaviour, but also, like the rest of us, by what is said about it. Yet, with all this something of the Gandhian aura still lingers. The Gandhian insistence—which again is a very Hindu insistence—that one must look for the truth in the other side's approach also is a major cause for the Indian reluctance to condemn Russia or, still more, China. Even with Pakistan, last year's Delhi Pact, when in Indian eyes there was a good reason for war, was as much a result of the Gandhian tradition as the release of the cash balances in 1947 was of Gandhi's direct pressure.

Above all, the public continues to set the high moral standard Gandhi first laid down. They still expect of their rulers his austerity, his simplicity, his self-sacrifice. Congressmen, however, are human, and office after years of pinching and jail-going is sweet. Relations have sometimes been given jobs, friends have sometimes been granted licences. Some Congressmen have taken money, more have misused their influence. Many however have been honest, and India is indeed as honestly governed as any country outside a few of the wealthiest countries of the West. But Gandhi set a higher standard and it is by that high standard that Congress is judged. Many individual defeats, and much of the Congress loss of votes in general, is due to a corruption which, in many other Asian countries would be regarded as too mild to notice.

Hinduism on a New Road

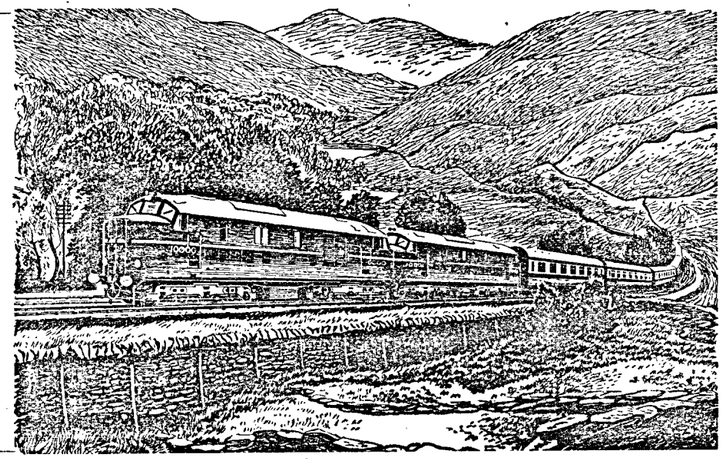
Gandhi's greatest work was in the sphere of applied religion. He found a Hinduism overlaid with superstition, split by caste into innumerable divisions, clinging to institutions many of which were in origin either abuse or a defence—a withdrawing into one's shell—against Islam. None of this would Gandhi accept. From the time when, at the age of 12, he refused to believe that it was wrong for the sweeper to enter the house, he accepted caste less and less until he came to insist on common kitchens in his *ashrams*, to marry his son to a Brahmin's daughter, and to live in Delhi only in the untouchable quarters. So, too, by accepting women disciples equally with men, he broke the tradition by which higher matters were reserved for men. Gandhi took Hinduism back to its essentials. He himself was a Karma Yogi—one whose approach to God was through works—and he insisted that what mattered for everybody was the approach to God, the search for truth. He said that there are many ways to God when questioned about his affection for Muslims. In a country where religion had all too often descended into caste observance and the ritual of the family ceremonies, this was a revolution, or rather a renaissance far more important than anything he did politically. Gandhi died with his work unfinished. The Hindu Code Bill might not have lagged as it did, had he been alive. But the main part of his task has been done just the same. He has set Hinduism in a new road, and, though with more side-stepping than in his lifetime, on that new road it will proceed.

Roman Crime and Punishment

[FROM OUR ROME CORRESPONDENT]

A TENDER spot in the Italian conscience was touched on January 19th when the Roman police came under suspicion of using extremely shady methods to obtain a confession from an accused man. A great part of the evidence on which a rather feckless slum dweller from a lamentable Roman suburb seemed to be on the point of receiving a life sentence for a sexual murder was suddenly shown to have been a confession extorted from the accused man by terrorism and bluff in such circumstances that his subsequent retraction of it became—in the view of the man in the street—both plausible and credible. On the following day the court gave a verdict of "acquittal for insufficiency of proof," corresponding to the Scottish "not proven." Both sides are to appeal: the Public Prosecutor against the acquittal, and the defence against the "not proven" formula, which leaves the acquitted man under suspicion. The announcement of the verdict filled the Roman squares with excited crowds as in times of high political tension. Every major organ of the Italian press the following morning addressed itself in solemn tones to the heads of the police force and the Minister of the Interior.

Of the case, it suffices to say that the man in question was arrested nearly two years ago and was then liberated. Rearrested, he made a confession and then denied his confession. He was also discovered communicating from the gaol with his wife to obtain the services of witnesses to testify to an alibi. Leaving aside the confession and the attempts to obtain the alibi, the court heard, from the prosecution and the defence, two alternative interpretations of the circumstantial evidence which were as nicely balanced in their probability as the alternatives weighed by the judge Porphyry in "Crime and Punishment." The confession and the incriminating letters seemed to hold the balance. The defence had made allegations of torture, and a nasty taste had been left by their revelation that two cell companions of the accused, to whom he had committed the incriminating messages to his wife, were police informers. On the eve of the final statement by the Public Prosecutor the presiding judge received a letter from these two cell companions. They declared that their consciences forced them to speak. On behalf of the police, they said, they had terrified the prisoner with tales of torture (one of them had even been painted up and bandaged by the police to simulate severe injuries) and he had penned his confession on their advice that this would be the only way to escape the torture chamber (he had already been beaten once). He obtained their promise to come into court and support him when he retracted—as he did very shortly after. They had also encouraged him to frame up an alibi. He had always, they said, maintained to them his total innocence of the crime.



Allegations against police

With this letter in the court's hands two alternative views were again possible. One was that the contents of the letter were true, in which case it seemed likely that much else that had been alleged about police behaviour was also true, while the unsavoury character of certain undisputed police actions thereby became far more sinister. Or, alternatively, the writers of the letter, paid informers of the police, had been bought at a higher price by the defence. In the light of the full-blooded anti-police campaign being conducted by the Communist press in their reporting of this and other current trials, the notion of a political plot by the extreme Left crossed some people's minds. Meanwhile, however, public opinion in the suburb, and by infection in Rome as a whole, had turned fiercely in favour of the man whose blood had been demanded two years earlier. A different verdict than that of acquittal might have had strange consequences.

When Mussolini fell from power in July, 1943, one of the first cares of Marshal Badoglio in his "forty-five days" of comparatively unchallenged tenure of office was to shape the complex Italian police system to his ends. Mussolini in 1922 did the same when he disbanded Nitti's unpopular *Guardia Regia* and sorted out the various police corps in a new fashion. Since 1943, the *Pubblica Sicurezza,* which was in Mussolini's day a civilian and, except in Rome, un-uniformed body, has in the main received uniforms and military status. Its numbers now approach, or perhaps surpass, eighty thousand. Naturally the criminal investigation section goes about its business in civilian dress. *Pubblica Sicurezza* has absorbed such elements of Mussolini's African police as could pass through some sort of political vetting, and also the special Rome corps of *Metropolitani,* whose

WHEN IT'S A QUESTION OF TIME...

It is only natural that, if there are fast and slow clocks about the premises, workers will tend to arrive by the slowest and leave by the fastest. Industry loses many millions of productive minutes every year through this time leakage alone. There is a simple answer. Accurate time must be clearly shown and sounded throughout the premises. T.R. Time Control does this, and much more, to eliminate time waste in industry and implant a wholesome sense of time values in the minds of everyone concerned. Spend a profitable moment now to write for full particulars.

urban duties are now performed, as in other cities, by municipal police. Quite recently a recruitment drive was in course for an additional 15,000 members.

To the public, in the ordinary course of life, the PS men are most vividly known in the guise of the *Celere*—jeep-riding, crash-helmeted, tommy-gun-bearing flying columns which of a sudden, when their patience has been tried beyond endurance (and even London policemen could scarcely stand Italian Communist baiting), charge across pavements and roar down thoroughfares clubbing in all directions, not always distinguishing between a Communist riot and—as happened in one case—a knot of sporting journalists waiting for a bicycle race. The *Celere* are especially identified in the public mind with their virtual creator, the Minister of the Interior, Mario Scelba. This intrepid Minister's success in restoring tolerable order in the streets between 1947 and 1949 has blunted much of the criticism and anger roused (not only on the extreme Left) by some of the exploits of the *Celere*, in whose ranks it is usual to say that the tougher Fascists have found a new spiritual and bodily home. The unpopularity of the *Celere*, like that of the former *Guardia Regia*, is perhaps not unwelcome to Italy's other and more picturesque and dignified police force, the never properly Fascistised, cocked-hatted *Carabinieri*. These answer both to the Ministry of the Interior and to the Ministry of Defence, have almost exclusive charge of country districts and, while generally respected, are in some loyal quarters feared for their monarchist sentiments.

It is now being said that not only do the toughest Fascists set the tone of the *Celere*, but that revelations like those made in this month's great trial show that the criminal investigation police are deeply imbued with Fascist methodology. It is suspected that in trials like this they work to the order, "There must be a conviction in the interests of prestige." Public opinion is now deeply stirred, and the effects may be healthy.

Northern Waters in Dispute

REPERCUSSIONS extending from the Baltic to Greenland are likely to follow the International Court's recent ruling on the Anglo-Norwegian fisheries dispute. Russia, Poland, Denmark and Sweden are involved; and both Britain and Norway, despite the settlement of their mutual differences, may face new problems as other nations take up the lead given by the Court.

The judgment delivered at The Hague on December 18th was the first ever given by an authority of such eminence on the general question of territorial waters. It was essentially a negative decision. The judges declared that the method of defining fishing zones adopted by Norway in 1935 was "not contrary to international law." This amounted to a clear recognition from a high source that no system of defining territorial waters could be regarded as universally binding. A serious blow was thus dealt to the hopes of those nations, including Britain, which have long pressed for the general recognition of a system based on a fixed distance from the low-water mark. It has never been suggested that such a system should be wholly inflexible; allowances have always been made for fjords, narrow bays, straits and other abnormal coastal features, and Britain and other countries which only claim a three mile limit have not questioned the Scandinavians' right to a limit based on their traditional four-mile league. But in an age which is seeing new sovereign states created in swift succession there is a strong case for the reinforcing of a simple principle like that of the three or four mile limit; and in an age of economic nationalism there are obvious dangers in the Court's belief that "economic interests peculiar to a region" should be taken into consideration when the validity of a definition of territorial waters is in question.

Indirectly, the Soviet Union is a beneficiary of the Court. Before the war, Swedish and Danish fishermen regularly caught salmon off the coast of Latvia, Lithuania and East Prussia, outside the three and four mile limits claimed by the Baltic and German governments. After the war the Swedes and Danes returned to their former fishing grounds in this area; but in 1948, without any warning, the Russians began to arrest the fishermen and to seize their catches and equipment. A series of Notes were exchanged; the Russians justified their action by citing a decree of 1927 applying a twelve-mile limit to all Soviet territorial waters, while the Swedes and Danes pointed out that in 1927 the south-eastern shore of the Baltic was not Soviet territory, and that the new Russian action drastically altered the long-established position in the Baltic. Denmark alone has been estimated to be losing a million kroner a year because of the Soviet action. Last July Sweden and Denmark jointly suggested that the matter be referred to the International Court, but the Russians refused the invitation, declaring that they were free to define their waters as they chose. Swedes now feel that the Court's decision in the Anglo-Norwegian dispute has strengthened the Soviet case. Moreover, Poland has recently warned Sweden and Denmark that "illegal" fishing in Polish waters will be severely punished. As yet the Poles have not defined their claims clearly enough to reassure Swedish fishermen, who fear that they may, like the Russians, insist on a twelve mile limit.

Competition for Shrimps

Indeed, the Court's ruling looks like creating problems for Sweden on all sides. Fishermen from ports on Sweden's western coast have long frequented the Oslo fjord, which is particularly rich in shrimps. The Norwegians themselves also fish in these waters, and after the war they found that the Swedes, whose ships and equipment had been modernised while Norway stagnated under German occupation, were getting the lion's share of the catches. A temporary agreement on Swedish rights in the fjord was reached a year ago; but it will expire at the end of 1955, and Norway may then cite the International Court's ruling as justification for excluding the Swedes altogether.

Norway, in turn, may suffer if Iceland extends its claims to territorial waters as a result of the Court's decision. This possibility, about which fears have already been expressed in British fishing circles, could have serious consequences for both British and Scandinavian fishermen; for the elusive herring is apt to move in very close to the northern coast of Iceland, which are deeply indented and where, if the Norwegian example is adopted, extensive areas would be closed to foreign fishermen. Much the same applies to the Greenland cod fisheries. Although Greenland is Danish territory, its own national council has recently been demanding that not only foreigners, but Danish and Faeroese fishermen, should be kept at bay in the interests of the local inhabitants.

Theoretically, in fact, there is no limit to the possible repercussions of the International Court's ruling. Like Mr Truman's proclamation in 1945, which reserved to the United States all mineral rights on the submerged "continental shelf" off its shores, the Anglo-Norwegian decision is likely to be cited as a precedent on the other side of the world. Indeed, the two precedents are already linked. Immediately after the Court's ruling, Peruvian fishing interests launched a wave of complaints against the activity of American tuna fishermen off the coast of Peru; although the Americans are operating well outside territorial waters, it is claimed that they are infringing a decree of 1947 which, in imitation of Mr Truman, reserved to Peru jurisdiction over waters extending 200 miles from the coast. The Truman proclamation has already had an important effect on the exploitation of oil in the Persian Gulf. The decision in the Anglo-Norwegian dispute may have started a chain reaction which will affect such distant fishing nations as Japan.

THE BUSINESS WORLD

Saving the Sterling Area

DR JOHNSON observed that nothing so concentrates a man's mind as the knowledge that he is to be hanged in a fortnight. Something of this mood seems to have stirred the conference of Commonwealth Finance Ministers that ended last Monday. Certainly, it is a mortal crisis that now confronts the sterling area; if it is to be saved, something more than emergency stop-gap operations of the 1947 and 1949 kind are needed. Danger has clearly been the dominant motif and propellant of the conference, and the response of the Finance Ministers to it has been more realistic and vigorous than at any previous conference of this kind. The meetings have certainly been successful—within the limitations of authority and executive power by which such conferences are inevitably bound.

But it will take more than last Monday's communiqué, despite all its resounding words, to overcome the perils that now stalk the sterling area. Agreement may have been reached about the character of the measures that should be taken to protect and rebuild the gold and dollar reserves of the sterling area and to end the chronic deficits that most of the leading members of the club have been prodigally running in their overseas payments accounts. It remains for the separate and autonomous countries represented at the conference to translate these general heads of agreement into action and it is not yet clear that their endowment of political courage and economic wisdom is sufficient for these grim tasks. The sterling area can survive on two conditions only.

First, all of its members must act immediately to get rid of policies that lead persistently towards insolvency; in short, they must live within their means. Secondly, the rest of the world must be convinced that sterling can, in time, be restored as a strong and convertible currency, no longer prone to recurrent crises whenever the trade winds that blow from America happen to change by a few points. To be of any use, assurances about these two aims must be couched, not in general and ultimate terms, but in ways that promise that the two conditions can be realised in good time.

Monday's communiqué had the particular virtue—refreshing after previous exercises in crises and expedients—of encompassing this wider vision, and of asserting most, though not all, of the steps in economic policy that will be required to achieve it. It is, indeed, true that the lasting solution of the sterling area's problem will be found only

> when the worldwide trade of the sterling area is on a substantially higher level than at present, when sterling is freely convertible into all the main currencies of the world and its position need no longer be supported by restrictions of imports.

Such gazing at the distant hills has been unknown since 1945, when promises to make sterling convertible bore little relation to the harsh realities of the immediate post-war situation. Whether these latest references to the convertibility of sterling carry any greater realism depends entirely on the measures to be taken following the conference.

These measures fall into two broad parts—the immediate emergency steps by which it is hoped to bring the sterling area as a whole into early balance with the rest of the world and the more fundamental measures that may lead to the goal of convertibility. Evidently, cuts in imports and other forms of overseas expenditure form the main part of the short-term emergency programme. It may indeed be questioned whether cuts of this kind, even if imposed with the most rigorous severity, would be enough to quench the pernicious deficit of the sterling area as a whole; and on such a scale they would bring in their train reductions in output and in exports for many members of the sterling area that would make their predicament worse. Indeed, the Finance Ministers themselves point out that the bridging of the gap "cannot be attained by negative and restrictive methods alone or merely by the imposition of cuts on imports from certain parts of the world." Yet, apart from import cuts, there is little that can be done to achieve the short-term objective of the Finance Ministers' "that the sterling area as a whole should be in balance with the rest of the world at latest in respect of the second half of 1952." The communiqué urges that this should include at least a balance with the dollar area within the same period.

★

The gap that has immediately to be bridged was running at the rate of about $3,500 million a year in the fourth quarter of 1951. It promises over the next few months to be appreciably reduced by the import cuts already prescribed by the United Kingdom but even allowing for these and for the fact that the December quarter included a full year's payment on the dollar loan it is evident that further substantial cuts, particularly in dollar imports and other overseas expenditure, will have to be sought by the United Kingdom and the other sterling area countries. The cuts that are to be put into effect in Britain are due to be announced by the Chancellor of the Exchequer soon after Parliament reassembles. The Dominions represented at the talks will consider similar measures, while proposals to the same end of achieving equilibrium on the balances of payments in the second half of 1952 will also be recommended by the Secretary of State for the Colonies to the governments of the territories with which he is concerned.

The other source from which immediate relief to the sterling area's balance of payments deficit may be secured is external borrowing. This question seems to have played a considerable part in the discussions of the Finance Ministers. The communiqué refers to it in connection with the need to develop the productive power of countries in the sterling area; "such development will require the investment of substantial financial resources and that it will be necessary for many member countries to obtain those resources from overseas." This passage appears to have only one connotation—a renewed drive on the part of sterling area countries to secure long-term loans in the United States market. The Finance Ministers agreed that "such investment is to be welcomed and that all necessary steps should be taken to encourage it."

★

When the communiqué sets out the methods by which member countries will overcome the deficit of the sterling area as a whole, it does not give first place to cuts in imports, but rather to steps "to ensure that the internal economy is sound and that all possible measures are taken to combat inflation." This is certainly to put the fundamental things first, but it will take time for the medicine to work. In Britain the patient has barely absorbed the first dose, and it is still not clear whether the whole course will be sufficiently strong. In Australia, the prescription has not yet been taken to the chemist. In parts of the Colonial Empire, where inflation is imported rather than home made, the doctor has not been summoned. The communiqué is not unequivocal in demanding the use of monetary weapons to combat inflation; and if it were, it would be expecting a lot to suppose that a disinflationary policy could restore equilibrium in the sterling area's balance of payments by the end of the year. It is a remedy that will take a longer time than this to produce its results. The second item in the list of short-term remedies is to increase exports and earning power. This again is an admirable intention, but it will take time to yield results in any way commensurate with the gap that has to be filled. Welcome relief to the sterling area's balance of payments should, however, be provided by the resumption of tin purchases by the United States following the Truman-Churchill agreement. It is only after these two proposals of disinflation and larger exports have been mentioned that the communiqué refers to the possibility of borrowing from outside the sterling area and "finally" to import cuts. The cuts may come at the bottom of the list but, to the extent that they are possible, they will have to accomplish most of the immediate work.

Assuming that a balance can be reached, the Commonwealth Finance Ministers visualise in their communiqué a period of "some years" during which the sterling area would gradually build up its financial strength and prepare for the ultimate goal of convertibility of sterling. During this period a policy of disinflation, a gradual building up of exports and the development of the latent productive resources of the Commonwealth should make themselves felt. During this period, it is emphasised, the sterling area will need to be in surplus with the rest of the world (including a surplus with the dollar area) and, after taking account of the inflow of long-term capital from abroad, all member countries should balance their external accounts. This should allow the steady strengthening of the gold reserves and prepare the way for the achievement of convertibility. The Finance Ministers do not hedge their references to this ultimate objective with any of the habitual reservations on this topic in recent years. They speak of their intention "to make sterling convertible and to keep it so . . . to work towards that goal by progressive steps aimed at creating the conditions under which convertibility can be reached and maintained." This goal cannot be completely realised without the active co-operation of other countries, "notably those countries which are consistently in surplus with the rest of the world," which means primarily the dollar countries. Nevertheless, self-reliance is the keynote: "It is primarily the responsibility of the members of the sterling area themselves to create the conditions under which convertibility can be reached and maintained." This matter is not to be left as a vague aspiration; an immediate investigation of the steps that should be taken along the road to convertibility has been arranged.

★

These references to convertibility may appear strangely brave and confident when the sterling area's reserves have been denuded to a level that would cover only a few months' expenditure at the recent rate. It may be argued, however, that it is only the very rich or the very poor who can contemplate convertibility of their currencies—the first because they can afford to do so, the second because they must if they are not to become poorer still. But apart from this compulsion of poverty it is surely right that the promise of convertibility should be unmistakably attached to sterling. It is only on this condition that sterling will become a stable currency, capable of playing its full part in world-wide trade, and contributing its proper share to the development of the world's economic resources. There may be considerable differences of opinion about the time that will be needed to reach this objective; but there can be no doubt at all that if convertibility is a will-o'-the-wisp, eternally eluding Britain's grasp, the days of the sterling area are numbered. If the measures now to be set in train give real promise that the objective of convertibility can be reached, there will be abundant justification for the Chancellor of the Exchequer's claim at the end of the conference that "we have given the sterling area a new lease of life." This week has produced its full quota of brave words. Now the time has arrived for really brave action—a joint and several operation by all members of the sterling area to save and fortify their money.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

London, S.W.1

Bankers in the Front Line

THE change in the supreme command and its prompt swing towards monetary policy has had the effect of putting the banks, with their battalions of branch managers and advances' controllers, right into the front line of the battle against inflation. What the commanders in the field think about the new policy, and what they are prepared to say about the way in which it has been applied so far, may therefore supply significant indications about its working in future. This changing rôle of the banks makes the latest of the annual series of chairmen's statements of more than usual interest. As in the past, their comments range widely over the whole course of the battle and its underlying strategy; but it is upon that part of the line in which they are now directly engaged that their views most deserve scrutiny. They merit study from four points of view. Do the bankers approve of the change of policy? To what lengths do they think it will (or should) be pushed? How will the rediscovered weapons work? Would any different deployment of them be likely to yield better results?

To the first of these questions the bankers give a clear answer. They all do approve. Lest anyone should still suppose this attitude to be rooted in narrow self-interest, it should be noted in passing that most of them specifically reaffirm the rebuttal (given by Lord Linlithgow just before his untimely death, and discussed in *The Economist* of December 29th) of the charge that the change of policy would put "millions of pounds" into the pockets of bank shareholders. They point out that the prospective addition to their net earnings from interest receipts and payments that may accrue over a full year, and will be secured partly because of a loss of liquidity, is much less than the "book" loss already experienced on investments. The new offensive against inflation must be painful; and inevitably those in the front line have suffered first, and to the extent of "tens of millions of depreciation, as Lord Balfour of Burleigh (of Lloyds Bank) candidly admitted. It might have been added that as the mass battalions of consumers and business men come within the range of fire, part of the shock they feel will also rebound on to the banks, in a rising incidence of bad debts.

This makes the general approval of the bankers the more significant. In the twenty years that have passed since an orthodox monetary discipline was last practised, and especially in these postwar years of heterodoxy, many people in the City had forgotten the classical principles of free markets on which its tradition was built, while others had come to assume that orthodox monetary technique could not be used without exerting unduly violent effects. Many people in the City who a few months ago would have opposed a return to orthodox discipline have lately been shifting their ground, while nearly everyone now perceives that even a moderate policy (which the present policy certainly is) can play a valuable part.

There are still, however, some clear traces of these earlier divergences of views among the bankers. Some of them greet the new measures with eager enthusiasm —especially Lord Balfour, who regards them as "precisely" what was needed and as affording the "first real hope of escape from the inflationary quagmire in which we have been floundering." Similarly, Lord Aldenham, of the Westminster Bank, describes bank rate as an "essential part of the mechanism of credit control" that has "for too long remained idle," and regards the psychological force of any increase in it as more important than the amount of the rise. Lord Selborne, the new chairman of the National Provincial Bank, makes the same point: the new measures gave warning that "a new era had begun," or, as Mr Tuke (of Barclays) put it last week, the "direction of the wind has changed." By comparison with the most enthusiastic comments, Lord Linlithgow's posthumously circulated statement to shareholders of the Midland Bank is more restrained. To find approval here it is necessary to look closely; the new measures may "deflect some of the less urgent demands upon the nation's productive capacity" and "there is sound reasoning in the attempt to bring about the removal of the inflationary element of demand."

To the second question—how far the new policy may need to go—none of the bankers attempts a definite answer. Nor, indeed, was it likely that they would do so, given the present uncertainty about the degree of toughness with which the Government will frame its non-monetary measures, and especially its retrenchment in public expenditure. All the bankers emphasise the need for firm cutting here, and several of them—notably Lord Selborne, as well as Sir Thomas Barlow of the District Bank—make the point more specifically, by observing that it would be wrong to have a "system of tight credit and high rates for industry and laxity in expenditure and cheap money for public undertakings." On the other aspect of the same question—how far the policy ought to go—there are some notable differences of emphasis. No intelligent person ought to suppose that there is any intention of pursuing drastic deflation leading to mass unemployment; but in view of the widespread misunderstanding among the public about the nature of orthodox monetary discipline, it is natural that all the bankers should now be at pains to explain that the purpose is, in effect, simply to cure the maldistribution of resources and loss of efficiency that have resulted from overfull employment. Upon the general

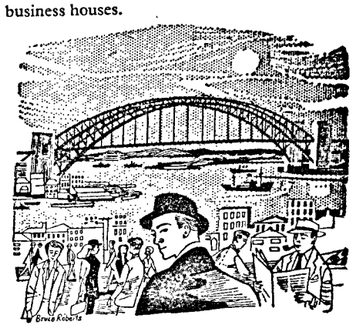
STRENGTH AND INTEGRITY

Friendly contact with each customer is synonymous with the banking house of Glyn, Mills & Co. No matter whether it is a private customer or a large concern, this bank still preserves the personal touch. It also provides a completely modern banking service, one that has earned a reputation for strength and integrity throughout the world.

GLYN, MILLS & CO.
BANKERS
HEAD OFFICE: 67 LOMBARD STREET, LONDON, E.C.3
Associated Banks:
Royal Bank of Scotland, Williams Deacon's Bank Ltd.

INDUSTRIAL AND COMMERCIAL
I.C.F.C.
FINANCE CORPORATION LTD.

Established by the Joint-Stock Banks in 1945 to provide finance by means of loans or the subscription of loan or share capital or otherwise for industrial and commercial enterprises in Great Britain particularly in cases where the existing facilities provided by banking institutions and the Stock Exchanges are not readily or easily available.



DIRECTORS:

Customers of yours?

The busy streets of any Australian city show a cross-section of Australian people who are engaged in a large variety of occupations and equally as varied and numerous are their requirements as consumers—a situation weighted with possibilities for British business houses... But a sound principle when framing any Australian marketing scheme is to precede planning by consultation with the Commonwealth Bank of Australia. For the Commonwealth Bank *knows* Australia. Its intricate network of branches throughout Australia provides a large source of information on any question of Australian life or industry. Its Financial Information Service is at the disposal of all British business houses.

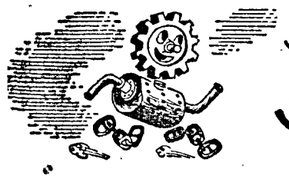
Hold on to SCRAP



and you hold up STEEL PRODUCTION

Search out every ton of scrap in your works and turn it in. Old plant, redundant buildings, machines and spares—it's all wanted back in the steelworks to keep up steel production. Round it up and put it in the hands of your local scrap merchant. It will go to make the new steel that you and every other steel user need so urgently.

Scrap merchants are glad to help with dismantling and collection.

WHEREVER YOUR NEW STEEL comes from, please return your scrap to merchants in your own locality. That will save unnecessary transport, and time, before the old scrap is turned into the new steel all steel users want.

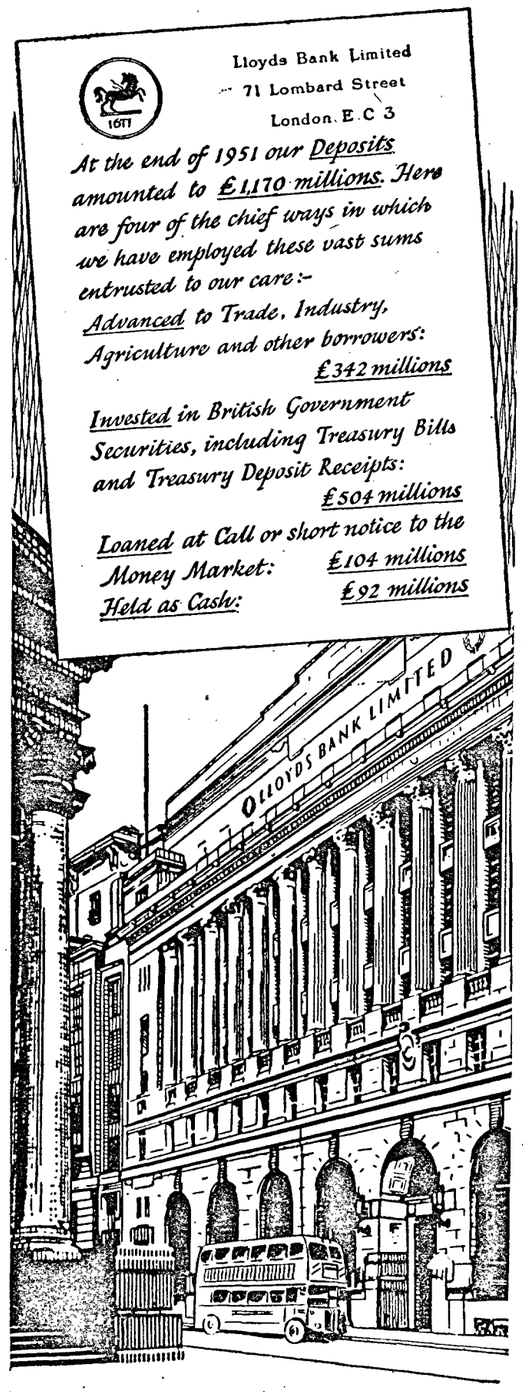
An Account of Stewardship

Lloyds Bank Limited
71 Lombard Street
London, E.C.3



At the end of 1951 our Deposits amounted to £1,170 millions. Here are four of the chief ways in which we have employed these vast sums entrusted to our care:-

Advanced to Trade, Industry, Agriculture and other borrowers: £342 millions

Invested in British Government Securities, including Treasury Bills and Treasury Deposit Receipts: £504 millions

Loaned at Call or short notice to the Money Market: £104 millions

Held as Cash: £92 millions

proposition the bankers are of course in full agreement; but the differing weight with which the point is made shows very clearly that some of them believe a considerable toughness will have to be shown by the Government before economic stability is restored, whereas others would favour a more timid approach.

In discussing issues of this kind in the context of monetary policy, the bankers are obviously troubled by conflicting considerations. They are concerned to demonstrate, quite rightly, that a move towards techniques that have not been seen for twenty years, or at least since the outbreak of war, does not open up a terrifying vista of business depression and social distress. They are equally concerned to play their part fully and loyally in the new policy, which means that they must reiterate the warning, given in concert two months ago, that all demands for advances will be rigorously scrutinised, that credit will become steadily scarcer and more expensive, and that the process of restraint will cause pain to many. Thirdly, they are all most anxious to apologise beforehand to their customers for the affronts that are to come, and to explain that although "credit-worthy" applicants may be shown the door (most politely, of course) in the months ahead, the banks will be most happy to welcome them in more propitious times. Such is the length to which forgetfulness about first principles of orthodoxy has gone; in former times the only test of credit-worthiness was ability to command credit. If a banker could not "afford" to lend to a particular customer because the proposition, however "worthy," was less attractive than the marginal one that just secured assent, there was no more to be said.

*

On the way in which the new weapons will work, the most important comments relate to the liquidity weapon and the effect of the funding operation. As the first table shows, the average ratio of the banks' cash, call money and bills to their deposits was 33.2 per cent at end-December, or slightly higher than that for November, in contrast with 39 per cent just before the new policy was launched. Although the ratio thus still stands a little above the level generally regarded as the conventional working basis in former times, several of the banks make it plain that the reduction is already exerting a strong influence on their lending policies. The Midland Bank, while drawing attention to factors that might tend to improve the ratio during the course of this year, remarks that the "scope for enlargement of advances has been abruptly narrowed" and considers that the banks may have to restrain further advances "severely." Lord Aldenham, similarly, speaks of the funding issue as having brought about a "severe curtailment" of the banks' capacity to make additional loans. Other bankers put the point less strongly, but the general impression given is that liquidity has now become a real factor in day-to-day calculations.

THE DECLINE IN LIQUIDITY
(Per Cent)

	Liquid Assets*			Advances and Investments*

*

The one surprising aspect of the statements is that, despite their differences in emphasis in approving the policy, none of them makes any criticism of its application in detail. Several of the banks draw attention to the difficulty of their task in imposing the requisite degree of restraint, but they say nothing about the evident conflict that must arise between a policy that applies orthodox pressures and "directives" simultaneously. The only point made in this context is that, if priority has to be given to "essential" borrowers, the restraint upon "non-essential" borrowers will have to be even greater than orthodox pressure would alone have required—which means, of course, that some who secure credit will be less "worthy" in the strict banking sense than some who are refused. It might have been expected that at least the more enthusiastic supporters of the move towards orthodoxy would have voiced a little surprise that the Chancellor should have resorted to directives to the Capital Issues Committee and the banks long before the new measures had been given a chance to show their worth—and should have decided, moreover, to impose an even more bureaucratic control than any operated by Labour Chancellors. Remarkably, too, none of the banks considers the question of the relationship of charges for advances to bank rate and money rates; nor is there any discussion of the relative importance of the interest-rate weapon and the liquidity weapon in restraining advances. These omissions suggest that the bankers are re-learning the mechanics of orthodoxy much more quickly than they are re-learning the principles.

There is, however, one highly important exposition of principle and one that is plainly in line with criticisms of this kind. It comes from Lord Balfour, who makes very clear the vital distinction between physical controls and monetary restraints.

> When the curb on spending comes from the fact that each of us, individually, is forced to economise, the decisions are taken by the person who in each case is most closely affected and has most knowledge of the relevant facts, including his own circumstances and preferences. The classification of objects of expenditure into "essentials" and "inessentials" may be convenient administratively but it is none the less purely arbitrary; beyond a certain point these are question-begging terms.

This decentralisation of economic judgments, Lord Balfour concludes, makes a properly working monetary system "infinitely more efficient and even more democratic than rationing and controls." Hardly anyone would now contend that the instruments and automatic regulators of a free economy should—or could—be allowed to work entirely without other aids. But Lord Balfour hits his target dead-centre when he remarks that "we seem to have forgotten the rule and remember only the exceptions." The Chancellor and the many City institutions who have a part to play in carrying out his policies would do well to ensure that the rule comes first.

Business Notes

The Metals Deal

So much information about the metals deal in Washington had already become available that the detailed communiqué issued at the end of last week had little to add except the precise quantities concerned. Britain is to receive 800,000 long tons of steel and 200,000 long tons of pig iron and scrap from America during 1952, at current American prices. America is to borrow (not to buy, as was suggested in *The Economist* last week) 15,000 metric tons of aluminium out of the supplies guaranteed to Britain under its long-term contract with the Aluminium Company of Canada; this will be delivered during the last three-quarters of 1952, and is to be replaced before the end of June, 1953. America is to receive from the British Government 20,000 long tons of tin by the end of 1952, at $1.18 a lb f.o.b. Penang, Singapore, London or Liverpool, subject to certain conditions concerning the price. The official agreement on steel supplies allows for an additional 750,000 long tons of iron ore, "to be made available by the United States steel industry to the United Kingdom."

In terms of steel, the agreement is highly satisfactory to Britain, though no more should be read into it than appears. The Americans accepted British requirements as 1,250,000 tons, and are to supply a million tons in metal. The 750,000 tons of ore "to be made available," presumably Swedish and African, would have an iron content of perhaps 55 per cent, compared with an iron content of possibly under 25 per cent in the leanest British ores that the blast furnaces might otherwise have to use. After allowing for a further minor adjustment for other advantages in blast-furnace operation, this quantity of foreign ore would therefore yield an additional 250,000 tons of "iron content" to cover Britain's whole needs. But the promise "to make available" may simply mean that American buyers will stand aside in the Swedish and African markets and reduce their bids by this amount; it cannot automatically be assumed that British buyers will be able to secure all that the Americans are willing to relinquish. In Sweden, for example, Britain has already had to make a firm promise to supply three times as much British coal as last year in return for the same amount of Swedish ore; if similar conditions were attached to this additional potential tonnage of ore, they might not be easy to fulfil. The American steel (which includes the 100,000 tons already allotted to Britain in the first quarter of 1952 under the original steel-aluminium deal in November) will arrive mainly in the second half of the year. Its contribution towards easing the steel shortage, as was expected, will therefore not really be felt until the third period of steel allocation. A "wild estimate" of the price was reported as $125 million; the steel will be mainly high-priced ingots or sheet.

*

If Britain receives the quantity of aluminium contracted for, there should be no great difficulty in lending this extra 15,000 metric tons to America until 1953, when it is due to receive back also the 10,000 tons it lent in November. The Aluminium Company of Canada is expected to supply Britain with 250,000 tons this year, under the agreement that guarantees Britain a million tons during the next four years; should deliveries fall below the contract, as happened last year, Britain may reduce the quantity of its loan to America. American reluctance last year to conclude a similar long-term agreement with Alcan—on the grounds that its own producers will be supplying ample quantities of aluminium from 1953 onwards—has thus provided a useful bargaining counter in securing Britain the steel it needs.

Optimism in the Tin Market

The tin market has been in a bullish mood since the announcement of the Anglo-American deal and prices have moved steadily upward to reach £979 a ton. This optimistic tone springs partly from the plain fact that most of the 20,000 long tons that this country will sell to the United States will have to be bought in the market and will be additional to British needs. But, more important, the deal is seen as a "face saver" to cover the ending of the American boycott.

In terms of profit and loss, the deal is not the best of bargains for this country; that, no doubt, is part of the price for a million tons of steel. By agreeing to sell tin to the American Government at 1 dollar 18 cents a lb (£944 a ton) the United Kingdom faces a loss at current prices on every ton that it buys for the Americans. And if tin follows the upward drift of commodity prices, the loss may mount in future months. But there are two clauses in the agreement that do something to safeguard the British position. In the first place, if the United States pays a higher price for tin from any other country, it will have to offer the same terms to the United Kingdom. Thus it will not be possible for the Americans to pay more for Bolivian tin on the grounds that Bolivian costs of production are higher. Secondly, if the United States buys tin independently at less than 1 dollar 18 cents and Britain is making a loss in buying for the United States at 1 dollar 18 cents, the difference will be refunded to this country to offset the loss.

In some quarters it has been asked why, if America needs the tin, it could not buy for itself in the open market. The British Government is therefore being accused of sacrificing the principle of a free tin market, so dear to the Malayan producer, in agreeing to sell at a fixed price. Facts so far available do not lend much support to this view. On the contrary, it seems likely that the agreement covers a complete *volte face* in American policy. Only a few weeks ago, when Mr Symington was still head of the Reconstruction Finance Corporation, the American administration still professed to be carrying on a price crusade to force tin to £896 per ton. Now it seems that shortage has forced these pious hopes to be abandoned. In Washington last week, Mr Fleischmann, the Defence Production Administrator, announced the American Government's intention to resume the buying of tin in Indonesia and Bolivia. The 20,000 tons that Britain is to supply this year will, in fact, be about sufficient to tide the Americans over only on the assumption that normal buying is resumed from all other sources. This implies the need for some action to give meaning to the rather vague statement that "both Governments agreed that it would be desirable if more normal arrangements for the conduct of the tin trade could be established as soon as possible."

* * *

Persuasion for Labour?

Shortly after Parliament re-assembles next week, Sir Walter Monckton, the Minister of Labour, is expected to announce "new measures" to influence the movement of labour towards defence production and other essential industries, and this week these measures were approved by the National Joint Advisory Council for Industry. The Minister does not appear likely to go beyond those measures that have been discussed for months—making it compulsory for employers to notify vacancies and engage labour only through employment exchanges, and encouraging more rapid training of new or unskilled labour.

It is easy to understand that any more onerous control over labour would be almost impossible for any government to impose today; direction is not justified and would not work efficiently. But unless the Minister has managed to redesign the control of engagements in some way that will transform its efficiency, the measures so far hinted at seem unlikely to help much. The efficacy of such measures depends upon the model worker who always takes the advice of the clerk at the Labour Exchange in finding himself a job; unfortunately or fortunately, British citizens tend to depart from that passive model. The Government would do better to rely upon a really disinflationary policy in squeezing workers out of the less essential industries; with well-paid jobs in defence production and other essential industry awaiting them, these workers may prove less immobile than they have appeared in recent years.

* * *

Foreign Exchange Activity

A further extension of the field of freedom in which the London foreign exchange market can operate was conceded this week when the British authorised banks were given permission to undertake exchange operations in Belgian francs with banks in the Belgian monetary area. Previously freedom to deal in Belgian francs in London was restricted to operations between banks in this country. Since it was impossible to arbitrage direct with Brussels and since the Belgian franc was in continuous demand in London, an appreciable divergence persisted between the Belgian franc rate as quoted in London and the sterling rate as quoted in Brussels. From this week, however, authorised dealers have been allowed to carry out bilateral arbitrage with Brussels and the two rates have come into equilibrium. The concession applies to spot and forward transactions. The opening of free arbitrage facilities between London and Brussels was immediately followed by a depreciation of the Belgian franc in London. It had previously been held at the Bank of England's official selling rate of 139 francs to the £. The rate has moved to 139⅞—140⅛. As a result of the arbitrage facilities a more active market and a narrower range of dealing prices have obtained.

The other main event of the foreign exchange market during the past week has been the persistent strength of the Canadian dollar. As a result of continuing commercial purchases and of bidding in the New York market, the Canadian rate caught up with the United States dollar last Tuesday. It has since risen to a premium of ½ to 1 per cent. Reports from New York and Montreal suggest that one of the factors in the appreciation of the Canadian dollar has been switching on British account. British participation in the development of oil resources in Canada is being financed in part by liquidation of United States investment holdings. There is no doubt, however, that the fundamental factor in the situation is the continuing inflow of American capital into Canada.

* * *

Exchange Leakages

The rate for transferable sterling in New York has weakened appreciably during the past month. The heartening effect of the reopening of the London foreign exchange market has been more than offset by the revelation of the gold and dollar losses during the last quarter of 1951. At $2.39-40—as against $2.45-46 at the beginning of the year—the rate has fallen to a level at which commodity "shunting" based on dealings in cheap sterling has again become attractive. A new drive against such leakages is under way. It began this week with a Treasury announcement that warning had been given to the London fur market that infringements of customs regulations relating to the export of furs would in future be punished. Extensive purchases of furs have apparently been made in London by American and other buyers with sterling obtained in overseas free markets. In order to qualify for payment in transferable sterling the goods in question have ostensibly been exported to the transferable account countries in question, but have then been relabelled in transit and sent on to their real destination, the United States. When the discount on transferable and other forms of free sterling is sufficient to cover the additional freight, handling and trans-shipment charges involved, shunting of this kind will be found extremely difficult to stamp out. At the present discount of about 14½ per cent the margin is not sufficient to encourage a considerable volume of such business except in articles such as furs and diamonds, where the ratio of value to bulk is high. It should not be assumed therefore that the commodity shunting and exchange juggling that now obtains is in any way comparable with what was occurring prior to the devaluation of sterling in 1949.

* * *

The Prudential Plan

It is not to be expected that Prudential "A" shareholders will give unreserved support to the proposed changes in the company's articles. No doubt, sufficient of them will accept the view that a simplification of the present highly complicated articles that determine the shares of the surplus that go respectively to policyholders and shareholders and a somewhat greater participation by policyholders than has hitherto been afforded are both desirable, politic steps. The existing provisions would give about 87½ per cent of the industrial profits to policyholders for 1951, leaving 12½ per cent for "A" shareholders. It is proposed to raise the policyholders' share to a minimum of 90 per cent with the eventual though not immediate prospect of something more. The corollary for "A" shareholders is that they must accept a corresponding reduction in the share of the industrial branch profits to which they have hitherto been entitled.

Their equity in the fund has recently been impeded by dividend limitation. The results for 1950 would have justified a dividend of about 23s. net, whereas 17s. tax free was paid. There have since been two payments of 3s. 6d. and 2s. 6d. tax free from the special dividend reserve fund that was set up in 1949 to conform with the dividend limitation policy. The scheme now put forward holds out the expectation of a net dividend of 19s. 6d. from the 1951 profits, coupled with a "small transfer" to a new dividend reserve. The directors also intend to distribute the entire balance of the special dividend reserve fund, equivalent to 9s. 11.37d. per "A" share. But the evident consequence of the proposals for "A" shareholders will be a sacrifice of an appreciable part of the equity in the expanding profits of the industrial branch. Under the new arrangements, Prudential "A" would become a long-term growth equity, rather than an immediate participant in expansion. But no other terms appear to be possible if the main object of the exercise is to succeed—that is, to give the industrial branch policyholders a contractual right to a minimum of 90 per cent of the profits of the fund. It is a step in line with the traditions of the Prudential, as the directors are entitled to claim. Alone among the industrial-cum-ordinary life offices, the Prudential accords contractual (as distinct from *ex gratia*) participating rights to industrial branch policyholders, and these rights were first granted as long ago as 1907. Given the left-wing attacks on the industrial offices, the wisdom of the latest move can hardly be questioned. But it can scarcely be expected that all recent purchasers of Prudential "A" shares will greet it with joyous enthusiasm.

* * *

Brazil and Foreign Capital

The Brazilian Traction, Light and Power Company, which has over $700 million invested in Brazil and is by far the biggest foreign company operating there, has rallied to the support of the Vargas Government in the dispute about its new exchange regulations governing financial remittances

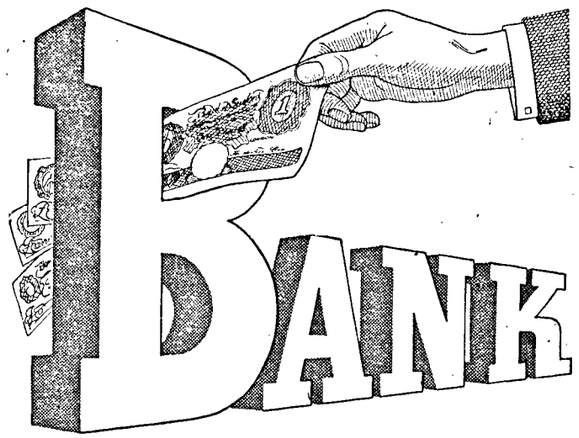
rom Brazil. In a statement issued last week, Mr Henry Borden, president of the company, announced that he had o reason to believe that the recent change in the regulations would "result to the detriment of this company or its security olders;" in particular, he dissociated himself entirely from he recent recommendation by the United States Council of he International Chamber of Commerce that financial ssistance to Brazil should be halted "until whatever restric- ive policies involved in the new exchange regulations are orrected."

If the decree announced by President Vargas in his virulent New Year message is enforced, it is difficult to see how foreign ompanies in Brazil can escape without very serious losses ndeed. As long ago as March, 1946, the Brazilians decreed hat foreign capital "registered" with the local Exchange Control should not be repatriated at a rate greater than 20 er cent per annum and that transfers of interest and divi- lends should not be greater than 8 per cent per annum of hat capital. The terms of this decree were stated to be ubject to amendment by administrative action of the Bank f Brazil at any time, and by the end of 1946 they had in act been "temporarily suspended." Even before this sus- ension, however, the bank seems to have been liberal in its nterpretation of what were capital remittances and of what as "registered capital"—so that there has not been any very ffective barrier against companies remitting what they anted to, although there have been delays when the bank as temporarily run short of sterling or other currencies. his wise liberality was largely prompted by the fact that razil was expanding rapidly with the aid of funds from the orld Bank and the Export-Import Bank, as well as from rivate American investors. When the nationalist Vargas overnment came into power last year there was some pprehension that it might reverse this attitude towards oreign investment. In fact, however, the Finance inister, Señor Horacio Lafer, has been following a com- aratively orthodox internal economic policy and has been ngling for bigger and better American loans. He hopes to ecure up to $500 million of American or World Bank invest- ent in his new development programme, and in these ircumstances seemed unlikely—up to three weeks ago—to ake predatory gestures towards those foreign investors who lready had a stake in the country.

President Vargas's statement on January 4th therefore ame as an unpleasant shock. Spurred by nationalists in his wn party—many of whom are hostile to Señor Lafer—he nnounced that 950 million cruzeiros had been "illegally emitted" by foreign companies in the past three years and hat the 1946 decree was henceforth to be strictly adhered o. He also decreed that "registered capital" meant capital ffectively brought in from abroad (i.e., it was not to include rofits earned and ploughed back in Brazil), and that all profit emittances in excess of 8 per cent of this capital since 1946 hould be deducted from the "registered capital" on which uture permitted remittance percentages will be based. This rithmetic would saddle some foreign companies with a egative registered capital, and for these "the privilege of epatriation is declared extinct." Immediately after his resident had launched this bombshell, Señor Lafer sadly set p a commission that "will study in an appropriate manner ny suggestions with regard to special cases" and will "deal ith the whole problem on an over-all basis"—whatever that eans. Unfortunately, this may be a difficult time of the year r the forces of moderation to gain the upper-hand. Brazil lways tends to have a winter sterling exchange crisis, which ounts to its peak just before the cotton crop is marketed in pril. This year the crisis was put back by the fact that the ritish Raw Cotton Commission seems to have obligingly ought at the top of the market last spring and by fairly eavy British purchases of coffee (partly for re-export). But nce November 6th the Bank of Brazil has not released any terling, and the old problem of sterling arrears may be raising s ugly head again.

Gas Turbine Tanker

The tanker *Auris*, the first and still the only merchant ship with a gas turbine engine, gave a demonstration off Southampton this week. The *Auris* has just completed her first round trip to Curacao running on the 1,200 bhp gas turbine and three 1,100 bhp diesel engines in place of her usual complement of four diesels; she is now leaving for a second Atlantic crossing using the gas turbine alone. The *Auris* is owned by the Anglo-Saxon Petroleum company and operated as a normal tanker, but she is also a floating test-bed for the Shell Petroleum Company's extensive programme of gas turbine research. Here is the perfect coincidence of interests—experiment in a new form of marine motive power, which the Shell group uses in prodigious quantity, coupled with a close study of the fuel requirements of gas turbines, largely oil products which Shell sells in prodigious quantity. But equally the gas turbine engine may have certain attractions for any owner of a large fleet, particularly of medium sized vessels like tankers. A gas turbine is smaller, lighter, and less complex than a diesel unit of equal power. Its maintenance costs and its first cost can confidently be expected to be lower although its fuel costs are higher. These conclusions can be deduced from a theoretical knowledge of gas turbine technology; what has been lacking, and what the *Auris* trials should provide, are data on reliability—so necessary in a marine engine—and the effect on its components of a continued feed of salt air. Air for the *Auris* is de-salted. Such data must be collected before gas turbines can move beyond the purely experimental stage and to obtain them Shell encouraged the turbine builders, British Thomson-Houston, to complete and instal the engine without much modification to the original design, even though, in the light of current knowledge, it has certain deficiencies.



It is not possible at this stage to draw any conclusions from the *Auris* experiment about the economics of the gas turbine at sea. Nevertheless, the first 2,000 hours of operation have justified a number of earlier calculations. For example, it needs about three-quarters of a gallon of oil per day, at 5s. 6d. a gallon, to lubricate the four bearings of the gas turbine, against 30 to 40 gallons of lubricant a day (at 5s. a gallon) on each diesel engine. Fuel consumption on the gas turbine has averaged 0.75 pounds per bhp-hour —about the same as that of a steam turbine, and considerably higher than that of the diesel. Both the diesel and the gas turbine are already running on the cheapest distillate, boiler fuel, which is purified by a process developed by Shell a few years ago. If the gas turbine fuel bill is to be reduced, it will have to operate on a still cheaper, non-distillate oil. This makes the question of life between overhauls of great importance. Heavy residual oils are bound to leave deposits on the turbine blades which will need fairly frequent removal. If each cleaning were to involve immobilising the ship in dock the general use of gas turbines at sea might be impracticable. There is, however, another possibility. A gas turbine is a small unit with few components and no reciprocating parts. It would not be difficult to standardise the components or even the complete engines used by a fleet. The parts due for overhaul could then be taken out, and a fresh component or engine fitted, without the need to take the ship out of commission—much as the diesel engines in American diesel-electric locomotives are slipped in and out.

Looking Ahead in Coal

How much coal is Britain likely to produce in 1956? British experts refuse to guess. But a special coal committee of OEEC, in a report recently made public, has been more rash: since Britain was the only one of the main coal producing countries of Western Europe to refuse a forecast of production in five years' time, the committee made an estimate—or rather two—itself. On the basis of the National

INVEST *through your*

One of the best ways to buy National Savings Certificates is through a Bank. It is extremely easy and there is no extra charge at all. Your Bank Manager will buy and if you wish, hold them for you. Everything done with traditional Bank efficiency, and you will be making an excellent and absolutely safe investment. All Savings Certificates, of whatever Issue, earn good rates of interest; the present 15/- ones become 20/3 if held for the full 10-year period, and the interest is Income-Tax-free. This is equivalent to 3% per annum and if you are paying tax at the standard rate of 9/6 in the £ it is equal to a taxable investment yielding £5 16s. 0d. per cent. gross. If you are paying more than 9/6 it is an even more attractive investment.

FAMOUS FOR ALL CLASSES OF INSURANCE

Coal Board's long-term plan, it put British production in 1956 at, perhaps, 224 million tons—218 million tons from the mines and 6 million opencast. From an examination of current output and trends, they estimated that total coal output in 1956 might conceivably reach 234 million tons. This second estimate drew the comment from the British delegate that if the decline in mining manpower continued, actual production in 1956 might be, say, 10 million tons lower—which would suggest that the first estimate of 224 million tons of coal from all sources would be more acceptable in the Coal Board and the Ministry of Fuel and Power. The British delegation, which declined to make an estimate for 1956

> because of the uncertainties of the forward position and because the level of production, consumption and exports may to an important extent depend upon questions of policy that have not yet been considered, still less decided, by His Majesty's Government,

did, however, put forward an estimate of output in 1952—which is more than has been done inside Britain. Output this year, it ventured, might reach a total of 223.5 million tons (or 227 million metric tons)—213.5 million tons from the mines and 10 million tons opencast. This may seem modest; but 5 million tons of last year's 7 million tons increase came from Saturday working, from which no further increase in tonnage can be expected.

The OEEC estimates were prepared as part of a study of how much fuel Western Europe will need during the next five years if it achieves the 25 per cent increase in the gross national product of its countries envisaged by the OEEC Council last December. Detailed estimates of consumption by countries for the whole period have not been published; but the report concludes that by 1956, if that increase in gross national product should be achieved, the OEEC countries would need 540-550 million tons of coal (compared with 486 million tons in 1951) and would have available 515 million tons (against 451 million tons in 1951). This means that the 35 million ton gap between demand and supply may still remain. Last year it was filled by about 25 million tons of American coal and 10 million tons of Polish coal; and in five years' time, the committee estimates, possible imports from outside the United States may be roughly the same. This means that on the lowest estimate Western Europe may still be buying 15 million tons of American coal a year in five years' time. This deficiency, and the smallness of the increases that the OEEC Secretariat was able to forecast for production in Britain, compared with other producing nations, re-emphasises the heavy cost to Europe of the drop in British exports, and the need to hasten those advances in production that are now promised only for tantalisingly distant years.

Changes in Fares

The Transport Tribunal has issued a summary of its principal conclusions on the draft Charges Scheme submitted by the British Transport Commission in April last year. The conclusions cannot take legal effect until they have been embodied in a revised scheme which will need formal confirmation by the Tribunal but, for the benefit of the public and the Commission, the Transport Tribunal has taken the convenient course of making its decision known as quickly as possible.

For ordinary railway fares the Tribunal concludes that third-class single fares should not exceed 1¼d. a mile for tickets issued up to the end of this year and 2d. a mile thereafter, with return fares double the single fare. The London Transport railways, London and Tilbury-Southend line and the London Transport road services (other than Green Line coaches) are to be governed by a scale which starts at 2d. for one mile, 3d. for two miles, 5d. for three miles, 6d. for four miles, 8d. for five miles, 9d. for six miles, and so on.

Two important points are involved in these decisions. First, the return railway fares at the new rate will be identical with the present monthly return rates, as the latter were increased at the beginning of this year. By reducing the standard fare basis from 2.44d. per mile to 1.75d. per mile (with provision for a subsequent increase to 2d. next year) the Tribunal will leave no discretion in the hands of the Commission about return fares, and the monthly and period return fares will in future presumably be identical. Further, the single fare will cost, up to the end of this year, 28½ per cent less than the present standard and from next year 18 per cent less. The decision of the Tribunal to make a two-stage alteration in the standard fare basis gives the Commission something of the flexibility in charging powers that it sought from the Tribunal, though not, it is fairly safe to say, in a form that it would have chosen for itself. The second point is that the Tribunal has not accepted the proposal in the draft scheme for a 3½d. fare for a two-mile stage on London Transport services. The total effect of these conclusions of the Tribunal on the expected return of £21 million under the draft scheme has not been disclosed.

* * *

The Gas Boards' Coal

An understandable public delight in any squabble between nationalised industries sometimes tends to obscure what the industries are really arguing about; to some extent this has been true of the complaints about increased coal prices that the chairmen of certain Area Gas Boards have been airing in the past week. Undue emphasis seems to have been placed upon the sad necessity of passing on price increases to the final consumer of gas, who as an efficient user of fuel, it is argued, deserves encouragement. This argument cannot be accepted. The consumer eventually has the whole of the increase in coal prices passed on to him—in coal itself, in gas, electricity, travel and virtually everything he buys. To the extent that the use of gas is an efficient way of using coal, the consumer will continue to benefit by buying gas.

A new system of pricing grades of industrial and carbonisation coals was brought in at the same time as the general increase. This has created the real point at issue. Industrial coals outside the carbonisation grades are priced on the basis of their thermal value, with allowance for their ash content; carbonisation coals are priced on the basis of thermal value and coking qualities, with a rather greater allowance for ash content. Both formulas, however, are further adjusted in accordance with what the Coal Board calls "commercial considerations": these include size, the profitability of the pit from which they are raised and, to some extent, the existing pattern of prices. The gas industry is aware of the weighting that the Coal Board gives to the physical properties in its basic price formulæ, though it does not accept them as equitable: but it does not know the weight given to the various "commercial considerations" that the Coal Board has in mind when it arrives at the price of each type of coal it buys. Since the gas industry's carbonisation equipment is designed to suit the particular coals it uses, the gas boards therefore feel that their own duty of weighing all relevant technical and economic considerations in its operations cannot adequately be performed. Nor can it satisfactorily check, by scientific tests, whether the coal it receives is worth the price paid, without knowledge of the price adjustments that take place between the technical formula and "commercial considerations"

The Coal Board is prepared to lay down, in broad terms, a technical specification of the coals it undertakes to supply in various price grades, which allows consumers to keep a partial check. But it is not prepared to furnish a detailed "make-up" for the price of each grade. On this point, it unrepentantly asks, "What other industry does?" This may be true. But it is also true that few industries are in its position of being a monopoly supplier of raw material to its two largest customers, gas and electricity, and at the same time competing with them. Inevitably the gas industry suspects discrimination, and the Coal Board denies it. Both nationalised industries have some weight behind their arguments: so the case—which presents yet another aspect of fuel co-ordination—may ascend to join those already on Lord Leathers's agenda.

* * *

Lancashire takes the Strain

The output of cotton yarn in 1951 is provisionally estimated as 1,076.6 million pounds. Last year's output was 24.5 million pounds more than the total for 1950—an increase over the year of two per cent. Between 1949 and 1950 the output of yarn rose by 6 per cent, but that large improvement was almost entirely due to the high rate of recruitment, and it would have been unreasonable to expect a similar rate of expansion during 1951. For most of last year the weekly output of yarn regularly exceeded that for the corresponding week of 1950 by 500,000 to 1 million pounds. The disappointingly small margin at the end of the year is largely explained by the wholesale closing of the mills during Christmas and the following week; in the first week of January, fourteen were still shut. By December 15th, when 50 weeks of the year had already gone, yarn production had reached a total of 1,047.62 million pounds, approximately three per cent higher than in the same period of 1950.

The recession in textile sales that led to the general shutdown over Christmas shows no signs of coming to an end, although there are more inquiries about than there have been for some weeks. The fact remains that the continuing stagnation is still being taken remarkably calmly by the industry. There are a few "weak sellers," but the great majority of companies are in a strong enough position to weather a set-back of this kind. Indeed, they appear to be going to the opposite extreme and disdaining to make any of the usual concessions, such as price reductions, that might be expected to stimulate the market's interest. One reason for their confidence is that the recession is not universal. It affects dress fabrics and household textiles only, and has not touched the industrial market that for some years has been taking a steadily increasing proportion of Lancashire's output. The second reason is that about one-fifth of the output of the industry is made up of imported grey cloth finished in this country. These imports last year amounted to 341 million square yards. This can be taken as evidence that the output of the spinning and weaving mills is still not large enough to meet the demands of the market for British cotton; but it also suggests that the best way to meet a recession is to cut grey cloth imports. Nevertheless, in the past six weeks, the spinning sections have lost 556 wholetime and 1,720 part-time workers to other industries out of a total of 124,170 on the spinners' books. A steady drain of this kind would make it difficult to increase output again when trade revives.

Fate of the Brabazons

Reports that the Bristol Aeroplane Company has been ordered to stop work on the Brabazon II have not been officially confirmed; it does not follow that they are without foundation. A year ago it was announced that the project would end with the completion of the second turbo-prop aircraft—the Brabazon I has piston engines—but there was little enthusiasm for continuing the work at all once it became clear that the smaller Britannia (Bristol 175), designed by the same company, met the BOAC specifications for long range aircraft capable of 4,000 mile flights. BOAC has 26 of these aircraft on order and needs them as soon as they can be delivered; the first is due to fly this summer. Much that has been learned in building and flying the Brabazon I has already been incorporated in the Britannia, and there may be little further gain either in theoretical knowledge or practical experience in completing the Brabazon II. It would equally be difficult to justify the continuation of work on a special coupled version of the Proteus engine that would be used in this one aircraft only.

Since these facts have been public knowledge for a long time, the release of the Bristol Aeroplane Company from its preoccupations with the Brabazon would certainly be timely. The company is awkwardly placed for labour, and has few men to spare for this work. The Ministry of Supply, and the other Ministries who are concerned with aircraft production might have reached what now appears as an inevitable decision about the Brabazon project at a much earlier stage.

The future of the Brabazon I has not been settled. The Air Ministry did not mention this aircraft when it announced that the big Princess flying boats were to be used as troop carriers. British European Airways has suggested that the Brabazon might be used for the London-Paris route—the antithesis of the London-New York flight for which the aircraft was designed. In the busy season it would be a sound commercial proposition—subject to one reservation. No aircraft is fully reliable, and faults may develop which make it necessary to withdraw an aircraft from a given flight. With only one Brabazon, a cancelled flight would raise the difficult problem of finding alternative transport for 120 or more passengers booked for the big aircraft.

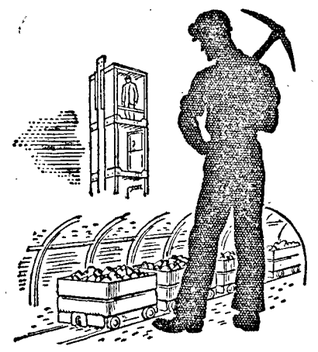
Building Societies on the Escalator



The Co-operative Permanent Building Society, which has assets of nearly £67 million, has become the second of the big ten building societies to climb on the escalator of generally rising interest rates; by raising its mortgage charges, it follows the Temperance Permanent Building Society (whose decision was discussed in *The Economist* of January 5th) and a growing number of smaller societies. The Co-operative Permanent will charge 4½ per cent (against 4 per cent) on all 20-year mortgages negotiated after January 21st. Rates on existing mortgage accounts will remain unchanged for the present, but the society states that "in all fairness it must be said that the possibility of some increase in the future cannot be disregarded." The society's present mortgage deed contains the usual interest variation clause, but it is now to introduce an alternative of the "fixed interest" type, whereby borrowers who undertake to pay 5 per cent on 20-year mortgages will have a guarantee that that rate will not be changed during the life of their contract.

Slowly, and by no means uniformly, the pattern of building society rates that prevailed before the change in official monetary policy last November—indeed that has been in effect since before the war—seems to be breaking up. The Building Society Association's statement on the morrow of the Bank rate change, which revealed that it was not recommending any alteration in rates for the time being, has been rendered at least partly out of date by the fall in gilt-edged prices in the interim—a fall that must, incidentally, have led to quite heavy depreciation of building society investment holdings. There are still some societies that resist a change, on the grounds that the movement is still experiencing a satisfactory inflow of funds (partly, no doubt, because of a movement of funds away from the stock markets and partly because of the recent genuine increase in personal saving). These societies also set great store by the movement's tradition of stable—and low—rates. It will be surprising, however, if societies as powerful as the Co-operative Permanent and the Temperance Permanent prove to have swum forward in this competitive business very much in advance of the tide.

Look up

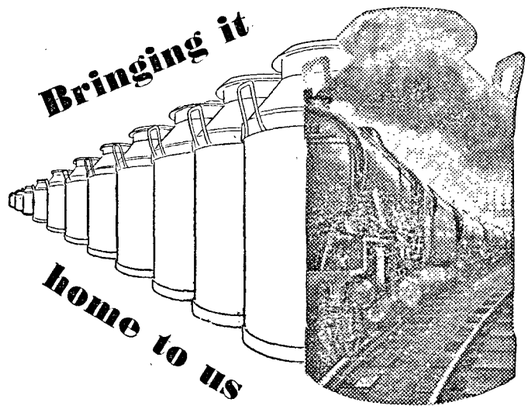
Look down

...you see DURALUMIN

REGD. TRADE MARK

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.



"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of re-armament are satisfied. Our development department will advise, entirely without obligation.

A knotty problem, with "Duralumin" —probably isn't !

Chemicals for Soil Conditioning

The first consignment of the Monsanto Chemical Company's soil conditioner, "Krilium," is on its way to this country from the United States. Field trials will start in the spring and parallel tests will begin in the commonwealth later in the year. Soil contains a proportion of natural gums that bond together earth particles in a way that gives good soil its characteristic porous structure, so that it neither bakes in the dry weather nor turns to mud in the wet. These gums are formed as by-products of organic decomposition of, for example, farmyard manure or compost. They are destroyed by soil bacteria and unless the land is continually fed with humus, the proportion of gums is gradually reduced and the soil deteriorates. The Monsanto product is a synthetic resin that has the same bonding action as these natural gums, with the further advantage that it resists attack from soil bacteria. In one sense it is an alternative to the peat moss and compost used by market gardeners; in another a quick-acting substitute for the present slow and costly measures used to check soil erosion.

American figures suggest that the cost of the product will be $2 a pound in the early production stages, presumably falling as the plant comes into full operation. One pound is reported to have the same reviving effect on soil structure as 200 pounds of peat moss at four cents a pound, or 500 pounds of commercial compost at 2½ cents a pound. The largest market is likely to be in large-scale reclamation projects. "Krilium" may also be used by private and market gardeners, both of whom crop intensively, but it is less likely to appeal to farmers. Nor in general would farm land need such treatment except in special cases; Australia may be such a case, since the new material holds water in the soil and might solve some of the farming difficulties created by high seasonal rainfall.

The fact that Monsanto is building a new $50 million plant to produce acrylonitrile, the raw material for the new product, does not mean that the entire output is going to be devoted to "Krilium." Acrylonitrile is also the starting point for a number of other chemical products, among them a new synthetic textile developed by Monsanto and the family of acryl resin plastics of which "Perspex" is probably the best known in this country. Monsanto has expanded considerably in Britain since the war, and the fact that it has rights to two promising end-products both produced from the same material will have some bearing on its future plans. The biggest obstacle to producing either "Krilium" or the textile fibre "Acrilan" in this country would be the supply of raw materials to make acrylonitrile. It can be produced from acetylene, which is both scarce and expensive, or from the petroleum gas ethylene, which is also scarce. Through its interest in other chemical companies Monsanto has access to the ethylene produced at Grangemouth by British Petroleum Chemicals. Most of the ethylene likely to be produced by BPC is, however, earmarked for other projects, and without further expansion it may prove impossible to find the extra ethylene needed for a new acrylonitrile plant of economic size.

* * *

High Prices for Ships

Current prices of second-hand ships, on the world market, are perhaps double the level of a year ago. Recently a British owner sold a Liberty type ship to a Panamanian buyer for £575,000, and others of this type, which a year ago would have fetched little more than £250,000, have been disposed of for about £510,000 with delivery four to six months later. These prices obviously reflect shipowners' general confidence that world demand for tanker and dry-cargo shipping will remain high for at least long enough to show a return on the outlay: but other factors are involved too. For British owners, one consideration is that when a vessel is sold at a price in excess of its written down value, a "balancing charge" is paid to the Treasury. To cover this charge, which reduces the proceeds of a sale to well below the cost of replacement, British owners are asking higher prices for vessels than they might otherwise expect. Again, when British owners sell ships of less than 15 years of age abroad, part of the proceeds is "blocked" against replacement by new building. For this reason they are demanding, and getting in a sellers' market, higher prices from foreigners than British buyers will pay.

A major influence on the cost of second-hand "ready" ships, of course, is the rising cost and long delays of building new ones. Owing to the crammed state of the order book in most shipyards, delivery of a tanker ordered today could not be expected before 1957 or even 1958, at least from a British yard. Prospects for dry-cargo ships is a little easier, but orders are being placed today for delivery in 1956. As for prices, increases in the wages of shipyard workers and increases in the cost of steel and components, have put up shipbuilding prices by about 15 per cent in the last six months alone. One estimate of the current cost of a plain motorship of 9,500 tons deadweight puts it at £575,000 (a sum that has been paid for a Liberty ship eight years old), compared with about £480,000 six months ago and £440,000 a year ago. Another estimate puts the price of a new tanker of 16,000 tons d.w. at about £53 per ton, but delivery could not be obtained for six or seven years and the owner would have to absorb any increases in the interim due to increased labour or material charges; while the delay in delivery might well be increased owing to the shortage of steel. It is not perhaps surprising that some companies are increasing their control over tonnage by buying shares in other companies that own ready tonnage and have building contracts nearing completion.

* * *

Steady Shipbuilding

For the first time for two years the quarterly shipbuilding returns compiled by Lloyd's Register of Shipping show a reduction in the total tonnage of tankers under construction in Britain, which at the end of December amounted to 105 vessels totalling 1,239,497 tons gross. This decrease—16,257 tons compared with the tonnage being built at the end of September—is only a small one, and since it was accompanied by a corresponding decline in the total of all merchant ships under construction from 2,271,640 tons to 2,209,012 tons gross the proportion of tankers to the total actually increased from 55.3 to 56.1 per cent. If ships for which plans have been approved or material ordered, though the keels have not been laid, are also taken into consideration, tanker tonnage now represents only 62.5 per cent of the combined total, compared with 67.9 per cent in the previous quarter, while the proportion of cargo liners has increased from 18.8 to 26.8 per cent during the same period. Thus tankers still predominate in shipbuilding work, and will continue to do so for a long time, but at last there is an indication that the trend

SHIPBUILDING OUTPUT IN BRITAIN, 1951

	Work Begun		Launched		Completed	
	No.	Tons Gross	No.	Tons Gross	No.	Tons Gross
1st quarter....	56	316,881	55	241,483	47	291,173
2nd "	79	382,478	79	414,138	70	346,211
3rd "	75	423,602	51	242,446	53	268,638
4th "	69	361,259	73	433,364	76	434,415
Total 1951.....	**279**	**1,484,220**	**258**	**1,331,431**	**246**	**1,340,437**
Total 1950.....	**284**	**1,417,977**	**278**	**1,314,535**	**319**	**1,388,922**

will be reversed, although not in time to have any effect on immediate requirements of steel. Although 422,340 tons of tankers were launched during the last six months, work was begun on another 495,260 tons.

The latest returns show that the balance of tonnage at various stages of progress, which was disturbed in the third quarter by an exceptionally low rate of launching and completion, was restored in the fourth quarter of 1951. It is noticeable that the tonnages launched and completed during 1951 compare favourably with those of the previous year, although the numbers of ships in all categories decreased. This is a further indication of the continually rising size of ships, particularly of tankers.

The outstanding feature of Lloyd's Register returns in 1951, however, has been the large increase in tonnage in the preparatory stage. At the end of 1950, 148 vessels totalling 954,486 tons were in this category; by the end of 1951 there were 295 ships of 2,225,404 tons gross. Of this total 1,391,290 tons consisted of tankers, 595,770 tons of cargo liners, and 116,900 tons of tramp ships, but there were only five passenger and cargo liners, totalling 53,250 tons. In addition, it is known that contracts have been placed for a further 2 million tons gross, and that these include a higher percentage of passenger and dry-cargo tonnage than for some time past. The total value of the work in hand and on order is estimated at £600 million, of which about one-third is for export.

* * *

Spending on Transport

In a paper to the Royal Statistical Society this week, Mr E. Rudd, of the Road Research Board, presented estimates of expenditure on road transport for the years 1949 and 1950 of which extracts are given in the accompanying table. Some of the many assumptions that Mr Rudd has

USERS' EXPENDITURE ON TRANSPORT AND TRAVEL, GT. BRITAIN
(£ Million)

	1949	1950
Road goods transport	470	540
Road passenger travel	550	640
The use of road vehicles on the public service	40	40
Total Road Transport and Travel	**1,060**	**1,220**
Rail goods transport	200	230
Rail passenger travel	130	120
Total Rail Transport and Travel	**330**	**350**
Other means of transport and travel	30	30
All Transport and Travel	**1,420**	**1,600**

been compelled to make may be open to argument—such as the apparently high allowance of £80 million for upkeep of roads and street lighting, which, so far as mechanical road transport is concerned, would seem already to have entered into the calculation through the payments of licence duties and fuel tax. But there seems no reason to disagree with Mr Rudd's general calculation that more than 10 per cent of the national income at factor cost of Great Britain was devoted to road transport, both in 1949—upon which most of his calculations are based—and in 1950.

This is a surprisingly large figure, and the author is right to make the comparison with expenditure on all means of transport. In doing so, he concludes that out of a total estimated expenditure on transport and travel of some £1,600 million in 1950, £1,220 million was accounted for by road transport and travel. For goods transport alone, road accounts for £540 million out of a total of £770 million.

The extent to which the nineteenth century pattern of transport has been transformed is remarkable; its unfolding has been obscured by the common user of the road track and the diversified ownership and operation of road vehicles. It is no longer true that the railways constitute the predominant means of internal transport in this country, and fiscal measures that have as their purpose restrictions on the growth of road transport cannot necessarily now be justified on grounds of national economic policy. The reasons for the long-term trend towards a greater use of road transport are well known, and it is not unreasonable to assume that the same considerations that have led trade and industry to develop the use of road transport will continue to operate in the economic climate of the coming decade.

* * *

World Consumption of Cotton

In 1950-51 Britain was the world's fourth largest consumer of cotton, coming after the United States, India and Russia. But it remained the largest consumer of Egyptian cotton, using 231,000 bales, or a sixth of the world's total. Egyptian cotton accounted for 10.6 per cent of Britain's consumption, while American growths accounted for 22.3 per cent. The bulk of the cotton used in this country is classified as "sundries" and is mainly American-type cotton grown in countries other than the United States, together with Sudan cotton. Russia, which the Egyptians like to believe could be an alternative buyer for their crop, used only 55,000 bales, or 2 per cent of its total consumption. The next largest consumer of Egyptian cotton after Britain is India, followed by France and Italy. The United States is wholly self-sufficient for raw cotton and in 1950-51 used two-thirds of

WORLD MILL CONSUMPTION OF COTTON

its crop. Japan used 926,000 bales of American cotton and only 32,000 bales of Egyptian—an indication of its specialisation on the lower grades of textiles and of its comparatively easy access to dollars—while Western Germany, whose total consumption is smaller than Japan's, used 650,000 bales of American cotton and 50,000 bales of Egyptian.

Shorter Note

A new wind tunnel for testing scale models of aircraft is being undertaken as a co-operative venture by a number of companies in the aircraft industry. The initiative for the project came from the technical board of the industry's trade association, the Society of British Aircraft Constructors. The design and construction will be undertaken by the Aircraft Research Association, a new body whose registration has just been announced. With one conspicuous exception, every big aircraft and engine constructor appears to be taking part. The name of de Havilland does not, however, appear among the list of founding members, nor is there mention of the aircraft division of English Electric.

Company Notes

Carreras.—Last year witnessed not only a fall in Carreras' trading profits from £3,366,058 to £3,290,121, but also an increase in the value of stocks held by the group by £2,372,973 to £13,408,838. Unwelcome though these movements were, they were almost inevitable once the stocks of leaf tobacco purchased before devaluation were used up and once the increased exchange cost and higher market price of leaf tobacco took effect. In order to finance its heavier commitments in working capital, the group has had to borrow more from the banks. Within the last financial year the group's bank indebtedness has grown from £4,624,406 to £6,792,671. The greater part of the new money has apparently been used in financing stocks held by the group's manufacturing interests in Britain, for the bank loan to Canadian subsidiaries has been reduced from £1,336,428 to £1,086,007, while the bank loan made to the parent company has risen from £2,707,000 to £4,961,000. At the same time, the parent company's "stock in trade, including leaf in the hands of agents abroad, at or below cost," has risen by just over £2,000,000 to £9,618,086.

Once the tax gatherer has taken his toll, which last year was raised to £1,907,920 (against £1,728,087) despite the fall in gross profits, the amounts that can be ploughed back into the business to help to finance stocks are comparatively small, consistent with the payment of a 35 per cent dividend. More money could be retained and invested in working capital if the attempt to restore a higher margin of profit by raising cigarette prices leads to an improvement in earnings. But it still has to be proved that the increase in cigarette prices forced on the leading

£1 "A" ordinary stock at 92s. 6d. xd yields £7 11s. per cent.

tobacco manufacturers last year will more than cover the rise in manufacturing and distributive costs that has already taken place. If the burden of stocks continues to increase, and if the company is unwilling—or finds it impossible—to expand its overdraft still further, then more permanent capital would have to be found. But an issue to the public might prove to be difficult for the current price of the "A" Ordinary shares at 92s. 6d. xd. to yield £7 11s. per cent. suggests that an issue of equity capital would have to be on markedly favourable terms. And an issue of loan stock, the solution adopted by Imperial Tobacco when faced with a similar financial problem, is not made easier by the recent advance in interest rates.

*

Cable and Wireless (Holding).—Once again the market has been taken by surprise by the dividend announced by Cable and Wireless (Holding). A year ago an ordinary dividend of 6 per cent. (against 4 per cent.) was declared for 1950, though stockholders generally had expected no more than a rate of 5 per cent. The directors have now recommended that a bonus of 2 per cent. should be added to the maintained ordinary dividend of 6 per cent., making a total distribution of 8 per cent. for the year ended December 31st last. The gratification of the market with this increase can be measured by the jump in the £100 ordinary stock from £115½ to £125½. The increase is in keeping with the policy outlined by Sir Edward Wilshaw last spring that the company aimed to secure and maintain a minimum dividend of 6 per cent. and then to increase it "by way of additional income from medium- and long-term projects." Before providing £216,000, against £187,000, for taxation, profits for the year amounted to £541,000, as compared with £369,000 in 1950 when the figure was struck after deducting £461,000 gross for the final dividend paid on the preference stock redeemed on June 30, 1950. The proposed distribution requires £210,000, against £165,000, and £100,000 is added to general reserve; in 1950 £930,000 was transferred to general reserve from profits brought forward from earlier years.

At the end of 1950 about 75 per cent. of the company's investment holdings was in equity stocks, so that the full accounts may show an advance in gross investment income, reflecting the modest increase in distribution on equity capital that took place during the year. A further £2,291,632 of the 3 per cent. unsecured loan stock has been redeemed, reducing the balance in issue to £3,666,612. This redemption necessitated the realisation of some part of the company's investments, so that the book value of quoted investments has fallen from £12,840,118 to £11,202,668 and their market value from £13,097,453 to £12,175,818. At the current price of £125½ the £100 ordinary stock units yield 6½ per cent.

*

Steel Company of Wales.—The opening of the hot strip mill at the Abbey works last July marked a decisive stage in the progress of the immense development scheme of the Steel Company of Wales, but it came too late in the year to have any marked effect upon earnings for the financial year ending last September. A preliminary statement shows that group trading profits have risen from £2,382,475 to £3,967,400. Earnings in the last financial year may contain an element of adventitious profits on stocks arising from the increase in steel prices last July. The advance may also reflect an increase in output from the works transferred to the group by the founder companies. The benefit of initial allowances upon the company's capital investments still makes a specific provision for taxation unnecessary. After providing for debenture and loan interest and for depreciation, net profits have risen from £725,500 to £1,128,106, more than correcting the adverse movement shown in the 1949-50 accounts. A balance of £2,319,289, against £1,451,512, is to be carried forward.

The closing of three open hearth furnaces—though these are outside the new works—owing to the shortage of scrap may lend weight to the fear that the achievement of full capacity working this year, as planned, will not be easy. At the end of September 1950, £41.4 million had been spent upon the development schemes at Margam and Trostre. When the full accounts are published they should reflect a major part of the full capital cost of the scheme which on the first estimate was to require £60 million. This has been appreciably exceeded owing to the rise in labour and material costs and to certain changes in the original plan.

Statistical Summary

EXCHEQUER RETURNS

For the week ended January 19, 1952, total ordinary revenue was £195,180,000 against ordinary expenditure of £89,887,000 and issues to sinking funds £570,000. Thus, including sinking fund allocations of £18,663,000, the surplus accrued since April 1, 1951, is £9,535,000 compared with a surplus of £296,630,000 for the corresponding period of the previous year.

On January 18th applications for 91 day bills to be paid from January 21 to January 26, 1952, were accepted dated Monday to Saturday as to about 62 per cent at £99 15s. 3d. and applications at higher prices were accepted in full. Treasury Bills to a maximum of £170 million were offered on January 25th. For the week ending January 26th the banks were not asked for Treasury deposits.

COMPANY MEETINGS

LLOYDS BANK LIMITED

THE INFLATION DANGER

NEW TURN IN MONETARY POLICY

GOVERNMENT'S INTENTION TO CURB SPENDING

HOPE OF FUTURE ECONOMIC RECOVERY

LORD BALFOUR OF BURLEIGH'S STATEMENT

The annual general meeting (being the ninety-fourth ordinary general meeting) of Lloyds Bank Limited will be held at the head office, 71, Lombard Street, London, E.C.3, on February 15th.

The following is the statement by the chairman, The Right Hon. Lord Balfour of Burleigh, D.C.L., D.L., accompanying the report of the directors and balance sheet for the year ended December 31, 1951:

My Lords, Ladies and Gentlemen,

To deal first with personal matters, the shareholders will be asked to confirm the election of four directors appointed to the board during the past year. They are:

The Hon. Thomas H. Brand, C.M.G.

Major T. K. Jeans, M.C., who has served for four years as a member of our Salisbury Committee,

The Earl of Scarbrough, K.G., G.C.S.I., G.C.I.E., a member of our Yorkshire Committee, and

Mr W. R. Verdon Smith.

These gentlemen have distinguished themselves in the fields of finance, agriculture, the public service and industry; their experience and judgment bring a valuable accession of strength to the board.

DIRECTORS' GOVERNMENT APPOINTMENTS

The change of Government has entailed for us the loss of Lord De L'Isle and Dudley, who joined the board in 1950, now appointed Secretary of State for Air; Mr D. Heathcoat-Amory, who joined us in 1948, now Minister of Pensions, and Lord Ismay, who joined us also in 1948, now Secretary of State for Commonwealth Relations. Sir Peter Bennett, a director of the bank up to a year ago, has been appointed Parliamentary Secretary, Ministry of Labour, and relinquishes his seat on our Birmingham Committee. We greatly regret the loss of the valuable services of these four gentlemen and we offer them our sincere good wishes in the arduous tasks which lie before them.

During the year a new committee, the Eastern Counties Committee, has been established, the members being Sir Edmund Bacon, Bt., as chairman, and Lord Luke, with Sir Henry Upcher, a director of the bank until last year, and Mr A. P. Cobbold.

CHANGES ON COMMITTEES

I have also to record with pleasure the appointment of Mr Lloyd H. Fox, formerly a member of the Fox, Fowler & Co. committee, to our Devon and Cornwall committee, of Lord Kenyon to our Liverpool committee, of Colonel Angus to our Newcastle-upon-Tyne committee, of Lieutenant-General Sir Henry Pownall to our Pall Mall committee, of Sir Percy Thomas, past president of the R.I.B.A., to our South Wales Committee, and of Mr Cecil Berry, on his retirement from the district managership, to our Yorkshire committee.

During the year a heavy loss was suffered by the bank in the death of Mr Alwyn Parker, a former director, the eminent editor of *Lloyds Bank Review*. We are proud to think that under Mr Parker's direction our *Review* created for itself a special place in contemporary economic literature, and we greatly miss him.

PROFIT AND LOSS ACCOUNT

I will now refer to our profit and loss account and the balance sheet.

Our profit at £1,815,858 is £54,255 higher than last year and may be considered satisfactory in view of the continued increase in running expenses. It will be realised, however, that we have not been able to provide for the depreciation of our investments out of the profits of the year, but have utilised a part of our internal reserves for that purpose.

Instead of allocating any of our profits to our published reserve, we have on this occasion utilised the whole of our profits in excess of the amount required to meet the dividends for the purpose of strengthening our internal reserves.

Our investment reserve, buttressed by transfers from less immediately needed reserves, has taken care of the whole of the depreciation without unduly depleting our contingency reserve. The history of the last three months illustrates forcefully the need for powerful internal reserves and justifies the prudent policy we have always followed.

BALANCE SHEET

Referring to the balance sheet, our current, deposit and other accounts at £1,171 million show a comparatively small increase of £22 million over last year.

The principal changes in our figures will be found on the assets side of the balance sheet. The effect of the Government's operation in the funding of a portion of the floating debt is shown in the fall of £62 million to £156 million in our holding of Treasury Bills and an increase of £87 million to £329 million in the figure of British Government securities. There has also been a welcome fall of £65 million in our holding of treasury deposit receipts.

Loans and advances at £342 million show a further increase of £53 million, and with the present high prices ruling and the necessity for assisting industry engaged on rearmament work, the export trade and agriculture, it is difficult to visualise any immediate fall in our advances in spite of our determination to reduce the supply of credit for less essential purposes.

FUTURE EARNING POWER

With regard to our future earning power, much publicity has been given to a figure of £25 million per annum, or £16 million per annum after tax, by which the net profits of the banks are alleged to have benefited through the increase by under ½ per cent. in the rate of interest payable on the total Treasury Bill issue of £5,000 million. To begin with, the banks' holding of Treasury Bills at that time was less than £2,000 million, the remainder, so far as we know, being held mainly on account of Government departments and overseas central banks. Moreover, simultaneously with the raising of the Treasury Bill rate and the rate we charge the discount market for Call Money, our deposit rate was put up to ¾ per cent.

The time deposits of the banks being substantially greater than the aggregate of their Treasury Bill holding and Call Money, it is clear that the additional earnings on those items must be largely if not wholly swallowed up by the increased interest paid to depositors. So the £16 million profit vanishes into thin air but the lie that begat it lives on.

Far from having presented the banks with a £16 million bonus, the raising of the Bank rate and the new monetary policy have begun by causing depreciation of our Government securities on a scale necessitating large provision. Shareholders may view with satisfaction the fact that our securities are valued in our balance sheet at or under market price, for that in itself is a tribute to our internal strength. The great bulk of our British Government investments are held in dated stocks, the large majority with a maturity date of less than ten years. We may therefore hope to escape ultimate loss; but the sharpness of the fall even in dated stocks is well illustrated by the fact that so comparatively short a stock as 2½ per cent. Savings Bonds 1964-67 suffered a fall between December 31, 1950, and the lowest point touched a few weeks ago of as much as 10 per cent.

INDIA, PAKISTAN AND BURMA

Our business in India and Pakistan continues to make satisfactory progress, the rise in raw material prices having been reflected in an increased demand for banking accommodation. An important development during the year was the fixing of the rupee ratio between India and Pakistan, which has brought about an improvement in the trading relations between the two countries. I am sure that the British banks have still an important role to fill in India and Pakistan, and that their presence there assists in some measure in maintaining the traditional trade relationship between these two members of the Commonwealth and this country. Our vice-chairman, Sir Jeremy Raisman, recently visited several of our Eastern branches, and close touch with our business in the subcontinent is maintained by the periodical visits of executives from this side.

The new branches in Karachi and Madras, to which I referred last year, have since been opened and are making satisfactory progress.

Although conditions in Burma remain unsettled, they show some improvement, and our business in Rangoon has been maintained.

The officials and staff of our Eastern branches maintain a high standard of service,

and I would like to offer them my warm thanks for what they have accomplished in a year of difficult conditions.

STAFF

I referred last year to our staff college and training centre and it is pleasing to record the progress which is being made in both those institutions, the benefits of which, both to the bank and to the staff, are becoming increasingly evident.

During the year very careful consideration was given to the position of our staff, particularly the younger members, in view of the continued rise in the cost of living, and as a result new salary scales were announced for men, women and the non-clerical staff which became effective on January 1, 1952. In addition, a cost-of-living cash payment is being made to the staff in order to assist them so far as we are able.

I record with great pleasure our sincere thanks to all the staff for another year's excellent service, evidence of which not infrequently comes to our notice from customers of the bank.

OUR LIVELIHOOD IN DANGER

I have dealt, I fear, much more briefly than they deserve, with the affairs of our bank because I am anxious to devote as much space as possible to the new turn in monetary policy and to try to make clear that, however painful it may be, it does hold out hope for our future economic recovery. Before beginning my survey, however, I want to emphasise, particularly at this moment, that my remarks are made in no partisan spirit. The simple fact is that our national standard of living, our daily bread, is in more acute danger than ever before in our long history, whether in peace or war. Unless we can learn to pay our way abroad, then, as Mr. Butler very truly said, we shall before long find ourselves, "bankrupt, idle and hungry." Views may differ about the steps which must be taken to ward off that very real threat; what is important, as Mr Gaitskell urged last October, is that arguments should be appraised on their own merits, that we should argue it out "peacefully, fully and if possible rationally and calmly."

To the ordinary citizen, the crisis in our overseas payments may well appear to have come upon us out of a clear sky. That is not so. Twelve months ago, the danger signals were already plain for those prepared to heed them. Since the outbreak of war in Korea, the prices of our imports have been bounding upwards and the greater part of this rise had still to be reflected in shop prices. A sharp rise in the cost of living was thus inevitable and was bound to provoke wage demands which if conceded would in their turn impart a fresh twist to the price spiral. With rearmament beginning and taxable capacity already strained to the limit, there were all the makings of an inflationary upsurge far swifter than the creeping inflation that had been steadily reducing the purchasing power of our money. Without a curtailment of public spending that would involve the reversal of cherished policies the purchasing power of the community could not, as I argued, be kept within reasonable bounds.

Even twelve months ago, therefore, the situation was already one of great danger. For if there is one lesson of economic experience which admits of no dispute, it is that a country in which inflation is rampant will always experience the greatest difficulty in balancing its overseas payments.

DWINDLING RESERVES

The present crisis cuts even deeper than those of 1947 and 1949, because this time our unbalance is not confined to our dollar accounts; it involves our payments with the whole outside world, including our partners in the European Payments Union and even our fellow members of the sterling area. Nevertheless, our most immediate danger lies, yet again, in the dangerously low level of our still dwindling gold and dollar reserve.

In this respect the balance of payments remained, to outward appearances, reasonably healthy up to the middle of last year, when the reserves rose to their postwar peak of $3,867 million. What, then, accounts for the subsequent *débâcle*, in which well over a third of this entire reserve has been lost again within the short space of six months? Among the combination of factors responsible, one of the most important has been the abrupt decline early in 1951 of American purchases of wool, rubber and tin, which in turn brought their prices down again with a run. The export earnings of the overseas sterling area have thus fallen sharply, while on the other hand the prices of most of the goods which the sterling area imports have remained at boom levels.

This particularly adverse relationship between import and export prices has doubtless been the largest single cause of the heavy gold losses that brought us so perilously near to the final disaster of a collapse of sterling. Does this mean that the whole crisis has been due to influences entirely beyond our control and completely independent of our own internal policies? By no means.

REARMAMENT IMPLICATIONS

It was quite clear that in a rearming world the prices of metals and other commodities needed for defence were bound to remain high. To balance our overseas accounts without an impossibly large increase in exports some reduction in imports for civil consumption was therefore imperative. Unfortunately, our internal policies were not calculated to achieve this. During the first nine months of the year the United Kingdom—which imports as much as all the other members of the sterling area taken together—actually increased the *volume* of its imports by one-seventh compared with the corresponding months of 1950.

To some extent, admittedly, this increase represented the replenishment of stocks which had been allowed to run down in the months after the outbreak of war in Korea. For the rest, it is plainly associated with the expansion of some 3½ per cent. in the volume of home consumption during the first half of the year. This in turn affords clear proof of the inadequacy of the financial measures that were intended to bring about an actual curtailment of consumption in order to make way for the demands of rearmament. In the event all forms of expenditure—consumption, investment and public—have been rising simultaneously. This has been too much for our rigid and overloaded economy. The gap between these excessive total demands and our limited home production has been filled by imports; in effect, the surplus spending power which could not be satisfied at home, even at ever-rising prices, has found its way abroad.

STERLING AREA STRESSES

Throughout the remainder of the sterling area, too, imports have been rising—sufficiently so, in many cases, to turn a former dollar surplus into a dollar deficit in recent months. It was indeed only to be expected that the enormous rise in the export earnings of these countries would translate itself into an increased demand for goods, and that if these were not forthcoming from the United Kingdom they would be obtained elsewhere. During 1950, this country maintained an export surplus to the rest of the sterling area more than double our deficit with the dollar area and much greater than the overseas sterling area's own dollar surplus. That was a healthy and normal situation—the familiar triangular method of settlement. During the first half of 1951, on the other hand, sterling area countries were no longer being paid for their dollars, for the most part, in goods and services but in I.O.U.s; their sterling balances, in the aggregate, mounted rapidly. In the next stage—the second half of the year—our sterling liabilities fell again, but only because the overseas holders of these balances were drawing upon them to pay for imports from outside the sterling area; the I.O.U.s were being presented for payment.

All this is placing a great strain on the cohesion of the sterling area. If pounds cannot be made freely convertible into dollars, it is doubly important that they should be freely convertible into goods, and at competitive prices. Nothing, of course, would do more to lessen these dangerous tensions within the Commonwealth than the restoration of free convertibility into dollars, at least on current account. At the moment, admittedly, this is not practical politics and indeed seems as far from achievement as ever. None the less, convertibility remains an essential object of policy. For years past, the discriminatory restrictions on dollar imports made necessary by the precarious level of our reserves have been a thorn in the flesh of our American and Canadian friends. In their interests scarcely less than ours, it is devoutly to be hoped that means will be found of effecting that reinforcement of our reserves needed to make sterling once again a strong and a free currency.

TIME NEEDED

But first the immediate crisis must be met. While I am confident that the measures now being taken are precisely what is needed to put us on our feet again, time is needed to achieve results, and meanwhile our reserves have already been brought very low.

Two facts will have emerged clearly, I trust, from this brief survey of the nature and origins of the crisis. First, that when the new Government assumed office they were confronted with a situation which if not desperate was desperately critical. Secondly, that this critical state of affairs cannot be cured unless domestic inflation is checked. To some extent, the programme adopted by the new Government follows the familiar pattern of previous crises. In particular, imports are to be reduced. This is, of course, a pure emergency expedient which helps us to gain time but does nothing to remedy the underlying situation responsible for the unbalance. Experience in earlier crises has shown that when inflation exists it is difficult to cut imports without at the same time depressing exports; for the money that would have been spent upon imports will still be spent and in the process we shall either consume at home goods that ought to have been exported, or divert labour and materials away from the export industries to the service of the home consumer.

RETURN TO MONETARY DISCIPLINE

In one respect, however, the remedial measures adopted do differ from those employed on previous occasions—and it is fundamental. I refer to the decision to reinforce the physical controls by the use of monetary measures. This is the most important change in our official policies for many years past and holds out the first real hope of escape from the inflationary quagmire in which we have been floundering since the end of the war. Even so, the new measures should not become the subject of acute political controversy, for in October Mr Gaitskell stated that further action would be required not only

through direct controls but "as far as practicable through credit restriction." What is in dispute, therefore, is nothing more than the limits of what it is practicable to achieve by means of restrictions on credit. That is a practical question about which men may reasonably differ, but it cannot justly be presented as a basic difference in economic or political philosophy; it concerns merely the means to an end, not the end itself, which by universal agreement is to stop inflation.

THE INFLATION PROBLEM

Let me present the inflation problem as I see it. First, the fact that prices have been spiralling upwards for years means that spending has been out-running production. Secondly, if people have, in this sense, been spending too much, it is because they have had too much money, in relation to the goods available. And this in turn means—since balances held on current account or deposit account with the banks are by far the most important form of spending power in a developed community—that bank deposits have been excessive. It is true that for some time past the rate of expansion in bank deposits has been very small; since 1947 the growth in incomes has been made possible by a more rapid turnover of existing bank deposits rather than by further additions to their total. Nevertheless, there has at all times been more than enough money in existence to feed the inflation; what we have needed has been an actual reduction in the volume of deposits. I am sure that this is absolutely common ground between the parties, since two policies of the former Government—that of budgeting for large surpluses and of discouraging certain types of bank lending—were clearly designed to keep down and if possible to reduce the volume of deposits.

NO FAILURE BY BANKS

How is it that these policies did not achieve their purpose? Consider first the discouragement of certain types of bank lending. As we all know, bank advances have risen in spite of this. There is no suggestion, to my knowledge, that this reflects any failure on the part of the banks to exercise the restraint which had been urged upon us; on the contrary, successive Chancellors have readily acknowledged the co-operation they have received from the banks. Indeed, the fact that personal and professional loans—the category most likely to reflect the incidence of official policy—have steadily declined from some 30 per cent. of the total to only 21.6 per cent. in the latest returns testifies to the restraint which has in fact been exercised.

The difficulty is that when costs and prices are rising fast it is impossible, with the best will in the world, to prevent an expansion in the money total of advances if legitimate trade is not to be hampered. Thus, even now that the restrictions on lending have been intensified, it will be surprising if the total of advances does not continue to expand for a few months. Once the germ of inflation is in the system, the utmost restraint in bank lending cannot be expected to eradicate the inflation by itself.

Bank advances, then, were bound to rise. It follows that if deposits were to be reduced, this could only be made possible by a more than equivalent reduction in other bank assets. It is true that during the two years to October, 1951, there was a substantial contraction in those assets of the clearing banks (such as Treasury Bills and Treasury deposit receipts) which form the counterpart of Government borrowing; but to a large extent that was undoubtedly a reflection of the heavy external deficit and the Exchange Account's losses of gold, rather than of a strong budgetary position. It was in any case more than outweighed by the expansion in advances over the same period, so that deposits rose instead of falling.

DEPOSITS AND CASH RATIO

But, it will be objected, the volume of bank deposits is rigidly linked, by the maintenance of an 8 per cent. cash ratio, to the amount of bank cash reserves. If the authorities were anxious to keep down the volume of deposits, could they not easily have done this at any time simply by refusing to make available the additional cash needed to carry any additional deposits? That is indeed so. But the adoption of this method was ruled out, until the recent change of policy, by the determination to prevent any rise in the Treasury Bill rate from the exceptionally low level of around ½ per cent. at which it had been pegged.

Let me show by a simple—perhaps oversimplified—example how this operated, always bearing in mind the 8 per cent. cash ratio to which the banks adhere. If bank advances rose by £100 million, increasing deposits by the same amount, the banks would have to keep an additional £8 million of cash, and to obtain it they would, other things being equal, restrict their purchases of Treasury Bills. This would immediately leave the discount market short of funds and would therefore tend to drive the Treasury Bill rate up. But other things were not equal. At the first sign of stringency the so-called "special buyer"—the official dealer—intervened in the market as a buyer of bills, paying for them by drafts on the Bank of England. The proceeds of these would swell the clearing banks' balances at the Bank of England which, together with our till money, make up our cash reserves. Before the war, the banks would normally have had to reduce investments to finance the additional £100 million of advances, a process that would restore deposits to their original level. Instead, they now found themselves automatically provided with the additional £8 million of cash with which to carry the advances and the rise in deposits could go gaily on.

TWO SIGNIFICANT STEPS

To end this system by which the Treasury Bill rate was pegged at ½ per cent. was thus the first indispensable step towards the resumption of control by the authorities over the supply of bank cash, and therefore of control over the volume of bank deposits. That has been done, at the cost of a rise of no more than ½ per cent. in the Treasury Bill rate. At the same time, two other steps of great significance have been taken. The first was the issue of £1,000 million of Funding Loan, a large share of which has been subscribed by the banks in exchange for Treasury Bills. The result has been to effect a sweeping reduction in our money market assets, which have been brought down very near to the level which the banks have regarded in the past as the minimum needed to reinforce the cash reserves.

This is of fundamental importance; for it is a move towards the restoration of the pre-war situation in which a rise in advances would normally be offset by a compensating change in the investment portfolio and for that reason would normally leave unchanged the volume of deposits. If, as is to be expected, still more Treasury Bills are retired in the next few months out of the very large tax payments which flow into the Exchequer at this time of year, the situation later in the year may not be very different from that we knew before 1939. In the case of our own bank, the combined total of our cash, money market assets and Treasury deposit receipts was equivalent on December 31st to 34.4 per cent. of deposits.

Meanwhile, the banks have been requested to give still greater emphasis to the former policy of refusing to make advances of an inflationary character, and at the same time to accord priority in their lending to the needs of essential industries engaged on rearmament work, on the production of exports or on other activities of the first importance, such as the production of food. In the new situation, the priority accorded to these essential activities will necessitate greater restriction of credit for all less essential purposes, though it goes without saying that we shall continue to treat every customer with the utmost consideration which is compatible with the carrying out of national policy.

OBJECTIVES OF THE NEW POLICY

All this, in brief outline, is what is meant by the use of monetary weapons. Next I must try to explain precisely what the policy is designed to achieve. How will it help to cure the many economic ailments that we have contracted during the years of inflation? The intention of the authorities is, by keeping a tight rein on the supply of money, to reduce spending. Hitherto, though many sections of the community have been feeling the pinch of higher prices, the nation as a whole has had money to burn; henceforth, in this as in more literal respects, there will be a shortage of fuel.

To curb spending is, of course, also the object of such physical controls as the restriction of imports, the allocation of steel, the issue of building licences. Such controls are to continue for a time at least. But there is an important distinction between physical controls and the monetary restraints. When the curb on spending comes from the fact that each of us, individually, is forced to economise, the decisions are taken by the person who in each case is most closely affected and has most knowledge of the relevant facts, including his own circumstances and preferences. The classification of objects of expenditure into "essentials" aid "inessentials" may be convenient administratively, but it is none the less purely arbitrary; beyond a certain point these are question-begging terms.

WISE HANDLING OF MONEY

It is this distinction—the decentralisation of economic judgments—which, in my view, makes a properly working monetary system infinitely more efficient, and even more democratic, than rationing and controls as the normal method of regulating our economic life. When the monetary system is functioning properly, costs and prices indicate correctly the true scarcity of goods and services; the price system provides us with a rational guide to economic conduct, and we no longer have to depend upon the arbitrary guesses of well-intentioned but necessarily far less than omniscient planners. I am far from asserting that this classical doctrine can be applied blindly; but in this generation we seem to have forgotten the rule and remember only the exceptions. The invention of money was one of the great steps forward in the development of mankind. Wisely handled, the monetary mechanism is an instrument of great delicacy, yet great power. It has been thrown out of gear and must be set to work again.

How far must this restraint of spending be carried? The basic rule is that it is one man's spending which creates another man's income. The object, clearly, is so to restrain expenditure that incomes as a whole at least cease to expand, except as the counterpart of increases in output. There is no question of seeking abruptly to bring down prices by cuts in wages or the deliberate creation of mass unemployment. Once an inflation has taken place, it is almost impossible to put the clock back; deflation carried to extreme lengths can be as great an evil as inflation and, like inflation, can give rise to much social injustice and hardship.

INCREASED PRODUCTIVITY THE SOLUTION

If the cost of living is to be brought down again, the reduction must come from other factors than cuts in money earnings. A fall in import prices would help, but it would clearly be unwise to count on this in the immediate future. The real solution must be an all-round increase in productivity. Nobody could contend that in the hot-house atmosphere of inflation our labour force has either been distributed to the best advantage between industries or has been working flat out. Now the windows are open again and the invigorating effect may work wonders.

All this may seem very remote from specific problems of great urgency, such as the need for more coal, the need to fill the half-million or more vacant jobs in defence industry, to curb imports and step up exports. In reality, it has the closest possible bearing on all such matters. To halt inflation admittedly will not solve all our problems overnight, but it is the first indispensable step and may well open up the way to a solution of problems that have seemed literally insoluble so long as inflation has persisted.

If the inflation is halted, the community as a whole will find itself in the position of a prudent housewife deciding how best to spend a strictly limited family income. If the prices of essentials rise, she is left with less to spend on non-essentials and must buy less of them; and we all know that rises have already taken place or are impending in the prices of many undoubted essentials, such as fuel and transport.

DESPERATE NEED OF COAL

How does this affect the particular problems I have mentioned? Everybody knows that we desperately need more coal. This means that we desperately need more miners and more output from every man in the mines. A few weeks ago the coalminers were awarded the largest increase in wages in the history of the industry. If this succeeds in attracting more men to the mines, no money could be better spent. But under the inflationary conditions we have known hitherto there could be little prospect that the wage increase would in fact achieve this purpose.

This is because under inflation every industry, however questionable its contribution to the national wellbeing, is able to earn abnormally high paper profits. Employers even in the least essential industries are thus able to offer good wages and anxious to hang on to their workpeople even if trade is temporarily slack, while the employees in their turn have no incentive to give up their secure billets to seek more essential work, possibly more arduous, less conveniently near to their homes.

So, in a state of inflation, the award of higher wages to the coalminers, which is perfectly justified and indeed highly desirable from the national point of view, is likely to provoke demands for higher wages in other industries; and if these are conceded, as in such conditions they must be, this will defeat the whole purpose of the original award. Mining will soon cease to be, as was intended, more attractive than comparable occupations; the higher wages paid to other workers will not only reduce the differential in money wages between mining and other employments; it will raise the prices of the things the miner has to buy and lower his real standard of living.

EFFECT OF STABLE INCOMES

Once the total of money incomes is kept stable none of these consequences will follow. Having to pay more for its coal, the community will have less to spend on other things. If the price of those other things is raised by wage demands, the workers concerned will face a still greater shrinkage in the demand for their products. It is this shrinkage in the demand for their products, rather than curtailment of bank credit, that is likely to be the main reason for any contraction in the inessential industries during the months ahead.

Once inflation is halted, we need no longer fear a wages spiral. There need be no inhibitions about granting higher wages in the industries to which it is sought to attract workers; and the trade unions will be free to resume their proper and valuable function of ensuring that their members obtain the highest wages that the traffic will bear. Nothing in the new policies, therefore, can be considered inimical to the interests of labour, and it is a great source of national strength that the T.U.C. have promised their co-operation to the new Government. Unless all sections can in fact pull together, we shall sink together.

TRANSFER OF LABOUR

In discussing the particular example of coal, we have answered by implication the more general question of how to effect the necessary transfer of labour to rearmament industry and the essential industries as a whole. Given an end to inflation, the people will no longer have the money to spend on the products of the less essential industries. Profits, turnover and employment in those industries will contract, as it is desirable in the national interest that they should. Workers will be released to make their way to the expanding defence and export industries. And with half a million or more vacancies to be filled in the essential sector, there can be no danger that the contraction elsewhere will give rise to any lasting unemployment. I recognise that even transitional unemployment means hardship for the individuals concerned, but the alternative—if the necessary redistribution of labour is not effected—is mass unemployment due to inability to buy raw materials.

By thus loosening the rigidities of our economy, the halting of inflation will help at the same time towards the supreme objective, which is to rectify our balance of payments. Indeed, the elimination of excessive monetary demand will assist in a number of ways. We have already seen that the untimely increase in the volume of imports during 1951 was due at least in part to the fact that home consumption was rising when it should have been falling. The inflated home demand for goods and services must also have been a factor impeding the expansion of exports. A slackening in home demand will not enable us to sell goods abroad if the markets for them do not exist or if we are unable to meet the challenge of reviving Japanese and German competition; but it will at least release goods for our exporters to try to sell abroad.

STIMULUS TO SAVINGS

These, then, are some of the reasons why I believe the determination to set to work once again our rusty and forgotten monetary machine to have been a decisive turning-point. They are by no means the whole story. I have concentrated on one simple aspect of the question: the fact that if incomes are limited higher prices in one direction mean less spending in other directions, and some of the beneficial consequences that flow from that fact. But in this sphere above all nothing succeeds like success. When prices are rising, this very fact makes people less willing to save, more anxious to spend—whether on the purchase of a new hat or the building of a new factory—before prices rise against them. Inflation feeds on itself. In the same way, the halting of inflation can transform the whole atmosphere. Given a reasonable prospect of stable prices, consumers, business men and even public authorities will be more willing to postpone inessential expenditure. Still more will this be the case if money is no longer cheap and abundant and if the expenditure in question must be financed by the sale of securities the prices of which have been depressed by the adoption of the new monetary policy.

To end inflation, in other words, is the greatest conceivable stimulus to saving; and a revival of saving, in turn, is one of the few things which would make possible that reduction in taxation which above all else is needed to restore incentive and stimulate production. That does not, of course, make it any the less imperative to curb the excessive public expenditure which is at the root of the inflation. In face of rising prices and rising defence expenditure, however, it will be no small achievement to keep budget expenditure at its present level. Some remission of taxation may nevertheless be possible if personal saving can be revived; for it would then no longer be necessary to aim at huge budgetary surpluses.

CONCLUSION

Let me recapitulate the objectives of policy:

To preserve the spending power of the £ and to halt the rise in the cost of living.

To effect as painlessly as may be the transfer of labour to essential industries.

To rectify the fundamental weakness in our balance of payments.

The people, sheltered by subsidies and other devices from the play of ultimately inescapable economic forces, remain for the most part unaware of the dangers with which we are all threatened. I appeal to everyone, particularly to those who, for whatever reason, distrust or fear the use of restrictive monetary policy, to study the case I have tried to make. He who, from ignorance or prejudice, obstructs such measures now will be taking upon himself a terrible responsibility.

I would conclude with a final word about rising prices. The inconvenience and hardships people are suffering are considerable and nobody should underestimate them, nor condemn out of hand the efforts anyone may make to try to maintain his standard of living. But there is this special danger in the present situation. Many people think of a further dose of inflation as just a little more of the same medicine as before, if perhaps a little stronger. It would not be like that if prices were allowed to get out of hand. The great mass of people in this country, both salary and wage earners, have no conception of what their sufferings would be if we had runaway inflation. The whole complex structure of our daily life, carefully built up over long years, could be destroyed almost overnight. It has happened in other countries—we all remember the mark in Germany after the 1914-18 war—but it must not happen here.

We must all play our part, uncomfortable though it may be, in keeping prices under control, and this is where the collaboration of the T.U.C. may be decisive. That great organisation will, I am certain, use every means in its power to bring home to its members what runaway inflation means. Inflation *must* be halted. The process will be painful—it has already proved so to the banks, who have suffered tens of millions of depreciation in the market value of their gilt-edged investments. But for the countless victims of inflation—the millions whose incomes have not kept pace with mounting prices—the return to some degree of monetary discipline holds out the first real hope of a tolerable future.

MIDLAND BANK LIMITED

DETERIORATION IN NATION'S ECONOMIC HEALTH

URGENCY OF REMEDIAL ACTION NECESSITATES ALL-ROUND CO-OPERATION

ILLUSIONS CREATED OR FOSTERED BY INFLATION

STATEMENT BY THE LATE CHAIRMAN

The one hundred and sixteenth annual general meeting of Midland Bank Limited will be held on February 15 at the head office, Poultry, London, E.C.

The directors deeply regret the loss, by sudden death, of their distinguished chairman, The Most Hon. The Marquess of Linlithgow. In the circumstances, they feel it would accord with the wishes of the shareholders that his statement, which was at an advanced stage of preparation at the time of his death, should be circulated without amendment. Extracts therefrom follow.

In my statement a year ago I noted the progress which seemed to have been made, on the test of generally accepted data, towards equilibrium on the balance of payments of the United Kingdom and the sterling area as a whole; at the same time, however, I suggested that the prime cause of anxiety for the immediate future was to be seen in the continuance, and perhaps intensification, of inflationary pressure within the national economy. The close connection between these two elements in the situation has been abundantly demonstrated in the course of events over the past year. Inflationary pressure has found expression in an accelerated shrinkage of the domestic purchasing power of the pound, while a dramatic change has manifested itself in the international position of sterling. The balance of payments of the United Kingdom, and indeed of the entire sterling area, has undergone a sharp deterioration; the steady building up of gold and dollar reserves was succeeded by an alarming drain, accompanied by a reversal of the creditor position earlier established in the operations of the European Payments Union.

It is a difficult time at which to comment constructively on such a manifestation of weakness. Various measures aimed at arresting the deterioration and strengthening the bases of recovery are being applied, and until a more comprehensive plan of action has been worked out than could have been elaborated at this stage it would be premature to pass judgment and something less than helpful to press detailed proposals. What can perhaps be done, by way of constructive assistance to those responsible for shaping policy and action, is to make some contribution towards a wider understanding of the nature of the difficulties that must be overcome before economic health can be fully restored. No one, surely, can be so complacent as to suppose that such a task is redundant or that the educative process has been completed by the impact of the series of economic "crises" experienced since the end of the war.

THE SETBACK OF 1951

The record of 1951 is a disappointing setback to the high hopes that had been engendered by a period of comparative steadiness and reinforcement, supported by American aid and fostered by the opportunities in export trade afforded through devaluation and an expansion of world demand. To some extent the brighter prospects were frustrated by the added strain put upon the economic system by growing international political tension. The resultant pronounced rise in world prices of many primary commodities served to enlarge the gold and dollar resources of the sterling area; on the other hand, it combined with the secondary effects of devaluation to bring about a marked increase in the cost of many raw materials used in British industry; and the all-round levering up of industrial costs has only latterly been slightly relieved by some decline in primary prices from the peak of the upward movement. The necessity of swift rearmament within a concerted plan of Western defence has imposed upon our productive capacity a requirement the magnitude of which has perhaps scarcely yet been generally appreciated. With that superimposed requirement, however, it has become clearer than ever before that we in this country have been living under a condition of continuous overstrain of economic resources. The quickened depreciation of the pound and the violent disturbance of the balance of payments are correctly to be regarded as more than ordinarily conspicuous and convincing evidence of a long-standing condition. The new demand upon the national resources tipped the scales, in an unsteady balance, so that the weight of excessive demand made itself apparent in unmistakable terms.

I tried to show last year that the prospective rearmament demand would call for a substantial diversion of growing productive resources, and suggested that it ought to be brought about primarily at the expense of current consumption. The records show that in fact this redirection of productive effort did not take place in the smooth and orderly manner that might have been hoped for—indeed, the volume of consumption seems to have been maintained in 1951 at the previous year's level—and the failure must be attributed, on the evidence, to the continued inflexibility of our economic system. In an economy like ours, peculiarly bound up with international trade and therefore sensitive to abrupt changes in world conditions, a high degree of adaptability is required; and this is all the more necessary when, as throughout the postwar period, productive capacity is fully engaged, with little or no slack to be taken up in response to a sudden expansion of a particular element of demand. Even before rearmament became an important factor, there had been continuing pressure to take more out of the national product in consumption, on governmental and private account together, than would allow for all the capital reconstruction and improvement that might have been justified under other conditions. The rearmament programme introduced a new competing demand which involved considerable recasting of the pattern of production as well as substantial diversion of the product of industry away from consumption or capital construction. The required adaptation was not forthcoming.

Apart altogether from familiar price indices and figures of gold reserves and balance of payments estimates, evidence of this lack of adaptability is to be found in a variety of forms. It can be seen, for one thing, in the excessive demand for some kinds of labour, contrasted with a shortfall in other branches of industry. There are reported to be several hundreds of thousands of unfilled vacancies listed at employment exchanges, arising largely in undertakings directly or indirectly concerned in defence contracts, while it is understood that workers are being retained in some places in excess of current requirements for fear of inability to recruit when restored supplies of raw materials, re-expansion of consumer demand or other factors make full running possible again. In contrast, many thousands of employees elsewhere are working short time, some because of a shrinkage of current demand for their products, others because of an irregular flow of materials. Clearly, skilled workers cannot be switched freely and swiftly from one kind of process to a totally different occupation; but there seems to have developed too close an adhesion of the particular man to the particular job—a degree of rigidity in the supply of labour which is traceable to many factors, including housing difficulties and travel problems, as well as direct inducements embodied in individual terms of employment. Further evidence of strain is to be seen in a reversion in some trades to lengthening delivery dates and renewed difficulty in accepting orders for export markets. Irregularity in the supply of materials, not to mention fuel and power, and immobility of labour are incontrovertible evidence of the sustained pull of excessive demand on limited, though still growing, productive capacity.

Symptoms of strain are to be seen also on the financial side of affairs. Year by year, the budget has been so framed as to exert a counter-inflationary effect by withdrawing monetary resources from consumers and those who might otherwise set up undue demands for capital goods; but every addition to the burden of taxation has entrenched further upon the ability and willingness of the individual to maintain his personal savings, and has thus to a large extent defeated its own purpose. The incomplete effectiveness of counter-inflationary budgets—given an already high level of taxation—has been reflected in the reappearance of the spiral of costs and prices. In the first eleven months of 1951 nearly 12 million workers were affected by rises in wage rates, computed to have added roughly 7 per cent. to the national wages bill, and these are far larger aggregates than in any preceding year. Similarly the rise in the index number of retail prices has been more pronounced than over any equal period since the end of the war.

REMEDIAL MEASURES

It would be absurd to look for a single remedy for overstrain and rigidity resulting from this complex of factors. Direct curtailment of public and private capital construction has been resorted to more than once already, as has direct restriction of imports; and no one supposes that these alone will this time be more lastingly effective than in the past. There is room for fiscal measures, though at this stage probably only by reallocating the burden so as to increase the incentives to work and resourcefulness rather than by aiming at a more powerful impact on spending power as a whole. Relief, too, may be found by economies in current Government expenditure. Financial controls, especially over borrowing for capital and other transactions, have again been tightened in pursuance of the general purpose; and the new monetary conditions, referred to in more detail in later paragraphs, may be expected, through their effect upon the lending powers of the banks, to defle

some of the less urgent demands upon the nation's productive capacity. Beyond all these measures, however, is the need—progressively insistent for many years stretching back into prewar times—for greater elasticity in the economic system as a whole and the requirement, which has characterised more particularly the postwar phase, of a general slackening of tension throughout the productive and trading organism.

Government measures, however wisely conceived and judiciously applied, cannot alone bring about this restoration of the quality of responsiveness and adaptability. Complete and speedy success, bringing its benefits to all sections of an inter-dependent community, requires the full co-operation of all—co-operation springing from conviction as to the nature of the requirements and the urgency of remedial action. Whatever Government may be holding office for the time being, it must for this purpose be able to count upon enlightened support for a plainly expounded policy, fair in its incidence and designed to serve the national interest as a whole. On this account encouragement is to be derived from the statesmanlike declaration by the General Council of the T.U.C. of its readiness to co-operate with the new Government in finding "practical solutions to the social and economic problems facing this country" and to advocate policies which it "believes to be in the best interests of the country as a whole." Nowhere is general understanding of the basic issues more necessary than in relation to monetary policy, and perhaps the most useful groundwork that can be done in this field is to identify and expose in the plainest possible terms some of the illusions created or fostered by inflation. They seem to me to group themselves conveniently under four headings.

ILLUSIONS FOSTERED BY INFLATION

The first may be called the illusion of welfare, which springs from the fact that inflation is usually accompanied by over-full employment with rising incomes—incomes swollen not only by successive increases in wage rates, but also by a variety of incentive payments and amenities and by opportunities of work at overtime or other special rates. Too often it is forgotten that the inevitable concomitant of inflation is a cumulative rise in prices, including even the basic and subsidised living costs. There is a tendency, moreover, to overlook the growing number of cases of hardship that arise where incomes are relatively, or indeed quite, unresponsive to a rise in the cost of living. Yet another incident of the general process is that the burden of taxation tends to grow, if only because of the diminution of the real value of income tax allowances and the movement of increasing incomes into the range of high tax rates. Thus inflation accounts for the fact that, despite successive postwar Budget reliefs for smaller incomes, the number of people paying income tax to-day is larger than ever before. Taking all things together, then, it is justifiable to say that the nominal enlargement of welfare is to some extent illusory. To illustrate the danger of the illusion, which became apparent in the history of not a few countries after the first world war, it would be possible to have in the United Kingdom several tens of millions of millionaires; but it would be a country well on the way to ruin, and many of its citizens, though millionaires, would already have been ruined.

Secondly, there is the illusion of security. The loss of value of accumulated savings, through long-continued inflation, has latterly become widely appreciated and may indeed have been a deterrent to fresh saving out of current incomes, thus giving added impetus to the inflationary trend. Less widely apprehended are the similar effects upon the adequacy of personal provision against misfortune, as through life insurance and contributory schemes for the protection of widows and orphans. All such arrangements presuppose a more or less stable value of money, and the momentary satisfaction to be derived from a growing income in terms of money is all too little to set against the risk that provision for dependants which seemed adequate when the arrangements were made should turn out to be so deficient, when the need arises, as to condemn them to uncovenanted hardship. The same observation would apply to pension schemes under which some part of an individual's immediate spending power is forgone for the sake of an income in old age which may turn out to be far smaller in terms of necessary goods and services than he had been entitled to expect. Closely related to such private frustrations are the inroads made by inflation upon social service provisions, exemplified by the severe cut in the value of the family allowance since the payment of five shillings a week for each child after the first was enacted by Parliament in 1945.

A third count in the indictment of inflation is on the ground that it creates an illusion of greater progress than is in fact being achieved. This is well illustrated by the tendency to treat a rise in such figures as the total of bank deposits or the turnover of trade as measures of business expansion when they may reflect nothing more than a rising level of prices and costs. Under similar conditions a growth of national income is deceptive until the figures are adjusted on to a common price basis, while the amounts applied out of current income to the improvement of economic and social capital may likewise be overstated. Compilers and interpreters of such statistics for public information find it a hard task to present the figures in a way that will defeat their inevitable tendency to deceive, and almost impossible to guard against the ever-present risk that less skilled commentators may be also less scrupulous to present the statistics with all necessary qualifications. It is so much easier to take the figures at their face value.

Closely allied with the illusions of welfare, security and progress is the illusion of prosperity. In times of inflation business profits, as ordinarily computed, show an expansive trend, and Government revenue from the taxation of profits is correspondingly buoyant. But just because profits are easier to make than in more rigorous times the incentives to economical production and distribution are weakened. In reality, the profits themselves are largely illusory. The generally accepted system of accountancy, sanctioned by law and by tax practice, presumes a stable monetary unit, having the same value over a long period and for all business purposes. When, as happens in an inflationary period, various items of running costs and revenues, liabilities and assets are reckoned in units of different value the upshot of the whole accounting exercise is falsified. As is now becoming clear to businessmen if not to the public generally, growing nominal profits have come to represent in part the "gain" resulting from the rise in values of stocks of goods—which will have to be replaced, when sold, at the higher level of prices—and from applying to the replacement of fixed assets a depreciation allowance which will go only part of the way to finance replacement at a much heavier monetary cost. In such circumstances a wise business management will set aside, to additional reserves, a large part of the accounting "profits," but the illusion has already been created by the announcement of increased profits, and tax has already been levied on this fortuitously swollen figure. Thus some part of the tax on profits—and perhaps even some part of the dividend paid out—may in effect have been levied on the capital in the business, while true profits, so far from increasing, may in reality have been shrinking.

The process of inflation in this country is evidence of a persistent attempt to do more, by way of consumption, capital construction and defence, than our current productive resources and effort would justify—an attempt, that is, to live beyond our means. We need, however, to note that productive resources can be overstrained either—or both—because the demands made upon them are too large or too highly concentrated at particular points, or because the resources are not deployed in the best possible way. From this it follows that a relaxation of the strain does not necessarily call for a ruthless curtailment of demand; it may be brought about largely or wholly by a better use of available resources, or, in the accepted phrase, by higher productivity if within this term be included the provision of basic services essential to a regular flow of raw materials and components throughout industry and, in addition, a ready adaptability to changes in the composition of demand. Thus we are brought back to the fundamental need of a change in the whole bodily condition of our economic organism.

CORRECTIVE POLICY

It was no doubt with this need in mind that the Chancellor of the Exchequer, when announcing changes in monetary arrangements early in November, spoke of the necessity of "producing the right financial climate" in order that the Government's "intention to make and keep sterling strong" should be carried out. It was reassuring to note in the same statement clear recognition of the fact that drastic unregulated deflation is no proper corrective for inflation. True, it reverses the trend of monetary conditions; but experience between the two wars, here and elsewhere, showed that it creates as many grave difficulties, multiple frictions and gross inequities as it can ever remove by the arresting of inflation. Too often the attempt has been made to go back in our tracks—with disastrous results. I am not sure that the use of the word "disinflation" as something readily to be distinguished from "deflation" is helpful to an understanding of what is required; but there is sound reasoning in the attempt to bring about the removal of the inflationary element of demand, so as to achieve a steady equilibrium in the monetary system, while avoiding resort to indiscriminate and ruthless monetary deflation. The one course of action, recognising that much of what is done cannot be undone, is designed to arrest the inflationary process and re-establish a firm foundation for the future advancement of the general welfare; the other creates a whole new set of violent disturbances and distortions, and thereby further postpones the establishment of a healthy basis for a sustained high level of economic activity. Uncontrolled deflation ignores the dividing line between full employment and serious unemployment; what is called disinflation—or, with due regard for the significance of the adjective, controlled deflation—if skilfully managed, is carefully regulated with close and continuous regard for the dividing line between over-full and full employment, between debilitating strain and continuous healthy activity.

Monetary action of this sort, however, cannot safely be charged with the entire responsibility for restoring health to our economic system. As already indicated, it has properly to be regarded as one part of a general assault on rigidity and inflexibility throughout the economic system. There lies the main guiding principle for action. If it could be generally accepted, as the logical outcome of intelligent understanding of the nature of our ills, then those responsible for directing the course of national affairs and setting the tone of business policies would be well on the way to restoring vigorous, lasting health to the economic system. Without

general agreement on guiding principles—or if public attention should be distracted by non-essential differences—the ultimate restoration of economic health can come about only by way of incalculable hardship, disruption and disaffection.

RECENT MONETARY MEASURES—EFFECTS ON THE BANKS

In fulfilment of the Government's "intention," as just quoted in the words of the Chancellor of the Exchequer, among the first measures announced was an attempt to bring about "a clear change of emphasis" in monetary conditions. It was made evident that the banks would have an important part to play in this reshaping of the financial background of public and private business, and their conception of the requirement thus placed upon them was plainly expressed in the "warning" and "appeal for co-operation" issued to the public through the press at the end of November. While, to quote the Chancellor again, "any sharp attempt to try to switch to drastic deflation would be unwise," the aim is to establish conditions in which credit will be available only for essential purposes and only in the minimum amounts indispensable for such purposes. The changed position of the banks, with their liquidity sharply reduced by the funding of Treasury Bills and with a closer hold by the authorities on the cash base, and the new official statement of the standards to be applied to the purposes for which bank credit should be made available are both directed to this end. The banks will be faced with many difficulties in carrying out this policy, but, as hitherto, can be relied upon to give the authorities their full co-operation in making the policy effective for the long-run benefit of the national economy. At the same time, the needs of essential production and trade can assuredly count upon receiving the most sympathetic consideration.

It is perhaps not surprising that critics of the Government's policy should have aimed their fire largely at the banks, notwithstanding their innocence of any part in shaping it and the fact that the banks had long been receiving an inadequate return from short-term Government borrowing. The particular presumption which is held to bring the banks properly under criticism is that the recent all-round rise in interest rates will yield them—so it is alleged—wholly unwarrantable enrichment at the expense of the taxpayer and, more especially, the borrowing customer. The wide dissemination of this allegation and its ease of repetition and acceptance make it necessary to give an objective reply.

NECESSARY FORTIFICATION OF FINANCIAL POSITION

The monthly returns of assets and liabilities of the London clearing banks provide a basis for an enlightening piece of arithmetic. From these figures anyone can deduce that the net addition to the annual gross revenues of the banks brought about directly through the officially actuated rise in rates on various bank assets—that is to say, on their holdings of bills and the new funding stocks, together with their short loans—offset by higher outgoings in deposit interest, probably works out at about £6m. before allowing for any continuance of the upward trend in costs of operation. Of this sum, however, the amount left at the disposal of the banks would be less than one-half, the larger part being paid over to the Exchequer by way of profits tax and income tax—to take no account of any possible further taxation of profits. As for the remaining few millions of pounds, it can by no means be considered as an addition to profits freely available, if the directorates of the banks were favourable to such a course, for distribution to shareholders in increased dividends—in which event, by the way, the share taken in taxation would be automatically increased. It is common knowledge that the investments held by the banks, notwithstanding the predominance among them of securities with fixed dates of redemption in the fairly near future, have undergone substantial depreciation by the test of market prices which govern their valuation for balance sheet purposes. The clearing banks' investment holdings—practically all of them gilt-edged securities, and therefore comparatively low-yielding—even before the recent funding of Treasury Bills amounted to more than £1,550m., and a decline of only 1 per cent. in average values between balance sheet dates entails a loss far exceeding the net addition to the banks' revenue, as just computed, after taxation. If it be argued that this is no more than a book loss, unless the securities are in fact sold at market prices, the answer is that nevertheless the requirements of the Companies Act as applied by accepted accounting procedure make it necessary to write down the investments to market value where this is below the preceding balance sheet valuation. In recent years this procedure has made heavy inroads on the "inner reserves" accumulated by the banks out of taxed profits. Quite apart from balance sheet requirements, moreover, the tighter credit conditions foreshadowed by official action might conceivably enforce actual realisation of some bank investments, at market prices, in order to meet inescapable demands for credit for essential industry.

The simple exercise in arithmetic, the result of which I have just given, indicates that any likely addition, through higher interest rates, to the net income of the banks after taxation will go only a small part of the way to making good the entrenchments, due to writing down of investments, on inner reserves that have been unavoidable in the long period of rising yields in the capital market. Ordinarily, that rising trend would have been reflected in an upward course of short-term rates, but in the postwar years these have been pegged at a low level. Accordingly, the banks have been deprived of the added revenue, from the more liquid assets, to compensate for the capital depreciation of investments. The recent addition to their revenue is a belated and necessary fortification of their financial position. Just as the Government's purpose, in its monetary policy, is "to make and keep sterling strong," so it is in the interests of all that the banks of this country should maintain their record—perhaps unique in the history of our troubled times—of unquestioned stability and strength.

EXPANDING VOLUME OF BUSINESS

The volume of business passing through the bank has remained on a steady upward trend, quite apart from the larger turnover due to higher costs and prices throughout the economic system. It reflects great credit on our administrative and managerial organisation and on the entire staff at head office and branches that this growing volume of business is handled so smoothly and efficiently and with the assurance to the public of unsurpassed safety and accuracy.

While the expansion has been general, one particular branch of our work may be mentioned for its interest in relation to current monetary developments. Activity in our overseas business has been maintained at the very high level which entitles us to claim pre-eminence in the financing of international trade through London. Not only does the volume of this business constitute in itself an important part of our bank's affairs, but through it we are enabled to provide a valued service to our customers in helping to solve the many problems which confront them in their foreign trade.

NATIONAL DISCOUNT COMPANY

The Annual General Meeting of the National Discount Company, Limited, will be held on February 13th in London.

The following is an extract from the circulated statement by the chairman, Commander the Hon. Lovel W. Coke, R.N.:—

The outstanding event in the discount market during the past year was the change of policy which took place after the general election. The policy adopted by the new Government and the Bank of England to meet the critical financial situation, and to resist the inflationary pressure in the country, was through the medium of a higher bank rate and higher interest rates, together with a tighter credit control in all spheres of finance. Since these changes there has been an improvement in the margin of profit on our turnover of bills discounted. Under the changed conditions the market may be forced to borrow from the Bank of England at certain times of credit stringency, and this may tend to restrict, to some extent, the size of our portfolio.

There has been a considerable increase in our purchases of commercial bills. The turnover in Treasury Bills has been smaller. Our turnover in short-dated bonds, though not as large as in 1950, has been considerable.

After making provision for rebate, amortisation of premiums on securities (including special amortisation), and taxation, and after making transfers to contingency reserves, out of which reserves depreciation on our short-dated securities has been provided, there remains a profit of £300,256.

It will be proposed at the forthcoming meeting to pay dividends of 5 per cent., less tax, on the "A" and "B" stock, making 10 per cent. for the year on both classes.

TANGANYIKA CONCESSIONS LIMITED

MR MAURICE HELY-HUTCHINSON'S REVIEW

The annual general meeting of Tanganyika Concessions Limited, was held on January 17 in Salisbury, Southern Rhodesia, Mr Maurice Hely-Hutchinson (the chairman) presiding.

The following is an extract from his circulated review:

The shareholders of the Union Minière du Haut Katanga have approved the payment of an interim dividend of 500 francs per Part Sociale in respect of the year 1951, as compared with the interim dividend of 400 francs in respect of 1950. The board of the Union Minière Company has announced that it anticipates that copper production during 1951 will reach about 185,000 tons, as against 175,920 tons in 1950.

The international and mineral traffic moving over the Benguela Railway has continued to show substantial increases during the first ten months of 1951. In order to place the line in a position to carry the increasing tonnages envisaged in the future, further capital expenditure will be required. We have therefore during 1951 opened negotiations with the Portuguese Government, and we are hopeful that agreement will be reached in the near future on a satisfactory basis.

This is the first annual meeting to be held at the company's principal office in Salisbury since the transfer of the seat of management and control to Southern Rhodesia. The move has been successfully accomplished.

Addressing the meeting, the chairman said he was confident that a widening range of opportunity, in new fields in Africa, lay before the company.

The report was adopted.

NATIONAL PROVINCIAL BANK LIMITED

VALUE OF SOUND BANKING SYSTEM

EFFORTS TO COMBAT INFLATION

PARAMOUNT NEED FOR CUTS IN EXPENDITURE AND LOWER TAXATION

THE EARL OF SELBORNE ON COUNTRY'S ECONOMIC PROBLEMS

The one hundred and nineteenth annual general meeting of National Provincial Bank Limited will be held on February 14th at the head office 15, Bishopsgate, London, E.C.2.

The following is the circulated statement of the chairman, The Rt. Hon. The Earl of Selborne, P.C., C.H.:—

BOARD OF DIRECTORS

It is with very great regret that we have to record the death of our late chairman, The Hon. Sir Jasper Nicholas Ridley, K.C.V.O., O.B.E. He joined the board in 1935, was appointed deputy chairman in 1937 and chairman in 1950. He had also served as chairman of our affiliated bank, Coutts and Company, since 1947. Sir Jasper was a man of great gifts and long banking experience. His death is a severe loss not only to this bank but also to the City of London and the business community generally, and his absence will be felt in many spheres.

At the invitation of the board, I have assumed the office of chairman, and Sir Frederick Leith-Ross, G.C.M.G., K.C.B., has been appointed a deputy chairman. Sir Frederick has had a distinguished career in the Civil Service, which he joined in 1909, holding the post of chief economic adviser to H.M. Government from 1932 to 1946. From 1946 until the beginning of 1951 he was Governor of the National Bank of Egypt.

We have with great regret to announce the loss by death of the services of Mr George Finch Hotblack, who joined the board in 1934, and whose discernment and experience were so freely placed at our disposal at all times.

During the year, The Right Hon. Lord Perry, K.B.E., LL.D., resigned, I am sorry to say, because indifferent health compels him to spend much time abroad, while we have also lost the services of Mr Maurice Robert Hely-Hutchinson, M.C., who has taken up residence in Rhodesia. Lord Perry was appointed to the board in 1930, and his great industrial experience and wisdom were at all times most valuable assets to the bank. Mr Hely-Hutchinson joined the board in 1941, and we have much benefited from his extensive knowledge of business and financial affairs. We thank both of these gentlemen for their unstinted services and convey our cordial good wishes to them in their new abodes.

We have had the pleasure of announcing the election to seats on the board of The Right Hon. Ralph Assheton, M.P., The Right Hon. Sir Alexander George Montagu Cadogan, O.M., G.C.M.G., K.C.B., Mr Stanley Paul Chambers, C.B., C.I.E., Mr Seymour John Louis Egerton, The Right Hon. Lord Latymer, Sir Frederick Leith-Ross, G.C.M.G., K.C.B., and Sir Rowland Smith, M.I.Mech.E. All these gentlemen are distinguished in their chosen spheres, and they will bring valuable contributions to the counsels of your board.

We regret to announce the death during the year of Mr B. C. Vernon-Wentworth, who served on our Yorkshire local board for more than forty years.

MANAGEMENT AND STAFF

During the year we have suffered a very great loss in the death of our late chief general manager, Sir William Hadwick. Sir William held high office in the bank for more than twenty years, during the last six of which he was chief general manager. His services to banking and the City generally were recognised when he was created a Knight Bachelor in 1950, and his services to our own bank were immeasurable. A man of many interests and great culture, he will be missed by all who had the privilege of knowing him.

In his place, the directors have been pleased to appoint Mr L. J. Williams to be chief general manager. Mr Williams has been a joint general manager since 1943, and he brings to his new position a wide experience of banking and finance. During the year, Mr R. H. Cutting, D.S.O., M.C., a joint general manager, retired after 43 years' distinguished service, and we have been pleased to appoint as joint general managers Mr F. Keighley and Mr C. G. Wheatley.

My predecessors have put on record each year their appreciation of the loyal and willing co-operation of both management and staff, and I, in turn, wish to pay a tribute to the great efforts that have been made to maintain a high standard of service to our customers, at a time when new problems and difficulties are constantly arising.

COUTTS AND COMPANY

The balance sheet of Coutts and Company as at December 31st last accompanies our own report and accounts. During the year Mr S. J. L. Egerton has been appointed chairman in succession to the late Sir Jasper Ridley.

STATEMENT OF ACCOUNTS

The balance sheet and accounts of the bank accompany the directors' report.

Current, deposit and other accounts which at the end of 1950 stood at £838,270,562 now show a total of £816,785,374. Shareholders will observe that the ratio to these liabilities of the more liquid assets, namely cash items, short money and bills, is 38.6 per cent. The fall in this ratio as compared with last year's figure of 45.9 per cent., which was in any case a good deal higher than normal for a variety of special reasons, is largely explained by the recent moves to restrict credit initiated by the Government. In particular, the funding of £1,000 million of Treasury bills in November last has caused a considerable diversion in our assets from bills to investments.

Our investments in British Government securities and other securities of a like nature are now shown at £202,380,741 giving a ratio to deposits of 24.8 per cent. as against 19 per cent. last year.

The policy of His Majesty's Treasury of reducing their requirements in the form of Treasury deposit receipts has resulted in a fall in our holding under this head of £44,500,000 to a figure of £14,500,000, representing 1.8 per cent. of deposits.

Advances to customers and other accounts stand in the balance sheet at £295,096,471, representing 36.1 per cent. of our deposits compared with last year's figure of £246,018,524, or 29.3 per cent. of our deposits at that time. Full provision has been made, as in previous years, for all accounts carrying any risk of loss to the bank.

PROFIT AND LOSS ACCOUNT

The net profit for the year is £1,469,765. This compares with £1,454,811 for 1950.

The amount brought forward from 1950 is £984,462 which, added to this year's profit, gives a disposable figure of £2,454,227.

An interim dividend of 7½ per cent. has been paid, accounting for £373,252.

It is proposed to deal with the balance as follows:

To pay a final dividend of 7½ per cent.	£373,252
To make an appropriation to Contingencies of	£750,000

Thereafter a balance of £957,723 will remain to be carried forward.

Operating costs have again risen substantially. Until the middle of 1951 it was possible to avoid any general increase in charges for bank advances and services. Clearly this could not continue indefinitely and we, in common with the other clearing banks, were compelled to revise our charges during the second half of the year. Since then further increases in operating costs have occurred, particularly in the field of remuneration to staff, and others are impending. I take this opportunity of saying that your directors have been convinced by the representations of our staff association of the necessity of material increases in the remuneration paid to our employees. Though the banks have rightly given heed to the exhortations of successive Chancellors of the Exchequer not to add to the inflationary spiral by increasing either dividends or wages, and even to set an example in this respect, it would be most unjust that the officers of banks alone in industry should not have their emoluments adjusted when prices and taxation have risen so steeply. As to dividends, it is also the case that the shareholders of this bank have received no increase in dividends for many years. In fact, dividends were reduced in 1931 and again in 1932, and have not been increased since. Although the present time, with all its uncertainties, would clearly be a wrong moment to consider an increase, your directors are not unmindful of the equity of the claim that shareholders can make for some readjustment of their dividend having regard to the fall in the value of money.

INCREASES IN BORROWING RATES

Recently, following the change of monetary policy initiated by the present Chancellor of the Exchequer, further increases in borrowing rates have been announced. In some quarters the new arrangements, especially the rise in the short-term money rates, have been criticised on the ground that the banks are profiting heavily at the taxpayer's expense. A few simple facts, easily ascertainable by anyone seeking to arrive at an impartial judgment, may serve to put the matter in proper perspective.

If the latest published returns (November, 1951) be taken as an average figure for the coming year, the increased allowance on deposit accounts, brought into effect simultaneously with the changes in other rates, will cost the clearing banks £5.18 million. Gross revenue may rise by £6.29 million as a result of the increase of ½ per cent. on money at call and short notice bringing in £1.41 Treasury Bills discounted amounting to £3.74 million; an increase of ½ per cent. on million; and an increase of ½ per cent. on other bills discounted which would earn £1.14 million. The change in rates, therefore, would result in a net gain to the clearing banks as a whole of about £1 million per annum. That is an insignificant figure in relation to the combined assets of all the clearing banks, and against it must be set the new expenditures to which I have referred.

There remains, however, the higher rate earned by the funds transferred from Treasury Bills discounted to investments by way of the new funding loans. But it would be quite wrong to assume that the whole, or even a substantial part, of this increase in yield will result in an addition to profits. For the nominal gain involved is at the expense of a reduced liquidity ratio, which implies a diminution in the amount of money available for advances to customers, and the consequences that follow from this are such that in the long run there can be no guarantee that the net effect on earnings will be favourable. The banks could at any time have increased their earnings from investments at the expense of liquidity, but they had very good reasons for not doing so.

I make no apology for asserting that in a world of instability a sound banking system is an asset worth preserving; that its value cannot be assessed in precise monetary terms; and that its accumulated reserves are a national sheet anchor in times of difficulty—not a source of enrichment of the few.

TRANSFORMATION IN FINANCIAL ATMOSPHERE

The past few weeks have seen a transformation in the financial atmosphere. The new Government had at once to face many pressing problems. The orgy of expenditure, in which the previous Government had indulged since the war, was bringing its inevitable retribution. Wages and prices were mounting steeply; in the last year the wage increases have been greater than the aggregate increases in the previous three years. The cost of rearmament had to be met by a Budget already overburdened; and the investment programme had to be financed at a time when savings were diminishing. As a consequence of our internal financial policy—for it cannot be too often emphasised that the two developments are connected—the balance of international payments was heavily adverse. Confidence in our national solvency was gravely disturbed, and the crises of 1947 and 1949 threatened to repeat themselves in an aggravated form.

How serious the situation was has been revealed in the latest announcement of the gold and dollar reserves of the sterling area. A fall of nearly 30 per cent. in our reserves over the last quarter in 1951 is a matter of the gravest import. In such circumstances a conference of Commonwealth Finance Ministers had clearly to be held without delay. No doubt there are some exceptional factors involved in the current drain on the reserves—but the fundamental difficulty is that not only we, but other countries of the sterling area, are spending more than we are earning. In no circumstances must matters be allowed to drift, and it is greatly to be hoped that vigorous measures will be taken to remedy the drain on our common resources.

I would refer to the annual statements of my two predecessors, Captain Eric Smith and Sir Jasper Ridley, during the last three or four years. In these, the present denouement was precisely forecast, as it was in the statements of other bank chairmen. If the late Government led their followers (and also, alas, the country) into the ditch, it was to the sound of loud warnings from those who had eyes to see ahead. The ill-effects of six years of extravagance cannot be repaired in a few months, but the Government has given evidence of its determination to put a stop to inflation, which was clearly its first duty. Inflation may be unavoidable in time of war or under the stress of rapid rearmament, but in times of peace it is inexcusable. It is the familiar expedient the opportunist politician is too often ready to adopt to avoid meeting his commitments, without perhaps realising that it constitutes a fraud on everyone who has trusted him sufficiently to lend money to the state or in its currency, or to work for pensions in that currency. It is a primary duty of the Government of every civilised country to maintain a stable currency. If the exigencies of electioneering make this too difficult, inflation may well prove to be the nemesis of democracy. People will not indefinitely support a system which makes mockery alike of their wages and their savings.

FIRST IMPACT OF DEFLATION

The first steps taken by the Government have been, in themselves, relatively small. The increase of Bank Rate to 2½ per cent, and the funding of the substantial amount of Treasury Bills had the effect of immediately tightening up bank credit. But, what was more important, these measures served as a warning that a new era had begun, and the market interpreted them in this sense. There was a sudden jolt: the chariot of state, which had been driven furiously along the road to ruin, was suddenly checked by the brakes. There was heavy selling of gilt-edged securities, and the resulting fall in the value of Government stock has inflicted severe losses upon the banks, who are among the largest holders of these securities. In this connection our own inner reserves have naturally not come through unscathed; but I am happy to tell you that, because of the great preponderance of short-dated securities in our investment portfolio, our problem has been much easier than it might otherwise have been. We recognise that the first impact of inflation must necessarily be upon the money market, and the wisdom of past and present directors in building up inner reserves to withstand such sudden (and often temporary) contingencies has once more been justified by events.

The effects of tightening up bank credit may be expected gradually to filter through all sectors of the private economy and make it necessary for individuals as well as companies to consider carefully how their affairs can be arranged without recourse to borrowing. The resources of the banks will be limited and they will be compelled to limit the accommodation they can provide to their customers. The instructions given by the Government to the Capital Issues Committee will reinforce the need for prudence, as it will be more difficult to raise capital in the market except for the most essential purposes. Such restriction was necessary as the capital available for investment was inadequate to meet demands, and if inflation is to be stopped the shortage of capital must be recognised and the claims upon it limited.

NEED FOR ECONOMIES AND REDUCED TAXATION

The control of bank credit and capital investment are, however, merely the mechanical devices for managing the flow of money; inflation can only be stopped if the underlying pressures can also be controlled. In particular, the Government must limit the demands on our resources made by it and by the nationalised industries for which it is responsible. It is not in the national interest that private industry and trade should bear the whole brunt of the restriction of credit and higher charges. We cannot have a system of tight credit and high rates for industry and laxity in expenditure and cheap money for public undertakings. The inflation from which we are suffering cannot be cured without a heavy cut in public expenditure and a reduction in taxation. Cuts in expenditure are never easy to make, or popular, but some cuts are essential if taxation is not actually to be increased to meet the increasing cost of the rearmament programme; still heavier cuts must be devised if taxation is to be reduced. And a reduction in the present level of taxation is imperative. The cumulative effects of our taxes today, at their level and by their incidence, are to destroy incentive, encourage extravagance, restrict efficiency and penalise skill. They prevent the formation of capital and the replacement of machinery. They stifle growing businesses in their infancy. They deter enterprise and frighten foreign capital from our shores. They make it nigh impossible for companies domiciled in this country to develop British colonies. They are undermining the foundations of our economy and crippling London's capacity to maintain itself as the money market of the world. If this is an example of "planning," I can conceive of no plan better calculated to hinder the recovery of our country from two world wars.

Taxation now takes approximately 40 per cent. of the total national income: any such proportion has traditionally been regarded as excessive, and recent experience proves that to be the case. But the evil does not stop there. The taxes are graduated so as to penalise effort and success. Every extra £ the wage-earner earns by overtime or quick work at piece rates is taxed two or three times as heavily as the £s he can earn without extra exertion. Is it surprising that the output of labour in many industries has fallen so much since before the war? Is it surprising that, in spite of the very high wages offered, there is difficulty in recruiting labour for unpleasant work such as coalmining? And the discouragement is still greater for the higher income groups. Not every man will exert himself, or take risks, in order to hand over to the tax-gatherer 15s. and more of every £ he receives. Is it surprising that it is difficult to get some of the best qualified men to take posts involving heavy additional responsibilities or to serve as directors where their ability would be most useful? Death duties at their present level are doing much damage to our economy: not only are they breaking up family businesses to the great detriment of their employees, but they also encourage extravagance by removing from the individual the power and, therefore, the will, to save for his children; for you cannot alter human nature by Act of Parliament. Purchase tax discriminates against the skilled artisan, because the finer the workmanship the higher the tax. Profits tax and income tax combined with inflation are making it impossible to replace obsolescent with modern machinery. Profits tax, income tax and surtax make it impossible for any small man to build up a great business, as so many have done in the past.

If such taxes had existed in the days when, for instance, Jesse Boot, Thomas Lipton and William Morris were starting their businesses, they never could have built up the great firms associated with their names. Such men, rising from the ranks, gained for Britain her industrial pre-eminence, found employment for thousands of their fellow countrymen and have carried

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE

The Governors invite applications from Graduates in Agriculture, Agricultural Economics or Economics for a post on the Agricultural Economist Grade.

Salary scale: £635 x £25—£760 x £30—£900 (Intermediate).

Candidates must have experience in the Provincial Economics Service or equivalent post-graduate qualifications.

Particulars and forms of application are obtainable from the undersigned, with whom the latter should be lodged, not later than February 10, 1952.

N. B. BAIN, Secretary.

6, Blythswood Square, Glasgow, C.2.

UNIVERSITY OF SYDNEY, AUSTRALIA

Applications are invited for the position of *Lecturer in Economic History.*

The salary will be within the range of £650—£1,000 per annum plus cost of living adjustment (at present £159 males, £121 females) (Australian), with annual increments of £50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful candidate.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is March 31, 1952.

RHODESIA UNIVERSITY ASSOCIATION

SENIOR LECTURER IN COMMERCE AND ACCOUNTING

The Rhodesia University Association intends to appoint a Senior Lecturer in Commerce and Accounting to organise and conduct, with the assistance of part-time lecturers, classes in Salisbury, Southern Rhodesia, for the degree of Bachelor of Commerce in the University of South Africa (and possibly also in the University of London).

The classes are primarily designed to assist students who are already taking correspondence courses from the University of South Africa for the Bachelor of Commerce degree and for the qualification of the Society of Accountants.

Applications for the above post are invited from persons who hold a degree in Commerce from a recognised university. Extensive practical and teaching experience and ability to lecture in specialised accounting subjects are essential.

The salary of the post will be £1,750 per annum, which includes a cost of living allowance. This remuneration will be fixed for an initial period of two years, prior to the university staff being expanded and a scale of salaries laid down. An allowance of £150 will be made towards travelling expenses in the case of a person appointed from overseas, a proportionate refund being required if the officer appointed resigns before the expiry of his contract. Accommodation in Salisbury will be guaranteed to the successful applicant.

Duties are to be assumed as soon as possible after April 1, 1952.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is February 29, 1952.

HOUBLON-NORMAN FUND

The Trustees of the Houblon-Norman Fund invite applications for Fellowships or Grants in aid of research into the working of financial and business institutions in Great Britain and elsewhere and the economic conditions affecting them.

Apart from exceptional cases, awards will be confined to British-born subjects normally resident in the United Kingdom and will take effect from October 1, 1952. Fellowships will be awarded for one year, renewable for a second year: and the amount of all awards will depend upon the circumstances of the candidate and the likely expenses of his work.

Applications should be made not later than March 31st and forms of application may be obtained from the Secretary of the Fund (W. M. Allen) c/o the Bank of England, London, E.C.2.

W. M. ALLEN, Secretary.

January 4, 1952.

WEST AFRICAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH, UNIVERSITY COLLEGE, IBADAN, NIGERIA

Applications are invited for the post of RESEARCH FELLOW IN ECONOMICS.

Salary £800 x £50 — £1,300 p.a. Point of entry in scale according to qualifications and experience. F.S.S.U. Partly furnished residential accommodation at rent not more than 7.7 per cent of salary. Passages paid for appointee and wife on appointment and annual leave. Outfit allowance £60 on first appointment.

Applications (six copies), giving full details of qualifications and experience, and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date March 4. 1952.

DON'T you often wish you had a simple means of keeping all your domestic papers, letters, documents, receipts, etc., in orderly form out of sight, yet always instantly available for immediate reference? The new Automatic Secretary for the Home is the ideal device, simple, compact, durable, inexpensive, it is also an automatic reminder.—Send postcard for descriptive leaflet AS.58, to Shaw Publishing Co. Ltd., 180, Fleet Street, London, E.C.4.

LORD LAYTON, on "European Unity," at Sunday Service, January 27th, at 11 a.m., at the Liberal Jewish Synagogue, 28, St. John's Wood Road, N.W.8 (opposite Lord's Cricket Ground). All welcome.

EVANS MEDICAL SUPPLIES, LTD. have vacancies overseas for positions with both parent and subsidiary companies; chemical, pharmaceutical or other scientific background essential; prospects of rapid advancement to senior administrative posts.—Apply giving full particulars of age, education and career to date, to Overseas Trade Director, Speke, Liverpool, 19.

CONTINENTAL HOLIDAYS—not "organised" or mass produced but arranged as you or your friends may want. Paris—7 days from £12 10s.; Brittany—10 days from £16 10s. 6d.; Italy—15 days from £27 11s. 6d.; also the Rivieras, Spain, Austria, Switzerland, and other countries. Write for brochure or 'phone.—Business & Holiday Travel Ltd., Grand Buildings, Trafalgar Square, London, W.C.2. WHItehall 4114/5.

NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

The Council invites applications for appointment as Director. The appointment will be for a period of five years in the first place, at a salary of the order of £2,250 p.a., with provision under the Federated Superannuation System for Universities, and family allowances.

The National Institute is an independent non-profit making research organisation of academic standing, concerned particularly with realistic economic investigation. High academic qualifications and experience in the planning, carrying out and supervision of empirical research, are essential requirements for the appointment.

Applications together with the names of three referees should be sent to the undersigned, from whom further particulars may be obtained, not later than February 29, 1952.

F. S. STONE, Secretary of the Institute.

2, Dean Trench Street, London, S.W.1.

SECRETARY AND EXECUTIVE OFFICER—CO-OPERATIVE WHOLESALE SOCIETY, LIMITED

The directors invite applications for the position of Secretary and Executive Officer, Designate.

The person appointed will be expected to assume the position in April, 1952, which will be six months previous to the retirement of the present officer.

The C.W.S. manufactures a wide range of commodities ; undertakes a variety of wholesaling and merchanting operations and performs many services on behalf of the Co-operative Movement in England and Wales. It has considerable trading interests overseas. The annual turnover is approximately £350,000,000, and the personnel employed number 55,000.

The officer is responsible for the secretarial and administrative function within the Society, in the discharge of which he is the liaison between the directors and management.

The vacancy is being made known simultaneously to the Society's staff, but, having regard to the importance of the appointment, the directors wish to consider the widest possible field of applicants.

A form of application with a description of the duties involved and the information required of applicants is available on request from the Chairman of the Directors at the registered office of the C.W.S., Limited, 1, Balloon Street, Manchester, 4.

COST ACCOUNTANT—MANCHESTER

A first-class Accountant required by a large rubber and rainwear factory. The post carries prospects and needs a man capable of controlling staff and also able to interlock the financial and costs ledgers. It is preferable that he should have a knowledge of punched cards and some knowledge of either the rubber or rainwear industry. The salary would be according to qualifications and four figures would be attainable.—Box 846.

STATISTICAL ASSISTANT

Young lady of good education required by important commercial organisation in London to assist with analysis work, card index records, etc.—Reply, stating age, previous appointments, experience, and salary required, to Box 857.

SENIOR SCIENTIFIC OFFICERS ; SCIENTIFIC OFFICERS ; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1952. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1952, may eventually be announced. Successful candidates may be appointed immediately. The Scientific posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first- or second-class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must, in addition, have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1952 may be admitted to compete before the result of their degree examination is known.

Age Limits : Senior Scientific Officers, at least 26 and under 31 ; for Scientific Officers and Patent Classes, at least 21 and under 28 during 1952 (or under 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales : Senior Scientific Officers (men), £750-£950; (women), £625-£850; Scientific Officers (men), £400-£650 ; (women), £400-£525 ; Patent Examiner and Patent Officer Classes (men), £400-£600 ; (Rates for women under review). Somewhat lower rates in provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S 53/52 for Senior Scientific Officers and S 52/52 and S 128/52 for other posts.

ADMINISTRATIVE CLASS OF THE HOME CIVIL SERVICE : SENIOR BRANCH OF THE FOREIGN SERVICE : SPECIAL DEPARTMENTAL CLASSES : STATISTICIAN CLASS : EXECUTIVE CLASS (UNIVERSITY GRADUATES).

Over-age candidates

The Civil Service Commissioners announce that, for the open competitions in 1952, the age limits have been specially extended to admit candidates born on or after August 2, 1925, who were debarred by the age rule from competing in 1951 or 1952, and whose degree course was completed in 1951 or will be completed in 1952.

Full particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 11-22/52/OA. Completed application forms should be returned by those affected by February 28 1952, but in exceptional circumstances they will be accepted up to the end of March.

A NIGHTCAP THAT FITS. To round off a good evening ; a dinner party ; a game of cards ; offer your guests a brandy and soda. J.V.R. South African Brandy is only 37s. 6d. a bottle. And what a splendidly inspiring drink it is. J.V.R. is sold in half-bottles, too, price 19s. 3d.

STATISTICIAN, 29, B.Sc.Econ.Hons., seeks suitable position.—Box 848.

Still Beginning

THE second instalment of the Government's economic programme embodies some inevitable emergency measures and some important decisions that will help to push the British economy back to solvency. But it is safe to say that on Tuesday evening most people felt that they had been let off lightly. That feeling is in itself, when so much remains to be done, a serious threat to the adequacy of the full programme. It was admittedly, hard to avoid. Mr Butler was not ready—with the Prime Minister barely back from Washington he could not be ready—to issue a supplementary budget forthwith ; and anything less than a budget was bound to be inadequate.

The decision to bring the date of the normal budget forward by more than a month, to March 4th, was therefore the best that could be done. But it leaves everything dependent on the toughness of the budget. Here Mr Butler implied that no decisions have yet been made. Some of the attitudes he indicated are not reassuring. He spoke of the budget as "the third stage in the operation which I began last November." It will be at once more and less than that. If all goes well, the British economy will be strong enough to stand an operation next year. It is first-aid that Mr Butler must apply now ; and he is still only just beginning. It is through arterial bleeding that the life of the sterling area is pouring away. Mr Butler has not yet applied a tourniquet to stop it. All he has done is to put the pad in position ; the screw that will press the pad down on the artery remains to be produced on March 4th.

This demands faster policy-making than the Government has yet achieved. After three months in office it has contrived to put a little fresh wind into the expedients used by its predecessor, the expedients that led to successive crises as they periodically became exhausted. The largest measure, now as in 1947 and 1949, is the restriction of imports. It can be done only because stocks are to be run down—stocks both of consumer goods such as tobacco and of essential materials. This is the quickest and least painful way of reducing the trade deficit ; in so acute an emergency there is no alternative. But to live on stocks this year is a tolerable risk only if economic policy is plainly and firmly set to ensure that next year imports can be increased sharply enough for stocks to be rebuilt.

There is no more free choice about the quickest way to increase exports. The engineering industries are to be cajoled or induced to deliver less of their output to the home market and more to overseas customers. The axe will fall most sharply on the supply of new machinery and equipment to private industry, and it is necessarily matched by some cuts in construction work on new factories, shops, and other buildings. The nationalised industries are apparently to escape lightly, and more house-building is still encouraged. This inconsistency gravely weakens the force of the whole programme. But, however bad the distribution of the cuts, this method of increasing exports quickly cannot be shunned. The mistake would be to think

that it is a policy that can work in isolation. The import cuts and the diversion of engineering products to export are intended together to reduce the supply of goods in Britain by £750 million a year. If money demand were left unchanged, there would be a direct increase in the inflationary pressure that is, as Mr Butler recognises, at the root of the external deficit. The physical restrictions would then not in fact put the balance of payments to right. They would be reflected instead in further congestion in the economy, in sharply rising prices and lower exports of other things. The austerity in imports and in capital investment would be in vain. It can achieve its purpose only if the reduction in supplies is fully matched by a reduction in demand. Mr Butler's direct emergency measures mean nothing without the financial measures to make them effective.

Those measures are of two kinds. They are action by direct monetary policy and action through the budget. Mr Butler claimed on Tuesday that the effects of tightening credit were already spreading through the economy and that the policy would be "maintained." The need, and perhaps the intention, is to push it farther. But it would be optimistic to assume at this stage that credit restriction alone will do much more than match the physical compression of investment. Consumption and defence have to be dealt with in the budget.

Mr Butler's task is therefore formidable. He has to eliminate the existing inflation and to offset two new inflationary pressures—the increase in defence expenditure and the reduction in imports of consumer goods. In theory, at least, he can do that in two ways: by cutting expenditure for purposes other than defence or by raising taxes. It is impossible as yet to guess confidently how sharp the changes may have to be. There are four principal unknowns. First, how much will the revenue from existing taxes increase in consequence of the past year's inflation? Secondly, how much of the reduction in imports can safely be matched by running down stocks rather than cutting current consumption? Thirdly, how far will prices increase faster than incomes and therefore limit the real demand on the nation's resources that consumers can make? And fourthly, how much is defence expenditure going to increase? If the rearmament programme were this year being carried out in full, its increased cost could not be much less than £700 million. Mr Butler indicated that in fact the programme will be cut. At a few points that is now inevitable. At some other points a large economic gain may wisely be secured at a small cost in military strength. But sweeping cuts should be ruled out of account. The British economy must achieve solvency, but security is the one thing that cannot be sacrificed to it.

Until these four questions can be answered, no one can say what a realistic budget is going to mean. But of one thing there can be little serious doubt. It will mean much more than the economies in government spending that Mr Butler announced on Tuesday. As far as they go, the cuts are well chosen. By the standards of previous postwar finance, it is a considerable achievement to hold non-defence expenditure constant in spite of a 10 per cent rise in prices. But in relation to the task of overcoming Britain's worst postwar crisis, of maintaining sterling as an international currency and safeguarding the living standards of these islands in a competitive world, it is inadequate. Mr Butler studiously did not mention the food subsidies on Tuesday and it is also, indeed, still open to him to make further cuts in the health service or elsewhere. This is the basis for hope. It is a hope that assumes high political courage in the leaders of the Conservative party. But they can hardly fear present unpopularity and criticism more than the ignominy of being forced out of office by the catastrophe from which the sterling area is separated by only a few months' supply of dollars.

Political calculations should, in any event, be secondary. The plain duty of Mr Churchill's Government is to strengthen the British economy whatever the consequences. It is for that, if anything, that the Conservatives can claim a mandate from the electorate. On March 4th they will have been in office for only four months, but it will in all probability be their last chance. If they fail then to take the measure of the British economic problem, to lead the country in the immediate sacrifices on which solvency and security depend, they will forfeit their claim to respect and, before long, their power to influence events.

Darkness in Egypt

A CHANGE of faces has taken place in Cairo but no one should assume that it spells any change of heart towards Britain. During last Saturday, a total collapse of public order for the space of the day demonstrated the inability of the Wafd Government to control the emotions that it had unleashed. King Farouk immediately and with aplomb exercised his royal responsibilities, dismissed the government for "failure to maintain peace and order," used the army to break up the rioters, and installed in place of the Wafd a team of independents led by a 68-year old lawyer known for his unusual honesty of purpose, Aly Maher Pasha. The speed with which all this was done is a matter for congratulation. By Sunday all was quiet and Cairo, much of it aghast, was left to contemplate the wreckage of its main commercial area as well as a considerable toll of dead. (Among them was Mr James Craig, an expert on finance who had served the Egyptian Government for over 50 years, and for whom *The Economist* cherishes personal feelings since he was at one time its local correspondent.) To those who have known Egypt in the past, there would normally be cause for comfort in the thought that this feat of restoring order was brought about by a circle of men so steeped in western ways of thought as are those who now immediately surround the King. But the events of the last few days rule out any such reassurance. The temper of the country has become such that no one is in a position to side with the west so long as British troops remain on Egyptian soil. The Wafd is not really under a cloud ; it is still the prime champion of national rights and the strongest party in Egypt. Aly Maher Pasha has gone out of his way to praise it. He certainly deplores some of its methods, but he shares its principal aim, which is British evacuation of the Canal Zone. There should be no illusions on this point.

But there is one aspect of the week's events which blurs this otherwise stark outline of Egyptian policy. The composition of the rioting mobs and the excellence with which their onslaught on westernised premises was organised places both Palace and government in a dilemma. Undoubtedly the rioters were set in motion by a British act—the previous day's onslaught by General Erskine's troops upon the headquarters of the Egyptian police in Ismailia, which alienated even moderate opinion and put the Cairo city police upon their side. Their venom was therefore in the first place directed against Britain ; thus far, they were expressing emotions that fire all classes. But their activities were undoubtedly also used as cover for venting other emotions—among them the mass fervour of the Moslem Brotherhood which opposes everything that smacks of the west, and—more alarming to many Egyptians—the passions of a growing left wing that wants less for the pashas and more for the poor. For the Egyptian Government to distinguish, among this medley of motives, between those which might be condoned and those which need to be condemned would be an impossible task. A government bent upon curbing violence must stamp upon the lot. This is what King Farouk and Aly Maher did and must to some extent continue to do. But the national temper is now such that they cannot hold it in check by repression alone. In due course, other action will be demanded of them, probably in the field of social affairs and certainly in that of relations with Britain.

*

Mr Eden, in a measured and temperate statement in the House of Commons on Tuesday, explained the reasons for the military attack at Ismailia which touched off so much dynamite. It had become necessary, he said, to bring about, if necessary by force, the disarmament or withdrawal of the auxiliary police who were stationed there because these were actively concerned in provoking armed clashes with the British forces. But the results of the action taken confront British policymakers with three inescapable facts. First, it is now evident that Egyptian troublemakers cannot always be intimidated by a show of force ; forty-two Ismailia policemen died fighting gallantly and now furnish an example which other Egyptians, if similarly placed, will strive to emulate. Secondly, opposition to maintaining the Anglo-Egyptian treaty in its present form is far more intense than had been supposed and must govern the actions of any Egyptian cabinet, however composed. (The British argument that a treaty creates rights and must be respected is summarily dismissed by all Egyptians, who retort that the British have infringed the undertaking by exceeding the size of forces and the area of occupation which it specifies, and have, therefore, themselves invalidated it.) The third unpleasant truth is that the very presence of British troops exercises, willy nilly, an unwanted but inevitable influence upon Egypt's internal affairs. The feeling against them is now so strong that all home issues are willingly shelved until the quarrel with Britain is settled. This inactivity suits two groups—the very rich, who are thankful to cling to their privileges while they may, and the growing mass of people crushed by oppression and the ever-rising cost of living, who see the way to social change only in violent revolution. As a corollary it produces among moderates the despairing impression that the British forces are the mainstay of the die hards.

Conducted against this background of fact, an analysis of present British military and political policy in the Middle East leads to a disquieting conclusion. Pursuit of the strategic aims diminishes the prospect of success in the political. The same act is seldom if ever expedient for both. The chief military aim is well known: it relates to world strategy and can be summed up as the anxiety of the North Atlantic community to maintain armed strength in the Eastern Mediterranean both in order to support its Greco-Turkish flank and to improve its chances of holding on to its chief source of oil. The Canal Zone is the best base from which to do this on account of the access it enjoys to sea lines from two oceans. The chief political aims are twofold: one is to preserve the validity of treaties ; to abandon them at the puff of opposition is to set a dangerous precedent in international relations. The other is to maintain or found in the Middle East local sentiments of affiliation with the west. Yet conditions in Egypt are now such that military security may become attainable only through the form of interference in local affairs that leads to hostility and—as last weekend proved—may produce violent social disturbance that is bound to have an anti-western complexion.

*

The antithesis is complete. Some see a way out of it in military terms—in an extension of military control over Egypt on a scale sufficiently great to preclude internal revolt. But to think thus is to turn a blind eye to a worldwide range of disastrous political consequences. Such interference would be repugnant to the British home public ; it would also commit troops that can ill be spared to a task that would quickly prove unwarrantably costly in money, nerves and lives. Lastly, it would diminish the charms of western alliance in the eyes of all other Asian and African peoples ; for who wants interfering allies ? The strategic argument for maintaining military bases in the Middle East is a very strong one ; it certainly cannot be cast aside when the result of doing so would be to leave an enormous gap in the defence line of the whole free world. But it must now be clear, even to those who could not see it before, that the political price of strategic security in the Middle East is very high indeed. It must be equally clear that Britain cannot afford to pay it alone, the British political reserves are no stronger than the financial.

Thanks to the quick action of the King, the dependability of the Egyptian army (which saved many British lives in the course of saving Cairo) and the courage of Aly Maher Pasha in coming out of retirement, there is now likely to be a lull in the process of incitement and counter-irritation. Inflammatory bulletins have disappeared from Cairo's newspapers and General Erskine, it is to be hoped, can revert to his policy of reducing to a minimum the contacts between the British troops and the Egyptian people. The statesmen, too, are doing something to build a bridge. Mr Eden has repeated Britain's willingness to discuss treaty revision and has expressed his belief that there can be a solution compatible with Egypt's national aspirations ; Mr Churchill has repeated Britain's desire to share with others the burden of defending the Suez Canal. Aly Maher on his side has said that he is "ready to consider any understanding Mr Eden may propose"; in particular he will think again about the four-power approach. It may have needed the horrible events of the past week to bring it home to both sides that the dangers of deadlock are greater than those of compromise. This provides the opportunity for statesmanship.

Making Prices Work—II

The Price of Labour

INFLATION, which creates more jobs than workers and makes manpower generally scarce, also encourages many factories to hoard manpower and to use it wastefully. This is by now one of the more familiar paradoxes of economic policy. Ministerial statements referred to the problem several times during the last few months before the defeat of the Labour Government ; nothing was done. The new Government can hardly claim to have grasped the nettle. Its solution, announced this week, is that eighty Ministry of Labour inspectors are to go round Britain's tens of thousands of factories looking for hoarded labour. Whether or not that is sound in principle (it is discussed on a later page), it is plainly too slight a measure in itself. But if an official inspectorate is not the way to prevent labour from being wasted, is there any alternative ?

The need is increasingly urgent ; and, by another paradox, disinflation would at first make it greater. Any normally human management lets some sleeping dogs lie if it can. Attempts to economise in manpower, leading to rows with the shop stewards and sometimes to bitter feelings throughout the factory, often do not seem worth while to the firm enjoying a sellers' market. But they may seem even less worth while for the firm whose need for labour is suddenly reduced, either because materials become scarce or because the demand for some of its products falls off. The firm will begin by hoping that the shortage, either of supplies or of orders, may be temporary. It knows that if it once dismisses workers they may be very hard to replace when business picks up or supplies improve. This is a powerful drag on a disinflationary policy. The purpose of such a policy is to reduce the less essential demands for labour and materials, in order to free resources for rearmament and exports. The firms at present possessing those resources will hold on to them as long as they can. If the cut in demand for their products is drastic enough, they must give way. But, as a matter of practical politics, the cut will probably not be very drastic. There is, therefore, need for some additional pressure which will make a mild disinflation effective by making employers in the less essential industries more willing to dismiss some of their workers.

This is the theoretical case for a payroll tax—for a levy on every firm of so much per employee per week. The argument may be stated more briefly in another, more academic form. To say that labour is scarce means that, in relation to the present volume of money demand for its products, the price of labour is too low. Demand and price can be brought into balance by action on either side. Demand can be cut—that is disinflation—or the price of labour can be raised. It generally causes the least friction to move from both sides at once. But to make labour dearer in the ordinary sense—to raise wages —is to increase incomes again and so offset the effects of disinflation. Therefore the price of labour should be raised without increasing incomes, by a tax whose proceeds the Government would save as a budget surplus.

It should be said at once that there are strong practical objections to this theoretically attractive proposal. Not least important is the purely political objection. "A tax on jobs" would be peculiarly open to misrepresentation by an irresponsible Opposition. But there are no crisis measures that cannot be misrepresented by an Opposition which wants to do so, and the political objection in itself is, therefore, certainly not conclusive. When repeated use has so nearly exhausted all the accepted expedients of economic policy, it is foolishness or worse not to examine fully and objectively any proposal that might push the economy the way it needs to go.

How, then, would a payroll tax work ? A heavy tax might be 10s. per head per week. It would yield over £500 million a year and add about 7 per cent to the national cost of labour—the total bill for wages and salaries. How would such a tax be paid ? In a few industries already suffering from a definite recession in demand, such as the clothing trade, it would probably be paid out of profits (and to that extent the yield of present direct taxes would be reduced). But in most industries the tax would, at first at least, be passed on almost in full to the consumer in higher prices. Wages and salaries are roughly half the gross national product. That is to say, a tax which raised the cost of labour by 7 per cent would fairly soon raise the general price level by about 3½ per cent.

This would be the effect on the average. The prices rising more than the average would be those of goods and services in which labour is an unusually high proportion of the total cost. To some extent, people would buy less of these things and more of others, and this redistribution of expenditure would in itself help to free labour for essential jobs—though it might also increase the pressure of demand on some materials that are in short supply. Again, within any particular industry, the firm that uses labour less efficiently than its competitors would, other things being equal, have to raise its prices more sharply ; it would, therefore, tend to lose custom, as the national interest requires.

But these discriminating results of a payroll tax, however useful they might be, are secondary. The general effect on prices might be highly dangerous. Unless the general policy of disinflation were at the same time putting a powerful brake on wage demands, a tax that raised prices by 3½ per cent might well provoke another full turn in the spiral of wages chasing prices. That could be true even of a smaller tax—say, one of 5s. a head, which would raise prices by about 2 per cent. Particular taxes, such as those for electricity and steel which were discussed in the first of these two articles, can exert an important special push without raising prices so widely as to throw the economy as a whole further out of balance. It is far more difficult to get controlled results from so generalised a device as a payroll tax.

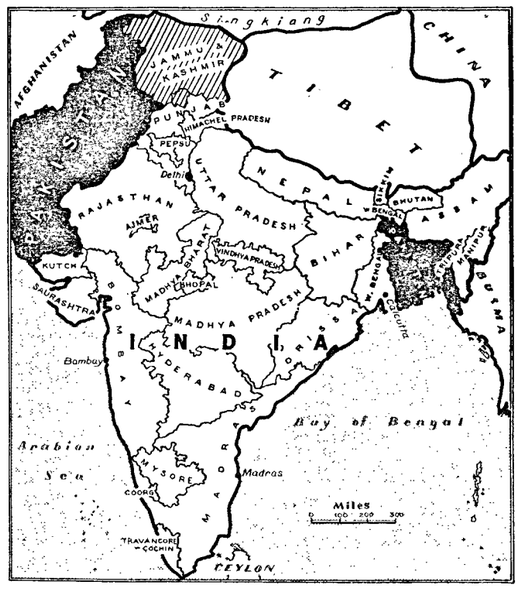
Whether or not these complications are worth incurring depends on how strong the primary effect of a payroll tax, in itself inducing employers to dismiss redundant workers, would be. At present the gross cost to the employer of keeping on, say, ten men for whom there is temporarily no work, at an average wage of £7 10s., is £75 a week. But the net cost, if the firm is paying income and profits tax at a combined rate of probably 60 per cent, is only £30 a week. A payroll tax of 10s. a week would raise the gross cost to £80 and the net cost to £32. It is difficult to believe that this extra 4s. a man—less than 3 per cent—would often, in present circumstances, be decisive. It is even more difficult to think that any Government would dare to impose a stiffer tax. A more likely rate is 5s. a week, and that would increase the penalty for wasting labour, after tax, by only 2s. a head—by little more than one per cent. Even that might have a useful psychological influence, bringing home to managers the national importance of saving labour ; in some firms it might just tip the balance in favour of dismissing workers now rather than holding on to them for weeks in the hope of getting the orders or the materials to employ them. But far more often, one suspects, it would make no practical difference.

This is not intended to be a final conclusion. The purpose of these two articles has been to stimulate thought about possibly useful devices that contemporary discussion has neglected. It is only tentatively suggested that a general payroll tax is a blunderbuss with too short a range to be much use in the modern economy. Perhaps the things that are needed are more of the nature of snipers' rifles. As far as the use of manpower is concerned, that would presumably be some sort of excess labour tax. The Government might lay down a schedule of non-essential industries and decree that any firm in these industries which did not cut its labour force by, say, 5 per cent in six months would be subject to a penal tax—£1 or £2 per head per week for everyone on its payroll. That is perhaps a little less fantastic, from any point of view except that of political expediency, than the excess profits tax to which the Government is committed. But a moment's reflection on the problems of definition that would be involved seems to be enough to rule it out of consideration.

If these conclusions are correct, it is important to recognise their implications. Essentially, the argument is that it is impossible to exert a significant influence on business decisions by such devices as a payroll tax because the motives of business are so thoroughly blunted by high taxation. The British economy now works by habit, not for profit. It cannot be made to change course by putting pressure on the entrepreneurs, on the people whose responsibility it used to be to make a delicate response to changing demands. For the sake of stability and security, the entrepreneur has been killed. But that does not remove the need for the economy to change course. It merely means that the pressure must be applied—more clumsily and, politically at least, more unpleasantly—on the public at large, on the consumer. It is most important to search for weapons that may still work at the traditional point, through such shadow of the profit motive as survives ; a steel tax, at least, is one such device that on first inspection still seems to have possibilities. But at the end of the search for special devices one is likely to come back to the familiar and still unpalatable conclusion: any sound economic policy for this country must be primarily a policy for cutting consumption. Security and solvency will be gained, if they are gained at all, out of the mouths and off the backs of the British people. More refined devices depend on a flexibility that governments have too long been set to destroy.

India's Choice

IN the Indian elections about half of the voting has now taken place, and the leaders of the Congress party begin to see how they will stand at the end. When polling finishes on February 15th they may expect to control, perhaps, three-quarters of the seats in the central parliament and to form the governments in all but about two of the states. On the surface, these figures represent a great victory. Indeed, there can be no question of any other party pushing Congress from power during the next five years. But there is also another side to the medal. Congress started the era of independence in 1947 with all the tremendous prestige of victory in the long struggle. It held the soul of India in the palm of its hand. Today it is riven by faction ; it is accused of corruption ; many have voted for it because nothing else meant anything to them. And, above all, the main rivals to Congress have proved themselves to be the Communists. This does not promise well for India's future.



In spite of the success of Congress, therefore, the incomplete results so far known are worth careful study. It can be asked what effect they may have on the new Indian government and on India's place in the councils of the nations. Of the first 100 seats for the central parliament of 496, Congress won 66. There were 13 Independents and 10 seats attributable to the Communists and their associates. The Kisan Mazdoor Praja, the Kripalani group which broke away from Congress last year, won only 3 seats, and the Socialists 1. There were seven others. By the time 200 seats had been filled, Congress had won 138. The outstanding feature of the elections has been the failure both of the extreme reactionary Hindus and of the Socialists. In spite of the high hopes it held a year ago no one had come to expect much of the Kripalani group, but the Socialists have done even worse than might have been expected. This removes even the slenderest hopes of forming a working coalition of moderate parties to provide a constitutional opposition in parliament. If democracy is to work in India, it will have to be adapted for the moment to a one-party system.

Most of the elections have so far taken place in southern India. In Travancore-Cochin, the most southerly state of all, Congress secured only 44 out of 108 seats, compared with about 37 controlled by the Communists ; these results are particularly bad because this state has the highest literacy rate in India. An anti-Congress government, dominated by the Communists, seems possible. This would be an alarming development and might place a severe strain on the working of the federal constitution. In neither Madras nor Hyderabad has Congress won a majority, although it should be able to form coalitions. In Bombay Madhya Pradesh, Madhya Bharat, Saurashtra, Mysore, Ajmer and Delhi, Congress has won an absolute victory. In general, Communist success has been patchy, and though in many places it has been quite definite, it is unlikely to be widely spread across the country. India is not yet going Communist. Hyderabad has been a special hotbed of Communist

revolt for several years and Travancore-Cochin was known to be infected. Bengal is the only other area likely to contain so much Communist strength.

These great elections have been a triumph for the democratic principle. A genuine choice has been placed before many millions more voters than on any previous occasion in all history. Not least of the achievements has been the way in which an electorate with an average literacy of only fifteen per cent has been taught to identify the party of its choice by means of symbols. The Communists chose to lay their full emphasis on a primarily agrarian policy, according to the strict pattern laid down for Asia by Chinese experience, and they significantly made their sign a sickle and three ears of grain—without the hammer. In spite of misgivings in some quarters, the whole remarkable procedure of the election is by all accounts passing off quietly and efficiently, with dignity, integrity and decorum. It is, in fact, India's most prominent contribution so far to the peaceful political evolution of Asia.

If the final results of the elections are along the lines now expected, Mr Nehru's position will remain strong but uneasy. There can be no doubt that many people voted for him personally rather than for Congress as a party. Before the elections he covered over twenty thousand miles on a four months' electoral tour, during which he was seen and heard by millions. On the other hand, the moderate left has faded away and he cannot look to any form of coalition between the left wing of Congress and the Socialists. He will have to rely increasingly for support on the centre and right of Congress, where he is never very much at home and many of whose members accept him only because he is the unchallenged national leader. The growth of Communist strength is also likely to intensify the contrast between the strongly anti-Communist policy adopted by the government at home and the third force aspirations of Mr Nehru's personal foreign policy. In the eyes of some of his fellow ministers India is not and never has been neutral. They feel that, in the last resort, it is on the side of the free democracies because it is itself a free democracy, as the present elections proudly prove. Even at the United Nations, as some Indians point out, on the last 61 occasions that votes have been taken India has voted twice with Russia compared with 48 times with Britain, and has abstained 11 times. Where Mr Nehru is at one with his followers is in not wanting to commit himself beforehand ; but it is this feature of his policy that may now be most affected by the twist of fortune in favour of the Communists at home. It seems almost certain to edge him just a little further into the ranks of overt supporters of the anti-Communist world.

The attitudes towards Mr Nehru of the Indian Communists and of the tacticians in the Kremlin swing with the winds of political expediency. At present, the leaders of the Indian Communist Party are treating him as something of a useful pet. They claim that he is no obstacle to the advance of Communism, because he leans back on the conservative landlords and oppressive capitalists while he fails, at the same time, to make the country prosperous. The Communists have also won some success by concentrating their fire not on Mr Nehru but on the British and American business interests which the Delhi government increasingly favours. This enables them to allege that, if they won power, they would expropriate only the foreigner and not the Indian capitalist, a line which fits in with their current phase of popular front tactics, constitutional behaviour and sweet reasonableness.

Although the Communists in India recognise that they have a long way to go, it is another question whether the Russians accept this view. They have lately made marked efforts to increase their influence and to improve their relations with India. Over Kashmir Moscow has come down heavily on India's side. There has lately been a new Soviet offer to supply industrial equipment, for payment either in rupees or in another soft currency, and Moscow has made a truly impressive effort with its large and prominent pavilion at the International Industries Fair in Bombay. In Delhi, the Soviet ambassador, Mr Novikov, has been speaking particularly honeyed words about the degree of civil liberty in the Soviet Union and the scope for development of economic relations between the two countries. Mr Nehru is reported to have received a renewed invitation to make an extended tour of the Soviet Union.

In reality the scope for Indian trade with the Russians is very limited ; during the past three years less than 1 per cent of India's foreign trade has been in this direction. Moreover, it cannot be lost on either Delhi or Moscow that India stands to gain far more from acceptance of the American aid which is now offered. This aid is partly the outcome of improved relations with Washington, particularly since the arrival in Delhi of the new American ambassador, Mr Chester Bowles. Last month he signed with Mr Nehru an agreement setting up a technical co-operation fund, under which India will receive $54 million in the next few months. Last year's supply of American grain was on a loan basis ; so, apart from $1.4 million given through Point Four and $7.5 million by means of specially low prices for the grain, this is the first direct grant of American economic aid. There are grounds for thinking that it will not be the last.

These factors, taken with the present elections, emphasise the links which in reality join India with the western nations rather than the Communist bloc. The only other countries in the world with populations on the Indian scale are the Soviet Union and China. It is inconceivable that in either of them a general election could have taken place in the Indian fashion, with 176 million people voting freely for 25,000 candidates —over half of them independents—to fill 4,412 seats in the central and local legislatures. The Indians have long shown a genuine flair for the parliamentary system of government. They have modelled their procedure in parliament on that of Westminster. By holding these elections in a spirit of tolerance and genuine freedom of individual choice, they have shown that adult suffrage, in Asia as in Europe, encourages the sense of self-respect and the consciousness of civic rights and duties which are the foundations of political liberty. The crucial task now is to prove that this democratic system can produce the result that India most needs—an improvement in the standard of living. This was the biggest issue behind the election.

NOTES OF THE WEEK

Mr Churchill on China

Mr Churchill has vindicated with great skill his attitude to Communist China, as revealed in his recent speech to the American Congress. In the House of Commons on Wednesday he deflated a swelling controversy to a degree that must have made some of his political opponents wonder what all the fuss had been about. Speaking of "the whole hypothetical question of what should be done should a truce [in Korea] be made only to be broken," he declared: "No change was made in this situation while we were in the United States. In fact the matters did not figure to any large extent in our discussions." Instead Mr Churchill dwelt on the positive approach to a Korean truce:

> We still hope that an agreement will be reached. We still hope that, being reached, it will be kept. I think we have secured a better chance for the reaching of an agreement by making it plain that the United States and Britain are working together in true comradeship.

This was not only a fine parliamentary performance but a convincing defence of the policy of standing by the Americans and thereby ensuring that they would seek and take advice. The Prime Minister's speech also illuminated two other important aspects of British policy. He made it clear that the Conservative government is no more prepared than its predecessor to accept the deployment of Chinese Nationalist forces in the allied armies ; and he left no one in doubt that the Government's first aim in the Far East must be to reduce and not extend the Korean war, let alone embark on a prolonged entanglement in China itself. "My own thoughts are never long absent from the European front" was the keynote of his message, and he threw into vivid relief the scale of the Asian danger by stating that 26 divisions—equivalent to 30-35 in Europe—were deployed in the Far East. This is the most telling argument for the view that war in China would be "the wrong war, in the wrong place, at the wrong time." If the Chinese make it inevitable Britain will stand at America's side, "prompt, resolute and effective." To give that warning in general terms can help to deter the Chinese ; to explain it in detail would be to give them valuable military information.

* * *

Containing the Communists

Mr Churchill was less specific about how the war in Korea is to be prevented from spreading. The main risk is not that the Chinese will make a truce and break it, but that they will fail to come to a truce at all. They seem to be counting on undermining their opponent's morale by exasperating delays, a calculation in which they are greatly assisted by some critics of the Americans in this country. But the effect on American public opinion is that it demands increasingly that the war must be brought to an end as soon as possible, and that, if the Chinese go on procrastinating, American air power should be used to strike at Chinese industries and communications. This is a state of mind which the British must handle with skill and patience, if only because Commonwealth casualties in Korea amount to only about one-fortieth of American losses.

Mr Churchill did not say precisely what the Government's attitude would be to proposals to bomb China or blockade the Chinese coast. On the contrary, he emphasised the general principle that his journey to the United States was intended to re-create something intangible but of immense importance in Anglo-American relations—mutual trust. There is no part of the world where it would be better at present to keep commitments fluid than in the Far East. To be specific in the face of so many uncertainties is extremely difficult—and also unnecessary, if confidence exists between London and Washington.

Over the next few months the most important task is to work out a uniform policy for setting limits to the Chinese aspirations which are examined in an article on page 289. About these aspirations and about Communist hopes of capturing Asia there can now be no reasonable doubt ; and those who say "peace with China at any price" are simply shutting their eyes to the perils of Burma, Malaya and Indo-China.

* * *

Double Talk on the Truce

The armistice negotiations in Korea are now at deadlock on two issues, both fundamental and both widely misunderstood—the construction of airfields during a truce and the exchange of prisoners. On the first the UN case is that the military strength of both sides should remain as it is for the duration of the armistice, and that this means a ban not only on reinforcements of personnel or armaments, but also on the rebuilding of airfields destroyed by bombing or the construction of new ones. So far Allied air power has interfered very effectively with airfield development in North Korea ; but, if the Communists were left free to improve their position under cover of a truce, it would bring a great change in the relative military positions. All proposals for restrictions on airfield construction have been rejected by the Communists on the ground that they would mean "interference in the domestic affairs of an independent, sovereign state"—i.e., North Korea. Such an argument from such a source is pure effrontery.

The question of prisoner exchange is more complicated. Two facts stand in the way of a straightforward agreement for a general exchange. The first is that while the Allies hold many more prisoners of war than the Communists, the latter hold a large number of South Korean civilians who were deported from South Korea during the original invasion ; the second is that many nominally North Korean prisoners in Allied hands are in fact South Koreans who were forced into the North Korean army. Moreover a number of North Koreans and Chinese among the prisoners are anti-

Communists and do not want to be repatriated. The UN delegates therefore propose that exchange of prisoners of war should be on a one-for-one basis, with the balance to be exchanged against civilians—which would ensure the return of civilian deportees now in North Korea—and, further, that all repatriation should be voluntary. The Communists object to these proposals on the grounds that to exchange soldiers for civilians is to treat them as "hostages" and that to leave the soldier to decide whether he should be repatriated or not is to deprive him of his "inalienable right" to be repatriated under the Geneva Convention—an instrument that the Communists have persistently disregarded. Those who criticise the UN negotiators should reflect on the morality and logic of these two specimens of Communist argument.

* * *

Labour and Mr Butler

The Chancellor of the Exchequer on Tuesday put his case for more import cuts, the restriction of investment and economies in government expenditure with moderation and great care. If he did not offend his own party, he certainly did not inspire it to feel that the British economy was being desperately pulled from the terrible quicksands that threaten it. He said enough, however, to bring the divided attitudes within the Opposition into full play. As had seemed only too probable, he failed to secure the support of any part of the Labour party for his proposals. But the division within the House of Commons is less important than the division of the Opposition along the demarcation line drawn by Mr Bevan, Mr Wilson and Mr Freeman when they left the Labour Government. It would be imprudent to underestimate the resentment felt by both groups within the Labour party at economies which will certainly wound many of their supporters in the country. Yet the temper of the House while Mr Butler was making his statement on Tuesday and during the first day of the debate on Wednesday was notably calm. Mr Gaitskell, of course, is not given to passion and had to tread with great care. Mr Wilson, who had a clearer field before him, is not much of a firebrand. Both these speakers from the Labour side recognised the existence of a crisis, and Mr Wilson even went so far as to say that rearmament had intensified the crisis but not caused it.

It seems that Mr Bevan had previously told the Parliamentary Labour party that rearmament was the sole cause of present difficulties. His attitude now appears to be gaining ground within the party. Some advance was to be expected when the party moved into Opposition. What is now being released upon the Conservatives is merely the distaste which so many Labour members felt for the health service charges when Mr Gaitskell imposed them, but which had to be restrained for fear of wrecking the Government. Mr Bevan, the pioneer critic, with his confidence and zeal, tends to attract the support of all those Labour members whose consciences are still uneasy. This load of conscience compelled the Parliamentary party to decide that it must table an official amendment of "no confidence" to the Government's motion of support for Mr Butler's statement. The wording of the amendment has for the time being cloaked the differences in the Labour party. But the amendment itself offended some back-benchers by its mildness, and in any case Mr Bevan has not yet finished his campaign to save alive the Socialist soul of his party. The economic crisis is plainly going to accelerate the process of Labour policy-making.

* * *

Another Lord

In principle it is wrong to have a soldier as Minister of Defence. He is a co-ordinator. His task, even in war, is political rather than administrative. It is, on the one hand, to see that the higher problems of defence policy or war strategy are settled in the light of the general needs of government; on the other hand, it is to make the needs of defence policy plain to his colleagues in the cabinet and, in general terms, to the country at large.

This is work for which political, not military, experience is the essential qualification. Even a soldier as brilliant as Lord Alexander, and as experienced in high command, is not normally the best Minister of Defence. But there are special circumstances that make Mr Churchill's choice of Lord Alexander welcome. In the first place, he has discharged with great distinction the tasks of Governor-General of Canada, which put him closely in touch with the whole range of political affairs. Secondly, though the Prime Minister is wisely giving up the additional daily burden of the Ministry of Defence, he will certainly retain his special interest in the main issues of defence policy. Lord Alexander will work with constant political advice, and he can probably play this difficult part more skilfully than any of the politicians who might have been spared from other offices.

But to this welcome there must be an important qualification. Mr Churchill now has seven peers among his sixteen Cabinet colleagues. That is too many. It weakens dangerously the Government's ability to expound its main policies in the House of Commons through men who have played a full part in making those policies. It spreads too thinly the political experience and habits of thought that, whatever their weaknesses, are indispensable to government and can only be gained by serving an apprenticeship, and becoming known to the public, in the House of Commons. A Prime Minister should not for this reason deprive himself of the services of men of Lord Alexander's particular abilities. But he certainly should not remain dependent on so large a proportion of such men for the highest offices within the cabinet.

* * *

European Partners Fall Out

There is a certain artificiality about the crisis into which negotiations on the European Defence Community have been thrown by two events: Germany's request to enter the North Atlantic Treaty Organisation and France's appointment of an ambassador in Saarbrücken. Words like "bombshell" and "perfidy" are being flung across the Rhine. Official spokesmen in Bonn have indicated that, unless France gives satisfaction over the Saar, Germany will think again about the European army. In this heated atmosphere it has been overlooked that the French have known, for a long time past, that Germany would want to enter Nato in order to secure equality with the other members of the European army; and that some way of associating Germany directly by treaty with Nato or its individual members would sooner or later have to be arranged. In any event, Professor Hallstein has not insisted that Germany should immediately be accepted into Nato, and has proposed a number of temporary alternatives. In the end he did no more than reserve Germany's right to claim membership in Nato later. It is doubtless very difficult for the French to explain to their Assembly that, contrary to earlier assurances, German rearmament must bring with it German adherence to the Atlantic Pact. But if Germany is to join a European army at all it is inevitable—indeed, desirable—that this should be so. By joining the wider group the Germans would be accepting new obligations, not merely acquiring new rights.

It has been argued that the various issues arising out of the effort to place Germany in the European community should be kept separate from one another, so as to exclude complicated and bitter bargaining. But it is dishonest to pretend that the matter of the Saar has nothing to do with the European Defence Community, or with the Schuman pool for heavy industry, or with the treaties with Germany that are to take the place of the occupation statute. All are different facets of an attempt to ensure that Germany's revived power shall be restrained by a freely accepted and equal association with its neighbours. If the French and Germans believe sincerely in a West European federation, they must see that rivalry over the Saar can be removed only if first steps towards union lead to others. The French still cling to the territory's coal and steel as solid rocks in a landslide. They endanger Dr Adenauer's work for federation by providing his opponents with what looks like plain evidence of their intention that the Saar shall become a satellite state of France. M. Grandval is a distinguished administrator, but his work in the Saar is associated with an era of Franco-German enmity. Having put their money on Dr Adenauer, the French would be wise to do nothing further to prevent him winning the race against his opponents. They will otherwise foster growing suspicions in Germany that the French would secretly like to see the whole structure of a European Defence Community break down before the nails are driven in.

* * *

Defence of the Defence Community

It must be recognised that the French have made great concessions to the views of their partners in the latest arrangements for the European Defence Community. The original Pleven plan has been transformed, in particular by the agreement that the council of the community will consist of six foreign ministers, still representing national governments and taking the most important decisions by unanimous vote. These opportunities for use of the veto will, however, be rare. The normal method of taking decisions—for example, on the use of the funds in the common budget and on the programme of arms production—will be by majority vote. This is, of course, the very stuff of federalism. But the fact remains that the defence community will be a loosely knit structure in its early stages—looser than some Frenchmen consider to be safe. This, say the British, is a practical solution on Commonwealth lines; and this, say the Americans, is a more tentative step towards ultimate federation than they hoped for.

Both are right, but this modified plan is all that was in fact possible. The aim of American and British policy should now be to ensure that the infant community survives the period of pre-federation, that it is helped and protected—perhaps sometimes remonstrated with. Mr Eden's advisers are believed to be giving this problem more attention than they ever gave to it under Mr Morrison, partly because some members of the British Cabinet have uneasy consciences about feeling on the Continent that Mr Churchill has let Europe down.

To find a solution will not be easy but no effort should be spared to formulate one in which the United States can take part. First it is necessary to define the relationship between Nato and the defence community, when it is formed. How can their mutual obligations be defined with the six members of the community acting as six members of the Council of Nato? Will the community eventually speak with one voice in a supreme Atlantic triad consisting of Britain, Europe and the United States? If that is the intention the Europeans will have to form federal habits rather faster than their present plans allow. And how, in case of deadlock or crucial disagreement, will the defence community be held together? If one member should defy its Council of Ministers, its Assembly and its Court and threaten a breach of the defence treaty, how is its authority to be enforced? Clearly this is a possibility that neither American nor British policy can ignore. To raise it now is to incur the charge of bad taste or scepticism; but it is one which is inherent in the process of federation, as the Americans found a century ago. And to find a solution to it now might be easier than, say, three years hence, when the community is to control 1,600,000 men in 43 divisions.

Still No Five Year Plan

In accordance with custom the Russians have now officially announced the results of the annual economic plan for the past year. Yet, while the summary report of the central statistical office released on Tuesday in Moscow mentions time and again the "overfulfilment of targets" for 1951, the planned objectives both for that year and for the current five-year period of which it is part remain unrevealed. In view of the tense international situation the Russians may well continue to draw a veil over their plans of economic development. Yet their talk in terms of percentages seems to show that both annual and probably long-term plans for internal consumption exist.

The summary report repeats, on the whole, the claims made by M. Beria in the review of the year he made last November. It is again claimed that during 1951 Soviet national income rose by 12 per cent and industrial output by 15 per cent, thus reaching a level double that of 1940. Production in the basic industries of fuel and power has apparently increased by 8 to 15 per cent, which again squares with Beria's figures of an additional output of 2.7 million tons of pig iron, 4 million tons of crude and 3 million tons of rolled steel. The total labour force grew from 39,200,000 in 1950 to 40,800,000, an increase of 1.6 million compared with 2 million during the previous year. With the emphasis on industrial development, urban housing has apparently been speeded up and 27 million square metres of floor space were built during the year. Rural housing, on the other hand, with 400,000 dwellings built during the year, lags behind the average of the last Plan.

The most striking disclosure is about agriculture. The speculation made earlier in these columns, that the 1951 harvest might have failed to reach the expected level because of regional drought, is now confirmed by the euphemistic statement that "despite the bad weather in certain regions . . . the grain crop exceeded 120 million tons." This is, in fact, about 4½ million tons less than last year's official yield and 5 million tons less than last year's target. It seems also that the modest three-year plan for livestock development, which was to be completed by the end of 1951, has not been crowned with success. No mention is made of the plan and there is only a vague statement that total numbers of livestock increased during the year by 14 million.

* * *

Money No Object

Mr Butler, in his broadcast on Tuesday, compared the nation to a man who cannot afford to improve his house while in debt. The analogy must have embarrassed Mr Macmillan, who this week sent a personal message to local councils urging them to use all means to build more houses, and promising them the necessary assistance. In an interview, the Minister of Housing went further. Housing should be treated as "a military operation," and plans should be laid for an expanding programme which would produce 300,000 houses a year—"at the end of, say, three years." Moreover,

> Money is not the difficulty; the Government has decided that all the money needed shall be forthcoming.

It is a long time since Dr Dalton used to say this sort of thing. He had at least the excuse that he was expressing a consistent government policy, even a national mood. It is a far stranger policy that allows one Minister to talk so glibly about finance in the same week as the Chancellor has launched a further instalment of cuts and economies.

Mr Butler stated clearly enough the relation between internal and external finance, between expenditure at home and the overseas deficit, that Dr Dalton sought to deny. But he appears to believe that, while dismissing white-collared civil servants and economising on the health service will help to free resources for exports, it does no harm

to employ more workers to build new houses because houses do not require steel. The argument is plain nonsense, as ministers surely know perfectly well. But the promise of 300,000 houses is a millstone round their necks, and they feel politically bound to try to swim with it. That is to say, other capital investment must be restricted all the more severely in order to make room for the houses.

Mr Macmillan's blank cheque to the local authorities suggests that the Government has finally decided to raise the Exchequer subsidy on new housing in order fully to offset the increased interest rate for local authority borrowing. How, then, are councils to be encouraged to build the smaller and cheaper houses that the Government approves? The general purpose of raising interest rates is to weed out the less economic forms of investment—such as unnecessarily large houses in the Bevan fashion. Why should the tenants of new council houses, who already receive a not ungenerous subsidy, be exempt from the national policy of credit restriction? Housing remains a pressing social problem and should not have its practical problems set aside, in the pursuit of an impossibly high ideal, as happened under Labour. But the first implication is that the fullest possible use should be made of the existing stock of dwellings. It is only then that the national need for new houses can be put into its proper perspective—in relation to the economy as a whole.

* * *

Vacancies to Order

The Minister of Labour is an optimist if he thinks that the Notification of Vacancies Order, which he laid before Parliament this week, will be more effective than the Control of Engagements Order which was introduced in the crisis of 1947. It is difficult to say whether the previous control did any good at all. It may have had some useful marginal influence; but—although it was combined with some little-used powers to direct workers to specified jobs—it certainly did not bring about the large shift of manpower to essential industries that the Labour Government at first set out to achieve.

There is nothing in the new Notification of Vacancies Order to suggest that it will be any more effective than its predecessor. This time the obligation to use the employment exchanges rests on the employer alone, not on the worker as well; but since it will be impossible to get lawful employment except through a labour exchange, the practical effect for the worker is the same. This time the Minister has no reserve power of direction. The effectiveness of the Order depends entirely on the employment exchanges' ability to choose which of the vacancies notified to them shall be offered to men seeking work. To this end, eighty inspectors are to tour the nation's factories, on the improbable theory that a brief inspection will enable them accurately to judge whether the demand for extra labour, or even for normal replacements, is justified or not.

It is difficult to believe that on this flimsy basis the employment exchanges will ruthlessly refuse to offer men jobs in non-essential factories near their homes, and in their familiar trades, in favour of essential work elsewhere. And the Order will, therefore, alter the distribution at a perceptible rate only if the non-essential industries are in any case dismissing many of their workers. This makes it inexcusable that the Government, against all the principles it professed so eloquently while in opposition, should have chosen to introduce the Order under the defence regulations. Even if the scheme could have had its effect more quickly—even if the economy were being so disinilated that workers from inessential industries were coming on to the labour market in large numbers—it would have been worth waiting a few weeks longer in order to submit legislation to Parliament. As it is, the Government may find that it has taken arbitrary and elaborate control of a labour market that has almost no one useful in it.

More Health Service Charges

Most of the new charges to be made in the health service will need legislation, and ministers will have an opportunity to explain more fully than Mr Butler was able to on Tuesday exactly how they will be collected and what exemptions will be allowed. It is useless to pretend that the charges will not cause any hardship. They are bound to, especially the shilling charge on prescriptions. But it is also useless to pretend that there has not been abuse of the pharmaceutical service. The number of prescriptions dispensed last year totalled between 4 and 5 per head of the population, and the average cost of each was nearly 4s. Any hardship caused by the charge of up to £1 for dental treatment will be more than offset if it restores the priority service for expectant mothers and children, who will be exempt from the charge.

But the chief importance of the new charges lies in their effect on the finances of the health service. Altogether, including the charges for appliances like wigs and surgical belts and boots, they will bring in about £20 million in a full year, of which the charge for prescriptions is estimated to bring in £12 million and that for dental treatment £7,500,000. This is a milder stroke of the axe than Mr Gaitskell administered last year. The charges for spectacles and false teeth were estimated to bring in £25 million in a full year.

Like his predecessor, Mr Butler intends to maintain the financial limit of £400 million on the cost of the health service to the taxpayer. What is not clear from his statement, and presumably will not be made clear until the new estimates are published, is whether all of the £20 million saving will be used up in offsetting the effects of higher prices on the cost of the hospital service or whether some margin will be available to meet, if necessary, the general practitioners' claim for a higher capitation fee. Arbitration proceedings on this claim have barely begun. If they go in favour of the doctors, Mr Butler may find himself faced with the need to find another large sum. In any case, as long as prices continue to rise, the £400 million limit cannot be maintained indefinitely without either curtailing the health service facilities—which in practice would mean curtailing the hospital service—or imposing more charges on the users.

The Future of Eastern Europe

Last week a conference was held in London, under the auspices of the European Movement, to discuss the problems of the European peoples now under Soviet domination. It was the first time that exiled leaders from these satellite countries had met their western friends in the movement in formal public conference. Their meeting was designed as a gesture of solidarity between the two halves of Europe, and it is impossible not to sympathise deeply with their aims—all the more so because the delegates evidently took pains not to raise any false hopes of early liberation. They hammered out resolutions on economic, agricultural, social and cultural policy which form blueprints of the sort of democratic regime they would like to see set up in Eastern Europe whenever it is liberated from its present bondage. These resolutions and the debates that led up to them are now being broadcast to the 100 million Europeans behind the iron curtain, in the belief that the knowledge that some alternative to their present plight is being considered—if only in theory—will help to keep alive a spirit of resistance and independence.

Unfortunately, however, the conference did not stop here. In its political resolution it was guilty of phrases which convey a false impression. History has shown that it is perfectly possible for Europe to exist for long periods "half slave half free." The fact has to be faced that the govern-

Old friends to know. Old books to read. Old wood to burn. Old wine to drink. And let us add—old shoes to wear. But they must be shoes that had it in them to grow old. ments and peoples of western Europe are not now willing—nor are they likely to become willing—to go to war in order to liberate eastern Europe. Nor is it likely that the majority of east Europeans themselves would welcome a war of liberation over their lands. It is doubful whether "real peace" with the Soviet Union can be secured in the predictable future on any terms acceptable to the west; but it is dishonest to suggest that the west would make the liberation of all eastern Europe a condition of "peaceful coexistence" with the Soviet Union. Until the Communist regimes begin to collapse through their own internal contradictions and under the attraction of western strength and prosperity, the only way to liberate eastern Europe will be by war. These are brutal and unpalatable facts, but it can do no good to ignore them. The most that the east European can immediately hope for is that his spiritual and cultural links with the free world should be maintained, and that he should understand how its power to discredit and defy Communist policy is growing.

Mission to Asia

The Marquis of Reading has gone to represent Britain at the meeting of the Economic Commission for Asia and the Far East which opened in Rangoon on Tuesday. The number of people who know that the United Nations has three regional subsidiaries—one for Asia, one for Latin America as well as one for Europe—would probably not fill the Palais de Chaillot. The Economic Commission for Europe is comparatively famous, largely because it was the place where eastern and western Europe continued to meet after the advent of OEEC and Marshall Aid. Perhaps the departure of the Under Secretary of State for Foreign Affairs will draw British attention to ECAFE, the only official forum where Asia and Europe can meet together.

The obscurity that has surrounded the commission does not mean that it has done no good, or that British representation has been consistently bad. But potentially, this could be a body of real importance. Europe, after all, has its eastern and western camps, clearly defined and organised within themselves. But Asia, with as many common economic problems as Europe, has nothing but ECAFE, apart from the association of some Asian countries in the British Commonwealth. It includes, as members or associate members, all the independent countries of South East Asia, including the Asian members of the British Commonwealth; the European powers with interests in the area—Britain, France and Holland; the United States and the USSR; and now, as the latest candidate for associate membership, independent Japan (subject to confirmation by the Economic and Social Council). The area is of crucial importance in the cold war. The economic relations within the area, particularly with a new and expanding Japan, and those of the area as a whole with the industrial powers of the west are of the highest importance. The commission has the ingredients, given the necessary stir, to provide substantial aid to the economic and political conditions in that part of the world. The Russians are there; but it matters comparatively little if they are bent on obstruction. There is no veto, though the more important decisions have to be endorsed by the parent body; and if Asia can see the Russians obstructing at the points where Asia suffers, so much the better. The decision to send a British Minister to this meeting is admirable. It is a small step in the right direction and should encourage the commission to work hard and seriously.

Peace, "Peace" and the Home Office

The development of Communist "newspeak" and of the campaigns of Communist sponsored "peace committees" as a weapon of Soviet disruptive strategy has set a most complex and difficult problem to the officials who have to enforce the regulations of the Home Office on the admission of undesirable aliens. Few of these officials are experts in the intricacies of international politics or the finer points of Marxist-Leninist dialectics; but they must strive as best they can by the light of reason and the book of the rules to prevent the entry of persons who are up to no good. Unfortunately foreign personalities of high eminence and the utmost respectability are now liable to suffer from the perplexities of British officials who find that the sorting of sheep from goats is beyond their powers. Since the Home Office excluded from our shores a number of the more mischievous delegates to the projected Peace Congress in Sheffield, immigration officials have become aware that the word "peace" can have sinister implications. But, in the absence of any clear guidance on how to distinguish between different kinds of peace, they can only sniff for it like a Customs official who suspects the smuggling of cocaine.

In the United States, long before the Stalinists started their *ruse de guerre*, there were endowments for the study and promotion of methods of attaining peace among nations. Recently a distinguished American visitor, who happens to be president of one of these peace foundations, was subjected to considerable annoyance on landing in England because he was a suspected agent of the Kremlin. In a period of "cold war," and after so many shocks over Hisses, Fuchses and so forth, it is no doubt inevitable that innocent persons should occasionally be mistaken for subversive elements; but it will be only a victory for the Communists if they have succeeded in creating so much confusion that it has become normally impossible to distinguish friend from foe. The Home Office would do well to explain clearly to all its officials (with lists of organisations under each head) the difference between peace and "peace."

Ethics of Fixed Prices

An early Budget means that Parliament will have little time for anything else until it is all over. The new monopolies Bill will therefore be delayed by a few weeks. If this is in most respects a pity, it will at least give the government more time to make up its mind about the kindred question of whether manufacturers should be allowed to dictate the prices at which their goods are sold to the public.

It is a difficult question, and one on which opinion is divided on both sides of the House. The late government decided to forbid all resale price maintenance, whether by individual firms or by manufacturers acting collectively, except in those industries that could make out a special case for exemption. A Bill to this end was drafted, but if it had reached Parliament it would not have found favour with trade unionists in the Labour party, who have a traditional fear of the effect of price cutting on wages. In its recommendations about distribution, published last week, the General Council of the TUC does some tight-rope walking. It sees no harm if an individual manufacturer enforces the resale price of his product by threatening to cut off supplies to a retailer who sells more cheaply. It is only the practice of coercing the retailer by collective action that the TUC finds objectionable, because it restricts entry into manufacture and trade, hinders the development of new methods of production, and because, by Star Chamber methods against which there is no legal redress, a retailer may suddenly find his shelves empty and his livelihood gone.

This is surely a superficial distinction. Collective resale price maintenance has a more obvious impact, especially on the retailer, but essentially the arguments against collective and individual price maintenance are the same. Both force the consumer to pay more than he should. A ban on resale price maintenance would put some retailers out of business,

Catesbys LINOLEUM *and* CORBULIN

The contracts listed suggest the wide variety of Floor-covering work and exemplify the craftsmanship attained by CATESBYS LINOLEUM CONTRACT DIVISION. They include canteens, hospitals, schools, factories, offices, churches, power stations, banks, universities, etc.

As the life and efficiency of Catesbys Linoleum and Corbulin depends upon proper fitting, it is important to get the craftsmen best suited for the job. We have a long established specialist staff of highly skilled fitters who know precisely what is needed when floors and floorings are in question. It is their job to know how to get greatest efficiency with the saving of material.

The use of Corbulin—the damp-proof floor covering, in various colours and thicknesses—has played a big part in bringing old and new concrete surfaces into use with a minimum of delay and the maximum of comfort and efficiency.

and the TUC thinks that the harm done to them and to their workers would outweigh the possible benefits. This is inconsistent with the rest of the statement, which says that the distributive trades are too large. There would certainly have to be some exemptions to a general prohibition of resale price maintenance, and this aspect of the question needs more study. But the need of the time is that workers should move to armaments and export industries, and this, combined with lower prices, is a large benefit to set against the hardship of those small shopkeepers who would find it difficult to get other work.

Libel Amendment

The gesture made by the Government in giving facilities to Mr Harold Lever's Bill to amend the law of defamation is a fair return for the assistance given by the late Government to a Conservative member's Bill to dispose of the common informer. Both measures come under the heading of non-partisan attempts to remedy defects in the law that have long been known to exist.

Mr Lever's Bill is based on the report of the Porter Committee on defamation. It might be described as a Bill to give the press better protection against the unscrupulous. It makes two main proposals. First, it provides the newspaper with a defence against the inadvertent libel. If a correction and apology are not accepted, the newspaper can defeat a claim for damages if it proves that there was no intent to defame the plaintiff or negligence. The Bill's second proposal is to extend the range of public documents and meetings to which the plea of qualified privilege applies. That is, if a newspaper prints a fair and accurate report of what is said and done, it cannot be held liable for defamation unless the claimant can show that it had some wrong motive in publishing the report.

There is one clause in the Bill which seems to go too far as it stands. This would allow a defendant in a libel action to give as evidence, in mitigation of damage, any facts relevant to the "character and reputation" of the plaintiff, even though those facts have no bearing on statements in the libel itself. The clause looks innocent enough on the face of it, but what of the case of the man who has lived down a black episode in his past? Is the defendant to be free to drag that out (or to threaten to drag that out, which may be even more effective), in order to ward off an action based on an undoubted libel? But, in general, the Bill is to be welcomed, and the additional safeguards that it requires can easily be added at the committee stage.

* * *

Nigeria's New Government

Nigeria's new House of Representatives met for its inaugural session this week—new in another sense, too, for only 13 of its 136 elected members were in the old Legislative Council. The House is also a young one. Most of its members are under 40, and this youthfulness is reflected in the average age of the twelve elected members of the new Council of Ministers, which is just over 40.

These twelve, who with six *ex-officio* members and the Governor as President make up Nigeria's first Cabinet, appear to have been chosen primarily for their abilities in other fields than politics. They are mostly either well-known rulers like the Oni of Ife, who is the only one over 50 years of age, and the Emir of Katsina, or barristers, educationists and university lecturers. Some of them have been members of the various marketing boards for Nigerian produce—which may lead to difficulties. But it will certainly not be a government of illiterates (seven of the twelve have British university degrees or diplomas) or of extremists.

Unfortunately, this does not mean that the Council of Ministers will be able to work together successfully as a team. An article on page 283 describes the growth of party politics in Nigeria in the last twelve months. But the main feature of the Council of Ministers is that it represents the regions and not either of the two main parties, the National Council for Nigeria and the Cameroons or the Action Group. Because of its success in the eastern region, the National Council sent a solid bloc of 34 of its own supporters to the central House of Representatives, where they have been joined by four of its supporters from the western region. The Action Group, although it has only 27 members in the central House, will in fact be the majority party, because it has been promised the co-operation of the Northern People's Congress, which has 68 members. Thus, the National Council will in effect be the Opposition, although it has four supporters in the Council of Ministers. How these four Ministers will comport themselves when the Government is attacked by their own party will be interesting to watch. So will the tactics of Mr Awolowo, leader of the Action Group, who has chosen not to be elected to the Council of Ministers. Presumably, he felt that his hands would be less tied if he remained outside the Government. If so, his decision may also have unfortunate consequences. If Nigeria's new constitution fails, it is likely to do so because it divorces power from responsibility.

Our National Defences

The subject of our national defences excites such intense interest at the present moment. . . . We have no desire either to tempt foes abroad, or to augment the panic at home. At the same time this panic may not be without its uses. It may help to check, before it is too late, that mania for retrenchment *coûte qu'il coûte*—at all hazards and at any price—against which we have incessantly raised our voice as a shallow and a fatal policy; and at the same time it may arouse the country to a more steady, strict, and ceaseless vigilance over the mode in which the supplies are expended, in place of the fitful outcry and hasty and unreasonable interference with which it now too commonly endeavours to replace the consequences. . . . The important matter is that our army, whatever be its numbers, shall be in a state of the very highest efficiency—that its arms shall be the best and its accoutrements the most judicious that can be devised—that the men shall be as admirably trained and exercised as those of any nation. . . . The prompt and speedy attainment of this state of things is beyond question the first and most pressing duty of Ministers, not only at this moment but at all times. . . . Whatever sum is really needed to render Great Britain secure at home, and formidable to defy her enemies, may be asked for by the Ministers, and will not, we may rely upon it, be grudged or denied by the country. *England will refuse nothing to secure so great an end.* . . . The present anxiety may be groundless. The idea of an invasion may be a chimera. But the mere possibility of the thing is to be precluded. The mere suspicion that England has ground to fear for the inviolability of her own shores—that she is unable to crush an unscrupulous enemy—that she must speak with bated breath when she remonstrates against inhumanity or oppression—that she must submit to insult, because unprepared to avenge it—that she must tamely watch while her allies are crushed, because too weak to aid them—will not be endured.

The Economist
January 31, 1852

Letters to the Editor

The House that Fell Down

Sir,—Your issue for January 19th contained a Note in which you used a recent judgment of the Court of Appeal to illustrate your view that a building society should not instruct a surveyor to value a property in which he is financially interested. Your readers might like to know that this has also long been the view of the council of the Building Societies Association and that it is normal practice for a surveyor to be required to certify that he has no financial interest in the property which he is valuing.

As you quoted some observations of Mr Justice Devlin in the same case, perhaps I might add that his remarks have been studied by the association with the respect due to them and that discussions are now taking place with other bodies, with the object of making arrangements which will carry his suggestion into effect.—Yours faithfully,

F. H. CHAMPION
The Building Societies Association, London, W.1

The Way to Simplify

Sir,—I am in broad agreement with you as to the importance of simplification and specialisation in British industry—the Anglo-American Productivity Council has evidence that leaves no doubt of the value of such measures in particular cases—but I would suggest that great care is needed in deciding that there is any general tendency for British industry to produce an "excessive variety" of end products.

There is a tendency to view such problems in terms of *given* demand and cost conditions, although in fact uncertainty about future demand and cost conditions is in many industries of the essence of the matter. I know, for instance, of a spinning firm which has steadily refused to allocate its quarterly yarn quota at the beginning of each period, because as a matter of policy it wishes to be free to take new customers. For similar reasons it is willing to take short runs. From a short period viewpoint its production costs are high and variety excessive. But the production costs of variety, in the view of the firm, are outweighed by the advantage of a diversity of market outlets. This policy has no doubt cost money of late; I wonder if it will continue to do so in the present condition of the industry?

In most industries production of new and improved products is an important form of competition, and diversity of market outlets desirable in view of uncertainty as to future market trends. It is no consolation to a firm operating in such conditions, when the demand for its product declines after specialisation, that specialisation need not reduce the variety of production of the industry as a whole. In fact, the productivity reports comment on the uneasiness some American producers felt because specialisation had increased their reliance upon demand from a few sources.

The possibilities of economies by simplification, possibly without need for specialisation, in the production of "intermediate" components for a number of manufacturers, are emphasised both by your correspondent and by the productivity reports. Here perhaps the case is clearer; it rests upon the ignorance of producers as to the precise requirements of their individual (manufacturing) consumers. Where such conditions prevail, it must normally be the case that the costs of obtaining the information are prohibitive to the individual firm. This seems to me a field in which co-operative action by trade associations would be of general benefit.—Yours faithfully,

JOHN WISEMAN
University of London

Estate Duty

Sir,—You have emphasised the need for a tough financial policy "working through budgetary retrenchment, taxation and monetary pressure." Budgetary retrenchment should tend to create a budget surplus, even at existing rates of taxation, and additional taxation might make this very large. But, as we have seen, the existence of a large revenue surplus constitutes a temptation to overspend which government departments find it hard to resist.

The present would be a good time, therefore, for the Government to abjure the profligate habit of spending the proceeds of Estate Duty as though they were income. This tax is a levy on capital which is paid out of the proceeds of capital, or with savings accumulated by means of life insurance policies, or in other ways. By abandoning the bad practice of squandering the savings of a lifetime in a year, the Government would be setting the kind of example in financial matters which it expects private people to follow.—Yours faithfully,

London, S.W.1 T. C. OWTRAM

How to Export Coal

Sir,—Your article on "The Case for Dearer Coal" was largely concerned with ways and means of increasing exports, even by a few million tons. One straightforward way seems to call for attention. The average usage of domestic coal in the country is roughly a ton per head of all population allowing for gas and electricity. The 700,000 miners received in 1951 over 5 million tons of coal—more than 7 tons per worker. No doubt they also use some electricity and gas, and allowing for, say, four persons per mine worker, it may be said that 2 million tons of coal at least is supplied in excess of the recognised national standard of the community as a whole.

Incidentally, the amount was 100,000 tons more in 1951 than in 1950 in spite of a much lower proportionate increase in manpower.

If this coal is regarded as corresponding to imports from the United States, it is costing us—in dollars too—probably £10 per ton, say £20 million per annum. It would pay the country well to reimburse every mine worker by say £30 per annum in lieu of this three tons of the coal allowance, and it seems well worth while sounding the Mineworkers Union to ascertain whether the men too would not welcome such a proposal.—Yours faithfully,

L. PATRICK
Haywards Heath

Paying for Privileges

Sir,—The recent increases in monthly return fares on the railways and in the price of coal to the consumer raise an interesting point. To transport employees who enjoy free travelling facilities, and coalminers who receive free or cheap coal, these increases (to the general public) constitute a rise in wages. It therefore seems reasonable that such employees should not escape this increase by virtue of their office, but should pay for their privileges by exactly the amount by which these charges have been increased.—Yours faithfully,

E. T. WALKER
Thornton Heath

Lancashire Takes the Strain

Sir,—May I be allowed to comment upon the question of grey cloth imports into Lancashire, which was raised in *The Economist* last week. Substitution of Lancashire cloths for those at present imported from India and Japan would not be a simple matter. Much of the 323 million square yards of foreign cloth imported into the United Kingdom for finishing last year, was of a type which has been little woven in Lancashire mills since 1945. Manufacturers and weavers alike, have been reluctant to handle the extra coarse and "wide" cloths, preferring to concentrate upon the finer goods, which proved more remunerative to both employer and operative alike.

Further, the bulk of the foreign cloth finished in the United Kingdom since the war has been re-exported to markets with low purchasing power. Under the present arrangement the foreign consumer secures the advantage of cheap cloth with a high quality finish, which satisfies his particular requirements. Higher costs in Lancashire mills reduce the possibility of producing these same cloths at prices comparable or competitive with present Indian and Japanese prices; there is no guarantee that the demand from these "low consuming power" markets would be maintained if the higher priced Lancashire goods were substituted for the cheaper foreign cloths.

Some Lancashire manufacturers have recently maintained that with adequate supplies of yarn and the full co-operation of their own workpeople, they could satisfy demands for coarse cloths made by foreign consumers, but at the same time few references have been made to the prices of such cloth. It is indicative of the industry's own lack of confidence in its competitive strength that few Lancashire manufacturers seem willing to switch their production to coarser cloths, until the industry as a whole has received some kind of assurance from the Government that the imports of foreign cloth for finishing are to be limited.—Yours faithfully,

ROLAND SMITH
Manchester

Shopping Guide

Sir,—The article on consumer research in your issue of December 22, 1951 calls for comment. By devoting more space to the danger of "anti-commercialism" than to the advantages of consumer research, it gives a wholly false impression. The organisation that you mention, Consumer's Research, Inc., is probably politically to the right of British conservatism. The other American organisation in the field, Consumer's Union of US Inc., is certainly further to the left; but even this organisation publishes very little that could be attributed to "doctrinaire anti-capitalists, crypto-puritans, intolerant highbrows and intolerant utilitarians."

Part of your argument suffers from bad logic. Of course, the consumer should be free to buy a "shoddily made shirt for a fortnight's holiday." He should be free to do so consciously, and at a lower price than he would pay for a durable shirt, but he should be protected from buying a shoddy shirt by mistake when he needs a good shirt.

You never mention one of the principal arguments for consumer research, an argument that has nothing to do with "showing up mendacious claims" or revealing anything concealed by the manufacturers. The consumer needs guidance to shop intelligently when buying complex modern industrial products. It is a matter of selecting the product that is best suited to one's needs. Even when the considerations involved are simple one discovers surprisingly often that one does not know simple facts. With the more complicated equipment —for example a refrigerator or car—the necessary knowledge is altogether beyond the scope of the layman. To have at hand a practical work of reference, where the relevant considerations are assembled in precisely the form in which they are needed by the prospective buyer, not only makes for a better outlay of one's money, but greatly increases the pleasure of shopping.

A reader of your article would never gather that consumer research is not only a "theoretically excellent proposal" but an idea which has been successfully translated into practice in the United States for over fifteen years by organisations with millions of subscribers.—Yours faithfully,

J. HAJNAL
Princeton, USA

Books and Publications

The War in the West

The Struggle for Europe. By Chester Wilmot. *Collins.* 766 pages. 25s.

There can be no doubt that this is an important book. The publicity with which it has been greeted has no doubt served the purpose of selling the book—which is a good thing, as it deserves to be widely read—but it may have prejudged the public appraisal of the book beyond repair. Many people will have gained the impression that it is an anti-American tract of a sensational kind. In fact, it is a solid piece of the historian's art, evidently based on a great deal of painstaking research not only into written records but into the memories of the participants on both sides; it gains enormously from the care with which the German records have been sifted as well as the British and the American, so that the story can be told from both sides at once. Moreover, it is written with detachment and fairness. It is true that there are severe criticisms of the Americans, but Mr Wilmot is careful to quote his evidence and to say what can be said on the other side before he reaches his conclusion. He can certainly be acquitted of prejudice, in the sense of approaching each controversy with his mind made up.

Mr Wilmot makes four major criticisms of American policy, military and diplomatic, in the years 1943-45. These are (i) that the Americans were never prepared to put real strength behind the Mediterranean campaigns or to allow them to diverge from Italy into the Balkans; (ii) that the greed of the US Navy for landing craft for the Pacific crucially delayed the invasion of Normandy; (iii) that the American propensity for attacking all along the line, instead of in one concentrated spearhead, ruined Montgomery's plan for crossing the Rhine and occupying the Ruhr in 1944, which otherwise might well have ended the war before the Russians got west of Warsaw; and (iv) that Roosevelt's unjustified trustfulness towards the Russians and even less justified distrustfulness towards British "colonialism" led him, at Teheran and Yalta, to make a free gift to Stalin of the overlordship of half Europe. Perhaps not one of these four allegations will be accepted by everybody. The first and the fourth, however, are now very widely accepted in America—indeed, it would be difficult at this time of day to hold that Roosevelt judged rightly at his two conferences with Stalin. The second charge Mr Wilmot documents carefully, and it would not be easy to get over his figures. On May 1, 1944, the US Navy possessed 16,582 landing craft of all kinds, but spared only 2,288 for what was agreed to be the major operation of the year. Of the vital LSTs, the US Navy spared only 188 for Normandy, although at much the same time it provided 87 for the assault on Saipan garrisoned by a single Japanese division without hope of reinforcements. There remains the third charge, that the war could have been won in 1944 if, after the break-out from Normandy, the real weight of the Allied forces had been put on the crucial left wing, where Montgomery was in command, rather than spread out among the American commanders further south. This has been much controverted and it would be rash to expect any agreement on it. But Mr Wilmot's arguing of the case is very impressive, not least his calling in evidence of the German generals.

> These generals are agreed that if even fifteen divisions had driven on after the capture of Brussels and Liége, as Montgomery proposed, the Wehrmacht would have been powerless to stop them overrunning the Lower Rhineland and seizing the Ruhr. Indeed Blumentritt [Rundstedt's Chief of Staff] says: "Such a break-through *en masse*, coupled with air domination, would have torn the weak German front to pieces and ended the war in the winter of 1944."

To very many readers it will seem, as it does to the present reviewer, that Mr Wilmot has made out his case on all four issues. It is therefore worth going on to say that, even if the conclusions be accepted, they are matter for regret but certainly not for recrimination. Very many more mistakes were made on the German side than the Allied. If the Americans made mistakes they also did some things supremely well. If Europe is now paying for one of Roosevelt's errors, it should also pay tribute to him (as Mr Wilmot does) for the single-mindedness and courage with which he insisted, even when other stalwarts like General Marshall were wavering, that the war in Europe must come first and the war in the Pacific second. That America, after Pearl Harbour, did not turn its back on Europe to be revenged on the Japanese was one of the miracles of the war; and it was due to Roosevelt above all others.

Anyone who wishes to understand the world of today ought to read Mr Wilmot's book. The prospective reader should, however, be warned that it has a grave structural defect. This is probably due to the unfortunate accident (unfortunate, that is, for the book) that Mr Wilmot, as correspondent for the BBC, was an eye-witness of some of the events he sets out to describe. To be an eye-witness and yet a good historian requires the supreme detachment and self-control of a Thucydides. Where Mr Wilmot is not on the spot, his writing is brilliant; but where he is present (or near at hand), the balance becomes distorted, the descriptions are crowded with names and too detailed to be followed without pencil and paper, and the main thread is lost. It would have been much better to have taken the purely military chapters (that is, about 10 of the 34) out of this book and made them into a separate work. What would then remain could be described as an almost classic example of how a war can be not merely described but explained.

Case History for Steel

Capital Development in Steel. By P. W. S. Andrews and Elizabeth Brunner. *Blackwell.* 374 pages. 30s.

In this book, Mr Philip Andrews and Miss Elizabeth Brunner have attempted a study of a kind all too rare in British economic literature. They started with the intention of putting to practical test accepted economic doctrines about the motives that impel industry to extend its resources and invest in new plant. They have ended in producing a book of wider range, important less for its theoretical conclusions than for its account of the history and development of United Steel Companies, Limited.

There are a few classical examples, mainly American, where economists have succeeded in the formidable task of testing theoretical principles against practical observation. This book is perhaps a little too diffuse to earn the very highest of marks, but it is, for all that, a study of extraordinary interest. Obviously, the authors were most fortunate, in the first place, in choosing the subject of their case history. United Steel Companies have roots that extend to the very beginning of the nineteenth century; the group is one of the biggest integrated concerns in the steel industry, and one with the longest traditions. Its receptive sympathy towards the object of the authors' researches was an essential condition of their success. The result is in no sense a commissioned history of the group, though it would be hard to imagine a better account of its development from the earliest stages of the industrial revolution through the financial pressures of the late twenties and the complications that attended the reconstruction a year or two later until it emerged as a rationally knit group turning out more than one-eighth of the total production of steel ingots in this country.

All these stages are set down in great detail, with proper but not exclusive stress on steelmaking technique and without any resort to the more frightening types of economic analysis. The result is a living picture of United Steel so acceptable in itself that the reader—and perhaps here and there the authors—can be forgiven for an occasional forgetfulness of the book's intended theoretical purpose. The conclusions show that what made United Steel Companies grow was not a behaviouristic response to the rate of interest; there were other factors, more direct, such as its cash resources, and the earnings prospects of new developments, on which, incidentally, a 20 per cent return is set as a standard.

But, in the end, the factors that have made United Steel what it is cover a range of human motives and technical decisions—a desire to ensure raw materials for the group as a whole, a sense of social purpose in keeping Workington alive and making it pay, a courageous decision to extend greatly its steel works at Appleby-Frodingham based on home ore, and the development of special steels. Policy has entered into all these decisions, but overriding them is the determination of those in charge of the group to keep its production machine in efficient operation and to preserve and strengthen its relative importance in its own industry. This book may not have advanced economic theory appreciably. But it does offer a valuable and objective study of the economic growth of the firm in being.

Defining War Crimes

UNO and War Crimes. By Viscount Maugham. *John Murray.* 143 pages. 12s. 6d.

Whether aggressive war was already an international crime in 1945 or whether the charge of a crime against peace in Article 6 (a) of the Nuremberg Charter was retrospective legislation will long be debated. Lord Maugham concedes that the Pact of Paris (1928), despite the absence of any "sanctions" therein, made aggressive war an international crime against the injured state. The pact, he says, removed a shield from the authors of an aggressive war. Nevertheless, he would prefer to exclude aggressive war from Uno's projected code of war crimes. Impressed by the difficulty of defining aggression—a difficulty not yet solved by the International Law Commission—and by differences among historians concerning the origins of past wars, he considers it unwise to make aggressive war part of a general criminal code.

But the law can and must distinguish between the historical causes of international disputes and the decision to solve them unilaterally by violence. The definition of the defences of provocation and self defence presents, no doubt, difficulties in the international law of aggression as it does in the municipal law of homicide. That does not, however, mean that aggression, like murder, is not generally capable of determination. If the Nuremberg precedent is not to become, as Lord Maugham fears, a pretext for liquidating vanquished enemy leaders, the essential point is that the crime should be punishable only in the name of the international community. Some will decline to follow Lord Maugham when he apparently sees in the Nuremberg trial nothing of the outraged international community and only the trial of vanquished by victors. If the community does not in future maintain a substantial solidarity, crimes against peace may well make bad law, but if it does hold together, they will form a natural element in its law of public security and it is so intended in Uno's code.

However, Lord Maugham's chief concern is with the personal guilt of the individual—his *mens rea* as the lawyers say—in the projected code of war crimes. He strongly denies that the Pact of Paris made criminals of anyone but the real authors of aggression. He accordingly attacks the phrase "the planning, initiation or *waging*" of aggressive war in Article 6 (a) of the Charter as being wide enough to make a criminal of every individual participating in the aggression. The word "waging" probably reads *eiusdem generis* with "planning" and "initiation," and meant the higher direction of aggressive operations; but the language was certainly very loose. Next, he criticises Article 7 for having excluded "act of state" as a defence to a war crime. Here, he scarcely seems consistent, for the legal shield which he accepts as having been removed from an aggressor by the Pact of Paris can only be the immunity which attaches to lawful acts of state. Then, he criticises Article 8 which excluded the defence of "superior orders" (another facet of act of state) without regard to the accused's "moral choice" to disobey. Under this article "superior orders" were at most to mitigate the punishment. The conflict between the individual's international and municipal duties is not easy to resolve, but Lord Maugham has the support of the International Law Commission in recommending that absence of a real moral choice should entitle the accused to full acquittal. Lord Maugham's contribution is to have directed attention to the mental element as the basis for responsibility in international crimes. This contribution would, perhaps, have been greater if he had entered rather more into both sides of each argument.

GOM and *Grand Seigneur*

Mr Gladstone's Last Cabinet. By the Fifth Earl of Rosebery. Printed in *History Today.* 2s. 6d. monthly.

This valuable and amusing document is a narrative of events behind the scenes covering the period from January 9, 1894, when Gladstone, aged 84, announced "in a speech of 50 minutes"

STORY & CO. LTD.

Designers of Interiors

KENSINGTON · LONDON

EXPERIENCE gained over many decades in the design of interiors and the *actual* production of fine furniture together with suitable floor coverings and textiles, enables Story's Contracts section to give competitive estimates on a high level of quality and design, both in English Traditional styles and in the Contemporary manner.

Since 1945, Board Rooms, Directors' and other offices, reception halls, showrooms, restaurants, canteens, residential staff quarters, etc., have been successfully executed (many in collaboration with the clients' architects) for over 30 notable organisations, including Martins Bank Ltd., I.C.I. Ltd., Tube Investments Ltd., Kuwait Oil Co. Ltd., Kodak Ltd., Cyanamid Products Ltd., Dunlop Rubber Co. Ltd., Patons & Baldwins Ltd., Lever Bros. & Unilever Ltd., Ind Coope & Allsopp Ltd.

LEAD LASTS

LEAD SHEET AND PIPE CAN BE DELIVERED IMMEDIATELY FOR ALL BUILDING WORK

The Technical Information Bureau of the Lead Industries Development Council exists to give assistance on problems relating to the use of lead sheet and pipe in building work. Details of its application are given in a series of information sheets. These sheets are available to architects, surveyors, builders, plumbers and other technicians interested upon application to the Council. " Students " applications should be endorsed by an instructor or master of a technical school.

that he would resign unless the Admiralty estimates were halved, to March 6th, a few days after Roseberry's accession to the premiership. The date of its composition is unstated and perhaps unknown. It was probably used by Lord Crewe in the composition of the "Life of Lord Rosebery," but thereafter disappeared until found by the present Lord Rosebery and published in the December and January issues of *History Today*.

A reviewer generally assumes that he is writing for readers who have not read the work he is reviewing. Many readers of these lines will, however, already have read Lord Rosebery's narrative, and will agree that it is both valuable and amusing. It presents, in fact, a political comedy with five characters. First there is the GOM himself, aged, incalculable and exasperating. Next the heir presumptive, in his own estimation at least, Sir William Harcourt, who would have been on all grounds the man for the premiership if his cantankerous and overbearing manners had not made him intolerable to all his colleagues. Attendant of Sir William, his son Loulou, eagerly canvassing on his father's behalf and not thereby improving his prospects. Fourth, John Morley, vain, irritable, intriguing, pining for the Foreign Office and hoping to extract it from whomever might secure the premiership. And lastly, the *grand seigneur, sans peur et sans reproche*, Lord Rosebery himself, who did not seek greatness but none the less had it thrust upon him. Is it a matter of history or an entertaining coincidence that the only character to emerge without shame from this story is the character who wrote it? That is a point on which every reader must make up his own mind.

Victorian Decline

Imperialism and the Rise of Labour, 1895-1905. By Elie Halévy. Second (Revised) Edition. *Benn.* 442 pages. 21s.

The enduring and stimulating qualities of Elie Halévy's work with its broad perspective and bold judgments remain unimpaired after a quarter of a century. But the author frankly confessed himself least at home with the themes and period of this fifth volume—the first of the epilogue. He found the chief glory of the Victorian Age in the *laisser faire*, pacific and cosmopolitan liberalism of the mid-century. Its decline before the onset of expansionist imperialism and the beginnings of collectivism in the late Victorian years, he interpreted as a movement toward national decadence.

Part of his explanation, which few would dispute, was the growing sense of insecurity and lack of confidence caused by the relative decline in British prosperity and power. Another, perhaps the most illuminating, was his interpretation of collectivism as the product of an unconscious alliance of employer and employed against the "zeal for production" and the "appetite for work." On the other hand, Halévy failed to stress sufficiently the fact that imperialism—the third horn of decadence—was from one aspect the result of a zeal for investment and indirectly, therefore, for production.

Halévy's Gladstonian approach indeed so confused his treatment of British imperialism that he attributed the transformation of the liberal anti-imperialist maiden of the golden age into the territory-grabbing ogre of the century's end to Chamberlain and the Unionists, who exploited "the war-like passions of the democracy." The author in this over-simplification has missed perhaps the most curious paradox of late Victorian imperialism: that the largest territorial acquisition were made between 1880 and 1890 when the old anti-expansionist attitude still prevailed in Parliament, and expansionist jingoism had not yet become popular. Despite their *laisser faire* convictions, the Gladstone Governments no less than the Salisbury Governments had already been forced by foreign expansion and protectionism to extend the protection of the political empire over the advancing frontiers of British trade and speculative investment. Furthermore, both used the power of the state under cover of chartered companies to promote British enterprise overseas.

Thus, Halévy's presentation of Chamberlain and the Unionists as almost the architects of a sudden jingoist revolution in imperial policy is misleading. It is a confusion of perspective which no doubt he would have corrected had he completed his work for the period 1852-1895. At the same time it is refreshing to find that he, unlike some who have attempted to bolster the imperial tradition since his day, did not shrink from reminding us of the seamy, financial aspects of late-Victorian imperialism.

Conference on Ageing

Growing in the Older Years. Edited by Wilma Donahue and Clark Tibbitts. *University of Michigan Press.* (*London: Geoffrey Cumberlege.*) 204 pages. 20s.

In 1950 the University of Michigan held its third "Annual Conference on Ageing," and the addresses are now, like those of the previous conferences, published with explanations from the editors. Each of the conferences attempted to concentrate on some special aspects of old age. This one dealt with medical health, mental hygiene and education; but inevitably the whole field, as much of it as is known, comes into view, and industry and health services, housing, incomes, the training of voluntary social workers and many other aspects are discussed.

Addresses tend to be haphazard when one speaker does not know what the others will say. There is repetition and a little contradiction, one speaker asserting that "today the person of sixty-five has little chance of living much longer than did the person of sixty-five in the year 1900" and another that "longevity has increased more than 35 per cent in the last half-century." Such contrasts indicate the general lack of knowledge about old age, which one speaker compares with the lack of knowledge about childhood in 1850; and, though speakers freely admit this, there is sometimes, particularly in the second half of the book, an emptiness or commonplaceness of idea masked with grandiose phraseology. On the whole, however, the book is rich in sympathy, sound sense and some interesting facts.

The English reader will note a certain American quality in the survey—the assumption, for example, that the individual failing in strength and on the way to death can be completely soothed by "human adjustment." There is an atmosphere of push and excitement about the conference almost as if the problem of old age had not existed before, and one speaker, advocating "conditioning of old people," demands a vast publicity campaign with "radio, television, films: I would even add the comics." But generally the American speakers discuss problems which exist in any industrial community where the proportion of elderly people is increasing. They consider forced retirement ("one hundred years ago, three-fourths of the older men were employed and worked seventy hours a week"), the pernicious effects of too much leisure, the shaky finances of the old and the disadvantages of individual firms' insurance schemes for workers, which not only tie people to their jobs but make the elderly work-seeker unwelcome. Altogether the speakers say very much what Lord Amulree said in his recent "Adding Life to Years," but detailed medical and psychological sections are added, and there is a broad sweep of idealism and optimism.

Government Publications

OFFICIAL HISTORIES OF THE SECOND WORLD WAR

The Economic Blockade

VOLUME I

BY

W. N. MEDLICOTT

The first of two volumes telling the story of the blockade of Germany in the Second World War. It recounts the delicate negotiations whereby neutral powers were urged to cease or reduce their trade with Britain's enemies. This volume takes the story down to the summer of 1941, when the German attack on Russia and the British and United States freezing orders against Japan commenced a decisive new phase in the economic war.

AMERICAN SURVEY

Far Eastern Course

Washington, D.C.

JUST how much trouble has been piled up by Mr Churchill's words in Washington on Far Eastern matters is by no means clear, up to now, on the American side of the Atlantic. Perhaps in the last week or so Washington has tended to attach too much importance to signs of alarm and despondency in London over Mr Churchill's promise to Congress that Britain will join in "prompt, resolute and effective" action against the Chinese Communists if a Korean truce should be made and then broken. Perhaps, after all, feelings in London have not been badly bruised by Mr Churchill's congratulations to Congress on the policy which has made Formosa, if not a source of international inspiration, at least a safe haven for General Chiang Kai-shek and his men. Now that the Prime Minister is home again the effect of these pronouncements, and of his defence of them, will doubtless become clearer, although maybe only gradually. In any case the outcome will be watched very carefully by the State and Defence Departments and the White House.

A certain comfort was felt by the Americans when they discovered, during the talks with Mr Churchill and Mr Eden, that the Conservative Government was much more inclined than the Labour Government had been to consider the possibility of coming to an arrangement, even a temporary one, with the present Persian Government. But the satisfaction over this disclosure was nothing compared with the warm glow induced by the Prime Minister's references to the Far East. There were some, nevertheless, who wondered whether Mr Churchill's speech had gone down as well with Mr Eden as it did with Congress. For Mr Eden had not, it seems, been quite as clear-cut on the British position in the event of a broken truce, or quite as cordial on the subject of American policy toward Formosa.

There was not, however, any mystery about Mr Churchill's reasoning, or any doubt that he had powerful arguments to bring against any at home who might complain that he was going too far. In the first place, the prospect of a satisfactory armistice can be improved at this point only by evidence of unity and firmness on the United Nations side. In the second place, if a truce into which the United Nations forces had entered in good faith were to be broken, such treachery would confront the free world with a new situation; and in these circumstances the highest priority would need to be given to a demonstration of Anglo-American solidarity. If Britain were to hesitate and compromise in such circumstances, refusing support to the far more heavily engaged Americans, the alliance and the United Nations itself would be in serious jeopardy. Not to go along with the Americans would be to invite perils infinitely greater than the risks of prompt, resolute and effective action in concert with the Americans. (The assumption has been that this phrase implies the bombing of strategic targets on the Chinese mainland, including Manchuria, a policy which had hitherto been considered to risk spreading the Korean war.) As for Formosa: does anybody, whether or not he likes General Chiang, believe that it would have been better to allow this important island to fall into Communist hands?

Thus Mr Churchill might argue, and thus he might well be vindicated. Yet there is a case, too, for asking whether in the long run the undoubted improvement in the condition of the Anglo-American alliance that was achieved during Mr Churchill's visit will be worth more than the arduous, anxious policy of maintaining a British hold on the Far Eastern brake. Mr Churchill is said to have expressed the view while in Washington that it was a bad thing to nag the Americans about their course in the Far East. The question may be, whether it is automatically a good thing to cheer them on the same course.

★

It is not that anyone need doubt American motives. They are as morally sound and as intelligent as British motives are. What does produce uneasiness is the extent to which the Administration, the Congress and the greater part of the press is willing, in this period of strain and politics, not only to yield to the doctrine that the end justifies the means, but also to think that anyone who challenges the means must be opposed to the end, and must therefore be either a weakling or an enemy.

From time to time, in these days when the State Department has to judge the effect upon the Congress as well as upon the Communists of every word it utters on the Far East, there emerge indications of a quite remarkable faculty for self-deception in high places. There are occasions in Washington when it appears that the official line is not merely to forget, but even to deny, that Japan was a dangerous enemy only a little over five years ago. The current issue of the quarterly review *Foreign Affairs* interestingly illuminates the gap between the American and Australian interpretations of recent history. Mr Menzies, the Prime Minister of Australia, in an article on "The Pacific Settlement Seen from Australia," says:

> The Japanese soldier proved himself an uncivilised enemy and a brutal and inhuman gaoler. Nobody in this generation of Australians will ever forget the instances, all too well attested, of brave soldiers murdered after capture, of nurses tortured and destroyed, of prisoners-of-war starved, enslaved, beaten, driven mad, driven into the grave.

In the preceding article on "Security in the Pacific" Mr John Foster Dulles, the architect of the Japanese peace treaty, writes:

> One disrupting fear is that felt by the peoples whom Japan assaulted that Japan will again be an aggressor. These peoples are not yet aware of the change of mood in Japan nor do they appreciate that the best insurance against a possible renewal of aggression is co-operation between Japan and others along the lines of the United States-Japan Security Treaty.

The Japanese peace and security treaties, and the accompanying group of treaties with Australia, New Zealand and the Philippines, are almost sure to be ratified by the Senate. Fears that the Japanese might want to establish trading and perhaps other relations with the Communist Chinese mainland have been removed, or at least lulled, by the letter which Mr Yoshida, the Prime Minister of Japan, wrote in December to Mr Dulles. In it Mr Yoshida announced that his government has no intention of concluding a treaty with the Chinese Communists, but does propose to offer the Chinese Nationalists on Formosa a treaty "applicable to all territories which are now, or which may hereafter be, under the control of the National Government of the Republic of China." That was what the Senate wanted to hear, and now it all seems to be in the bag.

But is it? Mr Dulles has denied that any American pressure was put on Mr Yoshida and his government to lead them into a decision so agreeable to American ears. But nevertheless this letter is going to bedevil Japanese-American relations for some time to come. A year ago Mr Yoshida himself wrote in *Foreign Affairs*:

> Red or white, China remains our next-door neighbour. . . . Economic law will, I believe, prevail in the long run over any ideological differences.

And apprehensive Senators at the treaty hearings asked Mr Dulles what would happen if Mr Yoshida's government fell. Mr Dulles admitted that Mr Yoshida's letter would not bind his successors, but Mr Dulles drew attention to the Battle Act, which would withhold American military, economic and financial aid from countries trading with Communist nations. That, he intimated, would keep Mr Yoshida's successors out of error. Moreover, China would not necessarily always be Communist. In the Administration's current lexicon, however, none of this is to be interpreted as putting pressure on a sovereign nation.

The Americans are indubitably going to steer their own course in the Far East, and there may be much to be said for not nagging them while they are thus engaged. Nevertheless, in the circumstances Mr Churchill may find it desirable to make it plain that what he said in Washington does not imply that Britain is ready to abandon its place on the bridge within reach of the wheel—an apparatus with which, one way and another, it has had quite a lot of experience.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Growing Pains in the Air

[FROM A SPECIAL CORRESPONDENT]

IN drawing up his defence budget for an election year, the President had to balance bullets against ballots, the monstrous demands of the military against what his political medicine-men thought the tax-payer would tolerate. Mr Truman told the services to lower their sights; they came down a notch or two and then refused to go lower. For weeks the White House huffed, while the military puffed. The controversy dragged on until the last week of 1951, just a few days before the President was scheduled to deliver his message on the State of the Union. Only then did he back down, and accept a $52 billion budget for defence in the coming year.

This was $4 billion more than the President had originally been willing to offer, and most of it was secured by the Air Force. When Mr Truman first let it be known that he wanted a much lower ceiling on new military expenditure, the morale of the Air Force had gone into a tailspin. Such a budget would provide handsomely for the Army and the Navy, but it drew a narrow compass round the horizons of the Air Force, which had widened from plans for 95 groups in August, 1950, to 143 groups at the end of last year.

To get enough aircraft to satisfy the requirements of such a force, argued the Air Force, money was needed at once to let the necessary contracts; the aircraft which are now rolling out of factories at the rate of about 600 a month were all paid for with funds appropriated in the year ending in June, 1950, and earlier. In fact, the Aircraft Industries Association has reported that so far not a single combat aircraft has been delivered as a result of orders placed from the $25 billion appropriated in the fiscal years 1951 and 1952. Even though it has warded off any severe cuts, the Air Force must resign itself to a stretching out of its programme of expansion; its goal of 143 modern groups is now not likely to be attained until 1955 or 1956, instead of in 1954 as originally hoped.

★

At the moment, the Air Force is spending the biggest share of its appropriations on the B-47 medium bomber, being built in the Boeing plant in Wichita, Kansas. The Douglas Aircraft Company is also re-opening its Tulsa, Oklahoma, plant to build B-47s, and the Lockheed Corporation expects to get to work on the same model in Marietta, Georgia, before the year is out. A sleek 600-mile-an-hour aeroplane with wings swept back at a 35-degree angle, the B-47 can carry 20,000 pounds of bombs, and is powered by six General Electric J-47 jet engines. But the B-47's comparatively short range—3,000 miles—rules it out as an intercontinental bomber. That mission is still performed for the Strategic Air Command by Consolidated Vultee's giant B-36 heavy bomber, which can carry 10,000 pounds of bombs on a round trip of 10,000 miles, and much heavier loads on shorter trips. The B-36 is still being made in limited quantities. But even when its six Pratt & Whitney 3,500 horsepower reciprocating engines are supplemented by four J-47 jet engines, it lumbers along at a mere 450 miles an hour, fair game for a supersonic interceptor.

The Air Force, of course, has long been working on a successor to the B-36. In addition to an all-jet, swept wing version of the B-36, the Air Force is developing the B-52, which looks something like the B-47 but is much bigger, big enough to make the vital 10,000-mile trip with the deadly 10,000-pound load. Its speed is a tight secret, but since it is powered with eight Pratt & Whitney J-57 jet engines, each developing about 9,000 pounds thrust (compared to 7,200 pounds for the British "Sapphire" jet), it certainly is in the 600-mile-an-hour class. However, this speed is still on paper, for the B-52 has yet to get into the air. The Air Force will have to depend on the B-36 for several years to come, and indeed, the Strategic Air Command is belligerent in its defence of the big bomber, which Navy pilots sneered that they could shoot out of the sky.

The Air Force's own fighter programme is at present concentrated on the F-84 "Thunderjet," being built by the Republic Aircraft Corporation in Kansas City, and the F-86, of course, has seen wide service in Korea, and is Incorporated, in Los Angeles. Both models can do better than 600 miles per hour, and one model of the "Sabrejet" has been officially clocked at 671. Large numbers of the F-84 are now going to service in Atlantic Pact countries; the

F-86, of course, has seen wide service in Korea, and is the only American fighter which has been able to stand up to the Russian-designed MIG-15s flown by the Chinese.

For all its salty talk of shooting down B-36s, the Navy has actually had a stormy time of it in attempting to design a good carrier-based jet aircraft. Carrier aircraft must be so built that their wings may be folded back, permitting easier stowage aboard ship. Unfortunately, the folding mechanism adds to their weight, and so cuts down their speed, and manœuvrability in combat. Furthermore, the decks of many carriers are not strong enough to take the weight of such new attack aircraft as the North American "Savage," which weighs 26 tons. The Navy is now strengthening the decks of most of its carriers, and working hard on new types of catapults which can hurl the heavier jets into the air. Production of fighters for the Navy is still concentrated on the Grumman "Panther," and the McDonnell "Banshee" and "Demon," but faster models are already moving on to the production lines.

In addition to these major projects, the flying services are producing a dozen other fighting aircraft as well as an impressive array of auxiliary craft. But all told, these efforts produced only about 5,000 aeroplanes in the entire year of 1951, compared to 9,000 a month in 1944. Consequently, the air has been thick with the slings and darts of critics who claim that the Administration has traded the nation's guns for an extra pound of butter for the voters. These critics have shot wide of the mark, but the truth is no less bitter. So heedless were mobilisation planners of one vital production factor, the machine-tool industry, that the defence effort would have been seriously curtailed even if Americans had tightened their belts to their backbones.

When the Defence Department rattled out its production orders after the war began in Korea, it did so without bothering to find out if the manufacturers would be able to obtain from the shrunken machine tool industry the drills, shapers, planers, jigs and fixtures which they would need to make the thousands of intricate parts in modern weapons. Not until the end of 1951, when the whole American productive machine was heaving and hiccupping like a Model T Ford on a steep hill, did the defence mobiliser come to the aid of machine tool manufacturers with a series of super-priorities for materials. By that time, eighteen months had been lost.

While these production difficulties have received most publicity in the aircraft industry, they are being felt in all branches of armament, including tank production. The American public, well drilled in the lesson that American productive power won the last war, has not yet grown unduly nervous. So far, it accepts the idea that the mobilisation programme is moving through an adolescent stage, and that its troubles are just growing pains. Everyone hopes that the West still has time, and that the country will not have to depend on a boy to do a man's work.

American Notes

Missing Heir at the White House

Like the Republicans, who have General Eisenhower pulling one way and Senator Taft the other, the Democratic party has now also sprouted two heads. Senator Kefauver has announced his candidacy for the party's presidential nomination and has obviously no intention of withdrawing, even should Mr Truman decide to run again. Mr Kefauver's chief assets are the fame he won last year as the head of the Senate's Crime Investigating Committee, his comparative youth and his proven appeal on the television screen. But these assets are also disadvantages, for they have aroused the jealousy of some of his colleagues and have turned against him the important Democratic city machines which were implicated in the scandals revealed by his investigation.

Senator Kefauver considers that President Truman's attack on corruption in government lacks vigour and Mr Truman in his turn has made it clear that he does not regard the Senator as his heir apparent. But he is not yet ready to designate anyone else, even though the fact that Mr Kefauver is openly seeking the support of delegates to the Democratic convention means that the President is being pressed to offer them an alternative. His present strategy seems to be to support candidates in the state primary elections, who, he hopes, can be trusted to deliver their pledged delegates to Mr Truman himself or whomever he eventually chooses. Senator McMahon, of Connecticut, was thought to be such a candidate when he entered the Illinois Democratic primary against Senator Kefauver; but he withdrew, on the grounds that he wanted Mr Truman to run, too late for anyone else to oppose Mr Kefauver, who will thus have a walk-over instead of a chance to demonstrate his strength.

"I Have The Same Trouble"

Herblock in the *Washington Post*

[The elephant traditionally represents the Republican party, the donkey the Democratic. The symbols were devised about eighty years ago by the famous American cartoonist, Thomas Nast.]

Mr McMahon's withdrawal is only part of the Illinois puzzle, for the Democratic governor of the State, Mr Adlai Stevenson, visited Washington last month and immediately became the newspapers' chosen crown prince, even though he insists that he is interested only in running again for governor. He has made a great success of reforming a corrupt and inefficient state government, without alienating the party machine or losing the popularity that won him an overwhelming and unexpected victory four years ago. He is further qualified to be Mr Truman's heir by his liberalism and by his work as United States delegate to the United Nations in its early days. But there are other possibilities in the Democratic family—the Vice-President, Mr Barkley, in spite of his age, the Speaker of the House, Mr Rayburn of Texas, Senator Robert Kerr of Oklahoma—even though the Chief Justice, Mr Vinson, apparently insists on staying where he is. And still no one can be sure that in the end Mr Truman may not decide to try and succeed himself.

Rats in the Granary

The Commodity Credit Corporation, which since 1933 has been supporting farm prices by loans and purchases, is to follow other government agencies under the microscope. None of the employees of the CCC is charged with more than lack of diligence, but the Controller-General, stepping in where the Department of Agriculture seemed slow to tread, shocked the Senate into action by revealing that there was a shortage of $3.8 million worth of grain stored in five south-western states alone. In most of these, and similar cases, individuals entrusted with government grain sold it, hoping to replace it later at lower prices; they were caught out when prices rose.

Mr Brannan, the Secretary of Agriculture, contends that, even if the losses reach $5 to $7 million, this is a relatively small matter; and it is true that, if the committee of inquiry is to be really helpful, it must recognise what a mammoth task the CCC has been asked to perform. In three bumper years alone it handled $10 billion worth of commodities, and Congress made matters more difficult by requiring that storage, as far as possible, should be entrusted to private firms, which often had to mix government grain with their own. The CCC, in existence since 1933, has lost only $1 billion, thanks in large part to abnormal demands during the war.

In 1950, the government's investment in commodities stood at a peak of $4 billion, but during 1951 about half of this was liquidated, and the CCC showed a profit. In his budget for the year beginning next June, however, the President has set aside $270 million for price support operations, as an aid to increasing production, and building up present low stocks of wheat, cotton and maize. Cotton farmers, in particular, bruised by last summer's price fall, are demanding higher supports for cotton prices; many lost substantial amounts of money when the Crop Reporting Board overestimated the cotton crop by nearly 2 million bales, and the price fell by 5 cents or more a pound.

The need for ensuring a high level of production has given the President an excuse for suggesting a change in the support system which at bottom seems to be only a new bid for the vital farm vote. In 1949, after much controversy, Congress authorised flexible price supports, to take effect in 1951 and 1952; the support level might be reduced when supplies of a given commodity rose substantially above normal. It is this element of flexibility which the President now proposes to discard, on the grounds that farmers should not be penalised for growing all the food and fibre the nation needs. Under the law, however, the Secretary of Agriculture need not lower the support price unless he believes it desirable. It would be a pity to revive the rigid farm supports which, in more normal times, might lead once more to overproduction of basic crops and discourage farmers from making the necessary adjustments.

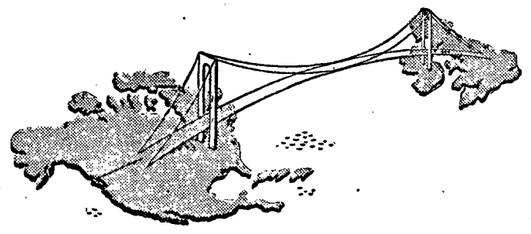
New Assault on the Federal Reserve

The Federal Reserve Board, which won a measure of independence from the Treasury last March, is soon to be called upon by Congress to justify that freedom. The accord reached nearly a year ago allowed the central bank, in the interests of restraining inflation, to withdraw its support from the government bond market; large institutional investors, no longer able to sell their government securities without loss, suddenly became unable to feed the domestic boom. Almost at once, a subcommittee of the Joint Committee on the Economic Report was created, under the chairmanship of Representative Patman, to inquire into credit policy and relations between the Treasury and the Federal Reserve Board.



This is ground which was covered only two years ago, and with great distinction, by a similar committee under Senator Douglas. Its report stoutly upheld the responsibility of the FRB to control credit in the interests of the economy as a whole, and deprecated the efforts of the Treasury to use the credit mechanism to perpetuate cheap money and keep down the cost of financing the federal debt. Mr Patman, however, has all the westerner's historic dislike of tight money and rising interest rates; in the past he has advocated printing-press money and the abolition of interest on the federal debt and last summer he urged that the Federal Reserve Banks be required by law to buy all government securities at par. The questionnaires sent out reflect his conviction that the Federal Reserve System should be made responsible to the political authorities, and his interest in nationalising the Reserve Banks by substituting government ownership for that of the member banks. The subcommittee's new economist is Mr Henry Murphy, a former Treasury man.

Some of the alarm of banking circles may, however, prove excessive. Senator Douglas, though no longer chairman remains on the committee, as do Senator Flanders and Mr Wolcott, both firm believers in the independence of the central bank. But if there were any deep-laid plans to undermine the independence of the Federal Reserve Board the President, an outspoken critic of its bond policy, would hardly have overlooked an opportunity to appoint to it men of his own persuasion. His two new appointments, Mr Robertson and Mr Mills, are the personal selection of Mr Martin, the FRB chairman. What the Patman inquiry may do is to throw more light on the truce between the Treasury and the Federal Reserve Board, which, it is rumoured, they still interpret somewhat differently. But the Treasury, which must depend on the central bank for help in its coming refunding programme, and in financing the deficit expected in the year which begins next June, is not, apparently, anxious to reopen hostilities.

Men for Security

Congress is being urged to approve the practical details of the programme for universal military training, already accepted in principle at the last session. The shortage of military manpower means that there is no hope at present of launching on a full scale the scheme which is now being called by the more prepossessing name of National Security Training; it would involve a $2-$4 billion programme for six months' training for 800,000 eighteen-year-olds annually. But the advocates of the measure would like to see a beginning made before the end of this year on a "pilot" basis of 60,000 youths, perhaps some of those deferred from conscription for occupational reasons, perhaps volunteers who would then be conscripted for only eighteen months instead of two years. Opposition to starting NST on any scale

Bridging the dollar and sterling areas

Familiarity with business and trade conditions on both sides of the Atlantic makes the Chase National Bank an effective bridge between the dollar and sterling areas. Officers of our three London offices combine a keen understanding of British trade requirements with practical knowledge of market and credit situations in the United States.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON—6 Lombard Street
51 Berkeley Square Bush House, Aldwych

whatsoever is not limited to the traditional foes of "militarisation"—educational, labour, farm and other civic groups. Congressmen with one eye on the budget and the other on the ballot-box are reluctant to put the programme into action, at least until after the election.

Meanwhile, the manpower "pool" of men aged from 18½ to 26 now liable for Selective Service is being drained more rapidly than it is refilled by youths growing up, and civilian manpower needs for factory and farm are more pressing than ever. Furthermore, this year hundreds of thousands of the conscripted, reserve and National Guard members of the forces, who were called up after the Korean outbreak, will complete their two years' service and be eligible for discharge. The realisation that manpower limits are being reached and that a slowdown in expansion of the services is needed apparently explains the cut in the draft call from 52,500 in February to 28,600 in March. About 800,000 men have already been called up since conscription was resumed in September, 1950.

One answer to the possible shortage of men for the services is the Bill now in Congress providing a 10 per cent increase in pay for all servicemen, which it is hoped will stimulate enlistment into the regular services for four-year periods. Such enlistments would reduce conscription needs. For a private entering the army, the pay increase would be from the present $75 to $82.50 per month; a second lieutenant's pay would rise from $213.75 to $235.13. Subsistence allowances would also be increased by 10 per cent and President Truman has asked for additions to survivors' benefit insurance. These increases will bring the total expenditure in the fiscal year beginning next July, for pay, clothing and subsistence for the 3,700,000 in the armed forces, to $11 billion, 21 per cent of the national defence budget.

Atoms Unlimited

When the latest programme for expanding atomic energy facilities is finished, in about five years, the American Government's investment in atomic energy will be quadrupled. Already, with atomic installations worth $2.5 billion, this industrial undertaking is larger than that of any private corporation; a further expansion, approved in October, 1950, which will bring the total investment to $5 billion, is under way, and last week the President proposed (and Congress seems sure to accept) yet another $5 or $6 billion worth. Moreover, this latest request will apparently cover only facilities for the production of fissionable material; more money will be needed for running the new plants and for putting their output to practical use. The $1.7 billion that the country is spending on atomic energy in 1952 will probably be exceeded for many years to come.

The new installations will not actually be begun until late in 1953, when the 1950 expansion should be completed. According to its report last Wednesday, the Atomic Energy Commission is already responsible for three per cent of the country's total expenditure on building and the $5 billion programme, if begun at once, would put an excessive strain on supplies of such scarce materials as structural steel and lead, and on the even scarcer supply of scientists and technicians. For these reasons the government is not prepared to expand its atomic activities nearly as fast as Senator McMahon and his Joint Congressional Committee wanted, although it apparently agrees with him that the expansion will eventually mean a saving on "conventional" weapons. For this is definitely a preparation for the "fantastic" new weapons which last autumn's atomic tests in Nevada proved feasible and it is being taken as a sign that the basic problems in the production of such weapons have been solved.

Even if, by some happy chance, the United States no longer needs fantastic weapons by the time an almost unlimited supply of fissionable material is available, it seems probable that much of the research that has gone into them will have peacetime applications. And since their production is being undertaken almost entirely by private firms on government contract there will be plenty of people with the experience necessary to make commercial use of atomic discoveries.

Atomic development is, however, still limited by secrecy and by the lack of international exchange of information. The latter was in theory made possible, under certain strict conditions, by Congress last autumn, but the procedure was so cumbersome that it was doubtful whether it would in practice be used. However, the first exchange under the new regulations has just taken place, between the United States and Canada, and the first steps towards a similar exchange with Britain were arranged during Mr Churchill's visit to Washington.

Woollen Wars

The civil war between north and south for the possession of the country's textile industry has now spread from cotton to wool. Last month the president of the American Woollen Company, which produces about one-seventh of America's wool and worsted fabrics, announced that its duty to its stockholders might require the company to move most or all of its operations from New England to the south. A number of its smaller competitors have already moved, or are considering moving, to such states as North Carolina and Mississippi. Woollen fabrics are at present in less demand than at any time in the last twenty years and New England firms are quite unable to compete with the lower wages and greater output a man-hour which enable southern firms to sell their cloth at from 20 to 50 cents a yard less than can those in the north.

The American Woollen Company employs over 20,000 people in Lawrence, Massachusetts, and another 40,000 or so in its 21 other factories scattered over New England. Its announcement of a possible move was a public warning to the textile workers' union, already concerned at the spread of unemployment amongst its members in the north. The union's contract with woollen and worsted manufacturers expires in March and the American Woollen Company and a number of other firms are seeking wage reductions and increases in individual work loads. In view of the rising cost of living and the general trend towards higher wages, the union feels that it has done all that can be expected of it by deciding not to seek a wage increase this year. A possible way out of the threatened strike is, however, shown by its recent agreement with the Wyandotte Worsted Company, where workers have undertaken to handle six, instead of only four, looms each for the specific purpose of meeting southern competition.

In the less strongly organised south, however, each worker handles up to sixteen looms. This adaptability of labour and the local tax concessions made to business in the south play a more important part in reducing costs, compared with New England, than do the south's lower wages, a differential which is in any case gradually disappearing with the growing industrialisation of the area. The federal government, urged on by the textile unions, may also help to wipe it out, by raising the minimum wage that must be paid to all those working on government textile contracts—for uniform cloth and so on—and perhaps by setting minimum rates for pensions and other benefits.

There is yet another civil war going on in the textile industry, that between wool and the new synthetic substitutes—dynel, dacron and others—and here the north does not seem even to be trying to fight the south. The raw materials for these new fibres come from the south's great chemical plants and it is mainly because of the new factories being built to spin and weave these synthetics that textile expansion has been breaking all records in the south, in spite of the depressed state of the industry as a whole.

THE WORLD OVERSEAS

Nigerians Become Politicians

(From a Correspondent in Ibadan)

THE surprisingly rapid development of party politics in Nigeria will almost certainly be reflected in the new central House of Representatives which met for the first time in Lagos last Tuesday. Since the first steps were taken towards the new constitution (and particularly since the conference at Ibadan two years ago) the pace of party development has been rapid. Dr Azikiwe's National Council for Nigeria and the Cameroons, mainly based on the east, but with some support in the west and the beginnings of a foothold in the north, has gained much ground. The emergence of Mr Awolowo's Action Group as a fully fledged party, now firmly entrenched among the Yoruba people of the west, has been even more striking. The elections, in fact, were fought more widely on a party basis than had been expected. Moreover, it is now seven months since the first elections were held and this protracted electioneering has provided a great forcing-house of party politics. Campaigning entered on a new and even fiercer stage as the election results came in, this time among the elected representatives themselves, and many members in the west and east have joined one or other party since their own election. In Ibadan, for instance, three members crossed the western House of Assembly to join the Action Group just before the elections to the central House of Representatives.

The constitution-builders have clearly been taken aback by the speed of these developments. At the opening ceremony of the Western House of Assembly in Ibadan early last month there was a slight hold-up because Action Group members refused to enter the House until the seating arrangements gave them the status of majority party. This may sound trivial, but it is a real straw in the wind. Mr Awolowo's successful challenge to the National Council in the west has raised the whole question of how the constitution will work in the context of party politics.

A Two-Fold Strain

It seems that the strain may be two-fold. In the first place the National Council has a majority in the east, not quite so large as at first stated but increasing as independents jump on to the party bandwagon. (But some very distinguished independents remain without party affiliation.) And the Action Group has a working majority in the west—but not a two-thirds one, as required for some purposes. In both cases there will be an attempt to conduct business on party lines. The central government may have to deal with two different majority parties in the two different regions. The only saving grace in this situation is that the two parties hardly differ in principle, both being equally anti-British and growing more extremist as each bids for nationalist support.

In the second place, the west has sent 34 members mainly from the Action Group to the centre, and the east 34 from the National Council, to meet the 68 from the north who are remarkable principally for their very strong northern exclusiveness. The two majorities claimed the right, as majority parties, to choose for themselves the four members who should become the Ministers at the centre for their own region, and the Governor's task in choosing the first Council of Ministers was extraordinarily difficult and delicate.

Naturally personalities count for much in this situation. Dr Azikiwe, or Zik, is a human dynamo, bursting with life and energy, a first-class agitator well equipped to raise public feeling, through his newspapers, on any subject under the sun. Mr Awolowo is quieter in manner and on the public platform, but has at least as much ability if less personal magnetism. Zik can draw crowds, but Awolowo can keep his friends. The irony is that both of them are now in the Western House. Zik chose to stand for a Lagos seat, though his main support is in the east, and thus the two giants are now ranged against each other.

Whether both of them would also go to the centre, was for a time a burning question. In the end only Awolowo has gone. Of the five National Council members elected for Lagos, two had to be chosen to go to the centre. The party discipline of the National Council failed to reduce the five candidates to two. All of them insisted on standing and the Western House, with its Action Group majority, naturally did not choose to elect Zik. The choice fell on Dr Nimbe, a Moslem Yoruba, charming, volatile, and popular as mayor of Lagos; and on Prince Adedoyin, the "gay prince of Shagamo," a valuable asset to the National Council as the only one of its leaders from a senior Yoruba chief's family. For the time being, it looks as though Zik has been worsted partly by implacable Action Group hostility and partly by lack of unity among his own supporters.

What Zik himself is thinking no one quite knows, though it may have occurred to him, as it may also have occurred to the administration, but apparently not to the Action Group, that he could become a far greater man and a far more dangerous one outside the government than inside it when he would have to share the responsibility for what it does. It is only a few weeks since he declared his irrevocable decision not to take office in "an inferior legislature of the colonial type," but this does not quite square with the desperate attempts he has been making to get either Nimbe or Adedoyin to make way for him.

In spite of these tangles the ultimate prospects for Nigeria and the new constitution are not gloomy. Once the mechanics have been mastered, and assuming a fairly stable government is formed, the existence of two strong and growing parties should be a great asset to the country. The dangers of party monopoly, as in the Gold Coast, should be avoided, though there might be an increased tendency towards regional separatism. At any rate, it is astonishing how quickly the new constitution has been clothed in the flesh and blood of political reality.

At the same time, there are dangers ahead. The rate of political development is so swift that the new constitution may be outdated in two or three years. The last constitution came into being in 1947, and endured just long enough for its successor to be formulated. Already voices are being heard demanding further advance, although the long-suffering National Council confines itself to the slogan "Liberty in 1956."

Meanwhile Nigeria's new legislators have much to think about. The regional budget sessions are due this month. It is most unlikely that new men will not want new measures. On all sides there is talk of the welfare state, and clamour for vast expansion in the social services. Not nearly so much is said about vital economic development. But the new constitution will remain a mere academic exercise in political theorising if the basic problems of economic progress are not more squarely faced. The Nigerians have become politicians. They have yet to prove they can be statesmen.

Germany's New Model Army

THE German public has been shocked out of its state of aggrieved confusion by the news that the first German divisions may be set up this spring. Minds are still by no means made up, as the available data have been meagre. Until very recently, the only discussions of the actual methods and ideas which should direct rearmament were those which have been taking place in professional military circles. The soul-searching visible among the ex-officers can be understood only when it is remembered how high the position was from which the army fell, twice in the last thirty years. Germany was the only western country which had a *mystique* of war. The soldiers were ready to die heroically in wars for the glory of the Fatherland or for a crazy crusade against Bolshevism. War was a biological necessity, or a political expedient, and defeats were a matter of "fate." The idea of having an army purely for the purpose of humdrum defence is quite novel. The old homogeneity of the army was, moreover, shattered by Hitler and Himmler. Men who did not belong to the social class of the old Prussian officer entered the services; and the *Waffen SS* set up a separate organisation with men chosen on biological grounds, who were indoctrinated against Christianity and the "inferior races." The SS itself was separated into sections which were responsible for most of the atrocious crimes of the Germans.

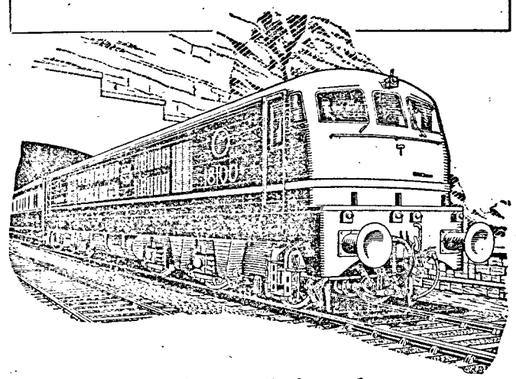
For these reasons, the prospect of a revived *Wehrmacht* has led ex-officers to debate such matters as *Soldatenehre* (soldierly honour), the July 20th plot, and the difference between rebellion and treason. Was it excusable to try and save Germany by killing its commander-in-chief? Should a West German under American command fight an East German under Marshal Zhukov? Should a German soldier blow up a bridge in a retreat from his country to cover a French army? Should the officer corps admit that actions in the last war sometimes fell far below the high Prussian standard, and hold army courts of honour to try the offenders? Should they show solidarity with the *Waffen SS*? Some of these questions have been answered on the principle that German loyalty *vis-à-vis* the outside world demands a solid front and no washing of dirty linen. The ex-officers will stand by the *Waffen SS*; and the western powers must clear Field-Marshal Manstein and other prisoners of any taint of crime. The foreigners who want to command Germans must re-establish the principle that the soldier's oath of loyalty is inviolable; otherwise they will only have themselves to blame if they are disobeyed in a future war. So runs the argument.

Although their own internal disputes are still incompletely resolved, a number of generals and ex-officers have approached the public with ideas for a new start. Leading figures such as Generals Blumentritt, Manteuffel and Westphal are backing Dr Adenauer's proposal that Western Germany, on a footing of complete equality, should come wholeheartedly into a European defence force with a new type of citizen army. They reject the original Pleven Plan, but would accept national contingents which were merged under international command at army level. (This is more than the present plan for a European Army will allow. National contingents will be joined at Corps level.) Their ideas have been published in a small book named *Armee ohne Pathos** (which is best translated as "Army without Heroics"). The arguments that they address to their fellow-countrymen indicate the obstacles to be overcome before the Germans accept the idea of defending the west.

* *Armee ohne Pathos*. By Adalbert Weinstein. Köllen-Verlag, Bonn.

The contributors ask for a moderate, sober approach to the problem—and this in itself is something new. They make the usual claims to equality, but also ask Germans to bury the resentment they feel against the west, and against those of their fellow-countrymen who suddenly became anti-militarist in 1945. The book gives, *inter alia*, a useful reminder that Germans have been brought up in the tradition of enmity to France, but not to Russia. There are men in military circles who remember Bismarck and Seeckt, and toy with the idea that Russia is really Germany's traditional friend; and there are others who think that Germany, by staying "neutral" and by playing off the east against the west, may emerge once more strong, if solitary.

Against all such views the contributors to *Armee ohne Pathos* present reasoned arguments in favour of defending the west. Some among them are not deterred by the thought that, in the event of war, German would have to fight German. They examine coldly the possible necessity of using Germany as a ground for mobile warfare. They point out that the terms "Elbe Line" or "Rhine Line" are meaningless. There has never yet been a line which could be held.



The German generals demand that the west shall produce a grand "strategic conception," embracing the world. Most Germans, incited by Dr Schumacher, want to know what the strategy is before agreeing to fight; and they insist, moreover, that the Allies' plan shall be one which will prevent Germany from becoming a battlefield. The generals complain that nobody, except perhaps Mr Churchill, has shown any imagination in the last two world wars. Too much reliance on technical material has weakened strategic thinking. They are convinced that the west would win a war in the end, for it has superior economic strength and would fight on exterior lines. If Stalin were to decide on a preventive war, he would strike at the points from which the west might close in on the Soviet Union, even if Russian tanks in the meantime had overrun Western Europe. This would mean a Russian move in the first instance through Persia and to the Suez Canal. But it is not considered likely that Stalin will start a war he would be bound to lose.

Citizens in Uniform

As for the new divisions to be contributed to a European force, the German "soldiers of the cold war" would not live in garrisons as a class apart. They would be highly trained for instant mobile action. But basically they would be citizens in uniform. The army would provide training for civil life, even a kind of trade union, and matters of supply and communication would be in the hands of "managers." Soldiers would keep their civil rights and receive no extra privileges. Training in individual initiative would take the place of Prussian drill. Some of these ideas had already been thought out by reformists in the Hitlerite *Wehrmacht* who called themselves the "Young Turks." The men who went through the Russian campaigns are hard men, who were determined to kill as many of the enemy as they could before they died. The older German ex-soldier is tired of heroics and does not want them in a new army; while the young men "couldn't care less" about an army at all.

The view is often expressed that the young men will have to be imbued with "an idea" more inspiring than that of democracy before they will be ready to fight the Russians and their Germans. The professionals who have compiled *Armee ohne Pathos* see this weakness, but still believe that it can be overcome by sober argument and by making a new start. There is no doubt that if the Germans agree to an army of any kind it will be created on the lines that the progressives propose. But will they secure their demands? The defence community as it is now taking shape falls far short of their terms: sovereignty, a European force of sixty divisions and a strategic plan which would leave Germany unscathed.

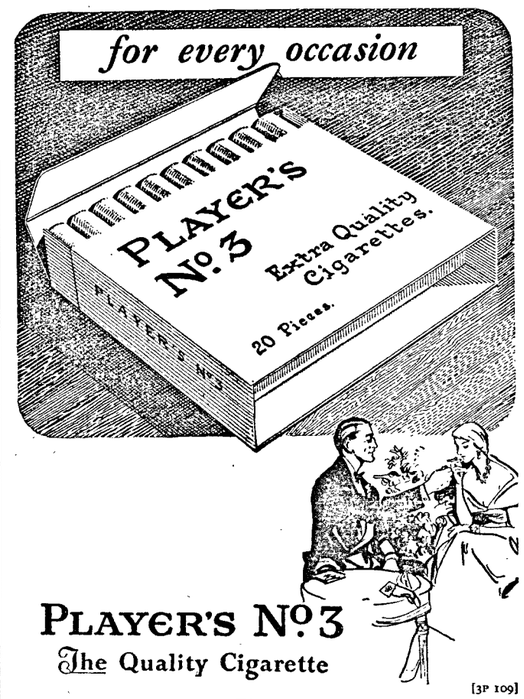
BLOCK & ANDERSON MEAN BUSINESS

The continuous expansion of B & A is founded upon four factors;

First, the success of B & A customers following installation of B & A machines and systems.

Second, the growing realisation, both here and overseas, that the wheels of industry can be speeded up by putting B & A machines to work in the office.

Third, the self evident advantages of *Spirit Duplication — the modern method* — on the BANDA 'Master' duplicator — superb product of Block & Anderson's twenty years leadership in Spirit Duplicating.



Fourth, the readily available service from B & A Specialists and Engineers in seventeen branches throughout the United Kingdom.

Portrait of a  Very Great Woman

She may not be exceptionally beautiful. She may not be exceptionally clever — though her wisdom and intelligence are a match for many more eminent personages and she has an inexhaustible fund of common-sense.

She has a husband and two young children and they live in a small house. She has to look after the children, do the shopping, clean the home, cook, do the family washing and the thousand and one other jobs necessary in running a home. She is now wondering whether she could possibly manage to take on part-time work in a factory.

She is only one of millions—the gallant housewives of Britain, an unsung army of heroines.

We are proud that many of these housewives already have the benefit of Hoover Cleaners and Washing Machines to help them in their duties, but far too many still have to struggle on without one or the other — or both.

We look forward, therefore, to the time when with free supplies of raw materials available, we shall be able to supply these essential pieces of equipment to all sections of the community at the lowest possible prices.

Partnership or White Supremacy?—II

[FROM A SPECIAL CORRESPONDENT]

It cannot be denied that in recent years Africans, the vast majority of the population, have made real progress in Northern and Southern Rhodesia. In Northern Rhodesia, it is estimated that while the cost of living index stands now at 168 compared with prewar, African wages have advanced 200 per cent. This does not measure the whole progress made. There have been considerable increases in expenditure on services, especially on African education. Northern Rhodesia owes its present prosperity almost entirely to copper. On the mines, reasonable housing and excellent medical attention are provided for Africans, and the mining companies are genuinely anxious to build up a stable, non-migratory labour force as far as circumstances will permit, as well as providing amenities to keep it contented.

In Southern Rhodesia, the growth of urban areas and industries has undoubtedly benefited Africans economically. There are still numerous industrial colour-bar restraints which are not necessarily enshrined in law: nevertheless, Africans in Southern Rhodesia are penetrating into industry and doing more and more semi-skilled jobs. It is now becoming recognised in Southern Rhodesia that the African's money is as good as anyone else's—and that African purchasing power is assuming significant dimensions. This does not mean that African wages are high. To put the average African wage in either of the Rhodesias as high as £3 a month would probably be over-optimistic. But, in countries as poor as these African territories, £3 a month becomes a powerful magnet.

Nyasaland, the Cinderella of Central Africa, has far fewer colour-bars than the Rhodesias. But it also has few economic opportunities. A very high proportion of Nyasaland's able-bodied adult male Africans look elsewhere for their livelihood—usually in the Rhodesias or the Union. Unlike its neighbours, Nyasaland has no penal provisions for Africans who "contract" to work and then fail to do so. But few Africans, in white employment or out of it, work more than three or four hours a day, and the average cash wage is not much more than 17s. 6d. a month—perhaps not surprisingly. Africans are perfectly free to form trade unions; but in 1950 the "biggest" union, the Nyasaland Motor Transport Workers' Union had an income of £1 5s against an expenditure of £10 7s. (By contrast the African Mineworkers' Union in Northern Rhodesia has a paid-up membership of 25,000, offices and a full-time staff.) District officers in Nyasaland maintain close personal contact with the people in their care, and race relations in Nyasaland are uniformly harmonious. But field workers in a recent survey of the Domasi area, near Zomba the capital, found that among the 14,000 people living there, wheelbarrows were unknown, all cultivation was by hoe, the energetic were held back by swarms of the crippled, the blind, the mentally deficient and the merely parasitical, and that half the women and two-fifths of the men reacted positively to syphilis tests, while there was much malaria and bilharzia. Nyasaland, a green and hilly country, is pretty to look at, but no paradise for the people who have to live in it.

White Rhodesians naturally contrast these conditions with those of Africans in the Rhodesias, and conclude that opposition to federation by Africans in all three territories on the ground that it might prevent Rhodesian Africans from ever acquiring the "rights" they enjoy in Nyasaland, and would bring the Nyasaland Africans "down" to the Rhodesian level, is absurd. But this misses a good deal of the point of the opposition. It is precisely because the Africans in the Rhodesias have made economic advances that they object to their further advance, being opposed by the artificial restraints of the colour-bar. As an official report on prewar disturbances on the Copperbelt remarked, "pathetic contentment is rapidly giving way to what has been called divine discontent." Its most significant aspect is that this "divine discontent" is being expressed most vocally by the minority of Africans who themselves have advanced farthest and fastest.

The Europeans are fond of saying that because this section is admittedly a minority, its views need not be heeded as they are only those of "intellectuals" who are "out of touch with the African mass." This is probably the biggest single blunder the Europeans could make. These vocal Africans are the new middle class who are backed by the growing industrial proletariat in both the Rhodesias. They cannot be ignored, nor can the Europeans placidly assume that because the mass of Africans are not vocal, therefore they are not interested in the outcome of the struggle. On the Europeans' own argument, it would be much wiser to gain the friendship of the advanced minority, since this would make them less vocal, while there could not possibly, in present circumstances, be that mass stampede of Africans through the opened doors of economic or other opportunity which the Europeans profess to fear. In short, the Europeans would lose nothing by opening the doors, because only the minority who are now hammering at it would have the ability, or perhaps even the inclination, to enter.

Some Europeans do see this; frequently now there are discussions on the desirability of "equal rights for all civilised men irrespective of colour." But these discussions remain quite academic. Even this preliminary step is only to take place in "twenty-five years" or at some similar conveniently far-off date. But the educated, "civilised" Africans are knocking at the door now. And nothing could be worse than the sort of lop-sided, half-hearted advance which, in Northern Rhodesia, instals two "educated Africans," Mr Yamba and Mr Sokota, on the Legislative

Here is a

REFERENCE BOOK which you will **read**

You would not pore over the Telephone Directory, nor read from cover to cover Who's Who or the King's Regulations—but you will dive right into KEESING'S and be most fascinated by its contents.

WHY?

—because KEESING'S is a Reference Tool designed to produce instantly full factual data on developments in Politics, Economics, Social Questions throughout the world.

At the same time KEESING'S documentation provides authentic, coherent material for a comprehensive study of contemporary history, as by means of the Lateral Index you will follow back, item for item, the chain of events which have led to the present situation.

To keep you constantly *au courant* and maintain your reference tool right up to the mark, a fresh supplement is mailed to you every week and the alphabetical Index is perpetually renewed, ready for filing in the book-like Binder.

Council, pays them about £900 a year each, thus putting them far ahead and therefore high in the esteem of their fellow Africans—and then submits them in daily life to much the same treatment as all other Africans.

Meanwhile the mass of white opinion in both the Rhodesias remains implacably opposed to any tampering with colour-bars. In Northern Rhodesia, even an "educated" African may find himself debarred from entering a Lusaka shop, and have to be content with being served through a hatch opening on to the pavement. White Rhodesians do not understand why, in the light of this attitude, the African leaders reject "partnership" as a pious fraud, and oppose federation. Yet a federation which really did include so modest a beginning of racial partnership as the removal of economic colour-bars, by the proffering of equality of economic opportunity to the few who alone at this stage could take advantage of it, and the conferring of equal political rights on all civilised men irrespective of colour (which again in present circumstances could not possibly result in any "submerging" of the Europeans) would almost certainly be in the best interests of all the inhabitants of all three territories, both white and black.

Troubles Over Tunisia—II

An article in *The Economist* of last week described the nature of the pull and counterpull that have for years been exercised upon successive French governments by the Tunisian nationalists and the French settlers in Tunisia. In the early stages of this conflict, the complications it presented in Paris could be mitigated by basing French policy on the feelings against the left wing Néo-Destour cherished by the Bey and a conservative upper class—*les Béni-Oui-Oui,* as they were contemptuously known to young nationalists. But since the war this technique has become less and less possible because demands for change in the form of government have been advanced by all classes up to and including the Bey.

For the first six years after the collapse of Rommel and the restoration of French rule, these claims produced only a few meagre alterations in the *status quo.* But in 1949 several events combined to produce an atmosphere conducive to change. On the one hand, the United Nations proclaimed the rapid stages whereby Libya was to reach independence. It became clear to everyone except the most diehard among the French settlers that the far more advanced Tunisians could not be left behind. On the other, the leader of the Néo-Destour, M. Habib Bourguiba, who had left for Cairo in 1945 in disgust with France and in hopes of basing Tunisian nationalism upon the Arab League, returned home out of love with that divided and disappointing body. Both Tunisians and Frenchmen were in a mood propitious to negotiation.

The government which they set out to change was—at the time—composed as follows: The Bey ruled through a cabinet consisting of seven Frenchmen and six Tunisians, but their decisions required a Frenchman's "visa" before they were passed upwards. The cabinet was served in economic and financial matters by two elected Grand Councils of equal size, one composed of Tunisians, the other of local Frenchmen but only in an advisory capacity. Local government, too, was nominally conducted by Tunisians. But in practice all internal control remained in French hands because a French official took the chair at all cabinet meetings, because French counter-signature was essential to all beylical decrees, and because French civil controllers supervised even municipal and rural authorities.

In the summer of 1950 the new moods of 1949 yielded two results of importance. In the teeth of the diehard element among the settlers, a new French Resident-General, M. Perillier, was instructed to institute three major reforms and, if possible, to do so with Tunisian collaboration. He was immediately to reconstitute the cabinet; he was to alter the terms of access to the civil service, making jobs available to Tunisians on a basis of fixed proportions instead of by competitive examination, as the French settlers prefer; and he was to institute municipal self-government. In August, 1950, and, unprecedently, after consultation with the Bey, he announced the formation of a new cabinet in which the number of Tunisians for the first time equalled the number of Frenchmen, and which was to be chaired by a Tunisian Prime Minister, M. Chenik. Among its seven Tunisian members were representatives of all parties except the Communists and the eastward-looking *Vieux Destour* party. Even the Néo-Destour agreed to serve. By February, 1951, several changes had been secured by agreement, including a ruling that ministerial decrees no longer required the hated French "visa" before passing to the Bey for signature. Everyone was pleased except the settlers. What went wrong in 1951?

The root of the recent troubles is that whereas the Néo-Destour, and, indeed, most Tunisians, look on these reforms merely as the start of a quick turnover to complete self-government, the French settlers regard them as limits beyond which Paris must not go. In October last M. Chenik, accompanied by M. Perillier, visited Paris to discuss further changes. The Grand Councils had become a dead letter and there were hopes that he would secure an elected National Assembly to which the cabinet would be responsible. Meantime, municipal reform had not materialised on account of the settlers' opposition to the proposals for their representation, and M. Bourguiba was becoming audibly more impatient. Yet all seemed to be going well in Paris. M. Chenik sent for colleagues. On October 31st his team turned in a memorandum. Whether because of alarm at the strength of the settlers' lobby in Paris, or because they were fired by the attention paid abroad to M. Bourguiba's grievances, or both, they delivered a document that was more intransigent than had been expected. It said that Tunisian political institutions must be entirely Tunisian. A roar of protest rose from the settlers, who proclaimed that their immense contribution to the prosperity and development of the protectorate had earned them a right to representation. A large cabinet committee consisting of assorted opinions from M. Pleven's team drafted the fatal reply of December 15th that has been the cause of so much subsequent trouble. It said that the settlers must be represented in Tunisian political institutions. The Tunisians took this as a flat rejection of their demands and went home.

Rival Sets of Claims

Back in Tunis, M. Bourguiba fired them with the idea of an appeal to Uno. M. Chenik, it is said, signed the appeal with misgivings. The Bey was not consulted. Upon its delivery, the French pointed out that it was out of order, since Tunisia must lay such complaints through Paris. Meantime M. Bourguiba had called a Néo-Destour congress, and some factions more extreme than he, and opposed as much to the Tunisian moderates as to France, had clashed with the police. The moment was unfortunate; a new High Commissioner, M. de Hauteclocque, had only just arrived, and France was without a government. The French authorities forbade the Néo-Destour congress and arrested M. Bourguiba and his chief lieutenant an hour or two before it was due to take place. There followed the armed clashes of the last two weeks. These have been checked by two expedients, first, an appeal for calm by the High Commissioner, launched in his name and the Bey's and seconded, from his place of arrest, by M. Bourguiba in order to give France a "last chance" to come to terms; and, secondly, the despatch to Tunisia of many French troops and police. But the French say that they can release the arrested leaders and resume conversations only if the appeal to Uno is withdrawn, whereas the Tunisians in the cabinet answer that the releases and fresh French proposals must come first. There is a lull, but it has done nothing to resolve the fundamental difference between nationalist and settler—that is, between two rival sets of claims to both of which France is in honour bound to attend.

Asia—According to Mao

In present discussion of the right policy to adopt towards the Chinese Communists there has been little attempt to assess their aims and policies from the only available source—their own pronouncements. Yet speeches and articles freely available provide a reasonably clear picture of Mao Tse-tung's attitude to the outside world and of the dominant role which he intends to play—or says he will play—in Asian affairs. To Mao his revolution has reached a stage comparable to that reached by the Bolshevik revolution at the time when it was forced to fight against foreign intervention. He is determined to proceed with the revolution at home, to stamp out all counter-revolutionaries, to transform China from an agricultural to an industrial country and, eventually, to undertake "economic construction on a colossal scale." It is recognised that China is a backward country and that these plans are highly ambitious and will take 30 years to carry out. This does not mean, however, that Mao has resigned himself to cultivating his own garden. On the contrary, he is well aware that his alliance with a strong military power—the Soviet Union—puts him in a far stronger position than was Lenin at a similar stage of the Bolshevik revolution. He can therefore afford to look outwards and exploit the situation that he sees in Asia.

The close alliance and co-ordination of policy between Mao and Stalin is the dominant factor in the Asian situation today. It might eventually be wrecked by growing personal rivalry between Stalin and Mao—or, since Stalin seems to be the more cautious, by disagreement over exactly what risks are permissible. But there is no evidence that a split between Mao and Stalin can be counted on in the immediate future, and the two leaders are clearly united in their determination to foment armed "liberation movements" among colonial movements everywhere.

As long ago as November, 1949, blueprints for Asian revolutions were drawn up at the Peking conference of the Communist-dominated World Federation of Trade Unions. At that meeting Liu Shao-chi, the leading "Moscow" man in the Chinese Communist Cabinet, said that "armed revolution must be the main theme in the people's liberation struggle," and that it must be supplemented by "legal and illegal mass-resistance" in enemy-controlled areas and cities. A week or so ago a leading article in *Izvestia* declared that the success of the Chinese revolution and the successful resistance of the New China to the American aggressors "inspires the peoples of Asia who remain under the yoke of imperialist oppression to intensify the national liberation struggle." It added that the Korean struggle has "become the standard of the liberation aspirations of all the oppressed people of the East" and that the plans for national liberation are "rapidly extending" in Malaya, Burma and the Philippines.

Although Stalin remains the chief planner of the grand strategy of Communist expansion, it seems that Mao has staked a claim to take over the tactical leadership in fomenting "liberation movements" in Asian territories. His claim to organise the Asian revolutions is based on his proved success in his own country. In China, where the industrial proletariat was extremely weak, it was necessary to work out a different revolutionary prescription from that used in

Russia, where the industrial workers in the cities formed a sufficiently strong basis for revolution. The methods which made Mao victorious are now to be applied wherever colonial or semi-colonial conditions make the methods of the October Revolution inapplicable. This was made clear by a prominent Chinese Communist, Lu Ting-yi, in an article written for the 30th anniversary of the Chinese Communist party last July.

> The classic type of the revolutions in imperialist countries is the October revolution. The classic type of the revolutions in colonial and semi-colonial countries is the Chinese revolution. To use the standpoint, viewpoint and method of Marxism-Leninism to solve the problems of the Chinese revolution scientifically, systematically and in a classic way and thereby also solve in general a series of concrete problems of the revolutions in colonial and semi-colonial countries—such a theory is Mao Tse-tung's theory of the Chinese revolution.

The speeches and statements of the Chinese Communists leave little doubt that they intend to try to extend their control, either direct or indirect, over the whole of Asia. They have specifically demanded that America and its allies shall clear out of Korea, Formosa, Indo-China, Malaya and Burma. It seems that they seized Tibet because they were determined to link up territorially with India, not in order to stage a direct invasion—at any rate not in the immediate future—but in order to have a base from which to foment revolution in India. (They have not forgotten Lenin's dictum that when China, India and Russia are joined in communism the victory of world revolution will be assured.) Perhaps the most important immediate aim of the Chinese Communists is the conquest of Formosa, because it is the most likely base from which counter-revolution, backed by the Americans, might come.

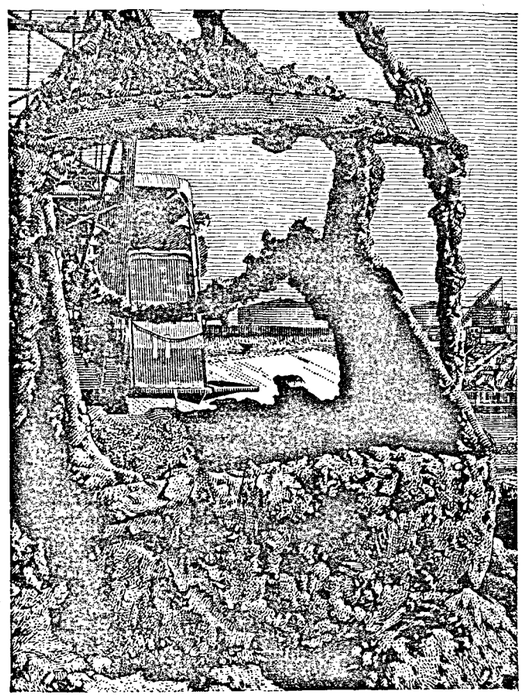
The Chinese people have been told that the revolutionary war is not yet completed and that they must be prepared for a protracted struggle with the "US imperialists." The industrialisation of China is to go on, but the highest priority is now to be given to building up a strong military force equipped (with Soviet help) with all the latest weapons. "All our construction work must evolve round our national defence." Thousands of Chinese have been enrolled in military cadre schools, where they are being given the technical training essential for modern soldiers. The importance of the past and future role of the People's Liberation Army is constantly stressed. It is "an instrument of the ideological leadership of the people's proletariat, serving the people's struggle and creating a revolutionary basis." It is already alleged to have made China a "military world power." Every effort is to be made to continue building it up into a "regular and modernised national defence army" so that it can not only defend China, but also "protect the peace of the Far East and the world." These things, and many others, can be read in the press and wireless output of China as clearly as the programme of Nazism could be read in *Mein Kampf*.

Nato's Wise Men Answered

THE governments of the North Atlantic powers have now all replied to the report of the TCC—or Three Wise Men—all, that is, except France, which has good reasons for delay. And the outlook, if not bright, is brighter. One part of the report consisted of specific recommendations to each country, except Britain, Portugal and America (to whom it scarcely applied), to increase their planned expenditure on defence during the current year. Apart from Canada, Belgium and France, countries have replied that they will meet at least 50 per cent of the increases required of them. It is true that these* are countries that cannot shoulder the main burden of defence either in men or production. But they have shown willingness, and that, in the political perhaps more than in the material life of Nato, is a major triumph for all concerned.

Belgium and Canada replied with a brusque but not entirely conclusive No. It was brusque, in Belgium's case at least, more because of the manner than the content of the recommendations. Both countries, indeed, have clearly qualified their rejection of the Wise Men's requests with a rider that they will see what they can do. The implication is that they do not in principle accept the obligation to do more, but that this will not stop them from doing more if they possibly can.

All this is encouraging; but the hard truth remains that the strength of Europe's defence must ultimately depend on three countries—Britain, France and Germany. What Germany can do, is prepared to do and should be allowed to do is a problem on its own, and not yet the concern of Nato. British rearmament is going along as fast as it can, perhaps even a little faster. Whether the Wise Men's attempt to close the gap between military demand and supply succeeds thus depends in the immediate future to a very large extent on France.



France's answer will be simple and sad. It can do only what is asked if there are developments in Indo-China which enable it to bring home some of its soldiers or at least to stop the steady suction of its trained men into the Far East. These developments could only be a truce, or American armed assistance in Indo-China. Dollar aid, which is one way in which the Americans might try to relieve the pressure on France, can be no ultimate solution. For what is wanted from France is primarily troops—15 to 20 divisions in Europe by the end of 1952—not production.

Slashing Material Costs

Whether the Wise Men's scheme as a whole can be followed during 1952 thus depends largely on events outside Europe, and it seems unlikely that anything will have happened to ease the French position before the Council meets in Lisbon on February 16th. This section of the report may therefore have to go in part by default, and the equation of military demand and supply may have to remain for the time being, precariously unbalanced. But the Wise Men did something else which substantially helped to balance a slightly different equation, the equation between military needs and economic possibilities. A large section of their report is concerned with slashing the material cost of a given unit of military strength. General McNarney, the Wise Men's time-and-motion expert, suggested cuts in the nutritional requirements of the various armies and in the scales of equipment; he recommended new methods of calling up reserves, of mobilisation and of training which would economise in manpower and weapons. Above all, he concentrated attention on the need to become as strong as possible in 1952.

If only these parts of the report are endorsed at Lisbon, a great deal will have been done. Greater strength will be possible from a smaller expenditure of money and material. And individual governments are unanimous in support of them. What is more, they are all agreed, whatever they feel about the Wise Men themselves, that a similar exercise—a balancing of the military supply and demand and of the military demand with the economic possibilities—must be done not once but every year. The administrative device of the Wise Men, representatives of Britain, France and America, acting as a high-powered executive for twelve countries, may never reappear. It was an emergency measure. Time, at the end of 1951, was short because so much had been wasted. If the new organisation of Nato works better than the old, this sort of emergency need never recur. If not there will have to be second thoughts. Whatever their shortcomings as a political experiment, the Wise Men have effectively done a job which it took the old Nato two years to fail to do.

*Denmark, Italy, Netherlands and Norway.

PLOUGHING

FOR OIL PLANT

On the marshy Isle of Grain in Kent, some 750,000 cubic yards of soil, poor for farming, are being moved in the construction of Britain's latest oil plant.

On this site, Anglo-Iranian's fourth refinery in the United Kingdom is rapidly taking shape. By 1953 it will be in full operation, producing over two and a half million gallons of petroleum products a day; and one more stage will have been completed in Anglo-Iranian's world-wide programme of refinery expansion.

More than half the income from Britain's exports is drained away in importing food from abroad. The price of foreign food is rising. Dearer food means dearer living and increased production costs. It becomes increasingly difficult, therefore, to sell goods abroad at a competitive price unless this trend can be reversed. The quickest way to do this is to grow cheaper, more plentiful food for ourselves.

There are 17 million acres of rough grazing in this country where the fertility could be enormously increased with the proper treatment. So we have the land to grow more food.

But the £5 million in 3 years, which is all that has been allocated for this purpose, is inadequate.

What farmers need is more of the modern farming equipment that can bring to agriculture the efficiency, increased output and lower production costs that modern machinery and methods have brought to industry. Once this is understood this leak in the nation's economy can soon be plugged.

THE BUSINESS WORLD

The four articles that follow discuss the most important aspects of the Chancellor of the Exchequer's statement last Tuesday. They examine the crucial role that the Budget and monetary policy are left to play; the difficulties and dangers of the cuts proposed in industry's new capital investment; the limited significance of the Chancellor's other measures to reduce public and private expenditure; and the prospects of balanced trade in the second half of this year.

Task for the Budget

BY advancing but not anticipating his budget Mr Butler has done both more and less than had been expected of him in the second instalment of his plan. On the one hand, the decision to introduce the budget a month before the end of the fiscal year, despite the arduous labour and technical difficulties this will involve, strikingly demonstrates both the Chancellor's own sense of urgency and the central part that the budget is intended to play in the whole scheme. On the other hand, if the measures now announced look less impressive and less strong than the grim warnings had led many people to expect, no one can feel sure that the omissions or inadequacies will not be made good in the final instalment. "There is much," Mr Butler said, "I cannot do here and now outside a Budget."

The ultimate objective of the three-part plan is to make and keep sterling strong; the immediate objective, adopted as Britain's share in the programme agreed at the conference of members of the sterling area, is the necessary but extremely difficult one of achieving external balance in the second half of this year. To bring this about within so short a time will require violent changes. In the second half of 1951 Britain's deficit with the non-sterling world amounted to £575 million; in the half-year beginning five months from now it is hoped that this deficit can be reduced to only £100 million. To achieve the immediate objective of total balance, Britain will therefore at the same time have to run a corresponding surplus with the rest of the sterling world; and, if progress is to be made towards the ultimate objective, the whole account will have to show a rising surplus from the beginning of 1953 onwards. The physical plans now envisage a total cut in Britain's external expenditure and an expansion in exports together amounting to £720 million to £770 million in a year. Fully two-thirds of this projected gain is expected to be secured by reductions in imports and other expenditure overseas. To the £350 million of cuts set in motion last November, the Chancellor has added a further £150 million a year—by cuts in imports and in tourism, discussed in detail below. The remaining one third of the gain rests on the assumption that, if £220 million to £270 million of products of the engineering and metal-using industries can be kept from the clutches of the home market, they will be readily sold abroad.

By far the most important of the newly-announced measures are, therefore, those for the restriction of industrial investment, which are expected to release £150 million to £200 million of plant, machinery and vehicles. There is also to be a drastic restriction of industrial and commercial building; but, since the building labour force is to be maintained and the total volume of building is expected to rise, these particular sacrifices by industry will not bring any net relief from inflationary pressure nor will they aid exports (except indirectly, by promoting economy in use of steel). The remaining £70 million is intended to be provided by cuts in the home supply of durable consumers' goods—bicycles, refrigerators, radios and the like.

*

At this penultimate stage in the disclosure of the programme it is still far from clear how the Government proposes to ensure that these large changes do in fact take place or, if they are assured, how it will mop up the large volume of spending power set free in the domestic economy. The additional inflationary stress that has to be countered by new financial measures will, of course, fall well short of the £720 million to £770 million of goods of which the home market may be deprived. If the £150 million to £200 million of investment goods are exported, that fact will of itself virtually imply that home investment of that kind has been reduced correspondingly; there is also likely to be a further substantial reduction in other fixed investment (chiefly on maintenance and repairs); and there may be a substantial fall in privately held stocks. In addition, the Government proposes to run down official stocks to a "reasonable" extent.

To ensure this reduction in private investment the Chancellor is relying upon a combination of measures —the impending withdrawal of the initial allowances, the new monetary policy, a tight and discriminating practice in steel allocation, and "voluntary" agreements with firms in the engineering industries to limit supplies to the home market. Whether these measures do in fact produce a big reduction in investment—and especially in stocks—is perhaps likely to depend principally upon the toughness of monetary policy. But, given such toughness, the saving on gross domestic investment could conceivably bridge some two-thirds of the additional inflationary gap.

The remainder has to be filled by the coming budget, the shape of which is quite uncertain. The inflation of the past year will keep prospective revenue buoyant, but a substantial part of this additional taxation will be paid out of surpluses already accumulated or out of recent wage increases that have still not exerted their full impact; to this extent, the extra revenue will not give any new disinflationary relief. Moreover, most of the new revenue that accrues from the first full year's effect

of last April's tax changes—notably, the ending of the initial allowances and the increase in profits tax—will show its effect in a reduction in investment. This has already been taken into account. It seems, therefore, that a substantial reduction in Government expenditure will be needed merely to bridge the prospective inflationary gap at present rates of taxation. But the general structure of the departmental bill for civil expenditure is now known: the effect of the cuts that Mr Butler outlined and of the new charges for the Health Service will be to keep total civil expenditure at about its present level. Given the rate at which prices and wages have been rising, this is no doubt the "major achievement" that he claimed it to be—it has reduced the proportion of gross national product absorbed by civil outlays from 15¾ to 13½ per cent. But it means, none the less, that the scope for reducing total expenditure in 1952-53 below its present annual rate is now very narrow; this appears to be limited to any net savings that may be secured by re-casting the subsidies—minus such additional sums as have to be provided for the defence programme at its retarded rate of growth.

These preliminary reflections on the budget, which are perforce founded on very flimsy data, suggest that the Chancellor's third instalment cannot be equal to the vital task now thrust upon it unless a substantial net saving can be wrung from the subsidies. They suggest, too, that a progressive toughening of monetary policy will be indispensable—both to ensure that the investment cuts are at least of the magnitude postulated above and to underwrite the whole disinflationary venture upon which the Chancellor is embarking.

Salvation by not Investing

THE Chancellor's outline of capital investment policy was clearer in its broad statement of the dilemma—defence, exports and home investment are all competing for the output of the engineering industries—than for the detailed steps that are to be taken to bring these competing claims within the limit of what is possible. The "rebalancing" of the defence effort is intended to bring about some reduction of the strain on the metal-using industries; solvency now comes first. The guiding principle—given the prospect that the expansion of output of these industries will be limited by shortage of steel in the first half of this year—is to restrict "certain types of home investment as well as consumption" in order to make greater exports possible.

Mr Butler sought to differentiate from the outset between capital expenditures that involve steel and those that do not. The Government intends to carry out its pledge on housing "which uses comparatively little steel." But it is difficult to detect the economic logic, as distinct from the political expediency, of a policy that holds out the promise of a "considerably greater" volume of building to be carried out this year compared with last. Specific commitments of this kind are bound to impede the best use of the country's resources during the period of pressure. Apart from a general statement that the Government will not "allow" the building labour force to grow beyond its present size, there is no recognition of this principle. The prospective increases in building for defence and the fuel and power industries may be inescapable, but their immunity involves "tight control" on all types of building using steel that are not of "fundamental importance" to the national economy. In fact, some industrial projects that in the long-term would manifestly be of such importance will be delayed or stopped. Past experience shows how easy it is to demote capital investment to a secondary place. But past experience does not encourage great faith in the prompt efficacy of control over building, particularly when control is based on the criterion of a single scarce factor such as steel. Tighter credit policy (which the Chancellor promised to maintain and, as necessary, develop further) is presumably expected to play only a minor part in restraining the demands on the building industry, since its output as a whole is expected to increase. This is one of the weakest features of the Chancellor's proposals for the 1952 investment programme.

If the contribution of the building industry towards external solvency is to be negative, the contribution from plant, machinery and vehicles for civil use at home is expected to be immediate and weighty. The Government's objective is to reduce such deliveries by £150-£200 million, compared with their level in 1950. On the Chancellor's estimate, this will mean a cut of one-sixth from the level of supplies in that year. It is necessary to distinguish carefully between what this proposes in principle, and the ways in which such cuts may work out in practice. According to the National Income White Paper for 1950, total capital expenditure on plant and vehicles amounted to £880 million at prices then current. The fuel and power industries, which are to be spared cuts as far as possible, spent nearly £140 million on plant and machinery and an unstated, though presumably small, amount on vehicles. Public service vehicles, road goods vehicles, railway rolling stock and ships and aircraft together accounted for £240 million. Thus plant and machinery (including passenger cars but excluding other vehicles) for industry and other services accounted for £500 million, of which manufacturing industry spent £283 million, and the conglomerate class labelled "other" spent £120 million. These last residual figures illustrate the severity of the cuts in plant and machinery that are now intended to fall on essential investment at home. If they work, they will provide relief in the short run, but only at the expense of industrial efficiency in the long run.

*

The instrumentalities by which the cuts are to be secured are diverse in character. The withdrawal of the initial allowances and stricter credit policy will clearly help. To the extent that building control prevents or delays certain classes of industrial building, the demand for plant will also be affected—though at a remove. There will be discrimination in allocating steel to encourage exports. But apart from this, the Government relies on appeals to industry to limit its demands for plant; it expects the engineering industries themselves to push exports; and it will discuss with particular industries the "appropriate division" between exports and home supplies. All this smacks of past export drives—with the single qualification that on this occasion credit policy may be used to give point to exhortation. The motor industry is the only one that has so far been given

set limits for home supplies—60,000 cars and the same number of commercial vehicles are to be sold at home, compared with "over 110,000" (perhaps as many as 117,000) cars and 100,000 commercial vehicles sold at home last year. It is worth recalling that last year's home quota of cars was 80,000; in past years there has been a persistent tendency for home deliveries to exceed the set quota. The exception was 1950, a boom year for car exports. The important question for the motor industry is not whether it can keep within the home quota that has now been set, but whether it can sell all the output of which it is capable, given the shortage of steel, in overseas markets that are now feeling the draught of competition. If the home quotas are fulfilled and no more, the motor industry may contribute £40 million or more towards the total cuts in plant machinery and vehicles that the Chancellor intends to impose on home market supplies. Clearly, much is expected of the industry; equally clearly, if overseas markets become tough, the question will arise whether present levels of output should be maintained. Mr Butler hinted that in "exceptional cases," supplies of certain manufactures might be prohibited beyond a certain level, "so that resources can be transferred to other products that can be sold overseas."

These are evidently tentative exercises towards balancing the overseas account; to translate them into real achievement will be difficult. It will, indeed, be impossible unless the Chancellor's wishes and the crude instruments of control that he intends to use are fortified by more rigorous action in credit policy. Any preconceptions about maintaining the level of employment in one industry, or maintaining the level of output of another for political rather than economic reasons, are bound to impede the changes in efforts of British industry and in the flow of British commerce that are necessary to secure solvency in this country's account with the rest of the world.

Clippers without the Axe

THE sections of Mr Butler's speech that dealt with his programme for securing cuts in current expenditure—public and private—were necessarily punctuated by patches of eloquent silence. Here, even more than elsewhere, March 4th throws its shadow before. The imminence of the budget precluded, naturally enough, any discussion of how private purchasing power may be cut down by higher taxes; there was also no mention, anywhere in the speech, of food and rent subsidies.

The Civil Estimates.—The Chancellor did, however, announce some of his decisions on the pruning of the civil estimates. He intends to hold these estimates to about their 1951-52 level. Since prices and wages have increased by 10 per cent in the year, this decision involves a "real" reduction; but the approach is still that of the nibble, not of the large bite.

The biggest cuts have necessarily been made in the fastest growing items. Expenditure on the National Health Service is again to be kept within a ceiling of £400 million, and this will necessitate passing on some £20 million a year in direct charges to the patients, £12 million from imposition of the 1s. charge for prescriptions, which Sir Stafford Cripps proposed and legislated for in 1949, but which Mr Bevan out-manœuvred on the ground that it was "administratively difficult," and another £7½ million from the imposition of a charge of £1 (or the full cost if less) for most dental treatment except dentures, which are already partially charged. In this, and the remaining £500,000 of health service economies, Mr Butler has taken a page from the book that Mr Gaitskell opened last year. He has done as much as—though no more than—would have been done by any Labour Chancellor who did not feel Mr Bevan's hot breath down his neck.

Outside health and education—where the approach has been most circumspect—the Government aims to save £5 million by reducing the number of civil servants by 10,000 in the next six months; it will press forward with further reductions later. Government information services at home and overseas will suffer a relatively heavy cut, though the absolute saving is little over £1 million. These cuts, Mr Butler declared, were in addition to "economies we are achieving in every branch of the public service just by patient attention to detail."

Hire Purchase.—The one measure directly restraining private consumption that was announced in Mr Butler's speech was the Board of Trade's new order on hire purchase terms. The object of this order is to limit the demand for metal and engineering products, the supply of which is to be cut down—probably to two-thirds of last year's level—by metal allocations and controls. From February 1st, hire purchase and credit sale agreements on a wide range of such goods must provide for a minimum initial deposit of 33⅓ per cent and a maximum repayment period of 18 months; the goods affected include radio and television sets, cars, office furniture, water heaters, lawn mowers and what the Americans call "major appliances" such as refrigerators, vacuum cleaners and washing machines. As a special case, hire purchase agreements on bicycles will have to provide for an initial deposit of not less than 25 per cent and a maturity of not more than one year. It is difficult to estimate how far consumer demand will be curtailed by this order; there are no adequate statistics of consumer credit in this country, and nobody knows how far its undoubted recent growth would have been cut back, in any case, by the general credit restrictions imposed last November. It will be noted, too, that the new order does not affect one of the largest fields in the instalment system—domestic furniture, where three-quarters of all sales are believed to be financed in this way. Rather strangely, electric and gas cookers are also excluded from the new order.

*

On the other hand, the terms laid down are fairly severe. For cars, they are the same as under Regulation W in the United States; for "major appliances" (where Regulation W demands only a 15 per cent initial deposit), they are stricter. The only hire purchase order in force in this country before this week provided for a minimum down payment of 12½ per cent, a maximum maturity of two years and a maximum service charge in interest payment of 20 per cent; it applies, however, to only a limited range of goods, and was part of the price control—not of the credit regulation—system.

Purchase Tax.—The object of cutting public and private expenditure is to free resources for rearmament or export industries. It is important, however, that the

measures taken to set resources free should not at the same time reduce the incentives towards greater exports. There is good evidence that purchase tax, by making it impossible for textile and other consumer goods industries to experiment on the home market, has defeated part of its own purpose in this way. Some months ago Mr Gaitskell appointed a committee under the chairmanship of Sir William Douglas to inquire into the connection between utility schemes and purchase tax; its terms of reference laid down that tax revenue from industries with utility schemes must not be reduced. The report of this committee has already been handed to the Government — it will be made public on February 24th — and Mr Butler announced that Government proposals arising from it will shortly be laid before the House. Under the present scheme any article that falls slightly outside the utility range becomes liable to the full rate of purchase tax, and is thus often made virtually unsaleable on the home market; the Board of Trade tried to mitigate this difficulty last year by widening the range of textiles and clothing that could be sold as utility goods, but this must have led to a sharp fall in the yield of purchase tax. The obvious solution here would seem to be a series of gradations in the tax scale, instead of rendering all non-utility goods liable to tax in one jump.

Tourist Allowance.—In one field the conventional process of nibbling may conceivably have gone too far. The tourist allowance, which was cut from £100 to £50 in November, is reduced again. In the year to November, 1952, British citizens will be allowed to spend only £25 each abroad. This means that the only legitimate British holidaymakers in Europe this summer will be week-end trippers or those willing to risk financial embarrassment. This step has been taken despite the recommendation of the Organisation for European Economic Co-operation of a minimum tourist allowance of £35 a year and in flat contradiction of Britain's pledges in the Uniscan agreement (to which "adjustments" are being made). The measure is being accompanied by a reduction of £15 for children and also for the car allowance for motorists and to £5 in the amount of sterling notes that may be taken out of the country. Inevitably, this unhappy expedient will spread ill-will and embarrassment across the Continent. The allowances should be raised as soon as possible. Meanwhile, there will be a saving of £12½ million a year.

Tobacco.—Mr Butler's decision to save £22 million in dollars on imports of tobacco represents a heavy cut in the present rate of import of American and Canadian tobacco, but "by a careful re-arrangement of our proposals about stocks, and other methods," he hopes to carry this out without causing any great shortage in the shops. Last year, out of total tobacco imports of 355.6 million lb., valued at £81.5 million, 212.1 million lb. costing £51.6 million came from the United States and 21.7 million lb., costing £4,500,000, from Canada. This cut, therefore, will reduce dollar imports of tobacco by about two-fifths and total imports by about a quarter. American tobacco is bought at sales during the autumn, so that this year's supplies have presumably already been purchased; the cuts will therefore fall largely upon purchases at next season's sales. In the American auctions that closed last month, British manufacturers spent some $147 million, and another $19 million in Canada; next season the buyers will have little more than $100 million to spend.

In terms of consumption, the reductions in imports represent nearly six months' smoking in Britain. But the level of stocks should enable the manufacturers to cushion its effect to a considerable extent. At the end of October stocks stood at 444.6 million lb., the largest since the war, and 38 million lb. larger than in October, 1950. Stocks generally rise during the last quarter of the year, so that the present level may be in the region of 460 million lb., or more than two years' consumption—though it must be remembered that for maturing purposes well over a year's consumption is usually considered essential by the trade. The manufacturers are planning, therefore, to maintain production at roughly the present rate by drawing upon stocks, and at the same time to increase their purchases in sterling markets such as Southern Rhodesia. Technically, the "other methods" that the Chancellor mentioned might include slight reductions in the size of cigarettes, so far as existing machinery allows. But more probably he was thinking of fiscal measures. Of personal expenditure on tobacco—some £800 million a year—less than £60 million represents the cost of retained imports; the Chancellor emphasised that less than 7 per cent of the price of a cigarette goes for imports and less than 5 per cent for dollar imports. The great bulk of that £800 million represents tax, and siphons off inflationary pressure. "Any human Chancellor," said Mr Butler, "must take this into account."

Petrol.—Inevitably, restrictions on the use of petrol had been the subject of conjecture before the Chancellor's statement; but Mr Butler made a good case for rejecting any return to rationing. Last year cars and motor-cycles probably used some 2.2 million tons of motor spirit, against 1.5 million tons in 1949, the last full year of petrol rationing; but since that time registrations have increased by about 10 per cent, so that rationing on the same scale would save only about half a million tons of petrol a year, worth some £8 million. Since rationing would take some time to re-introduce, Mr Butler estimated that only £4 million could in fact have been saved by its return this year. Against this he set the administrative cost—some 2,500 officials and nearly £1.5 million—and came to the inescapable conclusion "the whole thing is not worth while." Cutting crude petroleum imports, moreover, would seriously affect the increase in output of the British oil refineries, which by the end of the year may be supplying 90 per cent of the motor spirit consumed here.

Mr Butler said that "a good deal less than half of the consumption of motor spirit is by private motorists, and not very much of this is used for pleasure motoring." One recent estimate, based upon a survey at filling stations, suggested that more than 80 per cent of the petrol used by passenger cars in the year is for business purposes. This has an obvious bearing upon any budgetary measures; it means that an increase in tax would be likely to cut consumption only over a limited proportion of the nation's motoring, while over the remainder it would swell industrial costs.

Films.—The Anglo-American agreement that laid down the amount of money earned by American films that can be remitted to their producers in dollars was renewed last August, and it runs until September this year. Mr Butler could not, therefore, take any action to reduce the dollar cost of American films without abrogating the agreement; but he gave the American producers notice that he would "use the time till then

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged The Bank of Australasia Limited and The Union Bank of Australia Limited

The new Bank formed by the merger of The Bank of Australasia Limited and The Union Bank of Australia Limited, is known as Australia and New Zealand Bank Limited. The following points indicate some of the improved banking facilities and services which result from the merger.

RESOURCES · With an authorized Capital of £ENG.17,000,000 and the combined assets of the merging banks amounting to £A.400,000,000, Australia and New Zealand Bank Limited has powerful resources for the use of its customers.

LOCAL KNOWLEDGE · The knowledge and experience of local conditions in Australia and New Zealand, acquired by the merging banks in over a hundred years of banking, are at the service of the customers of Australia and New Zealand Bank Limited.

BRANCHES AND AGENCIES With the combined Branches and Agencies of the merging banks numbering nearly 600 in Australia and over 150 in New Zealand and Fiji, as well as an international network of Agents and Correspondents, Australia and New Zealand Bank Limited provides its customers with comprehensive and competitive banking facilities.

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

to consider the economies which may well have to be made in the future." He put the total dollar cost of films at £9 million, or $25.2 million; the agreement allows direct remittances of $17 million, and certain additional remittances proportional to the films' earnings under the current "Eady" levy on exhibition and the American producers' expenditure on British films. It may be, therefore, that the American producers are taking out, or spending here and in Europe, most of the proceeds that their films earn. This would offer some margin for reducing dollar remittances, which might stimulate film production here by both British and American producers. Here, too, the Chancellor has revenue to consider; the most probable result of showing more films made in Britain on the screens, unfortunately, might be fewer patrons in the cinema, and less tax to the Exchequer.

Can Trade be Balanced?

THE cuts in the import programme for 1952 that the Chancellor announced will reduce it by a further £150 million over and above the reductions totalling £350 million announced in November. This second operation cuts nearer the bone, and much of the saving will be achieved by using some of the strategic reserves of materials to keep industry going instead of increasing imports. Mr Butler would not say "for well recognised reasons" how the £150 million will be saved. Some £22 million will be saved on tobacco. The planned imports of coal from the United States will be reduced, since stocks are better than was expected, though only £2½ million will be saved here. No cuts will be made in imports of coarse grain, put by Mr Butler at 5,500,000 tons, and only minor cuts will be made in the Ministry of Food's purchases of non-rationed food and in imports of manufactured goods; both of these groups came under the axe in November.

The Chancellor proposes that the British payments account shall be brought into balance in the second half of this year. Compared with the outturn for the second half of last year, this will involve an improvement of £475 million on non-sterling account and an improvement of £250 million on sterling account; the expectation is that the non-sterling deficit of £100 million that will then remain will be offset by a sterling surplus of the same amount. In this formidable task, dollar aid for defence will help; some £100 million will be paid over in due course. The import cuts should in time count at an annual rate of £500 million and if home supplies of capital goods are cut as the Chancellor intends, exports of these items might perhaps expand by £150 million. As a broad guide, overall balance might be achieved if exports and re-exports in the second half of this year run level with the rate for 1951 as a whole. Can British industry maintain its past performance? The metal and engineering industries accounted for 47 per cent of total exports, and they are cast to play as important a role as they did in 1951.

In the Chancellor's words, "it is absolutely vital that the output of these industries should be increased," but in the first half of the year, at least, the limiting factor will be steel. Already a number of factories have been forced to adopt a shorter working week. It would be prudent to expect, therefore, that during the first half of the year production will be materially reduced in a number of the industries using steel. Though steel supplies should be generally more plentiful by the middle of the year rearmament production may be taking more steel and effort by then, despite exercises in "re-balancing." The "original" steel shortage was set at 1½ million tons of finished steel, or some 14-15 per cent of current steel consumption. Erring somewhat on the side of prudence, it might on that assumption be necessary to reckon with a fall in the total civilian output of these industries during 1952 of some 5 to 10 per cent, in assessing their potential contributions to the export drive. The restrictions in supplies to the home market that Mr Butler has announced makes possible some estimate of the goods that these industries might then make available for export—which is not, of course, the same thing as selling them.

The most important exporting industry in the group is the motor industry. Last year, the motor industry produced some 480,000 cars and exported 370,000, leaving about 110,000 for the home market compared with the limit imposed by the previous government of 80,000. If output this year were to fall by 10 per cent to 430,000 and if the industry keeps to the new limit of 60,000 for the home market imposed by the Chancellor last Tuesday, 370,000 cars would still be available for export. The production of commercial vehicles reached 258,000 in 1951, of which 162,000 were exported, the remaining 96,000 going to the home market. This year the Chancellor intends that only 60,000 are to be sold at home so that at least the same number could be exported even if production should decline by 10 per cent to 232,000 because of the steel shortage or because the factories have to make military vehicles. The motor cycle industry could maintain its volume of exports even if production fell by 15 per cent, and bicycles could keep at their 1951 level if production fell by 10 per cent. For domestic refrigerators and washing machines, exports could also be maintained if production fell 10 per cent, while for vacuum cleaners,

radio sets, and metal furniture production would have to fall by 20-30 per cent before the volume of exports need be affected. The volume of machine tool exports could be maintained if production were to fall by 10 per cent, while the volume of textile machinery exports could be maintained if production were to fall by 5 per cent.

These very rough and ready calculations suggest that if the output of the engineering industry does not fall by more than 10 per cent in 1952, exports might be maintained at last year's volume by virtue of the cuts that Mr Butler intends for the home market. The prospect of a balanced payments account would then be good. Much depends on steel supplies and even more depends on the terms of trade. The sharp deterioration in the first half of 1951 has subsided, and in December the terms of trade were no worse than in December, 1950. If this improvement in relative export prices were to continue this year, the chances of a balanced-payments account would be appreciably brighter. Equally, any deterioration in the terms of trade would make the country's tasks even more formidable.

Business Notes

Economic Aid Again

After a year of trying to do without direct economic aid, Britain has had to fall back on American generosity again. It was announced in Washington last week that President Truman has allocated $300 million from the current fiscal year's mutual security funds as "interim" economic assistance to this country. Hitherto Britain has received a share of the $4,819 million that Congress voted for overseas military aid in the year to June 30th next, but not of the $1,022 million that it voted for economic aid. The military assistance that this country has received has frankly proved of little economic significance. This aid comes across the Atlantic in the form of equipment, not of dollars—and the Americans have quite rightly shipped equipment that could not be made in this country, instead of equipment that is being made by resources that Britain would like to divert to the export drive. The various figures that have been mentioned as the value of military aid received to date have simply been additions of rather notional price labels (presumably based on replacement cost) attached to arms shipped from American stocks. The whole of the original $1,022 million of economic aid, which is paid out on the Marshall Aid formula of direct dollar reimbursement for eligible items on the import programme, was earmarked for other countries at a time when it appeared that Britain could paddle its own canoe. When it became apparent in November that Britain could not paddle that canoe—not, at any rate, without jettisoning a very large part of a rearmament programme that is already greater than that of all other European Nato countries put together—Mr Butler had to appeal to America for reassessment. He also pointed out that the fact that Britain is running its rearmament programme at more than full stretch means that it is not able to benefit, as much as some European countries can do, from producing quasi-military equipment and goods for PX stores for sale to the US defence department against dollars.

The Mutual Security Act provided that the President could switch 10 per cent of the military aid vote to economic aid. It is this provision that has been used to secure the new $300 million. The President has, however, to justify the switch to a congressional committee, and it is for this reason that certain conditions have been attached to the allocation. The most important of these is that the imports that will be eligible for dollar reimbursement must be "defence-like" materials. This category includes such things as military equipment not eligible for military aid, metals (including steel), sulphur and oil for the services. It remains to be seen how soon $300 million of goods in this category will be imported, and thus how soon the dollars will reach London. It is greatly to be hoped that some shipments recently made (and certainly contracts recently placed) will be eligible for this reimbursement; if not, Britain will again suffer from having set off to a more determined and earlier start on its defence programme than its European partners. Even if the reimbursement provisions are drawn up sensibly in this way, it seems likely that some of the dollars now allocated will reach this country after June 30th.

* * *

Conjuring with the Counterpart

Another provision attached to the new allocation is that the sterling counterpart must be spent on the defence effort. Thus starts a new chapter in a four-year comedy of errors. There is, of course, no such thing as a spendable "sterling counterpart" to dollar aid of this sort; the fact that the country is living so far beyond its means that it has to go on the dole, does not mean that the Government can legitimately sell that dollar dole for sterling, and then use the sterling for living beyond its means still further. The fiction of a "counterpart fund" has had only one justification since 1948; it has helped France and other continental countries that had some economic case for financing their recovery by a budget deficit and were impeded by constitutional difficulties in their effort to do so. In Britain, however, the counterpart fund was never more than a technical accounting device; Britain put this counterpart into the "Treasury special account" on the liabilities side of the Bank of England's balance sheet, wrote in an equivalent holding of interest free notes on the assets side, and then crossed out both figures at intervals so that no harm was done. This process was called "using the counterpart for retirement of debt."

In the early days of Marshall Aid there seemed to be a danger that Congress might protest that the counterpart fund was being used as a device for enabling certain continental countries to add to their internal inflations. In fact, however, the tone of criticism—through a strange series of misunderstandings—swung all the other way. Complaints began to be uttered that while the virile continentals were using American funds twice over to expand production, the slothful British were letting half their money waste away. This explains the new provision that the "counterpart" to the present aid must be used to finance the defence programme. Presumably, therefore, this "counterpart" will now be paid into the special account as before—where, incidentally, it will join the counterpart to the residual flow of Marshall funds and the so-called "Katz-Gaitskell" money (the ECA's reimbursement to Britain of British gold lost to EPU as a result of European drawings on pre-1950 sterling balances). In due course this "money" will be drawn out of the special account as an appropriation-in-aid of the service votes in the next budget. Part of the tax revenue that would have been set against the service votes will then have to be added to the ordinary budget surplus and used to retire the "debt" that the inflow of "funds" into the special account will have created in the first place. The point that will have to be emphasised at home, of course, is that the sudden emergence of this new appropriation-in-aid into the budget accounts does not mean that tax revenue can be smaller; spending power has still got to be cut down to match available supply, and neither is affected by this conjured-up "counterpart."

* * *

Fall in Bank Advances—

The first signs of the impact of the new monetary policy upon bank advances have been revealed in two statements published by the clearing banks this week. The combined statement of their year-end position (which is always delayed by the publication of the several balance sheets) appeared only two days before the statement for the January make-up (January 16th). Taken together, these two statements showed that over the whole period of eight weeks bank advances actually showed a net fall of £14 million, whereas in the similar period of 1950-51 they rose by £30 million and in 1949-50 by £52 million. This heartening contrast doubtless owes something to the substantial new issues that have lately been made, principally for the funding of bank advances; and there is no doubt at all that a large part of it is explained by the fact that special influences were forcing advances strongly upwards in the two earlier periods—at this time last year, it will be recalled, the first big impact of the commodity boom was being felt. Even so, it is evident that a contributory factor has been the new pressure upon the banks to exercise a more effective restraint upon borrowers than they have done in the past. The effects of this restraint should become more and more apparent in the coming months, though it is still far from certain whether it will be strong enough to prevent aggregate advances from rising further under the pressure of demand from credit-worthy borrowers in the "essential" categories.

It certainly cannot yet be assumed, therefore, that the threat of pressure by the banks upon the gilt-edged market is receding; for if the authorities contrive to keep a taut rein on the banks' liquid assets, the banks may feel that they must provide the funds to meet any net rise in their advances *by selling investments.*

* * *

—And Sales of Investments

The latest figures seem to confirm the market's impression that perceptible sales of investments by the banks have taken place already. In November, as already noted in these columns, the banks' investments rose by a good deal less than the amount of their participation in the new funding stock; in the six weeks to end-December, their balance-sheet valuation of investments dropped by £67 million; and in the first fortnight of January it dropped by a further £11 million—bringing the decline over the whole period to fully £100 million, or about 6¾ per cent. of the portfolio as it stood before the funding operation. This is certainly an appreciably bigger sum than is likely to be accounted for by writing-down; the portion represented by sales must have been substantial. In this context, it is interesting to observe that, of the December reduction of £67 million, over £25 million was attributable to the National Provincial Bank—although that bank has the smallest investment portfolio of any of the Big Five banks. The biggest movement in the first fortnight of January was shown by the Westminster Bank (a decline of £6¾ million), which has the second smallest portfolio.

If it could be assumed both that advances will not continue to rise and that the authorities will not tighten the screw, the liquidity threat to the banks would now look rather less menacing than was envisaged some weeks ago. A striking feature of the past two months is that the Government, despite the continuance of the heavy deficit on the balance of payments, has been a substantial net borrower from the banking system, whereas in the similar period of last year it was making repayments—thus reversing the relationship between the two periods that obtained a few months ago. These borrowings, which partly reflect the rise in defence expenditure and partly arise from the fact that in December the "departments" provided £60 million for the Transport Commission, have naturally increased the supply of bills to the banking system, and this supply has been further augmented by the substitution of bills for maturing Treasury deposit receipts. This enlargement of liquid assets, combined with the reduction in advances and investments, has had the effect of raising the liquidity ratio from 32.0 per cent in November to 33.2 per cent in December and 33.7 per cent at mid-January.

* * *

Ironfounders and the Steel Federation

As might have been expected, the ironfounding industry has at length reacted to the steel industry's contention that over-production of iron castings last year was the reason why the steelmakers did not quite reach their output target of 16 million ingot tons. A public argument between industries is unusual and not particularly edifying; and it may be surmised that the steel industry, which began arguing its case some weeks ago, had more in mind than seeking to excuse a quite marginal failure to live up to a forecast made last spring. During the past year the British Iron and Steel Federation must have had enough experience of planners not to become too thin-skinned when one of its own forecasts is out by roughly two per cent.

The federation's case, in detail, is that while steel production fell last year 360,000 tons below its estimate, the output of the iron foundries rose by some 260,000 tons of finished castings, or roughly 360,000 tons of metal poured. Both industries take pig iron and scrap—and therefore

> if iron foundry production had remained at the 1950 level, as was assumed in putting the steel industry's calculations for 1951 before the Ministry of Supply, steel production could have been almost exactly on the 16 million-ton mark, notwithstanding the fact that the scrap drive has so far met with only partial success.

The federation argues that use of steel in metal goods offers great economies in iron and steel-making materials, since the thickness and hence the weight of an article fabricated in sheet steel need be only a half or a third of an iron casting serving the same purpose. It concludes therefore that by means of some substitution of fabricated steel for castings in metal products, iron foundry output should be limited to the 1950 level—some 3½ million tons—until steel output could at least be restored to the 1950 figure of roughly 16¾ million tons. The period envisaged would presumably stretch beyond 1952; for this year the steel industry is not expecting to produce more than 16 million tons.

* * *

Castings or Sheet Steel?

The ironfounders' reply is, first, that the steel industry's assumptions about iron foundry output when it put its own calculations for 1951 before the Ministry of Supply have nothing to do with them. Whatever assumptions may have been made in various quarters about foundry output in 1951, no specific limit was laid down by the Ministry, which licences the industry's supplies of materials. At the end of 1950 the foundries had pig iron stocks amounting to roughly eight weeks' supply; at that time, the Ministry of Supply asked them to reduce these stocks to three weeks' supply, and restricted current deliveries of materials accordingly. Working to some extent on stocks, the foundries did produce at the rate of 3¾ million tons a year during the first half of 1951. In July the Ministry further reduced

the quantities of materials for the third quarter by some 10 per cent, and in October it reduced the foundries' supplies of coke by 12½ per cent. The effect of these measures takes some time to show in output; but it does appear that by the fourth quarter of the year the rate of output from the foundries was slackening.

The balance of national, as against commercial, advantage may be held to vary with the extremity of steel shortage. Against the man-hours, and cost, of melting an ingot of pig iron, pouring a casting, and the light machining that requires, have to be counted the cost of turning that iron into steel, rolling it to a given shape, and fabricating the steel into a product or component; and in normal competition the consumer will make his choice on grounds of cost and technical advantage. On some of the wide range of products in which substitution has been advocated, the steel used instead would need enamelling or perhaps metal spraying; and the iron-founders question whether sufficient capacity—in forges and presses for stamping and refractory muffles for enamelling—exist in the country. On the comparative properties of steel and cast iron, the experts could no doubt argue endlessly; but most consumers would probably consider cast iron at any rate far more durable.

There may well be a range of products in which some marginal substitution of cast iron by steel could take place, though not all of them at present take a large tonnage of castings. But it would appear that the restriction of output towards roughly the 1950 level, which the BISF is now advocating, may already have been in train through the normal licensing of raw materials by the Ministry before the federation launched its arguments. It seems doubtful whether any closer control of the foundries would be practicable even if it were needed; there are about 2,000 of them, many on a scale approximating to that of the village blacksmith, and at the other end of the scale some of the largest units are "captive foundries" owned by large iron—and steel—consumers.

* * *

South African Gold for Britain?

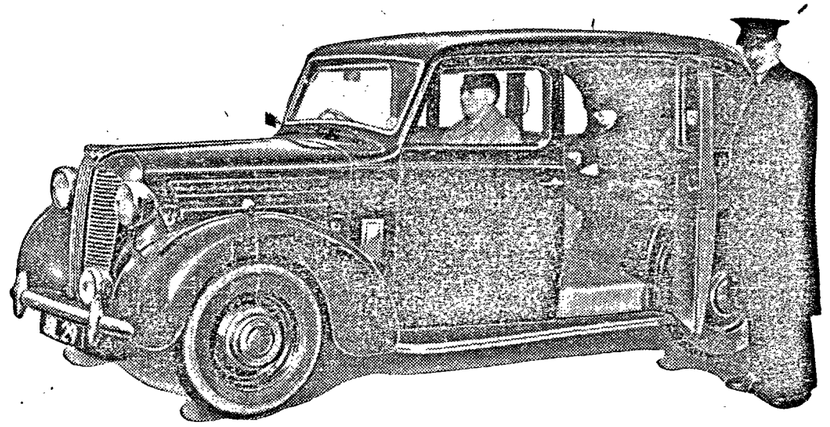
One of the first indications of a subject that must have been discussed at the recent Commonwealth Finance Ministers' Conference was given in a statement by the South African Finance Minister this week. At the moment all essential imports into South Africa are paid for in gold, but South African importers are allowed to buy these goods from whatever is the cheapest source of supply. Mr Havenga explained that under the GATT agreement South Africa has accepted certain limitations on its freedom to discriminate in favour of the United Kingdom; in addition, Mr Havenga is unwilling to compel importers to buy from the sterling area goods that they might obtain at a lower cost from the dollar area. He suggested, however, that the Union might be able to draw down its present gold reserve of approximately £67 million without overstepping the danger line. The implication is, presumably, that South Africa is considering either another gold loan to Britain, or a direct sale of gold against sterling. There have also been suggestions that the Union might provide some incentives to greater production by the gold mines, possibly by changes in the present tax formula; these rumours have led to a rise in Kaffirs on the London and Johannesburg stock markets this week.

* * *

Anglo-Japanese Payments

Reports from Tokio suggest that the Japanese Government is to make proposals for a conference to revise the payments agreement with the United Kingdom. This agreement, signed last August, made provision for special consultations between the parties if Japan's holdings of sterling at any time reached an excessive amount. Unofficial but reliable indications suggested at the time that the Japanese Government would regard £70 million as a reasonable upper limit to its sterling holdings at seasonal peaks and about £40 million as the maximum average working balance maintained over the year as a whole. The sterling area's deficit with Japan has been a by no means inconsiderable part of the total deficit that the sterling area has been running during the past year; in consequence, Japanese holdings of sterling have recently tended to exceed the ceiling envisaged at the time the agreement was negotiated. The basic provision of the agreement, that no convertibility or gold clause should be attached to the Japanese accumulation of sterling, naturally still stands; but the time has evidently arrived when consultations should be held between the two parties. There has been considerable public discussion of the situation in Japan and, so far, it is in this discussion rather than in official exchanges between the two governments that the proposal for a new conference has taken shape.

Recently, however, the issue has crystallised in the course of negotiations between Britain and Japan for purchases of Japanese steel: the amount in question appears to be some 700,000 tons, costing possibly some £5 million. The Japanese authorities have urged that nothing less than gold or dollar payments would be accepted for this scarce commodity. The Anglo-Japanese payments agreement gives Japan the right to use its sterling to pay for imports from transferable account countries. Japan has not been included in this group of transferable account countries, but the administrative transferability that has been conceded to Japan is interpreted liberally; no real barriers are put in the way of current payments to or from transferable account countries. An interesting illustration of this administrative transferability may soon be provided if Japan accepts the very tempting offers that have been made by Soviet Russia to sell coal to Japan against payment in sterling. Soviet Russia is in the sterling transferable account area, so that Japan would be entitled to transfer sterling to Russian account in payment for deliveries of coal. This is one way in which Japan's accumulation of sterling might be reduced; but such a solution of this particular problem is hardly likely, in all the circumstances, to commend itself to Washington.

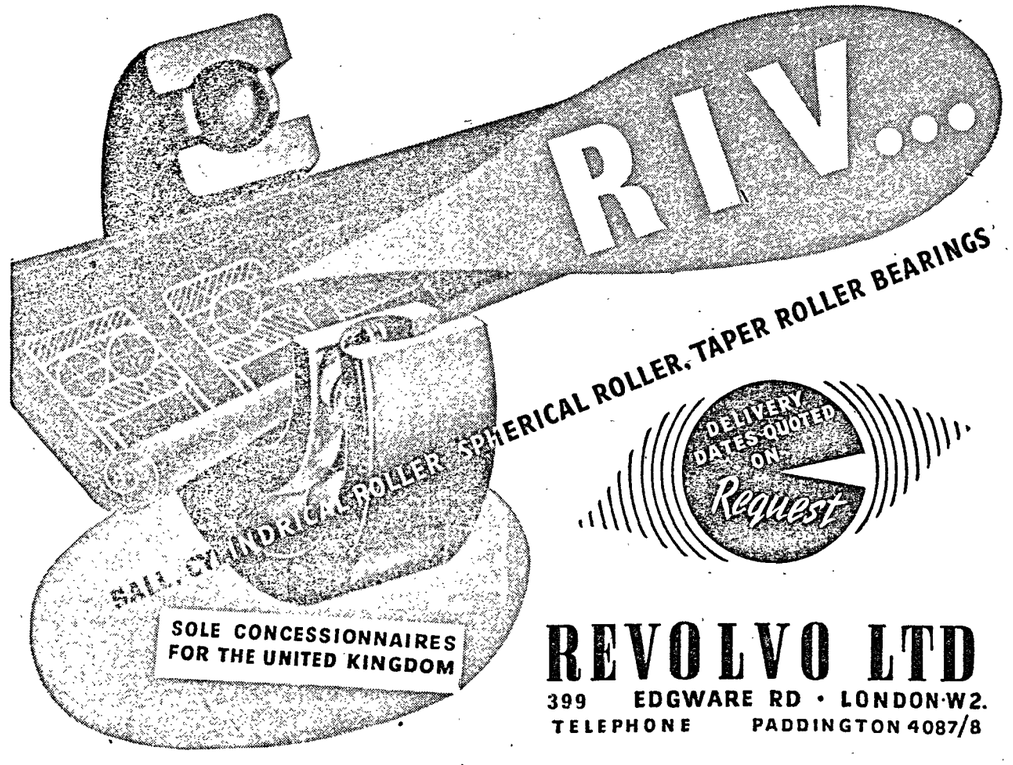


* * *

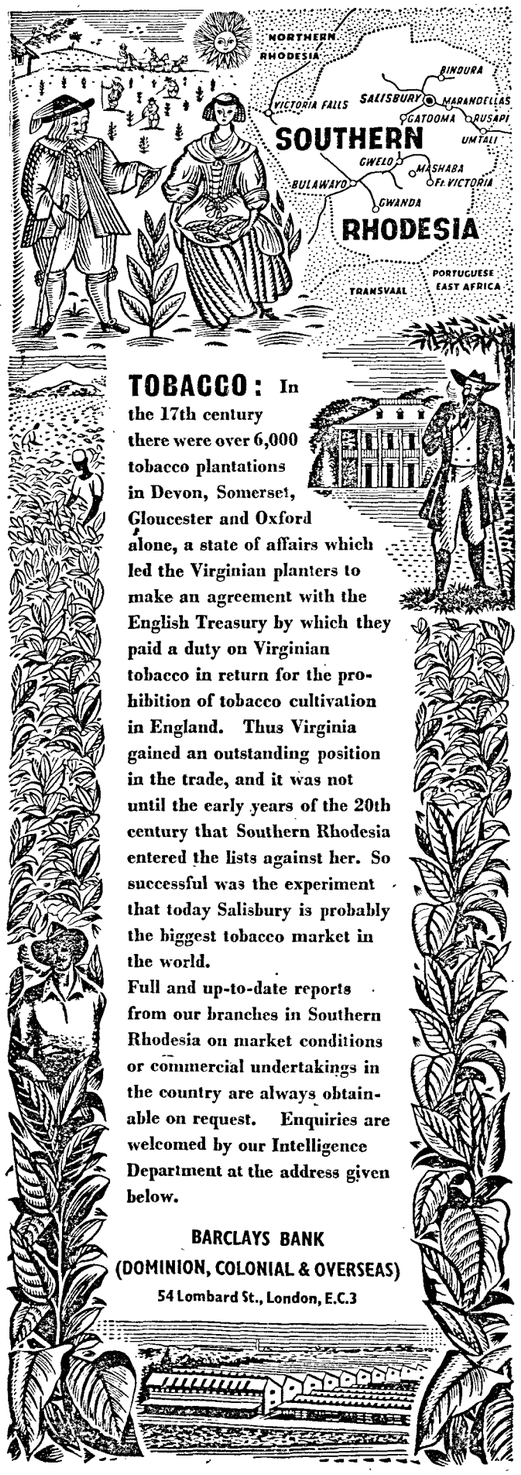
Rising Building Costs

The extra 1½d. an hour granted to the building workers last week is the equivalent of a wage increase of 11s. a week, and will cost the building industry between £25 million and £30 million a year. It has been estimated that this will add £25 to £30 to the price of a council house, and perhaps 6d. a week to its rent. The 4s. 6d. a ton increase in the price of cement has less serious consequences on house building costs; on the assumption that an average of ten tons of cement is used for each house and for the services attached to it, the new price means an addition of only £2 5s. But on large civil engineering projects such as airports, hydro-electric schemes or atomic energy plants, a 2 per cent rise in the price of cement will involve an appreciable increase in costs.

The steady rise in the price of materials and labour has more than offset any economies that the builders themselves may have achieved by improving their efficiency. The 1951 report of the National Federation of Building Trades Employers estimated that during the first ten months of the year the general level of material prices had risen by 20 per cent. The price of bricks and roofing and floor tiles had risen by 12 and 11 per cent respectively. This increase, and possibly half of the 28 per cent increase in cement prices, was due to increased transport costs. Cement prices were also affected by higher coal prices, by the high capital costs of some of the new plants that came into operation during the year, and by the surcharge imposed on home produced



YOUR FIRM needs this car...



A works or office car is an essential to the well run modern business. Austin build this special car which is exactly right for the job. With its two folding seats, it takes six in comfort and there is room for two more on occasions. Its 68 b.h.p. O.H.V. engine and great manoeuvrability ensure that it is always on time. This Austin is more impressive—more efficient at its job—than an ordinary saloon. Delivery is better, too. See your dealer today. This Austin is also the perfect Hire Car, for dependable day and night service.

AUSTIN —you can depend on it!

TOBACCO: In the 17th century there were over 6,000 tobacco plantations in Devon, Somerset, Gloucester and Oxford alone, a state of affairs which led the Virginian planters to make an agreement with the English Treasury by which they paid a duty on Virginian tobacco in return for the prohibition of tobacco cultivation in England. Thus Virginia gained an outstanding position in the trade, and it was not until the early years of the 20th century that Southern Rhodesia entered the lists against her. So successful was the experiment that today Salisbury is probably the biggest tobacco market in the world.

Full and up-to-date reports from our branches in Southern Rhodesia on market conditions or commercial undertakings in the country are always obtainable on request. Enquiries are welcomed by our Intelligence Department at the address given below.

Nuwara Eliya is 100 miles inland from Ceylon's port of Colombo—7,000 miles from the English fields where a famous Jersey herd is bred. There were risks to be faced in having the bull calf and three heifers shipped out across the world. Their new owner—like so many wise men of all nations—covered those risks with a British Insurance Company.

British Insurance Companies back World Enterprise

Issued by the British Insurance Association

ement in order to offset the higher prices of imported ement. In December the cement industry was paying an verage of more than £7 a ton for imported cement and elling it at the ruling British prices which, with the new ncrease, are the equivalent of £4 19s. 9d. a ton in the London rea. Softwood prices have risen 62 per cent, but may lecline in the future. There have been big increases in the rices of metal goods ; 24 per cent for steel, 25 per cent for opper sheets and tubes, 62 per cent for lead and 45 per ent for plumbers' brasswork.

Increased efficiency on the site has partly offset these ncreased prices, and building costs during the same ten nonths did not rise by more than 15 per cent. There are igns that the building industry has taken to heart the severe riticisms of earlier years ; two big factors contributing to n increase in output on the site have been the introduction f bonus schemes and more careful pre-planning of the work itself. Under today's conditions there are limits to any further improvements in this direction, and shortage of building materials makes accurate planning of work schedules almost impossible. But it should not be necessary to leave the whole responsibility for combating rising material costs to the contractor on the site. Modern building research has shown many ways in which construction costs can be reduced and, what is equally important, ways of conserving scarce materials. But many more architects could apply the results of this research work in their plans.

* * *

Rubber for Dollars

Following the agreement reached in Washington to sell to the United States 20,000 tons of tin at 118 cents a lb the British government has this week agreed to sell 25,000 tons of rubber from its stock at the current American buying price. Mr Butler disclosed on Tuesday that this deal will provide Britain with "well over" £8 million in dollars, from which it can be calculated that the American buying price must be around 44 cents a lb, equivalent to 3s. 2d., compared with the London spot price of 3s. 4½d. a lb on Wednesday. It is not known whether the American price is the landed cost in New York or based on the London or Singapore markets. But at least the difference between 3s. 4½d. and 3s. 2d. is of small significance given the fact that Britain's dollar needs are urgent, and that the United States has agreed not to reduce its buying programme by an equivalent amount.

In 1951, some 35,000 tons of rubber were added to British reserves ; before the sale took place, total stocks in government hands were of the order of 85-95,000 tons. Last year the United States put into stock some 295,000 tons of natural rubber, bringing the stockpile up to about 810,000 tons. It may be remarked that the United States has not sought to buy this additional quantity on the open market ; evidently rubber at 6s. a lb a year ago still rankles.

* * *

Discount Houses' Year

Before the change in monetary policy, there had been much discussion in Lombard Street about the shock that would be felt there if Bank rate were raised. In the event, the increase was less than some people had expected ; and the accounts of the "Big Three" discount houses show that the shock has been absorbed, if not painlessly, at least without causing undue disturbance. The largest of the three, the Union Discount Company, has, indeed, reported a small increase in profits ; and this company, like Alexanders, has met the whole of the depreciation on its bond portfolio from current profits. All three companies have maintained their dividends. This satisfactory performance reflects the good earnings experience of the market earlier in the year and the prudent reduction that it had been making both in the size and especially the average life of its bond holdings. As the accompanying table shows, the combined bond portfolio of the three companies rose slightly over the year as a whole (and that of the Union Discount rose sharply), but this movement was much more than explained by a large intake of short bonds after the change in monetary policy. During the main phase of pressure before the end of the year, when

1951	331·5	300·3	146·6	778·4

banks and others were selling short bonds for liquidity reasons, the discount market—or, at all events, its bigger units—was performing its function of providing a jobbing cushion to take the shock.

The change in policy, of course, caused loss to the market on its bill portfolio as well as on its bonds, since bills bought before November 7th had thereafter to be financed or resold at the higher rates. A more important consideration for the longer run is that the higher level of rates has increased the market's margin between bill rates and money costs, while the new flexibility in the system provides greater opportunities for the earning of profits by the exercise of skill and judgment. Current revenues are, therefore, giving the market a chance to restore a cushion of revenue against the risk of loss from any further sudden advance in rates. The greater risks that now have to be run are, however, likely to lead the market, on the whole, to keep smaller portfolios than in the past. The Treasury bill portfolio has, of course, already been sharply reduced in consequence of the decline in issues that followed the funding operation, although business in commercial bills has continued to expand.

Laurels at Monte Carlo

British victories at the Monte Carlo rally this week are the latest of a series of successful postwar trials that have done much to publicise British cars in countries where a few years ago they were quite unknown. Word-of-mouth recommendation plays a big part in car sales and the greatest difficulty faced by the British motor industry in building from scratch into the world's biggest exporter of cars was that many of its products were hardly known abroad. This is the first Monte Carlo rally for some years to be held in weather that the experts considered was bad enough to provide a real test of cars and drivers, and British cars took five out of the first six places in a total entry of 369.

None of the winning cars has, or is ever likely to have, big sales either at home or abroad. The Allard that took first place is a specialists' car of the kind in which British engineers excel. The Sunbeam-Talbot is a car of only 2,226 cc as against the Allard's 3,993 cc, which makes its victory in an open class the more impressive. But this, again, is a car for which there is a strictly limited market, chiefly because it has a smaller seating capacity than is usual in a car of its price. The fourth and sixth places were taken by Jaguars, the fifth by a Jowett and the eleventh by an Austin

A.90. Like many British cars today, these are too high-powered and expensive for the mass market for small cars; too low-powered and small for the mass market for big cars. The Jaguar does, however, represent an attempt to provide a high-powered (3,442 cc) car that is not at the same time a luxury car and it appears to be meeting with success abroad, especially in the United States.

Although the prestige of the motor industry as a whole gains from successes of this kind, there is a division of opinion among the big British manufacturers as to its direct advertising value for the winning cars. Austin and Rootes are the two most energetic supporters of open competition for production cars, and both would agree that their successful entries have been one of the cheapest and most effective forms of advertising yet devised. On the other hand, the last British winner of a Monte Carlo rally was an Invicta in 1931. In spite of its triumph then, the car is no longer in production.

* * *

Short Time at Home

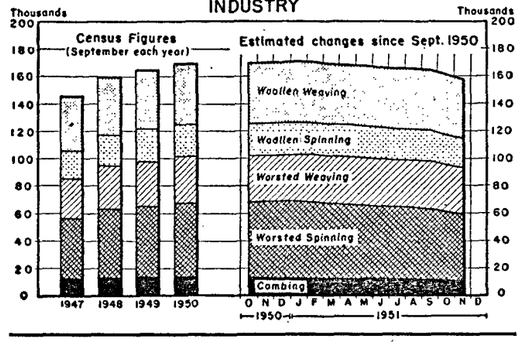
Shortage of materials has put 1,300 workers in the Morris factories on a four-day week and led to the dismissal of 800 men in the Humber works. A large number of men have been on sporadic short-time working in this second factory for some time; and even after the dismissals, short-time work will continue for many that remain. There is a good deal of under-employment in most car factories, and uncertainty about future supplies of materials is making it difficult for managements to know whether to dismiss men now, or keep them on in the hope of improvement later in the year.

Provisional estimates put last year's car production at 475,000, and during the coming months there may not be sufficient steel available to maintain output at more than 80 per cent of this total. This suggests that the first quarters' production this year might total only about 95,000 cars as against a quarterly average of 119,000 last year. But the steel allocations for the two months February-March have been drawn up under great pressure, and those for the second quarter will also show signs of hasty preparation. There are great difficulties in allocating different types of steel to manufacturers who combine them in different proportions in each different model that they make. The Ministry of Supply is also bound to take the cautious view to avoid any danger of giving manufacturers allocations that their suppliers cannot honour; in consequence the motor industry may acquire in practice rather more steel than appears available on paper. During recent months, some manufacturers have also managed to maintain their current rate of production by arranging to import their own sheet steel, but now that all types of steel, and not merely sheet, are scarce, it may become more difficult to maintain output by such strategems. Any improvement in supplies is dependent on the arrival of American steel; but this is unlikely to be distributed before the middle of the summer. The motor industry is unfortunate in having to face so uncertain a period at home at a time when the development of sales resistance abroad demands its managements' undivided attention.

* * *

Steel Company of Wales

The large increase in trading profits earned by the Steel Company of Wales last year will presumably have resulted largely from operations at the works taken over from its founder companies; the directors state that it also reflected the coming into operation of the company's vast new plant at Margam. The trading profit for the year ended September 29th amounted to £3,967,400, nearly £1,600,000 more than the previous year; since the Margam works was running for some weeks before it was formally opened in the summer, its early operations appear to have made some contribution. The company also earned "substantial profits" in the export markets, while a very large contribution came from the appreciation of stock values—£600,000 compared with £50,000 in the previous year.



During the year the company spent another £16 million on its development scheme for the new plants, bringing the total expenditure to £57,028,922; by the end of the year the board had sanctioned a total of approximately £68 million on the scheme, and it expects that the remaining plant will commence operating during the current financial year. The tinplate mill, at Trostre, is now also in the early stages of operation. Of the amount expended this year £7,800,000 has been received in loans from the nationalised Iron and Steel Corporation; of the loans that were made available by the Finance Corporation for Industry, £28,200,000 had been received before the date of nationalisation. The company in the year under review made provisions for loan charges totalling £1,118,885 and for depreciation of £1,264,403 (on existing plant taken over from founder companies and on such sections of the new plants as had been brought into operation by the end of the year; these covered about half of the development scheme). The eventual charges upon the new plants will presumably be heavy in comparison with those of other plants turning out similar products; but that is inevitable in such development during a period of rapidly rising prices for capital equipment.

* * *

Employment in Yorkshire

Activity in the wool industry showed a further fall in November, and another 2,611 workers left the industry. In January, 1951, it was employing nearly 171,000 workers; during the following eleven months it lost 12,600 of them. The workers are leaving the mills because there is no work for them, but the movement has now reached a point where it is beginning to worry employers. Losses on the present scale may make it impossible to expand output again when trade does improve. Moreover, the loss of labour is not evenly distributed throughout the industry.

PRODUCTION WORKERS IN THE WOOL TEXTILE INDUSTRY

Although the weaving sections have lost large numbers of workers, they have probably not lost more than three per cent of their total labour force. In actual figures the loss of workers in the combing sections is not much greater than from woollen or worsted weaving, but employment in these sections is much smaller, and there the decline represents a drop of 20 per cent over the eleven months from January, 1951, to November. Some members of the industry believe that it may by now be considerably higher. A fall of 20 per cent in combing labour could mean a drop of 20 per cent in the output of this section, with a corresponding reduction in the output of worsted yarn and so on right through the industry. Because the wool "pipeline" is so long, it might take as much as nine months for a shortage of this kind to become apparent; so that if trade revived immediately, there is every chance that the improvement would be checked in the autumn by a shortage of yarn.

The figures of wool tops production show how this situation has arisen. Output fell from 23.4 million pounds in January, 1951, to 14.3 million in November, while output in the weaving sections fell only from 37 million to 29.9 million square yards during the same period. The consumption of raw wool fell from 39.7 to 26.8 million pounds a month. It is clear that a revival in Yorkshire rests far more in the hands of the wool merchants than it does with the retailers.

* * *

Specialised Ships for Ore

Provisional details have now been announced of the six ore ships that are to be built for Ore Carriers, Limited, a company formed last year by Houlder Bros. and the British Iron and Steel Corporation. These are the first six ore carriers, designed as such, in which the British steel industry will have a direct financial interest; they represent a development in the industry's transport resources that was perhaps overdue. They were designed by William Gray, Limited, the West Hartlepool shipbuilders, drawing upon their own experience and upon data supplied by the British Iron and Steel Research Association, which is still studying the requirements of iron ore tonnage. These six are of 8,000 tons capacity and 9,000 tons deadweight, bulk carriers without any specialised unloading equipment, since all the ore handling equipment will be shore based. Their tonnage was settled with an eye on Port Talbot, where they will frequently be delivering ore; but BISRA, which has made a survey of the major ports—15 overseas and 10 in Britain—where ore is most frequently loaded and delivered, considers that larger carriers, up to perhaps 15,000 tons, might well be operated elsewhere.

The only particular feature of the ship's holds is the slight "hoppering" of its holds, by means of sloped bulkheads that facilitate the run of ore towards the grabs. Specialised ore handling equipment is already a feature of many of the coastal schemes under the steel industry's development plan. It has been estimated by BISRA that a third of the time an ore carrier spends in port "turnround" is in awaiting a berth, a third in clearing four-fifths of the ore carried in its holds with the mechanical grabs, and the final third in clearing the last fifth of its ore cargo—often by hand. Considerable efforts are being made to cut down the time taken in "trimming" this final residue of ore, and BISRA believes it may be brought down to less than a fifth of a reduced turnround period. But partial ownership of the tonnage in question, as against the chartering of tonnage owned by other shipowners, might obviously offer the steel industry an alternative; the final residue of the ore, to unload which so much time and labour has to be spent, might be left in the bottom of the hold.

* * *

Even Bigger Tankers

The increasing size of oil tankers has advanced a further stage with the placing of contracts for two single-screw vessels of 44,000 tons deadweight with Vickers-Armstrongs, Ltd., Barrow. They have been ordered by Mr Stavros S. Niarchos for the North American Shipping and Trading Company (London), Ltd., which has several tankers of up to 32,500 d.w. under construction, for charter to the Shell group. The largest tankers so far in service are of about 28,000 tons, but about a year ago the British Tanker Company started the movement by ordering a series of vessels capable of carrying 32,000 tons. Since then tankers of 38,000 tons have been ordered in Japan, and tankers of 40,000 tons in Germany, by American interests.

The new 44,000-tonners will be powered by geared steam turbines designed to develop a maximum of about 20,000 shaft horsepower, giving a service speed of 17 knots. This in itself marks an achievement in marine engineering, as this will be the highest power yet applied to the shaft of any single-screw ship. The increased speed, it is claimed, will contribute to greater security in the event of war and also to improved economy in normal trading. Each ship will have a deadweight capacity more than one-third greater than any other tanker now in service, and the two ships together will be capable of transporting a greater tonnage of petroleum than that carried by ten typical prewar tankers. Their range of ports will be limited, since they will draw about 36 feet of water, but they can, for a start, operate between Kuwait, Rotterdam and the Thames. Repair problems will also arise, since the dry docks that can take vessels 757 feet long, with a breadth of 97 feet, are few and far between.

* * *

Steel and Industrialisation

Steel consumption per head in Britain is only about half as high as in the United States, but twice that in France and five times that in Italy. These figures—which have obviously a considerable bearing upon the degree of industrialisation of different countries—are published by the British Iron and Steel Federation in its current statistical bulletin. Its table of "apparent consumption"—arrived at by dividing the home output of crude steel for each country, less exports and plus imports, by its population—shows that the United States has not only by far the greatest steel consumption, but that its consumption, which doubled beween 1937-38 and 1950, has increased at a faster rate than anywhere else. Only Canada, where steel consumption per head now almost equals British, increased nearly as fast as did the United States. The table (in which a few figures are not directly comparable) makes no allowance for "indirect exports" of steel in vehicles, machinery and other steel goods from nations such as Britain and the United States to less industrialised areas. The figure for Germany—which for 1950 includes only West Germany—was the greatest in the world in 1938; it is now presumably rising once more.

APPARENT CONSUMPTION OF STEEL PER HEAD OF POPULATION
(In Ingot lb Per Head)

	1937	1938	Average 1937 and 1938	1950
USA	826	456	641	1,237
UK	550	436	493	628
Canada	410	281	346	614
Sweden	558	406	482	567
Australia	401	455	428	540
Belgium-Luxemburg	437	268	353	501
Germany	537	654	596	469
Netherlands	376	290	333	370
France*	326	252	289	332
USSR†	232	235	234	309
Italy	118	127	123	137
India (including Pakistan)	8	7	7	11

Source: British Iron and Steel Federation.
* France and the Saar in 1950. † Owing to lack of trade statistics for 1938 and 1950 crude steel production has been assumed to equal consumption for all three years. The addition of net imports of steel in 1937 would raise consumption per head by only one lb.

* * *

Investment and Manpower

Mr Butler's decision to cut investment on plant, machinery and vehicles compared with 1950 lends particular

interest to an estimate of investment within manufacturing industry recently published by the Board of Trade. These show that during 1950 manufacturing industry in Britain as a whole spent about £496 million on capital investment, compared with £383 million in 1948 and £423 million in 1949. Plant and machinery accounted for some £337 million of the 1950 total, new buildings and works about £116 million, and vehicles, new and secondhand, £43 million. These figures, it should be noted, exclude the nationalised industries, Royal Ordnance factories, Service departments' establishments and "agency" factories owned by the Government even within manufacturing industry. Figures

CAPITAL EXPENDITURE IN MANUFACTURING INDUSTRY IN GREAT BRITAIN

Industries	No. of Establishments	Estimated Capital Expenditure (£ Million) 1949	1950	Estd. Capital Expenditure per Employee, 1950
Bricks, pottery, glass, cement	2,398	16·9	17·6	64
Mineral oil refining	9	18·0	32·1	3,320
Other chemicals and allied trades	2,149	43·9	56·1	161
Iron and steel manufacture	1,200	42·2	48·9	118

Source: *Board of Trade Journal.*

of capital expenditure, and of capital expenditure per worker (which exclude certain estimates included in the total above), calculated from a sample of 3,948 industrial establishments, are given in the table.

The figures of total investment show the chemical industry and allied trades as spending the largest amount, £56.1 million, followed by certain of the engineering industries, lumped together, spending £53.4 million, and the food and drink industry, spending £50.9 million.

* * *

Rumania's Currency Reform

Rumania is the latest of the Soviet satellite countries to be put through the penalising rigour of a monetary purge. The currency reform announced last weekend involves the calling in of all money in circulation against the re-issue of new notes. Reports from Bucharest, which are far from detailed, state that this currency exchange will reduce the volume of money in circulation by two-thirds. This suggests that the new currency and credit will on the average be issued for the old in the ratio of one to three. This, however, is an almost meaningless average since the currency and credit exchange is being affected in the highly discriminatory manner common to such operations in Soviet countries. The measure is directed against the farmers, because they have hoarded currency, and they are to receive no more than one new leu for every 200 held. Other categories get less penal rates—the scale of conversion varying not only with the amount of currency and credit involved in each holding, but also with the class to which the holder belongs. The new leu has been given a specific gold parity of 0.079346 grammes of fine gold, but is to be pegged to the Soviet rouble at 2.80 lei for one rouble, so that the rate for other currencies is to be established by reference to the rouble peg. The rouble bloc is clearly taking shape.

NEW AIR SUBSCRIPTION RATES

Owing to the increased cost of air freight, new air subscription rates to *The Economist* for the countries listed below will unfortunately have to be introduced from January 1st, 1952.

Australia	£6 15s. 0d. (sterling)
Canada	$22.30 or £7 14s. 0d.
Hong Kong	£6 10s. 0d.
India, Pakistan, Ceylon ...	£6 0s. 0d.
Malaya	£6 5s. 0d.
South Africa	£5 10s. 0d.
U.S.A.	$21.50 or £7 14s. 0d.

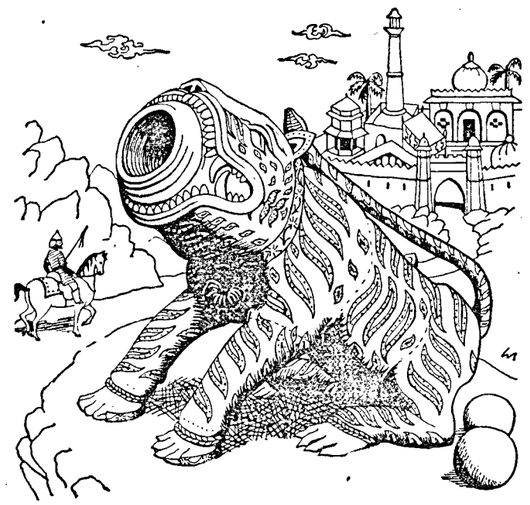
Rates to all other destinations remain unchanged.

Shorter Notes

Weekly wage rates during 1951 rose 10½ per cent, which was more than in any year since the Ministry of Labour's index began to be published in 1947. The total increase during the year amounted to £6,546,700 a week, the largest single increase being that secured by the engineering workers. But retail prices, as measured by the interim index, rose even more sharply—by 12 per cent. Compared with June, 1947, wages were 26 per cent higher by the end of last year, and prices 30 per cent higher.

*

Provisional estimates suggest that although British European Airways carried considerably more traffic last year than in 1951, the corporation's deficit is likely to increase by about one-third to £1,270,000 for the calendar year, against £952,500 in 1950. Revenue increased by 21.8 per cent, from £8,651,000 to £10,510,000, but operating costs rose from 43.9 to 47 pence per ton mile. Inability to bring new aircraft into service as planned has cost about £540,000 during the year and BEA has been competing for traffic against airlines having more modern aircraft. Labour troubles during the summer's peak traffic period caused a loss of £150,000, and delays in the conversion of other aircraft have all combined with rising costs to check BEA's steady progress out of the red. This year, when the new aircraft should at last be in service, ought to bring its rewards.



*

Responsibility for opencast coal production is to be transferred from the Ministry of Fuel and Power, under which it has been operated since it began during the war, to the National Coal Board. The step is logical; it was not taken before mainly because the opencast operations were expected to come to an end within a few years. In the present fuel stringency, such a happy ending appears less certain. The National Coal Board, which was saddled with such unpleasant responsibilities as the import of American coal, has until now managed to avoid this additional one, having sufficient unpopularity of its own. In earlier years, moreover, opencast production was carried on at a considerable loss. In the last year, however, it may approximately have paid its way; which may have made the Coal Board less chary.

*

In the note "Spending on Transport" in *The Economist* of January 26th, reference was made to an allowance of £80 million for upkeep of roads and street lighting in certain calculations of expenditure on roads and road transport made by Mr E. Rudd of the Road Research Board. It should be noted that this item was not taken into account in the table published with the note—"Users' Expenditure on Road Transport," which included the cost of licence duties and fuel tax.

COPPER

NEXT to iron, copper is the most useful metal in the world today. Millions of miles of copper wire and cable carry the electricity that drives motors and transmits messages from one end of the earth to the other. It is made into fireboxes for railway engines and, alloyed with zinc or nickel, into condenser tubes for steam generators in power houses and ships. Alloyed with zinc, copper forms brass, which has a thousand uses from curtain rails to cartridge cases. Alloyed with tin, copper becomes bronze, the alloy that makes springs, statues and heavy duty bearings. Copper was the first metal used by primitive man as he emerged from the Stone Age. When the Romans came to Britain, copper was already being widely used in the form of bronze. Mining and smelting were being carried out in Cumberland, Anglesey and North Wales. Today most of the world's copper ore is mined in Africa and the Americas.

I.C.I., which is the largest producer of wrought non-ferrous metals in the British Empire, manufactures vast quantities of copper and copper alloys in forms varying from printing rollers to coins.

BAY HALL TRUST LIMITED.

Summary of Directors' Report for the year ended 31st December, 1951, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT

The gross revenue amounted to **£170,881** compared with **£157,714** in 1950. After charging Debenture Interest, Income Tax, Directors' Fees, Management and General Expenses amounting to **£93,446** the net profit is **£77,435.** Adding **£140,946** brought forward, the total available for appropriation is **£218,381** and a dividend of **6½** per cent., free of tax, is recommended which will absorb **£65,897.** It is further recommended that **£10,420** be appropriated for writing down the book value of certain investments, leaving **£142,064** to be carried forward.

At market prices on 31st December, 1951 (or where no market price existed at valuations by the Directors at that date amounting to **£358,673**), the Share and Debenture Holdings and British and Foreign Government Securities had an aggregate value of **£2,948,433,** as compared with their book value of **£2,232,419.**

CHAIRMAN'S STATEMENT

The net profit of **£77,435** compares with **£70,636** for 1950, an increase of **£6,799.** Full provision has been made in the Profit and Loss Account for Income Tax and Profits Tax in respect of all income to 31st December, 1951. Double taxation relief allowable to the Company, amounting to **3s. 0d.** in the **£,** has been taken into account in arriving at this provision. At the end of 1951, the value of the investments showed an indicated appreciation of **£716,014** over book cost. Over **91** per cent. of the investments, including British Government Securities, taken at the valuations at 31st December last, are situated in the United Kingdom, Union of South Africa and other parts of the British Commonwealth. About **86** per cent. of the investments are in Ordinary stocks and shares and the balance in fixed-interest-bearing securities.

PENSION SCHEMES

WITH PROFITS

Throughout its century of service, the Prudential has taken a leading part in providing insurance to meet the changing needs of the community.

Another step forward is the extension of profit sharing to Group Pension Schemes.

Company Notes

Tate and Lyle.—Last year's increase in sugar imports and exports suggested that a further expansion in Tate and Lyle's sales would be recorded. In fact, the company's turnover rose by nearly 18 per cent from £84 million to £99 million for the year to September 30th. Trading profits advanced by 22 per cent from £3,052,558 to £3,723,868, an increase that suggests that profit margins were well maintained. After £935,540, against £856,345, has been provided for depreciation, the prosperity sharing scheme, etc., and £1,828,011, against £1,227,901, set aside for taxation, net profits show a slight fall from £968,312 to £960,317, a result that has prompted the directors to leave the full year's ordinary distribution unchanged at 20 per cent.

The increase in Tate and Lyle's turnover has brought considerable benefits to Silvertown Services, in the form of a jump in group trading profits from £571,875 to £967,895. Under the threat of nationalisation, Tate and Lyle hived off Silvertown Services as a separate entity to take care of the company's transport requirements. When the company was hived off in November,

Earnings :—	Years ended Sept. 29, 1950	Sept. 30, 1951
	£	£
Trading profit	3,052,558	3,723,868
Taxation	1,227,901	1,828,011
Earnings for ordinary stock	*907,414*	*921,278*
Ordinary dividends	557,500	551,250
Ordinary dividends (per cent)	20	20
General reserve	594,000	350,000
Added to carry forward	*Dr. 244,086*	20,028

15s. ordinary stock at 53s. xd. yields £5 13s. per cent.

1949, Tate and Lyle's equity shareholders received one 1s. ordinary share in Silvertown Services for every £4 of ordinary stock they owned in Tate and Lyle; the company seems in fact to be something less than a subsidiary, something more than an associated company. The new company's net profits after tax have risen from £258,048 to £378,371 and a dividend of 87½ per cent has been declared on the ordinary capital of £175,000, as increased by the one for three bonus issue last November, which compares with a dividend of 100 per cent paid in 1949-50 on the original capital of £131,250. At the current price of 13s. 3d. xd. the 1s. ordinary shares yield £6 12s. per cent.

★

Stanhope Steamship.—Recent rumours that a reconstruction scheme was imminent touched off a speculative demand for the 5s. ordinary stock units of Stanhope Steamship. The whirl of speculation was stilled when the details of the scheme were published at the beginning of January. This announcement has robbed the accounts for the year to September 30th of much of their interest for shareholders, except as an accounting for the past. It must, however, be recorded that trading profits jumped from £482,411 to £1,160,587—one more indication of the recent prosperity of the tramp shipping lines. An interim ordinary dividend of 15 per cent was paid last July, but in view of the reconstruction proposals no further dividend is to be declared for the year to September 30th. In the last few months, eight of the older and less economical ships in the company's fleet have been sold and negotiations for the sale of another three ships have been started. These sales will leave the company with a large cash surplus which the directors propose to distribute to equity shareholders. The present company is to be placed in voluntary liquidation and a new concern—of the same name—is to be formed, to which the remaining eight ships, of 88,779 tons dead weight, will be transferred. These eight ships include two newly built motor vessels of 10,250 tons each delivered last October. Presumably these ships are included in the estimate of £350,000 as capital expenditure outstanding on September 30th. The new company will have a capital of 1,600,000 £1 ordinary shares which will be distributed on a one-for-one basis to the 5s. ordinary stock holders, who will also receive about 29s. on each 5s. stock unit from the cash surplus. On the directors' estimate that "the proper consideration to be paid for the ships and business to be acquired by the new company is £3 million," each of the new £1 ordinary shares will be backed by a asset value of 37s. 6d.

In its first year of trading, the new concern is expected to earn a gross profit of £1 million, so that after a reasonable allowance for depreciation and taxation net profits

Earnings :—	Years to Sept. 30, 1950	1951
	£	£
Trading profit	482,411	1,160,587
Depreciation	245,000	285,000
Taxation	45,180	398,237
Ordinary dividends	55,000	31,500
Added to carry forward	553	204,014
Ordinary dividends (per cent)	*25*	*15*
Balance sheet :—		
Fixed assets, *less* depreciation*	2,316,432	2,412,055
Total current assets	499,523	812,596
Cash	292,630	441,588
Capital reserves	1,073,883	1,087,201
Ordinary capital	400,000	400,000

* Ships at cost, *less* depreciation, including payments on account of new tonnage.

should amount to some £250,000; the directors expect to be able to pay an ordinary dividend of 7½ per cent for the year. Shareholders might well appreciate fuller information about the basis of these estimates and to what extent charter arrangements have been made. The current price of the 5s. ordinary shares is 50s. 6d. If 29s. is distributed on each 5s. share—the actual amount will depend upon the proceeds of trading up to the date of liquidation and of the sale of the three ships—investors will in effect be paying 21s. 6d: for each new £1 ordinary share, to yield on a projected 7½ per cent dividend, nearly 7 per cent.

★

Patons and Baldwins.—Ample warning to shareholders in Patons and Baldwins that losses on stocks could be expected following the fall in wool prices was contained in the chairman's review of the financial year ended April 28, 1951. Mr Wright then emphasised that the value of stocks at £13,992,606 was arrived at "after writing off £557,290 to reduce to market values at April 28th and a further £417,115 to write UK wool and tops stocks down to market values at June 11th." Confirmation of the fear that the fall in wool prices since June would bring about further stock losses is now given in the company's interim dividend statement. The directors consider that the heavy stock losses that have been incurred can be met out of a contingencies reserve of £2,800,000, "which has been built up in recent years for this and other contingencies." The directors make it clear that a trading surplus has been earned since April 28th; but the interim dividend is reduced from 5 to 4 per cent. Trading profits could not be expected to run at the 1950-51 level, when, as the chairman pointed out, earnings were inflated by inventory profits when stocks, previously purchased at lower prices, were sold in a rising market.

The dividend statement, however, concludes somewhat cryptically that "the payment of an interim ordinary dividend at the rate of 4 per cent must not be taken as any indication of the total ordinary distribution for the year ending May 3, 1952." The £1 ordinary shares were marked down 2s. 6d. to 51s. 3d., to yield, on the basis of last year's final dividend of 15 per cent and the latest interim of 4 per cent, £7 8s. per cent.

COMPANY MEETINGS

ALEXANDERS DISCOUNT COMPANY

AN EVENTFUL YEAR

SIR ERIC GORE BROWNE'S REVIEW

The eighty-fourth annual general meeting of Alexanders Discount Company Limited will be held on February 20th at 24, Lombard Street, London, E.C.3.

The following is an extract from the statement by the chairman, Sir Eric Gore Browne, D.S.O., O.B.E., T.D., which has been circulated with the report and accounts:—

The year for which we now account, 1951, was an eventful one for the London Money Market. During the first quarter there was a steep rise in commodity prices, and other factors ensued which enabled the sterling area to add to its gold and dollar reserves and to suspend Marshall aid ahead of schedule. By midsummer the position was reversed; heavy buying by the sterling area, coupled with a falling tendency in prices, resulted in a fresh dollar deficit which increased in volume during the autumn. In the result, this country was faced with an increasing deficit, not only in relation to the dollar area, but also within the sterling area and the European Payments Union. Then came the general election, and the return of the Conservative party with a small majority, and, on November 7th, the bank rate was increased from 2 per cent. to 2½ per cent. Thus the Bank of England once more resumed its traditional function of exercising greater control over the volume of credit. We welcome this change of policy on the part of His Majesty's Government.

The result has been that the "special buyer" can no longer be relied upon to buy Treasury bills at the market price, and that when we are compelled to borrow money from the Bank of England we have to do so at a rate which is at present 2 per cent. for a minimum period of 7 days. In consequence, bill rates have risen sharply, and the rate for Treasury bills is now about 1 per cent. compared with ½ per cent., while the rate for three months bank bills is 1½ per cent. compared with ¼ per cent. a year ago.

Simultaneously with the rise in the bank rate His Majesty's Government decided to fund part of the Treasury bill issue, and £1,000 million of these bills were converted into serial funding stock maturing in one, two, and three years time. These operations caused a fall in the price of government securities, but I am glad to say that your company was not unprepared for this important milestone in its long history

THE ACCOUNTS

The balance sheet shows an increase in deposits from £140,677,567 to £144,921,025, an increase in bills discounted from £83,467,405 to £88,719,407, a decrease in British Government securities from £59,264,313 to £58,653,098, and an increase in our balance sheet total from £144,798,867 to £149,069,175.

The profit and loss account shows a balance of profit of £146,550, a decrease of £18,550 compared with last year's figure of £165,100. You will note that this year we are showing the balance of profit after deducting current expenses. We propose to pay the same dividends as last year and to carry forward £487,000 compared with £452,000 in the previous year.

The Chancellor of the Exchequer has again emphasised the need for restraint, and, in the uncertainties of the times, you will, I am sure, agree that it is vitally important for us to increase our reserves as much as possible.

THE UNION DISCOUNT COMPANY

AN EVENTFUL YEAR

LORD KENNET ON GOVERNMENT'S ANTI-INFLATIONARY MEASURES

The annual general meeting of The Union Discount Company of London, Limited, will be held on February 21st at 39, Cornhill, London, E.C.

The following is the statement by the chairman, The Rt. Hon. Lord Kennet of the Dene, P.C., G.B.E., D.S.O., which has been circulated with the report and accounts for the year ended December 31, 1951:—

The chief event in the affairs of your company in the past year, was the capitalisation in July last of £1,283,333 by transfer from share premium account to capital account, making the issued capital £5,133,333.

In the money market generally it has been an eventful year. On November 7th the Bank Rate was raised to 2½ per cent., the first move for many years, and it was indicated to the discount market that they could no longer count upon an automatic supply of cheap money. £1,000 million of outstanding Treasury Bills were converted into Serial Funding Loans due in 1952/3/4. We welcome these changes as an earnest that the Government intends actively to strive to stop inflation.

A discount house is a view point from which to watch the state of national commerce and industry and its relation to the money market. It may therefore be relevant to record the impression received from that outlook, of the vital necessity that a sound national economy should be restored by balancing the account of national production and consumption.

Thus has ended a period in which there was exceptionally little elasticity and variety in the business of the discount market. This change will emphasise the utility of the service which the discount market renders.

The reduction in the amount of Treasury Bills outstanding by the conversion mentioned has led to a considerable reduction in our total of bills discounted which is £66,030,189 lower at £150,720,014. On the other hand there has been much more activity in Commercial Bills which is only partly reflected by the increase of £3,297,372 in the figure of Commercial Bills rediscounted, shown as a note in the balance sheet.

INCREASED TOTAL OF SECURITIES

Another important change is the increase in the total of our securities, which is £11,787,027 larger than the figure for the previous year. The increase came towards the end of the year when for various reasons, such as a need for liquidity, etc., holders were disposed to sell short dated British Government securities.

It will be gratifying for you to know that such depreciation as there was in the value of our securities, was more than provided for out of the year's trading profits which, after providing for rebate, amortisation of premium on securities, depreciation of securities at December 31, 1951, and taxation, showed, after transfer to reserve for contingencies, an increase of £4,548 to £331,533.

This leaves us with a balance carried forward on the profit and loss account of £934,921.

In the more difficult conditions prevailing, we gratefully recognise the co-operation and good will of the banks and financial houses to whom we, for our part, try to render useful service.

The staff has earned your sincere thanks for their efforts in an active year.

STERLING ESTATES

MR DOUGLAS OVERALL'S STATEMENT

The twenty-fourth annual general meeting of Sterling Estates, Limited, was held on January 30th in London, Mr Douglas Overall, J.P., F.A.I., the chairman, presiding.

The following is an extract from his circulated statement:—

Rental income totals £124,088, an improvement of £7,213. Rental and investment income is £133,088 and there remains a net revenue of £76,620, an increase of £5,550.

The total income is smaller than that of the previous year and taxation shows a decrease of £9,893, being £47,587. This is some 62 per cent. of the net income, approximating twice the prewar percentage. While this rise is due in some measure to the increase in the standard rate of income tax, principally it is because of the increased rate of profits tax on distributions and operative for three-quarters of the year under review. The total reserves now amount to £273,460. Your board recommend a final dividend of 5½ per cent., less tax, making 8½ per cent. for the year.

Purchases during the year are reflected in the increased rental revenue, although it is not until the year following the benefit of a full year's income is felt. A total of £168,975 has been invested; the properties acquired include freehold and long leasehold shop properties. These purchases show satisfactory initial yields and promise of reversionary increases within the next few years. Renewal of certain leases during the past year will produce in a full year an additional £1,700. A new mortgage advance of £50,000 was arranged during the year upon satisfactory terms. The rate of repayment of existing mortgages remains at approximately £15,000 per annum.

The report was adopted.

BRITISH TABULATING MACHINE COMPANY

YEAR OF FURTHER PROGRESS

The forty-fifth annual general meeting of the British Tabulating Machine Company, Limited, was held on January 31st, in London, Sir Cecil M. Weir, K.B.E., M.C., D.L. (the chairman), presiding.

After referring to his appointment as chairman and to the recent much regretted death of Mr G. H. Baillie, consulting engineer and former director of the company, Sir Cecil Weir said: The accounts show that the real progress of the company's business continues on a satisfactory scale. The profits of the group before taxation show a rise, from £463,725 in 1949-50 to £489,863 in 1950-51. After taxation the net amount available is £212,459.

Revenue has increased in accordance with anticipations and in very nearly the same percentage ratio in the home and export markets. I am glad to say that our direct export trade is very substantial and continually improving.

We are much encouraged by the progress our research and technical staff are making on the development of new equipment and its uses. The Punched Card technique is more and more becoming recognised as an essential concomitant of efficient organisation in business and in industry as well as in Government Departments and public bodies of every kind. We have again had a record year in respect of orders for our equipment.

The report was adopted and a final dividend of 5 per cent., making 8 per cent. for the year, was approved.

TOWN INVESTMENTS LIMITED

SATISFACTORY RESULTS

MR P. M. ROSSDALE'S STATEMENT

The twenty-ninth annual general meeting of Town Investments Limited was held on January 30th at 51, South Audley Street, W.1, Mr P. M. Rossdale, chairman and managing director, presiding. The following is an extract from his statement circulated with the report and accounts for the year ended September 29, 1951.

The accounts now submitted to you reflect the satisfactory result of the year's work. As shown by the consolidated profit and loss account, revenue from properties, less outgoings, has increased from £274,053 to £300,002. The book value of properties owned, after deducting depreciation, stands at £3,401,124 compared with £3,242,740, an increase of £158,384 of which £125,660 relates to subsidiary companies' property holdings, reflecting the policy of the parent company, Town Investments Limited, referred to in my speech last year, of financing the purchase of further properties through its subsidiary companies. Last year I said I could confidently assure you that the dividends to be received in the future from subsidiary companies were more likely to increase than diminish. This year we have received £57,467 from this source as compared with £47,512 last year.

PARENT COMPANY'S RESULTS

The balance sheet of the Parent Company shows the issued ordinary capital at £416,603, this being more than last year's figure by reason of the issue in August last of 37,873 new ordinary shares, at par, to existing ordinary shareholders in the proportion of one for each ten ordinary shares held. This is the third consecutive year that such an issue has been made to ordinary shareholders. Last year I told you that it was your board's hope and expectation from time to time to repeat these issues of ordinary shares. Altogether 103,603 shares have been issued to shareholders at par and a dividend of 15 per cent. has been paid annually. I am sure shareholders appreciate that such issues cannot be continued indefinitely, and although Town Investments Limited and its subsidiary companies continue to expand shareholders must not anticipate further issues in future years.

The Parent Company's profit and loss account shows rents, less outgoings, at £135,251, as compared with £125,802 last year; the surplus on disposal of properties is shown as £15,811, on which income tax and profits tax has been provided, against £31,731 last year, on which income tax and profits tax had also been provided. I have warned you on various occasions that this source of revenue must be regarded as more or less casual and that only in the most exceptional circumstances can it be regarded as good business to sell property bringing in a satisfactory income and pay away in tax a large part of the surplus of the realised price over the lower price at which the property had been acquired in the days when money had a different value. Your directors always have to consider whether the net cash to be realised, after payment of tax and costs of sale and repurchase, can be reinvested to produce the same or a better income, otherwise it is seldom prudent to dispose of any property.

The net profit of the company for the year is set out in some detail in the report of the directors and it is interesting to note that after paying all outgoings, including taxes, there is a balance of £21,623 to add to the company's unappropriated profits account.

The report was adopted.

RAPHAEL TUCK AND SONS, LIMITED

JUBILEE YEAR

The fiftieth annual general meeting of Raphael Tuck and Sons, Limited, was held on January 30th in London, Mr Desmond Tuck, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to April 30, 1951:—

This year marks the fiftieth anniversary of the formation of your company. To its achievements in the world of art and to the genius of its founders both during the company's existence and in the many years preceding, when it was a private enterprise, and whose imagination and creative ability have done so much for the development of happy customs that have permeated not only this country but the entire civilised world, I would like to pay tribute.

The policy of your board, some few years ago, of investing capital in kindred manufacturing enterprises, has justified itself in the Group profits it is my pleasure to submit to you. These subsidiaries are useful tributaries to the main stream and affect its volume of business and profits according to the flow they are able to bring to it.

Moreover, they have in our case not been subject to many of those heavy items of expenditure which confront us, the parent company, in ever-increasing measure. A comparison, for instance, between costs of producing and of selling merchandise before the war, of handling orders and delivering them to their consignees, and costs prevailing now, is sufficient in itself to indicate the trend of things.

WIDE DISTRIBUTION POLICY

The choice that has laid open to us has been either to pass all of these increases on to the selling prices of our merchandise or alternatively ourselves to bear the burden of a portion of them. This past year we have adopted the second course, thinking that a continued wide distribution of our products represents a sounder long-term policy than a more immediate one with a higher ratio of profit but with a more restricted distribution would provide.

I referred on the last occasion to the greeting card consciousness of the British public. This, I am glad to say, shows no signs of abatement, and the demand for greeting cards produced for various occasions during the course of the year is meeting with growing popular favour.

THE MODERN SPIRIT

With the tradition of more than three quarters of a century behind us, we can justly claim that our productions breathe the modern spirit of today.

As regards our export trade, I referred last year to the development of manufacturing facilities in countries previously content with the importation of finished merchandise. It would seem, accordingly, that it might become necessary, in order to strengthen our foothold in such countries, ourselves to undertake certain manufacturing there, preferably under arrangement with already established concerns. This possibility is engaging the careful consideration of your directors.

It is gratifying to know that notwithstanding all the revolutionary changes that have taken place in the world, which it would be foolish to ignore, with their effect upon industry in general and ours in particular, the name and reputation of your firm, with its famous trade mark—the Easel and Palette—continues to stand as high as ever.

The report was adopted.

BUKIT KAJANG RUBBER ESTATES, LIMITED

The annual general meeting of this company was held in London on January 30th, Mr Jack Addinsell, the chairman, presiding.

The following is an extract from his circulated statement:—

The year under review has been a difficult one and I regret that I cannot report any improvement in the security conditions as affecting our estates—in fact the latest information from our Bukit Kajang estate in Malacca is of slashing of trees by bandits in our remaining outlying division, while in the Kluang district of Johore where Rengo Malay is situated the terrorists appear to be more active than ever. The infiltration of armed Communists into the Bukit Kajang district, and the numerous incidents at our Johore estate, have accentuated the labour difficulties with which our managers have had to contend. Nevertheless, crops have been maintained at a fair level, output for the year having been 1,553,750 lb. compared with 1,750,300 lb., the drop being mainly due to shortage of labour and absenteeism, as well as unusually wet weather.

Cost of labour and materials continued to rise and compared with the previous year the cost of production has increased by 7d. per lb. This cost includes the higher export duty in respect of which the company paid out £20,709 against £5,698 for the previous year on a larger crop, and outlays on providing protection against the terrorists at the expense of the estates.

The net profit for the year amounted to £112,470, which shows a very satisfactory increase over that for the previous year. The directors recommend a final dividend of 15 per cent., which makes a total of 20 per cent., as against 7½ per cent. for 1949-50.

The report was adopted.

CAMBRIDGE UNIVERSITY SCHOOL OF AGRICULTURE

Applications are invited for a post as Assistant Agricultural Economist in the Provincial Agricultural Economics Service. Starting salary between £360 and £450 per annum according to age and experience. Applicants should possess a degree in Economics and/or Agriculture and should be under 25 years of age. The duties of the post are concerned with the collection and interpretation of data for farm management and enterprise costing schemes.—Applications in writing, stating age and experience, to the Secretary, School of Agriculture, Cambridge, with names of two referees, not later than February 28, 1952.

WANTED URGENTLY by Research organisation. Complete set, runs or single copies, U.S.A. journals: *Public Opinion Quarterly* and *The Journal of Marketing*, etc. Face price paid or offer.—Send details of issues, condition and price required to Box 861.

AMBITIOUS young man, determined to get to the top in business life, is looking for an employer who will let him make the firm's affairs his hobby. In exchange for a good salary and prospects he can offer ability, initiative, logical mind, modern cosmopolitan outlook and capacity for hard work. Other qualifications include: B.Com.(Hons.) (special subject: International Trade), perfect Spanish, fluent Portuguese, some French; 10 years' experience export trade.—Write Box 865.

WELL-qualified and experienced Consultant in accounting, costing and general administration seeks further assignments to introduce or reorganise financial and administrative methods. Fees by negotiation, references can be supplied.—Box 855.

TRANSLATION.—Rapid service, German into English. Technical and Commercial material a speciality.—Apply, by letter, to "Translations," c/o Abbotts, Eastcheap, London, E.C.3.

REFUGE

ASSURANCE COMPANY LIMITED
CHIEF OFFICE
OXFORD STREET · MANCHESTER 1

THE REFUGE WILL SAFEGUARD THE FUTURE

RHODESIA UNIVERSITY ASSOCIATION

SENIOR LECTURER IN COMMERCE AND ACCOUNTING

The Rhodesia University Association intends to appoint a Senior Lecturer in Commerce and Accounting to organise and conduct, with the assistance of part-time lecturers, classes in Salisbury, Southern Rhodesia, for the degree of Bachelor of Commerce in the University of South Africa (and possibly also in the University of London).

The classes are primarily designed to assist students who are already taking correspondence courses from the University of South Africa for the Bachelor of Commerce degree and for the qualification of the Society of Accountants.

Applications for the above post are invited from persons who hold degree in Commerce from a recognised university. Extensive practical and teaching experience and ability to lecture in specialised accounting subjects are essential.

The salary of the post will be £1,750 per annum, which includes cost of living allowance. This remuneration will be fixed for an initial period of two years, prior to the university staff being expanded and a scale of salaries laid down. An allowance of £150 will be made towards travelling expenses in the case of a person appointed from overseas, a proportionate refund being required if the officer appointed resigns before the expiry of his contract. Accommodation in Salisbury will be guaranteed to the successful applicant.

Duties are to be assumed as soon as possible after April 1, 1952.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is February 29, 1952.

ASHRIDGE, Course 5, February 8th-11th: The State of the Nation. Introduction, The Rev. Lawrence Waddy, M.A.: Foreign Trade and the Balance of Payments, Ronald Brech, Esq.: Relations in Industry, Bryn Roberts, Esq.: British Agriculture, Sir James Scott Watson, C.B.E.: Some Reflections on Recent Elections, H. G. Nicholas, Esq., M.A. Inclusive fee, £3 15s.—Applications to Secretary, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

BRIGHT ideas are easier to find than the right ideas. For advertising that sells because it suits both your product and its public, consult SAMSON CLARK & CO., LTD., 57/61, Mortimer Street, London, W.1. MUSeum 5050.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free *specimen copy* with pleasure: Economic Research Council, 18, South Street, London, W.1.

GOLD COAST NATIONAL BANK.—Wanted, Managing Director with knowledge of commercial banking in the Dominions and Colonies who will be required in the first instance to advise the Government regarding the formation and establishment of the Bank and on matters to be included in necessary legislation. First appointment on contract five years, renewable, non-pensionable, subject termination either party three months' notice. Salary £2,500-£3,000, according to experience. Furnished *house, medical attention, and* air passages provided; also return passages once a tour for wife and children. Normal tour nine months with one day leave for each five days of completed *tour.* Gratuity on termination at rate £150 or £200 p.a.

Apply to Commissioner, Gold Coast, Melbourne House, Aldwych, London, W.C.2 (Tel. TEMple Bar 2913), giving full particulars, qualifications, experience, etc.

JOHN SUMMERS AND SONS, LIMITED, are anxious to set up an organisation to further the education of the junior staff employed at their large Steelworks near Chester. Applications are invited for the full-time position of organising and conducting this development. Personality and enthusiasm are considered the essential qualifications with a background of business experience and interest in education in the broadest sense.—Box 853.

QUALIFIED STAFF AVAILABLE NOW

Accountants, Office Managers, Company Secretaries supplied immediately.

FINE'S EMPLOYMENT AGENCY

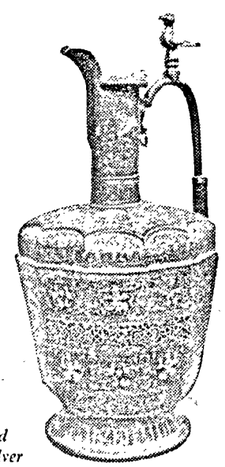
THE HISTORY OF ZINC

The Persians knew

ZINC

more than 700 years ago.



The Persian Ewer illustrated below can be seen at the Victoria and Albert Museum. It was made in the 13th century and is made of Brass.

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal, include the production of Sulphuric Acid, Zinc Pigments, Fluorine and Fluorine Compounds and ancillary products.

King George VI 1936-1952

KING GEORGE VI was not on the throne long enough to leave the mark upon the institutions of this and the other British countries that some of his ancestors made. But by any test he was a good king and the shock and sorrow that his sudden death has caused are not tributes to the eminence of the office alone; they are grief for a man who performed a difficult and unexpected task with honesty and devotion. Called to the throne suddenly, and in circumstances that might have been dangerous for the monarchy, he and his family so conducted themselves, in a more merciless glare of publicity than has ever afflicted a royal family before, that the solidity of that remarkable institution the British crown has been more than fully restored. What is more, this has been accomplished in a period of unending crisis; of King George's fifteen years on the throne, very few months have been free from anxiety.

Personal modesty combined with outward dignity, the ordinary man in the extraordinary situation, the openness of character and the tireless performance of tedious duties that are required of a public figure—these are the simple elements of the formula, and yet how difficult they are to combine. If the supreme duty of the constitutional monarch in a twentieth-century mass democracy is to provide a symbol to which the aspirations of the people can attach themselves, an example of character and service, then no king could have tried harder or done better than King George VI. He has earned his rest. He can take his place with honour in the long line of monarchs whose reigns record the greatness of this land.

Sympathy in the fullest measure will go out to both the widowed queens—to Queen Elizabeth, who has borne so much of the load of the crown with unfailing grace and goodness, and to Queen Mary, whose unbowed regality now has to sustain another blow. At no time, it may be guessed, will they find the burden of living public lives heavier than in the next few days and weeks. If the public sympathy presses upon them, they can at least be sure that it is genuine. The role of the king's consort is perhaps even harder than that of the king himself; in their very different ways both King George's wife and his mother have earned the respect and the gratitude of the people.

The deepest sympathy of all will be felt with the young woman who so suddenly finds herself Queen Elizabeth the Second. She is no stranger to her peoples or to the task awaiting her. But however long her preparation, however complete the dedication of herself, it is a spectacle to move the heart to see one so young plunged so suddenly

into a responsibility in which, for all the help she will receive from her husband, no one can share. She will need, and she will get, the prayers of the many millions who wish her well.

But if there is some pathos in the sight of a young queen on the throne, there is also much hope. England's greatest monarchs have been queens ; and it would be a hardened heart indeed that did not respond to the historical echoes. The great name that the new queen bears brings to mind another young princess, four centuries ago, who was also in her twenty-sixth year when she was called to the throne, and who went on to write the most glorious chapter in English history. The nearer parallel is with the new queen's great-great-grandmother who, at an even earlier age, started 115 years ago the longest and most fruitful reign of all her royal line. Queen Elizabeth II begins her reign better known than the first Elizabeth and better prepared than Victoria. Long may she reign. And may the second Elizabethan age be no less victorious than the first.

Mr Churchill and China

THE verdict of the House of Commons on Mr Churchill's visit to Washington has been postponed, but at least the charge brought against him by the Opposition has been reduced. When the foreign affairs debate that was suspended on Tuesday is resumed, he will face not a vote of censure on policy in the Far East but a mild rebuke for having talked too winningly to Congress. Having suggested that the Prime Minister did not tell the House of Commons the truth about American policy, the Labour party now says that he did not tell Congress the truth about British policy. Only heavy pressure from his restive backbenchers can have forced Mr Attlee into this sort of hair-splitting. What he said in the debate was certainly not enough to justify it ; and it is clear that a careful comparison between what Mr Churchill said to Congress and what he said to the House on January 30th had revealed to the Opposition no important discrepancy that could not be explained by the need to show a certain tact in addressing the legislature of the United States. Indeed, if it were not for the fact that party polemics would be deeply distasteful to most people at this time, it would be necessary to examine the Labour party's effort to create a China scare with pungent frankness.

As it is, the pause in Parliament can be used to reconsider realities in the Far East. There are two basic matters on which the mind of the public seems confused. The first and less important is a question of tactics. The second, by far the graver, is a question of national interest. To put the first quite crudely: what noises should the Chinese Communists hear from this country —soothing or minatory noises ? One would have thought there was cause for anger with the men behind a policy which has started—or condoned—a costly war, caused loss to millions of homes, disrupted economic life by the fears it caused and kept all Asia in suspense. Instead it is pretended by a section of opinion that we are not really at war with China and that defensive action by the United Nations is and should remain a sideshow. It is said that it is the Chinese who are frightened, who want nothing better than to get on with revolution and peaceful reconstruction ; that the Americans are the enemies of peace because their pride has been hurt and their mood is impatient ; that the British must steer a course between them, if necessary being nice to the Chinese who are hostile and being rude to the Americans who are friendly. It is with such arguments that powerful voices of the Left in this country make soothing noises for Peking to hear. Their effect in the Communist world is clear for all to see: there they mean that the Americans and British can be divided, and that it is safe to wage against the West a long war of attrition and nerves.

In such circumstances what should a British Minister visiting the United States say ? If he urges restraint on a people who believe they have shown very great restraint and who have certainly borne the main burden of battle, he irritates an ally and encourages the enemy. If he does the opposite he faces a vote of censure in the House of Commons and the final result is very much the same. In fact, Mr. Churchill in Washington said no more than was necessary to restore confidence between allies and to keep the enemy guessing. Was that not the course of wisdom ? And would not Mr Attlee, faced as Prime Minister with the facts about Indo-China, the build-up of the Chinese air force and the Communist attitude in the truce negotiations, have had to say much the same in his colder and more matter-of-fact manner ? There is no doubt about the answer ; and the essence of Mr Churchill's case is that by promising " prompt, resolute and effective action " against fresh Chinese mischief he has dealt a blow at Communist hopes of an Anglo-American quarrel, the effects of which in China are described in an article elsewhere in this issue. That is surely the explanation and justification of the key sentence in his report to the House of Commons:

> I think we have secured a better chance of reaching an agreement (with the Communists in Korea) by making it plain that the United States and Britain are working together in true comradeship and, in the event of a treacherous renewal of war, would together take prompt, resolute, and effective action.

Without such a warning and without such an agreement Mao Tse-tung and Stalin would have been tempted, and indeed entitled, to assume that nothing effective would be done to resist further steps for the " liberation " of South East Asia. Everything that has happened since the war has pointed to the fact that the Communists move in wherever the free world has no firm commitments and no clearly defined interests. And there is neither clarity nor firmness when London and Washington are publicly at loggerheads.

*

So much for the tactics of Far Eastern policy. But what of the substance of the policy itself? Apart from what Mr Churchill said in public, are there dangers in what he and the leaders of American policy are planning to do?

The common starting ground is that an extension of the war in Korea is against the interests of the free world and should be avoided if it is at all possible. That is certainly the view of both parties in this country. Equally certainly it is the view of Mr Truman and Mr Acheson—if only because their domestic political position demands it. It is, in fact, the view of virtually the whole of American public opinion except the MacArthur faction, and there is absolutely no reason to suppose that the responsible leaders of American policy, having got rid of General MacArthur, have now suddenly become MacArthurites. The difficulty is that it does not lie wholly, or even mainly, with the Americans or any of their allies to decide whether or not the war shall spread beyond Korea. That decision is Mao Tse-tung's, and if he decides on further aggression, the West will not be able to help itself. If fighting flares up again in Korea, is everything for which the war has been fought to be abandoned ? If the Chinese invade Indo-China, as they threaten to, the whole western alliance must take up the challenge ; it has far too much at stake in South East Asia simply to stand aside. If the Chinese attack Hong-kong, is no resistance to be put up ? And if such aggressions impend, as they assuredly do, does it help to keep the peace to say in advance that in all circumstances the Chinese Communists will be safe within their own borders, and that even outside them they will not be resisted except by ground troops, which the western alliance does not possess ? Is there not a better chance of preventing war if the Chinese can be persuaded that they cannot count on escaping any of the penalties that fall upon an aggressor ? There is no evidence that Mr Churchill or Mr Acheson or even the Pentagon want to go further than this.

There are obvious risks in making minatory noises. Of course there are ; there are risks in every policy. But those who so clamorously insist upon the risks of this policy seem to close their eyes to the risks of the alternative. Yet those risks are far greater. There is the general risk of being indefinite and irresolute, of playing down dangers, of keeping allies in doubt and the enemy in confidence—in fact the very dangers which one might have supposed that the present generation could never ignore again. And in the particular case of the Far East there is the supremely dangerous risk of disrupting the alliance between the United States and the democracies of Western Europe. Some people in this country perhaps do not positively like that alliance. But as a matter of plain fact all must agree that nothing would please Stalin more, or set his hands more free, than its destruction.

Policy must inevitably be a balancing between risks and dangers, the deliberate courting of the smaller to ward off the greater. Judged by this test the words and actions of the present British Government deserve support. If censure there is to be, it should fall on those who steadily refuse to look at more than half the picture.

How to Grow More Food—I.

Incentives for Farmers

IN 1947 the dollar crisis necessitated immediate cuts in food imports and brought the Government to take urgent and exceptional measures to get more food from British farms. This sequence of events is now being repeated. The import cuts already announced will gradually deprive people of a variety of unrationed foods which have been brightening the national diet for the last few years. Although ministers hope to avoid further cuts, which would directly reduce the level of basic rations, they are not sure of being able to.

In the circumstances the Government is again trying urgently to expand domestic food production. A first step—to be followed in due course by wider measures—was announced this week. There is to be a special subsidy of £5 an acre towards the cost of ploughing up old grassland and sowing it to an approved crop for harvesting this year. The intention is to increase meat production by improving the supply of home grown feeding stuffs. Unfortunately, it is too late in the farmer's year for him to make major changes in his cropping plans, and the spring sowings have in any event to offset a serious decline in the autumn sowings of wheat.

The original expansion programme of 1947 has now run its four years and its results can be assessed. Livestock production as a whole has increased considerably. During the last year there has been a spectacular rise in the pig population and a more modest increase in the numbers of sheep and beef cattle, offset by a mild decline in milk production. Meat production was previously lagging and this general change of emphasis from milk to meat was deliberately engineered at the last price review ; it undoubtedly fits consumers' wants. Crop production has been far less satisfactory. The Treasury's hopes of saving dollars by promoting a much larger wheat acreage have been completely disappointed. The area under main crops has in fact declined since 1948. These failures increase the dependence of British agriculture on imported feeding stuffs and weaken the possibilities of further livestock expansion. They seem to reflect also a reluctance of many farmers to intensify production beyond the point reached two years ago.

The expansion programme quickly brought the net output of British agriculture to a level of about 40 per cent higher than in the immediate prewar years, and at this point it seems temporarily static. The evidence of the last two years might suggest that further increases in one type of farm output will be obtained only by contraction in another. There is, in fact, no good reason to accept this conclusion. Farmers explain the situation by asserting that falling profitability has made them reluctant to expand output further until " confidence is restored." The 1947 policy was to raise prices in order to provide farmers with the working capital for expansion. The very sharp rise in farm incomes, which was thus deliberately engineered, came to an end in 1949. Total net farm income has been static for two years at about £300 million. The farmers can claim that, when the value of money has been falling, a static income means that farming is being made less profitable. But that this situation is inhibiting increased production is far more dubious.

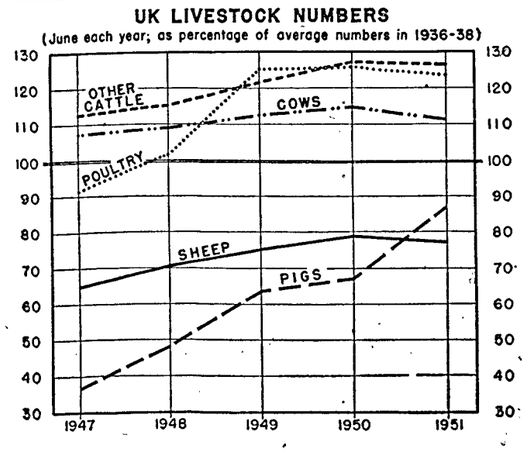
The Government now faces difficult decisions. There is still a strong temptation to try to get another increase in food production mainly or exclusively by following the 1947 formula of giving all farmers a new price " bonus." It is the easiest, simplest and most popular course to follow—and those are generally recommendations enough for the politicians. But in two respects the present situation is fundamentally different from that of 1947. In the first place, the connection between the price

paid to the farmer and that paid by the consumer has become more obvious since food subsidies were pegged —and will become plainer still if the subsidies are reduced. Ministers have become increasingly conscious of the need to keep the costs of food production within reasonable limits, and if they stray from the path they have urban constituents to remind them. Paradoxically, this consideration may count more strongly with the Conservatives, who as the farmers' traditional friends are fairly sure of their rural vote, than it did with Labour. And, in general, the chimera that money is no object in boosting the production of necessities no longer wins the favour it once was accorded.

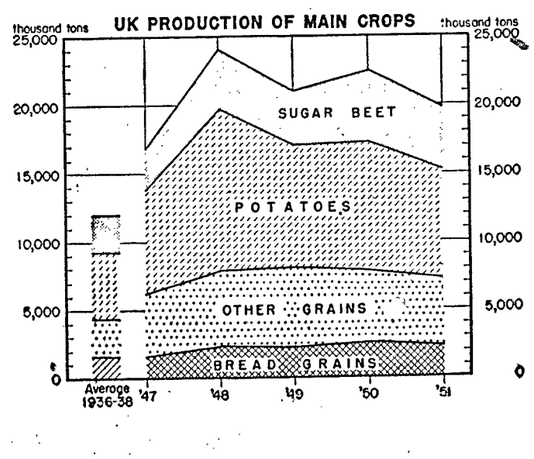
In the second place, agricultural policy is no longer a question of giving a general stimulus to production, but rather of expanding it selectively. Some products—in particular milk, whose value approaches one-third of the gross output of British agriculture—have reached the limit of consumer demand for the time being. The extent to which further expansion is possible, the rate at which it can economically be brought about, the ways by which it should be promoted—all these questions are more debatable today than in the simpler conditions of 1947 when total output was much lower and wartime conditions still lingered. In particular, there is growing realisation that the incentives which impel the farmer to greater productive efforts are much more complex than the data discussed at the annual price reviews.

*

The structure of British agriculture displays an amazing and almost baffling diversity. The striking differences in output achieved by farms possessing similar natural advantages indicate what large scope for expansion undoubtedly exists. The large increase in capital investment since 1939 has not been spread evenly over the countryside ; it has been generously applied to a minority of farms whose owners are prepared (sometimes aided by the profits of urban industry or trade) to match increased overheads with increased production. Side by side with the highly capitalised, heavily mechanised farms, are large numbers of working farmers whose capital and whose labour force (if they have any) are inadequate to the task of making full use of their land. It is from this latter class of farmers, rather than from the efficiently wealthy or, at the other extreme, from the occupiers of marginal land, that the big increase in output must come if it is to be had at all.



There is also considerable evidence that a majority of farmers would find it profitable, entirely on the basis of present prices, to expand their output. This is the conclusion reached in a recent sample study by Mr C. H. Blagburn*, who found that expenditure on the farms investigated tended to increase considerably less rapidly than the value of their output. He concluded that a moderate all-round increase in output—by about 30 per cent—would involve additional expenditure of no more than £55 to £60 for every £100 of additional output (valued at 1947-48 prices) that was obtained. This is an oversimplified statement, to which a number of qualifications need to be made. But the general conclusion stands. On most farms a rising output amply pays for itself, because it enables labour and machinery to be used more economically and reduces the incidence of overheads. There is, of course, an upper limit to this process, but it has been reached only on a few well-favoured farms ; the majority of farms are nowhere near it. The old adage that couples high farming with high profits is still broadly true.



If this is true, there is an apparent paradox to be explained. Why is an average working farmer content with a net income of, say, £600 a year when he has the opportunity of earning perhaps twice that sum by raising output ? The answer seems to lie in the special conditions of farming and of rural life. The rising incidence of income tax is quite as strong a deterrent to the farmer as to the urban worker. But there are other important factors. The farmer with a high output takes a greater risk and must lock up much more money in working capital, which makes him vulnerable to a slump (which farmers still fear) or even to a "change of emphasis" in prices. Moreover, he may have to work much harder himself especially if he is mainly dependent on family labour. Most farmers, regardless of income, are closely tied to their work, live in the same sort of house, eat the same sort of food, and go about in the same sort of weather. The limited attractions which a higher income could provide may simply not be worth the considerable risk and effort involved. The unambitious farmer enjoys the feeling of security reserved for those who are down and fear no fall. It is not surprising that there are so many of him.

If there is to be a real increase in farm output, it can only be brought about by making the efficient farmer's life more enjoyable. This may, of course, be done by making the unambitious farmer's life a misery. The two states are relative. Mr Blagburn, in the study already mentioned, suggests that a 10 per cent reduction in prices would greatly increase the incentive to expand production. Its effect on a typical low-output farmer of 200 acres in his sample would be to reduce his net income from £640 to £350 ; the advantages of working harder to double one's income are much more obvious at the lower than the higher level.

Such a policy would be regarded as Draconian by others besides farmers. It would be unlikely to work in practice. It might well defeat its own object by dissuading farmers from additional investment out of fear that prices would be reduced again. Anything which suggests a return to depression conditions for agriculture will fail to engender the confidence necessary for expansion. Farmers always have the option of cutting their overheads still further and reverting to "dog and stick" farming—a poor life, it is true, but at least a safe one. A policy of lowering prices has to be rejected. But simply to raise them has been shown to be an equally false approach. Enough has been said to suggest that incentives for farmers are by no means wholly—perhaps not even mainly—a matter of prices. A second article will consider what alternative incentives might be employed.

* "Some Economic Aspects of Increasing Farm Output." By C. H. Blagburn. University of Reading Department of Agricultural Economics. 1951. 5s.

The Lisbon Meeting

THE list of matters to be discussed at the Lisbon meeting of the Atlantic Council is portentous, even if the decisions that can be taken there are comparatively few. It includes first, the political items — the relations between the North Atlantic Organisation as a whole and the new European defence community which it is to embrace—and the Middle East Command. These are matters on which the decisions, if there are to be any at all, will be taken in Bonn, in Paris and in Cairo rather than in Lisbon. It is, in fact, unlikely that any of them will be decided before February 16th. Secondly, there is the question of increasing the effectiveness of Nato's own organisation ; but the answer to that must depend on what the military programme requires and the political developments permit. It is the military programme itself on which the decisive judgment must be passed at Lisbon.

The Atlantic Council will have to decide how quickly, and by what stages, the present complement of 20 divisions in Europe under the command of General Eisenhower (or his successor) can be increased to the 40 divisions which are the minimum requirement. The report completed just before Christmas by the Three Wise Men—Mr Averell Harriman, M. Jean Monnet and Sir Edwin Plowden—did not make this programme any easier of attainment. But it did make realistic discussion possible, since for the first time the military requirements were brought into relationship with each country's economic possibilities. The fact that Ministers of Finance are pleading that the wise men have asked too much, and the generals are arguing that they have recommended too little, suggests that the wise men themselves have struck as good a balance as possible in a situation where a perfect balance is impossible.
