Most of the Democratic aspirants would warmly second this identification of the Democrats as the friends of civil liberties, labour, and the little man, and the identification of the Republicans as the corporation-ridden party of big business. But then the President went on to slam the door firmly on any compromise in the field of Negro rights. The Democratic National Committee hoped that with Mr Truman's retirement the breach this issue has caused between the northern and southern wings of the party might be healed. Its members believe Governor Stevenson, a northerner of moderate views, is the man to do it, and that he will not turn the nomination down if it is handed to him by acclamation at the convention. Mr Truman, by refusing to countenance any watering down of Democratic doctrine, seems to be ensuring as fierce a controversy over civil rights at this year's convention as there was in 1948 and he has poured salt into the wounds of the south by denouncing the claim of three southern states to off-shore oil as the "biggest daylight steal" in history.

Business on the Level

It is about a year since the Federal Reserve Board's index of industrial production, which rose from 199 in June, 1950, to 223 in April, 1951, levelled off at around 220, and it shows no sign of climbing again. It drifted downwards in April to 217, but that could be explained by the steel strike; many observers find more ominous the downward drift during the last few months in other economic indicators which also levelled off last year. On an average, wholesale prices have dropped by about 2 per cent since January and prices of

sensitive commodities by considerably more. The long-term interest rate has fallen and so has the volume of commercial bank loans outstanding; the latter is, however, a seasonal movement as is the decline in the supply of money. Most unseasonable, and particularly disturbing, is the fall in department store sales, 6 per cent lower in the first four months of this year than in the same period of 1951.

But in the retail trade figures is also to be found one of the most promising of the still faint hopes that the economy is at last about to leap up again. For sales, even if low by last year's standards are now steadier and inventories are back in step, so that any noticeable rise in business should at once mean a spate of new orders for manufacturers; in fact they are already beginning to receive new orders in increasing quantities. Improvement in retail trade can only come about through a greater willingness to spend on the part of consumers. There is no real reason why they should not spend; unemployment is exceptionally low and personal incomes higher than ever before. Early this month, goaded by

Mother's Day promotions, they did begin to spend more lavishly, but on the whole they are still in the saving mood that has confounded the economic prophets for the past year. It is possible that this mood may change when the inevitable rise in steel and other wages makes another round of price increases seem likely.

There is another reason for expecting renewed inflationary pressure before long. The season of deficit financing by the government is about to begin; tax collections are concentrated in the first half of the year and from July onwards the government will be taking in much more than it will be paying out. It will not, in fact, be paying out as much as had been expected, since deliveries under the rearmament programme are running behind the original schedules. This is the chief reason why inflation has so far failed to put in its expected appearance this year. But present and future government spending—it is now running at $6 billion a month—can hardly fail to arrest any serious tendency for the economy to sink into a recession. The best guess seems to be that for the next few months the various strains up and down will cancel each other out and hold business at, or near, its present level.

* * *

Textiles' Civil Wars

In the south, where textile trade unions need to work together if they are not to lose their foothold, a new jurisdictional war is brewing. A number of locals of the United Textile Workers, affiliated to the Congress of Industrial Organisations, are following Mr George Baldanzi into the American Federation of Labour. Mr Baldanzi, a former vice-president of the UTW, walked out after he failed to oust Mr Emil Rieve, of whose "dictatorship" he has long complained, from the union presidency. Mr Baldanzi used to be the head of the CIO's organising drive in the south, and the AFL no doubt counted upon him to bring at least part of his flock with him. It is not very numerous, but it has cost the CIO millions of dollars since 1946, when "Operation Dixie" was first launched.

Both unions ought to realise they cannot afford a civil war when the failure to organise southern textile workers is putting such heavy pressure on northern wage scales and work assignments. Most of the cotton mills, all the new synthetic textile plants, and part of the woollen industry are now in the south and only about 20 per cent of their workers are trade unionists, compared to 85 per cent in the north.

A subcommittee of the Senate Labour Committee, after brooding over hearings held in 1950, has just reported that it is the Taft-Hartley Labour Relations Act which is largely responsible for the "ambushing" of the textile unions, because it encourages employers to procrastinate—sometimes for years—in coming to an agreement; it guarantees them freedom to speak against the unions; and has encouraged the passing of anti-labour laws and the use of court injunctions. Prophecies, made when the Act was passed, that its teeth would be felt only by the weakest unions, seem to have been correct. In the southern textile towns organisers are spied upon, denied the use of meeting-places, beaten, and sometimes kidnapped. Newspapers, the radio, and even the clergy, are usually hostile. Partly this is due to suspicion of "foreigners" and the CIO has learned, the hard way, that its organisers must become members of the community. Remedies from the courts and the National Labour Relations Board are often so slow in coming that the union has already been extinguished.

The textile recession of the past fifteen months, which has thrown 150,000 out of work, has made the organisers' task even more difficult. The government has at last recognised the state of things—now that it looks like mending—by suspending price controls on raw cotton and virtually all textiles at the manufacturing level. But plans to relieve distress in New England, where it is keenest, by channelling government contracts there (last year these accounted for 10 per cent of all textile sales) are fiercely opposed by southern Congressmen and mill owners. They insist this would be robbing Peter to pay Paul and that it is in the taxpayers' interest to let contracts go to the more efficient and cheaper southern mills.

Prejudice Goes to Court

Last autumn's revival in the Carolinas of the Ku-Klux-Klan, the white-sheeted secret society founded after the Civil War to terrorise Negroes, has been knocked on the head by the combined efforts of the federal and state authorities. The federal government, using the 1932 Lindbergh Kidnapping Act for the first time in a case of this kind, has obtained the conviction of ten Klansmen who transported the victims of their vicious flogging across the border between North and South Carolina. There was thus no doubt that this was an interstate offence with which the federal government could legally deal; it frequently finds itself without power to interfere in cases of this kind. Another difficulty is that local witnesses are afraid to come forward for fear of later retaliation from the Klan, and local law enforcement officers, judges and juries, even if they do not sympathise with it, are afraid to prosecute and sentence Klansmen. It has therefore not been easy to get convictions for this type of violence in state courts. But on this occasion two of the defendants in the federal case, with a number of others, had already been found guilty of similar offences in a North Carolina court.

The excuse put forward by the accused for their sadistic terrorisation of the district was not racial feeling but moral principles; the victims were in most cases white people accused of promiscuity, drunkenness or absence from church.

But in Florida at much the same time there was a series of outbreaks of racial and religious prejudice, directed indiscriminately against Catholic churches, Jewish synagogues and Negro homes; the most shocking was the murder, by a bomb explosion, of a Negro couple who had led the campaign for equal rights for members of their race. This campaign has had a number of outstanding successes in the last few years, largely as the result of Supreme Court decisions which have upheld the rights of Negroes to such things as equal educational facilities and a house in any district they can afford. And many southern states are putting their affairs in order for themselves, by outlawing the Klan, ensuring that Negroes are allowed to vote and so on. The legal and social tide is running against the ignorant and prejudiced and as a result they are turning desperately to terrorism.

In Florida state officials have not brought indictments in connection with these outrages, nor has the federal government made any accusations. It has been suggested that this was hardly to be expected in an election year in a state where the Administration's unpopularity is the result of its alleged favouritism to Negroes. There is no evidence to support this suggestion, but in Cicero, Illinois, where the Democrats need Negro votes, the federal government has not hesitated to make up for the shortcomings of the local authorities and courts. Town officials, who failed to prevent a riot which kept a Negro from moving into an apartment house, are appearing in the federal courts on charges of violating the Negro's civil rights.

Comeback for Fair Trade?

The first step has been taken to restore the price-fixing teeth of the "fair trade" laws that were knocked out by the Supreme Court last year. Up to then, in most of the 45 fair trade states, all retailers in a state were bound to charge the prices fixed by a manufacturer or distributor outside the state as soon as he had signed a price-fixing contract with one of them. It was this practice which the Supreme Court declared illegal and which the House, in passing the McGuire Bill by 196 to 10, has voted to restore. Price-fixing is of little value unless everyone participates. The Bill also attempts, though it is not certain how effectively, to get round the decision of a lower court which held that "fair trade" laws could not be applied to sales, such as those of mail order houses, in which the seller is in one state and the buyer in another.

Intensive lobbying by small businessmen's groups was responsible for the House's decision to consider only the McGuire Bill, which originates from the friendly and impressionable Commerce Committee. A less sweeping measure from the Judiciary Committee got nowhere, as did Mr Celler's suggestion that retailers could be quite adequately protected against unfair competition simply by banning loss-leaders—the sale below cost of one product to tempt customers into a shop. Little men, such as independent chemists and liquor dealers, are afraid of being driven out of business by a repetition of last summer's price wars. A good deal of covert price cutting is going on and attempts to maintain prices by boycotting individual retailers have run into legal trouble. The discount houses, which live by selling branded goods below list prices, are bringing suits against manufacturers who refuse to supply them, and the Federal Trade Commission has brought a charge of "combination and conspiracy to fix prices" against the Sunbeam Corporation, a great champion of fair trade and manufacturer of household appliances. Sunbeam refused to sell to any wholesaler or retailer unless he engaged to maintain prices. It is perfectly legal for one businessman to refuse to do business with another but not, the Commission contends, when the result is large-scale price-fixing.

Members of the House, all of whom are up for re-election this year, cannot afford not to seem sympathetic with the small man's problems—as indeed most of them are. But the Senate, which is not subject to so much pressure and which is behind with its work, may not be so co-operative. Even if it is, the President is sure to veto the Bill. The Administration would like, if it could, to do away altogether with the Miller-Tydings Act, which exempts the "fair trade" laws of the states from the federal anti-trust Acts.

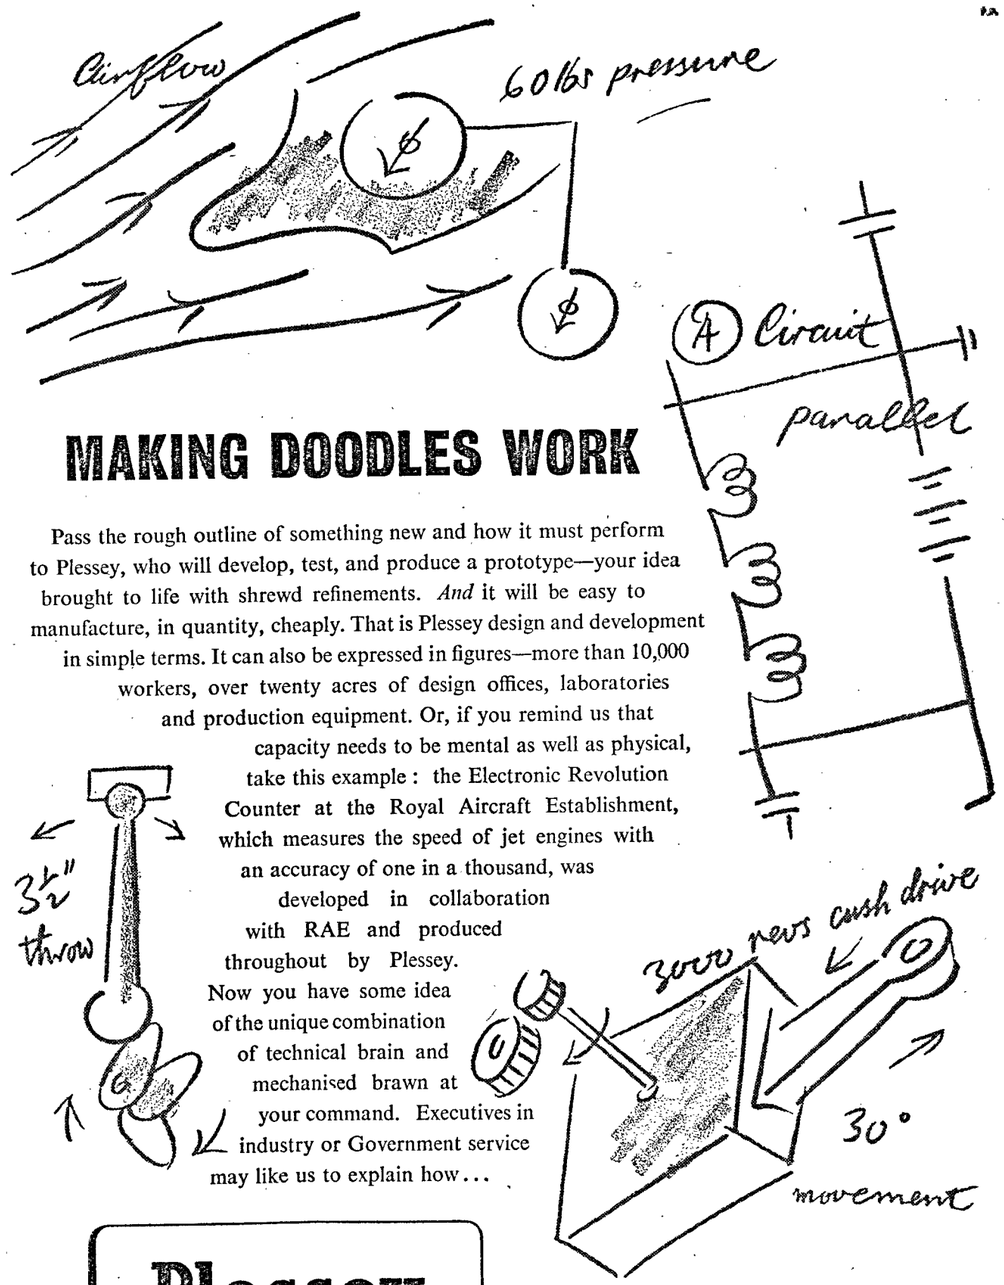
Safety for Coal



Inspired by last December's mine disaster in Illinois, and by Mr John L. Lewis and the prospective votes of his coal miners, the Senate has passed, and the House also seems likely to approve, an adequate federal Bill for ensuring safety in coal mines. The new legislation improves on previous efforts in the same direction by giving the federal mine inspectors power to enforce their recommendations, even to the extent of closing down mines. At present this is left to the state authorities, whose regulations differ widely and who are more easily influenced by the mine owners.

Mr Lewis has given notice that, should Congress fail to come up to scratch, he will insist on special safety provisions in his union's new contract. He has been free to open negotiations on this since April 1st, but he has not yet given the required 60 days' notice that he intends to do so. He may have been waiting to see what wage increases his rival, Mr Murray, gets for the steel workers; but this uncharacteristic hesitation may mean that Mr Lewis's new contract will be less favourable than anticipated. For during the last few weeks the demand for coal has fallen and very substantial stocks have been built up. This is a seasonal trend which strengthens the bargaining position of the coal owners; they are still, however, it is believed, prepared to pay higher wages, for they expect business to be satisfactory over the year as a whole. But, as Mr Lewis is well aware, what is satisfactory business for the coal companies today would seem like a depression in most other industries. Coal prices, at around $4.60 a ton at the mine, are lower than in 1948, even though there have been four wage rises since then, and there is unemployment among miners.

The underlying difficulty is that coal, which thirty years ago provided three-quarters of the country's heat and energy, now provides less than half. It has been replaced by oil, natural gas and hydro-electricity and, if the coal industry wishes to make its future safe, it must reduce its costs and find new uses for its output. In connection with the latter an interesting process, evolved by the Union Carbide and Carbon Corporation, looks like making it possible for coal to compete with petroleum, not as a fuel, but as a raw material for the rapidly expanding chemical industry. This industry is already outgrowing its original source of coal-tar products, the coke ovens in steel plants. Petroleum and natural gas are expensive and exhaustible alternatives, and the company has therefore been experimenting with a hydrogenation process similar to that used for making synthetic petrol from coal. In this case the products are basic coal-tar chemicals, such as benzene and toluene, the rarer ones used for drugs and synthetic textiles, and some so rare that there is as yet no use for them.

Shorter Note

Mr Henry Fowler, head of the National Production Authority, has been appointed to succeed Mr Manly Fleischmann as Defence Production Administrator. Mr Fowler will combine the two jobs—the NPA is concerned with the actual operation of defence industry, while the DPA deals with policy—and he may have a third and yet higher-level agency entrusted to his co-ordinating abilities, that of Defence Mobilisation, which has been without a director since Mr Charles Wilson resigned during the crisis over the steel strike.

MAKING DOODLES WORK

Pass the rough outline of something new and how it must perform to Plessey, who will develop, test, and produce a prototype—your idea brought to life with shrewd refinements. *And* it will be easy to manufacture, in quantity, cheaply. That is Plessey design and development in simple terms. It can also be expressed in figures—more than 10,000 workers, over twenty acres of design offices, laboratories and production equipment. Or, if you remind us that capacity needs to be mental as well as physical, take this example: the Electronic Revolution Counter at the Royal Aircraft Establishment, which measures the speed of jet engines with an accuracy of one in a thousand, was developed in collaboration with RAE and produced throughout by Plessey. Now you have some idea of the unique combination of technical brain and mechanised brawn at your command. Executives in industry or Government service may like us to explain how...

THE WORLD OVERSEAS

Pakistan Comes Back to Earth

(From Our Correspondent in Karachi)

PAKISTAN'S latest venture in international politics—the proposal for a Moslem Prime Ministers' Conference—appears to have ended in disappointment. This, together with the growing threat of economic crisis, has brought about the rebirth of the spirit of realism which was so characteristic of the Dominion's early years. In those days the struggle to make good, in circumstances of great stress and difficulty, left the government little time for ideological experiments. But with the attainment of political stability and a high level of economic prosperity, and with the gradual enhancement of Pakistan's standing in the councils of the United Nations, a more self-confident administration seems to have begun to feel that it was up to it to take as the government of the largest Moslem state a leading part in the politics of the Middle East. It must, in fact, have been difficult for the government to close its ears to the urgings of those sections of the Pakistani public, represented by the *mullahs* and others, who wanted to see the chief emphasis laid on the Islamic character of the state and believed that, abroad and at home, victory lay in the sign of the crescent. This school of thought noticeably gained ground after the assassination of Liaqat Ali Khan.

It did, however, take the administration some time to overcome its reluctance to be caught up in the vortex of Middle East affairs. It was always ready to promote closer cultural and economic relations (though the scope for increased trade between the Middle East countries was negligible) but further than this it would not go. The tour of Sir Zafrullah Khan round the Moslem capitals in February seems, however, to have been a turning point, for shortly after his return to Pakistan the Government issued invitations to the Prime Ministers of twelve Moslem countries to attend a conference at Karachi with a view to setting up a system of high-level consultation in matters of common interest. At the same time, the Pakistani delegation at the Security Council played a prominent part in pleading the cause of the Tunisian nationalists, with much more enthusiasm and vigour than Pakistan had officially displayed in the cause of Iran or Egypt in their disputes with the United Kingdom. It seemed that Pakistan had really thrown its hat in the ring as a contestant for the highest honours of the Middle East.

A Brake on Crusading

It now seems clear that the proposal to hold a Prime Ministers' conference was a mistake, and that a halt is likely to be called to the Pan-Islamic trend. The invitation at once provoked a certain amount of jealousy and suspicion, which was not unnaturally aggravated by the fact that an ex-President of the Moslem League had been attempting to organise a body called the "Moslem People's Organisation" which was, among other things, to supplant the Arab League; representatives met in Karachi earlier this month. Although several governments, including the Egyptian, officially accepted the invitation for Prime Ministers, unofficial comment has been somewhat unfriendly. For example, the Rector of Cairo's world-famous Al Azhar University observed drily that too many Islamic conferences had been called in Pakistan. He was no doubt referring primarily to the international Islamic economic conference and the world Moslem conference. But the most serious setback came when the Turkish Government replied, in so many words, that it was not interested in the setting up of the proposed system of consultation. Political alignments based on religion do not attract them.

The reactions in Pakistan have been striking, and the leading organs of the press have changed their tune. No less a paper than *Dawn*, the mouthpiece of the Moslem League, says flatly:

> the time has come for Pakistan's intelligentsia to realise that Pakistan is not adding to its prestige in the international field by running after certain other countries which are economically and otherwise in a far less stable position than Pakistan itself, and which can really be of little help to us.

There speaks the voice of realism at last. No longer are we likely to hear Iran and Egypt commended and supported in their disputes with Britain, simply because they are Moslem states, with no attempt at dispassionate examination of the issues. Another Karachi daily has devoted itself more to attacking the "tyranny of the *mullahs*" in the social sphere. Sir Zafrullah Khan himself has given a long and almost apologetic explanation of his recent policy. It was significant that he had to make it clear, with all possible emphasis, that Pakistan was not aiming at the leadership of the Moslem world and had no designs upon the Arab League.

Urgent Business at Home

The consequences of this reversal of trend—for it seems to be no less—on the future foreign policy of Pakistan may be far-reaching. Pakistan certainly has nothing to be ashamed of in its championship of the cause of Tunisia before the United Nations, which was not dictated by ulterior motives, and is not likely to alter its tone with any sort of idea of placating France and the other big powers. But at the same time there is likely to be a sharp decline of interest in Pan-Islamic ideas. Pakistan may take a leaf out of the Turkish book and turn its face westwards again, more especially because the Kashmir dispute must soon reassume its time-honoured place as its main problem. The Pakistan Government will have more than enough to do minding its own business. In social legislation, too, the influence of the obscurantists who claim to be the arbiters and interpreters of Islam is likely to receive a check.

The abrupt change in the economic situation has also helped to bring Pakistan back to earth. For the past two years the Pakistan Government have kept consistently hitting the jackpot in its economic policy, and it has seemed to Pakistanis that, with the special favour of providence, they could hardly go wrong. During the last two months, however, they have been brought sharply up against the realities of a world temporarily glutted with the primary commodities which Pakistan has for sale. The Government, as is the way of governments all over the world, has been slow to take measures to meet the threat, but there are few non-officials—and for the matter of that few officials—who are not convinced that it must now make the uncomfortable choice between either surrendering the bulk of the export duties or devaluing the Pakistan rupee. The export duty on wool has lately been removed but, even so, it will be difficult for Pakistan wool to compete with Indian wool which has the benefit of the lower rupee. Tea is in an equally precarious position, although a slight reduction in the export duty was made at the time of the last budget. Hides and skins are almost, and short staple cotton totally, unsaleable. Jute and long staple cotton are facing stagnant markets, and the cultivators and dealers have been saved only by a government undertaking to buy all stocks tendered at floor prices—a heavy commitment. It is evident that drastic measures are necessary and that the Government must be prepared to prune its wide and useful programme of expenditure severely. Pakistan has enjoyed its boom to the full, and a period of deflation, in more senses than one, may be very beneficial.

Canberra Buys Its Own Loans

[FROM OUR MELBOURNE CORRESPONDENT]

A CRISIS in Commonwealth and State Government finances has been reached in Australia with the virtual collapse of the public loan market which normally provides funds for the undertaking of public works. This year the Commonwealth Government has not been able to raise more than about £70 million of new money from the market to meet works expenditure of £225 million by the States, and next year public loans are not expected to yield more than about £50 million to meet State works of £180 million.

If the progress of development works in Australia were dependent directly upon the funds yielded by the loan market, there would have been a wholesale suspension of undertakings providing for electricity, water conservation, railways, roads, hospitals and schools. In other words, development would virtually have come to a halt until more money was available. As it is, the deficit is being made up this year from revenue by the Commonwealth Government and next year the Commonwealth is again prepared to meet works expenditures to the extent of £125 million, but not more. Thus, the Commonwealth Government by underwriting States' works programmes is in fact financing capital works out of revenue, a procedure admitted by the Government itself to be undesirable and unsound. Nevertheless everyone agrees that the development programme must go on, and the money must be found, whether the means are unorthodox or not.

Here, once again, the question arises as to whether Australia is still trying to do too much, whether the economy is being overstretched by the demands from immigration, from development, from defence, to the point that inflation measured by a rapidly rising level of costs and prices might well be cancelling out any gains that might be reasonably enjoyed from the post-war expansion. At this month's meeting of the Commonwealth Loan Council, a Commonwealth-State authority that arranges the financing of public works, the State Premiers ranged themselves in a solid phalanx against the Commonwealth in an attempt to force acceptance of development works far in excess of capacity of the loan market. The Commonwealth disregarded the States' demands and would go no further than "to arrange for subscriptions to the loans from Commonwealth sources to the extent of £125 million." This means that the Commonwealth Government, for the first time in its history, is openly subscribing to its own loans. This could well be done by means that would aggravate further the forces of inflation.

Commonwealth *versus* States

In the present financial impasse between the Commonwealth and the States, the lack of an overall policy working in the interests of the nation as a whole is painfully apparent. In the financing of Australian public works, no State can agree to an Australian order of priority. Each State, in effect, declares that priorities are its own business with the result that the Loan Council meetings invariably develop into an unedifying scramble for funds, irrespective of their contribution to the general economic weal.

The differences have become sharper since the Commonwealth had the financial mastery of the country bestowed upon it by the introduction of uniform income tax. Before the war, the Commonwealth and each of the six States levied their own income taxes with varying degrees of severity. In 1942, the Commonwealth became the sole income tax authority as a war-time expedient, but a High Court decision established it as the possessor of tax priority in peace as well as in war. As a result, neither the former Labour Government nor the present Liberal-Country Party Government has shown the slightest inclination of returning to the States the right of income tax priority. No Government is prepared to release its grip from the Federal purse. The Commonwealth, as long as it remains tax master, is able to call the tune to the States. The States bristle and fume against the Federal domination of finance. One, Victoria, has announced that it will challenge the Commonwealth's right to exercise priority in income tax collections. Victoria has strong feelings on this subject because compared with other States, notably Queensland, it no longer enjoys the undoubted advantage of having the lowest taxation scale in the Commonwealth.

There is little hope of checking the present rot in Government finances until the post-war inflation has been arrested. As yet, there is little evidence of costs being stabilised. Cost inflation is proceeding apace in Australia against a background of declining incomes which are basically due to the deterioration in overseas trade since June last year. Much could be achieved by an increase in production of, say, about 10 per cent. This could lead to an expansion of export income and at the same time enable some manufactured goods to be produced in Australia. But last year's inflated export income has led to a tremendous inflation of costs and prices in the domestic economy and unless by some magic formula something can be done to maintain internal income levels, the country could well be faced with a period of long and painful monetary adjustment.

International Law and the Korean Prisoners

[BY A LEGAL CORRESPONDENT]

THE Geneva Convention on the Treatment of Prisoners of War, together with the other Conventions for "humanising" the conduct of warfare, was revised in 1949 and the modern law is contained in new Conventions of that year. There are grounds for holding that in strict law the new Prisoners of War Convention does not bind the parties to the Korean conflict. However, the Convention is intended to establish principles for the humane treatment of prisoners which are of general validity, and the United Nations Command has very properly affirmed more than once that it will be guided in its treatment of prisoners by the new Convention. Consequently, it is by the standards of the new Convention that we must test the propriety of the action of the United Nations in declining to repatriate those prisoners who strongly object to returning to Communist territory.

Article 118 of the Convention provides—without exception or qualification—that "prisoners of war shall be released and repatriated without delay after the cessation of active hostilities." Accordingly, if the obligation to repatriate prisoners imposed by Article 118 on the detaining power is one established by the Convention in favour of the enemy state, and not primarily in favour of the prisoners themselves, then the language of the article does give the Communists some warrant for saying that they have a right to insist on the repatriation of all the prisoners held by the United Nations, both willing and unwilling. Reading Article 118

in this way, the Communists then argue that Article 7, under which prisoners " may in no circumstances renounce in part or in entirety the rights secured to them " by the Convention, precludes prisoners from renouncing the right of their own state to compel their repatriation.

Such an interpretation of Article 118, however, runs contrary to the whole tenor of the Convention, which throughout has regard to the interests of the prisoners themselves rather than of the states to whose armed forces they belonged. The Convention in form and in substance is a charter of rights for prisoners of war and, correspondingly, a code of obligations for the state which is the detaining power. The state to whose armed forces the prisoners belonged certainly has a place in the scheme of the Convention, but merely as the guarantor—with the aid of a protecting third power—of the rights of the prisoners. Almost every article testifies to the character of the Convention as one conferring rights on the prisoners themselves, and none more clearly than Article 7 itself, which forbids prisoners to renounce *" the rights secured to them "* by the Convention. But Article 6 is even more decisive on the point. This article prohibits opposing belligerent states from adversely affecting the situation or restricting the rights of prisoners under the Convention *by any agreement among themselves*. In other words, even the prisoner's state cannot treat his " rights " as its own rights to be bargained away to the enemy. In the light of this article there really cannot be any doubt that the Convention intended the " rights " established under it to be those of the prisoners themselves. Admittedly, treaties under international law generally confer rights only on states, but the Permanent Court of International Justice in 1928 expressly held in the Danzig Advisory Opinion that a treaty may confer rights on individuals where the intention to do so is clear.

Political Asylum

If repatriation at the end of active hostilities is the right of the prisoner himself and only secondarily of his state as the guardian of his right, then Article 7 cannot reasonably be read so as to compel the prisoner to undergo repatriation against his own wish and against his own interest. Renunciation implies the surrender of the prisoner's right to his prejudice. But, when the prisoner of his own free will calls on the detaining power not to repatriate him because return to his own country is distasteful and even dangerous to himself, it is difficult to see in this any renunciation at all. The prisoner would seem rather to ask for special treatment which the detaining power is under no obligation to give him and which he considers to be more favourable to him than the treatment secured to him by the Convention. There is nothing in the Convention to preclude a detaining power from giving a prisoner more favourable treatment than the Convention prescribes. The obligation imposed on the detaining power to repatriate at the end of hostilities was expressed in such unqualified terms only in order to preclude the retention of prisoners by the detaining power *for its own purposes*—e.g., to provide labour, as happened after the second world war.

The recusant prisoners in Korea are really asking the United Nations to grant them the privilege of asylum as political refugees. The Universal Declaration of Human Rights, proclaimed by the General Assembly in 1948, declares in Article 14 that " everyone has the right to seek and to enjoy in other countries asylum from persecution." Too much must not be extracted from this article. The right is only to ask for asylum and to enjoy it, *if granted by the state to which the request is made*. But under general international law a state has a long-established right to grant asylum if it chooses to do so. There is no reason to suppose that the Geneva Convention intended to deprive a detaining power of this right or prisoners of their right to ask for asylum. Although the law imposes no legal duty on the detaining power to grant asylum, there is a strong moral obligation to grant it for humanitarian reasons—as the Declaration of Human Rights recognises. The United Nations, whose charter enjoins it to promote respect for human rights, necessarily feels the impact of this moral obligation with particular force.

Handing Back Deserters

No doubt there is a possibility that the grant of asylum to prisoners of war might be misused by a detaining power to obstruct repatriation for its own purposes. But that is a matter of good faith in the execution of the Geneva Convention and the United Nations has satisfied the requirements of good faith by offering full and independent screening of all who object to repatriation. The Communist argument really amounts to saying that the detaining power is bound to enforce its enemy's authority and military law against deserters from the enemy forces. For refusal to be repatriated is clearly a form of desertion. Neither the Geneva Convention nor any other law requires a belligerent to hand back to an enemy state deserters from its armies.

Capital Replacement Costs

This service, prepared jointly with the Association of Certified and Corporate Accountants, provides indices of changes in the replacement cost of industrial plant, and is being steadily expanded. We have recently added new indices covering the following types of equipment:

Mechanical Handling Equipment.
Foundry Plant.
Tanning Machinery

These are in addition to our indices for factory buildings, agricultural machinery, electrical equipment, chemical plant, machine tools, textile machinery, food processing machinery, office equipment, and commercial vehicles.

Other indices can be prepared on request. For further particulars please write to:

Graduates of Nato

[FROM OUR SPECIAL CORRESPONDENT]

A BRITISH Member of Parliament recently ventured the guess that less than one-sixth of his colleagues in the House of Commons knew how Nato worked or what it was trying to do apart from the military defence of Europe. Such ignorance is even more common among officers and officials of the eleven continental countries that are members of the organisation, and it will take long and systematic education to overcome it. Because some governments either cannot or will not attempt this task Nato has been doing it for itself. Its International Defence College, installed in a wing of the *Ecole Militaire* in Paris, last week presented diplomas to the first 47 graduates who have attended its courses. In a fortnight's time the second course begins with a class of fifty officers and officials.

The Defence College was one of General Eisenhower's favourite projects, and it has made a good start under the direction of Admiral Lemonnier, with a former State Department official in charge of studies. Its purpose is much more to widen horizons and encourage discussion of Atlantic Defence problems than to establish and teach a military doctrine. It is modelled on the broad educational conceptions of the Imperial Defence College in London rather than on the curricula of, say, Camberley or Bracknell. It is not a course for technicians but a series of seminars for international staff officers.

Outstanding in the programme is the attempt to give a survey in outline of the political and economic situation in each of the fourteen member countries, as well as an analysis of its military situation and defence needs. Thus, a Norwegian who is somewhat sceptical of Turkey's place in the partnership, learns what interests it has in common with his own country. An Italian will have to sit patiently through a lecture on Jugoslavia's role in the international situation and can join issue with Americans and Greeks in questions and group discussion. Americans and Europeans come a little closer to grasping the mysteries of the British Commonwealth, and a historian explains where the Atlantic community stands in the long history of political and military coalitions.

Leaders for the Future

Among the most important lectures are those in which students have explained to them the working of Supreme Headquarters and the non-military branches of Nato. The only man in the world who really understands the infrastructure controversy—about who shall pay in what proportions for airfields and ports and communications used by allies on a member's territory—lectures and answers questions. The Chief of Staff, General Gruenther, explains the spirit of the operation; and distinguished economists explain the problems of defence planning between allies, as the Americans and British learnt them ten years ago. Military visitors explain the broad strategy of European defence and the effects on it of events in other parts of the world such as Indo-China, Korea, the Middle East and Africa.

There is no training in staff duties as such, although problems are set from time to time in order to show students, for example, the difficulties that arise in organising lines of communication and transport across the territories of fourteen nations. Lectures are given with simultaneous translation, but the experiences of question time and group study bring home to the colonels, commanders and group-captains the importance of mastering either French or English—or better still both—in addition to their own languages. In time, if this intelligent and lively operation is given the money and encouragement it deserves, there should be in every Nato country a group of fighting men, staff officers and officials who are linked across national frontiers by the memory of a common experience, intellectually stimulating and politically encouraging.

New Policies for Jugoslav Farming

[FROM A CORRESPONDENT LATELY IN BELGRADE]

CO-OPERATIVE farming in Jugoslavia, begun five years ago on the Soviet master-pattern for Eastern Europe of quasi-collectivisation, has not proved a success. The results show that agricultural production both on private farms and on co-operatives has declined, that the numbers of livestock have diminished and that many peasants who joined co-operatives either under pressure or in high hopes of economic betterment are now anxious to leave. The Jugoslav authorities admit that the method used to organise the co-operatives was a failure and that their administration was rigid, inhuman and inefficient. Their principal excuse is that the Soviet model was followed too closely. Now that they have decided to abandon this model, they are trying to work out a new policy for agriculture which will fit in with their modified Communist theories (which they call " socialist democracy ") and will yet ensure increased production.

At the beginning of 1952 there were over 7,000 co-operative farms comprising more than 420,000 households and farming 2½ million hectares, or about one-quarter of the total farming land in the country. These had been set up with the avowed aim of improving agricultural output and with the political objective of " socialising " the peasants and bringing them under the same kind of state control and political influence as the workers in state industries. The system provided for four types of co-operative farms, in three of which the peasant retained the title to his land and in theory at least received some kind of payment in return for it. Only in the fourth class, representing less than 5 per cent of all co-operatives, was there complete collectivisation on the pattern of the Russian kholkhoz.

Privileges of Co-operatives

During the past five years the co-operatives received many advantages denied to private peasants. It was easy for them to obtain state loans and credits, interest rates were negligible and when they could not be repaid were frequently written off. It is estimated that in five years 15,000 million dinars were invested in co-operatives. This is a rough and perhaps misleading figure, since it includes a good deal of building with home-produced materials and unpaid, unskilled labour. Investment in machinery, fertilisers, pesticides and blood-stock for which foreign currency would have been needed was only carried out on a minute scale. But it was this kind of investment that was most needed and that might have made all the difference between success and failure. Members of co-operative farms enjoyed the privilege of paying no income tax, though a fixed tax of 3 per cent was

An intelligent appreciation of History

An intelligent appreciation of History is essential to the understanding of present world trends. What is happening today—what will happen tomorrow—have an immediate connection with events that occurred one hundred, five hundred, even one thousand years ago. The key to present problems often lies in the remote past, and to understand today and forecast tomorrow, one must have studied yesterday.
Hence the success of HISTORY TODAY, an historical magazine, written by experts but intended for the general reader. Published monthly, copies may be obtained from your newsagent or bookseller price 2/6 or by subscription from the publishers, 30/- per annum post free.

History TODAY

charged against net profits (if any). In addition the state granted bonds allowing the cheap purchase of industrial goods for 15 per cent of the value of all produce sold by co-operatives on the free market. Members of co-operatives paid nothing for their homesteads and received free medical attention which the ordinary peasant has to pay for.

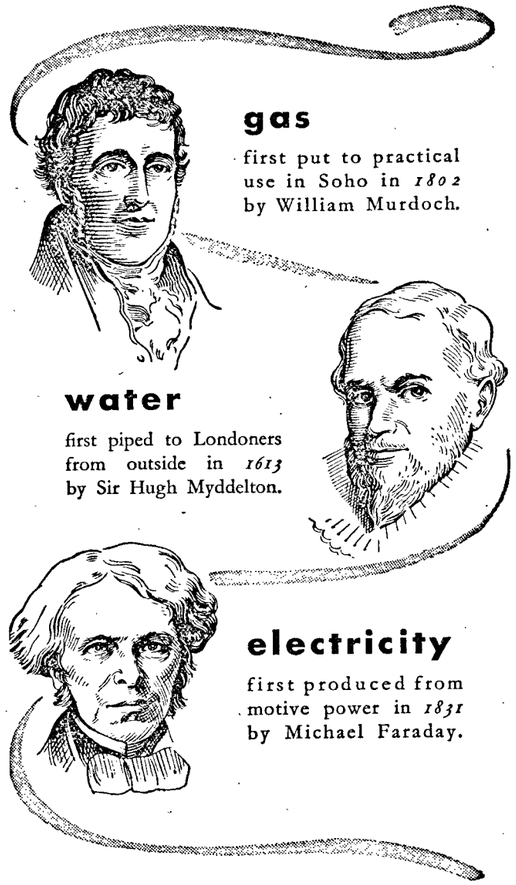
Yet, in spite of privilege, subsidy and much exhortation it is now admitted that one-third of all these co-operatives are working at a loss—in some cases a considerable one. Another third show a definite profit and can be regarded as successful, whilst the remaining third are on the borderline between success and failure. It has been calculated that peasants on co-operative farms work more land per head than private peasants, but that co-operative land is less intensively stocked and that the yield per hectare in the richer (though not in the poorer) farming areas tends to be less on co-operative farms. This is not true of state farms where the yields have tended to be slightly above average for their area. The following tables comparing the use of land and numbers of livestock before the war and at the present day, show that less land is farmed in Jugoslavia today than before the war and that livestock figures have not increased. The decline in livestock between 1949 and 1951 is very marked. The general figures of livestock may give an even better impression than is actually the case, since all agricultural experts are agreed that prewar figures of livestock were underestimated—perhaps by as much as one-third.

CHANGES IN LAND USE
(1938-51)

	Area in '000 Hectares			% Change in 1951	
	1938	1949	1951	From 1938	From 1949
Wheat	2,157	1,809	1,774	− 18	− 2
Maize	2,842	2,274	2,378	− 16	+ 5
Other grains	1,184	1,032	1,022	− 14	− 1
Industrial crops	187	515	388	+ 107	− 25
Other crops	1,333	1,691	1,594	+ 20	− 6
Total of above	7,703	7,321	7,156	− 7	− 2
Other farm land	6,734	6,693	6,744	...	+ 1
Total of all farm land	14,437	14,014	13,900	− 4	− 1

CHANGES IN LIVESTOCK
(1939-51)

	'000 Head			% Change in 1951	
	1939	1949	1951	From 1939	From 1949
Horses	1,273	1,050	1,091	− 14	+ 4
Cattle	4,225	5,264	4,720	+ 12	− 10
Sheep	10,153	11,650	10,267	+ 1	− 12
Pigs	3,504	4,127	3,910	+ 12	− 5
Poultry	22,450	19,287	17,146	− 24	− 11



In analysing the basic causes for this failure two things should be emphasised. The co-operative experiment has lasted for less than five years, during which time Jugoslavia underwent both its historic break with the Cominform and one of the worst droughts of modern times. Moreover, during this experiment agriculture has been the Cinderella of Jugoslav planning. The greater part of capital investment, foreign aid and national effort has been concentrated on industry. Some Jugoslav leaders now recognise this to have been a mistake, though they are reluctant to admit it. Human factors have also contributed to the failure. The management of co-operatives with its emphasis on work for the cause rather than for the individual has destroyed individual initiative. Peasants worked not in family groups but in brigades, on an eight-hour day and were paid according to the time spent at work rather than for a job well done. On a number of co-operatives working days per annum averaged less than 135. Where private peasants were accustomed to walk many miles in the course of their work, peasants in co-operatives have been known to refuse to go to work in the fields without transport. In theory, the co-operatives were run by a general assembly of their members and two elected committees. In fact many of them came to be dominated by a highly paid president—usually a Communist party member—and his clique regardless of their qualifications or efficiency.

The sternest critic of the wasteful mismanagement of agriculture in Jugoslavia is Vladimir Bakaric, Premier of Croatia. He has said that it has discredited the whole idea of co-operation and endangered the economy of the country. He and others are now considering how much can be salvaged and what is to be the policy for the future. What is certain is that the present system of co-operatives will not be continued. Every co-operative farm is now being examined to decide whether or not it can be made into a productive economic unit. Some of them in the poorest areas such as the Lika have already been disbanded and the land restored to its owners. In other places land has been partially restored and only the co-operative production of special crops suited to the locality—potatoes, vines, bee-keeping, etc.—has been retained. Another result has been that co-operatives that are unproductive because their land is in scattered strips are being encouraged to consolidate their holdings. Peasants with intervening strips are asked to join the co-operatives, or failing that the state has powers of compulsory purchase against fair compensation. It is probably impossible to consolidate holdings without causing resentment amongst the peasants, but much still remains to be done to eradicate wasteful strip farming. Recent declarations of policy have emphasised that compensation, whether monetary or in land, must be equitable—as it has admittedly not been in the past.

Pressure on Private Farms

To strengthen the attempt to keep some co-operatives in being and make them successful a campaign has been undertaken to make life difficult for the private peasants. Food prices on the free market have been forced down, railway fares and freight charges have been more than trebled. Income tax for private peasants during the early months of this year was assessed in the harshest and most arbitrary way. There are authenticated cases of peasants being assessed at anything from half to one million dinars. The aim of this policy is threefold; first, to show the peasants in co-operatives that, however much they may dislike it, it is not worth their while to revert to private farming; second, to force private peasants to produce more and make more produce available for export or home consumption; and third and perhaps most important in the long run, to use economic pressure to persuade private peasants to join, not the "working co-operatives" which are now discredited, but the "general co-operatives" for buying and selling. These were popular in Jugoslavia before the war and still exist, though until recently they have not been so vigorous, nor so favoured by the state, as the working co-operatives.

The pattern for the future seems to be to keep in being a limited number of reorganised working co-operatives, in which peasants would be allowed to work in family groups, and would be paid by results and given a share in the profits. Any that prove uneconomic would be disbanded. Otherwise the policy now is to concentrate on the general co-operatives encouraging them to undertake as many activities as possible—such as buying and selling, hiring of machinery, "savings banks"—even to embark on some co-operative production. Experts are now studying how similar co-operatives work in Denmark and other farming countries of Western Europe. A ten-year plan for agriculture embodying these changes is now being worked out. It is hoped thus to increase agricultural production and yet to satisfy the doctrinaire Marxists who regard the general co-operatives as a step towards the ultimate goal of a "socialised" agriculture.

BRITISH COMMONWEALTH PACIFIC AIRLINES LIMITED IN ASSOCIATION WITH BRITISH OVERSEAS AIRWAYS CORPORATION, QANTAS EMPIRE AIRWAYS LIMITED AND TASMAN EMPIRE AIRWAYS LIMITED

Other amendments designed for special cases are those to relieve the rubber, tin and other businesses that suffered in Japanese-occupied territory; companies mainly trading through a permanent establishment overseas; metal mines and oil wells generally; producers of metals, oil and asbestos whose output is expanding, if the Treasury has certified that expansion of the commodity in question is "in the national interest"; and investment companies, in respect of franked income.

As always happens when an effort is made to avoid the worst anomalies and injustices of a complicated tax, and to legislate for special cases, these welcome changes have made the EPL even more intricate than before, and threaten a much enhanced burden upon the Inland Revenue. But in meeting one other grievance Mr Butler has also contrived to lighten the administrative weight by narrowing the area of the tax: the exemption limit is raised from £2,000 to £5,000. This will exclude one-third of the small companies that seemed likely to be within reach of the tax, a segment of business that would have felt the disincentive effects with particular severity.

The substantial fly in all this soothing ointment is that the amendments are costly in terms of revenue, and the Chancellor is determined that at least a substantial part of the loss shall be made good; he seeks the counterbalance by raising the rate of profits tax on distributed profits from his budget proposal of 17½ per cent to 22½ per cent, which, on the new basis of net computation, compares with an actual rate of 26¼ per cent last year. Estimates "almost entirely speculative" suggest that the yield of EPL will be reduced from the budget expectation of £200 million in its first full year to £140-£150 million, and that the cost of the reductions in profits tax from 1951-52 rates will be narrowed from £100 million to £68 million, so that the budget estimates of the effect in 1952-53 are weakened on balance by £18-£28 million.

The Chancellor has been at pains to emphasise that the new changes thereby ease the burden of taxation on industry. But this figuring is not the only, or necessarily the right, criterion by which he should be judged. The burden of the two taxes taken together will be £70-£80 million more than that of last year's profits tax, and the effect of this week's proposals will be to shift a proportion of the weight from a new tax for a short-run emergency on to an existing tax that, despite its viciousness, looks more permanent. Thus does the Chancellor, while reaffirming the "moral basis" of EPL (and what a euphemism that is!), move still further from the original intent—which was to do no more than tax the "fortuitous" gains from rearmament while possibly even lightening the general burden simultaneously. There was never, at the early stages, any suggestion that a given additional sum had to be obtained from company taxation; and the Chancellor even now reiterates that EPL was not intended to be a revenue tax—though on this point, in particular, his several statements are full of contradictions, including the implication that he is not particularly concerned at the net £20 million or so now conceded. Since these taxes are very largely met from company savings in any case, there is a good economic argument for this unconcern; but the Chancellor did not expound it, perhaps because, at an earlier stage, he had fallaciously cited the big prospective yield from EPL as a justification for accepting next year's rise in the cost of his income tax concession to individuals.

EFFECTS ON TOTAL TAX BURDEN

Example I — Standard Profits	100·0	
Chargeable Profits	100·0	(i.e. no EPL)
(a) Full Distribution :—		
Income tax	47·5	
Undistributed profits tax	2·5	
Distributed profits (20% of gross dividend of 68·9)	13·8	
Net dividend	36·2	
	100·0	
Total tax payable, new basis	63·8	
Total tax payable, old basis	61·1	
Total tax hitherto payable	66·25	
(b) Nil Distribution :—		
Total tax payable, new basis	50·0	
Total tax payable, old basis	50·0	
Total tax hitherto payable	52·75	
Example II — Standard Profits	100·0	
Chargeable Profits	200·0	
(a) Full Distribution :—		
Income tax	95·0	
Undistributed profits tax	5·0	
EPL (30% of 100)	30·0	
Distributed profits tax (20% of gross dividend of 96·6)	19·3	
Net dividend	50·7	
	200·0	
Total tax payable, new basis	149·3	= 74·6%
Total tax payable, old basis	145·5	= 72·75%
Total tax hitherto payable	132·5	= 66·25%
(b) Nil Distribution :—		
Income tax	95·0	
Undistributed profits tax	5·0	
EPL	30·0	
Total tax payable, new basis	130·0	= 65·0%
Total tax payable, old basis		65·0%
Total tax hitherto payable		52·75%

Example III — Standard Profits	100·0	
Chargeable Profits	300·0	
(a) Full Distribution :—		
Income tax	142·5	
Undistributed profits tax	7·5	
EPL (15% of 300)	45·0	
Distributed profits tax (20% of gross dividend of 144·8)	28·9	
Net dividend	76·1	
	300·0	
Total tax payable, new basis	223·9	= 74·6%
Total tax payable, old basis		75·1%
Total tax hitherto payable		66·25%
(b) Nil Distribution :—		
Income tax	142·5	
Undistributed profits tax	7·5	
EPL	45·0	
Total tax payable, new basis	195·0	= 65·0%
Total tax payable, old basis		68·0%
Total tax hitherto payable		52·75%
Example IV — Standard Profits	100·0	
Chargeable Profits	150·0	
(a) Full Distribution :—		
Income tax	71·25	
Undistributed profits tax	3·75	
EPL (30% of 50)	15·0	
Distributed profits tax (20% of 82·75)	16·55	
Net dividend	43·45	
	150·0	
Total tax payable, new basis		= 71·0%
Total tax payable, old basis		68·9%
Total tax hitherto payable		66·25%
(b) Nil Distribution :—		
Income tax	71·25	
Undistributed profits tax	3·75	
EPL	15·0	
Total tax payable, new basis	90·0	= 60·0%
Total tax payable, old basis		60·0%
Total tax hitherto payable		52·75%

But there is more revealing argument still. The new changes—though they will ease the total EPL burden on hard cases and will put many companies, apart from the small ones, beyond the reach of EPL altogether—do nothing to ease the vicious disincentive effects of the tax on those who pay it, since the basic rate of tax, which falls without any abatement upon increments of profit, has been kept at 30 per cent. More significant still is the fact that, if all taxation of company profits is considered—and this is the ultimate test—the marginal aggregate rate actually proves to have been raised by this week's changes, except for companies whose profits have been more than doubled since the standard period. A company that escapes EPL altogether will now pay away 63.8 per cent of its total profits in tax, compared with 61.1 per cent under the budget proposals, if it pays the maximum dividend; and it will be no better off than before even if it pays no dividend at all (in which case taxation will still take half its profits). In the worst case of all, that of a company whose profits, though higher than in the base period, have less than doubled, the proportion of the additional profit left after tax will be no more than 14½ per cent (compared with 15½ per cent) if the residue is wholly distributed and 20 per cent (as before) if it is wholly retained. The only beneficiaries, on this test, are companies whose taxable profits have risen so steeply as to bring them within the relief afforded by the 15 per cent overriding rate for EPL; in these cases the proportion of the additional profit taken by tax will be 65 per cent (compared with 68 per cent) if nothing is distributed, but the gain will be a mere 0.4 per cent, to 74.7 per cent, if there is a full distribution.

EFFECTS OF CHOICE OF BASE YEARS

Company	Average of Three Years	*Average as Percentage of Best Year*	Average of Two Best Years	*Average as Percentage of Best Year*
A	96,275	*86·5*	104,579	*94·0*
B	225,589	*76·9*	256,900	*87·6*
C	84,058	*90·7*	90,674	*97·9*
D	345,258	*81·5*	422,132	*99·6*
E	45,543	*97·1*	46,910	*99·9*
F	236,021	*93·1*	246,388	*97·2*
G	158,193	*81·4*	185,209	*95·3*
	1,190,937	*84·1*	1,352,792	*98·6*

The pattern revealed is broadly similar, too, if the changes in the tax proportions of *total* profits are compared for companies at three other indicative points—where profits are the same as in the standard period, and where they are doubled or trebled. These comparisons are shown in the accompanying group of three examples, which revise the group presented in these columns on March 15th. The percentages in examples II and III are now identical, because the over-riding EPL maximum now operates at an earlier stage; for this reason, a fourth example is added to show the effect where the increase in profits is 50 per cent. The fifth table, illustrating the considerable relief afforded by the new choice of base years, similarly revises the table given on April 5th.

Two general conclusions tentatively emerge. First, the Chancellor has made a thoroughly bad tax a little less bad, by softening its grossest injustices. Secondly, he has put his countervailing charge at the point where, on a short view, it may do least damage—on distributed profits. But he makes even this a lever for bargaining with the trade unions, and thus moves in yet another way into the barren habits of economic thought that characterised his predecessors.

THE CHANGES SUMMARISED

GENERAL ALLEVIATIONS

(1) The base years for calculating standard profits are to be any two instead of all three of the years 1947-49 (but see point 7 below).

(2) The overriding limit on the amount of EPL payable by any one company has been reduced from 18 to 15 per cent of its total taxable profits (but see point 9 below).

(3) "Capital employed" is reintroduced as the basis of a capital standard additional to that based on paid-up capital. Companies that choose this new standard in preference to the profits standard will be rated at 8 per cent on net assets, plus the prescribed allowances on capital raised or money borrowed or profits ploughed back since the base date for computation of net assets; this, at the company's option, may be either December 31st, 1946, or December 31st, 1951. The basis for computation of net assets is broadly the same as under the old EPT except that investments and surplus cash are not this time excluded from net assets and that borrowed money is treated more favourably (see point 5 below).

(4) The rates of allowances on new capital and on profits ploughed back are to be raised from 10 to 12 per cent.

(5) A company that has raised new money by way of loan since the standard period will be granted an addition to the profits for that period at the rate of 4 per cent on the money; profits for the chargeable period will, as under the original plan and under EPT, be computed after deduction of the interest actually paid on the loan. A company whose liability is assessed otherwise than by reference to its profits in the standard period will have its profits standard increased by an amount equal to 4 per cent of the average amount of its borrowed money during the chargeable accounting period.

(6) Companies with a standard profit of less than £5,000 will not be liable to EPL; the budget had proposed a minimum standard of £2,000.

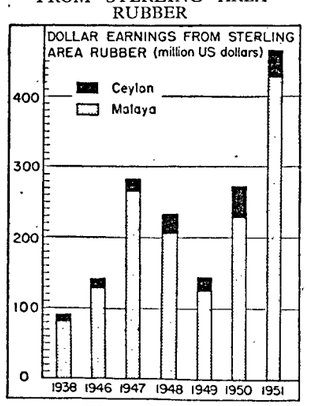
ALLEVIATIONS FOR SPECIAL CASES

(7) Companies whose main businesses were in territories occupied by the Japanese at any time between 1942 and 1945 will be offered the additional option of 1949 and 1950, taken together, in the choice of standard years.

(8) Companies carrying on the whole, or substantially the whole, of their trade through a permanent establishment overseas will be subject to an overriding rate for EPL of 10 per cent of total profits, instead of the 18 per cent first proposed for all companies and the 15 per cent now proposed for all other companies.

(9) Companies producing metals, oil and asbestos that have increased their output since the standard period will not be liable to EPL on the additional profits attributed to this increase in output—provided that the Treasury certifies that an expansion of the output of the commodity concerned is "in the national interest." The EPL-free profit margin on this extra output will be computed by reference to the profit margin in the standard period.

(10) For metal mines and oil wells in general, the additional allowances given to them (in consideration of the "wasting" nature of their assets) will be raised from 4 to 6 per cent in the case of short-lived mines or wells and from 2 to 3 per cent in the case of the longer-lived ones.



(11) Companies owning 25 per cent or more of the capital of another business will be relieved from double taxation under EPL. Since investment trusts rarely own as much as 25 per cent of the capital of any one business, this will not meet their particular grievance—but the Chancellor has promised that he will table an amendment introducing the principle of franked investment income, for investment companies only, at the report stage of the bill. Insurance companies, though they figured in the debates on this point, are not included, nor is the investment income of trading companies.

The Problem of Rubber

CHEAP rubber is more than a domestic problem for Malaya; it can have serious consequences for the sterling area's dollar accounts. Rubber is the sterling area's largest single dollar earner, and any sharp fall in its price, which is almost invariably caused by a reduction in American purchases, is accompanied by a corresponding fall in the dollar income of the sterling area. In the six years since the war rubber has earned $1,550 million, or just over a quarter of the sterling area's total dollar earnings from commodities. The annual totals have fluctuated quite significantly—from $141 million in 1946 to $283 million in 1947 and down again to $143 million in 1949, only to recover sharply in 1950 to $273 million and still more sharply in 1951 to $464 million. Last year's dollar income from rubber was inflated by the exceptionally high prices that ruled in the first quarter of the year; the quantity of rubber sold to the United States and Canada over the whole year was in fact smaller than in 1950. The trend in dollar earnings from rubber since the war is shown in Chart I; it will be seen that Malaya contributes by far the largest share, with a smaller amount coming from Ceylon. The dollar earnings of other sterling area rubber producers are negligible.

No other commodities earn so many dollars so steadily. The next largest dollar earners after rubber are wool and jute; before the war tin was coupled with jute in second place, but it now ranks fourth or even fifth. Dollar earnings from wool exceeded those from rubber in 1946, but in that year rubber production was only just beginning to recover from the war, while part of the large stocks of wool accumulated during the war years was being sold to the United States. Last year wool earned $449 million or only $15 million less than rubber. In 1949, jute and jute manufactures became the largest dollar earner among commodities, bringing in $1 million more than rubber, but that again was exceptional. In the six years since the war, wool has earned $1,245 million or $300 million less than rubber, while jute and jute manufactures have earned $850 million or nearly $700 million less than rubber. Tin, which used to be an important source of dollars, earned only $325 million between 1946 and 1951 and its annual earnings exceeded $100 million only in 1950.

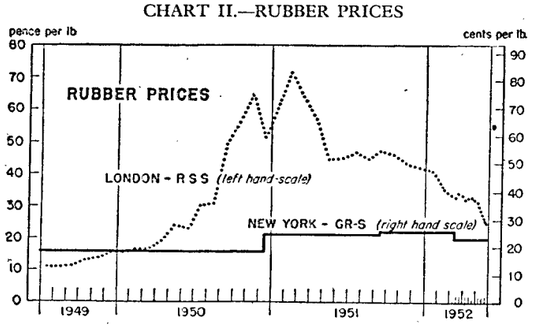


CHART I.—DOLLAR EARNINGS FROM STERLING AREA RUBBER

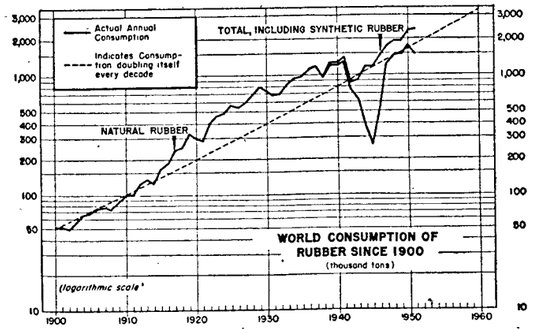
What contribution to the sterling area's dollar pool can be expected from rubber this year? The price has already fallen from 3s. 5d. a lb at the beginning of this year to 2s. 1d. a lb, compared with an average for the whole of last year of 4s. 3d. Moreover, total purchases by the United States (including purchases for stockpiling) are expected to be at least 5 per cent smaller. The effect of these two factors together will probably cost the sterling area some $250 million, in which case rubber's dollar earnings will be no more than $215 million or its lowest total in any postwar year except 1946 and 1949.

Dollar-earning capacity is only one side of the rubber problem. The other is its possible economic and political repercussions in Malaya. Rubber accounts for 66 per cent of the value of Malaya's total exports, and its export tax, on a sliding scale based on more or less current prices, provides 46 per cent of the Malayan Government's revenue. A sharp fall in the price of rubber can, therefore, have very disturbing effects in Malaya, just as the sharp rise in price had eighteen months ago. The present price of around 2s. a lb is not disastrously low. It is true that many of the inefficient producers are being squeezed and smallholders are finding that their income is less than that of rubber tappers. But efficient producers still have a margin, though this is a narrow one that could quite easily disappear if the price falls farther, unless labour costs can be reduced. In 1949, rubber was selling at under 1s. a lb, and in comparison the present price seems dear. But producers have been receiving more than 2s. a lb for almost two years, and during this period wages have become geared to this higher level. Under existing agreements wages for rubber workers are related to the

CHART II.—RUBBER PRICES



price of rubber—and they account for between two-thirds and three quarters of the costs of production. The real test will come at the end of next month when the new wage negotiations, based on a lower price of rubber, start. But will the present price of rubber be maintained?

At its recent meeting in Ottawa, the Rubber Study Group forecast world production of natural rubber this year at 1,690,000 tons, or 190,000 tons less than in 1951. It put world consumption at 1,450,000 tons, representing a decline of 45,000 tons on last year. Whereas the United States alone took some 300,000 tons for stockpiling in 1951, it has announced that its initial programme has been completed and that, although it will continue to stockpile, the rate of buying will be considerably reduced. On balance, then, there is likely to be a surplus of 240,000 tons of natural rubber, part of which may be absorbed into government stockpiles. The production of synthetic rubber is put by the group at approximately the same as last year—910,000 tons—while consumption is expected to increase from 815,000 tons to 875,000 tons. Although natural and synthetic rubber will be allowed to compete with one another in the American

market after June, the American Government itself has estimated that the consumption of natural rubber will increase by only 10,000 tons to 465,000 tons, whereas the use of synthetic rubber is expected to increase by 30,000 tons to 790,000 tons. It evidently realises that the present low price of general purpose synthetic rubber (1s. 8d. a lb) coupled with its injunction that at least 450,000 tons of synthetic rubber must be used, will be adequate protection for its synthetic industry. Natural rubber will be able to compete only if producers are willing to sell at a loss.

This year the surplus in the rubber market may not be too burdensome. But unless the United States alters its policy of protecting synthetic rubber or the production of natural rubber declines sharply, the rubber-producing countries of South East Asia may well be faced with a serious problem in 1953. The present American policy is, clearly, short-sighted. Politically, it is likely to create distress and unrest in a highly vulnerable and a strategically important area. Economically, it may well contribute to a serious shortage of rubber in a few years' time. In Chart III world consumption of natural and synthetic rubber has been plotted for each year since 1900. A logarithmic scale has been used to show the rate of increase. So far the consumption of rubber has more than doubled itself every decade, and many authorities maintain that this long-term trend will continue. A simple projection suggests that world demand for rubber in 1960 might be around 3,200,000 tons. Some American authorities have put it higher—at more than 4,000,000 tons, if certain new uses of rubber are developed. Provided that motor transport continues to expand with the increase in industrial activity and provided that tyres continue to be made of rubber this argument has some weight. If this forecast is correct, then in 1960 there is every likelihood of a shortage of rubber.

CHART III.—WORLD CONSUMPTION OF RUBBER

The highest output of natural rubber ever achieved was in 1951, when the world total amounted to 1,775,000 tons. The maximum capacity in America for producing synthetic rubber is put at 1,000,000 tons a year, though output has never yet exceeded the 820,000 tons a year reached in 1945. No new plants (except certain plants for producing special-purpose rubbers) have been built or are contemplated. Canadian capacity is put at 80,000 tons and West German capacity at 20,000 tons. The maximum output of synthetic rubber is, therefore, 1,100,000 tons—which gives a theoretical total production of all rubber of 2,875,000 tons, or some 325,000 tons lower than the consumption that might be reached.

This estimate of production, moreover, assumes that the output of natural rubber in 1960 will be at the level reached last year. But production both in Malaya and in Indonesia has already begun to decline for a variety of reasons, one of which is the present low price. It is true that in the past two years of high prices little replanting has been done, because rubber was too valuable; it did not pay to cut down trees even if they yielded only a small amount of rubber. When rubber is being produced at a loss, on the other hand, the problem becomes one of financing the seven-year delay before the new trees come to maturity. Most of the Malayan trees

are twenty to thirty years old. At the end of 1950, 3,379,000 acres were under rubber in Malaya; estates accounted for 1,977,000 acres and smallholders for 1,402,000 acres. Only 590,000 acres were planted with high-yielding stock, and all of them were in the estates. The problem is to replant the smallholdings, particularly those of 3 to 10 acres each. Any solution will require some form of government financing and perhaps the setting up of co-operative units. The same problem exists in Indonesia, though in not quite such an acute form. If replanting could be vigorously pursued now the higher-yielding trees would be coming to maturity around 1960. But governments are not likely to embark on such grandiose schemes unless they have confidence in the future of rubber: and the short-term trend of prices may sway them more than calculations about 1960.

On these grounds a *prima facie* case can be made out at least for studying the problem of rubber on an international level. If a shortage is likely to develop in the next seven or eight years, now is the time to start thinking, and the setting up of a special committee by the Rubber Study Group to examine whether a control scheme is necessary was perhaps opportune. But it is clear that from the standpoint both of the rubber producing countries and of the sterling area, the problem must be viewed as one of expanding output, not restricting it. It must embrace a programme for replanting, and it must be such as to attract the whole-hearted co-operation of the United States, which through its large stockpile of natural rubber and its large synthetic rubber industry controls the destiny of rubber producers.

Business Notes

Malaise in the Markets

The stock markets took a bad knock on Wednesday, with gilt-edged leading the way down; this sickness continued on Thursday, when War Loan 3½ per cent, which had fallen by ⅞ on Wednesday, dropped by another full point to 74⅞. The new Kenya loan, in which dealings opened at ⅛ discount on Wednesday, was down to a ¼ discount by Thursday's close, as was the recent Electricity loan. The immediate cause of the setback was a snowball of rumours, which started with stories of an imminent increase in Bank rate and then picked up some extraordinary embellishments on its way. Unless the authorities have in mind some dramatic *démarche* in exchange control policy, an early increase in Bank rate seems unlikely; but that does not mean that the market's reaction this week was a sign of false alarm. Since the Budget the sorry stream of fiscal surrenders by the Government has made it clear that monetary policy must now carry virtually the whole load of any plan for Britain's rehabilitation—if the Government has still got one. And this has occurred at a time when the efficacy of monetary policy itself has been impaired by the increased need for Government borrowing on floating debt, as a result of seasonal budgetary influences, of the trend of the balance of payments and of the switch within official portfolios out of floating debt into the BEA loan and into the £20 million of new stock placed by the North of Scotland Hydro-Electricity Authority with the National Debt Commissioners. In these circumstances the authorities, at the very least, will have to keep a tight rein on their operations in the money market (it should be noted that some discount houses were again forced "into the Bank" this week, though only for a small amount) and ought to allow a continuous release of stock from the "departments" to the market. The trade figures, inside EPU and out of it, are not such as to suggest that a flabby policy can be long maintained.

The industrial market has reacted in sympathy with gilt-edged, and has shown no sign of being cheered either by the new concessions on the excess profits levy or by the profits statements issued by a long list of industrial giants this week (and discussed in the following note). The very successful Distillers' issue opened at a premium of 6¼-7 per cent on Monday, but this had fallen back to 5-5⅛ at the end of the day; by Thursday's close the premium was only 3⅞. The *Financial Times* index of industrial ordinary shares, which had recovered slightly, to 109.9, just before the week-end, has fallen steadily since; on Wednesday alone it fell by 1.1 points to 108.1.

* * *

The Giants Report

This is the time of the year when the flow of annual reports from the giants of industry reaches full spate. The 1951 experience and 1952 prospects of eight large companies that have published full or preliminary profits statements in the last week—ICI, Dunlop, Unilevers, Shell, Royal Dutch, British Insulated, United Molasses and J. and P. Coats—are analysed in detail in Company Notes on pages 544 and 545. Last year the reports of most of these companies added fuel to the flames of a mounting boom in industrial share prices. This year their effect has been very different. It is true that all these companies (except possibly J. and P. Coats, whose statement is drawn up on a somewhat different basis from last year) report an increase in profits; and that five of them (the exceptions are Unilever, Dunlop and, again, J. and P. Coats) have also put up their dividends. But there the similarity with 1951 ends.

The three industrial leviathans, ICI, Unilever and Dunlop, all seem to have enjoyed an increase in turnover last year, but all have also suffered a steep rise in costs; the directors of Dunlop report explicitly that profit margins have fallen quite markedly, and the slowing down in the rate of expansion of both ICI's and Unilever's profits—despite probable stock appreciation—suggests a similar experience. United Molasses, Shell and Royal Dutch all had a very good year in 1951, but the chairman of United Molasses reports a sharp drop in sales at the beginning of 1952 and makes it plain that he believes that the price of molasses must come down. The directors of J. and P. Coats, as befits a thread manufacturer heavily dependent on supplies of Egyptian cotton, speak gloomily of probable stock losses in the coming year; Coats, however, are in a better position than most companies in the cotton trade because of their strong accumulated reserves, to which they have added by heavier remittances from overseas subsidiaries in 1951. The most cheerful note in this symposium is struck in the report of British Insulated, a company that is still faced with a booming overseas demand for its engineering products as well as with rearmament orders. This group's exports had to be restricted last year because defence orders impinged on a limited supply of raw materials and came up against the bottleneck of skilled labour—an excellent example of the root causes of Britain's troubles last year, troubles that the downturn in consumer goods trades is now doing something, though not enough, to relieve. But British Insulated, in common with some of the other expanding giants, is faced by acute problems of capital provision and a shortage of liquid funds; as with ICI, United Molasses and Shell, however, its directors clearly look forward to an expanding investment programme in spite of the Government's capital cuts.

Getting Out of China

British merchants and bankers in China have at last been compelled to accept the inevitable. Three years of Communist rule have convinced them that there is no place for them in the "people's democracy." As in the early decades of the nineteenth century, when China was a forbidden land to the foreigner, there may be some limited scope for trade with China, but not for trade in China The physical withdrawal has been taking place for some time past. Its completion has, however, been hampered by restrictions placed by the Chinese authorities on the exit of foreign nationals, some of whom have been kept in China as guarantors for payment of taxes and other dues. The issue has now been made the subject of a Note from the British Government to the People's Government in Pekin. This suggests that the requirements of Anglo-Chinese trade might be met by setting up a new form of organisation. Among the British-China merchants who took so prominent a part in pressing for the recognition of the Communist Government, hope evidently dies hard; some of them still believe that by maintaining a small representative association they would be able to maintain direct contact with the appropriate Chinese authorities and act as a permanent trade organisation.

In a statement in Parliament this week, Mr Eden pointed out that British firms in China had faced ever-increasing difficulties and that many firms had been operating at a loss for some time past. Not only have the Chinese authorities exacted arbitrary taxes; they have also compelled foreign firms to pay staff for which no work has been available. The valuable installations on the mainland have, therefore, lost all effective value. Mr Eden suggested that the immovable assets in China belonging to British firms might objectively be assessed as worth between £200 and 250 million. Some attempts have been made by the firms in question to lease or sell them, but in no instance have they been able to acquire more for their property than the sums swallowed up by their current expenditure. It is probable that by now most of the firms concerned have written these assets down to nothing and resigned themselves to the complete loss of their property. This is a sad end to a vital and constructive chapter in the history of British merchant adventuring. It may, however, be the end only of a chapter, not of a book.

* * *

First Effects of the Australian Cuts

The April figures for United Kingdom exports are the first to reflect the import restrictions imposed by Australia last February. Exports to Australia fell to £18.5 million in April compared with a monthly average of £34.4 million in the first quarter of this year, the drop in vehicle and textile exports being particularly severe. This decline in April is not quite so serious as the figures suggest; exports in the first quarter were inflated because Australian importers, fearing that restrictions would soon be imposed, made very heavy purchases about the end of 1951. Nevertheless, trade with Australia will worsen in the next few months. Exports in April were in fact only 17 per cent below the monthly average for the base period for the Australian import restrictions (July, 1950-June, 1951); when the cuts come fully into operation the restrictions are likely to cut British exports far more sharply.

Textile exports present a sorry picture. Cotton goods exports at £13.7 million were £7½ million below those of April, 1951, and wool manufactures at £10 million were little more than half those of a year ago. Exports of woollen goods have been declining for some months; now it seems to be cotton's turn. The long order books that for some months had kept cotton exports at a high level seem at last to be exhausted. On the other hand, the Australian

UNITED KINGDOM OVERSEAS TRADE
(£ Million)

	Imports	Exports	Re-exports	Excess of Imports over Exports
1950—monthly average	217·4	180·9	7·1	29·3
1951 " "	326·2	215·0	10·8	100·6
1951 January	288·7	214·4	8·6	75·7
February	248·5	175·4	7·8	65·3
March	304·3	190·5	17·1	96·7
April	311·8	230·2	11·0	70·6
1952 January	357·1	250·1	14·2	92·9
February	296·9	227·9	16·2	52·8
March	333·1	240·6	24·5	68·0
April	325·5	217·5	11·6	96·3

import restrictions do not appear to have had much effect on total textile exports: shipments to other Commonwealth countries fell off equally sharply, and there was a particularly marked drop in exports of woollen goods to Canada, from £3 million in April, 1951, to £1 million last month.

Fortunately there are still bright patches in the export story. Machinery exports showed the largest increase compared with April a year ago; at £37¼ million, they were nearly £5 million higher. Exports of machinery to Australia, the largest market, increased from nearly £3 million to £4.3 million over the same period. Vehicles are still the biggest single group of exports, but the rise this month compared with April last year was small compared with the rapid increases achieved during the last few months. At £42¼ million, exports in April were £3 million above those of a year ago, but about £4 million below those of March, 1952. Export of cars and chassis to Australia were valued at only £875,000 compared with £3,420,000 in March or £1,560,000 in April, 1951. The Canadian market has also been showing disappointing results, but British car exports to the United States show an encouraging rise, having reached £1 million compared with £820,000 in April, 1951, and about £660,000 in March this year. Among other groups the rise in exports of chemicals may be drawing to an end—last month they were about the same as a year ago. Pottery exports, although considerably bigger than last year, dropped from £7¼ million in March to £6½ million in April, largely because of the fall in shipments to Canada.

The increase in food imports was the chief reason for the rise in total imports compared with April, 1951. More wheat and dairy produce were imported, but imports of beverages fell sharply, largely owing to a reduction in the quantity of cocoa imported. Much larger supplies of oils and seeds and paper-making materials more than offset the decline in most other raw materials. Similarly, among manufactures, the rise in value of imports of metal goods and machinery was greater than the fall in most other manufactured goods.

* * *

Decision on Lamps

The Government has accepted the need for almost as much change in the selling practices of the electric lamp industry as the Monopolies Commission proposed last November. Mr Sandys this week expressed the agreement of the Government with eight of the nine recommendations of the Commission and with part of the ninth, and also with the conditions that the Commission laid down for the continuance of common prices among the companies that make up the Electric Lamp Manufacturers' Association. The recommendations approved were that ELMA members making lamp components should make most of these freely available to all purchasers on the same terms; that certain companies controlled by ELMA should continue to compete as suppliers of cheap companies and not be used as "fighting companies" against independent lamp makers; that sales quotas in the Association, by which companies were fined if they sold more than an agreed share of all ELMA sales and compensated if they sold less, should be brought to an end; that quantity and quality restrictions on lower-grade lamps should be abolished; that payments to associations of distributors should end, as should the enforcement of collective resale price maintenance by fines and a "stop list." The Government also agreed with a recommendation that exclusive dealing arrangements with wholesalers, retailers, and some users should be brought to an end, but reserved judgment about the payment of aggregated rebates based upon the quantities of lamps made by ELMA members bought during the year by the purchasers. The Government had in mind the possibility that the abolition of such rebates might adversely affect the smaller members of ELMA.

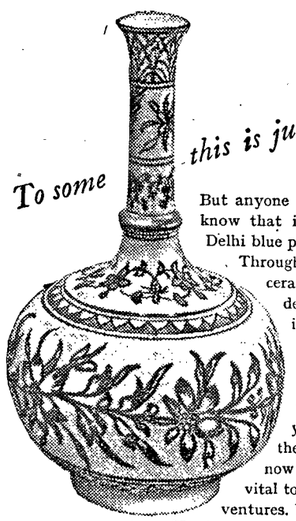
This is not on the face of it an important exception, though as the Commission concluded, "It is certainly a form of pecuniary pressure to buy exclusively from ELMA members," and should logically be swept away with the remainder of exclusive dealing. What is more noteworthy is the form of the Government's decision upon this report. Mr Sandys told the House that the Association had given him assurances that it was taking action to bring its arrangements into conformity with the Government's conclusions. This is a different course from that chosen by the last Government which gave statutory effect to those of the Commission's recommendations upon the manufacture of dental equipment that it wished to enforce.

* * *

Germany and the Debt Talks

The German debt discussions reopened in London this week for what should be their decisive stage. The previous sessions of this international conference sorted out the factual material and cleared the ground for specific proposals from

the German side. But these have now run into a hitch. Although many weeks have been available for formulation of these proposals, it was learned soon after the opening session began last Monday that concrete offers could not yet be presented. The explanation given by Herr Abs, the leader of the German delegation, was that the German Federal Government was now engaged in intensive work in connection with the contractual agreement to replan the occupation statute, and this made it inevitable that there should be some delay in presenting definitive proposals for settlement of the external debt. This delay may be due to the still unresolved problem of Germany's contribution to the European Defence Community. No agreement has yet been reached on how this proposed contribution of DM10,200 million a year should be shared between the Allied forces in Western Germany and EDC. Until the provisions of the agreement are known, the impact of rearmament on the future shape of Germany's external payments cannot be assessed.



Preliminary reports from Bonn suggest, however, that when the first German proposals are tabled they may cause some dismay among the creditors. Inspired German comments, issued as their delegation was leaving for London, indicated that the Germans might ask for a 50 per cent reduction of the capital amount of the debts, cancellation of accumulated interest, an interest rate of 3 per cent, and amortisation of capital at the rate of about 2 per cent per annum to begin after a 3 to 4 year moratorium. These comments were accompanied by re-emphasis of the basic German argument that any settlement must be attuned to German capacity to transfer the service of its debts abroad, and that this capacity has been gravely undermined by the separation of Eastern from Western Germany. The prospect for a satisfactory compromise on the question of the private debts may, however, have been improved by a recent statement of Mr Warren Lee Pierson, the United States chairman of the Tripartite Commission on German Debts. Mr Pierson pointed out that the United States, British and French Governments were prepared drastically to reduce their claims on Germany in respect of postwar economic assistance, if Germany first paid its prewar private debts. If this indicates a readiness to go beyond the generous offer made by the three western governments towards the end of 1951, it could have a considerable bearing on the course of the negotiations that have now been resumed.

* * *

A Stronger Cup of Tea?

The London tea market has hardened this week following the announcement that the increase in the tea ration to 2½ oz. a week is to be brought forward by one month to July 13th. Prices of what are known as "good liquoring" teas have been some 2d. to 4d. a lb higher than last week. The prospect of smaller supplies next week, when the quantity offered in London will only be half this week's amount, has, however, probably had something to do with this rise. In Ceylon prices have risen by a smaller margin.

Tea rationing is not due to end until towards the close of the year and its timing is not likely to be affected by the earlier increase in the ration. By raising the ration to 2½ oz. in July the Ministry of Food will have a longer period in which to study what is likely to happen to demand once price is undistorted by the subsidy. This is a wise move. The removal of the subsidy on June 15th will mean a considerable adjustment to prices for different qualities and it is difficult to assess what effect this will have on total consumption. The trade, indeed, believes that the Ministry is being too cautious. Stocks are seasonally high; at the middle of this month 146 million lb of tea was held in bonded and provincial warehouses in this country, and about 25 million lb was afloat. In the circumstances merchants felt that the ration could safely have been put up to 3 oz. a week in July.

To some this is just a Vase!

But anyone familiar with ceramics would know that it is a piece of world-famed Delhi blue pottery.

Through years of specialized study, the ceramics expert has attained a high degree of skill and discernment in his particular sphere and this is also true of the National Bank of India and its unrivalled knowledge of eastern trading. As a result of many years of continuous experience the National Bank of India can now provide much information vital to the success of modern trading ventures. Your enquiries will be welcome at the Head Office or at any of the Bank's branches.

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 300 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or projected interests in the Dominion.

You are invited to contact the London Office or the Head Office.

BANK OF NEW ZEALAND

(Incorporated with limited liability in New Zealand)

London Office: 1 Queen Victoria Street, E.C.4.

Head Office: Wellington, New Zealand

Branches also in

Melbourne and Sydney; Fiji and Samoa

This would have been tantamount to removing all restrictions on most people's consumption, as it is estimated that average unrationed demand will be between 2.75 oz and 3 oz a week. In fact, with freedom now in sight, merchants in this country are wondering whether consumption will ever again reach the prewar level of 2.9 oz a week. Long years of rationing have encouraged a taste for weaker tea; the habit of adding "one for the pot" may have disappeared for good.

ICC's Recipe for Convertibility

Freedom of current international payments from restrictions and of international trade from discrimination have been causes for which the International Chamber of Commerce has fought with pertinacity. At its recent meeting in Paris the Council of the ICC returned to the charge, but did so with somewhat more detailed recommendations than is usual for a body that has always had to show careful regard for the susceptibilities of its multi-national membership. The ICC's recommendations are based on the contention that "there is an intimate link between the strength of a currency and its free exchangeability. A currency that cannot be freely exchanged against other currencies is never really strong, since what strength it has is a purely artificial one created by controls."

The ICC proceeds to particularise these generalities by adding that "no currency can hope to continue for long as a key currency for large areas unless it is freely exchangeable." Hence the immediate aim, "notwithstanding existing difficulties," should be convertibility. The ways and means are set out in some detail. First, there is the full panoply of unexceptionable recommendations for domestic policies: hard money, a balanced budget, incentives to production, a tax burden that will allow adequate scope for enterprise and investment. More specifically, the ICC suggests that arrangements should be made for granting convertibility loans to countries whose reserves are insufficient to bear the immediate impact of a free exchange. For this purpose, the articles of agreement of the International Monetary Fund might have to be changed and its reserves strengthened; a sub-committee of the ICC is looking into these problems. The responsibility of creditor countries are stressed—not for the first time in resolutions of the ICC; the world would greatly benefit if the American members of the Chamber had a greater impact on the fiscal and tariff policy of their country. But the most significant of all the suggestions that emerge from the ICC statement is that "amongst the many adjustments that may have to be made (in the attainment of early convertibility) not the least important is that of the rates of exchange themselves; and it may be found unavoidable, at least during a period of transition, to allow the exchanges to move freely without there being fixed parities established between them." It is significant that so representative and authoritative an international organisation should thus be publicly pandering that in the present circumstances the sacrifice of exchange stability might be a worthwhile price to pay for convertibility of currencies.

* * *

Import Prices Lower

The terms of trade continued to move slowly in this country's favour in April, but, in contrast to earlier months, the improvement last month came as a result of cheaper imports: export prices remained at their March level. At long last the falls that have taken place in the prices of certain commodities are bringing down the cost of imports and after remaining steady at the December, 1951, level, import prices fell by one point in April. On the other hand, the rise in export prices may have ended for the time being. Higher prices for metal and engineering exports last month were only just great enough to offset the drop in textile prices while the prices of other manufactured exports remained unchanged.

The prices of imported raw materials, which had fallen slightly in March, dropped abruptly in April, and the decline more than offset the continued small rise in the price of imports of food and manufactures. This pattern of changing import prices follows closely that of wholesale prices revealed

Source: Board of Trade.

by the Board of Trade index for April. The index for basic materials (June 30, 1949=100) lost 4.6 points in April and reached 165, the lowest level since October, 1950. Textile prices fell steeply—raw jute dropped by no less than 53 points to 186, and cotton by 7 points to 179. Hides and skins prices fell by nearly 9 points to 86—the lowest level since the index began. The prices for rubber, hardwood, vegetable oils, sulphur, woodpulp all showed significant falls. Among basic materials the only exceptions to this downward trend were crude oil and lubricants, white spirit and some metals—aluminium, copper and brass.

Priceless Fuel Policies

In the fuel and power industries today it is highly unfashionable for anyone to be without his own fuel policy for Britain, and Viscount Ridley's committee on this subject is receiving, directly and indirectly, a deluge of professional and amateur advice. Up to the last few weeks most of the pronouncements seem to have come from the solid fuel enthusiasts, and electricity has received many an unkind stupe. But the joint deliberations of the British Electricity Authority and the electrical equipment manufacturers would now seem to have borne fruit; spokesmen of electricity, led into the field by Sir John Hacking, deputy-chairman of BEA, are striking some doughty blows for their favourite fuel—and even for that abomination of Mr Lyle and Mr Nabarro, the electric fire.

The technique of much of this argument is to take one's opponent's statistics of "thermal" or "coal economy" efficiency and turn them round to prove the opposite of what he says; and owing to the nature of such criteria this is not as difficult as it might sound. Sir John—briefed perhaps in part by that able chief of staff in this campaign, Mr Humphreys of the General Electric Company—has recently performed such an operation upon what have become the conventionally-accepted figures of "coal economy efficiency" for domestic heating appliances. Electricity, he said, was now produced from coal with an average thermal

efficiency of 22 per cent ; allowing for distribution losses and for coal consumed in transporting the coal from the pit to the power station, and use in a 100 per cent efficient domestic fire, its " overall efficiency " was 19 per cent. Gas he held to be produced with an efficiency of 47 per cent ; but counting the auxiliary power used in the gasworks, the heat content of tar and by-products used in road-making, and the coal consumed in transport, this drops to about 38 per cent ; used through a 50 per cent efficient gas fire, the final efficiency is 19 per cent again. Coal in the average open fire is burned with about 20 per cent thermal efficiency ; but after Sir John has calculated the coal used in transport and the losses through merchants' yards with a remarkable certainty, the answer still comes out at 19 per cent.

This fuelmanship would be exhilarating if its subject were not grim. Coal shortage in the next decade is going to become too bitterly serious for the brandishing of neatly-calculated percentages one against the other. For there are many refinements yet to come—the virtues of convected or radiant heat, the concept of " personal " as against " space " heating, and the fact that the average domestic fire may not behave precisely as one in test conditions did at some time.

*

Only one aspect of the discussion, it may seem to the outsider, appears to escape these controversialists' zest for figures. Prices and costs of the various forms of fuel are seldom mentioned—except for vague suggestions that somebody else's fuel is being sold too cheap. But one refreshing comment has recently been made by one spokesman of BEA:

> So many factors rightly enter into a consumer's decision to employ a particular means of satisfying his [fuel] needs that even the price criterion is not altogether decisive, but if prices properly reflect costs, then in future, as in the past, the consumers' freedom of choice between coal, coke, gas, and electricity will be the most practical and effective method of securing a proper economic balance in their use.

Nobody, it would seem, could say much fairer than this. But is this the policy upon which BEA acts ?. Electricity tariffs, at any rate in the past, have often seemed less to reflect costs than to be a tangle of traditional rates often partly irrelevant to costs. The Area Boards, however, have recently begun to introduce a number of new standard tariffs that may more clearly follow BEA's admirable precept. In the course of the next few weeks it is proposed to examine these new tariffs to see how " properly " they do, in their spokesman's words, " reflect costs."

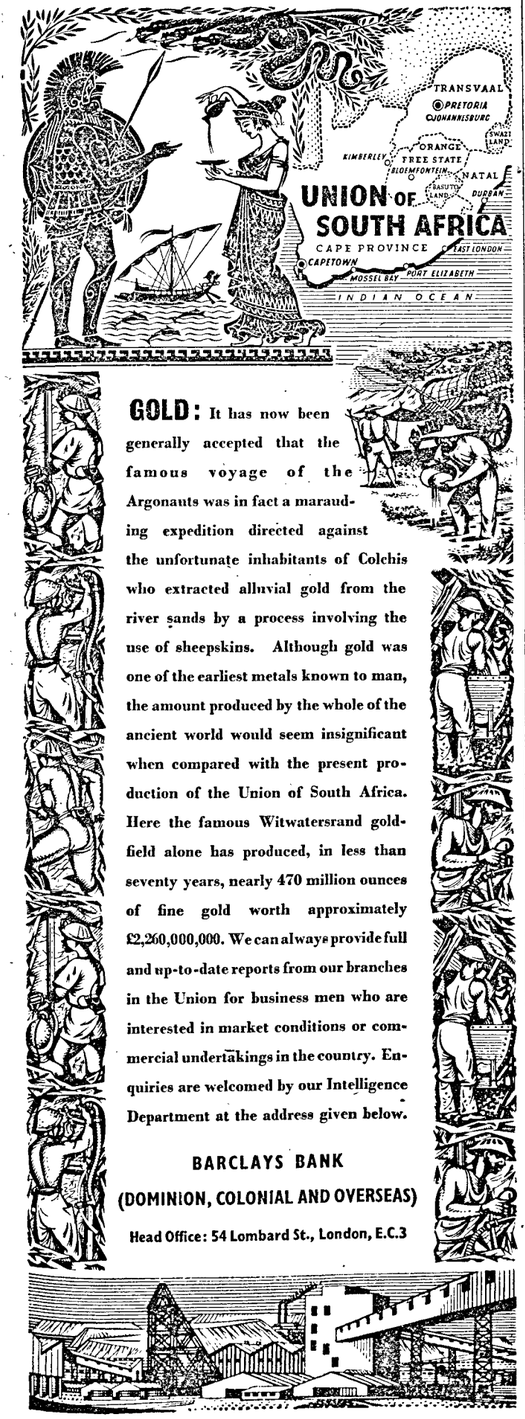
Freight Rates Slump Again

A fall of 28.3 points brought the Chamber of Shipping index of tramp freight rates down to 109.4 in April (1948 = 100). For the first four months of this year the average has been 142, compared with 168.5 for the first four months of last year and 173.7 for the whole of 1951. The index has been declining steadily since last October, when it stood at 190.4, but the fall suddenly steepened in March and April. The sudden drop in the demand for trans-Atlantic coal shipments started the downward trend, which was accelerated by the decision of Britain and Australia to cut their import programmes. The Australian and Argentine markets are dead, there has been a falling off in South African coal exports and Mediterranean ore shippers have benefited from the lack of competitive chartering by Black Sea grain shippers. The withdrawal of American ships back to the reserve fleet has prevented an even more drastic decline, but this has been largely offset by increasing competition from the growing German and Japanese merchant fleets. The Japanese, in particular, have been savagely cutting their rates in some trade in their anxiety to re-enter the lists.

Here and there, rates have shown an improvement during the first half of May. Whereas 13s. 9d. per quarter was

taken for prompt loading of St Lawrence grain for Britain or the Continent in April, charterers are now prepared to pay 15s. for a prompt vessel. Rates for sugar and sulphur from the Gulf of Mexico have advanced slightly, and even in the trans-Atlantic coal market vessels have been fixed at $8.50 per ton, compared with $7.50 earlier. Neither dollar fixtures nor time charter fixtures are included in the Chamber of Shipping freight index, and although the British liner companies are no longer in the market for ships on time charter at present, demand for ships on these terms has not declined markedly. Time charter rates are still in the region of 28s. per ton per month for about six months' trading, compared with about 12s. 6d. before the Korean war, while as much as 40s. has recently been paid for prompt voyages.

* * *



Manœuvres in Cotton

Whenever the International Cotton Advisory Committee meets, one of its topics of discussion always seems to be the possibility of introducing an international control scheme. Once again the item is on the agenda for its eleventh session, taking place this week in Rome. But this time the topic is being more seriously studied. Last November the ICAC set up a special committee to examine various control schemes and this committee is submitting its report to this week's meeting. The scheme that it apparently favours is a multilateral contract similar to the international wheat agreement, which was described on page 459 of *The Economist* last week.

There is as yet no threat of a burdensome surplus of cotton. World production for the current season is put at 34.5 million bales, and world consumption at about 30 million bales. The stock carried over to the beginning of the season amounted to 11.2 million bales and by the end of the season it will have increased to 15.7 million bales. But in 1938 world stocks totalled 25 million bales. Even if world production of cotton continues to expand and consumption shows no recovery, it will be some time before stocks can be claimed to be excessive.

Importing countries will clearly be against any scheme that attempts to make current cotton prices a set pattern for the next four or five years. Ever since the end of the war they have been at the mercy of the producing countries. The United States has maintained relatively high " floor " prices, and Egypt has openly rigged its market with the help of the government. The shortage of dollars has, until recently, driven to fantastic heights the price of American-type cotton produced by countries willing to accept sterling. Until the exporting countries agree to let the price mechanism operate freely for at least a season, to allow a realistic pattern of prices to emerge, the question of an international agreement should be scotched. The only tenable grounds for such a scheme would be the willingness of the United States to accept a price range related to the prices of other commodities freely traded in the world markets and not to its domestic support prices.

The cotton-producing countries are clearly worried about the textile slump. The Alexandrian market has almost ceased to operate because the Egyptian Government tried to maintain artificially high prices. Its latest move is to abolish the export tax on cotton for the rest of the season, and this has encouraged a modest increase in the volume of trading. The tax will be restored on September 1st at 75 per cent of its present level. The Egyptian Government hopes that by this measure it will be saved the expensive necessity of taking over the large stocks of cotton that have accumulated. It is clear from this manœuvre that the proposal to introduce an international commodity scheme for cotton is no more than an attempt by exporting countries to get the importers to help them to shoulder the financial burden of their own price-support schemes.

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand goldfield alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

WHITE HARVEST

IN many countries salt is still made by the simple process of running sea-water into large shallow ponds and allowing it to evaporate in the heat of the sun. The rate at which sea-water evaporates depends mainly on the amount of sunlight which it absorbs, but in normal circumstances much of the sun's heat is lost by reflection from the surface and bottom of the pond. It has been found, however, that if certain dyestuffs are added to the water more sunlight is absorbed and the rate of evaporation can be increased without affecting the colour of the salt.

An enquiry from a customer using a dyestuff for this purpose led I.C.I. to carry out a large number of tests, which ultimately resulted in the marketing of " Solivap " Green — a dye outstanding in both light-fastness and the power to absorb radiation, and thus the most satisfactory for speeding-up evaporation. Practical trials at the Osborne salt works of I.C.I. Australia and New Zealand Ltd. showed that the use of " Solivap " Green in the final evaporation ponds increased the yield of salt by 20% and correspondingly decreased production costs. Today, " Solivap " Green is helping to increase salt production in countries as far afield as Africa, Australia, Brazil and India.

ICI

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

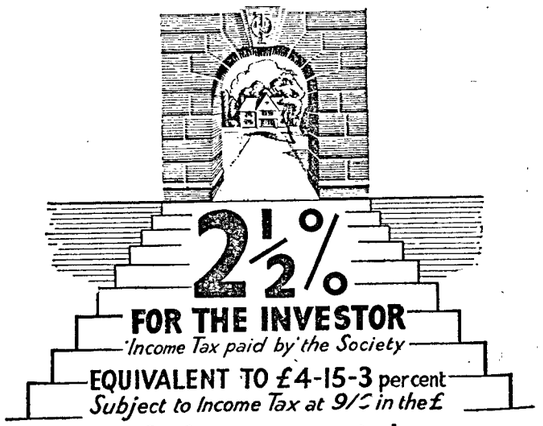
Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE ORGANISATION OF

HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £1,800,000)

is associated with



The British Metal Corporation (Pakistan) Ltd.
The Cyprus Co., Ltd., Drew, Brown Ltd. (Canada), Sandilands Buttery & Co. Ltd. (Malaya), and C. Tennant Sons & Co., of New York, as well as with the associates of The British Metal Corporation Ltd., Australia, Canada, India and South Africa.

The Group provides manufacturers and producers of finished articles and raw commodities with an economical method of marketing their products throughout the world. Expert knowledge in distribution and salesmanship is available through the various units of the Group.

Refinery Output Soars

Oil refineries in Britain last year produced nearly double the quantity of petroleum products that they had done in 1950. Figures issued by the Petroleum Information Bureau show that the total output was about 16,400,000 tons, compared with 9,200,000 tons in 1950; there were large increases in the production of motor and aviation spirit, from 1,500,000 tons to 2,900,000 tons, but the major expansion was in the output of fuel oils, from 3,800,000 tons to 7,600,000 tons. In total, therefore, the throughput of British refineries was almost as high as the consumption of petroleum products in the country, which reached about 16,900,000 tons in 1951.

BRITISH CONSUMPTION AND PRODUCTION OF PETROLEUM PRODUCTS
(in tons)

Product	Consumption in Britain		Product	Production in Britain	
	1950	1951		1950	1951
Aviation spirit	281,989	334,148	Motor and aviation spirits	1,477,955	2,932,181
Motor spirit (incl. motor benzole) ..	5,195,173	5,454,264	Industrial spirits ..	3,401	3,239
Indust. spirits (incl. indust. benzole) .	80,667	98,340	White spirit.....	48,826	51,641
White spirit.....	148,994	149,604	Burning oil	147,619	226,594
Kerosene (incl. aviation turbine fuel, burning oil and vaporising oil) ...	1,539,024	1,775,929	Vaporising oil.....	12,877	18,507
Derv fuel.....	1,034,103	1,125,623	Gas/diesel oil	1,890 745	3,055,076
Gas, diesel and fuel oils :—			Fuel oil	3,805,198	7,649,982
Inland trade :—			Refinery fuel consumption (ex own production)	539,542	852,863
Gas/diesel oil...	1,595,325	1,711,812	Bitumen.....	636,085	746,227
Fuel oil	3,092,691	3,417,785	Paraffin wax, scale and slack wax...	15,563	15,117
Refinery consumption.....	649,775	871,416	Lubricating oil....	427,288	412,154
			Propane and butane	23,736	19,337
			Miscellaneous products and loss...	254,917	456,107
Grand total inland trade	5,337,791	6,001,013			
Lubricating oils and greases.....	748,796	797,172			
Paraffin wax and scale.....	43,177	49,750			
Butane and propane	30,251	37,544			
Bitumen.....	621,281	745,647			
Miscellaneous	215,525	318,874			
TOTAL, ALL PRODUCTS ..	15,276,771	16,887,908	TOTAL.....	9,283,752	16,430,025

Note.—Deliveries for bunkers for ships engaged in the foreign trade are not included.

This represented an increase of 10 per cent, though the increases varied between different products. The total inland trade in gas, diesel and fuel oils rose by 14 per cent to just over 6 million tons, about a third of the increase in tonnage being accounted for by higher consumption in the refineries themselves. Consumption of motor spirit, however, rose by only about 5 per cent to about 5,500,000 tons, and the expansion was smaller for spirit sold through garages than sold direct to users. This presumably reflects the high cost of motoring after the first round of tax increases last year, though after de-rationing there may have been some transfer of business from garages to direct purchase, through business cars drawing their petrol from works storage.

* * *

Topsy-Turvy Metals

It has taken the Ministry of Materials a long time to learn the facts of trading. But it has apparently at last seen the errors of its ways in trying to make British manufacturers pay for its costly purchases last year. This week the Ministry announced a sharp reduction in the price of zinc—the first for three years—when it cut its selling price by £24 to £166 a ton. It did not follow the American market, where the price still stands at 19½ cents a lb (£156 a ton), but merely brought its prices more into line with the official American quotations. British manufacturers are still paying £10 a ton more than American manufacturers, though part of this is accounted for by transport and delivery costs, and some £30 a ton more than the "free" price for zinc on continental markets. But the move is at any rate in the right direction.

The price of lead was reduced at the same time by £2 to £129; this is the seventh decline since September, 1951. Once again the reduction was not related to any further fall in the American market and the British price is now only £9 a ton above prices there, but it is still some £25 a ton above continental "free" market prices. Lead supplies are ample, and now would seem to be time for the Minister of Materials to consider re-opening the London market—the New York futures market has been re-opened. At the beginning of this month the Minister said that the position would be reviewed at the end of June.

The base metal market is going topsy-turvy because rearmament has increased the demand for copper more than that for zinc or lead. The free market price of copper is still around £325 a ton compared with the British price of £231 a ton and the official American price of 27½ cents a lb (£220 a ton). But the United States Government has relaxed its price limits on domestic copper products, so that foreign supplies of copper can be bought at higher prices. This will enable imports from Chile to be resumed, and the price paid will be above 27½ cents a lb. The official American price, it is said, will remain unchanged; which presumably also means that the British purchase price for Rhodesian copper will also not be raised.

* * *

Films and Television

In last week's White Paper on broadcasting policy the cinema industry was asked to prepare a detailed scheme for the use of television transmissions for public showing—upon which the Government reserved judgment, stating only that

> subject to adequate safeguards for the interests affected, the development in its proper sphere of television for public showing to paying audiences should not be impeded by a refusal to grant the necessary wireless licences.

The three sides of the industry—exhibitors, renters and producers—are meeting next week to begin formulating such a scheme. But certain of the Government's safeguards may prove more acceptable to one part of the cinema industry than to the others.

The Government holds that no single branch of entertainment should receive an exclusive licence to use television to paying audiences; that entertainment so televised should not be introduced into the home (except by arrangement with the BBC or other possible television services); and that arrangements for the televising of public spectacles that would deprive viewers either in the home or in the cinema of the chance to see them—i.e., exclusive television rights—

Overseas Information

To enable *The Economist's* specialists to comment on events abroad a regular flow of information from our overseas correspondents and contacts is required. This information, and the judgments that are based on it, can be applied to commercial problems. Through The Economist Intelligence Unit regular reports, each designed to meet the requirements of a business or other organisation, can be commissioned.

The Economist Intelligence Unit
22 Ryder Street, St James's, London, S.W.1.

should not be allowed. These points would presumably be acceptable (except perhaps to the promotors of some of these "public spectacles," who might prefer to have more than one bidder for television rights). But the white paper also suggests that the cinemas—subject again to safeguards—should be prepared to make films more readily available to the BBC.

This is a proposal concerning which the cinema exhibitors remain adamant. Even old films, it was emphasised at the Cinema Exhibitors' Association last week, are still capable of doing good cinema business on reissue; and exhibitors will not accede to the BBC's request for more old films and for "prestige" British pictures that have exhausted their commercial run. Yet filmed material offers a major opportunity for the BBC or other television producers to reduce their production costs. Whether the exhibitors may make concessions in this regard as a point in bargaining remains to be seen; but there seems in any case a strong possibility that British film producers will not ignore the chance of making special filmed material for television. Continental producers—and American, particularly since the compulsory "divorcement" of production from exhibition in the United States—are beginning to look to this market, and some British producers have already made films for the American television networks. British production and exhibition are not so divorced; where they are linked, the profitable end of the business—exhibition—may dictate the behaviour of its production departments towards television.

* * *

Fire on the Rails

The two-year-old controversy about fire precautions on the railways between Lieutenant Colonel Walker, the Ministry of Transport's inspecting officer of railways, and the Railway Executive is brought to a head in Colonel Walker's recently published report on a fire that broke out last July on the Leeds express from King's Cross. As the result of a chain of small omissions the floor of a centre-corridor coach caught fire and four coaches were completely burnt out. Several passengers were injured in jumping through the windows on to the track 7 feet below. Among the factors contributing to the seriousness of the fire were a missing bar in the engine fire-box that allowed big cinders to escape; the absence of the usual asbestos packing around an air duct that allowed one of these cinders to lodge under the deal floor boards of the coach; the lack of fire drill among the train crew; the difficulty in finding communication cords to stop the train; and the fact that the first of the fire extinguishers brought to play on the flames failed to work. But had certain basic safety measures been taken, this chain of events, disturbing reading as it is, need not necessarily have resulted in the terrifying conflagration that took place.

The coaches became a mass of flame because they were lined with leather-cloth dressed with a nitro-cellulose finish—one of the most inflammable materials that could have been used. Many of the 22 injured passengers were hurt escaping through the broken train windows because the single narrow door at the end of the coach was blocked by other passengers. In several of his earlier fire reports, Colonel Walker has both protested against the use of cellulose finishes and has pointed out that the two end doors that are the only exits provided on the modern "open" coach cannot safely handle in such an emergency the number of passengers likely to be travelling in those coaches. He adds some extremely caustic comments in the course of this latest report about the attitude of the Railway Executive to the whole question of fire risk and fire precautions. Certainly the Executive does not appear to have put forward any convincing argument against the incorporation of an additional centre door in new "open" coaches. After a serious fire two years ago, an inspection was begun of the finish in all carriages and already £450,000 has been spent on replacing inflammable materials. But doubts about the effectiveness of this inspection are raised by Colonel Walker's comments on yet another fire that occurred after the present report had been written. This other coach, which was burnt out, was a new one tested by the railway authorities "and had been passed as safe." Yet its compartments were decorated with a material containing nitro-cellulose.

On the average, 87 fires a year in passenger trains are being reported, excluding gangway fires; on Wednesday a burning coach was taken off the Paddington-Fishguard express. In the past two years there have been three serious fires, causing five deaths and injuring 29 passengers. The strong language used by Colonel Walker may succeed in jolting the Executive out of its present views about what constitutes justifiable risks.

Shorter Notes

The retail price of motor spirit, and the wholesale prices of a number of other petroleum products, rose this week. Motorists have now to pay 4s. 3¼d. gallon in the inner zones (within 15 miles of the main importing centres), 4s. 3¾d. a gallon in the outer zones (15 to 40 miles away) and 4s. 4¼d. a gallon in the general and other zones; this price includes 2s. 6d. a gallon duty. Wholesale prices and price differentials between zones were altered for motor spirit, derv fuel, vaporising oil and burning oil, gas oil and light fuel oil. Benzole for industrial purposes is not affected. The last increase in the price of petrol was on December 21st, when it rose by ¾d. a gallon.

*

Although the Ministry of Fuel is still maintaining supplies of aviation spirit to British airline operators at the level of 70 per cent of their April consumption, the growing shortage of spirit on the continent is making further reductions in services inevitable. British European Airways will probably have to cut its continental flights to half the normal scheduled services in a matter of days, because of the difficulties of re-fuelling on the return flight to England. By doubling up services, BEA has so far continued to carry the same number of passengers as before, but when schedules are cut by 50 per cent this will no longer be possible and the company's revenue will suffer accordingly.

*

The directors of Imperial Chemical Industries devote a good deal of attention in their report to new research projects. Research on the mass culture of unicellular green algæ is in progress but though high yields per acre have been obtained it is not yet clear whether the process can be made an economic one. A more immediately promising development is the erection of a small pilot plant for the production of titanium sponge at the rate of about 100 lb a day; so much interest has been taken by consumers in this strategically important metal that there has been a considerable demand for the small quantities of wrought metal already produced. Meanwhile development sales of Terylene have strengthened earlier impressions that there should be a market for this textile fibre capable of absorbing the output of the large-scale plant now being completed at Wilton; the enthusiasm expressed in the report about the prospects for Terylene seem to be in some contrast with the directors' lack-lustre comments about Ardil, which the company has found difficult to launch in the contracting market for textiles.

FACTS ABOUT AUSTRALIA

Over 3,000,000 bales of wool exported yearly

Australia is the world's largest wool exporter and is one of the chief primary producing countries of the world. Her secondary industries are growing in importance and are well represented in her exports. The Bank of New South Wales welcomes enquiries about trade and business opportunities and the establishment of new enterprises in Australia and New Zealand.

UNILEVER LIMITED AND UNILEVER N.V.

The Boards of Unilever Limited and Unilever N.V. RESOLVED to-day to RECOMMEND to the Annual General Meetings of their respective Companies which will be held on 23rd June, 1952, the following DECLARATIONS of FINAL DIVIDENDS on the Ordinary Capital in respect of the year 1951 payable on the 4th July, 1952. These dividends, which are not payable on the new Ordinary Capital issued by the two Companies in 1951, are :—

In the case of Unilever Limited a DIVIDEND of 8⅓% actual (1/8.4d. per £1 of Stock) less income tax at 9/6d. in the £, making 13⅓% for the year ended 31st December, 1951 (1950—13⅓% for the year) PAYABLE to STOCKHOLDERS REGISTERED in the books of the Company on the 31st MAY, 1952.

In the case of Unilever N.V. a DIVIDEND of 7½% actual (Fl. 75 per Share of Fl. 1,000) making 12% for the year ended 31st December, 1951 (1950—12% for the year) PAYABLE, less 15% dividend tax, on PRESENTATION of the appropriate DIVIDEND COUPON.

The total dividends are equivalent in value under the terms of the Equalisation Agreement at the rate of exchange of Fl. 10.64 to £1 Sterling.

The combined trading profit on the Groups' operations *throughout the world before charging taxation on profits* was £53,933,152 (1950 £52,181,298) after charging reserve for replacement of fixed assets £5,115,037 (1950 £4,943,233). The combined consolidated net profit, after taxation of £31,209,664 (1950 £28,459,366) was £18,837,651 (1950 £19,226,875). The net profit for 1951 is after setting aside reserves against stock values amounting to £3,000,000 (1950 £2,629,699).

The results for the Groups separately were :—

	Consolidated Net Profit	*Profit of Parent Company*
Unilever Limited	£12,126,833 (£10,998,350)	£5,969,144 (£5,853,188)
Unilever N.V.	£6,710,818 (£8,228,525)	£3,657,385 (£3,799,776)

The Reports and Accounts of both Companies will be issued on 29th May, 1952.

21st May, 1952.

The measure of an Insurance Company's successful trading is an index of its efficiency; a reflection of its strength and of its service to the public.

ROYAL INSURANCE COMPANY LIMITED

1 North John Street LIVERPOOL 2 — *Head Offices* — 24-28 Lombard Street LONDON, E.C.3

Company Notes

Imperial Chemical Industries.—Raw material shortages put a brake on ICI's production last year, but these shortages did not prevent the achievement of new records in output in almost all the company's manufacturing divisions. Output was severely restricted only in those plants using nonferrous metals and sulphur—and even here it was possible to convert some sulphuric acid plants to the use of other raw materials. Despite this peak production, demand in many cases still outstripped supply. The group's sales to customers increased by over 19 per cent, from £220.8 million to £262.8 million, but the increase in turnover both in volume and value was matched by an increase in costs. The cost of raw materials and outside services, reflecting higher prices as well as increased production, rose by 18 per cent, from £134.9 to £159.2 million, and wages and salaries by 17 per cent, from £47 to £55 million, though the labour force increased by only 5 per cent to 110,000 employees. As the increases in costs began to

catch up with the expansion of sales, the rate of growth in profits began to slow down; last year group trading profits increased by nearly 24 per cent, from £41.7 to £51.6 million, but this compares with an increase of nearly 65 per cent in 1950.

Last year's inflation also brought in its wake the familar problem of financing increased production at inflated prices. In 1951 there was a staggering increase in the book value of stocks, from £59.9 million to nearly £84.4 million, and in debtors, from just under £35.8 million to £42.2 million; such a growth in the value of working capital imposed an alarming drain on liquid resources, so that while cash balances fell, from £8.8 million to just over £5.8 million, bank overdrafts increased from £5.8 million to nearly £15 million. The £20 million odd raised by the new ordinary share issue may not bring any notable relief, for at the end of last year the group was already committed to spend £25.7 million on capital projects as the first step towards the completion of its £78 million capital programme. ICI is having to push ahead with this programme at a time when costs continue to rise—about £2 million has already, for example, been added to its annual wage bill by the latest wage agreement—and when demand in overseas markets may taper off owing to the growth of competition, particularly from German industry.

*

Dunlop Rubber.—The detail of Dunlop's full report that should immediately catch the shareholder's eye is the marked difference between the growth in profits and that in turnover. The group's net balance from trading rose by only £300,000 to nearly £17.9 million last year; yet aggregate sales (including certain inter-group transactions) increased by £87 million to £284 million. The drag on profits appears to be all the more startling because the increase in turnover was due to a "significant increase" in the volume of business, as well as to the higher prices ruling throughout the year. The ratio of profit to turnover before tax fell from 9.2 to 6.5 per cent and after tax from 3.4 to 2.2 per cent. Such a fall must stem in part from a deliberate decision by the company to accept a lower margin of profit in the face of the steep rise in costs, particularly of raw materials. About one-half of the group's profits came from the company's overseas and export activities last year, and at the moment this proportion is almost certainly higher. The formidable obstacles that stand in the way of profit remittances from overseas subsidiaries to the parent company are reflected in some degree in the decline in dividends and revenue received from subsidiaries, from £2,617,214 to £1,977,656, and in the increase in retentions by subsidiaries, from £1,259,760 to £1,732,295.

Consolidated earnings :—	Years to Dec. 31, 1950 £	1951 £

Ordinary capital	12,853,969	12,853,969

£1 ordinary stock at 51s. 3d.xd yields £6 17s. per cent.

The increase in the group's inventories, from £40,015,731 to £61,246,077, bears testimony to the expansion of Dunlop's business last year; this increase has been due more to a rise in physical volume than to the rise in prices. To finance this heavy investment in working capital the group had further recourse—in keeping with its declared policy—to temporary borrowings; bank overdrafts were increased from £2,284,512 to £6,786,460 and bills from £4,569,820 to £13,565,631, while cash balances were drawn down by about £3 million to £8.7 million. Dunlop has tackled the allied problem of replacing fixed assets by transferring £2,960,000 from general reserves to a special replacement reserve, and by the appropriation of £470,000 from profits to this reserve. The directors draw attention to the link between taxation and replacement by showing a "net profit available for disposal" after providing for depreciation, replacement and taxation. It is the decline in this surplus, from £5,062,863 to £4,607,413, that shareholders must keep in mind in assessing dividend prospects; it may decline even further—if only because of the incidence of EPL—in 1952. A maintained dividend of 17½ per cent this year would mean an even lower rate of return on the capital employed in the business than the rate of 5 per cent earned last year; shareholders may draw what comfort they can from the fact that this rate has not been allowed to fall below 4.5 per cent in the past five years—but then it has not risen above 5.6 per cent.

*

Unilever.—As with Dunlop and ICI, the rate of expansion in Unilever's profits slowed down last year. The combined trading profit of the Unilever and Unilever N.V. diarchy, after charging an unspecified amount for depreciation and directors' emoluments and after appropriating £5,115,037 (against £4,943,233) to a reserve for the replacement of fixed assets, rose by only about 3½ per cent, from £52,181,298 to £53,933,152. This very slight increase compares with the 64 per cent increase achieved in 1950, when profits rose from £31.9 million to nearly £52.2 million. In these circumstances dividends have merely been maintained, at 13½ per cent for Unilever Ltd. (a dividend for which the recently issued ordinary shares do not rank) and at 12 per cent for Unilever N.V.

The group provided £31,209,664 (against £28,459,366) for taxation, so that net profits have declined from £19,226,875 to £18,837,651; within these totals the consolidated net profit of Unilever Ltd. showed an increase, from £10,998,350 to £12,126,833, but that of Unilever N.V declined, from £8,228,525 to £6,710,818 Net profits have been struck after setting aside £3 million (against £2,629,699) in stock reserves; this appropriation, together with that made for the replacement of fixed assets is a commentary in itself on the distorting influence of last year's inflation on profits and on the balance sheet values of fixed and working capital. It is clear that the directors of the group have given priority to reinforcing the capital employed in the business This is likely to remain their major concern in the current year, and shareholders would therefore be unwise to look beyond the maintenance of a dividend of 13½ per cent on the ordinary capital of £17,117,510 as increased by the recent issue of 3,423,502 new £1 shares at 30s. each. The yield on Unilever's £1 ordinary shares, at the current price of 44s. 3d., is 6.1 per cent.

*

Shell and Royal Dutch.—The season of oil dividends has been sent off to a good start by the announcement that the Shell dividend for 1951 has been raised from 12½ to 15 per cent, tax free, while that of Royal Dutch has been raised from 12 to 13 per cent In addition, the directors of Royal Dutch intend to supplement the cash distribution by a stock dividend of 2 per cent. The 10,902,939 new shares that Shell recently announced it is to create by a bonus issue (by a capitalisation of part of the share premium account) do not rank for the latest payment, but, even though the increase of 2½ per cent on the dividend is described as a "bonus," it seems reasonable to believe that the 15 per cent tax-free dividend will be paid on the revised capital of £54,514,696 next year. The intention of Shell's directors appears to be to bring equity dividends up to the level prevailing before the war, so long as dividend increases do not conflict with the reinvestment of a substantial proportion of earnings in the expanding business of the operating companies.

The latest increases in dividends were made possible by the remarkable expansion in profits last year. In 1951 the net income of the Shell-Royal Dutch group rose from £50,994,529 to £66,216,204. These profits are struck after deducting miscellaneous and exploration charges, taxation and depreciation; the latter provision has been supplemented by an additional appropriation of £22,053,608 (against £7,059,696) by certain companies in the group towards the replacement of assets. Out of this net income, dividends of £19,057,327 (against £16,283,382 in 1950) have been paid or will be paid to the two parent companies, Shell Transport and Royal Dutch; somewhat cryptically the preliminary announcement adds that "the balance has been retained in the business." As a result of these dividends Shell's own net revenue has increased by £960,652 (to £7,399,129). Its own dividend distribution however, has increased by rather more than £1 million, so that the appropriation of £500,000—as in 1950—to a general reserve has meant a small draft on the carry forward

he latter has been reduced from £2,748,027 o £2,683,309. At the current price of 44s. 4½d. Shell's £1 ordinary stock units ield just over 6 per cent; the Royal Dutch £1. 100 stock units, ignoring the proposed apital distribution, yield 4.4 per cent at a rice of 28.

*

British Insulated Callender's.—Although he British Insulated group was able to increase its volume of production by about 5 per cent last year, it found it impossible to keep pace with the demands for its products. Shortages of steel held up production in the power cables division, while the rationing of copper forced the company to make use of substitute metals in its wire mills; in the engineering division, the greatest drag on production was the shortage of skilled engineering labour. There was no sign of a contracting overseas market for the company's products last year but the shortages of steel and copper led to a slight fall in the group's direct exports (valued at just under £17 million). This fall seems to have been largely due to the group's defence orders.

The year's increases in production and prices are reflected in the advance in trading profits, from £6,130,642 to £7,966,464—but they are also reflected in an evident strain on liquid resources. Higher prices and increased production have led to a rise in the book value of stocks and work in progress from £16,222,960 to £22,269,037 and in debtors from £16,070,488 to £18,488,543, so that a cash balance of £1,516,778 has been turned into a bank overdraft of £1,997,377. The £3,340,000 raised by the recent successful issue of ordinary shares should help to relieve this strain. Inflation distorts the book value of fixed as well as of current assets and the chairman, Sir Alexander Roger, informs shareholders that the fixed assets owned by the parent company, which have a net book value of £4.8 million, would cost over £20 million to replace.

Towards the end of last year the shortage of materials became less acute. The volume of production in the last quarter of the year was 15 per cent higher than in the same quarter in 1950, while sales in the first quarter of the current year, following "the receipt of certain badly wanted materials towards the end of 1951," showed a marked improvement over those achieved in the first quarter of 1951. Although the reinforcement of the group's reserves remains an essential feature of the directors' policy, the directors feel that the "distribution for any year can now be determined more and more in relationship to the profit earned for the year in question." This encouraging statement on dividend policy suggests that a dividend of 9 per cent on the increased capital is the least that equity shareholders can expect this year if profits are well maintained—as, on present evidence, they should be. At the current price of 30s. the £1 ordinary shares yield 6 per cent.

*

United Molasses.—The record rise in United Molasses's profits in 1951, from £3.6 million to £8 million, was due to the high freight rates that then prevailed and to the strong demand for molasses that was maintained right up to the last quarter of the year. Since then demand has fallen sharply, as the abnormally high price of molasses has encouraged distillers to make use of such substitute materials as synthetic alcohol. In the chairman's opinion there is only one effective answer to this threat; it is to reduce the price of molasses substantially—but as yet the producers who control the bulk of the world's exportable surplus do not seem to share his opinion. As a result, in Sir Michael Kielberg's words, trade has swung in the last eighteen months from a state of "acute shortage to a state of abundance and rapidly growing stocks." The company itself has therefore experienced a sharp fall in its own deliveries to distillers in recent months, while its stocks of molasses have continued to mount. Fortunately, Sir Michael assures shareholders that the stocks of molasses held at the end of the year, with a book value of £3,061,401 (against £1,542,666), were "valued at prices so low that they should effectually cushion the impact of even a very steep decline later in the year."

In these circumstances and in view of the recent decline in shipping freight rates, it is not surprising that the group has experienced a serious fall in turnover since the beginning of the year. Nevertheless, profits earned in

* Equivalent gross rates on ordinary capital of £5,863,500

10s. ordinary stock at 30s. 3d.xd yields £6 11s. per cent.

the first three months of the current year still exceed profits earned in the same period of 1951, and Sir Michael is confident that earnings in 1952 will prove to be entirely satisfactory, compared with any year's profits except those in 1951. The group, therefore, still intends to add to its fleet; four tankers and four cargo vessels, which together will cost about £6 million, are now on order. The end of the profit boom may not necessarily mean the end of the increases in equity distribution, but ordinary shareholders must bear in mind that the company will have an unfavourable EPL standard.

J. and P. Coats.—There is a sting in the tail of the preliminary statement made by J. and P. Coats for the year to December 31st last. The directors add the unpleasant rider that substantial falls in raw material prices since the turn of the year may "necessitate an appreciable writing down in the 1952 accounts." The serious call that this could make on profits can be gauged by the fall of between a quarter and a third in the price of long stapled Egyptian cottons since the end of 1951. It is in Egyptian cottons that Coats, as thread manufacturers, are particularly interested. The recession in the textile trade has been too recent to find full reflection in the 1951 accounts, where profits before tax are shown to have fallen only slightly, from £12,779,717 to £12,033,180. The significance of this change has, however, been somewhat obscured by the fact that profits have been struck after certain unspecified charges; in addition, 1950 profits were inflated by windfall exchange gains of £2.8 million. The directors have lived up to their reputation for conservatism in dividend distribution by again maintaining the ordinary dividend at 12½ per cent; there is more justification for such caution now than perhaps existed in previous years, for net profits have fallen, from £9,217,376 to £6,529,820.

The parent company was apparently able to speed up the flow of remittances from overseas subsidiaries last year. Retentions by subsidiaries fell from £6,394,488 to £1,871,762; this incidentally, has led to a further charge for British taxation. The strengthening of the parent company's already large reserves that has followed from this greater flow of remittances from abroad is clearly welcome in these anxious times for the textile industry. Nevertheless the yield of 5.9 per cent on the £1 ordinary shares at the current price of 42s. 6d. may not fully reflect the difficulties in store.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 17, 1952, total ordinary revenue was £68,461,000, against ordinary expenditure of £77,405,000 and issues to sinking funds £250,000. Thus, including sinking fund allocations of £3,541,000 the deficit accrued since April 1, 1952, was £60,077,000 compared with a surplus of £32,320,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE UNION BANK OF SCOTLAND, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

INFLATION: NECESSITY FOR HIGHER PRODUCTIVITY

LORD BILSLAND'S REVIEW

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held on May 21st, The Right Honourable Lord Bilsland, MC, DL, LLd, chairman of the board, in the chair.

The chairman, in submitting the directors' report, said:

I have pleasure in submitting the report and accounts for the year ended April 2, 1952, which, with your permission, I propose to hold as read.

During the year, the Earl of Selkirk, who had been a member of the board since 1938, intimated his resignation on taking up an appointment in the Government, and this was accepted by the directors with regret.

In December last, the directors had pleasure in appointing Sir Kenneth B. Harper to be a member of the London local board.

BALANCE SHEET ITEMS

The balance sheet which we present today shows a total of £87,500,000 which compares with £93,980,000 last year, a decrease of £6,480,000. This is due to a decrease of £6,814,000 in deposits which on April 2nd amounted to £71,070,000 compared with £77,884,000 last year. During the first nine months of the year under review, our deposits were at a much higher level but in the last quarter of the financial year there was a marked decline. Notes in circulation at £7,678,000 are £64,000 lower, while acceptances and guarantees at £5,049,000 show an increase of £395,000.

On the assets side of the balance sheet, cash, money at call and short notice, and Treasury bills amount to £22,500,000, which represents 28 per cent of the bank's liability in respect of deposits and notes in circulation. From 1940 onwards, this country's floating debt was financed to a large extent by the issue of Treasury deposit receipts to the joint stock banks, but this issue, which reached its peak figure of £2,225 million in 1945, was liquidated entirely at the end of February last. The Chancellor of the Exchequer announced however, that while direct calls by the Treasury on the banks were to be suspended meantime, it was not intended that the system should lapse entirely, and that it might be brought into operation again should the need arise.

INVESTMENTS

British Government securities at £29,062,000 are £9,597,000 lower than last year on account of the fall in deposits and the increase in advances to which I shall refer. We are glad to report that, despite the sharp and continuous fall in the prices of gilt-edged securities and the further marked fall, after the intimation of the rise in the bank rate to 4 per cent just before the date of our annual balance, the market value of our investments is, in the aggregate, in excess of the amount at which they stand in the balance sheet. Our contingency reserves were adequate to meet the full extent of depreciation, and as our Government Securities are predominantly those having short or medium maturity dates, a large proportion of the existing depreciation will be recovered automatically as the maturity dates arrive.

The present economic state of the country makes it necessary that banking accommodation should be confined to providing finance for strictly productive purposes and that facilities should not be made available for speculative buying of securities or commodities. Although these considerations are kept carefully and continually in view, the high level of prices and the heavy burden of taxation have made a substantial increase in advances inevitable, and our loans and advances at £27,694,000 are £6,815,000 higher than last year.

PROFIT AND ALLOCATIONS

Costs of administration and the incidence of taxation continue to be heavy, and the profit for the year of £237,500 is about £8,000 lower than last year. A sum of £80,000 has been set aside as a reserve for contingencies, and the usual allocation of £40,000 has been made in respect of our liability for pensions and allowances. After giving effect to these allocations and providing for the dividend of 18 per cent recommended by the Board, the carry forward amounts to £188,800, an increase of £4,200 over last year's figure.

NATION'S GOLD AND DOLLAR RESERVES

"A violent and disastrous change took place, during 1951, in the overseas balance of payments of the United Kingdom—in these words the "Economic Survey for 1952," published last month, describes the crisis which broke upon us in the third quarter of last year, and seriously threatened, and continues to threaten, our national solvency. The measure of the effect of the change in our economy is shown in the catastrophic decline in our gold and dollar reserves from $3,867 million at the end of the second quarter of 1951, to $1,700 million in the first quarter of 1952.

It is a platitude, but also a stern fact not sufficiently realised in this country, that the state of our reserves—the foundation on which rests our economy and that of the sterling area—is a reflection of our success —or failure—in earning our living in the world and of the confidence—or lack of it—of the rest of the world in this country. At the end of last year we were losing our reserves at a rate which, had it continued unchecked, would soon have extinguished them. Severe unemployment, and a greatly reduced standard of living began to face us as a stark and immediate possibility. Happily in recent weeks a measure of improvement has occurred in the position—an improvement that derives more from a revival of confidence in sterling than from the action taken to restore the position which has not yet had time to have other than a minor effect. The crisis continues. The better trend of recent weeks merely puts it in suspense.

CAUSE OF DETERIORATION

The deterioration in our position in 1951 was due mainly to a large increase in the cost of total imports and to a serious loss of invisible earnings. Imports increased by 16 per cent in volume, mainly to effect the partial replacement of commercial and strategic stocks, seriously depleted in the previous year, but the cost increased by over £1,100 million, or 47 per cent, compared with the previous year. Invisible earnings fell from an annual rate of £486 million in the first half of 1951, to only £50 million in the second half of that year. Although the value of exports increased from £2,225 million in 1950 to £2,708 million in 1951, volume was only 3 per cent higher in comparison with an increase of 16 per cent in 1950 over 1949. In the result the United Kingdom had an adverse balance of payments with the rest of the world including the sterling area of £521 million compared with a surplus of £244 million in 1950. But even this serious position was not the full measure of our difficulties, for other sterling area countries, notably Australia, incurred very large deficits in their own balance of payments with countries outside the sterling area, with an ultimate effect on our dollar reserves. In the last six months of 1951, the dollar deficit of the whole sterling area, including the United Kingdom, reached the stupendous total of $1,578 million. In a year which witnessed such a sharp reversal of circumstances for ourselves and others in the sterling area it is gratifying to record that the British Colonies remained the one entirely solvent group of countries outside the dollar area.

The steps that are being taken in the United Kingdom to restore our position include a reduction of £600 million in overseas expenditure this year, which will fall mainly on imports of food and on stockpiling of food, tobacco and raw materials. We must do without many unrationed foods and accept lower commercial and strategic stocks than are desirable. For a number of reasons invisible earnings are unlikely to rise this year above the low level of 1951. Therefore, it is essential that we make every effort to maintain our export trade and wherever possible increase it. In this we have a duty not only to ourselves but to the sterling area for which we act as bankers so that we may play our full part in the measures concerted with others to restore the equilibrium as a whole. The immediate objective of these measures is that the sterling area should attain a gold and dollar surplus in the second half of 1952 and proceed thereafter with the task of rebuilding reserves. Apart from the necessity of re-establishing our reserves at an adequate level it is essential for this country to earn a surplus to enable us to participate in the development and progress of the Commonwealth and to protect our overseas trade.

PROBLEM OF INFLATION

The restoration of a surplus in our balance of payments is a gigantic task, beset with many difficulties. In the first place it is vital that inflation be held in check. Therefore one cannot regard without serious concern the many claims for increased wages announced in recent months. Unless increased wages are linked with higher productivity, they inevitably result in higher costs, with a serious effect on export trade, and in a reduction in the standard of living of others and ultimately of all. Since the war we have enjoyed a standard of living considerably higher than we have been able to earn. Until a year ago this was made possible by the generous aid of the United States of America and Canada: during the past year it has been continued by drawing on our capital. The facts are clear and inescapable. (To buy half the food we require and much of the raw materials of industry, we must sell overseas what our customers will buy at prices they are willing to pay—or go hungry, and suffer severe

unemployment. We cannot escape from that reality. There is no one who does not share the desire for a higher standard of living, but the nation, like the individual, must earn the means to provide it. The fact that the duty of facing economic reality appears so often to be evaded for political expediency is a disquieting feature of modern democracy—irrespective of party. Clearly we are not earning the means to provide a higher standard as it is shown in the "Economic Survey for 1952" that output per man in 1951 was only 1 per cent greater than in the previous year. It is therefore to be hoped that the British Productivity Council shortly to be established will receive the full support of management and organised labour.

EXPORT DIFFICULTIES

The end of the sellers' market in export trade creates a new situation which emphasises the importance of the price, suitability and presentation of our exports, and calls for greater initiative and enterprise on the part of the exporter. In present circumstances the increase required in our volume of exports must depend mainly on the metal industries, and in supplying the world demand for capital goods, on account of the greatly reduced demand for consumer goods, and notably textiles. The measures taken by many countries in the Commonwealth and elsewhere to restrict imports have created a serious position for many exporters in the United Kingdom, and to this difficulty must be added that of increased competition in available markets from German and Japanese manufacturers. On the other hand it would appear that there is scope for considerable expansion of exports in selected manufactures to the United States of America—particularly in the West—and Canada where the expansion is mainly required. There is need, however, for a wider realisation in the United States of the importance of the dollar gap as an American problem. The recent increase in the number of applications by American industrial interests for the withdrawal of tariff concessions, negotiated in the past few years, has been sufficiently disturbing to cause Her Majesty's Government to make representations to the State Department in Washington. It is to be hoped that the action taken as a result of these representations may be effective. Finally, as regards export trade, it is to be hoped that every effort will continue to be made to regain our former position in the export of coal.

The rearmament programme launched early last year provided for a total expenditure of £4,700 million spread over three years—a necessary but enormous additional burden on our already over-strained economy. The expenditure in the first year estimated at £1,129 million fell short of the programme by £120 million. The expenditure estimated this year will rise to £1,462 million, representing over one-tenth of the gross national product. A year hence it is anticipated that 9 per cent of the working population will be in the Services or directly engaged on defence production. Those figures emphasise the load to be carried and the need to ensure the maximum effort to maintain a sound economy which is the first line of defence.

THE BUDGET

The Budget opened on March 11th was noteworthy in several respects. In his statement, the Chancellor announced that bank rate had been raised to 4 per cent, which reintroduced orthodox monetary measures in dealing with the situation, and signified the Government's resolve to restore confidence in sterling. The decision to reduce the food subsidies by £160 million, with equitable adjustments in family allowances and other social security payments, was clearly correct as a step in reducing the swollen commitments of the Exchequer, and in lessening the illusion of prosperity which many of our domestic policies have created. In several respects the Budget was more lenient than was expected, for example, in the removal of two million people altogether from the ambit of income tax—a policy of doubtful wisdom. But the treatment of industry and commerce, proposed in the terms of the Excess Profits Levy as announced in the Budget statement caused the most serious concern, as being indefensible in theory and most unfair in effect, selecting for differential treatment the mainsprings of enterprise and efficiency. In the debate in the House of Commons last night the Chancellor introduced amendments which must be studied before comment is made. I shall only add that any form of taxation which makes it impossible for industry to accumulate the means of re-equipment, and difficult to attract fresh capital, is contrary to the interests of the country as a whole.

In the wider aspect of economic policy it is not apparent that we are making much progress towards a long-term policy to remove the causes of the recurrent crises in the balance of payments in recent years. Hitherto efforts have been mainly devoted to the tactics of cutting down overseas expenditure and, by various methods, diverting or trying to divert a larger proportion of our output overseas. What is required is the development of a general long-term economic strategy, in which, of course, others must be concerned with us.

UNEMPLOYMENT FIGURES IN SCOTLAND

The recent course of unemployment figures in Scotland has not been reassuring, particularly as regards women. In the first half of 1951 there was a more than seasonal fall in total unemployment which brought the figures down from 70,300 in January to 42,300 in June, but in the second half of the year there was a rapid and apparently more than seasonal rise. By January this year the total was again over 70,000. Normally, February marks the beginning of the seasonal fall, but this year the figures rose instead, and have remained static around the 70,000 level. This is mainly a reflection of reduced activity in the textile and clothing and some consumer goods industries. Male unemployment rose slightly from 2.9 per cent in April last year to 3.1 per cent this year, but in the same period unemployment among women rose from 2.3 per cent to 4 per cent. The heavy industries are fully employed and the placing of orders for defence projects will create an additional demand for male labour.

TRIBUTE TO GENERAL MANAGER, BRANCH MANAGERS AND STAFF

It is my very pleasant duty to express to the general manager, all our officials, and the branch managers and staff in Scotland and London, our very sincere thanks for the very good service they have given to the bank throughout the year. I wish specially to express our appreciation to Mr John A. Morrison for his fine services as general manager.

I now beg to move that the report and accounts of the bank for the year ended April 2, 1952, be approved, and that a dividend of 18 per cent per annum be declared, payable, less income tax, in equal proportions on June 10th and December 10th next.

Mr John S. Abbott, JP, seconded, the motion which was approved.

The Right Hon. Lord Bilsland, of Kinrara, MC, DL, LLD, and Mr James B. Findlay, DL, were re-elected ordinary directors of the bank.

The retiring auditors, Sir Ian F. C. Bolton, Bt, OBE, CA, and Mr Francis G. More, CA, were re-appointed in terms of the Companies Act, 1948.

The thanks of the meeting were tendered to Lord Bilsland for his services in the chair.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

Sir William Elderton, the President, was in the chair at the 190th annual general meeting of the Equitable Life Assurance Society held at 19 Coleman Street, London, E.C.2. The following are extracts from his speech:—

The directors have found it possible to declare bonuses on major-profit assurances as at January 1st last, only three years after the last distribution; the bonuses are at rates considerably higher than those declared three years ago and only slightly below the best of the rates paid between the wars.

The total of new assurances at over £4½ million is the largest figure in our history, and in addition we granted deferred and contingent annuities of £482,000 per annum, which effectively represent about the same amount of new business as the new assurances. A large part of the new assurances will participate, in surplus in the major-profits class. Their prospects for bonuses are good; apart from some calamity, I should say they are nearly as bright as they were at any time this century.

Claims by death in 1951 were just about the average of those of the preceding five years. Each £1,000 of original assurance in the whole life major-profit class was increased on the average to no less than £2,819, after allowing for bonus previously commuted.

While in one sense we regret the depreciation amounting to £944,000 which has had to be written off the book values of the Stock Exchange and similar securities, we welcome the easier investment conditions of which the depreciation is a sign.

SAN FRANCISCO MINES OF MEXICO

The thirty-ninth annual general meeting was held on May 16th in London, Mr C. E. Temperley, OBE, MC (the chairman), presiding.

The following is an extract from his circulated statement.

The gross value of the products sold by your company during the year under review was £9,547,000, against £7,977,000 in the previous year. The net profit for the year was £1,022,000, against £818,000. Adding £176,000 brought forward there is thus £1,198,000 available for appropriation.

The directors recommend the payment of a dividend of 6s. per unit on the increased capital. After deducting British income-tax at 9s. 6d. in the £, this dividend will absorb a net sum of £648,000. After charging directors' additional remuneration of £5,000 there remains an amount of £270,000 to be carried forward to the new year.

The satisfactory financial results of the year reflect the higher metal prices ruling and are the best on record. The tonnage milled, however, was 597,000 or 26,000 tons less than the tonnage milled in the previous year. The increase in production forecast in my speech last year was not realised. This was largely a result of power shortages arising from an extremely dry season which affected the power available from the Boquilla dam and from the need to service some of the power company's plants. The position improved in November last and the power supply was fully restored in January of this year. The power company hopes that, in future, the requirements of the mining companies will be fully met, provided that rainfall comes up to normal.

The report was adopted.

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

NEW ORDINARY LIFE BUSINESS EXCEEDS £100 MILLION

RECORD OVERSEAS FIGURES

FURTHER EXPANSION OF GENERAL BRANCH

SIR GEORGE BARSTOW ON THE OUTLOOK

In the course of his remarks at the annual general meeting, Sir George Lewis Barstow, KCB, chairman of the company, said:—

REVISED ARTICLES OF ASSOCIATION AND DIVIDENDS

The alterations in our Articles of Association which were approved by the shareholders in February last constitute an outstanding event in the company's history. The original step, taken in 1907, of granting to our Industrial Branch policyholders the right to a share of the profits was followed by other steps increasing their share. These steps have now culminated in their participation on the same basis as Ordinary Branch policyholders. Moreover this basis is potentially more favourable to policyholders than that which has hitherto applied in the Ordinary Branch, since the apportionment of the distributable profits is now determined at the discretion of the directors subject in each branch to the allocation of at least 90 per cent to policyholders.

Our Industrial Branch policyholders have already benefited substantially from the action taken by the shareholders last February. The action of the shareholders in approving the revised Articles of Association has enabled us to increase the rate of policyholders' bonus.

It will be recalled that the A share dividend declared in March last year in respect of the year 1950 was 17s. per share, and a further sum equivalent to about 6s. 2d. per share, being the balance of the shareholders' portion of that year's surplus, was transferred to the special dividend reserve fund. On this occasion the dividend declared is 20s. per share and a sum equivalent to about 2s. per share has been placed to the new dividend reserve fund. Thus the total shareholders' allocations for the two years were about 23s. 2d. and 22s. respectively. The estimate of the A share dividend contained in the directors' letter to shareholders of January 22nd last was necessarily a cautious one and events proved that there was some margin over our estimates. Your directors therefore felt it right to declare a somewhat higher dividend than was forecast.

INVESTMENTS

The year 1951 witnessed once again the development of a serious crisis in the country's economic position. Against this background the more important events which influenced the investment market during the year were the change of Government in October last and the marked alteration in official monetary policy which followed. One of the first steps taken by the new Government to cope with the difficult economic position of the country was the adoption of a policy of credit restriction and higher interest rates. This sharply accentuated the upward movement in yields that had occurred earlier in the year.

The uncertainty created by the announcement of the General Election, the instability in markets which followed and the knowledge that further measures to meet the crisis were to be expected in the 1952 budget made conditions in the new issue market very difficult during the last quarter of the year. Nevertheless, taking 1951 as a whole, we were able to invest outside the gilt-edged market the major part of the money which became available, including such sums as fell to be reinvested.

DEBENTURE STOCK HOLDINGS

The largest outlet for our funds, as in the previous year, has been in the debenture and debenture stock group.

I referred last year to the fact that a high rate of distributed profits tax had tended to deter companies from raising capital in the form of preference or ordinary shares and this tendency continued during most of 1951. The 1952 budget has reduced the rate of distributed profits tax and has imposed an excess profits levy in a form which has once again changed the impact of taxation materially. As a result the tax advantage of raising loan capital rather than share capital has been reduced and the pattern of new capital issues in the current year may show some change from that which it has followed in the last two years. It is unfortunate that taxation should have undergone such marked changes in its incidence during a relatively short period of time. A company raises new finance under a certain pattern of taxation only to find at a later stage that the pattern has been changed to the company's disadvantage. It is desirable that the form in which a company's finance is raised should be appropriate to its financial requirements and capital structure and should not be dictated by the form and weight of taxation.

ORDINARY SHARES

During the latter months of 1951 and early this year rates of interest were moving so rapidly that the issue of debenture stocks in the market became almost impracticable with the result that new capital for industry was raised in the form of ordinary shares. Although we gave substantial support to these issues of ordinary shares we nevertheless continued to supply funds to industry by way of debenture stocks, in many cases as a result of direct negotiation. In this way we have continued to fulfil our part in meeting demands for finance even though the normal channels of borrowing had for the time being ceased to operate freely. I have referred on previous occasions to the fact that the main objective of our investment policy is to invest our funds in the best interests of policyholders. Subject to this overriding consideration we are not unmindful that we have a responsibility to industry and I have mentioned our recent activities in the debenture market as an illustration of the way in which we recognise this responsibility. Whatever the market conditions we are always prepared to consider an application for finance whether made privately or through the normal channels.

One of the obvious consequences of the Government's policy of restricting credit is the curtailment of bank facilities; bank advances can rarely be increased and may in some cases have to be reduced. There may in these circumstances be a demand from companies for loan capital in cases where it is financially sound and proper to consolidate part of their bank loans into a more permanent form such as debenture stock. Such a conversion of bank advances into loans out of institutional funds representing long-term savings of the people would appear to conform with the Government's disinflationary policy.

It may be of interest to shareholders to know that our overseas life funds now amount to about £45 million and are increasing at the rate of some £6 million each year. Where political and economic conditions are sufficiently stable we adhere to the principle of investing our funds in local assets and I am pleased to inform you that in the main our overseas funds are so invested. In this way we balance our local currency assets and liabilities and at the same time we play a proper part in the development of the territories in which we operate.

RATES OF INTEREST ON THE FUNDS

The gross rates of interest earned on the funds during 1951 were £4 5s. 10d. per cent in the Industrial Branch and £4 4s. 0d. in the Ordinary Branch. These rates compare with £4 1s. 3d. and £3 19s. 10d. respectively in the year 1950. About one-half of these increases has been occasioned by the improved rates of dividend declared on ordinary stocks and shares. The higher rates of interest which we have recently been obtaining on new investments and the greater scope for investment outside the gilt-edged market have also contributed to the increase in yields, but as yet only to a small extent. The effect of a change in investment conditions must be gradual since recent investments form only a small part of our total assets; but, provided present conditions continue, further improvements in the yields on our funds may be expected.

EFFECT OF HIGHER INTEREST RATES IN LIFE BRANCHES

The rise in current interest rates is necessarily reflected in a lower market value of assets and you may have observed that the certificate as to the value of the assets appended to the balance sheet this year brings into acount the branch contingency funds. One of the main purposes for which we have been building up these funds since 1948 is to meet such a position as existed at December 31st last and it is natural that they should now come into play.

Since December 31st there has been a further fall in market values and I propose to devote a little time to explaining our views on the subject. This depreciation is not a matter which need cause us undue concern. The decline in the values of our assets has primarily been caused by the general rise in interest rates and has not been due to a reduction in the income derived from assets. The assets of the life branches are held against policy liabilities under long-term contracts and a rise in the rate of interest has therefore a similar effect in producing a decline in the value of these liabilities.

VALUATION BASIS

The basis on which the Actuary conducted the valuation of our liabilities at the end of 1950 was fully adequate in the conditions of interest rates then ruling. The same basis has been employed at the end of 1951 despite the changed circumstances which would have justified the use of a less stringent basis. Our valuation reserves are therefore relatively much stronger than they were a year ago. If higher levels of interest rates become established it may be desirable, and it would in every way be proper, to give formal effect to

the changed conditions by increasing the rate of interest employed in the valuation of the liabilities, thereby releasing substantial reserves which would be available to offset the decrease in the value of the assets.

I wish to emphasise that a change in the value of the assets in so far as it is consequent upon a change in the general level of interest rates is not in itself a matter for alarm to a life assurance office provided that the assets and liabilities are reasonably matched as to their average life. This is true whether the change increases the values placed upon the assets and liabilities or, as in present circumstances, reduces them. But there are other causes of change in the value of assets which do not produce a corresponding change in the value of the liabilities and the basic economic difficulties which have given rise to the present higher interest rates inevitably involve additional investment risks in the future. The possibility that some of these risks will materialise is one of the reasons why it is essential to hold substantial contingency funds. The other aspect of the rise in interest rates is its effect on the interest receipts from future investments and to this extent it will be advantageous to our policyholders on whose behalf we have large sums available for investment each year.

ORDINARY BRANCH

In the Ordinary Branch the number of life assurance policies issued at home and overseas during 1951, including group policies, was 141,000, assuring sums of £107,500,000. The total sums assured, including bonuses, under policies in force at the end of the year exceeded £752 million. In addition, a substantial volume of annuity business is transacted, mainly in connection with group pension schemes. The annual premium income under assurances and deferred annuities, both individual policies and group policies, was £36 million.

The directors have declared, in respect of the year 1951, for with-profit policies issued in the United Kingdom (other than group pension policies) a reversionary bonus at the rate of £1 10s. per £100 sum assured—an increase of 2s. per cent over the rate for 1950.

During the past twelve months we have secured new participating group pension business in the United Kingdom and South Africa producing an annual premium income of over £90,000. I think that the progress of this entirely new class of business, though not spectacular, is nevertheless encouraging, if it is borne in mind that when it was launched there was no past experience whatever of bonuses on this class of business. We hope that progress will be quickened now that the first declaration of bonuses has been made for with-profit group pension policies. Under this declaration for the year 1951 a compound reversionary bonus will be added during deferment at the rate of £1 5s. pension per £100 deferred pension and a special final bonus will be added on pensions commencing in 1952 at the rate of £9 pension per £100 pension in the case of males and £11 pension per £100 pension in the case of females.

OVERSEAS LIFE BUSINESS

A record volume of new business has once again been written overseas and indeed almost every individual Branch has achieved a record. More than 42,000 new policies were issued assuring sums of over £39 million. Sums assured, including bonuses, in force overseas are now more than £230 million and exceed 30 per cent of the total Ordinary Branch business.

In accordance with the principle of determining the rates of bonus for the separate territories in relation to the surplus earned, and having due regard to the local experience as regards interest, mortality, expense and taxation, the directors have declared reversionary bonuses in respect of the year 1951 at rates ranging from £1 per cent to £1 13s. per cent as set out in the directors' report.

INDUSTRIAL BRANCH

In the Industrial Branch the number of policies issued during the year was 1,437,000, assuring £77,800,000. The average sum assured per policy was thus over £54. The total sums assured, including bonuses, in force at the end of the year exceeded £950 million, and the premium income for the year was £41,800,000.

The expenses were 29.60 per cent of the premiums. In a business such as ours, inflation quickly and substantially increases expenses but has only a more gradual effect on premium income. In particular, a considerable increase in the remuneration of the field staff was made as from January 1, 1951, and the full effect of this is, therefore, included in the figures now before you.

In industrial assurance—how much more graphic if it had originally been called "home service life assurance"—it is, of course, essential that we should maintain an adequate standard of home service to our policyholders for the collection of their weekly or monthly premiums, for the payment of claims and for the other insurance facilities we provide. It is nevertheless a matter for regret that the cost of this service should, despite our continued vigilance, have increased after we had succeeded, by major re-organisation of our methods, in reducing it before the war to a level unprecedented in industrial assurance. We have this matter very much in our minds and, within the limits imposed by economic conditions and the needs of our business, we shall continue to do all we can to control the cost of the services we provide.

The sum of £1,500,000 has been allocated to the Industrial Branch contingency fund out of surplus and this fund now stands at £9,900,000. After allowing for this transfer and for the carry-forward, nine-tenths of the surplus for the year has been allocated to policyholders and the directors have declared a reversionary bonus in respect of the year 1951 at the rate of £1 6s. per cent on all participating policies. This is an increase of 2s. per cent over the bonus for the previous year.

The amount of bonus paid on claims by death and maturity in this branch last year represented an average addition of over 19 per cent to the sums assured payable under the policies.

PROGRESS OF LIFE BUSINESS

This year, for the first time, our total new business sums assured in the Ordinary Branch have exceeded £100 million.

In recent years our Ordinary Branch new business has exceeded that in the Industrial Branch—a fact which may come as a surprise to those who regard the Prudential as a predominantly industrial life office. A comparison of recent developments in these two branches may be of interest, and for this purpose I believe that the premium income provides a more suitable and stable basis of comparison. In the last fifteen years the Industrial Branch premium income has increased from £21 million to over £41 million. Over the same period the premium income in the Ordinary Branch has increased from £13 million to £35 million, and is fast approaching that of the Industrial Branch. Much of the progress in the Ordinary Branch has, of course, come from overseas business.

These increases serve to illustrate the most important part which is played by our staff in the campaign to increase savings.

MORTALITY

The payment of claims is the primary function of a life assurance company but I do not, as a rule, draw your particular attention to our mortality experience because the very large volume of our business leads to considerable stability from year to year. Nevertheless, there are exceptional years and, as I mentioned earlier, 1951 was one of these. The death claim payments in the Industrial Branch last year exceeded the 1950 total by the substantial amount of £1,250,000, an increase of over 11 per cent. Some increase is to be expected from the growing volume of business, but the abnormal increase is largely accounted for by deaths from influenza in the early part of last year. Over £1 million of the increase arose in the first quarter of the year, the additional claims being concentrated at the older ages and occurring particularly in the more densely populated parts of the country.

GENERAL BRANCH

The considerable expansion in our fire, accident and marine business to which I have referred in previous years has continued at an even greater rate in 1951. The general branch premium income totalled £9,600,000, an increase of £1,300,000. In addition, a premium income of £1,400,000 was obtained by our American subsidiary, making a total of £11 million, of which about £6,300,000 was derived from overseas sources.

The fire, sickness and accident, miscellaneous and marine accounts continued to show satisfactory profits. In common with the experience of other companies the profit on our home motor account has, however, fallen appreciably. Awards for injuries and the cost of repairs are both increasing and present a serious problem. A revision in premium rates was decided upon last June and whilst it is too early to suggest that this will provide a remedy it will at least be of some assistance. Our motor experience overseas has proved adverse. This experience is not confined to any one territory and, although steps are being taken to improve the position, it will naturally take time for these to be effective. Nevertheless, I think it is fair to say that the prospect for the underwriting surplus in the General Branch as a whole is not discouraging, particularly when we bear in mind the rapid expansion of our business.

With an expanding business we must contemplate substantial transfers to the Additional Reserve Fund and out of the profits for the year 1951 a sum of £100,000 has been so transferred. It is regrettable that the new excess profits levy will be a heavy strain on any increase in the surplus during the period when it remains in operation and will seriously curtail our ability to build up reserves in a way which we should normally regard as commensurate with the expansion of our business.

STAFF

The company is frequently judged by the personal service rendered by our representatives, whether in the homes of the people or at the company's offices. The prompt payment of claims of all kinds is a service on which we pride ourselves and one, moreover, which is never more appreciated than at a time of distress and anxiety. During the early part of the year the additional claims arising from the influenza epidemic in this country, to which I have already referred under the heading of mortality, laid heavy burdens on many of the staff, both in our offices and in the field. The staff concerned were, of course, affected by absences from the same cause and much extra effort was necessary to maintain our standards. This successful effort may seem a small matter when measured against the great total of work being performed by the company's servants in all parts of the world, but it is matters of this kind that make up that great total of the company's affairs and maintain its great traditions.

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

An extraordinary general meeting for the purpose of declaring the amount of profit to be set apart out of the Assurance Funds in respect of the quinquennium expired on December 31, 1951, and the ordinary annual general meeting of Legal & General Assurance Society Limited, were held on May 21 in London.

The Hon. W. B. L. Barrington, the chairman, addressing the former, said:—

The past quinquennium reveals a picture of continued expansion and progress. At the end of 1951 the total net sums assured and bonuses amounted to £356,237,649, compared with £176,528,000 five years ago, and the annual premium income of the life assurance and annuity fund increased during the quinquennium by no less than £13,121,537, bringing the total life premium income to £22,397,936.

INVESTMENTS

The directors have carried out a careful investigation of all the investments. The Stock Exchange securities have been valued as at December 31, 1951, by the society's brokers, and valuations have been made of our properties by the society's consulting surveyors. Mortgages on property and on reversionary interests and life interests charged to the society have been investigated individually and appropriate reserves made in the few cases where it has been considered necessary.

To meet the depreciation in the value of investments, the directors decided to transfer the sum of £3,950,000 from the life fund, which his been utilised to write down book values. This covers the depreciation by a substantial margin without recourse to our general reserve of £1,250,000.

The assets of the society increased during the quinquennium from £91,099,000 to £159,559,000—that is by a sum of £68,460,000.

The valuation of the liabilities of the life assurance and annuity, sinking fund and capital redemption accounts has been made by the society's actuary and forms the second part of the valuation statement.

NET RATES OF INTEREST

The net rates of interest earned during the first four years of the quinquennium were fairly constant at an average of £3 11s. 10d. per cent, but they increased during the fifth year to £3 17s. 6d. per cent, the average for the quinquennium being £3 13s. per cent as compared with £3 10s. 4d. per cent during the previous five years.

In regard to mortality, the society's experience under its life assurance contracts has been well within the table of mortality used in the valuation. In the case of the annuity business the mortality experience has also been satisfactory.

After providing the sum of £3,950,000, to which I ha e referred, in respect of depreciation in the value of the invested assets, there is a surplus in these funds of £2,302,974. The participating policy-holders are entitled to 90 per cent of the profits of all classes of business, including those of our fire and accident accounts, to the extent necessary to provide the maximum reversionary bonus of 38s. per cent compound. After providing the cost of this bonus and transferring £325,000 to the profit and loss account the surplus carried forward in the life fund is £871,518.

The sinking fund and capital redemption account has been valued and provides a surplus of £116,949, out of which it is proposed to transfer a sum of £45,000 to the profit and loss account, carrying forward £71,949.

The permanent sickness account has also been valued, and after transferring the sum of £30,000 to the profit and loss account a surplus of £42,783 is carried forward.

The third section of the report contains a brief summary of these figures and you will see that after transferring a total of £400,000 to the profit and loss account balances totalling £986,250 are carried forward.

The valuation report was adopted.

ANNUAL GENERAL MEETING

At the annual general meeting the chairman, in the course of his speech, said:—

Life Assurance and Annuity Fund.—The new life assurance transacted during the year constituted a record in the long history of the society, both as to the number of policies issued and in sums assured.

The ordinary business, comprised mainly of whole life and endowment assurances, amounted to £37,058,000, an increase of £9,191,000.

Decreasing term and group assurances—including the increases on existing group life business—amounted to £34,064,700, as compared with £26,313,600—an increase of £7,751,100. The total net sums assured were thus £71,123,200, an increase over the previous year of £16,942,000. In addition, deferred annuities were issued providing for the payment of £3,422,948 per annum, mainly in connection with pensions, as compared with £2,959,689 last year.

The net premium income in respect of new business for the year was £4,016,000, as compared with £3,490,000 in 1950. The total premium income amounted to £22,397,900. Figures of this magnitude place the society in the front rank of British life offices.

MORTALITY EXPERIENCE

Once again I am pleased to record that the investigation into mortality revealed that the death claims during the past year were within the amount expected under the mortality tables. The mortality experienced under our annuity contracts has also proved satisfactory.

RATE OF INTEREST

The gross rate of interest earned on the society's funds last year was £4 8s. 4d. per cent, as compared with £3 18s. 11d. per cent in the previous year—an increase of 9s. 5d. per cent. The corresponding net rates were £3 17s. 6d. per cent, as compared with £3 12s. 1d. per cent—an increase of 5s. 5d. per cent.

EXPENSES OF MANAGEMENT

The ratio of commission and expenses of management to life premium income, excluding the contributions for staff pensions, increased during the year from 9.05 per cent to 9.33 per cent. This is mainly due to the largely increased new business and partly to the burden of the rising costs of production. The contribution made by the society to the staff pension fund represents approximately ¾ of 1 per cent.

FIRE INSURANCE ACCOUNT

The net premium income in the fire insurance account, which includes the business of the "Gresham Fire," amounted to £1,923,124; the ratio of claims paid and outstanding, including fire brigade charges, was 36.02 per cent; and that for commission, expenses of management and overseas taxation 47.02 per cent. Provision for unexpired liabilities required a sum equal to 3.03 per cent of the premium income, leaving a balance of 13.93 per cent, or £267,896, as the underwriting profit on the account for the year. After adding interest on the departmental funds and providing for taxation and staff pensions, the surplus for the year's trading in this account was £110,027.

ACCIDENT INSURANCE ACCOUNT

In the accident account, which also includes the business of the "Gresham," the premiums for the first time exceeded 1 million pounds, namely, £1,081,609. Claims paid and outstanding were 43.97 per cent of the premiums; commission, expenses of management, and overseas taxation 42.06 per cent. The reserves for unexpired risks required 7.25 per cent of the premium income and there remained an underwriting profit of 6.71 per cent, or £72,600. This figure was increased by the interest on the departmental funds, and after making the necessary deductions for taxation and staff pensions, there was a surplus in the accident account for the year of £26,882.

During the past quinquennium the net annual premiums in the fire and accident accounts have grown from £1,613,688 to £3,004,733, representing an increase of 86 per cent. This large increase has necessitated considerable finance in respect of unexpired risks, and after providing over £580,000 for the premium reserves, the fire and accident underwriting profit for the quinquennium was £1,090,694. Gross interest earned on the departmental funds during the period amounted to £302,819 and £479,123 was paid or reserved for taxation; £130,887 has been retained in the additional fire and accident reserves to establish them at £250,000 and £150,000 respectively for the first year of the new quinquennium, and finally the sum of £379,680 was transferred to the profit and loss account.

MARINE BUSINESS

Our marine account has now completed its third year. The premiums received during 1951 amounted to £353,004. Expenses of management were £14,974, and claims in respect of current and previous years total £196,265. The 1949 underwriting account has so far proved satisfactory and we have set aside the sum of £50,000 to cover the tax liability. The remaining profit has been retained in the fund, which at the end of the year amounted to £403,259.

PROFIT AND LOSS ACCOUNT

Dealing now with this account, you will see that the balance brought forward from the previous year was £203,678, interest and dividends amounted to £109,926, and a total sum of £779,680 has been transferred from the various underwriting accounts.

ASSETS

The assets of the society amounted to £159,558,923, having increased during the year by £15,223,131.

The total assets of the society and its subsidiaries, excluding the Gresham Life Assurance Society, amounted to £160,410,718, as compared with £91,691,195 five years ago—the increase in the assets during the quinquennium thus being no less than £68,719,523.

The report and accounts were adopted.

LEYLAND MOTORS, LIMITED

SATISFACTORY OUTCOME OF MERGER WITH ALBION

TURNOVER AFFECTED BY SERIOUS MATERIAL SHORTAGES

GOVERNMENT CONTROLS ENDANGERING EXPORT MARKETS

MR C. BASIL NIXON ON CURRENT PROBLEMS

The annual general meeting of Leyland Motors, Limited, was held on May 20th at Leyland.

The following are extracts from the statement by the chairman, Mr C. Basil Nixon, circulated with the report and accounts:—

The outstanding domestic event of our year was the merger with Albion Motors, Limited.

Two Albion directors—their chairman, Mr Jackson Millar, CBE, LL, and their managing director, Mr Hugh W. Fulton—have joined the board. Mr Jackson Millar is an engineer with many interests in London and Glasgow, and was appointed to succeed the late Sir James Lithgow as chairman of that old-established and world-renowned Glasgow shipbuilding and engineering firm "Fairfield" shortly before that gentleman's death. Mr Hugh Fulton, son of one of the founder directors of Albion Motors, was, one might say, cradled in the motor industry and has a wide experience of it. He has travelled extensively abroad on behalf of his company and has recently returned from a successful visit to the Union of South Africa where he has completed a survey on behalf of both companies. These gentlemen will bring new strength to our board, and we welcome their help and advice.

The merging of the interests of the two undertakings is proceeding satisfactorily, and a happy relationship has already been established.

TRADING REVIEW

In spite of all the difficulties it is gratifying that the value of the combined turnover (eliminating purchase tax, first levied on goods vehicles by Mr Gaitskell's Budget) has increased by 7¼ per cent, but the volume of vehicle output is unfortunately lower by 6 per cent on account of serious material shortages. Credit is due to our overseas selling organisations for securing orders which, for the first time, have resulted in 50 per cent of our turnover being exported. The record order for 572 buses for Cuba has been executed without serious hitch. The promise to complete for shipment before the end of November was kept, and we are now engaged on an order for 900 buses for the city of Buenos Aires.

The increasing number of vehicles on the roads creates an ever-expanding market for spare parts; this demand, which superimposes a heavy call on our manufacturing and raw material resources, must be met even if vehicle production suffers temporarily. The company's industrial power units are now standard in many makes of industrial plant, more particularly in earth-moving equipment, and they are exported all over the world. We have an overflowing order book for these units, and the output is increasing.

In the second half of the year the company has been seriously short of materials, particularly of steel, and the position is still very critical.

Our steel quotas for the first half of 1952 for defence and civil production look imposing and theoretically satisfactory, but postulate the sale overseas of 75 per cent of our civil production. It will be difficult to achieve this target, even at the expense of the home market. It remains to be seen whether the supplies authorised materialise; we expect that during this six months' period they may not do so, but, at the moment, the forward steel position, that is, for the last six months of 1952 and early 1953, looks more promising.

As has been repeatedly pointed out, many special types of vehicles are required in different overseas markets. These are not saleable in the United Kingdom because of our archaic conditions and regulations, and our home models cannot therefore be switched to export as complete units or even as semi-manufactured material.

Over and above our production problems we have to contend with the fact that overseas markets open and close without notice and in accord with the amount of sterling exchange governments have available and because of other extraneous political considerations. The latest blow is the drastic and sudden cut in permitted Australasian imports.

Governments, too, are making things more difficult by indiscriminate restriction of credit. In new countries, especially, operators frequently require financial assistance in order to complete purchases. Normally such business is sound and provides essential transport. Applications for such financial assistance should be differentiated from others seeking finance for the sale of household luxuries, etc. Overseas it is mainly a question of delivery and credit that counts. Foreign manufacturers, often with assistance from their governments, are willing to accept payment over four to five years. In this country export credit insurance is being restricted. Consideration should be given by the Board of Trade to the provision of facilities which would enable us to meet this competition.

Export markets are rapidly becoming more difficult and risky at a time when the country desperately needs their expansion. We are not free to make our own decisions as to where we shall sell our products as, in effect, our policy is controlled and directed by a combination of a number of government agencies. When the government directs so large a percentage of civil production to export it should fully guarantee transactions which would normally be unacceptable to prudent managements, but which are nevertheless entered into with official approval.

People do not purchase our type of vehicle unless they have essential work for it. With the increasing tempo of rearmament and of production generally, the demand for road transport must grow: it cannot be thrust aside as of minor significance without serious consequences to the home economy and to the loss to this country of overseas markets laboriously built up during the last five years, markets which are now becoming so fruitful.

WORKING CONDITIONS

Since 1939, the advances in the earnings of workers in the engineering industry have outstripped the rise in the cost-of-living index. In response to demands, two national awards have been made, one in November, 1950, and another of 11s. a week, with proportional increases to other grades and a second week's holiday with pay, in November last.

It is estimated that this last settlement, together with the increased levy for the social services imposed by Mr Butler's budget, will cost the parent company alone at least £338,000 for a full year.

PRICE INCREASES

The progressive stepping up of manufacturing efficiency proved insufficient to cover such substantial increments and large subsequent increases in the cost of materials. With regret we advanced our sale prices on July 1st last and were compelled to authorise a further increase on February 1st this year. It may be that any further increase would result in raising prices to such a level as would exclude us from most export markets and constitute a most serious sales resistance at home.

FINANCE

An outstanding problem which is increasingly occupying the minds of directors arises out of the unstable purchasing value of sterling. The claim made by industry is simply that real profit only arises after provision has been made for the physical maintenance of productive assets and for the replacement of stock consumed in earning the profit. It is submitted that sums properly appropriated for these purposes should be allowed as a deduction from profits before computing the liability to income tax, profits tax, and especially Excess Profits Levy.

With taxation at its present level it is impossible to conserve sufficient cash resources adequately to maintain the assets or to replace the stock, and so far the Chancellor has not offered any remedy.

The proposed Excess Profits Levy must still further deplete resources. In the case of our own company we shall suffer by the inclusion of 1947 as a standard year. It may not be fully appreciated how long it takes a plant such as ours to change over from one class of manufacture to another. Until the end of the war we were manufacturing tanks to the total exclusion of commercial vehicles, and it was not until the year ended September, 1949, that our normal output was restored. As a result, the profits for the year to September, 1947, were depressed. We hope that if the Chancellor cannot abandon the proposal altogether he will, during the passage of the Bill, introduce an amendment permitting the selection of any two of the stated years as the basis of the standard profits.

CONSOLIDATED ACCOUNTS

The accounts are drawn on the accustomed lines, but are exceptional because of the Albion merger.

It is perhaps useful to note that the amount set aside for depreciation in the group accounts is £357,344, that £694,677 has been expended on capital account and that the forward commitment on that account is £733,577.

A further sum of £500,000 has been appropriated from the profit of the year and added to the general reserve, which now stands at £2,326,008. Because the cash resources of the company are fully employed in replacing assets, both fixed and current, at constantly rising prices, it follows that the reserves are already absorbed and do not in any way represent cash available for distribution.

It will be realised that our price advances, which were deferred as long as possible in the interests of our customers and the stability of market prices, could not affect this account appreciably, whereas, unfortunately, the advance in the cost of all supplies has been operative in varying degrees throughout the period.

CONSOLIDATED PROFIT

Having regard to the great efforts put forth, the trading and net profits for the year are disappointing. The reasons for this have already been referred to. This does not reflect on the work of the employees, who could not have done more under the circumstances. It is due to other causes beyond our control—material, shipping, etc. Fortunately, a partial settlement of tax liability releases a substantial figure. As a result of this and other minor adjustments, the available balance is £865,968, against £731,218.

FUTURE PROSPECTS

Our overseas prospects depend on the establishment by governments of satisfactory international trading conditions. These conditions are undoubtedly capable of vast improvement and development.

The prospects of the company at home will naturally be influenced by the effects of denationalisation of road and rail undertakings and the development of alternative plans acceptable to trade and industry. The conditions required to ensure free and fair competition have been set out in previous statements and have been placed before the government by various interested national bodies.

Apart from matters already referred to, there is still urgent need:—

(a) To remove the purchase tax on commercial vehicles;

(b) To withdraw the 20 m.p.h. speed limit on the heavier vehicles;

(c) To remove the 25 miles radius restriction, by which the private haulier is so unjustly handicapped;

(d) To reconsider the detrimental effects of taxing diesel oil, which is taxed on a far lower scale in most overseas countries.

(e) To lessen the handicaps to international trade.

(f) To promote a well-planned and rapidly expanding Commonwealth development policy.

In addition to undertaking, as agents, the management of a new government factory the group has accepted heavy responsibilities for design and development and as contractors in connection with rearmament, to all of which our staff and workpeople are also inevitably committed. These obligations present a challenge to our productive capabilities. A large amount of high productivity plant is on order for the company's and the agency factories. Our production programme, for defence, export and home, has been carefully balanced by the Ministry of Supply. We are authorised to obtain sufficient material for this programme and super priority is given for material for the agency factory. Working conditions in that factory are to be the same as in the parent works. No man transferred temporarily to the agency will suffer financially; nor will he lose seniority. The company pays a substantial annual bonus directly related to results, and affords the opportunity to make good piecework earnings.

I appeal, therefore, to all our employees and those shortly to be engaged in the agency factory, to set up a new high standard of which Lancashire can be proud.

In the present state of world tension anything can happen; one man's guess is as good as another's. All we can tell you is that we have a splendid team, a full order book and the intention to promote the interests of this company so far as is practicable in the conditions which from month to month may prevail.

The report and accounts were adopted.

BRITISH INSULATED CALLENDER'S CABLES

SUBSTANTIAL TURNOVER INCREASE

STULTIFYING INCIDENCE OF TAXATION

The seventh annual general meeting of British Insulated Callender's Cables, Limited, will be held on June 12th in London.

The following is an extract from the statement circulated by the chairman, Sir Alexander Roger, KCIE:—

In the parent company profit on trading has risen by £1,352,629 to £4,585,668 mainly due to the substantial increase both in the volume and value of our output for 1951, the advantages of a full order book, and the benefits of a constant improvement in methods and machines.

Taxation requires £2,707,881 or £643,244 more than in 1950 mainly due to the improvement in our trading profit and the increased profits tax payable on distributed profits.

In the balance sheet, the outstanding feature is the greatly increased moneys tied up in stock, work-in-progress and debtors and, as a consequence, that as compared with a balance at banks and in cash of £615,608 at December 31, 1950, we had a bank overdraft at December 31, 1951, of some £3,500,000 in addition to the loan of £2 million which we arranged some years ago and which under present arrangements is repayable by June 30, 1955, at the latest.

NEW ISSUE AN OUTSTANDING SUCCESS

Your directors decided some months ago that further permanent capital was required in the business and decided to obtain this by the offer to existing ordinary shareholders of £3,109,614 of ordinary capital on what we consider to be attractive terms. As is now well known, the issue was an outstanding success and has brought in some £3,340,000 of new cash.

If the inflation which our previous government did little or nothing to control is now to be held, if Britain is not only to surmount her present difficulties but continue to hold her rightful place in the world, the present stultifying incidence of taxation and the volume of non-revenue earning government expenditure must be reduced. At the very least it slows down the ability to undertake capital expenditure and developments so essential to British industry not only in maintaining but in constantly improving its competitive power in the world. And at the worst it stifles human initiative and makes more and more difficult the achievement of that greater and more efficient output per person without which this country will not for long remain solvent.

I welcome the initial steps taken by the present government to control expenditure and, through some small relief in personal taxation, to give some encouragement to greater endeavour. But I most fervently hope that further and stronger action will soon be seen under both these heads.

We have made a satisfactory start to 1952. Following the receipt of certain badly wanted materials towards the end of 1951 we have been able to complete a considerable proportion of partly finished stocks then held. Sales for the three months to March 31, 1952, show a marked improvement over those for the first quarter of 1951. We have also a full order book and altogether the prospects for 1952 look good provided—and it is an important proviso—our essential raw materials continue to be made available to us.

Apart from the intensive work we are doing on substitute and alternative materials, there is little we can do as we continue to obtain the great bulk of our vital raw materials through government departments. I know they appreciate the position and am confident they will continue to do everything to help.

BRIXTON ESTATE

IMPROVED REVENUE

The annual general meeting of Brixton Estate Limited was held on May 22nd in London, Lt-Col Sir Francis Humphrys, GCMG, GCVO (the chairman) presiding.

The following is an extract from his circulated statement:—

Properties.—During the year the company availed itself of opportunities to acquire the freehold interests in some of our leasehold properties. In the result, freeholds now represent about 90 per cent of the total book value of the properties. In order to assist in providing the necessary finance, one of our factories was transferred to our associated company at a profit of £14,619, which has been placed to capital reserve.

Gross Income—shows an increase of just over £10,000 to £129,829.

Net Revenue.—The accounts disclose the disappointing fact that, owing to the higher rate of income tax and profits distribution tax, almost the whole of this increase has been absorbed in additional taxation.

Bonus Issue and General Reserve.—During the year a further bonus issue was made by capitalising the general reserve of £25,000 and issuing 100,000 new 5s. fully paid ordinary shares to the existing shareholders in the proportion of one new share for every five shares held. As a result of allocations arising from the transactions of the year, including the capital profit mentioned above, new reserves, amounting to £49,050, have been created.

Future Prospects.—The expansion of the company's income should continue, with the assistance of our associated company. Its progress, however, is dependent on the obtaining of licences to develop sites. Until, therefore, the ban on capital expansion is lifted, some slowing down in the rate of increase must be expected. In addition, with the imposition of the Excess Profits Levy, the further expansion of net income must be correspondingly retarded.

Dividend on Ordinary Shares.—Two interim dividends amounting to 18 per cent, less tax, on £125,000 have already been paid, and a final dividend of 10 per cent, less tax, is now recommended on the increased ordinary capital of £150,000, making upon that latter capital a total distribution of 25 per cent for the year.

The report was adopted.

GALLAHER LIMITED

(Incorporated in Northern Ireland)
(Tobacco, Cigarette and Snuff Manufacturers)

INCREASED SALES OF PIPE TOBACCOS

BONUS SHARE ISSUE APPROVED

SIR EDWARD DE STEIN ON DANGERS OF EXCESS PROFITS LEVY

The fifty-sixth annual ordinary general meeting of Gallaher Limited was held on May 15th, at Winchester House, Old Broad Street, London, E.C., Sir Edward de Stein, the chairman, presiding.

The secretary (Mr George Iliff, ACA), read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated to the shareholders with the report and accounts for the year ended December 31, 1951:—

The company's business continues to be satisfactory within the limits imposed upon its operations by the restrictions still in force. I am particularly pleased to be able to report a further increase in our sales of pipe tobaccos despite a general downward trend in this class of goods. As we have also received this year the full benefit of the price increases on tobaccos which we were forced to make in November, 1950, this department of our business has now been able to make a reasonable contribution to the profits of the company.

EFFECT OF HIGHER COSTS

In my statement last year I told you that we had had to deal with rising costs, particularly the effects of devaluation, which would not be fully reflected in our accounts until the year 1951. Devaluation particularly affects our cigarette manufacture. Further rises in costs which we experienced in 1951 were so severe that we could no longer absorb them and prices of cigarettes had to be raised in the month of August. Despite this advance in prices the profits from the cigarette side of our business have not been materially different from the profits in 1950 although we have had the benefit of the price increase for a period of four months.

Our cigarette tobacco purchases in 1951 have again been more expensive than in previous years. These higher costs, together with the rise in packing materials and other production costs, will fully absorb the additional revenue which we should receive from cigarette sales in 1952. As I pointed out before, one of the chief disadvantages of having to limit supplies to the trade is that the public are unable to give effect to their particular preference.

UNSATISFIED CIGARETTE DEMAND

We can see no prospect of obtaining adequate stocks of suitable leaf tobacco to enable us to increase supplies to the trade, even on a limited scale, and, therefore, we cannot take advantage of the strong public demand for our cigarette brands, and for "Senior Service" and "Park Drive" in particular, to increase our turnover and obviate these adverse factors. The public demand for our popular brands must continue to remain unsatisfied. We shall at all costs endeavour to maintain the quality of all our brands and shall concentrate the skill and energy of our staff on all possible means of increasing our efficiency and on effecting economies in production.

So far as we can estimate, the company has a satisfactory standard for the Excess Profits Levy, but as a matter of general principle I should like to take this opportunity of saying that, in my view, one of the chief dangers of the Excess Profits Levy as a method of taxation is not so much that it tends to remove the incentive to increase sales and production as that it reduces the incentive to strict efficiency and economy in costs of manufacture.

BALANCE SHEET CHANGES

Turning to the balance sheet of Gallaher Limited, there are a number of changes. You already know that at the beginning of 1951 we issued additional ordinary shares and loan capital. These have resulted in the following alterations in the balance sheet:—

1. An increase in the issued ordinary share capital of £160,000.

2. An increase in share premium account of approximately £560,000.

3. An increase in loan capital from £2 million to £4 million.

A further material change has taken place in the company's reserves resulting from the final agreement of the excess profits tax and income tax liabilities for the years 1939 to 1946. This has released the sum of £486,000 from current taxation provision, which, together with an appropriation of £14,000 from profit and loss account, has been used to increase the balance on general reserve by £500,000 to £1,250,000. As regards the future taxation figure, I am pleased to be able to tell you that we have now fully provided in the accounts for the future estimated liability to income-tax on profits earned to date.

LEAF TOBACCO STOCKS

As a result of introducing £2,700,000 new money into the business we have been able to reduce our liability on bills by £1,500,000 and the balance has been absorbed mainly in financing stock in trade. Practically the whole of the increase of £1,500,000 in the value of stock in trade arises in leaf tobacco. At the date of the balance sheet we had a greater quantity of leaf tobacco in stock than at the corresponding date in 1950. In common with other tobacco manufacturers we received in 1951 a dollar allocation which enabled us to buy leaf for stock piling. In the year 1952 our dollar allocation will be reduced considerably and we will have to use these extra stocks in order to maintain output at the present level. In consequence our total liabilities will tend to fall. The increase of £800,000 in debtors is largely attributable to the higher price of cigarettes and the larger volume of pipe tobacco sales already referred to.

I am pleased to say that "Manikins," the principal product of our cigar manufacturing subsidiary, Associated Tobacco Manufacturers (Great Britain), Limited, are increasing in popularity. As regards our engineering subsidiary, Mono Pumps, Limited, it continues to expand its business both at home and overseas, and has enough work in hand to keep it fully occupied for a considerable time to come.

CAPITAL PROPOSALS

We will be holding an extraordinary general meeting at the conclusion of the annual general meeting to ask you to pass a number of resolutions. As has been already announced, we have received Treasury consent to the capitalisation of part of the share premium account, which is to be applied in issuing one new ordinary share for each ordinary share already held. We are, therefore, proposing to ask for authority to increase the authorised ordinary share capital by £3,500,000 to a total of £7 million.

If you authorise the distribution referred to above this will bring the issued ordinary share capital to £4,500,000, a figure which more truly reflects the amount of ordinary shareholders' money which has been directly invested in the business, although it does not, of course, reflect the large amounts which they have indirectly invested by the conservative policy of the past which has enabled the company to build up its substantial reserves. There will then be 2,500,000 ordinary shares of £1 each available for issue as and when required. We are also proposing to convert the company's share capital into stock and to make the ordinary stock transferable in units of 10s. This will be more suitable to the small investor but will have no effect on the total distribution by way of dividends.

HIGH STANDARD OF QUALITY

Our factories at home and our tobacco packing plants in Africa are continuing to work to a high degree of efficiency and are achieving for our products the highest standard of quality of which we are justly proud. During the year we have completed the reconstruction of part of our bond store property in Northern Ireland in which is now incorporated the most modern and efficient mechanical handling unit in the country for dealing with the raw leaf tobacco in bond.

As you all know, it is impossible under present conditions to make prophecies with regard to the future, since a great many factors are outside our own control. I would like, however, to say that I believe we have an exceptionally able and enthusiastic staff, that we have plenty of promising younger members in our organisation to safeguard the future, and that the happy atmosphere and high esprit de corps which has always existed among all our employees continues. If only we had a greater measure of freedom I should have full confidence in our ability to expand our trade.

In due course we shall be asking you to re-elect as directors of the company Mr R. J. Freeman, Mr J. N. Hogg and Mr M. R. Norman, who retire in rotation in accordance with the articles of association of the company.

The report and accounts were unanimously adopted and a final dividend of 25 per cent on the ordinary shares, making 32½ per cent for the year (net), as recommended, was approved; the retiring directors, Mr R. J. Freeman, OBE, Mr J. N. Hogg and Mr M. R. Norman, OBE, were re-elected, and the auditors, Messrs Hill Vellacott and Bailey, reappointed.

At the extraordinary general meeting which followed all the resolutions proposed were passed.

MANCHESTER OIL REFINERY LIMITED

SATISFACTORY PROFIT

PERIOD OF RISING COSTS AND GROWING COMPETITION

PROPOSED INCREASE OF CAPITAL

MR H. STUART EBBEN'S REVIEW

The fourth annual general meeting of the members of Manchester Oil Refinery Limited, will be held at the registered office of the company, 170 Piccadilly, London, W., on June 9th.

The following is the statement by the chairman, Mr H. Stuart Ebben, OBE, which has been circulated with the report and accounts for the year ended December 31, 1951:—

The accounts are in their customary form, but your attention is called to the following points of interest.

It is difficult to compare the figures of trading profit from year to year in view of items which are included therein and which are of a somewhat exceptional nature. In 1950 it will be remembered that reference was made to the profit which accrued to the company arising from the devaluation of sterling. In 1951 the profits include the figures relating to a special refining operation which has now been brought to a conclusion. It will be seen that the group profit before taxation, as shown in the consolidated profit and loss account at £345,373, is some £6,000 lower than that shown for the preceding year. If, however, the exceptional items, which are only capable of estimation, are eliminated the group profit for the year ended December 31, 1951, is approximately the same as that for the previous year.

EXCEPTIONAL DEPRECIATION

It will be observed that the depreciation charged before arriving at the group profit is over £53,000 in excess of that charged in 1950. Almost the whole of this excess is due to exceptional depreciation charged in connection with the special refining operation. The profit, which it is hoped you consider satisfactory, has been earned in a period of rising costs and growing competition in our standard products and is the result of our policy of continually seeking to improve and diversify our products and of maintaining technical and scientific collaboration with our customers. Our ability to meet competition should be assisted by an overall reduction in working expenses when the new plant, referred to below, comes fully into operation next year.

Further consideration of the consolidated profit and loss account reveals that after retaining a larger proportion of profits in subsidiary companies, and also after providing for taxation in respect of the year under review, there remains available for appropriation the sum of £107,090, to which there must be added the amount of £26,059 brought forward from 1950, making a total of £133,149. The dividend on the five and a half per cent preference stock absorbed £9,384 net; the interim dividend of 10 per cent, less tax, paid on October 18, 1951, on the ordinary stock, together with the proposed final dividend at the same rate, will require £40,950. The sum of £70,000 has been transferred to taxation equalisation reserve, leaving £12,815 to be carried forward in the accounts of the parent company and £38,979 in the consolidated accounts.

TAXATION POSITION

In view of the heavy inroads made upon the company's revenue by taxation and of the complexity of the problems involved, it is necessary once again to dwell at some length on the taxation position.

Last year attention was drawn to the fact that in its second year of operation ended on December 31, 1950, the company had set aside the full amount of its estimated liability to income tax up to April 5, 1952. The policy of reserving for future income tax has been continued for the year ended December 31, 1951, and thus the company has up to that date set aside its estimated liability to income tax for four fiscal years out of profits of less than three years' trading.

In 1949 a taxation equalisation reserve was also created, with the intention of transferring to or from this reserve sums equal to income tax at the current rate on the difference in each year between capital allowances for income tax purposes for that year and the depreciation actually charged in the accounts. Owing to the present basis of taxation we have, in setting up the full future tax reserve, taken into account capital allowances (including initial allowances) for income tax purposes for four years, as compared with charging depreciation for two years and nine months. As a result, the written-down value of the company's assets for taxation purposes is substantially less than the written-down value shown in the accounts; it will be appreciated that the effect of this position is to defer the liability to income tax on the difference between these two written-down values. In order that it should be possible to continue in future years to adjust the charge for taxation to that properly attributable to the profits earned during the year, your board has decided to adopt the conservative course recommended by its advisers to add to taxation equalisation reserve the estimated amount of this deferred taxation by an appropriation from profits. Accordingly, the full amount required of £70,000 has this year been transferred from profit and loss account.

Members may be well satisfied that the company's results have enabled it, so early in its life, to set aside these large sums for taxation. This achievement should not, however, be allowed to obscure the extent of the burden which has been imposed upon the company, both by the rates of taxation in force and the methods of computing profits for taxation purposes. The figures speak for themselves, and examination of our annual accounts shows that for the period from the commencement of trading in April, 1949, to December 31, 1951, profits have amounted to some £839,000, of which no less than £621,000, or 74 per cent, has been set aside for taxation purposes.

BALANCE SHEET ITEMS

Turning now to the consolidated balance sheet it will be observed that the book value of fixed assets has decreased by about £30,000. As a matter of fact, additions to these assets during the year amounted to approximately £126,000, but as a result of the completion of the special refining operation to which reference has been made, the cost of one item of plant, together with the relative depreciation, has been eliminated. Current assets have increased by nearly £630,000: this is accounted for by the facts that (a) there were two cargoes of crude oil afloat at the end of the year; (b) the stocks of materials, stores, drums, etc., had been built up in order to guard against the possibility of shortages that might lead to cessation of operations and deliveries to customers; and (c) the amount owing by sundry debtors increased in consequence of the greater volume of sales. On the other side the increase in sundry creditors is largely the counterpart of the crude oil afloat.

Up to this point no reference has been made to the unsecured loan of £50,000, but it will have been obvious to members that as a result of the growth of the amount invested in current assets, the company, like many others, is short of liquid resources. In view of this we obtained a temporary unsecured loan (which has since been increased to £100,000) to enable us to pay our way until we are able to make arrangements to adjust our finances to a long-term basis. To this end a resolution will be proposed at the annual general meeting to authorise the increase of the ordinary capital by £250,000 from £500,000 to £750,000. Not only do we need more working capital, but we require a considerable sum in order to enable us to complete the expansion of the plant and thus secure the optimum overall output. This entails the installation of additional capacity for distillation, fractionation, solvent extraction and chemical treatment, as well as some new equipment for the manufacture of certain of our specialised products, the range of which has been enlarged by successful work in the research laboratories. It is anticipated the extensions to the plant will be completed in the spring of next year.

NEW SHARE ISSUE

If the resolution for the increase of the authorised capital is passed it is proposed to issue a proportion thereof, and particulars of the new issue will be posted to all ordinary stockholders as soon as possible after the meeting.

In view of the imposition of the excess profits levy it is manifest that the new money we have to raise must be greater than it would have been if we were able to plough back our profits; the years which have been selected on which to base "standard profits" are peculiarly inappropriate in the case of this company, as, it will be recollected, we were working under a rental arrangement with the Petroleum Board (a quasi-Government body) until June 30, 1948, and it was only subsequent to that date that we were able to reap anything like the benefits accruing to the enterprise.

Figures which are just available show that the volume of lubricating oils and greases consumed in the United Kingdom in 1951 was 6.5 per cent in excess of that for 1950, and it is encouraging to note that the company's sales of the comparable group of products show a proportionately greater increase.

Reference should perhaps be made to Raven Oil Company, Limited, which, in addition to handling our exports, is concerned with other overseas business. This company has had a particularly successful year, but the difficulties which currently beset international trade may temporarily hamper its activities.

The board wishes to record its appreciation of the services of the managing directors, the general manager and all other employees who have again contributed to the success of the group.

J. BIBBY AND SONS

INADEQUATE PROFIT MARGINS

MR H. P. BIBBY'S REVIEW

The thirty-eighth annual general meeting of J. Bibby and Sons, Limited, was held on May 15th at the registered office of the company, 21, King Edward Street, Liverpool, Mr H. P. Bibby, JP, the chairman, presiding.

The secretary (Mr Angus Morrice, FACCA) read the notice convening the meeting and Mr E. T. Denton, of Messrs Edward Denton and Sons, read the report of the auditors.

The following is the review by the chairman, circulated with the report and accounts for the year ended December 31, 1951:—

You will notice that the profit shown in the consolidated profit and loss account is a little higher than last year and also that the figure of £444,379, representing taxation, is higher than might be expected in relation to the profit of £655,662; this is due to the fact that the profit on which the Inland Revenue base taxation is £236,000 higher than the profit shown in the company's accounts.

The difference arises because the company in its profit and loss account includes an item of £236,000 as provision for replacing assets at rising prices. This provision, which is barely adequate to provide for the rise in the cost of replacing plant alone, is omitted from the Inland Revenue computation of taxable profits.

COMPUTATION OF PROFITS

In the conventional method of computing profits (and this is the method adopted by the Inland Revenue for purposes of taxation), it is assumed that fixed assets can always be replaced, as they wear out, at the original cost price and the provision for replacement is based on this false view. It is obvious, therefore, that during periods of steeply rising prices, when fixed assets can only be replaced at far above the original cost, profits computed in the conventional way are grossly overstated, and give little inkling of the amounts available for dividends and expansion. If full provision were to be made for replacement of all assets (fixed and current) many companies would have very little profit to show at all.

It may be mentioned that the conventional method of computing profits is now recognised by industry as being quite inappropriate to periods of steeply rising prices and economists have expressed the view that the gross overstatement of profits during the last ten years or so has, by creating a false sense of prosperity, undoubtedly contributed to the present spiral of inflation. Possibly many shareholders have been a little bewildered to see companies carrying considerable amounts to reserve, and at the same time borrowing large sums to keep going. Some day perhaps they will demand that profit and loss accounts of public companies should show the true profit—that is, the amount available for dividends and expansion of business.

THE YEAR'S TRADING

As is reflected by the accounts, the year's trading has been fairly satisfactory. On the animal feeding stuffs side our sales have increased slightly although the total national sales have gone down because of a slight reduction in the ration. In seed crushing we have been rather less fortunate. The total national crush has decreased by about 15 per cent compared with 1950 and our company has suffered in roughly the same proportion. The reduction in total crush has been due mainly to the poor crop of groundnuts in Nigeria, from where the great bulk of our oilseeds are imported. The output of our oil refinery and compound cooking fat departments has been a little less and because of the reduced crush of groundnuts the output of Lecithin has also suffered.

The soap industry remains sternly competitive: 1951 was the first full year in which the housewife could buy soap without coupons, though retail selling prices were still controlled by the Ministry of Food. The demand for soap during the year was less than was expected, consumption being lower than in 1939. The company's position in the soap industry is unique in that it is the only independent soap-maker offering a complete range of domestic soap products to retailers in all parts of the country. Unfortunately, the trade is becoming gradually concentrated into very few hands and one wonders if this tendency will benefit anyone in the long run.

I am pleased to be able to inform you that our subsidiary company, Henry Cooke and Co. (1932), Limited, has had another successful year, and increased its profit over last year.

TWYFORD MILL, LIMITED

Many members will probably have already seen in the Press that in January, 1952, our company acquired the ordinary shares of Twyford Mill, Limited. While this transaction does not come strictly in the year under review, I think it will be appropriate if some reference is made to it here.

Twyford Mill, Limited, produce the finest pedigree seeds, and their mill is situated at Adderbury, near Banbury, Oxon. Our sales organisation have distributed a considerable proportion of their output for the past ten years and the association of the two companies has always been a very friendly one. I am sure that this union will be of great help in developing the business of Twyford Mill, Limited, and will, in addition, strengthen the parent company by giving it a little extra diversity in its range of products. The new board will consist of J. K. Bibby, chairman; S. P. Hoskins, managing director; and H. Mason Bibby and N. M. Bibby, directors.

PROFIT MARGINS

The main departments of the company are still under government control, and with the exception of seed crushing, the profit margins allowed to us by the Ministry of Food are exactly the same per ton of product as they were in 1939. The profit margins allowed for seed crushing have been increased as from January, 1951, because of the fact that the proportions of the various seeds crushed have changed over the past two or three years, but the new margins represent no more than would have been earned on the seeds in 1939.

The capital required for all departments has naturally increased very considerably; the price of animal feeding stuffs, for instance, has risen from £8 to £35 per ton and the capital we need to manufacture and market a ton of feeding stuffs has increased in similar proportion. The profit margins are, therefore, pitifully inadequate and especially so because in computing them it is assumed that plant and stocks can always be replaced at the prices at which they were bought. I have referred to this point in the first section of the review.

PERSONNEL

I deal with the subject of personnel last, but not because I consider it of least importance. The success of any business, and indeed the prosperity of any country, depends ultimately upon the human factor; upon the loyalty, enthusiasm and efficiency of those engaged in industry, whether in the factory, in the office or upon the road. One of the great problems of the present day is to maintain the enthusiasm and efficiency of those employed in industry at a high level, under conditions of large-scale production and the nation's standard of living depends upon a right solution of this problem.

In my last review I said that we were giving some thought to the question of incentives in the factory. We have not yet found any system which is applicable to a factory dealing with such a wide range of processes and products as we do, but in the meantime we believe that efficient management can itself be an incentive. I might mention that we have recently reconstituted our works council and it is now a much smaller body in which a more intimate and personal exchange of ideas between representatives of the management and of the workers can take place than in the former large council, and this is proving a success.

Before closing, I should like to refer to the friendly relations existing throughout the organisation. I wish it had been possible for the directors to have maintained the numerous personal contacts that were possible when the factory was smaller. Lastly, I wish to express on behalf of my co-directors and myself our great appreciation of the services of managers, foremen and workers who by their efforts contribute so much to the success of the company.

The report and accounts were unanimously adopted; the payment of a final dividend of 5 per cent, less income-tax, making with the interim dividend of 5 per cent, less income-tax, already paid, 10 per cent for the year, was approved; the retiring directors, Mr J. P. Bibby, Mr J. E. Bibby and Mr N. M. Bibby, were re-elected and, the remuneration of the auditors, Messrs Edward Denton and Sons, having been fixed, the proceedings terminated.

ASSOCIATED FISHERIES LIMITED

MR W. A. BENNETT'S REVIEW

In the course of his statement presented to the annual general meeting of Associated Fisheries Limited, held on May 20th, the chairman, Mr W. A. Bennett, said that there was every reason to be satisfied with the year's trading after the adverse results of the previous year. At the present time, however, the most serious and disturbing factor is the never ending rise in costs.

In October, 1949, the company was paying 94s. per ton for fuel oil while today the price is 184s. per ton. Nearly £600,000 is being spent annually on oil. The actual cost of operating a long-distance trawler before the war was £60 per sea day, while at the present time it is £260 per sea day for the latest oil burners. Overall catching costs in 1939 were approximately 1¼d. per lb and today they are 5d. per lb and these rising costs cannot be automatically passed on to customers. The industry is in an unenviable position. Although retail prices are approximately 2¼ to 2½ times those of prewar it must be remembered that retailers' costs have also risen substantially. The cost of distributing supplies from the port of landing to the retailer in 1939 was 1d. per lb—today it is in excess of 3d. per lb. Costs of production are at least four times higher than in 1939.

The fish industry is full of hazards and uncertainties and it would be unwise for anyone, however experienced, to predict the future. Nevertheless the company's trawling fleets are the most modern in the United Kingdom and comprise the largest catching unit in the world.

KEMSLEY NEWSPAPERS, LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The twenty-eighth annual general meeting held on Thursday, May 29, 1952, at of Kemsley Newspapers, Limited, will be Kemsley House, London.

The following is an extract from the statement of the chairman, the Viscount Kemsley, circulated with the report and accounts for the year ended December 31, 1951, to be submitted to the meeting.

The accounts which you have before you give the results for 1951 and the comparative figures for 1950. They show that after meeting debenture interest and all expenses of working and management the group's profit for the year was £1,662,000 of which the tax collector takes no less than £1,010,000, or over 60 per cent, and minority interests in subsidiaries take £8,000, leaving £644,000 as the net group profit attributable to your company for the year. The net dividend requirements on the preference shares take £272,500 and the margin available for reserves and for dividends on the £2,500,000 ordinary stock is therefore £371,000. The corresponding amount for 1950 was £493,000.

During the year we have redeemed out of the group's own resources debenture stocks of a nominal amount of £123,000 and have expended £446,000 on improvements and extensions of the properties, plant, transport and other fixed assets, or £200,000 more than the charge for depreciation which appears in the profit and loss account. Further substantial capital commitments are noted on the consolidated balance sheet; they amount in all to almost £700,000.

You will have noted that the working capital invested in stocks, which consist mainly of newsprint, increased from £638,000 to £1,164,000 during the year, that is by £526,000; this increased financial requirement was also provided from the resources of the group. Further increases in capital requirements for this purpose have occurred since the close of the year.

DIVIDEND POLICY

The upward trend of working capital requirements demonstrates the wisdom of the past policy of your company in conserving the group's resources and in raising debenture capital on favourable terms when, some years ago, interest rates were favourable to the company. The prospective further substantial requirements to which I have just referred and the very high proportion of the group's earnings which is taken by the Inland Revenue Authorities have caused your board to give further consideration to the dividend policy.

In all the circumstances the directors consider that the right course is to distribute a smaller sum from the net earnings than was distributed for 1950. We propose with reluctance, but with a sure conviction that it is in the best long-term interests of the stockholders, that the dividend for 1951 on the ordinary stock shall be at the reduced rate of 10 per cent. If this recommendation is approved it means that after allowing for the interim dividend of 5 per cent already paid at the same rate as for 1950 the final dividend will be 5 per cent as compared with 7 per cent for the previous year.

If this proposal becomes effective we shall start 1952 with resources greater in their balance sheet amounts by about £244,000 than those with which we started 1951. As I have already indicated, £200,000 of this is represented by a net increase in the investment in fixed assets. The remainder, namely £44,000, is all that is left as a contribution towards working capital requirements including those (£123,000) which were needed for debenture stock redemption during the year.

BURDEN OF TAXATION

I have referred on this and previous occasions to the crushing burden of taxation.

We now have an income tax at 47½ per cent and a profits tax at 2½ per cent levied on the undistributed profits of companies, with an additional 15 per cent levied on the gross amount of profits which are distributed in dividend. This additional rate of tax is levied with respect to preference dividends as well as ordinary dividends and, in the case of your company, the preference dividends attracted during 1951 no less than £210,000 by way of distributed profits tax. The whole burden, however, is payable by the company and thus falls upon the reserves and amounts available for the dividends of the ordinary stockholders. Moreover, it should be borne in mind that not all of the expenses which are necessarily charged in arriving at the profits shown by the accounts of the companies are treated as deductible expenses in assessing profits for taxation purposes. Matters like this are irritations when taxation is at low or medium levels, but at its present height are a serious burden upon the industrial machine.

PRESSURE OF COSTS

The pressure of costs has intensified the competition for circulation. The reason is obvious. Advertisement revenue is a vital factor in the economics of newspaper production, and while it is by no means wholly true that advertisement follows the large circulations, circulation is a major factor in determining rates. Yet quality of circulation is only less important than size, and many newspapers more than make up for a smaller circulation by the quality of their readership. At least two of our own newspapers are evidence of this. *The Sunday Times* although it has the largest quality circulation among Sunday newspapers nevertheless falls well below the mammoth figures of some of the popular Sunday newspapers. Yet its superiority as an advertising medium is never questioned. The same considerations apply to the *Daily Graphic*. That newspaper has a singularly faithful body of readers who prove themselves to be extremely valuable to the advertiser, for as every survey confirms, they are drawn from among those who have the money to respond to the offers advertisers make.

THE FUTURE

Looking to the future it must be obvious that under present conditions any material rise in the total circulation of newspapers can scarcely be expected. Our objective, then, must be to increase our share of that total by the utmost efficiency in production and attractiveness in presentation of our own newspapers. The value of advertising is even more widely recognised throughout the business world, and I am confident that the volume of advertising demand will continue to increase. So long, however, as newsprint remains at anything like its present price and so long as the total wage costs of production continue to mount, newspapers cannot achieve that degree of porfitability which the capital and effort engaged in them deserves.

We must therefore occupy ourselves in consolidation and economy against the time when we can make our calculations based on costs not subject to the sudden and striking increases we have experienced in 1951.

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS

FLUCTUATING PRICE LEVEL AND TAXATION

The sixty-seventh annual general meeting of The Society of Incorporated Accountants and Auditors was held on May 21st in London.

Mr C. Percival Barrowcliff, FSAA, the president, occupied the chair, and in the course of his address said:—

A much better understanding of the business structure appears to be necessary today. In so many ways we act as if we were dealing with something of strictly limited duration. We do not consistently regard business as a continuing enterprise nor approach it as an entity to be preserved. I would quote but two instances of this limited view: first, the accounting approach to the implications of changing money value, and secondly our present fiscal policy.

I submit that we need to reconsider seriously our attitude to the business structure. Its continuance is vital to the nation's economy. I think we should all agree that the successful business structure built up in this country has operated on the principle of continuity and that its success is in no small measure due to that factor. I suggest that there is much here to challenge our thoughts and I hope to cause a revision of our attitude to business enterprise.

MEASUREMENT OF REAL PROFITS

I have often stated my own views on the problem of fluctuating price levels. In measuring the real profits of an undertaking, depreciation of fixed assets should be charged on the basis of the current cost and, similarly, stocks should be considered in the same light because the fund so invested is virtually a fixed asset. Unless this is done in a period of rising prices, part of the capital of the undertaking is being included as profit. It is difficult to understand how such a profit, including—as it does—part of the capital resources of the business, can be represented as a "true and fair view" of the operating profit. Much is made of the difficulties in applying the foregoing principles. Admittedly there are difficulties, but we should address ourselves to a consideration of the serious effects of our existing conventions. I suggest these effects are more serious than the difficulties to be overcome.

TAXATION

There can hardly be two opinions on the question of the harm being done by the present crushing weight of taxation. I join with many others in deploring the crushing weight of death duties. Those of us in practice know full well the deep concern felt generally about the hardships occasioned by them. Moreover, the spirit of thrift which contributed so much to the country's financial strength in the past is rapidly disappearing. If we completely lost this spirit of thrift—what will be the result? I suggest there is only one answer—a diminishing standard of living.

I want to emphasise particularly the unfair incidence of death duties upon many private businesses. I would claim that family businesses are a vital part of the country's economy and should be preserved as a national asset. I ask for a reconsideration of the implications of death duties with particular reference to the unduly high rates for all ranges of estates and the invidious treatment of estates involving private businesses affected by Section 55 of the Finance Act, 1940.

RIO TINTO COMPANY, LIMITED

IMPROVED TRADING RESULTS

HIGHER YIELDS FROM RHODESIAN HOLDINGS

THE EARL OF BESSBOROUGH'S SPEECH

The seventy-ninth annual general meeting of R.o Tinto Company, Limited, was held on May 22nd in London, the Rt. Hon. the Earl of Bessborough, GCMG (the chairman), presiding.

The chairman, in the course of his speech, said:

The profit for the year, carried from revenue account to appropriation account, increased from £228,182 for 1950 to £944,015 for 1951, an increase of £715,833. Of this increase, £399,885 was due to the higher yields on your Rhodesian holdings, while on trading instead of a loss of £145,910 as in 1950, there was a profit of £144,164 for 1951.

The strength of the Rhodesian copper companies is remarkable, and as you have seen, this company has benefited handsomely from the extraordinarily successful year they enjoyed.

It is a matter for regret that so many overseas mining companies have been driven to take the control of their operations abroad, though we in this company from our own practical experience are well able to understand it, for we realise the weight of the extrusive pressure which the fiscal system brings to bear upon such enterprises.

ENCOURAGING OUTLOOK

Turning now to the company's trading position, members have had to wait a great number of years before the directors have been able to say that an improved outlook could be discerned for the company's Spanish business. However, the trading position did improve considerably during the year 1951 and, although the trading profit of £144,164 is small in comparison with the volume of trade done by the company, nevertheless there are reasonable grounds for believing that the long-term trading prospects are brighter.

Over the year 1951 exchange rates in Spain remained stable and in consequence a halt was called to the necessity for making substantial adjustments in the annual accounts because of exchange movements. Nevertheless, the surpluses which were achieved during the year were mainly reflected in a large increase in the company's Peseta assets in Spain. This in itself might even be regarded as something of an embarrassment so long as British taxation regulations maintain the absurd provision that profits arising in foreign currencies are taxable, whether or not they are remitted or able to be remitted. However, at the end of the year, accompanied by the managing director and Mr Gough, I paid a lengthy visit to Madrid, in the course of which, following interviews of a most friendly character with the Minister of Industry and the Minister of Commerce, arrangements were concluded for the resumption of sterling remittances. The implementation of these arrangements began immediately and certain sums have already been received. Your directors were given grounds to hope that these remittances would be continued.

I referred last year to the appointment of the Commission called Operation "P" to deal with the Spanish pyrites industry. Our relations with that body have been cordial and I should like to place on record our appreciation of the co-operative assistance rendered us by its members and of their understanding of the problems of the pyrites mines.

MINES IN SPAIN

The mines were in full production during the year and it is hoped that their productive capacity will be increased over the next year or two as a result of the Spanish Government having allocated $1,220,000 of the loan granted to Spain by the USA to the importation of plant and replacement materials which will be available for purchase by the Rio Tinto Mines. The labour supply is, however, at the moment only barely adequate for our needs. Sales of pyrites rose from 822,866 tons for 1950 to 951,175 tons for 1951. Rising costs have again overtaken the internal prices paid to the company for copper, sulphur and pyrites and your directors hope that too long a "time-lag" will not be allowed to occur before this disability is remedied by the authorities. It was the high price obtained for export pyrites which enabled the company to make Peseta profits.

Work at the mines continued uninterruptedly throughout the year under review and the directors are sure you will approve of the decision they made in December last to give a Christmas bonus to the Spanish staff and workmen amounting to about 4 million pesetas.

During the visit to Madrid to which I have alluded I had the honour of an audience with the Chief of the State. I was also most courteously received by the Minister of Foreign Affairs.

BALANCE SHEET

The market value of quoted investments has again increased and at the end of 1951 stood at £13,935,648.

EXPLORATION WORK

As stated in the directors' report, the board intends actively to pursue the examination of prospects in Africa and elsewhere as opportunity permits. Prospecting, it should be realised, is a long-dated programme and it is likely to be some time before anything will merit special mention.

ADMINISTRATION

No changes in the directorate have occurred since our last meeting. As you will have seen from the notice of the extraordinary general meeting which is to follow, certain amendments to the articles are being proposed which, with your approval, will, I hope, facilitate the day-to-day administration of the company.

DIVIDEND

As you have already been informed in the directors' report, the board recommend that the dividend on the ordinary shares be 15 per cent, free of tax, and that these shares should on this occasion receive in addition a bonus of 20 per cent, free of tax, on account of the extraordinary increase in Rhodesian investment income in 1951.

At the same time the carry-forward on appropriation account would be increased from £1,002,943 to £1,154,862.

The report and accounts were adopted.

At the subsequent extraordinary general meeting resolutions amending the articles of association were approved.

BEYER, PEACOCK AND COMPANY

(Locomotive Builders and General Engineers)

RECORD ORDER BOOKS

MR HAROLD WILMOT ON THE OUTLOOK

The annual general meeting of Beyer, Peacock and Company, Limited, was held on May 21st, in London, Mr Harold Wilmot, OBE (chairman and managing director), presiding.

The following is an extract from his circulated review.

The consolidated profit and loss account for 1951 shows the group profit, before tax, as £504,738 for that year, an increase over the previous year of £100,829. After taxation the combined net profit for the year was £238,065, an increase of £42,624 over the 1950 figure. This increase in profit was a reflection of higher total sales throughout the group.

In October, 1951, negotiations were started for the acquisition of further production facilities made necessary by additions to our range of products and the generally expanding order books of our group. These negotiations led to the purchase for £160,000 of the freehold land (approximately 30 acres), buildings, plant, machinery, motor vehicles, patterns, tools, dies and accessories, stocks of materials, spare parts, and work in progress, drawings, designs, and records of Dening and Company (1937), Limited. A new company called Denings of Chard, Limited, was formed as a wholly owned subsidiary of Richard Garrett Engineering Works, Limited, and this new company took over all the assets above described. Your directors confidently expect this acquisition to prove an added source of strength to the group as a whole.

SHORTAGES RESTRICT TRADE EXPANSION

The order books of the group stand at new record high levels and the only factors precluding considerable further expansion in productivity are shortages of skilled labour and the rationing of essential materials. Most of our products and their market are in categories officially described as carrying a high rating in the fields of essentiality. It should, therefore, be logical to expect little, if any, reduction in the volume of material supplies.

At the last annual general meeting a request was made that the Board should consider and if possible arrange for an interim dividend. An interim dividend—the first in the company's history—of 4 per cent gross was therefore paid on the ordinary shares in February last.

In my opinion the results for 1951 are gratifying. It would be folly to attempt a forecast in respect of 1952 without some warning that production problems are perhaps more serious and intractable than at any time in recent history. Our products do not suffer by comparison with those of our competitors which may account for our record order books at fair prices. Our factories are well equipped and finances are sufficient for immediate needs. Given adequate supplies of materials and no serious economic disturbance, the results for 1952 should be reasonable. Steel supplies in the first quarter were disappointing, but have subsequently improved.

The report and accounts were adopted and the proposed final dividend of 3½ per cent, plus a bonus of 2½ per cent, making 10 per cent, less tax, for the year, was approved.

BRITAIN STEAMSHIP COMPANY, LIMITED

VERY SATISFACTORY RESULTS

MR E. H. WATTS ON THE OUTLOOK

The sixty-eighth annual general meeting of the Britain Steamship Company, Limited, was held on May 16th at Winchester House, Old Broad Street, London, EC, Mr E. H. Watts, the chairman, presiding.

The Secretary (Mr F. J. Bassett, ACA) read the notice convening the meeting, and Mr B. Franklin, FCA, of Messrs Bagshaw and Co., the auditors, read the report of his firm.

The following is the Chairman's statement, which had been circulated with the report and accounts:—

I think you will agree that last year's results are very satisfactory. The company has made a lot of money and stockholders might well expect the directors to augment the increased dividend; the Government's appeal to restrict dividends should not, however, be ignored.

COMPETITION AND PENAL TAXATION

For 23 years I have warned the company's shareholders—now stockholders—of the inevitable result of successive governments ignoring the financial needs of the British Mercantile Marine and the fact that it is and has been open 100 per cent to foreign competition since the repeal of the Navigation Act early in the last century. As war succeeded war, the "inducement" demanded by neutrals—and sometimes allies—to charter their ships for the cause, was many times more than our economically minded Treasury would pay for British ships.

British profits were further reduced by penal taxation, a drain successfully avoided by our competitors. But it was not only in rates of hire that neutrals and others gained an advantage and the following example within our own knowledge will add point to this statement. When a five-year-old British ship was lost in the first half of the war, the government provided the owner with less than half the money needed to replace her, while the owner of a 30-year-old neutral was given the price of a new ship.

Stockholders have been advised of the wholly unsatisfactory financial position of their property if a new war breaks out. I am sorry to say that little real progress has been achieved during the last year in inducing the Treasury to agree to a fair war risk insurance scheme. For the first time this company has made profits, which will go some way to recovering the ground lost during the war.

EXTENSIVE BUILDING PROGRAMME

More than a year ago your directors worked out an appreciation of the world shipping situation by 1960. A large proportion of the world's dry cargo tonnage is obsolete or of poor war-time vintage. Many of these vessels would have to lay up, while "Britain" ships could still trade at a reasonable profit. Shipbuilders are overwhelmed with orders for tankers, but few tramps are on the stocks; there are not even enough of the latter to replace normal wastage. These are some of the reasons why your directors authorised the extensive building programme which is reported to you.

The new class of ship, m.v. *Windsor*, has been designed, as was the m.v. *Wanstead*, with an eye to developments of speed, subdivision, upkeep and efficiency not for today, but for ten years ahead. There is no need to remind you that ships are built to last 20 to 25 years.

One cost of shipowning which may be expected to rise progressively is repairs. That has been our experience since the company was founded. For this and other technical reasons we have resolutely set our faces against any welding in the hull. The only welding we have done is on the tank tops, the bulkheads and similar watertight structures. Welding is attractive from the point of view of first cost and weight-saving in the hull, but we think that owners who have gone in for it in a big way will pull long faces when their ships have hull repairs to be done.

FUTURE PROFITS

Stockholders will probably want some indication from us of our views for the future. During the past two or three months there has been a substantial fall from the rather absurd freight levels reached because of the demands for tonnage of the Korean war and different governments' stockpiling. I would here emphasise once more that the British share of the world's tonnage has dropped so much that we are no longer in a position to "make the market," and that these high rates of freight were run up not particularly by British shipowners but by a very large number of foreigners, including, curiously enough, the USA, who are footing most of the bill. Our view is that the profits for 1952 will not be as high as they were in 1951, but we still look for an adequate return for the services we render to the community.

The report and accounts were unanimously adopted; the retiring directors, Mr E. H. Watts and Mr D. Luke, were re-elected and Mr P. A. Clews was reappointed by special resolution. The remuneration of the auditors, Messrs Bagshaw and Company, was fixed, and the proceedings terminated with a vote of thanks to the staff, afloat and ashore.

JOHNSON & PHILLIPS

RECORD TRADING BALANCE

The forty-seventh annual general meeting of Johnson & Phillips, Limited, was held on May 22nd, in London.

Mr G. Leslie Wates, JP, chairman and joint managing director, in the course of his speech, said:—

The balance from the trading account for the year amounts to a record figure of over £800,000, and shows a satisfactory recovery from the fall in this balance which had occurred in 1950. The increase is accounted for mainly by increase in turnover, but partly by increase in the money value of some of our raw materials. On the other side the item which is substantially increased from the previous year is that of taxation. This includes the penal rate of profits tax introduced by the then Chancellor of the Exchequer in the Budget of 1951, and which, apparently, is now not to be redressed by the Budget of 1952. There is an increase in the net profit for the year of £140,000. We recommend that the dividend should be maintained at the same rate as for many years past.

Parliament is now debating a new excess profits levy. It is deplorable that the Government should contemplate any such tax on industry—a tax which is so unfair in its incidence, which penalises the progressive and energetic firms and in respect of which there is practically no incentive for any company to adventure and to produce more trade for the country. The well-established policy and practice common to all industry until the past few years has been the steady expansion and development of the business out of undistributed profits. This is impossible today because of high taxation.

The report was adopted.

THE UNITED MOLASSES COMPANY, LIMITED

INCREASED PROFITS

The twenty-sixth annual general meeting of this company will be held on June 10th in London.

The following is an extract from the circulated statement by the chairman, Sir F. Michael K. Kielberg, KBE:—

After charging depreciation and making provisions there remains a net profit of £2,452,650 compared with £1,173,052 for the year ended December 31, 1950.

The great increase in profits is mainly accounted for by high freights and increased profits on trading in Molasses which were favourably affected by the strong demand at high prices which continued right up to the last quarter of the year. Since then there has, however, been a steep decline in the use of Molasses for distilling purposes, largely caused by abnormally high prices since the autumn of 1950. Current prices are so high that they no longer bear any reasonable relation to available supplies and demand.

Although profits from Molasses in recent months show a sharp decline the consolidated profits for the first three months of the current year comfortably exceed profits earned during the same period last year and prospects for the next few months are equally promising. We live, however, in such uncertain and unpredictable times that all I feel safe in saying at present is that the year has started well and that the group's consolidated earnings for the current year, barring some catastrophic happenings in the months to come, should prove entirely satisfactory if compared with the earnings of any year prior to 1951.

PROCEA PRODUCTS LIMITED

SATISFACTORY PROGRESS

The fifteenth annual general meeting of Procea Products, Limited, was held on May 19th in London, Mr D. W. Kent-Jones, PhD, BSc, FRIC (the chairman), presiding.

The following are extracts from his statement:—

In spite of rising costs and despite competition, we have made satisfactory progress. This is reflected in our increased turnover, larger gross trading profit, and the highest net profit in the company's history. The period under review has, however, been difficult in many ways and particularly because of the ever-rising costs which the company has had to bear, part of which it has not passed on to its customers.

Today we have nearly 4,000 Procea bakers throughout the country, against the figure I reported this time last year of 2,800. During the year we have introduced a complete Procea flour and have reintroduced the Procea brown loaf.

There has been a steady increase in the sales of Procea bread and rolls. We have ample evidence of the public insistence on Procea bread, but naturally competition and reduced spending power of the public has meant that selling has not become easier. There is still a steadily increasing demand for both our Procea white and particularly for our Procea brown, and we are anticipating satisfactory results from a number of sales campaigns we are now running throughout the country.

In spite of the various problems we have encountered, and may encounter, I remain full of optimism and confidence.

The report was adopted.

UNITED DRAPERY STORES

SATISFACTORY PROFIT AND TURNOVER INCREASE

SIR BRIAN MOUNTAIN'S SURVEY

The twenty-fifth annual general meeting of United Drapery Stores, Limited, was held on May 22nd in London, Sir Brian E. S. Mountain, Bt (the chairman), presiding.

The following is an extract from his circulated statement:—

Our investments in subsidiary companies have increased by £541,000. This arises principally from two transactions. The first was the acquisition of 425,000 Ordinary shares of 5s. each in John Blundell, Limited, held by four insurance companies. We now hold over 90 per cent of the Ordinary share capital in this subsidiary.

The second transaction was the acquisition in September last of the business of John Fisher and Son (Glasgow), Limited, and its four associated household supply companies.

THE YEAR'S RESULTS

The increase in group trading profit by £492,000 to £1,894,124 must be considered satisfactory, particularly in a year in which retail distributors have not, in general, shown increased profits. Of this increase, approximately £180,000 arises from new businesses or interests acquired during the last two years. The remaining increase of £312,000 reflects the expansion of our other subsidiary interests. The latter increase has been achieved in spite of substantial rises in costs of every description, and is mainly due to a satisfactory increase in turnover.

Decreases in retail prices, due to reduced demands by the public and to heavy stocks held by manufacturers and wholesalers, have had the result that, for the first time since 1939, business has become really competitive. We welcome this competition, which has undoubtedly led to better values being offered to the public, and it will be our endeavour to continue to improve on the values we can offer in our businesses.

You will notice that there remains a resultant profit, before taxation, of £1,760,974, which is just over £500,000 higher than the comparative figure for the previous year.

EPL: A BRAKE ON PROGRESS

The demands of taxation require nearly £1,100,000 or about five-eighths of our profits.

Excess Profits Levy acts as a brake on progressive and expanding businesses and by its nature tends to destroy incentive and encourage wasteful and unproductive expenditure.

As far as our group is concerned, approximate calculations have been made of our possible future excess profits liability and, assuming that we earn next year profits similar to those before you, we estimate that the increased total charge for taxation, after taking into account the reduction in profits tax, will be in the neighbourhood of £100,000. This is indeed a heavy blow, particularly as any increase in profits above this year's figure will be taxed at 16s. in the £.

The net profit attributable to the group after taxation is £606,484, which is £170,000 more than a year ago. Your directors have decided to recommend a total distribution for the year of 30 per cent a modest increase of 2½ per cent.

I am confident that whatever lies ahead our organisation is well equipped to deal with the various problems that will undoubtedly arise. A stabilising factor in the present uncertainty is that our businesses are well spread and cater for all classes of the public. In spite of rising expenses and general uncertainty we are hopeful that the current year's results will in all the circumstances prove to be satisfactory.

The report was adopted.

MURPHY RADIO

EXPORTS MORE THAN DOUBLED

The annual general meeting of Murphy Radio Limited, was held on May 21st, Mr E. J. Power, the chairman, presiding.

The following is an extract from his circulated statement:—

In submitting the report and accounts for 1951 I am happy to say that the progress of the group has been well maintained. The parent company's turnover exceeded that of last year and the subsidiary companies, developing as planned, contributed in good measure to the group profit. The net profit before tax is £412,927 compared with £251,535. Taxation reduces the amount available for distribution to £168,272, and after payment of the preference dividend and provision for the 10 per cent on the ordinary shares, the carry forward at the end of 1951 was £149,879 compared with £20,260.

In spite of the increase in profits the board recommends maintaining the same rate of dividend on the ordinary shares as last year, since under present conditions they consider it essential to retain in the business as much cash as possible. The threat of dividend limitation, and the recently proposed financial measures of the 1952 budget, have contributed to the unfavourable conditions for the raising of further capital.

The new excess profits levy, if enacted in its present form, will probably result in a considerable increase in the burden of tax carried by your company. Whatever may be said for or against the form of the excess profits levy or even the necessity for it, there is no doubt that the word "excess" has a tang about it which is most objectionable and misleading.

INCREASED TURNOVER

Turnover in all products has increased and having regard to the nation's urgent need of exports and the increasing competitiveness of other manufacturing countries it is particularly gratifying to be able to say that the total of our exports has considerably more than doubled. Our subsidiary, associated and overseas companies have substantially assisted in this advance; they have strengthened their own positions, and provided a valuable source of revenue to the group.

The television relay service in Gloucester, to which I referred last year, is now well established and expanding rapidly. Many delegations have visited this pioneer relay service, and as a result concessions have been received from other cities.

In these days, when political action at home and abroad can drastically affect industry's prospects overnight, it is unwise to rely too much on carrying out preconceived ideas. The broad base of your company's products does, however, give us the opportunity of minimizing the effect of restriction in any one sphere. The opening of the new television transmitters in Scotland and Wales will bring more homes within the reception area, but the increasing cost of living and the government's restriction of hire-purchase facilities will restrict the overall demand for home market domestic products. However, the proportion of our manufacturing capacity which is being devoted to electronic equipment for supply to governments at home and abroad and to large corporations is rising rapidly. Orders for such equipment to be supplied during 1952-53 are considerably in excess of those executed in 1951, which themselves were greater than 1950.

Success depends a great deal upon the manner of carrying out the day-to-day work of the business, and once again I am glad to say, on your behalf and on that of the board, how much we appreciate the loyalty and keenness of our employees in all companies.

The report was adopted.

LANCASHIRE HANDBAG COMPANY LIMITED

SATISFACTORY RESULTS

MR R. W. JERRATT ON TRADING CONDITIONS

The twenty-first ordinary general meeting of the Lancashire Handbag Company Limited, was held on May 15th at 55 Bishopsgate, London, EC.

Mr R. W. Jerratt, the chairman, said: Gentlemen, we are submitting for your approval the twenty-first annual balance sheet and accounts, which, as in the past, you will no doubt agree to take as read. (Agreed.) It will be observed that your company has not escaped the effects of the recession which, during the second half of last year, hit the retail trade generally.

The trading profit is £64,112, as compared with £76,707 for the previous year, and the net profit, after providing for taxation and depreciation, etc., is shown at £18,654. Although the profit is not equal to that of last year, considering the special trading conditions with which your company was confronted we feel sure that you will agree that these results are not unsatisfactory.

RISE IN COSTS

The turnover in value for the year and the quantities sold were slightly less than those for 1951. During the year our costs rose due to increases in wages and materials and we continued our policy, to which I referred last year, of absorbing the increased cost to the maximum extent possible before passing this on to our customers. We must continue this policy in order to maintain production and stimulate sales and meet the keener competition with which we are now faced.

Present conditions of retail trading generally make it impossible to forecast the future of business but I can assure you that, given materials at reasonable prices, and with our efficient staff and competent management and a reputation for quality and design second to none in the trade, we shall, as always, continue to do our best for the company.

Your directors are conscious that the success of the company is dependent to a large extent upon the efficiency of the staff and I wish to take this opportunity, on your behalf, of expressing our appreciation to our managing director and members of the staff for the loyal co-operation which they have shown throughout a difficult year.

The report and accounts were unanimously adopted and the proposed final dividend of 10 per cent actual, less tax, making 20 per cent, less tax, for the year, was approved.

CROWN AGENTS FOR THE COLONIES

EX-ECONOMIC AND MARKETING OFFICER required by the Government of Uganda for the Department of Commerce for one tour of 2½ to 3 years with prospect of permanency. Salary according to age and experience in the scale £687, rising to £1,390 a year (including allowances). Outfit allowance £30. Free passages for the officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary Candidates under 30 years of age should be of good education and preferably have a knowledge of commercial practice or agricultural marketing. A University degree would be an advantage.

Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting on letter M.29085.C. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1952. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1952, may eventually be announced. The Scientific posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1952 may be admitted to compete before the result of their degree examination is known.

Age Limits: Senior Scientific Officers, between 26 and 31; for Scientific Officers and Patent Classes, between 21 and 28 during 1952 (up to 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers (men), £812—£1,022; (women) £681—£917; Scientific Officers (men), £440—£707; (women) £440—£576; Patent Examiner and Patent Officer Classes (men), £440—£655. (Rates for women under review.) Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S 53/52 for Senior Scientific Officers and S. 52/52 and S. 128/52 for the other posts.

SPANISH BANK REQUIRES SUB MANAGER, CANARY ISLANDS BRANCH, AND OFFICIALS FOR FOREIGN DEPARTMENTS IN SPAIN. SOME KNOWLEDGE OF SPANISH AN ADVANTAGE.—WRITE, STATING BANKING EXPERIENCE, BOX NO. 958.

AN EASTERN BANK seeks a Resident Principal (male) for its Training College for Asian executive officers which will shortly be opened in Surrey.

Candidates must be British subjects by birth, not older than 55, and they should have held teaching or administrative posts at universities or colleges in Southern Asia, South-Eastern Asia or the Far East. A degree in Economics or Commerce would be an advantage.

The appointment will be made for an initial term of five years.—Applications, accompanied by testimonials, should be addressed to Box 5835, c/o Charles Barker & Sons, Ltd., 31, Budge Row, Cannon Street, London, E.C.4.

SALES CONTROLLER.—Well known both home and export. For the past ten years has with great success directed the sales force of a large Textile Organisation, employing seventy-five travellers in the home trade and extensive overseas representation. Advertising, Sales Promotion and Market Research. For personal reasons is now considering a change. Would be interested in either sales or general management or possibly a partnership. Highest top level recommendations.—Write in complete confidence, Box 949.

A CHALLENGE to a young accountant of dynamic personality who can "stick it" and make good. Large British engineering company with works in Calcutta requires qualified Accountant for appointment under renewable contract; initial period three years. Good salary with generous allowances and six months' leave on full pay at end of each contract period. Advertiser only interested in applicants who are prepared to settle in India with the Company. Job is progressive and qualifies for good pension at early age.—Box 948.

THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write, Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

EXHIBITION OF BOOKS ON INTERNATIONAL RELATIONS (English American, French) at BOOK HOUSE LIMITED, 7, Whitehall, S.W.1, 10-5.30, Saturdays included; open to June 7th.

EFFICIENCY IN BUSINESS.—An Exhibition of the latest books on all aspects of business administration and management is open until June 6th, from 9.30 a.m. to 6 p.m. daily, at C.P.C. LONDON BOOKSHOP 6, VICTORIA STREET, S.W.1. Tel.: WHI 4011.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (*periodicals excluded*).

YOUNG graduate to initiate a market research programme wanted by large non-ferrous metal and chemical combine. Headquarters in London. Age 25-35. Some commercial background essential. Salary £800 upwards according to experience and results. Write for further details and form of application to J. Munro Fraser Ltd., 32, Duke Street, St. James's, London, S.W.1.

A CREDIT CONTROL MANAGER wanted for large industrial corporation with headquarters in London. Age 28-45. Experience of similar work essential. Salary £800 upwards, according to qualifications. Write for further details and form of application to J. Munro Fraser Ltd., 32, Duke Street, St. James's, London, S.W.1.

YOUNG MAN just left Public School, now waiting to be called up for National Service in August desires interesting post until then. Keen on gaining experience in industry or commerce.—Box 962.

UNIVERSITY OF ABERDEEN

POLITICAL ECONOMY DEPARTMENT

Applications are invited for a Junior Research Fellowship and Assistantship in Political Economy. Salaries: Research Fellow—£400 to £500, Assistant £450 or £500 per annum, according to qualifications and experience, plus F.S.S.U. and Children's Allowances. The University will pay a proportion of furniture removal expenses.

Applications should reach the Secretary to the University (from whom forms of applications and conditions of appointment may be obtained) not later than June 20, 1952.

The University, Aberdeen. H. J. BUTCHART, Secretary.

COLLEGE OF TECHNOLOGY, BIRMINGHAM

The Governing Body seeks to appoint to the

DEPARTMENT OF INDUSTRIAL ADMINISTRATION

someone of high personal calibre, with industrial experience, qualified to conduct study of the problems of

HUMAN RELATIONSHIPS IN INDUSTRY

and to develop the capacity of students of industrial management to work effectively with people.

The appointment will be in the grade of Senior Lecturer—*salary £1,000 by £25 to £1,150 (men) or £800 by £20 to £920 (women).* Further information and a form of application which must be returned not later than 14 days after the publication of this advertisement may be obtained from The Registrar, College of Technology, Suffolk Street, Birmingham, 1.—C. McCaw, Clerk to the Governing Body.

THE POLYTECHNIC

309 REGENT STREET, W.1

Session 1952-3

Enrolment can now be made for the following full-time courses:—

(1) Preliminary and Final B.Sc.(Econ.), and Final B.Com. of London University.
(2) Commercial Studies and Administration.
(3) General Secretarial Studies.
(4) Professional Course for Accountants.
(5) Professional Course for Statisticians.

Also

(6) A part-time Course in Economics of Labour and Industry.

Inquiries and applications to the Head of the School of Commerce, from whom a prospectus can be obtained.

UNIVERSITY LECTURESHIPS IN ECONOMICS AND STATISTICS

The Appointments Committee of the Faculty of Economics and Politics give notice that they hope to appoint a University Lecturer in Economics and a University Lecturer in Statistics to take office from October 1, 1952. The appointments will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Appointments Committee, the Marshall Library, Downing Street, Cambridge, to whom applications should be sent to reach him not later than June 18th. Candidates for the post of Lecturer in Statistics will be expected to provide evidence of their proficiency in Economics as well as in the theory of Statistics.

Eight copies of each application should be sent, and, if so desired, one or more copies of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

May 16, 1952.

APPLICATIONS are invited for the post of Provincial Agricultural Economist of the Eastern Province stationed at Cambridge. The duties are general responsibility for research, for economic investigations in the field, and for advisory work in farm management. The salary will be in the grade of Principal Agricultural Economist, i.e., £1,040 x £40—£1,240 x £50—£1,395. After some years of satisfactory service a responsibility allowance may be added. The successful applicant will be required to join the Federated Superannuation System for Universities. A limited amount of teaching of a suitable character may be associated with the post.

Applications, in writing, together with the names and addresses of three referees, should be sent to the Secretary, School of Agriculture, Downing Street, Cambridge, by June 7, 1952.

SENIOR BUSINESS EXECUTIVE with world-wide experience, fluent French, German, Spanish, available for executive position entailing business journeys abroad.—Box 944.

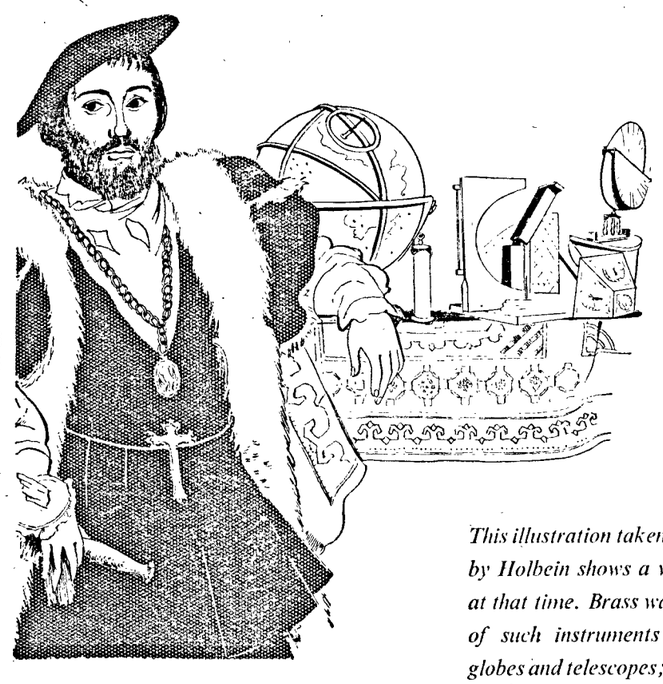
SECRETARY REQUIRED for Screen Advertising Executive. Must be well educated, with good appearance, able to handle interviews and correspondence on her own. Fluent French. Other languages an advantage. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.—Write Box E 628, L.P.E., 110, St. Martin's Lane, London, W.C.2.

AN important industrial educational organisation in the Midlands requires part-time services of enterprising liaison officer to contact industrialists at director level. Congenial occupation for right man.—Apply, Economic League, Lombard House, Birmingham 3.

HONOURS Graduate Economics (31), with full practical experience of Export up to executive level and knowledge of German, French, Spanish, seeks change offering scope.—Box 946.

TEXTILE Graduate (31), wide technical, commercial experience, travelled, foreign languages, invites proposition connected with export trade at home or abroad.—Box 960.

AMERICAN Professor, visiting England academic year 1952-53, wishes rent furnished flat or house; preferably London, Cambridge or Oxford.—Write details to Cyril Bibby, 14, The Avenue, Barnet, Herts.



POSTAL TUITION for **B.Sc. ECON.**

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 765 successes at Lond. B.Sc. Econ. Final Examinations, 1925/51.

Prospectus from the Director of Studies, Department P17 **WOLSEY HALL, OXFORD**

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland and Overseas 2d.—Saturday, May 24, 1952.

THE HISTORY OF ZINC

ZINC has been in use in Europe since the 16th Century

This illustration taken from the painting 'The Ambassadors' by Holbein shows a variety of Scientific Instruments in use at that time. Brass was used exclusively for the manufacture of such instruments as astrolabes, quadrants, sundials, globes and telescopes; many of these are shown in this picture.

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal and Pigments, include the production of Sulphuric Acid, Fluorine and its compounds and a variety of other important chemicals.

Campaigning Season

AS General Ridgway takes over this week the supreme command of allied forces in Europe, a new campaigning season opens in the cold war. One stage of the long diplomatic struggle with Russia for the allegiance of Germany has ended, and another now begins. In one treaty Western Germany gets the next best thing to a peace treaty and many of the essentials of sovereignty; in another it accepts the rights and obligations of membership in a European Defence Community. The way is open to a German army of 12 divisions—some 200,000 men—and a tactical air force; if the way is barred to independent German forces, a revived general staff, and the manufacture of the main scientific weapons, the Russians must still see in all this the beginnings of a German revival in the western camp of which the end cannot be foreseen. They will almost certainly be nervous; for the initiative in German affairs has, for the moment, been snatched from them and they face the prospect of a serious diplomatic defeat. Therefore, say those who feared war in May of last year and fear it again now—therefore, the Russians will strike back.

They certainly will; on that score there can be no doubt. But it does not follow that they will use military methods. Germany is not Korea, even though General Ridgway's arrival from the fighting front to the political front may suggest certain analogies between these two divided countries. There can be no purely local war on the frontier between western and eastern Germany, no secluded *Putsch* in Berlin; the guarantees given to Germany and to the Defence Community by Nato ensure that. Attempts to use force will be met by force. This should be clearly understood on all sides, for the whole purpose of Allied policy in Europe is to provide clear and powerful deterrents to aggression in any form—that and no more. This must be seen as clearly in Moscow as in Washington, and to suggest that the Russians ignore the deterrents and will deliberately provoke war is to imply that their political game in Germany and Europe is already lost. In fact it is not; the cards have been re-dealt, but the game goes on, with the Russians still strong in trumps.

In the first place, no one in France or Germany expects the two new treaties to be ratified before October. The results of so much private negotiation need thorough public and parliamentary discussion if the powerful resistance in the Assembly and the Bundestag is to be overcome. Neither M. Pinay nor Dr Adenauer is strong enough to bulldoze the Oppositions they face. In the second place, everything that the Russians do or say between now and the autumn will influence the chances of ratification. If they make it easier—as they may—to talk sense about free elections and unity for Germany, opinion in Western Germany will press for four-power talks, and progress towards ratification will slow down to crawling pace. If the Russians use the stick as well as the carrot, if they bully the free Berliners while wooing the westerners, they will close the official ranks in western countries but will cause grave uneasiness in the unofficial ranks behind them.

There is little that the western allies can do in Germany to hurry on execution of what they have put on paper; and there is much that the Russians—and the Germans—can do to slow it up.

*

What is to be expected, therefore, in this critical and crowded summer is a war of nerves such as the West has not experienced since 1948. Berlin may again be the storm centre, for it is there that the Russians have the strategical, and the German Communists the political, advantage. Things can be done to the free sectors of the city which are short of direct aggression, but only just. If there is one way in which the Russians might reckon to force the West into direct conversations it is by a variant of the methods of four years ago. It is true that such tactics might gain votes for Dr Adenauer, as evidence of the kind of pressure to which a united German government might be subject in the old capital of the Reich. It is also true that the bullying of Berlin would strengthen the determination of the free nations to get on with the job of giving Western Europe effective defences and cause some embarrassment to the critics of rearmament. But the Russians have miscalculated Western reactions in the past—indeed, they virtually created the Atlantic alliance—and they might calculate that the Allies could be frightened into pausing on the threshold of alliance with a rearmed Germany. Europe may have to show that it cannot be frightened.

In such a situation the role to be played by the Supreme Commander this summer is clear. It is to give undivided attention to everything that impedes fulfilment of Nato's defence programme for 1952. The operation is behind schedule and the causes of delay are well known: failure of governments to train adequate reserves for the divisions in the field; lags in the production of aircraft and weapons both in the United States and this country; delays in the arrival of American equipment; lack of energy and capacity in some subordinate commanders; inadequate arrangements for land communications and logistics. General Ridgway inherits the handicap that falls on every general staff that has purely defensive instructions: he has to execute simultaneously a long-term plan to make Western Europe gradually stronger and a short-term plan to deter any advisers of Stalin who feel that 1952 offers the last chance of preventing the West from achieving equality of forces in Europe.

But, it can be objected, if it is cold war that is to be expected this summer and not the real thing, is not the main effort called for elsewhere? Is it not morale that will be decisive, the strength of popular conviction that the Allies are following the right course? Western Europe is, after all, the arena; the troops defending it are surrounded by spectators. It makes a lot of difference whether they jeer or cheer. Whose job is it to argue with the crowd? That was one of the jobs that General Eisenhower did best; but it remains to be seen whether General Ridgway is the man to continue it. If he is to know his troops and his commanders, and make his presence felt among them, there will be no time this summer for the Eisenhower touch. Nor will there be time for the stream of non-military problems that were solved by it.

Political direction should be the task of Lord Ismay and the new permanent organisation of Nato that

he is building up. Unfortunately, the tendency there is to start again from scratch, to pull up all the roots planted during three years in London. If Nato has satisfactory organs of political and economic decision by the autumn most people will be surprised. Even then it is not certain that men with the requisite powers of leadership will be there to use them. Nato has passed the stage of planning and has now to put drive behind production and delivery, burden-sharing and exchange of equipment. Lord Ismay has to create the spirit of international loyalty that prevails in the Supreme Headquarters. It is not enough to talk of controlling the generals and setting the pace for them; the task for 1952 is to support the plans they have made and the troops they have organised. If there have been too many half-measures, it is the politicians not the officers who are to blame; and it is Nato's job to bring collective pressure to bear on them.

*

Where else, then, is leadership to be sought? General Eisenhower insisted on its importance in his parting speech in London: "We cannot focus our eyes too narrowly on tanks, guns, planes and ships. They cannot alone preserve peace nor can they preserve freedom." In other words, one of the major tasks of the Atlantic alliance falls on politicians and leaders of public opinion. For every six speeches that are made in the United States about the joint effort, only one is made in Europe. The statesmen, on the whole, have done well and Mr Eden has been outstanding; it is the politicians, trade union leaders, and others with access to public opinion who have failed. And here a special responsibility falls on parties in opposition, whether it is in Britain or in Germany or elsewhere. They accept, generally speaking, the need for democratic governments to be strong, but they cavil about the amount of strength required. What could be wisely and usefully said in 1954 is foolishly and harmfully said in 1952. The ordinary man who hears their arguments feels that if it is possible, as they say, to slow down rearmament and defence preparation, then the international situation must be improving. The politicians may stop short of throwing the baby out with the bath water, but the voter listening to them does not. The result is half measures in the factory and divisions of half-armed troops.

All over Europe the argument is being used that rearmament and the alliance with Germans make it more difficult to come to negotiation with the Russians, whereas the facts of the last three years show precisely the opposite. The gradual adjustment of military power between East and West is slowly obliging the Russians to define terms on which they will negotiate on specific issues. It is a tense and dangerous process of diplomatic attrition, because no one really knows what goes on in the Kremlin. But there was already tension and danger before the process started—and a feeling that nothing could be done about it. The duty of democratic politicians is to show that something is now being done about it, to be candid about international risks, to recall what happened fifteen years ago when these risks were not taken, and to explain that the Atlantic organisation is already an inspiring feat of solidarity among friends. General Ridgway must be free to delegate this task, for Nato itself cannot look after the home front, and it is there that the test may come during the summer ahead.

Mr Butler's Finance Bill

THE Finance Bill reached the end of the committee stage on Thursday morning. Its detailed discussion in Parliament is over. The long debates on a long Bill have left behind an impression that is certainly misleading and may be dangerous to the public interest. This is the impression that Mr Butler's financial policy, in its entirety, lacks an adequate degree of support either from Parliament or from public opinion. It was perhaps inevitable that criticisms should have predominated in the debates. The Labour party, in spite of Mr Bevan's threats, have not obstructed the Bill, but they have certainly opposed it. And the comparative moderation of their strategy has tempted the Conservative critics of certain parts of the Bill to go further than they might otherwise have done. The Chancellor's supporters have hung back—doubtless in the laudable desire to save parliamentary time. But the net result is to leave the impression that the Budget has lost its friends, and that the Conservatives who cheered themselves hoarse on Budget Day have had second thoughts.

This is not only unfair to Mr Butler, but it is also dangerous. The policy that Mr Butler has pursued since he took office—including the Budget, but not confined to it—has had its defects and its weaknesses. But on the whole it has manifestly been to the advantage of the country. Indeed, it represents the main ground for hoping that the battle for the pound sterling may yet be won; and it has required considerable political courage in its execution. If now the courage is not to be rewarded and it is only the defects of the policy that are to be recalled, then, politics being politics, the policy will lapse into inaction and the courage into compromise. All those who think the Butler policy, seen in the round, is better, not than some ideal alternative, but than what would in fact take its place if it were abandoned, should stand up and be counted.

To say this is not to palliate any of the Budget's defects. For the Excess Profits Levy, even in its revised form, it is impossible to say a single good word. It is still true, as it was in March, that the Budget takes too weak a view of the nation's necessities and would have been better if it had built up a larger surplus. It has become apparent, to be sure, that the Budget was about as severe as was possible in the political circumstances. But that does not so much void the criticism of its weakness as deflect it from Mr Butler to the colleagues and supporters who would not follow him any further.

There can be no retraction of these complaints against the Budget. But now that it is, for all practical purposes, enacted into law, it becomes more important to recall its favourable features, and to strengthen Mr Butler's hand for the future. He is, after all, the only Minister in the present Government who has been effective in changing policy and in changing it in the right direction. (Mr Harold Macmillan has also proved himself to be an effective Minister, but the more effective he is, the more the real public interest is damaged.) The Chancellor deserves more articulate support from public opinion than he has been receiving.

The first point that should be remembered in his favour—perhaps in the long run it will turn out to be the most important—is that he made a start with cutting the bloated total of state expenditure. This is democratically right—there can be no doubt that if the British people were ever asked whether they would like to have more of their own money to spend in their own way, the response would be overwhelming—and it is economically imperative; nevertheless, it required some courage to propose, for what is chiefly audible when cuts in expenditure are proposed are the complaints of those who are hurt in the first stage, not the gratitude of those who benefit from the reduced taxation. Nevertheless, it requires no argument that the British economy, if it is ever again to be supple and buoyant, must be relieved of the mountainous incubus of taxation that presses upon it. To take the first step in this direction, however small, is not a matter for one day's praise alone.

*

Moreover, Mr Butler's Budget had the merit of showing that the expenditure of the state could be cut without the standard of living of the working class suffering thereby. This is a political merit, and only a questionable economic merit, since if the Budget had been as much sterner as it should have been, then the Chancellor would not have been able to hand back in tax concessions and increases in social security payments as much as he took away by reducing the subsidies. But he deserves some defence on the point if only because it is the one on which he has been most unfairly attacked. There is undoubtedly one section of the working class that loses on balance from the Budget—those whose incomes are too small to benefit from the reductions in income tax and whose families are too small to gain from the increases in family allowances. Exact statistics are not available; but it is certainly a minority, and almost certainly a small minority, of the wage-earners of the country. Yet from the start the Labour party have sought to give the impression that "the poor" as a whole are being penalised in favour of "the rich," and the Conservative Central Office seems to be so inert in matters of public information, now that all its bright young men are so busy in the House of Commons, that it has very largely allowed the Socialists to get away with an assertion that is manifestly contrary to the facts. Even the *Economic Bulletin* of the Economic Commission for Europe at Geneva goes so far as to say that "the result" of the Budget "is generally regressive," and that "on balance, all families with an annual income of below £350, who represent something close to one-half of the total number of family incomes, will be worse off." Both statements are untrue. It is strange to see an organ of the United Nations either being taken in by, or lending itself to, the propaganda of the Opposition party in this country, and Her Majesty's Ministers would be within their rights in resenting it.

By far the strongest point of Mr Butler's financial policy, however, still remains to be mentioned. This is his revival of credit control, and the decisive stop that he has put to the era of dogmatic cheap money. The rate of interest, like that other great regulator the rate of exchange, is a most powerful weapon of economic policy, the more potent because its workings cannot be fully set out in advance. Those who like to have every-

thing worked out in a neat statistical table are inclined to say, beforehand, that a change in either rate would have very little effect. They said it before the exchange rate was altered in September, 1949, and they said it again before Mr Butler started putting Bank Rate up and tightening the base of credit last autumn. The effects cannot be seen or comprehended in advance, since they operate through hundreds of thousands of private decisions in every boardroom and bank parlour up and down the country and overseas. But they are nevertheless most profound and—at least in the case of Bank Rate—almost wholly beneficial.

The increase in Bank Rate was doubtless not the only reason why the pound sterling shot above parity on the day after Budget Day and the drain on the reserves temporarily ceased; but it was the main reason. Nor is it wholly a coincidence that the pound again fell below the line and (presumably) the losses started again precisely at the time when Mr Butler's policies seemed to be losing public confidence at home. If Bank Rate had achieved no more than to purchase a respite for those crucial nine weeks it would have been well worth while. But it has done much more, by taking up a great deal of the slack in the British economy; and it can do more yet, if there is full confidence that the stiffer monetary policy will be pursued with consistency and vigour. The need of the moment is not to jog the Chancellor's elbow, but to strengthen his hand.

Malaise Among the Mandarins

ONE had believed that policies were as much part of a British politician as recipes are part of a French chef—but apparently it is not so. We are told on the best authority that the Conservatives have, on many important matters, no policy. The Labour party is said to be in an even worse way, and to have no policy at all. Socialists are waiting for ideas as a becalmed ship waits for a breeze, and no amount of huffing and puffing by the neo-Fabians seems to help. The Liberals, too, have no real policy; they wait for no wind but row and row, like the men who went to sea in a sieve. This spectacle of politicians without policies is a serious matter, for it suggests that something vital in the English way of life is threatened with extinction. Can it be a result of the postwar revolution? Is it the fault of the *Zeitgeist* or of Dr Dalton? Has the decline in classical education something to do with it, or is the politician just no longer the man he was? The causes may be biological, psychological, ecological—or perhaps sociological. Someone should make it his business to be paid to find out.

On balance one would favour a sociological investigation, for there are few things more diverting than the sight of a sociologist—or should it be an anthropologist?—struggling to find order in the habits and customs of the English. His job should be strictly defined: to find out where and when and how policy was conceived in the days when parties still had policies. He might do worse than to make a comparative study of policy-making environment at four dates—say 1885, 1905, 1925 and 1945. That would cover the age of Webb, the glorious social revolution accomplished by Gladstone, Asquith, Lloyd George and Dalton. It would span the stretch of progressive thought from Marx to Mikardo, the social transition from country house party to summer school, from morning dress to corduroys, from Trollope to *Tribune*. There is no doubt that the ruling class, seventy years ago, spent its week-ends making policy in an environment quite different from that in which the ruling class of seven years ago conceived the welfare state. The task of research is to discover what there was in the ways of 1885 that prevented policy fizzling out in 1892, and to apply the knowledge to the circumstances of 1952.

One has heard that in Victorian and Edwardian days politicians imbibed ideas and exuded policies at house parties over nuts and wine. At dinner the young backbencher and the old front-bencher took each other's measure. So long as the ladies were present, politics were touched on with well-bred wit and casual wisdom. With the ladies out of the room, the company began to talk seriously about the state of the nation; and out of the zeal of the younger men to be original and the determination of their elders to be cynical there were born ideas. In the wide spaces of the country house cabals could form in the library and individuals could reflect in the solitude of the gunroom. What had been sketched at the dinner table on Friday could be painted in on Saturday over the guns or the croquet hoops. By Sunday something could be formulated in words. By Monday there was a policy, and by Tuesday it was a paper in Whitehall—and so on. There was no Economic Survey to consult; no one had to bother about the balance of payments; and the class war seemed mainly an affair between gamekeepers and poachers. The secret of the process lay in leisure and space, in the stimulus of select company, and in the feeling of intimate conspiracy which is common to ruling cliques and revolutionary societies. What such a company agreed on—whether at the Cecils' or the Webbs'—was *ipso facto* policy. If it happened to be foreign policy, it mattered comparatively little what the foreigner thought about it: Britannia ruled the waves and the Foreign Secretary had no telegrams to read.

It is difficult to believe that this gracious and leisurely manner of policy-making has entirely disappeared. The Labour Party, it is true, has made it almost impossible to live in country houses, and full employment has led to the extinction of the butler as swiftly as the tractor has driven out the horse. But there is still Chequers—and of course Chartwell and Hatfield and one or two others survive. (Mr Molotov, one remembers, was so alarmed by the easy-going ways of Chequers that he slept with a revolver by his bedside and a secret policeman standing at his door.) But where else are policies worked out by such methods? Are there houses where civil servants join their ministers late on a Saturday, with their red boxes, statistics and files? And what about the dons—especially the economics dons—without whom progressive policy-making is impossible? Where are they to be found at the week-ends? These are questions well worth investigating in a scientific spirit.

The Conservatives, one presumes, struggle to keep the tradition alive; but their opponents do their best to change it. Labour, on the whole, seems to favour at the week-end the country cottage and the company of philosophical gardeners; or beer and darts in the con-

stituency. If they use the country house at all, it is the mansion that has seen better days: the hollow-sounding house of bare corridors, with the well-kept lawn and neglected shrubs, dedicated to adult education, new philosophies and world citizenship. Fundamental social policies, enlightened views on marriage and medicine, and such like are hammered out against a background of cold supper and pingpong. The progressive counterpart of the Cliveden set is the summer-school week-end, where everyone but the lecturer pays his own bill and catches the first train on Monday morning.

Yet it is doubtful whether the sociologist would find out even there the springs of policy-making. It is inconceivable that men and women—for the ladies no longer withdraw—thrash out charges for dentures over dinner, or supper. It is inconceivable, too, that the way to re-nationalise steel should be discovered in deck-chairs on a lawn. The major problems of the welfare state can be effectively discussed only in more functional surroundings. We know they are not dealt with in the Whitehall rooms of Ministers and assistant secretaries, because both are too busy with politics and administration to think about policy. Where else, then, is the investigator to look?

He must give up high-falutin ideas of country house week-ends and begin his search in the suburbs and environs of London—in Wimbledon, or Hampstead, or one of the garden cities. He must seek out the detached house with garden of an official from—say—the Ministry of Health, choosing preferably a Sunday morning. There he will find the springs of policy-making, the permanent under-secretary shaving, the bureaucrat in his bath. Relaxing in hot water, the door locked, the telephone out of reach, inaccessible to man or woman, oblivious to everything but steam and soap, the Minister's right-hand man is thinking creatively. Not for long, it is true—half an hour at the most—but if the affairs of a Ministry receive 26 hours of concentrated and consecutive thought in the year, it is not doing badly. At bath-time the wood can be seen in spite of the trees; question-time in the House is a vague threat over the horizon; the mind can range over Policy. It is then that ways of increasing the cheese ration present themselves, and town and country planning unfolds in its full grandeur. It is then that mighty deals in non-ferrous metals are decided on.

Research might show that there is some exaggeration in this picture, but not much. It would probably show varieties of relaxation: the official from Agriculture prodding his pigs; the Treasury man doing his pools; the brigadier from the War Office listening to the Third Programme. But in each case the essential point is the same: policy-making is done by the civil servant, relaxed in modest privacy after 3 p.m. on Saturday.

If such facts as these were established and published, somebody would certainly want to do something about them. There would be talk of a policy for policy-making, of a new approach to the problem of the official's leisure. Whitehall might be offered its own Chequers—not a bad idea. An attempt might be made to concentrate under-secretaries in one of the new towns, surrounded by green belts and light industries, so that week-end thinking could be co-ordinated at the policy level. But such proposals would have to be examined with the greatest caution and scepticism. To switch from a scarcity of policies to a glut would merely aggravate that psychology of fatigue which progressive politicians have inflicted on Whitehall. Something, on the other hand, ought to be done; and the sociologist would probably find that a simple administrative decision would do the trick. Let the civil servant be given every Saturday morning off. That would make possible two morning sessions a week in the bath and double the yearly output of creative thinking in Whitehall. That would be just about enough to provide policies and cure the malaise of the mandarins.

Commonwealth Development—I.

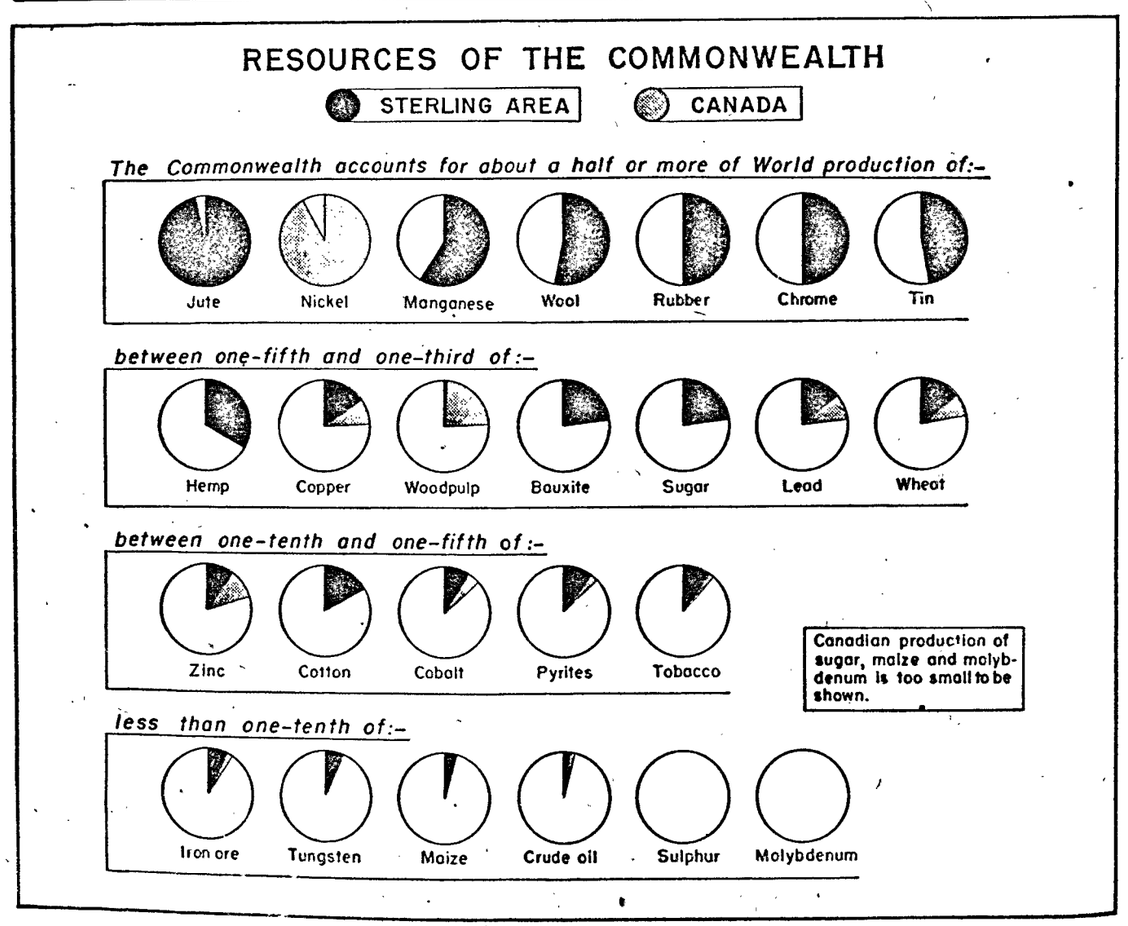
The Resources of the Commonwealth

TO many people, Britain, surrounded by the riches of its Commonwealth, is a typical example of poverty amidst plenty. To them, full development of power and wealth is a simple matter, held back only by the lethargy of governments—Lord Beaverbrook's crusader has been chained to the post for a long time. The resources are there; Britain and Commonwealth countries are anxious to develop them; capital can be had for the asking both here and in the United States; special prices can be arranged under long-term contracts or similar techniques of governmental trading. Such are the premises of this simple view. They are believed without investigation, indeed, without thought; it is a faith derived from the political concept of imperialism. But many changes have taken place since the heyday of British overseas investment; now, unfortunately, this problem of developing the resources of the Commonwealth is a highly complex one, bedevilled by both politics and sociology. Any plan of development, nowadays, must be a co-operative one. It must be agreed to and supported by the independent members of this family of nations; it must be freely accepted by its peoples. Even the economic factors cannot be accurately assessed or readily estimated. Many of the terms in the equation that determines whether development should or should not be pursued on economic grounds have to be guessed and the margin of error can be very wide. In this and in subsequent articles, it is intended to discuss the main problems raised by Commonwealth development and to point out what would be involved, for Britain and the other members of the Commonwealth, in a decision to speed up the pace of development. The purpose is not to formulate a policy, but rather to show what courses of action have to be taken to achieve certain objectives.

Members of the Commonwealth, it is true, have been well endowed by nature: they possess between them a variety of climates, geological structures, soils, peoples and cultures. All except Canada use currencies that can be freely exchanged with one another and also with the few non-Commonwealth members of the sterling area. Many of the resources have already been developed. India and Pakistan, for example, together produce practically all the world's jute; Canada produces four-fifths of the world's nickel, while the sterling members of the Commonwealth account for three-quarters of the

world's tea, two-thirds of its manganese, half of its wool, rubber, chrome and cocoa, and a little under half of its tin. They also supply a third of the world's hard hemps, a quarter of its coal, antimony and sugar, a fifth of its wheat, bauxite, woodpulp and lead and just under a fifth of its copper (though with Canada, the Commonwealth's share is a quarter). As a rough illustration of the extent to which these resources meet the needs of the Commonwealth, it can be taken that the Commonwealth accounts for between a fifth and a quarter of the world's consumption of most of these commodities ; Britain is by far the largest single consumer in the Commonwealth.

*



Many development schemes are already being pursued and a number are being considered. Copper production is being expanded in Northern Rhodesia and its electrolytic refining capacity extended ; copper is also being developed in Uganda. Large-scale production of zinc and lead is considered possible in Nigeria and zinc and lead output could be increased in Australia—though until transport facilities have been improved, it is doubtful whether increased quantities of both metals could be exported. Tin mining is being developed in Nigeria (the surface deposits are being worked out) and tin deposits exist in Uganda and British Honduras ; the existing tin reserves in Malaya are expected to last only 15 years and there has been little new exploration there for the past twenty years. Aluminium is to be produced in the Gold Coast from indigenous bauxite and possibly in North Borneo from Malayan and Indonesian bauxite. Two large deposits of bauxite are being worked in Jamaica and alumina will be produced locally before shipping to Canada. Manganese production could be increased in India and in South Africa, tungsten in Uganda, beryllium (an important modern mineral) in India, columbium (a special steel alloy for jet engines) in Nigeria and Uganda, cobalt in Northern Rhodesia and Uganda, iron ore in Sierra Leone and Malaya, and pyrites for sulphur in Cyprus. So far no commercial deposits of nickel have been found in the Commonwealth outside Canada (though a large deposit of low-grade ore was discovered in Tanganyika after the war), and no natural sulphur or molybdenum. But it has a number of the lesser known metals and minerals and also uranium and other atomic materials.

Oil prospecting is being carried out over a wide area, and the reserves in Trinidad, North Borneo and Brunei have been tapped for some time. Canada's great resources are now being quickly developed. Deep drilling is going on in Nigeria, Barbados and British Honduras. Coal production could be increased in Australia and South Africa ; the colonial deposits are all of poor quality. The Commonwealth has large reserves of timber and certain tropical deciduous trees from the Gold Coast, Nigeria and Malaya are now being used in Britain as softwood for housing. Woodpulp for rayon is being made from eucalyptus trees in South Africa. Cotton production can be and is being expanded in East Africa, Nigeria, Pakistan and India. Borneo is now growing manila hemp that previously came only from the Philippines. Of the foodstuffs, sugar production is already being increased under a long-term contract. Australia is attempting to increase its wheat production ; Australia and New Zealand could increase their output of meat and dairy products. Rice is to be grown in Northern Rhodesia, sorghums in Nigeria, vegetable oilseeds in Nigeria, Malaya and India and maize could be developed in parts of Africa.

This list is lengthy and so far only the surface has been scratched. No complete surveys have been made of the Commonwealth territories. The number of official geologists working in the colonies has increased from 58 at the end of 1946 to nearly 190, while the number of territories being surveyed has doubled—from eleven to twenty-two. In addition there are geologists attached to mining and prospecting firms. The preliminary investigations have been speeded up since the war, but there is still a vast amount of routine geological mapping to be done. And until these surveys have been completed, the full extent of the resources of the Commonwealth will not be known.

There is thus no room for doubt that an immense potential for development exists. Why, then, have these primary resources not been more fully developed in the past ? Why does not development proceed more rapidly today ? There are several answers, but the most important is contained in the one word cost. Resources can always be developed if cost can be ignored ; but neither Britain nor the other members of the sterling area can afford to ignore cost.

(To be continued)

NOTES OF THE WEEK

Conservatives in Distress

Conservative members of Parliament have left Westminster for the Whitsuntide recess more baffled and unhappy than seemed at all likely in the early spring. The enthusiasm with which the Budget was greeted has been replaced by ungenerous sniping at Mr Butler. And underlying that criticism is not only dissatisfaction with a bad tax—the excess profits levy—but an increased reluctance to recognise the facts of the balance of payments. As soon as the loss of gold had been reduced in March, many Conservative backbenchers pushed the battle for sterling out of their minds. They seem little more capable than the Labour party of sustaining courage to stick to unpopular policies, outside the moments of acute and obvious crisis.

The Finance Bill is not the only occasion of dissension in the Tory ranks. The scheme for returning road haulage to private ownership was to have rallied all the faint hearts and demonstrated the vigorous championing of competitive enterprise that the denationalisation of steel could not show. In fact the scheme was sour as soon as it was published and has produced more divisions of opinion than it has healed. A few Conservatives are openly disagreeing with some bitterness. Less openly, criticism of Mr Churchill's leadership has increased quickly. This criticism is not much concerned with policy. But the Prime Minister's tendency to surround himself with the men he knew well in the war seems to be growing rather than weakening after seven months in office. It is responsible for much confusion in administration and inevitably it also ruffles many tempers, both in Parliament and in Whitehall.

*

These—in addition to the Gallup Poll's evidence of the Government's unpopularity—are the causes of Tory depression. They are substantial enough. Yet the mood nevertheless seems exaggerated. There are considerations on the other side. The committee stage of the Finance Bill has taken less time, and has involved less bitter controversy, than at one time seemed possible. By shelving the Steel Bill, until the autumn at the earliest, the congestion of the Parliamentary time-table has been a little eased. On its fringes, at least, the administration has undoubtedly been strengthened by the promotion of able younger men like Mr Macleod and Mr Maudling. The process was carried a little further this week with the rise of Mr Watkinson, who goes to the junior post at the Ministry of Labour, and Mr Heath, who is promoted among the Whips. Brigadier Mackeson, who has been given the important post of Secretary for Overseas Trade, falls into rather a different category. The appointment is most easily explicable as a gesture of appeasement to the advocates of more imperial preference. But there are many more young men of talent who could be used if Mr Churchill had, or would create vacancies for them.

For older Ministers the relief of the summer recess will soon be on the horizon. And, above all, the Labour party's arrogance and vigour in opposition never for a moment conceal either its internal dissensions or the fact that no section of the party has a positive policy. The Tories have cause for concern but not for distress.

Moscow's Carrot and Stick

A Soviet Note, like a novel, is sometimes best sampled by beginning with the last paragraph. The latest expression of Moscow's views on Germany, published on Monday, gives in its final sentences a hint that should not be overlooked. It says in effect that an all-German government, having signed a peace treaty with the four powers, will not be bound by any agreements with other States signed by the present governments of Western and Eastern Germany. To the Frenchman this means that an all-German Government would not be bound by the treaty for a defence community signed on Tuesday ; but to the Pole it will mean that the same government would not be bound by the treaty between Poland and the Communist government of Eastern Germany. As this treaty confirms their existing eastern frontier the point is important.

This same paragraph says that the German government, after signing the peace treaty, "will have the same rights as the governments of any other independent, sovereign state." Does this mean that united Germany could become a member of Nato or an ally of the Soviet Union, according to choice ? If so, an important change has occurred since the last Soviet Note which said emphatically that Germany must not join alliances with anyone. Yet it is difficult to believe that the Russians would not resist by every means in their power a German government's attempt to join the Atlantic group, which is described in this Note as "aggressive." It is all very puzzling, and shows how careful the western

governments must be to get strictly defined limits for any talks which may result from the diplomatic exchanges.

The other point of interest is the Note's direct appeal to the German people. Western policy, it says, is "two-faced," asking for unification and a peace treaty but doing everything to prevent it. It is necessary, therefore, for the German people "to find its own solution of the problem of the peace treaty and national unity." This vague threat probably implies three thoughts in the mind of the draftsman: that Russian tactics can maintain and strengthen the opposition in Western Germany to Dr Adenauer's policies and frustrate ratification; that Eastern Germany can make life harassing for the West by causing innumerable difficulties at the frontier and in Berlin; and that the Western Germans, having been conceded the right to conclude trade treaties, can be tempted eastward by trading offers from the markets of the East.

*

Consideration of these tactics must not be allowed to obscure the essential fact that this Note does not answer the main and crucial question of the last Allied Note: how does the Soviet Government propose to guarantee that German unity is brought about and maintained in conditions of full political freedom? It is arguable that the way for the West to keep German allegiance, now that the new treaties have been signed, is to press on towards unity; but it can hardly be contended that democratic Germans would be grateful if they found themselves united on terms which give no guarantee of real freedom and independence. Some answer to this question must come from Moscow before talks can be usefully initiated.

* * *

After the Bonn Treaty

The conventions signed on May 26th by Mr Acheson, Dr Adenauer, Mr Eden and M. Schuman constitute neither a peace treaty nor a permanent settlement. The Treaty of Germany as it is now being called is a freely negotiated agreement—not in any sense a *Diktat*—on how Western Germany and the three Allied governments shall work together in a complex and dangerous situation. It makes the Germans equal partners with their European neighbours in most essential matters by ending the occupation and other restrictive arrangements arising out of the war which Germany lost. The Federal Republic regains authority over its external and internal affairs, but the Allies retain powers to negotiate for German unity with the Russians, to maintain rights in Berlin and to give the troops defending the territory essential facilities and a certain freedom of action in emergency.

The agreements are generous, but Germans will find much to resent if their politicians want to rouse resentment. As an article on page 593 describes, they have been received, as expected, without either enthusiasm or gratitude. Much in their working will depend on how loyally the Germans co-operate with the French and others inside the European Defence Community and the Schuman Plan, under which they accept obligations which would look, and in fact be, much more onerous if they appeared in a peace treaty. And, of course, it remains to be seen whether Dr Adenauer can get the defence treaty and the conventions ratified.

His prospects of doing so depend greatly on what is said and done in Europe and in this country between now and the autumn. If the Germans are to be accepted as allies they must be treated with confidence. Certainly things will be said and done by some of them to arouse new suspicions and confirm old ones; party politics alone will ensure that. But the elaborate safeguards freely accepted by Dr Adenauer should be carefully studied when the full texts of the Conventions and the EDC agreement are published. Those who say they are insufficient should realise that their voices will merely swell the chorus of Germans who say they are

excessive. To attack Dr Adenauer is, in fact if not in intention, to support his nationalist opponents. To demand German membership in Nato and the scrapping of the EDC is to offer Germans not less freedom of military action but more—more, in fact, than German democrats themselves think safe. If the Germans make the EDC work their claim to membership of the Atlantic Council will be irresistible; if they do not, the Americans, British and French are bound to consult. That is quite sufficient for the moment.

* * *

British Pledges to Europe

The Foreign Ministers have this week provided Europe, and especially this country, with an *embarras de richesses*. It will take time for the significance of all the promises that have been given to filter through to the men and women who have to honour them. At this stage there are two questions worth asking: first, has the British Government undertaken any new commitment, or is it the case that what was already fact has now taken form on paper? Second, do the new engagements further British interests?

It is fairly clear that the answer to the first question is No. Britain has guaranteed to help the European Defence Community if it is attacked and receives a similar pledge in return; but it was already bound to do this for France, Belgium, Holland and Luxemburg under the Brussels Treaty and for Italy under the North Atlantic Treaty. What is new is that Britain has formalised and made mutual an existing guarantee to Western Germany, which becomes in effect an ally of this country. Just in case of accidents—and the French still see them coming round every corner—a protocol has been added to the North Atlantic Treaty to extend its protection to the same group of countries. The real point of this protocol is that it provides some guarantee from the United States, which is unable to give any separate undertaking to the European Defence Community. It also commits Canada.

In the special declaration signed by Britain, France and the United States, paper does all that paper can do to ensure that if any government walked out of the EDC and thereby seemed to threaten peace, Britain and the United States would consult together and other partners. Clearly the departure of a rearmed Germany would be a threat to peace; the departure of Holland would not be. If General de Gaulle took France out, everyone would want to think again.

In fact, Britain would have done anyhow, in the predictable future, all the things that these three solemn pledges say it will do. But they should help to persuade both the French and the German parliaments to ratify the new treaties. The French must press for no more, or the British will get exasperated. By giving the formal undertakings that Continental opinion demands, the British Government is putting its weight behind the final attempt to make Western Europe into a community with hope for the future. That it should gain that hope is a vital British interest—and that is the answer to the second question. If it is protested that Britain has gone too far ahead of the United States, the answer is that Mr Eden has gone scarcely a pace ahead of Mr Acheson. So long as Nato exists, so long will the Americans be directly affected by any threat to their allies' security. Treaties can do no more.

* * *

Expanding Agriculture

The White Paper* on this year's review of farm prices contains an important statement on the Government's production policy for British agriculture. The word target is carefully eschewed. The Government prefers to "indicate

* Annual Review and Fixing of Farm Prices, 1952. Cmd. 8556. HMSO. 6d.

the directions" in which "further expansion is required." These directions are in themselves eminently sensible. The main emphasis is on expanding meat production by securing a large increase in the annual rearing of calves and in the numbers of sheep and pigs. In order to obtain feedingstuffs for the additional livestock, it is suggested that a million more acres of grass should be ploughed up while the utilisation of the remaining grassland would be greatly improved. The number of dairy cattle would not be increased, but the yield per cow would be. The expected result—not, it is emphasised, the goal—is that by 1956 net agricultural output will be at least 160 per cent of its prewar size. (At present, it is just over 140 per cent.) It is perhaps a mistake to introduce this one cautious guess about a distant date, especially since agriculture might in practice do better.

The immediate problem is to get the process of expansion going again after the setback of the last two years. The Government is rightly worried by the sharp decline last year both in cattle rearing and in the tillage area. What is less certain is that it has hit on the appropriate means for fostering a steady programme of expansion.

The results of the price review are intended to be closely related to these production objectives. Some of the new producers' subsidies—the £3½ million for ploughing grants, the £4½ million for calf rearing, the £7½ million for fertilisers—will clearly encourage farmers to do the sort of things the Government wants. But in other respects, the White Paper displays a faltering ambivalence between the Treasury viewpoint and the agricultural viewpoint. Thus it condemns the view that credit difficulties, which some farmers are undeniably experiencing, "are properly to be solved by increases in prices." The capital subsidy, introduced in 1947 for just this purpose, was to have been reduced by agreed stages. The White Paper's statement certainly implies that this reduction is sound and should continue. But in fact it has this year been abandoned. Again, "the Government cannot contemplate any prolonged continuation" of its loss on the sale of rationed feedingstuffs. But it is prepared to carry a much larger loss in the coming year to keep prices stable. Is the Government continuing policies which it knows to be wrong? What needs to be grasped is that the total sum available to British agriculture is strictly limited—so that the various possible ways of spending it need far more examination, and justification, than they are now getting.

* * *

The Price Settlement

Now that the details of the recent settlement of agricultural prices are known, they make rather better sense than in the Government's first sketchy announcement. Broadly, farm prices and subsidies have been increased, as a result of the special and annual reviews, by the equivalent of £52½ million a year. Against this, costs have risen by £57 million. The Government also paid out £24 million last year, and will probably find as much again this year, to keep feedingstuff prices stable. The effect, unless it is offset by a further rise in costs, should be to renew the financial incentives to a policy of expansion. Since higher prices almost balance higher costs, farmers who increase their turnover in the coming year (as it is hoped most will) should increase their profits. The Government also hopes for an increase in farming efficiency, which would have the same effect.

The White Paper suggests that farmers' profits have declined slightly in the last two years. The departmental calculation gives an average net farm income for the last four years of £290 million, with 1950-51 the worst year and the forecast for 1951-52 just above average. This works out at around £770 a farm to cover interest on working capital as well as the farmer's own labour. As an average, this cannot be said necessarily to suggest "featherbedding"; but neither does it indicate the serious decline in farming profits which is sometimes alleged.

The impression left by the White Paper is that the Government has not really plumbed the reasons for the farmers' reluctance to increase output. It believes the major cause to be "steeply rising costs against the background of a feeling of uncertainty about the demand for the farmers' products." This line of thought has led to the belief, strongly expressed by producers, that milk production fell last year because prices were inadequate. In another place, however, the White Paper blames the weather for this result and points out that this year there appears to have been a marked recovery in production. In truth, nobody knows what level of prices or distribution of subsidies is really the most effective stimulus to production. The classic laws of supply and demand have only limited relevance to the farming situation.

The Lords on Broadcasting

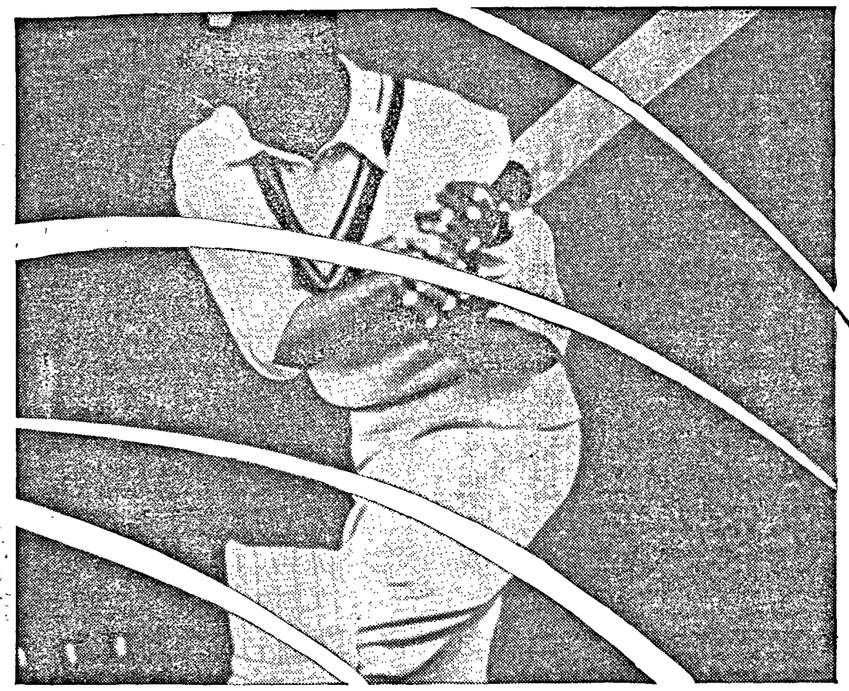
The House of Lords devoted two whole days of debate to Lord Reith's motion on the Government's White Paper on the BBC. There were 29 speakers—which is a great many for the Lords—and it was obvious that the subject created more interest among the peers than any for a long time past. On the first day there was an impressive procession of eminent figures, united in denouncing the Government's proposal to permit an experimental degree of sponsoring in television—Lords Reith, Samuel, Listowel, Halifax, Jowitt, Elton and Hailsham all spoke in this vein, some of them with great feeling, and Lord De la Warr, who represented the Government, got little support. This balance was somewhat redressed on the second day, when there were roughly as many speeches for the White Paper as against it, culminating with a very effective defence by the Lord Chancellor of the principle of freedom of the air.

On the whole, in spite of the feeling engendered, the arguments followed lines that are becoming familiar, and

ADVERTISING  WISDOM . . .

Buyers are human beings

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.



We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

very little that was novel was introduced. Apart from the central issue of monopoly, the chief bone of contention was the method proposed in the White Paper for the appointment of Governors of the BBC by an impartial panel of two politicians and two judges, presided over by the Speaker. This proposal came in for the strongest condemnation—particularly from Lord Waverley, who was not overly critical of the other proposals in the White Paper—and the Government may well think fit to reconsider it.

But it was monopoly, *pro* and *con*, that really interested their lordships. Several speakers made the very interesting point that the elderly peers seem to be mainly in favour of the monopoly while a majority of the younger peers—certainly of those who spoke—are opposed to it. That is not the only reason for suspecting that the Best People, whose noble representatives led the attack on the White Paper, are out of touch with public opinion on this matter. One peer wondered aloud whether these defenders of public morality had ever listened to the programmes that the listening public likes best. Indeed, many people who do not share the elderly peers' certainty of moral superiority will agree with the rebuke that the Lord Chancellor administered to their "holier than thou" attitude.

Perhaps the most significant thing about this debate is that it took place at all and aroused so much feeling—for until the very recent past the monopoly of broadcasting was simply taken for granted. Now it is subject to argument, and the Postmaster General stated specifically that methods of providing competition other than by sponsoring would be considered—though he did not attempt to reconcile that statement with the provision in the White Paper that the BBC should be the only body entitled to any share in the licence revenue. However, the door is not closed to any proposals for a more rational organisation of broadcasting, and that is a great gain.

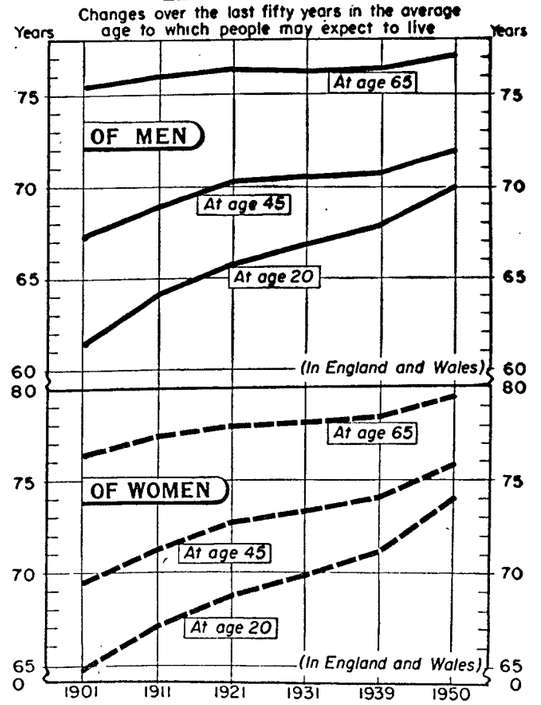
* * *

Swing Right in Italy

The best that can be said about the local government elections in Italy is that the results are not as bad as they might have been. There was, as expected, a swing to the right, and on the extreme left the Communists have by no means done badly in the rural areas. But the central block led by the Christian Democrats, although squeezed hard, has not lost as many votes as was at one time feared ; indeed, the Liberals have in some cases gained substantially, and in a few localities the centre has actually wrested control from the Communists. In Rome itself the Communists have failed to win against the Christian Democrats. In Sicily and the towns in the far South the centre has done well to hold its own. The Monarchist victory in Naples was fully expected. Perhaps the most unhappy upset occurred in Bari, where a particularly good Christian Democrat administration has been turned out by a predominantly Fascist right wing group. When all is said, however, the weakening of the centre parties is undeniable.

What, if anything, do these results portend for the general election due in a matter of months? The answer is bound to be gloomy for Signor De Gasperi, and for all who want to preserve a democratic Italy. At best, they serve as a warning that Christian Democracy, if it is to survive as the guiding force, must be backed with greater political skill and single-mindedness by the Church and must itself enhance its appeal. At worst, Signor De Gasperi would be well advised to consider aligning his party with the less extreme Right, the increasingly successful Monarchist party, against mounting Fascism.

Rigid conclusions should not be drawn from the voting. The South, where most of the recent polling has been, is not typical of Italy, although it constitutes a large part of the total electorate ; in the North the Fascists have done less well. Politics in the South are often more personal than elsewhere ; this still gives the landlords great influence over the voting, and their disgust with land reform has sometimes been reflected in the adverse votes of many whom the Christian Democrat government mainly seeks to help. The South also has a deep-rooted monarchist tradition which helps the Right. Men are moved more by emotional appeal and the false glitter of aristocracy than by the pedestrian, Attlee-type reasoning of the Christian Democrats, whom many find boring. The South, moreover, never suffered from the worst Fascist excesses of Mussolini's day. All these factors have helped the extreme Right in the South rather more than is likely to be the case in Italy as a whole.



* * *

Australia and Nato

Mr Menzies will be in good company if he decides, after discussions in London, that British overseas defence arrangements are complex and confusing. He will discover that the British Government, in many matters of military planning and defence economics, is more closely tied to its partners in Nato than to the governments of the Commonwealth ; that it is no longer master of the disposition of all its forces and equipment, and that it accepts a grand strategy for the West worked out by a committee of three Allied officers sitting in Washington. That strategy is chiefly concerned with Europe ; it may touch on but does not formally include two areas in which Australia has vital interests: the Pacific and the Middle East. In the Pacific the Australians have a pact with the Americans, of which the British are not signatories; in the Middle East—where there is no allied planning—an Australian jet-fighter wing is serving as a token of Australia's intention to "participate in the establishment of a proposed Middle East Command." The Pacific Pact has no connection with Nato ; the Middle East command, if it comes into being, will be only affiliated to Nato.

LENGTHENING LIFE

Changes over the last fifty years in the average age to which people may expect to live

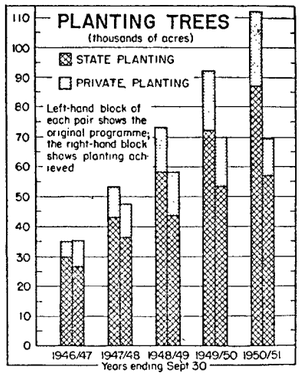
Australian anxiety is easily understood. Who is to decide where, in case of war, Australia's forces should be employed? Would the situation in South-East Asia make it impossible for Australian troops to reinforce the Middle East? This very problem harried Mr Churchill during the war against Hitler. If Nato is to be, in case of war, the West's policy-making and executive organ, where would Australia come in? Canada is already in, but what about the rest of the Commonwealth?

To set up new international organisations to meet these questions would be a mistake; there are too many committees already, making too great a demand on limited numbers of first-class staff officers and officials. Any suggestion to set up a Commonwealth military staff would encounter the familiar objections; and India and Pakistan and Ceylon would certainly not join it. There remains the proposal, recently heard in Canberra, that Australia might in some way take part in the councils of Nato. Australians have noticed that Greece and Turkey, before being made members of Nato, shared in its defence planning. Perhaps some similar liaison arrangement with the Atlantic planners would meet the case. Anything more formal seems to be ruled out by Article 10 of the North Atlantic Treaty. This, it is true, does not say that a member of Nato must have territory bordering on the Atlantic; but it does suggest that only European states are eligible.

* * *

Big House on Koje Island

The incidents at the prisoners' camp on Koje Island have revealed an extraordinary mixture of laxity and violence in the control of the camp. Some 80,000 North Korean and Chinese prisoners and internees were confined in a vast compound and left very much to their own devices, except when the American authorities carried out military expeditions in their midst. Among the amenities of the compound appear to have been a blacksmith producing Molotov bombs, a signalling organisation, underground tunnels, and a company of female camp-followers.



Subsequently Brigadier Dodd, placed in charge of the camp, was kidnapped by the prisoners and conducted negotiations for his own release in a manner which can hardly be regarded as becoming in an officer of his rank and responsibility. He purchased his freedom by persuading his successor, Brigadier Colson, to sign an agreement with the mutineers in very humiliating terms. The agreement was then repudiated on the ground of duress by the United Nations Commander-in-Chief and both Brigadiers Dodd and Colson were relieved of their posts. Meanwhile, reinforcements including British and Canadian units were brought in to overawe the truculent Communist element which had established control behind the wire.

Such disturbances should not be possible in prisoner-of-war camps which are properly administered from the outset. Unfortunately they have occurred at a time when the whole question of prisoners of war has become the central issue in the negotiations for an armistice in Korea. They have given colour to Communist accusations that North Korean and Chinese have been subjected to brutal treatment and that the refusal of many of them to be repatriated to their own countries is the result of American coercion. Actually the defect of the American administration seems to have been timidity rather than brutality, for the Communist committees were permitted to govern the compounds by a sort of martial law and openly defy the authorities, although the latter possessed all the necessary means for subduing them by force. It is most important that the administration of prisoners' camps by the United Nations forces should be above reproach, and that there should be no repetition of the recent incidents on Koje Island.

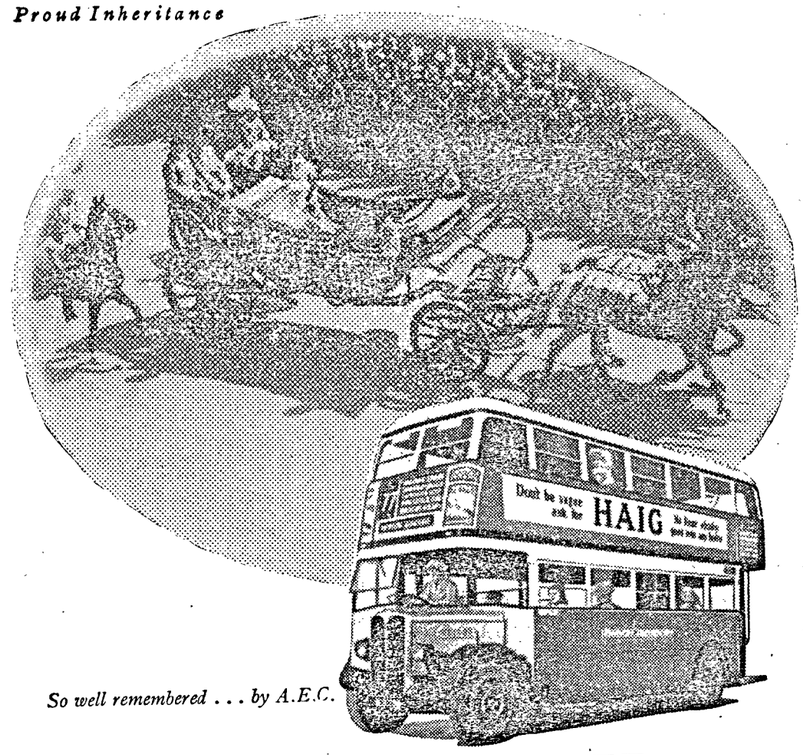
No Land for Trees

The report of the Forestry Commission* for the year ended September 30, 1951, shows that over the last five years the area of state forests in Britain has increased by 218,000 acres to a total of nearly three-quarters of a million acres. This is a formidable increase; yet it represents only the first instalment of a vast programme of public forestry that is intended to make good the fellings caused by two wars and a long period of neglect of private woodlands.

Moreover, the programme has lagged behind schedule, especially during the last year. The report says that the main reason for this is shortage of plantable land; reserves of land are said to have become disquietingly low. Thus last year the commission acquired less land for future use than it actually planted, which obviously bodes ill for a policy of steady expansion. The report does not explain why acquisition is so difficult. There is a conflict between the needs of forestry and of hill farming, but as forestry is generally more productive, the commission ought not to be denied the land it needs.

The replenishment of private woodlands is a still more difficult task, with which progress has been very slow. The revised dedication scheme has at last persuaded many more landlords to accept the commission's supervision in return for financial aid, the scale of which has been increased to match higher costs. Planting grants are now £14 instead of £12 per acre. But actual replanting is pitifully slow in relation to the large area of devastated yet potentially productive woodlands in private ownership.

To rebuild a reasonable reserve of standing timber it is necessary, in the commission's view, to limit fellings for ten years to an annual amount of 20 million cubic feet of hardwoods and 5 million cubic feet of softwoods. This policy is unpopular with many owners and with the timber trade, which has gained a temporary reprieve from its strict application. Yet it is essential that fellings should be strictly controlled and that new planting on the more suitable land should be fostered if the nation is to be sure of an adequate supply of timber in the future; and the commission is bound to take all necessary steps—if need be seeking new powers—to achieve that end.



* * *

Reaction in Engineering

This is a particularly bad moment to put the restriction on industrial mobility implicit in the resolution about dilutees recently passed by the Amalgamated Engineering Union. The union's national committee has instructed its executive to bring the present dilution agreement to an end and return to the rules in force in 1939. This action is grave both in itself and as a symptom. It is grave in itself because the need for expansion of manpower in the engineering industries is today only less crucial than it was in wartime; even were the obvious need deriving from rearmament to disappear, the claims of the export drive would still make expansion imperative. The decline in employment in the textile trades, however regrettable in itself, offers an opportunity for such expansion; by shutting

Proud Inheritance

So well remembered . . . by A.E.C.

THE SILVER JUBILEE, 1935

Not for years had the imagination of Englishmen been so stirred as by the Silver Jubilee. Here was a cherished link with the gracious serenity of a past era . . . the still-glowing embers of an England which was elsewhere only a memory. And as the cuirasses of the Household Cavalry flashed into view in the procession on that summer afternoon of 1935, the full-throated cheer which greeted the State Coach rose from the very hearts of the great crowd. Thousands had flocked to the capital for the celebrations—and amongst the special transport put into service for the occasion none of it was more traditionally part of the scene than the familiar A.E.C. buses—of which the six-wheelers had been in service for several years: for these, or their forerunners, had been active participants in all such great occasions since even before this long and gracious reign had begun: a great line of passenger vehicles that are today recognised all over the world as a symbol of the sovereign quality that is inimitably British.

A. E. C.

the door in the face of would-be recruits from the mills, the engineering workers would not only hamper the national effort towards strength and solvency but inflict a direct and serious injury on their fellow workers.

This direct injury is not, however, the end of the story. The AEU is a key union in more senses than one; its example counts throughout the trade union world. If it gives a lead back towards exclusiveness and rigidity, that lead is only too likely to be followed: not only the present textile recession but any shift whatever in the fortunes of different industries will be that much likelier to result in the tragedy of long-term unemployment rather than in the mere inconvenience of a change of job for those affected. There are quite enough natural obstacles to industrial mobility without the interposition of further barriers against workers who are available and willing. It is no doubt the memory of mass unemployment, stimulated by the spectacle of the textile trade's troubles, which has prompted this instinctive reaction towards exclusiveness—a reaction as inappropriate to present unemployment as it is, at the instinctive level, understandable. It has not yet been embodied in any irrevocable measure; and one may hope that the more rational attitude, the longer view, and a more generous disposition towards fellow workers in adversity may still carry the day in the AEU's counsels.

The Soldier's Liability

In the recent debate in the House of Lords on the revision of the *Manual of Military Law* a number of distinguished speakers with long experience of military or naval service expressed the widespread anxiety of serving officers at the position in which they and their men have been placed by the current edition of the *Manual*, brought out in 1944. The previous edition laid down that, in any violation of the laws of war, responsibility rested on the person issuing the orders and not on anyone who merely obeyed them. But the edition of 1944, as revised by the international jurist, Professor Lauterpacht, rules that members of the armed forces are "bound to obey lawful orders only" and are criminally liable as individuals if ordered to commit "acts which both violate unchallenged rules of warfare and outrage the general sentiments of humanity."

This revision was undoubtedly influenced by the prospect of bringing German war criminals to trial and the fear that everybody in Germany, except Hitler himself, might be able to plead obedience to superior orders to justify participation in the worst Nazi atrocities. In 1944 it was a question of bringing enemy soldiers (or men of the *SS*) to justice; the war was already as good as won, and there was no thought of the liability which might be imposed on British soldiers by the doctrine of personal responsibility from commander-in-chief to private for all acts committed under orders. Today, with British soldiers prisoners in Communist hands, with unverified accusations of bacteriological warfare officially endorsed as fact by Communist states, and with "peace laws" enacted by the same states which could be used to prosecute any soldier taking part in an "aggressive" war (all military operations carried on by countries of "imperialist warmongers" being by definition aggressive), the British soldier may well be worried that his own country should have withdrawn from him the legal protection given before 1944. As the Earl of Cork and Orrery pointed out, the soldier's position with regard to alleged war crimes is quite different from that arising in a possible conflict of orders with British civil law. For it is an enemy court which will administer the war crimes law, and if an unscrupulous enemy brings to trial (or blackmails by threatening to bring to trial) a prisoner of war on its own interpretation of international law, he is likely to be in a bad way if he cannot plead obedience to superior orders.

Lord Jowitt has argued that the *Manual* is not authoritative, but merely Professor Lauterpacht's opinion of what the law is; there is, nevertheless, no other written source to which a soldier can refer for knowledge of the law and foreign nations certainly regard it as representing official British legal doctrine. It is not surprising that there should be widespread objection to "Lauterpacht law" in the services, and fear of a general breakdown of discipline if, as Lord Winster suggested, men on active service were to start saying to their officers: "Would you kindly stop the action while I ring up my solicitors to see if this is all right." The Government would be well advised to reconsider the language of the 1944 edition of the *Manual* and to find a definition of responsibility less detrimental to men who may be called on to fight for their country.

* * *

Harnessing the Volta

This Saturday the Colonial Secretary, Mr Oliver Lyttelton, is due to arrive in the Gold Coast on his West African tour, the first to be undertaken by any occupant of his office for five years. He does so at the moment when a meeting has been taking place in London to discuss the financing of the huge Volta River project, the site of which he will inspect. The emphasis of Mr Lyttelton's tour is on economic development and, in spite of the far-reaching political changes which are on foot in the West African colonies, this is where the British still have great power to help the peoples for whom they are responsible. In the Volta River project the aim is to secure the investment of sums which may range beyond £100 million during the next six years. It would not be practicable to find so much money without the prospect of gain for the United Kingdom as well as the Gold Coast. This gives an obvious handle to people who raise the popular modern cry of exploitation. Nevertheless, it is an essential element in the proposed electric power scheme on the River Volta that, while a large part of the aim is to raise the standard of living by supplying abundant cheap electricity and water for irrigation, this would be economically quite impossible without the simultaneous development of a large-scale local industry.

The Volta River project has, therefore, three main parts. One is to produce about 550,000 kilowatts from a dam and hydro-electric station some 70 miles from Accra. Another is to build a plant capable of smelting over a million tons of bauxite annually, in order to produce about 200,000 tons of aluminium for export; the Gold Coast's bauxite deposits are estimated to amount to 225 million tons. And the third part of the project is to build a new port, which the territory badly needs and which will also handle the traffic to and from the smelter. The financing of all this is to be undertaken jointly by those represented at the London talks this week, namely, the British and Gold Coast governments, the British Aluminium Company, Aluminium Limited of Montreal and various other commercial interests behind West Africa Aluminium Limited, which has carried out much of the pioneering survey work. A fundamental problem is to determine the relationship between public authority and private business. If the scheme is to prosper in this period of acute political self-consciousness, the Gold Coast Government must be associated with all its aspects.

* * *

The Council of Europe

This week's events in Bonn and Paris have crowded the present meeting of the Council of Europe off the front pages of the newspapers. This is a pity, since its present session may mark the beginning of the end of the Council's long search for its proper niche in the European scheme of things. Last week the Committee of Ministers gave its blessing to Mr Eden's proposals for making the Council a framework into which the various European specialised bodies, such as the Schuman coal and steel pool, could be fitted. This week the Consultative Assembly has been considering Mr Eden's purposely vague proposals.

These do not further the wider ambitions of the Assembly to become "a European political authority with limited functions but real powers"; but they offer a real chance of steering the Council firmly into the main stream of European co-operation. If they come to grief, it will be not so much because the Assembly spurns them for their inadequacy, as because their advocates try to please everybody. It is right that the Ministers should carefully point out all the practical difficulties; and it is essential that the organic links to be established between the specialised communities and the Council should be flexible and variegated. But it would surely be a mistake to allow, for example, Sweden's anxiety over its neutrality to hamstring all attempts to link the Council and the European Defence Community. If the Council is to prosper it cannot be artificially insulated from all contact with such vital problems. With the development of specialised institutions like the EDC the Council is needed to save European integration from becoming the monopoly of soldiers, civil servants and technocrats. The besetting sin of Strasbourg is to allow the best to be the enemy of the good.

* * *

Catering Fullstop

Each report of the Catering Wages Commission gets more fantastic than the last. Over and over again one reads of recommendations being made "as a matter of urgency" and of the same recommendations being referred back for further consideration "as a matter of urgency." Now the commission's activities appear to have come to a fullstop. In 1950 it published the report of its special inquiry into the working of the Catering Wages Act. Its main proposal was that the existing wages board for "unlicensed residential establishments" should be abolished; that a single board should be set up to regulate wages for "large London establishments," "large provincial" and "small establishments wherever situate"; and that this board should be assisted by committees "confined to persons actually and actively engaged in the hotel industry," not drawn from the employers' and workers' representatives on the board. At the end of that year the commission was asked by the Minister of Labour to consider the views of "both sides of the industry" on the proposal and decide "as a matter of urgency" whether to make a formal recommendation, on which he could act.

All of this seems to have been wasted effort. The commission's report for 1951 (HMSO, 4d.) states that a year ago it consulted the Ministry of Labour's solicitor for advice on the terms in which its proposed recommendations should be drawn up. In July the solicitor informed the commission that within the terms of the Act it had no powers to make its recommendations about the reform of the wages board machinery.

The rest of the report is equally negative. The commission regrets that its suggestions for varying the wage regulation orders for licensed establishments have not been accepted in full. It regrets that another year has passed with little progress towards complete organisation on both sides of the hotel industry. It again draws attention to the delay in deciding special rates of wages for trainees and apprentices—a matter "which should be dealt with as speedily as possible." The only progress it can record is the work of the British Travel and Holidays Association, which leads it to the suggestion that its own responsibilities for the tourist industry should be transferred to the Board of Trade. With its main purpose stultified and another being successfully achieved by a different body, the commission's own future seems to require review "as a matter of urgency."

Consolidation for Courts

The Lord Chancellor introduced last week a massive collection of proposals designed to consolidate the statutes and rules relating to magistrates' courts. They consist of a Magistrates' Courts Bill, a draft of Magistrates' Courts Rules (to be made under the Justices of the Peace Act, 1949) and a long explanatory memorandum. The Bill will clear away a maze of existing legislation, not always consistent, dating back to the Indictable Offences and Summary Jurisdiction Acts of 1848. It will provide instead the single code of procedure which has long been needed.

This measure is a good illustration of the benefits provided by the 1949 Act dealing with the consolidation of statute law. Under that Act a Consolidation Bill which does no more than consolidate the existing law, tidying up its inconsistencies, can reach the statute book without needing to pass through all the usual stages of legislation. With the present pressure on Parliamentary time, this is the one thing that makes any real programme of statute consolidation possible. The new Bill contains 66 proposals which involve some departure from the strict letter of the existing law, but the Lord Chancellor is satisfied that none of them makes anything which could be called a substantial change; with that it is unlikely that anyone will disagree. The work of magistrates and their clerks, and of the advocates appearing before them, will therefore be that much lighter, and it is even probable that laymen will find that what goes on in court is in future a little easier to understand.

Derby Day

We are no enemies to horse racing. It is a better amusement than dice throwing or card playing. It is, at least, as ennobling as the ballets at the opera. It is not, perhaps, quite equal to cricket or yachting, but we should no more object to gentlemen taking an interest in a horse race than a boat race or a sailing match. Gambling of all kinds, including betting on horses, is so universal, that it seems a natural feature in the human character like the love of spirituous drink or fine clothes. But the Legislature has not taken this view of the matter, and as it formerly passed sumptuary laws, so it has equally unsuccessfully issued numerous decrees against card playing. As the promoter of morality, it has for a long period set itself very decidedly against lotteries, and all other means of getting rich by chance. By its authority, too, fairs at which the vulgar gambled, danced, and drank, have been very generally suppressed. Epsom on the Derby Day presents most of the worst characteristics of a fair. People collect in great crowds; they drink, gamble, and dance. In every meeting of a dozen or twenty people bets are taken on the winning horse. Tattersalls' is the most extensive gambling house in town, but Tattersalls' is frequented by many members of the Legislature. Many of them, too, go to the races. Peers and representatives are amongst the owners of the running horses, and win and lose fortunes by betting. That is, perhaps, rather unseemly in gentlemen who put down fairs, denounce gambling, and make numerous laws against indulging in games of chance. But, if what they do as individuals be, perhaps, of doubtful propriety, it is quite inexcusable that the House of Commons should postpone all business that the members might honour the Derby Day with their presence. That was consecrating, by the Legislature, the very vices they reprobate. It gives the practical sanction of the House to acts which the Parliament makes laws to prevent. . . . The Parliament that objects to gambling should not postpone the national business to allow its members to attend a horse race.

Letters to the Editor

Arts to Excess?

Sir,—Some of the statements in the article in your issue of May 24th are so typical of English opinion on technical education and, I believe, so erroneous, that I should like to comment on them.

It is widely believed that the British B.Sc. Honours degree in science or engineering brings a student to a more advanced standard of professional training than does the corresponding first degree in American universities. The best evidence I can collect indicates, however, that the American and British degrees represent almost equivalent standards. It would be desirable to settle this question by means of a common examination given to a statistically significant number of graduates on both sides.

If we compare institutions such as Birmingham, Edinburgh, Bristol or Manchester, with American counterparts such as California, Chicago, Cornell or Minnesota, we find almost equivalent standards. The students on both sides use the same books, work on the same problems and practical experiments, and have difficulties on the same knotty points at about the same stages in their university careers.

The principal difference between British and American training is the much greater amount of teaching in the American universities. The British student is on his own, his lectures providing only a bare outline of the work to be covered. The American student is systematically led over the ground by his teachers. Both students eventually learn the same material. The American learns more efficiently, and thus has time for humanistic subjects in addition to his technical training. The British student learns most inefficiently, but he gains in self-reliance, since he is essentially self-taught.

Secondly, may I comment on the statement that technical graduates in this country are paid high salaries. It seems, on the contrary, that these salaries are much too low. The British worker can expect half the salary of the American worker (in real wages); he produces about half as much in a given time, mainly because his employer has given him half as much equipment to work with. The productivity of the British scientist or engineer is not limited in this way; it equals 100 per cent of the American standard. Nevertheless his salary is also limited to the 50 per cent level. It would be only just, and highly beneficial to the national economy, to double the salaries of all British scientists and engineers employed in industry.

Simultaneously, to meet the influx of students into technical careers, two large new institutes modelled on the Massachusetts and California Institutes of Technology should be created. The trouble with British education is surely not "arts to excess" but "not enough engineers." A more basic trouble is an archaic system of secondary school education that separates the bookworms from the goats at the age of eleven, and casts the latter into the exterior darkness.
—Yours faithfully, W. J. MOORE

Washington, D.C.

*

Sir,—In your issue of May 24th you rightly point out that the Burnham Scale of salaries for teachers is looked upon with disdain by science graduates. The shortage of science masters will continue as long as first-class graduates in grammar schools are paid the same basic salary as a 2-year or 1-year trained teacher in other types of schools. The problem is not "insoluble" as you say, although it is true that "the science master cannot be paid more highly than the man who teaches history." The solution seems to be a separate salary scale for graduate teachers in grammar schools, whether scientists or not.—Yours faithfully, A. JONES

Hardingstone, Northants

A Soldier on Soldiers

Sir,—May I comment on one point of policy mentioned in your review of my book "East *versus* West" on May 17th. You state that my condemnation of our intervention in Korea is a contradiction of the views I express about the prestige of Easterners, and that our action in Korea was a smack in the eye to the Communists. I feel sure that the Russians are delighted at seeing the great effort that we are expending in Korea. Nor do I believe the suggestion you make that if America had not rearmed for Korea they would not have rearmed to meet the very serious menace in Europe.—Yours faithfully,

G. LE Q. MARTEL

Camberley

Nationalism in Morocco

Sir,—The article in your issue of May 17th contains so many inaccuracies and half-truths of French propaganda, eager to discredit Moorish nationalism in foreign eyes, that at least some should be corrected.

Your correspondent states that "Moroccans have become avid for modern education only in the last ten years." The fact is that most of the nationalist leaders studied at the Sorbonne or at other foreign universities in the early thirties, that is, after having received a "modern" primary and secondary education about thirty years ago.

Your correspondent states that the National Front numbers only some 120,000 people. I wonder how he reached that purely fictitious figure. Since the nationalist parties are afraid to issue membership cards, no one knows the figures except the leaders themselves. But the figure given by your correspondent is that contained in French propaganda. Had your correspondent personally attended nationalist manifestations (as I have done in most Moroccan towns), he would have noticed that in the larger towns a figure of between 50 and 100 thousand is common. The nationalist crowds that each year on the Sultan's Day of the Throne manifest unmistakably their true sentiments, surpass one million by a wide margin.

Your correspondent complains that there are not enough rural administrators (and he might have added, urban as well). He is, however, silent on the point that it was not until 1950 that the Protectorate authorities established the first school for native administrators—38 years after they occupied Morocco. And even then they provided only for fewer than sixty pupils. Is it then fair to blame the Moors for their administrative immaturity?—Yours faithfully,

ROM LANDAU

Barnstaple

Like Peter, Like Paul—Like Perón

Sir,—I am requested by the manager of the Australian Meat Board to draw your attention to a most misleading statement in *The Economist* of March 29th.

You state that Australia, too, "with its various Produce Boards, has not passed on to producers all the increases in prices it has exacted from its customers." The facts are that no increases, with the exception of relatively small amounts, the payment of which could only have been made retrospectively, have been withheld from producers. They have been reflected in the Australian Government's buying price immediately they have been negotiated.

It is true that for several years a percentage (one per cent or less) of these prices was retained by the Australian Meat Board to cover costs of administration involved in the purchase of meat for and on behalf of the Australian Government and the British Ministry of Food. From January, 1950 onwards, however, this practice was discontinued, the whole of the price paid by the Ministry of Food for all classes of meat being included in the buying price and passed on to the industry.

As regards retrospective payments which you say "would require a more elaborate system of accounting than exists," the problem of disposing of these resulted from delays which were experienced on a number of occasions in negotiating prices despite the Government and the Australian Meat Board having pressed for a prompt announcement. At no stage were these sufficiently large to enable appreciably higher prices to be paid during the following season and it was decided, therefore, that the amounts should be held by the Australian Meat Board on behalf of the industry. They are at present being used to meet administrative expenses in lieu of the

percentage (one per cent or less) previously deducted.

To describe such practices as "Peronistic autarky" is grossly misleading and likely only to give rise to further misunderstanding in the United Kingdom of the problems of meat production in Australia.—Yours faithfully,

R. H. HEYWOOD

London, W.C.2

Food Without Thought

Sir,—Your leading article "Food Without Thought" will, I am afraid, tend to confirm the opinion held by many of your readers that farming is the one subject on which you cannot write dispassionately.

On any other subject we see both sides of a question clearly and ably argued with the support of relevant figures. Why should agriculture be differently treated?

You criticise the recent rise in price granted to milk producers without mentioning the fall in winter production and the drop in heifer calves reared. It would also, I think, be fair to point out that the profit earned by the average small dairy farmer is small compared with what he could earn in almost any other industry in the country. As the alarm clock goes at 5 a.m. on Sunday morning, I venture to think that many are seriously considering investing their money in something less exacting than dairy cows.

I personally doubt if the Minister has gone far enough if it is desired to maintain the existing production of milk.—Yours faithfully,

CYRIL H. KLEINWORT

London, E.C.3

Stifling BIF?

Sir,—Those who pay for exhibition stands at, and meet visitors to, the BIF at Castle Bromwich will probably agree that on sunny, warm days the Exhibition Hall is one big Turkish bath. The roof has large areas of glass and when the sun beats down it turns the air into a vast hothouse for the thousands who are in the building. There is evidently no proper glass screening, ventilating, or air-conditioning system. Stand owners have tried, at considerable expense, to make their small reception rooms and offices tolerable by individual apparatus, but to draw heated air out only means that it is replaced by hotter air from the building.

This is a great permanent building, dedicated to demonstrate British efficiency. When so much public money is spent elsewhere, it seems inconceivable that air-conditioning is not thought important enough to warrant the cost of installation. What would happen if stand holders decided, individually and collectively, that they would not book space next year unless the air condition of the building is made reasonably comfortable?—Yours faithfully,

EDWARD R. CROSS

Manchester

Plain Word?

Sir,—On page 505 I read that all sensible people "must hope that neither side will set conditions of acceptance with which the other cannot fall in."

A slight diseconomy of language, I suppose.—Yours faithfully,

R. C. STEEL

[Fair cop.—EDITOR.]

Books and Publications

Sudanese Assessment

The Sudan Question. By Mekki Abbas. *Faber and Faber.* 201 pages. 21s.

When Sayed Mekki Abbas laid down his pen at the end of this book, he can scarcely have envisaged the timeliness of the day it would appear. He is Sudanese, and it is a Sudanese appraisal of the Anglo-Egyptian dispute. Its publication coincided almost to an hour with the arrival in Alexandria of the first important Sudanese delegation to discuss the problem directly with the Egyptian government, instead of through the medium of British officials.

The book has some outstanding merits. It uses British and Arabic sources with familiarity and dispassionately. It is short and clear, and makes a competent selection from a mass of material; and it avoids the repetitive detail about the abortive talks of the last thirty years that has overloaded so many books on the topic. It is able to lay emphasis, therefore, on the main turning points and grievances involved. For instance, it disposes adequately of the Egyptian contention that the British forced the Egyptian evacuation of the Sudan in 1884; with equal justice, it stresses the inopportunity of Lord Allenby's decision after the Stack murder in 1924 to show Egypt who was master by threatening to squeeze its Nile water supply. To that false move must be attributed many of the pangs of today.

Some aspects of the dispute which, in general, receive too little consideration are here given due weight. One is the effect upon the Sudanese; this is weighed and found detrimental since it has increased their propensity to disagree, and has ousted from the minds of budding politicians many considerations that they ought to have been learning to assess. A second important point that emerges from the narrative is the part that money has played in weighting decisions. The Egyptians' grievance against Britain, for instance, was given a flying start because of their resentment that the British bore only one-third of the cost of the Kitchener reconquest while their share in the management of the Condominium was out of all proportion to that figure. ("When two people become partners in a concern," remarks the author, "it is difficult to assess the value of such a thing as leadership.") Another money consideration—a decision in 1931 to reduce the starting rate of pay of employees newly graduating from the Gordon Memorial College, Khartoum—imparted to the Sudanese Graduates Congress the sense of grievance that has hallmarked all its activities. The fact that money talks even more loudly in the Nile Valley than in some other parts of the world may affect the future of Egypt-Sudan relations.

Mekki Abbas is an Oxford graduate and holds a studentship at Nuffield College. His book appears in a series distinguished for its scholarship. He tells his story and sets forth his judgments with all the restraint of which a senior common room is capable. This capacity for understatement has great advantages, but it presents one drawback that constitutes the chief flaw in a good book. The muted tones of Oxford are foreign to the Nile Valley, and it therefore fails to convey a hint of the extent to which emotion, strident speechifying and even shouts of "traitor" have affected the course of the dispute in the last few years. If he could, in his next political book, add to his qualities of scholarship and judgment just a spice of the art of describing the human scene, he would write an even better book than this one. To set a problem down upon paper is easier than to bring about its solution. But if the Sudan contains even a few men as capable of the second task as is this author of the first one, the birth-pangs of its self-government will not be so painful as some people fear.

Union Rebel

The Choice Before South Africa. By E. S. Sachs. *Turnstile Press.* 220 pages. 15s.

This is South Africa with the lid off. By a man who is well known to thousands of his fellow workers as "Solly" Sachs, the book is written with a sparkling vigour which is rare in the political life of South Africa. Mr Sachs tackles the great question mark of his country's economic and racial policies from the point of view of one who has had close personal experience of the colour problem in the trade unions. He believes that this, like South Africa's other difficulties, can only be solved on a basis of racial equality. So unpopular have his views proved to authority during the past few weeks of intensified crisis that Dr Malan's government has now banned his book in the Union. He himself has been twice arrested for failing to resign from the secretaryship of the Garment Workers' Union, which owes its political prominence to his work, and he has been "named" by the Minister of Justice as a Communist under the Suppression of Communism Act.

In the preface, Mr Tom Driberg

assures readers that Mr Sachs is not a Communist, and there is certainly an air of freedom blowing through his pages. But, whatever his political affiliations, nothing the Malan government can do will now detract from his standing as one of South Africa's foremost labour leaders, or from the point of view which he presents. In his book, he opposes both the main political parties and argues that the line of political division in South Africa is an anachronism. His attack is aimed first and foremost at the Nationalists. At all costs they must be driven from power if a peaceful and democratic South Africa is to survive. But it is stupid to place all faith in the United Party, so long as its leadership is so poor, its policy so unclear and its record tarnished with racial bias which is only less in degree than that of the Nationalists.

Unless these things are changed, argues Mr Sachs, the United Party will again be defeated at the election next year, as it was in 1948. What is wanted is, on the immediate electoral front, a coalition of opposition parties, basing their appeal on a "virile democratic policy" instead of race hatred, and aiming it at the urban areas where 800,000 white workers now hold the balance of power. This is the choice before South Africa. Although some of the language in the book verges on the vituperative, Mr Sachs gives solid chapter and verse to support his views, including sections on the economic life of the country—the mining industry, agriculture, the rapidly growing industrial development—and on the political parties, the influence of the churches and, what he knows best, the trade union movement. Anyone who wants to understand the decisive period through which South Africa is now passing should read what he has to say.

Methods of Science

Foundations of Inference in Natural Science. By J. O. Wisdom. *Methuen.* 242 pages. 22s. 6d.

The study of the methods of science has been central to twentieth-century philosophy. In this volume, Mr J. O. Wisdom (not to be confused with Professor A. J. T. D. Wisdom, who now holds the Chair of Philosophy at Cambridge) has made an important contribution to this study. For Mr Wisdom the fundamental scientific procedure is what he calls—after Professor K. R. Popper, to whom he acknowledges his debt—"the hypothetico-deductive system," that is, the method of deducing consequences from a hypothesis framed, ultimately, by an intuitive process and testing these consequences against observation or experiment. The most interesting of these hypotheses are what he calls "non-instantial," those like Newton's law of gravitation which have no instances in the world of phenomena. There is not a thing to which one can point and say, "This is gravitational attraction." Yet one can deduce from Newton's law consequences which can be tested against the actual behaviour of bodies.

Over against this Mr Wisdom sets the traditional approach, which centres upon induction and the attempts to justify it as a form of inference. These make use of an "order of Nature," or, more recently, of more refined principles formulated, notably, by Keynes and Broad. None of them is satisfactory. A powerful attack on the problem of induction came from the logical positivists, who argued that it was a "pseudo-problem" resulting from a "systematically misleading" use of language, since induction was not a form of inference requiring logical justification but a successful habit. An inductive procedure is essentially practical; it justifies itself, if at all, by its success. This answer Mr Wisdom rejects—rather summarily some of his readers will feel, since his own conclusion also is that induction cannot be justified as a form of inference. He reaches this conclusion after a discussion of probability, both its mathematics, from which he selects a few leading theorems, and its philosophy, which again is shown unable to justify induction.

He comes finally to his own solution. Science proceeds by testing hypotheses, that is, seeking to falsify them. The hypothesis comes first, and it is impossible to embark on any inquiry without in fact using some prior hypothesis. The scientist's inductive faith in a hypothesis which in several critical instances has not been falsified cannot be justified logically. Every attempt to do so is circular. This faith can, however, be justified on one primary hypothesis, that of a universe which is "favourable," which "has just enough order in it." But the universe may well be unfavourable, and to this extent scientific method is arbitrary and unjustifiable.

This notion of a favourable or unfavourable universe will seem to many artificial and far-fetched, in the light of science's immense and indubitable successes in the practical field. Even if science cannot be adequately accounted for as a set of rules for manipulating the world of experience, yet against Mr Wisdom's solution some such down to earth argument as the following will continue to assert itself. A farmer's faith in a plough lasts as long as he has fields that are ploughable and no better instrument offers. With a scientist's faith in a law of nature it is no different. It lasts as long as the law is not falsified by experience and until a better, more general law can be framed. It is unnecessary, on the pretext of rationalising this procedure, to attribute to the scientist a belief that laws which have not been falsified in the past will not be falsified in future. Such a belief would not even be scientific, and the mistake arises from putting it in inferential form.

Malayan Income

The National Income of Malaya, 1947-1949. By Frederic Benham. *Government Printing Office, Singapore.* 272 pages. $5.

These are the first estimates to be made of Malaya's national income. They are very detailed and honest. It is made very clear that there is a large element of guesswork in them and that the total figures may contain an appreciable error, although it is thought to be not more than 10 per cent. The estimates are built up mainly from export statistics and government accounts so as to obtain a total figure for national output, but some attempts are also made to gauge incomes received and the amounts of investment and consumption.

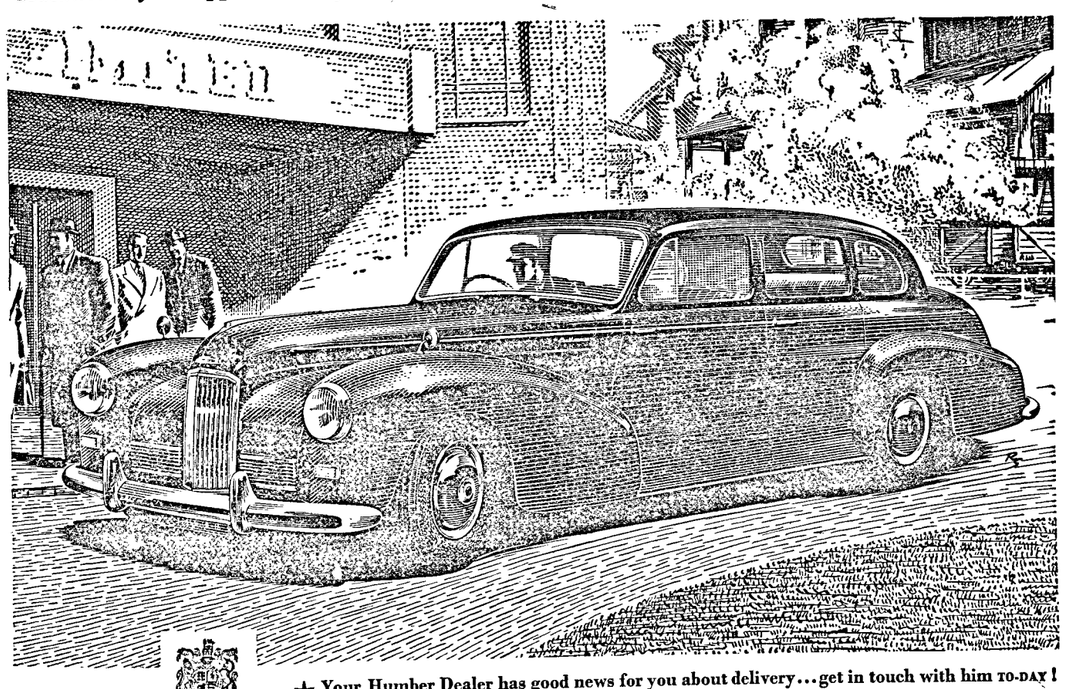
It is a pity that comparisons over the years have not been made easier. The chief drawback is that the main tables record only the gross value of output of the different groups of industries, and a single block deduction is made to allow for purchases from other industries and from abroad. Admittedly a search through the detailed figures allows rough adjustments to be made and a few net figures of "value added" are given in the text; but comparative tables would have been helpful. Some preliminary estimates for 1950 are included in the book. The rubber and tin boom that year naturally inflated the national product considerably in money terms and the rise over 1949 is put at about 60 per cent, with the contribution of the home-grown rubber industry to the total national product increasing from about 17 per cent to 32 per cent.

However rough some of these estimates may be, they are very welcome as giving a more complete picture of the economy of Malaya than has been possible before. They also provide a useful study of the many problems of national income accounting in a primary-producing country of this kind.

Too Many Themes

American History and American Historians. By H. Hale Bellot. *The Athlone Press.* 336 pages. 12s.

This is a curious book. One-third of it consists of bibliographies. The other two-thirds are devoted to essays on various subjects. Only the first of these deals with American historians, as such. This is a chapter which outlines some of the developments in the study and writing of American history over the last seventy-five years. The subsequent six chapters are semi-narrative, semi-analytical accounts of phases in American history between 1700 and the present day. Written in civil serviceable prose, they fully realise the author's expectation that they will not "be easily read." This is attributable partly to a continuous preference for the abstract over the concrete and partly to a somewhat baffling confusion of purpose about the way in which these themes are presented. If the author had contented himself with reproducing the main developments in American historical research over a selected number of fields he would have rendered a useful service. Unfortunately he has complicated, and to some extent impaired, this undertaking by superimposing on it various assessments of his own about the formative factors at each stage of American development.



The book thus falls between several

The quarterly Bulletin of the London and Cambridge Economic Service is now published as a special section of THE TIMES REVIEW OF INDUSTRY. The current Bulletin appears in the June issue.

The day is past when the business man, whether engaged in manufacture or distribution, could afford to concern himself with his own affairs only. To-day he must know what others in the same line of business as himself are doing. He must be acquainted, too, with developments in branches of production other than his own. And, if he is to maintain his position either in the domestic market or in export markets, he needs to be informed of industrial and commercial trends in other countries.

Month by month THE TIMES REVIEW OF INDUSTRY provides in convenient form the kind of information which enables those responsible for the conduct and administration of industry and trade to keep in close touch with developments at home and abroad. It is consulted by the far-sighted business man in every country.

stools. It is not a study of the development in American historical thought (for this purpose it would need to cast its net very much wider—to bring out, for example, the pervasive influence of Charles Beard's economic determinism upon a whole generation of American thinking). It is not a comprehensive, critical bibliography of recent research work, even in the fields which the author has singled out for attention. It is not even an entirely satisfactory analysis of the main influences that have shaped American historical development.

For all these reasons the book is unsatisfactory. But that does not mean that it is not useful. The author's principal interest is in economic history, particularly in the economics of Western expansion. What he has to say on this subject must command respect for its learning, thoroughness and freedom from prejudice. The chapter on the "Settlement of the Mississippi Valley," to take only one example, is full of shrewd analysis and helpful interpretation. But this only heightens regret that the book was not more carefully focused on this theme. No doubt it would have been a considerably more slender volume, but it might also have been a cheaper one.

Irish Nationalism

A History of Ireland Under the Union. 1801-1922. By P. S. O'Hegarty. *Methuen.* 811 pages. 50s.

The author of this large and well-documented book possesses unique qualifications for the task he has undertaken. He has accumulated one of the finest existing collections of books, pamphlets and newspapers dealing with Ireland, and has himself played an active part in the political and literary movements of the last fifty years. He thus has at his command a peculiar combination of bibliographical sources and first-hand information. The book is written with vigour and style, in the best tradition of Irish polemical literature. The author holds strong personal convictions on all the problems he discusses, but he is always conscientiously accurate.

The great Irish nationalist tradition is traced from Tone through O'Connell, Davis and Parnell to Collins and Griffith, who concluded the Anglo-Irish Treaty in 1921. The author's ardent patriotism renders him unsympathetic to the leaders of religious, agrarian and social movements whom he tends to regard as deviationists from the straight and narrow path. Indeed, the conflicts between the strictly political and other popular movements must have imposed a considerable strain on the Irish people at times. In spite of many difficulties, loyalty to the nation and to the Church was successfully combined.

If this excellent book contains a minor fault it is possibly its under-emphasis of the Ulster problem. The skeleton of Partition is kept rather in the background, perhaps because it takes away from the glory of the victory won by the author's friends thirty years ago.

Shorter Notices

Money and Employment in Ireland. By Laurence Hooper. *Fallon*, Dublin. 159 pages. 10s. 6d.

The scope and aim of this examination of the Irish economy are set out in an early sentence.

> The coincidence of severe unemployment and emigration with a strong international creditor position is very unusual and its continuance . . . suggests that the theory on which economic policy has been based has not been correctly formulated in relation to Irish conditions.

The author adds that there is a seasonal unemployment figure of upwards of 80,000 coupled with an annual emigration of about 15,000 while foreign assets total £400 million.

The author therefore attempts to translate Keynesian theory into Irish practice. Eighteen hypothetical cases are set out in which the effect of investment on the level of employment, the balance of payments and the volume of external assets is considered in detail. These models have been elaborately prepared and it is not possible to consider them as fully as they deserve. Criticism attaches to the assumptions on which they are based rather than to their details. Neither seasonal unemployment nor emigration will be cured by policies for full employment as the term is usually understood. Unemployment is seasonal because Irish agriculture is seasonal, and its volume is swollen by the inclusion of many who are not out of work in the generally accepted sense. Emigration is primarily a migration of unskilled labour. It is misleading to apply criteria derived from developed industrial economies to the Irish scene.

The case for investment in Ireland does not depend on considerations of the volume of employment. The Irish problem is created by a lack of technical skill, industrial tradition and enterprise rather than by any deficiency of capital. These shortcomings will not be made good by monetary policies; and one feels that the arguments of this closely reasoned book are more relevant to possible problems of the future than to those of the present day.

Uruguay. By George Pendle. *Royal Institute of International Affairs.* 100 pages. 11s. 6d.

Lord Bryce described Uruguay as "a cheerful country, with scenery constructed, so to speak, on a small scale, as befits a small republic." The Chatham House series of studies on Latin-American countries, of which this is the second, are also constructed on a small scale; some may complain that their price should be adjusted accordingly, but there is no doubt about the value of a short and very readable introduction to such a country as Uruguay. In spite of Britain's long and close connection with the eastern shore of the River Plate, no British author has written a book on Uruguay for over forty years, and during that period the country has been transformed. Whether the transformation has yet gone far enough to justify Mr. Pendle's use of the phrase, "South America's first welfare state," may be questioned; a national health service, for example, has yet to be created, and unemployment benefits are by no means universal. But Uruguay has certainly moved towards social democracy far more swiftly than any of its neighbours. Mr Pendle describes how this progress has been primarily the work of one remarkable man, President Batlle, to whom Uruguay also owes its liberation from ceaseless civil strife; the fact that Batlle, long after his death, remains the most powerful personality in Uruguayan politics, was demonstrated only recently, when the country formally adopted the system of government by council which he had advocated.

Letters from a Self-Made Merchant to His Son. By George Horace Lorimer. *Methuen.* 127 pages. 6s.

John Graham of the Union Stockyards, Chicago—Old Gorgon Graham, that rock-ribbed, unreconstructed tycoon, affectionate but illusion-proof parent, pawky *raconteur* and Self-Made man—is back in circulation, just under half a century from his first appearance. To his numerous friends and admirers, no other notification is necessary. Those who have not, via the second-hand bookshops or otherwise, made his acquaintance already, have a pleasure in store whose nature can be roughly indicated by drawing converging lines through Lord Chesterfield and Artemus Ward.

Text and Reference Books

Post Office London Directory for 1952. *Kelly's Directories Limited.* 2,847 pages. £5.

The newest addition to the information on London presented annually in "Kelly's Directory" is a street plan of Central London on a scale of 6 inches to the mile. There are four other plans on a scale of 4 inches to the mile for the rest of the London region. The 153rd edition of the book follows its predecessors in general layout.

Directory of Shipowners, Shipbuilders and Marine Engineers, 1952. *Tothill Press Limited.* 912 pages. 40s.

With the 1952 edition this directory reaches its fiftieth issue and the five indexes to its various sections occupy nearly as much space as the whole of the original edition. The first of the two main sections lists the shipowners and gives particulars of the services on which they operate, their fleets and other details. The shipbuilding section gives details of shipyards and marine engineering establishments and their normal output capacity and repair facilities.

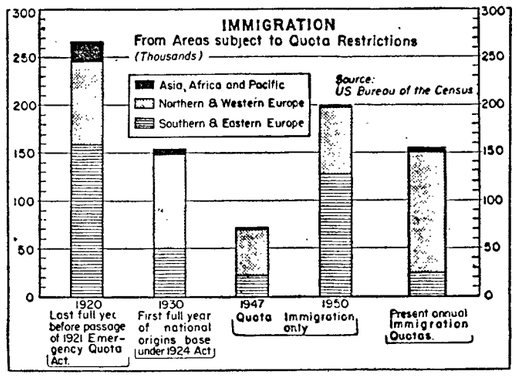
State of Israel Government Yearbook, 1951-52. *Israel Government Printers.* 536 pages. 21s.

The English edition of the Israel yearbook contains most of the information of the Hebrew edition and in addition has details of the new government of October, 1951, and a statement of its policy.

The book provides details of the ministries and reviews the history and economic development of the year. The principal legislation and armistice agreements are given. The last two sections are a list of the settlements in existence in December, 1950, and a statistical abstract.

Year Book and Guide to East Africa, 1952. Edited by A. Gordon-Brown. *Robert Hale Limited.* 435 pages and maps. 6s.

Year Book and Guide to Southern Africa, 1952. Edited by A. Gordon-Brown. *Robert Hale Limited.* 860 pages. 8s. 6d.



The latest editions of these two guide books prepared for the Union-Castle Mail Steamship Company follow the pattern of previous years. They provide historical, economic and geographical information and small-scale maps.

AMERICAN SURVEY

Immigration Omnibus

THERE is no doubt that amalgamation and codification are needed for the conglomeration of about 200 immigration, naturalisation and deportation laws which the United States has amassed over the last 150 years. And now is the time to sort out the muddle. The emergency measures intended to absorb part of the postwar flood of refugees from Europe have ended. The prosperity of the United States means that the country is, or should be, ready to welcome ordinary immigrants in substantial numbers for the first time since the nineteen-twenties; that is when the present restrictions on immigration were first applied and the subsequent depression meant that their full impact was never felt. Finally the recent panics about Communist contamination in the United States, and the legislation which they have inspired, the McCarran Internal Security Act, have led to a series of refusals of visas, deportations and so on, which have made many Americans realise how much harm is done to their country's reputation abroad by immigration policies which the average citizen seldom hears about.

It is because the average citizen knows little or nothing about these policies, and because the average member of Congress has neither time nor knowledge to study this complicated legal and human problem, which concerns foreigners, not American voters, that the omnibus Immigration Bill, which has now been approved, in slightly differing forms, by both the House of Representatives and the Senate, is so unsatisfactory. It is a measure which does little credit to a country which owes its past development and present power as much to the immigrants who came to populate it as to the great natural wealth they found waiting for them. The Congressional Judiciary Committees have been studying the Bill for three years, a period long enough to have dampened any enthusiasm the members may once have felt for it. As a result the drafting was done to the reactionary recipes of the committee chairmen, Senator McCarran and Representative Walter, both Democrats. And there was nothing to reawaken Congressional interest in the Bill when it finally reached the floor, for its implications and prejudices were hidden in over 300 pages of complicated technicalities.

It was partly to force the members to look into the details of the Bill and thus discover what it involved that its liberal Democratic opponents, Senators Lehman and Humphrey, produced 200 amendments on the floor and tried to debate each one. They also hoped by this means to wear down the resistance of the Senate and to get the Bill sent back to committee for further study. They failed to achieve this, but gathered enough votes to give them hope that, if the President vetoes the Bill, as it is thought he will, the two-thirds majority needed to override the veto will not be forthcoming.

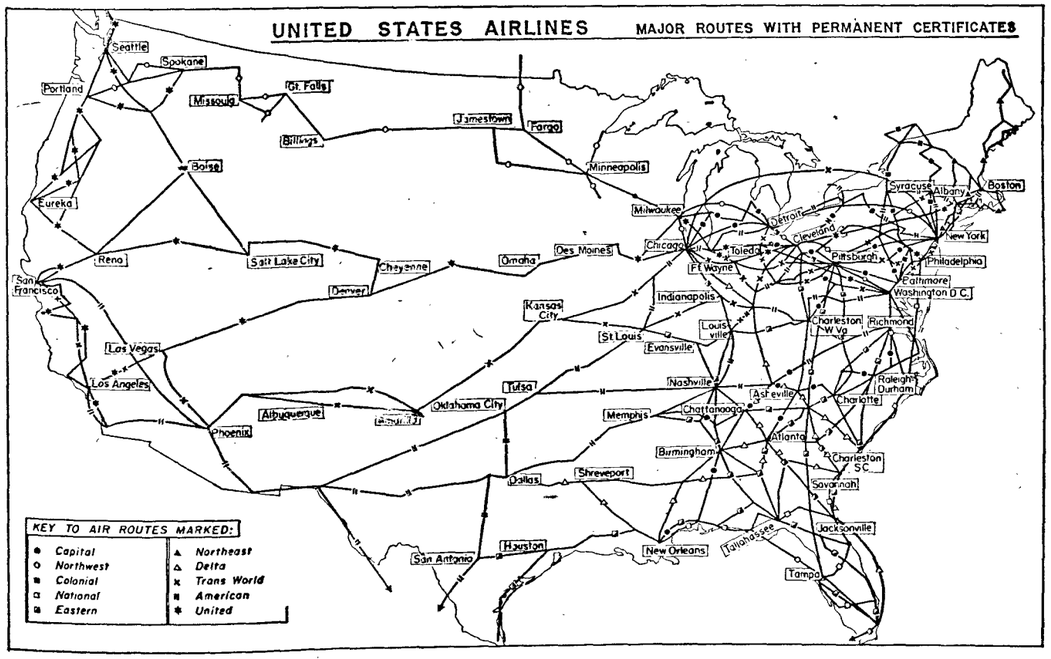
The main argument over the new Immigration Bill has been about its quota provisions which, with certain exceptions, govern the number of immigrants entering from each country, apart from those in the Western Hemisphere. The quotas, now fixed at a total of 154,206, were established under the 1924 Act in their present form, and are based on the national origins of the American population in 1920, something which officials have never pretended to be able to calculate on anything more accurate than guesswork. The purpose of these restrictions was to ensure that a large proportion of immigrants should come from northern and western Europe, countries such as Great Britain and Germany which were supposed to produce the best citizens and which were the main sources of immigration in the nineteenth century. During the early years of this century, when a million immigrants a year were crowding in, most of them came from southern and eastern Europe, the Baltic, Italy, and so on, and were thought to make less desirable citizens.

Senator McCarran has not outgrown these prejudices, or the even stronger one against Asia which has characterised so much of the immigration legislation, even though they are even more unbecoming to the United States today than they were thirty years ago. His new Immigration Bill does increase the total quota by a few hundreds and does provide quotas for Asians. It also extends to Japanese, Burmese and other Asians the privilege of naturalisation which has already been granted to Chinese and Indians. But the quotas for Asiatic countries are small, usually only 100 a year, and must also cover those who are half-Asian, wherever they were born and whatever their nationality.

Nor does his Bill do anything to alleviate the difficulties left behind by the Displaced Persons Act of 1948. Immigrants brought in under this Act were charged against the future quotas of their countries, which explains why immigration from southern and eastern Europe has since then been far above the quota. But this means that countries such as Poland, with an annual quota of 6,500 and admissions of over 50,000 in 1950, have mortgaged half their quotas until the end of the century. Meanwhile, however, countries in northern and western Europe, like Britain, which has much the largest annual quota of any country, 65,700, have not been using their allowances. Under the present system these surpluses cannot be transferred to other countries. Senators Lehman and Humphrey wanted to pool all these unused quotas for distribution in eastern and southern Europe and, even worse in Mr McCarran's eyes, amongst Asians. In addition the Senators would base quotas on the national origins of the population in 1950, which would mean a bigger share for the prolific southern and eastern Europeans. In Mr McCarran's opinion, such proposals would vitiate the purpose of the quota system and would transform the racial and cultural composition of the country in a generation.

★

Mr McCarran thinks that these proposals could only have been inspired by "subversive" sympathies, and his blind determination to prevent these spreading underlies the rest of his Immigration Bill, dealing with the exclusion and deportation of aliens and with naturalisation. It is difficult to judge how these regulations would work in practice but the Bill's critics maintain that some of them set up new and undesirable barriers against aliens, establish equally new and undesirable grounds for deportation, and make both exclusion and deportation even more subject than at present to the arbitrary decision of administrative officers. Furthermore, it is said that under the Bill aliens who had been naturalised would not be full Americans, for they could be deprived of their new citizenship if they joined a Communist group.



The philosophy behind this omnibus Bill seems to be that aliens are undesirables who should be encouraged to stay out of the United States rather than to come in. It is comforting to see that the protests against this isolationist point of view have come not only from the most respected racial and religious bodies but also from such influential sources as the American Bar Association and the big trade union organisations. In spite of Senator McCarran there are still plenty of Americans in the land of the free and the home of the brave who have the courage to recognise and fight for liberty.

Clouds Ahead for Airlines

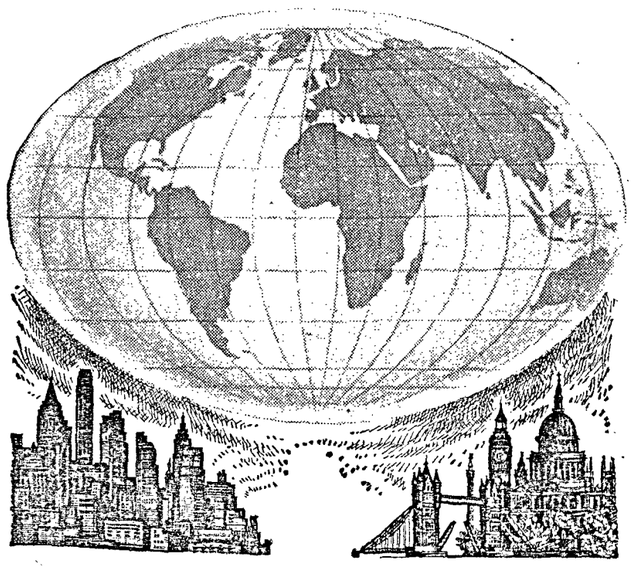
[FROM A CORRESPONDENT IN WASHINGTON, D.C.]

THE American flying public, grown used to inflation, took in its stride this spring's increase of $1 a ticket in airline fares. But the modest step-up made a big difference to airline officials, all of whom are uneasily aware that their companies need more revenue even though 1951 was the most successful year in airline history. The 34 regular lines which deal with the bulk of the domestic air passenger traffic carried 22 million passengers in 1951, a rise of one-third over the previous year, and revenues, which zoomed to $584,560,890, showed a comparable improvement. But the airlines also unfortunately managed to kill a record number of passengers last year. After a disastrous series of crashes, the rate at which airline business was improving slowed down perceptibly during the early part of 1952.

But airline operators are not seriously worried that the spectre of sudden death will frighten away their passengers. What haunts them is the possibility that, even under the best conditions, they may not be able to expand their market fast enough to fill the seats on the new equipment soon to be put in the skies. In the last two years, the regular airlines have invested $410 million in aircraft alone; many of these machines will be delivered in 1953. By the end of next year the seating capacity of airlines will be increased by 49 per cent and, although this makes life pleasant for the ticket agents, it brings with it a frightful load of overhead costs for the airlines; it is estimated that their revenues will have to go up by $400 million next year to cover the expenses of running the new aircraft. So far there are no immediate prospects of American jet airliners, although a subsidy

Braniff Airways, Chicago and Southern Airlines, Continental Airlines, Inland Airlines, Mid-Continent Airlines, and Western Airlines are not shown. The airlines linking Baltimore and Richmond with Washington, D.C., are too numerous to distinguish by symbols. From a *Civil Aeronautics Board* map.

scheme has just been proposed to encourage their development.



Where can the airlines get an extra $1 million a day? The competition from privately owned automobiles is growing rather than declining, with the construction of such direct super-highways as the 110-mile New Jersey Turnpike. As for taking more customers from the railways, the airlines have already won about half the first-class travel market, and have almost monopolised it in some areas; on the New York to Houston runs, for instance, it is estimated that aircraft carry 80 per cent of all first-class through traffic. The next obvious source of revenue is the so-called "coach service," recently extended to transatlantic flights, where the airlines offer a reduced fare in exchange for the elimination of such fripperies as free hot meals served aloft. But the major companies are already deep in the domestic coach trade: in 1951 the regular domestic lines flew 1,200 million coach passenger miles, nearly double the previous year's total. Some airline operators question the wisdom of expanding this service much further, on the grounds that they are simply competing with themselves; air coach passengers are mainly established air travellers who were weaned away from first-class travel by the cheaper rates.

As well as needing more passengers to fill their new equipment, the airlines are beset by rising costs, which are said to have gone up by 7½ per cent in the past year. The price of oil and petrol is getting higher, pilots' wages are up, and municipal airports are constantly raising the fees which they charge for landing. To get more efficient operation as well as more revenue, airlines are trying to arrange mergers, with the encouragement of the Civil Aeronautics Board; but stockholders are making difficulties. A scheme for amalgamating Capital Airlines, which has been depending for most of its revenue on the profitable New York-Chicago-Washington runs, with Northwest Airlines, which has been serving the Pacific northwest, has been rejected and so has one for merging Colonial Airlines, which links Washington, DC, and New York with Canada, with National Airlines which serves Florida. Eastern Air Lines, also operating in the south-east, is now negotiating with the Colonial company and a similar merger is being discussed between Delta and Northeast Airlines.

*

But, unlike the railroads, which developed in the most free-wheeling era in the history of American capitalism, the airlines grew up with "big government" and cannot solve their problems by merger, or in any other way, without permission. In a bygone day, a man with the swashbuckling temperament of Captain Rickenbacker of Eastern Airlines would have been bound only by the limits of his imagination, but today his horizons are tightly circumscribed by the Civil Aeronautics Board. Even so, they are not drawn as clearly as they might be, for the board, fourteen years after the passage of the Civil Aeronautics Act, still has not perfected regulatory machinery for an industry which has grown faster than any reasonable expectation. About the only section of the domestic industry which operates today with a fairly complete set of ground rules are the 16 "trunk" airlines, the big certificated carriers, so-called because they have been awarded permanent certificates to carry passengers and mail over specific routes. Headed by the "big four" (Trans World, Eastern, American and United Airlines), these bear the burden of long-distance transport by air, and last year flew over 10½ billion passenger miles.

One step lower in the hierarchy are the 18 local service or "feeder" airlines. While the trunk lines take care of jumps between big cities, such as from New York to Chicago, or from Washington to Dallas, the feeder lines serve the smaller cities, providing air transport to the intermediate points on the air map. They are under an equally tight

World-wide Banking

Businessmen with international interests rely on a bank whose services are world wide.

The National City Bank of New York provides a global network of 54 branches, as well as banking correspondents in every important centre of the world. The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2. WEST END: 11 WATERLOO PLACE, S.W.1

obligation to provide regular service on their routes, but they are operating on temporary certificates; the CAB is not granting them permanent franchises because the economics of short-haul air passenger traffic have not yet been tested as thoroughly as have those of the long-haul business. Like the trunk lines, the feeders are authorised to collect payment for carrying US mail, the traditional method which the federal government has used to subsidise air lines which are losing money.

In addition to the trunk lines and the feeders, the CAB extends the privileges of certification to two other domestic groups—a few well-organised companies which carry nothing but cargo, and a handful of pioneers who are setting up helicopter services in New York, Chicago and Los Angeles. Beyond these, the bulk of domestic American air transport is done by some 64 companies, lumped under the rather disparaging title of "large, irregular carriers," operating under permits called letters of registration. These companies vary enormously in size, ability and ambition. Some own multi-engined aircraft which carry full passenger loads from ocean to ocean, others offer little more than a local flying taxi service. But taken all together, they are making two major contributions to the development of domestic air transport: they satisfy some of the demand for air travel left unfilled by the big certificated lines and, in the scramble for revenue, they have thrown off dozens of good ideas. The air-coach was first developed by the irregular carriers; the certificated lines were forced to offer these special low-fare trips when they began to lose customers by the plane-load to the irregulars.

The CAB, trying to create the best of all possible half-worlds between regulation and free enterprise, keeps an alert but not unfriendly eye on the ferment in the irregular carrier field. On the one hand, the board protects the enormous investment of the certificated lines by forbidding the irregulars to provide regular service over established routes. On the other hand, by referring to the performance of the irregulars, the board jabs the certificated lines with a pointed reminder that they should be trying to give better service at lower cost. Last year, the CAB served notice on the certificated trunk lines that they should expand their coach service and reduce rates below the prevailing 4½ cents a mile, with the implicit threat that, if they did not, the board might allow the irregular airlines to fill the gap.

American Notes

Railways Out of Uniform

Shoulder to shoulder with the steel companies, disputing before the Supreme Court the President's right to seize the steel industry, stand the railway trade unions, whose own industry was seized nearly three years ago to prevent a strike. Complaining bitterly about "one-sided seizure" and "rule by labour injunction" (the government four times obtained court orders to prevent the unions from striking and one brotherhood was fined more than $100,000 for a violation), the engineers, firemen and conductors last week accepted terms from the President's mediator, Mr Steelman, not much better than those they turned down a year ago. The railway vice-presidents can now take off the uniforms they have worn as symbols of army control and prepare for at least some months of labour peace.

When the railways were seized, two of the unions favoured the move, confident that, as so often before since 1941, the White House would force the carriers to give way. Such expectations have led to the virtual abandonment of the Railway Labour Act, once considered a model of all that an industrial disputes law should be. But this time the only additional concession, won after fifteen months of seizure, was on changes in working rules sought by the companies: the unions will not be forced to accept an arbitrator's decision on whether the companies can send train crews into divisions far from their homes. The companies, of course, would be more anxious to reach a settlement if, when their properties were seized, profits were impounded, as Senator Morse suggests they should be. But under present practice this does not happen, and both the unions and carriers may, in future, try to keep their disputes out of the government's hands.

The railways were seized under the authority of a law passed in 1916, unlike the steel companies, which the President took over under his interpretation of his "inherent" powers. The very sharp questioning to which the Justices of the Supreme Court subjected Mr Perlman, the Solicitor-General, when he attempted to justify the seizure in terms of the defence emergency and to explain the President's refusal to employ the Taft-Hartley procedure, is not necessarily a sign that the Supreme Court will rule against the Administration in the steel case. Even if it does, the likelihood is that the Court, which is never enthusiastic about making broad constitutional rulings, or too sharply defining the separation of powers when this can be avoided, may confine itself strictly to the steel case, leaving the President's general powers unimpaired. But the Administration is already considering what steps to take if the ruling is adverse and the steelworkers once more walk out.

* * *

Controls—Latest Model

The Senate Banking Committee has taken two months to recover from the shock of the steel dispute, but it has at last managed to collect its thoughts on the renewal of the Defence Production Act, the legislation which authorises the government's economic controls. The committee has remodelled the wage control provisions to suit the steel situation. The Wage Stabilisation Board, which precipitated the dispute by recommending, without consulting the other stabilisation agencies, a much bigger wage increase than had been expected, would have power only to advise the economic stabiliser, under the committee's proposals. The board would be concerned only with wages, not with the other labour questions which were brought into its purview last year in order to reconcile the trade unions to wage controls; its approval of the union shop, under this authority, was even less acceptable to the steel industry than was its wage decision. Finally, the Senate committee wants all members of the board to represent the public, instead of being equally divided amongst industry, labour and the public. Many difficulties are thought to have arisen because the public members have had to compromise with one of the other groups, and usually chose labour, to get a majority vote.

Feeling that the economy has been stabilised for the present, but in spite of, rather than because of, control, and bitter about the handling of the steel dispute, Congress will certainly not want to settle for any less drastic modifications in the wage provisions of the Act. But on the other hand it will hardly dare to pull down controls altogether, for fear that a new wave of inflationary pressure may build up just in time to swamp the voters as they go to the polls in November. And the labour organisations have already given notice that, if the wage stabilisation machinery is changed as the Senate committee has recommended, they will refuse to co-operate in the stabilisation programme, and this in turn would wreck the price control machinery.

The committee proposed various changes in that machinery, too. The only one which would strengthen rather than weaken the legislation would prevent increases in retail and wholesale price ceilings under the Capehart amendment, which allows for rises in costs during the first half of last

year. It was intended only for manufacturers, but a recent court decision made it applicable also to distributors. The reversal of this decision had been requested by the price stabiliser, who insists that prices are about to shoot up again and that the present controls should be reinforced.

The Senate committee would extend the wage and price control authority only until next March, when the new Congress will be able to reconsider it. The other sections of the Act, providing for rent and credit controls, for the allocation of raw materials and so on, would be continued for a full year. The House Banking Committee is still considering its report and in any case experience shows that this is a Bill which is likely to be substantially rewritten in debate.

* * *

"The Miracle" Upheld

Hollywood has a foreign film and a small New York distributor to thank for its Magna Carta: a Supreme Court ruling that a film may not be banned because state censors consider it sacrilegious, and that motion pictures are entitled to the protection of the First and Fourteenth Amendments, which guarantee free speech and the freedom of the press. "The Miracle," one of an Italian trilogy voted the best foreign film offering of 1950 by the New York critics, portrays a simple-minded peasant woman deluded into believing that her child has been miraculously conceived. When the film was shown in New York City, where Roman Catholics are numerous and influential, a boycott was proclaimed by Cardinal Spellman. The state authorities speedily revoked the licence granted earlier, on the ground that the film was sacrilegious, although spokesmen for other religious bodies did not find it offensive.

"All Ready For D-Day?"

Herblock in the *Washington Post*

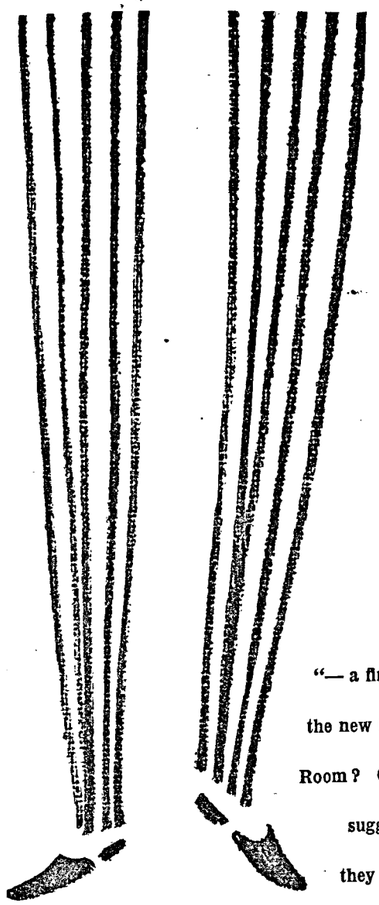
General Eisenhower returns to the United States on June 1st as one of the two leading candidates for the Republican nomination for the Presidency. For the first time he will be out of uniform and free to state his views on political questions, and he will be faced with a barrage of reporters and microphones.

In raising the status of the film industry to something comparable to that of the press, the Supreme Court reversed one of its own decisions. In 1915 it upheld the Ohio censorship law, on the ground that the exhibition of moving pictures was a business, pure and simple, on the level of the circus and other spectacles, and not entitled to be regarded as part of the press or as an organ of public opinion. Censors are now established in seven states and over fifty cities; the federal government does no more than bar the importation or carriage across state boundaries of indecent films.

The Supreme Court made it clear that its ruling does not prevent a censor, under a strictly drawn law, from banning films because of obscenity. But as far as official censorship goes, there is now nothing to prevent Hollywood from giving as adult treatment to adult themes as foreign producers do. In practice, however, pressure by private groups, particularly the Roman Catholics, has circumscribed Hollywood's freedom more effectively than the public censor. But at least after this week well-organised minorities will not be able to use the authority of the state to impose their religious views upon audiences of different beliefs.

* * *

Playing Politics with Pensions



It was not their much-vaunted enthusiasm for economy, but their subservience to the prejudices of the American Medical Association, that led 140 members of the House of Representatives into the surprising folly of voting against, and thus defeating, a Bill for increasing the benefits paid under the old persons' and survivors' insurance plan. The increases, much needed to cover the rise in the cost of living since this federal scheme was last revised in 1950, would have given the average recipient an extra $5 a month and increased the amount he could earn without sacrificing his benefit. About 45 million workers, out of a total of over 60 million, are insured under the scheme, and about 80 per cent of the voting population would have profited sooner or later from the Bill's proposals.

For this reason, and because its provisions were thought to be uncontroversial, the Bill was one of the few that Congress seemed certain to pass before adjourning for the election campaign. But at the last moment the Bill failed to get the expected majority, thanks to the American Medical Association's nose for "socialised medicine." This was the smell given off, according to the diagnosis of the doctors' lobby, by a minor clause dealing with retirement benefits for persons permanently and totally disabled. The decision as to what constituted such disablement was to be left to the association's bogeyman, Mr Oscar Ewing, the Federal Security Administrator, and to doctors designated by him. He would thus, according to the horrified AMA, be given "absolute control over certain medical activities."

Having saved the doctors, most of whom are convinced Republicans anyway, from this fate, the 99 Republicans who were the majority of those voting against the Bill realised that they had made an election issue to order for the Democrats by denying 4 million old people their extra pensions. A new Bill, without the objectionable clause, was hastily introduced, but it is by no means certain that the Democratic leadership in the House will help the Republicans to climb out of the pit they dug for themselves, by allowing the Bill to come to a vote. Even if it does, the delay may have lost it its chance of getting on to the Senate's crowded schedule, and once there it may be further delayed by attempts to broaden it into very necessary overhaul of the whole social security system.

Occupation Ends in Germany

(From Our Special Correspondent in Bonn)

"BONN has had its day." Germans made this ironical comment frequently last Monday when the three Foreign Ministers of the western powers came to this little Rhineland town to sign the conventions that end the occupation regime. The Germans were flattered by the presence of the great men in their provisional capital, but in general refused to be stirred far out of their normal attitude of surly suspicion. It was only a small crowd that gathered in the drizzle to watch the arrival of the statesmen at the *Bundeshaus*. It was, however, a friendly gathering which showed a particular liking for Mr Eden. With good sense the representatives of the western democracies did not indulge in ceremony. The friendly, informal equality with which they treated their host, Dr Adenauer, was an extraordinary contrast to Versailles in 1919. It brought home the fact that the conventions are negotiated agreements not a *Diktat*, that they do not represent a peace treaty and, finally, that they go hand-in-hand with the European Defence Treaty that was signed in Paris the following day. As the statesmen stressed, the conventions are intended not only to make an end to the postwar period, but to open up a new era of European collaboration. Mr Eden, after referring to the suffering caused by the two world wars, went on to say:

> It is within the power of statesmanship and the wisdom of nations today to bring that chapter to an end. Here we close, we believe, a war and its aftermath; but these signatures can mean much more than that. They can open a window on the future. They can give to Europe a chance to free itself from the wars that have tortured two generations.

Celebrations would have been very inappropriate in view of the attitude of the public. For large numbers of young men, the reopening of international motor-racing on the Nürburgring was a greater occasion than the signing of the conventions; the Bavarians ostentatiously showed that they were more interested in local affairs. Above all a number of Germans were oppressed by fear that the pacts mean the permanent division of their country and Russian action of some kind. The latest Russian Note, showing that the door to unity is still open, did something to remove this anxiety, but it will continue to kill enthusiasm for the new regime. Dr Schumacher went too far even for his own colleagues when he declared that anyone who supported the treaties with the West had ceased to be a German. But the Social-Democrat leaders are probably right in thinking that they will gain kudos in future by making a stand now against the conventions. Although Mr Acheson had deliberately stressed that the western powers would not have reached their final goal until after the whole of Germany had been reunited in freedom.

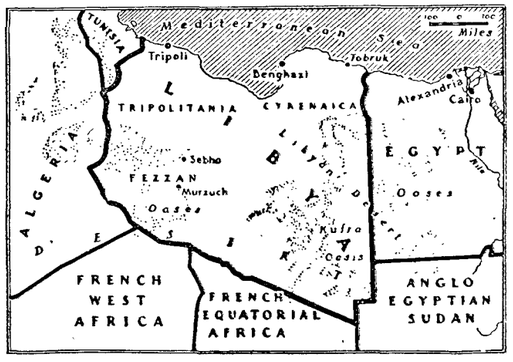
> I can assure you of my Government's continued determination to press steadily towards this goal until the unity of Germany in freedom has become a reality.

The ceremony of signature in the Upper House was not attended by the Social-Democrat president of the *Bundesrat*; he and the five SPD vice-presidents all had prior engagements. In the *Laender*, local Ministers said they had no intention of following the request from Bonn to hang out flags and declare a school holiday on Monday. The Bonn Minister of the Interior hastily withdrew his proposal. And, sensing some witticism from the Left, the Chief of Protocol removed one of the tapestries that had been hung in the Upper Chamber. It represented the Rape of Europa.

When the implications of some of the clauses of the conventions have been grasped there will be an outcry for revision. The powerful business and industrial interests whose influence is strong in Bonn will take the lead. It will be seen that the Americans have not abandoned their effort to wean the Germans away from trusts and cartels; a new Allied agency will try to carry on this reform until the German anti-trust law is passed. To the extreme annoyance of the Ruhr, the High Commission, on the eve of the new treaties, issued an order to dissolve the monopoly coal selling agency forthwith. The fact that the Bonn Government had undertaken to carry out this step at the time the Schuman Plan was concluded in no way affected German indignation. The incident reflected the attitude on both sides to the question of trusts.

Details Instead of Goodwill

It is also easy to see the objections that will be made to the extra-territorial rights which are retained by the non-German forces on German soil. Where is German sovereignty and equality, it will be asked, if a local American or British officer can decide that there is an emergency in his area and take over command? Safeguards against misuse of these and other rights have been written into the conventions. If, for instance, the three Powers declare a state of emergency, they will specify to what area it applies; they will consult the Federal Government to the fullest possible extent while the emergency continues; and if after thirty days the emergency is still in force, the Federal Government may appeal to the Council of Nato, and the three Powers will abide by its ruling. The extra-territorial rights may all some day save German democratic government from violent overthrow—but they wound national feelings. The negotiators of the voluminous conventions have laboured over the past eighteen months to satisfy everybody, and to cover all aspects of the new regime, from the fish to be caught by non-Germans to vital questions of state. They had to go into details because goodwill cannot be relied upon to replace clauses. The result, however, will be to give the impression that little has changed and that an occupation remains under another name. It is true that the powers now abandon the right to legislate in Germany but they had in any case made no use of the right for a long time past. For the Germans, therefore, the conventions will appear to contain a few new privileges which they will want to exercise immediately, and a number of restrictions on their sovereignty which they will at once demand to have removed. In theory, the occupation regime only ends when the European Defence Treaty as well as the new conventions have been ratified, but no realistic observer can doubt that, whatever the fate of the defence treaty, the occupation regime can never be revived.



Libya Deserta—I

The Political Scene

[FROM A SPECIAL CORRESPONDENT]

THE United Kingdom of Libya which was declared an independent sovereign state on December 24, 1951, is suffering from chronic growing pains which will take many years to cure. It is already apparent that unity has in no way improved relations between the Berbers of Tripolitania and the Beduin of Cyrenaica. Indeed, though they are now part of the same country, it is necessary for all travellers and residents to obtain visas and pass customs posts when they wish to cross the four hundred miles of grey desert which so effectively separates the two provinces.

There is considerable confusion and misunderstanding in the minds of politically conscious Libyans about the functions of the three cabinets—Federal, Tripolitanian and Cyrenaican—which are attempting to administer the country. It is a difficult task because Libya has no minerals, few natural resources and a scattered population of about one and a quarter million people of whom 90 per cent are illiterate. The Federal Government have, since the elections in February, been successful in the uneasy task of maintaining internal security; this has been accomplished through the medium of a police force composed of Libyan Arabs commanded by British officers. In Cyrenaica the police force

has grown out of the Senussi Defence Force which fought so well with the Eighth Army.

The new kingdom has, as yet, no army. It was hoped that a group of British officers would train the Emiral Guard, now only eighty strong, to become the nucleus of a new Libyan army organised on lines similar to the Arab Legion and as part of the western defence system. Unhappily, a recent mutiny in the Guard has caused this project to be temporarily abandoned. The new King, Sayed Mohammad Idris el Senussi, has never been liked in Tripolitania where he is frequently referred to as a "Shepherd Chieftain." Recently he re-emphasised his old loyalties by issuing a decree retaining the title of Emir of Cyrenaica. Today his popularity is waning throughout the state because the members of his large family not only demand important posts in the new kingdom for which they have few, if any, qualifications, but they run the entire business of the country and those businesses which have failed to admit a member of the Senussi family as a sleeping partner have little hope of avoiding bankruptcy. The poorer townspeople of Benghazi, who formerly worked their individual salt pans from which they earned ten shilling or more each year, now feel extremely bitter because the Senussi family have acquired a monopoly of the salt industry.

Greatly to the surprise of British officials on the spot, the speech from the throne delivered at the opening of the first Libyan Parliament on March 25th was pro-Egyptian in tone. King Idris said: "My government will take suitable modern Egyptian laws . . . as a basis for its forthcoming legislation." He added that the education system of the new state would be based entirely on that of Egypt. The strongly pro-Egyptian opposition party, the National Congress, led by Bashir Bey Sa'dawi had, in fact, been defeated at the general election, but the people of the coastal towns are so strongly influenced by Egypt that the King and Federal Government had thought it a wise move to make certain concessions to their views. There were no developments arising from the King's speech because from March 25th, when Parliament was formally opened, until mid-May, when the Chambers adjourned as Ramadan was approaching, no more serious questions were discussed than minor points of procedure and the remuneration of its members. The Federal Prime Minister, Mahmud Bey Muntasir, admits that he is worried by the failure of Parliament to tackle some of the more urgent and difficult problems of foreign policy that await it.

Future of British and American Bases

The Foreign Affairs Committee claims to have looked at the terms of the treaty which has already been initialled between the United States of America and Libya. This treaty, when ratified by Parliament, will enable the Americans to retain their large and important air base at Wheeler Field for an annual rent of $1 million. The British Minister has made various attempts to negotiate a treaty on terms somewhat similar to the American one. Great Britain has already pledged itself to meet an annual deficit in the Libyan budget, which this year may amount to about £1,500,000 and in exchange for this financial assistance the British Government hopes that the Royal Navy may retain a small base at Tobruk, the Royal Air Force a base at El Adem, and the Army the right to use the desert as a training ground. Although most members of the Federal Government are fully aware of Libya's dependence on foreign financial aid, Anglo-Libyan negotiations have as yet made little progress; but there is some reason to hope that a treaty will be concluded by the end of the year. The task of the negotiators, however, grows daily more difficult as the Nationalist movement, based on the Egyptian model, grows and becomes a menace to the new state. A large section of the press is violently nationalistic, as a typical editorial from *Ad-Diffa* of Benghazi on May 15, 1952, indicated:

> It is Britain who divided Libya and unnerved its economics and depressed its society. . . . It is Britain who created a deficit in Libya's budget. It is she who "took" our factories and sold them to Jews in Palestine. It is she who converted the administrative system into this state of anarchy, confusion and defeat. She is the missionary of ignorance, poverty and disease.

The Libyans complain with some reason that too many Englishmen are employed by the administration and in banks in posts which could be as efficiently and more cheaply occupied by Libyans. The Cyrenaican Government, which was dismissed earlier this month, was most unwise in its hasty dismissal of highly trained British advisers and technicians. The new Cabinet members will undoubtedly suffer when the team of much valued Humber Snipes, which are reserved solely for their use, breaks down through lack of proper maintenance. The skilled British motor mechanics were dismissed before sufficient Libyans had been trained to take their places.

The Army and the RAF have recently posted a better type of officer to Libya than they did during the immediate post-war period but the British forces are still disliked. They are served by excellent clubs and bars, but, unhappily, most of the locally run restaurants and cafés are out-of-bounds because they do not reach the standard of cleanliness required by the medical corps. Had the army spent a small sum on improving the kitchens of local restaurants instead of building "The Wavell Arms," there is little doubt that troops and

Arabs would benefit; the attitude of the Libyans might even soften towards the army.

The Fezzan, which forms the third province in the new state four hundred miles to the south of Tripoli across the Sahara, is barely aware that a united Libya has been created. A flag of the new state is said to fly from the former fortress at Sebha. The only reliable regular communication with the province is a French aircraft which flies every fortnight with supplies to a few French officials and the small units of the Foreign Legion whose work has apparently been unaffected by the creation of Libya.

(To be concluded)

Ideas Around Tito

[BY A CORRESPONDENT RECENTLY IN JUGOSLAVIA]

IN a speech last month to Jugoslav youth, Marshal Tito startled his listeners by saying that he would not mind if there were 100,000 less members in the Jugoslav Communist party. The phrase was obviously carefully chosen and was the first public declaration of the stresses and strains that the Jugoslav Communist party has been undergoing since the break with the Cominform. It is clear that the party—cut off from the east, and now opened up to influences from the west—has lost something of the *élan* and fanatical zeal of the early postwar years. Western ideas, allowed to penetrate into Jugoslavia after a lapse of nearly ten years, have been lapped up with the indiscriminate enthusiasm that usually turns to forbidden fruit. Literature, newspapers, films, music, modern art—everything western from strip-cartoons to Existentialism has had a tremendous vogue. Even party members have not been immune and the general effect on the party has been enervating if not downright subversive. When periodicals based on a western news service were available they supplanted the Communist papers. Translations of English novels have sold much better than the party classics. In some districts, party members have even taken to getting married, or having their children baptised, in church.

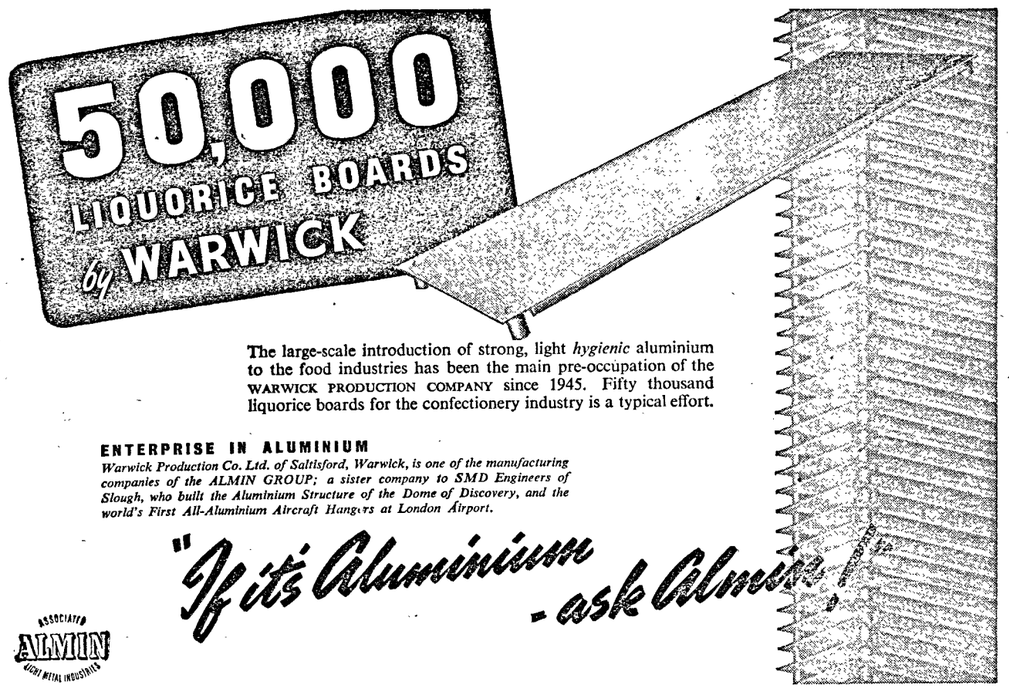
At the same time as Jugoslavia was hit by the wave of western culture, the Central Committee of the Communist party gave orders allowing Communists freedom to discuss and criticise political ideas. But this new freedom, exhilarating and stimulating after years of a mental strait jacket, has also produced some unpopular ideas. A number of young Communists have discovered this to their cost. In a recent speech Kardelj said

> There can be no doubt that the socialist state has not only the right, but also the duty, to stand up against anti-socialist criticism by administrative means, particularly to that criticism which tends to destroy the basis of new social relations.

This explains why some young Communists have been thrown out of the party after voicing opinions that were regarded as anti-socialist.

It is perhaps not surprising that many Jugoslav Communists have not kept up with the lightning change of ideas in their party. Of the 5,500 present members, most were recruited during the war when Communism was the alternative to Fascism and collaboration. Both during and since the war, party members have had to work so hard organising the new revolutionary state that few have had the opportunities for study that were afforded to their leaders who spent long periods of enforced leisure in prewar Royalist gaols; nor have they had their leaders' experience of prewar somersaults in Communist international policy. The break with the Cominform therefore came as a much greater shock to the rank and file than it did to Marshal Tito and his Politburo, and the rank and file have found re-orientation more difficult. But even the leaders were not prepared with a new set of ideals and ideology to take the place of Stalinism.

The new ideology is only now being worked out, and since it is considered "Stalinist" or "Zhdanovite" to dictate new ideas to the party, it will be some time before the leaders' theories have been accepted throughout the rank and file, and there will obviously be some casualties both in ideas and members by the way. On the negative side the new beliefs are clear and have been readily assimilated. "The Russian path is not good and should not be followed because it leads socialism and the working masses into a blind alley"; "the USSR has definitely become a conquering aggressive state," a state of "bureaucratic despotism." This attack on the Soviet Union was the first phase. The second phase, which began in earnest last year, came with the attack on the bureaucracy, inefficiency and privilege in the Jugoslav state—which were said to be the result of following the Soviet model too closely. This phase still continues and theory and practice are developing simultaneously. Factories and works have been handed over to Workers' Councils; most aspects of government except defence, security and foreign affairs have been decentralised. The penal code has been revised and the draft of a new constitution issued. The theory behind these steps is that they represent the beginning of the withering away of the state, and the democratisation of government and economic life.



"Rule of Brothers-in-Law"

At the moment all government departments and state organisations (and in Jugoslavia this covers the majority of jobs) are reorganising their personnel. The aim is to check qualifications, efficiency, length of service and to reappoint or dismiss as well as to regrade and fix wages and salaries. Thousands of committees are now sitting on this matter and everyone is unanimous in maintaining that Communist party membership is not of itself being considered as a sufficient qualification for reappointment, or high grading. This means that many Communists who climbed into positions after the war, and many others who owe their jobs to friends and relations in the party (or the rule of brothers-in-law as it is called in Macedonia) will find themselves downgraded or unemployed. Kardelj admitted in a recent speech that 50.3 per cent (63,390) of state officials have only elementary schooling and that 5.3 per cent have no schooling at all. Of course not all of these are Communists; but it is known that many Communists will be affected. And with privileges curtailed this puts an added strain on what Djilas calls "the weak members of the party and people on its periphery."

Milovan Djilas, the Montenegrin Minister without portfolio, is the foremost exponent of the new ideology. Conditions are now being created in Jugoslavia, he says,

> for an ideological impetus of unprecedented proportions. Our small undeveloped and wounded country has not only to fight for this new development but at the same time for its national existence, having no other ideological standards to rely on and being itself its own guiding star.

In short, Jugoslavia is working out a new form of Communism. It is a difficult and bold experiment in government. Tito is now allowing the simultaneous development of new ideas with a broadening of the government to include many who are not Communists. He obviously hopes to be able to control both processes and yet maintain the power and dominance of the Communist party. To do this he clearly needs a party of disciplined, trained and reliable supporters. This may well explain his cryptic threat; the party is to be allowed to shrink by a natural falling away of weaker members rather than by a purge. It does not follow that this experiment will be a success since it depends on so many imponderables and outside factors. But there can be no doubt of its importance.

The large-scale introduction of strong, light *hygienic* aluminium to the food industries has been the main pre-occupation of the WARWICK PRODUCTION COMPANY since 1945. Fifty thousand liquorice boards for the confectionery industry is a typical effort.

ENTERPRISE IN ALUMINIUM

Warwick Production Co. Ltd. of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP; a sister company to SMD Engineers of Slough, who built the Aluminium Structure of the Dome of Discovery, and the world's First All-Aluminium Aircraft Hangers at London Airport.

These facts are published to show what British workers can achieve in spite of difficulties, given opportunity and backed by enterprise.

It can be done

Holme Moss, most powerful television transmitter in the world, brings daily programmes from London to thousands of cosy firesides in the North. The British Broadcasting Corporation staff on the site—a remote peak of the Pennines 1,750 feet above sea level—have stout buildings of Yorkshire stone to work in, with cavity walls and double windows to keep them warm.

But what of the men who erected those buildings, made roads and laid drains across wild moorland and ravines when the thermometer never rose above freezing point for a month on end? They worked behind windbreaks (which on one occasion were blown away), often enveloped in swirling cloud, sometimes drenched to the skin. Every stone they placed during the winter of 1950 was hacked out of the snow that lay for 22 weeks, and thawed and dried over the coke braziers that were the only source of heat. They never gave in. They not only finished the work on time; they made a good job of it. They worked with a will and they worked as a team.

Competing with Japan

[BY A CORRESPONDENT]

LANCASHIRE is no longer alone in being worried by Japanese competition. Complaints are beginning to come in from one British industry after another, whether it manufactures machine tools or fountain pens, electrical equipment or bicycles. The story is always the same. The Japanese copy everything they see. They copy it and then quote prices no western manufacturer can hope to match. Nor is that all. They are winning a reputation for fair trading, prompt deliveries and superior salesmanship. Their goods are equal to their samples and up to specifications—which has by no means always been the case with British products since the war.

Nowhere is the clash of Anglo-Japanese competition now more apparent than in India. Recently, for instance, Japan equipped a small screw factory in North India with twelve machines at a cost, delivered at Bombay, of £2,024. A large Midland firm making similar plant could not have quoted less than £9,456 ex works. How is it done? The Japanese machine tools are rough but serviceable replicas of designs which western manufacturers have developed at great expense. Besides the long hours, hard work and low wages of Japanese labour, the Japanese manufacturer has virtually no research or development costs and no advertising expenditure; there is also an increasing element of dumping.

On the British side, goodwill is sometimes lost by too little regard on the part of mushroom firms for the normal conventions of commercial morality. Recently a Delhi merchant invested his fortune in 220-volt AC electric fans, but received 110-volt DC fans instead. His indignant letter of protest to the suppliers was returned by the post office marked "gone away." Gone, they may well have been, but not forgotten. British methods are also apt to be too rigid. Indians find it difficult to obtain machinery from the west, even when they know what to ask for. But, lacking technical experience, they often cannot even specify the plant they require for a new venture. The Japanese now take on the whole burden and quote for complete factories.

British Traders' Suggestions

There is no simple remedy for all these ills, but several steps have lately been suggested by British traders who have come up against this growing competition. It is proposed, for instance, that both at home and overseas there should certainly be much more co-operation between British business men than at present. A strong organisation would have two primary tasks. On the one hand it might exercise control over the quality of British exports and see that the fair name of British industry is not irretrievably damaged by the unscrupulous tactics of hit-and-run opportunists. On the other hand, it would have the funds, facilities and knowledge to bring often costly legal action in the Japanese courts for infringement of patents, copyrights, registered designs, trade marks, and plain fraud. If British business were organised on these lines, action could also be followed up against exporters, importers, distributors and even retailers of certain classes of Japanese goods. Merchants the world over might be made chary of selling Japanese reproductions which they now handle with impunity.

Now that Japan has regained its sovereignty, the Japanese government also has a role to play in these matters. And while many British business men blame the United States for indirectly subsidising unfair Japanese competition by continuing to give large dollar aid to Japan, there is a good deal that Tokyo could yet be asked to do in the way of encouraging modern trade unionism and pushing on with the labour reforms begun under the occupation. Nor would Mr Yoshida's present government be found hostile to these ideas. It is deeply concerned to re-establish the good name of Japan, and it has already offered co-operation with other governments in trying to prevent the gross abuse by Japanese manufacturers of internationally recognised trading practices. This co-operative spirit in official quarters in Tokyo may not last. While it exists it should therefore be welcomed.

Lastly, it is strongly felt by those who trade in the East that a higher priority should be given to markets in which Britain is facing the rapid growth of Japanese competition. Although India, for instance, lies within the sterling area, the moment is coming when it may be just as important to fight for traditional British markets there as to earn dollars. For manufacturers themselves this may often be a tedious and troublesome process. But if they do nothing, others will act. India is already receiving increasing attention not only from Japan, but from Germany, Switzerland, Italy and from behind the iron curtain as well.

Indian Inquiries

The difficulties are innumerable. It is often hard, for instance, to judge the value of Indian inquiries. After protracted negotiations, the apparently responsible firm towering behind an imposing letter-head may turn out to be only a small trader, squatting hopefully in his little bazaar shop and whose brother-in-law has access to a typewriter. On the other hand, inquiries from reputable and well-established firms and individuals are often swept aside too readily by British manufacturers because they are vague and badly drafted; requests for "a machine to make bicycles," or "a simple outfit for refining steel" should not always be politely ignored.

Many progressive British manufacturers do face the facts. For instance, last summer an Indian businessman walked into the office of England's biggest hypodermic needle manufacturers. He announced his intention to set up a similar factory in his own country, and asked for advice. He was shown around the factory; every machine, every operation was explained to him. All his questions were answered. The firm gave him samples of materials, names of suppliers, drawings and price lists, and then asked, "Now, how else can we help you?" Soon an agreement emerged, under which the British firm is now supplying certain semi-manufactured materials and technical assistance. In return, the Indian firm has undertaken to maintain prices and not to offer its products for sale outside its own country. The arrangement is working to everyone's satisfaction, and may form the basis of considerable future development.

Other Indians went to Redditch to seek the help of sewing needle manufacturers in setting up factories. They were refused; so they turned to Japan. They found the Japanese ready to supply factories without any conditions or stipulations. This leaves the owners free to under-sell the west, and, moreover, to export cheaply manufactured Indian products to other markets as well. These facts and examples illustrate how wide the British problem is, and they emphasise the urgent need to think out new trading policies now.

The Treaty of Germany

THE principal agreements signed at Bonn on May 26th were a Convention on Relations between the Three Powers and the Federal Republic of Germany; and three related conventions on the rights and obligations of foreign forces stationed in Germany; on finance; and on the settlement of matters arising out of the war and the occupation.

German Rights

The Federal Republic will have full authority over its internal and external affairs, "except as provided in the present Convention." The Occupation Statute is repealed; the Allied High Commission and the *Land* Commissions are abolished. The three Powers will in future conduct their

relations with the Federal Republic through Ambassadors. The Federal Republic will be included within the European Community on a basis of equality and the three Powers will sponsor its application for membership of international organisations. The Republic will assume full control of civil aviation.

Allied Rights

In view of the international situation, the three Powers will retain the rights they have hitherto exercised relating to (*a*) the stationing of armed forces in Germany; (*b*) Berlin; (*c*) Germany "as a whole, including the unification of Germany and a peace treaty." The Republic will refrain from any action prejudicial to these rights. According to Article 5 of the main Convention

> In case the Federal Republic and the European Defence Community are unable to deal with a situation which is created by an attack on the Federal Republic or Berlin, subversion of the liberal democratic basic order or a grave threat of any of these events, and which, in the opinion of the three Powers, endangers the security of their forces, the three Powers may, after consultation to the fullest extent possible with the Federal Government, proclaim a state of emergency in the whole or any part of the Federal Republic.

The three Powers can then take whatever measures are necessary to maintain or restore order and to protect their troops. If the three Powers do not end the state of emergency within thirty days after the Federal Republic has asked them to do so, the latter may appeal to the Council of the North Atlantic Treaty Organisation. When there is no state of emergency any military commander still may, "if his forces are imminently menaced, take such immediate action appropriate for their protection (including the use of armed force) as is requisite to remove the danger."

Position of Foreign Troops

The three Powers will station armed forces on Federal territory for "the defence of the free world, of which the Federal Republic and Berlin form part." The three Powers will obtain the consent of the Federal Republic before bringing into Federal territory troops of any nation not now providing contingents, except in the event of an external attack or an imminent threat of one. The foreign forces undertake to give due consideration to German interests. On its part, the Federal Republic undertakes to satisfy the forces' needs in accommodation, goods, materials and services, labour, public services, transport services and communications. These arrangements are similar to those applied by all Nato countries to friendly foreign troops. There will be a joint supply board and the foreign forces will "receive such preferential treatment as is necessary for fulfilment of the defence mission and as can reasonably be reconciled with the essential civilian and defence needs of the Federal Republic."

German Rearmament and Defence Contribution

The Federal Republic will participate in the European Defence Community. It agrees to make an annual contribution to western defence comparable to that of other western countries. From the effective date of the new agreements until June 30, 1953, the German contribution will be DM 850 million a month. After that date it will be settled by agreement on the basis of Nato criteria. In the first six months an average of DM 551 million will go to the support of foreign forces and in the following three months an average of DM 319 million; the rest will go to the budget of the EDC.

Berlin

The three Powers will consult with the Federal Republic on the exercise of its rights in Berlin and the latter will cooperate with the three Powers in the discharge of their responsibilities to Berlin. The Federal Republic will continue to give political, cultural, economic and financial aid to Berlin. Details of this aid are set out in an annexed declaration by the Federal Republic. The three Powers will exercise their rights in Berlin in such a way as to facilitate Federal aid to city, to permit representation of Berlin and its people outside the city, and to encourage the adoption of similar policies in Berlin and the Federal Republic.

A declaration by the Allied Kommandatura in Berlin replaces its declaration of May 14, 1949, and will come into effect at the same time as the contractual agreements. It declares that the three Powers will give the Berlin authorities "the maximum liberty compatible with the special situation of Berlin." The three Powers cannot relinquish their supreme authority in the city without jeopardising their right to be there.

Unification of Germany

The three Powers and the Federal Republic agree that their common aim is a freely negotiated peace settlement for the whole of Germany, and that the final settlement of the boundaries of Germany must await such a settlement. Pending a peace treaty they will work together to achieve by peaceful means a unified Germany which has a liberal-democratic constitution and is integrated within the European Community. In the event of the unification of Germany the three Powers agree to extend to the whole country the rights accorded to the Federal Republic under the present conventions and under the EDC treaties, assuming that a unified Germany would accept the Federal Republic's obligations towards the three Powers. Except by the common consent of all the signatories, the Federal Republic will make no arrangements which would impair the rights of the three Powers under these conventions and treaties.

Revision of the Agreements

The three Powers and the Federal Republic agree to review the terms of the present conventions "(*a*) upon the request of any one of them, in the event of the unification of Germany or the creation of a European federation; or (*b*) upon the occurrence of any other event which all of the signatory states recognise to be of a similarly fundamental character."

The Convention on the settlement of matters arising out of the war and the occupation deal with a variety of topics including war criminals, the deconcentration and decartelisation of German industry, displaced persons and refugees, reparations and former German assets abroad. The charter of an Arbitral Commission on property rights and interests in Germany is attached to it. Because of constitutional difficulties the custody of war criminals cannot be handed over immediately to the Federal Republic. But a mixed board, consisting of three Germans and three allies, will be set up to consider the granting of clemency.

A series of eight exchanges of letters dealing with Berlin and other matters is also included among the contractual arrangements. One exchange deals with the Federal Chancellor's suggestion that some provisions of the agreements might be put into force before the time provided in the conventions themselves—i.e., before ratification by all the signatory states and the coming into force of the EDC Treaty. The three allied Foreign Ministers have told Dr Adenauer that if, after the ratification of the conventions has been completed, there is any undue delay in the ratification of the EDC Treaty, they will be prepared to discuss with the Federal Government the possibility of putting some of the conventions into force immediately.

*

Correction.—In the second paragraph of the article "Sindri, a step forward," on page 448 of *The Economist* of May 17th, line 4, the phrase "a country that has perhaps 70 million people, two-thirds of them unemployed," should read "that has a population of whom perhaps 70 million are unemployed for two-thirds of the year."

Where on earth is Mackay?

Probably you are not quite sure. It is one of many prosperous sugar towns in Queensland — and it has a branch of the Commonwealth Bank. Like most of the communities that together form the Australian market, Mackay has its own social and economic conditions. These conditions are first-hand knowledge to the Commonwealth Bank which, by means of its nationwide network of branches, can give accurate details on any town or state, or the whole continent. British exporters viewing the Australian market 12,000 miles away will find this knowledge indispensable. It is readily available from our Financial Information Service at Australia House in the Strand.

PHOTOGRAPH OF A HIGH GRADE DRIVE

FENNER V-Belts plus Fenner precision-machined grooved pulleys complete a flexible, silent and efficient drive which requires little attention and no dressing. Stock drives available from 1/4 h.p. to 30 h.p. Belts available from 15" to 598" long.
And now speed variation (at a touch) is available from "Hainsworth" drives with Q and R Section V-Belts. Catalogue 200/1 gives full details — send for YOUR copy.

PRODUCTIVITY, EXPORTS and COAL are the core of our Balance of Payments problems. Higher productivity in house building sets free labour for other purposes. A reduction in imports, within certain limits, can reduce the strain on the nation's finances. Economies in coal consumption release additional supplies for productive work and export.

We have, in the Building Industry, already contributed greatly to all these factors by adopting solid floors, suitably covered, throughout our building programme of 300,000 houses. The alternative is to import £15,000,000 worth of Softwood for traditional timber floors, spend an extra £11,000,000 on construction costs and allow the heat losses, inevitable with ground floors of timber construction, to double.

Information on the various types of Thermo-plastic Floor Tiles is available on request.

THE BUSINESS WORLD

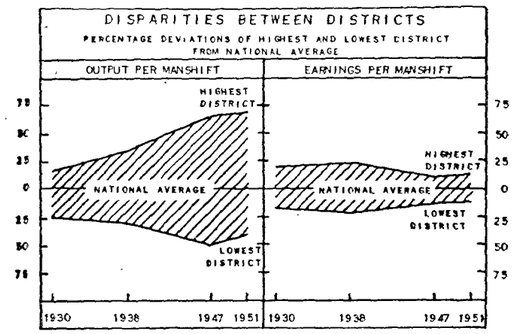
A Chance for Coal Exports?

RATHER suddenly, after six years, coal seems not quite so scarce as it was—a condition that in mid-1952 is true of more than one commodity in world trade. At the end of last year, throughout Europe, there was a serious shortage. Most of the available evidence suggests that by 1955, or much earlier, there will be a serious shortage again, in Britain at least. But today there is not; on May 17th, only three weeks into the coal summer during which coal stocks ordinarily rise by about six million tons, Britain was less than three million tons short of the minimum stocks required to begin the coal winter in safety. Consumption in Britain, which has been rising continuously for five years, is so far this year nearly 800,000 tons lower than in the same 20 weeks of 1951; and coal has had to be put in stock at a few pits supplying areas most affected by the textile recession, such as Lancashire. Had output this year grown at the rate it did last year, British coal stocks would have become even higher. Manpower is still considered in the National Coal Board as one of its greatest long-term problems, and at the end of 1951 the industry needed 16,000 men in nearly half its areas; but with 18,000 more men in the industry since the beginning of the year, the Board is beginning to find some difficulty in finding effective employment for all its recruits—though some areas are still seriously short. The European coal shortage, as measured by orders for American coal, seems for the moment to have abated, though British coal at present remains fairly easy to sell. The resemblance to some other commodities in the world market is completed by the fact that one high-cost producer, Belgium, is beginning to canvass the idea of at least a European buffer stock of coal.

These are the short-term coal problems of today; they find little reflection in the National Coal Board's report for the year ended December 31st, 1951—when things looked rather different. It is not the purpose of this compendious and well-arranged document to look forward; the Board's present opinion was affirmed by Sir Hubert Houldsworth this week: "We do want more men and we do want more coal." But the report is mainly a review of the Board's first five years; this is useful, though the sheer bulk of history has an inevitable tendency to compress much too closely some of the important things that the Board has to say about 1951. The five-year glance also accentuates the difficulty that comes from repetition only slightly supplemented with new detail; something that the Board did in January, 1951, and that it now has to mention in May, 1952, may be blurred by submergence in a general statement about changes over five years.

The first five years of nationalised coal show considerable, if uneven, progress; some of the relevant indices are recorded in a table on page 602. Yearly output rose by 17 per cent to 212 million tons, though this is still 28 million tons less than in 1937; output per man-year in 1951 reached the second highest level for 50 years, and output per man-shift was the highest ever. There were 12,000 fewer miners in 1951 than in 1947, but each man was producing about 40 tons a year more coal—which was about 13 tons a year more than in 1938. The total increase in output over the five years came almost entirely from improved productivity; increases and decreases arising from changes in manpower and in the number of shifts worked practically cancelled out. Over the five years the pithead price of coal rose by 27 per cent, while wholesale prices rose generally by 70 per cent. Total costs rose as a result of wage increases in 1947, but, despite some later improvements in wages, remained steady until the beginning of 1951. During last year they rose by 3s 9d a ton, about half the increase being accounted for by an increase of 2s 3d a ton in wage costs; the cost of stores and materials rose by about 10 per cent during 1951 to 10s 11d a ton. The total costs in 1951 were 49s 2d a ton, 7s 11d a ton higher than in 1947; the proceeds had risen during the period from 40s 3d to 51s 2d a ton, or by 3s a ton more than costs.

Financially, these sharp increases in wage and other costs made 1951 a disappointing year. In the first half of the year the Board made surpluses that promised to wipe out the £4 million remaining from the 1947 deficit of £23 million; and though it showed a deficit in the third quarter, at the end of September the Board still had a surplus of some £3 million—and was earning a premium of nearly £2 a ton from increased export prices. But in the last five weeks of the year it had to pay about half a million pounds a week more in wages before beginning to recoup itself from the higher home prices that did not begin until January, 1952; this, and other rises in costs, jerked it into the red. Thus it made a deficit of £1.8 million on the year (after paying £14.5 million in interest and interim income to the Ministry of Fuel and Power), and its accumulated deficit rose to £5.8 million. It is worth noting that for tax purposes three-quarters of the Board's loan stock is treated as equity capital: though it made a final deficit,



it is liable to profits tax in 1951, and this year to EPL and possibly to income tax as well. Its colliery profits amounted to £21.2 million, compared with £24.2 million in 1950; the profits of coke ovens and other ancillaries rose from £2.3 million to £2.8 million. It made a loss of £5.5 million (or £4 6s. 5d. a ton) on the 1.2 million tons of American, Indian, Canadian and Nigerian coal that it imported, and though its premium on British coal exported was about 24s a ton throughout the year, the cut in exports from 13 million tons to just under 8 million tons reduced earnings from this lucrative source (which are of course counted in reckoning colliery operating profits). It is not clear whether the Board's financial position will have changed for the better in 1952. But if its spokesman's statement at the time of the last price increase that the Board was budgeting for a small deficit in 1952 holds good—and the Board's provision for depreciation remains admittedly inadequate to cover replacement costs—coal may still be too cheap on financial grounds, apart from arguments of fuel policy.

Investment in the mines is still lagging behind the figures laid down in the fifteen-year plan. That called for an investment of £30 million in 1950 and of £38 million in 1951 (both at mid-1949 prices); in fact, the actual amounts invested were no more than £29 million and £32 million, during two years in which prices rose considerably. This investment was probably less than would be needed, according to the plan, merely to maintain the 1949 level of output until 1965. Difficulty in getting deliveries of stores and equipment, and lack of skilled staff—at all levels—of sufficient calibre for the exacting work of planning long-term development are the specific explanations; more generally, there is the constant preoccupation with production, and the consequent inability to take skilled miners from the coalface. Nevertheless, Britain is beginning to lag behind other European coal producers in modernising its mines; and it cannot afford to.

Studded here and there in the bulky historical review, this report contains some significant hints—and some interesting silences—about policy. For the first time in four years, it has something to say about the industry's wages structure; the board has begun, in conjunction with the National Union of Mineworkers, to review the tangle of differential earnings, related more to history than to productivity, between different jobs and different districts. The development between 1947 and 1951 of these disparities in output and earnings is plotted in a chart on page 603. The report devotes three sentences to experiments with standard costing for the industry, concluding, "No quick results can be expected," but says nothing about experiments with time study in the mines, which Mr Humphrey Browne, its production director, mentioned elsewhere this week. Its marketing department's preference for delivered prices for industrial as well as domestic coal is emphasised once more—but so are the problems and risks of this method of masking comparative transport costs. In a short but illuminating study of the stock question, it is concluded that "only the excess of [end-summer] stocks over 16 to 17 million tons is a true reserve against a worse than average winter." The report contains no word of changes in the structure of the NCB organisation, which may or may not be significant. The only adjustments of local responsibility that it records—in Scotland, the North-Western Division and South Wales—increase the number of areas from 47 in 1950 to 51 in 1952, which is not exactly the direction in which Conservative theorists upon the Board's structure would like to move.

The Board is now discussing with the Ministry of Fuel and Power the question of an increase in exports. The official export programme for the year is for 8.5 million tons (including the "two million tons extra" promised early this year but excluding very small coals and slurries, of which about 1¼ million tons were exported last year). There is a strong case for increasing exports to about 10-12 million tons this year, including slurries; and enthusiasts in the coal trade would like to aim at about 16 million tons in 1953 and more in 1954. They argue that the European market will still take much more British coal, with no more than minor adjustments in price (German and British prices of coal for export are now about the same; owing to the slump in freight rates, American coal is cheaper, but costs dollars). But they believe the chance may not last too long; and that to seize it Britain would need to offer some change in quality as well as in quantity. Germany and America are offering almost entirely coking coals, and it is coking qualities that the European importers want; so far, the NCB has been unable to offer any admixture of coking coals, and only limited amounts of large coals.

This is a hard choice to make. In Europe the market may look rather as it did in spring 1950; but within six months of that lull in demand all Western Europe was scrambling for American coal. Home demand must be expected to resume its upward curve in line with industrial production, and if the ration were ended domestic consumers might take up to 5 million tons a year more coal; as regards quality, the iron and steel industries would understandably oppose the export of more coking coals. Production is rising gradually, but the industry is still getting about 25 million tons of coal a year from Saturday working, opencast, and that second week's holiday that the miners have been promised but have not yet taken—and none of these supplements can be counted on for ever. This easing of the market, then, is temporary; Britain could consume at home all the coal it is likely to be able to produce in the next decade, barring a major recession in trade. But should Britain? The extreme argument for greater exports is simply that in the next few years, unless Britain takes risks to establish itself in the European market—by selling coal, not merely exchanging it as a counter in bilateral deals—its present foothold may be irrevocably lost. A policy of maximum exports would involve risks at home, and continued strict limits upon British consumers that might force upon them the economies in coal that so many are now discussing. Is the chance worth taking? The decision lies not with the Coal Board, but with the Minister of Fuel and Power—or his overlord? Whoever has finally to take it is not to be envied.

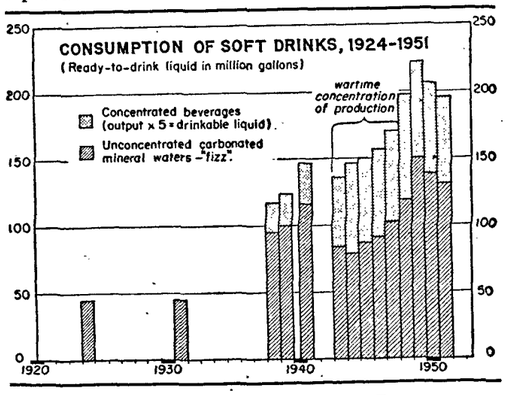
Effervescence in Soft Drinks



THE postwar debut of the American-style cola drinks—combined with the fact that some of them are being sponsored by British brewers, not by soft drink manufacturers—is potentially the most interesting development in the British soft drink market for some years. The sales of Coca-Cola, marketed by Watney Combe Reid, and Seven-Up, sold by Fuller Smith and Turner, do not so far appear to have been extensive. But the freeing of sugar allocation for drink manufacturers from its long-obsolete 1938-39 moorings, which the Ministry of Food says it is considering, should restore freer competition in this market, particularly if these newer drinks should make very large efforts in sales promotion. Their progress will be watched with care not only by British makers of soft drinks, but by other British brewers—not least because sales of these non-alcoholic cola drinks might be at the expense not only of other soft drinks, but of hard drinks as well.

The industry into which this still unknown quantity has entered is a highly diversified one. The 1,200 or so soft drink firms with 1,400 producing units differ in size, product and methods of distribution. In size, they vary from the 20 large manufacturers with nationally known products—Schweppes and Kia-Ora, Idris, Corona, Rose, Robinson and others—through the 150 or so medium-sized firms covering small regions, to the 1,000 or so small or tiny local firms, half or more of them with less than the eleven employees necessary to qualify for inclusion in the Census of Production.

Most firms produce the traditional ready-to-drink mineral waters, "carbonated beverages" to the scientist, "fizz" or "pop" to the schoolboy; some firms make the newer concentrated squashes and cordials to which water is added in the consumer's home; a few make both. (The fruit juices taken neat are not yet as popular as in the USA, and frozen soft drinks will have to wait a long time for deep-freeze cabinets in the British kitchen.) The two main kinds of drink tend to be marketed differently. Broadly, the mineral waters depend on local reputation and are delivered by the smaller local firms in their own transport direct to the consumer or to licensed and unlicensed retail outlets—public houses, hotels, clubs, restaurants, grocers and milk bars. The squashes, on the other hand, are largely nationally known brands fostered by national advertising and are distributed by their producers (mostly in SE England) over

wide areas by their own transport or common carriers —mainly to the consumer's home. There are exceptions: some large firms make mineral waters and some local firms squashes. But the basic reason for the broad distinction is clear. Mineral waters contain large quantities of water that it would be costly to cart over the countryside, and their markets are therefore mainly local. The squashes and cordials are concentrated juices that can more easily bear long-distance transport costs.

Britain's consumption of soft drinks as a whole has been increasing at a steady pace for some decades. A trade estimate put production at 40 million gallons of mineral waters in 1924. Sales presumably rose in the later 1920s, but fell back during the depression; the next estimate of consumption, in 1931, was again about 40 million gallons. But by 1938 consumption had risen to 117 million gallons, of all kinds of soft drinks. By 1940-41 it was up to 147 million gallons, and this was the figure at which production was stabilised during the "wartime" concentration period (1943 to 1948) by the Soft Drinks Industry (War Time) Association, "SDI." Deconcentration in January, 1948, was followed by a rapid increase in consumption to 197 million gallons for

that year and 221 million gallons in 1949. Poor summers in 1950 and 1951, and the rise in the cost of living, have since reduced consumption to 207 million gallons and 196 million gallons respectively. But the general trend is impressive: consumption has increased fivefold in 25 years.

The industry as a whole has yet to embark on large-scale market research to discover when and where all this is being drunk, and by whom. There has been an increase in population in Great Britain from about 43 million in 1924 to 50 million, and undoubtedly more people are drinking soft drinks. But the correlation with the decreasing consumption of hard drink is obvious. Redistribution of income in favour of the masses, rival amenities to the public house, the expansion of the multiple restaurants, and rising social standards explain equally the fall in alcoholic drink and the rise in soft drinks. The relationship is not wholly competitive; mineral waters are complementary to some spirits and sometimes to beer. But, on a long view, the competitive relationship is the stronger of the two.

The different rates of progress of mineral waters and concentrated drinks are of hardly less interest. In 1924 there was very little squash production. By 1941 it had risen to 6.2 million gallons. Squash becomes "ready-to-drink liquid" when diluted with about four times as much water. In 1941 it accounted, therefore, for some 31 million gallons of soft drink, or 20 per cent of the total of 147 million gallons. In 1948, the first year after SDI, it had grown to 68 million out of 197 million gallons, or about 35 per cent. It is true that in 1951 minerals were a little ahead of their 1948 figure, while squashes had fallen slightly behind. The squashes may have been over-expanded in the SDI period, although the movement to the lower priced bottles of mineral waters might also reflect restricted purchasing power; the coming two or three years may tell. But the trend remains: while the sales of minerals rose by barely two-fifths between 1938 and 1951, the concentrates have trebled their sales.

These are eloquent figures; they illustrate a trend evident also in the American soft drink industry. Part at least of the explanation is not far to seek. In order to economise in manpower, factory space, raw materials and transport, the wartime concentration scheme reduced the output of mineral waters from 120 million to 85 million gallons and raised that of the squashes from 6.2 million to 12.4 million gallons. No doubt conservatism and inertia are partly responsible. The Ministry of Food's distribution of orange juice for infants since 1941, and the resultant kudos for the concentrated product, may have spread the squash habit throughout the family (and may be partly responsible for the marked progress of orange squash as against lemon and lime). In 1951 the working-class household could probably afford the price of a bottle of cordial better than in 1941 or 1938. Perhaps, too, *middle-class incomes* are bringing middle-class habits, and more use is being made of the home as a place of entertainment. And soft drinks lend themselves to home drinking more than hard drink. *Home drinking has* indisputably increased: 80 per cent of squashes and cordials are sold to the housewife.

The conditions of supply, also, have changed significantly. The internal combustion engine, improvements in packaging and advances in productive techniques have enabled the larger manufacturer to penetrate into local markets by advertising. Even now the cost of transport, especially of the bulky mineral waters, is high, and distribution is normally limited to a radius of 30 miles. But high transport costs can be avoided by decentralising production: one of the largest firms has factories in nine towns, another in three; and even if the economies of large-scale production must be sacrificed, there are other economies in large-scale financing, planning, research and sales promotion. The future may see an increasing ascendancy of the larger firms at the expense of the smaller.

These trends would have been even more obvious were it not for the continued tying of manufacturers' sugar rations to their 1938-39 output. A change in this basis—if indeed one is practicable without an increase in total supplies—may increase competition not only inside the industry but also with hard drink and with the new American drinks. The brewers' backing of these newcomers has provoked much speculation. The newer drinks may displace some soft drinks, though they have to progress against the trend towards squashes and cordials; and perhaps even beer to some extent. But they may also stimulate competitors in both the soft drink and the brewing industries to overhaul their methods and modernise their policies. In an expanding economy the sale of all kinds of beverages may be

buoyant; but the fate of individual producers remains partly in their own hands.

The interest of brewers in soft drinks is not new. Some manufacture minerals, and others buy mineral waters for sale in their licensed houses. In 1949 the Brewers' Society recommended to their members a model tenancy agreement that permitted tenants to buy mineral waters on the open market. This should have cleared the way for independent manufacturers, although habit and economies in accounting and transport may have induced some tenants to continue to buy their supplies from or through their brewer. But more fundamental is the use to which the brewers put their licensed houses. Public houses may once have been shops for selling only beer; but they can be and are being adapted to other purposes. The brewers' collective advertising in recent years has been emphasising the attractions of the inn for companionship and recreation. Catering has been increased. Other developments are possible. If the adaptability displayed in the cola moves is applied by brewers generally in redeploying the attractions of the public house, they may be able to reassert its traditional role as a social centre and win back ground lost to the restaurant and the milk bar, thus assisting the consumption of beer at the same time.

Whatever the future, a reduction in costs would help the soft drinks manufacturer to meet it. Consumption varies markedly with the seasons: recently summer sales have been 60 to 80 per cent higher than in winter, with the sales of squashes fluctuating more than those of mineral waters. Ice-cream has now achieved a sale all the year round. Can the same be done for soft drinks? To the extent that it cannot, production for stock may help. Squashes, in particular, will remain drinkable for months or years. How far are the savings in production costs from more regular output greater than storage costs and capital charges?

A collective effort to popularise soft drinks faces difficulties: the divided loyalties of those with interests in both soft and hard drink, and the reluctance of the soft drink manufacturer to risk the loss of goodwill of the licensed trade through which he gains access to the consumer. Collective advertising might do more for the few brands already popularised by individual advertising than for the hundreds of small firms with little-known names. The wartime standardised drink is thought to have raised the prestige of the industry by increasing the confidence of the public in the quality of the product. Are standards necessary in peacetime competition? The Ministry of Food sets the minimum sugar and fruit juice (and the maximum saccharine) content. Even when sugar is freed, competition will be less than perfect because of the strongholds of the local firms. But, so long as state supervision of contents ensures safety for health, should the public be prevented by minimum standards from buying harmless and cheap but pleasing flavoured water? If competition is too sluggish to maintain "high" quality at the lower end of the trade, it may be vigorous enough at the upper end to stimulate excess in packaging and frills that add little to the consumer's satisfaction. Decorative labelling and "eye appeal" will be fostered by the development of self-service and super-markets; these may inflate costs.

Price policy raises other issues. The same mineral

waters sell at different retail prices at the Hotel Splendide and the village "local." But the national advertising of the squashes is sometimes accompanied by uniform resale prices. It remains doubtful whether this is really good business. The squashes leave the factory as physically uniform products but, in an economic sense, the product at the housewife's door in Liverpool is a different one from that at Land's End. Uniform prices yield economies; but they may also restrict the total market by making the near subsidise the distant, and they produce distortions by divorcing prices from costs. Increasing competition may bring changes here.

If SDI demonstrated the virtues, it also demonstrated the weaknesses of planning an industry in abnormal conditions without a free market. It is debatable whether it would have worked for long, in peacetime, as demand conditions changed, without provoking radical dissension among the conflicting interests and pressure for more authoritarian controls. Zoning, allocation of raw materials, standard formulæ and pack-sizes achieved very large savings in materials, equipment and manpower. The price paid was lack of variety; and the consumer has shown, by the reappearance of cross-hauls and brand names, that he is unwilling to pay it in peacetime. But this does not mean that he will pay for unnecessary variety, in contents or packaging, employed to foster the demand for particular brands. The outlook for soft drinks is set fair. But individual manufacturers may fare differently. Ingenuity from the brewers may yet restore the competitive power of beer and the pub. And the cola products may stimulate their rivals as well as their consumers.

Business Notes

Steadier Markets

The gilt-edged market has this week regained a little of its poise after the acute fit of nerves that assailed it in the second half of last week. The sickness persisted until the weekend, but on Monday, and again on Wednesday and Thursday, there were signs of rally. The effect on prices, however, has been small by contrast with the violence of the previous declines, which had carried prices of many stocks to their lowest yet. By the close on Thursday War Loan was ⅜ above the worst at 74¼xd and Old Consols ½ above it at 57, at which the flat yield is £4 8s. 5d. per cent. Industrials tried rather faint-heartedly to follow a like course, but by Thursday's close the ordinary share index of *The Financial Times* was showing a small net fall on the week, at 105.4, which is actually a decimal point below the post-budget low reached in March and only six full points above the nadir reached in 1949. During the past month there has been a depreciation of 7½ per cent.

The technical rally in gilt-edged was not unexpected, for the sharpness and suddenness of last week's break were almost as unrealistic as the previous firmness. The market's previous performance, and its smug acceptance of the way in which the authorities had relieved it of the burden of the electricity issue, were hopelessly out of line both with the dangers of Britain's economic position and with the measures of monetary policy that are likely to be needed. But the declines in prices—over three points in some of the longest stocks in less than a week—were of a magnitude that suggested expectations of imminent disaster. The extent of the fall doubtless owed much to the narrowness of the market; its firmness had been due to widespread but small buying from private investors, especially in the provinces, and prices had begun to sag as soon as this buying dried up. There was little cushion for the considerable selling that developed so suddenly—principally, it seems, from industrial quarters. The market still looks shaky; and in present circumstances it certainly has no title to robustness. If the authorities take the steps that seem necessary to guard against the risk of any relaxation of the monetary discipline, the market will feel some pressure; but for the present the psychological effect of the break in gilt-edged prices will itself serve as a stiffener of monetary policy, and will to this extent make the need for funding operations or tap sales less urgent. Any reasoning on these lines, however, still takes for granted the overriding condition—that the gold reserve is not drained afresh by a revival of bear pressure against sterling.

Sterling Contradictions

The relapse in the spot rate for sterling has gone further this week. From a recent high of $2.81¼ the rate has declined to $2.78¼. The covering purchases of sterling due to repayment of foreign credits falling under the new Bank of England ban are beginning to ebb, and a persistent commercial demand for dollars is again making itself felt. Bidding for dollars on behalf of the large oil companies has been particularly noticeable. In addition, some of the commercial demand for dollars that has appeared during the past ten days represents an accumulation of purchases that were postponed so long as the spot rate for sterling was showing signs of strength against the US dollar. As tends to happen in such circumstances, the covering of commercial requirements of sterling (against which there is still a substantial bear position) has lost some of its urgency; conversely the purchases are being accelerated now that the market has begun to turn. With spot sterling once again approaching the "lower gold point" of $2.78, the Bank of England is being called upon to satisfy some of the open market's requirements.

In contrast to the recent weakness of the rate for American account sterling, the rates for various types of "cheap" sterling have been hardening. Security sterling has strengthened this month from $2.43 to $2.47½. More important has been the concurrent rise in transferable sterling, which this week has strengthened to $2.62, at which level the discount in terms of the official rate has narrowed to 6 per cent. At that figure commodity shunting based on cheap sterling can be profitable for only a comparatively narrow range of commodities, such as silver, diamonds and furs, where the ratio of bulk to value is particularly small. The rise in transferable sterling partly reflects the past volume of these shunting operations and the consequent depletion of accumulations of sterling in transferable accounts. The most important of these accounts are those held by the Continent of Europe, and the mechanism of the European Payments Union ensures that current deficits between the sterling area and Europe are financed through this channel. When, as is at present the case, such deficits are met fully in gold, there can be no conceivable advantage to the creditor to allow them to accumulate in sterling balances. In consequence, accumulated sterling resources have been used to the fullest possible extent and their repatriation has therefore been financed through EPU. This mopping up of potential supplies of cheap transferable sterling and the absence of any concurrent creation of such balances may explain the remarkable narrowing of the discount at which transferable sterling is now quoted.

Finance Bill in Committee

The committee stage of the Finance Bill has this week dragged on towards its close. In the final stages of the discussion on EPL, members from both parties made a concerted attempt to extend the concessions already promised for oil wells and metal mines, in consideration of the wasting nature of their assets, to other forms of extractive industry such as mica, salt, sulphur, industrial diamonds and sand and gravel. The Government fell back on a running series of promises to consider each case on its merits, but resisted wholesale amendment. It also promised to cure an anomaly spotted by a Conservative member, arising from the taxation proposed for a company that is associated with one or more individuals in a partnership whose circumstances have changed since the end of the standard period. It remains to be seen how many anomalies of the same complicated kind have slipped through the sieve. By Monday evening, however, the committee, with the relieved air of a man able to take a wet towel from his head, had got back to mere emotional generalities. Mr Butler wound up the discussion on EPL with an impassioned plea that the Conservative Party was morally bound to implement this unhappy measure, and then went on to aver that there has "undoubtedly been a rise in industrial profits" in the past three years; in support of this contention he quoted figures of profits inclusive of stock appreciation, which are net profits as the national income statisticians understand them, or as a Chancellor intent on disinflationary budgeting ought to understand them. Mr Butler did, however, reiterate that EPL is not intended to "be a permanent tax." He drew attenion to the fact that distributed profits tax will now stand at 22½ per cent, against 26¼ per cent net last year, and that undistributed profits tax, at 2½ per cent, will be half last year's level, so that "when the Excess Profits Levy is removed, at such date as is suitable consistent with the reasons and motives which prompted its introduction . . . there will be a profits tax level which I hope will not be an undue burden on industry."

In the discussion of other clauses Mr Jay again returned to the attack on the increased national debt charge, though this time he recognised that owing to the fall in gilt-edged prices lending institutions "no doubt . . . have anxieties as well as increased revenue"; this represented a welcome retraction from his previous stand. Finally, on Wednesday, the Chancellor announced two blanket exemptions to the "ring fence" clause in last year's Finance Act, which makes it necessary for companies to obtain Treasury consent before they transfer their domiciles abroad. Permission will now be automatically granted for bona-fide sales of land (such as tea and rubber estates) for full consideration, to entirely independent purchasers; and also to proposals for the establishment of subsidiaries engaging in new industrial activities in the overseas Empire. Mr Butler refused to repeal the ring fence clause altogether but he pointed out that while 300 applications for transfer of domicile have been granted in the past year, only two have been finally refused and averred; in view of the spirit in which the restriction was being administered he felt that there "really was not much to worry about." This subject has been accorded added topicality this week by the decision of the Rhodesia Selection Trust group of copper companies to apply for an emigration permit; this decision is discussed in a later note.

Policy up in the Air

The Government's policy for civil aviation, which was outlined by the Minister of Transport in the House of Commons on Tuesday, has had a chilly reception. The basic problem of air transport economics is that the nationalised airlines, which face heavy competition abroad and which make losses on many routes that are only flown over for prestige reasons, cannot balance their accounts unless they are shielded from competition on the few routes that are really profitable to fly. The central issue at debate is whether rigid restriction of competition is a desirable way of financing continued operation over "prestige" routes, or whether some other solution—such as an outright subsidy or an increase in mail rates to the so-called "international" scale—would be a better way out.

In effect, the Government has decided to fall back on a compromise solution that promises to be unpopular with both sides. Mr Lennox Boyd announced three concessions to the independent operators on Tuesday. First, he confirmed that the broad field of charter, and especially freight, operations will be reserved for them. Secondly, and perhaps most important, he announced that independent operators are to be given equal opportunity with the corporations in developing new overseas services. In the past, charter companies have been given licences for services on routes not covered by the corporations, but only for a limited period and only if neither nationalised corporation had plans for developing that route at some unspecified future date; under the new policy licences will be granted for periods of seven, and in some cases ten, years without reference to the long-term development plans of either corporation, and, if the services are run satisfactorily, the independent operator can expect to get his licence renewed when it expires. Thirdly, private operators are to be given limited rights to fly what Mr Lennox Boyd called "third class services" on the corporation routes, where it can be shown that they will carry passengers who cannot afford either the first class or tourist services operated by the corporations.

A feature of Mr Lennox Boyd's statement was that it has not yet proved possible to make any settled arrangements about the future of British internal air routes. This mirrors the whole problem in miniature. Last year British European Airways lost about £1.6 million on these internal services and would be happy to see them handed over to the independent operators. But if BEA, with its facilities for spreading overheads, cannot make these services pay, there seems little prospect that smaller companies can do so either. If scheduled internal services are to be kept flying therefore, it seems probable that the government will have to subsidise them, and it may be preferable that it should continue to pay that subsidy to BEA.

Enterprise down in the Doldrums

There is no doubt that the independent operators have been bitterly disappointed by the new statement of policy. The seven, or in some cases ten, year term for the special licences for the new and the "third class" services was

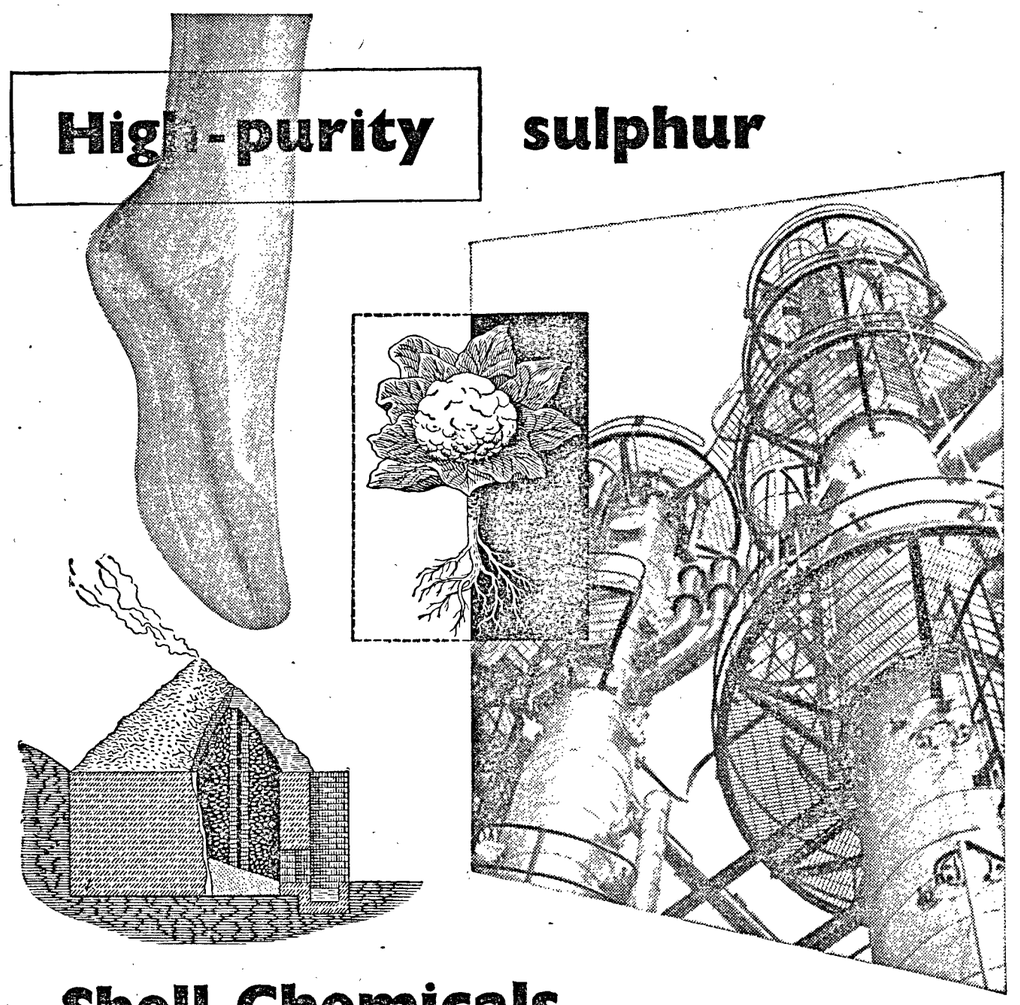
chosen because it covers the normal operational life of an aircraft, and the government believed that this would make it easier for independent operators to justify the investment necessary to run scheduled services. However, modern airliners cost between £200,000 and £500,000 (depending on their range), and it will not be easy to raise sums such as these on the basis of Tuesday's statement alone; without these aircraft, private enterprise operations are bound to be confined to charter work and to those "third-class" passenger services for which second-hand aircraft can be used. The operators had apparently expected some more positive assistance, possibly in the form of a Treasury guarantee, towards buying the aircraft necessary to develop new services.

Much will obviously depend on the attitude taken up by the licensing authorities. The Government intends to remove the function of granting these licences as far from politics as possible, but the crowded parliamentary programme makes it impossible to introduce the legislation that would be needed to convert the present Air Transport Advisory Committee into an independent licensing authority on the lines of the American Civil Aeronautics Board. Changes in the ATAC status are therefore to be limited to those that can be made within the framework of the 1949 Civil Aviation Act, and the committee, though reorganised and made quasi-judicial, will still have to make recommendations to the Minister when it hears applications for licences. Mr Lennox Boyd has made it clear, however, that only in the most exceptional circumstance would its findings be rejected by the Ministry. The revised committee will be ready by July to hear licence applications for services to be started next year. The volume of applications then will be a measure of whether the operators have any confidence in the future. There is already anxious speculation about how the committee will interpret its brief to refuse applications likely to compete with existing services of the two corporations. Like its predecessor, the present Government seems unlikely to take a sympathetic view of the airlines' claim for a large increase in their mail rates. Without such a concession the corporations will continue to have a real struggle to balance their budgets, and they must therefore be expected to resent—and resist—any move that may reduce the traffic coming their way.

* * *

Germany Tries it On

The proposals that have now been submitted by the German delegation to the London debt conference do more than confirm the ominous premonitions from Bonn that were echoed in *The Economist* last week. The German offer is based on the wholly unexceptionable contention that Germany should not be asked to meet an external debt service greater than its capacity to transfer and on a wholly inadequate measurement of what that capacity is. The Germans have assessed it at the equivalent of £51½ million a year. The first claim on this is reserved for the Israeli government, which has been promised the equivalent of £9 million a year for at least five years in respect of claims arising from the expropriation of Jewish property by the Nazi government. This leaves about £42½ million for the external debt service. Of this, £28 million has to be earmarked for the British, United States and French governments in respect of their written-down claims for postwar economic assistance to Germany. The meagre balance of £14,500,000 is what remains for the prewar external creditors. It represents about 1 per cent per annum on the total capital amount of their outstanding claims.



In order to relate the sum offered to the outstanding obligations the German delegation has suggested the writing down of the capital amounts of all German governmental debts by 40 to 50 per cent, the cancellation of all arrears of interest, the reduction of interest payments to 3 per cent or one-half of the contractual rate (whichever is the higher), and a moratorium on all capital amortisation until the payments to Israel are completed. The Germans also decisively reject any scheme for repayment of debts in German marks that might conceivably be converted into foreign currencies, and state that their "offer" can be carried through only if other countries guarantee to accept a volume of imports from Germany large enough to yield the foreign exchange required for the external debt service. If these proposals are not seriously amended, and if Germany shows no signs of willingness to restrain its internal standard of living in order to meet its contractual obligations, then the world will conclude that the traditional German attitude to a debt obligation, as something to be whittled down as far as possible, has changed very little since the 1930s. This is not the way in which to rebuild the new Germany's creditworthiness abroad, or indeed at home.

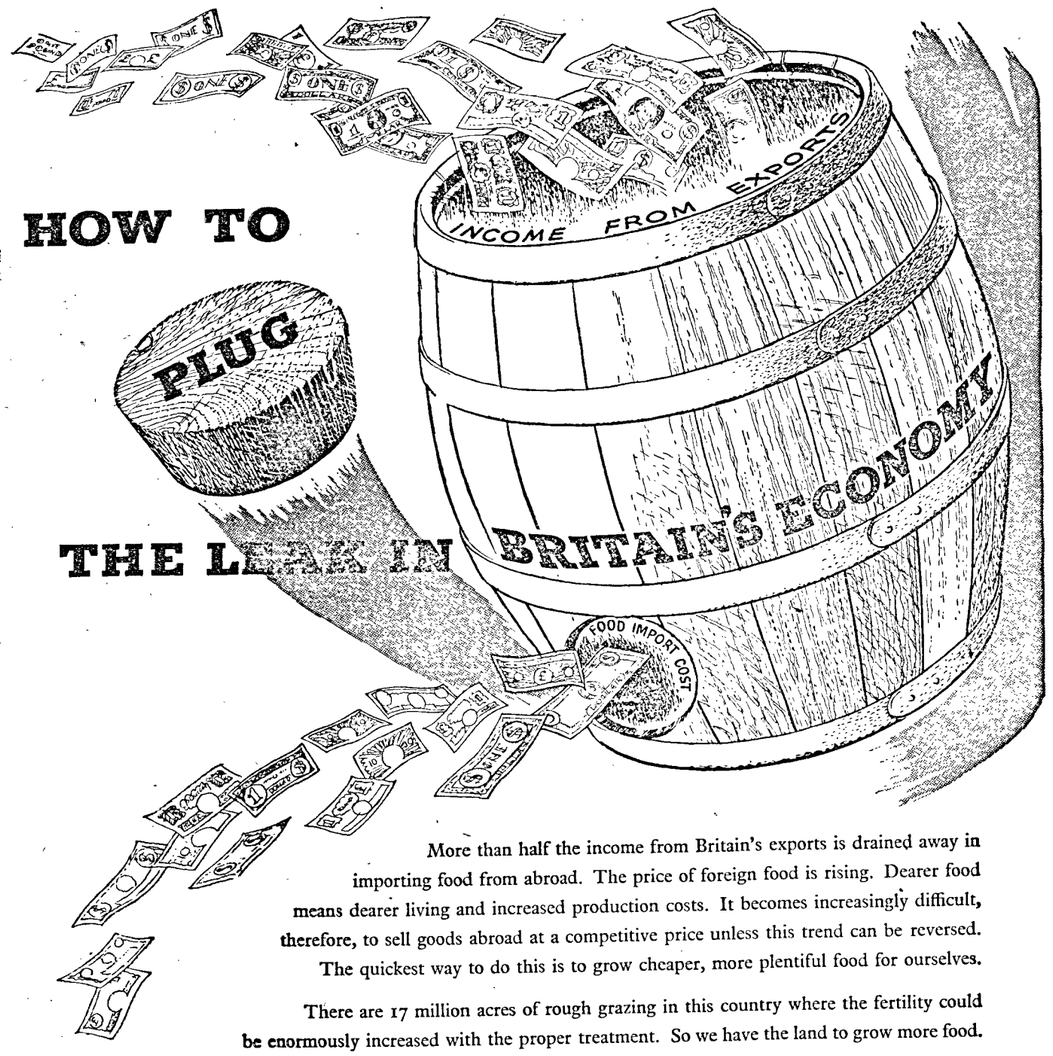
America and the Gold Clauses

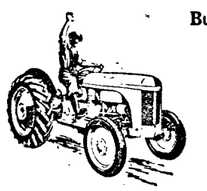
Unfortunately, Germany has been encouraged in its attitude by the fact that the American Government has been pursuing a policy that is based on an ill-judged concept of what it deems to be its own political and financial self-interest. Very early in these negotiations the German delegation proved adept at playing off the Americans against the others. American influence is alleged to have been at work behind the scenes in giving magnitude and priority to the Israeli claims to be the beneficiary of compensation for the crimes committed by Nazi Germany against German Jews: in an election year the political logic of such American intervention may not be difficult to seek. Even more serious—and much more reprehensible—however is the strong stand that the American delegation has taken against the operation of any gold clauses in German external debts. The United States government, which disowned the gold clauses in its own contracts in 1933, does not encourage other countries to show respect for similar obligations. The American delegation has also opposed the operation of dollar and other exchange clauses in the German debt contracts; it has argued that to invoke the Swiss franc clauses would be derogatory to the United States dollar, while to invoke the dollar clauses would give holders of non-dollar bonds carrying such clauses preferential treatment over that given to American creditors. This tortuous reasoning seems to be based on the assumption that the less that is paid over to other creditors the more there will be for Americans, and that one way of ensuring that less is handed over to other creditors is to deprive sterling bondholders of the protection against depreciation of sterling that was supposed to be afforded by the various exchange clauses in the contracts on which they were prepared to lend money to Germany.



Although it is to be hoped that the last word has not been said on these matters, German bonds naturally recoiled sharply after the shock of this initial German offer and of the revelation of the American attitude on the dollar and gold clauses. All the bonds concerned have fallen heavily on the Stock Exchange this week, led by those that had been buttressed by the enjoyment of gold and currency clauses. Dawes Loan, which recently stood at 66, has this week fallen to 48. Young bonds, the most important of the gold clause issues, have fallen even more precipitately, from 72 to 48. This weakness has spread to the market for Japanese bonds, as the American delegation has let it be known that it will try the same gambit on gold and dollar clauses in all other international debt negotiations. The Japanese 5½'s which had risen to 148 on the strength of the gold option in the bonds, have this week fallen to 130. It cannot be said that dismay on this subject has been removed by the Chancellor of the Exchequer's written reply to a Parliamentary question this week, indicating that "he

Shell Chemicals

The chemicals-from-petroleum industry is now helping in yet another way to meet this country's urgent need of raw materials. A shortage of sulphur means a severe drag on production. Rubber, rayon, steel, paper, dye-stuffs, many essential chemicals—even more homely things like starch and gelatine—all utilise sulphur at some stage of their making. In this country most sulphur is used for producing sulphuric acid, a vital need in literally hundreds of processes, not least in the manufacture of the super-phosphate fertilisers so important in present-day farming. Though Britain's sulphur is mainly imported, plants have been established to produce it here—plants very different from the traditional kilns. The first of these new plants to come into operation is at Stanlow, where rock sulphur, 99.9% pure, is now being produced by Shell from petroleum.



SHELL CHEMICALS LIMITED, Norman House, 105-109 Strand, London, W.C.2.
(DISTRIBUTORS)

More than half the income from Britain's exports is drained away in importing food from abroad. The price of foreign food is rising. Dearer food means dearer living and increased production costs. It becomes increasingly difficult, therefore, to sell goods abroad at a competitive price unless this trend can be reversed. The quickest way to do this is to grow cheaper, more plentiful food for ourselves.

There are 17 million acres of rough grazing in this country where the fertility could be enormously increased with the proper treatment. So we have the land to grow more food.

But the £5 million in 3 years, which is all that has been allocated for this purpose, is inadequate.

What farmers need is more of the modern farming equipment that can bring to agriculture the efficiency, increased output and lower production costs that modern machinery and methods have brought to industry. Once this is understood this leak in the nation's economy can soon be plugged.

Anglo-Iranian without Abadan

No very firm conclusions about the effect of the seizure of Abadan and the Persian oilfields on the fortunes of Anglo-Iranian can be drawn from the recently issued preliminary statement for the year to December 31st last. It is, of course, encouraging to shareholders—and to the biggest shareholder of all, the British Government—that in a year in which the company was deprived of six months' income from its Persian properties and was later forced to re-route supplies and to purchase oil from other producers, gross profits, at £75,899,965, were nearly two-thirds of those earned in its most prosperous year, 1950, and were higher than those earned in 1949. Too much should not, however, be made of these comparisons, for at the last general meeting Sir William Fraser explained that in the first half of 1951—that is, before the seizure of Abadan—trading results were exceptionally good. Judging by the scanty evidence of the

	Years to December 31, 1949	1950	1951
	£	£	£
Gross profit	65,638,310	115,661,714	75,899,965
Depreciation, etc.	24,353,920	34,195,372	23,682,949
Taxation	22,840,181	50,706,880	27,373,901
Net profit	18,444,209	33,759,462	24,843,115
Ordinary dividends	6,041,250	6,041,250	6,041,250
General reserve	10,000,000	25,000,000	16,000,000
Added to carry forward	277,532	*Dr.9,912*	120,566
Ordinary divs. (per cent)	*30*	*30*	*30*

royalty charges, which naturally enough have fallen (from £16,031,735 to £8,326,446), it is quite possible that as much as three-quarters of the year's profits were earned when the company was still in possession of its Persian assets.

Net profits have been cushioned against the decline in gross profits by the lower charge for taxation, which has fallen from £50,706,880 to £27,373,901, and the fall in net earnings has been limited to one of £8,916,347, to £24,843,115. The directors of Anglo-Iranian have therefore been able to transfer £16,000,000 (against £25,000,000) to a general reserve as well as to redeem their earlier promise to maintain the ordinary dividend at 30 per cent. On the test of these figures alone Anglo-Iranian has passed through the bitterest year of its history with its reputation enhanced, and the company should add further to its stature this year. The exceptional outlays involved in re-directing the company's fleet and in securing supplies from other producers should now be almost a thing of the past, and the steady growth in production at Kuwait may actually enable the company to handle a larger tonnage of products in 1952 than it did before the loss of its Persian possessions. It should be no longer a story of Anglo-Iranian without Abadan, but one of Anglo-Iranian with Kuwait.

* * *

Two Committees for Purchase Tax

The Government announced this week that it has decided to refer two of the most controversial aspects of purchase tax administration—the question of tax rebates when the rate of tax is reduced and the question of "uplift"—to two independent committees. This suggests that there is some chance of ending the stalemate that has persisted ever since 1949, when the Customs and Excise department turned down trade proposals for reforms on the grounds that they were administratively unworkable. Of the two, the question of tax rebates is the more important, because it affects all retailers dealing in goods that attract purchase tax. The tax is levied on the wholesale price of an article, and collected from the retailer by the wholesaler. If the rate of taxation is reduced the retailer is, in theory, still able to recoup tax paid at the old rate by selling goods in stock at the old price. In practice he generally has to reduce the price of his stocks to the new level and bear the loss himself. No satisfactory method of allowing retailers to claim a tax rebate on goods in stock has apparently yet been evolved, or rather none that will satisfy the tax collectors. In consequence, in the months before the budget, retailers make frenzied efforts to minimise their stocks of taxed goods; this year, moreover, the uncertainty has been prolonged and intensified before the budget by anticipation of the Douglas report and since the budget by government vacillations over the "D" levels and the tax rates themselves, thus seriously aggravating the depression in the clothing and textile trades. When the steps that retailers take to avoid losses on taxed stock begin to have such widespread repercussions throughout the textile industry, it is no longer possible to dismiss the question of tax rebates as a minor squabble on an insignificant technical point.

The question of "uplift," which the second committee will investigate, is one that concerns only those retailers who buy direct from the manufacturers. In their case, Customs and Excise adds a theoretical wholesale margin to the manufacturer's price in order to arrive at a basis for calculating the tax payable. The trade maintains that this practice should be abandoned.

Rhodesian Selection Trust to Migrate?

The directors of the Rhodesian Selection Trust group of copper companies have bowed to the inevitable by formally applying to the Treasury for permission to transfer control to Northern Rhodesia. Unlike the other Rhodesian copper producers, who transferred control before Section 36 of the 1951 Finance Act was passed, the Selection Trust group must obtain permission from the Treasury before it can migrate. Fortunately, the escape gate seems reasonably likely to be opened to it. Quite apart from Mr Butler's comments on the mode of operation of the ring fence control (discussed in an earlier note), it should be noted that permission was recently granted to Wankie Colliery, whose interests are closely bound up with the Rhodesian copper belt, to transfer its seat of control to Rhodesia. The companies making the new application are Rhodesian Selection Trust, Rhodesian Selection Trust (Services), the developing company Chibulana Mines, and the two operating companies Roan Antelope and Mufulira.

The question of a change in domicile has recently been kept very much alive in discussion, if not in decision, by the Selection Trust group. Three new companies formed by the group to direct the exploration of new areas were domiciled in Rhodesia; and the chairman, Mr R. L. Prain, suggested at the last general meetings of the operating companies that, as the centre of political gravity for Northern Rhodesian affairs was shifting away from Britain to Rhodesia, conditions might now be created under which it would be the directors' duty to seek to transfer control to Central Africa. Previously, the directors had rated political and administrative convenience above any savings in taxation, but it seems probable that the arbitrary imposition of EPL upon the existing weight of British taxation has now helped to quicken the directors' appreciation that "the recent emergence in Northern Rhodesia of political and industrial conditions calls for the direction of the policy of the companies from within the Territory." The total burden of tax would become much lighter after a change in domicile, especially as the group would benefit from the recent changes in the Northern Rhodesian taxation laws that aim to help

developing mining companies. The benefits that might be expected if the Treasury grants permission are to some extent mirrored in market prices. Towards the end of September, 1950, just before the Rhoanglo group of copper companies announced its intention to migrate, the 10s. shares of Rhodesian Anglo American stood at 40s. ; by last Friday they had risen to 53s. 3d. In the same period the holder of a 5s. share in Rhodesian Selection Trust had seen the value of his holding decline from 31s. 6d. to 28s. 6d. (the 5s. shares stood at 14s. 3d. last Friday, after allowing for the 100 per cent scrip bonus last July) ; on Monday these shares responded to the news of the application for migration by rising 9d. to 15s.

Market Prices for Metals

Last weekend Viscount Swinton, who is responsible for the Ministry of Materials, said that the government would revert to its former policy of basing its selling prices for metals on those currently ruling in the American markets. Selling prices of other materials (in particular jute) are to be based on "world" prices. British prices of non-ferrous metals will in future be only about £10 a ton above the official American prices ; this difference covers freight, insurance and delivery to consumers' works. This policy was first adopted for metals by the Ministry of Supply after its unsuccessful attempt to guess a price that would show neither profit nor loss over a period of time. It was discontinued last year when the Ministry of Materials started building up stocks and was obliged to pay prices well above those quoted in the New York market. For jute and other commodities it will be the first attempt to relate British prices to those ruling in the main markets.

The real difficulty about any government pricing policy is the absence of a proper world market that can be used as a yardstick. A government trading organisation makes profits or losses in two ways—on its direct trading and on the changing value of its stock. It must keep fairly large stocks, and its only chance to break even over a period of years is to buy constantly—in small amounts if necessary—so that the cost of its stocks represents the pattern of world prices during the period. If its selling prices are then kept in line with prices in other markets, it will make a profit when prices rise more sharply than they fall—or a loss if the opposite occurs. Such a policy should present the Ministry with no difficulty so far as metals are concerned, for its purchase prices are also geared to those ruling in the American market.

This reversion of policy simply means that the Ministry will now write-off its high cost purchases last year as a loss. Whatever the accounting merits of the change, at least it means that British manufacturers will pay no more for their raw materials than some of their competitors. It is true that at present "free" market prices for lead and zinc are below the official New York prices, but they are only for marginal supplies. Those manufacturers who would otherwise have been able to buy even small amounts at these lower prices, have to forgo this chance of lower costs. But clearly a Ministry cannot take these minor variations in price into account. The moral is, perhaps, that the Government should restore the London Metal exchange as soon as possible. And it might indeed be able to do it sooner than it expects.

* * *

Decorated Pottery at Home

The cautiously phrased statement in which the President of the Board of Trade announced the introduction of a home market quota for decorated pottery for the first time since the war has not pleased the industry. Mr Thorneycroft said that in addition to the "frustrated exports" that are

already individually licensed for sale at home, manufacturers would get a quota based on a percentage, yet to be announced, of last year's output. But this concession is to run only for a period of six months, and its operation will in any case be reviewed after the first three months "in the light of export prospects at the time."

It is clear that the Board of Trade intend to reimpose the ban on home sales of decorated china if there is any opportunity of selling that ware abroad, but whether such a control, once relaxed, can ever be successfully reimposed may seem doubtful. Exports during the first four months of this year have been higher than in the same period either last year or the year before. They were valued at £6.7 million, compared with £5.1 million in the first four months of 1951. But most of the increase came from sales to Australia and New Zealand ; shipments of china to Australia were nearly treble the value of the previous year. Not only are these exports subject to an 80 per cent cut under the new import restrictions, but there is probably enough china and earthenware still in transit to fill the greater part of the year's import quota.

* * *

Competition for the Comet

The beginning of regular passenger flights by the de Havilland Comet has given a stimulus to demands in the United States for a government subsidy to cover the development costs of a competitive jet airliner. It is ironic that when the de Havilland Comet is the only big airliner to have been built in this country since the war by private capital alone, the American aircraft industry should consider a subsidy necessary before it embarks on a similar project. The fact is that no manufacturer is prepared to go further than preliminary drawings without a firm production order from an airline. De Havilland would probably not have been able to lay down production lines for the Comet had BOAC not been willing to order 14 aircraft from the drawing board. The alternative procedure, in this country, is for the Ministry of Supply to order prototypes, and pay for the cost of developing them. In the United States this is done only in the case of military transports, and although the Civil Aeronautics Board has put a proposal to Congress for development loans to cover 75 per cent of the cost of producing prototype jet airliners, Congress is unlikely to find time to approve such a project before the election, and possibly not even then. Direct sponsorship is more likely to come in the form of military contract for troop transports.

But even if immediate action is taken, and companies such as Lockheed, already interested in jet airliners, start active development now in the hope of getting sponsorship later, it could take from five to seven years to bring such an aircraft into service. The impatience of the American airlines is understandable—and competition from BOAC may oblige them to order Comets rather than delay longer waiting for a still hypothetical American competitor.

Power at the Pithead

Miners themselves, as is well known, are still about the heaviest domestic consumers of coal: in the same way, the collieries use about ten million tons a year to produce power for mining—much of it wastefully under old and inefficient boilers. For some years the National Coal Board has been discussing with the British Electricity Authority the construction of power stations near the pithead ; in addition to supplying the collieries' increasing demands for power at the service of the miner, these might also serve the purpose of burning inferior coals—such as the residues from pithead washeries—that are uneconomic to transport for sale. Agreement has at length been reached, and the first station, at Barony Colliery

in Scotland, is now being put in hand by the Authority. This is a small station by BEA standards, though perhaps larger than some of the pithead stations that may follow it ; it is to serve the power needs of a group of pits in the area.

The agreement is that half of the new stations will be constructed by the Electricity Authority and half by the Coal Board ; they will be linked into the grid so that extra colliery needs can be made up or spare current may be supplied to consumers. No details have been given of the financial

COLLIERY COAL AND POWER CONSUMPTION, 1947–51

% decrease, 1947–1951	4%	11%	17%

* Including estimated coal equivalent of electricity and gas.

arrangements between the two nationalised fuel industries on this matter ; but last year negotiations seemed to have reached the point where the price of electricity supplied was to be directly related to the price of the coal used. The low quality of the fuel used may require a special design of boiler, and presumably the power station engineers will have some discretion in the qualities of coal that they are prepared to accept.

The table expresses colliery consumption of coal for power, heat and light, between 1947 and 1951, in three different ways. Since more low-grade fuel is being burned, the figures of coal consumed per ton of output under-estimate the improvement ; and, on the other hand, because relative prices of coals have changed, the second column overstates it. Whatever the improvement, the Coal Board is attempting to accelerate it ; it has placed orders for mechanical stokers for 500 of the 3,400 boilers at its pits that are still fired by hand, and has set up its own fuel efficiency service on the lines of that run by the Ministry of Fuel and Power.

Super-Priority for Minesweeping

The first of the minesweepers to be completed for the Royal Navy under the rearmament programme was recently launched at Cowes. Apart from conversion and modernisation work, naval rearmament is concerned wholly with small vessels, and the two most important types are frigates and minesweepers. These two classes of warship are the immediate counters to the two chief threats to British sea communications in the event of another war, the submarine and the mine. The danger of the modern submarine is generally appreciated: the equal danger of the modern mine has recently been emphasised by the inclusion of "anti-mine measures" as the only naval item in the "super-priority" category of defence production.

The mines with which the Navy is now primarily concerned are of the non-contact type, which are set off by magnetic, acoustic or pressure mechanisms. Pressure was employed in the "oyster" mines developed by the Germans towards the end of the last war. These were virtually unsweepable, as were some of the more ingenious British mines: clearing the approaches to the Channel ports after the war was a lengthy and arduous business in which divers had to be employed to dismantle many of the mines. The

mine laid by aircraft is still the main threat to shipping near a port.

Non-contact mines are laid on the sea bed, and can, therefore, be used only in shallow coastal waters. It now appears that they can be swept by comparatively small vessels of limited endurance—presumably using new equipment to do so. Two types are being built under the rearmament programme: coastal and inshore sweepers. The inshore sweepers, which are the smaller, are about the size of the Fairmile motor launches of the last war. The basic features of their design have been standardised among the Nato countries, thus allowing ships of any of the countries to work together efficiently. This is one of the first successful examples of weapon standardisation under the treaty. Nearly seventy have been ordered from British shipbuilders, and many others are being built in the United States, Canada, France and Holland. A group of eighteen has been ordered by the United States from Dutch shipyards, probably for allocation under the military aid programme.

To reduce their magnetism and to make use of boat-building capacity, these minesweepers are being built of wood on light alloy framing. Orders have been given to many small yards unaccustomed to naval work, and in many cases known chiefly for the construction of yachts or fishing vessels. To assist them in the work, "parent firms" have been appointed for each type from among larger yards, and these are building the first vessels. Samuel Whites, of Cowes, are the parent firm for the inshore minesweepers, and Thornycrofts for the coastal sweepers. Of the thirty-five inshore minesweepers for which orders have been announced, six were stated in the Navy Estimates to be due for launching before March 31st ; the programme is evidently behind schedule.

Second Thoughts on Soil Conditioning

Monsanto Chemicals Ltd. has decided to start pilot production of its synthetic soil conditioner, "krilium," in this country, as soon as possible, and plans for a full-scale plant are also being drawn up. The market for this product may, however, be more restricted than earlier reports suggested. The function of the chemical is not to act as a fertiliser, but to improve the texture of the soil. This depends on the presence of gums that hold the soil particles together in a porous structure. Without porosity, the soil is alternatively baked hard by the sun, or washed away by rain ; in either case it is useless for cultivation. These gums are normally provided by decaying humus, but "krilium" provides an alternative, synthetic, source of them. Its action was effectively demonstrated by Dr Mowry, one of the discoverers, in London this week, but at the same time he made it clear that the minimum rate of application is between 100 and 200 lb of chemical per acre. To treat poor clay soil to plough depth would take up to 1,500 lb per acre. The price of "krilium" in the United States has fallen from an estimated $2 a pound to less than $1 40 cents a pound, although production is still in the pilot stage. But even in full-scale production it may be some time before the price is much less than 75 cents a pound. This makes the cost of treatment exceptionally high, remembering that to be fully effective the chemical has to be worked into the soil. No indication of the price in Britain has been given yet, but since the cost of the raw materials is likely to prove higher than in the United States, it can be expected to be more rather than less expensive. Until the price can be reduced considerably, the use of "krilium" is likely to be restricted to greenhouses, intensively cultivated market gardens, and, on a smaller scale, to private gardeners, all of which make large and frequent applications of humus to keep the soil in condition. Single applications of "krilium" are still effective after three years.

An interesting turn to the development of soil conditioners

has resulted from the belated appearance on the market of a roughly similar compound to "krilium" produced by the American Cyanamid Company. This compound had been made on a small scale for a number of years, without its agricultural applications being considered. When the Monsanto patents for "krilium" are eventually published, it seems probable that American Cyanamid will enter into a licensing agreement with Monsanto, rather than persist with its own compound.

Shorter Notes

When British Celanese made a rights issue of ordinary shares last November the directors refused to forecast the future level of earnings and dividends, but the market assumed at that time that a dividend of 16 per cent would be made for the year to June 28, 1952. Since then this confidence has gradually ebbed away, and this week it received the final shock by the announcement that the interim ordinary dividend was to be limited to 4½ per cent, compared with last year's interim of 6 per cent. All previous estimates of the final dividend have thus been thrown into the melting pot and the 10s. ordinary stock units were immediately marked down 2s. 9d. to 19s. 9d. The directors felt obliged to cut the interim "in view of the severe depression in the textile industry"; their decision has inevitably deepened the uncertainty that surrounds the dividend shortly to be announced by Courtaulds.

A new plant to manufacture sulphuric acid from anhydrite is to be built by Marchon Products Ltd., with finance provided by the Treasury and the Industrial and Commercial Finance Corporation. The plant, which will have an annual output of 75,000 tons of acid a year is estimated to cost £2 million. ICFC will probably provide a third of this sum, the Treasury, £250,000. Marchon Products is a small and comparatively young company, mainly concerned in making the basic materials for the synthetic detergent sold by Colgate. Sulphuric acid is needed for its production, but only a small proportion of the acid produced at the new plant will be needed for this purpose.

★

The Board of Trade has announced import quotas for a large and assorted collection of goods, ranging from certain textiles and electrical hardware to haircurlers and mousetraps, that were subject to the withdrawal of Open General Licences for imports from Western Europe and some other countries on March 12th this year. Licences now being issued will be valid until December 31, 1952, and will be based on individual firms' imports during the calendar year 1951. Some stop-gap licences have already been issued to enable firms to import foods contracted for before March 11; these licences will be deducted from the quotas now announced. In certain cases the licences issued already exceed the new quotas and no further imports will be allowed this year. Imports of textiles for rearmament will be outside the scheme.

Company Notes

Unilever.—For the Unilever diarchy, 1951 fell into three distinct phases. In the first few months of the year it enjoyed brisk trade and rising prices, and its main problem was to produce sufficient supplies to meet a demand inflated by consumer hoarding. Gradually this pattern—first in the United States, then in other hard currency areas, and finally everywhere—changed to one where distributors, warned by the decline in raw material prices, began to reduce their inventories, while consumers, though buying their normal requirements, stopped buying for stock. In the final phase trade became slack and even consumers seemed to be content to fall back upon accumulated stocks; in this period turnover fell below normal, competition became keener, and profit margins fell. This third and gloomy phase continued through the first few months of 1952; more recently, however, there have been signs that trade may be picking up.

In 1951, as a whole, turnover increased from £988,870,000 to £1,205,447,000 (including £297,508,000, against £243,613,000, as the value of inter-group services and supplies); simultaneously, the value of exports from Britain increased from £27,225,000 to £37,395,000, and from the Netherlands from £14,191,000 to £23,497,000. These figures, however, are distorted by the inflation of prices, which also brought in its wake steep rises in costs that had to be borne at a time when trade was beginning to taper off. As a result, the expansion in profits was considerably slowed down. The combined profits of the diarchy increased by under 6 per cent, from £65,248,940 to £69,088,667, compared with an increase of 51 per cent in 1950. With these aggregates, Unilever Limited reported an increase in profits from £34,318,448 to £42,107,530, but N.V. a decline, from £30,930,492 to £26,981,137. This contrast is largely explained by the fact that the N.V. company, having benefited from the boom in trade in the United States in 1950, had to bear the brunt of the recession in American sales in 1951 while the British company benefited from an increase in sales in Africa in 1951 (through the exports of the United Africa group); turnover in the American market declined from 15 to 13 per cent of total sales but turnover in the African market increased from 18 to 19 per cent. As price changes distort gross trading profits, shareholders should perhaps pay more attention to net profits after tax, which are shown after making allowances for the replacement of fixed assets at current costs and after making appropriations to stock reserves; these net profits show a slight fall, from £19,226,875 to £18,837,651.

The reasons for the directors' decision to do no more than maintain the ordinary dividends (at 13¼ per cent by Unilever Limited and 12 per cent by NV) are evident from the consolidated balance sheet. The increase in the book value of stocks, from £143,073,407 to £212,357,159 was due in part to the piling

up of physical stocks following the recession in trade, but it also reflected the aftermath of an inflation of prices. The increased cost of investment in fixed and working capital has not been altogether balanced by the increases in equity capital (from £29,635,361 to £37,100,593) and in loan capital (from £44,464,940 to £58,541,076). The group has therefore been forced to increase its short-term borrowings, from £33,228,908 to £55,237,740, and to draw down its liquid balances; instalments received from the recent issues of ordinary shares and debentures have increased from £4,850,000 to £14,835,505, but cash balances have fallen, from £26,464,305 to £24,859,789, and short-term investments have declined much more steeply—almost entirely in the NV accounts—from £19,254,755 to £3,776,887. If prices remain at their present levels, however, considerable sums will be released as accumulated stocks are run down, and the dearth in liquid funds may therefore be only a temporary phenomena. At the current price of 42s. 3d. the £1 ordinary shares of Unilever Limited yield 6.4 per cent.

★

Associated Portland Cement.—Last year the Blue Circle group delivered nearly a quarter of a million more tons of cement than in its previous record year of 1950; its deliveries so far in 1952 are already a quarter of a million tons up on the same period in 1951, and the chairman, Mr G. F. Earle, hopes that production in 1952 as a whole will exceed 7 million tons. The increases in deliveries since the war have been achieved by extending and improving—and sometimes by reopening—the plants operating before the war, and, although the new Shoreham works have now come into production, there is still no sign of supply overtaking demand, so that expansion is likely to remain the order of the day. Mr Earle points out, however, that the cost of new works in England is now so high that it is practically impossible for them to compete with existing works unless the savings in transport are really large. He estimates that to replace the plant and other fixed assets owned by the group would cost about £56 million; the book value of the group's cement plants works out at about 14s. 6d. a ton of annual output, but replacement cost would be about £8 a ton. The Blue Circle group will therefore still concentrate on extending and improving the efficiency of its existing plants rather than on building new ones; these extensions and improvements should add about 500,000 tons to annual output. This increase may well be needed if the cement industry is to keep up with demand both at home and overseas, for the import of cement from Belgium was recently stopped under new EPU arrangements.

£1 ordinary stock at 95s. 7½d. yields £8 15s. per cent.

As profit margins on the sale of cement in Britain are still low, last year's satisfactory trading results (the group's trading surplus increased from £7,166,970 to £8,514,725) owe a good deal to exports and to trading in other goods than cement; exports accounted for over a third of profits and trading in other products for nearly a quarter. So far, it is the receipts from exports that have made it possible to finance the extensions of productive capacity under the crippling burden of taxation, which is now to be made even more onerous by the imposition of EPL. Taxation and the high cost of extensions and improvements must be taken into account in judging whether Associated Portland will pay more than the dividend of 27½ per cent paid in the last two years.

★

Marks and Spencer.—The day after the full accounts of Marks and Spencer were published, the 5s. "A" ordinary shares were marked down 1s. 6d. to 74s. 9d. Even in a depressed market this seems to be a churlish response to the report of a 15 per cent increase in the volume of business, an increase in the ordinary dividend from 75 to 80 per cent, the promise of a 100 per cent scrip bonus, and the announcement of only a slight fall in trading profits, from £7,486,863 to £6,696,194. Two factors largely explain the grudging attitude of the market. The first is that there is no mention in the full report of the fate of the small annual scrip bonuses that have been a feature of the accounts in earlier years; the importance given to these bonuses by investors was discussed in the analysis of the company's preliminary trading results in *The Economist* of May 17th. The second factor is the strain that has been imposed on liquid resources by investment in working capital at inflated prices. The directors had already explained that the fall in trading profits was due to the progressive writing down of stocks, following the fall in textile prices; it is now revealed that, despite this writing down, the book value of stocks has increased from £4,372,048 to £5,832,458. Moreover, advances to subsidiaries have been raised substantially from £2,442,282 to £4,249,316. These advances reflect the increasing interest that is being taken by Marks and Spencer in the production of the basic materials that are used in the manufacture of the made-up garments sold in its stores; the company has assumed responsibility for the purchase and conversion into finished products of large quantities of grey cloth. At the high prices ruling at the beginning of the company's financial year, the burden of financing such operations must have been considerable, and this burden, together with further investments in stocks, has made heavy calls on the company's liquid balances; investments have been drawn down from £1,374,135 to £848,124 and cash balances from £2,202,283 to £547,758, while tax reserve certificates of £1,500,000 have been used up. Investors may be beginning to ask themselves whether a more permanent basis will have to be found for financing advances to subsidiaries if these commitments continue to grow. However remote a possibility this may appear, it is sufficient in the troubled waters of the stock markets to set back the price of the equity shares; at the current price of 74s. 9d. the "A" ordinary shares yield £5 7s. per cent.

GOLD AND SILVER

The Bank of England's official buying price for gold was raised from 172s. 3d. to 248s. 0d. per fine ounce on September 19, 1949, and the selling price to authorised dealers from 175s. 0d. to 252s. 0d. per fine ounce. Spot cash prices during last week were as follows:—

1952	Silver: London per ounce	New York per ounce	Bombay per 100 tolas	Gold: Bombay per tola

COMPANY MEETINGS

ROYAL EXCHANGE ASSURANCE

232nd ANNUAL REPORT

GREAT PROGRESS AND STRENGTH

DIVIDEND RAISED TO 45 PER CENT

LORD BICESTER ON THE OUTLOOK

The two hundred and thirty-second annual general Court of the Royal Exchange Assurance was held on May 28th in London.

The following statement by the governor, the Right Honourable Lord Bicester, which had been previously circulated to the stockholders, was submitted and taken as read.

I commence my review of the operations of the corporation during the year 1951 with a reference to the changes which have occurred in the Court of Directors.

MR C. L. DALZIEL'S RETIREMENT

It was a matter of great regret to the Court and to me especially when Mr Charles L. Dalziel, for so long the sub-governor, told us last summer of his wish to reduce his business commitments for reasons of health. He was elected a director in 1922, became deputy-governor in 1924 and sub-governor in 1932. He resigned his office and also his membership of the Court at the end of October, 1951, after devoting almost 30 years' invaluable service to the affairs of the corporation and its associated companies.

Mr Dalziel possessed very great financial talents and, as our colleague, freely placed his experience and discernment at the disposal of the corporation. We held him in the highest regard and he is very greatly missed. I am confident that it will be your wish to place on record our appreciation of his long and valued service.

At the invitation of the Court of Directors, Brigadier the Hon H. K. M. Kindersley, CBE, MC, has assumed the office of sub-governor and the Hon David Bowes-Lyon has been appointed deputy-governor.

COURT OF DIRECTORS

In reporting the other changes in the Court of Directors since I last addressed you, it is with infinite regret that I have to record the death of Lt-Col R. W. Barclay, a past chairman of "Barclay Perkins," with whom the corporation has had close ties since 1789, and who joined the Court of Directors in 1938, and of the Rt Hon Sir Andrew R. Duncan, GBE, whose distinguished career both in industry and in the public service made him a most valuable colleague during his six and a half years as a director of the corporation.

On your behalf I would like to welcome Sir Ellis Hunter as a member of the Court. His leading position in "steel" and his intimate connection with industry generally are, I am sure, well known to you. I am also happy to tell you that quite recently Mr G. A. Perkins accepted an invitation to become a director, so that the close association with "Barclay Perkins" will be continued.

Before reviewing the departmental results I wish to refer briefly to two important overseas executive appointments which we made during 1951:—Mr Henry C. Pitot as manager in the United States, and Mr J. T. Buttery as manager for Canada. We wish them both success in their respective territories. Mr Pitot has very recently visited head office and we are happy to feel that the affairs of the group in the USA are in capable hands.

FIRE DEPARTMENT

There are good reasons why we should be very satisfied once again with the results of the fire department. Aggregate "group" premium income at £8,295,139 constituted a record and was more than £1 million larger than in 1950.

We have had a very good year and an excellent surplus has been derived from our operations at home, as well as from our vastly larger trading overseas. The aggregate profits earned in this department constitute a record for the group and permit the eminently satisfactory sum of £847,001 being transferred to the profit and loss account.

MARINE DEPARTMENT

In the marine department aggregate premiums were £2,089,458, showing an increase of almost £500,000 over 1950. Results for the years prior to 1950 cannot be counted unsatisfactory and it has been found possible to transfer £207,850 to profit and loss account.

By reason of the numerous casualties reported, particularly during the latter months of the year, 1951 is unlikely to prove a good one for marine underwriters.

Rising costs of repairs throughout the year will fall very heavily on our hull account and it is fortunate indeed that in the London market we have the continued support of the Joint Hull Agreement. The Joint Hull Committee has carried out an enormous amount of work on behalf of the market with great success and it would probably be true to say that if it were not for the Joint Hull Understanding, underwriters in all markets would have been involved in very serious losses in respect of their hull underwriting during the last few years.

On the cargo side of the business, rates have fallen still further as a result of the keen competition in our own market and abroad, and it would, I think, be correct to say that in many cases cargo rates are now too low, especially if the war risks premium is excluded. Last year I referred at some length to our Joint Marine Underwriting agreement with the "North British" and the "Sun," which, I am happy to say, is proving mutually beneficial.

ACCIDENT DEPARTMENT

In the general accident department, aggregate premium income has increased by some £1,400,000 to £11,634,420, and I am glad to say that once again our home and overseas sections have contributed to this new record figure. It is interesting to observe that the premium income of this department has almost doubled since 1946.

In regard to our employers' liability insurance account, you will remember that each year since the National Insurance (Industrial Injuries) Act, 1946, came into operation on July 1, 1948, I have referred to the difficulties in conducting this class of business. Higher wages and depreciation in the value of the £ are both important factors in the continually increasing sums required to settle Common Law claims: the inevitable result has been, as I forecast last year, that the rates for many trades have been substantially increased since February 1, 1952, but it remains to be seen whether these new rates will prove adequate.

Our motor insurance business has again presented us with many problems. The high cost of settlement of claims for both personal injury and damage to vehicles continues, and it is by no means certain that the small increase of 12½ per cent, which was made in our premium rates on the home section of the business as from June 1st last, will be sufficient.

The underwriting of motor insurance all over the world continues to be a source of great anxiety and, generally, rates are being increased. It is with regret, however, that I have to tell you that our 1951 account still shows a most unfavourable experience.

The very varied operations of our accident department (not all of which have been satisfactory, as I have explained) have resulted in a transfer to the profit and loss account of £216,562, which compares with a figure of almost £700,000 in 1950.

LIFE DEPARTMENT

During 1951 new life policies were issued with net sums assured of over £5,500,000, a record figure and an appreciable increase upon the levels attained in past years. The total premium income for the first time exceeded £2 million. Claims were again on the normal scale and amounted to £1,422,654.

One most important factor in managing life assurance funds is the yield of interest income which is obtained from the investments. The gross yield earned upon our life fund in recent years has naturally been limited through the cautious investment policy which we have felt bound to follow and upon which I will comment later.

It is therefore particularly pleasing to me to be able to report a gross yield of £4 12s. 10d. per cent for 1951, which exceeded that for the previous year by 8s. 1d. per cent. This is the highest return obtained from the fund since 1938, but one which I am hopeful may be improved in the current year if we should feel justified in taking full advantage of the yields obtainable on high-class investments today.

Our annuity account and capital redemption account each made satisfactory progress during 1951 and seem to require no special comments.

The proprietors' allocation account received £92,276 from the life fund, £130,637 from the annuity fund and £14,365 from the capital redemption fund, in all a very satisfactory total of £237,278, representing the stockholders' share of valuation surplus for the three years 1949 to 1951. This latest triennial valuation showed all three funds to be in a strong position.

A careful study of the affairs of our life department as revealed by the recent valuation, convinces us that a life or endowment policy in the "Royal Exchange" not only provides excellent protection but is also a very fine investment.

INFLATION AND TAXATION

In the United Kingdom, in the Commonwealth, in the United States and in the

many other countries served by the corporation and its associated companies, postwar economic conditions have been particularly subject to governmental influences. In the pursuit of a policy of full employment the economies, especially of the United Kingdom and the Commonwealth nations, have been exposed to inflationary pressures, and there have been wide fluctuations in the balance of payments of the sterling area.

In the latter half of 1951, and in the early months of the current year, the purchasing power of the pound sterling was placed in jeopardy once again. The impact of such a situation upon a group such as ours, whose contracts are written in a multitude of currencies, is naturally most unwelcome.

In recent months the British Government has abandoned the cheap money policy that had been the fashion for some twenty years. Through this introduction of flexibility to the country's economy, and by other financial and economic actions, we have demonstrated to the world our determination to restore strength and stability to our currency—a most welcome decision to British insurance offices, with their great world-wide business.

It has been the practice of your directors to regard the profits of the underwriting departments as surplus to be retained as additional future protection for its policyholders, rather than as revenue to be distributed to stockholders. Additions to reserves which should thus result from successful underwriting are, unfortunately, today relatively small, due to the crushing weight of taxation. I think I can best illustrate my point by telling you that in the last three years the general funds of the Royal Exchange group have had to provide a total sum of over £3,400,000 for taxation of various types.

INVESTMENTS

One automatic result of the Government's determination to re-employ the monetary mechanism was a substantial fall in security prices in the latter weeks of 1951, followed by further depreciation during the current year. In anticipation of the possibility of this situation arising, your directors have for some years now followed a cautious investment policy which embraced the holding of a large volume of short-term securities and tax reserve certificates as well as substantial cash balances.

Accordingly, even when valued at the low market prices of December 31, 1951, the investments of each of the life, annuity and general funds of the "Royal Exchange" represented in the aggregate substantial margins in excess of the figures printed in the balance sheets.

Certainly an amount of nearly £50,000 has been provided in the consolidated profit and loss account for reducing book values of investments, but this figure relates to minor items in the accounts of certain of the smaller associated companies.

Before leaving the subject of investments I wish to refer to the retirement in June, 1951, on pension, of Mr A. G. Ashton, who has been succeeded by Mr C. A. S. Cooper, OBE. Mr Ashton had been our investment secretary for a period of 20 years and I would like to pay tribute to his valuable contribution to the administration of the corporation's financial affairs.

PROFIT AND LOSS ACCOUNT

I now come to the consolidated profit and loss account, which totals £1,778,526 compared with £2,128,360 for 1950. This reduction is, of course, attributable to the much lower transfer from the general accident account to which I have already referred.

On the other side of the account you will see that £182,400 has been transferred to pension and staff allowances funds whilst a net figure of £779,470 has been provided for United Kingdom taxation including income tax 1952-53. If to this latter figure is added tax deducted from our investment income you will understand that the Inland Revenue has again benefited by well over £1,100,000 as a result of our business endeavours last year.

The remaining balance of £623,421 is transferred to the consolidated profit and loss appropriation account making with the figure of £1,947,429 brought forward from last year a total disposable sum of £2,570,850.

DIVIDEND

The background against which the final dividend in respect of 1951 requires to be judged is, in my view, one of great progress and strength. Underwriting accounts show increased premium collections and continued profitability. There have been further additions to reserves and surplus, whilst the stability derived from our careful investment policy has been amply demonstrated by the year end valuation.

Accordingly the Court considered that a further modest increase in the dividend rate would be no more than consistent with the satisfactory picture of the corporation's affairs which I have been able to give you. In these circumstances it has been decided to recommend a final dividend of 30 per cent, making with the interim of 15 per cent a total dividend for the year of 45 per cent, which compares with an aggregate distribution of 40 per cent for 1950. After deduction of income tax the year's dividend will cost £223,729, which compares with £438,470 net interest earned on our general funds.

The foregoing figures are, I am sure you will agree, very satisfactory. They are, however, in respect of a period of twelve months only, and in order to judge the success of underwriting policies at all adequately it is essential that the results of a series of years should be considered.

The years 1946 to 1951 covering the economic rehabilitation of so many countries after the war presented the insurance industry with numerous special problems, but it has been my pleasure to put before you during that period figures which have, on the whole, been consistently good.

THE FUTURE

Let me now turn to the future. In the early months of 1952 many countries adopted deflationary domestic policies and have also placed severe restrictions upon imports of goods, thus contributing to the decline in world prices for commodities.

These events suggest to me that 1952 may mark the end of an economic era and appear likely to restrict the rate of growth of premium income to which we have become accustomed in post-war years. They may well also presage less satisfactory profit margins for insurers.

The corporation, as you know, has been one of the world's leading insurers for over 230 years and in such a period of time great experience has been acquired. I do not therefore view the approach of less favourable trading conditions with undue pessimism.

TRIBUTE TO PERSONNEL

There is one important additional factor which encourages me about the future: the loyalty and zeal of the personnel throughout our world-wide organisation. For the excellent results of 1951 I am sure that it will be your wish to pay a well-deserved tribute to our general manager, Mr Phelps, to his able assistants, to the managers of our associated companies as well as to the branch managers, and to the staffs, both at home and overseas.

In addition I would like to thank the boards of our associated companies and our local directors at home and abroad for their valuable services during the past year. Finally, to our agents, representatives and other friends throughout the world who have so loyally continued to support us, I wish to send a message of appreciation and thanks.

The Governor moved the adoption of the report and accounts.

Brigadier the Hon. H. K. M. Kindersley, CBE, MC, the Sub-Governor, seconded the resolution and it was carried unanimously.

The proposed dividend was approved; the auditor, Sir Nicholas E. Waterhouse, KBE, was re-appointed, his remuneration was fixed and the proceedings terminated with a cordial vote of thanks to the Governors, directors, managers and staff.

JOHN DALE LIMITED

DEVELOPMENT OVERSEAS

The eighteenth annual ordinary general meeting of John Dale Limited (manufacturers of containers, collapsible tubes, plastic mouldings, and aluminium founders) was held on May 29th at the company's offices, Brunswick Park Road, New Southgate, N.11, Mr L. R. Carr, deputy chairman, presiding.

The following is an extract from the circulated statement of Mr R. D. Peters, the chairman.

The profit on trading for the year 1951 was £336,689, compared with £174,366 for 1950. The balance of net profit, before taxation, amounted to the record figure of £249,112, comparing with £125,704 in the preceding year.

During the year under review we continued our long-term capital programme aimed at further increasing the efficiency of our means of production so that we can maintain our position as one of the lowest cost producers of good quality products, and thus be well prepared at all times to meet competition and to give satisfaction to our customers.

Extensions to our factories at New Southgate and London Colney are in hand. We are also expanding our activities in Lancashire. We have now acquired the whole of the share capital of John Dale (Bury) Limited. The factory is showing a marked increase in efficiency and in the volume of its production. We have also concluded recently an agreement for the rental of a modern factory at Hindley Green, Lancashire, with a right to our company to purchase the property eventually. At this factory we have started an extension of our Plastic Moulding Division, which is making good progress.

The Board has been examining the possibilities of expanding the company's interests overseas. Messrs Hoare, Miller and Co., Ltd., of Calcutta and Bombay, have been appointed as agents in India, and this has resulted in increasing exports to that country. Investigations are also being made in Canada and Australia.

THE OUTLOOK

It is difficult to form confident views on the company's prospects. It is hoped that production can be maintained to meet all our customers' demands during the current year. The order position is on the whole satisfactory. For the first quarter of 1952 the company's sales were higher than for the corresponding period in 1951.

I hope that economic and political conditions in the United Kingdom and incentives for each of the major partners in industry will permit us to continue a steady expansion of our enterprise.

The report was adopted.

THE NORTHERN ASSURANCE COMPANY, LIMITED

CONTINUED SUBSTANTIAL PROGRESS

NEW RECORDS FOR INCOME IN ALL DEPARTMENTS AND FOR NEW LIFE SUMS ASSURED

The one hundred and sixteenth annual general meeting of The Northern Assurance Company, Limited, was held on May 28th, at Aberdeen, Mr David Gordon Cochran, chairman of the Aberdeen board, presiding.

Before proceeding to the formal business, the chairman said that since the issue of the notice of meeting and the annual report, their London colleagues had appointed Mr A. G. B. Burney and Mr G. F. B. Grant to be members of the London board. Mr Burney was a partner in a well known firm of chartered accountants in London and Mr Grant, among a number of varied interests, was closely associated with investment companies. Both were well qualified in their respective spheres and both were young, and the company could look forward to many years of valuable service from them. Their election would come before the meeting.

The chairman then referred to important changes which had taken place in the higher management of the company. He said that Mr C. H. Leach, the general manager, on attaining the age of 60 last year, qualified to retire on pension, and in agreement with the directors he retired on May 23rd. Mr Leach had given devoted service to the company for 45 years and during more than half that period he had held a succession of high offices culminating in that of the chief executive. All associated with the "Northern" felt greatly indebted to Mr Leach for all that he had done to foster the company's development and prosperity. Mr Leach had occupied an outstanding position in the insurance world symbolised in his election to the chairmanship of the British Insurance Association in 1949, an office which had greatly enhanced the prestige of the company. During his two years' tenure of that great office he rendered outstanding service at a critical time when the industry was under the threat of nationalisation.

The chairman then reported that to fill the vacancy caused by the retirement of Mr C. H. Leach, the directors had appointed as general manager Mr T. W. Haynes, FIA, who had been the company's actuary since October, 1947. Since then the directors had had ample time and reason to appreciate his gifts of judgment, his imaginative hard work and his commercial acumen.

Shortly over a year ago, Mr W. A. Brown was stricken with a sudden illness. At the time he occupied the dual position of deputy general manager and secretary. His illness had proved a protracted one, but the shareholders would be glad to know that the degree of recovery he had made had been remarkable. Mr Brown was still incapacitated, and the directors had had to deal with the question of the company's higher organisation. They had appointed as secretary Mr F. B. Joule. Since he went to London last year, consequent upon Mr Brown's illness, Mr Joule had shown himself to be possessed of far-sighted administrative capacity, which the chairman felt confident would be apparent in his tenure of the office of secretary. Mr Brown remained deputy general manager, and the chairman was sure that the shareholders would wish him to convey to Mr Brown and his wife their sympathy in the ordeal of his long illness, their admiration for the fortitude with which it had been faced, and to convey their best wishes for Mr Brown's progressive recovery of his health and strength.

The following is an extract from the chairman's statement which had been issued with the report and accounts:—

YEAR OF SUCCESSFUL ENDEAVOUR

The year just past has been one of active and successful endeavour amid difficult conditions. Apart from the influence of monetary conditions, it is our constant aim to expand the income of the Group in real terms wherever our service extends. To this end, extensive journeys have been undertaken by members of the board and management to foster and develop our connections overseas, and we have welcomed to this country many of our valued officials and representatives from abroad. The formation of our new Canadian Committee and of our new subsidiary company, the American Marine and General Insurance Company, of New York, may be instanced as examples of new development.

As a result of the year's activities, the total income of the company has increased by 17 per cent in 1951 and, at £22,420,981, substantially exceeds previous achievements. All departments and all territories shared in this progress. In addition, our new life sums assured, having reached record figures in 1950, far surpassed them in 1951 to attain a total of no less than £7,385,021.

Though this expansion has not been matched by profits quite so good as those of the last two years, the total transfers from our underwriting accounts, at £909,257, are a more than satisfactory achievement, particularly after taking into account the heavy demands which our provision of 50 per cent for unearned premiums entails in a year when premiums rose by £2,682,227.

DEPARTMENTAL RESULTS

The fire account bore in 1951 for the first time the principal weight of a full year's contribution to the Pension Fund established in July, 1950, which we treat as a trading expense. The profit of £534,276, or 6.7 per cent of the premiums, is an indication of the steady surpluses yielded by this department. Experience was generally favourable both at home and overseas and a small profit was derived from the United States.

In the accident department, where we made a loss of £162,852, results have been adversely affected by the continued deterioration in the experience of motor insurance, which forms a substantial proportion of our accident business overseas. The enhanced value of motor vehicles, the enormous increase in repair costs and the continuing heavy amounts awarded as damages in personal injury claims are all contributing factors, while the rates of premium have not advanced sufficiently rapidly to keep pace with the rising cost of claims. Close and constant attention is given to the problem and many revisions of rates were made during 1951, the full effect of which will not become apparent until this year, in which further revisions have already been adopted. It must be borne in mind that the 50 per cent provision which it is our practice to create for unearned premiums weighs heavily on a rising income.

This year, the marine account has yielded a handsome transfer of no less than £537,833 mainly from the accounts of underwriting years now moving towards their completion. The conditions in the marine market to-day are, perhaps, less encouraging than they were in the years to which these profits relate. With the abandonment of the combined marine surcharge two years ago and consequent reduction in cargo rates, and the continued delays and rising costs of hull settlements, we cannot hope to repeat results of this nature with regularity. The marine fund at 142 per cent of the premiums has been maintained on a conservative basis to meet the uncertain demands of the future.

INVESTMENT INCOME

Gross investment income amounted to £704,475, a considerable increase, largely due to the addition to our assets of nearly a million pounds retained in the business in the last two years. After deducting overseas and United Kingdom income taxes, less reliefs, the net investment income was £379,946 which compares with £352,852 for 1950. The true net figure is, of course, less than this owing to the incidence of profits tax.

With the addition of minor items, our gross profits for the year amounted to £1,687,225, from which no less than £1,233,988 falls to be deducted for the share of our earnings paid in taxation at home and abroad, so that the net trading profit is £453,237 compared with £744,878 in 1950.

The insurance business, no less than industry in general, has its own taxation problems of reserve replenishment; and the relatively greater weight of taxation in 1951 is in part due to the premature inclusion of marine "profits" for United Kingdom taxation purposes before they can safely be released.

VALUATION OF SECURITIES

In spite of the severe fall in Government stocks during 1951 the market value of our Stock Exchange securities at the date of the balance sheet is in excess of the value stated therein, after writing off £250,000 as shown in the accounts. Our reserves are substantial and well able to cover the falls which have since taken place.

The conservative practice by which insurance companies have come to regard their underwriting earnings as a source of reserve accumulation is a most valuable one. It is to our investment income, after taxation, that we habitually look first as the primary source of immediate dividend cover. The growth in this income enables the directors to recommend the members to declare a final dividend of 9s. 6d. per ordinary share, making 17s. per share for the year, which dividend will entitle the holders of the 6 per cent participating preference shares to a further dividend of 7s. 1.97d. per share, payable with the usual half-yearly dividend on July 1st next.

TRIBUTE TO MANAGEMENT

The company's service and reputation grows steadily. Important influences in this achievement are the loyalty and steadfast endeavour of its boards, management, staff and representatives at home and throughout the world; in their hands rests our reputation, founded and nourished through 116 years. Particularly to Mr C. H. Leach, our general manager, and to the several thousand men and women comprising the staffs of our world-wide organisation for whom he is responsible, we warmly accord our appreciation of another year of marked progress.

The report and accounts were adopted.

ALBRIGHT & WILSON LIMITED

IMPROVED RESULTS AT HOME AND ABROAD

MR K. H. WILSON ON THE EXPANSION PROGRAMME

The sixtieth annual general meeting of Albright & Wilson Limited (Manufacturers of Industrial Chemicals), was held on May 26th at the registered office of the company, Oldbury, Birmingham.

Mr Kenneth H. Wilson, OBE, JP, the chairman, who presided, in reviewing the affairs of the company, said: The report of the directors and statements of account for the year 1951, together with my notes thereon, have been in your hands for some time, and with your permission I propose to take them as read. (Agreed.)

In my speech to you last year I referred in broad terms to the expansion which we are carrying out at home and overseas, and I know you will wish me to keep you abreast of progress. During the past year considerable progress has been made in the construction of the company's new factories at Portishead and Kirkby designed to meet the increasing demand for phosphorus and phosphates, and in the equipment of the factory at Barry for the production of organic chemicals, particularly silicones. The Portishead site on the south side of the Bristol Channel comprises 20 acres adjoining Portishead Dock and facing one of the main power stations of the South Western Electricity Board, so that the new phosphorus factory will have direct shipping facilities for raw material and an adequate supply of electric power for furnaces.

Construction work is now proceeding on wharves suitable for the handling of ocean-going ships, and pneumatic plant will permit the rapid unloading of phosphate rock and transfer to reinforced concrete storage silos, for the construction of which preparatory work is well advanced. Work on the piling and concrete foundations is almost completed, and the erection of many of the ancillary buildings, including offices, boiler house, sub-station and workshops, is now going forward rapidly.

STEEL SHORTAGE OVERCOME

Difficulties of steel supply have so far been overcome, and the labour force of 300 men is fully occupied. To economise in steel much of the building work is being carried out in reinforced concrete, and the main furnace house is now under construction. Deliveries of plant have already commenced and are expected to keep pace with the building programme. From Portishead the phosphorus will be despatched to the Kirkby factory in the company's special rail tankers. The Kirkby factory is strategically situated for the supply of soda ash and the despatch of sodium tripolyphosphate to customers, and has many advantages from its situation on an industrial trading estate eight miles from the centre of Liverpool on the main East Lancashire road. The skyline of the trading estate has already been changed by the erection of the main process building and two phosphoric acid towers.

The steelwork of the main building, formerly an aircraft factory, transferred from Windermere, covers a floor area of 1½ acres, the acquisition of this building having been, in a period of steel shortage, an invaluable factor in the speedy development of the Kirkby factory Many of the buildings there are already in use, the workshops being equipped and employed on structural work for the company's projects, erection of plant has commenced and will proceed at an increasing rate during the present year. Although the site at present under development is 17 acres, advantage was taken of the opportunity of acquiring an adjacent 28 acres, and the company therefore has room at this factory for considerable future expansion.

MODIFICATION OF EXISTING BUILDINGS

At Barry purchase was made, on attractive terms, of an existing factory erected during the war for the production of magnesia from sea water, and covering a site area of 30 acres. This factory is already in production, operating processes for the manufacture of thioglycollic acid and the recovery of nickel from residues. Plant for the first step in the manufacture of silicones in this country is shortly coming into operation, and the modification of existing buildings is now proceeding for the installation of plant. This equipment is at present being fabricated by a large number of suppliers and full production should start next year. To deal with this programme of design and construction and the handling of the company's future development, a central engineering department was established last year at Oldbury with resident engineers on the new factory sites. This department was formed with a nucleus of engineers experienced in the company's service at Oldbury and Widnes. There has been much expansion of the engineering resources of the company by the recruitment of chemical and mechanical engineers and the enlargement of the drawing office. While the direction of these new projects and much of the design work has been carried out by the company's own staff most of the civil engineering and constructional work has been in the hands of various contractors and acknowledgment should be made of the part they have played in bringing forward our new construction as rapidly as the present-day restrictions and supply difficulties permit.

In the United States our subsidiary at Niagara Falls has concentrated on the increasing demand for chlorate of soda and manufacturing capacity for this purpose is nearing completion. In Canada it has been deemed desirable to erect a new factory on deep water frontage where electric power is available and this project, which has already started, will probably take at least twelve months to complete. In Australia the demand for our products is increasing and further plant is called for there. In August, 1951, your directors decided to finance our immediate United Kingdom capital requirements by raising a loan of £2,500,000, which was privately placed at 4½ per cent interest per annum and is repayable by equal annual instalments between 1957 and 1966. We have the option to repay the loan in whole or in part at any time after August 31, 1956, on payment of a small premium. We could have obtained this money in other ways, but were advised that a further issue of preference or ordinary capital would not have been to the best advantage of the company in the prevailing circumstances. This operation does not necessarily constitute a precedent for the raising of further cash which the company will need for its future capital programme. When that need arises it will be considered in the light of conditions existing at that time. Two of our overseas subsidiaries are also financing their expansion partly by medium term loans.

FINANCIAL RESULTS

I now ask you to consider the financial results. The year 1951 has shown steady improvement in our trading, both at home and abroad, and every company in the group increased its sales and profit. The profit of the group, before taxation, amounted to £2,235,822, which exceeded that for 1950 by £822,239. We thus had a record year. But we had to provide no less than £1,420,207 (or 63 per cent) for taxation, leaving a net profit of £815,615—£124,554 more than in 1950. Many of the leading bankers, financiers and economists have pointed out the damaging effect of the excessive burden of taxation on business generally and the difficulty which exists in meeting the calls for maintenance and expansion. I have nothing to add but to express the hope that some means will be found by the Government to enable manufacturing businesses to revert to the sound and traditional policy of financing expansion out of retained profits.

It has always been our policy to invest the greater part of our profits in the business and our figures emphasise this point very strongly—out of the group net profit attributable to the shareholders of Albright and Wilson, Limited (£754,308), we are distributing in dividends 28 per cent (£214,449), leaving 72 per cent to be devoted to expansion. You will expect me to make some reference to the new Excess Profits Levy. So far as can be judged at present, two main factors seem likely to effect a considerable reduction in the company's liability.

Firstly, a big proportion of the group net profit is normally earned by overseas subsidiaries (in 1951, £370,151 out of a total of £754,308). It appears that such profits will not be liable to the Levy unless remitted to the United Kingdom. Our policy for the next few years will be to draw as little as possible from overseas so that these subsidiaries can help to finance their expansion out of retained profits.

Secondly, the allowance of 10 per cent on new share capital and retained profits and the initial allowances on the heavy capital expenditure which we shall incur during the next three years should bring us substantial relief from the Levy. Two of our overseas subsidiaries capitalised part of their undistributed profits to the extent of £285,841, and issued shares accordingly. After this and other adjustments, and the payment of dividends, which included a small increase on the ordinary stock, there was left to carry forward £1,688,150, against £1,483,811 a year ago.

CAPITAL EXPENDITURE

If you will kindly turn to the consolidated balance sheet, you will see that our expenditure on fixed assets during the year amounted to £2,122,839, of which £1,158,278 was incurred by the parent company and the remainder principally by our USA and Canadian subsidiaries. Contracts for capital expenditure outstanding at December 31, 1951, not included in current liabilities in the balance sheet amounted to approximately £5 million: (*a*) parent company, £3,400,000; (*b*) subsidiary companies, £1,600,000. The net current assets stand at £7,007,451, an increase of £2,594,433, which is largely due to the loan to which I have already referred.

During the year your directors have given much thought and taken advice on the staff superannuation scheme, and it has been reviewed in the light of continued inflation of money values, high taxation and the consequent difficulty of making adequate personal savings in order to provide for old age or for dependants on premature death. The original contributory scheme dated back to 1929 and was one of the earliest in the country. It has been amended and enlarged on several occasions since and is now superseded by a new scheme, which is non-contributory, and the whole cost of which is borne by the company. Very substantial additional benefits are provided, and we believe that we now have one of the best schemes in the country. Full time working directors are permitted to belong to the scheme, and this accounts for the greater part of the increase in the remuneration of the directors as shown in the profit and loss account.

The report and accounts were adopted.

DAILY NEWS LIMITED

AN IMPORTANT TRANSITIONAL PERIOD

CONTINUOUS RISE IN COSTS

MR L. J. CADBURY ON ENTERPRISE OF NEWS CHRONICLE AND THE STAR

The annual general meeting of the Daily News, Limited (proprietors of the *News Chronicle* and *The Star*), was held on May 21st in London.

Mr L. J. Cadbury, the chairman, said: Though it occurred after the end of the 1950 financial year, the increase in price of the national penny press to a penny-halfpenny was mentioned at our last annual general meeting. As was to be expected, it was followed by a falling off in sales which affected both the *News Chronicle* and *The Star*.

The *News Chronicle* average sales for 1951 was 1,470,000 copies, which showed a loss of 5 per cent on the previous year.

The Star average sales for 1951 at 1,193,000 showed a loss of only 3.5 per cent, which is substantially less than the decline in the demand for periodical newspapers where losses, in some instances, of over 20 per cent have been experienced.

The increase to a penny-halfpenny was forced on us by the continuous rise in our costs, and the higher price of newsprint alone absorbed the greater part of the total additional revenue from sales at 1½d. While newsprint has been the main cause of our rising expenses, almost everything else has gone up as well, including substantial increases in the cost of carriage, wages and salaries. An agreement negotiated at the end of last year raised our wage bill by £120,000 per annum, and as the remuneration of most of our staff is now linked with the cost-of-living index a further £40,000 was automatically added on May 1st.

NEWSPRINT SUPPLY AND PRICE

We have been paying £66 a ton for our paper, compared with £32 at the beginning of 1950 and £10 prewar. The price of paper, we now have every reason to believe, is past its peak. The first break came recently from Scandinavia, where supplies for July to December have been agreed at £50 a ton. But this covers only a small proportion of our supply, the bulk of which still comes from home mills at a price of just over £63. Indications are that newsprint will be more plentiful, but unless the price is substantially reduced it may not be possible to take up the additional supplies. Nevertheless, it is our intention to make the fullest use we can of the additional newsprint by way of increased sizes, to run as many 8-page papers as possible and to endeavour to give our readers the best possible service of news and features.

It is ironical that at the very moment when there is a prospect of more newsprint its excessively high price should hamper us in increasing the size of our papers.

The increase to a penny-halfpenny has, however, had one merit. It has allowed advertising rates to remain unchanged in a period of rapidly increasing costs.

GROWING FLEET STREET COMPETITION

For newspapers, as for so many other commodities, the past twelve months have marked an important transitional period. There have been several signs of an awakening tempo together with a realisation that the long, comfortable years of controls, restrictions and insulated sales are coming to an end. There is certainly more competition in Fleet Street today than at any time since the war. As newsprint supplies become more plentiful (and we hope cheaper as well) these tendencies will become more pronounced and I believe they will exert a thoroughly healthy influence on the entire British Press.

No one, of course, desires a return to the wasteful practices of the circulation war during the '30s—that is a remote contingency in any case—but the climate in Fleet Street over the past decade has more often been enervating than bracing. That is no climate for free and healthy journalism, and the change will do no harm.

Nevertheless, the immediate economic conditions with which the Press as a whole is confronted do not make its task an easy one. We are faced with conditions which may well require considerable qualities of imagination and flexibility in both the managerial and editorial direction of publishing enterprises. After a period of comparative imobility this will not be easy. On the managerial side production costs have risen steadily and rapidly. Economies, which could be obtained through a more efficient use of men and machinery, are not easily accepted under conditions of full employment.

If the price of newsprint falls to an extent that will allow larger papers, some interesting editorial problems will arise. It is realised that the mass readership of the popular national dailies will not accept an automatic return to the kind of newspaper we were accustomed to before the war. The newspaper public has grown to like the short and lively style of news presentation which was forced on the British Press as a result of wartime restrictions. A new technique, aiming somewhere between the amplitude of the inter-war period and the austerities of recent years, will have to be found. It will have to take account of many changes: the improved level of education, the closer and more immediate impact of economics and foreign affairs on the ordinary citizen, the advent of television, and so on.

NEWS CHRONICLE'S EDITORIAL IDEAL

In both the *News Chronicle* and *The Star* much thought is being given to these problems. Already certain changes in regard to the use of typography have been put into effect in the *News Chronicle* and other changes of lay-out and presentation will shortly follow.

During the past year the *News Chronicle's* reputation for fairness and objectivity in its political reporting has been maintained and widely recognised. You may have seen advertisements of the paper which carry the message, "You get things *Straight* in the *News Chronicle*." That is something more than a slogan. It is an ideal which is the aim of every member of the paper's editorial staff.

It has been reflected in many of its features. Among the most notable of these was The Great Debate, during the general election campaign, when the columns of the paper were open to the leaders of the three parties.

During the past year, too, the *News Chronicle* has maintained its reputation for complete independence. In these days when political partisanship is growing more bitter and the country seems almost equally divided between Labour and Conservatives, it is more than ever important that there should exist a national newspaper not tied to any political party. Our aim is to present our readers with a fair objective picture of the great issues of the hour and to sustain what we believe to be the national interest.

REASONS FOR THE STAR'S SUCCESS

Of the London evening newspapers the enterprise of *The Star* has been outstanding, and this is no doubt the reason for its remarkable buoyancy of circulation in spite of the rise in price to 1½d.

Popular and pulling features included "Defence of London in Atomic Warfare," by General Sir Frederick Pile; "Elizabeth and Philip"; "The Battle of Britain," by Air Chief Marshal Lord Dowding; "A Woman in Russia," by Lady Kelly; and the "Nuffield Success Story."

Prior to these there had been "The Churchill Story," and this week *The Star* began the publication of Mr Clement Attlee's autobiography, which he has written specially for our evening newspaper.

"BACKGROUND TO THE NEWS"

One new activity during the year is worthy of mention at this point. The *News Chronicle* "Background to the News" booklets, which began publication last year, have proved an outstanding success. A high proportion of secondary and grammar schools throughout the country now subscribe to them. It is our aim to make them topical, informative and, of course, objective. One which attracted particular notice was "The Press." It traced the historic background of the leading British newspapers, gave facts about ownership and circulations and summarised the Royal Commission. "The Jet Age," published on May 2nd—the day on which the Comet airliner inaugurated the first passenger jet service to South Africa—was a good example of the series' topicality.

The Gallup Poll remains one of the features of the *News Chronicle* most eagerly looked for. It earned enhanced prestige in the general election of October last year, when it forecast the outcome of a closely contested race within a fraction of the percentage of votes actually cast.

The report and accounts were adopted.

BRUSH ELECTRICAL ENGINEERING

(Brush Aboe Group)

ORDER BOOK OF RECORD STRENGTH

PRODUCTS IN WORLD-WIDE DEMAND

SIR RONALD W. MATTHEWS ON EXPORT MARKET EXPANSION

The sixty-third annual general meeting of the Brush Electrical Engineering Company, Limited, was held on May 29th at Winchester House, Old Broad Street, London, E.C.

Sir Ronald W. Matthews, DL, MIstT, the chairman, presided.

The following is an extract from his circulated statement:—

In my survey for 1950 I referred to the problems which faced the BRUSH ABOE Group in increasing manufacturing capacity to balance a strong order book, at a time when we must play our full part in the national rearmament programme and face shortages of essential materials. The information, accounts and statistics which are annexed to this statement are evidence of the manner in which these problems have been met without stifling the expansion of our activities and production.

The orders we have received in 1951 totalling over £40 million (which is more than double the previous record figure of 1950) show that sales have in fact presented no serious problem. We have accordingly been able to effect some economy in our selling costs. Armament orders and exports have naturally taken priority, and we regret that we have been unable to satisfy all our customers, particularly in the home market. While in 1951 a substantial part of the orders executed were taken into our books during the preceding 18 months on the basis of fixed prices, to which we have been obliged to adhere regardless of increased manufacturing costs, the orders received in the same period have been accepted with but few exceptions subject to a rise and fall clause or similar basis, so that we face 1952 with an order book of record strength, of which less than 6 per cent by value comprises the outstanding balance of fixed price orders.

SALES

Having dealt at length with the consolidation of the Group organisation and the widespread manufacturing activities, the statement continues:

Our intake of orders has far exceeded our expectations and, although strenuous efforts have been made to increase production, we have experienced many difficulties, to which I have already referred.

The products of our Group of companies are in demand over a very wide field, from the small farmer to the largest Government authority; from the most highly industrialised country to the most primitive community. With demand seriously outstripping even our considerably improved rate of production, we have had some difficulty in dealing adequately with all inquiries, but we have striven neyertheless to maintain a fair balance between rearmament and power shortages at home on the one hand and exports on the other.

I was in a position to report last year that the input of orders from the export markets was very satisfactory. During 1951, I am glad to say that this trend continued and export orders received by the Group during 1951 were over twice as great as the previous year.

The network of overseas agents has been further strengthened by additional appointments, with a consequent increase in the availability of technical service and supply of spare parts on a world-wide basis. The policy of setting up, in the immediate post-war period, a number of subsidiary companies in essential overseas markets has been well rewarded, and has resulted in much closer contact with the agents and customers abroad. Our agents and sub-agents overseas now number approximately 600, many of whom employ fully qualified engineers who have been trained in our English factories. Our policy is to continue to offer factory-trained engineers to agents and major customers to ensure that we give service not only before and during installation, but also throughout the working life of the plant.

The Group now supplies over one-third of the total British exports of diesel engines and diesel-electric generating sets. Indeed, this proportion is very much higher in a number of individual overseas markets where industrial, agricultural and municipal users have come to rely on our power plant to meet a high proportion of their requirements. I am glad to report that this favourable condition exists in a number of Commonwealth markets, while in support of the Government's export policy an increasing part of our output is being supplied to the difficult dollar markets in the Western Hemisphere.

One particular contract worthy of mention is the electrification of the Holy City of Mecca, in respect of which an order was placed by the Saudi Electric Company following the successful electrification of the city of Taif. Hitherto, there has been no public electricity supply in the Holy City, but Mirrlees-Brush diesel generating sets will shortly be installed in a power station to be built outside the city walls. As only Moslems are permitted to enter Mecca, we have trained Moslem engineers to carry out essential work within the city itself, including the installation of 15 sub-stations.

As Britain's largest producer of diesel engines, the BRUSH ABOE Group was chosen to represent internal combustion engine manufacturers at the Festival of Britain, Heavy Industry Section, Kelvin Hall, Glasgow. The Group exhibit was modelled on the lines of a ship's engine room and contained a representative range of engines with ancillary equipment. This exhibit aroused much interest. In the Dome of Discovery at the South Bank Exhibition we exhibited a small Petter engine coupled to a dynamometer, while a number of other exhibits at South Bank contained engines manufactured within our Group. In addition, much of the internal transport at the South Bank was provided by Brush battery electric vehicles.

Two important press tours of BRUSH ABOE factories took place during the year. The first, a three-day visit in February to Wolverhampton, Stockport and Loughborough, was made by the largest party of overseas correspondents ever to tour British industry. The second, a three-day visit in September, was made to the Stockport, Ashton-under-Lyne and Staines factories by some 30 city editors of leading daily and financial papers. Every opportunity was given to our visitors to meet the senior executives of the Group and to hear at first hand of Group policy and achievement in the export field.

RESEARCH AND TECHNICAL PROGRESS

Our established policy has been followed in extending our resources for scientific investigation with the object of increasing the contribution which our laboratories can make towards improved production and higher standards of quality in our products. As an example, the shortage of materials creates the need for a continuous search for substitutes. Many materials must be subjected to careful checks by laboratory examination before they can safely be accepted for production purposes. Improved testing techniques have been developed by the application of radioactive and ultrasonic methods to the examination of materials. New equipment has been acquired in various fields, including X-ray and gamma-radiography, metallographic and X-ray crystallographic, chemical and spectrographic analysis, vibration and stress analysis, and other aspects of electrical, magnetic, mechanical and physical work.

During the year the development work on the new Mirrlees engines has been consolidated, both ranges of engines now being in production. One of these has now completed its Admiralty tests with satisfactory results. A large amount of development work on burning low-grade fuels has been carried out during the year and a certain amount of development work on pressure charging of smaller engines, with promising results. In the smaller engine types, the main development has been in air-cooling.

In the Petter petrol engine range, development of a new four-cylinder engine has been completed and this is now in small quantity production.

PERSONNEL AND INDUSTRIAL RELATIONS

On previous occasions I have stressed the importance we attach to the maintenance of good industrial relations. We believe that while this ultimately depends on the co-operation of all employees, the major responsibility for the establishment of an effective working team must rest on the various levels of management. We are therefore constantly seeking to raise our standards of management technique, and to build up training schemes which will enable existing personnel to fit themselves for promotion to positions of greater responsibility, alongside selected candidates from outside.

These arrangements will give excellent opportunities to men of ability to broaden their experience in a practical way at the various factories, and provide us with a management capable of dealing with the ever increasing complexity of industrial organisation.

I have given you a complete and, I hope, not unpleasing picture of the achievements at home and overseas of the BRUSH ABOE Group and of the parent company during the past year. Twelve months of intensive labour in the fields of research, development and production have established even more firmly the position of the Group throughout the markets of the world. It has not been an easy year, nor can we be justified in anticipating an easier passage in the months that lie ahead, but I have every confidence in the ability of the management to grapple successfully with each individual problem as it arises. Your managing director, Mr Good, has set an inspiring example to his team at every level, and the team, as every first-class team does, has responded magnificently to his leadership. Once more, on your behalf, I extend to them all our grateful thanks, and our best wishes for the current year.

The report and accounts were adopted.

PRESSED STEEL COMPANY, LIMITED

A DIFFICULT AND ANXIOUS YEAR

STEEL SHORTAGE REDUCES OUTPUT

IMPORT RESTRICTIONS AFFECT UNITED KINGDOM PRODUCTION

MAJOR ALBERT PAM'S SPEECH

The twenty-fifth annual general meeting of the Pressed Steel Company, Limited, was held on May 29th at Winchester House, Old Broad Street, London, E.C., Major Albert Pam, OBE, the chairman, presiding.

The secretary (Mr F. E. Cairns, CA) read the notice convening the meeting and the report of the auditors was read by Mr T. Howorth, FCA, of Messrs Price, Waterhouse and Company.

The following is the chairman's speech which had been circulated with the report and accounts for the year ended December 31, 1951: Ladies and gentlemen,—In my speech to you last year I told you that unless steel and other materials could be made more generally available to industry, a further slowing down of production would be inevitable. This forecast unfortunately proved to be correct and the past year has been a difficult and anxious one. That, in spite of all these shortages, your company should have been able to make a profit in 1951 only £100,000 smaller than that in the previous year is, to my mind, a most satisfactory result and reflects great credit on our management.

The full accounts for the year 1951 and the directors' report have been in your hands for some time; you will have seen that the balance of profit was £925,408, after again providing £250,000 for the increased cost of replacement of plant, machinery and equipment, and all taxation. The board recommends that out of this profit an amount of £550,000 be transferred to the general reserve, which will then be £2 million, and that a final dividend of 12½ per cent, less tax, be paid on the ordinary stock, making, with the interim dividend of 7½ per cent, less tax, a total of 20 per cent, less tax, which is the same as last year.

The figures in the balance-sheet and the profit and loss account speak for themselves and there is no need to comment on them beyond pointing out that trade creditors and taxation are considerably higher than in the previous year, and that on the other side of the sheet current assets are higher by £1,800,000 with a large cash balance of nearly £1,500,000 on December 31, 1951.

FIRST QUARTER-CENTURY

This is the twenty-fifth annual meeting of your company and we have completed the first quarter-century of our life. We started in a small way, with only a few hundred employees and a number of Americans in key positions, who were teaching us the "know-how," having been sent over by the E. G. Budd Manufacturing Company, of Philadelphia; we were using their processes and similar machinery and equipment. To mark the anniversary it is interesting to mention that we have formed among all the employees and officials of the company a 25-year club. We had, early this year, the first annual dinner of this club in our works canteen at Cowley, and of the 91 members who qualified by being employed in 1926, 89 were able to be present at the dinner. All the members of the club wear a special badge in their buttonholes when at work, and I am proud to be one of those who wear this badge. I am sure you will agree that the formation of this 25-year club is an excellent step in drawing the members of the organisation closer together—it is intended that as employees reach 25 years' service with the company they will be entitled to membership.

I have on various occasions told you of the excellent work which is carried out in our works hospitals, of which we are very proud. I have recently received the report of our chief medical officer, Dr W. A. B. Reynard, for the year 1951, and it is so interesting as showing the care which is given to the health and well-being of our employees that I should much like to send a copy to all stockholders, or anyhow a series of abstracts. But it consists of 24 foolscap sheets, closely typed; you will therefore have to accept my assurance that it is a most complete record of the treatment of surgical and medical cases, accident rates, blood transfusions, cold inoculations, mass radiography, physiotherapy and dental treatment.

NO IMMEDIATE SIGN OF IMPROVEMENT

Reverting now to the production in our three factories, I have already mentioned that shortages generally had in the past year slowed down our output. Rearmament work throughout the country is getting under way and the steel requirements for these orders must cut into the steel available for industry. We have heard it said that we are near the turning point in steel and that before long there will be plenty for all uses, but we can see no immediate sign of any real improvement. These shortages inevitably increase the cost of our products, and recent wage awards will again affect the upward spiral.

Apart from these difficulties, the restrictions which have been imposed on imports into Australia, New Zealand and South Africa are bound to have a serious effect on all United Kingdom production unless other markets can be found to replace them. It is not yet known to what extent these import restrictions will affect motor-cars, motor-car parts, or refrigerators, but we are discussing these matters continually with our motor-car friends; also with our refrigerator agents in order to be able to arrange, if possible, for shipments to other countries. We have received some substantial orders for rearmament, and we are making all preparations to carry out this production.

During the past year we have spent £450,000 on new plant and machinery, and we have on order further equipment estimated to cost £820,000. It has always been the policy of your board to keep the plant and equipment of the company in first-class condition and to scrap obsolete and worn out machinery so that it can be replaced by more modern and more efficient types. It is very regrettable that the present high rates of taxation do not allow for such replacement and modernisation as a charge on the profits of industry, as they should be. We have reserved a sum of £1,261,365 in our accounts for the increased costs of replacement, but this is not enough yet; and this reserve was made out of the profits which had been subject to full taxation. Although the new excess profit levy does not affect the accounts before you, I feel that I must mention that, if your company should be able to earn as much in 1952 as it did in 1951, our overall charge for taxation, due to this levy, would be increased by about £200,000. I shall not say more about this tax other than to express my opinion that, from every point of view, it is a very bad tax and that it ought to be repealed as soon as possible. As I write this speech, the committee stage of the Finance Bill is being debated, and I do not, of course, know what amendments the Chancellor of the Exchequer may decide to introduce to make the Bill less unjust and to reduce the hardships which the Bill in its present form undoubtedly imposes.

ALLOCATION OF PROFITS

In the past I have given you figures to show how your company's profits have been distributed. For the year under review we have paid an amount of £5,302,053 in wages, salaries, pensions, and National Insurance Fund contributions, and the profit, before taxation, amounting to £2,503,745 was absorbed as follows: 63.04 per cent by taxation, 28.53 per cent retained in the business, 8.43 per cent by dividends.

Last year I told you that we had acquired a fine and well-equipped factory at Theale; production in this factory of sealed units for our refrigerators was started last autumn, but it is not yet working at capacity owing to the delays in obtaining certain equipment. So far the results there have been very satisfactory.

At Linwood the output has now reached a very high and steady level; our production of railway wagons has for many months been very large and has only been limited by the amount of material allocated for our contracts, and we have been complimented on the regularity and quality of output. Our Cowley factory, as in the past, has throughout the year been working on a very satisfactory basis.

MORRIS-AUSTIN AMALGAMATION

The outstanding event in British motor-car production during the past year was the amalgamation of Morris Motors with the Austin Company. Both concerns were old and regular customers of ours and we are convinced that this amalgamation will be of great value to the whole industry. We expect and hope that we shall be able to produce bodies and parts for the joint concern as we have done in the past for each individual company.

The motor-car trade here is feeling the effects of foreign competition in export markets, and it is working to reduce costs in every direction. The prices of some materials have already been lowered and it is certain that every supplier will have to try to reduce costs and profits in order to help the industry.

"PRESTCOLD" REFRIGERATORS

The refrigerator sales have kept up well, but the home market quota is now only 15 per cent, the export of the remaining 85 per cent being obligatory. So far we have been able to meet this quota, but it is becoming more and more difficult to do so. Here again it is most important to produce as cheaply as possible, and this can only be attained by manufacture on the largest possible scale. To do this would need the availability of the home market for our product. Our Prestcold refrigerators have an excellent

reputation all over the world and we are satisfied that our product can compete satisfactorily with the best American models in appearance and efficiency.

During the past year we have introduced a new domestic refrigerator model of 7 cubic feet, which we call the L.71, which has been very well received. Next month we expect to introduce a new 5 cubic feet model; this will be exhibited at our London showrooms, which I hope that all shareholders will visit. There will also be exhibited there our new frozen food cabinets for the use in smaller shops and new versions of our large service cabinets.

THE FUTURE

I have tried in this speech to give you a more detailed account of our activities than I have done in the past. I shall not venture to prophesy anything about the future, but I fear that British industry is facing more difficult times with greater competition and reduced demand for goods. This will entail a tightening up of our production methods, and, we hope, an increased output by the workers to enable our products to be sold abroad and to earn for us the foreign currencies which we so badly need for the purchase of food and of raw materials. I am convinced that in your company we shall find such co-operation in our factories among our employees and staff. To them I shall send, with your permission, your best thanks for all that they have done in the interests of the company during the past year, with your best wishes and encouragement for the future.

The report and accounts were unanimously adopted; the proposed final dividend was approved and the retiring directors, Major Albert Pam, OBE, Mr C. E. Lloyd, Mr Alex. Abel Smith, Mr F. E. Cairns and Mr W. E. Lambourn, were re-elected.

YORKSHIRE INSURANCE COMPANY, LIMITED

FURTHER PROGRESS

The annual general meeting of this company was held on May 27th at York.

The Rt. Hon. Lord Middleton, MC, chairman, in the course of his speech, said: The figures show continued and substantial development in all departments. Total income has risen from £13,675,000 to £18,281,000, an increase of over 33½ per cent.

The year has been noteworthy for our life department. New business, which in 1950 rose from £6½ million to £10½ million, amounted in 1951 to £14½ million, thus for the third year in succession achieving a new record. Premium income has risen considerably and exceeds £2½ million. As a result of an actuarial valuation bonuses have been declared of 40s. per cent per annum for the last three years.

In the fire account premium income has risen by more than £500,000 to over £3½ million and we are able to carry £430,118 to profit and loss, a record profit.

In the accident and general account the year has witnessed further substantial expansion. Premium income, £5,360,891, an increase of over £1 million. In the marine account premiums amount to £2,103,000, an increase of £357,000. The 1949 underwriting account resulted in a satisfactory profit.

The net dividend was increased a year ago by 1s. 6d. per £1 of paid-up capital. There is an increase of nearly £5½ million in our total asset. The total funds have risen from under £30 million to over £35 million. The general picture of the results of the year's trading is a very satisfactory one.

The report was adopted.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

(Incorporated in Newfoundland)

GROUP RESULTS A RECORD

ALL SECTIONS CONTRIBUTE TO IMPROVEMENT

MR ELLIOTT M. LITTLE ON THE DIVERSIFIED ACTIVITIES

The ordinary general meeting of Anglo-Newfoundland Development Company, Limited, was held on May 28th at the offices of the company, Grand Falls, Province of Newfoundland, Mr Elliott M. Little (the president) presiding.

The following is an extract from the statement by the president which had been circulated with the report and accounts for the year ended December 31, 1951:

The consolidated net income for the year is a record for our group, being 41 per cent higher than last year and 36 per cent better than 1948—the previous peak year. All sections of our diversified activities contributed to the improvement and this was most marked in the case of Gaspesia Sulphite Company, Limited.

Prospects for 1952 appear good. From present indications the newsprint market will hold firm throughout the year, but some slackening of demand for sulphite pulp from the exceptionally favourable conditions prevailing in 1951 may be expected although the supply-demand position is substantially in balance. No significant changes in base-metal prices are anticipated, but the return from our mining interests could be influenced more by the grade and quantity of ore mined and milled. It is not foreseen that these latter factors will be less favourable than in 1951.

Looking beyond 1952 to the time when defence expenditures recede from their peaks, it appears probable that there may be an easing of business activity generally. In a period of readjustment the success or otherwise of the soft currency countries in overcoming their monetary difficulties will have some effect on our business. Whatever may be in store in the way of outside influences, the steps taken by your organisation to improve the operating efficiency of your plants will stand us in good stead and enable us to face the future with confidence.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The net profit from newsprint and pulp operations was the highest so far recorded. The increase in the sales price of newsprint of $10 per ton, which became effective midway through the year, was largely, if not entirely, offset by rising labour and material costs and by the declining premium on the US dollar. Income tax also took a larger toll, so that to have bettered last year's net result was noteworthy and only made possible by increased production—31,000 tons of newsprint and 3,000 tons of other products—and to improved efficiency of operations.

Our rehabilitation plans were affected to some extent by the general steel shortage, but, by making changes in programming the various projects, good progress was made. Installation of a further line of automatic grinders with the necessary hydraulic turbines and improvements to the wood-handling system were the major items in a total expenditure of $3,545,994. At the close of the year a sum of $4,649,478 was earmarked to complete capital jobs then in progress or planned for the near future. These included items authorised under our long-term programme and others necessitated by current operating requirements and for the replacement of obsolete and worn-out plant.

GASPESIA SULPHITE COMPANY, LIMITED

The mill operated at capacity throughout the year and produced 79,444 air-dry tons of unbleached sulphite pulp—22,180 tons more than was produced in the previous year. This output, which set a new record for the mill, combined with buoyant prices in a strong market, resulted in the exceptional improvement in net earnings. Adverse factors were higher pulpwood and sulphur costs and, of course, a more severe tax burden.

For years past the market for unbleached sulphite pulp has been sensitive to changes in trade patterns and is particularly vulnerable to downward pressures. For some time your directors have had in mind the advisability of converting to the manufacture of bleached sulphite which is a more stable product and less susceptible to shifting demands. Accordingly arrangements are now being made to install a bleaching plant which it is hoped to have in operation by mid-year 1953.

TERRA NOVA PROPERTIES, LIMITED—BUCHANS MINE

Crude ore milled was 324,000 tons—4,000 tons less than for 1950. Average grade of the ore was slightly lower than that obtained last year, but higher prices received for metals recovered increased total revenue and net income as compared to 1950 results.

Ore reserves as of December 31, 1951, were estimated to contain 3,877,000 tons of assured and probable ore, an increase of 322,000 during the year. In addition, there remained 165,000 tons of low-grade ore which can be mined and treated at a small profit, with prices comparable to those prevailing during 1951. The estimated reserves of assured and probable ore mentioned do not include prospective ore, indicated as yet only by widely separated diamond drill hole intersections, chiefly in the Rothermere area.

CONSOLIDATED POSITION

The consolidated profit, after depreciation and taxes, of $8,227,382 is equivalent to $1.50 per share and compares with $5,844,133, or $1.06 per share, in the previous year. The amount provided for income tax is the substantial figure of $6,841,039. If you compare the earnings before applying the tax burden, it will be seen that the figures for 1951 and 1950 are $15,068,421 and $8,697,123 respectively, an increase in 1951 of 73 per cent.

It is customary to conclude my statement with an appreciation of the contributions made by our officers, staff, and employees. The repetitive nature of such remarks may tend to lessen their significance, but I am convinced that the success of industrial enterprises today must be founded on the loyalty and teamwork of all members of the organisation and to the enterprise and resourcefulness of those in the more responsible positions. In these matters we are particularly favoured and I hereby record my sincere appreciation and thanks to all those concerned.

The report and accounts were adopted.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

EFFORTS TO COPE WITH INCREASING DEMAND

MR GEORGE EARLE ON THE ANSWER TO COMMUNISM

The annual general meeting of The Associated Portland Cement Manufacturers, Limited, will be held on June 19th in London.

The following is an extract from the statement by the chairman, Mr George F. Earle, CBE, which accompanied the report and accounts sent to stockholders:—

Last year the Blue Circle group of companies delivered nearly a quarter of a million tons more cement than in their record year, 1950, while the industry as a whole for the first time in its existence delivered to the home and export markets over 10 million tons of cement.

The sales of our other products were also satisfactory.

Abroad, the companies in which we are interested did well, especially in South Africa and Mexico.

The satisfactory overall picture produced the results before you, which but for the heavy tax, you will, I hope, find satisfactory. Our good results are due largely to exports and trading in goods other than cement.

The figures in millions of pounds are as follows: our trading surplus is 7.57, an increase of 0.81. Depreciation and plant and machinery replacement reserves amount to 2.28, an increase of 0.32. Debenture service and directors' emoluments, and the addition to the general reserve are 0.62, a decrease of 0.32, and we are left with a net surplus of 4.67 before tax, an increase of 0.81.

Our largest outgoing tax, which is equivalent to £89 per £100 of ordinary stock, takes 3.88. This is an increase of 0.87, which more than wipes out the increase in our trading surplus of 0.81. What it means is that these companies worked in 1951 for you, the stockholders who own them, from January 1st to March 3rd, and for the Government for the rest of the year.

THE PRESENT YEAR

So far this year our deliveries of cement are about a quarter of a million tons more than last year, and the sales of our other products are also satisfactory. The percentage increase in deliveries is considerably greater in the export than in the home market, and it seems reasonable to expect that our problems this year will be of production rather than of sales.

To meet the future demand we are concentrating on extending and increasing the efficiency of our existing works rather than building completely new works in England, though should conditions change the sites and our plans are ready. The cost of new works is now so high that it is practically impossible for them to compete with existing works unless the savings in transport are really large.

Our future increased output in England will be substantial.

It is with the greatest regret that we learn of the imposition of the EPL and hope that this additional charge on industry will soon be removed.

A clear picture of the weight of taxation is shown by the following: as already mentioned the profits of The Associated Portland Cement Manufacturers, Limited, The British Portland Cement Manufacturers, Limited, and Alpha Cement, Limited, after providing the reserves your directors think are essential, amounted to 4.67 million pounds. Taxation took 83 per cent of this sum, and had EPL been in force last year the percentage would have been even higher, but, in addition, there are other reasons why it is becoming difficult to finance the ordinary running of industry.

Comparing December 31, 1951, with 1950, our book debts less trade creditors were £1 million higher, while our stocks and stores and spare parts, including those held by our selling organisations, were more than £2.3 million higher. We have thus had to find £3.3 million in cash for these two purposes.

In the above figure is included our stock of paper and paper bags, which increased by over £1.1 million, a considerable part of which sum was due to the increased cost of paper. We use several qualities. The price per ton of the quality most used by us had advanced from £15 14s. in 1938 to £158 12s. at December 31, 1951—more than ten times as much. The price of cement itself has not even doubled in the same period, but unfortunately we have to include the price of paper bags in the price of cement, and this fantastic advance in the price of paper is having a serious effect on the cost of building. I am glad to say that many of our buyers now take cement in bulk and so help the country by reducing the imports of paper and pulp. I hope many more will do this, and so save money for themselves as well.

GOVERNMENT CONTROL

The Ministry of Works has released the industry from control, and when this was done we undertook not to increase our prices unless there were really serious increases in cost. Our reaction to this freedom has been that it is now up to us to do everything possible to get prices down. Although we have always been keen, for our own good, to keep prices low, the psychological effect of freedom from control is to make us even keener to do this. I believe this is the reaction one can expect from all industrialists.

It is good to know that the price of cement in England is still lower than anywhere else in the world, and also that our production per man per week in 1951 was higher than in 1950, and over 34 per cent higher than in 1945. Basic wage rates per hour increased at a greater rate than production per man.

PRESENT CONDITIONS

Since the war much has been done to stir up class hatred, and the propaganda has been successful. Nothing can do our country more harm.

Why is it that the theory of class hatred has taken such a hold? Communism has had much to do with it. Many may never go to Church, yet are deeply influenced by Christian ethics, and many people who are not Communists are influenced by Communist propaganda.

Some of us can remember when people of this country pulled together happily, each appreciating that the others were doing their best in their own jobs.

Our greatest leaders felt that it was more important to consider the happiness of others than ones' own.

This is not only the secret of success, but also of personal happiness. Let us realise this truth applies to business as well as to the pulpit. It is, to my mind, the only answer to Communism.

H.P. SAUCE LIMITED

ANOTHER RECORD YEAR

The twenty-seventh annual general meeting of H.P. Sauce Limited was held on May 22, 1952, at the Queen's Hotel, Birmingham. Sir Patrick Hannon, the chairman, presided and in the course of his speech said:

The quality of our products, and the efficiency of management throughout the whole organisation has been maintained on its traditional high level. The company's steady expansion has been maintained and during the past year the parent company and each of the associated companies has enjoyed increased production and a substantial growth in turnover. I am therefore in the happy position of presenting another record year in the progress of our trade operations.

The trading profit after provision for depreciation and pension scheme payments shows an increase of £72,336 on the previous year.

BURDEN OF TAXATION

I have made strong comment at previous annual general meetings of the heavy burden of taxation which attaches to every branch of enterprise in the United Kingdom. In the exigencies of the economic situation following upon war, and in the presence of a heavy programme of re-armament, industry must regard with a measure of patience the stranglehold of the State for years to come. In our own companies, our contribution to the Exchequer will be apparent from our accounts. For 1951 the total charge for dominion, foreign and British taxation amounts to £632,022, an increase of £125,974 over last year's charge. This latter figure is caused largely by the increase in profits tax, to which reference was made in last year's speech. If profits are maintained in 1952, the charge for taxation will show a further increase owing to the imposition of the excess profits levy.

As a result of the heavy increase in the taxation charge, the net profit of the parent company has been reduced to £252,908, compared with £313,532 for 1950. The general and other reserves have been increased to £569,500, which sum includes an allocation to an income tax equalisation reserve of £59,500.

Lea and Perrins Limited, Worcester, has made considerable strides in the enlargement of its output during the year. It maintains the high place it has always occupied in the field of condiments throughout the world, and the popularity which it has enjoyed for over a century is still fully maintained.

Lea and Perrins Inc., continues its broad sphere of activities in the United States, with the same vitality as has characterised its operations over so many years.

It is also satisfactory to report that notwithstanding the continued imposition of import licence regulations in many overseas countries, there has been a substantial increase in the export of a full range of our products.

During the year we have increased our holding in the American Company, and in November acquired a controlling interest in Norfolk Canneries, Limited.

BALANCE SHEET ITEMS

A study of the balance sheet will reveal that the company's investments in Trustee Securities have been largely realised in order not only to finance these acquisitions, but to provide for the purchase of additional fixed assets and the increase in requirements for current assets. The chief increase in the latter is in respect of stock in trade, which shows an increase of £323,000 in the parent company's balance sheet, and £715,000 in the consolidated balance sheet.

The report and accounts were adopted.

LONDON AND THAMES HAVEN OIL WHARVES

YEAR OF DEVELOPMENT AND PROGRESS

The fifty-third annual general meeting of London and Thames Haven Oil Wharves, Limited, was held on May 29th in London, E.C.2, Sir F. Vernon Thomson, Bt, GBE, (the chairman), presiding.

The following is an extract from his circulated statement:—The trading profit of London and Thames Haven Oil Wharves, Limited, for 1951, is £518,789, as compared with £246,748 for the previous year, an increase of £272,041. There is a net profit of £183,547, compared with £95,760 for the previous year.

Adding to the net profit of £183,547 the accumulated balance brought forward of £436,644, there is a total sum available of £620,191. After providing £21,500 for the dividend on the preference shares, the directors recommend a dividend on the increased ordinary share capital of £1,300,000 of 12½ per cent, less income tax, absorbing £35,313, and that the increased balance of £513,378 be carried forward.

BENEFITS FROM NEW ACTIVITIES

Last year, the directors indicated that the extension of our business arising from the new activities undertaken for the Shell interests, in handling and storing their crude oil and refined products, should show increased earnings in the future. The first full year's operation of these long-term contracts, together with the increased volume of business done with the other oil companies, is reflected in the substantial rise in the profit for the year. It was disappointing to find in the recent Budget that an Excess Profits Levy is contemplated on future profits in excess of a standard profit calculated on the average earnings of the years 1947, 1948 and 1949, which as far as this company is concerned were years of modernisation, development and war damage reconstruction. If our present rate of profit is maintained, it seems that this company may be penalised to the extent of the maximum scale under this new tax, amounting to a sum of between £80,000 and £90,000 in respect of the year 1952.

The capital expenditure programme, of which you were informed last year, has not yet been completed due to delays in obtaining the necessary materials, but substantial progress has been made. The demand for oil products, in this country and for export, is rising so rapidly that the directors have decided to increase still further the storage facilities and jetty accommodation. Subject, therefore, to Government permission, this new programme will be commenced as soon as possible.

COMPAGNIE INDUSTRIELLE MARITIME

It will be seen from the balance sheet and profit and loss account of Compagnie Industrielle Maritime, that the earnings for the year 1951 show a substantial improvement. The dividend declared has been increased from 10 per cent to 12 per cent, of which your company's share will be approximately £39,000 (as against £32,678 for 1950 credited in the present accounts).

The heavy commitments entered into for the construction of a new oil dock to meet the growing needs of the oil importers into Le Havre, as reported to you last year, have required the French Board to pursue a cautious financial policy.

The past year has been one of development and progress, and the satisfactory results obtained have been due in no small measure to the co-operation of our staff and employees.

The report was adopted.

THE FINANCIAL TIMES LIMITED

INCREASED NEWSPRINT ALLOCATIONS WELCOMED

LORD BRACKEN'S SPEECH

The twenty-fourth annual general meeting of The Financial Times Limited was held on May 27th at Winchester House, Old Broad Street, London, E.C.

The Rt Hon The Viscount Bracken, PC, chairman of the company, presided.

Mr A. E. Knock, the secretary, read the notice convening the meeting and the report of the auditors.

The Chairman said:—With your permission I will take the report and accounts as read.

Death has deprived this company of a director of rare sagacity, courage and clearness of mind. We owe much to our late vice-chairman, Major General Guy Dawnay, who was a director of most of the companies now associated with *The Financial Times* for nearly a quarter of a century. We, who were his colleagues, know that we shall not look upon his like again. He had a radiant graciousness that lightened the lives of all who worked with him, and a most attaching benignity and gentleness. All the graces of character were his from birth and he had a singleness of mind and heart which one never saw surpassed.

Your board has elected Colonel Oliver Crosthwaite-Eyre, MP, to be vice-chairman in succession to General Dawnay. We have also elected Mr L. J. Dearlove, general manager of *The Financial Times*, to a seat on the board, and we welcome his presence at our meetings.

PROFITABLE TRADING

During the year under review the company traded profitably. The profit of the group before charging taxation amounted to £441,599, compared with £400,151 in the previous twelve months. This improvement was largely due to a recovery in the profits of our two printing subsidiaries, St. Clements Press and W. Speaight and Sons, which were seriously affected in 1950 by the dispute between Master Printers and the London Society of Compositors. Of the group profit of £441,599, no less than £265,772, or 60 per cent, is absorbed by taxation. We are recommending the same payment to ordinary stockholders as in the previous three years, and if this meets with your approval the carry forward of the company and its subsidiaries will be increased by just over £86,000.

The liquid assets position of the group is satisfactory. You will see from the consolidated balance sheet that current assets exceed current liabilities by £727,868. The corresponding figure a year earlier was £819,031. The figures show a reduction for two reasons; first, because of the substantial expenditure on new plant and machinery, and, secondly, because of our decision, announced in the autumn of last year, to simplify the structure of the group by acquiring from the Financial News Limited its shareholdings in our printing subsidiary, W. Speaight & Sons, in which we are partners with George Newnes and C. Arthur Pearson Limited, who hold a one-third interest in the company.

NEW PLANT AND MACHINERY

You will see from the balance sheet that at December 31st last there were further commitments for the purchase of plant and machinery by subsidiaries amounting to £191,000. The most important single item in this total is a new fast running newspaper rotary press for St. Clements Press. The installation of this machine has now been completed and it will very shortly be employed in the printing of *The Financial Times*. The machine is the most modern of its kind. It has a very large capacity, with extensive facilities for colour printing, and we anticipate that it will undertake many jobs besides its main task of producing *The Financial Times* itself.

When I addressed you last year, I spoke of the newsprint famine. Although there was a very slight easing of the position in 1951, it is broadly true to say that the famine persisted throughout the year, and many would-be readers and advertisers had to be disappointed. We have in the last few days been informed that newsprint allocations are to be increased by 10 per cent. This relief is most welcome. It will enable us to satisfy a part of the demand for the paper and to improve our services to readers.

NO PROPHECY FOR THE FUTURE

Company chairmen often oblige their shareholders by attempting to forecast the fortunes of their businesses during the financial year ahead. I shall not attempt to do this. The costs of this company, like those of almost all British companies, show no signs of diminishing. Only a very bold man would be prepared to prophesy what lies in store for British industry during the next financial year.

I am sure you will wish me to express our thanks to our managing director, Lord Moore, the Editor, Mr Gordon Newton, and to all the other members of the staff who served this company so well during the past financial year.

The report and accounts were unanimously adopted.

BRITISH ROPES, LIMITED

GRATIFYING RESULTS

The thirtieth annual general meeting of British Ropes, Limited, was held on May 27th in London.

Mr Herbert Smith (chairman and managing director), in the course of his speech, said: The gratifying results of this year's trading were not anticipated a year ago, and some of the increased profit is due to larger sales in hemp and wire rope goods; the volume of our wire trade was rather less than in 1950 owing to the shortage of steel wire rods, but we hope that during the current year we shall get back to something like the output we had in 1950, if not more.

The trading profit of the group for the year 1951 was £2,363,000 as compared with £1,613,000 for the previous year. The total assets now exceed £10 million and show an increase of over £2 million compared with the previous figures. The total group capital and reserves amount to £6,466,000.

The shortage of steel has made it impossible to supply fully the needs of our many customers, and we must still ask their indulgence at any rate for the first half of this present year. The sales of our three sections give a total figure in excess of any previous year. The trading results and sales of our overseas interests have all been satisfactory.

Your company's products are essential to the efficient working of practically every industry in this country. We have fully maintained our contacts overseas and our knowledge of developments in world markets. I am therefore confident that as and when our steel supplies improve we shall rapidly regain our share of export trade.

The report was adopted.

J. H. VAVASSEUR AND COMPANY, LIMITED

(East India Merchants)

SATISFACTORY RESULTS

INCREASED DISTRIBUTION

The forty-eighth ordinary general meeting of J. H. Vavasseur and Company, Limited, East India Merchants, will be held on Wednesday, June 25th, at the Registered Office, 15-16 America Square, London, E.C.

The following is extracted from the statement of the chairman, Mr E. J. Mackenzie Hay, which has been circulated with the report and accounts for the year ended December 31, 1951:—

The overall results achieved last year were extremely satisfactory. Turnover continued at a high level; the trading profits of the Group as a whole were well maintained, while those of the company itself established a new record.

PROFITS

The combined profit of the Group amounted to £601,624, compared with £593,514 in 1950. A considerably larger proportion of the Group profits last year, however, was earned by the parent company and UK subsidiaries, on which the incidence of taxation bears most heavily, and in consequence the provision for taxation requires over £70,000 more than in the previous year. With increased allocations to depreciation and higher interest charges, this reduces the available balance of the Group to £195,800, compared with £261,640 in 1950. Of the Group profit, the company's share is £195,252, against £208,387 a year earlier.

The company's profit and loss account shows an income of £341,698, compared with £286,381 in 1950. Unhappily, most of this substantial increase in profits is taken by the Inland Revenue, as after the customary deductions, including provision for taxation, we are left with a net profit for the year of £107,160, compared with £100,056 in 1950.

With £66,198 brought forward from the previous year, and a return to profit and loss of £25,000 in respect of tax provision no longer required, the company has a balance available for distribution of £198,358.

APPROPRIATIONS

There have already been paid the preference dividend and an interim dividend of 5 per cent on the ordinary stock, and the directors recommend the remaining balance should be disposed of by a transfer of £50,000 to the general revenue reserve, the payment of a final dividend of 30 per cent on the ordinary stock (making a total of 35 per cent for the year), and to carry forward the increased amount of £81,421.

In the company's balance sheet the capital reserve and revenue reserve now total over £587,000, and with the issued capital the net assets aggregate £1,037,914, compared with £958,270 in 1950. A feature of the consolidated balance sheet is the further strengthening of the reserves, which have received an addition during the year of £168,230.

OUTLOOK

Our own trading during the current year to date has been very good. During a period of severely falling prices, there is inevitably some anxiety as to whether contracts entered into at substantially higher prices will be fulfilled, but I am glad to say that our experience in this connection has been very gratifying, and though we are not now passing through the intense activity of a year ago, the profits we have earned so far encourage us to believe that we shall be able, in due course, to present satisfactory results in respect of 1952.

INSTITUTE OF COST AND WORKS ACCOUNTANTS

MR A. W. MUSE'S ADDRESS

The thirty-third annual general meeting of the Institute of Cost and Works Accountants was held on May 17th at the Palace Hotel, Buxton.

Mr A. W. Muse, FCWA, FACCA, in the course of his address referred to the steady increase in membership, student registration and examinees during the past year and to the help given to businesses and individuals through the Institute's Appointments Bureau, which handled a large number of vacancies.

He also stated that the Institute, as one of the joint hosts, has taken its share in the preparations for the Sixth International Congress on Accounting, which takes place in London on June 16th-20th.

In referring to the visit last autumn to South Africa and Southern Rhodesia, undertaken by the Institute's director, Mr Stanley J. D. Berger, MC, FCIS, the president stated that the mission had proved in every way successful, resulting in a reorganisation of the South Africa branch, which promised well for the future.

The Institute's Research Committee had again rendered useful service to the business and professional world in the recently issued book on "Accountancy of Changing Price Levels," which had already attracted considerable attention. Mr Muse went on to say that the business world is entitled to know the authoritative view of the profession on this vexed question and he welcomed the recent statement of the president of the Institute of Chartered Accountants in England and Wales that they proposed to invite other professional bodies to join in their further study of this problem.

The report and accounts were adopted, after which the president invested Mr S. C. Tyrrell, FCWA, FIIA, the new president, with the badge of office.

At an extraordinary general meeting held immediately following the above, special resolutions were passed amending the articles of association of the Institute to give effect (a) to the proposals for establishing a Fellowship in Management Accountancy and (b) to widening the Council's powers of investment.

At the twenty-third national cost conference held on the previous day, Mr Muse, in his presidential address, referred to the tasks devolving upon the accountant in industry, which he summarised as follows:—

Firstly: He must find out where the business he was serving was heading at any particular time, and what its long-term proposals were. His forecasting must be based upon past achievements, tempered by present conditions and influenced by future possibilities.

Secondly: He must understand the managerial assumptions relative to the future of the business and the factors which had given rise to those assumptions.

Thirdly: He must satisfy himself that the policies upon which the business was operated were consistent with the assumptions which had been made and that his figures could prove or disprove such consistency.

It was with a view to supplying accountants competent to perform these tasks and tested by examination and experience, that the Council of the Institute had recently revised its examination syllabus and were establishing new conditions for the Fellowship of the Institute in Management Accountancy.

HUDSON'S BAY COMPANY

FACTORS AFFECTING PROFITS

The 283rd annual general court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held on May 29th in London, Sir Patrick Ashley Cooper, the Governor, presiding.

The following is an extract from the governor's statement circulated with the report and accounts for the year to January 31, 1952:—

Total profits before taxes of £1,919,004 were £216,954 lower than last year. After provision for taxes, net profit was £654,446, compared with £952,228 last year. Working capital (current assets less current liabilities) of £10,235,538 was an increase of £897,335. Of this, cash and Government securities totalled £2,163,823, compared with £2,591,464 last year.

Striking variations characterised trading conditions in 1951. The first quarter of the year was marked by a continuation of the Korean war boom; then it ceased abruptly and there followed a decline in sales, intensified competition and sharply rising costs.

Retail Stores Department.—Retail trade in Canada enjoyed a good year, but not as good as in 1950, which was abnormal. Sales were a record for this department, although the gain was offset by the general rise in commodity prices.

Fur Sales.—The three fur centres in London, New York and Montreal enjoyed another increase in sales, and profits were again satisfactory.

Wholesale Department.—The fifteen branches enjoyed a good year and the profit was maintained in spite of higher expenses.

The report was adopted.

LONDON BRICK COMPANY

NEW POSTWAR PRODUCTION RECORDS

The fifty-second annual general meeting of the London Brick Company, Limited, was held on May 29th in London, Mr A. T. Worboys (the chairman) presiding.

In the course of his speech the chairman said: The trading profit of the parent company and sundry income for the year amounted to £1,440,581 as compared with £1,042,650 last year. After providing a total of £400,000 for depreciation of fixed assets and £756,253 for taxation and other charges, there remains a net profit of £284,328. After transferring £22,829 to contingencies reserve and deducting the net dividend for the year on the 8' per cent cumulative preference stock and the net interim dividends totalling 17½ per cent on the ordinary stock, there remains a balance of £5,824, which has been added to the amount brought forward from last year, of £266,446, thus increasing the balance to be carried forward to £272,270. The directors do not recommend the payment of any further dividend for the year 1951.

Once again the directors' report records the achievement of new post-war records for the production and delivery of bricks. These are due in the main to an improved labour force and to further progress in our programme of mechanisation.

Now as to the future. The totals of our orders received and of production are both considerably higher than those for the same period last year. At the moment, therefore, there is some indication that next year I shall be able to report results as satisfactory as these of the year which I have now reviewed.

The report was adopted.

POWER SECURITIES CORPORATION, LIMITED

YEAR OF PROGRESS

The twenty-ninth annual general meeting of this company will be held on June 17th in London.

The following is an extract from the circulated statement by the chairman and managing director, Mr William Shearer:—

The directors' report and accounts reflect the successful progress of the Corporation's business during the year ended December 31, 1951. The consolidated profit and loss account shows that the gross profit for the year amounted to £535,336 (which includes final adjustments in respect of certain contracts completed during 1950 but not included in the accounts for that year), and compares with the figure of £440,166 in the previous year. The increase of £95,170 in the gross profit has, however, been more than counterbalanced by much larger provisions for taxation and depreciation, with the result that the consolidated net profit at £140,485 is slightly less than that of the previous year.

To the consolidated net profit there has to be added the balance of profit brought forward of £104,774, together with amounts in respect of taxation over-provided in past years and provisions no longer required, making a total of £256,585; out of which there have been provided £5,650 for the usual pension fund instalment, £100,000 transferred to reserves as against £84,335 in the previous year, and £43,575 for the preference dividend and the proposed dividend of 6 per cent on the ordinary shares, leaving a balance of £107,630 to be carried forward to the following year.

SUBSTANTIAL VOLUME OF WORK

Our organisation embraces the engineering construction business of Balfour, Beatty and Company, Limited, and other subsidiary companies, and is equipped to carry out the design, finance, construction and management of public utility and other undertakings in this country and overseas. We have in hand a very substantial volume of civil and electrical engineering contract work, including construction of thermal power stations, hydro-electric projects, high and low tension transmission lines, tunnels, port-works and other types of construction. Work on contracts in hand has continued to be influenced by the ever-increasing cost of labour and materials, while the shortage of certain materials, principally steel and copper, affected construction programmes during the year in varying degrees. Nevertheless, good progress has been made on our contracts, and I venture to think that the figures contained in the accounts now submitted show that our organisation is capable of dealing successfully with the numerous problems created by present-day conditions.

We continued work during the year on the two super-power stations at Staythorpe on the River Trent and at Carmarthen Bay in South Wales, which Balfour, Beatty originally designed in prenationalisation days, and for which they are the consultants and main contractors to the British Electricity Authority.

We have in hand a large amount of engineering and construction work for the East African Power and Lighting Company, Limited, in Kenya and Tanganyika, where the demand for electric power continues to grow rapidly. Last autumn, Balfour, Beatty were awarded a contract by the Iraq Development Board for construction of the Wadi Tharthar project, tenders for which were open to international competition. This is a scheme to control the flood waters of the River Tigris.

LONDON ALUMINIUM CO.

STATEMENT OF THE LATE CHAIRMAN MR ARTHUR H. JOHNSON

STEADY DEMAND FOR PRODUCTS

The annual general meeting of the London Aluminium Company, Limited, was held on May 28th at the Midland Hotel, Birmingham, Mr F. P. Webster, presiding.

After the meeting had stood in silence as a tribute to the late Mr Arthur H. Johnson, Mr Webster expressed appreciation of the outstanding services which Mr Johnson had rendered to the company.

Mr Webster stated that the board had appointed Colonel C. A. B. Lindop as its chairman, adding that the board were of the opinion that Colonel Lindop was well fitted to continue the policy of the late chairman. Unfortunately, Colonel Lindop could not be present at the meeting as he was in the USA on business.

The following is an extract from the statement by the late chairman, Mr Arthur H. Johnson, OBE, circulated with the report and accounts:—

There has been a substantial improvement in the company's liquid position. The current assets, as at December 31, 1951, exceeded the current liabilities by £169,703, as compared with an excess of current liabilities of £41,367 at December 31, 1950.

The trading profit for the year amounted to £108,136 and, after providing for depreciation and certain management and administration expenses, and making the adjustments set out in the profit and loss account, the debit balance on profit and loss account of £188,995 brought forward from 1950 has been reduced to £65,117.

BENEFITS OF REORGANISATION

The board consider that the company is now in a position to reap the full advantage of the reorganisation which has taken place in the works floor space and the benefits of the adoption of the new costing system should also be felt. The production of domestic holloware is now concentrated at the Charles Henry Street works. Although the company's allocations of aluminium for this side of the business have been curtailed, the company has been able to keep these works economically and profitably employed. There continues to be a steady demand for the output of utensils bearing the trade marks "Diamond" and "Atlas."

The engineering side of the business is concentrated at the Witton and the Bradford Street works. Both these works have been reorganised and new methods of production introduced. The chemical and engineering contracts involving site-work have been largely completed and the output on the engineering side is now predominantly fabrication work carried out at these two works. The company has substantial orders from the Admiralty, and the aluminium to fulfil these contracts is being made available to the company. The company has sufficient orders in hand fully to occupy its works for at least twelve months. I should mention that the output on the company's engineering side is approximately two-thirds in value of the company's total output.

It is too early to forecast what the results of the current financial year are likely to be, but preliminary figures for the first three months of the year indicate that the profits for the year should, unless unforeseen circumstances arise, be at least sufficient, not only to eliminate the debit balance on profit and loss account, but also to make a substantial payment in respect of the arrears of the dividend on the company's preference shares. The report was adopted.

CRYSTALATE LIMITED

STRONG FINANCIAL POSITION

The annual general meeting of Crystalate Limited was held on May 26th in London.

Mr J. Lesser (chairman and managing director) said that for the year under review the accounts showed a profit before taxation of £29,828, as compared with a loss of £3,055. After all taxation had been provided for, the result was a profit of £13,750, as compared with a loss of £3,055. The balance sheet showed that the company had continued to maintain a strong financial position.

The consolidated accounts showed a much improved result. The 1949-50 accounts showed before taxation a loss of £15,313, whereas this year they had a profit of £70,208. After taxation that resulted in a profit of £40,161, as compared with the previous year's loss of £24,188. The consolidated balance sheet reflected the strong financial position of the Group. The liquid assets were up from £218,482 last year to £253,810 this year.

For the year under review all its subsidiary companies had been on a profitable footing and each and all had contributed to the Group result. In particular, their major move involving the transfer of the plant and equipment of the Mica Company from Dalston to Tonbridge had begun to bring its anticipated reward.

The trading of their subsidiaries, the British Homophone Company, Limited, and Ebonestos Industries Limited ended on March 31, 1952, and from internal figures at their disposal they had every reason to anticipate that the profits of those companies would compare favourably with the previous year.

The report was adopted.

SILVRO MANUFACTURING

(Makers of "Bonsoir" Shirts and Pyjamas)

The sixteenth annual general meeting of Silvro Manufacturing Company, Limited, was held on May 28th in London, Mr Manley Cooper presiding. The following are extracts from his circulated statement:—

Your company has purchased a small concern at Bowes Park and we have equipped the workrooms with up-to-date machinery for the production of an additional 40,000 high-grade sports shirts per year.

We now have an American subsidiary company, which it is hoped will make a useful contribution to your profits and facilitate the handling of business in America, which has been steadily increasing.

Such purchases as we have made in raw materials have been at very favourable prices, and you will be pleased to know that prices which we are currently receiving for our products enables us to trade on a profitable basis at the lower levels of prices now ruling in the trade.

Your board has to report for the first time for very many years a slight reduction in profits. Although turnover showed a satisfactory increase, it has been achieved on slightly reduced margins, although not of such magnitude as to cause your directors any anxiety. They recommend the maintenance of the dividend at the same figure of 30 per cent as last year, the strengthening of the general reserve by £5,000 and increasing the carry forward by £2,565.

Taking into consideration the present position of the textile industry, we consider our production and sales for 1952 to be very satisfactory.

The report was adopted.

HUMPHREYS LIMITED

IMPROVED TRADING RESULTS

MR A. V. BRIDGLAND ON OVERSEAS DEVELOPMENT

The sixtieth annual general meeting of Humphreys Limited was held on May 27th, in London, Mr A. V. Bridgland, the chairman, presiding.

The following is an extract from his circulated statement:—

The accounts show the trading profit for the year as £61,750, and this represents an improvement of £11,224. From this trading profit no less a provision than £36,351 is required for taxation. The preference dividend, together with a dividend of 17½ per cent on the ordinary shares, will require, after taxation deduction, £12,075, leaving the carry forward to be increased from £56,118 to £67,791. It will be seen that the shareholders' reward for the year under review represents roughly one-third of what the tax authorities are claiming. The surplus of current assets over current liabilities is £315,616, and that is over one and a half times our issued capital.

Early in the New Year I again visited South Africa. It is apparent that considerable new building work is being undertaken there and is likely to increase. To take advantage of these conditions, your company has acquired as an investment an interest in an old-established building and civil engineering business in the Cape Province.

RISING BUILDING COSTS

Building costs in this country are still rising, and today they represent something like three times prewar levels. It is difficult to attribute this increase in building costs wholly to inflation. There are other factors, in my view, which have considerably increased the cost of building. Coupled with the difficulty of licences and controls, we have the problem of dealing with such a multiplicity of planning controls and regulations as drives one to despair. Many of these planning regulations are wholly impracticable and produce, in practice, an effect the entire opposite of what, in theory, they were supposed to achieve. I think it is not unfair to say that the result of these planning provisions and controls has a very great deal to do with the increased cost of building. I think, to sum it up, controls and restrictions prevent the smooth working of a contractor's business, they encourage the hoarding of materials, and they certainly waste a good deal of time.

It is good to see that the Conservative Party intend, as quickly as possible—consistent with the difficulties they have been faced with in taking over from the previous government—the rapid abolition of these controls and the amelioration of planning regulations, so as to enable work to be cheapened and speeded up. Partly as a result of heavy taxation, unemployment is rapidly rising in the building industry, and it will take time to reabsorb this labour, and to enable this to be done, some release of building controls will have to take place. Contractors will then have to rebuild their organisations. So far as we ourselves are concerned, because of excessive taxation, we really have no incentive in this country to increase our competitive business, for the risks are too great to do so for the poor rewards offered. It is for this reason, among others, that we are commencing to turn our eyes overseas to our Dominions.

I do not think the coming year will disappoint us, since existing contracts will not then be exhausted, but beyond that time I cannot prophesy.

The report was adopted.

CENTRAL MINING & INVESTMENT

SIR CLIVE BAILLIEU'S SPEECH

The forty-seventh annual general meeting of the Central Mining & Investment Corporation, Limited, was held on May 29th, in London.

Sir Clive Baillieu, KBE, CMG, the chairman, in the course of his speech, said:—

Perhaps the most outstanding influence in the Union's economy during 1951, as in that of most countries, was the continuing and even increasing inflation. Dearer money and surplus budgeting, backed by a decrease, or at least not an increase, in Government and Municipal spending, together with intensified import control, should do a great deal to tide South Africa over the next two or three years. This will be the crucial period before the beneficial effects of the expansion of the gold mining industry into the Orange Free State, are fully felt.

HARMONY GOLD MINE

Good progress has been made in shaft-sinking operations on the Harmony mine since I addressed you last year. An average rate of about 200 feet a month has been attained. The ventilation shaft, situated near the pioneer H1 borehole, is now expected to cut the Basal Reef horizon in three months' time. A further few months must then elapse before the shaft and auxiliary workings can be ready to serve a programme of active development. This circular shaft, primarily for ventilation, can be used for the hoisting of substantial tonnages of ore from development faces, and it is to be hoped that well before No. 3 main hoisting shaft is fully equipped, in 1954, an extensive area will have been developed and much knowledge have been gained of the economic prospects of the south-eastern portion of the property.

MINES OF CENTRAL RAND

Our Group is particularly concerned in the maintenance of maximum tonnage upon the deep and marginal mines of the Central Rand. In these mines, with their complex systems of sub-vertical or sub-incline shafts, long haulages and scattered workings, the burden of standing charges in European and native labour, employed upon directly non-productive work, is of particular severity.

It is appropriate to refer in this context to the position at the Crown Mines, employing 7-8 per cent of the Rand's labour force, where recent difficulties have been intensified by shortage of skilled and unskilled labour and where results and prospects would be gravely influenced by any further shrinkage in supply. This great producer still has great potential strength, in its total ore reserves of many million tons and large areas yet to be developed. The resources of comparatively high-grade ore locked up in shaft pillars, which will take several years to prepare and mine out in proper sequence, may have to be drawn upon, for the maintenance of satisfactory profits, much earlier than previously was planned.

The City Deep is another of the Group's large mines suffering with particular severity from rising costs imposed upon other adverse factors.

The deterioration in the political situation in South Africa has become a matter of increasing disquiet to all well-wishers of the Union. South Africa must depend for its continued and uninterrupted development on a smooth and regular flow of capital from the outside world, and this again will rest upon the confidence which the outside world has in the sanity and good sense of its people, and the underlying stability of the country.

The report was adopted.

DAVIS AND TIMMINS

RECORD TRADING RESULTS

The fifty-third annual general meeting of Davis and Timmins, Limited, was held on May 27th in London, Mr F. Le Neve Foster (chairman and joint managing director) presiding.

In the course of his speech the chairman said: It is my pleasure to submit results which constitute a record in the long history of our company. The group gross trading profit is £308,521, as against £153,944 last year, while the net profit amounts to £115,928, comparing with £63,540 for the previous year. These results are mainly attributable to the much larger turnover again achieved. This shows an increase in value of over 60 per cent, compared with the previous year 1950. The directors recommend a total distribution of 25 per cent for the year, as compared with 20 per cent for last year.

It is satisfactory to note that, notwithstanding the considerable increase of turnover which has had to be financed during the year, our cash position with £173,000 in the bank and in tax reserve certificates shows a remarkable improvement on last year. It should not, however, be overlooked that we have a heavy taxation bill to meet next January.

The consolidated balance sheet shows an exceptionally strong position. Our capital and revenue reserves now total a figure of £475,246, as against a total of £338,656 at the end of the previous year.

When speaking to you last year I told you of the serious shortages and lengthening of delivery times in metal supplies which we were experiencing. I am glad to say that this situation did not worsen during the year. Its continuance, however, caused us much anxious consideration in planning ahead and we were fortunate in being able to maintain a steady flow of production without any serious disturbance.

COMMODITY PRICES

The future of supplies and prices of metals must continue to give us cause for some anxiety. In most commodities there is definitely a downward world price trend, but as an exception copper, on the price of which brass is mainly dependent, seems to keep remarkably firm, due to American demands. Any change in world affairs, for example, the cessation of hostilities in Korea, might well alter the outlook and create conditions making for a further fall in prices of commodities, including copper, which, it appears to me, is bound to come sooner or later. While in theory we should welcome anything which reduces costs, we are mainly interested in stability. In a period of steeply falling prices conditions for business will become unfavourable.

Our sales of "stock" products have achieved a record for this year and comprise a higher proportion of our turnover than ever before.

During the current year up to date business and results continue to be good. We still have a heavy order book and all our works are running smoothly and efficiently. There are, however, indications of a slowing down of trade, due, I imagine, to the general conditions which are developing in this country and many other parts of the world.

Looking into the future, so far as your company is concerned I am confident that, with the benefit of our unrivalled position in the trade and the strength and efficiency of our undertaking, this company can and will continue to give an account of itself which will be worthy of its record in the past.

The report was adopted.

JOHN HOLT & COMPANY (LIVERPOOL) LIMITED

CHANGED TRADING CONDITIONS

The fifty-fifth annual general meeting of John Holt & Company (Liverpool) Limited, was held on May 23rd, at the offices of the company, Royal Liver Building, Liverpool, Mr John A. Holt, the chairman, presiding.

The following is an extract from his circulated statement:

Our gross turnover was at an annual rate of rather more than £22 million. This was about double the figure achieved in 1947 and even after discounting the effects of inflation shows a marked increase in the volume of commodities handled by the company. In relation to these figures and the commercial risks involved, the net retained profits can in no way be regarded as excessive.

The upward trend in produce prices created more purchasing power than could be absorbed by available stocks of merchandise and, moreover, stocks held in West Africa were at figures well below replacement prices. In French territories, the results exceeded those of the previous year, and we were able to show increased profits.

Vegetable oils and oilseeds, cotton, and cocoa purchases during the period under review represented our share of each crop appropriate to the size of our organisation.

John Holt Line Limited had a satisfactory year.

During the last few months there has been a substantial fall in the replacement price of cotton piece goods, and substantial losses appear to be unavoidable. Generally speaking the margins on other consumer goods are not being maintained at last year's levels. I do not wish to give the impression that the position is in any way critical at present, but our long experience of the West African Trade has shown how rapidly, and with what little warning, a statistically secure basis of trade can deteriorate.

The report was adopted.

ILLUSTRATED NEWSPAPERS

GRATIFYING RESULTS

The twenty-sixth annual general meeting of Illustrated Newspapers, Limited, was held on May 27th, in London.

Major H. Davenport Price, MC, JP, the chairman, in the course of his speech, said:—

The trading profit for the group totals £601,252, compared with £590,580 for the previous year; a gratifying increase of £10,000 odd.

The net profit attributable to Illustrated Newspapers, Limited, is £196,014.

It is proposed to pay on July 1st a dividend of 3 per cent on the ordinary shares with a bonus of 1 per cent. This carries with it a participating dividend of 1 per cent on the preference shares.

The current assets of the group show a surplus of £1,018,784 over current liabilities, including provisions for taxation and dividends, which is satisfactory.

I am pleased to say we have been free from labour troubles during the year under review. At the same time we have had to face substantial increases in the costs of paper, printing materials and wages and, indeed, overheads generally. Unfortunately, I cannot see any prospect of appreciable relief in this respect in the near future and these heavy increased costs will, I fear, be reflected in the next year's trading figures.

The publications of this group, I am pleased to say, maintain their high standard of production which is the secret of their continued popularity with readers and advertisers.

The report was adopted.

E. POLLARD & COMPANY

The fortieth annual general meeting of E. Pollard & Company, Limited, was held on May 27th, in London. Mr H. Edward Pollard (chairman and managing director) who presided, in the course of his speech, said: The group profits are £191,000 and, after providing for taxation there remains £88,000—a decrease of about £19,000 as compared with the previous year. Your directors are recommending the payment of a capital dividend of 10 per cent on the issued ordinary share capital of £400,000. Shareholders have the privilege of receiving this dividend without deduction of income tax and they need not include it in any return of income for income tax or surtax purposes.

During 1951 there was a steady demand for all our products but again the shopfitting section was hampered by stringent licence restrictions.

In contrast to shopfitting, the display section at our Highbury factory was able to increase its production and turnover.

In the electric lift section under Hammond & Champness a steady demand for all types of lifts was experienced.

The steel shutter business that is carried on under the name of Haskins can also report a satisfactory year.

The other engineering works occupied by the Morris Singer Company, had to face the stringent control of bronze metal which practically stopped this particular section, but they were able to increase their other activities.

Whilst I do not think we can hope for any great improvement in 1952, the outlook is sound and conditions in many directions a little easier.

The report was adopted.

ADMINISTRATION.—Applications are invited for senior administrative appointment in a very progressive Company engaged in food processing (E. Midlands). The position will be as personal assistant to Managing Director, responsible for review and building up of organisation structure, selection of additional executives, planning of management training programmes, etc. Candidates should have University degree (Economics, Sociology or Psychology) and wide industrial experience, embracing personnel, industrial engineering, and study of modern methods of organisation and control. This is an important appointment calling for keen, enterprising man who has courage, imagination and capacity for hard work. Age limits 30-40 years. Initial salary £2,000 upwards, plus pension, life assurance, etc.—Apply in confidence, with full details of education, career, age, etc., to Box 951

A HIRE PURCHASE FINANCE COMPANY, acting in conjunction with a large firm of Gas Cooker Distributors, REQUIRES ADDITIONAL BILL DISCOUNTING FACILITIES to the extent of £200,000-£300,000 per annum, in monthly units. Bills of Exchange are fully covered by collateral securities and are guaranteed. The discounting charge is equivalent to a simple interest rate of 12.48 per cent per annum. Particulars from the Company's Accountants.—Box 952.

REPRESENTATIVE in the South. A salesman of fine record and highest integrity. Experienced in both slump and boom. Requires change of occupation. Under 50 and fit. Only overtures from reputable and well-established concerns offering good remuneration and real prospects will be considered.—Box 961.

TRADE ASSOCIATION, with office in London, requires man with experience of export administration to take charge of Export Division. The post offers bright prospects for suitable man, who should, in addition to academic qualifications, have practical knowledge of currency regulations, tariffs and quotas.—Box 953.

EFFICIENCY IN BUSINESS.—An Exhibition of the latest books on all aspects of business administration and management is open until June 6th, from 9.30 a.m. to 6 p.m. daily, at C.P.C. LONDON BOOKSHOP 6, VICTORIA STREET, S.W.1. Tel.: WHI 4011

LAST minute Continental Holidays not arranged for the masses but individually for you. 10 days in Spain from £26 19s. 6d.; Italy £25 19s. 6d.; France £18 10s. 6d.; 7 days in Paris from £13 15s.—Write for brochure or 'phone: Business & Holiday Travel Ltd., Grand Buildings, Trafalgar Square, London, W.C.2. WHItehall 4114/5.

WILLIAM MALLINSON & SONS LTD., have vacant the position of HARDWOOD SALES MANAGER. The applicant must appreciate handling of high quality material; he must have sales ability by personal contact and must understand administration. This is a senior appointment with excellent prospects.—Reply, Secretary, 130/150, Hackney Road, London, E.2.

ECONOMIST with good knowledge of overseas markets willing to do Market research for manufacturing firm for period of three months. Moderate fee.—Box 959.

WOMEN graduates are invited to apply for appointment as Lecturer in the Department of Education of the International Wool Secretariat. Lectures are given on every aspect of wool in schools and colleges and to adult education organisations of all kinds. Previous lecturing or teaching experience is desirable. Some knowledge of wool would be an advantage, but training will be given after appointment. The work will entail considerable mid-week travel. Commencing salary £440, plus superannuation benefits. Subsistence allowance and first-class travelling expenses are paid.—Applications should be marked "Confidential" and addressed to the Secretary, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1, within two weeks of the appearance of this advertisement.

YOUNG WOMAN REQUIRED as Assistant to Economist in market research and statistical sales department of large manufacturing company in North London. Graduate or holder of suitable professional qualifications preferred. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952. Applicants should give details of age, education and experience.—Box 957.

OLD-ESTABLISHED highly reputable Company with selling agencies abroad has spare capital and some factory space available. Would like to meet man or small company in need of finance and space to manufacture some commodity in demand abroad, preferably in dollar countries. Raw material must be readily available. Recommendation by Solicitors or Accountants would eventually be required. Strict confidence.—Box No. 950.

QUALIFIED ACCOUNTANT, Cost Accountant, Secretary, Economist (34), just completing five years' practice as consultant to gain valuable experience industrial management, seeks responsible post, Adviser or assistant to technically trained Managing Director suitable. Present income £1,500, but reduction accepted for post capable of development through own effort.—Box 954.

AMERICAN Professor, visiting England academic year 1952-53, wishes rent furnished flat or house; preferably London, Cambridge or Oxford.—Write details to Cyril Bibby, 14, The Avenue, Barnet, Herts.

THE ITALIAN INSTITUTE, 39 Belgrave Square, S.W.1.—Wednesday, June 4th, at 6 p.m., a lecture (in English) by Senatore Giuseppe Medici, Professor of Agricultural Economics in Turin University: "Land reform in Italy." Admission free.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

CHARTERED or Incorporated Accountant required as soon as possible by important public company, East London easily accessible, as Secretary and Accountant. Experience of Cost Accounts necessary. Age preferably 30 to 40. Pension scheme. Excellent prospects.—Apply Box 526, C. P. Wakefield Ltd., 153, Fleet Street, E.C.4.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH ESTD. 1825 Branches throughout SCOTLAND

UNIVERSITY OF BIRMINGHAM

LECTURER IN SOCIOLOGY

Applications are invited for the post of Lecturer in Sociology. The appointment will be made in Grade III or Grade II, according to the qualifications of the successful applicant. Experience of fieldwork would be an advantage.

Applications, which should be accompanied by the names of three persons prepared to act as referees, should be sent to the Registrar, The University, Edgbaston, Birmingham, 15, not later than June 15, 1952. Further particulars may be obtained from the undersigned.

C. G. BURTON, Secretary.

The University, Birmingham, 3. May, 1952.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the following two posts in the Department of Geography:—

(a) Research Assistant, for a period of one year at a salary of £400, to continue an investigation within the field of Economic Geography on "The Journey to Work on Merseyside."

(b) Tutor for a period of one year at a salary of £350.

Candidates must be graduates in Geography.

Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than June 28, 1952, by the undersigned, from whom particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

May 23, 1952.

HERTFORDSHIRE COUNTY COUNCIL

HATFIELD TECHNICAL COLLEGE

PRINCIPAL: Dr W. A. J. Chapman, M.Sc.(Eng.)

Lecturer in Management Studies

Applications are invited for the above post at this new College which will open in September. Applicants should have responsible industrial or commercial experience, an appropriate degree and/or professional qualification, and preferably teaching experience. Salary £900 by £25 to £1,000. Application forms may be obtained from the Registrar (stamped addressed envelope) to whom they should be returned within 14 days of this advertisement.

MARKET RESEARCH OFFICER is required by Marleans Limited, Great West Road, Brentford, Middlesex. Applicants should be aged 30/35 and have wide experience in collating and interpreting Sales and market research statistics. Good starting salary and prospects; pension and profit participation schemes in operation.—Apply, with full details of qualifications and previous experience to Personnel Manager.

GOOD FOOD

We specialise in catering for industrial canteens, offices, and luncheon clubs. Our organisation is not too large or unwieldy and we can give personal supervision to all our contracts. Write for testimonials from our clients; addresses given on application to:-

POLITICAL ECONOMY DEPARTMENT

Applications are invited for a Junior Research Fellowship and Assistantship in Political Economy. Salaries: Research Fellow—£400 to £500. Assistant £450 or £500 per annum, according to qualifications and experience, plus F.S.S.U. and Children's Allowances. The University will pay a proportion of furniture removal expenses.

Applications should reach the Secretary to the University (from whom forms of applications and conditions of appointment may be obtained) not later than June 20, 1952.

The University, Aberdeen. H. J. BUTCHART, Secretary.

WHITE FISH AUTHORITY, CONYNGHAM HALL, KNARESBOROUGH

Applications are invited from persons qualified by training and experience to fill an appointment as Director of Costings in the Finance Department. The successful candidate will report to the Financial Controller and will be responsible for the organisation and control of a series of continuous investigations into the financial aspects of the operation of every section of the fishing industry in the United Kingdom and also for the conduct of special investigations and enquiries connected with the Authority's general activities. The appointment calls for a high degree of professional ability in modern accounting methods and financial and budgetary control. A wide knowledge and experience of applied economics in the commercial field is desirable, and experience of the fishing industry will be an advantage. Age limits 30-45 years. Salary £1,200 per annum rising, subject to satisfactory service, by annual increments of £50 to £1,500 per annum. The successful candidate will be required to contribute to a superannuation scheme set up under the Local Government Superannuation Acts 1937 and 1939.

Forms of application may be obtained from the Secretary and the closing date for the receipt of completed application forms is Monday, June 9th, 1952.

GLORIOUS BRITTANY.—Hotel Royal-Bellevue (3-star), St. Cast, near Dinard, from 1,200 francs daily, full board, PLUS ONE FREE DAY after each 6 days' stay, allowing a fortnight's seaside holiday on £25.

Taft and Tact

EUROPE should take warning from the broadcast speech on foreign policy delivered by Senator Taft on Sunday last. The speech was intended for purely domestic consumption, as a counterblast to General Eisenhower's homecoming. But that does not mean that it was without international significance. What the Senator said may by next year have become the broad basis of the foreign policy of the United States. What he said is, here and now, an index of how a great many Americans approach the problem of international relations. A presidential candidate does not gratuitously put forward views that have no general appeal.

Is the Senator an isolationist? He denies the charge. He declares that he would have been ready to establish a "Monroe Doctrine" for Europe—to declare that anyone attacking Europe also attacks the United States. He is willing now to leave the six American divisions in Europe until the Europeans can defend themselves. But these statements must be judged against the background of the whole speech. From this it is clear that Senator Taft's attitude towards the Atlantic alliance is at best that of a man accepting a not very welcome necessity. At worst, it comes close to regarding the European allies as expendable —"to admit for a moment that we could not defend ourselves, even if continental Europe were overrun, is defeatism pure and simple." The instrument of defence upon which the Senator would prefer to rely is a strong American air force, able to guard the United States, and, if necessary, to bomb Russia.

This is certainly not isolationism in the old sense. But it is equally far from support and enthusiasm for the idea of a "developing Atlantic community," from acceptance of the doctrine that America's partnership with the other free nations is a permanent and desirable thing. Senator Taft would not dismantle the North Atlantic alliance. But he would hardly make it grow, and without growth it would dismantle itself.

> Thou shalt not kill; but needst not strive
> Officiously to keep alive.

These are not the views of the Truman Administration. They are not even the views of a majority of Americans. But they are the views of a large minority, which might well grow. Many observers of American opinion whose own international sympathies cannot be doubted have lately been reporting that there is a new mood, not indeed of rejection of the objects of American foreign policy, but of scepticism about the progress being made in attaining them and of impatience with the burdens it imposes. This is not surprising. As the cost of the cold war mounts, and it seems to stretch out indefinitely into the future, Americans as well as Europeans get restless. This questioning mood is not isolationism; but it might grow into indifference.

To judge by many of the voices that are to be heard in Europe today, American indifference would almost be welcome. If there are

men and women in America who want to "keep out of Europe," there are men and women in Europe who want them to do exactly that. Communists and fellow-travellers have never wanted anything else, and Europe has also had its neutralists ever since the end of the war. But in 1952 the travail of rearmament and the turbulent problem of Germany have aroused much wider distrust of American policy. Men as divergent in their political views as General de Gaulle in France or the supporters of Mr Bevan in Britain have attacked the American association. In fact, more time and more emotion seem to be spent these days in attacking the Atlantic community than in reaffirming, with all possible vigour, the reasons for its birth.

Those who deplore America's Atlantic policy might usefully ask themselves in what state, without American rearmament and the American commitment to Europe, the free nations of the Atlantic fringe would find themselves today. The Stalinist empire has not changed its character simply because, in the West, some phases of rearmament are found to hurt. The leaders of Soviet Russia have never respected weakness. Compromise does not move them or it would have saved Benes and Masaryk and their country as well. Subservience does not touch them, or Anna Pauker might have evaded the latest Rumanian purge. The force needed to deter them from making their compulsive bids for total control must be available and it must be adequate. Neither condition can be secured in Europe without massive American commitment and support.

*

This case for rearmament as an indispensable check to Soviet ambition has been argued before and indeed, in less confused times, by Mr Bevan himself. What has perhaps been less clearly explained is America's crucial role in resolving the German problem. The essence of the present position is that Germany, whether in a divided or a reunited state, is recovering its sovereignty and, short of world disarmament, a sovereign Germany, with its size, its industrial wealth and its central position, will have enough strength to tip the balance of European politics one way or the other.

Such a Europe, taken by itself, would be inherently unstable. If German policy inclined one way, the Nazi-Soviet pact of 1939 would come to life again. If the German weight were cast the other way, the threat to peace would hardly be less. It is not a balance of power that creates peace, but an overwhelming preponderance of power on the side that has no interest in war. Europe by itself, even with British assistance, cannot achieve such a permanent security. It can only be done by building a permanent Atlantic community in which the United States plays a permanent part. The clever European politicians who want to embarrass their governments may not see that. But the great mass of ordinary people do. They know that the chief hope of peace in 1952, unlike 1914 or 1939, lies in the fact that the United States is actively engaged in world politics. When Senator Taft looks forward to the withdrawal of American troops and to Europe's "self-defence," he unwittingly places Europe at Germany's mercy once again and re-creates the conditions in which Germans and Russians can bargain at the expense of the West. Is this the consequence that the Gaullists or the Bevanites or Dr Schumacher in Germany really seek? Is this the end for which they are prepared to see the Atlantic Community dissolved?

No doubt they would deny any such aim. But Senator Taft's broadcast is a warning that it could happen. The idea of a permanent Atlantic community is not so firmly based in American public opinion that Europe can take it for granted or run any risks with it. For the European oppositions to use the American alliance as a convenient means of embarrassing their own governments is to play a very dangerous game indeed. Do they reflect sufficiently on the Europe that they would inherit if the American shield were to be withdrawn and Europe were once again to depend on whether Germans and Russians were striking blows or bargains?

*

This is not to say, of course, that there should be no criticism of American actions. Indeed, in many ways, the more constructive criticism there is of specific American policies the better for everybody. But it is a plea that, in this election year, there should be as much common sense and courtesy as possible in approaching the general issue of Europe's relations with America. The plea is directed in particular to the European oppositions. Some of them already see the point. Mr Attlee, for example, said on Monday that

> there is a lot of loose talk about the United States from people who refer to American imperialism and similar phrases; but no country in history has ever made greater efforts to help other countries than the United States has done in the last six years.

But Mr Morrison undid all, and more than all, the good his leader did by gratuitously declaring in Copenhagen on Tuesday that the Labour Party, when returned to power, would push for the admittance of Communist China to the United Nations. What possible good is served by saying that at this moment? The mischief it may do is incalculable.

Americans are rightly jealous of anything that they deem to be interference with their domestic politics, and it is perhaps as well to make the point that nothing of the sort is here intended. Europeans may have their hopes and fears about the identity of the next President; but they are not so foolish as to think that they can influence the choice. Least of all is there any suggestion that Europeans, by suppressing their real opinions for the duration of the election campaign, should try to deceive American public opinion. Quite on the contrary, the suggestion is that the basic truth—which Europeans, as they play their domestic politics, are apt to take for granted and leave unexpressed—should be plainly stated. However much indifference to the Atlantic Alliance there may be in America, there is very little in Europe. The mass of the people, all the politicians in office—and even the great majority of the critics when they in their turn bear responsibility—all know that on it rests the main hope of preserving peace.

British Banking

The Annual Review will be found on pages 687 to 705 of this issue, and a selection of British Banking Statistics appears in this week's issue of the *Records and Statistics* Supplement.

Reason in Rents

IN Britain, the great majority of rented dwellings—except for those owned by local authorities—come within the scope of the Rent Restriction Acts. Only a small minority of better houses with high rateable values are free from rent control. Houses built by local authorities do not have the protection of rent control, but they do have the benefit of large public subsidies. Thus, nearly all the citizens of Britain, other than those who own their own houses, enjoy housing that is cheapened by government action of one kind or another.

Those who see nothing wrong in this state of affairs have not considered its real effects. In practice, the present tangled system of rent controls and subsidies creates more in the way of waste and injustice than it relieves in the way of hardship. Rent control gives protected tenants a strong interest in remaining in their present dwellings, which most of them have occupied since before the war. It leads to inflated rents for the few uncontrolled dwellings, which causes a manifest injustice to be done to those not lucky enough to occupy a controlled dwelling. Many newly married couples have no alternatives but to share crowded quarters or to pay an extortionate rent.

This situation creates a whole chain of undesirable effects. In the first place, it makes workers less mobile, and it forces many people who do take a job in a new district to travel long distances daily, in order to remain in the controlled dwellings where they are sitting tenants; the vigour of the recent outcry against fare increases is in part a consequence of this situation. In the second place, strict rent control fosters the wasteful use of housing space to an extent which can only be guessed at but which is certainly considerable. Many families that are reduced in size by death or marriage find it distinctly cheaper to stay where they are than to move to a smaller dwelling—and larger families therefore have to remain cramped. People with a room to spare are under little pressure to take a lodger to help out with the rent. In the third place, controlled rents are undeniably too low, in relation to present building costs, to enable even the best of landlords to make proper provision for repairs. A considerable portion of the total stock of houses is being in this way hastened to premature decay and ruin.

These objections do not apply to the rent policies pursued by local authorities. Against these an objection of a different sort must be alleged. It is that the state is subsidising an arbitrarily chosen group of its citizens to an unwarranted extent. In 1938 the subsidy on local authority housing was £21 million. Currently it is twice this figure, exclusive of the high cost of emergency housing which is wholly borne by the central Government. What is more disquieting is that the cost has been increasing by some £3 million a year and that now, thanks to Mr Macmillan's magnanimity, it will rise faster.

Politicians quite fail to realise the extent to which they are mortgaging future revenue in blundering on with a policy which has never been rationally thought out and justified. The housing subsidies are not a selective relief to the needy. They are not given in aid of the poorest families, most of whom live in old controlled properties. Under existing legislation, council tenants are drawn from a wide range of income groups and without doubt many of them could afford to make a larger contribution to the cost of being housed.

The rents of controlled and local authority dwellings have to be considered in conjunction since they react on each other. Most of the houses covered by rent control were built before 1919; there are 8 million or so of them, which is more than half the total stock of houses. Most of them are far inferior, in every respect, to the 1,500,000 houses built by local authorities between the wars and still more so to the further 1,250,000 which have been completed since 1945. Local councils feel obliged in some measure to relate the rents of these newer and better dwellings to those of the controlled properties from which most of their tenants are originally drawn; and they have been under obvious pressure not to break the standstill on prewar rents. On the other side, one obstacle to raising the rents of controlled houses to an economic level lies in the fact that their tenants, as ratepayers, are helping to subsidise residents in council houses who are much better housed than themselves.

*

Such is the general nature of the rent problem. The present government has every reason to seek a speedy remedy. It accepts the vital importance of redeploying the industrial labour force; therefore it must wish to reduce artificial restrictions on the mobility of labour. It regards housing as the first social priority; therefore it must regard with dismay any cause of wastage and decay among the existing stock of houses. It believes in the ideals of home ownership; yet present housing policies

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

discourage and discredit this very ideal. The family buying a home gets no aid from the state, but the family which secures a state dwelling gets over 40 per cent of its rent paid for it. No wonder local authority waiting lists are swollen to such enormous lengths, while the demands for private building licences, now that at last they are more freely available, is below expectations.

There is also a political reason why the government should not be afraid to tackle the rent problem. Their opponents may otherwise steal a march on them. The Labour theorists, at least, are getting round to the modern rent question. One result is a recent Fabian pamphlet,* whose author, Mr D. L. Munby, suggests a plan which has at least the merits of being responsible, logical and comprehensive. Briefly, it is that urban working-class housing should be progressively and compulsorily municipalised, and rents then adjusted to take account of relative amenities and to provide, in the aggregate, for repairs, maintenance and a return on capital. Mr. Munby is as fully alive as a liberal economist to the anomalies of the present position, and to the case for an upward revision of controlled rents. Indeed he aims, through an average increase of 5s. a week in controlled rents, to find the money both for undertaking proper repairs and for reducing the subsidy bill by a substantial amount. He would use complete socialisation to lift most of the housing burden from the taxpayer and ratepayer.

Despite the plan's ingenuity, there will be few other than determined Socialists who can stomach the notion of a complete public monopoly in housing. Mr Munby would prevent too much concentration of power by arranging for municipal instead of national ownership and control. But this device has difficulties of its own. What guarantee, for instance, is there that local authorities would pursue the policy of rent rationalisation on which Mr Munby rightly insists? At present, most of them fail to do this even on their own estates.

This Fabian pamphlet may at least serve to show the present government the dangers of indefinite delay. If it dallies too long in making the moderate and unpartisan reforms which are surely open to it, it may find that the initiative is seized by the next Labour Government and used in a direction that cannot be reversed. Whichever party lets rents rise will, of course, earn some unpopularity. But the Tories ought not to turn in fright from the prospect when Socialists recognise, in theory at least, the need for higher rents. If the government played its cards properly—and if it acted in time for the benefits as well as the costs of rent reform to be visible by 1955—it need not lose votes as a result and it might even get for once more credit than blame.

*

The first requirement of a rational policy is an upward revision in the general level of controlled rents. In theory a case can be made for reverting by stages to a free market in rented property. In practical politics, even a policy of partial decontrol must be ruled out at present. But this does not mean that nothing can be done. The issue was faced once. After the first world war, all controlled rents were allowed to rise by a simple percentage. To repeat this would be a crude remedy; it would be particularly unpopular and it would perpetuate anomalies by ignoring changes in the relative values of properties which have taken place since 1939 or earlier. But even this blunt instrument would be far better than nothing.

It is probable, however, that a more scientific method of rent revision can be found. One interesting approach, for which fresh arguments have recently been adduced by the Chartered Auctioneers and Estate Agents Institute*, is to link the level of rents to the rating system. The first step would be to make the repairs allowance realistic at present prices; that is to say, the statutory deduction from gross rateable value allowed for repairs would be multiplied by the increase in the cost of repairs since 1939; the product would be added to the controlled rent. This would meet the most immediate problem. The full solution would consist in equating the controlled rent of each dwelling with its gross value as determined for rating purposes. This proposal has the great advantage that it could be related to the Inland Revenue's comprehensive review of valuation lists, which is intended to secure uniformity between local areas, if and when that review is completed.

It would take a fertile imagination to paint some such system of rent revision as the cause of much hardship and a myopic vision to see it as an act of class warfare. Since the earnings of the average industrial worker have about doubled since before the war, while his rent has remained unchanged, it is clear that the effective burden on the occupant of a controlled dwelling is about half what it was. The average controlled rent is little more than 7s. a week in the country as a whole and 11s. 6d. in London. To award an increase of up to 50 per cent could cause no more than a marginal amount of hardship, which —as with the food subsidies—would be better treated by larger social security provisions and family allowances than by keeping rents far below their economic level. So far as landlords are concerned, it is no more than common sense and justice to make allowance at least for the present cost of repairs. It would no doubt be prudent, and it would not be difficult, to strengthen the safeguards requiring landlords to keep their property in good condition.

*

The other half of rent policy is to apply the same general principles to local authority housing. The problem is complicated here by the widely differing practices of local authorities and by the high cost of postwar building. While the average prewar council house is still rented at little more than 10s. a week, the subsidy for postwar houses is based on the assumption of a notional rent of 18s. Moreover, the same type of postwar three-bedroom house was being rented last year at 9s. 3d. by one local authority and at 29s. 3d. by another.

Progress towards a more rational system of council rents requires councils to accept two principles. The first is that a local authority should pool its subsidies and fix its rents according to the intrinsic worth and amenities of its different properties, instead of according to the accident of when and under what Act each of them was built. It seems that only about a third of local authorities have consolidated rents along these lines. The second principle is that the local authority should fix a level of rents which will in total yield an income adequate, with the statutory subsidy, to meet its housing costs. This would put an end to the pernicious system whereby additional subsidies are found by raiding the repairs fund or the general rate fund.

But the Government should do more than impress on local authorities the essentials of sound housing management. It should accept the need for a reduction in the statutory housing subsidies which Mr Macmillan has just foolishly increased. To subsidise every council tenant, whatever his income, by an average of over 40 per cent of the cost of his house—or more than this if he happens to live in a flat—is an unwarranted extravagance. Subsidies for general housing purposes cannot now be immediately eliminated, but they should at once be kept within a strict upper limit of, say, a quarter of the economic rent. To go further than this is grossly unfair to that majority of the community who must support the tenants of council houses.

There is no reason to suppose that the application of this principle would cause widespread hardship. But in so far as hardship did result, as it would in a few cases, the local authorities have a means of meeting it through the system of rent rebates to families with very low incomes. Only a small minority of local authorities are at present operating rent rebate schemes. Objection is often taken to the "inquisition" into means which is entailed. But it is quite unfair that taxpayers and ratepayers should be mulcted indefinitely and subsidies paid to those who do not need them, in order to spare the susceptibilities of a small number of council tenants who cannot afford to pay a reasonable rent.

Such reforms as these would be far from perfect. They are a compromise between what is economically desirable and the reluctance of politicians to disturb anything that appears to benefit a lot of people. The point is that a practical compromise can be found—and ought to be put into legislation within the next year or two.

Roundabout and Roundabout

THERE is little point in protesting against the symptoms of political uncertainty in Britain. A government elected with a narrow majority seven months ago is already half-demoralised by evidence of its declining popularity, but has to face crucial issues both in foreign policy and in economics. In these circumstances debate is bound to concentrate on short-term matters. It is harder than usual to see the wood as a whole. Yet, even so, it is surprising that there has been so little discussion of the general constitutional principle behind the debates about denationalisation. How far are ministers entitled, under the two-party system of parliamentary government, to reverse their predecessors' measures?

The present government proposes to repeal the Steel Act, by denationalising the industry; it proposes to amend the Transport Act, by returning road haulage alone to private ownership. Labour last month responded to the second, milder proposal as it responded at the beginning of this Parliament to the first. The leaders of the party have indignantly committed themselves to restoring when they are next in office all the creations of the 1945-50 Parliament on which the Tories dare to lay a destructive hand. The difficulties and dangers of this situation need no labouring. Immediately, by frightening private investors who would be willing to return to steel and road transport, it raises a formidable obstacle to measures that Her Majesty's present Government firmly declared to be its policy before it was elected. And if the Conservatives nevertheless go ahead with their plans, steel and transport may find themselves faced with three fundamental changes of organisation—nationalisation, plain, de and re—within some eight years. No one, socialist or non-socialist, really wants that. The control and management of basic industries cannot be disturbed with every change in the tide of politics. If the parties are unable to avoid this result, the British party system is in decay.

The situation is serious enough for some people who do not like nationalisation nevertheless to regret that the Tories ever advocated denationalisation. The proposals for steel and transport are, it is said, an unjustified departure from the British political tradition. This attitude carries more weight because it fits in with practical considerations: there are undoubtedly Conservative leaders who would gladly be rid of one or other of the proposals. That is the measure of the power of obstruction that the narrowness of the party division gives to Labour. But the Government's difficulties over its timetable ought not to be confused with an assertion of principle. To say that no incoming government should have the right to undo what its opponents have done ill would be just as foolish, and nearly as destructive, in the long run, of the efficiency and stability of British democracy, as to establish the practice that every new government should repeal *in toto* all that its predecessors enacted. Neither extreme position is tenable.

*

Historically it is true that governments rarely have reversed their predecessors' measures, however strongly those were opposed before they became law. But a generalisation is not the same thing as an established rule. In British constitutional practice, precedents create conventions only when, as an eminent authority has put it, they are recognised to have created conventions. And hitherto there has been no recognition in this case. The Labour party followed no such rule when, as soon as it gained power, it repealed the Trade Disputes Act of a prewar Conservative government. Independent opinion did not condemn the Tories' present denationalisation proposals as unconstitutional when they were declared in opposition. To have doubts now is not to respect constitutional principles. It is faint-heartedness. It arises simply because Labour in opposition has bared its teeth in defence of its Iron and Steel Corporation and Road Haulage Executive.

The reason for this ferocity is plain. It is Labour's lack of policy. Defence of what the last government did is the only thing on which all sections of the party can unite with enthusiasm. The poorness of the motive does not make Labour's attitude any less important—particularly when its chances of forming the next govern-

ment are so good. But the fact that a bewildered party clings so bitterly to what is familiar to it is no basis for erecting a new constitutional principle. It is not a reason for limiting the freedom of government action that is one of the characteristics of British parliamentary democracy.

The significance of Labour's reaction is simply that it illustrates one of the practical reasons why governments are and should be cautious in reversing their predecessors' measures. Whether the measures in question have worked well or badly from their authors' own point of view, an open and direct reversal of them hits the defeated party at a tender spot. It rubs in the election defeat. Inevitably, it stirs strong emotions in any politicians, even if they are reasonable and disinterested as politicians go. It encourages them to strike attitudes and commit themselves irresponsibly to repeat what they did five years ago in circumstances, perhaps five years or more ahead, that no one can foresee.

These are overwhelming reasons for caution, but they are not excuses for inaction. Politicians will always on slight provocation strike attitudes and at times oppose irresponsibly. If a government were never to do anything that encouraged these things, it would do nothing. It is not the main duty of Ministers to keep their opponents on the narrow path of political moderation—even opponents far less inclined to stray than the present Labour leaders.

It is not only legislation that can be reversed. In practical politics, there is no sharp dividing-line between legislation and administration. And the denationalisation of steel and road haulage do not anger the Labour party more, or make it react more irresponsibly, than the health service charges. Anything new that a government does is in some measure a reversal of previous policy. It is by implication a criticism of the previous government and can, if the opposition is sensitive and arrogant enough, provoke resentful threats to restore the *status quo* at the first opportunity.

★

The conclusion of this argument is plain. There is no escape from the present party deadlock over steel and transport by trying to establish a principle that governments should leave undisturbed what others have done. This is not to say that a game of roundabout and roundabout can be allowed to develop. It would produce, in the case of nationalisation, denationalisation and renationalisation, little short of chaos in industry. How can this danger be avoided, or at least limited, by more flexible rules? Four points suggest themselves.

1. *Fair warning:* This is the field where the doctrine of the mandate is most clearly applicable. The reversal of existing legislation cannot be an unforeseeable issue; in all but the most exceptional circumstances, a government is justified in undoing its predecessor's work only if its election programme has plainly said so.

2. *Moderation:* Whatever the mandate, reversals of previous legislation should be moderate in scope. If a government should want to scrap an overwhelming part of what the other party in the state has done, the national unity underlying political differences would already be broken and democracy would be in peril. Neither party can afford to run any risk of creating such an impression.

3. *Fair trial:* The repeal of legislation, however fundamental the objections to it expressed in debate, must be rejustified by evidence that the legislation has in fact worked badly. Repeal is highly questionable if the case for it has grown no stronger with experience.

4. *Constructiveness:* Repeal still cannot be justified unless the alternative to the existing legislation is promising. No government should embark on undoing its predecessor's measures without a reasonable expectation that, by the time Parliament has run its natural term, there will be a clear improvement to show for the upset and risks.

The Tories' present proposals easily pass the first three of these tests. Denationalisation of steel and road transport were promised at the election. They undo only one item and a portion of another item of the Labour government's vast mass of legislation. The portion of an item—nationalisation of road haulage—has had little relation, in practice if not in theory, to the main effect of the Transport Act, which was to nationalise the railways. And it is no secret that the one full item—steel nationalisation—is a measure that some Labour Ministers themselves opposed and that was deliberately designed to satisfy socialist enthusiasm rather than to make any real reform in the industry. Finally, many liberals and independents share the Tories' view that nationalisation in these industries has not worked well so far and has shown little promise.

It is by the fourth test that the Tories are in danger of failing. Neither for steel nor for road transport have their alternatives to nationalisation yet been worked out in detail. But what has been revealed about the broad nature of their schemes is disquieting. They do not promise a regime of efficient, competitive enterprise instead of state monopoly. They offer little hope of solving the problems of steel and transport that nationalisation has failed to solve. Yet this is surely the critical test from the constitutional as much as the economic point of view.

If the denationalisation measures are ill-designed, Labour will enjoy itself in opposition and work itself into a position where it is absolutely committed to renationalise. But if denationalisation is after all well thought out, if it proves to offer real scope for lowering the cost of steel and transport, the Labour party will discover that irresponsible opposition yields electoral losses. Its leaders may by 1955 be announcing magnanimously that for the sake of industrial stability they will let denationalisation of steel and road haulage be. In the state things have now reached, that is surely the result which Conservatives who look beyond narrow party interests, as well as independent opinion, should hope for.

It involves for Ministers an extraordinarily difficult task: essentially, they are required by the wisdom of their own measures to shame the Labour party into a sense of responsibility. Success in such an endeavour cannot be guaranteed; it is an open question whether, when it is rent by internal quarrels, the Labour party is capable of shame. But genuinely to make the endeavour will at least justify the Tories in their decision to repeal two bad pieces of legislation. Otherwise, it might be British democracy that would be thrown off the roundabout.

The Mark of the Age

The submarine telegraphic communication between England and Ireland was completed on Tuesday. . . . Though the Legislature, therefore, stand still, or even under the guidance of Lord Derby try to retrograde, the business of life goes forward with an accelerating velocity. Discoveries in science and improvements in art are not dependent on Parliamentary enactments. The laws that call them into existence in all times and places are perfectly effective; they are never put on half-pay, and their operation is not to be suspended by any supineness, neglect, or even active opposition from any quarter whatever. In conjunction with them new trade springs up, new business is carried on, more people can find the means of subsistence, more children are born, more grow up, more are ready and willing to seek new homes in other lands, and society expands and fills more and more of the surface of the earth. . . . Material improvements, strange and unexpected, mark the age, and they are not confined to any one country. In various parts of the Continent and in the United States, railroads and telegraphs, the two most conspicuous modern inventions, are almost as common as in England. Never, perhaps did two great and remarkable improvements come so rapidly into general use. Society was everywhere ready to adopt them. They are congenial to it, and have become parts of it. They belong not to any one country, but, like trade, to every country. They are everywhere, or will become everywhere, parts of that society of which trade is another part, to which legislation, whether in Russia or in England, in the United States or in Japan, must be adapted. There are some elements, then, of society, some of its parts which are growing and extending, common to every community, and which all over the world will in time effect a considerable conformity of legislation.

Commonwealth Development—II

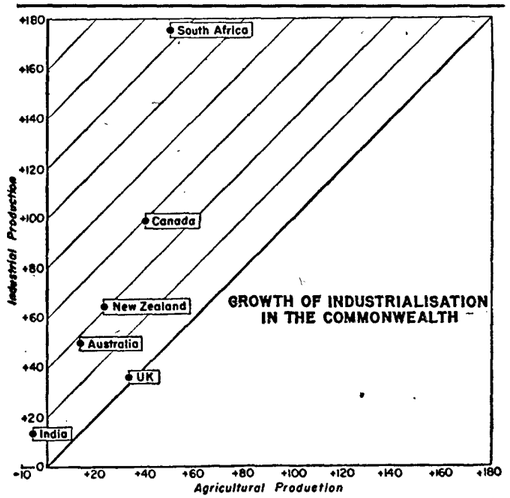
Two Basic Conditions

THERE is no doubt that the potential resources of the Commonwealth are vast, and some indication of their vastness was given in the previous article. But the mere existence of resources is not an overwhelming argument in favour of development. A vital consideration, particularly for countries dependent on international trade, is cost. The United Kingdom has never bought its imported raw materials or foodstuffs regardless of cost. Preferences have been given on certain commodities from the Commonwealth; but they are not large and have not been given for long. Indeed, it is vital that Britain should buy its requirements in the cheapest possible market. Britain is as dependent on its export trade for solvency fully as much as it is dependent on imports to prevent mass unemployment and mass starvation. The imports have to be paid for by exports, and the exports have to sell in world markets. Britain's manufacturers have to accept world prices for what they sell, and they cannot afford to pay more than world prices for what they buy. To be sure, these truths have been somewhat obscured by the universal sellers' market of recent years. But competitive conditions are beginning to return and in a country committed to high employment, manufacturers cannot afford to pay inflated prices for their raw materials. It is wise to proceed with development in the Commonwealth only where the resulting supplies will be available at prices no higher than other producers will demand.

This is not the interest of the United Kingdom alone but of the primary producers in the Commonwealth as well. No country likes to be linked to a single market. If primary production in the dominions and colonies is to be expanded, the main market for this extra output will doubtless be in Great Britain; but the producers will also want to be able to sell elsewhere, and for that they must be able to produce at competitive prices, without too great a degree of dependence on the preference they may enjoy in the British market or on any other devices for getting more than the world price.

All this is familiar—though it is often forgotten. But recent years have brought one important new element into the picture. What is the world price for a commodity? To a large extent, there now tend to be two world prices—one the price that is offered and accepted when payment is made in dollars or in other hard currencies convertible into dollars; the other (and higher) price the one that prevails when payment is made in one of the "soft" currencies which, convertible in various degrees into each other, are not convertible into dollars. This divergence between dollar and sterling prices for similar commodities was particularly marked last year; sterling prices ranged from 20 per cent higher for hemp to over 100 per cent higher for copper. The differences for selected commodities are shown in Chart I. But last year was exceptional and it would be unwise to expect such large premiums for sterling supplies to continue. Generally, sterling prices have been only about 10-12½ per cent above corresponding dollar prices.

If these conditions are likely to persist indefinitely, then the requirement that development in the Commonwealth must be able to justify itself competitively is lifted in a significant degree. It is not removed altogether; for Commonwealth supplies must still compete with other non-dollar supplies. Nor can the gap be very large; for the Commonwealth primary producers will wish to sell part of their output in dollar markets—indeed, in many cases it may be essential that they should do so; and the British manufacturer, in his turn, will have to sell part of his production in dollar



markets, where it will compete with goods made from cheaper materials. Sterling commodities cannot therefore afford to be more than a little more expensive than dollar commodities. There cannot be any wholesale development of commodities that at present have to be imported from the dollar area. Each commodity will have to be decided on its merits. If zinc can be produced in Nigeria at only slightly more than its cost of production in Mexico or in the United States, then a case can be made out for its development. But only in exceptional circumstances should development be pursued if costs are very much higher than in competing areas.

Nevertheless, the persistence of a division of the world's currencies into hard and soft, with imperfect convertibility between them, does create a certain added margin of potential profitability for Commonwealth development. But will this division persist indefinitely? Few things are harder to predict — and yet more essential to know as a basis of assumption. The official policy and hope is to restore the full convertibility of sterling. It seems reasonable to suppose, however, that even if sterling becomes officially convertible, Britain and the other non-dollar industrial countries of the world will have to watch very carefully the volume of their dollar purchases. Even if it is not enforced by exchange control, there will remain a strong bias in favour of purchasing where payment does not have to be made in, or the purchase money converted into, dollars. This should translate itself into a margin of protection, perhaps undefined and inarticulate, for the Commonwealth producer. But it is rather a shadowy foundation for expensive schemes of development—hardly enough to justify proceeding in cases where the basis of profit would entirely disappear if the globe became one world again in matters of finance and commerce.

*

There remains the second basic condition that will have to be observed if there is to be a great expansion in Commonwealth development. The dominions are independent countries, and even the colonial territories are being granted more and more independence in their domestic affairs. These countries cannot be told to develop; they must accept development as part of their economic policy. This is not just a matter of granting leases or arranging royalties. The government of the area must actively help in the project. Development is not always the simple matter of erecting a new mine or ploughing up virgin grassland. It often involves building new towns, providing all the necessary public services, including schools and roads. Further there must be no threat of nationalisation as soon as the project shows that it can pay its way. But the problem is even wider than that. The expansion of secondary industries can be a natural development, such as the movement of metal refining from the consuming to the producing areas. Since the great depression of the 1930's, however, many primary producing areas developed consumer industries in order to diversify their economies and to make them more stable in times of economic upheaval, and some of these new industries are dependent on imported raw materials. This tendency was stimulated during the war, when these countries were cut off from their normal sources of imports of manufactured goods, and it has continued since the war. Some idea of its extent can be seen from Chart II which shows the percentage increase in industrial output relative to agricultural output in 1950 compared with prewar years for certain members of the Commonwealth.

If a country is to develop its primary production, it must be willing to export its output and to receive in return goods that it cannot produce so efficiently itself. This does not mean that all secondary industries in the primary producing areas must close down. It does mean that their development must not be artificially stimulated. The benefits of international division of labour encouraged by expanding international trade have been forgotten in recent years. But the history of Britain during the last 150 years has proved that these benefits exist; indeed, were it not for international trade the British people would have a much lower standard

Countries where industrial output has increased more than agricultural output lie above the diagonal line; in those countries farther away from the diagonal, industrial output has increased relatively more than in those countries nearer it. If countries had expanded agriculture more than industry they would have been below the diagonal.

of living than at present. And this lesson will also have to be observed by the other members of the Commonwealth. They will need to appreciate that a development plan, designed to expand their exports, has direct implications for their imports also. They will have to ask themselves how—that is, in what goods—they are to receive payment for the additional exports they send out, or—to put the same truth in another way—how their potential customers are going to be able to buy from them except by selling more to them.

The Commonwealth, then, has vast resources, some of which have been developed and others remain to be developed. The two particular questions to be answered at the outset are, first, what resources can be developed at a cost not much above that in competing areas, particularly in the dollar area; and secondly, whether the countries concerned will permit and encourage this development and accept imports in payment for these exports? If the answers are in the affirmative—and again it must be emphasised that development must be studied commodity by commodity and area by area, and not as a grandiose all-embracing policy—other equally important problems remain to be solved. And the first is whether long-term markets exist for this extra output.

(To be continued)

NOTES OF THE WEEK

Bevan *versus* Attlee

When the Labour Party reassembles at Westminster next week for the last two months before the summer recess it will have to sort out a new version of the Bevan controversy. In the past Mr Bevan has tried to preserve some, at least, of the formalities of a dispute about things, not about persons. But just before Whitsun the Bevanites launched a direct and outspoken attack on Mr Attlee's leadership. In *Tribune*, the periodical edited by Miss Jennie Lee and Mr Michael Foot, Mr Attlee is accused of having endangered the unity of the party. He is charged with having thrown over, in the last debate on foreign affairs, the Labour party executive's declaration demanding that further talks between the four powers should precede any German rearmament. That policy was attacked by Mr Eden, and Mr Attlee in his reply sought with remarkable deftness to bridge the obvious gap between the executive's statement and the policy which the Labour Government had followed in power.

The open attack in *Tribune* was supported by a more subtle move in the House of Commons, where the Bevanites secured close on sixty signatures to a motion calling for the adoption of the national executive's policy. The very tabling of this motion by the back benchers of the Opposition can only imply that, in their view, the front bench is not doing its job. The Bevan controversy has become a direct challenge to Mr Attlee's leadership as well as to official party policy.

Dr Dalton's name was not on the motion about Germany, but he is undoubtedly playing an increasingly active role in trying to swing the Labour party decisively against German rearmament—and to make a personal come-back. The issue gives him a link with Mr Bevan which may become important in the internal politics of the Labour party. If they intend to hunt together for power some strange things may happen. Personalities apart, the question of German rearmament is a far more fundamental division of opinion than that about the degree of rearmament. And while Mr Bevan may not have succeeded in his avowed intention of ending the period of bipartisan foreign policy in the Commons, he is certainly putting an end to any such unity of opinion within the Labour party.

The effect of these repeated attacks on the party leadership is likely to be all the more grave because the attackers have no clear-cut programme, particularly on economic affairs, to offer instead. The Labour party is now in imminent danger of finding itself, if not utterly leaderless, at least with its leadership more weakened and divided than at any time for the past twenty years. It is feeling the loss of Ernest Bevin and Stafford Cripps even more keenly now that it is in opposition than it did in its declining months in office. As the perspective lengthens those two stand out more and more clearly as the real architects of the policy of the postwar Labour party, and the gap has certainly not been filled from either wing of the movement. Mr Attlee is a skilled and highly respected leader of men. But he is not a leader in policy. His great contribution to the Labour party was his ability to get the policies of Mr Bevin and Sir Stafford carried out despite the existence of a powerful opposition to their ideas within the ranks of his own supporters. His problem now is that he has been left with no such policies to put across.

* * *

Arms and the Unions

The General Council of the TUC showed courage in rebuking last week all the opponents of rearmament within the trade union movement. Its statement divided the protests against the present rearmament programme, which have now been registered at the annual conferences of a succession of unions, into two categories. There are the Communists "who, because the object of their first loyalty exists outside this country, have been consistently opposed to any rearmament of the free nations." And there are, secondly, people who think "that rearmament is a luxury which can be taken up, materially modified, or discarded at will"—in short, the Bevanites. The TUC rejects this view as decisively as ever. It maintains that the rearmament programme, though it may have to be modified, must be carried out at all costs and whatever happens. It rejects the theory, so popular in the unions, that Britain's economic troubles are caused by rearmament.

In saying these things the TUC fulfils an important and obvious public duty; it knows that most trade unionists would still, if the issue were put in this form, support the foreign policies that Mr Eden has inherited from Ernest Bevin. Unfortunately the organisation of the trade union movement makes it inevitable that the TUC should speak late in the day—after many unions have passed their resolutions calling for less rearmament. And, as the electricians and foundryworkers have shown this week, the TUC cannot change the opinions of unions whose delegates have already made up their minds.

The difference between the principal union leaders assembled as the General Council of the TUC and the individual unions is not, on an issue of this kind, surprising or necessarily disturbing. The TUC takes, at times, a national view; the unions think first of how rearmament affects the interests of their members, which they exist to protect. The national committee of the Amalgamated Engineering Union would probably never have voted against rearmament if a voluble few had not managed to convince a great many engineers that rearmament threatens to disturb their livelihood. It is significant that the National Union of Mineworkers, which is often more rebellious than the AEU, does not propose to discuss rearmament at all at its forthcoming conference; the miners do not feel personally affected one way or the other. When narrower interests determine so many union attitudes to political questions the direct influence of the TUC is bound to be small. It is to the political leaders of the Labour movement that the unions look for guidance on rearmament, and until the Labour party as a whole has made where it now stands more certain the disagreement between the TUC and many of its constituent unions will continue. The Council's pronouncements on foreign policy will carry regrettably little weight with those they are aimed at.

* * *

On the German Frontier

The measures now being taken to create a no-man's land along the 400-mile frontier between East and West Germany point clearly in two directions. First, the Communists and their Soviet advisers are intent less on sealing off their zone than on controlling access to and exit from it. When Grotewohl and company talk of stopping the influx of mischief-makers they should be taken seriously; for much propaganda goes in to Eastern Germany and much information comes out of it. But a complete sealing off would mean the end of illegal trade which is vitally important to the East German economy. Secondly, it is apparent that the Russians intend to thrust the East German government more and more to the front in dealings with the West in Germany. It must be expected that control of eastward movement will fall more and more into German hands, and that the western

governments will find themselves forced to negotiate with the regime and not with the Soviet occupying power. That is a prospect about which the Americans, British and French should do some hard thinking now—not forgetting Korean precedents.

The Russians and East Germans are playing their cards slowly, and will certainly keep something up their sleeves for the period when Dr Adenauer's agreements with the West come up for ratification. They can do many things to make West Germans think that unity is fading further into the distance while saying things that make it seem still possible. For there are insufficient honest men in West German politics to point out that the division and rearmament of Germany were begun by the Russians.

The action taken against the Communist broadcasting station in the British sector of Berlin was a quite justified gesture in the circumstances of the last three weeks. There is continuous danger of incidents arising as the Soviet cordon round the city is tightened; and one positive move from the western side which obliges the other side at least to negotiate is the only way to show firmness. Although there is still no sign that this is more than cold war of the familiar kind, the greatest restraint in action and language is called for.

* * *

Police and Partisans

A real trial of strength is now on between M. Pinay's government and the French Communist party. M. Duclos, the Secretary-General of the party, is in prison and last weekend the police raided the national and several regional headquarters of his followers. They were searching for evidence of an attempt against the internal security of the state. The clash in the streets of the capital which began the trouble seems to have been a calculated challenge to the Paris police; the party had had fair warning that demonstrations against the arrival of General Ridgway to succeed General Eisenhower would be suppressed, and it replied by turning out its trained bands—as ugly customers as any European city can produce. These were not by any means the first *bagarres* of this kind, but it is a long time since a French government reacted so vigorously and with so much popular support. Our Paris Correspondent describes in an article on page 661 the background to these happenings.

The Government's action will, of course, be criticised and every liberal-minded person will keep a sharp eye on how police forces are used in countries where the political trend may be towards the right. But it must not be overlooked that, if the police do not maintain order against the Communists in the cities, then others will start doing it for them, as happened in the Weimar Republic. Stern enforcement of law by Ministers of the Interior responsible to parliament is a legitimate and necessary part of the defence of democracy; and the more efficient and organised the forces of disorder become, the more efficient and organised the forces of order should be. The alternative is the appearance of the storm trooper and a gradual drift towards personal dictatorship.

With the Fascist experience to look back on, Signor de Gasperi's government has used this lesson for Italy. The special gendarmerie, called *Celeri*, are now treated with respect by street fighters of both Right and Left. Germany and Japan may be facing the same problem at any moment. It is puzzling to the layman that so little has been done to provide the police with ways of resisting violence which would be effective but not brutal. Hoses using dyed water are surely not the last word on the subject. It is difficult to believe that scientists could not help in the search for weapons which would reduce the risk that the maintenance of order should lead to irresponsible brutality by exasperated policemen. Is there anything specially democratic about hand-to-hand fighting?

Syngman Rhee and the Korean War

Whether or not the North Koreans and Chinese Communists intend to launch the military offensive for which they have been building up capacity, the United Nations now have plenty of trouble behind their lines in Korea. In addition to the extraordinary incidents on Koje Island (where it seems that Communist prisoners of war are now being intolerably "provoked" by being deprived of their right to fly their own flags and deck the camp with political slogans), there is the much more serious affair of the conflict between President Syngman Rhee and the South Korean Assembly which has resulted in the arrest of a number of its members.

Under the constitution the President is elected by the Assembly and Dr Rhee's term of office is due soon to come to an end. He has been on bad terms with the present Assembly, which was elected in May, 1950, just before the outbreak of the Korean war, and his chances of being re-elected by it are slight. He has now resorted to coercion and intimidation in an attempt to crush parliamentary opposition to his rule. This is a scandalous state of affairs in a country which is nominally democratic and owes its survival to its protection by the UN armed forces. The situation justifies measures by the United Nations' Command to compel President Rhee to observe the constitution even if it means his own political eclipse. As a political figure, he is worthy of respect for his struggle in early life against the Japanese oppression of his people (when he was imprisoned and tortured by the Japanese), for his stubborn perseverance in exile to obtain international recognition for the Korean national cause, and for the energy with which he has tackled very difficult problems of government since his return to Korea. Unfortunately he has reached a stage of self-importance in which he regards himself as indispensable for the salvation of Korea and all opposition to him, however legal and constitutional, as treason.

The United Nations' Command and the governments associated with it cannot be expected to share this view. Its army is in Korea to protect the Korean Republic against external aggression, and in consequence also against any Communist-instigated insurrection behind the lines aiming at the overthrow of the recognised government; but this protection cannot extend even indirectly to support of President Rhee against a body which has the constitutional right to remove him from office. There is naturally the greatest reluctance among the UN governments to intervene in any way in the Republic's internal affairs, for it is their aim to enable the South Koreans to preserve their independence; but they cannot remain indifferent if there is civil strife on their lines of communication, and they cannot go far wrong if they take their stand on the constitution which the South Koreans themselves have freely adopted.

* * *

No Easy Way

Lord Woolton's speech in the recent House of Lords debate on the working of the Town and Country Planning Act gave a hint that the Government may not amend the financial provisions of the Act so "drastically" as its election manifesto implied. If this means that the Conservatives recognise the need for continuity in town planning policy, it is all to the good. Unfortunately, it is more likely to mean that only a superficial solution will be found for the Act's grave defects. The discovery that agreed claims for compensation under the Act total no more than £360 millions, compared with the £300 millions available for this purpose, suggests the possibility of an easy solution. Why not pay out compensation (preferably in full) as provided by the Act, and then set to work to modify the objectionable features of the present system of development charges?

The Government will be sorely tempted to take this course, which would arouse no political heat, especially since the

compensation is due to be paid next year and no major amendment would be necessary immediately. Yet the results would be bad.

It has become clear that the payment of compensation, even in full, will not persuade owners to sell their land at prices which contain no element of profit. They have no incentive whatever to do so. The type of land market envisaged by the 1947 Act cannot be created, and the reasons for compensating owners once and for all for the removal of development value are largely vitiated, since development values cannot be effectively removed. But if the Treasury had paid out a large sum in compensation, it would hardly be prepared to sanction the complete abandonment of development charges. To do so would involve public finance in a wholly unwarranted loss. And greatly to reduce the incidence of development charge without abandoning it, would not prevent it from acting as a tax on development and improvement of property.

*

Both sides of the present equation are in fact badly designed. Owners who have no intention of developing are compensated and many would-be developers are frustrated. But the whole mistaken scheme hangs together. If compensation is paid on the present basis, it seems almost certain that the worst features of the development charge will be permanently preserved.

The Government should fully recognise that the basis of the 1947 Act—the public acquisition of all development value in land—has proved to be unworkable. The advantages of a return to the principle of a free land market, coupled with much stronger safeguards for the interests of town and country planning than existed before the war, are becoming increasingly apparent, even to some town planning officers. The Government should not prejudice the possibility of a rational and comprehensive solution by sanctioning large payments in aid of a mistaken objective now.

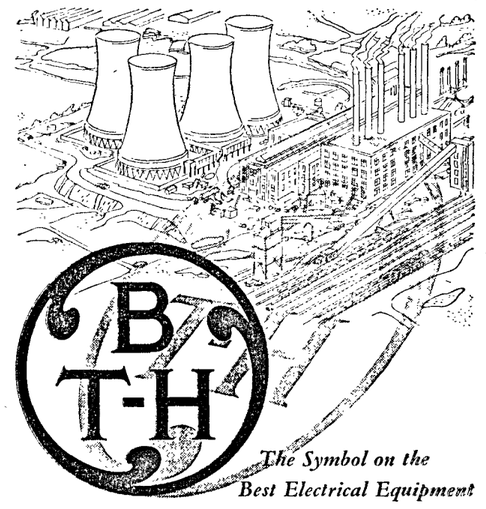
* * *

The Flat Rate Principle

The Family Allowances and National Insurance Bill passed through all its stages in the House of Commons before Whitsun—without controversy, without rancour, without heat. The only amendment that has been made to its original provisions took place on the report stage. It concerns the Industrial Injuries Act. Most of the benefits under that Act were already being increased by about 25 per cent by the new Bill. The effect of the amendment is to increase by the same amount the constant attendance allowance payable in cases of severe disablement.

The political harmony that has accompanied the Bill does not, however, mean that either party is entirely satisfied with it. Several members pointed out that the new insurance benefit and basic retirement pension of 32s. 6d. a week will still be 2s. 6d. below the basic national assistance payment of 35s. The assistance payment covers the cost of subsistence excluding rent, for which an additional allowance is made, and the rate is based on the cost of food, clothing, fuel, light and household necessities. Higher prices for these have brought the assistance payment to a level 46 per cent above that of 1948—which includes a margin for further rises in the coming months. In fixing the new level of insurance benefits, on the other hand, the Government has taken, as did its predecessor in raising retirement pensions a year ago, the whole index of the cost of living, which shows a rise of only 23 per cent since 1948.

It is clearly inappropriate that insurance benefits should be related to the same index as wages, and the Government has admitted that when the review of the whole scheme takes place other index numbers may be devised. But the Government had no need to rely on index numbers to justify the new level of benefits. Higher benefits, as the Minister



pointed out, mean higher contributions. If the benefits were to equal the assistance scales, the increase in contributions would have to be 50 per cent more than the Bill already provides for; Mr Peake and his two predecessors in office all declared that the contribution is becoming too big for the small wage-earner and self-employed person. "I do not think," said Mr Griffiths, "that we can sustain the flat rate contribution system much longer." It looks in fact as if Britain will be forced by its depreciating currency to adopt the system, used in most other countries, of relating contributions and benefits to earnings.

* * *

Charges in Force

The health service has already provided some classic examples of the hardships that are caused by a universal scramble for rights when there is not enough to go round. The provision of free dental treatment for the whole population deprived schoolchildren of their priority dental service. For some time they were also left well behind in the race for spectacles. The provision for the whole population of free treatment in hospitals has deprived the aged poor of their former right to die there.

The hitherto unlimited right to free drugs and medicines has produced overcrowding in doctors' surgeries and, in consequence, often inadequate consultations. As the new Minister of Health said at the weekend, if the prescriptions charge, which with the other charges came into force on June 1, reduces the demand for drugs and enables doctors to give better attention to those who really need their care, it will be a great gain. On the other hand, though it may redress the balance in this respect, the charge will provoke grievances among those who before 1948 never had to pay a penny for their medicines—the twenty-four million contributing under national health insurance, old age pensioners, and even nurses, for whom free drugs from their hospital

The Symbol on the Best Electrical Equipment

When it bears the famous BTH name, a turbo-alternator, a set of switchgear or a transformer embodies the results of very many years' expert research—hence the enviable reputation of BTH equipment all over the world. But power generation is only one direction in which BTH have specialised. It is the same in traction, marine engineering, mining, the aircraft industry—wherever first class electrical products are needed. With fifty-four years' experience and eleven factories, BTH can give outstanding service to industry in every sphere of electrical engineering.

THE BRITISH THOMSON-HOUSTON COMPANY LIMITED, RUGBY, ENGLAND

Member of the AEI group of companies

dispensary have always been a legitimate perquisite of office. All these are now paying the price of Labour's determination to provide a "free" service for everyone.

This does not mean that these particular classes should be exempt from the charge in present circumstances. Real hardship will be prevented by the Assistance Board, which will repay any of the new charges in cases of poverty. But the squeezing out of anyone from his previous privileged place does underline the need for the Conservatives' declared policy of priorities, not only in the health service but in all the social services. All the charges have been imposed so far purely for Budget reasons. Mr Macleod now says that he intends to watch their effect on restoring essential priorities. If they do have this effect, they would be justified quite apart from their immediate purpose of serving the policy of disinflation.

* * *

The Fall of Mme. Pauker

Until last week the major luminaries in the Rumanian Communist party appeared to pursue a somewhat less hectic course than some of their opposite numbers in other subject states of Eastern Europe. Now, however, with the startling fall from grace of Mme. Ana Pauker, the concealed tensions and discords within the party are more clearly revealed. Mme. Pauker, it is true, apparently retains her posts as vice-premier and foreign minister; but she has been moved from the real seats of power in the Party Politburo and Secretariat. She has been openly accused of both leftist and rightist deviations; and at the meeting of the Rumanian Assembly last week, she was observed seated in a lowly place, a shadow of her former self. To judge from past precedents, her complete eclipse is only a matter of time. Those disgraced with her include two strong men of the Party: Vasile Luca, Vice-Premier and former Finance Minister, and Teohari Georgescu, Vice-Premier and Minister of Home Affairs.

One can only guess at the reasons behind these precipitate somersaults from power. But the most convincing theory is that Moscow has thrown Mme. Pauker and her colleagues to the wolves in an attempt to palliate popular discontent at the grave and growing economic crisis. The currency reform of last January is known to have seriously miscarried. It has failed in its object of alleviating food shortages, inflation and industrial unrest, and has still further antagonised the peasants whose savings it wiped out. Vasile Luca is accused of open and direct sabotage of the monetary reforms and of the regime's economic plans. Mme. Pauker and Georgescu are accused of encouraging Luca and of conniving at his misdeeds.

Moscow's choice of who shall be a propritiatory victim and who shall remain in authority seems to have been guided by its wish to make the greatest possible appeal to the Rumanian people. Of the two chief victims, one is a Jewess, the other is of Hungarian origin; both are known to have strong ties with the Soviet Union. Their former rival, Gheorghiu-Dej, who has been promoted from vice-premier to premier, is a pure Rumanian; like Gottwald in Czechoslovakia, he is regarded much more as a "native son" than as a Moscow man. The pattern, indeed, bears a striking resemblance to the recent purges in Czechoslovakia; there also, it was the Jew and the staunch Moscow man who came to grief. It looks as if Moscow is reacting to popular discontent among its satellites by an attempt to disguise the iron hand of Soviet control in a velvet glove of nationalist and chauvinist appeal. Rumania would seem well-suited to such a policy, since, thanks largely to the work of Vasile Luca, the whole economy is thoroughly impregnated with Soviet technicians and advisers. If this theory is correct, the fall of Mme. Pauker and Vasile Luca provides perhaps the most impressive example yet of the completely cynical opportunism of the men in the Kremlin.

From Scarcity to Surplus

Eighteen months ago when the Korean commodity boom was rising to its peak, manufacturing countries were faced with the prospect of unemployment because there appeared to be insufficient raw materials to go round. Now, most primary producers are confronted with the spectre of surpluses, although prices are generally still above their pre-Korean level—prices of only four commodities, wool, Egyptian cotton, shellac and tallow, have fallen below it—and although output of most materials has increased only modestly. Price itself is no guide to profitability; the vital relationship is that between price and cost. The price-inflation generated by the scramble for supplies was in fact converted into a cost-inflation in primary producing countries and although producers are receiving much more for their output than they were in June, 1950, their profit margins have almost vanished.

The major item of costs in primary production is labour, and wages are notoriously difficult to reduce. Even wages based on a sliding scale geared to the price that the particular commodity fetches in the world market are seldom reduced, no matter what happens to the price. And politicians seek salvation in international commodity schemes. In the 1930's trading in practically every major commodity was controlled by some form of international agreement. At present a scheme for cotton is being studied, another for rubber will be studied shortly; the tea and sugar agreements exist but are not as yet in operation; the international wheat agreement due to expire in July, 1953, is expected to be continued for another period of four or five years. Tin at the moment is in a happy position, for its price is virtually pegged at a profitable level by the American Government. Commodity schemes are again becoming the vogue because they provide an easy solution to what is otherwise an awkward political problem, and more will be heard of them in the next twelve months.

The case for an international control scheme, and likewise the form of such a scheme, must be decided on its merits—both political and economic—commodity by commodity. There can be no general rule, save one. The world has not yet reached the state where too much food and raw materials is being produced to satisfy the developing needs even of the western world quite apart from the so-called under-developed areas. The expansion in American industrial capacity and the projected expansion in European industrial output is a vivid reminder that in a few years' time—say, by 1960—the world might well be faced once more with a shortage of primary products. If therefore a temporary surplus is to be prevented by international agreement, such an agreement must permit a constantly expanding output to meet the needs of the future.

Western Disarmament Proposals

At the Disarmament Commission in New York, the western powers have tossed some new proposals into the ring. They are concerned with the reduction of national armed forces and have much to commend them. The idea is that a fixed numerical limit should be set to the armed forces of the powers, and in particular, to those of the big five. The ceiling for the United States, China and the Soviet Union would be between 1 million and 1,500,000 men, while that for France and Britain would be between 700,000 and 800,000 men. Sir Gladwyn Jebb, who introduced the proposals, reckoned that if the present American strength is estimated at 3,500,000 men, it would have to be reduced by between 57 and 71 per cent; and that if Soviet strength is estimated at Mr Malik's figure of 2,500,000, it would have to be reduced by between 40 to 60 per cent. Here the Russians have been neatly hoist with their own petard, since their real armed strength is believed to be over 4 million men.

These suggestions offer a much more practical and realistic approach to the problem than does the Soviet proposal for a straight cut of one-third in the armed strength of each of the Big Five. For while the latter appears designed to perpetuate the present disparity between the armed forces of the Communist and non-Communist powers, the object of the new western proposals is to restore a rough equilibrium between them.

It is also hoped that the mutual confidence generated by agreement on this one point would make agreement easier on other aspects of the western disarmament plan, such as the control of atomic energy and the inspection and gradual reduction of armaments. The western powers certainly do not improve the chances of survival of their new plan by insisting that it is part and parcel of the general disarmament plan to which the Russians are already bitterly opposed; but it is hard to see how they could do otherwise. This is not to suggest that Sir Gladwyn Jebb and his French and American colleagues have been wasting their time. Their proposals may come to naught, but they have at least regained the initiative which for too long has remained in Mr Malik's hands. Above all, they have made an honest and constructive attempt to get on with the job.

Closed Minds in Durham

"I do not think that County Durham will ever climb down," said one of its councillors this week. That seems to sum up the council's attitude in the closed shop dispute—a stand for its own sake. The practical points of difference with the professional organisations are now small; but the council insists on trying to close at least the back door of the shop by requiring that applications for extended sick leave should be made through a trade union or professional body. It has again rejected a compromise proposal that these applications should be sponsored by one representative selected by each group of employees.

Rather than give way, the council seems ready to see the children untaught and their ailments undetected. Four thousand teachers have given notice that they will leave on August 31st. The doctors, too, are preparing to strike—the discreet formula being that the trustees of the British Medical Guild are "invited to consider taking all necessary steps, including the guarantee of financial support, preliminary to the collection of resignations." The council reckons, perhaps, that the Government would have to intervene before this point were reached, and may think it would lose less face by yielding to "dictatorship from Whitehall" than to the professional organisations.

Meanwhile the council's tactics seem to be to delay ministerial action as long as possible. It has not yet replied to the letter from the Minister of Education asking for its version of the facts that had been reported to her by the teachers. And now the Labour group of the council has thought of another way of complicating the decisions that Ministers have to make. The issue has now been reported to the Minister of Labour under Order 1376—in the hope, presumably, that an official inquiry might delay ministerial intervention, and perhaps give an outcome more favourable to the council than a directive based simply on the need to maintain local services. In deciding whether to order an inquiry, the Minister of Labour may want to await the result of the D. C. Thomson dispute. It is true that the cases are not parallel—indeed, they are opposite. But the decision whether or not an employer in Dundee has the right to insist on the open shop will at least influence the decision whether, in Durham, he can insist on the closed shop.

Violence in Bechuanaland

Presumably the Government expected some disturbance to be provoked by its decision to exclude Seretse Khama permanently from the chieftainship of the Bamangwato. At all events it seemed a little bit too ready to play down the recent incidents in Serowe when three African policemen were killed and many people injured. As a result police reinforcements have been called in from Southern Rhodesia, and troops have been mobilised for despatch if needed. The Government said on Tuesday that the disturbances were the work of a minority, led by the members of the recent delegation to London to press the claims of Seretse to the chieftainship. Only a few hundred, some of whom were drunk, were present at the gathering which ended in the violence, whereas a representative tribal meeting numbers several thousands. But more clashes have since been reported, and 100 Africans have been arrested, including two close relatives of Seretse Khama.

It is odd, and perhaps a little ominous, that the disturbances should have occurred so long after the Government's decision to exclude Seretse, which was announced towards the end of March. An immediate and spontaneous flare-up, which as quickly subsided when it was realised that the decision was irrevocable, would have been more reassuring for the future peace of the tribe than this delayed and organised demonstration. The danger is that in having to restore order and show its authority the local government will lose the chance of co-operating with the tribal leaders. The purpose of announcing the permanent exclusion of Seretse was to encourage the tribe to choose a new chief under whom it could settle down and through whom British rule could be exercised indirectly. In quelling the disturbances the British authorities may have to continue to exercise the direct rule that was adopted when Tshekedi and Seretse Khama were first excluded two years ago and which has proved so unsatisfactory. It would certainly be unwise of

New Start in India

The past month has seen the emergence of a new Indian government based on the full working, for the first time, of the new republican constitution. After the re-election of Dr Rajendra Prasad as President of India, Mr Nehru handed in the resignation of his council of ministers and immediately formed another. Coming so soon after the general elections, in which the Congress Party was returned to power with a considerable parliamentary majority—though actually a minority vote in the country—this change presented the opportunity for a useful cabinet reshuffle. Mr Nehru has made a number of appointments which improve the calibre of his cabinet and give it greater political backing through closer representation of the various sectional and territorial interests in the Congress Party. It has also been enlarged from twelve to fifteen members, and four extra ministers have been added without permanent seats in the cabinet. The key figures in the Nehru government are Dr Katju, with the new joint portfolios of Home Affairs and States; Sir Gopalaswami Ayyangar with Defence; Sir Chintaman Deshmukh at the Treasury; and Maulana Azad with Education, Natural Resources and Scientific Research. It is a pity that there is still no separate Minister for External Affairs, particularly since the appointment of Sir Girja Bajpai as Governor of Bombay removes from Delhi its most experienced civil service adviser on foreign policy.

This new government comes to power in India at a moment when some ideas are changing and a fresh approach is being made to old problems. Both at home and abroad the hostility of the Communists is now more apparent to Indian ministers than at any time in the past. "The methods they adopt in the national sphere," Mr Nehru said the other day, "however noble their motives may be, coarsen and degrade." In the State Assembly of Madras, the highly respected Mr Rajagopalachari put it succinctly with the remark to Communist members: "I am your enemy number one and you are my enemy number one. That is my policy towards you from A to Z." The battle is on for the survival of Congress as the ruling power in India, with the Communists leading the opposition. At home the main field of struggle will be in the development of industrial planning and the raising of food output. Abroad, three of the new trends are a rising Indian appreciation of American aid, a wariness in Delhi about Chinese intentions—Mr Nehru recently trekked on horseback up to the border state of Sikkim—and, above all, the impact of a now sovereign Japan. During the next few years the Japanese may come to have a profound influence on southern Asia's determination not to submit to Communist tyranny.

The Egypt-Sudan Talks

The direct talks between the Egyptian government and the Sudanese delegation that represents Mahdi Pasha are proceeding in Alexandria in an atmosphere of smiles and discretion. The Egyptian aim seems to be to obtain acknowledgment of the need for a common policy on Nile water and economics, and to obtain a symbol of this in the acknowledgment of King Farouk's sovereignty pending a subsequent Sudanese decision whether or no to be wholly independent. The aim of this particular Sudanese delegation is to retain the autonomous constitution that has already been drafted in the Sudan. It would, for instance, be wholly opposed to a constitution drafted in Cairo such as that which the Wafd government tried to dictate last autumn.

These two objectives are not irreconcilable; whether the negotiators can reconcile them remains to be seen. Even if they can, all troubles are not over; for each negotiating group will have to persuade personal and political opponents among its own compatriots that it has secured the best bargain possible. The talks which Hilaly Pasha has had this week with a rival Sudanese party—with the leader of one of the two Ashigga factions—are a reminder that this job will not be easy.

During the talks, two spectres lurk in all the corridors. One is called "British intransigence" and the other "American pressure," and both are convenient phantoms that can be blamed in the event of failure to agree. In fact, the intransigence of the British about King Farouk's title to the Sudan (which the Americans have certainly pressed them to abandon) was always based on the need for obtaining Sudanese consent, and would melt at once if that consent were given. Official opinion in London, therefore, most devoutly hopes for a direct agreement in Alexandria. It knows that Sudanese autonomy is just round the corner; it has no grasping nineteenth-century desire to stay on in the Sudan in the teeth of local opinion. Its concern was to avoid breaking its promise that the Sudanese should decide their own future, and this—if they can reach an agreement with Egypt on their own—will not be broken. A direct agreement would therefore salve the British conscience; it would also heal a sore that has troubled Anglo-Egyptian relations for 30 years, and contribute to world security.

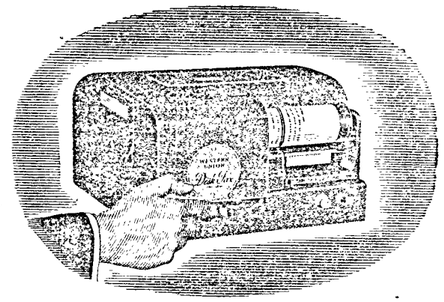
Fair Shares in Military Service

It looks as if the pistol that some members of the Labour party were holding at the heads of Britain's allies last week was not loaded. The ex-Minister of Defence, Mr Shinwell, together with his former parliamentary private secretary, Mr Wigg, and others, had asked in the House of Commons whether Britain is justified in continuing a two-year period of compulsory military service when other countries are not doing as much. It is true that of the Nato allies only the United States, Belgium, Greece and Turkey have as long a period as two years; the Dutch do 20 months, the French 18, the Italians 15 to 18, and the Norwegians 12, except in the navy where they do 18 months. In the Commonwealth, Canada and South Africa have no compulsory military service, while Australians and New Zealanders do less than six months. But the implied threat that Britain should reduce its military service unless they increased theirs seems in reality to have been little more than an internal party manœuvre to steal thunder from Mr Bevan in anticipation of the party conference.

It is difficult, however, to see the Labour party committing itself publicly to reducing national service in present conditions, just as it is hard to believe that Mr Shinwell, who worked so vigorously when in office for western European defence, would really wish it to do so; to do him justice, he has so far pressed for a levelling up of Continental service rather than for a levelling down by Britain. It would in fact be a gross disservice to reawaken the bitter controversies of 1947 over the length of military service, when the question has lately been kept so remarkably free from political strife. Even the Bevanites have concentrated their attention on arms rather than the man.

At the same time, there can be no satisfaction with the actual picture presented by Europe's reserves. The chief worry that confronts General Ridgway as he takes over command is the lack of trained and adequate reserves even for the forces at present in the field. For months his deputy, Field-Marshal Montgomery, has been hammering away at this matter, but without notable success. Mobilisation methods and training programmes are improving, but there is a long way still to go; and much depends on the time for training that governments are prepared to demand from their conscripts and reservists.



IN the modern laboratories of the Mullard Organisation, many new applications of electronics are being developed to meet the ever-changing needs of industry, communications, and medicine.
Bringing the benefits of this research to the community is another Mullard function. In great factories in Lancashire and Surrey, millions of valves, electron tubes, and components are produced for Britain's electronics industry.
Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

Letters to the Editor

Mr Butler's Finance Bill

Sir,—In your article you take strong exception to the estimate made by the United Nations Economic Commission for Europe that 'roughly one-half of British incomes are adversely affected by the Budget. But have you examined the evidence?

The combined effect of the changes in food subsidies and family allowances is to leave the single person worse off by £4 and a married couple poorer by £8. Where there is one child the family suffers to the extent of £12, while with two and three children the difference is £8 and £4 respectively. Where these amounts are not made up by the taxation reliefs the family is in fact worse off on balance. The following table shows the critical income for each group and the proportion of incomes falling below it.

Family Circumstance	Number of Incomes ('000)	Critical Income £	Percentage below C.I.
Single	8,813	225	45·6
Married	5,260	375	44·1
One child	3,054	440	65·3
Two children	1,877	480	68·3
Three children	673	535	77·2
TOTAL	20,040	...	49·9

Some adjustments have to be made to these figures as they are based on the distribution of incomes in 1949-50 and wage increases have altered the pattern since then. There is also some double counting: juvenile workers have probably been included with their families in many cases, and pensioners, for whom separate provisions were made, must be excluded where their incomes exceed £135. On the other hand, the undoubtedly regressive effects of the changes in purchase tax have not been taken into account, and on the whole the United Nations estimate does not in fact appear to be very wide of the mark.—Yours faithfully, H. R. COLE

London, N.W.8

★

Sir,—You criticise the *Bulletin* of the Economic Commission for Europe because it describes the Budget as "regressive" and for its estimate that "something close to one-half of the total number of family incomes will be worse off."

I think myself that the writers of the *Bulletin* are wrong in their estimate; instead of writing "something close to one-half" they should have written "something close to one-third." The immediate losers under the Budget are those whose increased expenses as a result of the reduction of food subsidies are not fully compensated either by an increase in family allowances or by the lightening of the burden of income tax. In the accompanying table I have listed the critical levels of income below which families of various types are losers (assuming that each family or single person is allowed £10 per annum for life insurance premiums paid). The latest official figures of the distribution of incomes are those published in the *94th Report of the Inland Revenue* and refer to the year 1949-50; but it is reasonable to assume that the shape of the distribution has not altered much since then. By assuming that incomes in the region of the critical levels have increased between 1949-50 and the present time in about the same proportion as the rise in average earnings between October, 1949, and October, 1951, I have worked out the 1949-50 equivalents of these critical levels, and have so estimated approximately the number of incomes falling currently below these levels. It appears that at least 6 million families (or single persons) are losers under the Butler Budget.

LOSERS UNDER THE BUDGET

Type of Family	Level of income below which families are losers		Approx. number of incomes falling below this level in 1949-50 ('000)
	1952-53 income £	1949-50 equivalent £	
Single males, no children	230	175	700
Single males, 1 child or dependant	320	240	200
Single females, no children	250	185	1,300
Single females, 1 child or dependant	320	250	300
Married couples, no children (one earner)	340	260	1,500
Married couples, no children (two earners)	460	350	
Married couples, 1 child (one earner)	460	340	1,200
Married couples, 2 children (one earner)	470	350	800
Total losers	...	...	6,000

Six million families are not "something close to one-half" of all families; but they are appreciably more than "a small minority of the wage-earners of the country," and it would be a serious mistake to believe otherwise. Moreover, I do not see how you can avoid describing the effects of the Budget as "regressive." The fact is that the Budget imposed net burdens on about one-third of families—for the most part the lowest paid sections of the population—and gave appreciable net benefits only to those in the higher income ranges. If this is not regressive, in at least the technical sense of the word, what is?—Yours faithfully,

H. F. LYDALL

Oxford

[Mr Lydall disposes of the most obvious error in Mr Cole's argument, but he forgets that national assistance payments, pensions and other insurance benefits are being increased as part of the policy of the Budget. Over 4,600,000 people draw retirement and old-age pensions, over 200,000 widows' pensions, and at any one time perhaps 700,000 people are receiving unemployment, sickness or injury benefits. In addition, some 400,000 not included in the above categories get regular weekly grants of national assistance. The total of 5,900,000 does not exactly coincide with Mr Lydall's 6,000,000 "losers," before taking the rise in benefits into account, but the two must largely overlap. There are other complications, and an exact calculus is impossible; but it is surely safe to conclude that, as our article said, the losers are "certainly a minority, and almost certainly a small minority, of the wage-earners of the country." We do not accept the view that a Budget should never be regressive, and no one denies that this Budget is regressive in parts; but it is most certainly not "generally regressive," which was the statement that we criticised.—EDITOR.]

Which Law for Korea?

Sir,—The legal case which your correspondent attempts to make for "voluntary repatriation" rests on the assumption that the recusant prisoners are claimants for political asylum. But the right of asylum can be granted only to those whose choice is free: shotgun weddings are no proof of love.

It is admitted that there are great political inducements on the Western powers to urge prisoners not to be repatriated. It is admitted (*The Economist*, page 497) that there may have been undue pressure on some of them. Moreover, it is patent that prisoners are by their very position exposed to such pressure and coercion, against which the Geneva Convention is intended to safeguard them. Lastly, the information which has come to hand about the management of the camps in South Korea and the process of screening there—where this has been carried out at all—shows that, as *Time* points out (June 2, 1952), any figures emanating from them are merely guesses, presumably not without bias.

We must therefore face the fact that (*a*) we do not know how many, if any, prisoners refuse repatriation or can be regarded as claimants for asylum and (*b*) it is extremely doubtful whether prisoners maintained and interrogated in the conditions obtaining in Korea (or in any similar situation) could be placed wholesale into this category without depriving the right to political asylum of its honourable meaning. One may add that no attempt to sort out *bona fide* claimants for asylum from others who refuse to return to their country for different reasons has been made, as one might expect it to be made if the camp authorities had been seriously concerned with this problem. Moreover, it is certain that no future plebiscite of prisoners could be regarded as satisfactory while the camps remain under the control of powers with a direct political interest in encouraging the refusal of repatriation.

Hence the "political asylum" argument cannot be used to justify the present American stand in the armistice negotiations. Nor need it be used, for, as your correspondent points out, there is no obligation on any state to grant asylum. It may be objected that this means the callous sacrifice of men's lives. But it is clear, even on the most extreme

(and discredited) assumptions about the number of recusants, and the most pessimistic (and unjustified) ones about their possible fate if returned, that many more people will suffer if the war continues indefinitely than if it concludes shortly. —Yours faithfully,

E. J. HOBSBAWM
King's College, Cambridge

[The argument of our article was that the question of principle remains even if the prisoners genuinely unwilling to return are fewer than has been stated. Mr Hobsbawm also ignores the fact that the United States has offered a re-check by a neutral commission if the principle of voluntary repatriation is accepted. As for the argument that all prisoners must be handed over because a greater number of people may suffer if the war continues, it is surely for the Communists to decide whether they will continue the war for the sole purpose of obtaining the forcible repatriation of men unwilling to return.—EDITOR.]

Displaced Persons

Sir,—A letter from Mr H. W. Rothschild, published in your issue of May 10th, expressed concern about the position of those refugees who had not been resettled when the International Refugee Organisation terminated its operations early this year.

I am sure he did not intend to create the impression that all voluntary work had to cease after the end of IRO. It is only fair to say that there are some twenty-three international voluntary agencies which are still doing their most valuable humanitarian work. It is, unfortunately, true that they are meeting with increased financial difficulties and that many have had to reconsider, and may have to curtail, their programmes because the grants they formerly received from the IRO are no longer available.

Emergency aid is urgently required to enable these societies to bring relief to certain groups of refugees whose level of existence barely reaches minimum standards. The United Nations High Commissioner for Refugees is well aware of this. In February of this year he obtained permission from the UN General Assembly to make an appeal for funds for these refugees. The Governments of Switzerland, Luxembourg, and the Federal Republic of Germany have already made contributions, and other countries, including the United Kingdom, have indicated their interest. The voluntary organisations are in close touch with the High Commissioner and in most cases, help will be given in consultation with them and through their good offices. It would seem, therefore, that the setting up of an international committee, as suggested by your correspondent, would not materially change the situation, particularly since the High Commissioner will be in a position to help these agencies financially if his appeal for $3,000,000 is successful.

May I also refer to your correspondent's assertion that the High Commissioner's Office is only now "under way" and that no provision was made for the interim period between IRO ceasing operations and the High Commissioner's Office assuming responsibility. The decision to create the Office of the High Commissioner was, in fact, taken by the General Assembly on December 14, 1950 and the Office started its operations on January 1, 1951. It was only on January 31, 1952, that the IRO ceased its operations of resettlement while it had already during the course of the year, handed over the responsibility for international protection to the High Commissioner's Office. It is also useful to remember that on July 1, 1950, IRO began to transfer the responsibility for care and maintenance of refugees to the countries of residence. Finally, I would like to remind your correspondent that the High Commissioner's Office through its branch offices in Germany, Austria, Italy, Greece and Shanghai, is in close touch with the governments and local authorities, the voluntary agencies in the field, and with the refugees themselves, and that at any time refugees can bring their problems to his attention, while he can bring refugees problems to the attention of the organs of the United Nations.—Yours faithfully, JAMES M. READ,
Deputy High Commissioner for Refugees
Geneva

Books and Publications

The Last Days of Europe

The World in March 1939. Edited by Arnold Toynbee and Frank T. Ashton-Gwatkin. *Oxford University Press* for the *Royal Institute of International Affairs*. 546 pages. 45s.

Dr Toynbee has written only a small part of this large volume himself, but, from the quotations from Demosthenes and the Book of Daniel on the title page onwards, his influence is apparent in nearly every chapter. Most of the contributors fall readily into the manner of the Master and even borrow his technical terms. The result is somewhat unsatisfactory. An essay on the world in 1939 by Dr Toynbee himself, reviewing the situation on the eve of war as a moment in the endless process of history, would have had its charms; a volume on the lines of the ordinary Chatham House Annual Survey, giving a chronological narrative, facts and figures, would have had its uses. This book falls between the two. Some of the essays attempt to interpret the situation in 1939 in terms of the categories of Dr Toynbee's philosophy of history; others give a narrative of events—in some cases an outline of the history of an area between the wars, in others an account of the years 1938 and 1939.

There is, however, one section of the book that undoubtedly meets a need and increases our knowledge of the world in 1939. This is the chapter by H. C. Hillmann on the economic strength of the great powers. It provides with great clarity exactly the kind of information the non-economist needs in order to understand the long-term trends of population and industrial capacity, the shifts in the economic balance of power in the twentieth century.

The task of providing a political survey of similar merit was perhaps most difficult; certainly few of the political chapters give an equally clear picture. Those dealing with the Far East, for instance, seem very hard to follow (especially in the absence of maps). Mr Martin Wight's chapters on Germany and Eastern Europe give a competent survey of Hitler's strategy and diplomacy and of the territorial changes between the Munich agreement and the occupation of Prague, spiced with historical parallels in the Toynbeean manner. Mr D. R. Gillie has contributed a brilliant essay on France within the scope of the 22 pages allowed him.

The whole volume is meticulously edited—even pedantically so, as in the transliteration of Arabic names—and is well produced. Yet, though it contains much that is useful and stimulating, its quality is uneven. It lacks the unity for the *tour du monde* it sets out to be, except in so far as this is given by the adoption of Dr Toynbee's ideas and even style by his disciples. The story of the last days of Europe has still to be written; perhaps Dr Toynbee will one day write it himself.

Simon Report

Retrospect. The Memoirs of the Rt. Hon. Viscount Simon, GCSI, GCVO. *Hutchinson*. 327 pages. 25s.

How often when an old man makes a book of his memories the most vivid and charming chapter is the first. Entirely delightful is the picture of these old Nonconformist worthies: the grandfather who was so strict a Sabbatarian that he preferred his sons to do their Sunday shave on Saturday evening, and the grandmother who, on reading of the Tay Bridge disaster, remarked "We ought to be very grateful to God that the dear Queen was not in that train."

Chance brought a young Fettes master to stay a night at his father's house, and he suggested that the clever little boy might win a Fettes scholarship. Of course he did so, and four years later a scholarship at Wadham, where he found C. B. Fry and F. E. Smith. Then All Souls (of which he is now the senior Fellow), rapid progress at the bar, and entry in the House of Commons with the Liberal landslide of 1906. It was inevitable that in a few years Asquith should make him a law officer. He was already in the Cabinet when, in 1916, he resigned, honourably but foolishly as he now considers, because he objected to conscription, not on "conscientious" grounds but because he believed it would not contribute to military efficiency. There followed fifteen years in the independent Liberal wilderness. Then office again in the 1931 coalition, successively Foreign Secretary, Home Secretary and Chancellor of the Exchequer, and finally Lord Chancellor in Mr Churchill's war government.

Lord Simon is one of those very able men who in the course of a long political career has held a number of high offices but has not made many memorable contributions to the course of history. In this respect he may be compared with L. S. Amery, an equally brilliant man and his twin at All Souls. Mr Amery has held many high offices, but the easiest thing to remember about him is that he quoted Cromwell in the debate that ensured the downfall of Neville Chamberlain. For what will Lord Simon be remembered? Perhaps for his devastating exposure of the illegality of the general strike and for his authorship of the best-selling Blue Book of all time; but the Simon Report on India was, through no fault of its author, already out of date at its publication.

The book is very agreeably and lucidly written. When Lord Simon argues, as he does in defence of Munich, he argues, as one would expect, with great cogency. His memoirs give many interesting sidelights on men and events but no new contribution of any great importance to our understanding of the last forty years.

Dynamic Analysis

The Rate of Interest. By Joan Robinson. *Macmillan*. 170 pages. 10s. 6d.

Mrs Joan Robinson is a *rara avis* among economists; at all events among those economists whose native air is that of the theoretical stratosphere. For one thing she writes, even when dealing with matters so rarified as to drive most practitioners despairingly from English to mathematics, with vigour and wit as well as with clarity; for another, she never prolongs a flight unduly without taking bearings from the solid earth of common sense. (It seems almost incredible that she should be the only serious economist to point out that the first effect of an increase in demand beyond the present capacity of supply is not a rise in price but a lengthening of delivery dates; memory, however, fails to reveal a precursor.) Like the Comet, she functions best at high altitudes—at lower levels, her peculiar social and political values exercise an undoubted drag—and this volume, whose title essay was first printed in *Econometrica*, shows her at her best.

Its connecting theme is, to quote her introduction, "the analysis of a dynamic economic system," an analysis, that is, which "cannot explain how an economy behaves, in given conditions, without reference to past history." Of the three essays of which it is composed, the first, "The Rate of Interest," is an elegant dissection of the various influences at work in the money market, from the underlying "real forces" of thrift and productivity, through the attitudes of lenders and borrowers to different types of assets, to the policies of the monetary authority. The second, "Notes on the Economics of Technical Progress," is less elegant; indeed, as its title implies, it is rather scrappy, but only in the sense that a rack full of novel and exquisitely constructed instruments is scrappy when compared with a single large machine-tool. The third and longest, cryptically entitled "The Generalisation of the General Theory," forms together with its appendix of "Acknowledgment and Disclaimers" not only an outstanding example of Mrs Robinson's own powers of analysis but a kind of creative concordance of modern economic thought on the stabilising and dis-stabilising influences at work in a dynamically developing free economy. Of this most valuable and important essay, which is likely to rank as a classic among serious students, the chief possible criticism is that it should have been written at four or five times the length; the next, that the "generalisation" should, both for intellectual satisfaction and practical usefulness, have been carried still further to cover the vicissitudes of progress in a centrally planned economy.

Sermon on *Realpolitik*

American Foreign Policy. By Hans J. Morgenthau. *Methuen*. 250 pages. 18s.

Mr Morgenthau's book is the latest addition to the now considerable American library of sermons based on the theology of *realpolitik*. He himself, however, is no recent convert. Indeed, as the author of "Scientific Man *vs* Power Politics" and "Politics Among Nations," he may claim to have argued the new orthodoxy if not before "Mr X" at least in advance of Mr George Kennan. His latest book combines a brief exposition of his theory of international politics, with an extended analysis of recent American policy and an outline of his own recommendations for the future.

The theoretical basis of Mr Morgenthau's argument is that it is illusory to suppose that "a nation can escape into a realm where action is guided by moral principles rather than by considerations of power." From this follows an exaltation of the concept of the national interest which, in its combined ingenuity and naïveté, is strongly reminiscent of the eighteenth-century ethical theories that reduced all moral obligations to the level of enlightened self-interest. By a natural transition Mr Morgenthau is led to insist upon the continuing validity of the nation state systems (despite his forceful insistence that Russia and the United States constitute now the only effective centres of power), and to denounce all attempts at the construction of international systems based on what he derisively terms "legatism" and "sentimentality." He insists, like most such realists, that the Russian threat is essentially imperialist and not ideological and regards the Communist revolutions in Europe as "phoney."

By a surprising transition into empirical, as opposed to theoretical, realism, Mr Morgenthau does, however, produce a very shrewd analysis of what he recognises as the truly revolutionary

THE WORLD IN MARCH 1939

character of the popular upheavals in the Far East. What he has to say about America's China policy is admirably put. No less sensible, as practical politics, are his warnings against some of the current utopian and crusading trends in American foreign policy. Indeed the book is full of individually shrewd appraisals and concretely sound recommendations. But the gap between Mr. Morgenthau's practice and theory becomes glaringly obvious when the time comes to put his practical proposals into operation. He wrings his hands as he contemplates the machinery of American foreign policy and the price in diplomatic efficiency exacted by American democratic government. He tries to preserve his democratic orthodoxy by depicting America as "a noble people ignobly led." It won't do. To level the whole indictment against "the Administration" is like loading the serpent with the exclusive responsibility for the fall. The logic of Mr Morgenthau's political Calvinism cannot so easily be squared with a disbelief in original sin.

Spain and the West

Spain in the Modern World. By James Cleugh. *Eyre and Spottiswoode.* 279 pages. 21s.

Prelude to War : The International Repercussions of the Spanish Civil War 1936-39. By P. A. M. van der Esch. *Martinus Nijhoff.* The Hague. 190 pages. 15 Guilders.

"The West to-day," writes Mr Cleugh, "acts as if 'Spain' were an ignorant, bigoted old tyrant intent upon darkness in her own part of the world and causing it elsewhere." The author's object is to controvert this popular view and to explain, by a sympathetic study of Spain past and present, why "the prevalent policy of refusing to incorporate this essential piece of building material into the Atlantic fortress" is from every point of view to be condemned.

Anyone familiar with Spanish affairs, however, and alive to "the modern world" as it is, will appreciate that Mr Cleugh's is an impossible task. Whatever may be the imperatives of geography and strategy, policy is rooted in psychological considerations. This is admitted here (on page 124)—"to enter Spanish life is to move back in history 50 years at least, perhaps a hundred"—and, for all its Christian pattern and social welfare pretensions, Franco Spain represents the opposite of everything that Western democracy stands for.

Mr Cleugh is a (Catholic ?) humanist of patrician type whose particular bugbears are the eighteenth century, liberal democracy and latterday materialism. Consequently he is not shocked or disturbed by the phenomena of political backwoodsmanship and religious domination ("the Church has, by law, a finger in every State pie") prevailing in present-day Spain and is quite disposed to interpret freedom as meaning "freedom from ruinous ideological dispute." Nevertheless, there is much to be said for an attempt to describe this political freak of our times and to convey the atmosphere of the other side of the Looking Glass. Mr Cleugh knows his Spain, and his book provides a useful comprehensive study of the contemporary Spanish state and of what he calls the fundamentally "Spanish" political ideas, based on the Roman Catholic religion and the recognition of military power as the only reliable guarantee of communal stability.

Patricia van der Esch has put us all in her debt by producing, as a doctorate thesis, this well-documented study of the international aspects of the Spanish civil war. Until the publication last year of the German Foreign Office documents very little had been done to disperse the smoke-clouds of propaganda which have obscured this subject. The facts, as substantiated here, are: (1) the *pronunciamiento* of July 17, 1936, was a well-prepared mutiny, backed by promises of foreign aid, against the will of the majority of the Spanish people expressed at the elections on February 16th of that year; there is no evidence at all of a Communist plot to seize power (the author is wrong, by the way, in saying that the Communists were represented in the Popular Front *Government*); (2) the intervention of Germany and Italy was a positive act of policy beside which the aid received by the Government was "small and spasmodic"; (3) French policy, so suicidal in appearance, was actuated primarily by fear of war and secondarily by pressure exerted by a class-biased British Government (of which, however, there is little direct evidence); (4) the Non-Intervention Committee was a by-blow of that fatal "appeasement" which was the father and mother of the democracies' foreign policy in the late thirties; the shifts and evasions resorted to in London and Geneva constituted indeed a sorry farce.

There is one curious omission in the phalanx of facts cited here. While recording Dr Negrin's announcement at the League Assembly in September, 1938, of the withdrawal of non-Spanish combatants on the Government side, the author makes no mention of the International Military Committee sent to Barcelona by the League to supervise that withdrawal.

First and Last Things

Introduction to Economic Organisation. By Henry Smith. *Sylvan Press.* 186 pages. 12s. 6d.

This book is modelled—pretty closely, one would imagine—on Mr Smith's lectures at Ruskin College, and it is a tribute to his pedagogic skill that they read as well as they do. His method is unexceptionable: he coats the necessary grains of theory very thickly with palatable fact and conjecture, and keeps the dullards awake with occasional excursions into irrelevancy.

Mr Smith has selected various aspects of "economic organisation" and fused them into a satisfactory outline; and the result is a useful brush-up-your-economics for second-year students. Unfortunately, he has been unable to resist the temptation to round off his well-documented chapters on the supply of labour and capital, the "availability of natural resources" and the structure of international trade with an entirely undocumented and rather alarming chapter on "the conflict of economic policy in the contemporary world." What will students—fresh from elementary definitions of futures, joint products, limited liability, the gold standard, vertical integration, and so on—make of such orotund pronouncements as this ?

> One can, for example, restate many of the arguments of Marx in terms of the contemporary analytical technique of economics and thereby obtain an instrument for evaluating the progress and stability of economic development, and develop techniques for evaluating the public interest, which are superior both to the contemporary practice of the individualist and the collectivist worlds.

There is no quarrel here with the ideas buried in this lengthy sentence: what is disturbing is the implied suggestion that such ideas can be discussed intelligently by students familiar with the preceding seven chapters. They cannot.

A New Geography

A Geography of Europe. By Jean Gottmann. *Harrap.* 699 pages. 30s.

Mr Gottmann's book was published in America last year. It is apparently intended for American students, but appears also to be directed at the general reader, since technical terminology, particularly of physical geography, is avoided. Its purpose is admirably and clearly expressed. In Europe, the political and economic events of recent years have so revolutionised man's demands on his environment that the need for a new geographical account is urgent. This need Mr Gottman attempts to meet.

It is in his treatment of the cultural and historical influences upon the geographical pattern of European life that Mr Gottmann is at his best, and where he shows his debt to the French school of geographical writing. The most stimulating generalisation must, however, be suspect if the facts it is based on prove incorrect. For example, the section dealing with Britain is accurate neither in its treatment of human and economic distributions today nor in its history. It contains a map of British industries in 1951, which ignores such vital developments as the steel works at Corby and the whole Tees-side chemical industry. The profusion of mistakes about such a well-documented country as Britain does not inspire confidence in the treatment of the rest of Europe.

Mr Gottmann's English style is not happy, and his maps, which are reprinted from the *Geographical Review*, show a distressing lack of relation to the text. It is indeed unfortunate that so many hard things have to be said about a book for which there is undoubtedly a need, which is well illustrated and printed and is a pleasure to handle. But there is no escaping the fact that Mr Gottmann has failed to measure up to his admirable intentions.

THE HISTORY OF THE TIMES

VOLUME IV AND FINAL

THE 150TH ANNIVERSARY AND BEYOND

1912–1948

The fourth and final volume is the story of the impact on *The Times* of the spectacular collisions between the European Powers after 1912, and between the Chief Proprietor and his Editors.

The narrative opens as German pressure was evolving from a threat into the certainty of war. The influence of *The Times* on British foreign policy before 1914 and on the making of war is reviewed. It is shown that, when peace by negotiation proved impossible, peace by victory, for which *The Times* pressed, was a valid course.

The hour of Allied success in arms was, for Northcliffe, the hour of private feud. Lloyd George, helped to power by Northcliffe, became his irreconcilable foe. Geoffrey Dawson, as Lloyd George's ally, was hounded from the editorial chair. How Wickham Steed, his successor, challenged a "Chief" now bent on despotic power over *The Times* is set out with profuse evidence from private papers.

But if Northcliffe was ruthless and cunning, he possessed great moral courage. If he was malign and suspicious, yet he was prodigal in generosity and affection; incalculable and devious, he was also insatiably curious and eternally stimulating. No malady could arrest the energies of "Northoleon," dominant in Fleet Street, unable to master Printing House Square. The frenzied progress of his last weeks is here told for the first time.

His death freed Printing House Square from its Tarquin. By manoeuvres as complex as they were tense *The Times* was then purchased by Colonel Astor and Mr. John Walter IV. Henceforth, the inheritance of principles of honest journalism was assured.

The attitude of *The Times* in the decade that led up to the second World War is exhaustively treated. The generation humiliated by Munich will find the chapter on the policy of Appeasement provocative and notably candid. An Appendix on the Abdication offers a new statement on the stand taken by the Press.

AMERICAN SURVEY

Eye of the Needle

Washington, D.C.

FOREIGN businessmen trying to reach the heaven of the American market may well be reminded of the passage of the camel through the needle's eye. American industry is never averse to boasting of its incredible achievements and its overwhelming strength and is even, perhaps, a little too inclined to deliver elevating lectures to its less enterprising brothers in less progressive countries. Yet when faced with signs of foreign competition in the domestic market, it behaves rather as a young girl straight from the vicarage might be expected to do if she found herself alone in the Kasbah. The self-conscious giants of American business, who grew to manhood behind the shelter of tariff walls and who fought each other to the death without complaint, have been given no cause for timidity when they have ventured outside the walls. Yet, even today, when it is suggested that a few rows of bricks should be removed from the top or that the lock on the garden gate should be made a little less complicated, cries of distress are heard again.

The *Journal of Commerce* recently remarked that there was no doubt that "what could develop into another strong protectionist tide is setting in once again." It is only one of many newspapers which have warned their readers that the real test of American postwar world trade policy is now beginning and that it is impossible to predict how far the recent protectionist swing will go before it is stopped and reversed. The most obvious sign of this attitude is the number of appeals that have been made to the Tariff Commission for increased protection on behalf of dozens of different types of articles.

The commission's first decision is expected shortly and it will be on the appeal of the Harley-Davidson Company, which has always made heavy motor-cycles, mostly for the police and the army. In dealing with these government customers it has the protection of the Buy American Act and has not had to worry about competition. But now that British manufacturers have created a market for a light machine in the United States the American company has built its own model and wants to be able to sell it secure from foreign threats. This being an extreme case, the Tariff Commission's decision is awaited with considerable interest.

So is the fate in Congress of a measure which the Treasury hopefully christened the "Customs Simplification Act of 1951" when it asked for its passage. Towards the end of April, 1952, the Senate Finance Committee heard evidence on this rather mild measure, which was drafted with no more sinister intent than that of removing some of the more ingenious administrative booby-traps set by the Tariff Act of 1930 and of making it possible for importers to discover how much duty they have to pay before their goods rot away. The theme of most of the trade witnesses was put succinctly by Mr Harry Moss of the American Hand Knitwear Association Incorporated, who said to the chairman:

> Senator, we are pleased to go on record in favour of simplification of customs administrative laws. . . . At the same time we do assert the need for continuation of a protective tariff system in this country for many industries such as ours. . . . Any move which might weaken our tariff in the name of customs simplification should be scrutinised. Some sections of this Bill need comment. . . .

Before the hearings had finished nearly every section of the Bill had been found to need comment. One Washington lawyer—a Mr Breckenridge—was kept particularly busy defending the free enterprise system from the unfortunate effects of free enterprise. Because he was involved in a hearing before the Tariff Commission he had to send an understudy to point out to the committee, on behalf of the Pin Clip and Fastener Association, the "loopholes" in the Bill, and the alarming postwar increase in imports of safety pins and straight pins.

Mr Breckenridge appeared himself, however, to represent the Dehydrated Onion and Garlic Industry of America and to warn the Senators of the "serious threat of subsidisation and dumping of these products by Egypt." He told the committee that

> representatives of Egypt, of the Egyptian industry, and of the Egyptian Government have been in the United States to learn our methods of producing dehydrated garlic, the standards desired by our consuming trades, and they have gone so far as to state that they intend to take over a substantial portion of the American market even if they have to have subsidies from their government to do so.

★

One section of the Bill which has struck terror into retail traders is a provision to raise from $1 to $10 the value of goods that can be imported duty-free by parcel post. Mr Rowland Jones, the President of the American Retail Federation, painted a gloomy picture of the American future if this innocuous proposal should be adopted. The duty lost, he said, would be very substantial; there would also be the collateral loss to the Treasury and to the states in the collection of corporate and personal income taxes representing the profits on this business which would be diverted to foreign mail-order operations. In addition, he said, it would also inevitably bring "loss of employment opportunity in the manufacturing establishments of this country."

Mr Jones put into the record a number of newspaper advertisements from British firms soliciting mail-order business, and he was supported in all he said—including the danger of unemployment and the loss of taxes—by Mr Irving Grinberg, the Executive Vice-Chairman of the Jewellers Vigilance Committee Incorporated. Mr Grinberg added to the previous exhibits the spring catalogue of a London firm, which, he said, had just been received by a "consumer-purchaser" in New York, and in which all but seven of the items offered cost less than $10. He asked the committee

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

to speculate on the flood of orders which would follow a decision to allow all these articles into the country free.

Powerful backing for his point of view came from the Pocketbook Workers' Union of the American Federation of Labour, which was described as at this moment experiencing one of its worst depressions since 1933 and whose spokesman said that it would be "the quality handbag part of the industry that will be most directly affected by the unfair import of handbags."

The American Retail Federation at last moved into the field of general policy when its President said that it had been argued that this simplification of customs procedure would be very helpful to foreign countries which are short of dollars and need them for the rebuilding of their economies.

> We think that . . . this is not a way in which we should help foreign nations increase their dollar balances and their exchange position. We are doing that in many, many other ways in the amount of billions of dollars, and we do not think that this foreign aid should now be injected to relieve foreign mail-order importers into this country on the basis that it helps those foreign countries in their foreign exchange.

These statements by American industry clearly provide grounds for the fears of the *Journal of Commerce* and such restrictions as the "cheese amendment" justify its comment that it could accept with a good deal more grace some congressional actions if it had any real confidence that the general run of legislators are actually following a purposeful policy and know what they are doing. Before accepting the most pessimistic predictions, however, it would be well to wait for the Finance Committee's report on the Customs Simplification Bill, for the Tariff Commission's decision in the Harley-Davidson case and for presidential action should that decision be a restrictive one. The President has the right to reverse the commission's findings but, if he does so too often, the Congress might be tempted to out-Smoot Hawley.

Reclamation's Jubilee

[FROM A CORRESPONDENT IN COLORADO]

IN December, 1901, President Theodore Roosevelt told Congress that, if the water going to waste in the semi-arid west of the United States could be stored and used, this region alone would be able to support more than the 76 million people who at that time made up the entire population of the country. This inspired Congress to pass the Reclamation Act, sometimes called the economic Magna Carta of the American West, which was signed on June 17, 1902. Its Jubilee is now being celebrated in western communities with various appropriate ceremonies and much accompanying publicity.

One of the most interesting of these celebrations was held last week at the gigantic Columbia Basin project, in the State of Washington, a perfect example of the type of land reclamation scheme that the Act made possible. It began with the building of a dam across the Columbia River, and electricity generators were ready in time to provide power for the Hanford atomic plant during the last war. Now the hydro-electric facilities are complete, with a rated capacity of 1,974,000 kilowatts, which makes this the largest single power station in the world; yet it is consistently overloaded. Meanwhile plans were made for irrigating more than a million acres of dry sagebrush by pumping the water of the Columbia River over a cliff into the huge bathtub-like Grand Coulee, the ancient bed of the river. It will take many years to put all of the land under irrigation, but last week the first 66,000 acres began to be watered.

The celebration took the form of making an eighty-acre farm out of the desert in one day. Enormous earth-moving machines ripped the sagebrush off, levelled the ground and ditched it with channels to receive and distribute the water; at the same time in one corner of the tract scores of workmen built a four-room modern house with all conveniences. Then this "farm in a day" was turned over free to its new owner, an ex-serviceman named Mr Donald Dunn, who was selected as the most deserving of many who applied. He represents a new type of migrant, fleeing not from the drought that drove farmers west from the Great Plains in the nineteen-thirties, but from the inundations of the nineteen-fifties. His fine farm in Kansas, and all his equipment, were completely ruined last summer by floods.

Engineers from the Bureau of Reclamation, the federal agency responsible for these schemes, study the possibilities of terrain near rivers for years before selecting a tract for irrigation. They look for relatively level land in parcels of several thousand acres; it must not be too high above the rivers, although pumping lifts of one or two hundred feet are common, and there are some much higher. Specialists investigate the soil to make sure it will grow crops and to decide what kind will do best; a heavy output of sugar beet is expected from the Columbia Basin project. A dam is then

Sources: US Bureaux of Reclamation and of the Census.

built to provide enough water for the scheme; usually, although not always, an electricity plant is included in the plan. In that case it is the first unit to be completed, partly because the west is always hungry for power and the project can therefore begin earning money at once to repay the government, and partly because the new community will need power almost as much as water, for pumping and farm and domestic use.

Nearly 5,500,000 acres have been redeemed by the Bureau of Reclamation from desert and prairie in this way, or given extra water to supplement that already provided by private enterprise. The Bureau's power plants can generate 4,500,000 kilowatts and in 1951 they provided more than 23 billion kilowatt-hours of electricity to aid farm production and the industrialisation of the west. In that year they earned

$41 million for the government and crops harvested from reclaimed land were worth more than $654 million. The power plants return their original cost with interest, but the farmers who settle on the new lands are generally subsidised to the extent of about 50 per cent; they pay back the cost of the improvements over a period of from forty to sixty years, but without interest.

The reclamation programme has played a very significant role in providing new opportunities for the people who come west, as so many are doing. Theodore Roosevelt's prophecy has not yet been fulfilled, but the population of "reclamation territory," the 17 western states, is now about 35 million, compared with 11 million in 1900. It is estimated that something approaching a million people are supported, directly or indirectly, on or around reclamation projects, and that the new business, new industry and new farm output resulting from them has repaid the federal government much more than the cost of the programme, through income and other taxes on the newly created wealth. That cost, spread over nearly fifty years, now amounts to about $2.5 billion, less than three weeks' spending on the cold war.

Privately financed irrigation schemes, most of them settled ahead of federal irrigation, now cover about 20 million acres; in the 31 eastern states there are less than 1,500,000 acres of irrigated land. When all the land in the western states that can economically be irrigated is supplied with water, about 38 million acres will have been dealt with. But this will take at least another fifty years, for the programme is one that Congress feels can be put off in the face of the mounting cost of rearmament.

*

In 1946, in a fit of postwar enthusiasm, the Bureau of Reclamation proposed a burst of development that would have cost $3 billion by 1954 and would by then have put water on 2,000,000 acres of new land and on another 3,600,000 that are now insufficiently irrigated. It would have added 4,000,000 kilowatts of electricity to the 2,500,000 available in 1946. The goal was to produce $1.5 billion worth of crops (at present prices) from federally irrigated farms by 1954. Congress never more than half implemented this programme and, after the Korean outbreak, government spending on reclamation was cut back from about $350 million a year to $225 million. The Commissioner of Reclamation has told Congress that this in effect means the end of any further extension of reclamation and that unless the Bureau gets more money, particularly for planning and research, it will be virtually out of business by 1956, apart from operating finished projects. Many of its best men are leaving and it now employs less than 14,000 compared with a postwar peak of 19,000.

Opposition to the Bureau's programmes comes from three principal sources: private electricity companies, which do not want any more public power to be developed unless they can control its distribution; eastern farmers and Congressmen who see no need for costly irrigation in the west to subsidise competition with agriculture in their part of the country; and the operators of the huge western factory farms, who resist the rule that no more than 160 acres of a single owner's land can be supplied with federally financed water. This so-called "160-acre limitation" was put into the original Act to make it a continuation of the homestead law of 1862, so that the west should be settled by sturdy freeholders on their own small farms. The limitation is still applied when new lands are irrigated, but factory farmers, particularly in Texas and California, have been trying without success for years to get Congress to repeal it.

American Notes

Separation of Powers

Mr Truman's penalty for the mishandling of the steel dispute is an unequivocal judicial limitation on the President's powers and a renewal of the steel strike under more unfavourable auspices. The President, as he promised, has at once handed back the steel mills to their owners and nine-tenths of them are now cold. In its 6 to 3 decision, the Supreme Court upheld Judge Pine's ruling against the Administration and the majority opinion, read by Justice Black, firmly denied that the President had any powers to seize private property, save those given him by Congress. The Constitution, the decision went on, makes Congress the law-maker; the function of the President is to execute the laws. Even the "expanding concept" of the threat of war, which, with the threat of economic disaster, has steadily widened the presidential powers during the past two decades, might not be stretched to give the ultimate seizure powers to the Commander-in-Chief.

This decisive check to the expansion of executive powers has been enthusiastically welcomed in Congress and throughout a country which is jealous of the sanctity of the Constitution; even those who do not believe Mr Truman himself has any dictatorial ambitions welcome the restatement of the doctrines of the separation of powers and the supremacy of law. Indeed, as Justice Frankfurter said in a concurring opinion:—

> Constitutional questions seem to exercise a mesmeric influence over the popular mind. This eagerness to settle —preferably forever—a specific problem on the basis of the broadest possible constitutional pronouncements may not unfairly be called one of our national minor traits. An English observer of our scene has acutely described it: "At the first sound of a new argument over the United States Constitution and its interpretation the hearts of Americans

leap with a fearful joy. The blood stirs powerfully in their veins and a new lustre brightens their eyes."

The quotation is from *The Economist* of May 10, 1952.

A few voices have already been raised to deplore the gaps which so sharp a separation of powers leaves in the fabric of government; they express anxiety about the capacity to deal with future emergencies—however poor the justification in the steel case may have been—and are eager for Congress speedily to authorise the President to seize industries in which a prolonged stoppage would be dangerous to the national welfare. Several such Bills are now before Congress, but many members are inclined to agree with Senator Taft, who will not lift a finger to help the President out of his difficulties until the possibilities of existing legislation—that is, the Taft-Hartley Act—have been exhausted. The only advantage of invoking the Act would be to postpone a strike for eighty days; if a settlement had not been reached by then, Congress would have to take action. And the steelworkers, who have already put off their strike for more than eighty days, would be justifiably embittered by further delay.

Justice Clark in his opinion suggested that the Administration might have taken a more acceptable course: the direct placing of government defence orders for steel with the mills. This would then have enabled them to be seized under a provision of the Selective Service Act. It may come to that, but with a month's supplies or more in the hands of domestic consumers, collective bargaining, which once nearly provided a settlement, may be given another opportunity. The Administration cannot, of course, wash its hands of the dispute, for it must determine the price relief to which the companies are entitled; this is the real sticking point. But the support of the courts places the companies in a strong bargaining position and the stabilisers' next thoughts must almost certainly be how to lessen the impact of higher steel prices on the whole price structure.

Ike's D-Day

General Eisenhower's personal D-Day, almost exactly eight years after his invasion of Normandy, came when he left the protection of his uniform last Wednesday and went back to his childhood home in Kansas to open his campaign for the Republican presidential nomination. There, watched by the whole country, he fired his first political salvo in a speech well above the head of his immediate opponent, Senator Taft, who had prepared for the General's return by an attack not only on his support of the Administration's foreign policy but on his competence when Chief of Staff. General Eisenhower, while explaining and defending that foreign policy, nevertheless aimed at his party's real enemy, the Democratic Administration, which he said had been in power too long. He outlined the four ways it threatened free government in the United States—unreasonable antagonism between economic elements (presumably a reference to the steel strike), inflation, excessive taxation and overgrown bureaucracy. There was little to inspire enthusiasm in the speech, and the General did not say how he proposed to counter these threats, but he can hardly avoid being more specific when answering newspaper reporters, which he is doing while *The Economist* is in the press.

General Eisenhower is probably right to try to avoid skirmishes within his party and save his strength for the decisive election battle. He must realise how little he knows about the detailed domestic problems of his country, and how many potential supporters will be offended by each definite stand he takes. Above all, his appeal to the voters lies in his present aloofness from party intrigues, in the belief that in the White House he would have a fresh and independent approach to the country's problems. But the General's managers argue that if he avoids skirmishes between now and the Republican nominating convention in Chicago on July 7th, it will be Senator Taft who leads the party into the final battle.

The choice will be made by the delegates to the convention, and at the moment Senator Taft is slightly nearer than is the General to having the promised support of the necessary 604. But the balance is held by an uncommitted group, and both sides are pinning their hopes on these delegates. This week's primary election for the delegates from South Dakota, so close that the result is still uncertain, shows how evenly the sides are matched. Mr Taft should have done better in his own Middle West, but a clear victory for General Eisenhower might have swept him into the nomination as his victory in New Hampshire swept him into the campaign.

Now both sides must capture delegates as and how they can. In Texas, Mr Taft's men proved that they would stop at nothing: by an unbelievably barefaced manipulation the local party machine sent a Taft delegation to Chicago against the wishes of the state's Republican voters; as a result there will be two rival delegations from this important state, and the nomination may depend on which one is finally approved. Faced with such manœuvres, General Eisenhower has agreed at least to put himself in a position to be shot at, even though he does not yet seem prepared to shoot back. From now until the convention, in New York, Detroit and Denver, he will answer the questions put by any Republican delegates who care to visit him.

* * *

Congress True to Form

The House of Representatives ran truer to form than did the foreign affairs committees when it cut a further $726.5 million, in addition to the $998.9 million recommended by its committee, from the $7.9 billion requested by President Truman for foreign aid in the coming year, and when it took all of this from economic rather than military assistance. The Senate, after some impassioned sarcasm from Senator Connally, rejected four more severe cuts and added less than $200 million to its committee's $1 billion reduction, spread equally over all sections of the programme. The conference committee has compromised half-way between the two, recommending a total of $6,448 million; this includes $3,416 million in military aid for Europe, and $1,283 in economic aid. The Senate is thought to be sure to approve this, but the House may make difficulties.

President Truman has already promised that, when he goes round the country campaigning for the Democratic presidential candidate, he will call Congress to account if it fails to provide adequate funds for either mutual security abroad or defence at home. He is obviously hoping to do as well for his successor this year as he did for himself in 1948 by attacking Congress, and Congress is helping him by keeping even closer to its usual form on other legislation than it has on foreign aid. It has refused even to make a pretence of considering Mr Truman's Fair Deal, the social legislation which appeals so much to the voters, on the excuse that at all costs the session must be finished before the Republican nominating convention opens on July 7th.

But even with this light programme Congress, and especially the Senate, is as far behind schedule as ever, partly because of the weakness of the Democratic leadership, but mainly because members, most of whom are standing for re-election, have been spending more time in their constituencies than in Washington. And when they have passed Bills they have sometimes only succeeded in making more work for themselves. Time will have to be found, for example, for an attempt to override the President's veto on the Bill giving the oil under coastal waters to the states.

The only major piece of legislation Congress has actually finished with this session is the ratification of the Japanese peace treaty and the accompanying Pacific pacts. Little difficulty is expected in obtaining Senate approval of the two agreements with West Germany that involve the United States. But there is likely to be controversy over the necessary extension of the President's war powers and there already is controversy over the extension of economic controls. The Senate is dealing with these this week, but the House has not yet received a Bill from its Banking Committee. However, it has completed action on all but one, funds for foreign aid, of the eleven major Appropriations Bills, while the Senate has hardly begun on them. It is very doubtful if such a backlog can be dispersed in the month that remains before the convention, even though the Senate is now disposing of legislation with unusual speed.

* * *

Everybody Loves a Farmer

The farmer, who contributed so notably to the Democrats' victory in 1948, is being courted this year with grim determination by both parties. Four years ago the Democrats convinced the farm states that declines in agricultural prices were due to the failure of a Republican Congress to provide adequate storage facilities—a charge which still rankles. The President's opening shots in this year's farm campaign were once more directed against Republican "mossbacks" who oppose the farm programme as "socialism." But in fact, the Republican farm stand is likely to pay the Administration the sincere compliment of almost slavish imitation. Republican farm experts approve the present system almost in its entirety, though they will make much of the laxity in administration which has enabled dishonest warehousemen to fleece the government.

Indeed, Congressmen from the farm states, whether Republican or Democratic, are anxious to go further in favouring the farmer than all farm groups consider prudent. In the Senate, Democrats—two of them, Senator Russell and Senator Kerr, candidates for the Democratic nomination—have introduced Bills which would repeal most of the recently hard won reforms in the price support system and the related concept of parity, the imaginary "just price" which would guarantee farmers the purchasing power they enjoyed in an earlier period. By 1954 a new base for parity is scheduled to replace entirely the traditional 1910-14 base, which unduly favours producers of such staples as cotton, maize, and wheat and which discourages desirable diversification. Both Senators would continue the out-moded base for parity. This is opposed by the Administration, but it supports Senator Kerr's efforts to abolish the present "sliding scale" of price supports, designed to discourage over-production and the piling up of costly surpluses by lowering supports in times of abundance and raising them when crops are short.

It is argued that the farmer's present reluctance to increase his acreage, which this year is falling 7 million below the government goals, is due to his fear of being penalised for plenty. In fact most of the major crops are being supported at 90 per cent of parity; Mr Brannan, the Secretary of Agriculture, has taken no risk of quenching farm enthusiasm for production or for the Democratic party by experimenting unduly with the sliding scale for basic crops. How quickly feast can turn to famine has been shown in potatoes, from which supports were withdrawn two years ago and which now are so short that housewives and hotels are being asked not to serve them in order to break a flourishing black market.

Congressional anxiety to appear on the farm hustings bearing gifts will be restrained only by fear of consumers' resentment in the big cities. But it is doubtful whether higher prices are the real solution for the farmers' troubles. Though farm prices are falling, and the big postwar boom is clearly over, what will pinch the farmer this year most is the cost of the things he must buy. His purchasing power this year may be lower than it has been for a decade, with the exception of 1950.

Matchmaking Taxes

The excess profits tax is promoting some strange and some not so strange marriages of convenience among corporations, particularly those which are growing with painful rapidity into the higher tax brackets. In this marriage market past losses may be more endearing than future earnings for, under last year's tax Bill, losses may be carried forward three years, instead of two, as an offset to later profits. In advertisement columns firms may be seen putting their best, that is their tax loss, foot forward. In a recent case of a merger between an expanding ice-cream company and a maker of buses, it was considered that the latter's dowry, a three-year loss of $5,500,000, was as

strong an attraction as the fact that ice-cream needs to be delivered.

Among more blue-blooded corporations the excess profits tax is helping to sweeten, at least, a contemplated merger between the Atlas Corporation, Consolidated Vultee Aircraft Corporation and the Kaiser-Frazer Corporation; the latter holds seventh place among automobile manufacturers as well as making aircraft. No progress has yet been announced to the hopeful stockholders of Atlas, but the advantages are clear. The merger would give Consolidated a foothold in the automobile market, insurance against the day when its aircraft orders fall off from their present $900 million backlog. Also the automobile company, which may later this year turn the profits corner, can offer a $40 million tax credit on past losses, $19 million of which must be used before the end of 1952. The obstacles involve obtaining the consent of half a dozen different government agencies, the Department of Justice, the Securities and Exchange Commission, the Reconstruction Finance Corporation, and others, not forgetting the Department of Internal Revenue, which, before approving the use of the tax credit, would have to be satisfied that this was not the principal reason for the merger.

The tax load is now considered so heavy that unless there is a new inflationary tide, covering up the present soft spots in the economy, the pressure on Congress to reduce taxes next year may be irresistible. The issue cannot be sidestepped. The excess profits tax, which was revived after the Korean war, was given a short lease of life. It expires on June 30th next year, and six months later the increases in personal income taxes voted in 1951 also expire, unless Congress decides to continue them.

Shorter Notes

Mr James McGranery, the new Attorney General, has taken over his duties as head of the Department of Justice to succeed Mr Howard McGrath, who was dropped in the controversy over the dismissal of Mr Newbold Morris as special investigator of corruption in the government. Mr McGranery's confirmation by the Senate was preceded by lengthy debates on the adequacy of his understanding of basic US law and on how vigorously he could be expected to investigate the Administration. For his part, Mr McGranery has pledged an "unspectacular clean-up" that will not involve "running around the country on television and radio."

★

Plans to merge two large banks in New York City, the Manufacturers' Trust Company and the New York Trust Company, have been dropped after shareholders in the latter were reported to be dissatisfied with the terms arranged for the exchange of their stock for that of the new enterprise. Had the merger been carried out, the new bank would have been the fourth largest in the country, with deposits of $3.275 billion in 114 offices in the city. This is the second time within a year that an important banking union has narrowly missed completion in New York; last August legal obstacles prevented a merger between the Chase National Bank and the Bank of the Manhattan Company.

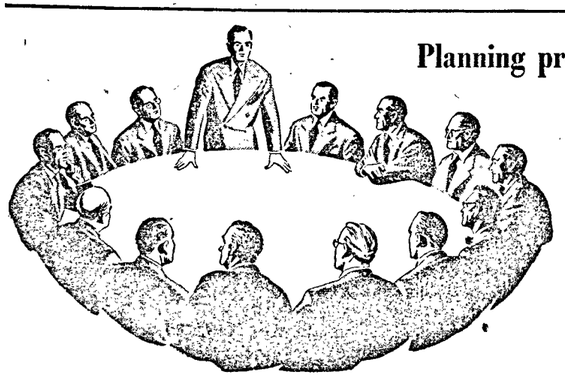
★

Washington will not after all have the diversion of seeing the Capitol, where Congress meets, picketed by helicopter and showered with leaflet-carrying balloons. An agreement has been reached by which the firm painting the building will use trade union labour; the contract for the painting had been awarded to a non-union company and, since picketing is forbidden on Capitol Hill, the union had decided to take to the air in protest.

★

The conversion of the speedometers on Air Force planes to knots instead of the present statute miles is another declaration of this service's independence from the Army. After July 1st Air Force "ships" will be calibrated as water-borne craft are, since much of their flying is over water. Civil aviation companies are, however, objecting to a proposal that they should do the same.

★



A department store's scheme for selling musical instruments is helping the budgets of music teachers in Cleveland, Ohio. Under the plan the prospective musician takes a trial course of instruction at the shop, with instrument and music provided free. If his interest is sustained and he shows ability, at the end of the trial he is encouraged to continue with private lessons—on an instrument of his own purchased from the store's music department.

★

The long controversy on the New York City budget for the fiscal year starting on July 1st concluded rather tamely with its unanimous approval by the Board of Estimate. The Mayor, Mr Impellitteri, was responsible for the $1.47 billion programme, the highest in the history of New York, which will be financed in part by special new levies as well as by a continuation of the 3 per cent tax on retail sales which is due to expire at the end of this month.

★

California's Alien Land Law, passed in 1920 to stifle Japanese competition in agriculture, has been declared unconstitutional by the State Supreme Court and the decision has been accepted by the state government. The Court held that the law, which barred aliens who were not eligible for American citizenship from owning property, was unconstitutional on racial grounds; a lower court had declared it invalid because it contravened the United Nations Charter. At the time the Act was passed, aliens from the Orient were excluded from ever becoming citizens; the ban on naturalisation has now been, or is likely to be, removed from all Asians.

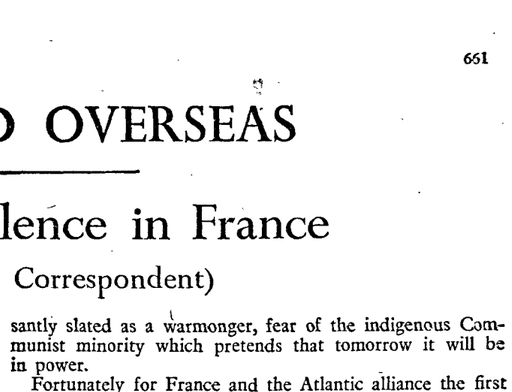
Communist Violence in France

(From Our Paris Correspondent)

BEFORE Whitsun Paris had its liveliest political week since the big strike of November, 1948. It began with the floating of M. Pinay's loan; it continued with the signing of the treaty for a European Army, a diplomatic fixture "*pas comme les autres*"; it ended with the arrest of M. Jacques Duclos, acting secretary general of the French Communist Party, who had been discovered during the bloody riots of the night of May 28th, in a motor-car with his wife, his chauffeur, a short-wave receiving set, a loaded revolver and two warm dead grey pigeons. M. Duclos, the first Communist leader to be arrested since the liberation, spent Whitsun "inside" with M. André Stil, editor of *Humanité*, who had been locked up some days previously. *Humanité* itself was twice confiscated before Whitsun; and the police have carried out a search of the premises of the Communist Party and affiliated organisations. The legal consequences of the rioting are at present veiled behind the phrase *atteinte à la sûreté intérieure de l'Etat*, so that some days will probably pass before it is known who is to be prosecuted and for what offence. At the time of his arrest M. Duclos was described by the press as having been caught *flagrante delictu*; but doubts as to the precise nature of the case against him have since been coupled with speculations about a wider prosecution of organs of the Communist Party and of the associated Communist bodies which called for the demonstration.



Orders from the Kremlin

It is believed that the riots, which took the form of a large planned attack on the police by gangs of *militants* armed with clubs, iron bars and spiked stakes, followed instructions given by the Kremlin to M. Francois Billoux, who recently returned from a visit to M. Maurice Thorez, still convalescent in the Soviet Union. In a contribution to *Les Cahiers du Communisme* M. Billoux proclaims the absolute necessity of smashing the French bourgeoisie.

> The bourgeoisie is handing over the country to the American occupation. . . . It is not a kind of *victim* of the American colonisation, for it has voluntarily and deliberately submitted to the orders of the American millionaires. . . . The defence of French industry cannot be assured by a "national union" of the workers, middle classes and industrialists . . . this would only be a union of betrayers and betrayed.

Spurning the bamboozlements of M. Pinay, who, in the words astonishingly permitted to emanate from M. Duclos in prison, "was a national councillor of Petain, did business with the Germans and deserved to be prosecuted for making illicit profits," the French should take determined action—against the American army in France, against their own excessive rearmament and military service, against colonialism in North and Central Africa. Nor, says M. Billoux, should the people forget the national claims of Alsace and Lorraine. The *Cahiers* also attacks "the high dignitaries of the Church, who are trying to maintain barriers between Catholic and Communist workers." Thus Wednesday's demonstration against General Ridgway seems intended to mark a new phase in the French Communist Party's "peace tactics"—a switch from the semi-soporific technique of the Partisans of Peace, which played upon popular lassitude and neutralism, to that of the organised *putsch* with its double incitement to anger and fear: anger against the foreigner who is incessantly slated as a warmonger, fear of the indigenous Communist minority which pretends that tomorrow it will be in power.

Fortunately for France and the Atlantic alliance the first essay in Communist violence was a resounding failure. Out of over 700,000 Parisians who voted for the Party last June only 7,000 or 8,000 turned out "against Ridgway" in the streets. In fact, Wednesday's manifestation only differed from previous flops (for example, demonstrations against General Eisenhower and against the German ex-generals at the EDC conference) in the scale of the operations organised by the rioters against the police. The Communists had repeatedly failed to arouse the population in the streets, in the factories and at the docks, against the American military alliance and presumably expected to fail again this time. What, however, they could make sure of was a straight fight with the French police. The usefulness of this tactic is not evident. It is true that the population as a whole dislikes the police, who are rather rough, and is disinclined to come to their rescue when they are set upon by other rough men; whereas, if the same gangs attacked American buildings in Paris, the crowd might conceivably turn actively against them. But occasional violence against a vague anti-Atlantic campaign

Reproduced by kind permission of "Realities."

muddled up with protests against the government's economic policy seems unlikely to carry the Communist cause further. On the face of it, indeed, the riot seems to have been for the purposes of world Communist propaganda: it will make good reading in China and Peru. Yet to continue in the path of violence is bound to be costly for the French Party—unless the Government's reprisals are paralysed by judicial impotence, with the state once more proving incapable of enforcing the very adequate existing laws.

The most up-to-date and accurate information about French Communism has been published by the review *Realities*, which instructed the *French Institute of Public Opinion* to conduct an elaborate survey of the problem. The replies given to the Institute's questionnaires (which were addressed to Frenchmen of all shades of political opinion) indicated very clearly several rather unfamiliar features of the Communist electorate. For instance, answering the question:

"What points would you like the Party to stress particularly?" only one Communist voter in 17 talked about "shaking off the American yoke" or "stopping the war in Indo-China," and only one answer in ten contained ideas of the class struggle. The main themes of the replies were bread (or economic stability) and peace. But by peace the bulk of the French Communists, the Institute found, understood not the Kremlin's "fight for peace" (i.e., the maximisation of the international class-war) but simply neutrality, that is, non-involvement, either in a military alliance in peace, or in a war between the Soviet Union and the United States, should it come about. Thus to the question: "Do you think that France should take part in a Soviet American war even if she could stay completely neutral?" 65 per cent of the sample of Communist voters replied: No; and only 22 per cent: Yes. *Realities'* survey proves almost beyond possible doubt that of the 5,431,000 Communist voters of last June (26.5 per cent of the electorate) the vast majority are concerned primarily with a more consistent system of parliamentary republican government and with more stable economics. Less than a quarter of the Communist electorate has any genuine feeling of solidarity with the Soviet Union or any comprehension of the theory of the universal class-war. Moreover, when asked whether they thought their standard of living could be improved by reforms or only by a revolution (meaning another parochial revolution in France) no more than 41 per cent replied "only by a revolution" or "by a revolution if necessary"; the majority declared itself to be respectably reformist.

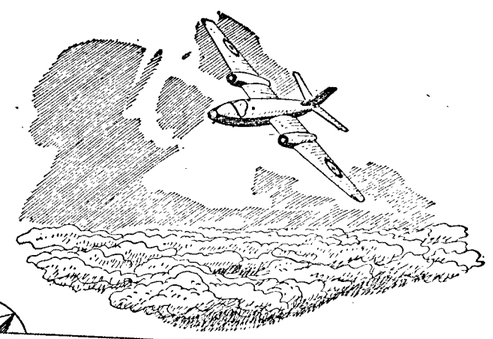
If, therefore, the figure 22 per cent is taken to represent the convinced Stalinist core of the French Communist electorated, the percentage of Stalinists in the whole nation becomes about 3 per cent (1,200,000 voters). What seems to be required in France is the kind of gain in political and economic confidence which reduced the Communist vote in Britain from 4 per cent of the electorate in 1945 to 0.8 per cent in 1951. Meanwhile the French Left, in the socialist party, the MRP and the non-Communist unions, has provisionally retained a tiny jot of faith amidst its scepticism of M. Pinay's government. M. de Menthon, leader of the MRP, has said: "In France the Right is against the nation and the Left is against the state." The rest of the year will show whether there is a way out of this dilemma.

Persia and the Court

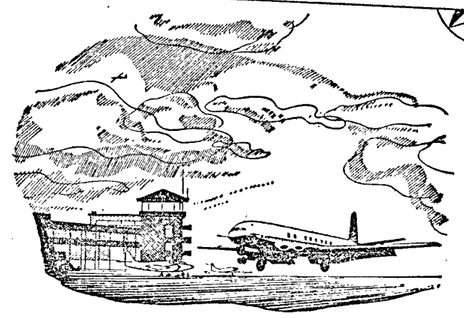
ON Monday, Dr Mossadegh makes an appearance on the international stage that may well be his last. He has come to The Hague to present before the International Court of Justice Persia's argument that the Court has no jurisdiction in the matter of its oil dispute with Britain. Before he captures the headlines (which he always does, thanks to his dramatic talent) it is worth surveying the purposes that are served by the proceedings. Many people feel that they are unlikely to promote a solution that will put Persian oil back upon the world map, and. that, therefore, they have little value beyond that of a peepshow. This estimate leaves out of account some results of the court verdict—results that must follow whichever way the judges decide, and that are described below.

The proceedings which begin on Monday have nothing to do with the merits of the case. All discussion of these is in suspense until the Court has dealt with the question of jurisdiction which is raised in a preliminary objection filed by the Persians. On jurisdiction, the British argue that the Court has competence in the matter because the Anglo-Persian oil agreement of 1933 had a dual character. They contend that it is on the one hand a simple oil agreement, but that it is also an international convention since it was negotiated under the auspices of the League of Nations as the basis of settlement of a previous dispute. The British case points out that Persia bound itself to accept the Court's jurisdiction in such a matter when it ratified the Optional Clause regarding jurisdiction in 1932. The British, adding a point which borders on the merits of the case, claim that the dispute does not fall exclusively within Persia's domestic jurisdiction since it has entailed treatment of foreign nationals along lines that infringe international undertakings given by Persia in treaties of 1857, 1903 and 1928. The gist of the Persian reply is that the Court has no competence because nationalisation of industries is a purely internal affair, and that Persia has not maltreated foreign nationals since it was always ready to pay them compensation, provided they would let it sell its oil. The President of the Court, who is a martinet when witnesses stray from the point (he recently reproved Sir Hartley Shawcross for doing so) will have his work cut out to keep the questions of jurisdiction and of merits from overlapping. Dr Mossadegh's farewell broadcast upon leaving Teheran suggests that he, in particular, has no mind to keep them apart.

The Court's decision as to whether or no it has jurisdiction is not prejudiced by the fact that last July it issued an interim Order to the parties in the dispute. It stated specifically, at that time, that its Order "in no way prejudged the question." (It will be remembered that the Polish and Egyptian judges dissented from the Order, on the grounds that it had just this effect; the Russian judge was ill.) The Court is therefore free to decide either way. But if it were to decide that it has not jurisdiction, at least two important consequences would be implicit in its decision. First, this would suggest that all agreements reached between local governments and foreign companies are none of the Court's business, even when reached under international auspices; it will therefore discourage the investor from placing his money abroad, to the detriment of all countries which seek to increase their industrial potential by encouraging foreign investment. This consideration is of the greatest concern to all potential investors; it is of equal concern to all areas in need of investment or aid.



Causes of Failure to sell Oil



Secondly, such a decision is likely to affect the immediate course of events in Persia. For, beyond a doubt, the Court's interim order of July 5, 1951, has affected the course of events there in the last year. Persians like to imagine, and their press and radio tell them constantly, that their failure to sell oil since the British left is due to the deep and bitter "machinations of the British Government and former oil company." In fact, such were not necessary and did not happen. The major causes of failure were first, that crude oil is plentiful and that the only variety available from Persia was high-grade aviation spirit which the Persians were not by themselves capable of extracting in quantity from the Abadan refinery; secondly, that selling oil is not the simple waterfront operation they had imagined; and, thirdly, that tanker owners—even those with bootlegging inclinations—were deterred from carrying goods the ownership of which had been thrown into doubt by the Court's order, because the operation might entail a hold-up and months of costly wrangling. If the Court were now to decide that it has no jurisdiction and were to rescind its order, this third handicap would be removed and Persia might sell a little oil abroad if it were not fussy about price. The first two handicaps would, of course, survive; they will also become increasingly hampering as the months go by and the many new local refineries which companies and governments are now building as the result of the fright at Abadan come into operation one by one. Even with one handicap removed, therefore, Persian sales might remain negligible.

If on the other hand the Court were to decide that it has competence, it would need to move on to the question of merits—on to the British claim, which covers restitution or, alternatively, damages, and on to a Persian counterclaim for "illegal plundering." Years of wrangling would lie ahead

and might be abortive. Indeed, the Persians have threatened to nip such proceedings in the bud, since they have proclaimed that the ultimate decision of the Court will "make no difference to their intention to follow the road they have chosen." A Court decision that it has jurisdiction might therefore have no immediate practical result on the flow of oil, but it would have some legal and moral consequences that would be of interest to the whole world.

It is perhaps pertinent to add that the Court's decision will greatly affect Dr Mossadegh's personal position inside Persia. A triumph for his view will win him a short further lease of life; a defeat will hasten the growth of the mounting opposition to his policy. But this is a domestic Persian affair. It would be of interest to the world at large only if it were possible to discern a good candidate to take his place. None is apparent at the moment.

Unrest in the Rumanian Countryside

[BY A CORRESPONDENT]

A LARGE measure of responsibility for last week's upheavals in Bucharest, which included the replacement of the Minister of Agriculture, can almost certainly be placed on the deteriorating economic situation within the country. The currency reform of last January has failed to bring the peasants to heel and the perennial problem of food shortages again seems to be a source of much anxiety to the Government. Vigorous police supervision and numerous prosecutions have not prevented renewed activity on the free and black markets, and on the latter there has been a steady increase in the exchange rate of the dollar which recently stood at 18 lei instead of the official 11.09 lei. The whole object of the January currency reform, the promotion of a lower cost of living by a reduction in food prices, is being jeopardised by a general recrudescence of illegal transactions in food. The Government has been sufficiently alarmed to adopt a series of measures designed to rectify certain grave omissions in its agricultural policy.

For many years, in fact since 1945, priority in capital investment has been given to the programme of industrialisation. Agriculture and rural development in general have been relegated to a position of secondary importance, and have had to be content with a lower scale of financial assistance, as the following table shows.

Percentage of national capital investment

	Industry	*Agricultura*
1949	47.2	9.4
1950	50.2	6.6
1951	51.4	10.0

The result has been that agricultural productivity has not kept pace with industrial expansion, and the growing demands of the industrial proletariat have not been satisfied. The Rumanian press has given many examples of the adverse effects of this policy on the feeding of the population. It has described how some rations have not been honoured for months; how peasants and school children have been conscripted to gather beechnuts which the authorities then pressed into oil as a substitute for edible oil rations; how the Bucharest People's Council was at one period so appalled by the disastrous food situation in the capital that it advocated the compulsory transfer of all farms in the vicinity to the State regardless of ownership. This and other conclusive evidence of alarming food deficiencies galvanised the Government into extending more liberal grants towards the raising of agricultural productivity. This year, a total of 337 million lei—106 million more than in 1951—is to be allocated to this purpose, and will be partly spent on speeding-up the mechanisation of agriculture.

Grave defects in another direction are to be eliminated. Despite the propaganda and money spent on stimulating trade between town and countryside through consumer co-operatives and ancillary organisations, such as Fruit and Vegetable Centres, the Government seems to have been unable to induce the peasants to part with their surpluses after the compulsory surrender of the annual quotas of cereals, meat and milk to the State. During the brief debate on this year's Budget in the National Assembly, the deputy for Botosani deplored the fact that whereas over 121 million lei worth of industrial products had been sold to the peasants by the co-operatives, the latter had only received 4.5 million lei worth of agricultural products in return. Other deputies voiced similar complaints.

The reluctance of the peasants to do business with the co-operatives does not seem to be wholly due to their ineradicable suspicion of State trading units. In many cases, the Government appears to have neglected to supply the co-operatives with adequate stocks of the most elementary necessities. In its issue of December 19, 1951, the influential paper *Universul* confessed that whereas in theory the peasants should find the best outlet for their surplus production in consumer co-operatives, the failure of these trading units to provide everyday needs like kerosene, matches, sugar, salt and cloth was keeping the peasants at arm's length, and encouraging them to dispose of their surplus to private traders for eventual sale on the free market.

Persuasive Financial Measures

The Government has realised that the situation is not likely to improve in view of the all-absorbing demands of heavy industry on the resources and finances of the country. It has therefore fallen back upon a more stringent application of the two prescriptive remedies for food shortages—collectivisation and collections. It has renounced its somewhat peevish attitude towards the more intransigent peasants who refuse to believe in the benefits of collectivisation, and who forced it to modify its policy of registration in collectives by indirect pressure a year or so ago. Instead, it has been trying to break down the passive resistance of the peasants by persuasive measures of a financial nature such as, for example, the new taxes on farm buildings based on a decree of January this year, and the compulsory insurance of agricultural property which followed in February. These are intolerable burdens on all classes of peasants, but what made them more onerous was the fact that many farmers were required to pay the taxes for the first half of the year by the end of February. The peasants were already severely crippled by the January currency reform, which deprived them of most of their ready money. They will have little money at their disposal to meet both taxes and premiums until after the spring and autumn harvests. Some of them may thus have been forced to enter the collective farms, especially as the non-payment of taxes entails severe penalties amounting in some cases to long periods of penal servitude. The fact that the Rumanian press referred to the establishment of scores of new collective farms during February and March testifies to the relative success of this new financial counter-attack on the economic independence of the peasants.

Compulsory Collections

The Government also intends to extract the compulsory collection of the highest possible annual quotas of agricultural products from all classes of cultivators, particularly from the kulaks. New decrees of assessment have been issued, and fresh instructions for their rigorous execution have been circulated among the state collection units. The decree for the compulsory collection of meat which came into operation at the beginning of the year, the decree for the collection of vegetable produce of March, and the decree for the collection of milk, all follow the revolutionary principle

governing the collection of grain—that quotas are to be fixed, not according to the fertility of the soil, but to the size of the holding. In the case of vegetable produce, two new provisos have been added to the effect that quotas may be increased in regions of exceptional fertility, and that farmers are henceforth disallowed the right to contest assessments. In view of the fact that kulaks are compelled to yield quotas 30 per cent higher than other farmers, and that collective farms are conceded reduced quotas, it is plain that the underlying motive of these decrees is to make the position of independent cultivators as untenable as possible, and to force them into the collective fold. By these and similar measures the Government hopes, perhaps, to accumulate sufficient reserves of food for exportable purposes, although it is doubtful whether it can do that and continue to supply the Soviet Union with the vast quantities of agricultural products dispatched regularly to that country every month. But its immediate purpose is to avoid a repetition of last year's failure of the collection scheme, and of the rationing system associated with it.

The Indian Slump

[FROM OUR CORRESPONDENT IN INDIA]

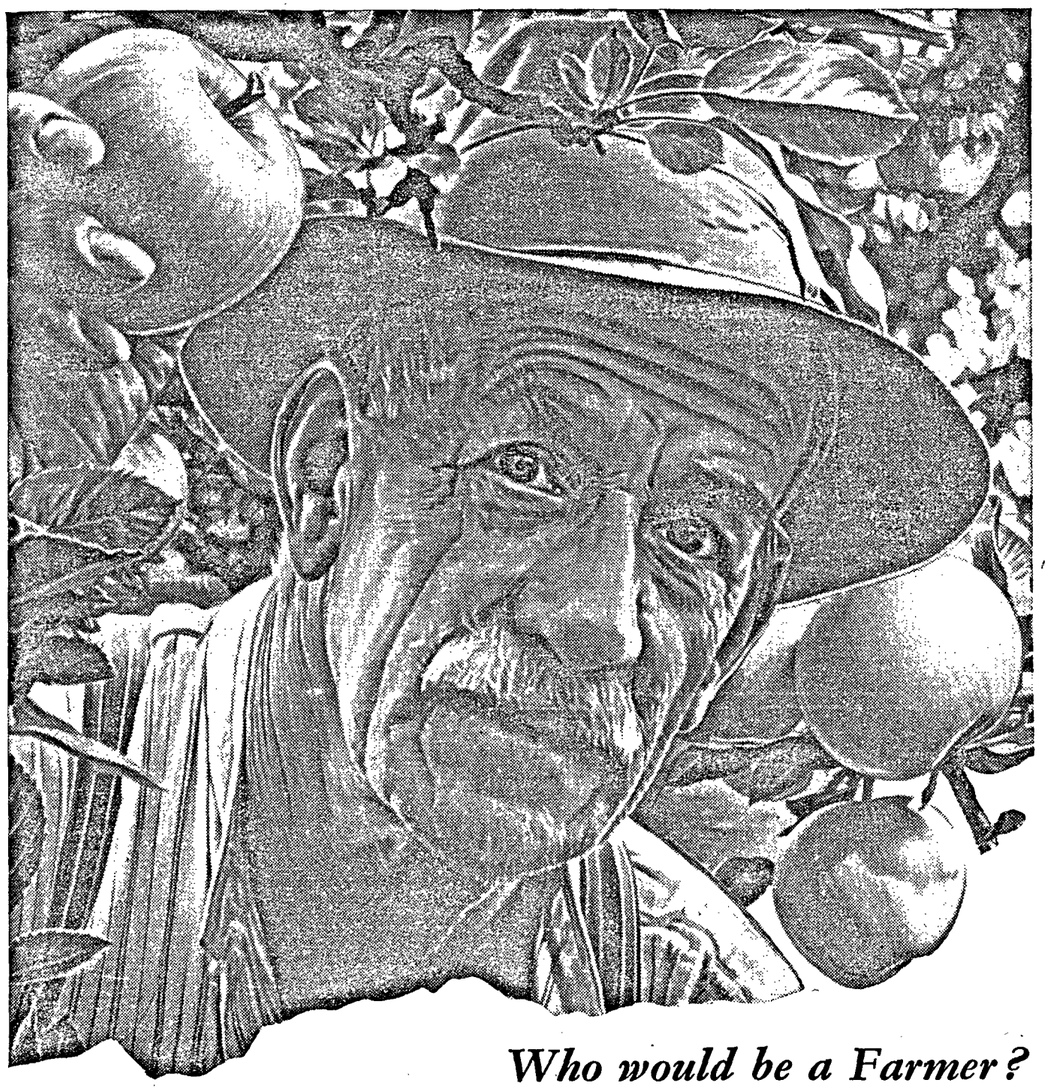
IN India the world recession has assumed the proportions of a real shake out, though a shake out which is now stabilising itself. The wholesale price index has dropped by one-fifth over the last year, and, at the bottom, in March, was below its pre-devaluation level. It is still only a little above that level, and is below the pre-Korea level. This result, which the Indian public quite clearly regards as happy, has been achieved by a combination of world factors and skilful government policy. India was a considerable beneficiary from the rise in world prices of raw materials which followed Korea; all its exports, from cotton textiles to hides and from jute goods to manganese, met with a strong demand at high prices, and the terms of trade improved by several points. But now that stockpiling has slackened, and rearmament programmes are being drawn out, the demand and prices of Indian exports have dropped correspondingly. Jute goods, hides and skins, edible oils, shellac, for example, are all at only half their peak levels, and the demand for both hessians and cotton textiles has noticeably slackened. Last year Indian inflation was largely imported; this year external influences are notably deflationary.

Indian import prices, however, have gone down much less, despite notable falls in such commodities as Pakistan jute, Ceylonese coconut oil and Egyptian cotton. The terms of trade have worsened by perhaps 10 per cent and in 1952-53 India may well have a trade deficit some £40 million larger than the £140 million of 1951-52. Most of the 1951-52 deficit was met by the American wheat loan and the sterling balance releases; this year there may well have to be cuts to restrain inflation which will have the effect of retarding development, unless the American Congress grants, as it is indeed expected to do, some $250 million of aid.

Fight Against Inflation

This drop in the world prices of its exports has been accompanied by a skilful disinflationary policy that the Indian Government has been following, consistently for the last year, and inconsistently ever since independence. The currency has been slowly but steadily contracted; the budget has never been in deficit on revenue account, and in 1950-51 and 1951-52 produced large surpluses (in 1951-52 £70 million, or a fifth of the total), small savings have been made sufficiently attractive to produce some £30 million a year net at the present rates, the sterling balance releases have been used for machinery, not luxuries, and the rate of interest on gilt-edged has been allowed to rise slowly. There have also been errors, such as the failure to import more food in 1950, and frequent failure adequately to associate welfare with productivity; and, above all, decontrol in 1948 and devaluation in 1949.

On the whole, however, the Government has held steadily to its fight against inflation and in the last year its policy has been notably successful. It combined a budget surplus with an import surplus, and export duties to reduce the impact of world prices on the economy and, at the beginning of the crop-moving season, when demands for credit are highest, the Reserve Bank raised the bank rate and limited the credit the banks could give by announcing that it would no longer buy gilt edged at a more or less fixed rate; this has greatly reduced the banks' capacity for increasing their liquidity at will, and, since two-thirds of their deposits are now tied up in advances, it has made money really tight.



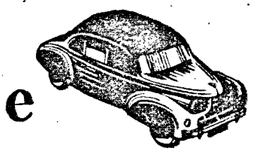
As prices dropped, speculators found that, since the banks would not lend, they were constantly having to unload stocks of one commodity in order to pay for losses on another. Silver is now below world parity, and gold is as low as in 1946. For the first time since 1939 speculators have really lost a great deal of money; they have been reminded that it does not always pay to hoard for the rise, and the public's resultant pleasure has been visible. In the countryside the drop in prices has considerably reduced the cost of living, in some places by as much as 10-20 per cent. In particular, it has virtually abolished the black market in cloth and has reduced that in food; the worst sufferer from both of these was the villager who does not grow enough for his needs. In the big towns, where cereals were subsidised by about one-third of their price, the Government has been able to abolish the subsidy, which would have cost £70 million at present import prices, without raising the cost of living.

As the situation has eased, the Government has been fairly quick to take off controls. Forward trade in jute goods, for example, has been permitted, while most of the present internal distribution controls on cloth and yarn and the destinational quotas on exports of textile and jute goods have gone. It has been quick, too, though not always quick enough, to reduce export duties. The duty on most edible oils has been abolished, that on hessian has been halved; at Rs. 750, however, the hessian duty is still too heavy, and Indian textile exports are now severely handicapped by the failure to give a drawback on the duty on the imported cotton used and by the 25 per cent export duty on coarse cloth. The Indian textile industry is, however, still better placed than any of its competitors, for it has behind it a home market which is getting only 13 yards per head against 16 yards before the war, as well as the only major cheap short staple cotton crop in the world; the price of Indian cotton is at the moment at about half world parity, and the Indian spinner can use shorter staple growths which cost only one-third of the American cotton Lancashire or Japan has to buy.

Sweden's Economic Prospects

[FROM OUR SCANDINAVIAN CORRESPONDENT]

"WORSE than it was, but not as bad as it is made out to be." In these cryptic comparisons a well-informed observer recently summed up Sweden's present economic position. The deterioration referred to is the end of the export boom of 1951. The pessimistic interpretation which is dismissed is that of many exporters, whose previously enormous profits are being reduced and who, in consequence (and partly for tactical reasons), tend to exaggerate the adverse effects of the return to more normal trading conditions. Yet even on the worst assumptions yet made of reduced prices and quantities,



Who would be a Farmer?

Insecticides are often a greater trouble than the weather in a farmer's life, but the development of new insecticides has made it possible for aphids, red spider and other insect pests to be brought more readily and more surely under control. Essential chemicals in many of these new insecticides are made by Albright & Wilson.

Sweden is likely to have again this year the most advantageous terms of trade in Europe.

Many of the difficulties it now faces are due to three factors—the importance of forest products, especially pulp, in its export trade; the unabashed exploitation of the sellers' market for pulp; and the consequent disturbances caused by the influx of part of the profits of this trade into the national economy. The following table illustrates Sweden's main exports in 1950 and 1951.

MAIN SWEDISH EXPORTS IN 1950 AND 1951
(In '000 Kronor)

	1950	1951
Pulp, paper	1,754,623	3,897,407
Wood, wood goods	666,853	1,134,052
Machinery	705,859	934,844
Base metals	663,713	914,510
Ships, vehicles	444,260	490,597
	5,706,665	9,206,776

Source: *Kommerskollegium, Monthly Trade Statistics.*

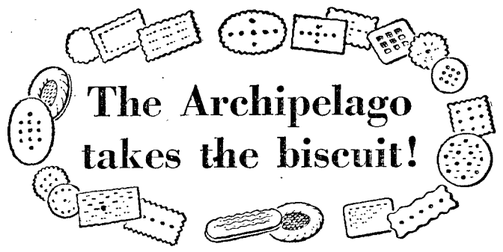
The volume of exports did not change as much as their value in the above table indicates. Indeed, in round figures, 53,000 tons less pulp was exported in 1951 than in 1950: in 1950, 552,685 tons of bleached sulphite pulp were exported for 283,331,000 kronor, but in 1951, 491,166 tons earned 677,441,000 kronor. Iron ore exports, however, rose by some two million tons to 15 million tons. Similarly, more machinery was exported, largely because of the completion of long-term orders placed under the now expired Russian trade agreement—8,393 tons of generators and motors as against 5,813 tons in 1950. The index of the volume of foreign trade, prepared by *Svenska Handelsbanken*, shows an increase of only 4 points for exports last year—from 144 to 148 (1948=100)—compared with an increase of 20 points for imports—from 108 to 128.

The result of all this was that Sweden's visible trade balance showed a surplus of 19 million kronor. The surplus on invisible items was 860 million kronor. At first sight, therefore, the Swedish economy appears to be in a healthy state. But the good results of last year's trading were due almost entirely to the high prices obtained for pulp. These prices are now dropping, in the first place as a result of British action earlier this year; and they are likely to drop still farther. Moreover, the trend of world production and consumption makes it most unlikely they will regain last year's high level. Increased production in the United States is weakening the sellers' market and freeing for export elsewhere Canadian pulp previously sold to America. Admittedly this pulp must be paid for in dollars, but Britain now has such a big debt to the European Payments Union that its deficit has to be met fully in gold. It may therefore be more willing to buy cheaper Canadian pulp for dollars than dearer Swedish pulp for gold.

Alternative Markets to the West?

Theoretically the Swedes should be able to offset their losses on pulp to some extent by increasing exports of machinery and other products. Exports of ore, for example, will certainly increase. But the inflationary situation of the past eighteen months has raised Swedish wages and costs to an unhealthy level, so that many products are at a competitive disadvantage. Swedish exports of machinery in particular are being hit by increased competition from Germany, now that the Ruhr is producing again, and producing on very favourable terms—low costs, a tax system designed to encourage exports, and quick delivery since the industry is as yet free from the burden of armaments production. Both German and British costs are commonly one-fifth to one-third below comparable Swedish quotations.

In these circumstances two factors are of paramount importance—internal economic policy and the prospect of new markets. Unfortunately general elections will be held in Sweden this September, which means that the Government is unlikely to take any strong measures to halt inflation. This normal political tendency is reinforced by the fact that the present Swedish Government is a coalition of Socialists and Agrarians. The Agrarians, sometimes on the basis of very shaky figures, insist on higher prices for farm produce. The Socialists, requiring Agrarian support, grant increases—and the unions have an irrefutable statistical case for increased wages. So it is that the much heralded "once for all inflation" of early 1951 still goes on.



Nor is it easy to find alternative markets for goods that cannot be sold profitably in the West. There is no doubt that many longing eyes are cast to what are imagined to be the steady and profitable markets behind the iron curtain and in the East. Marginal areas like Indonesia, Pakistan, Persia or Egypt might help a little. But the scale of trade likely to be involved, even on the most favourable assumptions, is very small and can do little to offset decreased earnings from trade with the West.

All this looks pessimistic: and compared with the boom of last year it is. Pessimism, moreover, is reinforced by the frequent news that this or that concern has had to lay off workers, or even close down. But investigation usually shows either that the concern involved was producing nylons, which can only be profitably produced in Sweden in the abnormal conditions of recent years, or that some part of the forest industry, which is waging a war of attrition against foreign buyers, has temporarily reduced its activity. But on a longer view two factors are of undoubted significance—the falling prices of most important raw materials and the indigenous strength of Sweden's position. It has great resources and a standard of living high enough to admit a considerable fall without hardship to its people. Whether, on the showing of recent years, it will pursue the policy best calculated to exploit these advantages is a more open question.

Export Markets for Cars

MR BUTLER'S call for an increase in engineering exports appears at the first glance to have met with an encouraging response from the motor industry. More British cars were exported in the first quarter of this year than in the same periods of either 1951 or 1950. Nevertheless, the prospects for motor exports during the remainder of 1952 present some disquieting features, not the least of which is the industry's continued dependence on the sterling area markets. The rate of car production, which has fallen from 564,000 cars a year to 430,000 cars in little more than twelve months, is determined by the industry's steel allocation; and while steel remains scarce, the size of that allocation is determined, in theory at least, by its rate of exports. The allocations to the individual companies are decided on the same basis; and just before the holiday the Parliamentary Secretary to the Ministry of Supply reaffirmed that the Ministry would continue to give increases in steel allocations to companies that expanded their exports and that, in considering such increases, it would "have full regard to the success of motor manufacturers in increasing their exports outside the sterling area." It still seems probable that by the fourth quarter of this year steel in general, and even sheet steel for cars, may have become less scarce, unless the imports from America fall far below or behind schedule. If motor exports should have fallen significantly by then, the industry may be asked some searching questions by the government. First, and most obviously, could it earn more hard currency by the export of additional motor vehicles than was spent on the steel that it uses; and, even though that might be demonstrable, could it earn more dollars by the export of additional cars made from extra steel than other industries might earn by turning that steel into more easily exportable goods? These are questions to which the industry may find it hard to give a convincing answer.

Car output has fallen from 522,515 in 1950 (the industry's peak year, when it produced nearly 800,000 vehicles of all kinds) to 476,000 last year. In the first quarter of this year, 113,500 cars were produced, compared with 123,200 in the first three months of 1951. Assuming a slight but accelerating improvement in supplies of materials during the year, production for the twelve months might be put at not less than 450,000 cars. If the home market's 1952 allocation of 60,000 cars were to be strictly observed, the actual number available for export might therefore be about 390,000, compared with actual exports of nearly 400,000 in 1950 and 369,000 last year. However, in the first two months of the year 26,000 new cars were registered in this country; allowing for the fact that some of these were registered by visitors, the home market probably took a third of its year's quota in the first sixth of the year. The industry is smugly confident, however, that the original quota will again be exceeded this year though the Ministry may save face by raising the quota to nearly as high a figure of home releases as the industry expects. Last year, when the allocation was 80,000 cars, actual deliveries surpassed 112,000; and it is now estimated that actual home deliveries this year might be 100,000. On that basis, Britain would have some 350,000 cars to sell overseas, or only some 20,000 fewer than it sold last year. Since more than 100,000 cars went abroad in the first quarter, the task at first glance might not look unreasonable; but the main difficulties confronting the industry in 1952 did not begin to take effect until the second quarter.

Where will overseas buyers be found for 350,000 British cars this year? An examination of the distribution of exports in the last eighteen months illustrates the immediate problem. Of all British cars exported, the proportion going to the sterling area rose from 53 per cent in 1950 to 64 per cent last year, and in the first quarter of this year to 73 per cent. It is in the biggest markets in the sterling area—Australia, New Zealand and South Africa, which last year took 165,000 of the 240,000 cars exported to the sterling area—that the most drastic import cuts are expected to be imposed. The immediate upsets in the industry caused by the reduction and cancellation of import licences for cars to Australia are probably temporary; cars can be adapted for sale in other markets. The longer-term prospects are more serious; if exports to Australia fell by, say, 40 per cent this year, with what may prove to be minor cuts in the other two markets, the industry would have about 50,000 extra cars to dispose of in alternative foreign markets. There are signs that this additional number can be sold elsewhere in the sterling area; many British exporters have discovered since the war that the small and miscellaneous markets can take a surprisingly large total of goods. The remainder of the sterling area—countries like Malaya, Iraq, and the British colonies in Africa—took about 72,000 cars last year when British

Source: Society of Motor Manufacturers and Traders.

manufacturers were rationing deliveries to the local dealers. At present these markets seem able to absorb whatever extra cars can be sent to them.

But to justify its claim to be the country's major currency earner, and prove its right to steel in competition with other exporters and essential users, the motor industry must develop its sales this year in two areas where demand for its products has recently been falling—the dollar markets and the other non-sterling countries. The recent trends of exports to these markets are not encouraging. The main change in sales to these markets last year came in Canada, where—owing largely to restrictions upon credit sales—the shipments of British cars fell from 76,000 in 1950 to 27,000. In 1950 about 8 per cent of British car exports went to dollar markets and a little over 17 per cent to the markets in Europe and North Africa; in 1951 these proportions had changed to 9 per cent and 15 per cent, but in the first quarter of this year only 6.6 per cent of sales went to dollar markets, while "European" sales increased fractionally to 15.5 per cent. In this same quarter, moreover, sales to the United States dropped by 13 per cent, to Brazil by 11 per cent, and to Canada by more than 90 per cent below the quarterly average for 1951. It might now be possible to achieve a considerable increase in exports to Canada for, since the lifting of credit restriction there, some British manufacturers have again been shipping at a rate of 2,000 cars a month. Orders from the United States have also been reviving. But any substantial increase in sales to other markets may be hard to achieve, for these are the marginal markets where Britain is meeting increased competition—and where the industry may need new models before it can attract more customers.

Of the big British manufacturers, only Ford and Vauxhall have put new models on the market during the past eighteen months. It is significant that both have larger engines than the Austin A.40, which since the war has probably sold abroad in larger numbers than any other single British model. The A.40 is not a baby car in the Continental sense, but it is still a small car of only 1,200 cc. The new Fords and Vauxhalls range from 1,400 cc and 1,500 cc for the four-cylinder versions to 2,200 cc for the six-cylinder. The Standard Vanguard falls into the same class as the 6-cylinder models, and the new Vanguard that is now being tooled up will certainly be no smaller, since the company uses the same engine for cars as for the Ferguson tractor.

These newer models are partly designed for markets inside and outside America that were previously dominated by the American car. The Vanguard was initially designed in 1946 to give the same seating capacity as the standard American car, and the same might be said of the new Fords and Vauxhalls. The Chevrolet, with a 3,549 cc engine, is typical of the standard American design. General Motors produce about a million a year; in Belgium, one of the few "free" markets, it sells at Fr 123,000 compared with Fr 108,500 for the Vanguard, Fr 97,500 for the six-cylinder Vauxhall and Fr 88,800 for the four-cylinder Ford. These are not unfavourable comparisons for the American car, but the difference in price might still be big enough to give the British manufacturer some advantage even in the dollar markets themselves, always providing his product is attractive in performance as well as in price. But if the medium car market were developed to any considerable size, it is certain that American manufacturers would then put such a car into production. The existence of a British dollar market therefore probably depends upon its remaining a small one.

In the past two years Europe has been becoming an increasingly competitive market. Table II shows the relative shares of British, German and French exporters in four European countries in 1950 and 1951. Comparative export figures are not yet available for the first quarter of 1952; but it is worth noting that in this period, while British output has declined, German production rose slightly to 68,000 cars and French output rose from 78,000 to 92,000 cars. In the past there has not been any tendency to sell these cars outside Europe, but Renault is now believed to be planning an assembly plant in the United States for its small model, and the German industry is expected to make considerable efforts to sell cars in South America.

This competition is one reason why British manufacturers are turning to the small car as a second string, especially for those sections of the European market where petrol prices are all-important. The Hillman and Austin cars of about 1,200 cc are well established, but Austin, Standard and Ford have plans for smaller models to meet the competition of the 700 cc to 1,000 cc baby car that sells in Belgium for between Fr 50,000 and 70,000. The only postwar small British car that has been tested in these markets, the Morris Minor, has certainly been successful, but it does not follow that markets can be found for any large number of these cars. Some manufacturers believe that there is a market for baby cars outside Europe, but this is a matter for conjecture.

TABLE II

To	Year	Exports of Cars from			Total from 3 countries	UK Proportion %
		Germany	France	UK

Among competing European models, the most significant development is the start of production by the Renault factory of the new *Frégate*. The most formidable competitor in the export markets last year from France was the small 750 cc Renault. But the size and limited performance of the baby Renault would be handicaps to its sale in substantial quantities in markets where cars are expected to be used for long journeys. The *Frégate* is a much more conventional design, having the same seating as the new Ford and Vauxhall cars, and, with a 2-litre 4-cylinder engine, claiming to have a performance similar to the 6-cylinder versions of the two British cars.

Italian competition, for some reason, seems not to have been seriously in evidence except in a few markets such as Switzerland. The Fiat 1400, however, might become a more serious competitor in neutral markets than it appears so far to have been; and there are rumours of a successor to the small Fiat 500, which has enjoyed wide popularity. Competition from Germany has hitherto come chiefly from the Volkswagen, sales of which in Switzerland, for example, have been substantially higher than those of the whole of the British industry. The production rate of the Volkswagen, at 2,000 a week, is probably the highest of any model in Europe. In the medium weight class, both the Opel (the German General Motors car) and the Ford Taunus may also become more serious competitors.

All factors considered, it is not easy to be confident that the markets outside the sterling area, even assuming a major increase in sales to Canada, can be induced to take many more cars than they did last year. If these exports should not rise, the Ministry of Supply would then be entitled to divert any extra steel it finds available to other industries that could use it more profitably in defence or non-sterling exports. Whether it would do so is less certain. On the one hand, the Ministry ought to be more ready to act severely in this matter than at any time since the war, and there are certain industries—even in the metal consumer goods field—that have been fulfilling even higher export quotas than the motor industry for articles made largely from flat steel products. On the other hand, several manufacturers have new models almost ready that may strengthen their competitive ability; a further cut in output, by increasing overhead costs per unit, would make competition even more difficult; and already the industry as a whole is operating at only 60 per cent of its capacity, which has been doubled since the war. Moreover, if sheet steel were to become less scarce, the Ministry might not deem it practicable to refuse extra supplies to the industry that is so important a consumer. What the Ministry may in fact do—and certainly should do—is to discriminate even more severely than at present in allocating steel to different manufacturers.

Business Notes

More Gold Lost to Europe

The United Kingdom's deficit with the European Payments Union in May is provisionally estimated at £17,689,000, compared with £20,200,000 in April. This deficit, which is, of course, the result of the trading experience of the whole sterling area with Europe, has finally sent the United Kingdom over the top of its permitted credit line with EPU and into the range where all further deficits have to be met wholly in gold. For the sterling area, therefore, Western Europe is now—temporarily at least—as hard a currency area as the United States of America. From last month's deficit a bare £1 million could be added to the United Kingdom's overdraft; all the rest—£16.7 million, or approximately $47 million—will have to be met by a transfer of gold. The summer months are customarily a poor season for the sterling area's export trade to Europe, and to that extent last month's decline in the rate of deficit can perhaps be regarded as a slight—though it is only desperately slight—improvement against the seasonal trend. But it certainly does not seem sufficient to inspire recovery in either the foreign exchange or the stock markets, where investors in the past week have been doing no more than meditatively lick at their wounds. By Wednesday's close sterling stood at $2.78¾ on the London market, the same as on the eve of the holiday; the *Financial Times* index of industrial ordinary shares had fallen slightly, from 104.7 to 104.1, while War Loan 3½ per cent had risen fractionally from 74¼ to 74⅜.

Meanwhile, the future shape of EPU itself still hangs in the balance. The Ministerial Council of the Organisation for European Economic Co-operation met in Paris this week, but the indications are that it will be impossible at this short meeting to reach agreement on an amended version of the Union, with all the i's dotted and the t's crossed, ready to slip into action when the current version comes to an end at the end of this month. The main differences between members are not insuperable, but the Belgians are still at some variance with the rest of the club. The Belgian delegation still demands a funding and gradual repayment of the credits that Belgium has extended to EPU in excess of its quota obligations; if the terms on which this excess is funded are over-generous, they will place an impossible burden on the gold and dollar reserves of EPU.

Bank Deposits and Treasury Borrowing

The banking figures for May confirm that the banks are succeeding well in retaining their grip over bank advances, and the total volume of credit—as measured by net deposits—contracted again after its mainly seasonal expansion in the first month of the fiscal year. But the most significant feature of this latest statement is not that deposits declined but that the decline itself was so small—it amounted to just under £19 million, bringing the total down to £5,697 million. Yet during the month the banks felt the full effect of the repayments of advances by the British Electricity Authority from the proceeds of its £150 million loan, on which 40 per cent has now been paid up (apart of course from any subscriptions paid in advance). The amount available was therefore £60 million, a sum that aligns very closely with the £62.3 million decline shown in aggregate bank advances over the month. Unless, therefore, the figures were distorted by any reduction in intra-bank clearings (which all save one of the banks group under the head of advances), it appears that the aggregate of all other loans has shown a further small decline. At the same time there has been another steep contraction in the banks' holdings of commercial bills, which have fallen by £31 million on the month and, at £102 million, are now no less than £85 million below the peak reached in February—a decline that reflects the new credit restrictions and higher bill rates, the decline in prices and the overseas import cuts, and the retention of a bigger proportion of the available bills by the overseas banks.

Taken together, these two movements—in advances and in commercial bills—might have been expected to reduce the total volume of credit by at least £90 million. Unfortunately, however, most of this contractionary force has been neutralised by the expanding demands of the central government. The rise in Treasury borrowings on tender bills that began some months ago is steadily expanding the banks' holdings of such bills; these rose by no less than £84 million in May and £72 million in April. These credit needs arise partly from the seasonal swing of the Exchequer's domestic position into deficit, and partly from the narrowing of the gap on the external balance of payments, which means that the Treasury secures less finance from overseas; but there is

no doubt that the intensification of the demands recently has been due to a further factor—the need to finance the heavy subscriptions by extra-budgetary funds to the BEA loan. If the departments still held two-thirds of the stock at mid-May, the date of the first call, the Treasury would have had to find roughly £40 million in all by increasing its borrowings on tender bills in order to repay tap bills formerly held by the "departments." In other words, to this extent the BEA's funding operation, instead of reducing the volume of bank credit, merely transforms it from bank advances to bank holdings of Treasury bills or call money. Hence, despite the steep reduction in supplies of commercial bills, the banks' total holdings of liquid assets have risen during the month by £49 million and, at £1,944 million, are now £72 million above the low point reached in March. In consequence, the ratio of these assets to gross deposits has risen during the month from 31.6 per cent, to 32.9 per cent, while the ratio of "risk" assets (i.e., advances and investments) now stands appreciably below its peak, at 64.8 per cent.

Making up for Abadan

The full reports and accounts of Anglo-Iranian and of the Shell and Royal Dutch group, which are analysed in detail on page 684 of this issue, throw more light on the effect of the evacuation from Abadan on world oil supplies. Anglo Iranian's output of crude oil fell by nearly 9 million tons, to about 33 million tons, last year; a decrease of 15.6 million tons in output in Iran was partially offset by an increase of 6.8 million tons from its other Middle East wells, particularly Kuwait. In 1952 output from its wells in Kuwait, Iraq and Qatar is expected to increase by a further 9½ million tons, to 26 million tons, so that the deficiency of crude oil caused by last year's events should be fully made good. Meanwhile, the production of crude oil by companies in the Shell and Royal Dutch group rose from 367 million barrels in 1950 to 429 million in 1951, excluding oil received under long term contracts. (There are between 6.7 and 7.6 barrels to the metric ton, depending on the specific gravity of the oil.)

The most serious continuing legacy of the Abadan evacuation is the shortage of refinery capacity outside the United States, and the consequent need to purchase quantities of aviation spirit, kerosene and gas/diesel oils from that country; it seems probable, in fact, that Anglo-Iranian purchased about a third of its supplies from outside sources after the evacuation, and it was because of this that it was able to market 36½ million tons of oil last year, only 2 million tons less than in 1950. The Abadan refinery processed over 12 million tons in the first half of 1951, and although throughput in the company's other refineries (including those at Llandarcy and Grangemouth in this country) is constantly expanding, it was naturally insufficient to bridge the gap caused when Abadan closed down. Refineries in the Shell group processed 558 million barrels in 1951, or 20 per cent more than in 1950 and double the level attained in 1946; throughput in the group's refineries in the United States increased by 13 per cent to over 142 million barrels last year, and in its European refineries by 47 per cent to 135 million barrels. These developments took place against a background of continually increasing world demand for oil. Sir Frederick Godber, the chairman of Shell Transport, estimated that world consumption increased by 10 per cent, to 4,250 million barrels, last year, after having increased by 12 per cent in 1950. In these circumstances, and in spite of prevailing political uncertainties, the far-flung boom in investment in the industry is continuing with giant strides. Capital expenditure by the Shell group exceeded £100 million last year and that by Anglo-Iranian was approximately £46.8 million; both giants financed this spectacular level of investment out of their massive internal financial resources.

Germany's Debt Offer Rejected

The Federal German Republic's offer to prewar foreign creditors has been summarily rejected, as failing to provide even a basis for discussion. The creditors, in a unanimous reply, have set out four main conditions that any future German offer should endeavour to fulfil. The first is that the capacity of individual German debtors to pay in marks should not be confused with the temporary incapacity of the German Federal Republic to transfer those marks into foreign currencies. The second point is that the annual transfer suggested in the German offer—DM 170 million per annum rising to DM 270 million—is a completely inadequate measure of Germany's transfer capacity and will have to be substantially increased. Thirdly, the creditors insist that any new offer should contain detailed and specific proposals for the separate categories of debt. The "single package" offer, leaving the various classes of creditors to fight out details of apportionment among themselves, smacks too much of the principle of "divide and conquer." Lastly, the creditors object to the German condition that any settlement should be dependent on an undertaking by the creditor countries to import a "sufficient volume" of German goods. No one denies that there is a link between an effective foreign debt settlement and the volume of Germany's export earnings, but this is a consideration that lies outside the competence of the creditors' representatives—and introduces a thoroughly undesirable escape clause into a contractual agreement of this kind.

On the receipt of this answer, the leader of the German delegation, Herr Abs, returned to Germany. He is now back in London again, but there was no further hint of his Government's intentions at the time that this issue of *The Economist* went to press. The only development in the debt negotiations this week has been a meeting of the Standstill creditors' representatives. Last week's abortive German offer did not refer to the Standstill credits (the short-term credits to German concerns which were immobilised—chiefly in the hands of foreign banks—in 1931) but it is understood that the Germans have proposed far more generous treatment for them than they did for the bonded debt. Apparently no scaling down is proposed for these credits, and an offer has been put forward that would provide a basis for their "recommercialisation," sweeping them into the available credit facilities that German firms can command in the markets of the creditor countries. The process of recommercialisation would not involve the extension of additional credit to Germany, though new credits might be extended on condition that a proportionate amount of the old debts were paid off. The object would be to transfer these debts from the category of dead and frozen obligations to a new circulation of revolving credit that would have as its basis a genuine movement of goods. The Germans apparently consider that they will have more need—or at any rate will have more hope—of raising commercial credits of this sort in the future than of floating new bond issues; they are therefore willing to offer the Standstill creditors better terms. Unless satisfactory new proposals for the bonded debt are forthcoming, the creditors may have to abandon their united front, and each creditor country may have to make bilateral settlements with Germany. This would be an evil, but a lesser one than complete breakdown.

. . . Castlereagh's production lines move into top gear

The latest addition to The British Tabulating Machine Company's group of factories is at CASTLEREAGH, near Belfast. Planned and equipped in the finest traditions of modern precision engineering, Castlereagh's 250,000 square feet is being geared to meet increasing demands from all parts of the world for Hollerith ancillary machines. Castlereagh's output will make a major contribution to the nation's productivity.

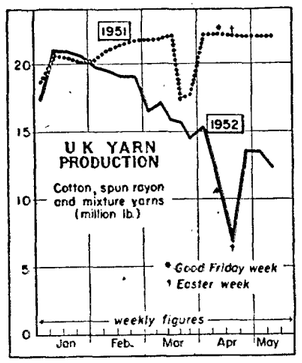
Film Policy from the Rank Group

The Eady levy, by which a proportion of cinema box-office receipts is siphoned off direct to the producers of British films, has by now rendered solvency in production at least possible; but it comes to an end in August, 1954. The industry is therefore anxious to have some statement of the Government's policy towards films beyond that date, and this anxiety was voiced very clearly last week by Mr John Davis, managing director of the Rank Organisation. Unless arrangements to extend the levy beyond 1954 are made by next spring, Mr Davis declared, British film production will start to fall.

Mr Davis said this in the course of a lecture to the British film academy that constituted one of the most important statements of policy on film production to come from the Rank group for some years. He added that the Cinema Exhibitors' Association had voluntarily suggested that the levy should be extended. This statement seems to be well substantiated, but has still caused some heartburning among some of the association's rank and file members. Ever since it was begun, the levy—which is a voluntary scheme that was traded by the exhibitors two years ago for certain concessions on Entertainments Tax—has been subjected to an undercurrent of criticism from some of the smaller cinema owners, who argue that they are feeling the pinch themselves and should not be obliged to give the film producer more than his film would earn in the ordinary line of business. It seems clear that the headquarters of the association, however, might have been prepared once more to offer an extension of levy in exchange for further concessions in duty, whether they have said so publicly or not.



Mr Davis's optimism about the future of—duly assisted—British film production was based upon a high opinion of their current quality—"comparing with those coming from any country in the world"; and upon box-office results in Britain and abroad. The best six or eight British films in a year, he said, now earn collectively as much money at the British box-office as the best six or eight American. Film exports, too, were becoming much more profitable; Mr Davis, whose group have acquired considerable interests in cinema ownership overseas "to assure an outlet for British films," gave no general figures, though he mentioned that today a producer is receiving about $7,000 to $10,000 a film from showings in South Africa compared with an average of "about £700 in the old days." Upon the real prospects of the industry, Mr Davis was much more cautious: "I think most experienced producers would agree that generally speaking at the present time British films cannot recover their cost without financial aid. I hope this position will not always be so." But he did not suggest how long the industry—and the taxpayer—might have to wait for it to change.

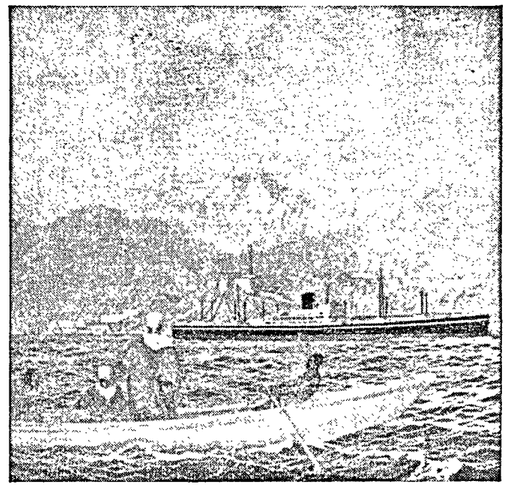
Marking Time in Lancashire

The Whitsun holiday provided Lancashire with an opportunity for the same wholesale closure of the cotton mills that took place during Easter. Then 186 spinning mills, containing more than 13 million of the total of 28 million spindles, were closed down for the whole of Easter week. Exact figures for Whitsun will not be known for another few days, but the closure was on roughly the same scale. Yarn output has been falling precipitously during the past four months and its weekly rate is now down to little more than half the level at the beginning of the year. Early in January the mills were turning out a combined total of between 20 and 21 million pounds of cotton, spun rayon and mixture yarns a week. By the middle of May this had fallen to just over 12 million pounds. It has remained at that figure for two consecutive weeks, with 61 mills closed one week and 56 the next. The mills that remained open were running at between 64 and 65 per cent of capacity, compared with 85 to 90 per cent last winter. By mid-May the number of workers on the spinners' books had fallen from a peak of nearly 124,000 in the last quarter of 1951 to less than 106,000, of which 11,810 were on the books of the mills closed for the particular week of the count.

This may mark the nadir of the industry's depression. The slump has had the salutary effect of revising many companies' ideas of what constitutes a reasonable selling price. A sharp scaling down of profit margins has once again made Lancashire's products competitive in export markets that could not afford to buy at 1951 prices. In the home market business has received a definite stimulus from the recent revival in retail sales of cotton goods. But if Whitsun marks the low point in the industry's fortunes it will be many months before production gets back to normal, and there is no assurance that it will return to the weekly production figure of more than 20 million pounds of yarn to which the industry had grown accustomed last year.

* * *

Rayon Production Drops



Until recently, the textile depression had had no very marked effect upon rayon production, so that the cut in output, when at last it came, was dramatic both in its extent and its suddeness. The peak rate of production reached last November, at 36 million pounds a month (19.3 million pounds of continuous filament and 16.7 million pounds of staple fibre) had eased off gradually to just under 30 million pounds in March. During April it dropped to 16.6 million pounds, 44 per cent lower than in the previous month and considerably less than half the output of which the industry was capable. The biggest fall was in staple fibre production, which fell by 61 per cent between March and April, to 5.5 million pounds. By comparison, production of continuous filament yarn fell only moderately—by 29 per cent, to 11.1 million pounds.

The collapse of staple production is partly explained by the fact that spinners have been buying considerable quantities of yarn for stock. Rayon staple was at one time relatively scarce, but stocks at the mills must by now be so large that it will be some time, even if business revives, before the spinners are in a position to start buying again—or, indeed, before the rayon producers have disposed of their own considerable stocks. Certainly no improvement in rayon production seems likely to be shown for May, and the chances of any real recovery this summer may depend on a number of other factors besides the volume of goods in the pipe-line. For example, buyers are beginning to ask when the fall in wood pulp prices is going to be reflected in the price of rayon yarn; and, since the industry uses more than a pound of pulp for every pound of yarn, pulp prices are a considerable ingredient in its costs. Since other costs have been rising, rayon producers may feel that the margin for reduction is small, but if rayon is to share in any general improvement in the textile markets, producers may not be able to resist the pressure to cut prices.

The recent decision to adjust the "D" levels for heavy fabrics, was intended to stimulate a recovery in the sale of

SEALED AND DELIVERED

A FIRM of British motorcar manufacturers with a large export trade to Australia were worried about the deterioration in finish which occurred in transit. The bodywork was found to be blistered and the upholstery to be disfigured by mould. The company appealed for help to I.C.I., as suppliers of the finish. It was decided that the cause of the trouble and its cure could only be found by following the cars through from the moment they were placed in their packing cases in this country until they were delivered to the customer "down under". This meant long and tedious observation over a period of many months, during which a technical service man from I.C.I. Paints Division at Slough travelled to Australia in a cargo ship with a consignment of cars. The trouble was eventually tracked down to "cargo-sweat" — a condition due to the combined action of heat and humidity in the holds of the ship during its passage through the tropics. The problem was then referred to I.C.I. Plastics Division at Welwyn for a cure, and a method was devised for wrapping each car completely in a sealed envelope of polythene film 0.002" thick. This material, being waterproof and providing a moisture vapour barrier, proved completely satisfactory.

Thus, by combining the technical service resources of two of its manufacturing divisions, I.C.I. helped a British car manufacturer to maintain a valuable export market in Australia.

For the Nation's Good

In the unremitting struggle to expand British exports, a vitally important part is played by the men who travel all over the world to the various markets — surveying, supervising, organising and, above all, *selling*.

These representatives of British Industry include Hoover executives who, between them, visit every country in which export business can be done — from Finland to Siam, from Pakistan to Chile — at least once every year. Their sole object is to maintain and increase Hoover exports — Electric Cleaners, Washing Machines, Polishers, F.H.P. Motors, etc. — and some measure of their success is indicated by the fact that shipments of Hoover products are now being despatched regularly to 66 countries in all parts of the world.

It is encouraging to note that during 1951 Hoover exports were about two and a quarter times as large as in 1950, which was itself a record year. Indeed, during 1951, Hoover Limited exported nearly 50% more electric cleaners and 50% more electric washing machines than all other British manufacturers combined.

furnishing textiles made from cotton and rayon, but it is doubtful whether it will do so. Under the original budget proposals, a "D" limit of 4s. a yarn was fixed for all non-wool fabrics. This meant that utility furnishing fabrics in cotton and rayon attracted a much heavier amount of tax than other ex-utility goods, and, far from being helped by the new scheme, they became practically unsaleable. Since it was impossible to draw up a satisfactory definition of a furnishing fabric, the Treasury has now proposed to raise the "D" limit for all fabrics over a certain weight to 6s. This concession is hardly enough to stop manufacturers from straining their ingenuity to incorporate 15 per cent of wool into their cloth constructions, when they immediately qualify for the higher "D" figure of 14s. 6d. that covers all cloth with this minimum wool content.

* * *

Deflation in Balloon Street

The Co-operative Congress met at Margate on Whit-Monday in anything but a holiday mood. The president, Lord Williams, gave a blunt warning of the danger of a decline in the rate of "divies" paid by the societies this year, announced that there was already unemployment and short-time working in Co-operative factories, and complained bitterly that the proportion of the movement's supplies that was being bought from its own wholesale and productive undertakings was the smallest for many years. The time, he declared, was plainly ripe for "a reawakening of the Co-operative conscience."

These complaints followed hard on the publication of the annual report of the Co-operative Wholesale Society, of which Lord Williams is also chairman. This report reminded the committees and buyers of the retail societies of "the absolute necessity of affording the CWS the first opportunity to meet all needs" and to "exercise strict watch on purchases from non-Co-operative sources" in view of the return of difficult trading conditions. In the year to January 12th last the CWS showed an increase of between 11½ and 12 per cent in both total sales (£359 million) and the value of supplies from productive undertakings (£107 million). It is clear, however, that these increases were almost wholly due to price inflation. The board believes that there can be little doubt that the volume of sales in the grocery and provision departments contracted last year, although their value increased by £13.4 million to £241.4 million. The soap and jam factories were hard hit by competition, while the dry goods section, which enjoyed a boom in the first half of the year, experienced a general recession in the second half; this general recession was accompanied by "considerable stock depreciations, more particularly in the woollen and leather industries."

It was, however, the experience of the CWS "Bank" that must have struck most severely at the movement's finances in 1951. Despite Lord Williams's tale of woe, the net surplus of the CWS's trade departments fell by only £162,169, to £6,727,954 last year. The board found it necessary, however, to provide no less than £4,800,000 for transfer to the banking department; although the provision for the final "divi" at £3,001,000, absorbed £1,460,000 less than last year, £3,860,000 had to be drawn from various types of reserves. The bank itself has applied the whole of its current revenue surplus of £117,600, together with £1,500,000 from its general reserve of £2,796,381, to investments account—and there seems no doubt that the special transfer from the trade department was needed for the same purpose. The bank's investment holdings (entered at or below market values) declined by £37 million to £142½ million in the year, while total deposits declined from £209½ million to just under £184 million (owing mainly to a decline in the deposits of the CWS itself). It is known that the CWS bank plunged heavily into long-dated stocks during the Daltonian cheap money drives six years ago, and that it must have had a hard struggle to meet depreciation of its investment portfolio in 1949—even before it suffered a body blow from last year's decline in gilt-edged prices. It seems clear from these figures that it was not so much the shadow of trade recession as the shade of Dr Dalton that last year came to rest—perhaps not without some homing instinct—at the CWS headquarters in Balloon Street.

Buying Back Steel

While the Steel Bill remains in cold storage, the former owners of nationalised steel companies obviously cannot commit themselves on the question whether or not to buy them back. The statements about denationalisation made during the last fortnight by General Sir Ronald Weeks, chairman of Vickers, and by Mr J. H. Jolly, chairman of Guest Keen and Nettlefolds, were therefore both wreathed in qualifications; but their difference of emphasis is important. Sir Ronald averred that "in the normal course" Vickers would desire to reacquire its previous holding in English Steel Corporation; but he listed a number of factors bearing upon the ultimate decision that suggested some doubt whether the course of events during the immediate future could be expected to be normal. Mr Jolly's remarks suggested a more sanguine outlook. Guest Keen's, he said, would be prepared to consider buying back the iron and steel companies formerly controlled by the group, subject to "fair financial terms on reacquisition and the extent to which free enterprise may be allowed."

In view of these differing attitudes, it is worth noting that Vickers has held on to the British Iron and Steel Stock —£15,261,081 at par—that it received in February, 1951, in the hope, Sir Ronald explained, "that people who still held the stock when denationalisation took place would be able to pass it back at par." Guest Keen's, on the other hand, disposed of their £18,537,774 of steel stock shortly after receiving it, at a loss of about £380,000. The company distributed some £3.4 million of the proceeds to shareholders last year, which left about £4 million of the net surplus on the transfer in its reserves; with some £3 million from last year's profits, it now holds some £20 million in investments and cash. Both groups, therefore, would be comfortably placed—upon their slightly different assumptions about the form of the take-over—to repurchase holdings in steel: Sir Ronald, it may be noted, spoke of his group's steel stock being "largely absorbed" if it repurchased "a shareholding" in English Steel Corporation, which would suggest that it might not necessarily purchase the same amount of shares.

The Parliamentary timetable now seems unlikely to allow the Steel Bill to come forward before the autumn, if the Transport Bill is brought before Parliament in the next few weeks; only a sudden switch in priority would alter this. But the financial operation that it proposes is a much more complex one than the resale of road haulage companies, and prospective purchasers should be given at least the Government's outline of it as early as possible.

On Pricing Cotton

The Raw Cotton Commission did none too well out of the Korean commodity bubble. Its trading accounts for last season, 1950-51, show that its net profit on operations amounted to only £177,390, compared with £9,938,523 in 1949-50. The bubble burst too soon and the Commission found itself saddled with large costly stocks. Lateness in the publication of the accounts destroys most of their interest, but there are two points worthy of comment. The annual report describes the Commission's pricing policy and how it attempts to base its selling prices on current replacement

costs ruling in the world markets. During the 1950 season the United States Government allocated exports of raw cotton because of its small crop, and prices of non-dollar American-type cotton rose sharply. The commission therefore decided to average its selling prices for American-type cottons so that those spinners who were fortunate enough to get American growths did not pay less than those who had to use Brazilian, Turkish and similar growths. In the circumstances that was a reasonable arrangement, but the real difficulty came later, towards the end of the season.

In the spring of 1951, commodity prices were already beginning to fall. It was also apparent that the new American cotton crop would be very much bigger than in 1950-51. Manufacturers all along the line tried to postpone buying and a bear market was created. But under the existing licensing system spinners could buy only old crop cotton at prices substantially higher than the forward quotations for new crop in world markets. Hence the Commission decided not to introduce its new season's prices until spinners had reached the new licence period.

The late introduction of these lower prices led to severe criticism from certain sections of the trade, which maintained that the Commission should have disposed of its old stock at the new lower prices. This principle is important because the Raw Cotton Commission is in fact acting in place of a market. If Lancashire is not to be burdened with a dearer cotton than its competitors, who have access to proper markets, the commissions' selling prices must reflect current replacement prices, whether its stock was bought at those prices or not. If in so doing it suffers a loss that cannot be written off over a period of years, that is an argument against this method of trading. But to maintain prices at an artificially high level, even for a short period, in order to make a profit and loss account look better than it would otherwise do, cannot be justified on any grounds.

* * *

Cheaper Jute for Dundee

The Jute Control has belatedly brought its price for raw jute into line with that ruling in the world market. In consequence, Dundee has been able to buy its raw material at some £40 a ton less than it was paying before June 4th. Mill Firsts, for instance, have been reduced from £165 to £125 a ton, and there have been corresponding reductions in the Control's price for yarn and hessians. Some adjustment in jute prices had been expected for some time, for the previous reduction, which took place in April, had still left British prices much higher than continental prices. British manufacturers will still be unable to compete on equal terms with the Indian mills, because they can buy only "old crop" (1951) jute from the Control, whereas their Calcutta competitors can get the cheaper new crop jute now coming on to the market.

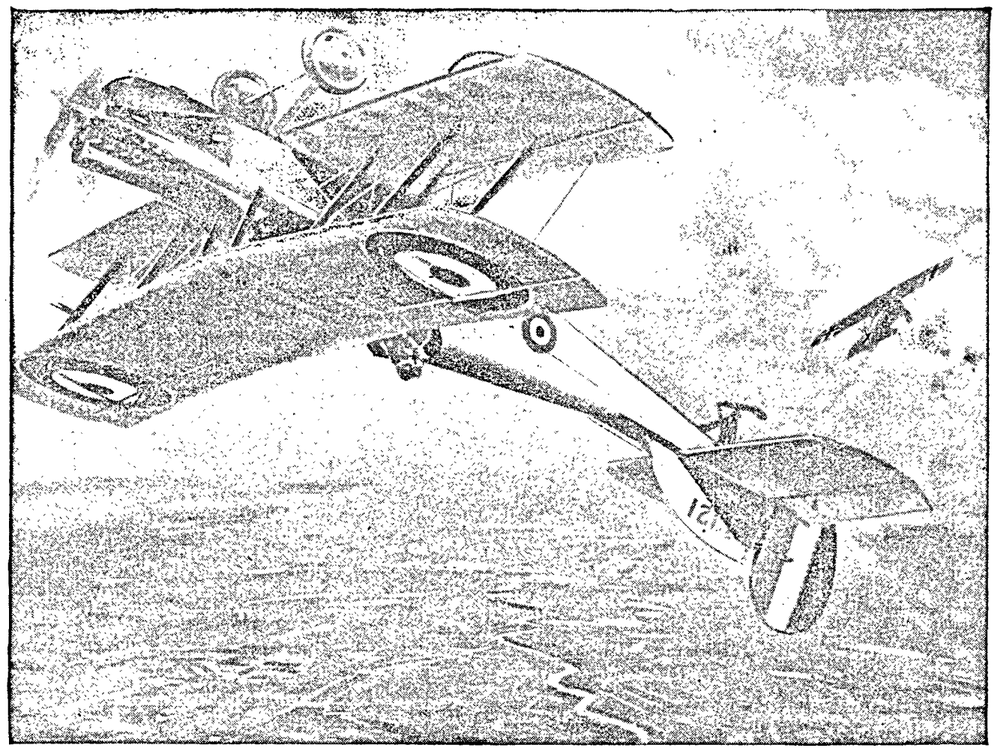
The world price for new crop jute stands at £107 a ton c.i.f. European ports—that is, £18 a ton less than quotations for the old crop—and trade in the old crop has now ceased. Estimates put the amount of old crop jute remaining unsold in India and Pakistan as high as 2 million bales, and this heavy carryover is likely to have a depressing influence on the raw jute market—particularly as another good crop, of at least 11 million bales, is expected this season. It is not known whether the Pakistan Government intends to maintain its minimum internal price of £125 a ton for export qualities during the coming season or not.

Prices for jute manufactures have been falling throughout the world, but the outlook for the Indian market promises some improvement in the near future. The United States is expected to buy large quantities once more, now that the export tax on Indian jute goods has been sharply reduced. Dundee, unfortunately, is unlikely to benefit from this revival. Stocks of goods in this country are heavy and large quantities of imported cloth and sacks continue to arrive. Many of the mills are now working a three-day week, and the news of the Control's reduction in price has not given rise to any feeling of optimism in the industry.

* *

See-Saw in Metals

The cuts in official American prices for base metals that began a month ago are still continuing. This week zinc followed lead downwards when American smelters cut its price by 2 cents to 17½ cents a lb (£140 a ton). In Britain the Ministry of Materials has reduced its price by a corresponding amount, and is now selling zinc at £150 a ton. Only last week the Ministry's price was cut from £190 to £166 a ton to bring it down to the so-called "world level." This decline in the American price of zinc, which is its first since October, 1949, is said to have been a direct result of the steel strike. But demand had been sagging for some while, and the free market price has been down to £130-£135 a ton for nearly three months. It is true that the threatened shortage of steel may reduce the demand for zinc from the galvanising industry which until recently has been using record quantities. But the weakness in the market existed well before the strike.



In contrast to zinc, copper seems to be on the point of rising. Since last week, when the United States removed the limit of 27½ cents a lb (£220 a ton) for imported metal, Chilean copper has been sold on the New York market at up to 35½ cents a lb (£284 a ton). Only a few weeks ago negotiations between the United States and Chile for a new copper agreement broke down because the Americans refused to meet the Chilean request of 33½ cents a lb (£268 a ton). Although Chile was known to be holding large stocks, it declared that it could sell its entire output to other countries for 35 to 40 cents a lb. It supplies nearly a quarter of the United States' total requirements of copper, and at this stage, despite the additional release of copper from the stockpile, American manufacturers can hardly do without Chilean supplies. As this issue was going to press the official American export price for copper remained at 27½ cents a lb, but the *Engineering and Mining Journal*, which the Ministry of Materials has been taking as a base for its copper prices, was quoting an average price of almost 34½ cents a lb (£276 a ton). For the first time this journal has included in its average price the sales of Chilean and Canadian copper to non-American buyers. The question is whether the Ministry will raise both its purchase and selling prices of copper in line with this new quotation or whether it will use the official New York market price.

* * *

Cut in Carpets

The latest reduction of 10 per cent in carpet prices is the third within twelve months, and it is not likely to be popular among retailers, who hold embarrassingly heavy stocks. Since last March, the price of Axminster carpets has dropped from 27s. a linear yard to 20s. 9d., while production has fallen from a monthly average of 3.6 million square yards to one of 2.9 million. Sales of durable household goods such as carpets have been the worst sufferers during the retail slump in textiles, and the fact that carpet prices came down while wool prices were at their highest suggests an exceptionally strong degree of sales resistance.

The fall in raw wool and in jute prices renders this latest price reduction comparatively painless, but the April figures for wool consumption in Bradford show how far the industry is still from any real recovery. The very slight improvement in the rate of wool consumption that started in March was continued during April, although the amount consumed was fractionally less, 28.11 million pounds compared with 28.80 million. Twelve months ago, the industry was using nearly 38 million pounds a month, and the improvement in March

We've solved some problems in our time!

WANTED—*an unspillable aircraft battery*. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manœuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

¶ Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

¶ For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

¶ Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

STARCH PRODUCTS

FOUNDRY WORK FOR AN AUSTIN CAR ENGINE

By courtesy of Austin Motor Company Ltd.

MOULDING sands should have enough 'bond' to hold, firm and sharp, whatever shapes the patterns impress on them. They should be permeable to the gas that is formed between the molten metal and the sand surfaces. If the gas cannot escape through the sand it blows into the metal and causes bubbles. After casting, sand cores should crumble easily, or they will strain the cooling metal as it contracts round them. And if any of these qualities are lost or impaired when the sands have been used, it should be possible to restore them.

Starch as a binding agent

Until the Brown & Polson Group developed the Kordek and Kordol series of sand-binding agents based on starch, there had been some difficulty in imparting all those virtues to foundry sands. Today Kordek and Kordol binders are in general use throughout the foundry industry. Small admixtures of them with silica sands produce firmly bonded, permeable core and moulding sands which break down easily after casting; and the bond can be restored to the moulding sands, without loss of permeability, by further small additions of a Kordek or Kordol binder before they are used again.

The development of starch binders for foundry use is one example of the kind of service that the Brown & Polson Group has performed for many widely different industries, and is ready to perform wherever opportunity exists. Enquiries will be answered by responsible experts. They should be addressed to

Visit the
ZAGREB
INTERNATIONAL TRADE FAIR
September 13th – 28th. 1952

In the fortnight that the Zagreb Fair was open last year, over 2½ million pounds worth of business was transacted. This year the Fair promises to be bigger and busier than ever, all stand space has been taken, and initial reports show that there will be a record attendance by visitors and business men from every part of the world. There will be an extensive range of exhibits of interest to every branch of industry, with exhibitors from all over the globe competing for national and international trade.

SPECIAL TRAVEL FACILITIES FOR FAIR VISITORS
Special facilities, open to visitors to the Fair, include 50% fare reductions on all travel inside Yugoslavia, and free Visas.

If you are interested in presenting your goods to international buyers there is still some space available in the official Fair catalogue, but applications should be submitted immediately.

Further information about the Zagreb International Trade Fair can be obtained from:—
The Yugoslav Commercial Counsellor 19 Upper Phillimore Gardens, London, W.8.
or direct from:—
The Management, Zagreb International Fair, Zagreb, Savska Cesta 23, Yugoslavia.

and April is certainly not sufficiently marked to lead to a revival in confidence. It is too soon for it to have had any effect either on yarn or cloth deliveries, which continue to fall, nor on the steady drain of workers from the industry. A further 1,317 left the industry in April, bringing the total labour force down from 171,000 at the beginning of 1951 to little more than 144,000. This in itself is enough to prevent production from returning to 1951 levels.

* * *

British Insurance in 1951

With one exception, the results of all the leading British insurance companies in 1951 have now been published; they reveal a sharp reduction in underwriting profits, largely because of unfavourable experience in motor insurance. The net trading profits shown in these accounts amounted to £3,356,000 in 1951, compared with £7,737,000 in 1950 and £8,153,000 in 1949 (which was an exceptionally profitable year). This fall occurred in spite of the fact that the aggregate premium income from fire, accident and marine business rose to £390.2 million last year, compared with £339.8 million in 1950 and £296.0 million in 1949; moreover this increase of over £50 million in 1951 was not affected by the revaluation of dollar business that was so significant a factor in the increases in premium income shown in 1949 and again in 1950. Last year's increase was due partly to worldwide inflation and partly to a further increase in the volume of business transacted.

New ordinary life assurance was also extremely buoyant last year, with new sums assured 19 per cent higher than in 1950; when the full figures are available they will be found to have considerably exceeded £700 million. Life assurance effected in connection with group and other staff assurance schemes undoubtedly accounted for a large part of last year's increased new business, but there was also a marked expansion in new individual life assurance. New industrial life assurance, which was no more than maintained in 1950, increased by nearly 9 per cent last year to about £250 million.

The fire premium income of these leading companies expanded by a further £19.5 million (the same increase as in 1950) to £170.7 million; in this field underwriting profits rose to a new record, at £17.1 million compared with £15.6 million in 1950, although expressed as a percentage of the premium income they declined from 10.3 to 10.0 per cent. There was no repetition of the American windstorm disasters of 1950, but fire losses in the United Kingdom rose to a new high record of £23.1 million. The profits transferred from marine insurance accounts in 1951 amounted to £4.2 million (compared with £3.5 million in 1950), but, owing to the delay in receipt of hull claims, these transfers relate to premiums received in 1949 and earlier years. The sharp rise in the cost of repairs that took place after the outbreak of the war in Korea led to an increase in hull premiums of 10 per cent on the first renewal date after February, 1951, but it is by no means certain that this increase will prove to be sufficient. Cargo insurance rates are now cut so fine that marine insurance seems unlikely to yield more than a very meagre profit during the next few years.

* * *

Unprofitable Accident Rates

It was, however, the adverse experience in accident insurance that was entirely responsible for last year's fall in insurance profits. Motor insurance and employers' liability insurance was carried on at a loss by most of the companies in most of the countries of the world. This loss was rather more than recouped by profits from the other classes of accident insurance (such as burglary, personal accident and others) but, even so, accident business as a whole showed an underwriting profit of only £504,000 (or 0.3 per cent of premiums) last year, compared with an underwriting profit of £7.7 million in 1950. Total premium income from accident business again expanded strongly in 1951, to £195.3 million compared with £170.2 million in 1950 and £144.4 million in 1949. United Kingdom rates of premium for motor insurance were increased by 12½ per cent from June 1, 1951, and there have been similar increases elsewhere, but the rapid rise in the cost of repairs and in the damages awarded to third parties makes it unlikely that this class of insurance will do much better than break even in 1952. Employers' liability business was also unprofitable last year because of the increase in damages awarded. Here again premium rates have been increased this year, both at home and abroad.

Ordinary dividends, after tax, paid by these leading companies showed a small increase last year, from £6,160,000 to £6,341,000. Although underwriting profits were less than half those of 1950, net interest earnings on the substantial reserve funds (other than life) were nearly £500,000 higher at £9,735,000, so that it was still possible to plough back £6,750,000 into the business as additional free reserves, compared with £10,847,000 in 1950. Large as these additions to reserves may appear to be, they are insufficient to maintain the existing ratio of free reserves to premium income. Since net dividends are still in the aggregate lower than before the war, it is clear that it is taxation that is preventing insurance, like so many other industries, from building up as large reserves as it otherwise would.

* * *

American Victory on Tin

The United States seems on the point of winning its year-old struggle with Bolivia over tin prices. It has been reported from Washington that the American government buying agency, the Reconstruction Finance Corporation, has bought for 118 cents a lb the stocks of Bolivian tin that had accumulated at Chilean ports. This is the same price as the United States is paying for Malayan and Indonesian tin this year; the Bolivians had previously refused to accept it, as they argued it was insufficient to cover their high costs of production. It seems now that the new Bolivian government has found difficulties in financing the huge stocks that have piled up during the negotiations. It is reported that American banks had offered further credits, but that the Bolivian government had refused because it did not wish to extend the American financial hold over its tin industry.

When it came to power a few months ago the Bolivian government announced its intention of nationalising the major tin mines in order to end foreign domination of Bolivia's most important industry. This week it has appointed a commission to work out the technical details involved in carrying out this policy. At present the mines are organised into three main groups—Patino, Hochschild and Aramayo—which together account for nearly 90 per cent of Bolivia's total tin exports. The first of these groups, Patino, which is easily the biggest, sends its output of about 15,000 tons a year exclusively to Britain. The other two companies, Aramayo and Hochschild, are American-controlled and supply the Texas smelter with concentrates.

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

The Economist Intelligence Unit

22 RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

Since the expiry of the last agreement with the United States the output of these two groups has been taken over by the Bolivian government, and this is the accumulated stockpile that has now been sold to the RFC.

* * *

Uranium in the Commonwealth

The recent discovery of large uranium deposits in Nigeria suggests that the Commonwealth may eventually become one of the world's biggest producers of uranium. Canada at present accounts for a considerable proportion of total production, the Great Bear Lake deposits are one of the few that were being worked before the war. The first of the uranium extraction plants that are being erected at many of the South African gold mines are now in production, but it may be some time before the two large deposits recently identified in Australia and Nigeria by scientists from the Geological Survey can be exploited. No report has yet been published on the size or workability of Australian deposits in the Rum Jungle, or even of the deposits in the region known as Radium Hill. The main difficulty with the Nigerian deposits would appear to be extraction of the uranium metal itself from the mineral carrying it, and of the mineral, pyrochlore, from the granite rocks in which it is found. The survey suggests that the deposit contains several million tons of granite, containing about 120 grams of uranium and 2,600 grams of niobium oxide a ton. The presence of this second metal makes the prospect of mining such a low-grade deposit considerably more attractive. It is one of the scarcer alloying materials that have been in demand only since the development of the jet engine, and with it, the need for alloy steels that could withstand exceptional temperatures. Preliminary reports suggest that a plant handling 3,000 tons of granite rock a day, or a million tons a year, might expect at a 75 per cent extraction rate to produce 100 tons of uranium and 2,000 tons of niobium a year. These are not very encouraging figures, but the sheer size of the deposit, as well as the high current prices of the two metals, are expected to justify working ores of such low concentration. It is in any case essential that methods be found of working low-grade ores economically if there are to be sufficient reserves of uranium fuel to justify the building up of an atomic power system. Within this country the old uranium deposits in Cornwall are probably neither rich enough nor big enough to justify much serious development; the prospects for small-scale mining for uranium in North Wales are a little more attractive.

Shorter Notes

The fact that Easter fell in March last year and in April this has made it difficult to interpret many statistical series that are recorded monthly, and the statistics of industrial output are no exception. According to information so far available, the official index seems likely to give a figure of 138-139 for April, compared with 148 in March and with 151 in April, 1951. Output in April this year, therefore, may be nearly 9 per cent lower than in April last; on the other hand, output in March was 5 per cent higher than in the same month last year. Over the two months, therefore, output would appear to have been—still—slightly lower than in 1951.

*

The ban on any further imports of cement from Belgium, one result of this country's mounting deficit with EPU, has led indirectly to an average reduction of 3s. a ton in the price of cement. When imports from the continent were increased last year a levy of approximately 4s. a ton was imposed on the price of the much cheaper home-produced cement in order to sell the imported product at home prices. The home prices have now been reduced by rather less than they were increased by the original levy; which suggests that the industry will continue to import small quantities from other countries.

Company Notes

Shell and Royal Dutch.—Last year companies in the Shell and Royal Dutch group produced 429 million barrels of crude oil (an increase of 17 per cent) in fourteen different countries, processed 558 million barrels (an increase of more than 20 per cent), and carried their products across the world in a tanker fleet of 6½ million tons dead weight (with large additional orders for tankers recently placed in the shipyards). As a result of these operations, and of its investment and other miscellaneous revenue, the group earned a net income of £249,493,215 in 1951, compared with £190,378,100 in 1950. Of this, over £76 million went in taxation, not counting approximately £206 million for sales tax, excise duties and similar levies paid to governments (which are deducted before arriving at the figure for trading profit). In addition, nearly £90 million, against £62.7 million, was provided for depreciation and amortisation of fixed assets; of this, £22 million (against just over £7 million) represented "additional depreciation"—that is, depreciation provided by reference to values in excess of original cost, chiefly in the small (but fortunately increasing) number of countries where the tax laws permit a depreciation allowance more in line with replacement values than does the rigid British system. After these and certain other deductions, the group had £66,216,204 (against £50,994 529) available for distribution; it ploughed just over £47 million (against £34.7 million) back into the business, and distributed £19,057,327 (against £16,283,382) to the parent companies of Royal Dutch and Shell Transport and Trading, in the usual proportions of 60 per cent and 40 per cent. As already reported in *The Economist* on May 24th, this allowed Shell to raise its dividend from 12½ to 15 per cent tax free, and Royal Dutch to raise its dividend from 12 to 13 per cent (supplemented by a stock dividend of 2 per cent).

Group earnings :—	Year ended Dec. 31 1950 £	1951 £
Group income from trading, investments and miscellaneous revenue	190,378,100	249,493,215

Accumulated income and other surpluses	232,738,037	344,049,202
Long-term borrowings	113,425,521	112,801,822

After allowing for depreciation calculated on the basis of cost price, fixed assets as shown in the balance sheet rose from £382.3 million to just over £420 million, and current assets after deducting all liabilities from £182.7 million to £255.7 million; total stocks increased by some £53 million and cash and securities by £21 million. The whole of last year's capital expenditure of over £100 million was financed by income retained in the business, and although Shell Transport proposes to increase its authorised capital, over and above the increase required as a result of the recently announced capitalisation of reserves, Sir Frederick Godber emphasises that the directors "have no plans to issue additional capital for cash or otherwise and can foresee no immediate necessity for doing so." The group, in other words, while continuing its policy of pressing ahead with its truly massive investment and exploration programme, seems confident of its ability to provide internal finance from its expanding profits.

*

Anglo-Iranian.—Despite the evacuation from Abadan, which lost the company some 15 million tons of Persian oil last year, Anglo-Iranian's sales in 1951 were only 2 million tons below the 38½ million tons sold in 1950. This was made possible partly by increased supplies of crude oil from Kuwait and other wells under the company's control, partly by hiring additional refinery capacity and partly by purchases from other sources. It was inevitable that the year's events should lead to a sharp drop in profits. Consolidated profit before charging United Kingdom tax is down from £84,466,342 to £52,217,016, but this figure has again been arrived at after charging the £8,326,446 royalty that would have been payable to Iran on the basis of the 1933 Convention, and after setting aside £9,500,000 to the credit of special contingencies account. After providing for taxation, the amount available for reserves and dividends is £24,233,050, compared with £33,102,572 for the previous year. From this, £1 million has been allocated to preference stock reserve (bringing the total to £9 million) and £16 million, compared with £25 million, has been placed to general reserve (which now stands at £81 million). The maintained ordinary dividend absorbs only £3,171,656 and is thus very amply covered by earnings.

Consolidated earnings :—	Years to Dec. 31, 1950 £	1951 £

Ordinary capital	20,137,500	20,137,500

(*a*) After charging royalty (£8,326,446) and crediting £9,500,000 to special contingencies.

£1 ordinary stock at 5½ yields £5 1½s. 3d. per cent.

The chairman, Sir William Fraser, states in his report that "the accounts have been prepared in the same form and on the same basis as those for 1950, but figures in respect of current assets and liabilities in Iran have had to be estimated to a considerable extent." Although total capital expenditure in 1951 amounted to approximately £46.8 million (of which some £8 million was on account of the tanker fleet), fixed assets, less depreciation, are shown in the balance sheet as having increased by only £8,974,936 to £64,406,855. It is not known what proportion of the various assets applies to properties in Iran, but, if the worst befalls in that country, the special contingencies account, which with this year's allocation now amounts to £49,987,440, should prove to be a substantial safeguard. For the rest, investments in subsidiary companies not consolidated and allied companies have risen from £91,398,147 to £111,731,643, while cash is up from £50,960,747 to £59,074,918. Whatever eventually happens in Iran, shareholders should be able to look forward to the future with confidence born of the knowledge of innate strength.

*

J. and P. Coats.—The slump in the textile trade has been too recent to make its mark on the profit and loss account of J. and P. Coats, which was drawn up on December 31st last. Group trading profits still show an increase, from £15,546,151 to £16,172,694, and the directors add that if allowance is made for the windfall exchange gain of £2,800,000 in 1950, trading profits in 1951 were some £2 million up last year. But shareholders must ask themselves how much of this £2 million represents a true increase in earnings, and how much of it merely represents inventory gains. The tax collector does not, of course, make this distinction, and the charge for British taxation has increased from £3,234,986 to £5,170,617, while foreign taxation is up from £1,991,053 to £3,291,664. These tax increases reflect a bigger flow of remittances from overseas subsidiaries to the parent company last year, and also largely explain the steep decline in net profits, from £9,217,376 to £6,529,820.

In the preliminary statement, discussed in *The Economist* on May 24th, the directors warned shareholders that the severe decline in raw material prices since the turn of the year might "necessitate an appreciable writing down in the 1952 accounts." The balance sheet figures now available show the serious call that such a writing down might make upon profits. In the consolidated balance sheet the book value of stocks has risen from £39,876,780 to £53,496,310. This increase is due partly to a greater quantity of stocks held (which may have been the first hint of a recession in trade) and partly to higher raw material prices. This inflation in the cost of investment in working capital has made a serious call upon the group's liquid resources. Cash balances have declined from £5,611,649 to £4,247,450, and quoted investments from £3,399,815 to £1,600,107, while bank loans have risen from £953,485 to £5,196,006. With such figures in front of them, it is not surprising that the directors did no more than maintain the ordinary dividend at 12½ per cent. The full accounts strengthen the impression that the yield of £6 1s. 3d. per cent on the £1 ordinary stock units at the current price of 41s. 3d. may not fully reflect the dangers that surround the dividend payment this year.

Consolidated earnings :—	Years to Dec. 31, 1950 £	1951 £

Royal Mail.—The preliminary statement by Royal Mail for the year to December 31st last shows that the company made a remarkable recovery after the fall in operating profits reported in 1950. Net profits for 1951 are entered at £588,331 (including £171,614 of profits earned in earlier years), compared with £539,302 (including £107,927 of earlier profits) in 1950. These figures, however, have been struck after charging a much higher provision for taxation in 1951. This increase in taxation, from £755,181 to £1,937,929, may partly reflect the reduction in initial allowances on new shipping tonnage, but it was also due to an increase in the gross operating surplus. Earnings in 1950 were particularly depressed by the cessation of meat shipments from the Argentine, and although meat shipments were resumed in 1951 they were on such a small scale that the resumption in this trade cannot wholly explain the recovery in earnings. As with the other Liner companies, the growth in Royal Mail's profits last year must largely be accounted for by the boom in the freight market in 1951. The recent decline in freight rates and the fact that Royal Mail's traffic to South America has dwindled suggests that this year may prove to be a more difficult one. Nevertheless, the directors have increased the ordinary dividend from 7½ per cent to 10 per cent, although the tax-free distribution of 2 per cent in respect of capital profits arising from the realisation of investments has not been repeated. At the current price of 26s. the £1 ordinary shares yield £7 13s. 10d. per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 31, 1952, total ordinary revenue was £71,198,000, against ordinary expenditure of £73,252,000 and issues to sinking funds £110,000. Thus, including sinking fund allocations of £4,001,000 the deficit accrued since April 1, 1952, was £81,685,000 compared with a surplus of £18,845,000 for the corresponding period of the previous year.

On May 30th applications for 91 day bills to be paid from June 3 to June 7, 1952, were accepted dated Tuesday to Saturday as to about 71 per cent at £99 8s. 1d. and applications at higher prices were accepted in full. Treasury Bills to a maximum of £240 million were offered on June 6th. For the week ended June 7th the banks were not asked for Treasury deposits.

PERSONAL SERVICE

A century ago, when England was enjoying a period of peace and prosperity, the English private banker and his customer were well known to each other and banking was a personal service based on mutual confidence.

Today, modern practice is more comprehensive and includes many specialised services not imagined by the banker of a hundred years ago. National Provincial Bank, however, with its widespread resources and organisation, *still* maintains the banking tradition of personal service. The entire banking organisation is adapted to serve individual needs, and the Manager is always glad to meet and advise each of his customers.

BRITISH BANKING SURVEY

The following articles comprise the editorial section of THE ECONOMIST'S *annual survey of banking trends in Britain and the British Commonwealth, which this year appears in more extended form—to mark the importance of the dramatic change in British monetary policy that began last November. The articles are intended to be read in conjunction with the special 16-page selection of British Banking Statistics that appears in this week's issue of the* RECORDS AND STATISTICS *supplement. A complementary editorial survey of Foreign and International Banking, with an associated statistical selection, will be published in the autumn. These half-yearly features together comprise the new form of* THE ECONOMIST BANKING SUPPLEMENT, *which has been published for many years.*

The New Monetary Orthodoxy

BRITAIN'S monetary policy has lately undergone its most revolutionary change for twenty years. The change has falsified the forecast, but confirmed the analysis, given in these columns twelve months ago ; and the falsification is as welcome as the confirmation. The forecast was that, unless the balance of payments ran into heavy deficit, the Government would be increasing its borrowings from the banking system, and that bank advances would continue to rise in any case. The conclusion was that the only way of preventing a further credit expansion was to pursue a tougher and more orthodox monetary policy "with the object of either curtailing demands for advances or of forcing the banks to meet part of the demands upon them by selling gilt-edged securities." This policy, which seemed unlikely so long as a Labour government remained in power, is precisely the one that Mr Butler and his advisers have adopted. The revolution in monetary policy, however, should not be attributed to the change in government alone ; a much less radical shift in policy would have been likely if Britain and the sterling area had not been plunging simultaneously into a dollar emergency more menacing than any of its postwar predecessors.

The five articles in this survey examine different aspects of these far-reaching developments ; and because intricate as well as major changes have followed one another in bewildering succession, more emphasis is put upon exposition and explanation of what has been happening than upon the problems that lie ahead. This first article is concerned primarily with the tasks laid upon monetary policy and its achievements up to date ; the technical changes themselves are recorded in a later article. Two articles examine the impact of the crisis, and of the monetary correctives, upon sterling and upon the overseas sterling area. And a fifth article discusses the repercussion of these events, and of some longer-term trends, upon the profitability of the banks.

It is still too soon to assess the full effects of the new orthodoxy. Indeed, its effects at the most fundamental points—especially its relationship to the recession in some consumer goods industries, the rise in transitional unemployment, the slightly better flow of labour into the metal-using industries, and to the level of investment—may long be a matter of dispute and will never be precisely determinable. But there is little doubt that, measured in monetary terms, the domestic response has reached the best expectations of the authorities. Indeed, the early effects of the measures of last November were probably sharper than even they—and certainly much sharper than most people in the City—had foreseen. The chief tests at this stage were, first, the violence of the fall in the gilt-edged market once it grasped the implications of the special funding operation in drastically altering the pattern of bank asset ratios ; and, secondly, the indication that the shocks administered to the banks were severe enough to ensure a really salutary toughening of their attitude towards advances. Some academic economists who prefer the "social priorities" of planning and who distrust monetary orthodoxy and the price mechanism may still debate from a distance the relative force of a tightened "directive" and of the quantitative measures combined with rising interest rates in achieving the new credit discipline (see, for example, the opening articles in a recent symposium arranged by the Oxford Institute of Statistics) ; but everyone in the City knows that the latter have been overwhelmingly the more important.

The early indications of the strength of monetary policy explain the rapid increase in the responsibilities that have been loaded upon it. At the first stage, when there was only a "token" increase in Bank rate, by ½ per cent, the Chancellor did not contemplate any "dramatic process" or any "decisive results." Monetary policy seemed cast for a relatively minor role ; and everyone took it for granted that a large part of the work of squeezing and moulding the economy into the shape required to make and keep it solvent would be done by a strong budget—one that cut government expenditure sharply and also pressed directly upon consumption. But, if that was Mr Butler's original intent, he abandoned it at first glimpse of the likely effects of the sterling area's cuts upon the consumer goods industries ; and the only means of preventing a soft budget from having grave repercussions upon overseas confidence in sterling was to brandish the monetary weapon that was proving so much more potent than he had supposed. Hence a policy designed as a "change of emphasis" gave place to a 4 per cent Bank rate regarded as an "action that is, and is seen to be, decisive"—especially in its effects on opinion overseas.

But that is very far from being the limits of the responsibility put upon the monetary authorities. If the Government is still determined not only to get the economy by hook or crook past this year's danger-point but also to give it a reasonable chance of keeping clear

of danger thereafter, the presumption has to be that monetary policy is burdened with most of this arduous work. For the monetary changes are almost the only novel ingredient in the economic policies of the Conservative Government; the remainder are merely slight variants of the—mainly physical—devices that proved so insufficient in the hands of the Labour Government.

The immediate tasks thrust upon monetary policy were, therefore, to sustain confidence in sterling by persuading overseas opinion that the Government "meant business," to curtail foreign short-term borrowings in London, to play a large part in the cutting down of private investment in plant and vehicles and stocks, and generally to make up for the softness of the budget. For the slightly longer term, the policy is presumptively left with a large share of the responsibility for accelerating the flow of labour from the consumer goods industries into the metal-using trades—a transfer that is indispensable if the hoped-for expansion of exports of capital goods is to be sustained without repeating the damaging cuts in home investment. Moreover, if solvency is to be assured, it is imperative to maintain an external surplus to build up the reserves; if, therefore, the Government is not prepared for tougher budgeting, monetary policy would have to shoulder the even more onerous task of keeping consumption in check, and perhaps of actually contracting it.

TABLE I
CHANGES IN BANK DEPOSITS AND ASSETS
(£ Million)

Years to May	1946	1947	1948	1949	1950	1951	1952
Net deposits	+266	+638	+255	+ 47	− 40	+199	−152
Advances	+ 99	+243	+234	+102	+211	+155	+ 98
Investments	+196	+148	+ 7	+ 25	+ 1	+ 53	+377
TDR's	−508	− 24	−102	−211	−672	− 95	−269
Bills and call money	+454	+318	+ 88	+137	+421	+ 62	−344
Cash	+ 26	− 48	+ 28	− 1	− 5	+ 22	− 13

These are vastly bigger responsibilities than anyone has previously suggested that monetary policy should (or could?) bear; and if it is really intended that it should carry any large part of them, then measures of the present intensity are unlikely to suffice. But, judged by more limited objectives and by monetary tests, the record so far is good. A dangerous credit trend has been arrested, and the measures by which this was achieved have imposed a salutary restraint that is gradually being felt through a large part of the economy, and is certainly tending to curtail investment.

In the six months before the new policy was launched, bank advances rose much more rapidly than in any comparable period; and although net bank deposits rose less rapidly in this phase than in the similar period of 1950, this was solely due to the huge amount of finance that accrued to the Government as a result of Britain's plunge from external surplus into catastrophic deficit. The narrowing of the deficit since then has cut down this external source of finance, and rearmament outlays have been rising; in the past six months, therefore, the seasonal reduction in governmental demands for bank credit has been much less than it was in 1950-51. Yet, over this period, net bank deposits have fallen by £277 million, or by £95 million more than they fell in the similar period of the previous year.

The whole of this improvement has been due to the abrupt check successfully applied to the private sector of the economy; indeed, if private demands had risen at the same rate as in the similar period of 1950-51 (not to mention their much sharper rate of rise in the six months immediately before the launching of the new policy) the resultant inflation of deposits would have been so large as actually to obliterate the strong seasonal tendency to contraction. In the five months to mid-April, when bank advances reached their peak at £1,953 million, their growth amounted to under £28 million,

TABLE II
TRENDS IN BANK ADVANCES
(£ Million)

	1946–47	1947–48	1948–49	1949–50	1950–51	1951–52
May to November	+107	+105	+ 17	+ 46	− 28	+132
November to May	+135	+129	+ 85	+165	+183	− 35

compared with £156 million in the similar period of 1950-51. Moreover, in this phase, the demands of the nationalised public utilities were still rising very rapidly; the latest available classified figures of advances, those for February, showed that over the first three months of the new policy the rise in total advances was wholly attributable to these public borrowers—despite the fact that the banks have been increasing their credits to the expanding metal-using industries (and despite the fact that they seem to have been relatively lenient towards the consumer goods trades that have been piling up stocks). Although the monthly statement for May reflected the first repayments out of the proceeds of the £150 million BEA loan, it seems certain that, in the six months to that date, the aggregate advances to the public borrowers still showed an appreciable net rise; yet, as Table II shows, total bank advances actually declined in this period, by £35 million, presenting an impressive contrast with any previous postwar year.

Nor is this all; to gauge the pressure put upon the private sector by the new policy, it is necessary to look also at the banks' portfolios of commercial bills and investments. Since last November all the English clearing banks have shown their commercial bills separately; although the aggregate portfolio rose in the first three months, from £152 million to £187 million, it has since fallen by £85 million, to £102 million—partly in response to dearer money and the new qualitative restraints upon foreign credits and drawings, and partly because some overseas banks in London have been retaining a higher proportion of bills themselves.

TABLE III
CHANGES IN ASSETS STRUCTURE, 1951–52*

	May, 1951		Oct., 1951		May, 1952	
	£ mn.	%	£ mn.	%	£ mn.	%

Total "Inflexible" assets	3,617·5	58·9	3,628·7	58·5	3,822·9	64·8

* Percentages of assets are related to *gross* profits.

More significant still, from the domestic standpoint, has been the salutary reduction in the clearing banks' investment portfolio; if the equivalent of the £500 million of Serial Funding bonds is excluded (since they

represented a virtually enforced switch from Treasury bills) the aggregate portfolio has shrunk by £123 million to £1,432 million, its smallest since the closing months of the Daltonian campaign. An important part of this decline, of course, reflects the painful writing-down that has been forced upon the banks ; but there have also been some considerable sales. Since the authorities, on balance, have certainly not been buyers of gilt-edged in the market since last December (when they gave substantial aid in brief sallies at the worst point of demoralisation), and may have been net sellers, this selling by the commercial banks has tightened up still further the money supply in the private sector. In addition, of course, it has added substantially to the other psychological influences making for restraint.

The bankers themselves, who have been tougher in their credit policies than any of them thought feasible last autumn, are certainly entitled to claim that they have responded effectively to the new policy. And, until a few weeks ago, it could also be claimed that the new monetary measures, by inducing or enforcing a narrowing of the short position, were sustaining sterling through a phase in which other influences to resist a further slide were all too weak. But now the relief from enforced bear-closing is virtually exhausted, and the more fundamental sources of relief have not developed as steadily as had been hoped.

A new wave of nervousness has therefore led people to ask whether the monetary discipline may not have to be tightened still further. Certainly, this is no moment to relax it ; yet several influences are already tending in that direction. Although the direct impact of higher interest rates upon borrowers has probably played a bigger part than is generally recognised, there is no doubt that the new credit restraint has so far been chiefly achieved by the impact upon the banks of the tautening of their assets ratios at a time when interest rates, long as well as short, were rising. Now the tension is being eased, because a resumption of Government borrowing is increasing the supply of Treasury bills. These borrowings are partly seasonal and partly due to the contraction in the rate of external borrowing ; but they are also attributable to the BEA loan. This would have eased the banks' position in any case, because of the resultant repayment of bank advances ; but, since the "departments" took up some two-thirds of the issue, the financing of their purchases is further increasing the banks' liquid assets.

If these tendencies persist for long they will certainly have some repercussion upon advances practice, for the banks do not find it easy to refuse long-established and substantial customers. For a little while, the psychological effects of the recent sharp break in gilt-edged should suffice to hold the line in credit restraint ; but steps ought to be taken soon to reinforce it more tangibly —especially in view of the big maturities of bonds in the next nine months. In the early future, the reinforcement is much more likely to take the form of a funding loan or more persistent sales of gilt-edged through "the taps," than of a further increase in Bank rate—unless there is a dramatic change in the exchange market. But if and when monetary policy is deliberately brought to bear on the longer-range problems, it will certainly have to deploy all available weapons simultaneously.

Sterling Area off Balance

IN the last five years the sterling area has seen two false dawns of hope, interspersed between three grave balance of payments crises. When the Commonwealth Finance Ministers met in London last January, at the depth of the third and worst crisis, they had therefore to trudge along a drearily familiar road. The programme that they initiated then, as since amended in Mr Butler's budget statement, aims at reducing Britain's payments deficit with the non-sterling world from £600 million in the second half of 1951 to zero in the second half of 1952 (after taking account of American aid) ; the task set for the overseas dominions and colonies represented at the conference is to eliminate the deficit of between £100 and £150 million that they ran with the non-sterling world in the second half of 1951, and turn it into a surplus of at least £100 million by the second half of 1952.

It is unfortunate that the detailed targets announced after the conference laid this emphasis on non-sterling payments, while the general measures of disinflationary policy agreed upon merely—and rightly—emphasised the need for each country to balance its overall accounts. It is true that for Britain itself the dichotomy between these two expressions of intent is not glaringly obvious. The easiest imports for Britain to cut happen to be the unrationed foodstuffs and other consumer goods that have flowed into this country from Europe in increasing volume since liberalisation of intra-European trade began. The second easiest to cut, given the present level of stocks, are imports of some raw materials from the dollar area ; there must be some uneasiness in Whitehall that Britain's habit of relapsing into a balance of payments crisis whenever inflation damps down in America may mean that this country always tends to run down its stocks at the bottom of the market and start purchasing heavily at the top of it—but it must be some comfort to be able to adopt a balance of payments formula that does not demand similar upside-down economics in relation to purchases of sterling area raw materials. Finally, if some goods have to be diverted from the home market, it is politically convenient to make the cut in investment goods, which happen to be readily saleable in non-sterling markets.

For practically every one of the overseas sterling area countries, however, a policy aiming at overall balance and a policy aiming solely at improvement of non-sterling payments are two very different things. The imports that these overseas countries think they ought to cut—and on economic as well as political grounds they are almost certainly right—are imports of consumer goods, which come largely from Britain. It was for this reason that when the Finance Ministers of Australia, South Africa and (to a less extent) New Zealand went home last January, they proceeded to swing their axes at imports from Britain—and immediately caused a howl of protest from manufacturers in this country, who wanted to know what relevance these savage cuts had to the problem of dollar payments. It is only when the answer to this protest is appreciated in this country, and accepted by the British and the Dominion Governments, that a clear-thinking approach can be made to the saving of sterling.

Before the war Britain accounted for about 50 per cent of total sterling area exports (valued at some £1,100

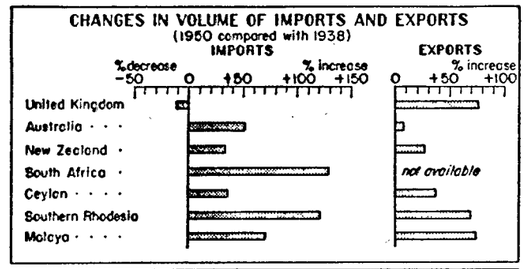
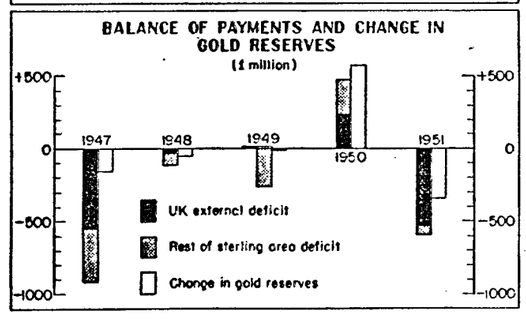
million f.o.b. in 1938) and some 60 per cent of total sterling area imports (valued at some £1,580 million c.i.f. in 1938); in 1950 the relevant proportions were 43 per cent of total sterling area exports of some £5,250 million and 47 per cent of total sterling area imports of £5,500 million. It is, therefore, still reasonable to regard Britain, on the one hand, and all other sterling area countries, on the other, as two trading entities of broadly equal importance. The fortunes of these two groups since 1938 have, however, been very different. The volume of Britain's exports has increased by 80 per cent, the volume of its imports has slightly declined and its terms of trade (that is, the ratio of import to export prices) have gravely deteriorated. In almost all the overseas sterling area countries, by contrast, the volume of exports has increased only slightly, the volume of imports has sky-rocketed and the terms of trade have greatly improved. In consequence, as the accompanying charts show, the overseas sterling area has been in continuous external deficit ever since the end of 1946, except for the brief eighteen months between January, 1950, and June, 1951. Throughout most of the last five years, indeed, the external deficit of the dominions has been greater than that of Britain, although the colonies seem to have been in surplus throughout.



The sum of the deficits (or surpluses) of Britain and of the overseas sterling area is, of course, mathematically identical to the overall deficit or surplus of the whole sterling group with the outside world. It will be seen from the charts that up to the end of 1949 this overall deficit did not bear any constant relationship to the concurrent drain on the central gold and dollar reserves; its effect was masked by Marshall Aid and by the willingness of European and other non-sterling countries to receive payment for their exports in sterling. Since Marshall Aid ended and EPU started, however, this relationship has become much more direct.



The implication is obvious. If sterling is to be saved, the overseas dominions must cut down their internal expenditure on consumer goods. Insofar as the cuts fall on domestic manufactures, then the resources thus freed must be diverted to their export industries, which in most dominions implies a policy of back to the land. Insofar as they fall on imports from Britain, then the resources that Britain has utilised for the manufacture of these goods must be diverted to the manufacture of goods that can be sold in non-sterling area markets, which means, in effect, to the engineering industry.

It is for this reason that the overseas sterling area's recent cuts in imports from Britain should be welcomed in this country, provided they are matched by corresponding cutbacks in purchasing power within the dominions concerned. The big danger at the moment, of course, is that they will not be so matched. There is a very real risk, for example, that the shutters that have clamped down on Australian imports will turn that country into a hothouse for the growth of high cost domestic industries, eager to fill the gap that the decline in imports from Britain has left. In this case the sterling area will have the worst of all worlds; a desirable switch of resources in Britain will be offset by an undesirable switch in Australia.

What are the prospects that the overseas dominions will in fact follow sufficiently stern disinflationary policies to keep their economies in balance? The greatest single source of hope lies in the worldwide resurrection of monetary policy as a positive disinflationary weapon in the last twelve months. Very few of the dominions have economies—or civil service machines—that permit of once-a-year disinflationary budgeting, or of what may be called the "economic survey" approach to disinflationary planning; their national incomes are subject to wild fluctuations in the course of any one year as a result of changes in the prices of a handful of staple commodities, and it is not therefore surprising that their annual budgets tend to be based (at best) on the projected balancing of revenue and expenditure, rather than on any planned withdrawal of a given quantum of purchasing power from consumers' hands. The most potent disinflationary weapons in such economies are therefore those that are based either on the politically difficult "marketing board" approach—that is, on the temporary withholding of exporters' incomes above a given level in boom years—or on a flexible use of interest rates.

At the moment, flexibility is not, unfortunately, a characteristic of the monetary policies of most dominions. Australian monetary policy has long been wedded to

rigid—and largely unsuccessful—quantitative and qualitative controls; indeed the Australian Government actually prevents intelligent use of the interest rate weapon by fixing a maximum rate of interest on bank advances (a maximum that has remained unchanged at 4½ per cent since December, 1946). The central bank can to some extent control the volume of funds available for bank lending by requiring the commercial banks to hold a varying proportion of deposits in sterilised "special accounts" (approximately 39 per cent of deposits were sterilised in this way at the end of last year), and discrimination against "inessential" bank lending is enforced by statute. The central bank has let it be known that industries seeking to expand production of consumer goods in order to fill the void left by the import cuts will be classed as "inessential," but since this cumbersome machinery, like the equally rigid control of capital issues, has never shown much sign of working effectively, this is small comfort. The most hopeful aspects of the Australian scene are that the

Commonwealth budget of last September did seem to inaugurate a period of genuine budgeting for a surplus, that the drain on liquid funds caused by last year's balance of payments deficit has caused an air of caution to clamp down in bank board rooms, and that the cessation of the inflow of foreign funds has driven up the interest rate on 11 to 14-year government bonds from $3\frac{1}{8}$ to $3\frac{3}{4}$ per cent and exerted some check on public works programmes. But it seems doubtful if disinflationary policy in Australia can ever get on to the right track until interest rates are allowed to rise further than at present. Unfortunately, New Zealand also seems to favour an inflexible approach to monetary policy. Although interest rates have been allowed to rise there, a great deal of reliance has been placed upon qualitative control of advances; since December, 1951, the trading banks have been required to examine all accounts in excess of £10,000 and to submit most applications for increases in advances above this limit to a cumbersome machinery of Reserve Bank scrutiny.

In India there have been welcome signs of intelligent use of the interest rate weapon. Even before the Bank of England changed its policy last November, the Indian authorities had decided to raise the Reserve Bank rate from 3 to $3\frac{1}{2}$ per cent at the beginning of the "busy" winter season; this increase was duly made in mid-November and it has undoubtedly played a considerable part in the recent diminution of inflationary pressure in India. Since November the Reserve Bank has increased its room for manœuvre in the Indian money market by the steps that it has taken to create a new bill market, and the Finance Minister has introduced a budget that, despite needed reductions in export duties, gives nothing away to those who have been complaining that disinflation is turning into slump. Among India's neighbours, Pakistan does not yet enjoy the benefits of a flexible banking system (most bankers in pre-partition India were Hindus) but Ceylon is carrying out an ambitious experiment in disinflationary banking technique with the aid of American experts.

In South Africa, last year's import spree and balance of payments deficit was aided and abetted by an extravagant increase in bank advances, which was partly made possible by a decline in the commercial banks' cash ratios from 25.7 to 15.5 per cent in the course of the year. Since then Mr Havenga has imposed substantial tax increases, the Reserve Bank rate has been raised from $3\frac{1}{2}$ to 4 per cent, and support prices for government bonds have been lowered sufficiently to allow the yield on them to rise to $4\frac{1}{4}$ per cent (against $3\frac{1}{2}$ per cent a year ago). It should be noted, however, that a high level of South African imports does not necessarily lead to a drain on the sterling area's gold reserves; in fact, in so far as "essential" imports come from non-dollar sources more South African gold is sold to London.

It would be idle to pretend that any survey of monetary conditions in the overseas dominions holds out great hopes that internal disinflationary pressure has yet been pushed far enough to buttress their rather shaky systems of import licences and other physical controls. For a short time, no doubt, the "hangover" effects of last year's over-importing by local merchants will exert some disinflationary pressure of its own. It is as this hangover wears off that the need for greater monetary realism there will become imperative, if sterling is to be saved. Meanwhile, Britain's role should not be restricted merely to putting its own house in order. Even though the overseas sterling area's import cuts will hurt individual manufacturers in this country, it is important that the dominions should not be diverted from the road to salvation by Lancashire's political exertions—or by Whitehall's uneconomic example.

Reopening the Exchange Market

THE past six months have been an exceptionally eventful period in the history of sterling exchange. The dramatic change that has occurred in domestic monetary policy since the advent of the Conservative government has had a counterpart—though a less dramatic one—in the sphere of foreign exchange. Moreover, the tempo of events there suggests that there may be further changes and developments of major importance in the near future. The initial rise in Bank rate and in short money rates was too small to have much direct effect upon the foreign exchange situation; but it was quickly followed by a major change in exchange technique. In mid-December the authorities reopened the London foreign exchange market, which had been virtually closed since 1939. This step involved no change whatever in the rigour of exchange control, but it provided much greater freedom for dealings between authorised banks, and at rates determined—within limits—by market forces. In their foreign exchange operations previously, the authorised banks had to act almost exclusively in the guise of agents of the Bank of England; they bought and sold specified currencies at fixed rates, both in the spot and the forward markets.

The progress towards a freer market announced last December was greatest in the realm of forward dealings. Since December 17th dealings in forward exchange have been transacted at rates determined solely by supply and demand. The special facilities previously provided by the Bank of England for buying and selling foreign currencies forward were withdrawn, and no new official dealing rates were fixed, so that fluctuations of rates in this market have not been subject to definite limits—though official intervention may have intruded at times.

In the spot market, however, the scope for movement is formally circumscribed. The Bank of England widened the range of its own official buying and selling rates to an extent very close to the maximum—i.e., 1 per cent either side of parity—allowed by the articles of agreement of the International Monetary Fund. The new buying and selling rates for the U.S. dollar, for example, were fixed at $2.78-$2.82, the Bank of England holding itself ready to sell dollars at the lower and to buy them at the higher of these two rates. Within this range—which incidentally, is wider than the spread of gold points under the old gold standard—the authorised banks were allowed to deal at competitive rates again, to marry transactions and to maintain working balances in foreign currencies up to limits fixed by the Bank of England.

This granting of a wider measure of freedom to the

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds —a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to:—

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

J. A. CLEZY, London Manager and Secretary.

Chief Office in Australia: Collins Street, Melbourne.

London foreign exchange market can be regarded as complementary to the reintroduction of a flexible credit policy in Britain. The two moves together ensured that the relative level of money rates in London and other centres could once more find some reflection in forward exchange quotations, though the reflection could not be as clear and as free from distortion as it was when international movements of capital were not fettered by exchange controls. In the spot market, too, the movements of the rate between the upper and lower official points now provide a measure of the strength or weakness of sterling that was not available when all transactions took place at fixed official rates. The movement of these spot rates, especially for the United States dollar, has provided some indication (though by no means a conclusive one) of the trend towards improvement or deterioration in the gold and dollar reserve.

★

For almost three months after the reopening of the London exchange market the United States dollar remained very close to the Bank of England official selling rate of $2.78, and the authorities constantly supplied dollars at that level. That pattern, however, was dramatically broken on March 12th, when the effects of the budget and especially of the further increase of Bank rate to 4 per cent came to be felt. Within a day the spot rate had moved to $2.80⅞; it rose to a peak of $2.81½ by the beginning of April. The lifting of the spot rate above the Bank of England's selling rate for dollars, and actually above its dollar parity, could be regarded as an indication that the pressure on the gold reserve was easing. It could not, however, be taken as an indication that the reserve was rising. Many transactions that may involve loss of gold take place outside the market in U.S. dollars. Payments to Canada are a case in point, those to Europe through the European Payments Union are another, while the gold purchase agreements between the various gold producing countries in the sterling area and the Bank of England create gold movements that take place independently of what may be happening to the dollar-sterling rate. Moreover, even in the matter of dollar transactions, very substantial operations are made in respect of government bulk trading, and the relevant exchange operations will in many cases bypass the market altogether. If the market is strong, some of these official needs are likely to be settled through it—but there is no means of knowing what proportion of them is being thus met. Nevertheless, allowing for all these reservations, it may be assumed that as the spot rate for sterling in terms of dollars recovered to and beyond its parity, it indicated that the normal commercial demand for dollars fell short of the offers that came on the market and was, therefore, being satisfied without recourse to the gold and dollar reserve of the Exchange Equalisation Account.

The demand for sterling that created this considerable strengthening was partly, and perhaps largely, attributable to the greater confidence engendered by the budget and the concurrent rise in Bank rate. It was also the result of covering operations in sterling that followed a general and considerable restriction, towards the beginning of March, of credit facilities granted by London banks to overseas clients. These restrictions were brought into operation as a result of directions from the Bank of England requiring banks and acceptance houses in London to limit drafts under foreign credits to a maximum of ninety days, to refuse all refinancing or prefinancing credits and to restrict all new external credit facilities to the financing of goods actually in movement. These restrictions have come into effect as maturing credits have fallen due and have failed under these new provisions to secure renewal. Funds have therefore had to be remitted to London in repayment of these facilities.

The repayment of sterling credits has also been encouraged by the higher rates for bills quoted in the London market. The previous sub-normal level of discount rates, together with the comparatively cheap rates quoted by the Bank of England before last December for forward accommodation in the exchange market, had made it possible for foreign traders to secure credit facilities in the London market on abnormally cheap terms. They had been borrowing in London to provide for many transactions that in the normal course should have been financed in their own domestic markets. Not only had they been accommodated more cheaply in London than they would have been at home but they had thus secured facilities that allowed them to be short of sterling and long of commodities.

This type of operation had been only one in the considerable network of semi-speculative transactions against sterling that had developed over the previous months of steeply falling gold reserves. The fixed rate of $2.80 was again under suspicion, there was no possibility of a strengthening of sterling beyond that parity, and any foreign operator who secured facilities enabling him to go short of sterling was therefore handed a chance of making substantial speculative profits if in fact sterling were to depreciate. The open position against sterling was enlarged by every device that allowed foreign importers from sterling countries to postpone remitting the proceeds of their purchases to the exporting country.

It is unlikely that this speculative position founded on normal commerce has been reduced by more than a small proportion. There has been compulsory covering where the credit restrictions ordained by the Bank of England have come to apply. But any foreign merchant or operator who has not felt this compulsion—and there are many devices for going short of sterling that lie outside the orbit of the Bank of England's technical remedial measures—is unlikely to have been induced to cover solely by the increase in discount rates in London. The official parity of $2.80 is still under suspicion and there is no possibility of upward revaluation of sterling; in consequence, where a foreign merchant can leave a short position in sterling open, he will be strongly inclined to do so.

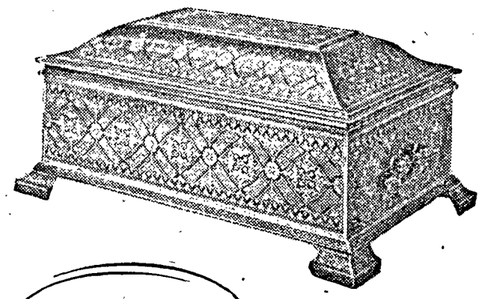
The compulsory covering operations began to lose their force towards the beginning of May. The sense of urgency to cover them may have been diminished by the Government's retreat on purchase tax and railway fares and by suspicions that the measure of political determination behind the tougher credit policy was not as great as might have appeared in March when Bank rate was increased to 4 per cent—or, in January, when on the conclusion of the Commonwealth Finance Ministers' meeting in London it was boldly decided to make the convertibility of sterling an early objective of exchange policy. From a spot rate of about $2.81 at the beginning of May the quotation of sterling in terms of the US dollar has fallen steadily to $2.78½. Commercial demand for dollars has been persistent and has tended to outstrip the demand for sterling in New York, which in the main has reflected the covering of the short position.

The dollar rate has thus returned very close to the point at which the normal commercial demand for dollars must in part be satisfied out of the reserve of the Exchange Equalisation Account.

So far, therefore, the return to credit discipline and exchange flexibility, the import cuts and the creation of confidence by the promise of convertibility, have failed to make any lasting impression on the foreign exchange market. There is, however, an all-important segment of that market in which the position has notably improved over the past six months—in the various rates for cheap sterling. When the foreign exchange market was reopened last December transferable sterling (which is not, of course, quoted in London) was at $2.40. It has since risen almost uninterruptedly to over $2.60. Over the same period security sterling has improved from $2.32 to $2.50, while the rate for bank notes in Zurich, the most active of the note markets, has risen from Frs. 10.32 to Frs. 11.22.

The most important of these rates is that for transferable sterling, since it provides the basis for the commodity shunting operations that make it possible for sterling held by non-residents to be converted eventually into dollars—at some sacrifice compared with the official rate. The extent to which the technique of commodity shunting has developed has, however, tended to produce its own corrective—for the time being, at least. The supplies of transferable sterling have tended to dry up. The reason why they are not being replenished lies chiefly in the fact that the European Payments Union mechanism ensures that any British deficit with Europe is now reflected, not in a rise in the volume of sterling held on European account, but in gold losses suffered by the Exchange Equalisation Account. It is not surprising, therefore, that the recent weakening in the spot rate for sterling in terms of dollars should have gone hand in hand with the strengthening of the various cheap rates for sterling. This movement, if it proceeds far enough, would ease the transition into what may be the next chapter in the exchange history of sterling, a phase in which the convertibility of non-resident currently earned sterling promised last January may become a reality—perhaps at the price of a divorce from the existing fixed parity with the dollar, but with the advantage of levelling all commercial rates for sterling.

Seven Months of Monetary Discipline



BRITAIN'S first moves in the return to orthodox monetary policy were made on November 7, 1951, less than a fortnight after the general election ; they were announced by Mr R. A. Butler in his maiden speech as Chancellor, after the close of business on that day.

In the opening phase, most of the emphasis was put upon a rapid re-creation of the mechanisms required for orthodox credit control, and upon quantitative restraint to be achieved partly by psychological shock, rather than upon increases in rates. Bank rate, unchanged at 2 per cent since the war loan conversion of 1932 (apart from its brief flutter to 4 per cent in 1939), was raised rather as a gesture than as a direct deterrent. The increase to 2½ per cent was accompanied, moreover, by a change in the prewar convention governing the rate most relevant to the money market—the rate at which discount houses holding "discount accounts" at the Bank could secure loans against approved collateral. Formerly, these loans, for a minimum period of seven days, were charged at ½ per cent over Bank rate ; but last November it was intimated that seven-day loans against Treasury bills would be charged 2 per cent (i.e., ½ per cent under Bank rate). Bank rate as such was to apply not only to the discount of approved bills but also to seven-day loans against either commercial bills or short bonds.

Much more significant, therefore, than the increase in Bank rate itself was the indication that the Bank's rate for market loans was likely—for the first time since before the war—to become effective, in the sense that the market would from time to time be driven to seek such accommodation. The operative change here was the fundamental one of withdrawing the facilities, made available to the market since the early phase of the war, for securing whatever finance it required by selling Treasury bills to the Bank's agent, the "special buyer," at the current (and in fact long-stabilised) level of market selling rates. The Bank indicated that in future the "special buyer" would operate only on official initiative, for strictly limited amounts, and at such rates as it deemed appropriate.

In principle, this change at once restored the traditional situation in which rates for marginal supplies of money and market rates for bills (and, in less degree, the Treasury bill tender rate) were bound to fluctuate according to the degree of ease or stringency resulting from the ebb and flow of demand, and the official tactics from day to day. The resultant rise in rates, doubtless influenced at the outset by consultation between the clearing banks and the authorities, was small ; as will be seen from the full table in *Records and Statistics*, it ranged from ¼ to ½ per cent. But a flexibility of rates, within fairly narrow limits, developed quickly.

These measures alone would doubtless have exerted a considerable psychological effect. But, in the absence of other measures, the direct effects in restraining the growth of credit would have been geared simply to the level of rates (and the willingness of the authorities to allow them to rise further), since the excessively liquid condition of the banks would have left them free to secure whatever additional cash they required by running down their bills or call loans and thereby causing the central bank to supply funds to the market. The funding operation designed to cut away the surplus of these liquid assets, and thereby to make the banks immediately sensitive to the orthodox pressures, was, therefore, an integral part of the plan. All holders of Treasury bills, tap as well as tender, were offered in exchange (for parcels with an average life not exceeding 60 days) 1¾ per cent. Serial Funding Stocks of one, two or three years life offering redemption yields of 1¼ per cent, 1½ per cent and 1¾ per cent respectively ; these were allotted in tranches of £450 million, £200 million and £350 million respectively —an aggregate of £1,000 million, of which the clearing banks took half and a large part of the remainder went to the overseas holders of sterling balances. The domestic effect was to reduce the aggregate of the banks' liquid assets—cash, call money and bills—from 39 per cent of

In the tradition of things well done

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

gross deposits to 32 per cent, and to raise the proportion of "risk assets"—investments and advances—from 55.7 per cent to 64.0 per cent. The position was thus brought sufficiently near to the conventional limits of tightness to make the banks feel that they ought to finance any additions to their advances at least in part by sales of investments.

Not content with these rapid moves towards a re-establishment of orthodox control, the authorities resorted also to exhortation. They urged the banks to toughen their advances policy and also to raise their advances rates—even though a revision begun in the summer to meet rising expenses was still incomplete, and despite the fact that the rise in bill rates was scarcely large enough to justify, by traditional rules, any further increase in loan charges. The banks responded by the unusual step of making a concerted announcement, at end-November, that bank credit would become both more difficult to obtain and more expensive. Their deposit rates had been raised forthwith, by $\frac{1}{4}$ per cent, to $\frac{3}{4}$ per cent.

The gilt-edged market, moderately resistant at first, took fright as the measures unfolded; it had to face heavy selling, partly from the banks, and was apprehensive of further selling both from them and from would-be borrowers disappointed by the banks. Industrials suffered similarly, partly through adjustment to the new interest basis and partly through actual and apprehended pressure of new issues, especially for the funding of bank advances. The steepness of the decline is shown in the accompanying table. In gilt-edged, the worst phase occurred in early December; at this stage, but at that alone, the authorities gave substantial support. One or two of the biggest discount houses also absorbed large lines of short bonds offered by the banks.

Thereafter, the City generally settled down in the new conditions; the banks were levering up their advances rates moderately, were scrutinising all new requests with great care, and were also seeking repayments in some instances. But this progress of the new policy, which by February had stabilised the level of advances to the private sector of the economy, did not seem to be throwing additional pressure upon the markets, and they gradually recovered their nerve. At this stage, indeed, it was being said that the authorities obviously wanted to avoid any violent rise in interest rates, partly for fear of political criticism of the resultant money cost to the Treasury. In the City, many wishful thinkers, hard hit by the first rise, were arguing that any further rise would be pointless. More thoughtful observers were beginning to wonder whether the authorities were, after all, half-hearted in their pursuit of orthodoxy.

These doubts were set at rest on budget day, when Bank rate was unexpectedly raised by the "crisis" step of $1\frac{1}{2}$ per cent, to 4 per cent, and the new special rate for seven-day loans against Treasury bills was raised correspondingly, to $3\frac{1}{2}$ per cent. The banks responded forthwith by raising their deposit allowances and their minimum rate for short loans to the money market against Treasury bills from $\frac{3}{4}$ per cent to 2 per cent, with the result that the Treasury bill allotment rate rose first by nearly 1 5/16 per cent to 2 5/16 per cent, and then to $2\frac{3}{8}$ per cent. The impact upon medium and long gilt-edged stocks was moderate and upon short bonds violent—because the banks at first raised their charges for money market loans against bond collateral by no less than $1\frac{3}{8}$ per cent, to $2\frac{3}{4}$ per cent. But, out of consideration for the difficulties of the discount market, they quickly dropped this rate to $2\frac{1}{2}$ per cent, and thereby stimulated a smart rally in gilt-edged.

After a short interval, the recovery in the mediums and longs was resumed, on the argument that the second move in monetary policy, unlike the first, ought not to put pressure on gilt-edged since it was not accompanied by any intensified pressure upon bank liquidity. On the contrary, seasonal factors and the narrowing of the external deficit were expanding Treasury borrowings and therefore augmenting the banks' liquid assets—a process that was accentuated at end-April, when the £150 million of Electricity stock was placed on terms that obliged the authorities to take up at least two-thirds themselves. By the date of the May make-up, these tendencies had restored the liquidity ratio to 32.9 per cent (compared with the low point of 31.6 per cent reached in April), despite the simultaneous steep decline in supplies of commercial bills. By the same date, the repayments of electricity advances (raised to over £121 million at end-March) had reduced the "risk assets" ratio to 64.8 per cent compared with 66.0 per cent at the peak and 55.7 per cent last October.

Given the Treasury's continuing need for domestic finance, this easing of the pattern of banking ratios cannot be corrected unless the authorities resort to funding loans or to determined sales of stock from departmental holdings. The gilt-edged market's belated recognition of this played a part in provoking last month's sharp break, when disappointing trade figures, the continuing deficit at EPU, and a relapse of sterling combined to demonstrate that the toughness of monetary policy would have to be at least maintained. This conclusion was in sharp contrast to the comfortable assumption widely made after the second increase in Bank rate—that the "next move would be downwards." Happily, there is no sign yet that the rigour of banking scrutiny of advances is easing—though it is noteworthy that the authorities recently deemed it necessary to reinforce new controls of hire purchase (requiring minimum down payments and maximum terms) by a "request" to the banks to reduce lendings for hire-purchase finance by 10 per cent by end-September. Meanwhile, the process of levering up rates for advances continues. The charge for the government-guaranteed advances to the nationalised boards is now 4 per cent (compared with 2 per cent twelve months ago); for high-grade industrial borrowers it is $4\frac{1}{2}$ per cent; and for other borrowers it is 5 per cent—or more.

Bank Profits Under Pressure

MUCH of the dust that was thrown up by last November's misunderstandings and misstatements about bank profits has now subsided. Some of those who greatly exaggerated the improvement in the banks' net revenues that would follow from the rise in Bank rate have now retracted, or, at least, have publicly recognised how heavily the accompanying fall in gilt-edged prices must have impinged upon inner reserves. The object of this article is not to track over this well-trodden ground, but to examine the banks' earnings problem in long term perspective and to explain why it seems inevitable that the upward trend of bank charges has still to reach its peak.

The banks faced a considerable earnings problem even in the early postwar years. At that time a central difficulty was that the expansion in deposits that had taken place since the 1930s had not been accompanied by an equivalent increase in the main earning assets. A high proportion of the new deposits was absorbed by borrowings by the Government, at rates then held down at around one-half of one per cent. In 1947 cash, money at call, Treasury deposit receipts and bills discounted absorbed well over one-half of the total deposits of the London clearing banks; in 1949 the proportion was still only a little less than one-half, and not until the funding of Treasury bills last November did it fall to its conventional prewar level of about one-third. With investments at about the same proportion of deposits as in prewar years, the proportion accounted for by advances, the most profitable earning asset was necessarily small for a time of boom. On the other side of the balance sheet, a large part of the new deposits was held in current accounts, which rose to two-thirds of total deposits, against rather more than one-half in prewar years; this meant that the banks had smaller outgoings on the interest allowed on credit balances, but it also caused an enlarged demand for cheque services, which grew ever more costly to provide.

Even before last November the pattern of this problem was being changed, chiefly because of the rise in advances. From less than one-fifth of total deposits in 1947, the proportion of advances has risen to approaching one-third, the average for the London clearing banks for 1951 being nearly 30 per cent. Then, following the funding of Treasury bills in November, investments rose from about one-quarter of total assets, at which level they had stood throughout the postwar years, to nearly one-third. Money market assets also became more remunerative following the rise in short money rates. As an offset to these increases in revenue, of course, the banks are now paying 2 per cent on deposit accounts, compared with ½ per cent before November.

These changes have radically altered the shape, if not the size, of the banks' earnings problem. It is true that, measured against the national income as well as in terms of bank balance sheet ratios, advances have still some way to go before they reach their relative prewar size, but the indications are that the road will not be followed to the end; certainly the expansion in advances in the near future is likely to be less than in the recent past. In these circumstances the picture is no longer likely to be one of a yearly rise in operating costs that is offset, in greater or less degree, by a yearly rise in the volume of earning assets. Emphasis has shifted instead, against a background of higher and more flexible rates but probably also of more stable balance sheet totals, to the traditional problem of earning a sufficient margin between the interest allowed on deposits and that received on assets. And it seems likely, for a number of reasons, that the rates differential will need not only to be wider than in prewar years, but also to be supported by increased service charges.

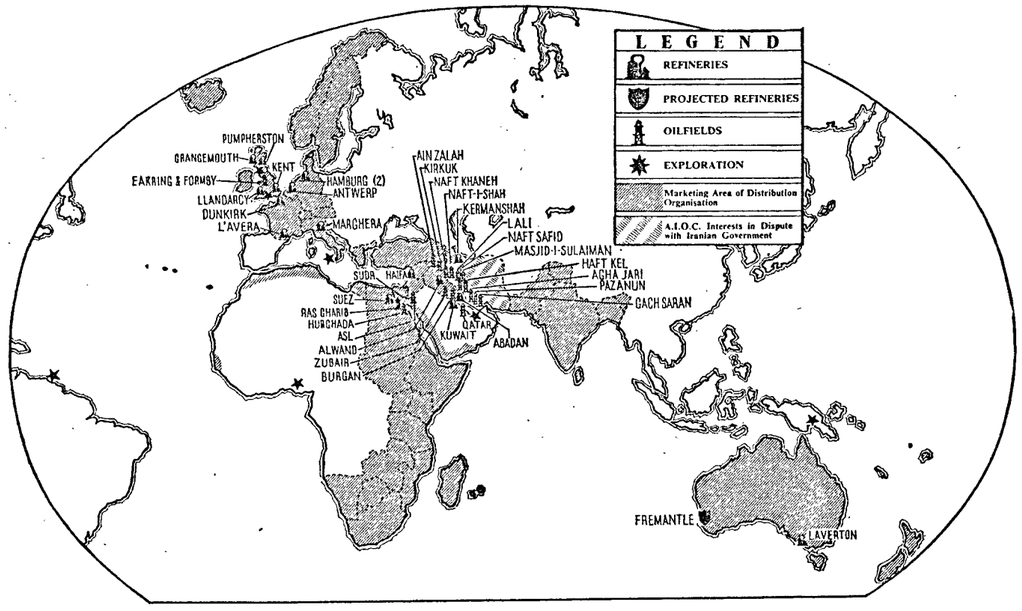
One reason for this is, of course, that banking resources are swollen to nearly three times the prewar level, and earnings must therefore help to provide for wide fluctuations in the value of risk assets. Losses from bad debts can no longer be expected to be so unusually modest as n the expansive period of the early postwar years, and the course of investment prices has for long added to the anxieties of bank managements. An average fall of 1 per cent in the market price of the clearing banks' investments would now lead to a draft of not much less than £20 million on inner reserves; aggregate book losses last year must have run into some tens of millions of pounds. It is true that the big clearing banks' investments are all in dated securities, with short-term stocks predominating, so that substantial recoveries may be expected as maturity dates are reached. Meanwhile, however, investments have to be written down to market values or lower for balance sheet purposes, and with a stable level of deposits, there is always the danger that liquidity ratios will have to be reinforced by sales of these investments at a loss.

Another reason why earnings need to be continuously strengthened is the relentless upward pressure on costs. It may be that expenditure on the restoration of war damaged buildings has passed its peak, but the same cannot be said about day-to-day requirements for stationery, premises, heating and lighting, transport, telephones, mechanised equipment, publicity and so on. More important still, the new salary scales recently introduced by all the principal English banks (which generally provide a much better standard of remuneration for younger employees, but have left many "over scale" men with only a trifling increase in total remuneration) are clearly not the last chapter in the long tale of necessary salary increases. In addition, pension costs continue to rise, and outlay on staff training, for senior men as well as new entrants, is still increasing.

Finally, certain miscellaneous sources of bank revenue have been diminishing for some time. In the early war years the banks' share in commissions on stock exchange transactions was reduced from one-half to one-third—for executor and trustee business, it fell to one-quarter—while the volume of stock exchange activity, and business in new capital issues, have not recovered their relative prewar importance. Some forms of overseas business especially dealings in foreign currencies, have also no provided revenue at the prewar level, and exchange control has added to the burden—and cost—of providing these services.

It is not surprising, in these circumstances, that the banks initiated a rise in advances' rates even before the change in monetary policy, and that they have since tried to establish a wider margin between charges and deposit rates than obtained during the years of cheap money. The rate allowed on deposits is now at a maximum of 2 per cent for 21 days' notice, or 2 per cent below Bank rate; previously the maximum was 1½ per cent below Bank rate and shorter notice was required. In addition, the banks have avoided any restoration of the allowances on credit balances on current account that were often offered before the war, especially outside London. Again, there have been instances of charges for advances at "one-and-a-half over Bank rate, minimum 5 per cent," or even higher, for customers who in prewar years would have borrowed at only one per cent over Bank rate. Even for borrowings by nationalised undertakings with a government guarantee, the rate has risen from 2 per cent last year to 4 per cent now; for ordinary commercial borrowers rates are necessarily higher, and for private individuals higher still.

The banks have sought to increase their revenue from service charges both by raising old rates and imposing new ones. From mid-1950, for example, the two largest banks introduced a scale of charges, applied on an inter-bank basis, for agency work on behalf of other banks; for many years previously the principal banks had acted for customers of the other banks without charge. During the past year the banks have applied charges for specific services such as night safe facilities, and one, at least, has levied a fee for items held in safe custody. Far more important, however, is the bread-and-butter charge for working an account. This is assessed in various ways. It may be in the form of a "free" cleared balance regularly held, or of a charge on debit turnover, or simply of a sum assessed on the work caused by the account; or these methods of charging may be combined. Where the charge is levied on turnover, it seems probable that the range is from the long-established 2s. 6d. per cent of turnover for comparatively small private accounts, to rates of a few pence per cent for large business undertakings, with possibly a point about midway (say, 1s. 6d. per cent) for medium-sized commercial accounts. Turnover charges of this kind are being applied more widely, particularly in London, whereas before the war they were confined, more or less, to provincial banking.



In contrast to these changes, one claim on banking profits has been stable: dividends to shareholders have shown no change for the past twenty years, following slight reductions for four out of the five large banks in the early 'thirties. Since then published reserve funds have been enlarged, and are now generally about as large as paid-up capital, but with the growth of deposits the banks' own funds represent a far smaller proportion of banking resources. At the end of 1938 paid-up capital and published reserves together accounted for over 6¼ per cent of net deposits of the London clearing banks, by 1945 the percentage was just half the prewar figure and by 1951 it had fallen to about 2½. If the banks, in view of these declining ratios, should some day seek to raise new capital on the market, the ordinary shareholder may have to be given a little more jam on his bread; but unless this happens—and the contingency still seems a remote one—the trend of costs and earnings, and of the strain upon reserves, suggests that the shareholder might be unwise to harbour hopes.

COMPANY MEETINGS

ANGLO-IRANIAN OIL COMPANY

ACCOUNTS REFLECT ABNORMAL TRADING CONDITIONS

NEW MIDDLE EAST AGREEMENTS

INCREASED SUPPLIES FROM OTHER SOURCES OFFSET IRANIAN CESSATION

SIR WILLIAM FRASER'S STATEMENT

The forty-third annual general meeting of the Anglo-Iranian Oil Company, Limited, will be held on June 26th at Britannic House, Finsbury Circus, London, E.C.

The following is the statement to stockholders by the chairman, Sir William Fraser, CBE, which has been circulated with the report and accounts for the year ended December 31, 1951:—

As the presentation of our annual report and accounts had to be postponed last year owing to the course of events in Iran, only six months have elapsed since my last statement to you.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The accounts for 1951 have been prepared in the same form and on the same basis as those for 1950, but figures in respect of current assets and liabilities in Iran have had to be estimated to a considerable extent. It should be borne in mind that during the second half of the period covered by these accounts trading conditions were abnormal.

The consolidated trading profit is £47,694,933, which compares with last year's profit of £81,300,622 and is after provision of £23,682,949 for depreciation on fixed assets, oil exploration interests and survey repairs of tankers. The corresponding provision in 1950 was £34,195,372.

The gross trading profit of £71,377,882 before making the above provision, compared with £115,495,994 last year, results from all of the widespread activities in which the company is interested.

Royalty payable to the Iranian Government for 1951 under the 1933 Convention amounts to £8,326,446. An amount of £9,500,000 has been placed to special contingencies account, which has been treated as allowable for United Kingdom taxation purposes. This account now stands at £49,987,440.

The item land, oil wells, pipe lines, refineries, tank installations and buildings in the consolidated balance sheet shows an increase of £8,534,047 compared with last year. This is largely due to expenditure on our refineries in this country.

Among current assets, the item stocks of crude oil, products, and receptacles, has increased by £6,682,499. This increase is due to a substantial rise in tonnage and in the freight content of the value of these stocks.

The item creditors, accrued expenses and current taxation has increased by £36,067,592 mainly owing to increased liability to UK taxation on the record profits of 1950. It will be noted that the forward estimate for UK taxation based on 1951 profits is £20,378,286, about half the corresponding figure for the previous year. Of the total of £101,621,069, taxation liabilities account for approximately £54 million.

After providing for taxation on profits from all sources, the amount available for reserves and dividends is £24,233,050, compared with £33,102,572 for 1950. Your directors have allocated £1 million to preference stock reserve, bringing the total to £9 million, and have placed £16 million to general reserve, which now stands at £81 million. They have recommended a final dividend of 25 per cent, less income tax, on the ordinary stock, making 30 per cent for the year.

Depreciation provided and amounts written off, as shown in the profit and loss account, added to the above allocation to reserves total £40,682,949.

The total capital expenditure of the group in 1951 was approximately £46,800,000.

Of this expenditure some £8 million was on account of our tanker fleet. The written down value of the fleet in service at December 31, 1951, was £5 14s. 0d. per deadweight ton, and the average age per deadweight ton of the vessels was just under nine years. While the cost per deadweight ton of building tankers varies according to the size of the vessel, an average figure is now of the order of £60.

THE COMPANY'S INTERESTS IN IRAN

In my statement to you last November I described the course of events which had so gravely injured the company's interests in Iran.

As then explained, the British Government had instituted proceedings in May, 1951, before the International Court of Justice at The Hague, on the ground that the company, a British national, had been treated in a manner not in accordance with the principles of international law, and that there existed a dispute between the two Governments.

Later, in response to a request from the British Government, the Court made an order indicating certain provisional measures which would apply pending the Court's final decision in the proceedings already instituted. While the British Government at once undertook to comply with these measures, the Iranian Government announced that it regarded the Order as invalid. At the end of September the former submitted the dispute to the Security Council of the United Nations, requesting the Council to call upon the Iranian Government to comply with the terms of the order.

The Iranian Government had disputed the jurisdiction of the International Court to deal with the case, and at the hearings before the Security Council similarly refused to recognise the council's competence. It will be recalled that the Security Council adjourned its debate until the International Court had ruled upon its own competence in the matter.

In October, 1951, the British Government submitted to the International Court documents dealing both with the merits of the case and with the question of jurisdiction. In February, 1952, the Iranian Government filed with the Court its "preliminary observations" regarding the Court's powers of jurisdiction. Following the receipt of observations and submissions from the British Government in regard to the Iranian Government document, the Court announced that the oral public hearings on the question of the Court's jurisdiction in the dispute would commence on May 6th; subsequently the Court postponed these hearings until June in response to a request from the Iranian Government for an adjournment for a month.

Towards the end of last year the International Bank for Reconstruction and Development approached the British and Iranian Governments and offered its good offices to assist in the settlement of the differences between them, both being members of the International Bank. In so doing the bank stated that it would avoid passing judgment on the merits of the controversy, and would be prepared to act only upon the invitation of both Iran and the United Kingdom. The two Governments accepted the bank's offer.

Subject to the agreement of the parties, the bank intended, in its role as a neutral and impartial institution, to set up for a limited period of time a temporary management for the operation of the oil properties which would be responsible to the bank; there was, however, no intention of the bank engaging in oil operations permanently or as a business venture. The aim would be to achieve agreement on a temporary arrangement (covering a period of two years or less) whereby efficient large-scale operations in South Iran might be restored, in the interests of Iran, the United Kingdom, and the bank's members as a whole, and in the hope of creating an atmosphere suitable for the negotiation of a final settlement.

Letters outlining this position, together with the bank's understanding of the main points on which an agreement could be based, were addressed by the bank to both Governments at the end of December, and it was made very clear that no steps would be taken which would compromise the legal rights of the parties. It was envisaged in the bank's proposals that the company would enter into an agreement with the bank to purchase oil on terms satisfactory to the parties, and that part of the proceeds of sale would be held by the bank, pending final settlement.

After a preliminary visit to Iran by representatives of the bank, a mission led by Mr R. L. Garner, vice-president of the bank, in February, 1952, visited first Tehran and then London for discussions with the Iranian and British Governments respectively. Representatives of the company were consulted by the bank on this and other occasions and readily supplied all such information as was requested. There followed a further phase of discussions in Tehran in March, 1952, after which a joint communiqué was issued by the Iranian Government and the International Bank indicating that no agreement had been reached on several important points.

The bank later published a detailed review of the negotiations, in which it was explained that the main unresolved issues were concerned with the status of the bank during the period of its operations in Iran, with the employment by the bank of British technicians and thirdly, with the price at which oil might be sold by the bank.

The Iranian Government had proposed that the bank should state that it was acting for Iran's account but, in its position as a neutral intermediary, the bank could not agree to any wording which could be construed as an acceptance by the bank of the legal position of one member and as a denial of the legal position of another. As regards technicians, the Iranian Government would not agree to the employment of British subjects, while the British Government could not accept discrimination against British nationals as such. In this connection the bank explained that the advice of the bank's oil con-

sultant and other leaders in the oil industry had been that under existing conditions the necessary qualified technicians would not be forthcoming for temporary operations, and that it would be necessary to draw on some of the company's personnel to form the integrated organisation that would be needed to attain large-scale production within two years. The bank also felt it would be inconsistent with the bank's international character to agree to exclude the nationals of any one member from an operation to be undertaken by the bank.

In the absence of agreement on these points, it will be realised that a basis for the operation of the industry did not exist.

In addition, as the bank statement explained, the question of prices at which oil would be purchased by the company was explored with the Iranian Government and no conclusion was reached. The bank finally stated that it had informed both the Iranian and British Governments that it stood ready, as in the past, to assist in working out any practicable suggestion offering a reasonable prospect of success.

MIDDLE EAST AGREEMENTS

Since I last addressed you, new agreements have been negotiated affecting the company's principal interests in the Middle East other than Iran.

Discussions between the Iraq Government and the Iraq Petroleum Company conducted during 1951 resulted in the signature by both parties on February 3, 1952, of a supplementary convention whereby profits from the operations within Iraq will be shared equally with the Iraq Government. This should provide Iraq with a large future revenue and the government has announced its intention of devoting the greater part thereof to plans for raising national living standards. The new agreement contains provisions to assist in the supply of cheap oil products within Iraq and to accelerate the progressive increase in the proportion of Iraqis employed in the industry. The agreement, after ratification by the Iraq Parliament, and the Royal Assent, is now in force.

In December last an agreement was concluded between the Iraq Government and our two wholly owned subsidiaries in Iraq, the Khanaqin and Rafidain Oil Companies, which has since received ratification and the Royal Assent. The Khanaqin Oil Company has hitherto produced and refined oil for internal consumption, the oil being marketed by the Rafidain Oil Company. By the new agreement our refinery plant at Alwand and internal oil distribution facilities have been sold to the Iraq Government, on whose behalf the Khanaqin Oil Company will operate the refinery and, until 1961, act as sole distribution agent. The Khanaqin Oil Company will continue its production and exploration activities in north east Iraq, and there will be an equal sharing between the government and the company of the profits arising in Iraq from export operations should sufficient oil be found.

A revision of the Kuwait Oil Company's concession agreement of 1934 has also been concluded. The Ruler of Kuwait will henceforth receive half the profits arising from the company's operations in Kuwait, which will assure him greatly increased revenues. The agreement thus follows what is now the pattern generally accepted for oil concession agreements in the Middle East. As a counterpart the concessionaires have received an extension of tenure of 17 years, making its duration 92 years from 1934; and a settlement has been reached regarding the seaward boundary of the concession area which was previously in doubt. These changes took effect from November 30th last. They have been accompanied by corporate changes in the structure of the concessionaire company. Our one-half interest in the concession has been assigned to a new AIOC subsidiary, the D'Arcy Kuwait Company, Limited; the Kuwait Oil Company, which we own equally with our American associates, continues to act as the operating company.

PRODUCTION AND EXPLORATION

Operations in the oilfields of Iran continued normally until June, 1951, except for a slight interruption due to a strike in April. In June production was cut back and in July was shut in as export had ceased and storage was full. Production amounted to 16,177,000 tons up to that time, about equivalent to the 1950 production rate. The only serious oilwell fire that we have experienced in 40 years occurred in May, 1951, when a large gas well at Naft Safid field caught fire. It was successfully capped after six weeks of tireless efforts by the British and Iranian staff under the guidance of an oilwell fire-fighting expert.

Turning to the crude oil at our disposal in 1951 outside Iran, we obtained from Kuwait 13,287,000 tons, nearly double the previous year's figure. At present our offtake from Kuwait is approaching the rate of 20 million tons per annum. The field has proved fully able to sustain the increase involved and further drilling has proved a significant northerly extension of the structure.

Our share of the Iraq Petroleum Company's production was 2,316,000 tons compared with 1,681,000 tons in 1950. Development drilling in Kirkuk by that company continued in preparation for the greatly increased offtake made possible by the commissioning in April this year of its new 30-inch pipeline to the Mediterranean. During the current year our share of this production is expected to be about 4 million tons, and about 5,500,000 tons in 1953.

The Mosul Petroleum Company has proceeded with development drilling in northwestern Iraq and it is hoped this company will commence export at the beginning of 1953.

In southern Iraq the Basrah Petroleum Company's production plant and pipeline to the shipping terminal at Fao have been completed and the first exports were made in December. The initial rate of production, in which we have a 23¾ per cent interest, is 2,200,000 tons a year, but a substantial increase is planned.

Our wholly owned subsidiary, the Khanaqin Oil Company, produced 437,000 tons from the Naft Khaneh field, against 384,000 in 1950. Drilling at Chiah Sourkh continued and a test to deeper levels is necessary before the value of this field is established.

Qatar also showed an increase in production; our share was 592,000 tons, compared with 380,000 in 1950, and this year is expected to be over 700,000 tons. This field yields crude oil of good quality and, as experience has shown that it can sustain a higher offtake, a further increase is planned by the interests involved.

Compared with 1950 there was a decrease during 1951 of 15,573,000 tons in the oil production at our disposal from Iran, and an increase of 6,820,000 tons from our share of production in Kuwait, Iraq and Qatar. During 1952 our supplies from these three sources are expected to be about 26 million tons, compared with 16,632,000 tons in 1951.

Our crude oil production in the United Kingdom was 45,100 tons. Output is being maintained by means of secondary recovery by water injection. An exploration well drilled at Ainsdale, Lancashire, to search for the lower source which is thought to be feeding our shallow field at Formby was unsuccessful, but test drilling continues.

In Scotland production of shale was 1,411,000 tons, yielding 104,500 tons of oil. Operations were affected by higher costs of coal, chemicals, pitwood and mining stores generally and by higher wages, but these were offset by an increase in the value of products.

Our exploration activities continue in various parts of the world. In Papua, where we work in partnership with American and Australian interests, two deep wells were drilled during the year and one gravity and three seismic exploration parties were active. Owing to complex geology and difficult working conditions in tropical forest, progress is slow.

In Nigeria, where we are partners with the Shell group, the first deep test well was started during the year. Three seismic and two gravity parties are operating there.

We have a holding in Trinidad Northern Areas, Limited, which during the year completed a test well at Mount Harris at 10,695 ft without result, and is now preparing to make a seismic survey of the Gulf of Paria.

Geological and geophysical work is being carried out in the concession areas which we hold in Sicily.

REFINING

In Iran, up to July, 1951, when our refining operations ceased, Abadan refinery had processed 12,188,000 tons of crude oil and the small Kermanshah refinery 70,000 tons since the beginning of the year.

In Iraq the Alwand refinery processed 430,000 tons, an increase of 46,000 tons on the previous year. The throughput of the Haifa refinery was 729,000 tons, mainly of Venezuelan oil. It is still impossible to operate this plant at its full capacity of 4 million tons a year on Iraqi crude oil, for which it was designed. The pipeline to Haifa remains closed.

The Kuwait topping plant, the prime purpose of which is to produce bunker fuel for tankers, dealt with 1,157,000 tons of crude oil.

In Great Britain, throughputs at Llandarcy and Grangemouth were greatly increased. Llandarcy refined 3,671,000 tons, against 2,634,000 tons in 1950, and towards the end of the year a rate of over 4 million tons per annum was attained. At Grangemouth the completion of important parts of the programme of modernisation enabled 1,512,000 tons to be processed compared with 657,000 tons in 1950; a new 1,500,000 tons per annum distillation unit was commissioned in March, 1951, and the new boiler house and power station came into service in April, raising the capacity of the refinery to 2,250,000 tons a year.

At Pumpherston refinery which operates on Scottish shale-oil and crude petroleum produced in the United Kingdom, throughput was 149,000 tons. Detergents produced at this refinery are finding an increasing market and new products are being developed.

The British Petroleum Chemicals Limited plant at Grangemouth, in which we are partners with The Distillers Company Limited, began production of commercial alcohol in May, 1951. The neighbouring plant of Forth Chemicals Limited, now under construction, is expected to commence the manufacture of styrene later this year.

Good progress has been made with construction of our Kent refinery, which it is hoped will start operations at half its eventual 4 million tons per annum capacity during this coming summer. Catalytic cracking units for the production of high-grade motor spirit are being installed at Kent, Grangemouth and Llandarcy refineries.

In France, L'Avera throughput was 1,814,000 tons, an increase of about 260,000 tons over 1950, and modifications of plant have enabled a current rate of 2 million tons per annum to be reached. At Dunkirk a new distillation unit of 1,500,000 tons capacity was commissioned in October last, which has brought the present total capacity of the refinery to 2 million tons per annum. In 1951 617,000 tons were refined.

At Porto Marghera in Italy the Industria Raffinazione Olii Minerali refinery dealt with 687,000 tons, an increase on 1950 of 126,000 tons. A new distillation unit commissioned in December has raised current throughput, which we expect to total 1,200,000 tons this year.

In Belgium the new Antwerp refinery, which we own jointly with the Petrofina Company, was successfully commissioned in October, 1951, and had processed 318,000 tons before the end of the year. Throughput during 1952 is expected to be 1,500,000 tons.

At Hamburg our Eurotank refinery throughput was 620,000 tons, some 270,000 tons higher than in 1950. In March, 1951, we extended our German interests by acquiring a majority holding in the Oelwerke Julius Schindler refinery at Hamburg, which handled 150,000 tons of crude oil during the year and includes plant for the production of lubricants; we are thus enabled to meet our German outlet more extensively from German refinery production.

In Australia, the Laverton plant of Commonwealth Oil Refineries treated 143,000 tons of crude oil in 1951. We have decided to build a new refinery at Kwinana, near Fremantle, which will have a capacity of 3 million tons a year.

PIPELINE AND SEA TRANSPORT

The commissioning in May, 1951, of the Finnart to Grangemouth pipeline across Scotland enabled the greater part of our crude oil supplies for Grangemouth refinery to be imported by this route.

In my last report I informed you that the British Tanker Company's fleet numbered 153 ships of 1,854,000 deadweight tons. Since then two old ships have been sold and four new 28,000-ton ships have been delivered, making the present total 155 ships of 1,950,000 deadweight tons. There remain under construction or on order 21 ships totalling 426,000 deadweight tons, comprising six steam turbine ships of 32,000 tons, 12 motor vessels of 16,000 tons, and three motor vessels of 14,000 tons. In addition, the keels have been laid of two of the ten 16,000-ton ships on order for the Lowland Tanker Company which will come into our service in due course.

We have on charter about 2 million deadweight tons of tanker shipping, more than half of which is fixed for several years ahead.

Although tankers are being built at a rate of about 2 million deadweight tons annually, more than half of them in British shipyards, the world tonnage has remained barely adequate to demand and consequently freight rates have remained high. Further substantial orders have, however, been placed, both in the United Kingdom and elsewhere, including many ships for comparatively early delivery.

DISTRIBUTION AND SALES

World demand for petroleum products increased by approximately 12 per cent in 1951 compared with the preceding year, this high rate of expansion having thus occurred for two years in succession. In meeting so striking an increase in world consumption despite the cessation of supplies from Iran at the end of June, the world oil industry has once again demonstrated the strength of its resources and the flexibility of its operations.

World market export prices f.o.b. for products and crude oil remained substantially unchanged during the year, but the increase in freight rates, and the impact on distribution expenses of the general rise in costs were reflected in increases in selling prices in the consuming markets. Moreover, petroleum products continue to be relied upon by governments to make heavier tax contributions to their revenues; such levies now constitute in many instances a major part of the price which the consumer pays.

During the first half of 1951 the expansion of our business continued, although the flow of our supplies was temporarily disturbed by a strike in Iran in April. After supplies from Iran had ceased in July we supplemented the fullest use of our own crude oil and refineries by hiring refining capacity and by purchases from other sources. The result was that our sales for the year declined only by some 2 million tons from the 1950 total of 38,500,000 tons, although events in Iran deprived us of some 15 million tons of supplies from that source.

Our largely increased supplies of crude oil from Kuwait, Iraq and Qatar, as already described, have more than offset the discontinuance of our crude oil exports from Iran. The increased supply of refined products from our own refineries and from processing arrangements made with other refiners cannot, however, meet our marketing requirements. We shall continue to supplement our own supplies of products by purchases where we can do so on satisfactory terms, thus using every endeavour to conserve both our goodwill and a sound trading position until such time as we have available supplies from our own resources sufficient to enable the company once again to go forward and expand its business as in the past. Profit margins on such purchases have suffered from the high rates of freight which have prevailed, and the extent to which this purchasing policy can be followed is governed by many factors and is constantly under review.

The refining section of this statement has described the progress made in providing new plants and in expanding throughput at others. An important addition to our available products will follow the commissioning later this year of the new refinery in Kent, which, with our other refineries in the United Kingdom and those in Belgium, France, Germany and Italy, will give us a large refining capacity in our Western marketing area. The problem of maintaining the supply of products has naturally been most troublesome in the case of our Eastern markets because of the long hauls involved, and every effort will be made to accelerate the construction of additional refining capacity to meet these Eastern requirements.

A major change took place during the year in the marketing of motor spirit in the United Kingdom, where schemes were introduced under which the service station or garage owner can, if he wishes, undertake to sell exclusively the motor spirit of one company, or, as in the case of the scheme operated by our marketing company, the motor spirit of a selected number of companies. Similar developments have taken place in Australia, New Zealand and South Africa. By the adoption of this method and by the closer co-operation with the dealer it is hoped to secure economies of distribution and to improve the standard of service to the motorist.

The sale of branded motor spirit in the United Kingdom is not yet permitted. It is to be hoped that economic conditions will soon prevail in which the consumer can be offered in the form of a premium grade the alternative of buying the higher quality product. In the United Kingdom the consumption of all petroleum products continued to expand and, including ships' bunkers, exceeded 20 million tons for 1951.

RESEARCH

Oil industry research problems have increased with the need for improved methods for locating new oilfields, and for refining with maximum efficiency a greater variety of crude oils than was the custom in the past. Our objectives in refining are to produce types of fuels and lubricating oils to meet all demands at competitive prices and to increase the range of products marketed by the company. A notable development in catalytic desulphurising processes is "autofining," a process pioneered to the pilot plant scale at our Sunbury research station and to the full scale plant at Llandarcy refinery.

The Geophysical Centre at Kirklington Hall has applied itself to the various instrumental problems that have arisen in the course of the geophysical surveys carried out by the company's staff. Of special interest has been the development of miniature seismic equipment, while good progress has been made in developing a borehole gravity-meter which will have important applications in geophysical prospecting. A study is being made of the possible effects which geological history may have on the type of crude oil found in a reservoir. This problem has a bearing on locating fresh reservoirs, and also on their control when being produced.

PERSONNEL

Our personnel overseas, at home and afloat have given devoted and zealous service. It is a matter of great regret that events in Iran have led to substantial reductions of staff. The directors are deeply conscious of the many problems of adjustment to home and family plans with which the staff have been confronted, and to meet this unfortunate situation special arrangements have been made.

I am sure that you will wish me on your behalf to express to all personnel our special appreciation of their loyalty and resource over a period characterised by major readjustments consequent upon the action of the Iranian Government.

W. T. HENLEY'S TELEGRAPH WORKS COMPANY, LIMITED

NEW ORDINARY SHARE ISSUE

The annual general meeting of this company was held on May 30th in London.

Sir Montague Hughman, the chairman, in the course of his speech, said: The year 1951 was a period of great activity in the Henley Organisation and our business continued to expand in almost every direction both at home and abroad. On January 1, 1952, the orders in hand for the group amounted to approximately £7 million against approximately £5 million a year earlier. While none of us can foretell what the rest of the year will show, for the first four months of 1952 turnover shows an increase over the corresponding period of last year.

We are carrying out our full share of rearmament work, which type of work naturally absorbs throughout the country large quantities of raw materials. During the last year the shortage of essential materials prevented us from carrying out many orders and that, unhappily, is still true. One of our worries is to finance our large and expanding business with prices of materials still reaching extraordinarily high figures, labour and overhead expenditure continuing to rise, and costs of replacing machinery and plant showing an enormous increase.

During 1951 we had a record turnover—and do not forget Henley started this business 115 years ago—and while some of this is due to the increased cost of materials, we showed an increase in volume output over 1950. I trust you will consider the results shown in

he accounts as satisfactory. All our subidiaries have made satisfactory profits and ıave paid good dividends.

Our business, particularly in the home narket, expanded substantially during the ear, but the margin of profit in some secions was rather narrower than we have btained in recent years. In our overseas usiness we have obtained an increased turnver, although its proportion to our total urnover is somewhat lower than in 1950.

FINANCE PROPOSALS

The developments which have taken place, nd which are still to take place, call for urther finance which your directors have ecided should be provided in permanent form. The Capital Issues Committee's consent has been obtained to an issue of 3,250,000 new ordinary shares of 5s. each which will be offered in the first instance to the holders of the existing ordinary stock at the close of business on May 19, 1952, in the proportion of one new share for 10s. of ordinary stock. I anticipate that in the absence of unforeseen circumstances the company will be able to maintain, on the capital as increased by the issue of shares now offered, the same rate of dividend and bonus for the year 1952 as you have received in 1951 on the then smaller capital.

Your directors have also had under consideration the advisability of bringing the issued capital of the company more into line with the actual value and earning capacity of the assets employed. In this connection the Capital Issues Committee's consent has been obtained to the capitalisation of £2,437,500 of reserves which will be applied in paying up in full 9,750,000 unissued ordinary shares of 5s. each for distribution among the ordinary stockholders on the basis of one 5s. ordinary share for each ordinary stock unit of 5s. then held.

In the near future a further meeting of stockholders will be called to authorise the increase in the capital of the company necessary to put this decision into effect and to approve the proposed capitalisation of reserves.

The report was adopted.

THE UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

CONTINUED SERIOUS INCREASE IN OPERATING COSTS

SIR F. VERNON THOMSON'S SPEECH

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held on June 5th in London. Sir F. Vernon Thomson, Bt, GBE, who presided, said:—

ACCOUNTS

The report of the directors with the audited accounts of the Union-Castle Company, and of the Union-Castle Group, for the year ended December 31, 1951, now submitted, together set out the position of both clearly.

The net profit of the Group exceeded that for 1950 by about £204,000. This was due primarily to a marked increase in the profits of one of the company's subsidiaries, King Line, Limited, which, as members will be aware, owns a fleet of cargo ships engaged in general trading, and accordingly benefited from the improvement in world trade in 1951 and the higher world market rates of freight.

The net profit of the Union-Castle Company itself for the year 1951, after providing for debenture interest, depreciation, taxation, etc., amounted to £1,287,926, that is approximately £190,000 less than for the preceding year.

INORDINATELY HIGH COSTS

The company's revenue from passenger and cargo traffic was substantially higher than for 1950, but this was more than offset by the continued serious increase in operating costs throughout 1951. The voyage costs of the company's vessels, which increased by more than £1,200,000 in 1950, compared with the preceding year, increased by a further £2 million in 1951. Every item of expenditure incurred in operating our vessels cost more during the past year and especially oil fuel. These rising costs, which have to some extent been masked by the earnings from increased carryings during the last few years, cannot be borne and absorbed indefinitely by the company without effect upon rates of freight and passenger fares.

The rates of freight charged on cargoes carried to and from the Union of South Africa are fixed by an agreement with the Union Government. Moderate increases were agreed by that Government operative from July 1, 1951, but already the benefit of these has been more than neutralised by further rise in costs.

Further substantial increases also in the cost of new tonnage add to what was already a very grave problem. To maintain the company's service at its high standards of efficiency and regularity, it is essential to replace older vessels from time to time, but shipbuilding prices have reached such a high level (double those of even 1945) that only urgent need would warrant the economic risk involved in ordering new passenger tonnage for the company's services at present rates of freight and passage money. Thus to replace one of our mailships now would cost well over £5 million.

It is plain that the Inland Revenue allowance in assessing income tax liability, based as it is on the original cost and not upon replacement cost, is by itself quite inadequate to finance the construction of replacement tonnage at current high costs. If this state of affairs continues for a protracted period it must lead inevitably to the diminution of the British mercantile marine. To my mind, this would be disastrous nationally. This is proven by the experience of two world wars. Whilst recognising that this is undoubtedly a difficult problem, I would again urge that amounts reserved for the construction of replacement tonnage during this period of inordinately high shipbuilding costs (so largely due to inflation or depreciation of currency) should not be taxed if they are so utilized in rebuilding the mercantile marine. An arrangement of this nature is already in operation in the Scandinavian countries. In the absence of such tax adjustment we must try to safeguard the company during these times by putting to reserve what we can for replacement tonnage. The average dividend upon the ordinary stock for the past 10 years has been 7½ per cent. As stated on previous occasions, it is essential that a substantial part of the company's earnings, already depleted by taxation, should be retained in the business. Only thus have we been able since the war to rebuild our fleet to its present size and efficiency, and only thus can we hope to obtain essential revenue and to maintain the standard of service which we aim to provide for our passengers, shippers, and the overseas territories the company serves.

In accordance with this policy, we have again transferred the sum of £1 million to general reserve.

We have also transferred the sum of £50,000 to staff provident account.

After payment of the preference dividends and the proposed dividend of 12½ per cent on the ordinary stock, the balance carried forward is approximately £1,900,000, as compared with £1,925,000 brought forward from 1950.

CAPITALISATION OF RESERVES

At an extraordinary general meeting to follow this meeting, it will be proposed that £2,740,000 of the company's reserves be capitalised and distributed to the ordinary stockholders as ordinary shares on the basis of one ordinary share of £1 for each £1 ordinary stock held at the close of business on May 21, 1952. The new shares will forthwith upon issue be converted into ordinary stock.

The accounts before you today show that the actual capital employed in the company's business is far in excess of its issued capital, even on the basis of the existing book values of the company's fixed assets, which are valued very conservatively. The board has decided that the time has now come to bring the issued capital of the company more into line with the capital actually employed in the business. The capital employed in the business has been augmented substantially during the past seven or eight years by ploughing back a large part of our earnings and investing it in essential new tonnage upon which, from the end of the war to December 31,1951, we have spent over £16 million. This capitalisation of part of the reserves will but recognise existing facts, since so large a part of the reserves is already invested in ships.

In connection with these capitalisation proposals, may I say that it would not be prudent to expect the same rate per cent of dividend to be maintained after the ordinary capital has been doubled. Accordingly if a holder sold any of the new stock which will be issued to him he would be disposing of part of his existing proportionate interest in the assets of the company, and correspondingly his expectation of future dividend.

FLEET

The company's fleet has been maintained in a highly efficient state and happily was operated throughout the year without serious accident.

MAIL SERVICE

The frequency and regularity of the company's weekly mail service between Southampton and Cape Town throughout the years compares favourably with that provided over a similar distance between any two countries in the world, and although its continued maintenance and regularity year after year have come to be accepted as a commonplace, it is in fact an outstandingly fine service of which we may well be proud, and the more especially in view of the many difficulties which impede the successful operation of regular liner services today.

NEW TONNAGE

The delivery of the *Kenya Castle*, which we had hoped would be made before the end of 1951, was unfortunately delayed until February this year by a trade dispute between those engaged on her construction. It had been our original intention to sail her in the Round Africa Service early in January, but it was not possible to fit her into this service subsequently until the end of March. She was accordingly utilised for a cruise in the interim, which proved most acceptable to the passengers.

The third vessel of this class was successfully launched at Belfast on April 24, 1952, when she was named *Braemar Castle* by Mrs Geyer, wife of His Excellency the High Commissioner for the Union of South Africa. It is hoped that this vessel will be delivered in November, 1952.

To supplement the company's cargo tonnage, orders were placed with Messrs. Harland and Wolff, Limited, for two general cargo vessels, each of about 7,300 gross register tons. It is expected that these vessels will be delivered in December, 1953, and February, 1954, respectively. They will be named *Tantallon Castle* and *Tintagel Castle.*

PASSENGER AND CARGO TRAFFIC

There was a gratifying increase in the number of passengers carried outwards and coastwise by the company's vessels in 1951, but the numbers travelling homewards from South Africa fell slightly. As a result of the increased accommodation available in our Round Africa vessels, the passenger traffic to and from East Africa was again higher than for the preceding year.

Cargo traffic outwards and homewards showed an improvement in almost all the trades in which our vessels are engaged.

It is by no means certain that the volume of passenger and cargo traffic carried by the company's vessels in 1951 will be maintained. The imposition of stricter limitation of imports into the Union of South Africa, to assist in the balance of payments position, is already having its effect in reducing the volume of outward cargo offering.

PORT CONGESTION

Congestion at a number of South and East African ports recurred in 1951 and in some cases has continued ever since. At certain ports it has been more severe than ever before, entailing very serious and expensive delays to a large number of vessels, including many belonging to this company. The problem continues to receive the urgent attention of the Governments of the respective territories, together with the various authorities more immediately concerned, but in some cases it is clearly a problem which can only be finally solved by a long-term programme of port development and increased transport facilities between the coast and inland centres. In the meantime curtailment of the number of vessels calling and the volume of cargo passing through the congested ports is unfortunately essential in order to alleviate the grave situation which has arisen.

BOARD

It was with regret that the board of directors received from Mr C. L. Dalziel his resignation to take effect from December 31st last. Mr Dalziel had served on the board for fifteen years and his colleagues greatly valued this association. Unhappily Sir William Clark has also found it necessary to tender his resignation for reasons of health, to the regret of his colleagues.

To fill the two vacancies which thus arose, Sir George Erskine, CBE, and Mr F. C. Howard have been co-opted to the board. In accordance with the articles of association they retire at this meeting and offer themselves for re-election. I feel certain that the company will benefit greatly from the addition of these two distinguished gentlemen to the board.

OUTLOOK

In some respects the situation in the trades in which we are engaged is more difficult today than at any time since the war, but even so I think we can look forward to a satisfactory demand for the services which we provide.

STAFF

The company's staff have carried out their duties loyally and with zeal, and I wish to take this opportunity of expressing, on behalf of the board, our appreciation of the good service rendered by the company's personnel, ashore and afloat.

The report and accounts were adopted and the retiring directors were re-elected.

At an extraordinary general meeting held immediately after the annual general meeting, resolutions were passed increasing the capital of the company to £10 million, converting the unissued preference shares into ordinary shares, authorising the capitalisation of reserves and the issue to the ordinary stockholders of one new ordinary share for every £1 of ordinary stock held, and altering the articles of association.

The proceedings terminated with a vote of thanks to the chairman and directors.

LISBON ELECTRIC TRAMWAYS

RECORD PASSENGER TRAFFIC

The annual general meeting of Lisbon Electric Tramways, Limited, will be held on June 25th, in London.

The following is an extract from the circulated statement of the chairman, the Rt Hon Sir Hugh O'Neill, Bart, PC, MP.

Another record has been established in the number of passengers carried by the company's vehicles during 1951. Compared with 1950 the increase in passengers was over six millions or 2 per cent, a total of 314,133,521 having been reached.

The mileage run by our tramcars and elevators increased by 337,301 and by our buses 945,928, giving an additional mileage of 1,283,229 or 5.8 per cent. The total number of miles run by all our vehicles was 23,315,998.

The additional number of passengers carried has resulted in increased revenue but this has been offset by increased cost of operation due to additional mileage run, a wage increase to our workpeople, and to the advance in the cost of practically all materials necessary for the maintenance of our system.

The final result of the year's operations shows a net profit of £63,520 after providing for all charges including general and depreciation reserve, a decrease of £6,870 compared with 1950. This profit, together with the balance brought forward from last year, gives a total of £113,512. The preference dividend and the ordinary dividend of 5 per cent net for the year absorb £60,957, leaving a balance of £52,555 to carry forward to 1952.

Generally Portugal continues to benefit from the peaceful programme and prosperous years resulting from the administration of H. E. Dr Oliveira Salazar.

The report was adopted.

P. & O. STEAM NAVIGATION COMPANY

IMPROVED RESULTS

The one hundred-and-twelfth annual meeting of this company was held on June 4th in London.

Sir William Crawford Currie, GBE, the chairman, referred to the increase of £2,296,259 in the company's deferred stock, which had been issued to deferred stockholders during the year, and to the difficulty of providing for fleet replacement out of profits which were subject to crippling taxation.

The accounts of the group for the past financial year showed, he said, a considerable improvement over 1950 due chiefly to the heavy world demand for shipping and to the absence of any reconditioning expenditure. The normal depreciation charge, including relief from income tax in respect of initial allowances, absorbed nearly one half of the total operating profit. If the company was to survive, its ships had to be renewed out of earnings. The report showed that amounts set aside for depreciation and to reserves of all kinds in 1951, amounted to slightly less than was required for one year's normal replacement purposes. There was thus no cause for complacency or for saying that shipping profits were abnormally high.

FINANCING COMMITMENTS

The group's net current assets were £5 million short of the amount required to finance present commitments without making any allowance for necessary working capital. There would, of course, be additional cash accumulations before it was necessary to meet liabilities for ships not yet laid down, though what they would amount to must be problematical.

The situation was not quite easily summarised, however. Although not evident from the group accounts, five companies with commitments of over £18 million would require, in order to finance those commitments, not only their present resources but almost the whole of their probable future profits of the next few years after allowing for taxation and dividends at the present level. It should therefore be emphasised that the sums placed to reserve by the group, far from being excessive, were barely adequate for the maintenance of its business.

The excess profits levy, as an additional tax on industry, was bad, and for the shipping industry could produce only one result—a reduction in the tonnage that could be built to replace the old. The industry welcomed the Chancellor's proposals for the removal of the worst inequities of the levy.

THE FUTURE

There was undoubtedly at present a recession in the freight market as compared with a year ago, and unfortunately expenses had not receded, but had increased, except for Suez Canal dues, which had been reduced as from September 15th last by 6d. per ton. That was a useful reduction in the cost of a round voyage to the East or Australia and back, and showed that the Suez Canal Board were not unmindful of the interests of their clients.

While it would not be wise to attempt to prophesy, he would be lacking in candour if he omitted to say that he did not expect the results of the current year to be as satisfactory as those for 1951. The peak had passed. Tonnage was no longer in such great demand; various countries were reducing their imports and there would be more competition, in the main from their former enemies, Japan, Germany and Italy.

The report was adopted.

61ST ANNUAL GENERAL MEETING—JUNE 27, 1952

PRINCIPAL POINTS OF INTEREST IN THE ANNUAL REPORT ON 1951

The year 1951 again showed record activities in all phases of operations of the Royal Dutch-Shell Group.

Production by Group companies of crude oil and natural gasoline, inclusive of quantities available under long-term contracts, amounted to more than 12 per cent of world production in the year 1951.

Crude production of 549 million barrels compared with 455 million barrels in 1950, an increase of some 17 per cent. The level of production in 1951 was double that of 1946.

The amount of crude oil processed in Group refineries at 558 million barrels in 1951 was more than 20 per cent higher than last year and more than double the level attained in 1946.

Because of extensions and new construction completed during the year the total throughput of Group refineries in Europe was 47 per cent higher than in the previous year.

The total tanker tonnage controlled by the Group and Eagle Oil and Shipping Company, Limited, including chartered tonnage, reached the figure of 6,250,000 d.w.t., representing about 21 per cent of world tanker tonnage. Of this amount 2,500,000 tons are owned by the Group and Eagle Oil.

In addition to tanker tonnage already on order the Group, early in 1952, placed orders for 28 tankers with a total tonnage of over 600,000 d.w.t. to be delivered by the end of 1956 or shortly thereafter.

The net profit of the Royal Dutch Petroleum Company for 1951 at fls 127,034,126.61 as against fls 111,220,805.87 for the year 1950, makes it possible to pay a dividend of 4 per cent on the preference share capital of fls 1,500,000 and 13 per cent in cash on the ordinary share capital of fls 917,432,000 outstanding on December 31, 1951, 4 per cent of which was made payable as an interim dividend on February 7, 1952. In addition, 2 per cent on the ordinary share capital is made available, largely from the undistributed balance of profit, in the form of a stock dividend.

The Annual Report again shows financial figures covering the main companies through which the Royal Dutch-Shell Group operates in various parts of the world.

After deducting all charges—including exploration, depreciation (including additional depreciation of £22,053,608 against £7,059,696 in 1950), taxation and miscellaneous appropriations for the purposes of individual companies—the net income for the year available for Group Appropriations was £66,216,204 (1950: £50,994,529). From this sum dividends have been or will be paid in respect of the year 1951, to the parent companies namely Royal Dutch Petroleum Company and The "Shell" Transport and Trading Company, Limited, of £19,057,327 (for 1950: £16,283,382). The balance has been retained in the business.

Copies of the full report and accounts can be obtained free of charge by anyone interested from Messrs N. M. Rothschild and Sons, New Court, St. Swithin's Lane, London, E.C.4.

DE BEERS CONSOLIDATED MINES, LIMITED

(Incorporated in the Union of South Africa)

UNABATED DEMAND FOR DIAMONDS

SIR ERNEST OPPENHEIMER ON DISCRIMINATORY TAXATION

The sixty-fourth ordinary general meeting of De Beers Consolidated Mines, Limited (Incorporated in the Union of South Africa), was held on June 4th in Kimberley.

Sir Ernest Oppenheimer, the chairman, in the course of his speech, said:—The year under review has been an exceptionally prosperous one for the diamond industry. The demand for both gem and industrial stones continued unabated throughout the year and record sales totalling £65 million have been effected, which compares with £51 million for 1950. Since the close of the year, this demand has continued and up to May 31st £32,856,000 have been sold, made up of £21,057,000 of gem diamonds and £11,799,000 of industrials.

The accounts show that your company has shared in this prosperity and the gross profit for the year, before allowing for taxation and other appropriations, amounted to the record figure of £12,938,000, compared with £10,380,000 in 1950.

SATISFACTORY CASH POSITION

The balance sheet discloses a very satisfactory cash position, current assets, including the loan to De Beers Industrial Corporation (since repaid) exceeding current liabilities by £8,500,000.

The profit and loss account shows that almost half of our revenue was derived from interest and dividends on investments. After allowing for dividends received on our shareholdings in the Consolidated Diamond Mines of South-West Africa, Limited, and the Diamond Corporation, Limited, a substantial amount accrued to us from sources not connected in any way with the diamond trade. We have every reason to believe that these sources of revenue will steadily increase.

TAXATION BURDEN

The Hon. Minister of Finance has decided to increase our taxation to 9s. in the £1. We realise that large sums are required for defence in these difficult and dangerous times, and that everyone must be called upon to make the fullest contribution to the revenue of the country, and under the circumstances we accept the increased taxation as a temporary measure.

I have been connected with the diamond trade for more than 50 years. It is my privilege to have been chairman of your company for the last 26 years, a period which covers the greatest and longest depression in the diamond trade, as well as the recent prosperous period.

I am convinced that the principle of discriminatory taxation is neither justified nor fair to the diamond producing companies. In asserting this principle, I have in mind the vicissitudes of the diamond trade, the large contributions to the state's revenue made in prosperous times, and the efforts made by this company and its associates during good years to put the industry on a sound financial basis. Moreover, discriminatory taxation is against the best economic interests of our country, because it makes the re-opening of old mines more hazardous and the prospecting for diamonds and the equipping of new mines much less attractive.

MR HAVENGA'S VIEW

The vicissitudes to which the diamond trade is exposed can best be described by quoting Mr Havenga's own words. During the prolonged and severe depression in the 1930s, many of the leading personalities connected with the industry were so doubtful about its eventual recovery that they retired from the business. The Minister of Finance (Mr Havenga) also had his misgivings. In presenting his budget in 1937 he proposed that the revenue from diamond export duty should be credited to loan account and not revenue as under the latter heading, owing to its variability, it was a source of embarrassment rather than strength. He also said:

"During every depression the public is inclined to think that matters will never improve again; during periods of prosperity they forget the lean years ahead."

It would appear that the Revenue Authorities have forgotten this wise counsel when they selected the diamond mining companies for discriminatory taxation simply because for the time being these companies are prosperous.

CONTRIBUTIONS TO STATE REVENUE

An important point to consider is whether the diamond companies, as a group, have made fair contributions to the revenue of the state.

For the ten years ended 1941, which covered the period of the severe crisis in the early 1930s, when small profits were made and no dividends were paid, taxation amounted to £1,482,504. For the next ten years which ended with the year 1951, the diamond companies paid the considerable total of £36,621,755 to the Union Treasury. In addition to these amounts, over the ten years ended 1951 the United Kingdom received £11,428,207 and the South-West Administration £4,493,851, or a total of £52,543,813, was paid in taxation during the ten years, exclusive of the 10 per cent export duty paid by the diamond mining companies.

Turning now to the efforts made to place the trade in a sound financial position, we learned, during the depression of the 1930s, that large cash resources are essential for the stability of the trade. In the following ten years, when conditions were prosperous, as a group of companies, we observed a conservative dividend policy, which has resulted in the creation of reserves adequate for the protection of the diamond trade, thus ensuring that we can carry on our mining operations without interruption and that the selling and trading organisations need not have recourse to the banks for financial aid in quiet times.

EXAMPLES OF DISCRIMINATION

I said earlier that discriminatory taxation was against the best economic interests of the country, as it destroys initiative and discourages the financing of new enterprises. I will quote two examples:

First, the Jagersfontein Mine. At December 31, 1951, capital expenditure incurred by your company on re-equipping the Jagersfontein Mine amounted to £1,640,000. Over the period 1946 to 1951, inclusive, working expenditure accounted for a further £1,849,000 or a total of £3,489,000. Since the resumption of mining operations, proceeds of sales of diamonds by the company has brought in £2,472,000, leaving a deficit of £1,017,000 yet to be recouped. Our technical advisers inform us that the life of the Jagersfontein Mine is unlikely to exceed five years. With taxation at 9s. in the £, it is doubtful whether the money laid out on re-equipping and operating the mine will be recovered and there will certainly be no return on the capital invested.

THE PREMIER MINE

The second example concerns the Premier Mine. The capital spent to date on re-equipment totalled over £4 million and our consulting engineers have prepared a statement of the annual profits that can be expected. The figures are:

	£
Revenue—at present prices	2,700,000
Less production costs	1,375,000
Working Profit	1,325,000
Less 60% — Government's share	795,000
Balance	£530,000
From which Income Tax at 9s. in the £ deducted	238,500
Leaving a distributable profit of	291,500

which is clearly an inadequate return on the capital invested in the mine.

During the past year or two, your company has been engaged in an active programme of prospecting and sampling at De Beers Mine and Kamfersdam Mine, situated at Kimberley, and at Koffiefontein Mine in the Orange Free State, with the intention of reopening one or more of these mines if payable values were disclosed. We had always hoped to be able to reopen the Koffiefontein Mine in substitution for Jagersfontein when the latter ceases operations, but with the present high rate of taxation, unless the results of sampling indicate very much higher values than can reasonably be expected, it is clear that your directors would not be justified in incurring the heavy capital expenditure necessary to bring the mine to production, whilst in the case of Kamfersdam we have decided to abandon further prospecting work.

THE OUTLOOK

Shareholders will be interested to have some idea of the future trend of the diamond trade. In my opinion 1952 will be another prosperous year, as the combined gem and industrial sales of £32,856,000 for the first five months have indicated. It is pleasing to report that the industrial diamond business is steadily expanding providing an additional stabilising factor to the diamond trade as a whole. There are, however, tangible signs that the excessive boom conditions are abating, one indication being the drop in prices in the so-called "free market" to levels closer to our own selling rates.

Boom conditions cannot continue indefinitely, and shareholders should be prepared for quieter times but with this difference—they can rest assured in the knowledge that the financial resources of our group will be employed as a stabilising influence in countering any market recession which may lie ahead, and in mitigating or altogether avoiding a recurrence of the disastrous circumstances and vicissitudes experienced by the diamond trade in years past.

The report was adopted.

CITY DEEP LIMITED

FACTORS AFFECTING RESULTS

MR G. V. R. RICHDALE ON ENCOURAGING PROSPECTS

The fifty-first annual general meeting of shareholders of City Deep, Limited, was held on May 28th, in Johannesburg. Mr G. V. R. Richdale, chairman, presided, and said: The net profit in 1951 at £1,090,038 was £379,350 lower than in the previous year. This fact, coupled with the serious decline which has taken place in recent monthly profit declarations, has no doubt been a cause of disappointment for shareholders, as it has been for your board.

When seeking the reasons for this deterioration of the profit position two main factors must be taken into consideration, lower gold recovery and the upward trend of working costs. Until the series of sub-decline shafts which are being sunk from the 45th level of the mine on the 8,500-ft horizon are in commission it is necessary to draw a greater proportion than usual of the ore for the mills from the lower-grade South and Main Reefs in the upper levels of the mine, which naturally has an adverse effect on gold recovery. Furthermore, as was forecast at the annual meeting last year, increased development in this upper area has resulted in a reduction in the average grade of ore developed. Shortages of steel and cement during 1951 retarded operations in these sub-incline shafts, and as a consequence it is unlikely that they will be sufficiently advanced before 1954 materially to affect the tonnage reaching the mill from the Main Reef Leader in the lower levels. It is hoped, however, that when full-scale stoping operations can be undertaken from them the average grade of ore mined will show an improvement.

STEADILY RISING COSTS

It is unfortunate that during this difficult transitional stage, while these plans for the development of the mine in depth are being implemented, your company should be called upon to face steadily rising costs. Working costs, which amounted to 39s. 2d. per ton milled in 1950, rose by 2s. 9d. to 41s. 11d. per ton milled in 1951, the advance being due partly to further increases in wages and benefits to employees, and partly to a sharp rise in the cost of stores.

While dealing with the question of costs, I would like to draw the attention of shareholders to the fact that approximately 35 per cent of sloping operations in the mine is carried out by the resue method which, while it increases appreciably the grade of ore sent to the mill, results in higher working costs. This point should be borne in mind when comparing the company's level of mining costs with that of other mines, and it should be understood that while the adoption of open stoping methods throughout the City Deep would reduce working costs per ton milled it would also result in a considerably lower average grade and on balance a reduced working profit. I may add that it is only in Main Reef Leader stopes that conditions are suitable for this method of mining.

DEVELOPMENT

The total footage developed during the year at 54,883 ft was 4,837 ft less than the figure for 1950. The footage sampled was slightly greater than in the previous year, although due to the fact that, as I have explained, a greater proportion than usual of the total development was carried out on the lower grade South and Main Reefs in the upper levels of the mine, only 8,250 ft or 32.8 per cent were classed as payable compared with 11,925 ft, or 48.1 per cent, in 1950, while the average value of payable disclosures fell from 15.9 dwt over 24 ins to 14.2 dwt over 23 ins.

It would be misleading to attach undue significance to the decreases in the footage developed and in the percentage payability. Nevertheless, these factors are in these days of rising costs, and consequently higher pay limits, a clear indication of the necessity for pressing forward with all possible speed with the opening-up of the lower levels of the mines where it is expected that the average grade will be higher. In this connection it is satisfactory to know that the relatively small amount of development so far carried out in this area has disclosed some encouraging values which tend to confirm our hopes of a better average grade in future.

POWER SHORTAGE

In common with the majority of gold-mining companies, City Deep experienced during the year a severe decline in the supply of non-European labour, which is becoming an increasingly difficult problem exercising the active attention of the industry as a whole more now than ever before. The shortage of electric power on the Witwatersrand, which is likely to continue for the next few years, is another factor which tends to increase the difficulties of maintaining profits at the 1950 level. In spite of every effort to decrease its requirements during peak periods, your company's mine suffered many power cuts during 1951 and any further deterioration in the position will inevitably prove detrimental to production.

CAPITAL EXPENDITURE

It was expected that capital expenditure incurred during 1951 would be of the order of £650,000. Owing to shortages of steel and cement, to which I have already referred, the amount actually spent on capital equipment was only £211,306, most of this sum being incurred in connection with the deep level sub-incline shafts and the extension of the City reduction plant. Capital receipts from sales of freehold reduced this sum to a net figure of £193,403, to which was added £27,985 as an adjustment to the cost of the acquisition of the Nourse Mines, Limited, property, bringing the net capital expenditure for the year to £221,388. Capital funds on hand at December 31, 1950, amounted to £181,924 and were therefore exhausted during the year, the balance of £39,464 expenditure on capital account being appropriated from profits.

Capital expenditure during the current year is likely to be of the order of £360,000. The full capital programme, which includes the provision in due course of additional cooling plant to enable stoping operations to be carried out in the new deep level areas of the mine, will continue to be financed from profits. In the light of the much lower level at which these profits are now running, however, it is clear that this can only be done at the expense of the dividend position, which must be subjected to substantial encroachment during the next few years. The situation is temporarily difficult, but at the same time it contains many signs of encouragement for the future. Once the present transitional stage has been completed the grade position may be expected to improve, while the heaviest incidence of the capital expenditure programme will have passed. The prospects for the future prosperity of your mine should then be good.

The report was adopted.

THE BRITISH SOUTH AFRICA COMPANY

SIR DOUGAL MALCOLM ON THE IMPROVED RESULTS

The annual meeting of The British South Africa Company was held on May 29th in London.

Sir Dougal O. Malcolm, KCMG, the president, in the course of his speech, said:

Our profit at £2,723,209 is very nearly double that of last year, which was £1,460,742. This great improvement is, of course, due mainly to the increase of nearly £2,500,000 from a little over £3 million to over £5,500,000 in our revenue from our mineral rights. This, of course, is due in the main to an increase in the amount of copper produced in Northern Rhodesia, from 265,000 tons odd to 297,000 tons odd, and to a great increase in the price of that production on which our royalties are based from just under £36,500,000 to nearly £56 million. Taxation for the year has increased by about £1,600,000 to £3,735,129.

DIVIDEND POLICY

The figures, I am sure you will agree, reflect a very strong position. We have had to consider very carefully our dividend policy, and you may feel that, in the light of an increase in our profit for the year under review of about £1,260,000 as compared with last year's figure, our proposed final dividend for the year of 26¼ per cent, which with the interim dividend of 13¼ per cent paid last November brings the total for the year to 40 per cent, or 6s. per unit of stock or share of 15s., as compared with last year's 33¼ per cent, or 5s., absorbing £1,379,779, as compared with £1,204,569, is a very modest one. At least you will agree that we have taken very full account of the Chancellor of the Exchequer's adjuration in his Budget speech that there should be what he calls "a sane policy of dividend limitation."

We have also had to take into account the probable effect on our fortunes of the proposed Excess Profits Levy, assuming that the Finance Act will impose a levy substantially in accordance with the Budget proposals as they seem likely to be amended by Parliament.

The production of copper from Northern Rhodesia amounted during our year under review to 297,380 tons at an average price as calculated for our royalty purposes of £186 7s. per ton, has so far proceeded during the first six months of the year now current at the rate of 301,850 tons for a full year at a corresponding price of £209 11s. per ton, and this notwithstanding continued difficulties in the matter of fuel supply to the mines. We must not forget the possibility of changes which we cannot control, or the chapter of accidents. Certainly the four great copper producing mines of Northern Rhodesia and and Rhodesia Broken Hill Development Company are very prosperous, and they are not all. Opening up of some new important copper mines is in prospect, and new large-scale prospecting enterprises covering large areas of Northern Rhodesia are being vigorously pursued.

Meanwhile our very modest dividend proposal will enable us to add no less than £1,222,000 odd to unappropriated profits, thus furnishing us with ample funds for the prosecution of the policy which I endeavoured to lay before you last year of building up a great body of long-term investments not only in Rhodesia, but in other South African enterprises, particularly mining enterprises, in regard to which, along with our business associates and friends, we have good opportunities of keeping ourselves well informed.

The report was adopted.

CENTRAL PROVINCES MANGANESE ORE

CONTINUED WORLD DEMAND

ONEROUS TAXATION BURDEN

MR H. R. HOLMES ON THE RECORD RESULTS

The forty-fourth annual general meeting of the Central Provinces Manganese Ore Company Limited, was held on June 4th in London, Mr H. R. Holmes, chairman and managing director, presiding.

Mr A. Linton, MC (director and secretary), read the notice convening the meeting and the report of the auditors.

The chairman said: Ladies and gentlemen —The report and accounts for the year ended December 31, 1951, have been in your hands for some time and I propose, with your permission, to take them as read. (Agreed.)

Before asking for your approval of the accounts I would like to make a few comments on the figures which appear in the balance sheet and profit and loss account.

In my speech to you last year I foreshadowed that the prospects for 1951 were satisfactory, and this has proved to be the case, as the balance on trading account at £1,937,389 constitutes a record for the company. It has been possible to achieve these results owing to the continued demand for our ore in the world's markets and to the prices at present prevailing.

Owing primarily to the large amount which has to be provided for taxation—namely, £1,257,500—the net profit available for the year is only £643,386. The question of taxation is a very serious one as the company is subject to the full rate of tax obtaining in India, and in the absence of any tax convention between that country and the UK, we get relief in this country only, and that relief is limited to approximately 75 per cent of the UK taxes.

I would here like to mention that, apart from the £939,500 paid in respect of Indian taxes, considerable benefits accrue to the Government of India from our manganese ore business. The export duty on the ore we shipped during 1951 amounted to more than half a million pounds, while royalty on the ore railed was over £110,000, making altogether a total of more than one-and-a-half million pounds. In addition, we give employment to many thousands of Indians, whose wages and the many amenities provided for them amount to a very large sum annually.

Income from investments is higher at £30,500, as compared with £17,125, due to the increase in our holding of British Government securities.

On the other side of the profit and loss account, the sum charged for depreciation of fixed assets is higher. This, of course, is due to the fact that as we continue our programme of mechanisation the amount of capital invested in plant and machinery increases.

APPROPRIATIONS

Your directors recommend that out of the net profit available the following appropriations should be made:—To staff benefit fund, £20,000; to workers' welfare fund, £10,000; to general reserve, £100,000. An interim dividend of 1s. per unit, free of tax, has already been paid, and it is proposed that a final dividend of 2s. per unit, free of tax, plus a bonus of 2s. per unit, free of tax, should be paid, together absorbing £500,000.

This will leave £185,066 to be carried forward, as compared with the amount of £176,357 brought in.

With regard to the allocation of £20,000 to the staff benefit fund, it is essential that this fund should be built up whenever we can afford to do so, in order to provide something for our staff, both European and Indian, when the time comes for them to retire. With taxation at the present level it is impossible for anyone to save sufficiently for retirement, as you all must know, and I feel sure that this allocation will have your approval.

WORKERS' WELFARE

The Government of India are very keenly interested in the welfare of all work-people in industry, and your directors have no hesitation in recommending the allocation of £10,000 to the Workers' Welfare Fund. From the accounts you will see that during 1951 the sum of £8,170 was spent on various projects for the welfare of our work-people. These projects were decided upon in consultation with the trade union and the representatives of our labour force.

The health of our labour force in India continues to be good, and constant attention is being given to housing, sanitation, water supply and the control of malaria.

In the accounts we have also provided for a sum sufficient to give those of our work-people who qualify for it by service during the year a cash bonus on similar lines to that drawn by the staff. The Contributory Provident Fund for our work-people, to which I referred last year, came into operation from January 1, 1952.

These are very important matters and it is most desirable that our relations with our labour force should continue on the same satisfactory footing as they have been for many years past.

BALANCE SHEET FEATURES

Turning to the balance sheet, you will notice on the assets side that the value of stocks of manganese ore has fallen from £628,363 to £530,828. Railings during the year were not sufficient to equal our forward sales and we had consequently again to encroach on our stocks to some extent, in the endeavour to meet these commitments.

Sundry debtors and payments in advance have risen from £74,139 to £202,544, which is due to an increase in the tonnage afloat at the end of the year and to payments for machinery.

The only other point on the assets side to which I need draw your attention is the increase in the total of British Government securities, tax reserve certificates, and cash, which together amount to £2,472,799, against £2,037,976. There is, on the other hand, a substantial increase, principally in respect of taxation, on the liabilities side.

DIRECTORS' VISITS

Early this year two of your directors—Mr Linton and myself—visited the United States of America with the object of keeping in touch with our very important customers there, who are the largest producers of ferro-manganese in the world. Our object was also to fix up further contracts with them, which we were able to do on satisfactory terms. Although I have said this before, I would not like this opportunity to pass without expressing our keen appreciation of the great understanding of our problems that they showed, and also of their very kind hospitality to us during our visit.

During the past winter two other of your directors—Major Herring and Mr Bartlett—visited the mines in India, when they made a thorough examination of the mines and settled several outstanding problems. They submitted full and informative reports to the board, and there is no doubt that these periodic visits to the mines by members of the board are of the utmost value to the company.

MINES IN GOOD CONDITION

Generally speaking our mines are in very good condition, with development work well ahead of ore extraction. The mechanisation of some of the mines is proceeding, and, as I have mentioned previously, this is very necessary, as we cannot get the number of work-people that we require.

With regard to diamond drilling, our immediate programme at Balaghat and Ukwa mines is completed and the plant has now been transferred to our Kandri mine.

Last year I referred to a heavy media separation plant which we are to instal at our Dongri Buzurg mine to extract the manganese ore from our old dumps there. Much of the machinery for this has now been shipped to India, and I hope that we shall have it erected and working by the end of this year.

I am glad to be able to say that there is considerably less delay than formerly in the granting of import licences by the Indian authorities.

The demand for our ore in the world's markets continues to be in excess of the amount available, and prices remain firm.

Railings are one of our constant anxieties, particularly during the first half of each year, which is the dry season, and this has again been the case this year. Nevertheless, assuming that there will be the normal improvement during the second half, I think I may say that the prospects for the current year's trading are satisfactory.

TRIBUTE TO STAFF AND AGENTS

Again I have pleasure in acknowledging the excellent work of the staff both in India and in London, and also of our shipping agents in India, Messrs James Finlay and Company, Limited. I am sure that they will appreciate the thanks of the stockholders which, with your approval, I propose to convey to them. We have a good staff, and I would particularly like to mention again our agent and general manager in India, Mr W. A. Hardy. In addition to the general supervision of the work on the mines, he has to deal with many matters of considerable complexity, and largely as a result of his efforts I am glad to say that our relations with the Government authorities in Delhi and with the Provincial Government continue on a satisfactory basis.

I now beg to move:—"That the report of the directors and statement of accounts as

at December 31, 1951, be and are hereby approved and adopted, and that the profits be appropriated as recommended by the directors." I will ask Major Herring to second the motion, and before putting it to the meeting, I shall be glad to deal with any questions which stockholders may wish to ask.

Major A. C. Herring, VC, ACA, seconded the resolution, which was carried unanimously.

The Board's proposal of a final dividend of 2s. per unit, free of tax, and a bonus of 2s. per unit, free of tax, was also approved.

The retiring director, Mr L. H. Bartlett, OBE, was re-elected, and the remuneration of the auditors, Messrs W. A. Browne and Co., having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff, both at home and abroad.

AMALGAMATED ROADSTONE CORPORATION

EXCELLENT TRADING RESULTS

MR J. S. KILLICK'S STATEMENT

The sixteenth annual general meeting of Amalgamated Roadstone Corporation Limited was held on June 4th in London, Mr J. S. Killick, CBE, MInstCE (the chairman), presiding.

The following is an extract from his circulated statement:—

The accounts and reports clearly show the company's position. I would, however, draw your attention to the following points: Trading profit, after depreciation, amounts to £456,857, which is £143,529 more than last year. Depreciation at £156,396 is £33,131 higher. Carry forward is increased by £69,972 to £152,786. Initial allowances of £51,735 are increased by £7,223. Taxation for the year, £170,777, is £69,271 higher than the previous year. Provision towards future taxation of £20,000 is an increase of £10,000. Tax equalisation (initial allowances) of £46,813 is £10,647 over last year. Provisions towards future taxation now total £194,976.

During the five years ending October 31, 1951, capital expenditure (less sales)—almost entirely on postwar and re-equipment mechanisation and expansion, not forgetting considerable addition to our road transport—has amounted to £1,455,600, of which no less than £820,000 has been contributed out of profit by way of initial allowances and depreciation, and this current year's similar contribution will be at least a further £250,000. Since the date of the balance sheet, the capital redemption policies have been surrendered, realising £80,731.

Initial allowances, of course, came to an end at the end of March this year, and it is therefore fortunate that we have been able almost to complete this important programme and that from now onwards the ordinary depreciation allowances should suffice to cover such similar expenditure as may prove necessary. Your properties have now been put into a condition second to none in the country, such as to enable us to meet any competition.

Now that we have this burden of heavy capital expenditure behind us we should hope, but for increased taxation, the effect of which it is as yet difficult for us to assess, to show an increasing margin above the rate of our current dividends.

The balance-sheet value of the fixed assets totalling £2,534,012, comprises properties (freehold and leasehold) £934,585, and plant, equipment and transport £1,599,427, the latter figure exceeding by only £144,000 the capital expenditure of the last five years above mentioned.

Highway engineers and road users alike realise that the roads of the country, taken as a whole, are deteriorating. Probably the members of the Government are of a similar opinion, but unfortunately the country's financial position does not appear to permit of adequate funds being made available to Highway Authorities. That position must sooner or later be rectified, and when that time comes your company will undoubtedly benefit.

You will be pleased to hear that the first five months' trading results of the current year show a substantial improvement over the corresponding period of last year.

I cannot conclude without expressing my own gratitude, and I hope yours, for the whole-hearted and loyal co-operation of your company's personnel which has so largely contributed to the excellent results of the year's trading portrayed in the accounts under review.

The report and accounts were adopted, and the dividend distribution of 10 per cent for the year was approved.

THE BURY FELT MANUFACTURING COMPANY

RESULTS SATISFACTORY DESPITE DIFFICULTIES

LT-COL BUCKLEY ON RAW MATERIAL PRICE FLUCTUATIONS

The forty-seventh annual general meeting of The Bury Felt Manufacturing Company, Limited, was held on June 5th in Manchester, Lt-Col A. Buckley, CBE, DSO, JP (the chairman), presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1951:—

Shareholders will notice a slight decrease in the trading profit of the past year to £280,274, as against £293,968 for 1950. Owing to the increased rate of profits tax on the gross figure of distributed profits, there is little reduction in the amount charged for taxation, namely, £145,667, compared with £146,472 in the previous year.

The sum of £20,000 has been charged for depreciation and is added to the reserve account in the balance sheet in furtherance of the procedure outlined in last year's report. Further normal charges and credits result in a net profit for 1951 of £109,074, as against £123,426 for 1950.

This year your board recommends transfers of £30,000 to general reserve and a further £20,000 to contingencies and stock depreciation reserve. Initial taxation relief of £3,000 on capital expenditure during the year is carried forward for future allocation.

The staff pension fund initiated some two years ago at a cost of nearly £16,000 has been beneficial both to your company and to the staff, and it is now proposed to extend the scope of the present scheme to embrace working foremen and, for this purpose, the sum of £7,000 has been appropriated from the year's profits.

Your board recommends a dividend on the ordinary capital of 75 per cent, less income tax at 9s. 6d. for the year ended December 31, 1951, which, with the preference dividends, absorbs £41,344 net. This figure, as a matter of interest, may be compared with £57,000 for profits tax alone on the year's profits, total taxation being some three-and-a-half times the actual amount distributed to shareholders. After the above appropriations, the balance remaining in profit and loss account is £145,137, against £137,814 brought forward at the commencement of the year. Reserves and the balance of profit and loss account now total £536,406, against £448,676 at December 31, 1950.

POLICY OF LIQUIDITY

The cardinal feature of our industry during 1951 has been the fluctuation in the prices of raw materials. During the year, your management concluded that the existing economic circumstances and the prospects for 1952 dictated a policy of liquidity. It will be observed that the stock in trade at December 31, 1951, is valued at £263,922, a reduction of more than £100,000 on the figure of 12 months ago. Your company was affected by the incidence of falling values, but the necessary provision at December 31, 1951, was duly made before arriving at the trading profit and was no greater than might have been required in a year of less extreme price fluctuation.

Cash resources have increased from £361,490 to £503,909.

At the date of this statement, the Finance Bill is still under discussion but, on the facts available, it would appear that your company will not be liable for an appreciable amount of Excess Profits Levy unless profits exceed those disclosed by the accounts now reviewed.

Throughout the year it has been the endeavour of your management to minimise the effect upon the company's customers of violent price fluctuations. Even at the peak of wool prices in the earlier part of the year, few of the prices charged for our products fully reflected the increase in raw material costs. This policy, we believe, has done much to cement the goodwill of our customers, many of whom have been loyal supporters for nearly fifty years.

FACTORIES FULLY EMPLOYED

At the present time, all your company's factories are fully employed. Nevertheless, competition has become keener. Costs of production continue to rise, particularly the cost of supplies and services from the nationalised industries which are still increasing at an alarming rate. The efficiency of the nationalised and monopolistic concerns warrants the serious consideration of a competent and neutral authority if exporting industries are to feel assured that their prices do not carry the incubus of unwise and unnecessary expenditure.

Your company, in common with other industrial concerns, cannot remain immune if its customers are adversely affected by the difficulties of the times. But without indulging in excessive optimism I am not unhopeful of the future. We are well equipped to maintain our position in the industry and you can be assured that every effort will be made to overcome whatever difficulties we may have to meet.

In conclusion, I am happy to state that the company's relations with its staff and employees have continued on an amicable basis throughout the year. Their efforts have enabled such a satisfactory result to be attained and our thanks are due to them for their loyalty.

The report was adopted.

CROWN MINES, LIMITED

POSITION CAUSING ANXIETY

MR W. H. A. LAWRENCE'S ADDRESS

The fifty-sixth annual general meeting of shareholders was held on May 28th in Johannesburg.

Mr W. H. A. Lawrence, chairman, presided and said: The directors report and the audited balance sheet and accounts for the year ended December 31, 1951, presented for your approval and adoption today, together with the accompanying reports of the consulting engineer and the general manager, contain full particulars of the operations at the mine during the period under review and of the financial results obtained.

The position at the mine, as you will have observed from these reports, is causing anxiety. The labour strength, both European and native, continues to be far below requirements, thereby restricting output to below the capacity of the plants and adversely affecting operations in other directions. This fact in itself is serious, but what is of graver concern is the steady and persistent decline in values and percentage of payability on the main reef leader with increasing depth. This unfortunate feature coupled with the extent to which working costs have risen must seriously affect the economic prospects of the ore remaining in the property below the present levels.

The figures given in the tabulation in the consulting engineer's report clearly indicate the degree of the falling off during last year in the tonnage and grade of the ore milled, resulting in a decrease of 51,514 ounces fine in the total gold recovered as compared with the previous year. This serious decline coupled with the increased working costs reduced the margin of profit by 3s 10d per ton milled. These factors caused the working profit to diminish by the substantial amount of £695,728 despite an increase of £218,973 in the additional revenue received during the year from the sale of gold at enhanced prices.

The higher cost of commodities and further wage concessions granted to employees throughout the gold mining industry caused working costs to continue to rise steadily during the year until they reached the average figure of 38s 7d per ton milled for the last quarter of the year, as compared with the average of 35s 10d per ton milled for the whole year. This trend in costs is rendering unpayable more and more of the marginal ore in the mine and narrowing the margin of profit on the payable ore.

Your attention has been drawn in the past to these various adverse circumstances and trends, but the general position and prospects at the mine deteriorated sharply during 1951 as a result of the large increase in working costs, the continued decline in yield, the substantial decrease in values exposed on the Main Reef Leader and the disclosure of the serious proportions and extent of the reef dislocation at the bottom of the mine.

EFFECT OF ADVERSE OPERATION CONDITIONS

The table below which compares the salient details of results during the first four months of the current year with those for the same period of 1951 reflects the continued effect of the adverse operation conditions:

There are small tonnages of the main reef and south reef still to be mined, but the main reef leader is now the only reef of economic importance and is being worked at depths approaching 9,000 feet. I have referred at previous annual meetings to the decline in the values and percentage of payability of this reef with increases in depth, and it is now the case that the lowest levels of the eastern and central sections are generally unpayable. Shaft sinking in these sections has been completed and only a limited amount of development remains to be done. In the western section, however, where the workings are not quite as deep, current development is still payable although the values and percentage of payability continue to show declining trends.

FUTURE OF SOUTHERN AREA

In my address last year I informed you of the intersection of a strike dyke in the south-eastern portion of the mine. Work carried out during 1951 and to date in the current year has indicated that the dyke, which varies from 280 to 600 feet in thickness, persists for at least two-thirds of the width of the property at a depth of about 9,000 feet. The reef has been thrown down more than 500 feet on the south side of the dyke. The question of the future of this southern area is at present under close investigation from all angles and particularly in the light of the heavy capital expenditure which would be necessary on shaft sinking and development to open it up beyond the dyke at nearly 10,000 feet below the surface. The fact that values to the north of the dyke are generally unpayable, coupled with the poor values intersected in boreholes and in the limited development done south of the dyke, indicates that economic exploitation of the area below the dyke is improbable. Although the working life prospects of the mine have been seriously jeopardised by these developments there are certain factors which will tend to arrest further declines in working profits in the immediate future. The reduced scale of incline shaft sinking and development at depth will help to affect any minor increases in working costs that may take place. The reserves of ore contained in shaft pillars are substantial and their values are well above the average for the mine. All the payable ore development in the eastern half of the mine will have been stoped out by the time the pillars of the shafts serving that area have been extracted.

GROUND FOR MODEST ENCOURAGEMENT

In its time Crown Mines has been one of the greatest of the gold mines of South Africa and it is still one of the best known. The peak of its gold producing and profit earning capacity was reached a number of years ago, however, and since that time the fortunes of the mine have declined gradually but inexorably. All mines are wasting assets and Crown Mines is no exception to the rule. In recent months the unexpectedly severe increase in working costs which has taken place throughout the goldmining industry, together with the serious shortage of native labour and such local difficulties as the big strike dyke to which I have referred and a general falling off in the mine grade, have combined to accentuate sharply the waning prosperity of your mine. There are, however, as I have already indicated, certain aspects of the situation which give ground for modest encouragement. Considerable progress has already been made with the task of arresting the rapid deteriorating of the position which has taken place since our meeting last year. The technical problems involved have been tackled most actively by the mine management and the company's technical consultants, while all aspects of the matter, technical as well as financial, constantly receive the close attention of your board. As a result of the frequent and detailed assessments which are made of the difficulties facing the mine and of the prospects of the future I feel able to state with some confidence that there is every likelihood of profits being maintained at their present level during the next few years and even perhaps of some modest improvement in the position.

I now move that the audited accounts for the year ended December 31, 1951, the balance sheet at that date and the report of the directors, laid before the meeting, be received and adopted.

The report and accounts were adopted.

	Jan./April, 1952	Jan./April, 1951	Incr or Dec.
Tons milled	1,044,000	1,063,000	Dec. 19,000
Yield per ton milled	3·286 dwt.	3·485 dwt.	Dec. 0·199 dwt.
Working revenue	£2,136,778	£2,306,493	Dec. £169,715
Working revenue per ton	40s. 11d.	43s. 4d.	Dec. 2s. 5d.
Working Costs	£2,007,555	£1,840,124	Inc. £167,431
Working costs per ton	38s. 5d.	34s. 7d.	Inc. 3s. 10d.

RANSOMES, SIMS AND JEFFERIES

SHORTAGES AFFECT PRODUCTION

The sixty-eighth annual general meeting of this company was held on May 30th at Ipswich, Mr Reuben J. Hunt, chairman, presiding.

The following is an extract from his circulated statement:

The year 1951 has been dominated by heavy increases in costs of manufacture arising from national causes quite beyond the control of your board. It has also been a year of further progress in widening even further your company's already large overseas trade and connections, but production has been upset by serious material shortages.

Our group net profit of £216,648 in comparison with the estimated capital employed of £5,450,905 is only 4 per cent. All concerned must agree that this rate of net remuneration on capital employed is not only far from excessive, but on the contrary is lower than necessary. I wish to draw particular attention to this point in view of the careless and uninformed political statements regarding excessive profits which are giving a false impression quite contrary to the national interest.

Income tax and profits tax are over eight times the net amount distributed to preference and ordinary stockholders. High taxation rates will in the long run be disastrous from the point of view of the country's productive capacity. I take the gravest view of the newly introduced excess profits levy.

In spite of all the difficulties, including material shortages, our last year's volume of Home trade has been maintained this year and still exceeds the volume of our export trade. We have shipped goods during the year to over one hundred different countries, of which seventeen are in the dollar area, but the biggest part of our export trade this year has been within the sterling area.

The report was adopted.

BRISTOL AEROPLANE COMPANY, LIMITED

INCREASED TRADING PROFIT

The forty-second annual general meeting of the Bristol Aeroplane Company, Limited, was held on June 5th at Bristol.

Sir William G. Verdon Smith, CBE (the chairman), in the course of his speech said:—

Profit and loss account.—The consolidated profit and loss account shows a trading profit after depreciation of £1,349,945—an increase of £231,853.

Taxation increased from £694,571 in 1950 to £941,455 in 1951.

Provision for depreciation of fixed assets amounts to £580,344 compared with £367,979 in 1950. With the final settlement of our liability to tax during the EPT years, provisions amounting to £778,886 no longer required, together with the transfer to general reserve of £271,114 from 1951 profits, make a total of £1,050,000 retained in the business, and we recommend a final dividend of 8½ per cent. This, with the interim dividend of 5 per cent, results in a dividend of 13½ per cent for the year.

Balance carried forward in the consolidated accounts is £405,484, compared with £359,663 for 1950.

Balance Sheet: Capital, reserves and surplus have increased by £1,086,479 from £8,049,091 to £9,135,570.

REVIEW OF COMPANY'S ACTIVITIES

The year 1951 was one of great endeavour, and our activities reflected the nation's increasing concentration on the overriding needs of export and defence.

Freighters: Orders for close on 200 have contributed handsomely to our earnings of foreign exchange and we are increasing capacity.

Britannia: The first flight of the prototype is due shortly. Britannia promises to be the first aircraft truly capable of low-cost air travel.

Helicopters: The Sycamore, single-rotor model, is now in limited production. Type 173, the world's first twin-engined helicopter, started its flight trials early this year, and we are looking ahead to a still larger size of helicopter.

Piston Engines: We hold substantial orders for "Bristol" Hercules and Centaurus piston engines.

Gas Turbines: The Proteus Series II received its ARB type approval certificate and the Proteus Series III recently made a brilliantly successful start to its experimental running.

Development of the Olympus turbo-jet has gone ahead well and gives us good grounds for confidence.

Cars: The "Bristol" car and engine go from strength to strength.

Buildings: The Bristol Aeroplane Company (Weston), Limited, continues to develop and supply buildings for home and overseas.

Overseas: Following the formation of Bristol Aeroplane Engines (Eastern) Limited we are building a new factory in Montreal, Canada. We have also formed The Bristol Aeroplane Company (Australia) Proprietary Limited to develop all our interests in Australia.

General: To our civil commitments we have added a large defence effort on guided missile and other important aircraft and engine projects.

AUTOMATIC TELEPHONE AND ELECTRIC CO.

The annual general meeting of the Automatic Telephone and Electric Company Limited will be held on June 24th in London.

The following is an extract from the statement circulated by the chairman, Sir Alexander Roger, KCIE:

The profit of the parent company before charging taxation amounts to £1,171,981 as compared with the 1950 figure of £1,269,436. After £686,539 is provided for taxation (58.6 per cent) the net profit is £485,442. Dividends at the same rates as last year are proposed.

During the past year the value of sales was a record in the company's history. In common with manufacturers in this country we have, during the years since the war, vastly expanded our exports of telephone equipment.

I have great doubts, however, whether this concentration on the export market regardless of the requirements of the home market, has not been carried too far in the case of telephone equipment and very likely in the case of other industries. Quite apart from the needs of the public whose demands for telephone service will not be met for increasingly longer periods, the industry can best rest on the solid foundation of a growing demand in the home market.

What lies ahead is beyond the wit of most of us to foresee, but if the nation could recapture the spirit of 1939-45 and cast out the doctrines which all too frequently disrupt the team effort of the people, we could then with confidence look for the restoration of better times and the improvement of our world position.

INTERNATIONAL PAINTS (HOLDINGS) LIMITED

INCREASED SALES

The forty-fourth annual general meeting of International Paints (Holdings) Limited, will be held in London on June 25th.

The following is an extract from the circulated statement by the chairman, Mr Charles R. Petrie:

As a result of the changes which were authorised by extraordinary general meeting last year, your company ceased trading at June 30th and is now a holding company with investments in a group engaged not only in the manufacture and sale of paints, varnishes, distempers and ships' compositions, etc., but also of steel containers, spray gun equipment, electric scaling hammers and in several other activities. Group companies are to be formed throughout the world in sixteen countries and operating in all twenty-two paint factories.

The total profit of the group for the year under review is the highest figure in the history of the company, the increase over the previous year reflecting the greater value of sales, both at home and abroad. Home sales showed a satisfactory expansion and I am pleased to say that our export sales increased by 48 per cent. This increase, although very gratifying, would have been even greater, had it been possible to obtain import licences to satisfy all overseas demands for our products.

We have fully maintained our position as the largest supplier to ships throughout the world, and during the year we have coated a large proportion of new ships with *International* Anticorrosive and Antifouling, including the new well tried "Silver Primocon" which has met with singular success on new ships.

LICENSES AND GENERAL INSURANCE COMPANY

MR RONALD GILBEY'S ADDRESS

The sixty-second ordinary general meeting was held in London on June 4th.

Mr Ronald Gilbey (the chairman) presided, and in the course of his address, said:—

My optimism of twelve months ago would seem to have been justified, for as will be seen in the figures before you very definite progress has been made.

The premium income shows an advance of £264,307, while interest earnings are higher at £74,760—the total income, therefore, being £2,209,774.

In the life department we have continued to pursue the quiet way, avoiding any speculative increase, for we believe in maintaining a conservative policy and we are laying foundations which must be of present and ultimate value.

Generous support has enabled the fire premium income to advance to £613,595. Claims have been on a reasonable level at 45.2 per cent. Having provided for unexpired reserve, and for outstanding claims, the profit transfer is double that of the previous year at £60,366.

Our miscellaneous account, which you will remember includes license, public liability, burglary and many forms of accident business, continues to show progress, the premium income having advanced to £473,222. The claims ratio at 50 per cent suggests a reasonable experience and all necessary reserves having been adjusted to requirements, there is a resultant profit of £43,360.

A final dividend of 25 per cent, making 40 per cent for the year, was approved.

EXPERT TOOL AND CASE HARDENING COMPANY

IMPROVED RESULTS

The thirty-first ordinary general meeting of the Expert Tool and Case Hardening Company Limited was held on June 5th in London.

Mr A. H. Redfern, the chairman, in the course of his speech said: The net profit for the year under review is £147,292 against £110,527. The revenue authorities take no less than £97,250 for taxes this year, and the net surplus amounts to £50,042 compared with £39,567. The proposed excess profits levy is, in my opinion, very much to be deprecated. The economic needs of the country call for continued improvement in production methods and for drive and expansion in business generally. The proposed levy removes not only the incentive but also the capital needed. The levy will involve your company in still higher taxation, but will in no way prejudice the continuation of the same rate of dividend if, as we hope, the net profits are reasonably maintained.

Your directors recommend a final dividend of 15 per cent less income tax, making 26½ per cent for the year. After payment of the dividends on both the ordinary and preference shares, transferring £20,000 to general reserve (against £10,000), £1,050 to preference share redemption and providing for loss on trade investment, there remains £23,502 to be carried forward against £22,155 brought in.

The order books of your subsidiary companies are in a healthy state and the trading results of the current year to date show an improvement on last year.

The report was adopted.

NATIONAL BANK OF EGYPT

Incorporated in Egypt
Liability of Members is Limited

Head Office - - - CAIRO

Commercial Register No. 1 Cairo

FULLY PAID CAPITAL - - £E.3,000,000
RESERVE FUND - - - - £E.3,000,000

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE
LECTURESHIP IN ECONOMICS

Applications are invited for a Lectureship in Economics. The holder of the post will be required to give instruction in Mathematical Economics to students taking a joint Honours Course in Mathematics and Economics. Salary £550 x £50—£800 x £50—£1,100. Initial salary within this scale will depend upon qualifications and experience. The candidate appointed will be required to reside in College accommodation when this is available. Application forms and further information can be obtained from the Head of the Department of Economics, The College, Keele, Staffordshire, to whom applications should be forwarded not later than June 21, 1952.

WEST AFRICAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH. UNIVERSITY COLLEGE, IBADAN, NIGERIA

Applications are invited for the post of Executive Officer to supervise and assist in planning an Agricultural and Economic Survey of the Northern Provinces of Nigeria with emphasis on the ground-nut- and cotton-growing areas. Appointment of two to three years' duration. Salary in the range £1,500 to £2,000 p.a. The project will be in association with the Nigeria Produce Marketing Boards.

Applications (six copies), giving full details of qualifications and experience, and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date June 21, 1952.

OTTOMAN BANK
(Incorporated in Turkey with Limited Liability)

NOTICE IS HEREBY GIVEN that in accordance with Article 29 of the Statutes, the Annual General Meeting of Shareholders will be held on Wednesday, the 25th June, 1952 at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m., to receive a Report from the Committee with the Accounts for the year ending 31st December, 1951; to propose a Dividend; to receive statements regarding the Convention between the Turkish Government and the Bank and its renewal, and a report on the exercise of the powers previously conferred upon the General Committee; and to replace the retiring Members of the General Committee.

By the 27th Article of the Statutes the General Meeting is composed of Shareholders possessing at least 30 shares, who, to be entitled to form part of the Meeting, must deposit their shares at the chief office of the Company, Istanbul, or at either of the several branches or agencies abroad (in London at 20/22, Abchurch Lane, E.C.4, and in Paris at 7, rue Meyerbeer, 9me), 10 days at least before the day fixed for the Meeting.

J. VASSALL ADAMS, Secretary to the Committee.

3rd June, 1952.

THE CUNARD STEAM-SHIP COMPANY, LIMITED
FIVE PER CENT CUMULATIVE PREFERENCE STOCK
SIX PER CENT SECOND CUMULATIVE PREFERENCE STOCK

NOTICE IS HEREBY GIVEN that the Transfer Registers in respect of the above Stocks will be closed from June 11 to 17, 1952, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending June 30, 1952, to be paid on and after July 1, 1952.

By Order of the Board.
H. EAVES, Secretary.

Offices: Cunard Building, Liverpool June 5, 1952

NUMBER 6 IN A SERIES

THIS IS 'THE SAPPHIRE'—
MOST POWERFUL JET
ENGINE IN THE WORLD!

Armstrong Siddeley
increases thrust to
record-breaking 8,300 lbs.

★ **Armstrong Siddeley Sapphire 150-hour official type-test: 8,300 lbs. Static Thrust.**
Look at that record-breaking figure, remember it well. For with it Armstrong Siddeley wins fresh laurels from world aviation. Now their mighty Sapphire, for 20 months world's most powerful jet engine, strides further ahead of all rivals with a new increased output of 8,300 lbs. static thrust in over 6 days of continuous running, 17% greater than any other engine similarly tested. And this leadership is not a matter of mere bench-testing. Already twin Sapphires hold the world's climb-to-altitude record, power the sensational new Gloster GA 5 Delta Fighter and are specified for the American built Canberra bomber and the F 84F Thunderjet fighter. To meet this urgent demand, Sapphire production is speeded on both sides of the Atlantic. Armstrong Siddeley is still another member company of the Hawker Siddeley Group. Largest of its kind, this great industrial commonwealth to-day employs its mighty resources in building the defensive strength of the Free World.

Germany as an Ally

BONN is losing no time over the ratification of the conventions ending the Allied occupation and of the treaty embodying the European Defence Community. The process may be helped by the German Social Democrats' appeal to the Federal Supreme Court, contesting the German Government's constitutional right to sign the agreements, but this is no more than a delaying action. The general view in Germany is that ratification will take place, even if the majority is small. That this should be likely will surprise only those who, like Mr Michael Foot, claim to know "by plentiful evidence" that a majority of the Germans oppose the agreements. In fact, the ascertainable mood of the German people is far nearer to apathy, to the desire to be left alone and, like Louis Philippe's bourgeois, to enrich themselves. Any apprehension lest the new settlement may delay German unity and invite Russian counter-measures is more or less balanced by the knowledge that the EDC convention represents a formidable advance towards equality and freedom of action.

The West Germans, without an army or even the pretensions to one, receive completely equal status with the French whose military establishment is large, independent and already in being. Moreover, in the first stages, an agreement with the Americans offers the Germans the possibility of building up an army at bargain prices. At first, Germany will be responsible for nothing but maintenance costs. The United States is to provide the heavy equipment during the period of training and much light equipment. Later on, it is true, when the full cost of modern armies is realised by the Germans, and when, under EDC orders, the Ruhr may begin to produce tanks and guns, diverting heavy industry from civilian use, the matter may look different. But for the time being the path offered by EDC to the recovery of sovereignty and equality of arms is fantastically favourable to a nation which, only just over seven years ago, was still dragging itself and Europe down in a common destruction.

It would be encouraging to record that a realisation of this fact is general in Western Germany and that the new vista of sovereignty and responsibility is showing up qualities of statesmanship in people and press at large. Unhappily, Dr Adenauer's brave conception of Germany as a partner of the West and a good neighbour in Europe, is, like the agreements which give embodiment to the idea, received with considerable indifference. Interest concentrates upon the guarantees given Germany, not upon the responsibilities it assumes. There is little feeling that Germany needs allies. It is rather that Germany is being asked to sacrifice itself in someone else's cause.

A reaction of such narrow national self-interest is hardly promising for the growth of a European community. Now, therefore, that the immediate pattern of German sovereignty and rearmament is known and the first German reaction has been tested, it cannot be said that reassurance has taken the place of earlier fears among Germany's neighbours or that the spectacle of a rearmed and independent

Germany chills the blood any less. Memories are not after all so short and it may well be that the real crisis over ratification will occur not in the German Assembly but in Paris. There is a similar reaction in Britain. The Labour party, in demanding that fresh German elections should precede the ratification of the new agreements, is not in theory asking that they should be abandoned—that would be too embarrassing for Mr Attlee and Mr Morrison. But that, nevertheless, would be the obvious result.

Admittedly, the political motives of those who have forced Mr Attlee to accept this gloss upon German policy are probably domestic. They do not so much fear German rearmament as need some issue upon which to differ from the bipartisan approach to Western Europe evolved under Mr Bevin and continued under Mr Eden. Yet the rider is now included in Labour's official programme for its autumn conference, and although the retreat from bipartisanship on this point will make no difference to British ratification, it will confuse further a public opinion already confused enough about putting weapons back into German hands.

★

It is, therefore, of supreme importance to remember that even now, when the contractual agreements have been agreed and signed, they cannot be left to speak for themselves. The real and overriding reasons for them must still be explained and repeated and insisted upon, in season and out. Short of world disarmament, there is no way in which the most powerful nation in Europe can be kept without sovereignty and without arms. Short of permanent occupation, there is no way in which a people, even a divided people, of nearly 70 million, can be deprived of the attributes of power which their neighbours possess. The great argument for the EDC and for the contractual agreements is that they are probably the last opportunity of persuading Germany to contribute, as the recent statement of Labour Party policy demands, " towards a system of collective security . . . within which German forces could serve without danger to their neighbours." In the long run, this can come about only if sufficient Germans wish it to come about. The present experiment is almost certainly the last opportunity of coaxing them into a collective system and of proving to enough of the new generation that the system works. Delay it, impede it, abandon it, and in its place will finally come the armed, united, sovereign Germany bargaining between East and West and owing no allegiance to anything save its naked self-interest.

Yet, if the new agreements offer the last opportunity for securing German rearmament within a collective framework and with proper safeguards, this does not mean that the safeguards are already sufficient and that the framework is adequate at every point. In the House of Commons on Tuesday, Mr Eden referred to the agreements as " a culmination " of the policy of bringing Germany into the western community. It would surely be wiser to refer to them as a beginning only. It is no use talking about the Atlantic community and the West European community as though they existed. They do not. In fact, on the economic front, both attempts at association are suffering grievous setbacks this year and are likely to suffer more. At the moment, it seems more certain that Western Germany will be rearmed than that the restraining collective framework will be made to work. The months ahead need to be a period of the most vigorous effort to ensure that the Allies' German policy does not go off at half-cock—with Western Germany sovereign and rearming and its neighbours no more united than they are today.

The needed line of advance lies first of all in Western Germany itself. There the processes of rearmament should not be hurried. In the military office of Herr Blank, working closely with Dr Adenauer, there are men sincerely convinced of the ideal of European defence, anxious to keep German rearming clear of any taint of the old militarism, determined to maintain civilian and European control. They must be allowed to make the pace and form the cadres. If too much pressure for quick expansion is applied, they will be swamped by the old guard. There were only 40,000 ex-officers after 1918. Hitler's legacy was 400,000, among them thousands of generals. Dr Adenauer must not be forced to throw down the dams against this turbulent tide. At the same time, Germany's allies need to continue in the excellent mood established by General Eisenhower, the mood not of war, but of peace through strength. The distinction is not yet familiar to Germans who, when asked whether they wish to defend themselves, tend to reply that they do not want war.

Within Europe, the need is to hasten forward with all speed the creation and functioning of the various " communities," whose existence is the best guarantee of a generally collective spirit and policy. If, for instance, the officers of the new Germany are to learn a European spirit, it is better that they should start, not finish, their training in European staff colleges. But the staff colleges have first to exist. All that Britain can do to hasten the process of unification and to participate in it within the political limits set by both parties should be set on foot at once. It is encouraging that Mr Eden has himself taken the chairmanship of the Council of OEEC and that, at Strasbourg, his proposals to associate the Schuman Plan and the EDC with the Council of Europe were so well received and given such wide support. The need now is for Britain to become a pace-setter for Europe's advance towards unity.

The decisive arena is, however, the Atlantic world. No European arrangements, even with British participation, can do more than restore the balance of Stresemann, Locarno and the twenties. The overwhelming concentration of power necessary to bring Germany down decisively on the western side lies in the United States, and no caution over premature rearmament inside Germany, no advance towards unity in Europe, no British participation therein, can safeguard Europe against an irresponsible German resurgence unless the United States is a permanent partner in the Atlantic community. Any belief in America that Germany can be built up as a substitute for American commitments in Europe has in it the seeds of the next war. In fact, Germany should be a partner not only in the West European but in the North Atlantic community as well, so that its statesmen and its generals can be exposed day by day to the realities of American participation and American strength.

To say so much is no more than to repeat how long the road ahead still is before any equilibrium or stability can be secured in the western world. The negotiations are over, the papers are signed. The framework of a European policy exists. It is only now that the real work begins.

More Jobs Than Dollars

THE figures published by the Ministry of Labour this week show that the amount of unemployment in Britain changed very little last month. The talk of a slump may be swelling, in the clubs and the boardrooms as much as in trade union offices and Labour party meetings, but it has no confirmation in the statistics. There were 7,000 more textile workers unemployed in May than there had been in April ; but outside textiles the number of unemployed fell on balance by 7,400. The slump, which for months now so many people have been claiming either to see or to foresee, has not come.

To point out that there is no slump in Britain is not a flinty-hearted denial that there is distress in Lancashire. In the textile industries as a whole, 143,000 men and women—15 per cent of the number employed—are now out of work. Although the rapid increase in unemployment seems at last to be stopping, there is little chance of all the textile mills returning to steady work for many months. At least in the weaving towns of mid-Lancashire, where there are relatively few other industries to provide alternative employment, some thousands of workers face the bitterness of months without a job. No effective remedy for this evil can be neglected. But a full concern about Nelson and Haslingden is one thing ; pretence about the condition of Britain is quite another. It is either blindness or cold-blooded political opportunism to advocate as remedies for a local problem measures—such as a general inflation of demand—that would harm the national economy as a whole. That is no service to Lancashire, which as much as any part of the country depends for its prosperity, in all but the very shortest run, on the competitive strength of the economy as a whole. Nothing but harm can be done to the textile industries by pretending that their particular problems are simply the reflection of a general slump.

It is true that the textile slump does not stand quite alone. Some other industries have found their sales falling and many more have met enough buyers' resistance to make them fear that sales soon will drop. That can hardly be surprising. For one thing, the textile slump has now lasted long enough for some indirect effects to spread through the economy. By reducing the incomes of textile workers it checks the total expenditure on other goods ; and by providing one example of falling prices it encourages everyone to hope that he may gain by putting off buying other things as well. Again, clothes were not the only things with which people stocked themselves up early last year ; a widespread, if slight, damping down of the demand for durable consumer goods this year is the natural consequence. Above all, Mr Butler's monetary policy is proving to be more effective than many critics of credit restriction, as a supposedly outmoded economic weapon, ever supposed. Perhaps just because monetary discipline had become so unfamiliar, a moderate tightening of credit has profoundly affected business psychology. It has not yet forced many firms to contract, and so free labour for more important uses, but it has induced many firms to go more cautiously and in particular to stop wildly building up stocks of materials. Its restraining influence on some forms of consumer buying is also apparent ; the sharp fall in used car prices can be attributed in part to tighter credit.

These are the results that monetary policy was designed to produce. Some sections of the Labour party are at least consistent in objecting to them. But for the Tories to get into a panic because their policy is working—a little—is another matter ; it should be cherished by historians as an extreme example of the curious nature of politics. There is not even the excuse that monetary policy has yet got to the stage of producing in any volume the transitional unemployment that is the unpleasant but unavoidable forerunner to producing more arms and more exports quickly. One of the accompanying charts shows how slight is the increase in unemployment outside the main textile regions, Yorkshire and the North-west. If the special cases—textiles and clothing—are excluded from the reckoning, the number of unemployed in May was only 102,000 bigger than it was a year ago. But last summer was a time of acute inflation even by postwar standards ; fewer people than ever were out of work and there were nearly three times as many jobs vacant as there were workers without jobs. The Labour Government used to console itself by looking back to the middle of 1950, before the rude disturbance of the Korean war, as the time when the economy was nicely balanced, when full employment without inflation had supposedly been achieved. If textiles and clothing are again excluded, 299,000 people were out of work in May, 1950 ; in May, 1952, the number was 307,000. That is to say, one extra worker in every three thousand is now unemployed. By the Labour party's standard (which can hardly be supposed to err on the deflationary side) the economy outside textiles is now for all practical

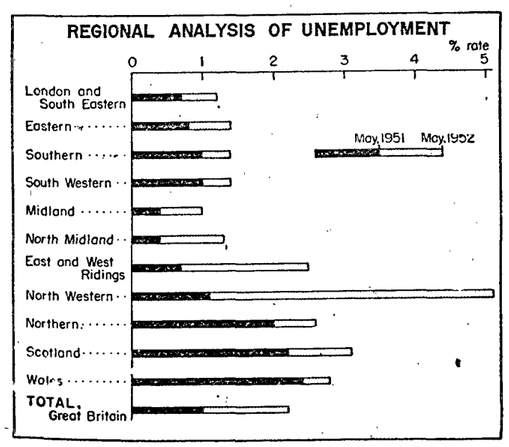
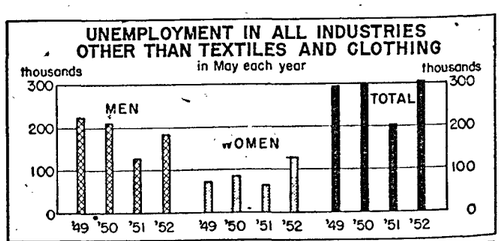
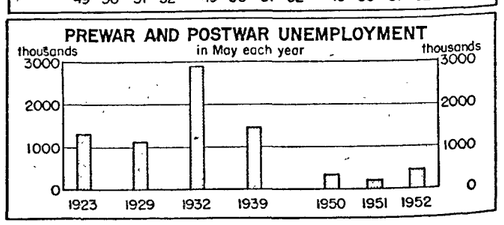
purposes in the same state of perfect full employment as it was in two years ago. It is certainly not in a slump.



It may be, of course, that the people who forecast much greater unemployment merely got their timing wrong. The slump that was not, in fact, round the corner in February may be just round the corner now. The turns in economic affairs come too quickly for this possibility ever to be dogmatically excluded, but it does not look especially strong at this moment. The textile recession is not so deep that the reduced incomes of textile workers will in themselves sharply cut total spending and so deflate other incomes. In most industries, except textiles, wages are certain to rise in the near future. Monetary policy is nipping some spending, but is not cutting it off sharply. There are still great reserves of demand for capital goods that could be released if other pressures on the economy were relaxed. In short, incomes in general are likely at least to be kept up and a widespread slump in home demand is conceivable only if people spend less because they save much more ; though it is precisely what has happened in the United States, in Britain a sharp change in this direction is still highly unlikely.



*

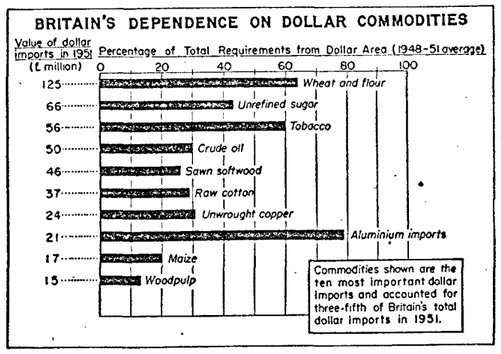


The one serious threat to the structure of full employment in Britain, therefore, still lies not in a failure of the home market, but in a slump of exports. That is indeed possible. But it could not produce a depression of the familiar kind. On paper, of course, it is true that if many workers in the export trades lost their jobs, their reduced spending would in a fairly short time induce a slump in the home market calling for Keynesian counter-measures to expand demand. But in a much shorter time, an export slump would cause Britain to run out of dollars. Imports would have to be cut again—drastically, haphazardly and catastrophically. Unemployment would be precipitated by shortages of raw materials and could not be cured by Keynesian methods. Its cause would lie in physical shortages, on the side of supply, not in monetary problems, on the side of demand ; and to stimulate demand would therefore merely raise prices and make the export slump worse.

The critical point for the British economy is—now as much as at any moment since the war—its balance of overseas payments. Jobs may be less plentiful than they were, but they are still far more plentiful than dollars. The politicians have put the crisis of solvency out of mind since March, but it is now being forced back on their attention. Both Mr Churchill and Mr Butler have spoken gravely this week. Although the catastrophic loss of dollars has been halted during the three months since the budget, the outlook for the summer is highly uncertain—and the reserve is too low to stand shocks. Bank rate apart, the Government's chief policy for closing the external gap was to restrict imports, and that weapon has proved to be blunted. The cuts are taking effect only very slowly and they are provoking more retaliation by other countries than the Government seems to have expected—and more than can be arrested by Mr Butler's appeals for understanding at Paris. The meaning of retaliation is that British exports are reduced along with British imports and the balance of payments shows little improvement. There is room for argument whether the existing degree of restrictionism in British economic policies does—on balance, and in the short run—more good than harm. What is certain is that the British problem will not be overcome by yet more restrictionism. A dash for freedom might be disastrous ; a further retreat into restrictions would certainly be.

Closing the external gap therefore now depends on expanding exports ; exports cannot be expanded in time without an industrial shake-up that must involve more transitional unemployment ; and such a shake-up cannot be achieved without some cut in domestic demand (a cut that should now fall primarily on state-stimulated outlays for such purposes as housing). The need of the hour is not fearfully to watch the unemployment figures for the arrival of a slump. It is boldly to try to expand exports at some cost in temporary unemployment—not because unemployment is anything but an evil, but because the probable alternative will before long be to watch helplessly while the number of unemployed mounts dramatically as imports of raw materials have to be cut. If the remedy is painful, no one has suggested any alternative ; and when the crisis of solvency is becoming more acute, even a weak government cannot afford to shrink from the one positive course of action open to it.

Commonwealth Development—III.



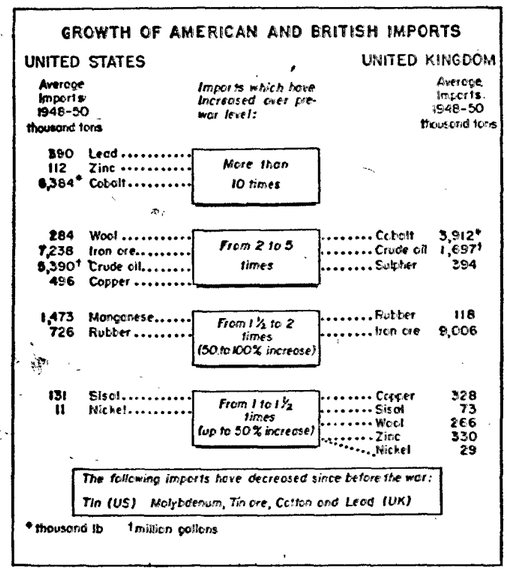
Long-Term Markets

IF the resources of the Commonwealth are to be developed, producers must have confidence that they will be able to dispose of the new or additional output over a sufficiently long period of time and at prices satisfactory enough to service and amortise their new investment. This applies to all investments by private enterprise ; it applies equally to all investments by governmental organs except the small minority of projects whose political or strategic importance is such as to warrant a permanent subsidy. Profitability depends upon costs of production relative to those of competing suppliers, and reasons were given in the preceding article for the view that Commonwealth production will not be permanently profitable unless its costs of production are as low as—or at the very best only a little higher than —those of the rest of the world, particularly the dollar area. The present article passes on to the next question. What reasons are there for believing that, even at competitive costs, there is a long-term market for greatly expanded production in the countries of the Commonwealth and the sterling area?

The United Kingdom is an obvious outlet, particularly for those products which it at present has to import from the United States or other dollar sources. There is a long list of these, covering fourteen major commodities and a number of minor ones. From the first chart it will be seen that Britain could be a large market for sterling grain—though the areas where it would be grown in the Commonwealth are limited. Sugar production is already being expanded, under long-term contracts, to what is considered its economic limit. The possibilities of substituting Commonwealth-grown Virginia flue-cured tobacco for American tobacco are also limited until the British smoker becomes less fastidious and acquires a new taste. Zinc production could be developed to replace dollar supplies, provided that smelting and refining capacity were also increased. Electrolytic refining of copper is being increased and soon the Commonwealth will supply most, if not all, of its own needs. Aluminium is to be produced in the Gold Coast, but there is little or no scope for developing the production of nickel or molybdenum or indeed of elemental sulphur, though pyrites sulphur is being produced in Cyprus. Production of American-type cotton could be increased—at considerable expense and trouble—but the scope for either softwood or woodpulp is limited. The sterling area possesses large reserves of crude petroleum, but it still lacks adequate refining capacity.

In Britain, then, there is a market for a number of primary products to replace those at present bought for dollars. But nobody would suggest that such a market is necessarily a long-term one. It exists at the moment because the dollar shortage prevents sterling from being freely convertible into dollars. If the United States were to import raw materials on an increasing scale, or if it were to become a large overseas lender, the dollar shortage would diminish, the range of convertibility between sterling and dollars would increase, and the protected market in Britain for the increased Commonwealth production would contract. The development of Commonwealth resources as a means of replacing dollar supplies can be justified only if the costs are more or less competitive with those of dollar producers. Development as part of an autarkic policy—if, indeed, the Commonwealth as a whole would tolerate it—could in the end lead only to a reduced standard of living and a contracting economy, as events have shown quite conclusively both in recent time and during past centuries.

The real long-term markets for the development of the Commonwealth exist in the steady expansion of the world economy. Expansion has been taking place since the dark ages, though the sharp rise began only with the industrial revolution. There have been periods of apparent stagnation or even decline, but the secular trend in total output during the past two centuries has been



unmistakably upwards. It is true that the consumption or use of raw materials does not rise at the same rate as the increase in manufacturing capacity or industrial output. Greater efficiency and more skilful management lead to economies in the use of primary products. But if the material standard of living of the peoples of the world is to continue to rise, production of primary materials must also expand. People who believe in developing the Commonwealth's resources must have faith in this concept of a steadily expanding world economy. Statistics can show only the expansion that has already taken place ; they cannot prove that it must inevitably continue. Again, reliable estimates of world consumption exist for only a few commodities and for only a relatively short period of time. But some idea can be obtained from what has been happening in the two largest manufacturing countries of the free world—the United States and Britain.

Since the war, the United States has become not only a much larger consumer of most if not all raw materials, but also a much larger importer. During the past thirty years it has gradually become the world's largest market for one commodity after another, and in the past three years it has become the largest market for raw wool—a position traditionally occupied by Britain. Before the war it was able to supply most of its raw material needs from its domestic resources ; it lacked only two important materials, tin and rubber. Now it has had to rely more and more on imports from overseas. As yet the proportion of imports to its total requirements for most materials

is small, and far smaller than the corresponding proportion for Britain. But because the total requirements of the United States are so much larger, it is gradually becoming the largest importer of many raw materials.

The second chart shows the increase in imports of a number of commodities into the United States and Britain in the three postwar years, 1948-50, compared with the immediate prewar years. An attempt has been made to make the figures comparable over the period of time and as between the two countries, but the comparison must be treated with caution. For the United States at any rate, the expansion that has taken place during the past decade is so great that any error that might exist in the figures cannot alter the conclusion. The United States now imports twenty times its prewar quantity of

lead and zinc, more than ten times its prewar quantity of cobalt, while imports of petroleum and tungsten are at least four times larger, those of iron and wool three times larger and of copper twice as large. Imports of nickel, tin ore, sisal and even natural rubber have also increased.

In Britain the story is broadly similar, though the increases are much more modest. For a few materials—cotton, lead, molybdenum—imports and consumption are both smaller than before the war. But imports of cobalt are five times larger than the prewar quantity, petroleum three times larger, and manganese, sulphur and rubber about twice as large. Britain's imports of food are smaller than before the war; but if rationing is to be abolished, these imports will have to be increased quite considerably. In Europe, too, consumption and imports of many commodities are back to or above their prewar levels, and if the member countries of the Organisation for European Economic Co-operation are to achieve their objective of increasing their total output by 25 per cent over the next five years, their demand for raw materials will increase by at least 15 per cent.

Where figures for the whole world exist, the rising trend in consumption is unmistakable. The development of rayon has done little more than prevent an expansion in the consumption of raw cotton; world consumption of all textile fibres taken together has increased. The development of synthetic rubber has had a like effect on consumption of natural rubber; but even so, in recent years, it has reached record levels. New materials are being developed. Titanium, a new light metal, is likely to be used in increasing quantities in the future and may compete with aluminium or even with some of the non-ferrous metals. Uranium and other minerals are being discovered to generate atomic power. New alloy metals are being developed to produce heat-resistant steels for jet engines and for use in atomic power units.

For those commodities where adequate statistics exist, it can be shown that the world's consumption of most of them has been rising during the past two or three decades at a rate which, if it is continued, would, say by 1960, reach a level far higher than potential output. And yet some of those commodities are threatened with a surplus supply either this year or next. The world, of course, might be in the throes of a recession in 1960 with an actual consumption smaller than at present. This would not invalidate the argument; it would merely postpone the increase for a few years. This paradox of the short-term surplus coupled with the long-term shortage is likely to be the major stumbling block to Commonwealth development. In a period of surplus supplies development costs are usually low, but it is only the far-sighted with a faith in the future who will accept the risk and plan to expand output to meet future requirements. This is not a new dilemma. Indeed, every previous generation has been familiar with it, and has contrived to develop the resources of the world in spite of it.

*

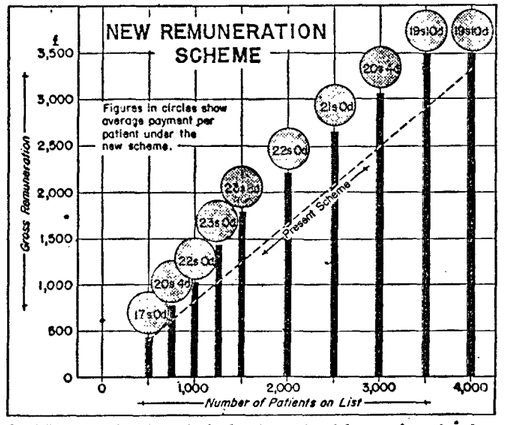
In these circumstances international agreements to prevent surpluses are of little help unless the old idea of restricting output is abandoned in favour of expanding output from existing sources and of developing potential resources. It will not be easy to get consuming countries to agree to finance the holding of stocks and at the same time to encourage production; governmental commodity schemes are subject to public opinion, and public opinion is always prone to believe that the circumstances of the moment will continue for ever. If Commonwealth development is made to await such agreements, it might well prove to be still-born.

In the short term, there are possible markets in Britain to replace some of those goods at present purchased from the dollar area. But these markets depend upon the existence of a dollar shortage and will vary with its intensity. In the long term, there are expanding markets for most primary products in the United States, in Britain and in the other industrial countries of the world. This is a belief based on current trends and it is a belief that is not difficult to accept. But primary production might have to be expanded in a period of apparent surpluses. Special international agreements might be of some help in this matter, but it would be unwise to count on them. In the past the development of primary production depended on the enterprise of individuals with little or no help from governments. But then, capital was readily available. Who will supply the capital now?

(To be continued.)

Rewards of Practice

THE method of paying general practitioners in the health service has not so far had the attention it deserves; after all, important principles are involved in the conditions offered by the state to a profession which now has almost no other market for its services. Probably this neglect is due to the complicated calculations that have to be performed by anyone sitting down to consider the question. He will soon find himself reeling. First of all one has to think of a number (the Spens Committee's recommendation for net taxable incomes); then add to it the amount, agreed or disputed, for practice expenses; then add a betterment factor for the rise in the cost of living since 1939; then add again a sum for the increase in the population; then take away a sum for doctors' earnings outside the health service, and another sum for earnings like maternity fees inside the health service. By this time one may have arrived, roughly, at the figure the Ministry of Health considers should be the central pool available for distribution.



But before the pool is distributed to local executive councils more sums, for instance mileage payments, have to be deducted. And before the councils can distribute their allocations among individual doctors, they have to take away the basic salaries for which some doctors qualify. Only after all this arithmetic does the doctor receive his quarterly cheque, based on the number of patients on his list multiplied by the capitation fee worked out by his executive council.

All things considered, it may appear somewhat odd to the layman that most doctors have always resisted so firmly any idea of a salaried service. It will be remembered that in 1948 general practitioners, with the support of their colleagues, refused to enter the health service until Mr Bevan had agreed, among other things, to write into an amending Act a promise that a full-time salaried medical service would not be introduced. Why has the British Medical Association always insisted on this, and preferred the extremely complicated and uncertain method of payment by capitation fee?

Put at its highest, this dislike of a salaried service is inspired by the determination to preserve professional independence. General practitioners lost their best guarantee of independence when, for good reasons, their ownership of goodwill in a practice was taken away by the original National Health Service Act. They lost this round to Mr Bevan, but on payment by salary they were determined to stand firm. It can be argued that the teaching profession has not lost its independence by receiving salaries from the state, and even among practising doctors there are many consultants in salaried posts. Nevertheless, the wish to preserve professional independence can only be applauded; if doctors think their independence might be threatened by the introduction of a salaried service, they have every reason to resist it.

This, however, is not their only motive for preferring payment by capitation fee. Put at its lowest, the doctors' dislike of salaries is provoked by the knowledge that they provide no extra reward for extra effort or special merit. Unlike the teachers who, even in state schools, receive higher salaries for extra responsibilities; unlike the salaried consultants, who have the chance of a teaching hospital appointment and a "distinction award," the general practitioners must all do the same work with no prospect of promotion. The conditions of work and leisure vary greatly from one part of the country to another, which is why, in spite of the introduction of the health service, some areas remain persistently under-doctored and others over-doctored. Wherever a doctor practises, his responsibilities are the same. There are no headmasterships or other plums in general practice.

This being so, payment by capitation fee is the only reasonable method so far devised which combines the security of a service financed by the state with the incentives of private practice. (Doctors could, it is true, be paid for each item of service they perform, as they are

in New Zealand and, indeed, as health service dentists are in this country. But it is a system that is open to grave abuse.) Payment by capitation fee means that the more patients a doctor has on his list, the more his remuneration, and the number of patients he has on his list is a rough index of his ability.

It should be pointed out that patients have an interest in how their doctors are paid. Most of them cherish the right to choose their doctor and, even more perhaps, to change him. But if doctors are all paid the same salaries which vary only with age, obviously they will all tend to look after the same number of patients. Idealists may believe that a good doctor always works to the best of his ability without having to have a carrot dangling before him. But this is surely putting too great a strain on the sense of vocation. General practitioners work, on the whole, in isolation. They have not got the stimulus of working with colleagues which helps to keep salaried teachers and consultants up to the mark. Patients have every reason to fear that a salaried medical service would both result in their being allocated to a doctor not of their choosing and lower the standards of general practice.

Neither doctors nor patients, however, are satisfied with the working of the capitation system since the health service was introduced. Largely this dissatisfaction has sprung from the fact that, as the Danckwerts award recognised, the central pool has been much too small and the capitation fee far too low. Because they have been underpaid for each patient, doctors have tried to take on

too many patients or to supplement their rewards from general practice by work in clinics. In either case, the standard of family doctoring has tended to suffer. So, too, has their professional independence—and the taxpayer—in so far as, for fear of losing patients, they have given certificates and prescriptions unjustifiably.

*

The Danckwerts award, which if agreed to by Parliament will substantially increase the central pool, might of itself have gone far to remedy these grave defects. But the implementation of the award has always been conditional upon an improved method of distributing the central pool, aimed at safeguarding the standard of medical service. Last week, the working party composed of representatives of the British Medical Association and the health departments, which was set up to devise this improved method, produced its recommendations. Its main proposal is that the basic capitation fee should be increased by 10s. per patient for all patients on a doctor's list in excess of 500 and up to 1,500. For patients above this limit doctors will receive only the basic fee, and if they have more than 3,500 patients on their list, they will receive no fees at all for the excess. (This maximum is, of course, raised for partnerships.)

The effect on doctors' gross incomes of loading the capitation fee is shown in the accompanying diagram. If the proposal is adopted, doctors will no longer be financially encouraged to take on more patients than they can look after properly, and those with medium-sized lists will be financially securer. A better method of providing security for the doctor starting in practice has also been devised. In under-doctored areas only, he will be eligible for an initial practice allowance chargeable to the central pool, not, like the present basic salary, payable at the expense of his neighbours' capitation fees. This allowance will be £600 in the first year, falling to £450 and £200 in the second and third years respectively. But in the second and third years the allowance will depend on the number of patients on his list. If he is not successful, he will receive no allowance. If he is so successful that his earnings exceed £1,000 in the first year and £1,100 in the second, he will also receive no allowance. The allowance, in fact, appears to be a highly ingenious method of giving some, but not too much, security to the young professional man.

What of incentives, of extra rewards for the exceptionally good doctor who has established himself? Here the working party confesses itself beaten. It could not devise a scheme, it says, which would be fair and not invidious in its application. In balancing incentives and security, the working party seems to have come down perhaps a bit too heavily on the side of security; and to have diminished too much the reward for the exceptionally able and hard-working doctor who can look after more than 3,500 patients properly. Perhaps some way of strengthening incentives will be found through the much-discussed College of General Practice; or perhaps the committee on general practice of the Central Health Services Council will make some fresh proposals. In the meantime the working party's scheme should at least ensure that the extra money to be found by the taxpayer for the Danckwerts award is spent efficiently.

NOTES OF THE WEEK

Suspense in Korea

The Prime Minister's recent statement to the House of Commons on the possibility of a new Communist offensive in Korea has been followed by the arrival in Tokyo of Lord Alexander and Mr Selwyn Lloyd for discussions with the United Nations Commander-in-Chief, General Clark. It is most satisfactory that this high-level contact should take place now, before there is any further crisis in the Far East, and it should go far to dispel the widespread belief in this country that the British Government has no say in the direction of the Korean war proportionate to its commitment. The problem to be discussed in Tokyo is that of the countermeasures to be taken if the Communists launch a major offensive. The question is a hypothetical one; the rumours of an impending offensive may have been started by the Communists themselves as a device for getting their way in the truce negotiations. But there seems no doubt that they have made good use of the eleven months of lull afforded by Allied expectations of an armistice, and are now capable of mounting a very formidable attack. According to General Clark, Communist ground strength has been increased since June of last year from about half a million to just short of a million, while air power has been doubled and now includes 1,000 jet aircraft. Soviet equipment and Soviet training have been provided without stint, and there is the prospect of a trial of strength which may present some very critical moments, not only on the field of battle, but also in international relations.

General Clark has publicly declared his opinion that if there is an offensive, the United Nations forces should react "with no holds barred." "We should," he said, "retaliate as circumstances dictate." This implies at least action against Chinese air bases in Manchuria, and perhaps also against the coastline of China from Shantung southward as a means of diverting and dispersing Chinese military and air power. If battle is joined on a large scale, the demand in America for such a widened strategy must be expected to be stronger than ever before. President Truman was able to overcome General MacArthur's opposition last year because he and his supporters convinced the great majority of Americans that the war in Korea could be won and a reasonable settlement obtained without extended operations. But if the war is renewed with even greater intensity, these hopes will have been dashed, and there might be a rapid change in the climate of opinion. General MacArthur is to be the "keynoter" at the Republican Party's convention next month, and fate could provide him with no better background for his eloquence than the clamour of fresh battle in Korea. The Communists can have an armistice today if only they drop the unacceptable condition that the Allies return unwilling prisoners to them by force; if, nevertheless, they seek again the arbitrament of arms, they will thereby issue a challenge to war without the limitations which Allied self-restraint has so far imposed.

* * *

Trade *or* Aid

At its meetings in Paris last week the Council of Ministers of the Organisation for European Economic Co-operation took a number of important decisions. Among them was the election of Mr Eden as Chairman of the Council. Both Europeans and Americans have welcomed his acceptance as a sign that Britain intends to co-operate more closely with the Continent. In fact, it probably reflects an awareness in Whitehall that the OEEC is here to stay, and also that the organisation can provide valuable support for the economic side of Nato's activities.

The Council also agreed on a compromise which makes possible the renewal of the European Payments Union beyond June 30th. The immediate problem was how to liquidate the large credit which Belgium has extended (over and above its quota) to other West European countries through EPU. This was solved by a complicated and ingenious scheme that calls among other things for the placing of Belgian rearmament orders with the union's two largest debtors—Britain and France. (The scheme is described more fully on page 767.

No one pretends that the current settlement is either a permanent or a fundamental solution to the European payments problem. Although the union has undoubtedly stimulated intra-European trade, it contains a basic weakness: the member countries do not constitute a self-balancing partnership. Except in abnormal circumstances, some countries tend to be persistent debtors, others persistent creditors. This would not matter if the debtors were able to feed into the union a steady stream of gold or dollars, but unfortunately the very countries that run deficits in EPU are those most afflicted by a dollar shortage. Thus at bottom, EPU's problem is the dollar famine.

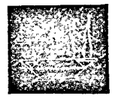
Mr Butler, speaking before the Council on the subject of the dollar gap, urged that Europe's slogan should now be "trade instead of aid." It would have been more realistic if he had said, "trade or aid." The fact that the problem is clearly one of alternatives was put very bluntly by Mr Draper, European Representative of the Mutual Security Agency, when he listed the only possible ways of solving the dollar shortage as American investment in Europe, larger American imports from Europe, or continuation of aid.

* * *

The Throne of Jordan

The illness of King Talal of Jordan—who is suffering from schizophrenia, entailing bouts of violence between periods of complete lucidity—is a personal as well as a political tragedy. It is personal because it has upset a happy home in which a competent and wise queen had borne him four splendid children. It is political because it comes at a time when Jordan, having added to itself the part of Palestine, now known as the West Bank, that teems with people who dislike the royal house, can ill afford a week throne.

When King Talal succeeded King Abdullah last September, he had already suffered from his affliction. The constitution was therefore altered to provide that, whether the sovereign be absent or present, Parliament could endow a Regency Council with sovereign powers. In May, far from well, he agreed to the creation of such a Council and went abroad for treatment, leaving it in the hands of his principal supporter, the Prime Minister Tewfik Abdul Huda. Tewfik's assumption of both offices was criticised, and on June 4th, when unfavourable reports of the King's temperamental behaviour were arriving from Paris, the Prime Minister constitutionally set about the appointment of a semi-permanent Regency Council consisting of the President of the Senate and two senators, one of them from the West Bank. The heir is Prince Hussein—sturdy and authoritative, but only 16 and still at Harrow.



There are further complications. Jordan is not, economically speaking, a viable state. It has survived only thanks to a subsidy from Britain paid chiefly to its army, the Arab Legion. This is now being supplemented by some American and UN expenditure. Locally, no one can imagine that Britain pays the piper without calling the tune, and rumour flies as to whether it does or does not want King Talal back. In fact, all depends on his health. Though much cooler towards the British than his father was, he is unquestionably the best person for the job provided he is well. But Jordan's economic frailty also makes it a prey to rumours of union with a neighbour, Iraq being favoured by supporters of the dynasty, Syria by its enemies. The Regent of Iraq, disturbed that no member of the Royal House was on the Regency Council, visited Amman last week in order to try and add a prince to its strength; he failed, and by his ill-advised intervention provided the anti-dynastic factions with ammunition. In a word, uncertainty as to the future is rife, and is all the more unfortunate in a country which is racked by the economic misery and the political restiveness of the West Bank inhabitants, as well as by an unduly large load of homeless refugees whom the western powers are supporting bodily, but not in spirit.

* * *

Labour Looks at the World

Like any other body of decent, sensitive people, the Labour party wants peace and goodwill on earth. In general its document on foreign policy prepared by the national executive committee for the autumn conference does little more than state this fact. One can therefore no more quarrel with most of it than with the Christian beatitudes. The difficulty lies—as with life itself—not in defining paradise, but in getting there.

Moreover, there is a serpent in Eden. The Labour party executive names it fairly—"the Soviet Union's uncooperative policy." Here is a state that wants only "a people's peace and goodwill" notoriously unlike the real variety. The first problem of foreign policy is thus to cope with the serpent and, after all the rumblings on the Left and in the unions, it is a relief to find Mr Ernest Bevin's prescription

ADVERTISING  WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

largely unchanged and Britain still enjoying bipartisan foreign policies over a very wide field. Rearmament, Atlantic unity, the integration of a rearmed Germany in Western Europe—all are there, even if armament is disguised as "sufficient military strength" to fulfil Britain's obligations under the United Nations, and a sop is thrown to Mr Bevan in the shape of a demand for new elections in Germany—a proposal which is very likely to be overtaken by events long before the autumn conference. Compared with this substantial agreement, the decision to press for Communist China's seat on the Security Council is a very small breach in national unity.

The serpent, then, can be dealt with. The difficulty for Labour and for Conservatives alike is that even without a serpent, the world is no Eden. On the contrary, as Mr Churchill pointed out this week, Britain stands on a "trap door" which may give way. Of this fact the Labour party executive makes no mention at all—no balance of payments difficulties disturb the pages, no need for national solvency, no hard road to follow in its pursuit. If Labour's international policy were to be judged solely on this complete unwillingness to face unpleasant fact, one might say that the statement on foreign policy is a blue print not even for paradise but for cloud cuckoo land. The relative realism, however, with which Britain's political necessities are faced leaves the hope that one day economics will receive the same treatment.

More about Sponsored Television

The exhaustive debate on broadcasting that has been carried on in the press and in the House of Lords was continued in the House of Commons on Wednesday, but without contributing anything new to the familiar arguments. An Opposition amendment, moved by Mr Herbert Morrison, regretted the Government's ultimate intention to introduce sponsored television and also the proposed appointment of governors by a committee with no responsibility to Parliament.

The Home Secretary lucidly re-examined the arguments for and against monopoly and sponsoring, and expressed faith in the good taste of the British people, who, he had the temerity to say, were much more sophisticated and mature than the Americans. He defended the proposal to single out television for sponsoring on the ground that as there was already a choice of programmes on the BBC television was the most suitable field for the experiment. This implied no fundamental objection to commercial sound broadcasting either, although Sir David Maxwell Fyfe did not, like, the Lord Chancellor, actually defend the idea. His arguments were no answer to the important criticism, of which too little has been heard, that the proposals will further separate television from sound broadcasting, when they ought to be drawing together.

The Government has been held to the proposals for commercial television by the vigorous pressure of some of the back benchers, who showed in the debate that they were determined to hold ministers to their promise. But opinion in the Conservative party is certainly not unanimous. The motion approving the White Paper was carried, but there was a three line whip, and with Labour and Liberal members solidly against it there seems little doubt that if the vote had been free the proposals for sponsored television would have been rejected.

* * *

Official Spokesman

Mr Churchill learned his politics long before anyone had thought of public relations officers, and he has regarded the practitioners of this new craft with a good deal of wariness. His speeches have certainly needed no "ghosting," and the procedure of parliamentary questions makes anything like the weekly press conference of the American President unnecessary for British Prime Ministers—though what a master of this technique Mr Churchill would have been. It is not surprising, therefore, that the Prime Minister has decided to drop the post of public relations adviser at No. 10 Downing Street, and to transfer the functions of official spokesman to Lord Swinton, Chancellor of the Duchy of Lancaster, who is to be assisted by an able civil servant.

To make a politician responsible for this work presumably means that he will be given the fullest authority, equivalent to that of a Minister of Information, to expound the main lines of Government policy. The task of a modern British government is so complex that ample information and honest and expert guidance are essential if the daily press, working at high speed, is to put the issues accurately before the public. Fifty years ago the central themes of politics, such as Home Rule, Free Trade and Protection, or the future of the House of Lords, were broad and straightforward enough for their presentation to be safe in the hands of politicians; but today, when a change in a complicated schedule of railway fares, or even a reshuffle of the fare stages of London buses, can become matters of Cabinet decision and produce major political rows, the spokesman's task is one for the specialist. Mr Attlee met this situation by creating the post of public relations adviser at No 10. Its first holder had almost the status of a minister and certainly helped greatly to smooth the Labour Government's path in its earlier days. Mr Churchill can have had no political reason for altering the arrangement. The established civil servant who held the post last October no doubt had Mr Churchill's respect; he was a forthright opponent of appeasement in the days when he wrote leaders for the *Yorkshire Post*. But the Prime Minister would have none of these new-fangled arrangements. For some months the situation was allowed to drift; the outcry from within the Tory ranks at the inadequacy of the Government's public relations has brought about the present change. Its success or failure depends, above all, on whether Lord Swinton has the authority to give the papers adequate information and explanation.

Development and Misdevelopment

The development of underdeveloped territories, the raising of the standards of backward peoples, the conquest of hunger and want, the exorcising of the Malthusian devil by the beneficent magic of western capital and western techniques—all these are ends, or aspects of an end, of which everyone is in favour in the same sense as Calvin Coolidge's preacher was against sin. But just because the need is so obvious, just because the practical difficulty of raising and applying western resources is so great, little thought has been spared for the underlying, almost philosophical, question: what is the relationship between "development" as a social process—the growth of attitudes, tastes, skills, standards, social structure—and the "development" represented by the growth of capital equipment? The latest in the series of essays in international finance, published by Princeton University,* discusses this question at a high level of abstraction and generality; but the author, Professor S. Herbert Frankel, is much more than an armchair student of colonial problems.

To confuse or actually to identify the two processes is, he asserts, the way to economic waste and political disaster. "Capital" as a homogeneous mass of wealth is merely an accounting abstraction; "capital" in its various concrete

IN THE HATTON GARDEN WORKSHOP of a scientific instrument maker, in 1895, strange new pictures were thrown on a magic lantern screen — pictures that *moved*. What may have seemed merely an intriguing novelty to the admiring witnesses was, in fact, the first commercially practicable film projector to be made in this country — the Theatrograph. Its inventor was Robert W. Paul, one of the purposeful men who made the 1890's a period of promise unique in our history. Another was Albert E. Reed, who that same year began to make super-calendered newsprint and other printing papers at Tovil, near Maidstone, having converted an almost derelict straw mill acquired the previous year. Expanding his paper-making business with the energy and enterprise so typical of the times, he founded one of the largest paper-making organisations in the world. For to-day the four mills of the Reed Paper Group, with its unrivalled technical experience and resources, produce more than a quarter of a million tons of paper a year — newsprint, printings, Reed's famous Aylesford Kraft and other kinds of wrapping papers.

PIONEERS IN MODERN PAPER TECHNOLOGY

WISE WORDS

On April 22nd, speaking at a dinner at the Savoy Hotel, London, Lord Hollenden, the President of the Wholesale Textile Association, said:

"Clothing prices are as low today as they are likely to be for a long time to come. Indeed it is true to say that textiles and clothing are being sold today at prices below their true value and at prices at which they cannot be replaced."

On May 1st, Mr. Peter Thorneycroft, President of the Board of Trade, said in Parliament:

"I agree that there are very good bargains to be had in the shops and I wish people would buy them."

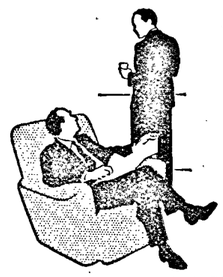
Look on the building site

. . . or in the garden

. . . you see DURALUMIN

REGD. TRADE MARK



Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

Have you considered the advantages light alloys can bring to your business? You may perhaps not have heard all the latest developments. A request to us to call upon you would place you under no obligation whatsoever.

forms depends for its income-generating power on its relation to the whole economic and social order in which it finds itself. It is itself an influence in shaping that order, but not the only or the most important influence. A metropolitan or international planning organisation can appropriate capital sums, and direct capital goods to underdeveloped territories, by a series of central decisions; but no central decision can "develop" the society in which they are to function in the sense of bringing into being "new, socially acceptable, patterns of co-operant behaviour." And it is this unforeseeable, unenforceable, indigenous growth which settles what sort of capital is wanted and what, therefore, will "pay," whether in terms of net income yield or of local welfare.

This argument is all extremely abstract, particularly when flanked by a rigorous discussion of the meaning of income and the concept of welfare. But it links up with the highly practical conclusions of those field workers who have evolved a double rule-of-thumb test for the acceptability of development projects: does it meet a want which the people concerned actively feel? Is it a job in which the people concerned can actively participate? In his plea for a decentralised, flexible, sensitive and harmonious endeavour, Professor Frankel speaks for a great number of wise men with dirty boots.

*

So much cannot be said for the report,* published this week, by a committee under the chairmanship of Mr Harold Wilson. It pleads that capital should be put into the underdeveloped areas at a rate rising to £5,000 million a year; Britain's fair contribution to this total might well be £350 to £400 million. The arguments for so heavy an investment —arguments both from principle and from self-interest—are powerful and are mostly well put. Whether it could best be done through an ambitious "International Development Authority" is, to say the least, highly questionable. But what is really disturbing, in a report addressed to the developed countries who would do the investing, is that the meaning of such an effort to them is hardly considered. Plainly it is the duty and the interest of Britain to participate heavily in overseas development. But to do so is to export more than Britain imports; it is to have a surplus instead of a deficit on the balance of payments. What policies are the Labour party's thinkers willing to devise, and to advocate to their constituents, in order to make the British economy capable of providing a regular surplus for overseas development? Until they are realistic about this, the advocacy of large-scale help to underdeveloped countries is nothing but sentiment.

* * *

Germans Embarrassed by Prosperity

The obvious ways in which their economy progresses are becoming an embarrassment to the Germans. It was realised with some anxiety that an unfortunate impression would be created at the London debt conference by the *Bank Deutscher Laender's* recent decision to reduce the discount rate to 5 per cent. The move was unexpected, as only a few months ago the Bank had expressed grave concern at the large volume of short-term credit. Since then, however, stocks have been reduced and credits correspondingly paid off. The Bank took its step chiefly in order to create a margin between the discount rate and the interest which will be offered in public capital issues. Its decision was part of a move to recreate a market for capital investments. The signs are that the time is now ripe for approaching the public if the return on capital is made sufficiently attractive. Savings in the first quarter of this year were 71 per cent of the total for 1951.

The *Bank Deutscher Laender* is a very cautious institution. It had certainly good reasons for declaring that its action would not lead to a dangerous expansion of credit or an importing spree. Germany's position in the European Payments Union suggests that the lowering of the rate was indeed a good move, if it fosters imports without causing a flood. When Germany was a large debtor in the EPU the Bank raised its rate. Now the situation is reversed. In May the Federal Republic was the largest creditor in the Union. Its surplus for May was $66 million, against $35 million in April. Half of this amount was paid in gold, making the total payment received by Germany in gold or dollars $67 million.

Dr Erhard, the Federal Minister of Finance, is now conducting, with the support of bankers and economists, a campaign for convertibility of the D-mark. The D-mark is now so strong that there is almost no difference between free market and official rates of exchange—a remarkable success for a currency which was launched in 1948 as nothing but paper without even a signature on the notes, let alone reserves behind them. However, lack of adequate reserves still prevents the Germans from letting loose their currency. Convertibility of the D-mark in the EPU area would amount to total liberalisation, and would only be feasible if the United States were to raise their contribution to the union.

Mr Zapotocky Complains Again

Mr Zapotocky, the Czechoslovak Premier, must by now have become accustomed to denouncing the failings of his fellow-countrymen in the mines, the foundries and the factories. It is always difficult to say how far these denunciations are a true reflection of the industrial scene and how far they are deliberately exaggerated in order to galvanise the workers into fresh efforts. But there is no reason to doubt the substantial accuracy of the gloomy pictures that Mr Zapotocky invariably paints. In his latest statement, made at the end of last week, on various production deficiencies and labour shortcomings, the main burden of his reproof fell on the trade union organisation for which

Diphtheria Immunisation

The results of the diphtheria immunisation campaign are illustrated below. Unfortunately, the success of the campaign hitherto in eliminating diphtheria has encouraged people to think that immunisation is no longer necessary. The number of babies immunised in 1951 was well below the number necessary to ensure the elimination of diphtheria as an epidemic disease.

* "War on Want." Issued by the Association for World Peace. One shilling.

he himself is largely responsible. He complained that the trade unions did not conform to Comrade Stalin's definition of "a link between the masses of the workers and their vanguard—the Communist party." The socialist reconstruction of industry and agriculture was being hindered by a lack of initiative on the part of the trade unions which could only be remedied by their thorough reorganisation. In particular they are to be kept more firmly up to the mark through closer supervision by the party organisations in the factories; in future, the latter are to devote at least two-thirds of their work to trade union matters.

A particular reason for the renewed alarm of the Czech Communists over the labour front would appear to lie in the situation in the Ostrava coal basin, where a huge new industrial complex and a new "socialist city" are under construction. It is plain that things here are not going entirely according to plan. Coal output is lagging; there is a serious labour shortage; and work is being seriously hampered by the failure of factories in other areas to produce promised supplies of machinery, equipment and building materials. The troubles at Ostrava are endemic throughout the country; but every effort is being made to impress upon workers elsewhere their patriotic duty to make what contribution they can to the completion of the Ostrava project. For, in the words of a leading article in *Rude Pravo*, "without Ostrava's steel, iron and coal, our country would be weak and her defence would be compromised." The special urgency now being given to Ostrava is, indeed, most probably a reflection of the stepping-up of Czechoslovak defence production in response to demands from Moscow. In a speech several weeks ago, Mr Zapotocky boasted that his country's defence preparations were proceeding apace, but he admitted that they called for "great working efforts and financial sacrifices."

* * *

Defence by Night

The Air Ministry has for the time being silenced critics of its night fighter policy by signing an order last week-end for the delta-wing Gloster fighter, still inelegantly designated the GA. 5. The RAF is better equipped in this respect than the other Nato countries, and it has greater experience in this form of combat than any other air force, including the American. But this only serves to underline the general weakness of Europe's night defences. The principle of defence against atom bombing is that the lone bombers should not be allowed to approach their target; in the case of this country they must not be allowed to cross the coastline. But the best that Britain can put into the air against such night attacks are Meteor and Vampire night fighters—both aircraft that will soon be taken out of production; there is also the prospect of some Venom night fighter squadrons next year. These aircraft are no longer fast enough to provide a reliable defence system, although the widespread belief that the Russians are no better equipped has encouraged a good deal of misguided complacency.

The fact that the Americans have met no serious night fighter opposition yet in Korea means only that Russian night fighters are being reserved for defence nearer home. A study of postwar Soviet aircraft* suggests that single-engined jet night fighters with performances approaching that of the Mig 15 are in squadron service, and at least two formidable twin-engined night fighters are coming into production—both likely to be faster than any British night fighter that will be in service during the next two years, but considerably slower than the new Gloster fighter.

This fighter, which will be the first delta wing aircraft to be put into production anywhere in the world, made its first flight only six months ago; because of its size and complexity, it may be as long as four years before it is in service in reasonable numbers. Until that time, British night defences must continue to give cause for alarm.

* "The Soviet Air Force." Asher Lee.

* * *

Too Many Dockers

In his foreword to the National Dock Labour Board's annual report for 1951 Lord Crook, the chairman, points out that the situation has changed radically this year. In 1951 the books showed a favourable balance; operating costs were less than in the previous year—in spite of higher wages and prices and a larger number of workers. This was due to a very high demand for labour, so that only 6 per cent of the dockers were proving attendance—that is, drawing pay without having any work to do. The board was able to pass on the benefit by reducing the rates of levy from which the dock labour scheme is financed. But now, Lord Crook says, the board

> finds itself in a position in which it is carrying large surpluses of labour. This factor, coupled with the increased costs due to the new holiday and wage rate agreements, means that the board has been operating at a loss.

The dramatic change came at the beginning of the year, but already in the last quarter of 1951 the shortage of labour had become less acute. The board had been resisting local pressure to raise the "sanctioned strength": the right solution was to take on temporary workers for short periods. But in some ports there was resistance to their employment, and the total registered labour force was allowed to rise from 77,000 in the first quarter of 1951 to 81,000 in the fourth quarter. As a result there are now on an average between 9,000 and 10,000 workers proving attendance each day—more than twice as many as last year.

The rate of levy has been raised again; recruitment has been stopped, and dockers who leave are not replaced. But the board has not yet declared any men redundant. It does not want to be stampeded into doing this because trade may pick up and because it thinks it must not undermine the decasualisation that is its *raison d'être*. It is afraid to upset labour relations—which, however, have shown an unusual degree of harmony and discipline since the shadow of unemployment has reappeared. But to wait for last year's volume of trade to return seems a costly policy. In the meantime, the burden of 10,000 idle dockers adds to the cost of British exports at a time when their markets are in no condition to stand it.

* * *

Counting the Shops

The nation of shopkeepers has been shy of its label. No complete count of Britain's shops had been made before a survey taken in 1950, the results of which were published this week.* There are 551,214 ordinary shops—one for every 89 persons—which, for the size of the population, is nearly half as many again as in the United States. When restaurants, hairdressers, repair shops and garages are added, there is one retail business for every 69 persons.

It is a pity that the figures cannot really be as tidy as the comprehensive statistical tables would suggest. The aim of the survey was to provide a mailing list for the Census of Distribution forms and the enumerators who tramped the streets had to judge the main business of a shop from its windows. There must have been many a small store, in towns as well as villages, which hovered uncertainly on the list. Nevertheless, this survey should provide a truer picture than any estimates have done before. It may not cause surprise that women and children can choose their clothes at three times as many shops as men can; but that there are more hairdressers than greengrocers needs more explanation.

Shopkeepers are densest in Lancashire. For its size Blackburn has more shops than any other town, followed closely by Burnley and others. The north-west as a whole has more shops for a smaller population than Greater London, and this is true not only of the total but of nearly every type of shop except fishmongers—presumably ousted by the fried fish shops—and men's shops. Nothing is said about the size of establishments but it seems that the small independent trader still thrives in the north.

In the most concentrated business area, the City of London, there is one shop for every five residents and one restaurant for every twelve. Many comparisons whet the curiosity. The literary reputation of Oxford seems to be at stake when Southend-on-Sea can boast 4.7 booksellers and stationers for every 10,000 of its inhabitants, as against Oxford's 4.2. Cambridge may be a man's town but Bournemouth has relatively more men's wear shops. Stepney has 13.4 hairdressers for every 10,000 people, while the more fashionable Marylebone has only 12.8. Social investigators may well draw from such figures many hares to chase.

* * *

Technicians for Under-Developed Areas

The demand of the world's underdeveloped countries for all kinds of help with their economic and social problems is practically boundless. This is made clear in the latest report of the United Nations Technical Assistance Board which has been submitted for discussion at the current session of the Economic and Social Council. Pakistan alone, for example, has sought help from the Board in a wide range of fields—rural under-employment, land tenure, industrial welfare, cement production, highway construction, medical training, and slaughterhouses. The Board reports that from the start of the aid programme in July, 1950, to the end of 1951, 797 technical experts were sent out to 75 under-developed areas. Some 845 men and women drawn from 46 countries and territories have been sent to training institutions abroad. The amount spent on the programme to date is approximately $12½ million.

Among the dozens of specific projects described in the report are several examples of how the under-developed areas themselves have contributed to the programme. Thus, the ILO has provided additional instructors and fellowships for Brazil's National Service of Industrial Apprenticeship (SENAI) in Sao Paulo. In turn, the Brazilian Government has offered 100 fellowships to technicians from other Latin American countries for study in SENAI schools.

A number of difficulties that beset the United Nations aid programme in its early stages are disappearing. By now many under-developed countries have had general surveys of their economy carried out, at least a semblance of a development plan exists, and some attempt has been made to centralise these activities. As a result, UN officials tend to be less bombarded with unco-ordinated appeals from individual ministries and institutions.

Of the troubles that remain the worst is the existence of at least five other schemes for extending technical help to under-developed countries. These include the bilateral aid programmes of the United States, the regional schemes of the Colombo Plan and the Organisation of American States, the programmes instituted by metropolitan governments in non-self-governing territories, and the technical aid activities of the International Bank. Machinery has had to be set up to guard against overlapping, and there is the constant problem of finding enough competent technicians to go round. The contributors to the various technical aid funds are also faced with the embarrassing task of deciding which of the sponsors to support. The under-developed areas can no longer complain that the rest of the world is indifferent to their difficulties. But the quality of their teachers will not be assured until there is a thorough-going rationalisation of all technical aid programmes.

* * *

Bolivia Uses the Tin Opener

Last week the deadlock which had paralysed Bolivia's exports of tin ore to the United States for eight months was broken ; and the day after the first American freighter arrived

Bigotry at Oxford

For some time past rumours have been prevalent of an intention on the part of a section of Oxford graduates to bring forward a third candidate for the purpose of ousting Mr Gladstone from the representation of that University. The project is strongly condemned by a large number of members of Convocation. Among these are 20 double firsts, 92 classical firsts, 24 mathematical firsts, 102 classical seconds, and 8 mathematical seconds—in all 246—besides many who took less eminent honours. Mr Gladstone's opponents, on the contrary, are stated to be nearly all men unknown to fame, either at Oxford or in the world. Nevertheless it appears that they have succeeded in finding a candidate . . . in the person of Dr Marsham, Warden of Merton College—a gentleman of whom little is known except that he represents a class of opinions now seldom found except in a fossil state, and that some years since he earned for a few weeks an unenviable notoriety by jocularly describing millions of his then famishing fellow-citizens as men who "rejoiced in potatoes." . . .If Oxford wished to give the world the measure of its backwardness . . . it could not do so more effectually than by this opposition to the return of Mr Gladstone. If it desired to ring its own knell, to pronounce its own sentence, to sign its own death-warrant, to seal its own fate, to write its own epitaph, as an obsolete and incurable institution—it could not more effectually realise that desire than by rejecting one of its greatest ornaments in favour of one of its most insignificant materials. The present is a critical moment for that ancient and venerable seat of learning: the public has of late manifested a strong opinion as to the desirableness of a reform in its discipline and laws ; . . . and precisely this moment is seized by a fanatical portion of the University for quarrelling with one of the most respected and most credited of her sons—one who . . . does honour to the influences to which he has been subjected, and bespeaks gentle treatment and sincere respect for an *alma mater* which can turn out such *alumni*.

The Economist

June 12, 1852

at the Chilean port of Arica to load Bolivian ore, it was announced in Washington that the United States had recognised the government of Señor Paz Estenssoro, which had seized power early in April. But this recognition was not the only gain that President Paz sought to achieve by resuming the tin shipments; indeed, the Washington decision was almost bound to follow after the speedy recognition of the new regime by most other Latin American governments. More important to Bolivia was the economic recovery which increased tin exports could provide. The Paz government was all the more alive to this fact because its success in overthrowing its predecessor had been largely due to the latter's failure to end the depression caused by the deadlock.

But President Paz's realistic approach to the question of sales to the United States does not imply that his government will abandon its intention of nationalising the larger tin mining companies. An official commission has been instructed to report within four months on all aspects of nationalisation; and as a first concrete step in this direction, the Paz government last week assumed the monopoly of all exports of minerals. Even if the President himself were to prefer a more cautious approach to this problem, it is doubtful whether he would prevail against the doctrinaire extremism of Señor Juan Lechin, his Minister of Mines, whose grip on the Bolivian trade union federation puts him in a strong position to carry through his policy of following "the example of Persia." The outcome will depend primarily on the contest of personalities within the revolutionary government; and it is unlikely to be long delayed.

* * *

Preserving the Churches

Britain's churches have fallen into a sad state of disrepair. According to a report published recently by a commission appointed by the Church Assembly,* it will cost £4 million in the next ten years to put them in order, over and above what the parishes can raise themselves. Of 15,000 churches nearly a quarter are in need of structural repair, and most need more money spent on them than is likely to be raised in the parish. This general decrepitude is mainly due to the enforced postponement of repairs since 1939, but the amount of maintenance work needed is in any case becoming greater; the smoky atmosphere of the towns eats into the fabric, and buildings put up some 100 or 150 years ago—some of them architecturally admirable but structurally poor—are beginning to need constant attention. The commission estimates that after the accumulated repairs have been done, the annual cost of maintenance, at present prices, will be some £750,000.

While the Church may be able to raise an annual sum of that size from its resources, the £4 million needed in the first place will indeed be hard to find. The commission thinks it may be possible, however, if a national appeal is made through a trust for the Preservation of Historic Churches. If all else fails, the churches would have to ask for help, and in that case the commission hopes that it would be given unconditionally, as it is to the University Grants Committee and the Arts Council. But this should be a last resort:

> There is to-day a prevalent tendency to look to the state to solve all the problems of life, individual and corporate. The Church should set an example in trying to manage her own affairs without recourse to the state.

The Church would prefer that, rather than consider giving money, the state should take less away. There will be sympathy with the commission's view that money bequeathed or given under deed of covenant for church repair should be exempt from death duties and tax. Yet all proposals for nibbling at the revenue, however good the cause, must be regarded with great suspicion. Certainly it must be hoped that the appeal which will no doubt follow the commission's report will rouse the general response of which it is worthy.

Books and Publications

The Great Society

Declaration of Faith. By Herbert Agar. *Collins.* 222 pages. 12s. 6d.

Few people in 1952 will quarrel with Mr Herbert Agar's discouraging description of the Atlantic Community today. "We strengthen each other with arms, grants and pacts, while weakening each other with tariffs, quotas, currency controls, prohibitions of immigration and every convenient device for making our total Western Economy inefficient." Nor will many people in the West deny that more than common funk, more even than the most enlightened self-interest, is needed to change this factious group of nations into a genuine and lasting Atlantic unity.

Great changes in political and social organisation occur not only when economic techniques are modified but chiefly when determined men and women stamp their vision upon the new material—as Lenin did in Russia, or the Founding Fathers in America, or Gregory the Great at the dawn of the Middle Ages. An Atlantic Community will not grow simply from quick transport, modern communications, the dollar gap and the pressure of Soviet imperialism. It will grow because people believe in it and have a vision of its purpose and efficacy.

But what can that vision be? It is to this question that Mr Agar's "Declaration of Faith" is directed, and in rapid, rhetorical and often eloquent writing, he suggests that the foundations of such a vision can be found in Western tradition, in the concept of a Great Society to which "the monstrous fiction"—absolute national interest—is subordinate and which is based upon the concept of a natural law transcending individual interests and individual states.

This concept of order and brotherhood is a noble one, and Mr Agar has little difficulty in showing what calamities have befallen the Western world when absolute state interest and the overriding of all notions of justice have led the nations into wars of "unconditional surrender." The Greeks in the fourth century BC courted disaster as certainly as the Byzantines in their struggle against Bulgaria or the nations of Europe in the Thirty Years War.

Yet in spite of the relevance of Mr Agar's aim and in spite of his obvious sincerity, the book does not fully achieve its purpose. The weakness lies in the problem of which audience it addresses. For those who share Mr Agar's beliefs, the book is to some extent a résumé. As he himself suggests, "the reader may wonder why he is led down such well beaten paths." On the other hand, the unbeliever, the nationalist, the cynic, the fellow traveller, or even the active member of the Senate Committee on un-American Activities will find little to convince him—little beyond a quick sketch of history which he will find largely incomprehensible and a profession of faith which he does not share. Perhaps the greatest obstacle to the growth of the Atlantic Community is this break in the communication of ideas, and the technique of bridging it does not emerge in Mr Agar's study.

Yet if he does not overcome the formidable gulf, the attempt is a brave one. Faith and courage are infectious things, and Mr Agar's robust defence of a great tradition will hearten others and encourage them to make their own "declaration of faith."

The Strength of the West

The Defence of Western Europe. By Drew Middleton. *Frederick Muller.* 255 pages. 15s.

What harm can be done to a serious writer by a publisher's blurb? When one reads that the views of an author are fearless and his analysis ruthless one is set off looking for intellectual arrogance, generalisation beyond reason, and a desire to shock and impress. Mr Middleton is too good a journalist to commit these faults, though he sometimes sails a little close to the wind. He drops very easily into the future tense when talking about war with the Russians, and there are some general statements about strategy and national character that only a journalist would dare to put on paper.

There are also instances here and there where he appears to have been the victim of a headquarters point of view or of a hand-out. For example, to take the now burning question of General Ridgway's lack of reserve divisions: he takes over *en bloc* the French version of their reserve mobilisation methods and compares them with the British to the latter's disadvantage. There is much that is wrong with British readiness, but Mr Middleton can be certain that the two Territorial divisions of which he speaks would be equipped and capable of fighting. Does he really believe that this is true of the French reserve divisions or that the French could produce twenty divisions for the line thirty days after an emergency has begun?

Statements like this make one doubt the accuracy of his other judgments. If he had said a little more often "It is claimed that" and had occasionally given reference to a source, the reader would have been able to discriminate between first-hand and second-hand information. Likewise Mr Middleton is a little rash in his economic judgments. Did the Three Wise Men really say that rearmament was already seriously threatening the economic health of Europe? It is more likely that they found the fears of governments on this score eight months ago somewhat exaggerated.

These are all familiar pitfalls of reporting, and for the rest there can be nothing but praise for the sharpness and balance of the general picture that the book presents. Its attention is well distributed: three chapters about Russian and satellite strength, on the whole encouraging provided the West tries hard enough to make itself safe; two on the international army and its command; three chapters on the American, British and French army contributions, an excellent one on the "calculated risk" of rearming Germany in which he describes the tactics of the Pentagon as "bull-headed"; and a very judicial and worrying chapter called "If War Breaks Out To-morrow," which means any day this summer.

It may fairly be complained that Britain's power is much underestimated: the engineering industry, which can set an example to the Americans with the Centurion tank and the Comet, is surely worth a mention, and Mr Middleton might recall that we still have a navy. But if the author's selection of facts is sometimes curious, his shrewd judgment and refusal to think wishfully are reassuring. His conclusions are worrying, but the story he tells shows that the West, while being nervous about its weakness now may well feel confident about the future—provided it is given the time and takes the trouble.

Informing the Commonwealth

Consultation and Co-operation in the Commonwealth. By Heather J. Harvey. *Oxford University Press* for the *Royal Institute of International Affairs.* 411 pages. 30s.

This is a handbook designed to provide reference material about the machinery of the Commonwealth. It follows a previous work with an almost similar title, the significant difference being the inclusion of the word "British" last time. This was published in 1934 by Gerald Palmer, also under the auspices of Chatham House. While the current volume delves a long way back where necessary, its main aim is to cover in detail the developments which took place between 1934 and 1951. The book is in three parts. The first shows how the machinery of consultation has grown up; the second is devoted to defence, outlining in particular the changes which have taken place in methods of co-operation since 1939; and the third part covers Commonwealth participation in international action, through Uno, in the war and now in the North Atlantic Pact.

For anything as intangible as the Commonwealth, it is sometimes surprising how large a case history exists. On the other hand, this peculiarly British institution has grown up by the thoroughly British method of adding precedent to precedent; and it is this form of development that provides the subject matter of the present book. The day-to-day working of the Commonwealth consists mainly of the exchange of information. But, as Miss Harvey points out when quoting Lord Bruce in 1948, while the information now goes out from Britain to the other members "in an almost unlimited flow," the return flow is very much smaller and exchanges between other members are almost negligible. If the Commonwealth is to remain a living force while changing from an organisation of which Britain was the permanent chairman to something more like a club in which all are equal, more may have to be done to stimulate these other streams of information and consultation. It is characteristic of the change, as Miss Harvey suggests, that the last imperial conference was held in May, 1937, when King George VI ascended the throne. Since the war there have been "meetings of Commonwealth Ministers."

In spite of the need for as wide an area as possible of Commonwealth defence co-operation, the most important section of Miss Harvey's book is Part I, which deals with the machinery of consultation. Here she gives in concise and readable form the answers to all the questions of those, both in and outside the Commonwealth, who are baffled by its elusive political quality. Her facts range from the first

Ten Great Economists

discussions about an imperial conference in 1903 to the recent entitlement of High Commissioners to be "Your Excellency," from an account of every ministerial meeting of any consequence to a description of all the permanent organs of the Commonwealth—though it is a pity that more could not have been said about the Commonwealth Liaison Committee. Now that the nature and extent of Commonwealth membership are as fluid as at any time in the past, this up-to-date summary is most opportune.

The Changing Law

Law and Social Change in Contemporary Britain. By W. Friedmann. *Stevens and Sons.* 322 pages. 37s. 6d.

"And yet it does move." The Communist and the Western worlds differ widely in their view of the function of the courts. The Anglo-Saxon lawyer bristles at the notion that the courts are, and must be, obedient instruments of state policy. The Communists must wonder at, disbelieve or regard as an inefficient anachronism the spectacle of a supreme court sitting in judgment on the right of the chief executive in a state to order such a vital industry as steel production to remain at work. Even Mr G. R. Strauss once expressed horror at the idea that a mere regional traffic commissioner could overrule a decision of the central executive. And, since the division between the two schools of thought is so important, both tend to exaggerate the virtues of their own beliefs. The importance of this book is that Professor Friedmann is both able and willing to steer a middle course, to retain his judgment, to accept that a legal system is not and cannot be outside the social and economic structure of its society and yet that it must apply tests other than those demanded by the immediate policy requirements of the executive.

Three things should be said about this book. The first is that it is hard to imagine anyone better qualified to write it. Professor Friedmann has won legal degrees at three universities, London, Berlin and Melbourne, and is now Professor of Law at Toronto. He is a continental lawyer who has absorbed the atmosphere of the Anglo-Saxon common law in Britain, Australia and Canada. As Lord Justice Denning says in his preface, "he teaches us more about ourselves and our law than we ourselves knew." The second is that the problems the book discusses are all essential aspects of the uncompleted changes within the modern state: the relations of the public corporation and the private individual; the powers of, and checks on, the new economic giants, such as the trade unions; all the tensions and conflicts that arise within what is loosely called the welfare state.

The third thing to be said about this book is that Professor Friedmann does not lack either influence or disciples (which, perhaps, is very much the same thing). Lord Justice Denning may, with respect, be described as one. In his judgment in the case of *Lee* v. *The Showmen's Guild of Great Britain*, it was the social aspect of the problem before the court that was very much to the front of his mind. That case concerned the rights of a domestic tribunal within a trade union to expel a member. Had the member any redress in the courts and, if so, what? "These courts," Lord Justice Denning said, "intervene every day to protect rights of property. They must also intervene to protect the right to work." It is most unlikely that those two sentences would ever have been found in any judgment delivered fifty years ago. It is difficult to avoid the cliché that this is a book which everyone responsible for or interested in public affairs should read.

Is Kensington Human?

From a Garden in London. By Henrik v. Ringsted. *Jonathan Cape.* 279 pages. 15s.

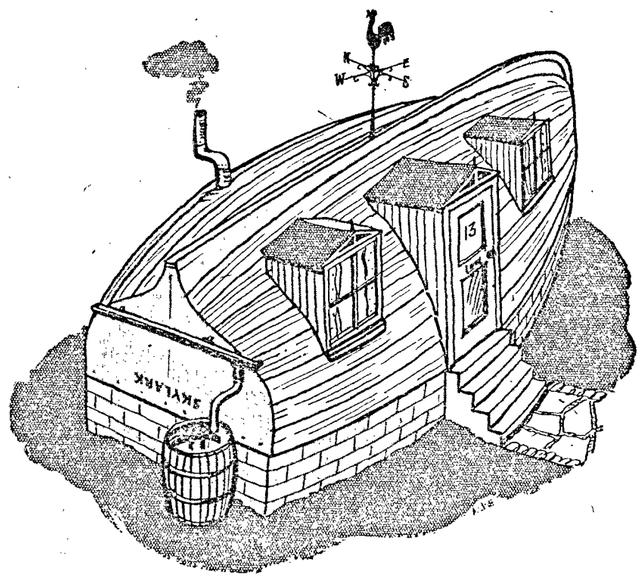
Yes, it is, says Hr. Ringsted in this most kindly, sunny, perceptive, but unsentimental book. So is London as a whole, though to confound Kensington with London would be a great mistake. So are Londoners and the English, though it would be a rash Dane who would claim to understand them completely, even after long acquaintance. Go slowly; cultivate your garden (seven yards twelve inches by nineteen yards) and your "local" (waiting, with serene patience, for the day when you will graduate as a "regular"); take a firm line with your own natural irritation over draughty doors or leaky roofs, demented street-numbering systems, medieval garbage collection, boldly conceived exterior plumbing, and similar peculiarities of the island race; learn to appreciate cats and the ritual of weather conversation; and you will find London and Londoners not only human but even, within limits, admirable.

Hr. Ringsted's book was written in the first instance for his fellow countrymen and especially for the benefit of Danish war brides—whom he warns, incidentally, that England is a man's country where women are kept in their place. If he overstresses this aspect of British life, there are others on which he lets us off extraordinarily lightly. To write as he does of London River without even pointing the deadly contrast with Copenhagen's harbour—where the racing eights skim over clear blue water under the gantries and the cargo boats are as clean and trim as the sailing dinghies in the yacht basins ten minutes from the city's centre—argues a real generosity.

On the other hand, is it—can it be—really true that the English type is most faithfully depicted, as Hr. Ringsted says it is, in the cartoons of Giles. On the other hand again, how delightful and how salutary to read the unvarnished truth about regulation girls' school tunics; what a relief to find that Coventry Street appears a less nauseating spectacle to a civilised foreigner than it does to a civilised native; and with what inarticulate cries of assent does one hail the general remarks on "tourism" and the "tourist trade" which adorn the final chapter. Perhaps, somewhere in Copenhagen, on a flower-garlanded balcony, some urbane and keen-eyed Englishman is gathering the materials for a book as sound and entertaining as this. Perhaps; but one doubts it.

Turkey Transformed

The New Turks. By Eleanor Bisbee. *Pennsylvania University Press.* (London; *Geoffrey Cumberlege*). 298 pages. 40s.



Modern Turkey deserves more attention than it gets in the West. This is not just because it is able and willing to play an important part in the defence of the free world. Even more is it because the transformation of Turkey over the last thirty years from a backward and disintegrating section of the old Ottoman Empire into a strong, democratic modern state is in itself an absorbing and important story. Miss Bisbee, who from 1936 to 1942 was Professor of Philosophy and Psychology at Robert College and the American College in Istanbul, has set out in this book to make the new Turkey and its people better known in the West. Her survey includes the origins and history of the republic, its physical characteristics, its political, economic and social institutions and its relations with its neighbours.

Not content with all this, the author gives a comprehensive account of the customs, character and activities of the Turks. Very little seems to have escaped her, from marriage customs to behaviour at football matches, from children's games to the Turkish sense of humour. Indeed, there are moments when the spate of information, not by any means all of equal value, gives the book something of the appearance of a guide-book. But Miss Bisbee is rarely dull, and she is not content merely to record what she has observed. She judges and criticises with scrupulous fairness, balancing praise for all that has been achieved with a realistic estimate of the magnitude of the tasks still to be tackled. But it is a pity that the impact of this interesting book should be deadened by its very undistinguished style and its complete lack of all literary graces.

Critical Biography

Ten Great Economists. By Joseph A. Schumpeter. *Allen and Unwin.* 305 pages. 21s.

The ideal critic, like the ideal actor, must be able to achieve a very difficult blend of close self-identification with the subject and of the most deliberate and objective detachment. Neither the partisan who lends all his gifts, however great, to the uses of partisanship, nor the dispassionately hostile evaluator—however acute—of error and failure, is doing the whole of a critic's work. There must be interpretation before there can be assessment, and to interpret, the critic must think and feel himself into the performer's mind and nature; but assessment is needed too, and to assess and evaluate the critic must be free from the spell to which he has deliberately subjected himself. Inability to perform this feat may matter little when criticism relates to a single

Pickford's Manchester and London Fly Van, 1826

IT was not until 1754 that Manchester and London were in direct communication by coach. The Manchester "Flying Coach" did the journey between Manchester and London in four days. The growing rivalry between Manchester and Liverpool was now clearly discernible in that four years later the Liverpool "Flying Machine" was put into service, to travel the 206¼ miles between Liverpool and London in three days.

THE mutual interests of the two great Lancashire cities, Manchester and Liverpool, were strengthened when Martins Bank Limited (formerly the Bank of Liverpool and Martins Limited) acquired the Palatine Bank in 1919 and the Lancashire and Yorkshire Bank Limited in 1928.
The retention of local control under an influential Board of Manchester Directors preserved to customers intimate and prompt attention to their requirements.

achievement or failure, a point of technique, a particular judgment or misudgment; it matters intensely when its subject is a whole life-work and the man accomplishing it.

In this posthumous collection of essays the late Professor Schumpeter reveals himself as possessing the critic's specific gift to a very high degree. It has more scope in the masterly and substantial essay on Marx (reproduced from 'Capitalism, Socialism and Democracy" and occupying nearly a quarter of the book) than in the six-page obituary article on Walras, translated from the German original of 1910; though even this, which might have been no more than a graceful conventional tribute from a young writer to a respected and regretted senior, shows the same sureness and sense of perspective as do the longer studies, such as those on Marshall, Pareto, and—last of the ten—Keynes.

Personal biography and exposition of theory are combined in different proportions. The essay on Taussig, a lifelong friend, is predominantly biographical, that on Böhm-Bawerk, though touched with the warmth of personal acquaintance, is predominantly analytical, But the two elements are always there, strengthening and sometimes explaining one another. Sometimes, indeed, one may feel that too much is laid upon their interaction. True as it is, for instance, that Keynes's theory was always closely related to his preoccupation with current events, it is too sweeping a denial of their more general validity to say that "practical Keynesianism is a seedling which cannot be transplanted into foreign soil; it dies there, and becomes poisonous before it dies." These feelings, however, are matters of stress and degree. This is an illuminating, stimulating, and highly civilised book.

The Last Chartist

Ernest Jones: Chartist. By John Saville. *Lawrence and Wishart.* 284 pages. 25s.

This annotated selection of the speeches and writings of Ernest Jones, prefaced by Mr. Saville's scholarly biographical introduction, throws much-needed light on the personality and ideas of the last leader of Chartism. Jones was born in 1819, the son of an equerry to the Duke of Cumberland, who was his godfather. Nothing in his background and early years foreshadowed his conversion to Chartism. He had had literary ambitions and had been called to the Bar in 1844. Yet, from the time of his adherence to the Chartist cause, around 1845, he became one of the most militant of its leaders; he spent the years 1848-50 in grim imprisonment for seditious behaviour; throughout the fifties, he kept alive, almost single-handed, what was left of a dying movement. Disillusionment with independent working class action then drew him closer to the growing Radical movement of the sixties, but his death in 1869 robbed him of the place his undoubted gifts might have earned him within its ranks.

Ernest Jones is a remarkable illustration of the truth that men are the prisoners of their times. The circumstances of the fifties doomed him to failure as a leader of labour. He preached social revolution to a working-class that had turned away from it; he was a militant political organiser when both militancy and political organisation had been replaced by trade unionism geared to limited aims, primarily economic, as the typical form of working class action. Jones was also one of the few Englishmen of his time who knew both Marx and Engels well and who sought a solution to the national and international problems of his day with reference to an approximation of Marxist doctrine. Mr Saville prints an entertaining and instructive selection of the Marx-Engels correspondence relating to Jones; it shows the hopes they placed in him and the disappointment they felt at his deviations.

This book is a useful contribution to the understanding of the causes of Jones's failure to make a serious impact on his time, and of a period which is the least well-known, yet one of the most crucial, in British working-class history.

Letters to the Editor

Which Law for Korea?

Sir,—Before starting his meticulous examination of the uncertain and obscure, Mr Hobsbawm might have spared one glance for the obvious. Many of the recusant prisoners are voluntary deserters. The shotgun wedding is a ludicrously false analogy for these men.

In fact, if you wanted an example of a man exercising a free choice, the deserter from an army in the field would be hard to beat. And since a man who makes a free choice is entitled to asylum, even according to his own ungenerous logic, Mr Hobsbawm's case collapses.—Yours faithfully, H. B. BARWISE

Oxford

Better British Films

Sir,—One of your recent notes on the film industry says that it has still to be demonstrated that a high quota of British films for exhibitors to show "by hook or crook," will result in the production of sufficient good British films. This seems to me an over-simplification of the problem. The quota system was conceived in 1925 as a means of protecting the British film production industry from competition of American films, which had already met their production costs in their home market and which could, therefore, undercut our pictures. The quota became law in 1927, when the first ten-year Cinematograph Films Act was placed on the statute book. But the Act also introduced a renters' quota which required all renters who imported films to foot the bill for a proportion of British production.

The exhibitors' quota and renters' quota, working together, not only protected the native industry, but also ensured the production of British films for the cinemas to show—until Gatt forced this country to abolish the renters' quota from October, 1948. The whole weight of the quota was thus placed on the shoulders of the exhibitors, who, unlike the renters, had (with very few exceptions) no connection with and no experience of sponsoring production. The 1948 "Quota" Act also absolves cinemas from such an obligation, because, far from forcing them "by hook or crook" to fulfil their quota, it makes provision for exemptions from the quota, if they can demonstrate that the films are not available to them. This has been interpreted by the Board of Trade in a manner generous to the cinema owners.

The National Film Finance Corporation from its inception recognised the key position of the renter in film production. But the Board of Trade, in allowing the renters' quota—and, incidentally, any other comparable means of protecting British film making—to become contrary to international agreement, has been less wise.—Yours faithfully,

CHRISTOPHER BRUNEL

Gerrards Cross

Productivity After the Teams

Sir,—In the "Business Notes" of your issue of May 10th you refer to the Scottish Productivity Panel as an independent body acting apparently without consultation with the British section of the Anglo-American Council on Productivity.

The action of my board was the outcome of a plan made two years ago which was taken stage by stage. The board arranged for the American Consuls-General in Scotland to speak to its district committees on the facilities offered by that service in exporting to the United States. The district committees followed up these meetings by sponsoring firms dealing with productivity, but it was soon realised that firms in themselves were not enough. A Scottish panel was considered last autumn and discussed with a representative of the Anglo-American Council, and with the American Minister. Every step taken was made known to the constituent bodies of the Anglo-American Council, who gave the warmest support to the Scottish scheme. I fail to understand, therefore, how it can be said that this board acted without consultation.

The rest of your comment is again misleading. At the conference, industrial consultants were asked if it would be possible for them to take part in advising the proposed panel, and representatives present volunteered at once to assist in every possible way. In conclusion, may I add that it is the intention of the board that the panel should act in conjunction with the British Productivity Council when that body is set up.—Yours faithfully,

CHARLES MURDOCH, Chairman,
Scottish Board for Industry

Glasgow, C.2

AMERICAN SURVEY

Mister Eisenhower

Abilene, Kansas

THE most difficult of the decisions now facing Mr Eisenhower may well be very different from those which General Eisenhower had to make. What these decisions are, and what may follow if they are wrongly taken, could be glimpsed during the jamboree at Abilene, Kansas, last week when Mr Eisenhower set sail upon the political flood-tide.

Arriving back in his pleased and exhilarated home town in the middle of America the newly demilitarised Ike, now dressed in a light summer suit and panama hat, was led to the place where the Eisenhower Museum is to be built. Here, close to the railway tracks and next door to the splendidly ordinary white frame house where his boyhood was spent, there was a foundation stone to be laid. With this ceremony went a little speech which would be of such limited national interest beside the big political speech he was to make five hours later that Mr Eisenhower had not even prepared notes for it.

It was something he could do supremely well: it was about his father and mother, and about their belief in the Bible and in the simple theory that so long as you did your best with the material the good Lord gave you there was no need to worry or fear, because the good Lord Himself would provide whatever else might be necessary. Mr Eisenhower spoke eloquently and with much feeling. Memory, he began, was bound on such an occasion to turn backward; and in fact

> this day eight years ago I made the most agonising decision of my life. I had to decide to postpone by at least twenty-four hours the most formidable array of fighting ships and of fighting men that was ever launched across the sea against a hostile shore. . . . The greatest break in a terrible outlay of weather occurred the next day and allowed that great invasion to proceed with losses far below those we had anticipated.

The afternoon wore on and there was a parade past him with high school bands and drum majorettes, and cowboys and tableaux "depicting incidents from the life of Mr Eisenhower"; and then it rained immoderately so that the Eisenhower stadium was a morass of mud and sodden people when the moment came to start on the big speech. With the lightning still flashing across an ominous sky there seemed little reason to expect any memorable display of enthusiasm from the crowd. But there were bursts of clapping, cheering and horn-honking from time to time as Mr Eisenhower read the speech, and one of the loudest spontaneous reactions of approval came when he reached a passage in which he said:

> The mystery must be removed from foreign relations—our essential requirements and objectives must be clearly set forth for us and all others to read and comprehend. Americans instinctively and properly dread the kind of secrecy that surrounded Yalta.

The fact that this passage had been included appeared, to many of the Washington correspondents present, to be an almost perfect example of the new decisions Mr Eisenhower is now being required to take. A candidate for the Republican nomination could hardly expect to succeed without a word of criticism of the Democratic Administration. But there is plainly a choice of grounds upon which the Administration can be attacked—a choice ranging all the way from those springing from pure conviction to those dictated by pure demagoguery.

There was no proof at Abilene that someone had advised Mr Eisenhower that it would be a good thing to assail the secrecy at Yalta, that there was a lot of public feeling about it, and that a candidate who took the critical line on it could rely upon a ready response from his audience. But to some of those present it looked as though he had been pressed to do this for political reasons. It looked that way because a military man would not need to be told why a wartime conference between heads of states could not be satisfactorily held under klieg lights in Madison Square Garden; because there was an uncomplicated military reason why decisions reached at Yalta had to be kept secret for some time after the conference ended; and because, of all the inexpensive methods of securing applause from a crowd recently devised by either political party, this is probably the one which least bears examination on either ethical or factual grounds. As a General, Mr Eisenhower understood this; as a politician, he had decided to overlook it.

*

Mr Eisenhower is not the first and will not be the last candidate who has been confronted by arguments that powerful support can be won, and advisers can be kept sweet and happy, by playing the game in what is usually called the professional way. But the first week of the political career upon which he has embarked so late and so conspicuously has made it clear that, while he enjoys advantages most other candidates labour half a lifetime to secure, he is bereft of many of the defences that are developed during a normal apprenticeship in politics.

The American audience is inclined to yield to any politician who has played his role for some years the right to do and say expedient things when he feels that occasion requires it. Loyalty to the party is usually accepted as a reason why certain manœuvres have to be carried out, certain promises have to be made, and certain insincerities have to be uttered. But it is doubtful whether the audience will extend the same indulgence to Mr Eisenhower—at least not immediately. He has responded to "a clear call to duty": he appears, late in the play, "in response," as the Governor of Kansas put it, "to the hopes and prayers of millions of Americans . . . seeking a leader summoned by destiny." At the Abilene press conference, with no advisers at his elbow and no carefully phrased sentences to drop into any text—on his own, inspiring the conviction that by force of rugged character and vigour of bearing he will be able to overcome all obstacles—he was very nearly irresistible, even to the newspapermen who were supposed to be submitting him to ordeal by fire.

The trouble is that to be irresistible to the professionals in the Republican party, without whose aid he is unlikely to be nominated, Mr Eisenhower must develop his role rather differently. Senator Carlson of Kansas threw light on this aspect of the Eisenhower homecoming when, in briefing correspondents on what had happened during visits to the candidate by Republican delegations from neighbouring states, he said that some of them had asked Mr Eisenhower whether he was "an organisation man." Senator Carlson reported happily that Mr Eisenhower had assured them that he was indeed an organisation man and was "going to work with the precinct worker, the county chairman, the local captain and all the rest" of the party officials.

The question is not whether Mr Eisenhower will be doing anything discreditable by appearing as an organisation man: the question is whether he will be staying in character. His fellow organisation men, and particularly those in stations more exalted than precinct worker, county chairman and local captain, are likely to make upon him demands which it may not always be easy to reconcile with those of the clear call to duty. Mr Eisenhower cannot expect to win the nomination by spurning the advice he receives from the men of experience who are staking their own political futures upon him. Yet he will be jeopardising the very foundations of his strength whenever it becomes obvious that he is proclaiming any but his own thoughts and convictions. The most important of the new decisions he will be called on to make in the next month will be those which determine the relationship between the advice he gets from the professional politicians and his own instinct, his quality of character and earnestness which, when he makes it evident, lifts him to a point at which he is by all odds the most attractive figure on the present political stage. He has to decide how to balance advice against instinct, how to make himself attractive enough to the Republican professionals to secure the nomination without making himself so unattractive to the American voters that he wins the nomination and yet loses the election.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes

Steel Shuttlecock

When the high hopes of a negotiated settlement of the steel dispute collapsed unexpectedly on Monday, President Truman at once threw the ball to Congress. He went in person to ask it for power, which the Supreme Court had said only Congress could grant, to seize the steel industry and run it until a wage agreement had been reached. But the Senate, which until then had been busily drafting various seizure plans of its own, at once threw the ball back to Mr Truman, and requested him to use the power he already had and get a court injunction against the strike under the Taft-Hartley Act. The House has not yet confirmed this request but it seems unlikely that the President will be able to escape from doing something which he has told Congress would be unfair to the steel workers and the worse of the two possible methods of securing essential steel production, assuring equal treatment for both sides in the dispute and encouraging them to settle their differences. But he has at least shifted the blame for invoking the Taft-Hartley procedure, so much disliked by labour, from his shoulders to those of Congress and has given new life to what has in the past been a useful election issue.

It will be some days before an injunction against the steel strike can be obtained, for first a fact-finding board must certify that the dispute endangers the national safety. While the steel workers are unlikely to disobey the injunction openly, they may not work very whole-heartedly when they go back. Nearly 90 per cent of the steel industry is now shut down and manufacturers are having second thoughts about their optimistic forecasts of having enough steel on hand for a month or more of full operations. Already certain types of steel, especially the alloys needed for jet aircraft, are becoming scarce and all exports have been banned except for defence purposes. The trade union and the steel companies are, however, working out a scheme for continued production of the steel needed for essential military needs, which may mean for the Korean war only.

Once an injunction has been obtained against the strike, it will last for eighty days, but there is no reason to suppose that a settlement will be any easier to reach after this further delay than it is now after months of negotiation. With all the publicity that has been given to the dispute it has become almost impossible, for reasons of prestige, for either side to make concessions. The collapse of bargaining on Monday apparently came not over wages—a "package" increase of about 21 cents an hour seems to have been tentatively agreed—but over the union shop. The steel workers insist, and the companies refuse to agree, that all employees should be required to join the union within a month. The Wage Stabilisation Board endorsed the union shop in its controversial recommendations on the steel dispute and Congress, in renewing the Defence Production Act, is punishing the board for this excess of zeal by confining its activities directly to wage questions.

* * *

After the Primaries

While Mr Eisenhower beams upon his party's delegates, hoping to unfreeze the hard, calculating uncommitted hearts of the Pennsylvania and Michigan delegations, and bring the 390 votes he is promised closer to Senator Taft's 460, the Taft machine has been busy elsewhere. The choice of General MacArthur to make the keynote speech at the convention—the opening address which sets the party's sights and fixes the meeting's tone—is one more sign of how strongly the Taft supporters are entrenched in the party organisation and how ruthlessly they will exploit their advantage. General MacArthur, despite his uniform, is an open supporter of Senator Taft; so is Mr Walter Hallanan, who will be in the chair when the vital decisions are made whether to admit pro-Taft or pro-Eisenhower delegations from the contested southern states. Senator Lodge, for Mr Eisenhower, has spurned Senator Taft's offer of a "reasonable" compromise of these disputes, a compromise which, it seems probable, would concede Georgia's fifteen votes to Mr Eisenhower and retain the lion's share, those from Texas and Louisiana, as ill-gotten gains for Senator Taft.

There is an ominous parallel with the convention of 1912, the last occasion a partisan keynoter was chosen, and the scene of steamroller tactics by Senator Taft's father which split the party disastrously. If sharp practice by Senator Taft's organisation secures him the nomination, many indignant Eisenhower supporters would refuse to vote for him. But the evidence of the always-small primary vote, such as it is, suggests the parallel should not be pressed too far. Theodore Roosevelt in 1912 carried most of the primaries—the elections in which voters may express their preferences for candidates—before he was frozen out at the convention. This year Senator Taft and Mr Eisenhower have each carried six, though the latter's miraculous write-in in Minnesota, his near-victory in the isolationist state of South Dakota, and his heavy totals in the big states suggest that his popular appeal more than makes up for Senator Taft's months of hard work. The evidence in the Democratic primaries is similarly inconclusive. Senator Kefauver's almost unbroken string of victories make him look like the people's choice, but in all but two states the people were not given any real choice; there was no opposition.

The state primaries, in fact, have proved as inadequate a tool of popular government as their critics alleged early this year when a valiant attempt was made to institute a national presidential primary. There have been primary elections in only sixteen states. But even in these, the leading contenders have subjected themselves to the voters' scrutiny only when it suited their own books. In Maryland, anxiety to avoid antagonising Governor McKeldin kept both Senator Taft and Mr Eisenhower on the side-lines. In some states voters were allowed to write in names not on the ballot and forgiven for grievous spelling mistakes; elsewhere they were not. The rules of the game, varying in every state, confused candidates almost as much as voters. Yet now that the primaries are over, it seems all too likely that the Bills for a national primary will be forgotten, until it is too late in 1956, and the traditional smoke-filled hotel room of the bosses will remain the only place where a clear decision is to be had.

* * *

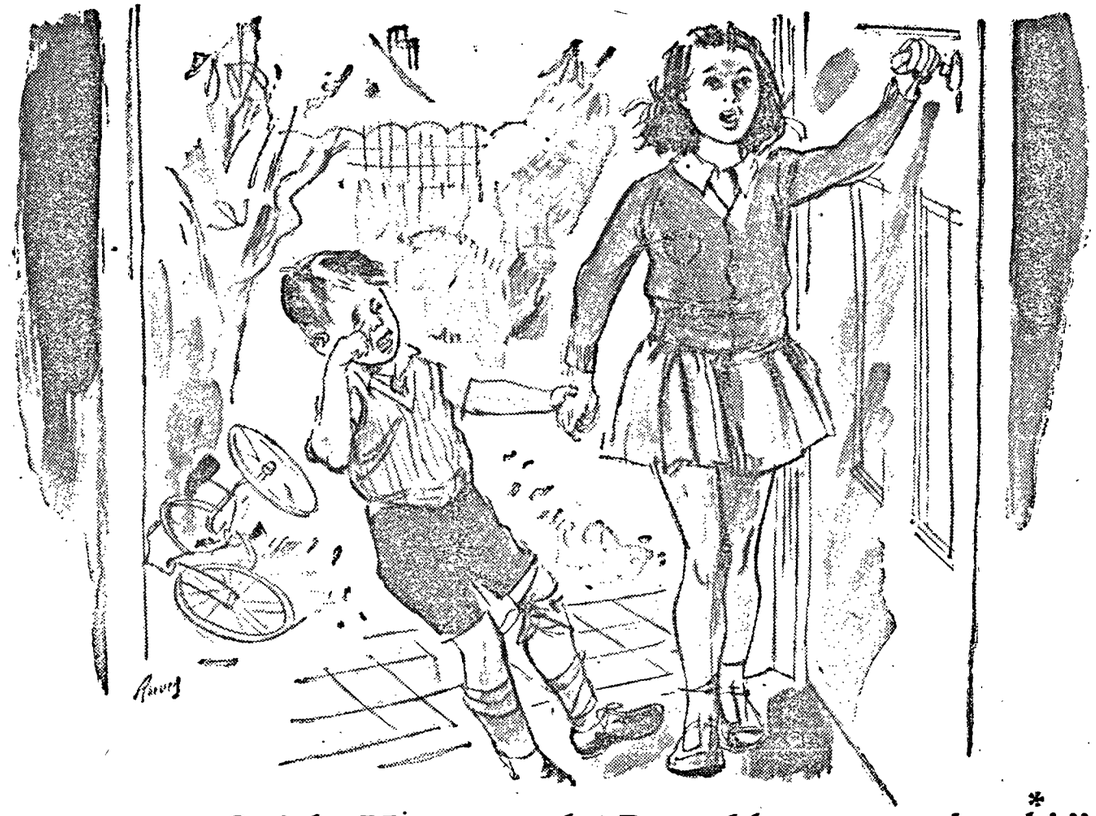
Mischief in Copper

The Administration hopes that Senator Fulbright's amendment to the Defence Production Bill, authorising American participation in the International Materials Conference, may deflect the torpedo aimed by Senator Ferguson at the fair sharing of scarce materials. The Senate accepted the Ferguson amendment last week, over the protests of its Banking Committee and, if the House follows suit, the President will not be able to save the IMC from a premature extinction. To veto the whole Bill would simply end all controls on June 30th, just as Congress is preparing to adjourn for the political conventions. What may save the IMC is the realisation that if small businesses, schools and hospitals lose out in a new scramble for copper—the only one of the three major metals which is still really scarce and the one which the amendment is designed to free—Congress would be presenting Mr Truman with a first-class election issue which he could be trusted to make the most of.

The amendment sponsored by the Senator from Michigan, the big automobile state, provides that if the domestic supply of any commodity covers the needs of defence, foreign military aid, and the stockpile, as that of copper does, buyers will be free to buy all they can abroad; that no price ceilings shall be imposed on imported materials; and that, if the domestic supply of any material is enough to meet all domestic needs, no allocations whatever may be imposed. The first clause would not only abolish international control of copper; it would also make it impossible to guarantee supplies, under the Controlled Materials Plan, to defence-supporting industries and civilian users in the United States. The last clause would deprive foreign countries of any incentive to share their nickel, cobalt, and other still scarce materials with the United States by making it impossible for the United States to guarantee them supplies of sulphur. The only beneficiaries would be the big automobile companies who, unlike other producers of civilian durable goods, are raiding their next quarter's supplies of metals to take advantage of a brisk market.

Republicans have tried energetically to pin the blame for American unemployment, in Detroit, for example, on the IMC quotas. But, as far as copper is concerned, these allocations have not been taken up in full because buyers, under price stabilisation, could not pass on the world price. They are now permitted to pass on most of it, a decision taken to mollify Chile and revive the flow of copper from that country, which in May decided it could no longer sell 80 per cent of its copper to the United States at a price lower than that in the free market. But strict allocations continue, and to the irritation of mills which have had access to domestic copper, priced artificially low, the government proposes to use the machinery to spread the burden of higher foreign prices fairly over all mills. If it offers a subsidy instead, the demand for throwing off all restraints may subside.

Foreign Aid Halfway



The mutual security programme for the fiscal year that begins on July 1st has now reached the halfway point in its Congressional course, if not in good condition, at least in better condition than might have been expected in the heat of this election year. An expenditure of $1.5 billion less than the President requested has been authorised, and it only remains to appropriate as much of the money as Congress can be induced to provide. This is unlikely to be as much as the full authorisation, for the Taftian economisers in the House of Representatives agreed to a compromise on the authorisation with the more generous Senators only in order to waste no time before they got their second chance of making cuts. And on appropriations the Senators, anxious to end the Congressional session, will be ready to agree to most, if not all, of the cuts that the House imposes.

The compromise on the authorisation was reached halfway between the totals voted by the two Houses and provides $4.6 billion for military, and $1.8 billion for economic, assistance. The main weight of the cuts fell on Europe, but no one has yet publicly assessed whether they are so severe that they will "discourage our friends and encourage our potential enemies" as Mr Eisenhower earlier predicted. He has been invited to give evidence on this point before the Appropriations Committees, but he has not yet said whether he is going to take this opportunity of debating with Senator Taft on what is one of the main issues between them.

MUTUAL SECURITY FUNDS FOR FISCAL YEAR 1953
($ million)

	Requested	Authorised
Europe		
Military aid	4,070	3,416
Defence supporting aid	1,819	1,282
Near East and Africa		
Military aid	606	560
Economic and technical aid	196	181
Asia and the Pacific		
Military aid	611	565
Economic and technical aid	468	321
American Republics		
Military aid	62	58
Economic and technical aid	22	20
Multilateral technical and other assistance	30	28
Administration	75	not known
TOTALS (rounded figures)	7,900	6,400

The figure for Africa and the Near East includes $60 million for Arab refugees and $70 million for Jewish ones. There is also $9 million for assisting Europe's surplus peoples to migrate and $16.5 million (not included in the total) for the United Nations Children's Fund. Senator McCarran saw to it that Spain got $25 million in addition to last year's $100 million, as yet unspent. The Senate, more lavish with money than the House, was also more lavish with unsatisfactory amendments, most of which were struck out in conference. Senator Kem failed at the last moment to reimpose his notorious ban on trade with the Soviet satellites, and all counterpart funds will not after all have to be set aside for buying strategic materials for the American stockpile. But $150 million in counterpart funds is still to be made available for stimulating free enterprise and productivity in Western Europe by means of loans. Another amendment rejected by the conferees would have hamstrung technical aid to India and Pakistan, and some of the teeth were drawn from Senator Dworshak's amendment which would have prevented "propaganda" in the United States and thus have stopped Americans being told what was being done with the money they are providing for mutual security. Finally, and most important, it will again be possible this year to switch up to 10 per cent of the funds from military to economic aid or the reverse.

"Quick, Mummy—the Parachlorometaxylenol!"*

Heaven forbid that eight-year-olds should ever learn to talk like that! Yet this germ-killing chemical with the formidable name will be helping to protect them during their lives. Antiseptic fluids and disinfectants play a vital role in reducing the danger of disease and the threat of death through infection. Monsanto germicides which are the active ingredients in these preparations are used in hospitals, surgeries and homes throughout the world.

Monsanto makes important contributions to countless other industries, too—with an ever-growing range of versatile chemicals and plastics.

* *This chemical, and Cresantol 3 and Cresantol 15 (Registered Trade Mark), are germicides produced by Monsanto for many applications, including the manufacture of antiseptic and disinfectant fluids.*

Krilium Comes to Market

Krilium, the remarkable new synthetic soil conditioner which is hundreds of times more effective—and many times more expensive—than humus, has gone on the market in limited quantities almost a year before the Monsanto Chemical Company had expected it to. What has forced Monsanto's hand is the flood of new producers, anxious to exploit the great public excitement shown when Krilium was unveiled six months ago. Those interested have been offered a great "one-time only" five-pound pack of Krilium for $6.95, enough to condition approximately a twelfth of an acre, while other producers have been sternly warned that Monsanto will protect its patents.

The Monsanto Company insists that the present Krilium is not based upon acrylonitrile, as are its competitors, Fluffium, Acrisoil, Agrilan and others; it is an improved formula, employing a modified vinyl acetate maleic acid compound, raw materials in plentiful supply and under Monsanto's own control. This is taken as an answer to the refusal of the American Cyanamid Company, sole big producer of acrylonitrile, to continue to supply Monsanto. Monsanto itself is building an acrylonitrile plant in Texas and it declined, it is believed, to give the Cyanamid Company a long-term contract for supplying the chemical to Monsanto companies for the manufacture of Acrilan, one of the new wool-like synthetic fabrics. Acrylonitrile is also used as a base for certain rubbers and plastics.

With so versatile a chemical, the problem is to decide which is the most profitable use. The Cyanamid Company has already been selling its own soil conditioner, Aerotil, in bulk to smaller processors and distributors—something which probably did not improve its relations with Monsanto. Even the synthetic textile companies which are going into the acrylonitrile business to provide raw material for their fabrics, and have invested nearly $200 million in the new fibre plants, may be tempted into soil-conditioning. By the middle of next year it is expected that there will be ample acrylonitrile output to support a production of 140 million pounds of acrylic fibres.

* * *

Paper Pinch

To newspaper publishers in the United States it looks as if newsprint producers in Canada are using the strength of their dollar to exploit their near monopoly. The United States, taking nearly 6 million tons of newsprint a year, over half the world's supply, gets 80 per cent of its needs from Canada. On Sunday the price it has to pay to Canadian producers goes up by $10, for the second time in a year, to $126 a ton delivered in New York. The increase applies only to exports to the United States and the reason given is that a year ago the present price of $116 a ton was worth $123.40 in Canadian money, but is now worth only $113.50, since the Canadian dollar is at a premium. This justifies the $10 increase, in the opinion of Canadian government officials, especially since, as they pointed out in reply to a strong protest from the United States Price Administrator, the cost of producing newsprint has also gone up by an additional $10 during the past year.

The increase will, however, cost newspaper publishers about $50 million a year, and it may finally drive them to break away from their dependence on Canada, as they have long talked of doing. Already the mobilisation authorities had decided that, in the interests of a free press and a plentiful supply of information, an expansion in newsprint production was essential to the defence programme. Tax concessions have been offered to facilitate an increase of 494,000 tons in the present US newsprint capacity of a little over 1 million tons a year, but so far only about three-quarters of these concessions have been taken up. The Department of Commerce has now promised a Congressional committee that it will do all it can to encourage existing and potential producers of newsprint to expand further. Lack of capital and high costs have always been the main difficulties; the tax concessions will help and it has also been suggested that newspaper publishers might form co-operatives to manufacture newsprint. A good deal of interest is being shown in paper made from materials other than wood pulp; bagasse, from sugar-cane waste, seems particularly promising and would do much to ease the shortage of newsprint in Latin America as well as in the United States.

The demand for newsprint might, of course, be reduced, as well as the rise in costs covered, if prices and advertising rates were increased, for both of these are now thought to be as high as the market will bear. But this would drive many smaller newspapers into bankruptcy; it is expected that the latest increase in the price of newsprint will be more than some of them can stand. In the last forty years the number of daily and weekly newspapers in the United States has been halved and the most disquieting aspect of this trend is that many towns now have only one paper, or two owned by the same company. Continuation of newspaper competition in Cincinnati, Ohio, has, however, just been assured by the enterprise of the employees of the *Cincinnati Enquirer*, which was to have been sold to its chief rival, owned by the Taft family. The employees, with the help of a steel company, managed to raise the $7,600,000 needed to top this bid and are now running the paper themselves. They insist that they were inspired to make this great effort not by political opposition to the Tafts, but by devotion to a free press.

Shorter Notes

The Treasury's latest long-term non-marketable bond issue turned out to be even less attractive than had been expected. Offered at the low rate of only 2¾ per cent, it obtained just over $300 million from private investors, instead of the $3 billion that had been hoped for, and the experts who had said that a rate of at least 3 per cent was needed were proved right. The consequence is that, during the coming period of deficit financing, the Treasury will have to rely on short-term issues purchasable by banks, which will have a directly inflationary effect on the economy.

*

The National City Bank of New York, surveying the leading American industrial corporations, finds that, when judged by the value of assets at the end of 1951, the largest is the Standard Oil Company of New Jersey, worth $4.7 billion, followed by the General Motors Corporation and then the United States Steel Corporation, both in the $3 billion class. The bank points out that, far from being the preserve of a privileged few, many of these companies have more shareholders than they do employees. Standard Oil of New Jersey, for example, has 254,000 shareholders and only 120,000 employees, while General Motors has about 470,000 of each.

*

The citizens of Washington, DC, have been condemned by the Supreme Court to remain captive to broadcasts of music and advertisements in the city's public transport vehicles, and as a result of this decision passengers in other cities will probably also be sold into bondage. The Court, reversing a decision of the Court of Appeals, ruled that these broadcasts did not violate free speech or deprive passengers of their right to privacy; Mr Justice Frankfurter did not participate in the decision because his feelings were too strongly engaged as a victim of the practice. The National Citizens' Committee against Forced Listening is now turning to Congress for relief.

THE WORLD OVERSEAS

The Soviet Press—I

One Voice from 8,000 Journals

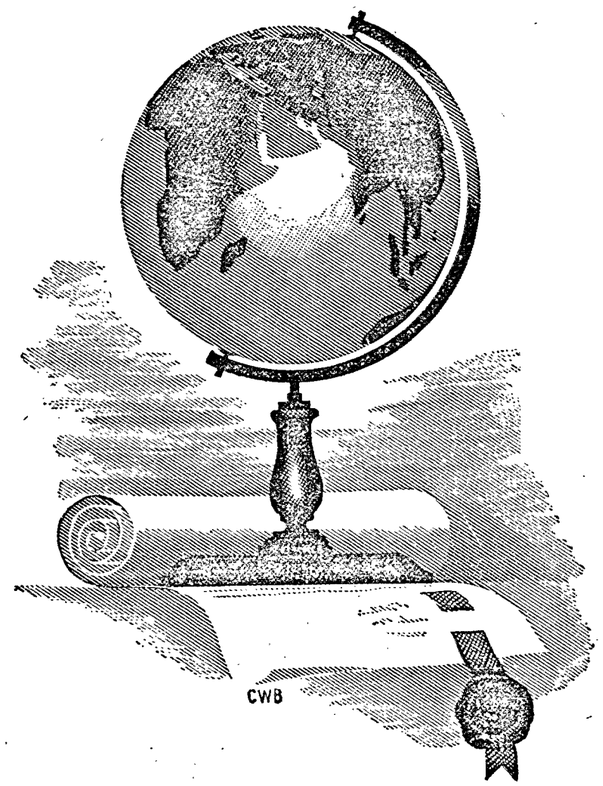
SEVERAL weeks ago the Soviet Union celebrated its annual Press Day, which commemorates the anniversary of the foundation of *Pravda*. Soviet commentators described the path travelled by *Pravda* since its foundation forty years ago and, in general, the growth and spreading influence of the whole Soviet press. There can indeed be no doubt that it has advanced with great strides. In 1913 the whole Russian press was selling less than three million copies daily. Now, it is claimed that the average circulation has reached 40 million copies. The figure is inflated as it includes journals published twice or three times a week. All the same, the daily circulation is probably above 30 million and one daily paper for six or seven persons is quite an achievement in a country, where not long ago three-quarters of the population were illiterate.

Yet what it has gained in power and circulation the Soviet press has lost in spontaneity, critical spirit and independence. The early Bolsheviks made no bones about the fact that their journals were an instrument of revolutionary struggle. But within these limits there was still wide scope for brilliant writers, lively polemics and acute criticism. Stalin realised the importance of the press in the struggle for power and the danger of a critical press for his dictatorship. Hence the press had to fit into the general pattern, and change with the rest of Soviet society. From a lively, restless weapon of revolutionary propaganda it was progressively transformed into a powerful but blunted and docile instrument of a stratified bureaucratic state.

But although much changed since its early revolutionary days the Soviet press remains radically different from its western counterpart. It has a different status and a different role to play in society. No western paper could afford to devote such a large proportion of its space to an apparently serious analysis of home and foreign politics, as well as to all the branches of science, arts or philosophy. The tragedy lies in the fact that having given this most laudable form to its newspapers, Stalinism then compelled its journalists to fill them not with real analysis or faithful description, but with dictated slogans and stereotyped formulae.

No Seamy Side

Russian newspapers can afford to devote so much space to outwardly serious topics, because they need no advertising. Nor do they require to indulge in sensationalism to boost up their circulation. There is a total absence of reports on crimes, divorce cases and other court proceedings. But here the baby has been thrown away with the bath water. The reader will not only look in vain for something lurid and sensational in these papers, he will also fail to find any picture of Soviet society, any scenes of Russian everyday life. This sobriety in the Soviet press is not solely due to the puritanical tinge characteristic of Stalinism. The Soviet papers are not expected to reveal the seamy side of Russia, except in criticism licensed by the Party. Their duty is not to show Russia as it is, but as it ought to be. Their principal task is to mould public opinion according to the latest policy directives from the Party and to spur the workers to higher production. And if, in fulfilling this twin task, the editor produces a dull paper, he need not worry. There are no livelier competitors.



In fact the other striking thing about the Soviet press is its uniformity. All papers seem to be modelled on *Pravda*. The latter is now the generalissimo of the Soviet Press, the only paper which can attack all others without fear of being answered back. There was a time when *Izviestia* (which is officially the central organ of the state, while *Pravda* is that of the Party) challenged its supremacy. Now its only distinctive features are the slogans: "Proletarians of All Lands Unite," written in sixteen official Republican languages on top of the first page and the short reports in the same languages during the session of the Supreme Council. *Trud* (Labour)—the paper of the Soviet TUC—used to express the viewpoint of the trade unions, which sometimes conflicted with that of the Party. But for a long time now, although it devotes more space to labour questions, it has taken its general policy line obediently from *Pravda*. In peacetime the army in Russia is given no voice and its organ, *Krasnaya Zvyezda* (Red Star) or that of the navy, *Krasnyi Flot*, are not allowed to have any distinctive features. In the same way *Socialisticheskoye Zemledyele* (Socialist Agriculture) gives fragmentary evidence of regional sowings or local weather conditions, but policy, even rural policy, is made in the columns of *Pravda*. In general, the various specialised national papers, while devoting more space to the particular topics within their competence, are closely modelled on *Pravda* and faithfully echo its tone. Hence a brief description of *Pravda* should give an idea of the appearance and contents of the Soviet press.

Imperatives and Pæans

In size *Pravda* is not unlike the British national dailies reduced by paper shortage. As a rule it has four pages, sometimes it has six. Two columns of the first page are occupied by a leader which is often couched in the imperative form: Let us raise the output of coal, or oil, or grain. As much as three columns are usually devoted to the "Day of Our Fatherland." This is a sort of uplift section advertising the achievements of the Soviet economy. The last column is now often occupied by news from the people's democracies. Only cheerful news is kept for this first page. The drawbacks and failures are relegated to the second page, together with the internal party news and instructions. Incidentally, reports of shortcomings need not always be taken literally. They, too, have often a pragmatic, "pedagogical" meaning and are designed to raise production in a given field.

From time to time the appearance of the paper changes radically. The whole first part is taken up with laudatory messages to "the father and teacher of the nation." The occasion and period vary (after Stalin's 70th birthday messages went on pouring in for over a year), but the contents are monotonous. The miners from Donbass or the farmers of Kazakhstan greet the Leader and promise to fulfil and exceed their targets. With the exhortations of the leading articles and these strange pæans of praise *Pravda* then looks

Brains our common wealth

THE BRITISH COMMONWEALTH is more than a vast area of the world's surface. Our common wealth is also the abundance of technical and inventive genius within that area. BRUSH ABOE are largely concerned with the export of the means whereby the earth may become more fruitful. But to think of export in terms of anything except brains is an anachronism.

It is with the object of encouraging the brains within the Commonwealth that BRUSH ABOE have instituted their Commonwealth Scholarship Scheme. This is planned to provide scholarships for engineering graduates from Australia, Canada, Ceylon, India, Pakistan, New Zealand, Rhodesia, Singapore and South Africa. Each scholarship is worth about £1,000 and the student receives two years' free training in the factories of the BRUSH ABOE Group. Already arrived in this Country are students from South Africa, India, New Zealand and Pakistan. More are on their way here from various parts of the Commonwealth. And within the Group itself more than 1,000 employees are receiving some form of training. It is by developing the brains within the Commonwealth towards the technical knowledge of what the diesel engine and diesel electric power can contribute to make the earth more fertile that the problem of world food shortages can best be attacked.

PLASTICS
inspire new ideas

Is there a material for electrical conduit tube better than metal — and not in short supply? Egatube is the name given to the extruded rigid tube made of BX Polyvinyl Chloride which has recently come to the fore in this sphere. The plastic conduit needs no protection from fumes in factories, from rust or other chemical attack —not even painting, and it can be had in various permeated colours for decorative purposes.

Other useful qualities are extreme toughness, ease of manipulation and excellent insulation properties. It can be easily screwed in accordance with metal conduit practice, but a saving of up to 25% in labour costs is gained by the use of push type Conduit Fittings, moulded from P.V.C. and available in a wide range. Every day plastics inspire the answers to new problems. Today, maybe, you could solve a problem of your own by consulting the BX Technical Service Department

A Noble Scotch Blended for Connoisseurs

like a cross between a military order of the day and a byzantine prayer-book.

A post-war novelty is the emphasis laid on foreign news. In addition to reports from the Soviet bloc, news and comments on foreign affairs cover the whole of the fourth page and a great deal of the third. (Here *Pravda* is privileged, as it has its own correspondents. Other papers mostly use the service of Tass, the Soviet Telegraphic Agency.) This is an implicit recognition that the slogans of isolation, of socialism in one country no longer correspond to the reality of the situation.

Obviously regional papers have not such a big foreign coverage. Yet they, too, do not differ much from the model. They, too, have gained in power and lost in originality. Out of the 8,000 or so Soviet papers probably three-quarters are provincial papers. But these 6,000 all bear the same stamp. There was a time when the Leningrad *Pravda* jealously guarded its originality, probably because of the rivalry between the two capitals. Now, provincial editors, once they have filled the local news columns, rely on the Tass reports, the radio dictation and the leaders from the central press to fill the rest of their paper. Even those in languages other than Russian look as if they have been translated literally from the latter. The importance of these papers is difficult to assess. They must fear the competition of the Russian language papers, since in every region there is a Russian paper in addition to the native one. On the other hand, the Russians claim that they have taught all the backward people to read and that newspapers are now published in the Soviet Union in as many as 70 languages.

Campaigns Against Dullness

A total of 8,000 journals, with a daily circulation of over 30 million, published in some 70 languages and all speaking with the same monotonous voice—this is the paradox of the Soviet press. The Soviet rulers are well aware of its dullness. Every few months a campaign is started for livelier papers and more criticism. But how are the poor editors to know where to draw the line? How far will their critical capacity be praised and at what point will it be penalised? From time to time th *feuilletons* of a veteran journalist like D. Zaslavsky or a Communist of more recent vintage like I. Ehrenburg show that Soviet journalists could still write if given the latitude. But as a rule they think it safer to hide themselves behind empty clichés, dull quotations and the magic formula: "As Comrade Stalin rightly pointed out. . ."

This does not mean that the Russians just disregard their newspapers. Some remnants of the old intelligentsia no doubt still read their news critically. Others have developed an acute sense for reading between the lines, for judging for instance the status of a member of the Politbureau by his proximity to Stalin in a parade photograph. But the great mass of Soviet readers—the ex-muzhik or backward Tadjik —have only recently learnt their alphabet. They have no critical standards, and no controversial matter is allowed to shake their faith. In the long run, a closer aquaintance with the classics of Marxism, and of Russian and foreign literature may sharpen their critical sense. But this takes time. In the meantime the press fulfils its function. The factory papers—a Soviet institution—and the numerous letters received by all papers (Pravda claims to receive as many as 800 a day) help to vent at least some grievances. Through its innumerable correspondents the press enables the rulers to keep in touch with the mood of the rank and file; through its instructions it helps in directing the life of the country. For some time to come the mass of Soviet readers will probably continue to swallow what is handed out to them. As for the growing Stalinist class of managers, technicians and bureaucrats, their needs are partly satisfied by a more specialised periodical press which will be dealt with in a later article.

(To be Concluded)

Aspects and Prospects of the Italian Centre

[FROM OUR ROME CORRESPONDENT]

THOSE Italian political circles which feel some pride of parentage for the shape of things in Italy towards the end of the first post-Mussolinian decade and some desire for a continuous development from this to the next decade, now ask themselves how a Centre can best present itself to the electorate of 1953 which will have to elect a second free national parliament. What doctrine and programme will best mark it off from the extremes? What mutual obligations and what technical arrangements will be necessary to hold its component parts together.

Save for active Marxists and Fascists, every Italian party or tendency, even the "Nennian" Socialists and the National Monarchist Party (P.N.M.), have moments when they strike a "Centre" attitude. Signor Nenni, when pressed to explain why he keeps a separate party in being instead of merging in Communism, replies with references to a different historical background and atmosphere. Without doubt many of the working class voters for the Nennian party believe that, by contrast with Communism, it is both unextreme and central. The appeal of the P.N.M. is largely, though not wholly, felt by people who appreciate the notion of a royal moderator between extremes. Yet in the present political situation Nennians and P.N.M. both have to be regarded as extremists.

The Christian Democratic party regards itself as *the* Centre, and especially the Premier, Signor De Gasperi and his chief party associates, who have with some success tamed two attempts to colour the party with differing brands of Catholic political extremism. The first attempt was made by Professor Dossetti, whom one may, rather crudely, call a clerical-revolutionary and the second by Professor Gedda, who works on the party from outside, and can similarly be dubbed a clerical-reactionary. And the "lay democrat" parties, the Social Democrats, the Liberals, and the Republicans are all, in their modest dimensions, centre parties, whose appeal lies in their centrality. After all, nineteenth-century United Italy came into existence both as a defiance of the philosophy of throne and altar, and as a rejection of the revolutionary (though dissimilar) prescriptions of Doctors Mazzini and Marx. And Italy's foreign policy in the ensuing century consisted in a chequered attempt to make the most of its modest weight by holding the balance between resolute adversaries. Such arts, and their application to internal as well as to international politics, are expected by the Italian in his leaders; and if technical knowledge, administrative ability, and moral integrity are added to the prime requisite, so much the better.

Evidence of Local Elections

It is, then, in a sense, a nation of connoisseurs which watches how Signor De Gasperi and other centralists prepare for the next elections. Surely the hope that a proper poise may be found should be stronger in Italy in 1953 than impatient fanaticisms. Yet on the other hand, too much concentration on balance is apt to lead from time to time to nasty slips. The Fascist era followed at no great distance upon the decade dominated by that past-master of the balancing arts, Giolitti. There is a distinct movement now to advise the typical men of the Centre not to over-indulge in cleverness but to seek plain issues and methods.

The evidence of the Centre's hold on the public contained in the results of the recent local elections cannot be conveyed in correct percentage calculations. The South voted a year after the North and neither the 1946 local elections under a different law and utterly different conditions, nor the 1948

general election, give good standards of comparison. It is better to try to reconcile the claims of the parties and the retorts of their adversaries with the broad impression formed by the man in the street. Christian Democracy which once commanded half the country's votes for itself, seems now only to be able to command a full half with the aid of its three quasi-allies, the "lay democrat" parties. These latter, after heavy losses, still jointly command 14 per cent of all votes, considerably outstripping the joint result of "Missini" (or neo-Fascists) and Monarchists (10 per cent). Christian Democracy taken in isolation still distinctly outstrips Communism together with Nennian Socialism. For the Centre, after four years of wear and tear, such results might, by British standards, seem creditable. This, however, would be to overlook that such wear and tear ought to be offset by the positive consequences of four years of patronage and police management. From the standpoint of the Centre the election results are not grave but they are challenging. They show the Centre on the verge of becoming a minority. Something has to be done about this, and the Centre is now wondering what this should be.

One possibility would be to rush through a parliamentary electoral law which would exploit the fact that the Centre, although no longer stronger than the Right and Left extremes taken jointly, is still stronger than either taken separately. France has such a law and Italy has used this technique in its municipal elections. But leading men of all colours in the Centre doubt the prudence of this course. They feel that if there is any chance of the Centre not being at the top of the list (and thereby being completely excluded from power) it would be wiser to cling to the relative safeguard of proportional representation. They also point out that so long as so big a premium is put on the top place, there is the strongest incentive for existing groups on the extremes to preserve their unity. Proportional representation, by diminishing the incentive to coalitions, makes it much easier for the Monarchists to go into the elections untied to the "Missini" and for the Nennian Socialists to weaken their ties with the Communists. In this way, the Centre might later obtain proselytes from the wings.

Help From "Moderate" Extremists?

A second possibility might be to enlarge the Centre by bringing in the "moderate" extremists from one or both wings. But with regard to the Nennians, such a move would meet with the insuperable difficulty of their anti-Atlantic policy, and with regard to the Monarchists it would automatically entail the withdrawal of some existing partners in the Centre combination. If the Christian Democrat party were to be completely reshaped under new leadership into a proclaimed Monarchist party it might draw fresh votes by the million. It would however, cease to be the Centre, and would find its present allies and some of its own following seeking an independent existence by throwing out feelers to the anti-Atlantic camp. This has already happened to some extent, and accounts for the voting losses of Republicans and Social Democrats. The process was, however sharply arrested by the dramatic resistance of Signor De Gasperi to an attempt by Professor Gedda last April to grasp the direction of the party's election policy.

The third possibility of a regrouping and re-animation of the existing Centre is beset with material and moral difficulties—tired men, a widespread belief that the second rank of Christian Democrat politicians is not up to the standard of rectitude of the first rank, and the scent of clericalism which "lay" democrats sniff uneasily even in quarters of Christian Democracy which withstand Dr Gedda. It is this third possibility, however, and not the cleverness of a fancy electoral law, or a desperate combination with incompatible allies, on which the representative men of the Centre pin their hopes of seeing Christian Democracy continue to guide Italy on the path adjustment to the modern western world.

Mr Lyttelton in Nigeria

[FROM OUR CORRESPONDENT]

THE Colonial Secretary's visit to Nigeria has been a distinct personal success. Lacking the emotional warmth of his predecessor at the Colonial Office, Mr Griffiths, he might have given the impression of big business on a hot scent. Instead, he deployed his own brand of easy good humour and helped to allay residual fears that a British Conservative Government would slow down progress in West Africa. Unfortunately the description of his tour, in a London daily newspaper, as an oil and ore survey, has reawakened all the suspicions of British economic policy that his visit might have cleared up, and there have been a number of less enthusiastic second thoughts that may outlast the memory of his geniality.

At any rate Mr Lyttelton has seen for himself the complicated nexus of difficulties—practical, emotional and psychological—that makes the work of government in Nigeria a daily miracle. Although there has been no breakdown there is perpetual crisis. Now that African Ministers have applied themselves to work, very strenuously and with the utmost zeal, tensions are developing between the politicians and the administrators; they are rather reminiscent of the sort of situation that arose when Labour took over in Britain in 1945 and there were continual demands from the rank and file of the party for the dismissal of the "old guard" in the Civil Service and the Diplomatic Corps. In Nigeria, the situation is complicated by the fact that the administrative mechanism has not been reshaped to the new political pattern under the new constitution. There are, for instance, ministers but no ministries; the old secretariats in the regions and at the centre continue to act as a pooled service, and the various departments by no means correspond to the division of subjects among the ministers. The problem is a practical one, and there is no conflict of principle, although solutions are not easy to find; but the matter tends to be treated as yet another question of race relations, and the propagandists rush to put salt on wounds caused by the mechanical jarring of what is after all a very new combination. Hence, there are bitter attacks on British expatriate officers, and the press demands the removal of all but a chosen few.

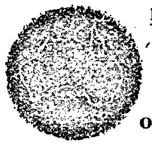
Danger of Paralysis

In these circumstances Mr Lyttelton was not altogether happy in his references to British officers. On one occasion he said that if Nigeria did not want them, he did, and could use them elsewhere. In his parting message he expressed "my personal conviction that even higher numbers of officers from overseas will be needed by Nigeria as it develops and expands" as part of a service expanding all round to include more and more Africans as well. Presumably he was doing his well-intentioned best to give necessary reassurance to British officers, but whether justified or not, his conviction is far removed from the Nigerian climate of thought, and is irrelevant to the immediate situation. The urgent problem now is that Nigerian Ministers wish to expand and improve the whole range of government activities, civil, economic, and social, and at the same time to re-model the entire machinery of government while it is under the greatest pressure. The danger is one of paralysis through attempting too much and gravely slowing down the existing machine without adequate guarantees of anything better.

Moreover this summer Ministers will put before the legislatures new salary scales which affect every government employee from the Senior Service to labourers; this in itself is a task bristling with difficulties. Meanwhile, formidable political danger spots still exist; the situation in the west requires careful handling, and the inscrutable Mr Awolowo pursues an ambiguous policy at the centre through the four Action Group Ministers in the central Council of Ministers. Dr Azikiwe's party is making frantic efforts to get him back into the front line, though he himself has decided to go to Helsinki for the Olympic Games instead of attending the next sessions of the Western legislature. The regional houses meet in July, followed by the central House of Representatives in August, and anything may happen then.

In economic affairs Mr Lyttelton acquired two good marks and one bad. His visit has been justified by the sense of urgency he brought to transport problems; without wasting time on postmortems he has made it painfully clear that things must be put right. His second good mark comes from the avoidance of reference to Nigeria's dollar earnings. Much harm is done by incautious (and naive) statements in England that the colonial empire can somehow help Britain to escape from its economic plight. The boundaries of twentieth century mercantilism are not only narrow, but the whole conception is flatly in contradiction with the declared policy of helping the colonies forward to self-government; the thought that Nigeria can be used to pull British dollar chestnuts out of the fire is a British daydream and a Nigerian nightmare. The only acceptable reason, in Nigeria, for the expansion of Nigeria's productive capacity is the need for raising the standard of life of its own people, and the only acceptable economic relationship with Britain is that of willing buyer and free seller.

Mr Lyttelton's bad mark is for a mistake in emphasis, not in policy. The Colonial Secretary was at pains to stress the importance of Nigeria's agricultural potential rather than its industrial prospects. Agriculture, he said, was and would remain the main source of wealth and should have first priority in the national effort. It is true that Nigeria is in the fortunate position of being able to supply primary agricultural products greatly needed by the world; it is also true that without the sources of basic power (oil and uranium are big question marks) and without technical resources or traditions of industrial craftsmanship, the country is debarred from engaging in heavy manufacturing industry. But Nigeria, like every other primary producer, hates being fobbed off with what it regards as the inferior status of an agricultural country.



It has a dim feeling that industrialisation is part of the British *arcana* of empire; and as there is a wide variety of processing and secondary industries that are perfectly practicable and highly desirable, with African capital, ownership, and management, Mr Lyttelton's theme might have been one of encouragement in this field, not discouragement from others. As it was, he was accused of making an appeal for cheap fats for Britain, and lost an opportunity of making a positive and welcome approach.

Libya Deserta—II

The Economic Picture

[FROM A SPECIAL CORRESPONDENT]

THE future of the United Kingdom of Libya depends entirely on foreign economic and technical aid. In the forty years since it came into the orbit of modern western Europe, its great poverty—it is 95 per cent desert and has one of the lowest *per capita* incomes in the world—has been marked by the fact that it has always had external help from someone. Under Italian rule before the war three-quarters of its budget (which then turned over at about £10 million at present rates) was a subsidy from Italy. Under the subsequent British administration, the British subsidy to Tripolitania and Cyrenaica was at the rate of £2 million per annum; France also subsidised the Fezzan. This year—Libya's first as an independent state—estimated expenditure is, in round figures, £5.9 million; towards this, it is now hoped that as much as £4.8 million will be derived from Libyan sources, the principal of which are £1.4 million from

FACTS ABOUT AUSTRALIA

Over 3,000,000 bales of wool exported yearly

Australia is the world's largest wool exporter and is one of the chief primary producing countries of the world. Her secondary industries are growing in importance and are well represented in her exports. The Bank of New South Wales welcomes enquiries about trade and business opportunities and the establishment of new enterprises in Australia and New Zealand.

customs and excise, £913,000 from licences and direct taxation and £765,000 from the tobacco and salt monopolies. A deficit of at least £1.1 million remains.

The United Nations Commissioner, who was obliged so quickly to prepare the three provinces for independence, was fully aware of this state of affairs. He anticipated a budget deficit that could only be met by outright gifts from abroad. In the matter of international payments, he pointed to an adverse trade balance whereby exports paid for only 45 per cent of imports, and to a consequent unbalance only 40 per cent of which was covered by the military expenditures of the three western powers who maintain forces in the country —Britain, France and America. At present the Americans stationed near Tripoli are spending at an annual rate of £720,000 and the British forces are spending even more. He made it clear, therefore, that direct foreign financial help must continue in several forms, but he held out the hope that by means of foreign technical aid, and of the country's two potential resources—untapped manual skill and soil that is good if it can be irrigated—this position might improve with the years.

As a result of the arrangements made either on the basis of United Nations findings or directly between western states and Libya, the present position is as follows:—Great Britain continues to meet the main budget deficit, in return for certain safeguards as to prudent and orderly budgeting which it specified at the time when Libya decided to enter the sterling area and maintain a currency with sterling backing. And France will meet the deficit on the Fezzan budget, which is likely to be about £160,000 per annum, and will pay this sum to the Federal Government provided it is earmarked for the Fezzan.

Foreign Aid For Development

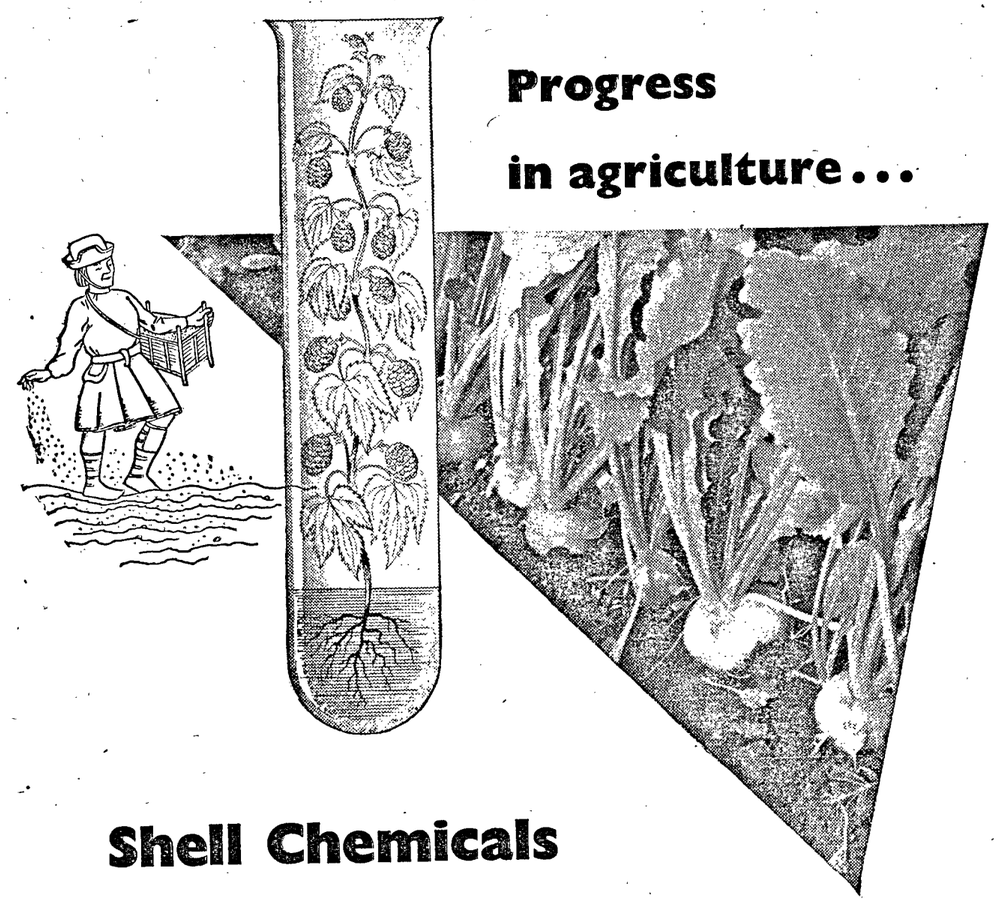
In addition to assistance with its budget, Libya is receiving foreign contributions to a Development and Stabilisation Agency, the creation of which was recommended by the United Nations, and to a Libyan Finance Corporation. The grants to the Agency are to be divided between development and a stabilisation fund in a ratio of three to one. The prime purpose of the latter is to afford relief measures in drought years, and when it reaches £1 million, all is to go to development. Unfortunately, owing to a bad crop in Cyrenaica caused by a ten day *khamseen* wind, there will be drawings from the fund this year. Contributions towards the Development Agency, which expects to spend £500,000 annually, will at present consist of £380,000 from Britain, £100,000 from France and £10,000 from Italy. The aid granted by the United States under Point IV ($1 million for the current year by a direct agreement of January 21, 1952) will be integrated with the work of the Agency. The Libyan Finance Corporation, which will also be subsidised by governments acceptable to the Libyan Government, will grant loans along investment banking lines, but will make them with a view to development rather than to profit.

United Nations technical assistance bodies are also in the field and, in order to prevent the overlapping which has so bedevilled financial and technical aid in the Middle East, the Federal Government has set up an Economic Planning Committee which will be the funnel for all financial and technical aid and will be the administrative link between the Council of Ministers, the agencies and the provinces. The new body is presided over by the Minister of Finance and Economy and is composed of representatives of the Point IV organisation, the UN Technical Assistance Bureau, the three provinces, the Libyan Development and Stabilisation Agency and the Libyan Finance Corporation. This mixed body has a British secretary who knows the country well. It is his task to pass to the Council of Ministers the plans which have been co-ordinated inside the committee, which in any case requires the approval of the Federal Government before they are put into operation. So far the smoothest relations have been maintained between these various bodies, and Anglo-American relations are more cordial in Libya than in any other part of the Arab world—a tribute to the team of outstanding men of both nationalities who are serving as advisers.

Schools provide an example that well illustrates the division of work that is attainable if only international efforts are from the start channelled through a single committee. The Development Agency builds the school building, the UN Technical Assistance Bureau (in this case Unesco) provides the teachers and the Point IV organisation the equipment. Agricultural projects are divided in a similar manner. The irrigation is undertaken by the Development Agency, the UN Technical Assistance Bureau provides agricultural experts and advisers and the Point IV organisation the tools.

Marketing Problems

However successful the agricultural efforts may be, produce will be similar to that of the entire Mediterranean basin. In detail, certain special markets can be satisfied by, for example, the production of dried fruits. To do this, new vines must replace those cultivated by the Italians when they provided cheap and plentiful wine for their troops. But on the whole the Libyans will not find easy markets for their produce with the exception of early fruits and vegetables. The production of luxury fruits on a large scale to satisfy the Christmas markets of London, Paris and Rome is complicated and the risks due to bad flying conditions over the Mediterranean in winter are considerable. Olive oil is likely to become their richest product as trees planted twenty years ago come into bearing, and if the Italian farmers who produce it obtain, for sentimental reasons, a market in Italy; but meantime their ancient trade in fish and sponges, hides and wool remain the Libyans surest exports. An Australian adviser is trying to help them to improve the quality of the last.



The Libyans wish to encourage tourists to their splendid beaches and ancient ruins and this trade has considerable possibilities if more hotel accommodation and better facilities are provided outside Tripoli. They are, however, hesitant about a similar but more lucrative proposition. The Government has so far refused residence visas to those who wish to retire within the sterling area but to live in the sun—a much steadier source of foreign exchange than a few tourists.

The Libyans achieved independence before they were prepared for it. They are already attempting to run before they can stand up alone. At present they are accepting advice, but if Egyptian influences increase, and foreign views are disregarded and foreigners dismissed, the outlook will be black. It remains good only so long as they realise their economic frailty and stick to small, practical projects. Grandiose schemes—so dear to the Arab heart—will merely provide future tourists with additional ruined towns to visit along the North African coast.

(*Concluded*)

China "Liberates" Tibet

DURING the past year, since the Chinese People's Republic gained control of Tibet by the so-called Agreement on Measures for the Peaceful Liberation of Tibet signed in Peking on May 23, 1951, the Chinese Communist Government has been facing a difficult problem of colonial administration. The Chinese Communists do not, of course, admit that Tibet is a colony, or even a dependent territory, or that their relation to it is in any way comparable to that of Britain to Nigeria or of France to Tunisia or of Belgium to the Congo. The repudiation of any similarity to a colonial system is not based simply on the claim that the Chinese People's Republic as a "people's democracy" is incapable

Shell Chemicals

Woodstock Farm, near Sittingbourne in Kent, is the agricultural research station of the Shell Group in this country. Here, in up-to-date laboratories and in the surrounding orchards, hop gardens and farmland, teams of experts are carrying out a broad programme of investigation devoted to the control of insect pests, the prevention of plant disease, the selective destruction of weeds in growing crops and other problems of importance to the nation's food production. Some research is long-term and fundamental; other lines of attack are the day-by-day screening of all new petroleum-derived chemicals for possible use, and the maintenance of carefully controlled trial plots. If promising, these lead on to full-scale trials under normal commercial conditions. This policy of step-by-step progress ensures that new products bearing the name Shell have an informed background and proved capabilities before they are offered to the farmer.

of the "imperialist" exploitation held to be an essential feature of colonial rule by a capitalist nation. The basic claim, which has been persistently made in all Chinese Communist publicity on the subject, is that the Tibetans are "one of the nationalities of China." The fact that they do not speak the Chinese language, that they have an entirely different cultural tradition, and that they have been independent of China for most of their history, including the forty years 1911-1951—that they have in short the qualifications which are normally supposed to be sufficient for separate national existence—is not admitted to count for anything against the fact that Tibet was subdued by the Manchus in the eighteenth century and thus became a part of "China."

There is indeed an ambiguity in the word "China," which is not always appreciated in the West; a European, speaking of the Chinese, means the nation which has Chinese for its language and does not include under the same name Mongols, Turkis, Tibetans and other peoples formerly comprised in the Chinese empire. But the Chinese speak of their country as Chung Kuo, the "Central Country," a term which has no ethnic significance, while they refer to themselves ethnically as Han; thus China as the Central Country consists

of various nations of which the Han are one. The conquest of Tibet after forty years of independence is, therefore, not an act of imperialism, but a "re-unification" of China and a return of the Tibetans to their "motherland"; it is "peaceful," because the Tibetans capitulated after some months of fighting had demonstrated that they were too weak to resist and that India would do nothing to help them; finally it is a "liberation" because the Tibetans are to be delivered by the People's Liberation Army, not from their own native rulers (who are being retained for the time being as instruments of Chinese indirect rule), but from the "imperialist aggressive forces" which are to be "driven from Tibet."

What are these "imperialist aggressive forces"? They consist of two companies of Indian troops which are stationed under an old agreement at Yatung and Gyangtse just across the Tibetan border to protect the trade route from India into Tibet in a region where brigandage was formerly prevalent. Down to 1947 they could be said to represent British imperialism in Tibet, but since 1947 the imperialism, if any, can only be that of India. In any case these outposts have never been strong enough to dominate or coerce Tibet. China, however, has now sent 15,000 troops to Tibet to liberate the Tibetans from the two companies of foreign troops within their territory and, to frustrate the wicked designs of the notorious reactionary imperialist Mr Nehru. The Peking Government is reported recently to have requested the withdrawal, not only of the Indian military outposts at Yatung and Gyangtse, but also of the Indian diplomatic mission in Lhasa, on the ground that Tibet has now been reunited with China and that all questions affecting

it must in future be handled through Peking. The Indian Government is not at all unwilling to renounce former treaty rights in Tibet, but wishes to make such a readjustment as part of a general settlement covering the potentially dangerous issue of frontier demarcation—on which a premonitory warning has been given by a Chinese claim to Badrinath in Garhwal, twenty-five miles within the supposed Indo-Tibetan frontier and only 150 miles from Delhi itself. So far the Chinese have hedged; they want India to renounce all rights in Tibet unconditionally and leave the disputed frontier until they have built up their military power in Tibet.

This is proving a task of some difficulty for the Chinese because it is easier to send a body of troops into Tibet across the high mountain passes which separate the country from Chinese China than to feed them when they are there. The People's Liberation Army has been well disciplined in its occupation of Tibet and it has been part of Peking's policy to conciliate the Tibetans by paying in Chinese silver currency for all supplies needed by the invaders. But as there is not enough food in Tibet to support a large addition to the normal population, and as it is impossible to feed an army from China during the winter months, the Chinese forces have been forced to live on the country to the exasperation of the Tibetans, whose discontent recently expressed itself in riots in Lhasa. The Chinese have now been reduced to requesting permission from the Indian Government to send food supplies for their army in Tibet through India—an acknowledgment of the fact that the only effective lines of communication from Peking to this "part of China" are by way of Calcutta. When it is taken into account that the Chinese military purpose in Tibet, in the words of their own proclamations, is to "consolidate the national defences of the south-west" (that is to say, against India), that the Chinese conquest has substituted on India's northern frontier a great military power, including a rapidly growing air force, for an antiquated buffer state which could be a menace to nobody, and that the Chinese have begun the construction of a military airfield within 250 miles of Delhi, the rulers of China certainly have a nerve in asking India to facilitate the supply of their conquering army. But nerve is the pre-eminent characteristic of the new regime in Peking, and so far it seems that India's desire for friendship with "the new China" is equal to any strain which Peking puts upon it.

Tibetan Divisions Exploited

For maintaining control over Tibet the Chinese are relying, not only on their forces of occupation, but on exploiting political divisions among the Tibetans themselves. In the first stage the old Tibetan ruling class, consisting of Buddhist lama monks and land-owning nobles, is not to be displaced, but its unity is to be disrupted by playing on the old jurisdictional rivalry between the two great dignitaries of the lama church—the Dalai Lama who resides in Lhasa and the Panchen Lama whose seat of authority is at Shigatse, a town to the west of Lhasa. Soon after Tibet became independent in 1911, the Panchen Lama of the time was forced to leave Tibet and take refuge in China; the Chinese Communists have now brought back his successor (a boy of 15) and installed him in office. They have also, with the aid of two Tibetan local magnates, set up a new administrative centre at Chamdo, in eastern Tibet within the nominal border of the Chinese province of Sikang, which is apparently meant to become a new capital free from the conservative tradition of Lhasa. Meanwhile the Chinese have begun the inevitable endeavour to get hold of the younger generation and train cadres of a Tibetan Communist party to take over power under Peking at no distant date. Tibetan students in India have all been recalled to Tibet and will be sent to China for education instead. Finally, Peking plans to settle 15,000 Chinese families in Tibet to reclaim uncultivated land and start new industries. In the words of Chinese publicity, the Tibetans are now for the first time going to enjoy a "free, happy life."

WHEN IT'S A QUESTION OF TIME...

minutes per man hour...

Too many businesses suffer from three way time losses . . . time lost through late starting of day or shift; time lost through early knocking off for breaks or leaving and time lost by workers trying to find out what o'clock it is. T.R. Time Control reduces such losses and extracts more productive minutes from every man hour. It improves works relationships and gives Management essential wages and job costing statistics—all especially vital to industry today.

TR SERVICE speeds production

Today's need for maximum output has so increased demand for T.R. Service—Time Control, Internal Telephones, Staff Location and Internal Broadcasting—that new installations can now be undertaken only in organisations engaged upon work of National Importance.

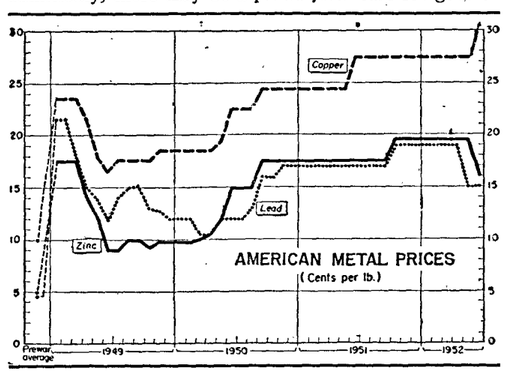
THE BUSINESS WORLD

What Freedom for Metals?



SO much has been said and so little has been done about freeing the metal markets that merchants must almost by now have ceased to mourn the departed freedom of the London Metal Exchange. Even the recent announcement that the Ministry of Materials is returning to the policy of basing selling prices on those ruling in the New York market can hardly be construed as a step towards freedom, though it is undoubtedly a move in the right direction. Only tin has yet been returned to private trading, and throughout its two and a half years of operation the London tin market (reopened in November, 1949) has been constantly subjected to government interference from one side of the Atlantic or the other. The reopening of the lead market is apparently "still under discussion"; it will be reviewed again at the end of the month. The excuse put forward for maintaining government control remains, as it has always been ever since the end of the war, the state of Britain's balance of payments.

Government trading in metals has been proved a failure by its pricing policy. It took the Ministry of Supply four years to learn that a government organisation has no prescience in fixing prices. Between 1945 and 1949 it attempted to guess the level that would even out fluctuations over a period of time and yet equate supply and demand. The folly of this method was not appreciated until 1949, when the American inventory recession left British manufacturers saddled with higher raw material costs than their foreign competitors. In July of that year, the Ministry of Supply announced that it would in future base its selling prices on those ruling in the American markets; and it followed this policy faithfully until the Ministry of Materials was set up last year. The new Ministry decided to base its selling prices on its purchase prices, and since it had to buy quite substantial quantities at free market prices that were almost double the official American prices, it raised its selling prices correspondingly. Now it has reverted to the Ministry of Supply's policy and is prepared to write off its losses on its dearly bought stocks of metals.

The real difficulty in the metal trades is that without London there is no world market that the Ministry of Materials can use as a yardstick. It is forced by circumstances to accept the official quotations in New York, even though that market is dominated by large integrated companies interested in both the production and the consumption of metals. It cannot take into account the variations in price that exist in the so-called free market, where lead and zinc are still selling below the official American level and copper above it. Even the Raw Cotton Commission, despite its elaborate pricing technique, came in for severe and, on the whole, justified criticism for its late introduction of new crop prices last summer, because it could not take account of clearly foreseeable trends in prices. The free market prices for metals admittedly apply only to marginal quantities, but they indicate a possible rise or fall in the official American prices, and in this sense they are to some extent akin to a futures' price. If the American metal market were better organised and more flexible and ready to accept any currency, these free market prices would cease to exist and the Ministry of Materials' task would become much easier.

Whether a continuance of government trading in metals can be justified in present circumstances depends, in the main, on two questions. First, does it in fact reduce Britain's dollar expenditure, or at least prevent an unwarranted increase? Second, does it ensure that Britain obtains sterling area supplies that might otherwise be sold to other countries? The assumption that implicitly underlies the present policy is that both these questions can be answered in the affirmative.

It is difficult to prove or disprove the validity of this assumption; and any conclusion is likely to depend in part upon the particular observer's faith—or lack of it—in the efficacy of private trading. In certain conditions, admittedly, there may be a *prima facie* case for government trading on such grounds. If Britain has to obtain any major part of its requirements of the metals concerned from dollar sources, it may seem reasonable to presume that government trading is likely to achieve the greatest economy in dollar expenditure in Britain's import costs. In any case, if the metals are in short supply, it is arguable that, in the absence of governmental arrangements—whether by way of long-term contracts or gentlemen's agreements—Britain might not secure so large a proportion of supplies from the sterling area as it can count upon in present conditions. If there were private trading in scarce metals, part of the sterling area supply might be secured by other non-dollar countries and Britain might thereby be driven either to go short of supplies or to increase its purchases from dollar sources—or would at least be forced to pay more for its sterling area supplies than it might have done

under government trading. These, it should be noted, are presumptions rather than conclusive arguments; but at least the presumptions are sufficiently strong to make the conditions of supply in each case a vital part of the data bearing upon the problem. As a first step, therefore, it is desirable to consider briefly the extent to which Britain's supplies of each of the principal metals concerned—copper, zinc and lead—have to be met from dollar sources and also the extent to which world supply and demand for these metals are in balance.

Britain's requirements of virgin copper averaged 330,000-335,000 tons a year in 1950 and 1951 compared with 260,000 tons before the war, and in the first quarter of this year they have been running at an even higher annual rate—approximating to the 1948 level of 360,000 tons. At present 13 per cent of the supply comes from Canada, 3 per cent from Chile and a further 27 per cent from the United States, Belgium and Germany. The copper supplied from these last three sources is, however, of Rhodesian origin; it has to be imported from non-sterling sources because of the insufficiency of electrolytic refining capacity in the sterling area. Only the refining costs, therefore, represent a net strain upon the dollar reserves. In twelve months' time, when the new electrolytic refineries in Northern Rhodesia are in full operation, Britain should be able to obtain practically all the copper it needs within the sterling area. It will still probably have to import certain special shapes from Canada and some blister copper from Chile. But by and large, copper will be a sterling commodity; and it could even become a dollar earner.

WORLD SMELTER PRODUCTION OF COPPER, LEAD AND ZINC
(Thousand tons)

	Aver. 1934–1938	1946	1947	1948	1949	1950	1951
Copper	1,750	1,800	2,190	2,280	2,270	2,500	2,660
Lead	1,470	1,070	1,340	1,360	1,540	1,710	1,670
Zinc	1,410	1,340	1,560	1,490	1,810	1,970	2,070

Copper is in great demand for rearmament, and in the United States supplies have been so tight that quantities have been released from the stockpile to help industry. Domestic production there has increased during the past two years, but the United States still imports a net 250,000-350,000 tons of copper metal a year and about 100,000 tons of concentrates; its consumption in 1951 was 1,220,000 tons. Consumption in Europe is also expanding and the continental free market price of copper is still about £100 a ton above the official American quotation which until a week or so ago was pegged at 27½ cents a lb or £220 a ton. Since the United States Government began to allow American manufacturers to buy foreign copper at prices above the ceiling fixed for domestically produced copper, the New York market has quoted a range of prices, the highest being 35½ cents a lb (£284 a ton). Because of this, the copper market is at the moment very confused and until a definite price emerges the Ministry of Materials has suspended sales of copper for all deliveries beyond the end of this month. But so long as rearmament continues, demand is likely to remain high, though its excess will still be curbed by international allocation.

Zinc, which until recently was also scarce, can now be obtained in adequate supplies; a fortnight ago the International Materials Conference decided not to recommend international allocation for the third quarter of this year. The free market price for zinc was until recently some £35 a ton below the official American price of £156 a ton (19½ cents a lb); last week, however, the American price came down to £128 a ton (16 cents a lb). The real shortage in zinc was in smelter output rather than in mine production, and it was accentuated by the fact that the United States, which has the largest smelter capacity, restricted its exports of zinc metal. But consumption of zinc is closely related to the availability of other materials, particularly steel, and recently it has tended to decline in many countries. In Britain last year, consumption was low—190,000 tons against 240,000 tons in 1950—because of the restrictions on its use in certain civilian goods. This year consumption has revived somewhat, though it is still not much above its prewar annual rate of 205,000 tons. But 25 per cent of Britain's requirements of zinc has to be met from dollar sources.

Lead is not scarce, and it is also mainly a sterling commodity. Three-quarters of Britain's imports come from Australia. In both 1950 and 1951 Britain used about 165,000 tons, less than half the prewar consumption. Copper and other materials have been substituted for lead in the building and plumbing trades and aluminium sheathing is now being used for cables. In other countries, too, consumption has declined, though the United States is an important exception. But the United States normally has to import something like 250,000 tons of lead metal a year, and in 1950 its imports rose to 400,000 tons. Despite the recent fall in the official American price of lead to £120 a ton (15 cents a lb), the free market price is still some £20 a ton cheaper.

The position of the three metals can thus be summarised as follows. Copper is likely to remain fairly scarce but will soon be a sterling metal. Zinc is more plentiful but is a dollar metal. Lead is plentiful and is to all intents and purposes a sterling metal. On the arguments instanced above, therefore, the difficulties of Britain's balance of payments may afford a *prima facie* case for government trading in copper and zinc, though not in lead, as a means of minimising the dollar cost of British imports. But these arguments are not conclusive. Against them, it can be urged that if imports of these metals generally, and dollar purchases of them in particular, have to be restricted, the restriction could equally be achieved by the licensing of private trade; and, in this context, it is noteworthy that in fact the volume of Britain's imports has been rising. There is, moreover, a much more fundamental weakness in

BRITISH AND AMERICAN CONSUMPTION OF COPPER, LEAD AND ZINC
(Thousand tons)

		Aver. 1934–1938	1946	1947	1948	1949	1950	1951
Copper,	U.S.	572	1,126	1,235	1,200	921	1,225	1,221

	U.K.	204	216	223	223	199	237	188

these particular arguments for government trading—the fact that they are almost wholly based on the premise that relief for Britain's dollar account is much more important than relief for Britain's balance of payments as a whole. In a short run emergency such as that of 1952, that may be true; but it is certainly not true in the longer run.

This same consideration is also of vital significance in a quite different context. Whatever effects a restoration of private trading might have on Britain's own import costs, it is commonly assumed that the purely international workings of such trading would throw a strain—and perhaps a dangerous and incalculable one—upon Britain's dollar reserves. Since the United States is the world's largest consumer of non-ferrous metals (it accounts for half the world total), a reopened market in London would obviously have to provide some facilities for arbitrage with the New York market. That would involve some dollar outlay, simply to provide the dollar working capital of the market; but the mechanism itself would not necessarily involve a current and continuing loss of dollars, and, if Britain were looking to its balance of payments as a whole rather than to its dollar account alone, there is little doubt that the overseas earnings of the market could be regarded as affording a good return on the capital laid out.

In the present dollar emergency, the authorities would doubtless contend that they could not afford the capital outlay in any case; and they might argue, further, that a "free" market could scarcely function at all if the licensing arrangements were sufficiently rigorous to guard against the danger that London would merely become a channel for the supply of dollar metal to overseas purchasers who paid in soft currencies. Even this argument loses much of its force so long as Britain has to settle its EPU deficits wholly in gold; but amid present difficulties it would be unrealistic to suppose that this particular risk could be entirely ignored on these grounds. Britain, unhappily, may need to take further emergency measures; and the authorities would be chary of any steps that limited their scope for manœuvre.

Short-term arguments of this kind, being based upon the extremity of Britain's present plight, deserve rather more respect than does the more general attitude of Whitehall towards private trading. The general argument against freeing the metal market in fact reasons in a circle. In effect, it is said that such freeing cannot be contemplated unless the dollar position is strong and metal supplies are plentiful—two conditions that can never, it is claimed, be satisfied simultaneously. If the dollar position is strong, and the sterling area has a surplus on its dollar account, then commodity prices must be high and supplies scarce—too scarce to permit private trading. On the other hand, if supplies are abundant and commodity prices are low, then the sterling area will be faced with a dollar shortage—and that, too, must prevent the restoration of private trade. These arguments will be just as valid (or invalid) next year or in 1954 as they are now; to accept them is to concede that government trading and restrictionism must continue indefinitely. Of course, if and when the general economic policy of the Government becomes tough enough to free Britain from the constant threat of recurrent crises, then arguments of this kind will cease to have validity. But the various moves towards freedom that may, in the end, be the only means of achieving this happy state cannot all be ruled out indefinitely on the ground that it is not "safe" to make them. Sooner or later, some risks must be taken; but perhaps it is in the exchange markets, rather than in the metal market, that the first imaginative moves will have to be made. Certainly, it would be impossible for the metal market to function with full freedom so long as currently earned sterling is not freely convertible into dollars; but that does not mean that some move towards restoration of the market is not desirable—even if some restrictions had to be imposed upon hedging facilities in dollar metals.

The Price of Electricity—I

The New Standard Tariffs

ONE of the duties enjoined upon the British Electricity Authority and the Area Electricity Boards by the Act of 1947 was "to promote the simplification and standardisation of methods of charge for supplies of electricity." Shortly after vesting date, April 1, 1948, the BEA set up a Retail Tariffs Committee to study what needed to be done: during 1950 this committee recommended certain general tariff principles to Area Boards; and after discussion with their Consultative Councils, most of the fourteen Area Boards have announced standard tariffs covering part at least of the field. A national policy for electricity tariffs is now, therefore, beginning to emerge. It may be useful to examine how closely this conforms to the requirements of the Act; and it is even more important to inquire how closely the price policy of this public monopoly conforms to the economic requirements of fuel policy.

It must be said at once that those who looked for some single set of tariffs throughout the country—and who used this as an argument for nationalisation—are clearly to be disappointed. A more limited and practical objective appears to be within sight of achievement—identical tariffs for all consumers of a given class within any one area, and generally similar tariff structures throughout the fourteen areas. In parallel with this will be the virtual elimination of alternative rates, and the gradual substitution of published tariffs for large numbers of private industrial agreements.

In interest and in complexity, the domestic tariff comes first. Domestic consumers take only a third of the total units sold; but the prices they pay have always been the subject of most complaint, and during the present plant shortage it is the "promotional" nature of domestic tariffs that has rightly been called in question. Two major changes are being made in the character of domestic tariffs; a change from two-part to variable-block, and a change in the basis of the fixed charge or its equivalent from the rateable value or floor area of the premises to the number of rooms.

To appreciate the effect of these two changes, it is necessary to know something of the technicalities of domestic electricity consumption. Its special feature

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

Established by the Joint-Stock Banks in 1945 to provide finance by means of loans or the subscription of loan or share capital or otherwise for industrial and commercial enterprises in Great Britain particularly in cases where the existing facilities provided by banking institutions and the Stock Exchanges are not readily or easily available.

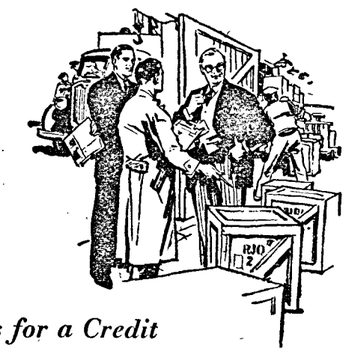
THE THREE BANKS



Finance and Eastern Trade

"Mercantile" service extends not only throughout India but also to every important trading centre in the East.
For sixty years the "Mercantile" has closely studied financial conditions in all Eastern markets. Its accumulated knowledge is at the disposal of British business houses interested in developing Eastern trade.

THE MERCANTILE BANK OF INDIA LIMITED

Head Office: 15, Gracechurch Street, London, E.C.3.

INDIA—PAKISTAN—BURMA—CEYLON—MALAYA—SINGAPORE—HONG KONG—CHINA—MAURITIUS—THAILAND—JAPAN.

Bombay asks for a Credit

It is a simple matter for the Westminster Bank to establish local credits anywhere in the world, for there is no town of commercial importance in which it is not represented. Equally, the collection of funds due to you from foreign buyers presents no difficulties. The comprehensive service of information and advice which the Bank provides for those who trade abroad is fully described in a booklet called 'The Foreign Business Service of the Westminster Bank'. We shall be glad to send you a copy on request.

WESTMINSTER BANK LIMITED

Foreign Branch Office: 41 Lothbury, London, E.C.2

Banking Business of every description transacted at all Branches and Agencies.

is that there is a sharp dividing line between the small-scale user—lighting, wireless, cleaning, etc.—and the large-scale heating and power user. In a room heated and lit by gas the heating may consume five times as much as the lighting; but electric lighting is so efficient that if the same room were heated and lit electrically the heating would probably consume twenty times as much as the lighting. There are, therefore, two distinct groups of domestic consumers, those who use electricity for lighting alone and those who use it for light and heating: and the difference is such that even a large, wealthy household using it only for lighting may consume only a few hundred units a year, whilst the smallest and poorest household using electric cooking or heating as a major source will probably use a thousand units a year. At present about a quarter of the domestic consumers are in the "lighting only" group; they take only about three per cent of the units sold and contribute about 10 per cent of the revenue. Economically, too, the two sorts of consumption are also sharply differentiated: the former has an inelastic demand and is comparatively expensive to supply.

★

The original way of meeting this situation is a duplication of service. The lighting consumer has small-capacity wiring and meter, and pays, say, 4d. a unit, whilst the lighting and heating consumer has, in addition, a second heavy-current circuit to which his heating appliances are connected, fed through a separate large-capacity meter at, say, ¾d. a unit. Unfortunately this means a high cost of installation and a lack of flexibility as regards heating points, for example. It also retards the normal process of development whereby consumers graduate easily from the first class to the second. In most countries, therefore, it has been superseded by the "all in" system with a single installation and meter, and a composite tariff that has usually consisted of a fixed annual charge and a low running rate. This resembles the telephone tariff, with its quarterly rental and call charge. This two-part tariff meets the case of the large and medium-scale user but not that of the purely-lighting consumer. It has, therefore, to be flanked by a flat-rate alternative to act as a price ceiling on the rate per unit charged for low consumptions. But this greatly complicates the tariff schedule.

This difficulty has been cleverly circumvented under the new tariffs, which are of the "variable-block" type. This omits a fixed charge entirely, and substitutes in its place a first block of high-price units. Subsequent consumption is at a low "follow-on" rate comparable to the running charge of a two-part tariff. For example, under the Midlands Area Board tariff a 6-room householder will pay 4d. per unit for the first 72 units per quarter (288 per annum) and ¾d. for additional consumption. In effect, he will pay 4d. a unit for his "essential" lighting and small-scale consumption, and ¾d. a unit for any optional heavy-current uses. Hence this operates as two different tariffs according to the scale of consumption. Below the basic figure (about 300 units per annum for this size of house) it provides, in effect, a "lighting" flat rate of 4d. a unit; above, it corresponds to a two-part tariff consisting of a fixed charge of £3 18s. 0d. a year and a running charge of ¾d. a unit.

The table shows the domestic tariffs of ten Area Boards that have standardised prices throughout their areas. The first part of the table shows the tariff as laid down and the latter part shows the "equivalent fixed charge" when the consumer is taking units over and above the first block. Two of the Boards in this table employ a second block (equal to the first) at an intermediate price, and two offer a straight two-part tariff as an alternative.

It is too early to predict the effect of the second major change in the new standard tariffs—the use of the number of rooms as the basis of assessment. Since the size of room is not brought into consideration the broad result will be that poorer-class premises with small rooms and low rateable values may pay rather more for their electricity than before, whilst higher-class properties and those with large rooms will pay rather less. This slight differential effect, however, is likely to be swamped by overriding increases due to rising costs of supply. Fundamentally this assessment is of the same kind as before, in that it depends on some feature (dimensional rather than electrical) of the consumer's house. Failing any practical and economic method of measuring the consumer's effective demand on the supply system, the fixed charge (or its variable-block equivalent) becomes very largely a device for spreading indivisible costs where they can best be borne. The change in basis, therefore, is merely one of detail, though it may be administratively convenient; it is impossible to say whether one unsatisfactory method of assessment is more desirable or equitable than another.

Apart from these comments on structure, something may be said regarding the actual sums charged in the new tariffs. The Area Boards receive bulk supplies from the BEA on a two-part tariff in which the running charge is dependent on the average cost of coal consumed in power stations in that area. This arrangement was adopted so that Area Boards could continue to compete with other forms of heat, light and power, the cost of which is also influenced by regional variations in the price of fuel. At the two extremes, in 1950-51 the South Wales Board paid a running charge of 0.38d. per unit, whilst the Southern Board paid 0.54d. Very little correspondence can be traced between those bulk supply running costs and the "follow-on" rates shown in the table. Some allowance must be made for the difference in dates: moreover, certain of the standard tariffs that were earliest in the field may have to be modified.

Another surprising feature of the tariff values is that only in two cases is there any specific coverage of "consumer costs." A number of supply costs, such as metering, billing and the cost of digging a trench for the service

* Per room. † Per 400 sq ft. ‡ Square ft. § Proposals subsequently modified

connection, are proportional to the number of consumers and independent of the size of the load. Logically, therefore, there might be a non-proportional element in the equivalent fixed charge to cover this.

Outside the domestic field standardisation of tariffs has not been carried so far, but several Boards have announced their intentions and it seems likely that a similar pattern will be followed by the remainder. Large consumers are offered a two-part "maximum demand" tariff whose running charge varies with the price of coal. Smaller industrial and commercial consumers are offered a variable-block tariff, in which the size of the first block depends on the size of the electrical installation. The problem is complicated by the fact that the standard tariff has not only to synthesise a number of published tariffs but also ultimately to take the place of possibly hundreds of separate agreements. Such tariffs are less open to criticism than the domestic rates, since they follow more closely the pattern of the costs falling on the Boards. Thus the bulk-supply charge of £3 15s 0d per annum per kW becomes about £6 per kW in the retail tariff, which is a reasonable figure in view of the proportions of capital investment in generation and distribution respectively. The bulk-supply running charge of, say, 0.5d per unit with coal at 58s, becomes a retail price of about 0.7d per unit.

Nationalised electricity, therefore, can justifiably claim to be progressing towards fulfilling the obligation to simplify and standardise laid upon it by the Act. Progress has been slow: but it must be remembered that four years ago there were nearly 600 different tariff-making authorities. The North-Western Board recently stated that its new standard domestic tariff involved the scrapping of between 300 and 400 different rates. The methods of charging indicated by the domestic tariffs so far made public are more simple and more standardised, without any doubt. But there is equally no doubt that they do not reflect the varying incidence of electricity costs during the day; and in the present period of general and continuing scarcity of fuel and special scarcity of plant, the need for tariffs that reflect these varying costs accurately is particularly imperative in the nationalised fuel and power industries. It may be argued that tariff standardisation should be regarded as a process in two stages; first producing a common tariff and then redesigning it to reflect costs accurately. The first stage then is to get all the particular consumers in an area on to a common tariff with the minimum of distress and disturbance. The tariff that emerges at this stage is likely to be little more than a numerical mean of those which it replaces. The second stage should be to remould it somewhat nearer to the ideal. At the moment the tariffs are only at stage one as regards values and proportions, and there should be no difficulty in progressive improvement that will bring these values closer to the various costs. But step-by-step changes are hardly possible with the structure, and the forms now emerging must be regarded as more or less permanent or at least long-term.

The fundamental weakness of the tariff structures, at least in the domestic tariffs, is that they entirely fail to discriminate as regards the peak responsibility of different classes of consumption. The same price is charged for summer water heating and for winter spaceheating at peak hours; propaganda, instead of price, is relied upon to urge consumers to avoid the peak. The problem of achieving the necessary discrimination between peak and off-peak consumption at an economic cost has not been solved, and there is little evidence that it has even been seriously considered. The possibilities—and difficulties—of designing tariffs that might more nearly approach this economic ideal will be discussed in a later article.

Business Notes

Long Road to Solvency

The Chancellor's statement in the House of Commons on Thursday carried with it the first faint signs that the sterling area is reorientating its trade in the direction of dollar solvency. The preliminary figures for United Kingdom trade in May, which were published on the same day, carry the same implication—but they also show that progress along this road will have to be notably quickened if the objective of securing a small overall surplus in the second half of 1952 is to be attained. The fact that the gold reserves have run down by less than £10 million since the end of March, despite large transfers of gold to EPU in this period, means that the sterling area must have been running only a very small current deficit with the dollar area (before allowing for the receipt of about $100 million of Mutual Security Aid). It is true that the Chancellor's statement seems to have been made the day before another transfer of $47 million of gold to EPU (in respect of the sterling area's deficit with Europe in May) fell due; even allowing for this, however, it will be disappointing if the total fall in the gold reserves in the second quarter of this year proves to be very much in excess of $50 million.

Meanwhile, the latest trade figures suggest (if an allowance of 12½ per cent is made for the element of freight and insurance included in the recorded import figures) that Britain's external deficit on visible trade was running at an annual rate of between £500 and £550 million in May, compared with an annual rate of about £450 million in the first five months of this year. It seems unlikely that the invisible surplus can have been offsetting this at a rate of more than £250 million a year. In view of this, it is clear that imports will have to be cut back very substantially in the second half of the year if solvency is to be attained; so far the full effect of the import cuts announced last November, January and March has still not made itself felt—partly because of prior commitments and partly because importers have hastened to use up their quotas—while imports still under open general licence seem to have expanded alarmingly.

* * *

Trade in May

The preliminary trade figures for May show that British exports amounted to £225.9 million in the month, compared with £217.5 million in April and £229.8 million in May last year. These figures, however, conceal a decline in the daily rate of exports to some £8.3 million, compared with £9.1 million in April (which was a short month because of Easter) and £9.3 million in March. This decline, however, may have been wholly due to a decline in exports to the Commonwealth. Exports to North America in May are provisionally estimated at £24.7 million, or 23 per cent above the monthly average for January to April. The Canadian market seems to be reviving rapidly: exports to Canada in May were £11.2 million and nearly a third more than the average for the first four months of the year. Although the May figures may have reflected some exceptional shipments, some exporters to the dollar area profess to have seen the first signs of an upturn in American consumers' demand during the past few weeks.

Imports, while still proving obstinately difficult to cut, showed a further slight improvement in May. The import bill last month amounted to £320.4 million compared with £338.0 million in May a year ago and £325.5 million in April of this year; when allowance is made for the larger number of working days this May, the trend is moderately encouraging. In all, imports (valued c.i.f.) exceeded total exports (f.o.b.) by £84.7 million last month, compared with £96.8 million in May last year and £96.3 million in April; but the excess is still appreciably larger than that recorded in February and March.

The New EPU

Agreement on the amended version of the European Payments Union has been reached more rapidly than had been generally expected. When the Ministerial Council of the Organisation for European Economic Co-operation met in Paris last week, it had two outstanding problems to discuss—the urgent need for reinforcement of the gold and dollar reserves of EPU, and the special position of Belgium as a creditor. Solutions have been found for both these problems. The reinforcement of the reserves of EPU is to be achieved by an amendment in the sliding scale on which debtors have to be paid in gold as they work through their quota and by the establishment of a guarantee fund of $100 million.

Proportion of Deficit Met in Gold

Old Scale	% of Current Deficit Met in Gold	New Scale	% of Current Deficit Met in Gold
Cumulative Deficit in:-		*Cumulative Deficit in:-*	
First 20% of quota	Nil	First 10% of quota	Nil
		Second 10% "	20%
Second 20% "	20%	Second 20% "	30%
Third 20% "	40%	Third 20% "	40%
Fourth 20% "	60%	Fourth 20% "	50%
Fifth 20% "	80%	Fifth 20% "	70%

The new sliding scale, which is shown in the accompanying table, will apply retrospectively to all cumulative positions as they appear on the settlement for July. When this settlement is completed in mid-August all countries whose cumulative deficits lie within the first three sectors of their quotas will have to adjust their position by paying in more gold. Britain, which has already exhausted the whole of its quota, will not be immediately affected, but its turn for some sacrifice will come if and when it returns to creditor status. Once it has reduced its cumulative deficit to within the confines of its quota it will regain gold from any further current surplus at a somewhat slower pace than would have been the case under the present sliding scale—in the first instance at 70 per cent instead of 80 per cent.

The reinforcement of EPU's gold reserve will also be ensured by a guarantee fund of $100 million set up by the members of the Union. If the gold and dollar assets of the Union fall below $100 million, the member countries will be called upon to implement their guarantees; their payments in gold will be scaled in accordance with their quotas (Britain's total contingent liability being $27 million) with the creditor countries called upon to pay first. The gold and dollar reserves of EPU, buttressed by these two devices, should be sufficient to withstand the maximum gold loss that EPU could conceivably sustain, and the Union's threatened "crisis of liquidity" seems thus to have been successfully solved without direct assistance from the United States.

* * *

Settlement with Belgium

The other main problem facing the Ministerial Council last week-end—that of the persistent creditor status of Belgium—has been tackled with equal ingenuity. At the moment Belgium has extended $223 million of credit to EPU over and above its normal quota of $330 million. It has now been decided to increase this Belgian quota by $86 million to $416 million. Half of this $86 million will thus be added to Belgium's normal quota loans to the Union, while the other half will be considered to have been financed by the gold that Belgium has already received from EPU outside its quota. By this sleight of hand Belgium's excess grant of credit to the Union is written down from $223 million to $180 million. It will be further reduced by an outright gold payment of $80 million by the Union to Belgium on July 1st next. Half of the remaining $100 million is to be redeemed by the supply of arms to Belgium by Britain (between $25 and $30 million) and France (about $20 million). This will leave a final balance of excess Belgian credit of $50 million, which will be funded in the form of obligations repayable in five annual instalments, beginning in 1953; these obligations will not be repayable in gold, but the form of repayment will be adjusted to Belgium's position with EPU at the time when each instalment is due. Belgium, for its part, intends to monetise this $50 million by borrowing an equivalent amount for a five-year period from the International Monetary Fund, repaying the Fund out of the annuities from EPU.

This neat solution takes care of the immediate problem of EPU's outstanding debt to Belgium. In return, Belgium has agreed to grant additional credits to EPU of up to $125 million in the next twelve months, on the condition that every additional dollar of credit will be accompanied by an equal payment of gold to it. In return for their promise to deliver military equipment to Belgium, Britain and France will have their cumulative deficits with the Union reduced. In other words the $25 to $30 million of equipment that Britain delivers to Belgium will in fact be paid for in advance (probably in mid-August) in gold by EPU or will involve a corresponding saving in the amount of gold that Britain would otherwise have to make to EPU if it continues in deficit. The whole story seems to be one of a nasty problem neatly solved.

* * *

More Coal for Export

The decision to export 1½ million tons more coal this year—making a total of 10 million tons of good quality coal and 1½ million tons of slurries and very small coals—seems a sensible one. Distributed stocks of coal on May 31st amounted to 14,929,000 tons, more than four million tons

above the level at the beginning of June last year. Stocks may well rise between now and the beginning of the coal winter in November by perhaps five million tons; though winter consumption obviously varies with the weather and the rate of industrial activity, a figure of 17-18 million tons looks a safe enough stock with which to start the winter. So far this year, about 4.6 million tons of general coals have been exported; so the rate will not need to be greatly accelerated.

Though the British announcement was welcomed in Geneva, and in general supplies of coal on the Continent are probably sufficient to meet needs, no agreement has been reached yet upon allocations for the third quarter of this year. Most of the importing nations are attempting to get more German coking coal than Germany wants to export; and since Germany is the one nation in Western Europe still prepared to import American coal at a substantial rate —about 1½ million tons a quarter—its need to restrict exports cannot be controverted. German consumption is expected to rise by 10 million tons this year, half of the increase going to domestic consumers, whose ration is now to be raised to a ton a year. Few other countries are importing more than about half a million tons of American coal a quarter for the rest of the year, though it is now available in Europe at a landed cost of about $16.50 a ton, which is roughly the fob price at which European exporters are offering it. Polish exports to Scandinavia seem likely to increase; but the Polish price remains high. The one coal exporter that is really suffering from the lull in demand is Belgium, where stocks at the pithead are mounting. Belgian producers believe that by the end of June it may become necessary to begin curtailing production in their high-cost mines, but as yet they have not begun to trim their prices.

British coal is still readily saleable on the Continent and the exporters should have no difficulty in disposing of the increased export allocation this year and probably more next. The increase in exports should have a healthy effect upon the board's financial results, since a premium averaging more than 25s. a ton over the home price is still being earned on each ton sent overseas. In the first quarter of 1952 the board had once again to cover a loss of £1,220,000 on imported coal, and made a provision of £4,500,000 in respect of taxation. Nevertheless, it earned a profit of 3s. 2.2d. a ton on the 51,338,759 tons it sold, and after setting aside £3,900,000 for interest due to the Minister of Fuel and Power, a final surplus of £249,360 on the quarter.

* * *

More Running Repairs for EPL

The Parliamentary resolutions giving effect to this year's budget expire on July 12th, and the Finance Bill must therefore be passed through all its stages by that date; otherwise the whole machinery of tax collection would be thrown into confusion. In normal circumstances the four months' period of grace between Budget day and the day by which the bill must become law is quite long enough to save the Government from embarrassment. This year, however, it is hard put to it to spot the host of anomalies in its ill-conceived excess profits levy—and to devise the necessary running repairs. On Wednesday morning, therefore, the Chancellor tabled his latest—although not necessarily his last—batch of EPL amendments. They will provide more food for thought by an already bewildered House on the report stage of the bill next week.

In general, these amendments give effect to promises made by the Government at the committee stage of the bill. Only two of them are really important. The first of these comes to the aid of investment trusts by exempting from the levy a proportion of their excess profit equal to the proportion of their total income that is derived from ordinary or preference dividends paid by United Kingdom companies; thus an investment trust that receives 60 per cent of its income from dividends paid by United Kingdom companies and that would normally have a chargeable excess profit of £10,000, will have to pay EPL only on a notional excess profit of £4,000. It should be noted that payments of debenture interest and interest on Government or Government-guaranteed stocks are not eligible for this relief, on the grounds that they are not payments made from a pool of funds that have already been mulcted by EPL. The investment companies that will enjoy this relief are those whose function is "wholly or mainly the holding of investments"; this definition looks like ensuring full employment for the courts, but real property companies are explicitly—and insurance companies and most mining finance houses seem to be implicitly—excluded from it.

* * *

Referees for Wasting Assets

The second important new amendment relates to industries with "wasting" assets. When the bill emerged from the committee stage it proposed "additional allowances" of 6 per cent for short-lived metal mines and oil wells and 3 per cent for longer-lived ones in consideration of this "wasting" factor. Under the old Excess Profits Tax additional allowances were accorded to any industry that successfully pleaded its case before the Board of Referees; in fact, however, only metal mines, oil wells, coal mines, and some asbestos producers did so succeed. The amendment tabled by Mr Butler on Wednesday reintroduces this function of the Board of Referees and provides that the industries that succeeded in convincing the Board last time will get the new additional allowance automatically, while other industries concerned with "mineral deposits of a wasting nature" can try their luck before it. This Board of Referees, which consists of a panel of business men appointed by the Lords Commissioners of the Treasury, has been continually in being since 1915; for example, the Inland Revenue's assessment of individual wear and tear allowances can be disputed before it. Since nobody seems to use it for its normal functions, however, it is only the unwise but recurrent resorts of governments to excess profits taxation that recalls it to really active life.

The other amendments tabled last Wednesday are mostly tidying-up measures, the need for which became apparent at the committee stage of the bill. For example, the clause in the original bill that was designed to prevent prosperous companies from playing the old EPT trick of buying up unprosperous companies (in order to change their businesses and enjoy their favourable standard) was apparently legal nonsense in its first form; several paragraphs of closely

SPEED THE SCRAP

Almost every steel-using firm possesses scrap iron and steel in the form of old plant, redundant buildings, machinery and spares. Every ton of it is wanted back in the steelworks to make the supplies of new steel that your own and other factories need so urgently.

Have a search made on your premises. Make prompt decisions to turn in all the old iron and steel you can find. Scrap merchants are glad to help with dismantling and collection.

THE RAILWAYS GET A MOVE ON

The amount of salvage by the staff of British Railways is enormous and the quantity of iron and steel scrap which they rounded up in 1951 was 664,000 tons.

written type are now introduced into the bill to make it less so. Another amendment permits companies whose financial year straddles January 1, 1952 (the date to which EPL is retroactive), to introduce split accounts for the trading period since then if they wish; this may be important for companies that did much better before January 1st than after it, although the Chancellor had already indicated that the Inland Revenue would have the discretion to consider split accounts of this sort. A lengthy amendment has also been introduced to deal with the complicated situation that arose when a company has changed the extent of its participation in a private partnership; while another is expressly designed to ensure that the provisions that apply to a business transferred by an individual shall also apply if the business is transferred on behalf of a certified lunatic by his committee in lunacy. This last addition to the tax deserves to stand as its epitaph.

* * *

Steel Output and Imports

Steel production in May was at an annual rate of 16,245,000 tons, or considerably higher than the rate of 15,866,000 tons attained in April, which was affected by Easter holidays. It was also well above the rate of 15,864,000 tons a year produced in May 1951. So far this year the average rate has been almost exactly 16 million tons a year which is what the industry has been hoping to achieve in 1952 as a whole, though the official estimate was conservatively put at 15,750,000 tons. It is difficult to trace any seasonal pattern of output for steel; comparisons with last year, for example, are thrown out by the fact that shortages of raw materials had most of their effect in the last three quarters of 1951. Comparing output so far this year with the first five months of 1951, for example, it might be estimated that the year's total would still fall short of the 1951 figure; in comparison with the same period during the record year of 1950, this year's production so far would indicate an output of about 15¾ million tons. The industry's conditions of production have changed, however, to a considerable extent; for example, production of pig iron this year has been at the rate of nearly 10,400,000 tons a year or much higher than in 1950, and the rate of scrap consumption in steel-making has declined sharply. A home steel output of 16 million tons therefore, may be possible this year; it is still too early to be confident that it is likely.

For the moment, steel is still scarce; and the industry's hopes of adequate supplies to meet demand by the end of the year depend almost entirely upon the margin that will be afforded by imports from America. Up to the end of May American producers had delivered about 365,000 tons of steel, scrap, and pig iron, and 266,000 tons had arrived in Britain. This leaves some 735,000 tons to be brought in by about the end of the year, if the original programme is to be fulfilled. The American ban upon exports not covered by a certificate that the steel is required for defence or "direct defence-supporting" purposes may not cover more than a small percentage of the steel intended for shipment by October. Such certification has to be somewhat rough and ready. So far, a high proportion of the steel Britain has received has been in ingots; and it is hardly possible to tag American ingots that are rolled into steel products in British mills. However, in terms of quantities Britain has a good case for certifying that the steel is required for defence; by the end of this year, steel requirements for defence will probably have reached the rate of well over a million tons a year. Nevertheless, even American defence requirements will be severely affected should the steel strike last long; and the British Government can hardly be expected to consider lifting steel allocation at an early date before it is satisfied on this point.

Textile Trade in April

Although there has been a revival in retail sales of textiles in recent months, this had not, by the end of April, spread back to the wholesale trade. Indices published at the end of last week of activity in April in these two sections of the trade therefore show two wholly different pictures. Retail sales of clothing during the month were higher in April than in March, the rise being larger for women's and children's wear than for men's and boys' clothes. Though they were not as high as in April last year, when the "buying spree" was at its height, they were well above the value of two years ago. The indices put sales of women's and children's wear at 12 per cent higher than in March, and 21 per cent higher than in March, 1950—though 4 per cent lower than in April, 1951. Sales of children's wear were higher than a year before, presumably reflecting buying during the school holidays, and sales of women's stockings were 15 per cent higher—as nylons began to become less scarce. The stocks of women's and children's wear, too, were slightly lower than in March and about 18 per cent lower than in April, 1951. Trade in men's and boy's clothing did not pick up so much, rising 6 per cent above the March level and about 9 per cent above April, 1950; and stocks, though 4 per cent lower than a year earlier, were still slightly higher than in March. It is difficult to estimate the seasonal elements in this revival of trade in clothing, particularly on account of the variable date of Easter. Moreover, all the indices of sales are based upon value; the retail price index for the clothing and footwear group had risen by about 24 per cent between April, 1950, and April, 1952, so that the volume of sales was still probably slightly lower than it was two years ago.

According to the indices of wholesale trade in textiles during April, the shopkeeper still remained very cautious about replenishing his shelves or stocking up for the summer season. Total home sales by wholesale textile houses were 18 per cent smaller than in March; sales of piecegoods fell by 36 per cent. Comparisons with April, 1951, were very unfavourable, sales showing a drop of 34 per cent; but in the wholesale trade, too, that was a month of abnormally high business. Stocks in the wholesalers' warehouses remained high, though they were about 4 per cent lower than in March, and lower than in any month since July last year, when the spectacular rise in stocks began. With sales even lower and stocks still dropping, wholesale purchases too must have declined further in April. At the production end of the pipeline, the Cotton Board this week said that yarn production in the industry in the first quarter of this year had declined by 14 per cent in comparison with the previous quarter, and cotton cloth production by 7 per cent; output of rayon and nylon mixtures was also 7 per cent lower than in the last quarter of 1951. Up to the end of April, five months after the cotton recession began, the producing side of the industry had lost 41,000 workers, or about 11 per cent of its total labour force in November last year. The Cotton Board adds that in the first quarter of this year yarn production in a group of ten major cotton producing countries was only 4 per cent lower that in the first half of 1951; a slightly smaller sample of rayon-producing countries showed a fall of 11 per cent. Nevertheless, most of the major exporting nations, in the first two or three months of this year, managed roughly to maintain the volume of their exports of cotton and rayon piece goods.

* * *

Lower Kaffir Dividends

The June season of Kaffir dividends has made a bad start, perhaps even a slightly worse one than the far from confident market had expected. Most market forecasts had suggested that six of the nine producing companies in the Consolidated Gold Fields group would have to pay lower dividends than they did last December. In the event seven

have had to do so. The main disappointments are Venterspost, which had been expected to maintain the dividend on its 10s. shares at 8d. but has had to drop it to 6d., and Sub Nigel, whose dividend reduction (by 9d. to 4s.) is greater than had been expected. It should be noted, however, that West Witwatersrand Areas, the holding and investment company in this Consolidated Gold Fields group, has been able to maintain its dividend at 50 per cent, or 1s. 3d. a share.

Since September, 1949, costs of production in South African gold mines have risen by about a third, and the benefits accruing from the devaluation of sterling at that time have therefore largely run out. In the last six months the upward spiral of costs has been accentuated by the increased prices of steel and other materials, higher food prices, and the shortage of electric power in South Africa.

CONSOLIDATED GOLD FIELDS DIVIDENDS
(December, 1950—June, 1952)

Ordinary Shares	December, 1950	June, 1951	December, 1951	June, 1952

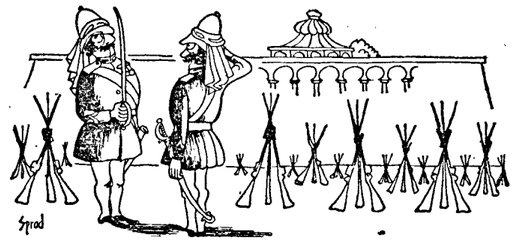
Profits have also been squeezed recently by the fall in the premium on sales in the "free" gold market, in which the South African producers have for some time past sold about 40 per cent of their output. Those who buy Kaffirs at present levels—and there were signs of a resumption of buying this week—are therefore in effect speculating on the beliefs either that sterling will be driven to a new devaluation (perhaps through the device of a free rate) or that the United States, in the event of a slump, would be bound to put up the dollar price of gold.

* * *

Have Shoes Touched Bottom?

Sales of boots and shoes rose in April considerably more than is normal at this time of year, and in the larger retail shops were higher than in April, 1951. So far this year footwear sales by independent retailers are still 11 per cent lower in value than in the first four months of 1951; but sales by the larger stores are only 4 per cent lower. According to Mr. F. J. Stratton, of the Footwear Distributors' Joint Council, "in the period from the beginning of this year to Whitsun, compared with the same period last year, there has not been very much difference in the number of pairs of shoes that have been sold." Since the percentages quoted above, from the Board of Trade returns, are all based upon value, and prices appear to have fallen by between 10 per cent and 30 per cent during the period, his estimate of volume seems plausible.



A period of slack selling in which various stores have offered shoes at quite sharply reduced prices tends to persuade the public that there may be more reductions to come, and the trade is now naturally concerned to argue that "prices have about touched bottom." During the past year leather prices have fallen by about 50 per cent, which prompted a suggestion in Parliament this week that footwear prices had not come down far enough and might require a reimposition of price control. The boot and shoe trade admits that shoe prices have not fallen as much as the price of leather, which represents some 40 per cent of the cost of a shoe; it argues that all its other costs, including wage rates varying with the cost of living, have risen during the same period. The price of leather has been more stable in the last few weeks, and may, the trade thinks, even rise: "housewives will find it difficult to get the exceptional bargains some of them have secured in the last five months." With this desire to convince the public that waiting to buy will not be worth while, the trade has now put into cold storage its opposition to the "D" scheme of purchase tax. Employment in the manufacture of footwear has not varied considerably in the trade fluctuations of recent months; to some extent the slack has been taken up by dispensing with outworkers, who had provided a margin of production. Mr Stratton referred to the current level of stocks—which at the end of April were 22 per cent higher in value than a year before, and made up presumably of mainly cheaper boots and shoes—in the words "The shelves are beginning to be well stocked up." He remained sure that except for a number of shoes in seasonal demand footwear would not continue to be unloaded on to the market at cut prices. This is a point that consumers may find it less palatable to accept; the housewife, in particular, may be unwilling to believe that she will not remain able to find that bargain.

* * *

Handling Higher Output

During the past five years many of the larger concerns in British manufacturing industry have invested fairly heavily in mechanical handling equipment. The employment of mechanical power to pass an article right along the chain of production processes is often a short cut to higher productivity; any point in a modern factory where the human hand has to shift rather than to guide materials may be an obstacle to a steady rate of output. Among these firms, the first missionary job of the mechanical handling engineers is perhaps done, and the firms are beginning to come back with specialised problems. Among the great variety of smaller manufacturing firms, interest in mechanical handling is rather patchier, and investment in the equipment is even more so. In the transport industries, all of whose equipment in a sense is handling equipment, there is a great deal of interest; but here, again, their requirement may be specialised, and development is slow.

At its third Mechanical Handling Exhibition, which has opened this week, the industry shows efforts to adapt itself to meet these different trends of demand. The exhibition at Olympia contains a large proportion of specialised applications of existing equipment to meet particular requirements; the now familiar lift truck, for example, appears with a wide variety of forks, platforms, clamps and hooks for picking up differently shaped or stacked materials. In the convention that is going on at the same time as the exhibition, a number of speakers are emphasising the improvements in materials handling that small firms can achieve at comparatively low cost, through the use of gravity conveyors, chutes, power hoists and conveyor tracks at floor or roof level. A number of manufacturers, too, are aiming at the massive handling jobs of the major transport industries; there are huge lift trucks that can carry 18,000 lb up 17½ feet, for docks as well as for heavy engineering, mobile conveyors and cranes, and specialised cargo-handling gear. It may well be that the most important single job the handling engineers could achieve would be to revolutionise loading efficiency in the ports, bringing the handling of general cargoes towards the level of efficiency that obtains for bulk cargoes such as oil, coal, and ores. But here, as in factories where conventional handling aids are already installed, change is required from the consumers as well as the suppliers of handling equipment. In the factory, the final refinement is the consideration of materials handling as a major factor in planning new construction. In the docks and other transport industries, the

Hesitation can mean disaster

Whether it's Mutiny or Heavy Duty Cooking

On May 12th, 1857, the rebels captured Delhi and there was a great Ball in Lahore. Quite an eventful day: the local troops were planning to revolt as well. Next morning, they were summoned to a general parade. Taken completely unawares, four Regiments obediently piled their arms and marched safely away. So it was — simply, heroically, and at the eleventh hour — that the entire Punjab was saved from Mutiny.

Just as procrastination in those days would have been a thief of Empire, so in our time it can be a thief of money. For instance, if you order Falkirk cooking equipment *now*, you will get it now — and at a very competitive price. If you delay, the opportunity won't wait for you.

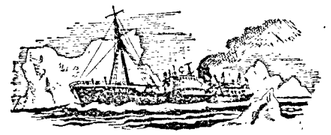
HARD FACTS ABOUT FALKIRK

Equipment for Gas, Electricity, Oil, Steam and Solid Fuel.

Really tough cast-iron construction — will last for years.

Efficient modern equipment means less work for small staffs.

No weak links, a complete and balanced range of equipment.



Specially designed installation and plans for each customer.

Price most competitive.

If you need new kitchen equipment, *now* is the time to buy.

NEWS FROM THE FISHING INDUSTRY

Voyage of Discovery

On February 11th last, the British trawler "Loch Doon" sailed home and into the headlines of scores of newspapers. Braving dense pack-ice and 'bergs "as big as the Albert Hall," she had penetrated farther in her quest for fish than any British trawler had ever been at this season of the year. Round the tip of Greenland she went, then up the Davis Strait towards Baffin Bay.

The reward of her exploit? Nearly 30,000 stone of fine fish. But far more important than her individual success are the implications of the trip. The "Loch Doon" and her crew have proved that the passage to one of Greenland's richest fishing grounds is not, as was formerly believed, impossible during the winter months. True, hardships and hazards abound, but the way is open to men of courage and endurance.

Next winter it is certain that other British vessels will attempt the trip and, if all goes well, real progress will have been made in the drive to bring housewives more and consequently cheaper fish in the months of scarcity.

As one great national newspaper said of the voyage: *"This is the spirit which sent Drake out in his cockleshell to sail uncharted seas. It is the spirit that we need today."*

British trawlers know their job!

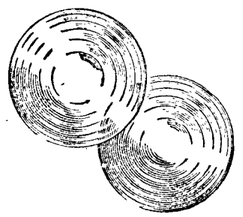
JOBLINGS
OF SUNDERLAND

versatility in glass

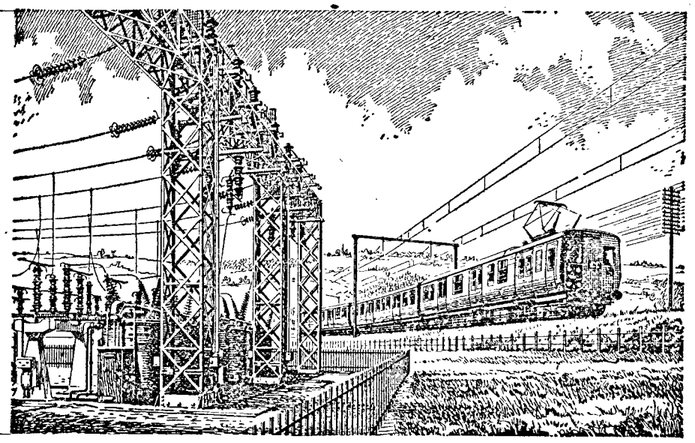
Glass was first made in the Sunderland district over a thousand years ago. Today, and for some generations, the works of James A. Jobling and Co. Ltd. have been producing an ever increasing range of articles and instruments from a variety of glasses including the famous 'Pyrex' brand, the original heat resisting glass in the world



FOR NYLON SPINNING
— a Godet spinning wheel made entirely of Joblings 'Pyrex' — because 'Pyrex' is unaffected by acids and humidity, and can be accurately moulded and machined

FOR YOUR TELEVISION SET
— the envelope of this cathode-ray tube is made entirely of 'Pyrex' to withstand high temperatures

FOR THE RAILWAYS
— signal lamp lenses, made to serve any requirement in railway signalling. The lens is designed to produce the character of beam required and is manufactured from special high transmission glass



AND FOR THE HOME — THE GENUINE
original oven-to-table glass

'ENGLISH ELECTRIC'

The 6.15 is but one link in the chain of electric power that transports thousands of passengers daily between cities and their suburbs. These links include the turbines and generators which provide the electricity, the transformers, switchgear and substation equipment which deliver current to the track, and the traction motors and control gear on the train. The ENGLISH ELECTRIC Company not only supplies all these vital links, but complete trains as well.

bringing you

'ENGLISH ELECTRIC' has electrified more than 60 railways in 5 continents, bringing faster, cleaner and more comfortable travel to millions of men, women and children. In the field of transport alone 'ENGLISH ELECTRIC' has over 40 years of specialised experience.
Wherever electricity can play its part, by land, sea or air — in industry or the home, 'ENGLISH ELECTRIC' generates and adapts it for the use of mankind.

better  living

Bleak Prospect for Freights

Widespread weakness has developed in the tramp freight markets in the last few days, and voyage chartering in most trades seems almost at a standstill. Grain charterers from the St. Lawrence, for example, appear to have covered all their requirements for the time being, and have obtained their recent fixtures at markedly lower rates. The latest fixtures for the United Kingdom from there have been made at 12s. 6d. per quarter, compared with 14s. earlier, while vessels for Jugoslavia have accepted 68s. 9d., compared with 78s. only a week before. Taking advantage of this weakness, Transatlantic coal charterers have been obtaining vessels as low as 52s. 6d. per ton for June and July loading. Two vessels have been fixed at 47s. 6d. per ton for sugar from Mauritius to Colombo ; the last time similar business was arranged the rate was 70s. North Pacific Coast charterers, who have been short of tonnage for a long time, seem now to be able to get all they want at continually decreasing rates.

This depression in the freight markets is mainly the result of a simultaneous drying up of demand in practically every trade, and particularly in the Indian Ocean, Australian, Far Eastern and Pacific waters, accompanied by an increase in competition from Japanese vessels. Freights ordinarily tend to be easier at this time of year, but how much of the present weakness is due to seasonal influences and how much to restriction of trade it is difficult to say. As a result of import cuts, the liner companies have totally withdrawn from the time charter market. The prospects of early improvement cannot be regarded as bright. As things are, shipowners will soon have to start laying vessels up, particularly as long-term charters previously made at high rates begin to expire and more vessels come on to the market. Already there are indications that an increasing number of vessels are being sold for scrap, since there are practically no buyers of secondhand tonnage for operational purposes, in spite of the steadily rising cost of new shipbuilding and the difficulties of obtaining early berths.

Fewer Dollars for Tobacco

The cut in the allocation of dollars for purchases of American tobacco will be much more severe than had been expected. No firm figures are yet available, but it is understood that purchases from this year's American auctions, which begin in July, will be limited to about 50-60 million lb, or a quarter of last year's purchases. Arrangements are being made by British buyers to spread the impact of this cut over the 1952 and 1953 crops. They will be able to earmark tobacco from this year's crop, for which they have not at present sufficient dollars, and will have the option of concluding the purchase in 1953. This method will avoid any sudden pressure on the 1953 crop if next year's dollar allocation is increased, and it will at the same time enable British manufacturers, in that event, to buy matured tobacco.

Drastic as the cut appears to be, it is unlikely to cause a shortage of tobacco for British smokers this year. A large allocation of dollars for purchases from the 1951-52 crop permitted 212 million lb to be imported from the United States last year and 22 million lb from Canada. It was largely these increased dollar supplies that brought stocks in this country up to a record level at the end of last year. In the first three months of this year imports, particularly from Canada and the United States, continued to be much above their level for the same period last year. On the other hand, consumption showed a tendency to fall and stocks at the end of March amounted to more than 2 years' consumption at last year's rate ; but large stocks are necessary in order to allow the leaf to mature.

Prospects for supplies from non-dollar sources are good. Rhodesia may become this country's principal supplier this season, and reports suggest that its crop will not fall far below the expected level of 120 million lb. Export control has been lifted, but the new marketing arrangements are working smoothly and Britain hopes to get 75 million lb. Including supplies from India and Nyasaland, total imports of tobacco this year may reach nearly 200 million lb, or only a little below the annual rate of consumption, despite the smaller dollar allocation.

Wool Looks Up

The twenty-first Conference of the International Wool Textile Organisation opened in London this week in an atmosphere of quiet confidence. There was a widespread conviction among the members, representing manufacturers and merchants from 16 countries, that the worst of the textile depression is over. During the last two months raw wool prices have risen quite appreciably ; in London, merino prices have increased by 20 per cent and crossbred prices by 20 to 25 per cent. Wool consumption has been rising, though modestly, since the last quarter of 1951 and this improvement has lately spread to top-making ; world top production in the first quarter of this year was 5 per cent higher than in the preceding quarter. But the revival has not yet penetrated the later stages of the wool textile industry. World yarn output in the three months ending in March this year was 23 per cent below that of the last quarter of 1951, and worsted yarn showed a greater fall than woollen yarn.

Certain interesting trends can be gleaned from the results of the annual questionnaire on wool statistics issued jointly by the IWTO and the Commonwealth Economic Committee.

Sources : International Wool Textile Organisation and Commonwealth Economic Committee.

World wool consumption in 1951 declined by over 400 million lb (clean) to 2,248 million lb, and it was in fact only 4 million lb smaller than available supplies in the 1950-51 season. Consumption in the major consuming countries fell quite sharply compared with 1950, but in the

smaller consuming countries the fall was quite modest. There was a similar divergence in the movements of stocks of wool held by the larger and smaller consumers. In those countries with large wool textile industries stocks declined; in other countries they increased.

Looking further ahead, it seems quite likely that there may be a surplus of raw wool this year, for world consumption may not be much above last year's level, but current supplies are some 200 million lb. larger. On the other hand, if consumption subsequently returns to its postwar average of 2,450 million lb, a shortage might develop later on because the world clip cannot be expected to yield much above 2,300 million lb (clean) for the next two seasons.

Hard Times for Government Scientists?

Although the pay and conditions offered to scientists employed by government establishments working directly on military projects may now compare fairly favourably with those offered by industry, the plight of the official scientists carrying out non-military but nevertheless essential research calls for some attention. The 1951-52 report of the Advisory Council on Scientific Policy notes that among the big public and private employers of science graduates, only the Department of Scientific and Industrial Research and the Agricultural Research Council had any serious complaints about the quality of the men they took on. The report comments: "we think that their views may be biased by the fact that many of the best science graduates appear to be attracted to employment outside the Government Scientific Service." The professional trade unions put this down to the difference in the pay of a scientific and an administrative employee; but some part of the explanation may lie in the working conditions of the civil research establishments. For example, the annual report of the DSIR for 1950-51 conveys the impression that since the war science has been a Cinderella among government departments. At the end of the war, a building programme was approved that was then estimated to cost £4 million a year (£7.5 million at current prices). Actual permitted expenditure has persistently lagged behind schedule; there seemed some hope that it would eventually reach an agreed rate of £1 million a year, but the report suggests that the latest cuts make it unlikely to reach as much as £500,000 in 1951-52. As a result of this, "water pollution research is at present carried out in a house at Watford and in huts on the grounds of the Building Research Station" and much of the work of the Radio Research Board is being carried out in huts at Datchet. These are two of the worst examples. With considerable restraint, the report comments that "staff cannot give of their best when compelled to work in over-crowded and make-shift laboratories."

*

Although the report asks for "some moderate annual increase of the order of 5 per cent in DSIR's annual expenditure until its post-war plans are fulfilled," a more satisfactory solution might lie in a drastic review of the work of the forty or so industrial research associations that are financed partly by the DSIR and partly by the industry concerned. Some of these bodies appear to have been working on the same projects since their establishment, with no very obvious results. There is a slight suggestion in the report that more care needs to be taken to ensure that the government and the industry concerned do get value for money. A transfer of some of the work (and of the income) of these associations to DSIR laboratories might be of benefit to all parties. An agreement with the universities about financing nuclear research would also lighten the load on the department's budget. The DSIR is financing the construction of a number of heavy pieces of equipment classed as "non-recurring capital expenditure" and costing as much as £400,000 apiece. It was expected that after the first five years when the projects were established, the University Grants Committee would take over financial responsibility for them. The DSIR, however, has got the worst of recent negotiations with the universities, and is now committed to financing much of this "non-recurring capital expenditure" for a further five years.

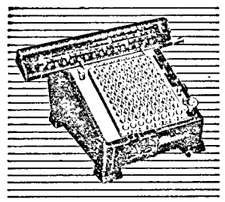
Remploy in the Red

No one would have expected that a chain of factories set up specially to provide employment for disabled people would be particularly profitable, especially in its early years. But that after five years it should be losing £380 a year for every disabled person it employs—more than the average wages it pays—is probably worse than anybody feared. Remploy Limited, a company set up by the Ministry of Labour after the war, has now set up 92 factories, and employs some 6,000 disabled people in them or as outworkers in their own homes. The Ministry advances loans for capital expenditure, and makes direct payments to cover trading losses. Up to 1950-51 these direct payments totalled about £3,850,000, and in 1951-52 the company expects to have made a loss of £2,280,000, higher than ever before. Between April and December last year only two of the factories were showing a profit—the highest one of 66s. 4¾d. a week per disabled employee; 73 of the 85 working in the period were losing more than £4 a week per employee, the worst being one with a loss of £10 12s. 2½d. a week for each disabled worker. The Select Committee on Estimates, which records these details in a recent report, notes the company's estimate that in 1952-53 it may make a loss of only £2,150,000; but concludes, not surprisingly, that "considerable reorganisation of the management of the company is now imperative."

The company's factories are engaged in knitting, woodwork, bookbinding, leatherwork, engineering, printing, packaging and the manufacture of cardboard boxes, brushes, school furniture and mattresses. The degree of mechanisation varies, but Remploy seems to have followed a policy of avoiding mass production methods on the grounds that such methods would take too much space and might make the factories fulfil orders faster than they obtained them. At one time this view was so exaggerated that the company insisted on all processes being carried out by hand, at "fabulous" cost; partly for this reason, it made little attempt to find plant that might have been within the powers of disabled workers to use, to adapt existing machine tools, or to offer any special training to its disabled workers. Little study appears to have been made of the type of products that the factories might best produce, while stock control was so inadequate that at the end of 1951 the cost of materials used in the products of the company averaged 80 per cent of the selling price. The company was run by a board of 13 members, but only one was a full-time executive director; a financial director was employed and paid fees only as his services were needed.



The committee's recommendations suggest little more than what should have been obvious to any organisation setting up such a company: that it needs more full-time directors, probably including one from the Ministry of Labour since that ministry pays the piper, a reorganisation of management, particularly of sales management, closer attention to materials, stock control and product study, and better liaison on the one hand with the rehabilitation sections of the Ministry and on the other with commercial companies employing a large proportion of disabled people. The Committee comments:

> . . . the consideration of the undoubted and unquestionable value of the work which the company is doing for the

Prospects for Fuel Oil

To what extent is the rise in consumption of fuel oil in Western Europe dependent upon the shortage of coal? This question is now becoming of considerable importance to the oil industry. For the rise in demand for fuel oil—some 22 per cent per year since 1948 in Western Europe—may soon begin to put some strain not only upon the industry's refining capacity but upon the traditional price structure of petroleum products. In the last few years, consumption of heavy oil has risen much more sharply than consumption of motor spirit; and successive rises in petrol taxation, in a variety of countries, may soon begin to price motorists out of the market. Motor spirit consumption in Britain so far this year, for example, appears to be little higher than in the same period of 1951.

If demand for fuel oil continues to rise, the oil industry as a whole throughout the world may not find it easy to meet. Prospects of fuel oil supplies are affected by the fact that demand for it in the United States has not risen to the same degree as elsewhere; since 1947, American consumption has risen by only 15 per cent, according to the Petroleum Press Service, and represents only about a quarter of the total demand for petroleum products in that country, against about 45 per cent in the rest of the world. Since world oil prices are based upon the price structure of the Texas Gulf, this disparity between the trends of American and of world demand affects the profitability of switching towards fuel oil in refineries elsewhere. The yield of these heavy oils is now averaging about 37 per cent of output in European refineries, against 20 per cent in the United States, and technically it may be possible to raise the yield of fuel oil even more. But while this oil, as a residual product of the refining process, remains the cheapest of a refinery's major products, any considerable increase in the proportion of it that is produced would cut refinery earnings.

Prices of fuel oil have usually been related to the price of coal, with which it competes. During last winter the landed price of fuel oil in Europe was roughly equivalent to the price of British and German coal, though somewhat cheaper than American coal. Dry-cargo freight rates have fallen since then more than tanker rates, so that American coal will presumably be cheaper, during the present period of slack demand for Transatlantic freights. But should this coal demand revive, or should the demand for fuel oil continue to rise in spite of a slackening in demand for American coal, the argument for some rise in fuel oil prices would gain strength. How far this growth in external demand would make itself felt in the American oil industry depends to some extent upon the dollar shortage that still affects many American customers, and upon the relative pattern of demand for petroleum products in the United States. But unless the suppliers of fuel oil to countries outside America become able to earn somewhat higher prices than the present levels that are based on Gulf prices, any continued growth of demand in Europe will probably remain unfulfilled.

* * *

Saving Scarce Metals

One healthy result of the shortages of metals brought in the wake of rearmament—notwithstanding the fact that some of these have since abated—has been the impetus they gave to attempts to conserve metals in industrial use. Britain has at present a committee studying the possibility of substituting alternative materials for steel in construction, a Directorate of Alloy Steel watching the use of the richer alloy steels, and various committees within the metal industries studying the technical possibilities of saving metals. None of these will necessarily issue any public report; but a rather more formal "joint sub-committee" of the International Materials Conference, set up to study the utilisation of five scarce alloying metals, has now issued a technical report and recommendations.

The metals concerned are manganese, nickel, cobalt, tungsten and molybdenum; though these vary widely in scale of supplies and degrees of shortage, all seemed alike to the sub-committee in that output could not be largely increased during 1952. This may not remain true long: nickel output, for example, may by 1954 be about 32 per cent above the 1951 level, and production of manganese, too, may be expanded fairly quickly. But in the short terms of the current rearmament programme, at least, the utmost economy in their use is necessary. Manganese is already less scarce than the other four metals, so that in some cases it may be substituted for them; and the production tonnage of nickel is about fifteen times that of cobalt, so that here, too, substitution might greatly ease the shortage of cobalt without greatly affecting nickel supplies. Methods of saving these metals mentioned by the sub-committee include the use of boron steels, which are being adopted intensively in the United States, the "downgrading" of high-nickel alloys for many uses, the use of plated products instead of solid stainless steels for corrosion-resistant parts, and the saving of tungsten and molybdenum in high-speed tool steels by the use of vanadium and the substitution of tungsten carbide tools by ceramic-tipped cutting tools (developed in Britain). The sub-committee adds that a scrutiny of the specifications laid down by the military services for the materials of construction in their vehicles and power plants might well reveal greater opportunities for conservation than anything in the civilian field. But it adds that the reduction of the alloy content of steels in most cases means a downgrading of the qualities of the materials used; and it instances chemical plant, oilwell drills, tungsten carbide tool tips, and high-alloy materials in jet aircraft engines as uses in which no limitation of properties can be tolerated. In such cases reduction of the alloy content would be the very reverse of an economy measure.

* * *

Loans to Save Fuel

Full details have now been issued of the loans that the Government is prepared to make to industrial companies to finance the installation of "approved fuel-saving equipment"; but these make the real usefulness of the scheme no more evident. During the coming year, the Government may lend up to £1 million, in individual loans not normally exceeding £25,000, for the installation by industrialists of back-pressure turbines, feed water economisers, air pre-heaters, heat exchangers, waste heat boilers, and for the structural insulation of factory roofs and walls. The loans will be at full commercial rates, and the terms will be negotiated upon the Government's behalf by the Industrial and Commercial Finance Corporation.

Somewhere in this scheme a positive idea appears to have gone astray. If economy in fuel is of such over-riding importance that investment in fuel-saving equipment should be subject to less stringent commercial scrutiny than other investment, the Government might express its valuation of that importance by offering finance at less than commercial rates. If it is not, and fuel-saving equipment is judged not by thermal but by "dollar efficiency"—as the Government seems to think, probably rightly—it is not easy to see why these special loans should be required. This money is perhaps rather more readily accessible than it might be from other sources; but it remains doubtful whether it will persuade many industrialists to invest in fuel saving.

Company Notes

J. Lyons.—The steady growth in profits earned by the J. Lyons group since the end of the war has gone hand in hand with an extensive modernisation and development of the company's restaurants. This modernisation has undoubtedly attracted more custom, and this, together apparently with a policy of keeping prices in line with increases in costs, again led to an expansion in profits in the year to March 31st last, this time from £3,022,138 to £3,512,812. Capital development has meant, however, that the directors have been more concerned with the ploughing back of profits than with claims for an increase in equity distribution; the ordinary dividend has therefore been maintained at 22½ per cent since 1946. This rate has again been recommended, but it is to be paid on the equity capital as increased by the one-for-three rights issue made in January, 1951. This payment was foreshadowed when the rights issue was made, and it should not be taken as indicating any break with the conservative policy that has been pursued since the war.

More generous dividend payments cannot be ruled out of court if the growth in earnings is maintained, but the cost of investment in fixed and working capital has already made its mark on the balance sheet. Last year's receipts from the capital issues (reflected in the increase in preferred ordinary capital from £493,829 to £564,846, in the "A" ordinary capital from £1,266,273 to £1,926,273, and in the share premium account from £189,962 to £2,512,457) have not altogether balanced last year's increase in capital investment. The book value of stocks, for example, rose from £8,221,112 to £10,654,979 and the net book value of fixed assets from £12,733,641 to £14,794,372. These increases, despite the receipt of the new money, were accompanied by a slight decline in cash balances and, more seriously, by an increase in the group's short-term indebtedness; acceptance credits have risen from £750,000 to £2,000,000 and a secured bank loan of £21,180 has been replaced by a bank overdraft of £250,330. The cut in the food subsidies may mean that further sums will have to be locked away in working capital this year, and thus impose further strains on the group's finances. Against this, however, there are signs that less will be spent on fixed assets in 1952 than has been customary in earlier years; at the end of the last financial year the group was committed to spend £740,000 on its capital programme, compared with commitments of £1,570,000 a year ago.

Metal Box.—The preliminary trading results announced by Metal Box for the year to March 31st last should pave the way for the success of the company's coming rights issue of ordinary shares. The directors have felt able to raise the dividend on the ordinary capital of £3,612,770 from 12½ to 15 per cent, thanks to advances in group profits (after depreciation) from £2,636,000 to £3,720,000 and in net profits from £1,094,000 to £1,515,000. Trading profits earned at home rose from £1,701,000 to £2,545,000 and those earned overseas from £935,000 to £1,175,000. These increases are in part reflections of the general inflation of prices, but they are large enough to suggest that the company achieved a genuine expansion in its trade despite the shortage of tinplate. The increase of 28 per cent (or by £8,114,000 to £36,423,000 in income from sales and investments) compares with an increase of over 40 per cent in group profits; this suggests that selling prices have been kept well ahead of any increase in costs. Taxation, at £2,205,000 (against £1,542,000), has of course eaten into profits, but last year's advance in earnings was sufficient to permit the directors to put more to reserves despite the higher dividend payment; overseas subsidiaries have retained £212,000 (against £203,000) while £752,000 (against £415,000) has been retained by the holding company.

The company's recent prosperity has owed a great deal to the ploughing back of profits in the past, but it cannot support a further expansion in business under the present burden of taxation without appealing for external finance. The method of appeal chosen is a rights issue of ordinary shares, under which stockholders are offered 903,192 new £1 ordinary shares at £2 each in the ratio of one new share for every four held. The presumption is that the dividend of 15 per cent will be maintained on the revised ordinary capital. In this case the yield on the new shares at the issue price of £2 would be 7½ per cent; this compares with a yield of 6¾ per cent offered by the existing stock units at the current price of 44s. 3d.. Prior to the announcement of the rights issue and trading results the stock units stood at 43s. 9d.

*

Fine Spinners and Doublers.—Last December, when an interim ordinary dividend of 5 per cent was declared, the directors of Fine Spinners were able to announce that trading results for the half year to September 30th last were better than those achieved in the corresponding period in the previous financial year. Now the preliminary statement for the full year to March 31st last shows that the recent slump in the textile trade, particularly in rayon in which the company has a considerable interest, has cut into profits in the last six months of the financial year—and presumably in the two and a half months since then as well. Group profits (including investment income) for the full year are shown to have fallen from £4,879,418 to £4,379,227. The main brunt seems to have been borne by subsidiary companies, whose profits have fallen from £1,103,284 to £807,158; only £6,635, compared with £303,646 in 1950-51, has been transferred to their reserves. This, together with a smaller provision for taxation (of £2,274,567, against £2,400,657), has meant that net profits, which have fallen from £1,366,418 to £1,185,641, have not felt the full impact of the recession in trade. The directors have therefore been able to maintain the year's equity distribution at 12½ per cent. They recommend a final dividend of 7½ per cent and a transfer of £700,000 (against £500,000) to general reserve. After the announcement that the ordinary dividend was to be maintained, the price of the £1 shares jumped from 19s. 6d. to 20s. 9d.

COMPANY MEETINGS

UNION CORPORATION, LIMITED

SHARP INCREASES IN GROSS PROFIT AND TAXATION PROVISION

MR P. M. ANDERSON'S REVIEW OF THE GOLD-MINING INDUSTRY

The ordinary general meeting of shareholders of Union Corporation, Limited, was held in Johannesburg on May 27, 1952, Mr P. M. Anderson presiding.

The chairman, in moving the adoption of the report and accounts for the past financial year, said:—

Gentlemen,—The accounts of the corporation for the year 1951, together with the directors' report, are submitted for your approval.

Our gross profit for the year was £2,205,076 compared with £1,519,366 for the previous year, or an increase of £685,710.

Dividends and interest received rose by £297,170 to £1,705,876, while net realised profits on shareholdings, fees and sundry receipts, after charging expenses, increased by £388,540 to £499,200.

The provision for taxes on the profits for the year rose sharply to £1,153,000, the higher rates of United Kingdom income tax and profits tax having contributed to this rise.

The net profit after taxation increased by only £55,395 to £982,714.

Out of this profit your directors have considered it desirable to appropriate £300,000 to exploration reserve. After deducting £187,637 expended during the year, this reserve now stands at £478,938.

The corporation's programme of prospecting is substantial and provision on this account is therefore required.

During the year the benefits provided by the Johannesburg and London staff pension funds were improved to bring them into line with modern practice and £47,000 has been provided from current profits towards the resultant increased liabilities of the pension funds.

The dividends declared for the year amounted to 6s. 6d. per share free of United Kingdom income tax, an increase of 6d. on the previous year. These dividends absorbed £604,500, leaving £313,541 to be carried forward to the new account, against £282,327 brought forward from 1950.

As your corporation's principal interests continue to be centred in the gold-mining industry of South Africa, it is perhaps appropriate that I should touch upon the position of the industry in general.

An important event during the year under review was the commencement of milling, in November, 1951, by the first two mines in the Orange Free State—namely, St. Helena Gold Mines, Limited, which is under the administration of your corporation, and Welkom Gold Mining Company, Limited.

Work is proceeding apace in this new goldfield, where no fewer than 11 other companies are at present engaged in shaft sinking or underground development work.

In addition, work continues in opening up the westerly extensions of the Witwatersrand, where early this year West Driefontein Gold Mining Company, Limited, commenced production.

Two further mines are expected to start milling in the course of the year—namely, Stilfontein Gold Mining Company, Limited, near Klerksdorp, in the western Transvaal, and Western Holdings, Limited, in the Orange Free State, in both of which companies your corporation is interested.

The expansion of the gold-mining industry at present taking place and the development of the country in other directions is throwing a heavy strain on the Union's economy.

The gold-mining industry, no less than others, has at present to contend with the difficulty of raising capital, delays in obtaining necessary equipment, shortages of labour and electric power, and a rising cost structure.

However, I feel we can look forward to making continued progress and that in time the difficulties will be surmounted.

RESULTS OF OPERATIONS

In the following review of the results of operations by the gold-mining industry during 1951 the figures include those for the Orange Free State mines, which, it should be remembered, at this stage in the development of the new field, make up only a very small proportion of the total.

In 1951 the tonnage milled by the industry decreased somewhat to 58,648,800 tons and the output at 11,019,045 ozs fine was 166,276 ozs lower than in 1950.

The consequent loss of revenue was, however, more than offset by the increased premium received from sales of gold at enhanced prices for industrial and artistic purposes, which in 1951 brought in £6,693,001 as compared with £2,123,547 in 1950.

Accordingly the working revenue rose by £2,573,285 to £144,187,861.

On the other hand, working costs at £93,337,806 rose by £5,381,163, so that the working profit of £50,850,055 was £2,807,878 less than for the previous year.

After appropriating from profits nearly £4 million to cover capital expenditure and other items, and after providing for taxation and share of profits payable to the Government amounting to around £24 millions, dividends distributed to shareholders totalled £22,787,806, or a decrease of a little over £1,900,000.

The increase of about £1,500,000 in the amount payable to the Government is due largely to the increase of 5 per cent in the formula tax which became effective from January 1, 1951.

WORKING COSTS

The rise in working costs continued in the year under review and working costs for the whole industry averaged 31s. 10d. per ton milled, or 2s. 3d. per ton more than in 1950.

This was due in part to increases in wages and other benefits granted to employees during the year, but mainly to factors outside the control of the industry, such as further rises in prices of stores and commodities. Costs have continued to increase, and during the first quarter of the present year averaged 34s. 1d. per ton, as compared with 26s. 3d. per ton during the three months immediately before devaluation in 1949, equivalent to a rise of almost 30 per cent.

The recently announced increases in the price of steel and the prices of maize and other Government-controlled agricultural products in South Africa indicate that costs must be expected to rise still further this year.

On the other hand, certain recent developments in world markets suggest that the present period of world-wide inflation may be coming to an end.

If this is so, working costs may be approaching their peak, though it may take some time for any reduction in commodity prices fully to be felt in the South African economy or to be reflected in the working cost figures of the industry.

The rise in costs of production also rendered unpayable greater quantities of ore previously included in reserves than were made good by development, so that the ore reserves declined by rather more than 4 per cent to 184,284,000 tons, the average grade being slightly higher at 4.88 dwts per ton.

POWER SHORTAGE

As I indicated earlier, the gold-mining industry is suffering from a shortage of electric power.

For some time past, owing to the general increase in electric power demands in the Transvaal and the Orange Free State and to the delayed installation of new generating plant, the Electricity Supply Commission has found it increasingly difficult to supply the gold-mining industry with its full power requirements.

The commission has intimated that the inability to meet the full power demands will continue for several years.

In order to meet the position it has been necessary, *inter alia*, to curtail milling during periods of peak loads on week-days and, where possible, to make good the tube mill hours so lost either by operating reduction plants on Sundays, by making use of any available excess milling capacity during off-peak periods when power is more freely available, or by rearranging normal mill maintenance work.

So far, these arrangements have ensured that there has been very little loss in production, but if further power cuts have to be imposed, some further loss of output is likely to result.

As usual, I will now touch briefly on the affairs of the gold-mining companies under our administration and some other companies in which we are interested.

GOLD INTERESTS

East Geduld Mines, Limited.—The ore milled in 1951 was 1,738,000 tons and the net profit was £2,158,393. Dividends totalling 4s. 4d. per unit of stock were declared, being a decrease of 3½d., and £557,797 was carried forward.

Geduld Proprietary Mines.—The ore milled was 1,259,000 tons and the working profit therefrom was £658,396. Dividend income from holdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, was £770,585.

The net profit was £1,154,000. Dividends declared totalled 14s. 9d. per share, being a decrease of 1s. 9d., and £387,440 was carried forward.

Grootvlei Proprietary Mines.—The tonnage milled increased to the new record figure of 2,338,500 tons and the net profit was £1,818,798.

Dividends declared totalled 3s. per unit of stock, being the same amount as for 1950. The sum of £661,121 was carried forward.

Marievale Consolidated Mines.—The tonnage milled increased slightly to the record figure of 729,000 tons and the profit was £512,140.

Dividends declared totalled 2s. per share, an increase of 2d., and £467,751 was carried forward.

Modderfontein Deep.—Work on the surface clean-up of the property and the disposal of plant and equipment is approaching completion.

A liquidation distribution of 1s. 6d. per share was recently declared, making a total of 12s. 1½d. per share since the company went into liquidation.

Van Dyk Consolidated.—The tonnage milled was 1,204,000 tons and the net profit was £249,703. Capital expenditure for work in the No. 5 shaft area, where development was continued on the 48th level, absorbed £176,645, and £71,460 was carried forward.

St. Helena Gold Mines.—Development work is being pressed forward as fast as possible in order to build up ore reserves and to provide sufficient stope faces to feed the reduction plant with stope ore on a scale commensurate with its full capacity of 80,000 tons per month.

The value of the ore being sent to the reduction plant is below the average grade of the mine, as only about half the tonnage milled is coming from stopes, the balance being made up from development rock.

The yield has, however, improved with the gradual increase in the proportion of ore from stopes since milling commenced, so that this year the mine has been earning modest working profits on an increasing scale, in contrast to a working loss for the two months' milling in 1951.

Withok Proprietary.—The deep borehole which, as I mentioned last year, was being sunk in the north-eastern portion of the company's farm Withok No. 7, district Brakpan, intersected the Main Reef horizon at a depth of 7,034 ft, disclosing no values.

A deflection of this borehole failed to encounter the reef horizon owing to the presence of a dyke and faulting.

OTHER MINING INTERESTS

San Francisco Mines of Mexico, Limited.—After taking into account certain non-recurring credits relating to previous years, this company earned a record net profit of £1,022,000 for the year ended September 30, 1951, compared with £818,000 for the previous year.

The directors have recommended a dividend of 6s. per stock unit on the recently doubled capital, making a total distribution of £647,896, as compared with £377,939 for the previous year.

The increased profits reflect the relatively high metal prices obtained during the year.

The tonnage milled was adversely affected by power shortages, and the mill treated 597,000 tons, compared with 623,000 tons in the previous year.

The ore reserves increased from 4,164,000 tons to 4,209,000 tons. The mine continues to develop well, and underground work is well ahead of immediate mill requirements.

Chrome Mines of South Africa, Limited, continued operations at its Zwartkop and Groothoek mines throughout the year, but was greatly hampered by the continued inability of the South African Railways to transport more than a portion of the ore sold by the company for export.

Production had, consequently, to be curtailed.

OTHER INTERESTS

Bay Hall Trust, Limited, declared a dividend of 6¼ per cent, free of United Kingdom tax, in respect of the year 1951, compared with 6 per cent, free of tax, in 1950. At the end of the year the appreciation of its holdings over book cost amounted to £716,000.

British Enka, Limited, further increased its output in 1951, and the net profit, after providing depreciation and taxation, was £419,000, compared with £300,000 in 1950.

In addition £80,000 previously over-provided for taxation was brought back to the credit of the profit and loss account.

The company maintained its annual dividend of 10 per cent, placed £350,000 to general reserve, and increased its carry-forward by £55,666.

South African Pulp and Paper Industries, Limited, again increased its production at the Enstra mill. The net profit was £274,022, and dividends declared for the year amounted to 2s. per share.

Expansion of the Enstra mill and the construction of the Tugela mill, which together will lead ultimately to increasing the company's present output of paper fourfold, are progressing satisfactorily.

To the great regret of his colleagues the Rt. Hon. Lord Leathers resigned from the Board of Directors in October, 1951, following his appointment as Secretary of State for Co-ordination of Transport, Fuel and Power in HM Government in the United Kingdom.

I am sorry to report that, since the close of the year, Mr S. T. Amner, one of our managers in London, has died. He had 34 years' faithful service with the corporation, and his death is a sad loss.

In conclusion I would like to thank the staff of the corporation, both in London and Johannesburg, and the managers, staff and employees of the companies under our administration for their loyal and efficient services during the past year.

The report and accounts were adopted and the retiring directors re-elected.

GREEFF-CHEMICALS HOLDINGS

EXCEPTIONAL RESULTS

MR STANLEY BAYLISS SMITH ON EPL

The sixteenth annual general meeting of Greeff-Chemicals Holdings Limited, was held on June 12th in London, Mr Stanley Bayliss Smith, FCA (the chairman), presiding.

The following is an extract from his circulated statement:—

The net profit of the group is £136,823, as compared with £73,667, and after providing for taxation amounts to £59,695, against £40,348 in the previous year.

Your directors would have liked similarly to have increased the ordinary dividend to the stockholders, but in view of the necessity to put aside profits for capital commitments, to which I am referring later in this address, have decided only to increase the total dividend including bonus for the year from 17½ per cent to 20 per cent, by proposing a final dividend of 8 per cent and a bonus of 7½ per cent, making with the interim of 4½ per cent a total dividend and bonus of 20 per cent. The increase in the interim dividend to 4½ per cent as against an interim of 4 per cent in the previous year gave stockholders a very fair forecast of what the total dividend and bonus for 1951 might be.

Taxation has increased from £33,319 to £77,128.

After providing for the final ordinary dividend and bonus, placing to reserve in the subsidiary £33,687 and deducting the interim ordinary dividend and preference dividend already paid, there remains £1,356, which has been added to the amount brought forward, making a total of £20,426 to carry forward to next year.

CONTINUALLY RISING COSTS

In 1951 trading generally continued to be on an increased scale until the third quarter of that year, when a recession in trade became noticeable. This recession has continued to date this year, but because of the expansion of new lines of business, turnover this year is at least equal to that of the same period of 1951, although margins are generally lower and costs are continually rising. For this reason the directors do not expect that the exceptional results of 1951 will be repeated in 1952.

The resources of the company, as will be seen from an examination of the consolidated balance-sheet, are still fully extended, but the excess of current assets over liabilities shows a gratifying increase, being £229,814, as compared with £197,560 in 1950. The contingent liability in respect of uncalled capital of a trade investment amounting to £26,787 has now been paid and the directors expect to have the opportunity of increasing further that investment by about the same amount before the end of this year.

The businesses in which we have trade investments continue to prosper. They appear in the balance sheet at cost £204,928, a figure which is obviously an under-valuation when the gross annual income therefrom amounts to £35,086.

The executive directors have been very active, having made numerous visits to the Continent of Europe and North Africa, and one of them is at the moment in the United States of America. Relationships with connections overseas continue to be close and cordial and our contacts with the United States of America have been further strengthened during the year.

EFFECTS OF EPL

You will wish me to say something about the effect of the provisions of the Finance Bill now before Parliament with regard to Excess Profits Levy. While it is impossible to give a final forecast of the effect of that levy as far as your company is concerned, if Excess Profits Levy is payable on the dividends arising from its trade investments which are in companies themselves subject to Excess Profits Levy, the result will be double taxation, which must be to our disadvantage. I have already referred to the increased burden of taxation and it is therefore most regrettable that the efforts of the executive directors and your staff alike should be further neutralised by the introduction of the Excess Profits Levy, which mainly hits those companies who by their exertions have shown and are showing progressively better results. If it is necessary in the national economy for the State to take more out of the results of trade, then surely the increased burden should be shared equally.

In conclusion I would again refer to the loyalty and devotion of the staff and in that connection I would mention that the company's pension scheme has been further extended during the year. All the directors other than Mr Lake and myself are executive directors and I should like to thank them and all members of the staff for the excellent results shown by the accounts before you.

The report was adopted.

DUNLOP RUBBER COMPANY, LIMITED

SUBSTANTIAL INCREASE IN TURNOVER

SIR CLIVE BAILLIEU'S SPEECH

The fifty-third annual general meeting of the Dunlop Rubber Company, Limited, was held on June 9th in London.

Sir Clive Baillieu, KBE, CMG (the chairman), in the course of his speech, said:—

One of the most important features of our Dunlop Group results for the past year is the substantial increase in turnover which, resulted in total sales for the year of £284 million. This represents a very large volume of sales—in fact, the highest we have ever reached—and I think it right at the outset to emphasise that this directly causes or affects several other important features of the Group's position. I would especially ask you to remember this when, in my subsequent remarks, I touch on such subjects as the total capital employed, the increased inventories, the financing operations which necessarily were involved during the year and the ratio of profit.

TOTAL CAPITAL EMPLOYED

The total capital employed by the Group from all sources in order to achieve the turnover was £121 million as at the close of the year—an increase of over £21 million on the preceding year's figure. That is a very large amount of capital to put to use in a group trading in so many countries as we do. The increase is due not only to the continued world inflation in 1951, but also, and to a larger extent, to the increased quantities of goods required from the Group. It should be noted especially that the ratio of turnover to capital employed rose from 1.97 to 1 in 1950 to 2.35 to 1 in 1951.

INVENTORIES

The major item in the capital employed is inventories, and at December 31st last we had over £61 million invested in inventories in the Group as compared with £40 million the year before. When this total inventory is related to the turnover involved for the year you will, however, note that the ratio at 21 per cent of sales is not out of line with the previous year at 20 per cent of sales. Furthermore, there are certain conditions which affect inventories of goods at present, such as the shipping time from one part of the world to another, the turnround of ships, shortages of warehousing space, delays arising from import formalities and other similar factors.

At the close of 1950 our inventories were on the low side, and during 1951 every endeavour was made to build up to a more normal level having regard to the expanding turnover which it was necessary for them to support. Another most important factor is the Dunlop position in relation to the motor, motor-cycle, and cycle industries, particularly in the United Kingdom. These industries have responded magnificently to the national need for exports, and because of the large and important position we occupy as suppliers of tyres and other products to them we have a considerable responsibility to carry the necessary inventories to ensure the even flow of their production and deliveries. This responsibility of supporting these industries, and consequently the national effort, is constantly in the mind of the management in framing the policy governing production and inventories.

You may be assured that the volume and composition of our inventories is constantly under review by the management, and that our policy will continually be to keep them only at levels essential for the smooth operation of a world-wide business.

FINANCE PROBLEMS

The increased working capital requirements created considerable financing problems during the year. You will recall that when we issued further shares in 1950, we stated that our working capital requirements consequent upon the high level and uncertainty of our raw material prices would be financed by temporary borrowing. Bills have been used to an increasing extent and these, together with bank loans and overdrafts almost entirely overseas have satisfactorily met our requirements. I would like here to express appreciation to the numerous banks, both in the United Kingdom and overseas, which have co-operated with us and have provided the facilities we have required. They have served us well and we believe the overall cost in interest and charges compares favourably with the cost of any other form of borrowing we might have undertaken.

You will already have noted from the directors' report that the ratio of profit to turnover declined from 9.2 per cent in 1950 to 6.5 per cent in 1951, both figures being gross before deduction of tax. You may remember that last year, in my speech to you, I pointed out that the policy we had followed was to give to our customers the full benefit of our inventory position when raw material prices were rising. The lower ratio clearly substantiates that statement and also indicates that the group has in 1951 absorbed a considerable part of the rising costs and not just passed them all on to consumers in increased selling prices. I think these facts should be remembered in the conditions emerging now in 1952 when we have the reverse position of certain raw material prices falling.

EVER-INCREASING BURDEN OF TAXATION

With the ever-increasing burden of taxation, which in 1951 absorbed 66 per cent of the Group's profit what appears to be a reasonable profit margin before taxation becomes almost dangerously low when taxation has been provided, the percentage in 1951 being 2.2 or 5¼d. in each £1 of sales. I suggest to those who consider industrial profits are too high that the ratio of profit to sales and not the amount of profit is the real measure. In the case of Dunlop the large increase in turnover and the low ratio of net profit is the best measure of our service to the community.

I have referred to the fact that taxation has absorbed 66 per cent of the Group's 1951 profit whereas in 1948 the rate was only 54 per cent. Part of this increase is due to the fact that our tax legislation makes no allowance for the serious inflationary position which has been developing during recent years and in particular in 1951. During last year the average wholesale and retail price index stood at 258 compared with 194 in 1948, and 100 in 1938. Accordingly, depreciation on fixed assets charged on the basis of original cost is inadequate and must be supplemented by a further charge. This the directors have provided both for the year 1951 and for previous years as explained fully in their report, but this additional charge is not recognised in computing taxable profits.

At previous meetings I have emphasised the dangers arising from excessive taxation imposed to sustain a level of expenditure beyond our resources and in itself constituting a basic inflationary influence in our economy.

NEW GOVERNMENT'S ACTION

Since we last met there has been a change of government in this country. We must acknowledge the courage with which it has approached its task and the effort it has made to start grappling with some of the more fundamental issues which, for too long, we have chosen to leave in abeyance. It has attempted to set a limit on state expenditure and it has returned in our extremity to the experience of the past by bringing into operation again the instrument of credit control through a more flexible use of the interest rate.

These actions alone entitle it to the confidence and support of industry. But it is a matter of grave concern to the future of this industrial nation that there is no indication, at least in the United Kingdom, of any adequate taxation relief. In fact, with the withdrawal of initial allowances and the imposition of the Excess Profits Levy the immediate taxation burden on industry has been increased.

OVERSEAS BUSINESS

I would like at this point to refer to one or two aspects of our general overseas business. This makes a great and growing contribution towards the results of the Group. We have had a good year abroad and by reference to the reports on the individual territories, which are included in the report on divisions and subsidiary companies, you will see that satisfactory profits have been earned over a wide field.

During the year it was decided to establish a tyre factory in Brazil, subject to satisfactory arrangements with the Brazilian Government, as well as the approval of the Bank of England. A site has now been bought and is being prepared. This is the Group's first industrial venture in South America, where the rapid development of recent years is dependent upon road rather than rail transport.

In 1951 our general export business was at a high level, but declined towards the end of the year. Whereas the artificial barriers to trade were being breached one by one in 1950 and the early part of 1951, this trend has since been reversed. The return towards the bilateral balancing of trade accounts between countries means inevitably a balance at a reduced level. This imposes limits on the country's export business, which do not lie in the power of industrial companies to overcome. It is, therefore, much to be hoped that the country's importance as a buyer of food and raw materials will reassert itself, so that a widening range of British manufactured goods may be sent to countries which seem ready and able to take similar goods from our Continental and other competitors. In the case of some countries trade is governed by trade agreements. While an exchange, for example, of food for fuel may be the dominating purpose of such an agreement, the ancillary trade in manufactured goods is of great importance to this country. Under these circumstances only the Government can open the way for the trader, and one practical step towards this end might well be to make more specific references to individual groups of product, by name, in trade agreements when they are negotiated.

The report was adopted.

RAND MINES, LIMITED

ANOTHER SUCCESSFUL YEAR

SOUND FINANCIAL POSITION

MR W. H. A. LAWRENCE ON RISING COSTS

At the fifty-seventh annual general meeting of shareholders held in Johannesburg on May 30, 1952, Mr W. H. A. Lawrence, the chairman, in the course of his remarks, said:

Your company again had a successful year, total revenue amounting to £1,336,883, which was only £3,376 less than the figure for 1950.

Throughout the gold-mining industry, operations in 1951 were characterised by a continuing shortage of labour, both European and non-European, and by further increases in costs. In addition there was an increase in the rate of taxation. The impact of these conditions varied in severity as between mine and mine, depending upon circumstances, but in general, rates of milling and development were retarded, profits and dividend distributions were lower and pay limits higher. Some relief was afforded by an increase in the additional revenue received during 1951 from sales of gold at enhanced prices, but the amount of revenue now accruing to producers has been falling off during the past twelve months or so and is now at a much lower level than it was a year ago. In addition, the shortage of power which developed on the Witwatersrand in the early part of 1950 increased in severity during 1951 and is now adversely affecting production. The gold-mining industry, at the expense of convenience and efficiency, has rearranged operations so that its total requirements of power are more evenly distributed throughout the 24 hours of the day and the seven days of the week. In spite of this, however, the power system is being overloaded at certain periods and the Electricity Supply Commission has been forced to call for emergency shutdowns of plant. These power cuts are dislocating mining operations with consequent wastage and a further lowering of efficiency. Although the Electricity Supply Commission is building new power stations and installing additional generating equipment, it is bound to be some time before the supply of power overtakes the increasing demands, not only of the gold-mining industry but also of secondary industry and other consumers.

DISTURBING TREND OF WORKING COSTS

The position in regard to the trend of working costs of the gold-mining industry on the Witwatersrand is disturbing. Immediately prior to devaluation in September, 1949, the average was about 26s. 3d. per ton milled. The adjustments in the wages and other benefits of gold-mining employees which had to be made immediately after devaluation gave a sudden upward impetus to costs, thereby offsetting to some extent the immediate advantage normally gained from the time lag between devaluation and its resultant inflation. From the early part of 1950 to the latter part of 1951 costs rose fairly steadily at the rate of about 2s. per ton per annum, but since then there has been an increase in the tempo of the rise in costs, the averages for the last quarter of 1951 and the first quarter of 1952 being 2s. 5d. and 2s. 9d. per ton milled higher than for the corresponding periods a year previously. While there are signs of a break in prices overseas, added impetus has again been given to the South African cost spiral by the recent further increases in the prices of such basic commodities as maize and steel. The prospect of any early abatement in the rise in gold-mining costs is therefore not encouraging.

EFFECTS OF HIGHER PRICE STRUCTURE

The higher price structure, apart from its direct effects on working costs and therefore on working profits, has also resulted not only in an increase in the working capital necessary to carry on mining operations—due to the material increase in the amount of money required to be invested in stocks of stores in order to maintain these at a reasonable level—but also it has resulted in an increase in the cost of any capital expenditure that is necessary to maintain or extend operations. On top of this, taxation has absorbed an increasing proportion of gold-mining profits. The net result is that dividends are being doubly squeezed, firstly by the reduction in profits resulting from decreasing revenue and increasing costs, and, secondly, by the reduction in the amount available for distribution on account of increases in working capital, capital expenditure and the rate of taxation. Add to these factors the hardening of interest rates and the present unsettled political situation in South Africa, and it is not surprising to find that the weather vane of public confidence in the general economic position—the Stock Exchange—is in the doldrums.

I would now like to make a few comments on the current domestic position at certain of the individual mines of the Central Mining-Rand Mines group in which Rand Mines, Limited, is particularly interested as a shareholder.

The Blyvooruitzicht mine continues to prosper and, although it has not been possible yet to bring production up to the existing milling capacity largely due to the general labour shortage, the mine is already the premier gold-producer and profit-earner in the industry. Its participation in the South African uranium production programme is a factor of potential importance.

[Mr Lawrence then made reference to the current position and prospects at the City Deep, Crown Mines and East Rand Proprietary Mines as revealed at the recent annual meetings of these companies.]

PROGRESS OF HARMONY MINE

Good progress was made during the year with the work of opening up the Harmony Mine in the Orange Free State, in which your company has a substantial direct interest, as well as an indirect one through Central Mining Free State Areas, Limited, and Union Free State Coal and Gold Mines, Limited. The provision of accommodation for European and non-European employees, offices, workshops and recreational amenities continued satisfactorily. Sinking operations at No. 3 shaft and at the ventilation shaft were subjected to no serious interruption, although a considerable amount of time was necessarily devoted to the work of sealing off water fissures by advance cementation. It is expected that the ventilation shaft will intersect the Basal Reef during the third quarter of this year, while No. 3 shaft may reach the same horizon at the beginning of 1953. In March this year the Harmony Company made a successful issue of 5,600,000 shares, bringing its total issued capital to £3,400,000. After repayment of outstanding loans the company now has some £3 million cash in hand.

RECORD COAL OUTPUT

The coal-mining industry again produced a record output during 1951, although operations continued to be restricted by inadequate railway transport facilities and an embargo was placed on exports half way through the year. The loss of this lucrative export business is of serious consequence not only to the coal producers but also the country as a whole; furthermore, there seems little likelihood of the embargo being lifted while there is insufficient railway transport available to cope with the increasing demands of the inland market. Some small measure of relief is being afforded—at added expense—by shipping coal round the coast to the Cape and by the operation of a road lift, but the only real solution lies in railway expansion.

The industrial interests of the Central Mining-Rand Mines group generally had a successful year but operations were hindered directly and indirectly by the restrictive influence of the railway transport position. Good progress continues to be made with the reconstruction and expansion programmes of the Pretoria Portland Cement Company and its associated companies, and with that of the Hume Pipe Company. Output was maintained by the Northern Lime Company, which is prospecting a promising new deposit. The forestry, sawmilling and mining timber companies of the group made good progress but considerable difficulty was experienced in supplying the mines with their timber requirements on account of the general shortage of railway transport.

SOUND ECONOMIC POTENTIAL

In these troubled times it is, as I stated last year, a fortunate fact that South Africa's basic industries are soundly conditioned and have great potentialities, and that your company is in a sound financial position with substantial cash resources at its command. This position has only been built up, however, as a result of co-operative effort both here and overseas based on a hard core of faith in the inherent soundness of the country's economic potential. It must be remembered that we are still largely dependent on overseas capital for our continued progress; such progress is also largely dependent on the maintenance of international understanding and good will. These are facts which we cannot afford to disregard.

The report and accounts were adopted.

CAPSEALS, LIMITED

INCREASED PROFIT AND TURNOVER

The eighteenth annual general meeting of Capseals, Limited, was held on June 5th in London. Mr Oscar Morduch, BSc, AMIEE, the chairman, presided, and during the course of his speech said:—

After payment of dividends at the rate of 6d. gross per stock unit, the balance remaining as undistributed profit is very nearly 140 per cent of paid-up capital, and you may consider the board's decision not to increase the dividends payable for the past year to be a measure of excessive caution. We may be called upon to carry additional burdens of taxation, and your directors think that before the present somewhat uncertain situation is clarified, it is advisable to make no dispositions regarding the reserves available in the company.

The increased profit is largely due to the increased turnover arising from the recently acquired companies, and while the exceptional conditions prevailing during last year have undoubtedly contributed to this increase, your board feel confident that, with time and given normal conditions, the business of your existing companies is capable of further development.

I am glad to be able to report that the company's trading for the first four months of this year was on a satisfactory basis, though naturally, should the present subdued conditions on the market continue or develop into a real depression, the turnovers of your companies, and consequently the profits, are bound to suffer. I repeat, however, that your directors feel no reason to be unduly perturbed about the immediate prospects.

The report was adopted.

CAPE ASBESTOS COMPANY, LIMITED

LARGER PROFIT

MR ROBERT WALKER'S REVIEW

The fifty-ninth ordinary general meeting of the Cape Asbestos Company, Limited, was held on June 6th in London, Mr Robert Walker, MBE, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts.

It is gratifying to present accounts of the past year which demonstrate the further progress made by the group. The group's trading profit amounted to £1,381,659, compared with £913,960 in 1950. After allowing for depreciation and other charges and adding certain specified credits, there remains £1,156,188 of which £1,144,495 is attributable to your company. Adding £716,921 brought forward from the previous year and a credit in respect of taxation, an amount of £1,995,099 is available for appropriation.

Against this, provisions for taxation call for no less than £700,000, while a total of £209,269 has been added to reserves in various companies of the group. Dividends, after deducting income tax, amount to £123,068, leaving £962,762 to be carried forward.

The parent company's trading profit for the year, including dividends and other receipts from subsidiaries, amounted to £566,520, as compared with £374,330 in 1950. This profit, as also the much higher profit figure of the group, has resulted from increased productivity rather than from any sharp rise in selling prices.

Your directors recommend for your approval the declaration of a final dividend on the ordinary shares of 20 per cent, making, with the interim dividend of 2½ per cent, a total of 22½ per cent for the year.

The group position has been further strengthened and improved. Current assets at £3,385,739 exceed liabilities by £2,175,058 and reserves have been increased. The total value of net assets amounts to £4,298,102, so that £1 of ordinary share capital is represented by just over £4 worth of net assets.

FURTHER EXPANSION

I am able to report another year of expansion on the manufacturing side of your company's activities. A feature to which I wish to refer particularly is the excellent labour relationship which exists in the factories. The loyal support of our operatives is greatly appreciated and we are glad to be able to demonstrate this in practical forms. We have recently introduced a Retirement Benefit Scheme which gives every employee the right, after five years' service, to receive, without payment, life assurance cover until retirement age, followed by a substantial payment upon retirement.

The Barking factory has achieved a higher figure of output than ever before. At the same time improvements in operating methods have been effected, and various departments have been and are being thoroughly modernised. Our CAPASCO Brake Linings have been notably successful and in the insulation field the CAPOSITE Sections and Blocks, which are manufactured from Amosite fibre, have again demonstrated their popularity as the world's most efficient form of insulation. It is a source of great pride to us that the British Admiralty has recently remodelled its specifications in such a manner as to concentrate exclusively on the use of Amosite insulations for all steam temperatures in excess of 500 degrees F.

Addressing the meeting, the chairman said: Since I circulated my statement with the accounts of the company, a new point has been reached in the development of the company's interests to which I should make a brief reference. This is the registration of a subsidiary company called Marinite Limited, a joint venture by ourselves and our old and powerful friends, the Johns-Manville Corporation of America, to manufacture Marinite in this country for the first time. Marinite is an incombustible board used principally in ship construction and has achieved a long record of success in the United States. This step has been taken in accordance with our policy of developing and widening the range of products based on our own crude asbestos.

The report was adopted.

F. FRANCIS AND SONS

RECORD RESULTS

The fifty-first annual ordinary general meeting of F. Francis and Sons, Limited, was held on June 12th in London, Mr John Ismay (the chairman) presiding.

In the course of his speech, the chairman said: It is with pleasure that I submit the present report, reflecting as it does a record profit both for the parent company and the group.

The net profit for the year at £297,040 reflects increased profits of the group of £52,946, but against this we have an increase in taxation of £38,750.

The position in regard to the supply of certain raw materials, particularly steel and tinplate, still remains difficult due to continued shortage, but it is anticipated that there will be an improvement in this respect during the current year.

It is difficult to forecast for the future, and I can only say that the turnover of the group for the first five months of the current year is in excess of that for the corresponding period of 1951.

Your directors have decided to increase the nominal capital of your company from its present figure of £500,000 (which is all issued) to £700,000 by the creation of an additional 800,000 ordinary shares of 5s. each. There is no intention at the moment of issuing any of the proposed new capital. The necessary formal meeting will be held in due course.

The very satisfactory results of 1951 could not have been achieved without the co-operation and teamwork of all employees, and I would like to pay a special tribute to all for their loyalty and service.

The report was adopted.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £13,600,000

The annual meeting of the Union Insurance Society of Canton, Limited, was held on May 22nd, in Hong Kong, Mr J. F. Macgregor, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £3,278,788. After releasing £200,000 to profit and loss account, and increasing the additional reserve by £150,000 transferred from reinsurance fund, the marine fund stands at £4,205,231.

Fire.—The net premiums for the year amounted to £2,444,141; £230,615 has been transferred to profit and loss account. The fire fund stands at £1,360,967.

Accident and General.—The net premiums for the year amounted to £1,128,120: £63,651 has been transferred to profit and loss account. The accident and general fund stands at £551,248.

Dividend.—The directors recommend the payment of a dividend of £1 17s. 6d. per share, free of Hong Kong corporation profits tax.

Profit and Loss Account.—Interest and dividends amounted to £310,315 and transfers from underwriting accounts to £494,266. After charging outgoings not brought into account elsewhere, making provision for taxation, and allowing for the minority interests of the outside shareholders of the subsidiary companies, the profit for the year appertaining to the society is £466,845.

Consolidated Balance Sheet.—Total assets amount to £13,601,888.

CHAIRMAN'S STATEMENT

The marine, fire and accident and general revenue accounts show excellent results and reflect the progressive and, at the same time, conservative underwriting policy which, over the years, has brought the society to the position of strength it holds today.

In my statement for the year 1950 I referred to the enhanced values of various commodities, resulting in high insured cargo values and therefore increased premiums. This position continued during the first half of 1951 and was in some measure responsible for the substantial increase in marine premiums written, as compared with the year 1950. During the second half of 1951, however, there was some recession in the market values of commodities.

All branches contributed to the record volume of business shown in the revenue account.

To ensure that our marine fund retains its strength in relation to the increased premium income, shareholders will note that the additional reserve has been increased by £150,000 to £550,000, and that the marine fund now exceeds £4 million.

Although unsettled conditions continued in several eastern areas where we operate, a particularly good year has been experienced by the fire department which enables the fire fund to be further strengthened by increasing the provision for unexpired risks from 45 per cent to 47½ per cent of the net premium.

The net premium income in the accident and general account now, for the first time, exceeds £1 million, which is a notable record. After taking into consideration the increased amount retained within this account for unexpired risks, the profit realised is satisfactory.

The report and accounts were adopted.

THE DAILY MIRROR NEWSPAPERS, LIMITED

TRIBUTE TO MR H. G. BARTHOLOMEW

MR CECIL H. KING'S REVIEW OF WIDESPREAD INTERESTS

The thirty-second annual general meeting of The Daily Mirror Newspapers, Limited, was held on June 6th at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, the chairman and managing director, said:—

As you have the accounts before you I will not take up your time by dwelling on the actual figures. The year under review was a good one, and we have thought it right that the shareholders as well as the staff should share in the company's prosperity. As you will have seen in the press at the time, I was invited by my colleagues last December to assume the chairmanship of the company in succession to Mr H. G. Bartholomew. And before I cover the various interests of the company in my review, I would like to give you some idea of the great services rendered by my predecessor to this company.

Mr Harry Guy Bartholomew, your company's chairman since 1944, had been the inspiration of the *Daily Mirror* for more years than most can remember. "Bart," as he was known to all who worked with him, has now left us—he is in his sixty-eighth year—but his influence on the development of the *Daily Mirror* was immeasurable. He came to the newspaper when the circulation was about 25,000; he left it with a circulation of about 4,350,000, the highest daily sale in the world.

FIRST DAILY PICTURE PAPER

He joined the *Daily Mirror* in January, 1904, some two months after it was founded, and on the eve of its conversion into the world's first daily picture paper. This was a revolution in daily journalism, and "Bart" helped to create it.

Coming into the newly formed engraving department, he brought with him technical knowledge and ability that helped to produce the line and half-tone blocks for the newspaper's early illustrations.

It was on photographs that the *Daily Mirror's* first success was founded, and it was to the broader field of photographic enterprise that "Bart" soon transferred his energies. His zest and organising powers won for the *Daily Mirror* many notable picture scoops. The story is still told of how "Bart," hastening back to Britain with the first pictures of a royal tour, set up engraving plant in a cross-Channel steamer and made the blocks during a stormy crossing.

For a time he was Assistant Art Editor. In 1913, at the age of twenty-eight, he was appointed a director of the *Daily Mirror*. The field of his activities constantly widened.

As Art Director, "Bart" arranged the use of special trains to hasten the pictures. When aviation developed, he hired special planes. Meanwhile, he was working on a scientific method of transmitting photographs by telegraphic cable. Basing it on early experiments by a German professor, he helped to evolve the Bartlane process which transmitted the first pictures across the Atlantic.

FUNDAMENTAL CHANGES

It was in 1934 that he was called to devote his full energy to the editorial direction of the *Daily Mirror*. He had the instinctive creative touch of a great newspaper man, and the changes which he made were fundamental and decisive. The *Daily Mirror* soon reflected "Bart's" own ebullience and warm, human sympathy. It increased in popularity from day to day, and from a falling circulation of a million or less was soon on the way to the present figure of over 4,400,000. When war came, he played a prominent part in arranging the *Daily Mirror's* special newspaper for operational submarine crews.

In 1944 Mr Bartholomew succeeded Mr John Cowley as chairman of both the *Daily Mirror* and *Sunday Pictorial* Companies. As chairman, he played an important part in the widening of our investment interests in overseas fields. These interests involved him in visits to Canada, Australia and West Africa. And his vision largely inspired our investment in *Reveille for the Weekend*, which since has risen in circulation from under 100,000 to over 3 million.

Yet despite his great accomplishments and his powerful position, "Bart" never courted publicity for himself. He had a very real devotion to the ordinary people of this land. He felt himself one of them, and was quick to champion their interests.

We shall not forget his forceful leadership, his boundless energy—these things will continue to inspire his colleagues in years to come. In his retirement, we all wish him nothing but happiness and well-earned rest.

EFFECT OF PRICE INCREASE

During the year under review, the *Daily Mirror*, in common with the other popular daily papers, was increased in price to 1½d., our first price increase since 1917. This move was forced on us by the high price of paper and by increases in wages negotiated with the different unions in the newspaper industry. We had anticipated a substantial drop in sale, but in fact the fall was only some 4 per cent and, since then, a substantial part of this has been recovered.

While our increased wages remain with us, the price of paper has been falling and the quantity available has been increasing. In consequence, papers are tending to be larger and the increased competition for advertising is bound to lead to increased competition for readers. In any struggle that may ensue, the *Daily Mirror* is particularly well placed, and we have every hope and intention of increasing our circulation in the months to come. Profits of the newspaper are satisfactory to date, but are likely to fall below last year's level unless the fall in the price of newsprint is steep.

INTERESTS IN OTHER NEWSPAPERS

The *Sunday Pictorial* Company, in which your company owns about 25 per cent of the equity, is doing quite well. The sales of the paper are tending to rise and so is the advertisement revenue. At present, profits are running rather below last year, but the future level depends partly on the degree of competition and partly on the price of paper.

Reveille, the weekly family newspaper in which your company is largely interested, is doing well. Sales are well above last year's, though at the moment profits are somewhat down.

So far I have been dealing with the brighter side of the newspaper picture. In Australia, I have to report a set-back. As you know, your company and the *Sunday Pictorial* Company share a controlling interest in The Argus and Australasian Limited, the company that owns the Melbourne *Argus* and various other properties. That company, when the interests were acquired, was earning profits, but it has since had rather chequered experiences, and at the moment is incurring substantial losses. The circulation of the *Argus* is some 30 per cent higher than it was when the interests were acquired in 1949, but Australia is going through very difficult times just now, and since the beginning of the year there has been a serious decline in advertising revenue. A month after my election to the chair of the *Daily Mirror* I went out to Australia, and various measures are being worked out to put this magnificent property back on its feet.

AUSTRALIAN RADIO STATIONS

While on the subject of Australia, I should like to mention that your company and the *Sunday Pictorial* Company subscribed further capital to our proprietary company in Australia in order to purchase control of Broadcasting Associates Pty. Limited, a company that controls some five broadcasting stations and has a lesser interest in several others, mostly serving the State of New South Wales.

This investment is showing promise. The revenue of the various commercial stations is rising, the expenses are falling and the profits are exceeding our estimates. At the request of the Australian Government, I have given an undertaking that the indirect holding of your company and the *Sunday Pictorial* Company in the various broadcasting companies in this group will be reduced.

WEST AFRICAN NEWSPAPERS

Our remaining newspaper interests are in West Africa, where we are concerned with the leading daily newspapers in Nigeria and in the Gold Coast. The *Daily Times* in Lagos is making a reasonable profit and since we acquired our interest the sale has risen from 8,000 to 44,000 per day, and this in a country where the literacy rate is about 3 per cent. In Accra, we were associated with the founding of the *Daily Graphic* in October, 1950, and it already has a sale of over 35,000, which I believe to be more than the whole of the rest of the Gold Coast papers put together. This undertaking is still in the development stage but we hope it will earn its first profit within the next 12 months. We are also proposing to associate ourselves with the publication of a daily newspaper in Sierra Leone, where the combined daily and weekly sales of the whole Press of a country with a population of about 2 million amount only to about 4,000!

PAPER MANUFACTURING

So much for our publishing activities. In addition to producing newspapers, we are also largely interested in the business of paper manufacturing, partly through our Canadian subsidiary, Anglo-Canadian Pulp and Paper Mills, Limited, and partly through our associated company, Albert E. Reed and Company, Limited.

As far as Anglo-Canadian Pulp and Paper Mills is concerned, it enjoyed boom conditions last year and made very handsome profits indeed. We have reason to hope that the dividends paid by our Canadian subsidiary will be maintained at the current rate of $2 per share, but the profits for the current year are bound to be below the very high level which prevailed last year. During the year, quotation was obtained on the

Montreal Stock Exchange for the shares of Anglo-Canadian Pulp and Paper Mills, Limited, and your company disposed of a small part of its holding in order to supply the market with stock. You will have noticed from the published accounts the greatly increased value placed upon your company's holding in its subsidiary, which is based on the market quotation for the shares.

Your company has for many years had a substantial holding in Albert E. Reed and Company, Limited. During the past year, however, this holding has been considerably increased and the *Daily Mirror* now holds some 25 per cent of the voting capital in that company.

It is common knowledge that the paper making industry in this country made substantial profits last year. I would say, however, that it is impossible to forecast what the results of the current year's trading are likely to be because of the difficult conditions which at present prevail in the industry. Albert E. Reed and Company, Limited, is, however, a strong and financially sound organisation, and I feel sure that we shall reap great benefit in the future from this investment.

I have endeavoured to cover in my remarks all the main activities of your company and of those other companies in which you are interested. I think with declining trade and increasing competition it is more difficult to look ahead, but your property is in fine shape, your staff is on its toes, and whatever conditions we may have to face we shall give a good account of ourselves.

In conclusion, I would like to pay a tribute to the staff of the company who, by their efforts, have contributed so much to the satisfactory results disclosed by the accounts.

The report and accounts were adopted.

SELANGOR RIVER RUBBER ESTATES

SATISFACTORY RESULTS

The twentieth annual general meeting of Selangor River Rubber Estates, Limited, was held on June 10th in London, Mr J. Bligh Orr (the chairman) presiding.

The following is an extract from his circulated statement:—

The profit for the year at £84,838 is equivalent to 28½ per cent on your company's issued capital and must be considered satisfactory, but the weight of taxation, both on profits and in the form of export duty, limits our total dividends for the year to 16 per cent, less tax, after transferring £8,000 to general reserve. Our profit before charging export duty amounts to £102,645 and out of this sum we are called upon to pay £76,443 by way of export duty and taxation. We now have to face the prospects of an excess profits levy by the United Kingdom Government.

Our crop for the year at 1,330,000 lb was just a little lower than the crop for the previous year, but sales at 29.34d. per lb realised 11.34d. per lb more. The total cost of producing the crop, however, rose from £71,234 to £104,315, the all-in cost per lb, including export duty and upkeep of immature replanted areas, being 18.82d. against 12.67d. for 1950.

Addressing the meeting the chairman said: It is now with the profoundest regret that I have to tell you of the death of the manager of Belata River Estate, Mr Alfred Nicoll, who was murdered by bandits on May 20th. He will indeed be sadly missed.

The report was adopted.

SCHWEPPES LIMITED

INCREASED DEMAND FOR PRODUCTS

The fifty-fifth annual general meeting of Schweppes Limited was held on June 11th in London, The Hon. R. Hanning Philipps, MBE (the chairman) presiding.

The following is an extract from his circulated statement:—

At home the trading profits of the company have been well maintained in spite of continually rising costs. This has only been possible as a result of intensive selling, which has led to a considerably increased demand for our products. While this larger turnover is already placing a considerable strain on our productive facilities, we believe it would be unwise in the present world economic situation to embark upon any further large-scale capital development for the present. With the completion this month of our new export factory at Aintree and with the installation of the new plant in our Fareham factory, we can congratulate ourselves on having built up an organisation capable of meeting any difficult times which may lie ahead.

During the year the value of our sales for all our company's products increased by 19.1 per cent. We are continuing the policy of selling hard all the year round and so using our machines to the maximum and passing on to our customers the fruits of the added efficiency thereby gained. Costs, however, are still rising.

OVERSEAS INTERESTS

In Australia trading conditions were adversely affected in the early part of the year by continued shortages of certain raw materials and, towards the end of the year, by the slackening of demand for our products, due to the economic stringency. Since the end of the year trading in Australia has been even more unsettled, but there are signs that this is now giving way to a more optimistic outlook and our sales are once more beginning to respond.

Schweppes (South Africa) Limited had another good year of trading with record sales. Their new factory in Durban is nearing completion and should be in production in time for their next summer season.

In order to widen the company's activities in overseas markets, we are experimenting in the granting of franchises for our products to selected reputable firms. The first franchise agreement was given to Messrs Simonds-Farsons-Cisk, Limited, in Malta, and the result so far has been most encouraging.

We have now entered into a new agreement with our associated company in Belgium, whereby Schweppes (Belgium) Limited will operate in Belgium, Holland, Luxembourg and the Belgian Congo on a franchise basis for a period of 30 years. We are confident that this should be a satisfactory and profitable arrangement for both companies.

Last autumn I paid a visit to Canada with a view to studying at first hand the possibilities of increasing the sales of our products in that country. While there is undoubtedly a growing market to be had in some of our lines if we can obtain suitable manufacturing facilities over there, the present currency restrictions have added considerable complications to our problem. We are hopeful that in due course we may reach a satisfactory solution.

As regards the immediate prospects for our business, I can only tell you that sales in the first quarter of 1952 have shown a satisfactory increase over the same period of 1951. Provided there is no further substantial rise in costs, particularly in road transport charges, we can, I think, look forward to another good year's trading.

The report was adopted.

UNITED BRITISH OILFIELDS OF TRINIDAD

STEADY PROGRAMME OF EXPLORATION

The thirty-ninth annual general meeting of the United British Oilfields of Trinidad, Limited, was held on June 12th in London, Sir Robert Waley Cohen, KBE, the chairman, presiding.

The following are extracts from his circulated statement:—

The profit for the year 1951 was £202,038 after £875,000 had been appropriated to reserve. The corresponding figure for 1950 was £210,574 after £905,000 had been appropriated to reserve.

The value of oil sales for the year at £8,919,000 is higher by £341,000 than in the previous year; this is due to modest increases in the world market prices of the main products. On the other hand, this advantage has been more than offset by the higher prices which we have had to pay for purchased oils and the rising trend of operating costs.

Our expenditure on exploration amounted to the considerable sum of £330,000, though this was not as large as in 1950 when we had an exceptionally heavy exploration programme. On new plant and equipment we spent £635,000. In spite of these expenditures, our cash position improved during the year, though it should be noted that at December 31st our current liabilities of £2,653,000 were still a little in excess of our current assets at £2,640,000.

I shall comment shortly on our reserves of oil, but first it is necessary to consider the position as it affects our finances. It is essential to retain very substantial cash resources to meet expenditure on the effort to find new sources of crude oil. Although our cash reserves have increased during the year, they are by no means excessive if we bear in mind the heavy calls to carry our a steady programme of exploration.

It is, I think, unnecessary for me to make any general comments on the excess profits levy as proposed, announcement of which was received in all quarters with profound apprehension. Nevertheless, before leaving the subject of the accounts, I feel I should remark on the need for a cautious policy at the present time, since it is impossible accurately to gauge the implications of this tax, which will continue to be a matter of great uncertainty, particularly until the Act is passed and we know the precise lines on which this new burden on industry is to be imposed.

RESERVES OF OIL

To return now to the question of the reserves of oil, our inability to maintain our crude production over the last two years at the record figure attained in 1949 draws attention once more to the importance of early discovery of new fields. This problem is one which is also vital to the Colony as a whole in view of the dependence of its economy upon a prosperous oil industry. Trinidad's record production of some 22 million barrels in 1940 has never been equalled since that date, the figure for 1951 being 20,841,000 barrels. The drop in our own exploration expenditure in 1951 to £330,000, as compared with £450,000 in the previous year, is attributable to a temporary reduction of one drilling string pending the results of the experimental seismic survey to which I referred last year. The latter was initiated by a Shell party and continued in 1952 by a contract party, and good results are now being obtained which it is hoped may lead to the selection of promising sites for exploratory drilling.

The report was adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

CHANGED CONDITIONS IN THE NEWSPAPER INDUSTRY

MR CECIL H. KING'S REVIEW

The thirty-second annual general meeting of Sunday Pictorial Newspapers (1920), Limited, was held on June 6th at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, chairman and managing director, said:

As you are aware, I was invited by my colleagues last December to assume the chairmanship of your company in succession to Mr H. G. Bartholomew, who retired. "Bart" became chairman of your company in 1944. He was a great newspaper man, and under his guidance the company has prospered greatly.

The year under review was satisfactory. You have the accounts before you, and, as they speak for themselves, I do not propose to repeat the figures. We have recommended that the dividend be stepped up somewhat, but only to a rate which we hope can be maintained through any foreseeable emergency in the future. We can, indeed, look forward to the future with reasonable confidence.

Circulation and advertisement revenue tend to rise. At present, however, profits are running rather below those of last year, but the level will depend partly on the degree of competition, and partly on the price of paper.

WORLD-WIDE INTERESTS

With one exception, the various enterprises in which your company is interested are in good shape. The *Daily Mirror* Company had a good year and was able to declare an increased dividend. *Reveille*, the weekly family paper, is doing well, and its circulation now exceeds three million. In West Africa, the *Daily Times* of Lagos, Nigeria, and the *Daily Graphic* of Accra, the Gold Coast, are making excellent progress. We are now proposing to associate ourselves with the publication of a daily newspaper in Sierra Leone.

The exception is our main Australian investment. Your company and the *Daily Mirror* Company share a controlling interest in The Argus and Australasian, Limited, the company which owns the Melbourne *Argus* and various other properties. This company is at present making substantial losses, due in some degree to the difficult time through which Australia is passing. I have recently visited Australia, and measures are now being worked out to put this excellent concern back on to its feet.

Against this, I am glad to report that an investment which we have recently made jointly with the *Daily Mirror* Company in a chain of broadcasting stations, mostly serving New South Wales, is proving very satisfactory.

PAPER MANUFACTURING

Your company is also interested in the paper manufacturing industry by virtue of its holdings in Anglo-Canadian Pulp and Paper Mills, Limited, and Albert E. Reed and Company, Limited. It is common knowledge that the paper making industry made substantial profits last year. It is, however, difficult to forecast the result of the current year's trading, due to the difficult conditions which at present prevail in the industry. Both of these organisations are, however, strong and financially sound, and I feel sure that we shall continue in the future to derive great benefit from our holdings in them.

I would like now to deal with some more general aspects of the newspaper trade.

CHANGED CONDITIONS

Fleet Street these last few years has had to adapt itself to conditions which have changed rather drastically. The price of our newsprint since the thirties has risen very steeply, and, although it is now dropping, we still pay about seven times more than we did. Our selling price has only increased by 25 per cent in the case of Sunday papers and 50 per cent in the case of dailies. Advertising rates have risen, but in the case of the *Sunday Pictorial* are only about 11 per cent above pre-war level when calculated on a square inch per thousand basis. The fact that we are able to turn in a satisfactory profit is due to two facts: (1) That newspapers are much smaller than they used to be, and (2) that circulations —notably our own, which exceeds five million —are much larger. But now that more newsprint is available, the *Sunday Pictorial* is printing more 20-page papers, which at the present price of newsprint are less profitable than the 16-page ones. From time to time there is an outcry about the need for more newsprint for larger newspapers, but for the mass circulation national papers large papers are less profitable papers, and now that our readers are used to their news in concentrated form, it is doubtful if they would say thank you for the same news in more verbose form. I am under the impression that with the techniques developed by our sub-editors during the war, we publish as many stories in our 20-page papers now as we did in our 48-page papers before the war.

SALARY LEVELS

The far greater skill required from journalists now is reflected in their salaries. The minimum rate for a fully trained journalist on a national newspaper in London is now £14 per week, and we have few or none in our organisation on that level. A good sub-editor or reporter can command about £1,300 a year, and salaries rise from that level to that of the editor of a national newspaper who looks for something near the remuneration of the Prime Minister. Journalism—as everyone knows—is a hazardous profession, but high wages are customary throughout the industry. For example, our compositors' average earnings range from £14 to £22 a week, while packers in our warehouse can earn from £11 to £15 10s. a week.

The tendency for many years—originated, I believe, by Lord Northcliffe—has been to accept rising costs of production of newspapers. This does no great harm to the successful ones, but has eliminated many of those not quick enough to move with the times. Though your paper and its associates in this country are prospering, there are several well-known journals trading on a very narrow margin of profit or actually incurring a loss at the present time.

PRESS COUNCIL

There has been an agitation these last few years for a Press Council, originated by the Labour Government, but supported by people of other political persuasions. The project has been discussed by all the bodies involved, but there is no sign of any set-up that would secure the support of the public opinion of the industry. In general, we at Geraldine House are opposed to the idea, which in any form that has been widely discussed would provide a platform from which the representatives of the more pompous sections of the Press would pontificate at the expense of their more interesting and far more successful rivals.

At one period *The Times* had by far the largest sale of any daily paper in the world. This position was in time taken over by the *Telegraph* and the *Daily Mail*. The *Daily Mirror* held the crown during part of the first war and now holds it again, followed at a respectful distance by the *Express*, its predecessor in that proud position. Such success has always been a source of pride to those responsible, and it is only of recent years that small sales and a small public are held to carry with them some special virtue.

THE LAW OF LIBEL

A more important development has been the introduction of a bill in the House of Commons by Mr Harold Lever (Socialist MP for the Cheetham Division of Manchester) to amend the law of libel. The main trouble about the law of libel is that it is uncertain, and unreasonably costly even to the victor. For these reasons the freedom of newspapers to comment on and expose abuses is materially restricted. In very many cases people who bring libel actions have little reputation to lose and are impecunious, so there is little or no prospect of recovering any costs against them even when we successfully defend actions brought against us. In Geraldine House we have two whole-time barristers and two part-time ones, who scrutinise all copy before publication, but, in spite of taking every reasonable precaution, we incur damages for libel. When I say that the law of libel is costly, I do not refer only to the legal and other costs, but to the fact that too often the damages awarded by the Courts bear no relation to the actual damage done to the plaintiff, nor as the law stands need they. This particularly applies when the so-called libel is unintentional. The principal effect of all this is that it is becoming increasingly hazardous to expose many abuses in public life, and, unless they are first brought to light in Parliament or in the Courts of Law, they do not get the publicity they should.

In other cases, libel damages are pretty certain, while the good done to the public welfare is always to some extent problematical. Perhaps the present situation will be clearer to you if I say that Dickens' novels would have involved their author, printers and publishers in mountainous damages for libel, and the same would be true of many great authors in the past without going back to Pope or Rochester. It would be an immense gain if libel damages could be limited to a sum having some relation to the actual damage done. The bill before the House at the present time will by no means satisfy any newspaper, but, if passed, it will make an editor's life somewhat less harassing.

SPONSORED RADIO

A proposal to have a measure of sponsored radio or television in addition to the existing BBC services has caused a good deal of controversy lately. Very broadly, the case for sponsored radio is that it would act as a spur to the BBC, while the case against it, when stated in public, is that sponsored radio or TV is so vulgar. In private, more is made of the fear that the advertising revenue spent by sponsors would come out of the advertisement appropriations that are at present almost monopolised by newspapers and magazines. This fear seems to me quite exaggerated. There was never any evidence in America that money spent in sponsored radio would otherwise have gone into magazines or newspapers. Anyway, even if some marginal advertising media did suffer, we have every confidence that the *Sunday Pictorial* would be able to hold its own.

INFORMATION SERVICES

Another subject of recurrent controversy is the amount spent by the Government on information services of different kinds. It is repeatedly stated that the Government is wasteful and extravagant in the sums it lavishes on the British Council, on Public Relations officers and the Central Office of Information. I am not attempting to argue that all the money spent on such services is well spent: I know it isn't. But the total amount is far too small, not too large. The present annual figure is under £12½ million pounds, which I believe is less than that spent by at least one international commercial organisation. And surely we should all agree that Britain and the British way of life should be kept before the public of the world, and to do so would inevitably cost more than the sum expended in advertising a range of manufactured products. The effect of the recent cuts in the expenditure on information services has been that the British case has gone by default to an even more lamentable degree than in previous years.

In conclusion, I should like to pay a tribute to the staff of your company, who, by their efforts, have contributed so much to the satisfactory results disclosed by the accounts.

The report and accounts were adopted.

HALL TELEPHONE ACCESSORIES LIMITED

EXPANSION OF ORDERS

The twenty-fourth annual general meeting of this company was held on June 6th in London, Major The Hon Oscar M. Guest, the chairman, presiding.

The following is an extract from his circulated statement for 1951:—

The net trading profit was £46,237, which compares with £62,375 for the previous year. This net profit, together with over-provisions in the previous year, £71, and the carry forward from the previous year, £22,609, make a total of £68,917.

Taxation will absorb £30,658, and it is worthy of note that this represents approximately two-thirds of the net profit. Your board recommend that the dividend be retained at 10 per cent (less tax).

Materials have proved increasingly difficult to obtain, and this has had its effect on the rate of output. We have, therefore, found it necessary to obtain information from our clients as to their requirements for a longer period ahead. Our order book has shown satisfactory expansion.

We are engaged in a growing office machinery business. We have carried out and completed an important development contract for the Post Office, as well as development work for other Ministries; and we have accepted orders in connection with the re-armament programme.

It is difficult to forecast the future, but the volume of work we have on hand should enable us to see a fair result in the year that lies ahead.

The report was adopted.

BRIGGS MOTOR BODIES

YEAR OF GREAT ACHIEVEMENT

MR W. D. ROBINSON ON RECORD VOLUME OF BUSINESS

The seventeenth annual ordinary general meeting of Briggs Motor Bodies, Limited, was held on June 5th in London, Mr Stanley Worth Cochrane (deputy-chairman and managing director) presiding.

The following is an extract from the chairman's circulated statement:—

Your board is pleased to present a financial statement reflecting the results of a year of great achievement.

In my statement last May I gave some details of the difficulties we had experienced during the early part of 1951 and as to the position then arising on sheet steel and other material supplies. On the facts then known I mentioned that I feared we should not be able to maintain our volume of output for 1951 at the record 1950 level. I am happy now to state, however, that, despite increasing difficulties, our volume of business in 1951 again broke all previous records.

Production for the motor industry was again largely for the export market, and 1951 saw an increase in work undertaken for the Government under its defence programme.

The company during the year also embarked upon a large programme for the production of jet engine components for the aircraft industry. We have been mainly engaged so far in tooling up and equipping a factory for this production which is as yet in its initial stages, and the results from the work already undertaken will be reflected in future trading.

The net profit amounted to £754,721 and compares with a corresponding figure of £679,790 for 1950, and, having regard to all the difficulties experienced, the results of the year's trading can be considered very satisfactory.

IMPROVED PRODUCTIVE FACILITIES

Your board has again authorised during the past year substantial expenditure to augment, replace and maintain the company's productive facilities to obtain the highest level of efficiency and in order to meet the large production requirements of its customers. In 1951 we spent a sum of £569,563 on buildings, machinery and equipment and further commitments of a capital nature were outstanding in the amount of approximately £484,000 at the date of the accounts.

The further rise in cost levels generally in the country and difficulties of material supplies are the constant concern of your board, bearing in mind that the company's existence depends on the availability of material supplies and on its ability to sell its products at competitive prices.

The company has since its inception followed a conservative dividend policy and consistently each year a large proportion of profits earned has been ploughed back into the business, enabling its development and growth to be financed out of its own resources. This is still the policy of your board and we recommend a dividend on the ordinary shares of 12½ per cent, less income tax, in respect of the year 1951, which is equivalent to only 3.9 per cent on the capital employed in the business.

The results to date this year have been satisfactory. Final results, however, will depend upon the availability of sheet steel and other materials, the volume of exports achieved and the Government's attitude towards motor car and commercial vehicle production for the home market.

The report was adopted.

MERGUI CROWN EST

CONDITIONS IN BURMA AND MA

The twentieth annual general meetin Mergui Crown Estates, Limited, was held June 5th, at the offices of the company, 52, Leadenhall Street, London, E.C.

Mr W. J. C. Richards, chairman of the company, who presided, said: I wish to supplement my address to the shareholders, which has already been circulated with the report and accounts for the year ended June 30, 1951. I regret the delay in presenting the accounts which has been caused by the disturbances in Burma, and the necessity for compiling a consolidated balance-sheet. Since the report and my address were drafted, events affecting the company have occurred, of which you should be informed.

The tapping season in Burma is now at an end. The crop for the year ending at the end of this month is approximately the same as that for the year reviewed in the report, and the year will be profitable.

INSECURITY IN BURMA

Recently the insecurity of life and property in the district where the company's assets are situated in Burma has become intensified. Milaungchaung division was evacuated at the beginning of March and production there by the company ceased. The supervisory Asiatic employees on Palaw division were threatened with death by insurgents for assisting Government forces and they have been compelled to leave the estate. Production by the company has now ceased there. The so-called Communists and the Karens are reported to have joined forces to further the one object they have in common—that of embarrassing the Government of the Union of Burma. There is a real danger that the estates may be illicitly tapped, which recent experience elsewhere in Burma has demonstrated, rapidly leads to complete destruction.

The local administration has insufficient forces at its disposal to provide protection and the Government of Burma has sanctioned the recruitment, equipment and maintenance of an armed guard at the company's expense. If reliable recruits in sufficient numbers can be attracted—and it is believed they can be—they may prevent the spoliation of the company's property. The cost will be heavy; the result is uncertain and the experiment must be regarded as a speculative venture essential to protect the company's plantations.

If these private armies can be raised and supported entirely at private expense the reason why the Government of Burma cannot expand its own forces to maintain law and order is not clear, especially as the Government is not short of money. We have to face the possibility that the Burma subsidiary company will work at a loss in the year beginning on July 1st next, and in the present state of insurrection in Burma it will be fortunate if it survives the year without the loss of its estates.

PROSPECTS OF MALAYAN COMPANY

The subsidiary company operating in Malaya is still working profitably in spite of the heavy fall in the price of rubber. Here also the year which will be completed at the end of this month will be profitable, but the cash resources will not be correspondingly increased as there has been considerable capital expenditure on extensions. The prospects for the year opening at the beginning of next month mainly depend on a substantial decrease in wages commensurate with the heavy fall in the price of rubber.

The natural rubber industry has to adjust itself to compete in price with synthetic rubber and the period of transition will probably be long and costly. I believe that

the demand for rubber at near the present price will absorb all the natural and synthetic rubber becoming available and there will be no burdensome surplus.

The report and accounts were adopted and the proceedings terminated with a vote of thanks to the chairman, directors and staff in Burma, Malaya and London.

THRELFALL'S BREWERY

A GOOD YEAR

The sixty-fifth annual general meeting of Threlfall's Brewery Company, Limited, was held on June 12 in London.

Mr Frederick Cornwall (chairman and managing director), in the course of his speech, said: Again we have had a good year, and I think you will agree that after taking into account the effects of increased taxation, wages, and the cost of materials, the results which have been submitted are satisfactory. In comparison with previous years our profit per barrel is lower after taking into account payments for duty and increased costs, but this position is fortunately to a large extent offset by the rapidity of the turnover. The net profit on one barrel of beer is small.

The total amount paid by the company during the financial year under review for beer, spirit and licence duty and taxation amounted to more than 3½ million pounds, representing approximately fourteen times the net profit.

To what do we attribute our own success? Chiefly to the excellent quality of our beers served in first-class establishments on which in recent years very large sums have been expended, and of which your board and the stockholders may be justly proud. Our "Blue Label" bottled beer has acquired a reputation second to none in the areas covered by our business.

The profit from trading is £753,490, an increase on last year of £14,536. The net profit is £255,132. The directors recommend the payment of a final dividend and bonus on the ordinary stock, which makes 20 per cent and a bonus of 3 per cent for the year.

The report was adopted.

ROCK INVESTMENT COMPANY, LIMITED

SUBSTANTIAL PROGRESS

The thirty-third annual general meeting of the Rock Investment Company, Limited, was held on June 12th in London, Mr C. W. Black, MP, the chairman, presiding.

The following is an extract from his circulated statement for the year 1951:—

Substantial progress has been made in the re-establishment of the fortunes of your company. In the balance sheet as at December 31, 1950, there were investments (marketable) of a market value of £5,592, and other investments (unmarketable) against which a note appeared that "in the opinion of the directors very little value attaches to these investments." The whole of these remaining investments have been sold.

The purchase of the Oak Property Company, Limited, has been completed and we have acquired at a price of 18s. per share the whole of the 5½ per cent cumulative preference shares of £1 each.

The group of companies now own freehold properties of a value of £389,598, and leasehold properties of a value of £199,716, making a total property holding of £589,414. The properties are nearly all situate in the Greater London area and consist, in the main of shops (mostly with living accommodation over) in good class retail trading positions, in many cases let to leading multiple concerns, and blocks of moderately rented flats. The shops are in many cases let on leases at prewar rents and in course of time these leases will be renewed at rentals more appropriate to values prevailing today. These properties are virtually all rent producing and are showing a satisfactory return.

For the future our intention is to develop the companies which we control, and to take any opportunities that may occur of acquiring control of other companies.

The report was adopted.

VAB PRODUCTS LIMITED

The fifteenth annual general meeting of Vab Products Limited was held on June 11th in London.

Mr I. Lloyd, AMIAE, FCS, MInstBE (who presided in the absence, through indisposition, of the chairman, Mr J. E. Hodgkin, MIEE, MIME), in the course of his speech, said:

It gives me great pleasure to report a year of progress. The results give cause for satisfaction in view of the difficulties which were encountered during the year in shortages of raw materials, which seriously affected some of our subsidiaries.

The trading profit amounted to £82,482 as compared with £86,705. I am sure you will agree that this is an excellent achievement.

The importance of exports having now been realised for the survival of the country, I feel sure that our Government and those of the other nations in the British Commonwealth will do all they can to have the present restrictions minimised, and as conditions improve our agents abroad will be enabled to place larger orders and co-operate with us to extend our markets.

In spite of keen competition and lower prices we have been able to maintain the quality of our products and we believe that we are getting our fair share of business under present conditions.

The report was adopted and the ordinary dividend distribution of 20 per cent for the year was approved.

MILFORD STEAM TRAWLING COMPANY

The annual general meeting of the Milford Steam Trawling Company, Limited, was held on June 11th at the Great Western Royal Hotel, Paddington, London, Mr J. M. Whittington (the chairman) presiding.

The following is an extract from his circulated statement:—

The accounts for this year show a great improvement over those of either of the two previous years. The net result is that £10,000 has been added to general reserve and nearly £3,000 to the balance at profit and loss account. This practically makes good the depletion of those funds caused by last year's loss.

REPLY TO DEAR FISH COMPLAINT

Just as last year's improvement in demand was due to the ceiling established on food subsidies, so the recent Budget should go further to put fish in a competitive position. The cry that "fish is dear" has been heard too long. If meat, cheese, and eggs, to say nothing of bread and butter, are priced in the shops at their full cost, fish will look cheap. Indeed, judging by what is necessary to maintain a healthy fishing fleet, it may be said that fish is already too cheap. Unfortunately there can be few industries about which the public are so ill informed, and there is a deep-rooted suspicion that somehow they are being "done." Trawler owners are widely believed to be exploiting the public by overcharging and even by organising shortages. Since all fish is sold at the quay by auction, owners have no chance at all to fix prices; they are fixed in the long run by what the housewife thinks she ought to pay and of this the trawler owner receives about one-third. Landings from certain waters have in the past been restricted by laying-up schemes when markets were hopelessly over supplied; but laying-up is at any time a disaster for owners and no one can make money out of it. All experience shows that times of scarcity and high prices are bad times for owners. If you have not caught the fish, it does not matter what the price is, you lose money.

But we can take comfort from the fact that whatever the outcry, the weight of fish landed in England and Wales increased last year by 12½ per cent and the value per lb from 4.8d. to 5.68d. The competitive position of fish is therefore sound and is likely to become stronger as the prices of subsidised foods rise further.

The report was adopted.

THE NATIONAL BANK OF NEW ZEALAND

PERIOD OF EXCEPTIONAL CONDITIONS

The annual general meeting of The National Bank of New Zealand, Limited, will be held on July 3rd in London.

The following are extracts from the circulated statement by the chairman, Sir Sydney Parkes, CBE:—

The year ended March 31, 1952, for which the accounts are now submitted, covers a period of unusual economic and industrial conditions in New Zealand. It is only necessary to mention the waterfront strike, which so seriously impeded the movement of ships, the phenomenal fall in the price of wool and the excessive imports following the relaxation of restrictions for you to realise the impact these things must have had on our figures. While we are able to put before you a satisfactory profit position for the year, the increase in the totals of our balance sheet is largely due to these special influences.

On examining the balance sheet you will find that deposits and current accounts at £59,180,000 show an increase of £9,216,000. Bills payable and other liabilities remain about the same as the previous year. On the assets side our liquid assets stand at £23,120,000, while advances at £43,425,000 show an increase of £11,738,000, which is attributable to some of the reasons I have stated.

The net profit after provision for taxation is £244,015, an increase of £39,101. The directors recommend a final dividend of 5 per cent, less United Kingdom income tax at 9s. 6d. in the £, thus raising the total dividend to 8 per cent.

Apart altogether from the exceptional conditions I have named, there has been another general increase in the bank's business in the Dominion. This has been accompanied by the opening of many new accounts, and a greater volume of transactions handled in all departments.

As a result of the general economic position, money for capital purposes has become much harder to obtain, either for investment in share issues or for placing on mortgage, and interest rates have tended to harden. The Government has, however, announced that it will not increase the maximum rates allowed in the categories of interest subject to control. These include bank overdraft rates, the rates for deposits in savings banks and building societies, and the rates allowed for new issues of debentures or preference shares in public companies.

South America

With our own branches in 19 important Central and South America cities, and correspondents throughout South America, we are well equipped to serve British traders interested in Latin American markets. Correspondents the world over.

THE UNIVERSITY OF MANCHESTER

Applications are invited for research posts in GOVERNMENT, SOCIAL ADMINISTRATION, and ECONOMIC AND SOCIAL STATISTICS. There are three grades: Grade I, £500-£1,100 per annum; Grade II, £450-£500 per annum; Grade III, £350-£400 per annum. Applications should be sent not later than July 21, 1952, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

CROWN AGENTS FOR THE COLONIES

ECONOMIC AND MARKETING OFFICER required by the Government of Uganda for the Department of Commerce for one tour of 2½ to 3 years with prospect of permanency. Salary according to age and experience in the scale £687 rising to £1,390 a year (including allowances). Outfit allowance £30. Free passages for the officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates under 30 years of age should be of good education and preferably have a knowledge of commercial practice or agricultural marketing. A University degree would be an advantage.

Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting on letter M.29085.C. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

MANAGEMENT STUDIES

The College of Commerce, Bristol, announces a new course commencing in September for graduates and those of similar age. —Prospectus showing its particular features obtainable from St. George's Road, Bristol, 1.

CHARTERED or Incorporated Accountant required immediately for progressive Public Company in London, as Secretary and Chief Accountant. Industrial experience essential. Age 30-40 years. Commencing salary about £1,500. Excellent prospects of advancement to higher administrative levels.—Applications, giving details of age, education, qualifications, experience and salaries, should be sent to Robson, Morrow and Co., Box No. 001, 59 New Cavendish Street, London, W.1.

GOVERNMENT ACTUARY'S DEPARTMENT: ACTUARIAL APPOINTMENTS. The Civil Service Commissioners invite applications for about 3 pensionable posts in the grade of Actuarial Assistant. Candidates, if not already Fellows of the Institute of Actuaries or of the Faculty of Actuaries; must have reached an advanced stage (equivalent approximately to Associateship of the Institute) in the examinations of those bodies. The inclusive salary scale for fully-qualified male officers in this grade is £597 to £933. Starting salary increased by about £26 for each year since attaining Fellowship. (The commencing salary of a candidate not yet fully qualified would depend on his age at appointment; he would be placed on the above scale immediately on obtaining his Fellowship.) Candidates should preferably be under age 30 on July 1, 1952.—Full particulars and application forms from the Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4146/52. Completed application forms must be returned by June 20, 1952.

QUALIFIED ACCOUNTANT, Cost Accountant, Secretary, Economist (34), just completing five years' practice as consultant to gain valuable experience industrial management, seeks responsible post. Adviser or assistant to technically trained Managing Director suitable. Present income £1,500, but reduction accepted for post capable of development through own effort.—Box 954.

A HIRE PURCHASE FINANCE COMPANY, acting in conjunction with a large firm of Gas Cooker Distributors, REQUIRES ADDITIONAL BILL DISCOUNTING FACILITIES to the extent of £200,000-£300,000 per annum, in monthly units. Bills of Exchange are fully covered by collateral securities and are guaranteed. The discounting charge is equivalent to a simple interest rate of 12.48 per cent per annum. Particulars from the Company's Accountants.—Box 952.

A LONDON firm of Mechanical Engineers require the services of a statistician. Preference will be given to a young man just leaving university with a suitable degree.—Reply, Box 966, giving qualifications.

YOUNG Executive. Much experience modern selling, advertising, marketing and production methods—home and export. Seeks position front rank National company anywhere in world. Minimum commencing salary required £1,600 per annum. Languages.—Box 970.

YOUNG BUSINESS MAN, 27, B.Sc. (Econ.), Public School, Languages, seeks job. Offers please.—Box 965.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—DIVIDEND NOTICE—ORDINARY CAPITAL STOCK—At a meeting of the Board of Directors held today, a dividend of seventy-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1952 payable in Canadian funds on August 1, 1952, to shareholders of record at 3 p.m. on June 24, 1952. Of this dividend, twenty-five cents is attributable to railway earnings and fifty cents to other income. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 10, 1952.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—DIVIDEND NOTICE—PREFERENCE STOCK—At a meeting of the Board of Directors held today a dividend of Two per cent on the Preference Stock in respect of the year 1952 was declared payable on August 1, 1952, to stockholders of record at 3 p.m. on June 27, 1952. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 10, 1952.

STATISTICAL SERVICE FOR THE SMALL FIRM

Organisation and research by graduate team of statisticians. Installation of routine sales, production, etc., recording methods, Moderate fees for periodic supervision.—Box 971.

EVENING student taking Inter Economics wants several coaching sessions late June pref. Kensington-Richmond area. State fee. —Box 967.

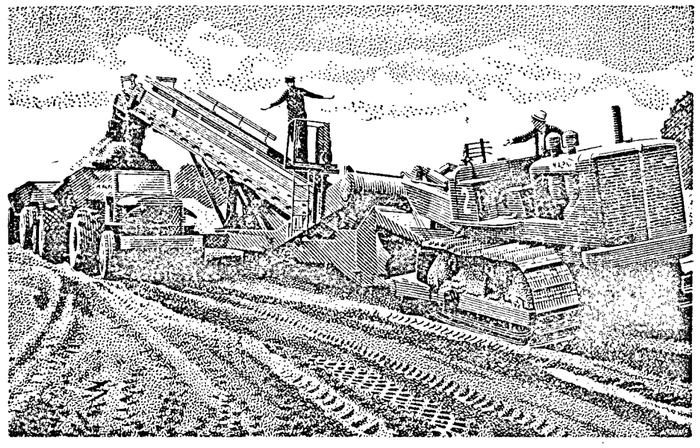
THE SCOTTISH HOLIDAY that will send you home really rested, really fit, is at Major Fullerton Carnegie's Stronvar House Hotel. Wonderful food (home farm), country house comfort. Ideal for children. 18,000 private acres of woods, lochs, moors and mountains in the heart of Rob Roy's country. Own boating, tennis, fishing, shooting, stalking. Overnight London.—Write, Major B. Carnegie, "Stronvar," Balquhidder, Perthshire.

CHARTERED or Incorporated Accountant required immediately for progressive company in the West Country, as Secretary and Chief Accountant. Age 30 to 40 years. Commencing salary about £1,250.—Applications, giving details of age, education, qualifications, experience and salaries, should be sent to Robson, Morrow & Co., 59 New Cavendish Street, London, W.1.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations: B.Sc. (Econ.), LL.B., and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams., and for the professional exams., in Accountancy, Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.



More than 30,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exam. or subjects in which interested to the Secretary

Mr Churchill

THE Conservative party, unlike Labour, does not relish open discussion of its internal differences. Criticism of Mr Churchill among his own supporters has nevertheless grown, particularly during the past two months, to such proportions that it is no longer concealed. Some of the criticism is unimportant; it reflects the disappointment of partisan hopes that were never realistic. But much of it goes wider. One of the fundamental assumptions of British politics has been that, whatever their faults, at least the Tories are the businesslike party. It was in this belief that so many Liberal and independent votes turned away from Labour in 1950 and 1951. And it is this belief that the facts of the past eight months most sharply challenge. On the major issues of policy, the Government has been consistently indecisive. Nationally, that could be disastrous; and, electorally, it is more damaging to the Tories than unfulfilled dreams of red meat and broken promises to set the people free are ever likely to be.

Indecisiveness in government is the failing for which, above all others, a Prime Minister can never escape blame. At the very least, he chooses the ministers who cannot make up their minds, and by his handling of cabinet meetings he creates the framework that makes good administration easy or difficult. When the personality is as powerful as Mr Churchill's, when the Prime Minister stands in experience and authority so far above his colleagues, his influence extends much beyond this minimum—and so, therefore, does his responsibility. Indeed, there is every sign that Mr Churchill's own interventions, combined with his unpredictable methods of work and of consultation, have sometimes been the direct reason why government policy has not been settled early and on clear lines.

The most recent example of confusion in Downing Street is particularly significant. On Wednesday of last week Mr Churchill spoke bluntly and dramatically about the economic dangers facing Britain. For six months previously—since his broadcast just before Christmas—he had not, unfortunately, been "sounding an alarm." No other statesman can make an alarm so effectively a call to effort rather than a signal to rush for the fire escape. But Mr Churchill chose for this welcome re-exercise of his unrivalled powers of leadership the very day before Mr Butler was to announce that in the past two and a half months Britain has lost $28 million from the dollar reserves, compared with $1,250 million in the first five months after the general election.

By this conjunction the impact of Mr Churchill's words was blurred. Formally, there was no inconsistency between the two speeches. A respite from heavy dollar losses in no way removes the underlying causes for alarm. Mr Butler recognised this, just as Mr Churchill recognised that lately the country had been keeping its head above water. But the Prime Minister emphasised one face of the medal and the Chancellor emphasised the other. No damage would have been done if the speeches had been made the other way round, if Mr Butler's relatively reassuring announcement had been followed the

next day by a warning from Mr Churchill that nevertheless the country was standing on a trap door. That ought, indeed, to have been said regularly. By sounding an isolated alarm the day before the dollar figures were announced, Mr Churchill has confused, not clarified, the public mind and the public will. Even so cautious and so loyally conservative a journal as Lord Kemsley's *Sunday Times* has been driven to comment:

> If there is confusion, it is traceable to a prime error of the Government in their eight months of office. They have failed to make known their problems and policies continuously to the people. . . . Ministers should speak frankly, fully, more often, and with one voice and intent.

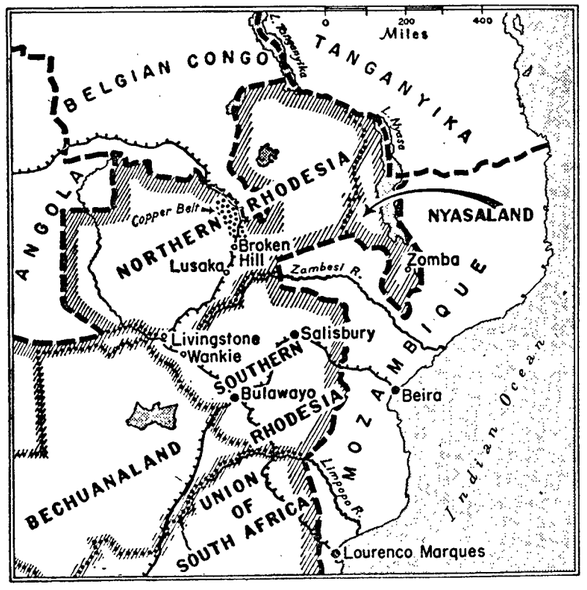
Mr Churchill is too experienced a politician for anyone to suppose that he will be indifferent to such widespread criticism of his government and its leadership. It would be the sharpest of tragedies if, by indifference to it, he allowed criticism to grow into pressure on him to retire. Although he cannot be spared responsibility for the Government's weaknesses, improvement certainly will not be secured by making him the scapegoat for everything. Moreover, an agitation against Mr Churchill, even if it were justified, would almost certainly end in frustration. Mr Churchill would probably be as ready as any man to resign if he were genuinely convinced that he was no longer an asset in his office. But when he looks at those around him—and opposite him—he needs no immodesty to conclude that at 77 he still has more to contribute to British government than almost any other man. His powers of leadership and of understanding, particularly in defence and in foreign affairs, are far too great to be lost to this country a day before they must be.

The best course for Mr Churchill and for the Government is therefore obvious. It is that Mr Churchill should limit his responsibilities to those things that he does supremely well. This is not a euphemism for saying that he should become less than a Prime Minister. It means that he should stop trying to be more than a Prime Minister. He has already moved in this direction. But Lord Alexander's appointment as Minister of Defence certainly did not end Mr Churchill's special attention to defence policy; and the recent freeing of Mr Crookshank from departmental duties does no more than enable him to lead the House of Commons with the attention and skill that the parliamentary situation requires; he has not the authority within the party to be also a general policy-maker. Except for the shadowy overlords, Mr Churchill still lacks a general assistant with whom to share the enormous burden of decision that must now come to the centre of government.

The straightforward solution is that Mr Eden should give up the Foreign Office and become the Prime Minister's deputy in fact as well as in name. As Lord President of the Council he could and should take responsibility for the broad conduct of home affairs. The case for this arrangement would be strong even if the Government were working smoothly. As things are, it is overwhelming. For the Foreign Office, there are two or three competent successors to choose from. The possible difficulties are on the domestic side. The arrangement would work only if two conditions were fully observed. First, the definition of Mr Eden's duties would have to be specific; a real devolution of authority from Mr Churchill to him is required. That would be easier if Mr Eden also became leader of the House of Commons —which would have the further advantage of strengthening the administration by enabling Mr Crookshank to take charge of one of the major departments. Secondly, there would have to be a close understanding between Mr Eden and Mr Butler. Because of the Foreign Secretary's inexperience in domestic affairs, and especially in economic policy, he should be willing to put his authority firmly behind the Chancellor in all matters for which Mr Butler is responsible. There is no reason to doubt that the two can work well together.

On these lines, a reshuffle of the Government offers some hope of overcoming its major weaknesses. It is not, of course, by such means that the fortunes of either the Conservative party or the country will be directly restored after all the disappointments of the past eight months. The failure is of measures, not of men. But, by a better distribution of the men for their tasks, at least a base for firm policy-making may be established where none now exists.

Federation Moves On



IT is just over-a year since the scheme for federating the two Rhodesias and Nyasaland was officially launched. In the meantime there has been much unofficial discussion of the scheme and much conferring of Ministers, Governors and officials both in London and in Africa. In the meantime, too, there has been a change of government in the United Kingdom. On the whole, a critical reception was given to federation; and the change in government could have provided a ready excuse for allowing the whole thing to lapse. But in spite of all this, the proposals have moved forward, and this week the draft scheme for federation adopted at the London conference in April and May was published.

The White Paper issued a year ago was mainly concerned with arguing the general case for closer association of the three central African territories. Its proposals for the federation's constitution were only outlined. This week's White Paper takes the case for federation as accepted. It is almost wholly concerned with the federal constitution, which is given concrete and detailed form. In this respect, it is an undoubted improvement on the first White Paper. The proposals made a year ago for safeguarding African interests, though attractive at first sight, were later in at least one important matter considered unworkable. This was the provision that there should be a Minister for African Interests in the federal Cabinet. He would be appointed by the Governor-General and would not, therefore, be bound to accept responsibility for all the Cabinet's measures.

The new scheme drops the proposal for safeguarding African interests in the executive. It relies instead on the African Affairs Board, which also appeared in the original scheme but which is now strengthened. The chairman of the African Affairs Board will be appointed by the Governor-General with the approval of the Secretary of State. He must not be a member of either the federal or a territorial parliament and he must not be a public officer; he can be either a European or an African.

The other members of the board will be an African and a European from each territory, nominated by the respective Governors. They too must not be members of parliament. Although the board has positive functions —it can suggest measures which it considers to be in the interests of Africans—its main function is to watch all federal legislation from the standpoint of whether it would be detrimental to African interests either explicitly or in its practical application.

To enable the African Affairs Board to carry out this function, a copy of every Bill that is to be introduced in the federal parliament (to be called the Federal Assembly) has first to be sent to the Board—save in exceptional circumstances. If the Board considers that the Bill discriminates against Africans, it may object to the Prime Minister, and he is bound to lay such an objection before the Federal Assembly. If the Federal Assembly nevertheless passes the Bill, the Governor-General has to reserve his assent and send the Bill and the notice of objection to the Secretary of State, with whom the final decision will lie. Two minor points may be mentioned. The first is that since, apart from the chairman, the African and European members of the board will be equal in numbers, the possibility of a deadlock may arise between them. If this happens, the Chairman's casting vote is to be given in favour of keeping the matter under discussion. The second point concerns which Secretary of State is to have the power of deciding whether a measure is to go through or not. The White Paper is careful to say "a Secretary of State." In practice this will apparently mean the Secretary of State for Commonwealth Relations acting in consultation with the Secretary of State for the Colonies.

It should be emphasised that although the African Affairs Board is the most important instrument for preventing discriminatory legislation in the Federal Assembly, its task is limited by the fact that matters most closely affecting the Africans are expressly excluded from the Assembly's scope. The preamble to the constitution will affirm the protectorate status of Northern Rhodesia and Nyasaland and their right to enjoy separate governments responsible for their political advancement. Direct amalgamation of the three territories is thus ruled out, and any fear that the Africans of the two protectorates might in consequence lose the political promotion they have obtained is also groundless. Indeed, their political progress might by federation spread to the Africans of Southern Rhodesia, who are at present not represented in the Southern Rhodesian Parliament; for of the three elected members for African interests to be returned by Southern Rhodesia to the Federal Assembly two must be Africans.

Another deep-seated fear of the Africans in the protectorates is that under federation their land rights might be prejudiced. Here again, therefore, safeguards are laid down. All powers of the Federal Assembly and Government to acquire land will be subject to the Northern Rhodesia and Nyasaland orders-in-council which secure the rights of Africans in native trust and native reserve land.

In the last twelve months, a frequent criticism of the original federation proposals has been that even if the safeguards for African interests were acceptable and adequate, there is no guarantee that they would be maintained. In the Union of South Africa, it has been pointed out, such safeguards have been written into the constitution, but the South African Government then declares that it intends to amend the constitution. What provision is there for ensuring that the safeguards contained in the federal constitution for Central Africa will not be treated in the same way? The proposals seem to pass this test as well. They provide that a Bill amending the constitution must, first, be passed by a two-thirds majority of the Federal Assembly. In practice this will mean that 24 members of the total of 35 must vote in favour of the amendment. Since, if the amendment altered a safeguard, the nine members representing African interests would presumably vote against it, a two-thirds majority will be obtained only if the other elected members are all but unanimous.

But a two-thirds majority is not enough. The Governor-General will not have power to assent to a constitutional Bill, but must reserve it for Her Majesty's pleasure, and if objection to the Bill is forthcoming either from a territorial government or from the African Affairs Board, the Queen's assent must be given by order-in-council, which will then be subject to negative resolution in the Imperial Parliament.

In short, the proposed constitution seems to contain every reasonable safeguard that could be devised to protect African interests. It should be pointed out that the protection against discriminatory legislation is far stronger than a similar provision in Southern Rhodesia's constitution. In the latter case, the Imperial Government has the power of veto, but is not bound to use it. Under the federation proposals, the Imperial Govern-

ment must express its positive assent, and a disputed measure cannot become law until that assent is given. There is, therefore, no chance of such a measure becoming law through default. Moreover, although it may be argued that the Secretary of State's refusal to give his consent might provoke a showdown between the Imperial Government and the Federal Government, this is a remote contingency that cannot be guarded against in any constitution. Even the most recalcitrant politicians are hardly likely to wreck the whole constitution for the sake of one measure.

But even if the new proposals pass every test, even if they are both morally acceptable and practicable, it is still not clear that they are really necessary. If opinion in Central Africa were in favour of federation or lukewarm about it, enough economic and political reasons could be mustered to justify the scheme, and a new and interesting chapter in British constitutional experiments would have been written. But the reverse is the case. In the last twelve months, African opposition to federation has been unmistakable. It is no use pretending that this opposition is unreal because a few African politicians are by this means furthering their own interests. From nearly all accounts, the opposition is universal; it may be instinctive, without any basis in either study or understanding of the proposals, but it nevertheless cannot be ignored.

It may be that the referendum to be held in Southern Rhodesia will show a majority against the scheme, in which case it will presumably be abandoned. But if Southern Rhodesia agrees the Government may stick to the scheme even though African opposition in the protectorates persists. Does it think that the evil of leaving matters as they are is so much worse than the evil of losing the goodwill of Africans? There is no reason to suppose that a Labour Government, which after all started federation rolling, would be acting any differently today from the Conservative Government. But neither Mr Gordon Walker and Mr Griffiths a year ago, nor Lord Salisbury and Mr Lyttelton now, have ever explained just why federation is considered essential and not merely desirable. The forthcoming debates should elucidate this point, for until the case for federation—not the case for the particular form of federation now described—is made clear beyond doubt, any attempt to force it on the Africans will be mistaken.

The New University

THE Government last week announced its intention of "building up at least one institution of university rank devoted predominantly to the teaching and study of the various forms of technology." At the same time, it rejected one of the last intentions expressed by the Labour Government before it went out of office. There is now to be no Royal College of Technology.

So direct a reversal of policy is rare enough to attract attention—and opposition—for that reason alone. There are other reasons why the Government must expect to have to fight for its plans. The best-known advocate of a new university for technology is Lord Cherwell, and that does not lessen opposition to the scheme. Educational opinion is almost unanimously against it. The universities would prefer to have their existing departments of applied science and technology expanded, rather than see a specialist competitor established with what would necessarily be a very large call on government funds. But personal and professional jealousies ought not to be allowed to confuse the real issue in the layman's mind. They should not deflect the Government from a course that could prove to be of great benefit to the British economy.

All discussion of technological education starts from the assumption that a large, permanent export trade for Britain depends on high quality and, perhaps most of all, on inventiveness and skill in developing new products ahead of other countries. And in order to achieve that, there is an urgent need to attract a fair share of the nation's best brains into the study of technology at the level of a university education. Here agreement stops. There have been years of controversy about the best means to the obvious end. The Labour Government followed the advice of the Council on Education for Industry and Commerce. It decided that some of the existing technical colleges should be raised in status in order to produce technologists—as opposed to technicians. A Royal College of Technology was to be established as the instrument of this reform. It would not have been itself either a teaching college or an examining body, but it would have approved the new, higher courses in the technical colleges and granted awards—of associateship and membership—to people who had taken the approved courses.

The reasoning behind this proposal was sound, given its premises. Few technical colleges have enough prestige for their awards—except for the specialised courses sponsored by professional institutes—to be generally accepted as proof of anything more than elementary competence. The Royal College could have provided an external guaranteee of standards without interfering with the colleges' freedom to use their own methods of teaching and to adapt their courses to special, and particularly to local, needs. But the proposal was unrealistic in the standards at which it aimed. The new courses in technology were intended to become equivalent to university degree courses. They would be narrower, certainly, and more closely geared to industry, but on the other hand they would involve a deeper study of specialised problems. The hope was that associateship of the Royal College would come to be regarded as the equivalent of a first degree and membership of a post-graduate qualification. It was also thought that such awards would induce more people to undertake the courses.

This scheme was well liked by the technical colleges, but that it could ever have led them to turn out the equivalent of university graduates and more is most unlikely. In the first place, as the advisory council for education in Scotland pointed out, a miscellaneous body representing the universities, professional organisations and local authorities could not gain the prestige and authority of a university faculty. Secondly, what of the students? Now that the financial obstacles to a university education have been removed, the abler young men, even those devoted to applied science, would certainly continue to choose a university in preference to a technical college. The colleges would collect the many unsuccessful applicants for university places in applied

science. Though such students are not necessarily incapable of getting degrees, their average standard is certainly lower than that of the entrants to universities. Thirdly, it seems unreasonable to suppose that the colleges could educate both technicians and technologists. Could they possibly establish the atmosphere—and the teaching standards—of a university without turning away the mass of less ambitious students working in evening classes for ordinary national certificates?

The fact that the colleges could not have become minor universities does not remove the need for a less far-reaching attempt to raise their standards. And if they are to help at all to meet the need for more technologists, some nationally recognised award for students taking the more advanced courses is essential. It is therefore a pity that the Government has rejected the idea of a Royal College altogether, instead of making it more realistic. The advisory council that first put the proposal forward particularly emphasised that, whatever the final decision, a new technological university could not be, in itself, a sufficient alternative to a Royal College. Many people who have discussed the subject, both in the House of Lords last week and elsewhere, have not grasped this point and have wrongly regarded a new university and a Royal College of Technology as alternative means to the same end.

In fact, some of the responsibility for improving technological education must fall on the colleges. The Government has certainly not abandoned the intention of raising their status. Mr Butler said last week that more financial help would be given to selected colleges. It is not clear how this will be done—whether the money will go directly to the chosen colleges or, as now, through the local authorities responsible for them. Out of some 60 colleges in the country, presumably only a few will qualify for extra assistance: those at Manchester, Bradford and Birmingham and the Northern Polytechnic in London would be among the strong candidates for help in improving their equipment and accommodation and in providing new courses covering the branches of technology now most in demand. But in keeping this part of its predecessor's policy, while rejecting the proposal for a Royal College, the Government is in danger of spending money without providing the stimulus that is needed to raise standards and, by the promise of a recognised award, to attract able students.

★

But if one part of the problem is still being neglected, it is equally true that the Labour Government's proposals were, in themselves, no alternative to providing more technical education of a genuine university standard. Here the choice lies between a new university and expanding the departments of several existing universities. The last Government would not accept the proposal for a new university because it could make no contribution to the supply of technologists for a long time, whereas the need is here and now. If the intention is to build an entirely new university, there will certainly be a delay of some five years before it comes into being and of another three or four years before it produces any graduates. Its cost, if it provided for 2,000 to 3,000 students, would be at least £6 million. Quicker results could be obtained, at less cost, by expanding some existing institution and turning it into a university. One possible candidate is the Manchester College of Technology, which is already, to some extent, the applied science department of Manchester University; another is the Glasgow Royal Technical College, which stands in the same relation to Glasgow University. A third possibility is to detach the Imperial College of Science and Technology from London University and constitute it a university in its own right. But whatever the decision, there is a strong case for placing the new university—whether entirely new or based on one of the present colleges—near to an existing university, as Harvard and the Massachusetts Institute of Technology exist together at Cambridge, Mass. In this way the technologists might enjoy something at least of the association with people of different interests that is one advantage of university education.

The universities argue that this can be most readily achieved simply by giving them more money to set up or expand departments of applied science and technology, instead of concentrating on one great, new institution. Two arguments may be used in answer to them. The first is that technology might not then get the special attention that the Government intends it to have. The universities are not free from the prejudice that regards applied science as in some way inferior to pure science. If technology were competing with other departments for its share of the university chest, it might get only a fair share instead of a favoured share. But if the Government were firm the universities would no doubt do what was required of them, and as a last resort the device of the earmarked grant, disliked though it is by the universities, could be used again as it has been used in the past.

A more effective argument against expanding departments within the present universities is that the apparatus required in a first-rate technological training is very costly and the most economical way of providing it is therefore to let it serve as many students as possible. Lord Cherwell spoke of 3,000 to 4,000 as the ideal number, but of the two famous institutions which have inspired the present plan—the Massachusetts and California Institutes of Technology—the latter has less than 1,500 students. The new British university seems likely, in fact, to aim at a student population of between 2,000 and 3,000. It will certainly be a larger number than could be accommodated in a single university department without entirely upsetting the balance of studies in the university—and so destroying the point of using an existing university. On the other hand, to expand to a smaller extent the departments at several universities would mean wastefully duplicating expensive equipment or else going short of it. Moreover, it is most unlikely that any department of technology could ever gain, as a new, specialised university eventually might, the high reputation of its counterparts in the United States, Switzerland and Germany.

The case for the Government's proposal, therefore, seems to be made out. There should be no unnecessary delay in taking the preliminary decisions that follow from it—in particular, where the new university is to be and approximately on what scale it is to be planned. At the same time, there should be no neglect of the need to raise the standards of the technical colleges; and, in particular, the Government should reconsider whether a Royal College of Technology might not play a useful part if it aimed to encourage broader courses of a standard intermediate between many of the present ones and the level of a university degree.

NOTES OF THE WEEK

Stalin's German Army

Herr Grotewohl announced on Monday that an army would be set up in Soviet Germany. His audience consisted of members of the National Democratic Party, a puppet organisation which was formed to attract ex-Nazis and officers of Hitler's *Wehrmacht*. Herr Grotewohl declared the new East German army was needed "to prevent the planned American attack"; but he spoke under a much more aggressive slogan proclaiming: "We Germans want to and will be masters in all Germany."

A bill to set up armed forces is now being drawn up by the parties in the East German national front, all of which are subservient to the Communists. It appears to provide for conscription, and the punishment of conscientious objectors on the grounds that "whoever is not ready to take up arms against the attackers of peace encourages the attacker and endangers peace." This brings the Soviet campaign against German remilitarisation round full circle.

It is perfectly plain that the West Germans are to be terrified with the prospect of a civil war, in which they would be driven against far superior forces and their country devastated with atom bombs and germs. The East German force, it is said, will be thirty-five divisions against Western Germany's twelve. How much reality lies behind these threats is hard to say. It is certainly a fact that the German Communist leaders have recently been roping into the police force hundreds of thousands of volunteers from the factories and the ranks of the Free German Youth; and that the recruits have been ordered to become sharpshooters with all possible speed. The new "national army" announced by Herr Grotewohl will doubtless be formed from these volunteers, led by the cadres in the *Bereitschaften*. The *Bereitschaften*, however, are far below the original target strength, and it is hard to believe that Stalin trusts the Germans enough to build up a formidable army until he has sufficient politically reliable cadres. Nor does it seem possible that the Soviet Union is so much better supplied than the United States with weapons and equipment that it can rush a new army into being.

*

For some time to come the West German force is likely to remain a dream, and its Soviet counterpart a nightmare. Nevertheless, it would be wrong to think that the Russians will not find sufficient Germans to serve them in due course. Even now there are enough members of the People's Police who are willing to fire on their fellow-countrymen and drive them out of their homes along the Elbe frontier. And the hundreds of thousands of youths who can be mobilised for demonstrations under giant portraits of Stalin suggest that the present reluctance to take up arms will be overcome in Soviet Germany. It is, indeed, a remarkable fact that West Germans who affirm that ninety per cent of the Soviet Zone is anti-communist, at the same time take it for granted that in a war the East Germans would fight for the Russians.

There is no doubt that the members of the *Bundestag* who are now called upon to vote for or against the European Defence Community are in an appalling dilemma. It is impossible for them to be quite sure that the EDC will help and not hinder the reunion of Germany without war. Memories of a totalitarian regime and signs of reviving nationalism are too clear for any man not to hesitate before placing himself on record in support of a measure that may some day be denounced as treachery. It is natural that, in this predicament, members of the *Bundestag* should want to feel assured that no acceptable alternative to the EDC exists. For this reason, despite Dr Adenauer's desire to secure ratification of the treaties without delay, the Western powers will be under increasing pressure to invite the Soviets to negotiate on free elections and the formation of an all-German government.

* * *

Mr Gromyko Comes to Town

The appointment of a diplomat who has risen so high in the Soviet hierarchy as Mr Gromyko to be Soviet ambassador in London is an action flattering to this country. It suggests that the London embassy is regarded as a key post and that the Kremlin attaches great importance to its relations with Britain. If it were only a matter of improving these relations and of relaxing the tension which has recently existed, it could be nothing but a cause for satisfaction that so able and experienced a representative should be sent to London, and any signs of a genuine Soviet desire for a *détente* with the free world will certainly evoke a ready response in this country. But unfortunately there is ground for a suspicion that Soviet policy is now intensifying its effort to detach Britain from America and disrupt Nato solidarity by gestures designed to encourage neutralist tendencies on this side of the Atlantic.

Since the Moscow economic conference it seems that the Soviet propaganda appeal in Western Europe has been emphasising no longer "peace" so much as the "freeing of international trade," meaning concretely, agitation for breaking through the ban on the export of strategic materials to Communist countries. The planners of policy in Moscow are well aware that nothing has recently evoked such ill-feeling against Britain in America as real or alleged British trading contrary to the principle of withholding supplies from the Soviet bloc's war potential, and that nothing would exacerbate this feeling so much as British nibbling at the kind of bait dangled before an export-questing Britain at the Moscow economic conference. Equally the Soviet leaders are aware that nothing is so likely to stimulate anti-American feeling in Britain as the growth of a conviction that trading relations with Eastern Europe or with China which might be of great benefit to the hard-pressed British economy are being thwarted by American interference. The appeal for freer trade and for "business without ideology" (which the Communists themselves, of course, never mix) has the advantage that it attracts not only the political Left but also industrial and commercial interests which are normally immune to Communist propaganda.

It may be that it will be part of the task set to Mr Gromyko by his government to work on the economic hopes and fears of Britain for Soviet political ends; he would be well fitted for such a role, for, although better known as ambassador in Washington, delegate to the United Nations and Soviet assistant foreign minister, his early career was in the economic field. He will be personally welcome in London as his country's diplomatic representative, but after so much bitter experience of Soviet tactical manœuvres in recent years, nobody should be surprised if it turns out that a Trojan horse has been included in his luggage.

* * *

Jets for Food

Mr Menzies's visit to London has, from all accounts, been a success. The discussions ranged over a variety of topics from import cuts to Nato. Conversations at this level have happened before and the results have often been disappointing. But this time the prime ministers of Britain and Australia have concentrated on what has been the weakest link in the economic chain binding the two countries together.

Once upon a time the two economies were complementary, with Australia providing primary products—and in particular food—and Britain sending in return manufactured goods. But this relationship has changed. Australian food production has declined and its output of manufactures has increased. It has even begun to build Canberra jet bombers and other modern types of jet aircraft as well as jet engines—at much higher cost than they can be produced in Britain—while the labour for these new factories has been drawn from the countryside. Britain, on the other hand, because it could not import a sufficiently large quantity of food, has had to expand its agricultural production, also at great cost to itself. The essential result of these new talks between Mr Menzies and Mr Churchill is that Australia will now concentrate on increasing its food production while Britain will supply Australia with defence equipment.

If this is the first real move towards making the two economies once more complementary, it will be an achievement of great political as well as economic significance, for the political ties within the Commonwealth rest in part at any rate on economic relationships. Mr Menzies, in his statement, said that it should be possible to improve "in some respects the situation caused by the Australian import cuts." This again is a move in the same direction. But this reversal of policy cannot happen overnight. Australia is at the moment confronted with a meat shortage, chiefly because of the drought in the northern territories, and it will take years to build up herds to the requisite size. So long as the Australian Government takes the initial steps to make agriculture a flourishing industry, the British public can wait with confidence. But Australia must not be surprised if optimism in Britain is at the moment tempered with doubt, for Britain has already experienced the signing of a fifteen-year meat contract without seeing even a glimmer of hope that larger meat exports will be forthcoming.

* * *

Fares and Governors

The controversy about passenger fares was duly rounded off by the Minister of Transport on Monday. On the Government side there was obvious relief at being rid of the matter, which has certainly provided one of the least happy incidents in the Government's domestic policy. The Minister announced that the Transport Commission had agreed to cut, at a cost of nearly £2 million, the increases in fares that were proposed for the provinces and were already operating in London. The reduction has been achieved by preserving substandard fares, and Mr Lennox Boyd claimed that this removed the "gross anomalies" in the Commission's revision of fares. In fact, of course, the gross anomalies existed before, the Commission was trying to remove them, and the Government has insisted on preserving them. But whether right or wrong, the changes the Government has made are certainly too small to justify the fuss created for both the Transport Commission and Parliament. A Government that knew its own mind on general policy would never have wasted time on this small issue. Both sides at Westminster are heartily sick of the whole affair, and it will no doubt be hastily buried.

The other immediate issue of domestic controversy—the future of the BBC—also seems now to be fading. The proposed new charter for the corporation has been published, and the Labour party intended to attack it again next week. The emphasis of the attack was to have been shifted from sponsored television to the committee that the Government proposed to make responsible for appointing the governors of the BBC. At present the government of the day is responsible. There should be general sympathy with the Conservatives' aim of taking the appointments out of politics. But Mr Morrison last week voiced Labour's vehement opposition to the proposed committee, which was to have included the Speaker. He argued, that it would bring the Speaker into politics—for the choice made by the committee would be open to public criticism—and that at an important point it would sever Parliament's ultimate control over the BBC.

No piece of machinery, however well-intentioned, can in itself ensure that a matter of this kind is taken out of politics. That depends on the will of both sides of Parliament to avoid controversy. When the scheme has aroused so much controversy, the non-political members of the proposed committee were plainly right to ask to be excused, and the Government on Thursday retreated gracefully from the proposal. But it seems rather a pity to return to the present arrangement. A possible compromise would be to leave the responsibility of appointing the governors in the hands of the Government, but to require it to consult an advisory council consisting of five or six distinguished holders of non-political offices.

* * *

Progress with Town Development

The aim of the Town Development Bill, which has now had its third reading in the House of Commons, is to make it easier for people to move from the area of one local authority to another. Such movements may be very large during the next twenty years. The Bill is intended to promote co-operation between the "exporting" authorities, which are mainly overcrowded county boroughs, and the "receiving" authorities, which are numerous small (and often poor) county districts. It has been amended to enable county districts adjacent to the County of London or to "another big centre of population" to share in the benefits of the Bill as exporting authorities. This should meet the point that there are a number of minor local authorities, in Middlesex, Essex, Lancashire, and elsewhere, which have a surplus population.

The main doubt about the Bill is how effective it will be. Its effectiveness will depend on two things—on how much Exchequer aid is forthcoming to assist development by "receiving" authorities, and on how freely the Minister uses his powers to compel dissentient authorities to reach an agreement. On the first point, Mr Macmillan has rightly insisted that the money available will be strictly limited. The modest success already achieved by the joint action of local authorities in Lancashire shows that schemes of this sort can be operated without central aid or compulsion. But the scale on which co-operation between local authorities will be necessary has not yet been realised.

The development plan for Staffordshire provides a good illustration of this point. There are 35 district councils in the administrative county. No less than 28 of these are intended under the plan to absorb "overspill" population coming from Wolverhampton, Walsall, Dudley, Birmingham, Stoke-on-Trent and other congested towns. The total transfer of population over a twenty-year period, if the scheme is implemented, will be 171,000. This means that over a quarter of the new houses built within the administrative county would form part of "overspill" schemes. So large an operation will strain the present framework of local government to its limits. It must be doubted whether, even with the Bill's aid, so many minor authorities will be prepared to undertake development on such a scale. It might perhaps be more effective, and cheaper to the Exchequer, to reorganise the local government system than to try to paper over its inadequacies with measures of this sort.

* * *

Bipartisan Agriculture

The debate on agriculture in the House of Commons last week was disappointing. Both the present Minister and his predecessor took pains to emphasise the bipartisan nature

of agricultural policy. Mr Tom Williams did insist that the fall in some branches of production in the last two years could not be blamed on inadequate prices, but this year he thought it was right to give the farmers higher prices. He approved the details of the recent price settlement, except for a warning that the various producer subsidies were a dangerous target for Treasury economies at some later date, a thought which caused him alarm.

He left the present Minister, Sir Thomas Dugdale, with no case to answer. The only discordant note was struck once again by Mr Stanley Evans, whose objection to the annual price review was that it tucked farmers up in their feather bed with unfailing regularity. Mr Evans's best point was that the Government's policy, by providing far too many inefficient farmers with an assured living and security of tenure, is preventing any real influx of new ability into the industry. His speeches give a necessary prod to the "bovine complacency" of the two Front Benches, but he spoils his case by exaggeration.

The Minister did admit that the present system of fixed prices, coupled with state purchase, has certain defects. It is, in fact, clearly inconsistent with the return to a freer economy towards which "the Government are most anxious to move as rapidly as we can." Sir Thomas did not explain how the Government guarantee to agriculture would be administered under such changed conditions. His general idea is apparently to restore the powers of producer-controlled marketing boards, coupled with stronger safeguards for the public interest. But it is surely clear to other members of the Government, if not to the Minister of Agriculture, that no producer board can be allowed to administer large public subsidies, whatever the safeguards. Is it the Government's intention, then, to eliminate subsidies more or less completely? The truth is plainly that no serious thought has yet been given to the nature of agricultural policy in a freer economy.

The *Rose Mary's* Test Run

Failure has attended the adventure of the tanker *Rose Mary*, which was, simultaneously, an attempt by merchant adventurers of the oil world to turn the Anglo-Persian dispute to account, by channelling oil on to the world market at cut prices, and an attempt by the Persians to snap their fingers at courts of all kinds, saying: "See! we can sell our oil." The *Rose Mary*, a small vessel of only 632 tons, started the week in the Indian Ocean set on a course from the Persian Gulf to an Italian port carrying 780 tons of Persian crude oil. It was pounded with command and counter-command from its owner—a naturalised Swiss named Rizzi—and its charterer, an Italian oil firm called EPIM which intended to deliver the oil, after refining, to the Swiss oil firm of Bubenberg.

At the back of Signor Rizzi's commands to put into Aden was the Anglo-Iranian Oil Company, which, though it recognises Persia's basic right to ownership of Persian minerals, is able to point in Article I of its concession to a grant from the Persian government of "the exclusive right, within the area of the concession, to search for and extract petroleum as well as to refine or treat in any other manner and render suitable for commerce the petroleum obtained by it." At the back of EPIM's contrary orders to make straight for Italy were a band of interested tanker owners of several nationalities, all of them ready to buy or charter more vessels if oil on the cheap was to be had without litigation. The captain, who professes not to know that he was carrying legal dynamite, finally obeyed the Rizzi order to put into Aden. There, the Anglo-Iranian Oil Company has obtained through the courts a temporary injunction to prevent the removal of the oil from Aden, pending litigation.

Two law suits are bound to follow, one between the owner and charterer, the other—of far more general interest—between the company and agents who have bought oil which, if it came from within the concession, is the company's property. The Persians, if they wish to contest the company's argument, must now put their case to a court. The case against them is not that they have nationalised their oil, but that by the manner in which they have done so—that is, by tearing up an agreement and then selling the fruits of that agreement without breath of compensation—they have jeopardised the whole framework of international commercial dealings. The only other European company so far to buy Persian oil, a firm which bought 32 tons when its vessel the *Issa Vigo* ran out of bunker fuel in the Persian Gulf—put itself on the right side of the law by paying the Anglo-Iranian Oil Company in sterling for the transaction. If it also paid the National Persian Oil Company, and therefore paid twice, purchases of Persian oil are not as profitable as the low price now being quoted by the Persians would at first lead one to suppose.

No Fanfares at Alexandria

As a slogan, "the unity of the Nile Valley" sounds splendid. The one requirement for clothing it with meaning is that the Egyptians and the Sudanese shall agree on the practical arrangements it shall entail. No one is stopping either party from proposing such arrangements. Yet none have so far emerged from the direct talks which ended last week at Alexandria. These went off in an atmosphere of goodwill and harmony. Generalities flowed on such subjects as cultural unity and sharing the Nile waters; there was friendly chat on the thornier topic of economic links between two neighbours whose economies in fact compete more often than they dovetail.

Perhaps it is early to expect results. The Egyptian participants were government representatives and were in a position to take national decisions; those from the Sudan, on the other hand, were not, for they represented one party only, the Umma party. Yet this party is, of those in the Sudan, one of the most averse to a spread of Egyptian influence. Therefore the atmosphere achieved is a pointer to the possibility of thrashing out, ultimately, a fairly wide measure of agreement between Khartoum and Cairo on common economic and cultural interests.

The political picture offers no such prospect, and accounts for Egyptian silence on the result of the talks. The Egyptians maintained their demand for recognition of King Farouk's title to kingship of the Sudan, as an umbrella beneath which the Sudanese were to rule themselves. Egypt seems to attach importance to this point because, by denouncing the condominium in order to get rid of Britain, it has cut its own official painter with the Sudan, and would like another. But the Sudanese were unresponsive. The Umma party is not alone in feeling nervous of a neighbour who, only last autumn, laid claim to run the Sudan's finance, defence and foreign policy and has never rescinded that claim. It has lately been expressing to Arab governments its view that they disregard Sudanese opinion if and when they recognise King Farouk's double title, as most of them have lately done. No one in the Nile Valley is good at compromise; if Egypt sticks to its thesis about title, an independent Sudan seems inevitable.

* * *

The Japanese Play Fair

The recent arrival in London of Mr Shunichi Matsumoto, the first Japanese ambassador since the war, has a considerable economic, as well as political, importance. For the moment, indeed, the economic aspect of British relations with the new Japan is paramount. It is true that

Japan, with Germany, is one of the most crucial battlefields of the cold war, but the conduct of the struggle there lies primarily in American, not British, hands. For Britain the most practical problem of the next year or two will be to come to terms with Japanese commercial competition and to evolve new Anglo-Japanese sterling arrangements that are at once harmonious and realistic.

Fortunately, Mr Matsumoto has come to London with instructions to do all in his power to establish a good name for Japan in international trade. Although it is not always realised in Britain, the government in Tokio has already taken a number of steps to prevent the abuse of foreign designs and copyrights, and it has on several occasions expressed its desire to co-operate with the British authorities in this respect. The Japanese patent office has been instructed to take up any complaints made against Japanese firms for infringement of trade marks and designs registered in Japan. And the government has now prepared a further Export Trading Bill dealing by law with many aspects of unfair practices adopted by Japanese exporters. It is understood that, once a clear case has been made out against any Japanese nationals, the government in Tokio will take firm action.

There may well be doubts about either the effectiveness or durability of anything that the Japanese government may be able to do in pursuit of its present policies. But the proof of the pudding is in the eating. And if the Japanese are in fact making, on an official level, the genuine and serious efforts to ensure fair trading that they appear to be, it is up to British traders to give them every assistance. The process is bound to be laborious since it means the registration in Tokio of a vast variety of patents and other designs. But the channels are now open for this purpose and they should be given a real trial, even if this means evolving new forms of British business organisation for the purpose. In economic, no more than in military or political affairs, is it fair to condemn the new Japan just because it succeeds the old?

* * *

The Horse Trade

The *Manchester Guardian* has made a deep impression by its recent series of articles on the trade in Irish horses. The response in this country has been a renewed wish, which has found expression on both sides of Parliament, to make sure that animals slaughtered in this country endure no unnecessary suffering. There has been more varied comment in Ireland. Our correspondent in Dublin points out that the present trade has grown, in postwar circumstances, out of the traditional export of working horses from Ireland. Trade returns show that in 1938 some 9,390 horses (excluding racehorses) were exported at a value of £837,071. The numbers have grown to 29,331 in 1949; 22,488 in 1950 and 35,740 in 1951. The trade was valued at £3,128,486 in 1950. In the first four months of the present year, 12,382 horses were permanently exported; of these, about 7,800 were sent to France and Belgium and about 4,300 to the United Kingdom.

In the past the sole responsibility assumed by the Irish authorities has been to ensure that no animal is shipped that is unfit to travel and that the ships carry adequate supplies of fodder and water. The investigator for the *Manchester Guardian* found no fault with the discharge of these functions. The suffering comes from the sea voyage, particularly the long voyage to France, and from the manner of slaughter. Conditions in the *abattoir* in Paris have now been made notorious, but they should not be allowed to obscure what happens elsewhere. And whatever is done to improve them, the suffering to which the horses are exposed in transit remains.

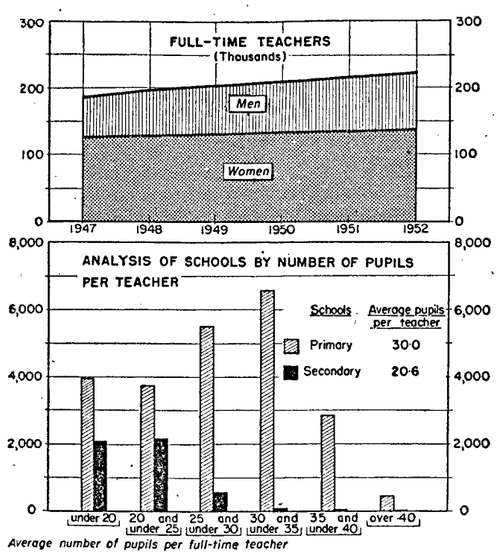
From time to time people have urged that the Irish Government, being necessarily powerless to supervise the trade beyond its own ports, should prohibit it. Our correspondent emphasises that the chances of this drastic step being taken are not improved by the added suggestion that horses should be slaughtered and canned in Ireland. The refusal of successive Irish governments to permit this is not the consequence of mere indifference or complacency. A trade in horseflesh for human consumption would certainly be enormously profitable for the exporter; but it might very quickly lead to confusion with the present trade in Irish meat. This point cannot be lightly brushed aside, yet it surely ought not to preclude any remedy. Could not the Government's powers of inspection be sufficiently rigorous to ensure that beef and horseflesh are segregated and that the reputation of the existing meat trade, in no way damaged?

These issues are not at all novel to the Irish public. The Irish societies for the prevention of cruelty to animals have raised the matter many times. It was discussed again in the Dail this week; the arguments did not get an altogether coherent answer from the Minister for Agriculture. His refusal to stop the export trade in horses need not be taken as final. On the other hand, it should be realised that too much expression of public feeling in this country will make some Irishmen doubt whether it is disinterested and cause tempers to be lost on both sides—while the horses continue to suffer.

* * *

Scarcity of Schoolmistresses

The Ministry of Education's report for 1951* shows that the real crisis in education is not so much the Government's prescription of economy as that not enough girls



* Cmd. 8554. HMSO. 6s.

want to be schoolmistresses. Nearly two-thirds of all the girls who stay at grammar schools until they are eighteen, and who do not go to universities, have been entering training colleges. But this is not enough to fill the training college places—1,300 out of 8,000 places available next autumn have still to be filled; and it is not nearly enough to fill the growing need for teachers, as the children born just after the war crowd into the schools.

The situation is the more serious because the present rate of recruitment—producing over 3,000 extra women school teachers in 1951—cannot be kept up. It was swollen by the emergency training scheme, which provided more than 23,000 men teachers and nearly 12,000 women teachers before it came to an end last year. The Ministry has had to "ration" women teachers to the local authorities. Two-thirds of them, however, have not succeeded in getting their allocation, and they have been told to employ men whenever they can.

The spectacle of male "dilutees" may afford some satisfaction to the feminists, but they will take it the more hardly that women teachers do not get equal pay. An obvious step, *ceteris paribus*, would be to make the profession more

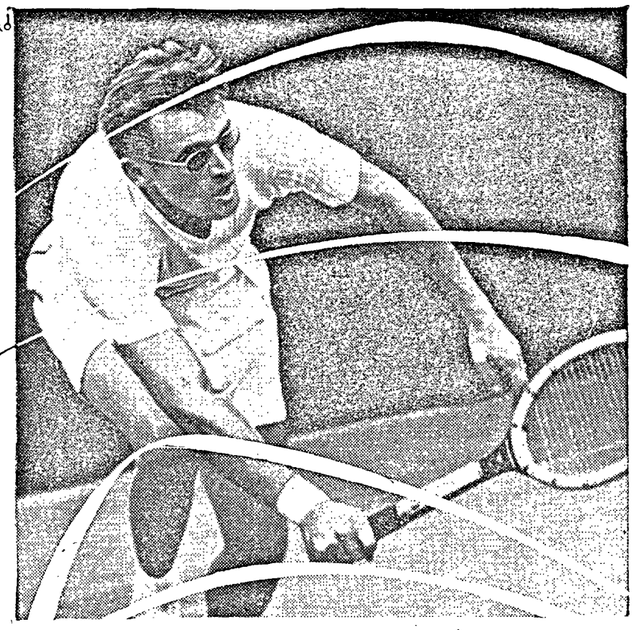
Average number of pupils per full-time teacher

attractive financially. But women teachers could not be given equal pay without giving it also to the civil service—where the case for equal pay is certainly less strong when set beside the need for economy. In any case, although better pay might help recruitment, its present level is not the reason why schoolmistresses are scarce. The salary range in primary and secondary schools is £338 to £504, with additions for graduates and for those with special responsibility; and a new cost of living award of £32 for women (£40 for men) will be paid from July 1st. These rates of pay may be little better than wages in manual work, but they compare favourably with most other salaried occupations for women. The salary scale for men, on the other hand—ranging from £375 to £630 a year, again with additions—compares badly with men's salaries as a whole. Yet, if there is a shortage of schoolmasters it is only just beginning to be felt; the only real shortage so far has been particular—the lack of men, as of women also, to teach science and mathematics. Perhaps the real trouble is that for women the teaching profession has the reputation of creating spinsters. The Ministry of Education might think hard about recruitment propaganda.

Maintaining a Patient

The cost of the hospitals is mounting steadily; but hitherto it has been hard to say whether there is undue waste in hospital spending because, as the Select Committee on Estimates pointed out last year, the only hospital accounts that have been published have been in a summarised form and useless as a means of comparing one hospital with another. For the last two years the Nuffield Provincial Hospitals Trust and King Edward's Hospital Fund for London have been undertaking a complete unit costing of a number of representative hospitals. In the light of these experiments, some form of costing suitable for hospitals will eventually be adopted. In the meantime, a simple form of cost analysis has been introduced, and the first returns based on it were published by the Ministry of Health last week (HMSO, 10s.).

The returns, which give figures for each hospital management committee in England and Wales, divide the hospitals into different types: wholly general, mainly general, maternity, chronic, mental, and so on. From the costs under different headings such as provisions, staff, drugs and dressings, and so on, which are divided into running charges and standing charges, a figure has been worked out for the "total inclusive net cost per week of maintaining a patient." This figure has then been adjusted by eliminating, first, the cost of out-patient departments, which is done by assuming that five out-patient attendances equal one in-patient day, and, second, the distorting effect of beds which are staffed but not occupied.



The Ministry of Health considers that in order to compare the cost per patient—either between hospitals of the same type or between one type and another—the figures adjusted for out-patient expenditure provide a reasonable basis. If so, some fascinating contrasts emerge. The national average cost per patient in a wholly general hospital is £13 10s. 3d. a week, but the regional average varies from £11 10s. 3d. in Liverpool to £17 0s. 8d. in the north-west metropolitan region. The low cost, comparatively, of maintaining a patient in a mental hospital or mental defective institution (between £3 10s. and £4 a week) is mainly due to their low proportion of staff to patients. Similarly, teaching hospitals, which have a high staffing ratio, show a higher cost than non-teaching hospitals, particularly in London. But why does a comparison of, say, Bart's and the London Hospital show a difference of £7 10s. a week in favour of the London? Proper unit costing, when established, may show discrepancies like this to be justifiable. In the meantime, the new returns justify the discrepancies being pointed out.

* * *

Shocks for the Swedes

The Russians seem to feel that in their dealings with their "neutral" neighbour, Sweden, they can go as far as they please. Their shooting down of an unarmed Swedish flying boat on Monday was no isolated incident. Since 1948 they have systematically seized any Swedish fishing vessel that neared the southern or eastern shores of the Baltic, even if it was well outside the twelve-mile limit which the Russians claim. Stockholm's protests at this practice have been rebuffed or ignored, and Swedish proposals that the matter should be referred to the International Court have elicited only a curt statement that it was a purely Soviet concern. Meanwhile the arrest and trial of a number of Swedish Communists have revealed that over the past few years the Soviet Embassy in Stockholm has obtained very full details of Sweden's sea, air, and land defences.

Early this month, without, apparently, giving the customary warnings of its intentions, the Soviet fleet and air force began extensive manœuvres in the Baltic, not far from the Swedish island of Gotland; and it was during these manœuvres that a Swedish Dakota aircraft disappeared, with

The legs rush him up from the base-line. The shoulders stoop into the stroke. The right forearm tenses. The left arm balances the body. The racket is held square for the classical low backhand volley. The eyes can all but read the maker's name on the ball. ***It all adds up to*** Game, Set and Match to Frank Parker.

GREAT INTEGRATION

The member companies of A E I work by themselves, and as a group.
That is the policy. As a group, Associated Electrical Industries spend
a million pounds each year on research and run the only industrial
School of Physics in the country. Integration of the different companies means
real rationalisation of production, the pooling of knowledge,
of experience, of resources. It means *co-ordinated effort* for the public good.

These are the companies of A E I
Metropolitan-Vickers Electrical Co Ltd
The British Thomson-Houston Co Ltd
The Edison Swan Electric Co Ltd
Ferguson Pailin Ltd
The Hotpoint Electric Appliance Co Ltd
International Refrigerator Co Ltd
Newton Victor Ltd
Premier Electric Heaters Ltd
Sunvic Controls Ltd

it all adds up to A E I

Associated Electrical Industries

the loss of eight men. The flying boat which, while searching for the lost Dakota, was shot down three days later was well out over the open Baltic, near enough to the international shipping routes for its crew to be rescued by a ship bound from Germany for Finland; but this did not save it from unprovoked attack.

These events took place a bare ten days after Hr Unden, Sweden's Foreign Minister, had assured his people that there was still room for neutral nations in a divided world. Some of his compatriots, however, are inclined to feel that, in the face of a truculent and mighty neighbour apparently intent on making the Baltic into a private pool, an "alliance-free" nation is not so much unfettered as unclothed.

* * *

Schuman Pool Preparations

It is two years since the French Foreign Minister, M. Schuman, first put forward his proposals for the pooling of West European coal and steel. It is twelve months since the draft treaty of the Schuman Plan was signed by the Foreign Ministers of the six participating powers and sent on its way through the Parliaments of the member countries. With the ratification by the Italian Parliament last week, the process was completed and it has been announced that the Plan is expected to go into operation next month.

The six Foreign Ministers will meet shortly to consider the preparatory work completed last week by the Interim Committee in The Hague. Their first task is to name the eight members of the High Authority, the executive organ of the Schuman heavy industrial pool, and then to decide where the body is to make its headquarters. They must also choose a site for the other institutions of the Plan—the Assembly and the Court of Justice. Should all three major bodies be located in the same city to form a kind of "European capital," or is something to be gained by dispersing them throughout the six member countries? This question is proving so difficult that it will probably be given only an interim answer.

Ratification has come not a moment too soon. Some of the parties to the Plan have used the delay to carry out what might almost be called "rigging" in preparation for the new single market. Both the Germans and the French have lost no time in appearing before the Steel Committee of the Organisation for European Economic Co-operation with grandiose plans for the expansion of their national steel industries. If they gain the approval of the Steel Committee, they no doubt hope to present the High Authority with a *fait accompli*. In fact, the planning of investment in steel production—in order to secure its most economic location—was to be one of the Authority's main responsibilities.

The High Authority may also be confronted with another intractable obstruction which if not removed would make nonsense of the Schuman Plan. As one condition of the Plan, the Bonn Government had promised to use the interval to disband the German monopoly coal-selling agency. For twelve months they have stalled. The dying act of the Occupation Powers was to demand once again the abolition of the agency, but the Germans have done little beyond appointing experts whose advice they show no inclination to take. The only alteration they have suggested amounts to another cartel under a different name.

Rates of Pay by Order

The High Court has now given two decisions on the Industrial Disputes Order, 1951, one shortly after the order came into force, the other last month. Between them, they clear up several uncertainties. The 1951 order replaced the notorious order which imposed, in effect, compulsory arbitration on industry and made strikes illegal. The new order brought into being the Industrial Disputes Tribunal and gave it two main fields of activity. First, it was to be the tribunal to which industrial disputes are referred; an industrial dispute being a dispute between workmen and employer. Secondly, it was given power to determine as an "issue" whether an employer should be compelled to observe a nationally negotiated agreement for the terms and conditions of work in his industry.

The first case heard by the High Court was that of the South Shields town clerk, whose Corporation refused to follow the increased scale of pay recommended by the organisations representing local authorities and their employees; the town clerk, through his association, claimed that an industrial dispute had arisen in consequence. The court held that this was not an industrial dispute because a single town clerk cannot be "workmen," which is the word used in the definition of an industrial dispute in the 1951 order. In other words, a dispute between a single individual and his employer was outside the scope of the order. The second case dealt with an "issue," not a "dispute." The National Union of Journalists claimed that a London suburban newspaper was not paying the minimum rate of pay agreed between the union and the Newspaper Society, representing employers. The proprietors replied that they were not members of the Newspaper Society and therefore not bound by the agreement. In response, the union claimed that an "issue" had arisen under Article 2 of the order and requested the Minister to refer it to the Industrial Disputes Tribunal, which he did last November. The employers asked the court to declare that the tribunal had no power to hear the complaint. The court decided otherwise; this, it said, is exactly the circumstance with which the order sets out to deal.

The effect of the two decisions is to make it clear that, while a single employee cannot create a "dispute," he can create an "issue" and that the result of the issue may be an order by the Minister declaring that all employers in an industry must adhere to the scales of pay laid down by a national agreement, whether they are members of the negotiating associations or not. Freedom of contract over terms and conditions of work is a one-way street.

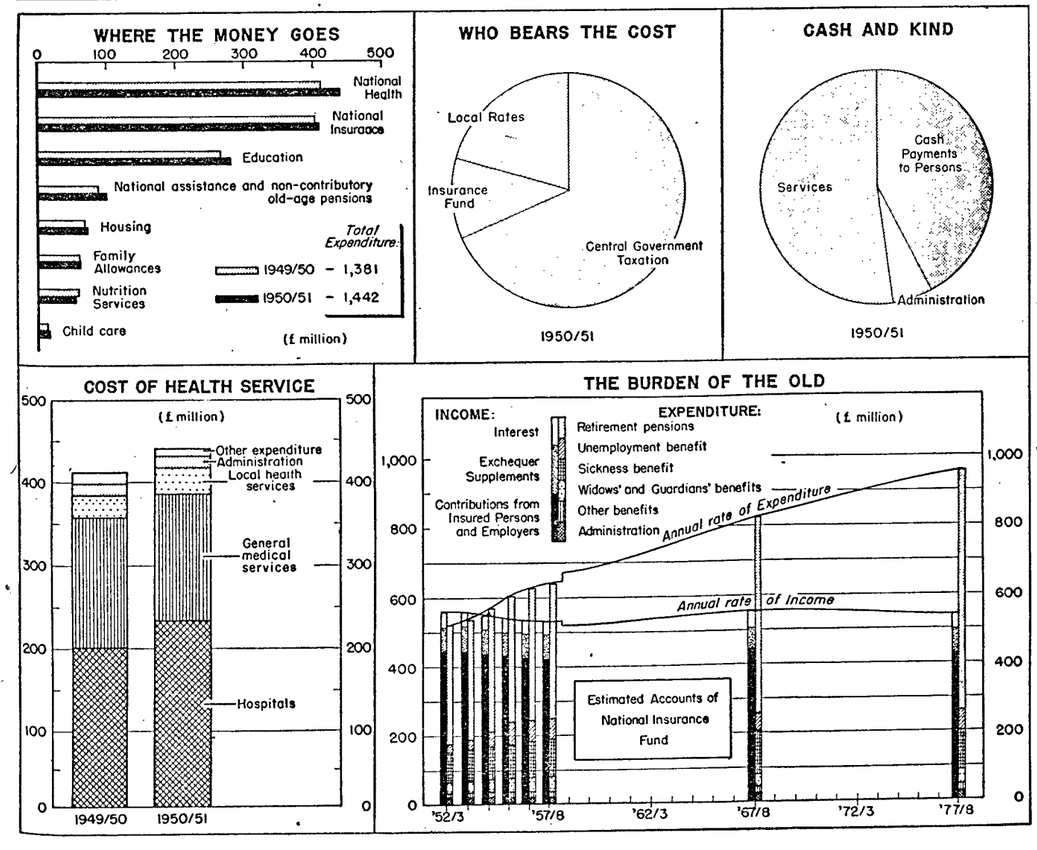
Economics in the Jungle

"The economic problems of the monkey population in Sierra Leone" was the title of a paper by Messrs A. F. McKenzie and T. S. Jones, which was read to the Royal Zoological Society on Tuesday. The problems disclosed should arouse much sympathy, particularly perhaps among readers of this journal. Evidently the monkeys are pushing their disconcerting resemblance to man a stage further. By now they too are probably haunted in their individual lives by their collective anxieties. No doubt they have a Yawning Gap and pep talks about standing on their own feet. Deforestation has perhaps led to a housing shortage and disinfestation to unemployment among the older monkeys. Is the cream of the population emigrating to Regent's Park? Or has its rate of increase outstripped resources?



The paper showed that the population increase is indeed the trouble, but the economic problem is man's. Mainly because of the shortage and high cost of ammunition the monkeys have multiplied exceedingly. In their numerical strength they have lost their fear of man, and they have become extremely fond of cocoa. To check their depredations, the native is offered a decapitation fee of 6d. for every monkey's head. This should save the monkeys from the neo-Malthusian fate that is predicted for their assassins. But it is an unjust world in which a fondness for cocoa can lead to such an untimely end.

Social Service Expenditure

The May issue of the *Monthly Digest of Statistics* gives the most complete official figures on social service expenditure that have appeared since the war. What is a social service is always debatable, and there is some cause to dispute the analysis in the *Monthly Digest*. It includes expenditure on war pensions, but it omits the food subsidies except for the milk and welfare foods scheme. The official definition of a social service is apparently expenditure on benefits for a limited number of people; food subsidies, from which everyone benefits all the time, are therefore excluded. But to say that everyone benefits from food subsidies merely underlines what a wasteful form of social service they are. Whether grants to universities should be considered social service expenditure is also debatable. *The Economist* normally includes them in the cost of education, whereas the new analysis omits them.

Although too many details would blur the picture, under some headings the Central Statistical Office might consider giving a few more. In the analysis of expenditure on education by the local authorities, for instance, it would be useful to distinguish expenditure on primary and secondary schools. There is also a case for giving separate figures for recoveries from users of the social services. Under housing, a figure is given for rents received, which is valuable. But under other headings recoveries have been set off and only the net expenditure given. Particularly now that charges have been introduced in the health service, it would be of interest in future returns to see how much they yield in proportion to total costs. On the whole, however, there is every reason to congratulate the Central Statistical Office on the new return, which offers a ready guide to social service expenditure. The distinction of capital from current expenditure is valuable, and the information on the cost of housing is much more complete than anything readily available elsewhere. Another useful feature is the separation, in every case, of the cost of administration.

The first three diagrams below illustrate some of the information given in the tables. (The cost of both war pensions and food subsidies has been excluded.) The fourth, giving the estimated income and expenditure of the national insurance fund in future years, has been issued by the Ministry of National Insurance in an attempt to bring home to the public at large the mounting cost of old age pensions. In this connection, it should be pointed out that the *Monthly Digest's* figures, being concerned with expenditure only, do not show the surplus that is accumulating in the fund at present when income is still exceeding expenditure. The second diagram, therefore, which shows how the money for the social services is raised, does not give the total amount paid in national insurance contributions; it merely shows that part of them which is actually spent. The third diagram distinguishes social service expenditure that provides income to the recipient—such as insurance benefits, assistance payments, family allowance, scholarships, etc—from direct expenditure by the state on services like schools, hospitals and other medical services.

Letters to the Editor

Export Markets for Cars

Sir,—Your interesting, if disheartening, article in *The Economist* of June 7th, makes one assumption which we in the motor industry regard as unjustified, and a suggestion which, if your assumption is in fact correct, might have the effect of leading to the gradual extinguishing of this great export trade.

The assumption is that overall car exports are likely inevitably to fall. While it is true we shall have to work for markets in the way with which we were familiar before the war, and while the larger and more expensive cars (handicapped at home by purchase tax) may encounter difficulties, many leaders of the industry are convinced that we can not only hold but expand our export markets.

Nobody would quarrel with the suggestion that the Minister should use available steel to the best advantage, nor are we an industry that wishes to be "feather-bedded." Moreover, we have demonstrated our capacity to contribute to the nation's overseas need. The underlying suggestion, however, that if, for any reason, and at any particular period, the industry is not able to sell a high percentage of its products abroad, it should be proportionately starved of steel and other materials in short supply, is despairing to the point of being dangerous.

One of the reasons which causes our prices to remain high (quite apart from the non-existence of a large secure home market, such as enables the Americans to spread their overhead costs so effectively) is the fact that, due to steel and other material shortages, our factories are running at an average of no more than 60 per cent of capacity. This, when combined with ever-increasing labour and material costs, is inevitably reflected in the price of our vehicles. Indeed, the industry can, I think, take pride in the fact that in spite of these handicaps it has been able to keep its prices so comparatively low, and remain competitive in world markets.

The suggestion that whenever the industry runs into difficulties in selling its vehicles abroad there should be a consequent cut in steel for the benefit of "other industries that could use it more profitably" can only mean setting up a vicious circle, for the consequent lower production would mean higher prices. Higher prices would mean smaller exports, smaller exports would be penalised with lower production and so *ad infinitum*. The motor industry having once established itself in overseas markets, will, and must, stay there —whatever temporary vicissitudes it may suffer here or there. It is disturbing to our customers, harmful to our prestige, and dangerous to our balance of payments position to hint at restricting the industry every time there is a seasonal, local or temporary recession of trade.—Yours faithfully,

WILLIAM ROOTES

London, W.1

Which Law for Korea?

Sir,—Any collection of 100,000 or so prisoners of war will contain some deserters, though it is quite illegitimate to assume that none of them want to return to their homes after the war. How many deserters there are, nobody knows, for the reasons I gave in my first letter. Nor have we heard of any American estimate of their numbers, valueless though this would be.

Every man freely choosing to leave his country is not automatically a claimant for political asylum, though every such claimant must have made a free choice.

It is not my province to judge whether it is ungenerous to want the Korean war to end with the greatest despatch, the least further sacrifice of human lives and happiness, and the maintenance of an international convention which protects all prisoners of war, including our own. —Yours faithfully,

E. J. HOBSBAWM.

King's College, Cambridge

Mr Butler's Finance Bill

Sir,—In preparing my estimate of the number of families who are losers under the Budget I made an assumption which I should have made explicit. I did not "forget" about the old age pensioners and others who are to receive increased benefits but I assumed, with some reason, that very few of these people have incomes large enough to bring them within the purview of the Inland Revenue. The tax exemption limit in 1949-50 was £135 per annum while the retirement pension of a single person in that year was £68; of a married couple £109. Some pensioners, it is true, received supplementary grants from the National Assistance Board and others added to their pensions by part-time work; but there must have been very few, if any, whose assessable income in 1949-50 exceeded £135.

These considerations dispose of 4,600,000 of your list of 5,900,000 people likely to benefit from the Budget. (They represent, incidentally, only about 3,600,000 "incomes," since about two million of them are husbands and wives each drawing pensions.) For the rest, one must admit that there were probably some widows, unemployed and sick not already excluded from my estimate whose incomes exceeded £135 per annum; but not many. And against these must be set the persons who are not entitled to any benefits but whose incomes in 1949-50 were below the exemption limit. I doubt, therefore, if there is much net overlap between the 6 million families that I estimated to be losers under the Budget and the beneficiaries to whom you drew attention.

I was, however, in error in describing these 6 million families as "about one-third" of all families. If the married couples and single persons with incomes below the exemption limit are included, it appears that there are now between 24 and 25 million separate "incomes" in the United Kingdom; of this total, 6 million represents about a quarter.—Yours faithfully, H. F. LYDALL

Oxford

[There is obviously room for different opinions about how many of Mr Lydall's "losers" become beneficiaries when increased pensions and other benefits are taken into account. Since there seem to have been about 5,400,000 people outside the purview of the Inland Revenue in 1949-50, this group cannot absorb the 5,900,000 beneficiaries as completely as Mr Lydall suggests. There are other complications, but it seems to us likely that on balance the number of real losers should be put at 4 million rather than 6 million. These uncertainties do not affect the main point. The proportion of incomes reduced by the budget is not, as the Economic Commission for Europe alleged, a half; it is a minority of, at most, less than a quarter, and more probably of a sixth.—EDITOR.]

More About Sponsored Television

Sir,—On page 730 of your last issue you stated "The motion approving the White Paper was carried . . . with Labour and Liberal solidly against it. . . ."

The voting list recorded in Hansard shows that such Liberals as were present, including the Liberal Chief Whip, voted with the Government. Surely this is in accord, not only with Liberal tradition, but also with the evidence submitted by the Liberal Research Group to the Beveridge Committee, in which they stated: "Liberals are bound to entertain serious objections to the exercise of monopoly in vital instruments of ideas such as broadcasting and television."

I believe it would be wrong to say that any political party was "solid" on this issue, and certainly the Labour party would not have "voted solidly," if the evidence that this party and the Fabians submitted to the Beveridge Committee is representative.

A recent Gallup poll by a national paper showed that 63 per cent advocated some competition to the BBC. It is true that since the poll was taken, those closest to the BBC, ex-governors and members of their General Advisory Council, have fought a most vigorous campaign in the press and the House of Lords. In spite of this, I think a free vote of the House would have produced a result very similar to the Gallup polls. Notwithstanding the occasional inaccuracies in the free press, which for a hundred years has been sponsored by advertisers, the majority of us would fight to uphold it. We feel the moment is ripe to begin applying this same principle to broadcasting.—Yours faithfully,

C. I. ORR-EWING

House of Commons

[We apologise for our mistake about the Liberals. We do not think that Mr Orr-Ewing is justified in assuming that all who oppose monopoly in broadcasting approve of sponsoring.—EDITOR.]

Fly round the world on one ticket by British airlines

Have the world literally "at your feet" for just over £500 — the cost of a special round-the-world concession ticket by British airlines all the way.

Fly eastward, for example, from London to Sydney on the Kangaroo route, then across the Pacific by B.C.P.A., across North America, and finally across the Atlantic to London again by B.O.A.C. Or fly westward — whichever way you go, you enjoy a swift, sure flight and the same high standards of British service, hospitality and flying experience.

Your round-the-world ticket includes liberal stopover privileges which enable you to break your journey where you wish — in a dozen or more countries — for as long as you wish, provided it is completed within 12 months.

Consult your local Travel Agent or any B.O.A.C. or Qantas office.

History TODAY and the Advertiser

HISTORY TODAY, first published in January 1951, is a magazine designed for the intelligent man and woman, planned upon entirely new lines. The basic idea is very simple—that, to understand *today* and forecast *tomorrow*, one must have studied *yesterday*, and that the key to present problems often lies in the remote past.

But readers of HISTORY TODAY are not merely specialists. They are students of the modern world, whose interests extend to every field of human activity—industry, economics, the history of science, besides political thought, art and literature.

As HISTORY TODAY has grown and prospered, more and more advertisers have come to recognise its value as an advertising medium. Among its readers are many of the consumers to whom *your* product will make a strong appeal.

History TODAY

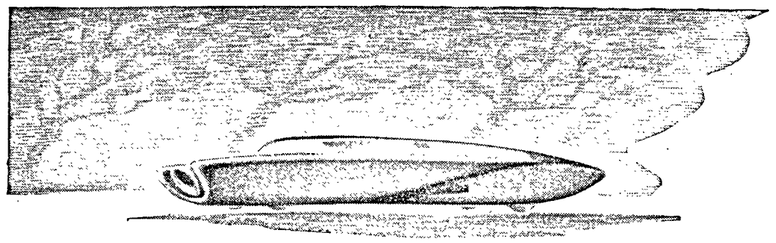
4th GERMAN HANDICRAFT FAIR

MUNICH

JULY 4th—JULY 20th, 1952

The important handicraft fair with international participation

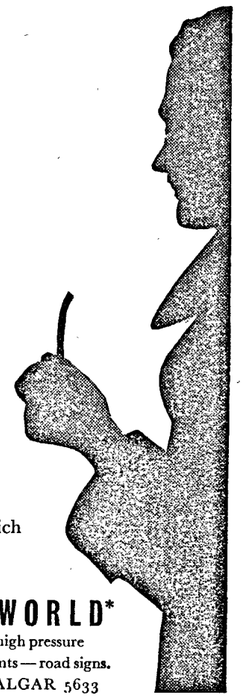
1951: 1150 exhibitors
290,000 visitors



An extensive offer from 600 groups of exhibits.

Fashion saloon — International fashion parades—Model exhibition "The Modern Home."

Permits of entry are distributed free of charge in the German Consulates against presentation of the tickets for admission to the fair. Fare reductions.

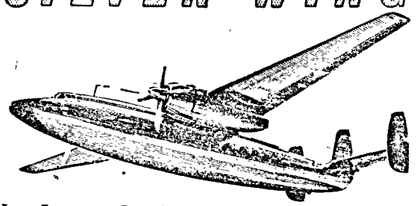


Reduction on air-tickets. Tickets for admission to the fair are available at all Chambers of Commerce, Travel Offices and Air Traffic Companies.

Which year's model?

EVER SINCE 1769 (when a certain French artilleryman fell out of a self-propelled three wheeler) the automobile industry has been planning ahead. What will it offer us in 1962? Gas-turbines seem a probable. Gas-discharge lighting? . . . regenerative braking? . . . stepless transmission? . . . When the next decade's new model rolls off the assembly line, TI technicians will share in the achievement. For then, as now, TI will be ready with many of the parts to make the whole, from the components of the axles and steering columns to the seats of today — or their unheard-of equivalents to come. Ready with the bicycle of 1962, which you might not recognise. Ready with the road signs, which you certainly will.

TI's FIFTY-ONE FACTORIES SERVE THE WORLD*



*Precision tubes — tubular components — wrought aluminium — bicycles — electrical equipment and appliances — high pressure cylinders — mechanical handling — metal sections — bus body skeletons — gland packings — tubular furniture — paints — road signs.

An Olympian Mind

Acton's Political Philosophy. By G. E. Fasnacht. *Hollis and Carter.* 265 pages. 21s.

Essays on Church and State. By Lord Acton. Edited and introduced by Douglas Woodruff. *Hollis and Carter.* 518 pages. 30s.

For those inclined to dismiss nineteenth century Liberal thought with the contemptuous labels of *laisser faire*, progress and middle-class morality, it would be a salutary discipline to read Mill, de Tocqueville and Acton and learn at first hand the force and depth which the greatest Liberal thinkers could command. As we begin to re-discover, one by one, the giants of the Victorian Age, it may be hoped that some day Mill will be read again and assessed at his true value. A definitive edition of de Tocqueville is already beginning to appear in French, and now, in the year which marks the fiftieth anniversary of his death, it looks as if interest in Acton, too, were beginning to revive.

Acton has certain advantages. He was a Catholic, not a Nonconformist; he was never insular, but as much at home with German, French and Italian as with English and American thought (he was born at Naples and died at Tegernsee); he stood apart from the often narrow controversies in which Liberalism spent its force after Gladstone. Acknowledged by contemporaries as the most widely-read and learned man of his time, he failed to accomplish the task to which he dedicated himself, to write the history of freedom for which he prepared himself for forty years; yet in the essays and lectures which he threw off incidentally he left behind the indelible impression of an Olympian mind, as subtle as it was lucid.

A master of history, Acton had read widely and deeply in economics, sociology, political philosophy, ethics, theology and law, not to mention the literature of half a dozen countries. Yet the weight of his scholarship never robbed his writing of a sense of unflagging interest in whatever he touched on. Nor did it blur the sharpness of the moral principles to which he held or that passion for liberty, conscience and toleration which he defended against the tyranny of absolutism whether exercised by Church or State. Acton the doctrinaire could quote with approval the sentence of Burke: "The principles of true politics are those of morality enlarged; and I neither now do, nor ever will admit of any other." But Acton the historian could write to Mary Gladstone: "My life is spent in endless striving to make out the inner point of view, the secret of fascination for powerful minds of systems of religion and philosophy, and politics, the offspring of the others, and one finds that the deepest historians know how to display their origins and their defects, but do not know how to think or feel as men do who live in the grasp of the various systems." It is in this combination of strict moral principle with catholicity of sympathy and great learning that the attractive quality of Acton lies.

As a guide to Acton's thought, Mr Fasnacht's book is disappointing. He lacks the power of plain statement. Rather than say in half a dozen sentences what was in Acton's mind, he takes refuge in piling quotation on quotation, often to the confusion of the reader. But the book has two virtues. Mr Fasnacht has dug deeply into the mass of unpublished notes Acton left behind, and from these has produced much that is new and interesting. Secondly, by the arrangement of his material, he contrives to bring out facets of Acton's thought, such as his appreciation of economic factors, which have been neglected. Whatever its shortcomings, this is the first attempt to survey the whole range of Acton's ideas and to bring them into some sort of relation to each other.

Mr Woodruff's introduction is much more accomplished. The essays in this volume, some of them reprinted for the first time, come from the first of Acton's two productive periods, the 1860's, when as a young man he tried unsuccessfully to establish an independent Catholic periodical in this country. Mr Woodruff's account of Acton's efforts in this direction, and of his relations with Newman, is full of interest and told with skill. The essays themselves cover a wider variety of topics than is suggested by the title of the volume and include a number of book reviews. It needs to be remembered that this is not the Acton of the great period, the years from 1895 to 1902. But it is a fitting introduction to what promises to be a complete edition of Acton's writings, including one or more volumes of extracts from the Cambridge MSS and from his letters, together with reprints of the lectures and essays already published. It is much to be hoped that the publishers will persist in their enterprise. Only in this way can the fragmentary character of Acton's writing be overcome and a just impression gained of one of the richest minds of Late Victorian England.

Young Fascist

Ciano's Diary, 1937-1938. Translated by Andreas Mayor. *Methuen.* 220 pages. 21s.

The earlier section of Ciano's diary now made available to the English-speaking public portrays a younger, more naïve Fascist than the one the later diaries made familiar. In 1937 he is still very conscious of his startling promotion in June, 1936, to be Foreign Minister at the tender age of 33; he still worships at the shrine of his hero, the Duce, and takes pleasure in his family life with the Duce's daughter and the children. His vanity, which becomes more grotesque in translation than in its original form, glories rather in straight imitation of his Master, an imitation excellently portrayed in the fierce frontispiece to the present publication. In the later volumes Ciano's vanity is expressed, as we know, rather in the prognostications of a critical Dauphin.

Ciano's diaries, as all contemporary historians probably agree, together provide a source-book out of all proportion in its importance to the importance of their author. Here, too, the reader may follow a section of Italian policy in the making. Mr Muggeridge in his introduction suggests that the earlier diary is of particular interest to the British public on account of the abortive Anglo-Italian negotiations which revolved a little absurdly around the Spanish Civil War. The majority of readers in this country may actually find the endless Perth-Ciano interviews rather dull. But the day-to-day film—as it were—of the political life of Mussolini, preposterous as it is, is never for a moment dull. It is dominated, certainly during 1938, by the twin topics of the Axis friendship and the Duce's sudden conversion to a policy of persecution of the hitherto happily assimilated Italian Jews. A small but interesting point is to be found in Ciano's entry on October 6, 1938, where he records the anti-Semitic attitude only of the Minister of Education, Bottai. Since the latter was never pro-German nor anti-intellectual, this can only have been to curry favour with his chief. Five years later he was prominent in support of the Grandi motion at the meeting of the Fascist Grand Council which led to Mussolini's

fall. He has now been able to rehabilitate himself, and today he is one of the old leaders back in Italy who may, it is thought, be guiding the neo-Fascist movement.

While Mr Mayor's translation is commendable, it is a pity that he should have repeated certain slips in the original Italian edition. As for the Italian misprint of Schnante, why improve upon it by turning Vicco Karl Alexander von Bülow-Schwante into the improbable Dankward Christian von Bülow-Schnante ?

Prophetic Admiral

Portrait of An Admiral. By A. J. Marder. *Jonathan Cape.* 407 pages. 30s.

Shortly before Admiral Sir Herbert Richmond's death in 1946 Professor Marder obtained permission to study the private diaries which the Admiral had kept while at sea and in the Admiralty between 1909 and 1920. It is these diaries, and the papers which Richmond kept with them, that form the greater part of the present volume. The actual biography is brief (one chapter), and one must therefore presume that Professor Marder intends the portrait of the Admiral to be the self-portrait drawn in the diaries.

That Richmond rose to high positions in two spheres—naval and academic—is good enough reason why a full study of his life and work should be made and, when that times comes, Professor Marder's book should prove very valuable. But it may be doubted whether, at any rate on the evidence produced in this volume, the conclusion that Richmond was "perhaps the ablest officer of this generation" can be justified. Nor is acceptance of the diaries as a self-portrait entirely fair to Richmond. For he used them as a safety-valve for the anger and frustration which he felt over the many rebuffs he received. And it must be admitted that the safety-valve was very lightly loaded. Few indeed are the naval officers or politicians who escape his wrath. "Winston [is] very, very ignorant"; for Lord Fisher's departure from the Admiralty "the Navy . . . cannot but be thankful"; Asquith "looks a poor creature"; and as for the Admirals (especially those who were unlucky enough to be serving in the Admiralty) they are all, or nearly all, nincompoops, totally lethargic, incapable of coherent thought, or intellectually corrupt. Jellicoe himself, whether commanding the Grand Fleet or First Sea Lord, is anathema, and most of our naval ills stemmed from his "defensive outlook" and his "ignorance of war." It must, however, be admitted that the few men whom Richmond admired and approved were, each in their own line, outstanding. Hankey was his closest confidant; he corresponded constantly with J. S. Corbett the historian; Admiral Hall (Director of Intelligence) is justly acclaimed while Beatty himself can do or think no wrong.

If the diaries be accepted as a true self-portrait they show a very clear thinker with great powers of exposition, an officer deeply imbued with the history of past wars and of immense professional competence. But they also reveal a sensitive, hypercritical man, extremely stubborn in his views and arguments and unable to accept even honest disagreement.

Richmond was by no means always right. For instance, he was notably wrong over Von Spee's probable movements after Coronel. Yet it seems true to say that if he had been allowed his way there would have been no Coronel, that the failure at the Dardanelles might have been turned into a decisive success—there or in Syria, which was his favourite offensive project. And, if he goes too far in concluding that we won the 1914-18 war only by superior weight of numbers, it does now seem that on many issues of principle time and history have justified him. His mind covered every possible activity in naval warfare. He urged offensive rather than defensive minelaying, the employment of destroyers to attack the enemy rather than to protect our own fleet, the offensive disposition of submarines, that convoy and escort were the proper answer to the submarine, and so on. Nearly a quarter of a century before Taranto he was trying to get torpedo planes used to attack the enemy fleet in harbour, and he wanted to use lighters to land tanks in Syria long before the tank landing craft had been thought of.

The tragedy, as Professor Marder points out, is that all this ability, clear thinking and almost prophetic foresight were so little used. But surely the Admiralty was not, as his biographer implies, solely to blame for this. Richmond went about his work in a way calculated to frustrate his purposes and to make enemies for himself. One cannot but admire Richmond's intellectual honesty while feeling that, with more moderation, he could have accomplished far more of his objects.

As far as his naval career goes it is as a thinker and as a teacher of the principles of maritime war that he will be remembered. Methods that are regarded as commonplace in the Naval Staff today, the outlook in the Staff Colleges and the Imperial Defence College and the teaching given to young officers in the Tactical School all owe something to him.

However much of a philosopher Richmond was in his historical studies and in his writing and research work he was, as a naval officer, ambitious and it was the failure of his ambitions that brought him distressing, even undignified, disillusionment and bitterness. It is therefore good to know that, in the autumn of his life, he found fulfilment and a just appreciation of his work and stature in the University of Cambridge.

Political Sociology

Social Order and the Risks of War. By Hans Speier. *George W. Stewart.* New York. 497 pages. $4.75.

The present volume, which is subtitled "papers in political sociology," is made up of a collection of separate papers written over a period of about twenty years on a variety of topics, but linked in some sense by the author's particular interest in the study of war as a social phenomenon. Mr Speier, who came to the United States from Germany in 1933, has held a number of academic and governmental posts in sociology and propaganda, and is obviously a person with wide general knowledge both of his subject and of related matters of contemporary politics.

If his book is none the less unexciting for most of its length, it is perhaps because even the best sociologist is limited by his approach; so much sociology is simply a rather elaborate way of expressing the obvious that it makes no impact on the mind even when the observation is in fact a fresh one. This is a pity for where the subject is important, and one where Mr Speier is moved to a direct statement of his own point of view, he shows himself to possess a fairly penetrating political intellect. This is particularly well shown in a previously unpublished essay written in 1947 on the United States "re-education" policy in Germany. He shows a clear understanding of the difficulties inherent in the very idea of "re-education," though his alternative policy of an active encouragement to "the non-Communist left" may have represented only another form of Utopianism.

An essay on "The Future of German Nationalism" published in December, 1947, is even more striking since it shows an appreciation rare indeed then, and still too rare now, of the real contemporary menace of reviving German nationalism and even of reviving Nazidom. At the present time Mr Speier's warning is as timely as it could be.

BIS 1930-50

The First Twenty Years of the Bank for International Settlements. By Giuseppe Ugo Papi. *Bancaria.* Rome. 270 pages. 1500 lire.

The chief merit of this book lies in the very extensive bibliography arranged in chronological order and occupying more than two-fifths of its space. It was supplied by the Bank of International Settlements itself, and it speaks well for the institution that many highly critical books and articles are included.

The text proper consists of two parts. The first ninety pages provide a summary of the monetary history between the Treaty of Versailles and the Young Plan. The section dealing with the Bank for International Settlements occupies less than sixty pages, and even that section contains much general material regarding the gold exchange standard, the functions of a central bank and so on. There is thus very little space left for a factual account of the history of the bank itself. This is a pity for, even though much has been written on the subject, it would be useful to have a detailed reference work viewing the bank from a historical perspective.

As far as it goes Professor Papi's account serves a useful purpose. It would have been much more useful, however, if he had dealt in the text with the immense material enumerated in the bibliography, instead of using up most

AGRICULTURE— and the Nation's Food

Ministers of the Crown, economists and indeed all who understand Britain's needs to-day declare that home food production has become supremely important. We are an industrial island of 50 million people accustomed to rely on imports for half our food. We have to grow more at home.

British agriculture has increased its output by 44 per cent. compared with before the war and now this has to be raised to 60 per cent. The success of this campaign depends on everyone engaged in agriculture, directly and indirectly, seizing every opportunity to increase output at economical cost.

The Times has always devoted special attention to British agriculture and the problems of the land. Now *The Times Agriculture Review* is to be established as a quarterly publication presenting a reliable survey of progressive farming practice and the measures that have to be taken by Parliament and the agricultural industry to provide more ample supplies of food for the British people.

The Times Agriculture Review will be published on the occasion of the Royal Show, the Dairy Show, the Smithfield Show, and at Lady Day. It will regularly include illustrated articles on :—

New Machines for the Farm ★ Estate Maintenance ★ Marketing Pedigree Stock ★ Government Policy ★ Farming Methods Oversea New Publications

The first issue will be published on June 24, a week before the opening of the Royal Show at Newton Abbot.

some metaphors, thoroughly mixed . . .

With a flourish of trumpets the Imperial "Good Companion" has emerged from the chrysalis and taken on a new lease of life. It will be instantly seen by those with their ears to the ground that the Imperial people have surpassed themselves by taking a firm stand and leaving the others far behind. They must have been working like beavers with their noses to the grindstone to have produced such a beautifully efficient portable, for the "Good Companion" is all that a portable should be even if this telling-about-it is all that it shouldn't be. Which only goes to show what an overdose of enthusiasm will do.

How to save on traffic-control costs

The maintenance of effective all-day control of traffic at a single intersection can engage the full time services of two police officers at a total cost of £1,200 every *year!* An Electro-matic installation at an initial cost of £1,750 approx. with an additional £175 a year for running and maintenance can, in five years, effect a saving of no less than £3,375 or £675 a year and a further economy of £1,025 each subsequent year. An examination of these figures in relation to a number of intersections will reveal a potentiality for a most impressive saving in traffic control costs. Throughout the country, Electro-matic installations have been proved to be the most economical system of efficient, safe and reliable traffic control. We are at your service — without obligation — for discussion and advice regarding *your* traffic control problem.

of his space for a recapitulation of inter-war monetary history, a subject which is already more than adequately covered.

Professor Papi seems to be somewhat out of date in his views on co-operation among central banks. His brief section dealing with the subject might have been written twenty years ago, at a time when central banks were in a position to determine monetary policy. Meanwhile Treasuries have gained control, and co-operation among central banks is now necessarily confined largely to the technical sphere. In international financial negotiations the role of central bank governors and officials is now to advise their respective finance ministers.

Another defect of the book is that it contains no reference to the change of the situation and prospects of the bank resulting from the Bretton Woods Plan. The name of the International Monetary Fund is not even mentioned. Yet a book covering international monetary co-operation without reference to that institution is like Hamlet without the Prince—or at any rate the gravedigger. The IMF has assumed most of the functions for which the BIS was created. The author should have devoted more space to making it plain that notwithstanding this the bank has a *raison d'être* within a more limited sphere.

Semantics in Language

Language in Thought and Action. By S. I. Hayakawa. *Allen and Unwin.* 307 pages. 18s.

Semantics, the science of meaning, has been formed from the adjective semantic, itself from the French *sémantique*, coined in 1897 by Michel Bréal as a complementary to *phonétique*. One of the classics of the subject is "The Meaning of Meaning" by C. K. Ogden and I. A. Richards.

Professor Hayakawa of America owes, as he fully acknowledges, much to Alfred Korzybski, whose extremely important "Science and Sanity: An Introduction to Non-Aristotelian Systems and General Semantics" (1933), has originated such popularisations as Stuart Chase's "The Tyranny of Words." But Professor Hayakawa is a disciple, not a populariser, of Korzybski. He owes little to the psychologists and psychiatrists of the Freud dynasty; something to the linguistic methods of Yale (Sapir and Bloomfield); and something again to the cultural anthropologists (notably Ruth Benedict and Margaret Mead).

Professor Hayakawa conducts his argument at an agreeably high level of intelligence: and, even while they are violently disagreeing with him, the majority of intelligent readers will enjoy this alert and lively book. The sub-title on the jacket fairly summarises both the attitude of the author and the contents: "How men use words and words use men." What Professor Hayakawa, his immediate precursors and his contemporaries all forget is that this seemingly modern, even modernistic, outlook upon language merely re-dresses, not (as they fondly suppose) redresses, the implications of an attitude almost two hundred years old implicit in the phrase "the magic of poetry" or, more widely, "the magic of words."

The book deals excitingly with the functions of language and, in the second part, with the relations of language to thought. Not all of it makes easy reading; yet none of it is dull.

Oddly enough, Professor Hayakawa says nothing about the most fruitful and fascinating, the most abiding, of the many aspects of semantics: the importance of semantics in the determination of word-origins and word-history, inextricably interwoven with the rise, development and mutations of ideas or, better, of civilisation. The more general aspects of this branch of knowledge constitute a fundamental part of his theme; etymology he ignores. He evidently ignores it intentionally. For instance, he does not even mention that it is Professor Ernest Weekley who has humanised etymology by giving to semantics their rightful place in that difficult art and science.

Diplomats at Large

Bears in the Caviar. By Charles Thayer. *Michael Joseph.* 288 pages. 15s.

Mirror to Russia. By Marie Noele Kelly. *Country Life.* 248 pages. 21s.

Mr Wodehouse's critical summation of the works of Matthew Arnold—"nowhere to go for a laugh"—would fairly describe all the endless works by travellers from the Soviet Union were it not for such rare and agreeable exceptions as Mr Thayer's hilarious reminiscences of Moscow between the wars. That was before Iron Curtain and cold war, when there was enough ideological antagonism to give spice to party conversations—but when party conversations with Russians were possible. And not only conversations: a young American Third Secretary in those days could find himself appointed polo instructor to the Red Army (which post, for all he knows, Mr Thayer still holds), or dancing with Lepeschinskaya, or negotiating with the Moscow Zoo or the fabulous Durov family to invite performing seals to an American Embassy party.

Those were the spacious days, for that matter, when an American diplomat in Berlin could pretend (as Mr Thayer did) that he was a Communist, just for fun, without having to answer to Senator McCarthy, or report to the Federal Bureau of Investigation. Like so many who have been to the Soviet Union, Mr Thayer once found himself arrested; but he must be alone in having bewildered his jailers into providing him with "an excellent omelette and an even better bottle of wine"—the present reviewer could never find an eatable omelette even when at liberty and, when arrested, could not command so much as a taxi-ride back to his hotel. But that is a measure of Mr Thayer's personality, which is expansive; his style is beamingly cheerful to match — and the proof-readers have treated his spelling cruelly.

Lady Kelly, an ambassador's wife, could hardly permit herself such frolics as Mr Thayer's, and times, in any case, have changed. Even so, she travelled, until less than a year ago, far more widely in the Soviet Union than any of her western diplomatic contemporaries, and she has brought back a most stylishly written, most handsomely illustrated, account of Russian architecture, both of the Muscovite-Byzantine of the ancient churches and of the classic and the baroque of Petersburg and the great country houses.

Primarily a book about pre-revolutionary art and architecture, this is also enlightening and unprejudiced about Soviet life to-day—the plentiful food and the queues; the drabness and the determination; the splendour of the ballet and the limp propaganda of the theatre—and evocative in its description of the toneless spaciousness of the steppes.

Text and Reference Books

The Concise Oxford Dictionary. 4th Edition. Revised by E. McIntosh. *Oxford University Press.* 1,540 pages. 15s.

The fourth edition of this dictionary has been completely revised and reset and additions have been made to bring it up to date. The last revision was in 1934, although revised addenda were published in 1944.

Guide to League of Nations Publications. By Hans Aufricht. *Columbia University Press.* (London: *Geoffrey Cumberlege.*) 682 pages. 63s.

For nearly thirty years "League publications" have been known to be a valuable source of information to students of world history and economics. But to know which publication, or how many, would provide the items required has not been easy. This bibliography will help to shorten and enrich the work of many.

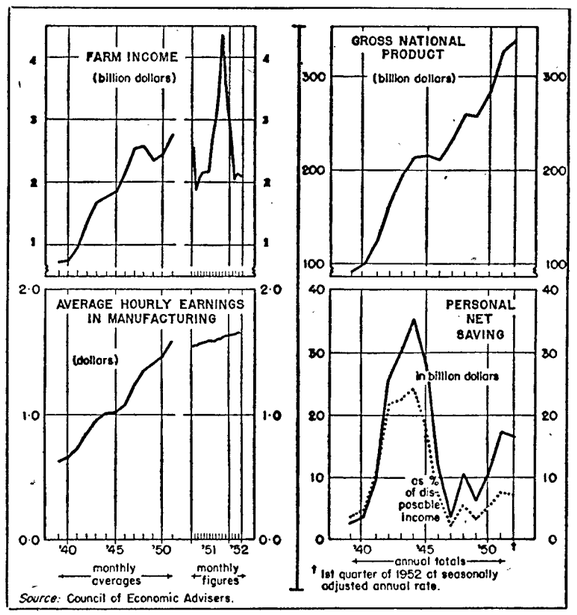
It deals with the documents published only by the League of Nations and not with the affiliated organisations, such as the International Labour Office. The documents are catalogued by principal organs and main activities. Since these documents cover the entire life of the League of Nations the Guide provides a summarised history of the first attempt at large-scale international co-operation. It is perhaps not surprising to find how similar are the early events in the life of the League of Nations and the United Nations Organisation.

The Guide includes all types of documents, not only those put on sale and included in the sales catalogue. It is arranged by subject so that all important information is listed in one place whichever of the various agencies (Assembly, Council, Secretariat, committee or special conference) published it.

Some of the major documents relating to the League of Nations are reprinted, and the Guide itself is well indexed.

Official Year Book of Southern Rhodesia, 1952. *Central African Statistical Office.* 792 pages and map. 10s.

This is the fourth issue of the official Year Book of Southern Rhodesia and it presents statistics mainly up to 1950. The first issue was in 1924, the second in 1930 and the third in 1932. Some statistical reference books have been published in the intervening period but the figures from previous year books have now been brought up to date to provide a comprehensive reference book. It also contains articles on the major aspects of the country's history and economic life.



AMERICAN SURVEY

Another Republican Slump?

Washington, D.C.

ONE of the evils which General Eisenhower, in his speech at Abilene, suggested could "ultimately throttle free government" and which seemed to him to be a dangerous lapse from the American way of life was inflation—inflation which "can not only destroy our savings, but our jobs." It is possible to quarrel with the General's assumption that in the past the "American way of life" has been deflationary; the dollar, like every other currency, has declined in value, over the years, ever since it was invented. But it is not practical politics to disagree with his attack on inflation. Inflation is something which everyone finds it necessary publicly to deplore, however much most people may privately enjoy its benefits.

But it is possible to question whether it is true that inflation is the most serious problem now facing the United States—and it was not until much later that the General appeared to dethrone it in favour of "peace and security." It is possible to wonder, too, whether "down with inflation" is a promising slogan for the presidential campaign, should the General be called upon to wage one, and whether inflation will be the economic danger which calls for immediate action when the next President has been inaugurated. A buying spree of the kind which caused such trouble in the months following the outbreak of the Korean war could, it is admitted, at any moment upset the nice balance which has been kept for so long, but there is no sign of one starting yet. If it is delayed another few months it may be welcome when, and if, it comes.

That General Eisenhower should show such genuine anxiety on this subject was proof of what many people had been saying before his return: that he knew more about the economies of a dozen European countries than about that of his own. The United States may not be immune to the kind of inflation which has destroyed the savings of nearly all Europeans but it is complacent about the danger because it has no experience of it. It treats threats to the value of its currency today much as it treated threats of invasion in 1914.

The real value of money may be no more than half what it was in 1939, but the farmer is getting three times what he received for his products in that year, the wage-earner in industry is getting about two and a half times the hourly wage he was then paid as well as being more sure of employment, and the gross national product has risen from just over $91 billion to nearly $340 billion. Everybody is better off, in real terms, than he was twelve years ago, except the *rentier*, those living on fixed salaries and those paid by the federal government (of whom, incidentially, General Eisenhower has always been one). This prosperity has bred a confidence in the currency which it may be hard for economists to justify, but which is expressed in the rate of personal savings. A people who in 1939 were saving less than $3 billion a year, then 3.8 per cent of their income, after taxes have in the last twelve months saved nearly $20 billion—or almost 9 per cent of their disposable income.

Even those who know what inflation can mean often succumb to the charms and convenience of a mild dose of it. There are few American trade unions who would know what to do if inflation stopped. Nothing is more satisfactory to a labour leader than to be able to emerge from his annual negotiations for a new contract with an increase in actual money wages regardless of whether there has been any improvement in real wages. All long-term agreements are predicted on a continuation of the present mild inflation. Mr Walter Reuther would have a hard time explaining what had happened if his agreement with the automobile companies, which is based on the cost of living, ever called for a substantial reduction in pay. The whole of organised labour would prefer the risk of too much inflation to that of any deflation.

Whoever else may or may not understand this, Mr Truman does. He is taking every precaution to ensure that the inflation continues through the election period, relying on the fact that there is little danger this year of anything which might temporarily drive the cost of living far out of line with the pattern of wages. A sudden rise in prices after the outbreak of the Korean war cost the Democrats a number of seats in both Houses of Congress in 1950. This accident encouraged the Republicans to believe that there was a popular revulsion against inflation when there was only a popular revulsion against high prices because wages had not had time to catch up. It is interesting to watch the opposition using inflation as an election issue while the Administration takes such care to see that it continues.

The recent relaxations of the restrictions on hire purchase and down payments for houses show which way the political wind is blowing. In economic terms, the latter certainly was not justified. To an extent the Federal Reserve Board, in reaching its decision to ease credit for houses, must have been consciously retreating before the pressure exerted by Congress, which seldom does more than reflect the influence of those most immediately interested. In this case it was the real estate lobby. The board's action cannot have been welcomed in the Treasury, which has the problem of trying to finance a $10 billion deficit, has failed dismally to sell some 2¾ per cent bonds, and does not want the task made any harder than it is already. But the *Journal of Commerce* is probably right in seeing, in all the measures taken recently, a drive to instil another artificial uplift into the civilian sector of the economy and in concluding that the Administration obviously remains committed to the use of inflationary measures whenever a downturn in business is threatened.

★

There have, indeed, been signs of a slight deflationary trend in the last two months. It is a trend which would do no harm if continued for a while and which any Administration could view with tranquillity if there were no election in November. After five years in which 5,293,000 houses have been started the country could well afford to stop building at such a rate. The various regulations reduced the number started in 1951 by 300,000 below the total of 1950 and they were becoming increasingly effective. Their relaxation will mean that new private building, which might have proved a useful cushion for the economy when the expansion of industrial plants needed for the rearmament programme is over, is going to be encouraged immediately to keep production running at its present exalted rate until after the election.

Almost all the controls on inflation have been gutted already, but nobody is prepared to predict with accuracy how long this will suffice. It may be some months before any significant deflationary signs are visible, as the slack will for a time be taken up by direct defence expenditure, which rose between February and May from $3 to $4.2 billion a month. There is, however, little doubt that, by the spring, there will be no need for anyone to worry about the evil effects of inflation. It will be the after-effects which must be dealt with. If General Eisenhower arrives in the White House at that moment intent on using deflationary machinery—and he would have the delighted support of most of his party in Congress in any attempt to take the surplus wind out of the economy—he may easily find that he has turned a healthy disinflation into a slump. And it would be fatal for the Republican party to be associated once more with anything like a slump. Should the country ever feel that the Republicans had undone the work of twenty years in six months it would be the end of them.

New York's Favourites

[FROM A CORRESPONDENT IN NEW YORK]

In the State of New York the novel thing about this year's election is that Governor Dewey is not running for the Presidency. The emptiness which this leaves is not filled by the fact that General Eisenhower and Mr Averell Harriman, respectively seeking the Republican and the Democratic nominations, are by residence New Yorkers. The state does not feel that either of them is one of its own, while Mr Dewey is so bound into the daily life of New York politics that nobody thinks of him other than as a New Yorker. He may have been born and bred in Michigan, but he made his fame in New York, and he is its favourite candidate. Even New Yorkers who do not vote for him like to see him run. He has been Governor since 1942; he was willing to run for the Presidency in 1940, he practised running in 1944, he nearly made it in 1948. That he should be moving only behind the scenes in 1952 makes his fellow citizens feel as though the political campaign had an important tooth out. They keep feeling for him with the tip of the tongue, and find only a smiling vacancy. It does not hurt, but it is extraordinarily empty.

This is not to say that the Governor is taking no part in the campaign. He has declared himself for General Eisenhower, and certain members of the "brains trust" which surrounded him in 1948 are working for the General. But the spectacle of Mr Dewey championing someone other than himself is rare and curious. He does not take to it comfortably. There are rumours that he would like his self-sacrifice to be rewarded with the post of Secretary of State. But here he would have the active competition of Mr John Foster Dulles, who thought he was going to be Mr Dewey's Secretary of State in 1948 and who is now said to be the choice for that post of both Senator Taft and General Eisenhower. There are, of course, other cabinet posts, and notably that of Attorney-General, which might be the logical place for a man whose first fame was made sweeping gangsters out of New York.

★

All but one of the 96 Republican delegates from New York, the largest state delegation to the nominating convention, are claimed to be for the General and are expected to cleave to him as long as hope lasts. The Democratic delegates, on the other hand, quite properly regard Mr Harriman's candidacy as that of a "favourite son," to be supported in the early days of the convention and dropped without rancour if, as seems likely, he fails to attract wide attention. If either of these state residents should be nominated for the presidency, state patriotism will come into play. Thus far it appears to be sitting on the sidelines.

In New York City itself small knots of enthusiasts are clustered like raisins in a large cake of indifference. With notable exceptions, the city is Republican in class and Democratic in mass, while the country districts are Republican nearly all the way through. The Republican organisation follows Governor Dewey's lead in supporting General Eisenhower, but his most ardent followers are the Republican insurgents who worked for Wendell Willkie in 1940. Around them surge impassioned independents who proclaim:

> If the Republicans are so dumb as to nominate Taft, I'll vote for any Democrat.

At the same time Mr Taft has heated outposts in the financial district where his followers hope that the party regulars will rout the surging independents and speak with caustic distrust of those "Dewey amateurs" advising General Eisenhower.

The division in the Republican ranks has lifted the spirits

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

of the Democrats, at a low ebb during most of the spring. The state party organisation has begun a grass roots campaign and the Democratic women have sent out a "whistle-stop caravan" of motor cars to hold regional meetings in urban and rural centres. The purpose is to strengthen what, in these long years of a Republican regime in the state, has come to be a somewhat limp Democatic organisation.

The task in the state at large is not made easier by the fact that Democrats in New York City are traditionally linked with the underworld through Tammany Hall. That most famous of Democratic clubhouses is only a shadow of what it used to be in the corrupt nineteenth-century days of its glory. The glory departed with the power as voters moved from the slums to better housing in the suburbs, and political leaders in outlying districts arose to challenge the entrenched chieftains. And the postwar scandals surrounding Mayor O'Dwyer have spread a green scum over claims that graft has been cleared out of the Hall.

*

Meanwhile the Irish leadership of the Democratic party in New York has been challenged by the Italians. For a long time it was said that an Irishman would always vote for an Irishman, while the other national groups were less dependable and therefore less powerful. Until Fiorello La Guardia was elected in 1934 the long list of New York mayors contained English, Dutch and Irish names, but no Italian. He was the reform candidate of many groups and, having been born in Oklahoma, was commonly considered an Italian only by accident. Only a few observers noted that he was, through the eleven years of his regime, building a political machine as potentially powerful as the Democratic machine which he scourged with such warmth. When he left the Mayor's chair an apparently reformed Tammany came back to power with familiar Irish names in the lead. But La Guardia had given the Italians a zest for power, and shown them how to get it. In 1952 the head of Tammany Hall is a shrewd Italian, Mr Carmine de Sapio, the most powerful political figure behind the scenes is an Italian newspaper owner, Mr Generoso Pope, and the Mayor himself is Mr Vincent Impellitteri.

The Italian revolt has been long in coming, and its effects have not yet been felt. Italians say somewhat wryly that

> the Irish think themselves Americans the moment they hit the dock, but an Italian can be here for generations and everyone still treats him like a wop.

This sense of being a perpetual immigrant on whom older residents look down is perhaps sharper than the facts warrant, but it can be usefully harnessed to political ambitions. No one yet knows how far these ambitions may go. It is rumoured that Mr Impellitteri would like to be the next Governor of New York State. He keeps very close to the powerful Irish Roman Catholic hierarchy, and thus far has had their support. Little of this reaches the attention of the general public, but it does have an effect on the political destinies of candidates for office.

If the competition between Irish and Italians reaches the point where it acts as an important divisive factor within the Roman Catholic Church itself, there will be new political alignments in New York City, and more signs of a growing Italian influence than the road rollers of the Sicilian Paving Company or the dark beauties arriving for the Italian Trade Fair. This influence has not yet had an open impact on the national political scene. But if General Eisenhower and Mr Harriman should get the presidential nominations they are seeking their fate in the vital State of New York in November may depend in part on what is thought of them in Italy.

American Notes

Ike Speaks from the Heart

The political maxim—"As Maine goes, so goes the nation"—has long ceased to have any general significance, for nowadays Maine always goes Republican. But it is to be hoped that it still has some significance for that party, for this week, in choosing their candidates for the coming Senatorial election, the Republicans of Maine rejected Senator Brewster, the isolationist incumbent and a Taft man, in favour of the Governor, Mr Payne, a strong supporter of General Eisenhower. But the General will need a far bigger surge of popular enthusiasm than this to carry him over the party machine, which is saving a presidential nomination for Senator Taft by its control of the convention arrangements. All the vital committees and chairmanships are in Senator Taft's pocket, and General Eisenhower's men are responsible only for car parking and music, jobs which will give them little influence in the convention hall.

Futile attempts to escape from under this steam roller have left General Eisenhower's managers with little time to spare for grooming their candidate, and a week ago he decided he could do better for himself, at least when it came to talking. Tearing up the speech which had been written for him in Detroit, he announced that in future he would rely not on a ghost but on his heart and would simply try to answer sincerely the questions that were being put to him. There is no doubt that he was wise, for his press conferences had been doing him as much good as his speeches had harm.

But in speaking from the heart, General Eisenhower has been unable to conceal the deficiencies in his head, although so far his frank admissions of ignorance have prevented his lack of knowledge of domestic problems, and his refusal to commit himself on them, from doing much harm. In Detroit, in fact, his ignorance was bliss, for it enabled him to avoid giving a detailed opinion on the Taft-Hartley Labour Act to the automobile workers. He also managed to avoid offending their wealthy employers by riding in one make of car and putting his wife in another.

The receptions the General got in Detroit and Denver, which came up to expectations for the first time since he took off his uniform, showed that his instinct was sounder than his advisers' when it came to courting popularity. But what count at the moment are convention delegates: they cannot be won by instinct and here Senator Taft is still well ahead. Hundreds of them have come to see the General during the past fortnight, but few, if any, seem to have been conquered. They are not all, however, as frank as Governor Fine of Pennsylvania, who is determined to keep his large delegation on the fence until the last moment and is not yet ready even to discuss patronage. He would probably not have been given much chance of discussing it, for General Eisenhower has declared that he will not make any deals to secure the nomination. He knows that his independence will be his great asset if he is allowed to fight the election.

* * *

Congress on Controls

The repulse of Republican attempts to throw off all price controls, on the ground that inflation is now in retreat, shows that Congress dare not take the responsibility, in election year, of disarming the Administration. But how much it will blunt the anti-inflationary weapons contained in the Defence Production Bill will not be known until the Senate and House reconcile their differences next week. The best the Administration can hope for is that the Senate measure, passed last week, will prevail; it makes few changes. The Bill drawn up by the House Banking Committee is much less acceptable, and the worst may be yet to come in the lower chamber. A number of weakening amendments are awaiting their chance on the floor. In one respect, and one only, the Bill the House is debating is to be preferred.

What controls it spares are given a year's lease of life. The Senate would extend authority over wages and prices only until next February, a provision which would force the new Congress to make up its mind on their future almost before it has time to organise itself.

Members of the House, all up for re-election this year, are prepared to go further than the Senate to meet the demand of business for relief. Businessmen, under the House Bill, would be exempted from reporting to the price authorities if their products were selling at 93 per cent or less of their ceilings. Controls over consumer credit and housing loans would be discarded despite the Administration's efforts to show that it can be trusted to use them sparingly. Unlike the Senate, the House committee would make only a token concession on the notorious limitation on the imports of fats, oils, and dairy products, which has so injured foreign cheese producers.

Fears that the House, when it debates the Bill, might complete Senator Ferguson's work of blowing up the International Materials Conference are much less now that five Senators, who did not realise what they were doing a fortnight ago, have seen the light and helped to adopt the Fulbright amendment, which specifically authorises domestic and international allocation of scarce materials. But the House may wish to go further than the Senate in punishing the wage board for its excessive generosity to the steelworkers. The Senate, in the end, by a single vote, that of Vice-President Barkley (a presidential aspirant who knows better than to antagonise the trade unions), decided to retain the present representation of labour, industry and the public on the board, though it is stripped of authority over non-economic matters and its members would have to secure Senate confirmation. Finally, the House, which like the Senate has stoutly refused the President seizure powers to deal with the steel strike, is expected to follow the Senate's lead and request him to use the Taft-Hartley Act instead. This is probably the signal the President is waiting for before seeking a court injunction against the strikers. He cannot wait much longer. The half-hearted attempt to persuade the industry and the union to produce a limited amount of steel for defence bristles with difficulties, and supplies, especially of the steels needed for arms, are running low.

* * *

Liners at Cut Rates

The passenger ship *United States*, which is expected to prove the world's fastest liner, seems almost certain to be turned over to the United States Lines this week, however loudly Mr Lindsay Warren, the Comptroller General and Congressional watchdog over executive spending, may bark at what he considers daylight robbery. The ship is due to sail on its maiden voyage on July 3rd with 2,000 passengers. The contract with the shipping company was made in 1949 by the now defunct Maritime Commission and provides that, of the $70 million cost, the line should pay only $28 million. The government was to shoulder the rest, $24 million on account of special defence features, and the balance as a construction subsidy.

In Mr Warren's view, the ship subsidy law was twisted scandalously to permit the government to make up the difference between what the line would pay and the cost of building the ship in the United States. Its speed, for example—which is an official secret, but is certainly in excess of 34 knots an hour, and believed to be ample to enable it to capture the Atlantic blue riband on its first return voyage—is rated as a defence feature, but Mr Warren is certain the shipping company would have insisted on it anyway. Quite apart from the defence subsidy, the Comptroller estimates that the construction aid is $10 million bigger than it should have been. Mr Warren's complaints, which go back three years, have been vigorously supported by the House Committee on Executive Expenditures, and they may be aired in court.

The Secretary of Commerce, Mr Sawyer, insists, however, that a binding contract was entered into; this is, perhaps, why the Maritime Board has made no effort to revise the terms as it has those under which the *Independence* and the *Constitution* were to be sold to American Export Lines. It is possible, moreover, to sympathise with the board; nothing it does gives universal satisfaction. Last February, in deference to criticism, it cut $11 million from the subsidy granted American Export Lines. The company is now refusing to accept the ships on these terms, and the board is being urged by the House Merchant Marine subcommittee to reconsider—something it is quite willing to do.

The industry attaches great importance to the passage of the long-range shipping Bill passed by the Senate and now before the House. This makes a number of concessions to encourage private owners to replace and modernise their vessels in order to avoid the merchant marine, which is now largely war-built, all becoming obsolete at approximately the same time. Clearly it will be difficult to persuade the industry to order new ships if the amount of the construction subsidy is to be the subject of a continuous tug-of-war among Congressional committees, the Comptroller General, and the Department of Commerce. But the room for dispute would be smaller and the swings less wild if the shipping industry, and its trade unions, were more modest in their demands and less prone to high-pressure politics.

hardly reject, a new "GI Bill of Rights" which assures the new veterans, whether they have seen active service or not, of most of the educational and readjustment benefits enjoyed by their elder brothers. At the same time, it is hoped to avoid much of the red tape and many of the mistakes of the original, much larger programme. In 1946, when millions of men came flooding out of the services, schools were invented overnight to take advantage of the government's offer to pay fees up to a maximum of $500 a year. Established institutions sometimes raised their charges to this level; others charged for services they never rendered. GI's themselves abused the unemployment compensation provided; many joined the "52-20 club," that is, chose to accept the offered $20 a week for a year rather than go either to work or to college.

Under the new Bill no such free rides are provided, and those who wish to take courses in bar-tending, swimming, and personality development will have to do so at their own expense. The great change, however, is that instead of the government paying the fees at the college of each veteran's choice, the ex-serviceman himself would be given a monthly sum—$110 in the case of those without dependants—to cover both his living and schooling costs. The GI himself, it is argued, will be much quicker to detect fraud, and much more interested in protecting his own nest-egg, than any remote government department. Administration should be greatly simplified, both for the colleges and for Washington.

All this may be true, but the privately supported colleges, many of which would have gone aground financially but for government cheques after the war, fear it means they will be left stranded. GIs, they suspect, will flock to the tax-supported institutions of the states and cities, which charge little or no tuition, and refuse to pay the $500 or $600 a year which many private colleges are compelled to demand. This point may receive the hearing in the Senate which it was denied in the House. Dr McGrath, the Federal Commissioner of Education, who doubts that the private colleges will suffer, has pointed out that

> the purpose of this Bill is to aid veterans in obtaining education, and not to provide financial assistance to institutions of higher education.

The Bill certainly will benefit the private colleges to some extent. But its effect on them can hardly be dismissed so cavalierly. For some years, perhaps for a very long time, military service will be required of all young men and thus most of them will obtain their education at the government's expense. The programme is smaller, but ultimately it may be more revolutionary than the wartime one which expired last year.

* * *

The Atom under Water

Momentous as it will be in naval warfare, the US submarine *Nautilus* will have as much significance for peacetime purposes when it enters into service in 1954, as it is confidently expected to do. For it is to be run by atomic energy, and will provide a practical demonstration of a controllable atomic power plant which could be used by industry. This plant is already being built by the Westinghouse Corporation at the Atomic Energy Commission's testing station at Arco, Idaho. There is little doubt that, with the knowledge thus gained, the company will in due course be able to manufacture an atomic power plant that can produce energy at an economic price; at the moment conventional sources of energy are still much cheaper. The submarine engine is understood to be a fairly low-temperature project in which heat from a few pounds of uranium serves as the source of power. The vessel will have a high underwater speed, of over 20 knots, and will be able to travel almost indefinitely without refuelling or coming up for air.

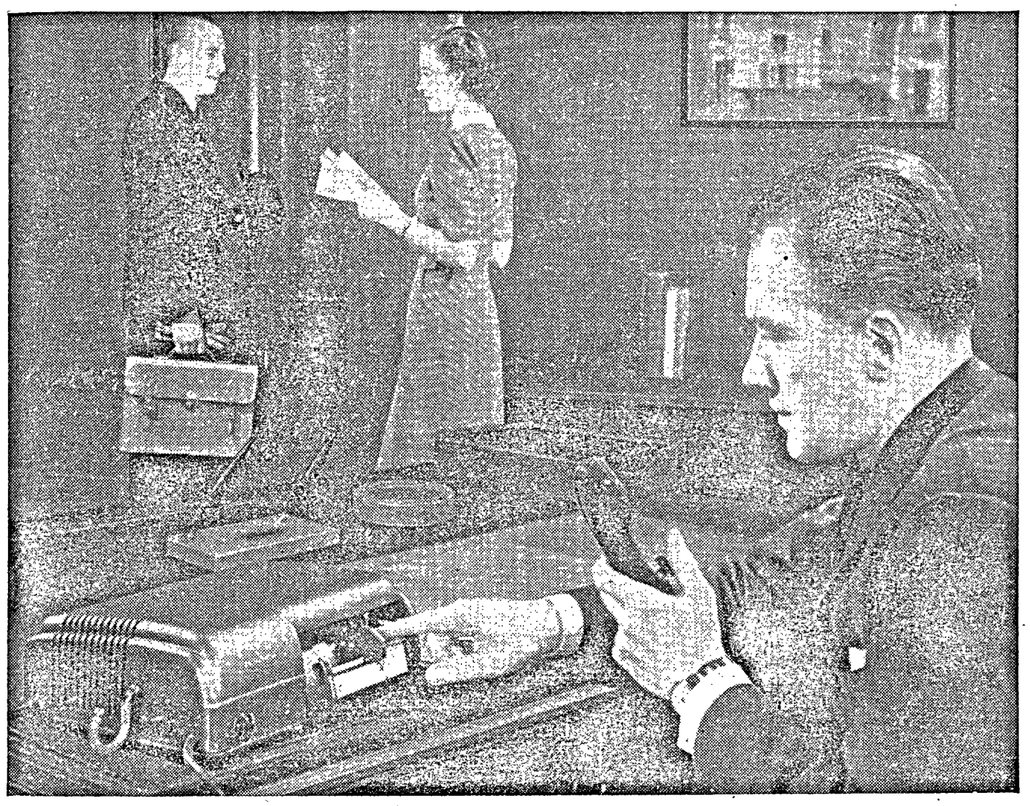
Probably every American agreed with President Truman when he said, in laying the keel of the *Nautilus*, how much he longed for the time when atomic development could be devoted to peaceful ends but how important it was, as long as the Soviet rulers were unwilling to compromise, that most of America's scientific resources and government expenditure should be devoted to defence. A new expansion of the atomic programme, to cost $4.2 billion over five years, has just been put before Congress. Appropriations of $3.3 billion are wanted, but of this only $650 million will actually be spent, in the coming fiscal year. Part of the money is needed for expanding electric power facilities, but about $3 billion is for a new gaseous diffusion plant, probably in the Ohio River Valley, for the extraction of U235 from natural uranium. This is something approaching the concentrated atomic programme which Senator McMahon, of the Congressional Atomic Energy Committee, has long been advocating. In the heat of running for the Democratic presidential nomination, he has just announced that he would like to have hydrogen bombs manufactured in thousands. This is taken as an indication that the scientific problems of making such a bomb must have been mastered; it is already rumoured that one is to be exploded this summer.

It is also being rumoured that, if the Communists stage a mass attack in Korea, it will be met with tactical atomic weapons. This would be the first time they had been used in the field and would presumably be possible only if sufficient quantities of fissionable material were now available to enable them to be made in large numbers, and if the recent tests, in which troops advanced into target areas immediately after atomic explosions, had been successful. Both of these conditions are thought to have been fulfilled.

Shorter Notes

Congress is at last prepared to consider handing one of America's two nationalised industries—synthetic rubber and atomic energy—over to private firms; the legislation extending for another 21 months' government control over synthetic rubber production, due to expire on June 30th, lays the groundwork for such action. The measure contains a clause stating that by next April the President must give Congress a complete plan for disposing of the 28 synthetic rubber plants to private concerns.

*



America's pattern of life is no longer dominated by its farms, for the 1950 census showed that the division of the population into town and country dwellers is about two to one—96 million Americans live in urban areas and 54 million in rural areas. New Jersey leads other states with 86.6 per cent of its residents living in towns.

*

Washington and Boston have both joined the controversy between New York City and Wall Street business firms, with beguiling invitations to the brokers to leave such inhospitable terrain for a friendlier atmosphere. Wall Streeters have threatened to desert New York if the proposed increase in the city tax on gross incomes of financial businesses is passed; they claim the rise, from 2/5 of 1 per cent to 4/5 of 1 per cent, is unduly heavy. They are encouraged in their position by Washington, which says that since most of the rest of national finance is carried on there, the District of Columbia might as well have a complete monopoly on such transactions.

*

The latest wheat forecasts, of conditions on June 1st released by the Agriculture Department, show that a bumper crop of 1.326 billion bushels is expected this year, far above the production goal of 1.15 billion bushels. Most of the harvest, and of the gain over last year's production of 987 million bushels, is in winter wheat, now being harvested; good weather has helped to raise the average yield per acre to 20.8 bushels from the 16.2 bushel yield of 1951.

"Ah yes - that's where I was!"

Place-finding is automatic on the Dictaphone Time-Master dictating machine

IMMEDIATELY a visitor has left your office, you can find instantly the place you had reached in your dictation before you were interrupted. For the Time-Master automatically backspaces to enable you to hear your last few words of dictation.

PERFECT CRYSTAL-CLEAR RECORDING

The Time-Master is a trim streamlined machine you can be proud of on your desk. It records on Dictabelts—little plastic belts, each one taking 15 full minutes of perfect crystal-clear dictation. The dictation too is more easily and clearly recorded, and therefore simplicity itself for your secretary to transcribe.

Small and pliable, Dictabelts fold flat for filing and may be mailed in an ordinary envelope, up to ten at a time for a 2½d. stamp.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine only 4¼ inches high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place-finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107, Kingsway, London, W.C.2, or ask for a demonstration at your local Dictaphone branch.

THE WORLD OVERSEAS

France's European Army

(From Our Paris Correspondent)

EVER since Nato was formed France has been wrestling with the problem of how to become the leading European power when all its best troops are 7,000 miles away. In the good old days of the Brussels Pact the question did not arise, for when all the European countries still had only paper armies France could point to Indo-China for present performance and pipe-dream with the rest of the club about the European future. Indeed, two or three years ago most Frenchmen staunchly opposed German armament and, with logic, simply pulled the bedclothes over their heads at the mention of defence against the East. The theme of the *chansonniers* in those days was: *Europe sera-t-elle cosaque avant d'être chinoise?* and there most people left it. At this time France occupied the position of the leading European vacuum, a role now recalled with nostalgia by the neutralists who have no taste for the cosmic arms-race.

The National Assembly's debate on defence last week showed that in 1952 France is again regretfully becoming an important military power. It is therefore at this stage of the game that serious doubts are bound to arise in French minds as to the quality of the army to be and the value the country is getting for the enormous sums spent. M. Pleven, it is true, drew what seemed to be an impressive balance of achievement since August, 1950: 10 fairly strong divisions instead of 5 very weak ones, with two more to be created next October; 27 modernised air-groups instead of a completely obsolete air-force; a larger navy with a modernised air arm plus the reconstruction of two bases, Brest and Mers-el-Kebir; in all, 819,000 men under arms instead of 646,000. The increases in strength are: Army 132,000 (25 per cent); Air Force 50,000 (70 per cent); Navy 13,500 (25 per cent). Since 1950 France has also built 20 airfields, laid 7,000 km of underground cable and installed a radar system between Switzerland and the Channel. The Defence Minister made it clear, however, that defences are still very weak and that 1952 is only the first year in a four-year rearmament programme under the Nato armament plan. The importance of this year lies in the establishment of a durable pattern of Franco-American finance, which is indispensable to the production of arms in France itself.

Matching the Vietminh

This pattern is best demonstrated by reference to the Lisbon agreement of last February. France then agreed to sustain a military budget for 1952 of 1,400 billion francs; this was the sum which had been previously computed by the Three Wise Men as the maximum that French political and economic conditions would allow. At the Nato meeting France secured a promise of American aid amounting to $500 million (175 billion francs), thereby saddling itself with a rock-bottom budgetary defence burden of 1,225 billion francs. The American aid under the MSA programme was to be divided into direct economic aid ($300 million) and off-shore purchases ($200 million).

The first basic commitment which M. Pleven had to face was naturally the war in Indo-China. In order to keep level with the Vietminh, which steadily expands with Chinese support, France needs immediate American assistance in kind. This takes the form of shipments of tanks and aircraft direct to Indo-China under end-item aid (the same source from which existing French formations in Europe have been equipped during the last two years to the value of 1,000 billion francs; and of dollar aid for the purchase of ammunition in the United States. The Far Eastern commitment (which is again being reviewed in Washington) has threatened more and more to cramp the effort for Nato and especially the production of heavier arms in France. The $200 million in off-shore purchases will now make it possible, for instance, for the French aircraft industry to get started on a four-year programme designed to remedy the country's extreme weakness in this sector.

Since Lisbon, moreover, the French government has seen that a far greater volume of American off-shore purchases is required if French-type armaments are to be satisfactorily produced in France. This sum is estimated at another 170 billion francs spread out over 1952-1955 (inclusive). The defence budget during these years will be at least as large as this year's, and will therefore require a sustained American "defence support" in the form of off-shore purchases if Nato formations are not to suffer from the increasing Indo-Chinese encroachments. In order to relieve the defence budget, off-shore purchases will, if the United States Administration agrees, be of those products which already come under French equipment budget.

Demand for Women

M. Pleven also spoke of the Indo-Chinese drain on manpower. France had 186,000 men in the Far East alone, against a total of 75,000 overseas in 1938, including those in Syria. (In Washington, M. Letourneau has said that 26 per cent of French officers and 37 per cent of French NCO's are engaged in Indo-China.) It seemed certain that the number of troops overseas elsewhere than in Indo-China, which was at present 50,000, would have to be increased more quickly than French troops could be relieved by Vietnamese national forces. Next year, therefore, it would be seen whether an extension of military service to 18 months was inevitable. The Minister said it was essential that many more women should join the army. "There is no modern army, be it — English, American or Soviet, which does not use women for many technical or office jobs."

Such was M. Pleven's progress report. General Koenig, chairman of the Assembly's national defence commisssion, who opened the Gaullist attack, did not think much of it. He spoke of inadequate training, of poor morale, of ill-co-ordinated research, of a prehistoric high command and obsolete mobilisation methods. Two other RPF generals urged far greater financial incentives to a military career, since the supply of officer candidates was running very short. (One famous school, the *Ecole Polytechnique*, which turned out hundreds of officer candidates before the war, produced only seventeen last year.) General Billotte said that the plan for a European Army was highly equivocal, since there was no guarantee that Nato seriously intended to stem an invasion of Europe. This doubt was expressed in a different form by M. Max Lejeune (a former Socialist war minister), who believed that the war in Vietnam was undermining France both in Africa and in Europe.

Without the Indo-Chinese war France would, he said, have another 10 divisions in Europe and the European community could then safely be forged under its leadership and not that of Germany.

The War and Air Ministers, MM. Chevigne and Montel, were more precise and rather more gloomy than their chief. M. Chevigne said it would be impossible to have the 15 divisions promised to Nato by the end of 1953 without lengthening the period of military service. Also something must be done immediately to make the army more popular as a career. On the other hand, a good number of excellent weapons were coming off the assembly lines: the Delahaye armoured car, anti-tank mines, howitzers, rockets and wireless. Off-shore purchases would allow more anti-tank and anti-aircraft guns to be produced. M. Montel said that the aircraft industry depended entirely on off-shore purchases. It was essential that production of the MD-452 and Mystere IV should be started. There was up to 50 per cent surplus capacity in the industry. Other deputies complained of the obsolescence of the aircraft (Hurricanes, Vampires and Mistrals) which are to be produced this year and next. But in spite of these criticisms, whatever the difficulties now facing the French armed forces and armament industries, there can be little doubt that, given three or four years, France will possess a small efficient modern army with the air strength required to support it and the munitions industry to feed it.

The Soviet Press—II

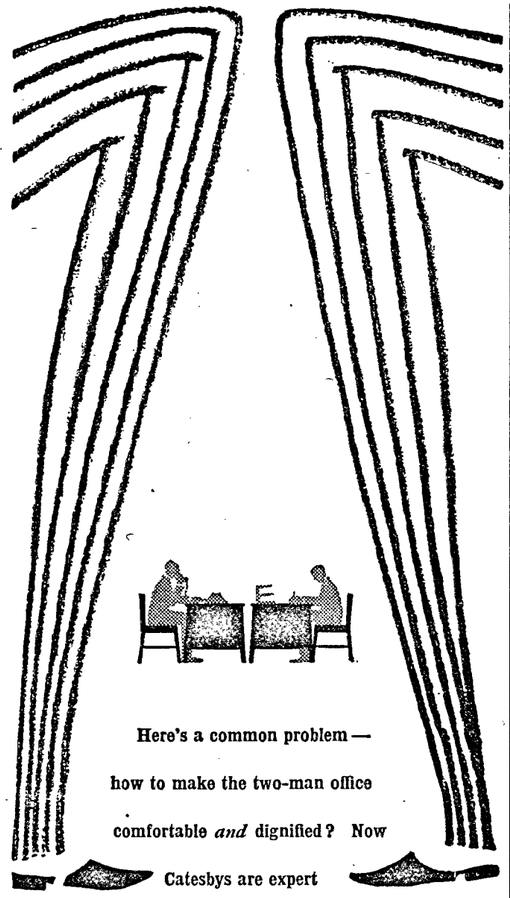
The Role of the Periodicals

THE shades of Soviet opinion are more easily discernible in the periodicals than in the daily press. In last week's article it was said that these periodicals partly satisfy the needs of a growing Stalinist *intelligentsia*. Yet this obviously is not their only task. The more popular ones assist the daily press in its duty of mass propaganda. Broadly, it could be argued that the smaller the circulation, the greater is the latitude given to the writers. In a specialised journal read by less than 50,000 high party or government officials it is sometimes possible to reveal—indirectly and in highly esoteric language—certain facts which, if put plainly in a mass circulation paper, could do untold damage and would certainly be branded as heresy.

The most popular of the periodicals is probably the illustrated weekly, *Ogoniok* (Little Flame), with a circulation of about half a million copies. It inherited its title and external appearance from a pre-revolutionary journal. Compared with the Western illustrated press its photographs are much more retouched. Retouched, too, is the image of the Soviet Union. We are shown only a Russia of rapidly increasing bright houses, fertile fields and well dressed, well fed, happy shock workers. In addition there are coloured reproductions of classical Russian paintings and scenes from the canonized version of the revolution, with Stalin always in the limelight.

If photography is well suited for official propaganda, satire and caricature are normally the weapons of the opposition. The Bolsheviks used it successfully in their struggle against Tsardom. Now the official satirical journal—The *Krokodil*, published every ten days in 300,000 copies—has the ungrateful task of providing "constructive humour." It may attack the smaller fry—the corrupt or inefficient petty official—but beyond that it must mix laughter and praise.

A higher form of entertainment is provided by the literary press. The educated Russian's passion for literary journals is now satisfied in quantity, if not in quality. A special newspaper—*Literaturnaya Gazeta*—published three times a week, is chiefly devoted to criticism, reviews and essays. It must, however, give a substantial share of its space to political problems, in particular, lately, to questions of foreign policy. The monthlies—such as *Novy Mir* (New World), *Oktyabr* or *Znamya* (the Flag)—are more purely literary. In addition to essays and reviews they contain short stories, poems and novels in instalments. Although the material is only too often written slavishly to schedule, these journals are nevertheless almost permanently under fire for falling into the sins of formalism, of modernism or for giving a distorted view of Soviet life.



The role of public prosecutor is usually filled by the *Bolshevik*, the Party's theoretical and political organ. Among periodicals it stands somewhat apart. It has a large circulation, but it certainly is not a popular, entertaining paper. It is published every two weeks in over half a million copies of 80 small pages. As there are probably some 6 million Party members—including candidates—the *Bolshevik* is not read by the mass of the Party. But for the cadres and for all those taking an active part in Soviet political life, it is an indispensable guide, a guardian of orthodoxy. Its position towards the other periodicals is somewhat like that of *Pravda* towards the other dailies. It is the commander-in-chief. It criticises, castigates, advises and shows the path to be followed. If the *Bolshevik* had an article on philosophy, its line will be plugged in the forthcoming issues of *Voprosy Filozofii* (Problems of Philosophy); if it underlined the progressive role of Tsardom in Central Asia, *Voprosy Istorii* will quickly withdraw its anti-Tsarist interpretation.

On the economic side the *Bolshevik's* hints are expanded by the two chief journals, *Voprosy Ekonomiki* and *Planovoye Khozyaystvo* (Planned Economy). The former is a relative newcomer. Founded five years ago, it is published by the Academy of Sciences and has a circulation of over 40,000. It is read mainly in university circles and by higher officials of the foreign service. Of the two it is the more academic and devotes more space to economic conditions abroad. In addition to official versions of progress in the satellite countries or China, it provides statistical data on the Western world taken from Western statistical digests and the economic press (*The Economist* is a frequent source of information). True, the figures are judiciously chosen so as not to give too rosy a picture of the "imperialist camp." Still, for those who can analyse or read between the lines, the picture is not as black as is normally proclaimed in Moscow. It is necessary for the expert on foreign affairs and the future expert or his professor to know more about the outside world than the ordinary layman.

Shift of Emphasis

The *Planned Economy*, published every two months by the *Gosplan* and with a slightly smaller circulation, is as old as the Soviet planning system itself. It used to be a real mine of information, but with the dropping of the iron curtain the stream of information was reduced to a trickle. More and more the emphasis has been shifted from actual plans to planning technique. In fact the evolution of the periodical press under Stalinism is characterised by this shift of emphasis from general analysis to detailed technique, from the social science to technology. An expanding economy needs experts, and a dictatorship has least to fear from narrow-minded specialists. While the general political, social or literary magazines are but a shadow of their former selves, small journals dealing with specialised subjects like machine tools or machine building have grown and multiplied.

Yet it has not proved an easy task to harness all the energy of the growing educated class into the process of production and thus to blunt completely its critical spirit. From time to time journals must be scolded or closed down for various "deviations." Thus, for example, the *Istoricheskii Journal* was closed down after the war, when the Party decided to drop its ultra-patriotic and Slavophil propaganda. Incidentally, its successor—*Voprosy Istorii*—is now being attacked for lack of patriotism. Another periodical—*World Politics*

Here's a common problem — how to make the two-man office comfortable *and* dignified? Now Catesbys are expert at this sort of thing. They'll alter a desk, or design a special chair to suit the room and the person. They've done some good work for I.C.I., Richard Thomas and Baldwins, and other important firms. Their Contracts Department (directed by Peter Catesby) like to have things right — whether it's just a desk you need or complete refurnishing.

and Economics—disappeared because its editor, the veteran economist Professor Varga, continued after the war to argue that an immediate crisis was not inevitable in the capitalist world. Generally, their discipline, somewhat relaxed during the war, was harshly reimposed under the leadership of the late Zhdanov. The screw was probably turned too tightly and this caused some restlessness, since Stalin himself, when writing on linguistics over a year ago, mentioned *en passant* that there was too much barrack-room discipline in Soviet science. The hint was quickly taken up and the Zhdanov line gave way to milder forms of control, to what has been called the Malenkov line, after the name of Zhdanov's rival. Thus persons criticised in the *Bolshevik* have recently been allowed to defend themselves in the columns of that paper. Authors were told not to paint everything in rosy colours and critics were allowed to discuss the place of the "negative" hero in Soviet literature. A courageous writer even dared to argue that culture is international and that the claims of Russian supremacy and self-sufficiency have been exaggerated. All this may seem little to an outsider, but for the Russian intellectual these are signs of liberalisation and encouragement to speak up more freely. Obviously one does not know how far this "liberal" line will stretch or how long it will last. In the past the policy towards the *intelligentsia* has been prone to sudden reversals, and changes in the international situation were not the least factor in determining it.

Actually the rulers responsible for the guidance of the press are faced with a paradoxical situation. The mass of people who have only just learnt to read and write gives them little worry. The real trouble is caused by those to whom Stalinism gave the opportunity to learn much more than the alphabet. Not that this educated class is opposed to the regime. On the contrary, it is a privileged class with a stake in the prevailing order. Yet it must be longing desperately for more freedom of expression. Hence the real dilemma is how to satisfy or appease this longing without undermining the basis of Stalinist society.

(*Concluded*)

Belgium and the European Army

[FROM OUR CORRESPONDENT]

BELGIUM is a small country with a direct and obvious interest in the development of international co-operation. But its historical traditions, the nature of its Constitution, and the temperament of its people, all naturally give rise to certain anxieties and to certain demands, whenever a new step is being made towards the integration of Europe. The uneasiness aroused by the European Defence Community rested in the first place on the fact that the chief partners, France and Germany, did not sign the Treaty with any enthusiasm; on the contrary, its ratification is by no means a foregone conclusion in either country.

To understand more exactly what is worrying the Belgians about the EDC, it is best to recall the particular points raised by the Belgian delegates during the treaty negotiations. This list gives an excellent picture of the traditional preoccupations felt by the Belgians whenever they are confronted with any project for international co-operation. Among these problems, it is the length of military service and the size of the defence budget that are of most direct interest to the Belgian people. Military service in Belgium, which has been fixed at 24 months, is higher than that of any of the other EDC partners; it is designed to secure the forces necessary to fulfil Belgium's international engagements, and was adopted in the hope that other countries would act on the same principle. In fact, Belgium now finds that the other European governments are lagging behind it in this matter; and the Government has firmly announced that it will shorten the period of military service to the level fixed for the whole EDC by its Council of Ministers. But this would entail a reduction in the military contingents provided by Belgium. This question is all the more important because of the general public's direct and lively interest in it, and because the Socialist party has from the beginning been opposed to a military service of 24 months.

The problem of the size of the national defence budget is also of general interest, particularly in parliamentary circles, all the more so since Belgian constitutional traditions and the functioning of the parliamentary regime might be affected. This was why the Belgian delegation insisted that the EDC's budget should be fixed by the unanimous vote of its Committee of Ministers. The hierarchical primacy of the Council of Ministers, especially in financial matters, has been one of the main objectives of the Belgians from the beginning of the negotiations. They were anxious that the position of the Council should be such that it would be possible for the Belgian Government and Parliament to use it as a channel of intervention if necessary. The Belgian delegation also insisted that if the EDC's scale of military pay would involve a financial loss for the Belgian soldier, a supplement could be provided out of the national budget.

The existence in Belgium of different linguistic communities, the Flemish and the Walloon, has naturally made the Belgian military authorities specially preoccupied with the question of what languages are to be employed in the EDC. The decisions taken in this matter conform to the principles applied in Belgium. In principle, every member of the European defence forces is to use his national language and communications between different units are to be made in the language of the subordinate unit.

Jurisdictional Guarantees

The Belgian delegation also insisted that the nomination of the commanding officers of the national units should be reserved to the national authorities; and it also approved the decision that the unanimous consent of the Council of Ministers should be necessary for nominations to higher posts. The Belgians also insisted on certain jurisdictional guarantees for the benefit of Belgian nationals, since the Belgian Constitution does not allow the transfer of jurisdictional powers in cases, for example, of material damages, to foreign tribunals. Thus the victim of a damage done in Belgium who would not accept the decision of the "European Indemnities Commission" would be able to summon the Belgian state before the Belgian courts. In penal as well as in civil cases the Belgians successfully opposed the willingness of the other delegations to transfer judicial powers to the Community.

The EDC treaty has not yet been discussed by the Belgian Parliament, and it is as yet too early to make out how the proposal for its ratification will be received both in Parliament and in the country as a whole. But one can get some idea of the sort of opposition to be expected from the discussions on the Schuman Plan Treaty which was ratified by the Chamber of Deputies last week. The Socialists, who had abstained on the Schuman Plan vote in the Senate, in the Chamber voted in its favour. This was the result of M. Spaak's intervention. There were thus 165 votes in favour, 13 against and 13 abstentions. Among those abstaining was the President of the Chamber, M. van Cauwelaert, who was not convinced that the provisions of the Treaty were in accord with the Constitution and who feared that the development of international co-operation would profoundly change the functioning of the present parliamentary system.

The vote on the Schuman Plan showed that within each party there are both supporters and opponents of European union; but in spite of the reservations made by many speakers, the Schuman Plan debates made it clear that those in favour of more integration have managed to convince a large part of the Belgian Parliament.

German Nationalism and the New Treaties

[BY A CORRESPONDENT]

THE question whether the treaties concerning the European Defence Community and the so-called "Contractual Agreements" are to be ratified by the present or by a newly elected German Federal Parliament has aspects which far transcend the party political struggle. Suppose Dr Adenauer succeeds by his statesmanship in silencing the grumbling opposition in the ranks of the government parties and in steering the treaties through the present Bundestag and Bundesrat—what will be the attitude of the German voters at the next election, which is due in 1953? Will they conform to the spirit of European co-operation which is embodied in the treaties? Or will there be a victory for the nationalist spirit which expresses itself in the new parties of the Right, as well as in the departure of the German Social Democrats from the international tradition of August Bebel and Wilhelm Liebknecht? Nobody can be bold enough to answer these questions with certainty, but a backward glance at the experience of the Weimar Republic may be instructive.

In the summer of 1929, at the Hague Conference, Stresemann achieved the enormous success of securing the evacuation of the occupied Rhineland. On August 29th, at a personal meeting with Briand in Scheveningen, he extracted from him after long and strenuous persuasion the promise that the evacuation should be completed not later than June 30, 1930—five years before the date fixed by the Treaty of Versailles. Dr Schmidt, who was present as an interpreter at this tête-à-tête, became lyrical in describing the moment when Aristide Briand gave this historic promise.

> The sun suddenly shone brighter and the sea radiated still deeper, and this light was reflected on the face of the two statesmen who had wrestled so hard to come to a solution. Both hoped at this hour, that a new era was approaching, when France and Germany would be really good neighbours.

It was the crowning triumph of Stresemann and the policy of Locarno. Briand had in the name of the French people abandoned the policy of Versailles, which had excited so much passionate resentment in Germany. Now certainly, people thought, nationalism would lose its power.

The French kept their word. On June 30, 1930, the evacuation of the Rhineland was completed. Ten weeks later a new Reichstag was elected. How did the German voters greet the new era of international understanding? The National Socialist votes jumped from 800,000 to 6,400,000, their seats increased from 12 to 107. It was at this moment, when the last allied soldier had left the soil of the German fatherland, that the National Socialist movement became a danger to be reckoned with. On the extreme left the Communists won 1.2 million votes and 23 seats. Stresemann's party, the *Deutsche Volkspartei,* lost a third of their 45 seats.

Two-Faced Tactics

When the Germans suddenly found they had become full-fledged members of a republic, they had slowly to learn many things which were well understood in states with a longer parliamentary tradition. It was disastrous that the nationalist and monarchist opposition was double-faced. It condemned passionately all that the Reich had to undergo in consequence of its catastrophic defeat; at the same time it was glad that other parties were willing to make the patriotic sacrifice of accepting the inevitable. This tactic began even when the Treaty of Versailles had to be accepted. On June 23rd 1919, when Clemenceau demanded unconditional acceptance within twenty-four hours under the threat of military invasion, the *Deutschnationalen* desired the surrender as much as anybody else; they even promised solemnly not to impugn the patriotic motives of the deputies who voted for it. General von Seeckt, certainly neither a friend of the government nor of surrender, wrote in a letter: "Many deputies who voted against the signature did so because they knew it would be accepted in spite of their vote." But when the Treaty was signed, an indignation campaign was conducted with the utmost vehemence against those who had submitted to surrender. Erzberger, who was held mainly responsible for signing the Treaty, was murdered.

This double game became clearer still when the Dawes Plan came up for acceptance by the Reichstag in August, 1924. Again the *Deutschnational* Party opposed it vehemently and voted against it. There was no danger to Germany in this because they knew that a majority in favour of the proposed laws was secure; but then came a characteristic and revealing incident. The constitutional lawyers found that one of the bills, concerning the railways, involved a change in the constitution and was therefore valid only if accepted by a two-thirds majority. This could not be secured without the votes of the *Deutschnational.* Reichspresident Ebert let it be understood that he would dissolve the Reichstag if the Dawes Plan were rejected. What happened now? At the third reading about half of the *Deutschnational* members voted in favour, the two-thirds majority was obtained and the dissolution which the *Deutschnational* evidently feared was avoided. Thus the Nationalists by their tactics prevented the German people from giving a responsible and clear verdict on a decisive question of foreign policy.

It is this precedent of the Weimar Republic that causes concern. When the advantages of the new treaties have been secured for the Germans through their ratification by the present parliament, nationalist agitators will be free to make the most of the few restrictions that were necessarily included in these treaties. Many people in the Federal Republic, while fully appreciating the reasons behind Dr Adenauer's policy, feel that it may contain dangerous pitfalls.

Mr Holland's Optimism

[FROM OUR NEW ZEALAND CORRESPONDENT]

NEW ZEALAND, which is unused to such spectacles, has recently been edified by the appearance of its two leading economic advisers, the Governor of the Reserve Bank, and the Secretary of the Treasury, as witnesses in an application by the New Zealand Federation of Labour to the Court of Arbitration for a general wage increase of £2 11s. 4d. a week. The application, which was supported by the New Zealand Public Service Association, was estimated, during the hearing, to represent a claim for £70 million when applied to all the wage earners in industry and the public service. There is provision for any wage increases granted by the Court to be passed on to the primary industries.

The chief purpose of the questioning of Messrs. Fussell and Ashwin was to show that the wage-earners are lagging substantially behind the farmers and company shareholders in their earnings. On the basis of the official consumers' price index it was argued that the cost of living had increased by over 15 per cent since February last year when the Court ordered a general wage increase of 15 per cent. It was also maintained that wages had increased at less than half the rate of farmers' and shareholders' increased returns during the past twelve months. The federation's arguments, supported by the Public Service Association, were directed to show that this disparity requires rectification in the general interests of economic stability and industrial peace.

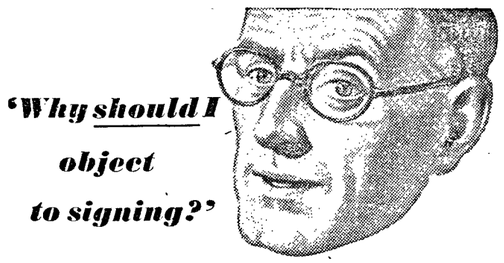
Although it is by no means certain that the Court will find for the workers on the scale adopted last year, the political implications of an award falling substantially short of the federation's demands may provide problems for the present administration. The Prime Minister, Mr Holland, who is of a naturally sanguine temperament, has been criticised recently for giving the impression in a speech that he was ignoring this and other current grievances.

On the face of things the Government should indeed be cautious in its optimism for there has been a considerable change in New Zealand's economic fortunes in the past six to nine months. Over-importing encouraged by last year's wool boom and stimulated by the depletion of stocks during last year's five months waterfront strike, has pushed up imports to an unprecedented extent; at the same time prices for wool and hides have fallen very sharply, though meat and dairy products have shown some gains. As a result, the favourable balance of £28 million which New Zealand showed for the first four months of 1951 has been transformed, during the first four months of the present year, into an adverse balance of over £10 million—in other words the country's position has deteriorated by over £38 million in twelve months. It is difficult to impart a very hearty ring to optimism under these circumstances.

Exchange Allocation Plan

Another current source of discontent, at least among a section of the community, is the exchange allocation plan announced three months ago. This limits importers to 80 per cent of the overseas exchange they used in 1950, a sum estimated provisionally at about £172 million in all. Over and above this, however, the New Zealand Reserve Bank, which is administering the scheme, has an estimated £60 million available to deal with special cases, including those of importers who were not in business in 1950. Since the scheme was announced, nearly 4,000 importers have applied for a share of this extra amount and the total of applications is nearing £300 million. This makes it inevitable that many applications will be drastically cut and equally inevitable that many importers will blame the Government for the reduction. It also creates the danger that the black market in overseas exchange, which arose two years ago under the "no remittance" system of car importations, will revive on a wider scale. The Labour Party, which introduced New Zealand to import licensing, has not been backward in suggesting that the Government should have reverted to this system of controls rather than accept a scheme which will be difficult to police and to administer. It is too early yet to predict whether exchange control will cause less heart burning than import licensing, but both seem calculated to raise the blood pressure.

The trading banks and the Reserve Bank have both received some blame for allowing advances to mount to record levels and New Zealand to import beyond its means, but one of the freedoms the present Government has not restored is the freedom of the banking system to regulate its own affairs. Indeed, there are some signs that this freedom has for long been forgotten, and that the partial removal of controls, after Labour departed, has found some banking executives ill-equipped to deal with the new conditions.



A Reasonable Prediction

The partial resumption of controls which the Government has imposed in order to restrain importers and conserve overseas funds has occurred at a time when the unions' application for increased wages has redirected public attention to the increased cost of living and when the Government is experiencing some of the inevitable loss of popularity which follows the consolidation of a new administration. Nevertheless, Mr Holland's Government, with its very comfortable majority, has more than two years to go before it must face another general election, and in the meantime some at least of its policies will probably have been vindicated. In any case, Mr Holland is far from being alone in his optimism. When the Governor of the Reserve Bank was asked, during the Arbitration Court hearing, whether he still felt that New Zealand could fulfil its promise to the sterling area by balancing all its payments by the middle of 1953, he said that he expected the country to have a surplus of £20 million in its overseas trading by that time. If the Government can bring imports down to manageable limits, and if New Zealand's export prices maintain their present levels, the prediction appears reasonable.

Jews Behind the Iron Curtain

[BY A CORRESPONDENT]

BEHIND the iron curtain, where Communism claims to have rooted out racial prejudice, Jews once more find themselves a discredited and even threatened minority. Not because of anti-Semitism in the old sense, but because Soviet policy now demands that all who have international connections or ties abroad be classed as suspects and unreliable. Where Jews are concerned the stigma of disloyalty is apparently automatic. It expresses itself in forms of discrimination, notably over official appointments, and in smear propaganda linked to attacks on Israel which once more render Jews conspicuous as a racial group. The effect, therefore, particularly on East European peoples, is hardly distinguishable from anti-Semitism. While the cold war lasts, Communist policy is not likely to change. In the event of open conflict it is doubtful whether the iron curtain Jews, already classed as potential enemy agents, would even have much chance of survival. In the meantime, emigration, their only hope, is becoming daily more difficult. It has never been permitted from the Soviet Union which even in the post-revolutionary period, when the attitude to Jewish aspirations was still tolerant, opposed Zionism in theory and practice; and in the satellites today only a few thousands yearly, mostly the aged, succeed in securing exit permits.

'I can quite see the guv'nor's point of view in taking out a Fidelity Guarantee in my name. I know that he trusts me, but the fact remains that he has the responsibility of other people's money as well as his own, and the Guarantee is only a reasonable precaution—like the annual audit. Any man in his position is justified in doing the same thing—and he will if he's wise.'

Peace of mind costs very little

'General' Guarantee Policies can, at a very low rate, cover embezzlement and misappropriation risks of all kinds as well as pay-roll and cash in transit robberies. Send off the coupon right away for further particulars.

In numbers the extent of the problem is not inconsiderable. Almost one-quarter of the 11 million Jews in the world live in the Cominform countries. Whilst the exact total is unknown, it is estimated by outside sources that it approximates 2,430,000. Of these some 2 million live in the Soviet Union, a decline, due to German measures and assimilation, of 1 million over the prewar figure. Soviet Jews are, of course, the most isolated. But although so long exposed to Marxist proselytism and to pressure to merge into the Communist system, they still maintain, visitors report, a certain communal integration. This is helped by the fact that most of them are congregated in cities where they can gather together for religious worship, and so preserve a sense of community and separate culture. The largest communities are in Moscow—where there are said to be 500,000—Minsk, Kiev and Biro-Bidjan. The last is the Jewish settlement promised as an autonomous state but never realised. These communities have little contact with each other and none at all with Jewries in the world outside, not even in the satellites.

Zionism Among Russian Jews

Hitherto the lot of the Jews in the Soviet Union has not been unfavourable. In the post-revolutionary era they were considered of particular value because they were urban, adaptable, generally better educated and more skilled than the then illiterate Russian. Discrimination against them was condemned and often punished. This made them more eager than most to work for the new order and explains why so many have played an important part in building Communism in the Soviet Union and later in the satellites. The liberal policy continued up to the war. The Soviet authorities readily granted facilities for the publication of Yiddish books and newspapers, of which there were many; and Yiddish theatres flourished and were renowned. Today none of this exists except as part of Communist propaganda which now obtrudes itself into religious matters.

Russian Jewry has been forced, under pain of severe penalties, to efface from its religion all mention of the political concept of Zionism, which is logically inseparable from it. On this a constant watch is kept. Nevertheless, there is every evidence that the Russian Jew is not only deeply conscious of the new Israel but passionately interested in it. There were, for instance, the extraordinary demonstrations in 1949 when the first Israel mission attended the synagogue in Moscow; these were followed by arrests and the closing down of Jewish printing plants and offices. This interest though inarticulate has not diminished. Jewish foreign visitors tell of being followed in the streets, of whispered words in Yiddish, of the handclasp in the dark. Only recently in New York, the former Israeli Minister, Dr Mordecai Namir, described the sensation of being watched "by X-ray eyes."

In satellite Europe, the Jews' situation varies with the country and with circumstances. Thus in Czechoslovakia where they number but 17,000 and the people are not traditionally anti-Semitic, the situation of the ordinary Jew, despite the arrest of Slansky and half a dozen other Jews in official positions, and the recent denunciations by the Minister of Information of "cosmopolitanism and Zionism" is still easier than elsewhere. But emigration is not allowed. The largest satellite Jewry, totalling about 180,000, is in Rumania. Here policy is increasingly rigorous and oppressive. Press reports indicate that the new deportations from Bucharest of 200,000 "unproductive elements" include a great many Jews. One-fourth of the Rumanian Jews have registered to emigrate but, apart from the aged, every obstacle is being placed in their way. All property must be sold, they are allowed to take little money out and even personal belongings and food for the journey may be impounded at the last moment. Yet in Rumania, as also in Hungary, where there are 175,000 Jews and conditions are no easier, they continue to besiege the authorities for exit permits, although to do so makes them doubly suspect and invites punishment. Even Party members do this. Many try to depart illegally. Some weeks ago the Rumanian Security Police raided a ship due to sail from Constanza and arrested several escaping to Israel. For some time emigration has also been prohibited from Poland—where there are 50,000 Jews. A few weeks ago a rumour that the Warsaw Government were negotiating to reopen facilities caused an onrush of applicants at the Israeli Legation. The police broke up the crowds and made arrests.

Anti-Semitism now Unchecked

In all three countries, Jewish communal organisations have been put in control of Jewish Party members. All Jewish international organisations such as the American Joint Distribution Committee, the ORT and so on, were forcibly disbanded some time ago. The Rumanian regime, according to a report, only recently closed 21 "disused" synagogues in Transylvania and turned them into Communist clubs. Anti-Semitism, never far from the surface in these countries, and fanned by the regimes' attacks on Israel, is reported on the rise again. The authorities, it seems, no longer try to suppress it. It is significant that as a result of an outcry by workers in Polish state industries against the high wage earnings in co-operatives manufacturing clothes, shoes and furniture—mostly manned by Jews—the Government has by decree reduced earning rates and acted in other ways to curtail the co-operatives' operation. In Poland there are still Yiddish newspapers, mainly vehicles for Communist propaganda, and Jewish schools carry on under Communist direction. School textbooks issued in 1951 exclude all reference to Jewish nationhood and Zionism. In the welter of angry anti-Israel propaganda poured out by the Polish press and radio, the would-be emigrant is branded an emigrate, traitor and spy. Jewish children write to newspapers accusing their parents of trying to take them to Israel.

In such an atmosphere the predicament of the Jews with their undeniable connections and family ties abroad can easily be understood. It is true that compared with those in the Soviet Union, these Jews in the satellites are even today still permitted a restricted measure of separate collective expression through Yiddish schools, theatres and a few newspapers. But they know that this will come to an end because satellite policy towards the Jews, as towards everything else, must conform to the Soviet pattern. Communism is in effect putting the Jews of Eastern Europe back to where they were in the bad old days. But then at least there was no iron curtain; they could at least emigrate.

At a time when every nerve is being strained to increase the export drive, we are neglecting our richest source of production — the land. There are 17 million acres of rough grazing in Britain whose fertility can be vastly increased — for the first time — by modern mechanical methods. Every million acres of land thus reclaimed is capable of fattening 250,000 store cattle. Yet only £5 million in 3 years has been allotted for the reclamation of marginal land.

At a time when our strategic and economic security depends on self sufficiency, this situation makes neither strategic nor economic sense. We are spending more than half the proceeds of our export drive on buying expensive foreign food. We are trying to keep food prices down by subsidies instead of by growing more and cheaper food.

One way out of this highly uneconomical situation is to equip farmers in the same way as we have equipped industry — with efficient, labour saving machinery. *Harry Ferguson Ltd., Coventry.*

FERGUSON SYSTEM

THE BUSINESS WORLD

Spokes in the Wheels

THE British Transport Commission's accounts for 1951, which were published last Monday some three weeks in advance of its full annual report, show a revenue surplus for the year of £2,943,512. Out of this, the commission required £2,671,344 for capital redemption and £158,605 to meet certain special expenses, such as those arising from the acquisition of new undertakings and the need to pay compensation to their redundant staff. This left a credit balance of £113,558 for the year, which, for an organisation with a gross revenue of over £624 million and balance sheet assets of just under £1,750 million, is a very tiny figure for a year of boom. It is, however, the first credit balance that the commission has ever earned; it compares with a deficit of £14.1 million in 1950 and with an accumulated deficit of £39.5 million in the four years since the nationalisation of transport took effect. The more is the pity, therefore, that 1952 seems certain to be another year of deficit; such a relapse is an almost inevitable consequence of falling traffic, mounting costs and Mr Churchill's dart down from Olympus to stick a spoke through the wheels.

There are some people indeed, who would say that the Government has inserted not one spoke but two. The commission itself is among those who would voice this double complaint. It clearly considers the proposed denationalisation of road transport to be almost as undesirable as the Government's meddle in fares. In the notes accompanying its accounts the commission goes as far as a nationalised board decently can in setting out the reasoned (as distinct from the socially chuckle-headed) brief for those who believe that long distance lorries should be left in public hands. Since the specific object of advancing the publication date of the 1951 accounts was to provide the electorate with sufficient material to view the Government's transport policy in perspective, the commission's thinly guarded comments on this question deserve attention.

In part, the commission's case against denationalisation of road transport is based on the assertion that it is now running the lorries very efficiently; since 1949 it has carried out some sensible staff economies, reduced the number of empty-running vehicles, pushed up the load per vehicle so sharply that nationalised lorries are now carrying some 250 million packages a year, and (as the accompanying table shows) transformed British Road Services' net deficit of £1,200,000 in 1950 into a net surplus of £3,200,000 in 1951. As, however, no really comparable figures are available of what was the former position (let alone what would be the new position) under private enterprise, there is not very much meat in all this. Very wisely, therefore, the commission bases its main case against denationalisation on the need for integration. In sharp contrast to the fluffiness of most outside commentators, however, it goes on to define that blessed word in the proper way. Integration of freight services, in its view, means that each package carried across the country should be carried in the medium that, for that particular package on that particular journey, would involve the least real cost.

Under truly competitive conditions this function of integration would be achieved by the price system. But the commission declares that in the haulage undertakings that it has absorbed "the pattern of road freight charges has not [the commission puts the "not" in bold type] been found to correspond closely with the pattern of road cost." Where there has been competition from the railways, private road hauliers have apparently tended to undercut them deliberately, and where there has been "a virtual monopoly of the road, the charges seem to have varied more according to the market, from place to place and time to time, than according to long-term cost." After a series of studies of traffic costs, which "made considerable progress during 1951," the commission made "sundry revisions" last year, and thus feels able to report—rather sadly—that "the beginnings of a more rational price policy were in sight."

In addition, the commission claims that last year it managed to shunt off a fairer share of the railways' public obligations on to the road services. By public obligations it means the requirements to operate a regular and sufficient service to meet all peak traffic needs even where this is not financially profitable, and "to apply uniformly an approved and published tariff, which does not necessarily reflect the cost of the services rendered" (but imposes on a package carried a hundred miles along a deserted and expensive route no bigger charge than that on another package of equivalent size carried the same distance along a crowded and cheap route). Considerable sympathy will be attracted to the commission's view that the excess costs attaching to these public obligations should be fairly spread between rail and road—although not everybody will agree that the second obligation (a uniform tariff) is as desirable as the first (the need for services adequate to meet peak demand).

* Includes carrying and delivery services.

This, then, is the reasoned case for continued nationalisation of road transport. Labour politicians would do well to study it. But the case is still not a watertight one. With due respect to the excellent principles set down in the commission's report, the experience of the past four years has shown that once a nationalised board has all the cards in its hands, it is under no continuing incentive to shuffle the pack. If the railways' public obligations were cut down to a sensible minimum (especially in the matter of the uniform tariff), and if prices on the railway system alone were brought more into alignment with costs, then competition from privately owned road haulage would act more as a spur than as a barrier to efficiency. A glance at the accompanying chart will show how small is the proposed transfer of resources from public to private hands in relation to the estimated freight capacity of the country's available railway wagons and road vehicles.

The issue therefore comes down again to the basic question of the need for alignment between railway charges and railway costs, and leads inexorably to condemnation of the folly of the fares standstill—a condemnation that is mutely emphasised by almost every figure in the commission's 1951 accounts. The Minister of Transport's statement in the House of Commons this week makes it possible to view his folly in perspective, both as regards the railways and provincial services and as regards London Transport.

It will be seen from the accompanying table that the net revenue surplus of British Railways rose by £8.1 million, to £31.7 million, in 1951. The economies whereby this improvement was achieved lay partly in reductions in the labour force (which is down to just

under 600,000 compared with just over 660,000 in 1948), partly in the withdrawal of unremunerative services (more than 1,000 miles of unremunerative route and several hundred stations have been closed since 1948), and partly in increased efficiency (the commission's favourite, if complicated, statistic of "net ton miles hauled per total freight engine hour in service" has increased from 461 in 1938 to 543 in 1948 and 595 in 1951). These factors made possible an improvement in the railways' surplus in spite of an 8 per cent increase in wages and other expenses in 1951 and in spite of the fact—not generally realised—that the average fare paid by railway passengers has steadily declined since 1948. In that year the railways' average receipts per passenger mile were 1.38d., in 1950 1.26d. and in 1951 1.24d. This decline in average fares has been mainly due to the increased number of passengers utilising concession fares such as workmen's and season tickets; well over half of those using the railways now travel on such concession rates, while the number paying ordinary single and monthly return fares has been declining.

★

Concession fares are mostly accorded to those who travel at peak hours, that is to say at the hours when the real cost of transport is greatest. The Passenger Charges Scheme for 1951 therefore proposed, very sensibly, to increase workmen's and season tickets by 20 per cent, and to increase monthly returns by only 10 per cent; it proposed that ordinary single fares should actually be reduced, from 2.44d. to 1.75d. per mile. Within each of these categories, however, there were a number of special sub-standard fares—accorded either to particular groups (such as commercial travellers) or on particular routes, often as a result of historical accident; the Passenger Charges Scheme proposed to sweep away a large number of these special concessions, provided that the increase on any one ticket should not be more than 42 per cent.

After a year of proceedings before the Transport Tribunal, the scheme was approved, but—as the commission sadly remarks—"the correction of relativities thereby secured" was then made "subject to the standstill order of the Government." This standstill order, by delaying the introduction of the full scheme (on the provincial bus services as well as on the railways) from May 1st to September 1st, seems likely to cost the commission some £1,800,000 this summer. In addition, when the scheme does come into effect, the provisions for ironing out sub-standard anomalies will have been removed from it (except for sub-standard individual single and return fares, which will have been allowed to rise by up to 20 per cent), while the special categories of travellers that had previously been allowed to travel at half or two-thirds of the ordinary rate will suffer increases of less than 10 per cent (instead of losing their privileges altogether). This pruning of the proposed scheme for railway fares and bus fares outside London will cost the commission £660,000 in a full year. It will also, inevitably, tend to discourage further efforts towards aligning fares with real costs. At the end of 1951, in fact, the commission had also drawn up a Goods Charges Scheme that, it claims, would have "corrected many of the maladjustments" between costs and charges on the freight side. This scheme has now been "suspended by Parliamentary events" and it seems unlikely that it will be introduced this year.

The axe that Mr Lennox Boyd swung last week at the new London Transport charges scheme was even more regrettable. It will be seen from the accompanying table that London Transport services were alone among the commission's principal carrying activities (other than railway collection and delivery services) in showing a net revenue deficit last year; their loss of £1,600,000 compares with a surplus of £1,700,000 in 1950. The reason for this loss was that the Transport Tribunal sat on the commission's request for fare increases from April, 1951, until early in 1952. "Consequently," says the commission, "London Transport worked for the whole of 1951 at fare levels which were appropriate to a much earlier situation." Within London Transport's deficit, for the first time in history, rail showed better results than road; this was largely because the commission shifted some of the relevant

"public obligations" (especially in respect of cheap workmen's fares) from the trains to the buses during the year. But all travellers on London Transport, whatever their experience in the past two months, were in effect subsidised by the rest of the country in 1951.

The London Transport charges scheme, which came into effect on March 2nd and which was designed to remove this subsidisation, followed the same pattern as the general passenger charges scheme. There was, however, a large number of special sub-standard anomalies that needed to be ironed out in London, and this involved some re-shuffling of fare stages—although once again (except for certain very short journeys) the increase on any one ticket was limited to 42 per cent. From August 31st, the alteration in fare stages is to be rescinded, the anomalies smoothed out on March 2nd are to be ruffled up again, and the increases in most sub-standard charges are to be reduced to the level of the increases in standard charges of the same value. These "rectifications" in London will cost the commission £1,240,000 in a full year.

Among the commission's activities other than the railways and London Transport, both the provincial and Scottish buses and the shipping services earned satisfactory surpluses last year. Once again, however, there was a large element of cross-subsidisation. Among the buses, the long-distance express coaches—which, thanks to the limitation of services offered, achieved load factors of over 90 per cent—subsidised the stage carriage services. Among the shipping services, Scotland was heavily subsidised by the rest of Britain.

★

This pattern of cross-subsidisation is complicated by the fact that there are two other milch cows upon which the British rail user has drawn for many years. First, he has lived off the rentier. Before the war 3s. 1d. from every £ of receipts of the railway companies and 2s. 9d. from every £ of receipts by the London Passenger Transport Board went in interest or dividends; in 1951 the relevant figure for the whole British Transport Commission was 1s. 1d. in the £ (with interest charges expressed per £ of capital being, of course, much lower). Secondly, the traveller has lived off posterity. The commission points out in its published notes that costs have risen by far more than charges to the public since 1938 (57 per cent more in the case of the railways and 77 per cent more in that of London Transport); and it specifically asserts that one of the reasons why it has been able to bridge this gap is that "the amounts reserved for replacement are based mainly on historical and not on current cost." It seems evident from this statement that the real value of capital assets in the transport system is not being kept intact.

The commission's fixed assets, including goodwill, rose by £32.8 million to £1,446.9 million last year, and its stores and materials by £16.7 million to £87.1 million. To finance this investment, it sold a steady stream of marketable securities (nearly all of them gilt-edged) and then raised £60 million on 1¾ per cent one-year stock from the National Debt Commissioners towards the end of the year. The funds thus raised were not immediately re-invested in gilt-edged, for the commission's balance sheet on December 31st showed a fall of £61.2 million in holdings of marketable securities, to under £8,500,000, and a rise in "bank balances, Treasury bills, deposits at short call and cash" by £43.6 million to just over £84 million; somebody was exercising a canny liquidity preference here.

The general impression that emerges from these figures is that Britain now has an over-expanded but rusting transport system that is being compelled each year to carry a growing amount of high cost traffic at subsidised rates, while a dwindling amount of low cost traffic pays more than its economic fare. The commission attempted some sensible improvements last year, and in a year of booming traffic managed to reach temporary solvency, but even without the Government's ill-considered intervention on sub-standard fares it would still have had a long way to go before the pattern of charges was in any way aligned with that of real costs. It has become increasingly clear that the root trouble of British transport is that its whole system of charges and fares is riddled with anomalies. So long as the Government is afraid to face up to this fact, it cannot really expect wholehearted support for its proposals to tinker with the mechanism of management and ownership. The response it must expect is that which would have greeted Mr Edward Lear's jumblies if they had issued a White Paper on their transport policy, before they, too, went to sea in a sieve.

The New Nobility

Our "old nobility" live in the popular traditions as men of great hearts and great achievements. If they rode down the farmer's corn in pursuit of their game, or horsewhipped the churl who crossed their path, at least the farmer and the serf had the satisfaction of believing in the great superiority of their oppressors and they had some reason, either from former deeds or present acts of high-handed courage and generosity, to respect and admire those who scourged and oppressed them. But modern nobility . . . has dwindled out of respect as much as it has improved in behaviour. It is only pursuing the same downward path for one of its members to state in the House of Commons that . . . the nation is bankrupt, demoralised, and ruined; though nowhere, among a population accustomed to complain and have their grievances redressed . . . has there been even a public-house meeting, much less a parish or county meeting, to inform Legislature that the people are suffering. . . . The activity of every class in its proper business and the general contentment warrant the laughter and cheers with which the unfounded statements of the Marquis of Granby were received on Monday. . . . The Noble Lord might have been silent, and remained in possession of all the respect which belong to the heir to the Dukedom of Rutland and the future owner of Belvoir Castle. But to make statements in the House of Commons, which the whole community disavow, and to be the mere mouthpiece of others, is to sink himself and help to sink his class below those whose statements he adopts. The old nobility were the leaders of the people, their banners waved in front of the national battles, and their wealth improved the public taste. Their descendants, like Lord Granby, are generally in the rear of the people; or if ever they go in front it is to fight for their own advantage. . . . Their old functions have come to an end, and not having the capacity to create new ones, they exhibit in Lord Granby the melancholy spectacle of an old and once-honoured race fallen to decay.

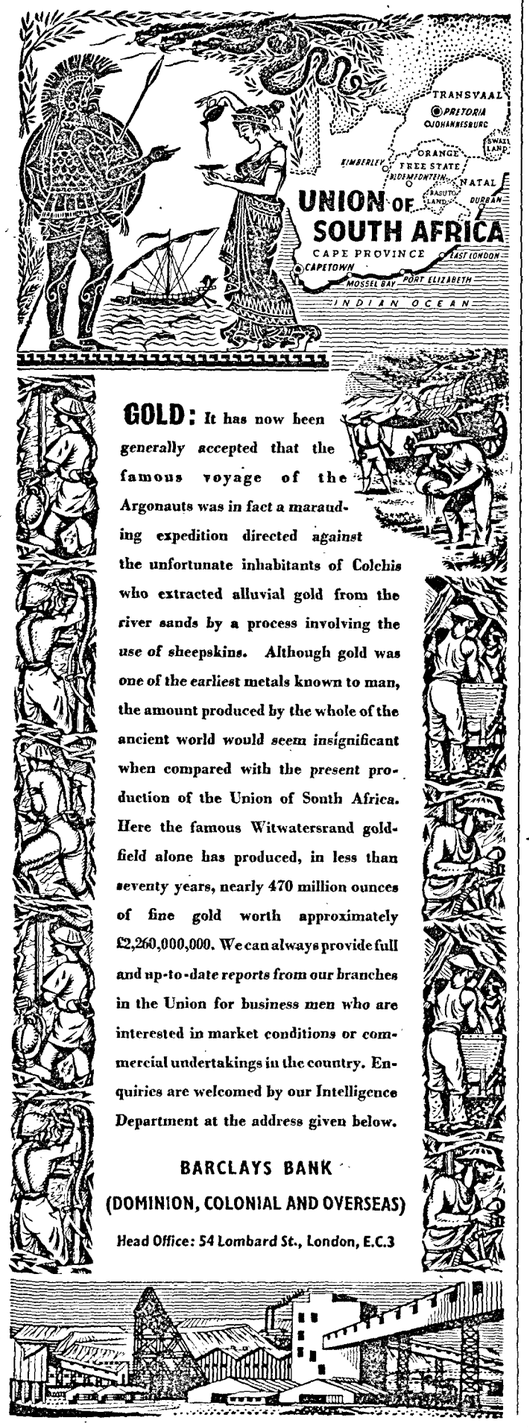
The Price of Electricity—II

Promoting the Peak?

UNTIL very recently, electricity was perhaps the only commodity bought in the home that cost less than before the war. In the financial year 1950-51, the last period for which figures are available, domestic consumers paid an average price of 1.463d. a unit, compared with 1.596d. in 1938-39; and the average price to industry had risen only from 0.667d. a unit to 0.930d. In other words, although retail prices in general have more than doubled and wholesale prices have more than trebled, domestic electricity charges have actually fallen by nearly 10 per cent while industrial charges have risen by only 39 per cent. Last year electricity prices were increased; but probably not very substantially on the average. In general, therefore, complaints that electricity now costs too much are clearly unjustified; and though alterations in tariffs have obviously borne hardly upon some consumers, even their complaints are perhaps mainly based upon sharp, sudden changes in their electricity bill, rather than on comparisons with the prices they pay for other goods. In June, 1950, Sir Henry Self said, "Electricity is still, relatively, a cheap commodity"; and that holds good today. But is it too cheap?

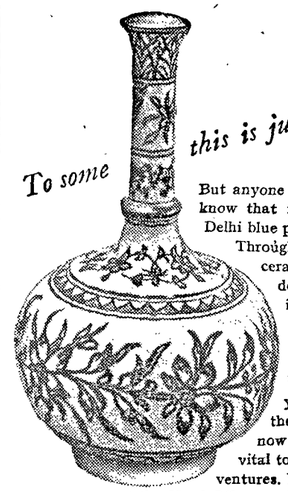


There are two distinct points of view from which this less conventional criticism is today being ventured against at least the domestic tariffs of the nationalised electricity industry. The first, often expressed in these columns and elsewhere, is that by offering electricity below cost to domestic consumers during the hours of peak demand, the industry promotes the additional peak load that it has generally to spread and on occasion to shed; and thus, by making less than the most economic use of the capital equipment it now operates, may tend to make an undue claim upon national investment resources for additional equipment to meet this "promoted" demand. The second argument that electricity is being offered too cheap is based upon the need for economy in coal. These critics, arguing that for space heating in particular electricity is an inefficient way of turning coal into heat, accuse the British Electricity Authority of encouraging excessive and inefficient use of coal that is becoming increasingly scarce by offering householders cheap electricity. Both criticisms are sometimes voiced by the same people. But one should not be confused with the other; their implications are by no means the same.

In accounting terms at least, it should be noted that the BEA's revenue is covering its total costs. In the three years to 1950-51, it earned a net surplus after meeting interest charges, and is probably doing so still. Its provision for depreciation is probably inadequate. At the 1950-51 price of about £50 a kilowatt, its generation equipment alone might cost £650 million to replace; in 1950-51 BEA provided £14,600,000 for depreciation of all assets and put £1,300,000 to a central reserve (not specifically allocated to cover extra costs of replacement). In common, admittedly, with many commercial concerns—and with the other nationalised fuel industries—BEA is probably giving capital away, even though its average prices nominally cover its average costs of supply.

But it is fairly clear that its domestic tariffs do not reflect marginal costs—the cost of supplying a particular consumer with electricity as and when he buys it. The industry's new "variable block" tariffs, it was concluded in an earlier article, are merely a convenient variant of the old two-part tariffs. Both are equally "promotional," in that the price of the next unit of electricity a consumer buys—whenever he happens to buy it—is slightly less than the price of the last. Yet the cost of supplying electricity varies widely at different times. Broadly speaking, electricity cannot be stored; so the industry requires an amount of generating capacity related not to its customers' total consumption at all times, but to their greatest total demand at any time. According to the "peak responsibility" allocation of costs, therefore, the capital costs of generation and a large proportion of the capital costs of transmission and distribution should be attributed to consumption at peak hours alone—since the capital equipment required to supply consumption at other times must already be installed to meet peak demand. Any tariff that offers electricity at "promotional" rates at peak times as well as off the peak, and broadly covers average costs, will thus be selling it too cheap at peak hours, and too dear off the peak. This is more than theoretically important. In earlier years, the industry's "promotional" tariffs were offered in order to attract consumption at off-peak hours, and thus to improve the load factor on its generating capacity; they succeeded, for a long time. But in recent years, during which a very large number of electric fires have been installed in British homes, the electricity load has become increasingly weather-conscious; the extra consumption that has recently been promoted seems increasingly to be taken at peak hours. The load factor can no longer be counted upon to improve as a result of promotional selling; it is now artificially high as a result of load-spreading and power cuts, and it is expected to worsen.

*



Can tariffs be designed that would more closely reflect these marginal costs of supply; could they be put into practice; and would they restrain or transfer demand at peak hours? Many methods have been suggested. Some are based upon estimating the contribution to maximum demand of particular types of electricity consumption—lighting, cooking, heating, power, and others—and discriminating in price between these in proportion; but such methods do not discriminate between the actual demands made by different consumers, and would put a premium upon evasion. A more practicable form is the "maximum demand" tariff, in which the fixed charge in a two-part tariff is made proportional to the maximum metered demand of the consumer. The Area Boards are tending to use this form of tariff for supplies to industry; and since the maximum demand of most industrial consumers may broadly tend to be made during peak hours for the supply system, the prices at which industry buys electricity probably will reflect the real costs of supply more closely than most domestic tariffs do. But perhaps the least arbitrary of all forms of tariffs would be a "time

GOLD: It has now been generally accepted that the famous voyage of the Argonauts was in fact a marauding expedition directed against the unfortunate inhabitants of Colchis who extracted alluvial gold from the river sands by a process involving the use of sheepskins. Although gold was one of the earliest metals known to man, the amount produced by the whole of the ancient world would seem insignificant when compared with the present production of the Union of South Africa. Here the famous Witwatersrand goldfield alone has produced, in less than seventy years, nearly 470 million ounces of fine gold worth approximately £2,260,000,000. We can always provide full and up-to-date reports from our branches in the Union for business men who are interested in market conditions or commercial undertakings in the country. Enquiries are welcomed by our Intelligence Department at the address given below.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)
Head Office: 54 Lombard St., London, E.C.3

To some this is just a Vase!

But anyone familiar with ceramics would know that it is a piece of world-famed Delhi blue pottery.

Through years of specialized study, the ceramics expert has attained a high degree of skill and discernment in his particular sphere and this is also true of the National Bank of India and its unrivalled knowledge of eastern trading. As a result of many years of continuous experience the National Bank of India can now provide much information vital to the success of modern trading ventures. Your enquiries will be welcome at the Head Office or at any of the Bank's branches.

NATIONAL BANK OF INDIA LIMITED

Branches in: INDIA, PAKISTAN, CEYLON, BURMA, KENYA, TANGANYIKA, ZANZIBAR, UGANDA, ADEN and SOMALILAND PROTECTORATE. *Bankers to the Government in* ADEN, KENYA COLONY, ZANZIBAR and UGANDA.
Head Office: 26, BISHOPSGATE, LONDON, E.C.2.

FACTS ABOUT AUSTRALIA

Over 3,000,000 bales of wool exported yearly

Australia is the world's largest wool exporter and is one of the chief primary producing countries of the world. Her secondary industries are growing in importance and are well represented in her exports. The Bank of New South Wales welcomes enquiries about trade and business opportunities and the establishment of new enterprises in Australia and New Zealand.

Ask your bankers to consult—

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA
LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1
FIRST and LARGEST COMMERCIAL BANK in the SOUTH-WEST PACIFIC
(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

IT BEGAN WITH THE CRUSADES

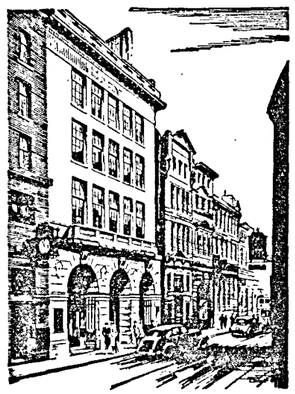
We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6



Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE PERSONAL TOUCH IN BANKING

Nearly two centuries of financial experience and personal service to each customer have helped to build up the present tradition of Glyn, Mills & Co. The banking service which is provided is completely modern in all its aspects, yet has never become impersonal in its attitude towards the large concern or the private individual.

THE RT. HON. THE EARL OF VERULAM.

of day" tariff, by which consumption during peak hours—which in recent years have become more settled and predictable—is recorded separately and charged for at a rate that reflects its "peak capacity" costs, while consumption off peak is charged for at a price reflecting in the main "energy costs" alone—fuel and other running costs. Such a tariff would not appear difficult to design: about a year ago, for example, Mr H. S. Houtthaker calculated that from BEA's costs and operations in 1948-49 a charge of about 3½d. a unit in peak periods and about ½d. a unit off the peak might be justified (making provision for depreciation at replacement costs). There would remain the so-called "consumer costs," such as connection, billing, meter-reading, and certain other indivisible overhead costs, which would have to be recovered either in a fixed charge or in the unit prices.

A maximum demand meter costs about £25; and metering to record consumption at different times separately for a time-of-day tariff would also cost more than the ordinary domestic meter, since it would have to incorporate some form of time-switch (perhaps clockwork-driven, but electrically wound) or centrally controlled relay. Even the second of these, therefore, would probably cost too much to apply to any but the larger domestic consumers and to commercial consumers. For other domestic consumers, these meters would not be economic to install; the best that might be done to restrain their peak consumption might be to make the present tariffs less "promotional" by evening out the rates in the variable-block tariffs, towards a flat rate for electricity, and by offering cheap rates for special off-peak consumption, such as water-heating—which some Area Boards already do. But the capital cost of time-of-day meters and any additional maintenance they might require hardly explain the quite adamant opposition in the British electricity supply industry to such tariffs. They are dismissed as technically impracticable—though they are, in fact employed to some extent on the Continent. More plausibly, BEA argues that "a tariff incentive reasonably related to the costs of supply is unlikely to be sufficient to offset the value to the consumer of the emergency use of electric space-heating in abnormally cold weather." This utter disbelief in the price mechanism surely needs to be substantiated. Does BEA really believe that a sharply higher price during peak hours would not induce a margin of consumers to reduce their demand? As a short-term answer to the problem of power cuts, BEA may be justified in preferring—or rather, disliking slightly less—the much more arbitrary method of restraining peak demand by load-limiting devices, which render all or part of a consumer's supplies at peak hours liable to interruption. Last year, after prolonged opposition, BEA did reluctantly consent to experiment with such equipment, and at one point even stated that it was directing its Area Boards to order load-limiters without awaiting final conclusions from its tests. Whether it has actually done much in this direction, after an encouragingly mild winter without power cuts, remains to be seen.

But the case for tariffs that more closely reflect marginal costs of supply remains independent of the possible effect of such tariffs upon the problem of power cuts; the alternative BEA has chosen is the investment of about £140 million a year in extra capacity. If the industry's load factor could be improved by tariffs that restrained or transferred demand at peak hours, the additional electric power that Britain needs in coming years might be supplied with a somewhat moderated rate of capital expansion. Many factors affect any comparison of cost; but in terms of capital, if time-of-day tariffs offered to about two million large domestic and commercial consumers, costing £10 each, or £20 million in all, for special metering, were to restrain these consumers' demand during peak hours by half a kilowatt each, it would reduce peak demand by a million kilowatts. At current prices, the generating stations to supply that slice of the load—leaving out transmission and distribution capacity—would cost £50 million or more. Forms of tariff that might transfer demand from the peak might well be a sound commercial proposition for BEA.

*

Nobody would suggest, on the other hand, that the prices suggested for electricity upon grounds of coal economy would be good business for BEA. The coal savers want to reduce coal consumption in power stations as a whole, not selectively. Electricity for domestic space heating, they argue, should be penalised; most simply, by indiscriminate price increases for the domestic consumer, and by the reservation of electricity for the purposes it serves incomparably well—lighting and certain forms of industrial power. One suggestion—put forward as a shock treatment for the consumer—would be to turn the BEA "variable block" tariff upside down. The domestic consumer would receive enough electricity to cover lighting and other essential uses at a moderate rate; further units would become progressively more expensive. The average price, such fuel planners argue, should be increased until it equated demand to supply—which does not mean generating capacity, but the amount of coal that under a national fuel policy "ought" to be allowed to electricity.

It would be tempting to explore the effect of such a tariff upon BEA's finances. Would it enable electricity to be offered much more cheaply to industrial consumers—thus rendering uneconomic another favourite of the solid fuel economisers, private power generation? Seriously, one's acceptance of the need for such drastic measures must depend upon one's reading of the prospects of the demand for coal and its supply during the next decade and of the comparative figures of efficiency of the different fuels—combined with the costs in money, real resources and personal inconvenience of the various fuel-saving measures now being proposed by various contributors to the debate on fuel policy. But it is clear that such a policy of deliberately charging more than the traffic would bear, and driving away customers it has recently sought to win, is not one that any fuel industry—nationalised monopoly or not—could be expected to adopt of its own accord. In that sense, this is a question not for BEA but for Viscount Ridley, Mr Lloyd and Lord Leathers. For the present, the balance of evidence on fuel policy does not seem clear enough to justify so violently disincentive a form of tariff for electricity alone. Coal is the primary source of the great majority of the fuels consumed in Britain; upon such reasoning, should not the National Coal Board manipulate the prices of coal to bring demand into line with supply and with the relative efficiency and convenience of the different fuels? If such a policy should be decreed—and if it could ever be administered—electricity is not the only fuel the price of which would have to be aligned with it.

On examination, indeed, it may be concluded that the

two forms of criticism of BEA's tariff policy tend to clash. Such forms of tariff as would improve load factor on the electricity system would not necessarily save coal; if BEA's load factor reached 60 per cent instead of 47 per cent, for example, it might cost another ten million tons of coal a year. But from the point of view of saving coal, even power cuts have their virtues; the fact that additional demand for electricity may have been attracted on to the peak has meant on occasion that part of it was simply not supplied, and thus did not take coal. But whatever the modifications of fuel pricing policy that may be dictated in the interests of national fuel economy, the case for tariffs that reflect marginal costs of supply remains a strong one. And until it offers such tariffs—or demonstrates conclusively that they are impracticable—BEA's argument that the best way to select the most efficient and convenient fuel for a given purpose is to leave it to the free choice of the consumer seems rather disingenuous. For it is still offering its own wares—for some of the time—at cut price.

Business Notes

Markets Slipping Further

The news that the sterling area's gold reserves fell by less than £10 million between the end of March and June 11th has not been sufficient to restore confidence among investors. The big institutions, who by now must have piled up a considerable backlog of liquid funds, have remained firmly on the fence. The small private investors, whose buying was principally responsible for the firmness of the market before last month's crack, are no longer giving any notable support—although they do not, at the moment, seem to be generally disposed to sell. In these circumstances the market is narrow and unduly vulnerable to any new expansion of sales. The pace this week seems to have been set by industrial companies caught in the credit squeeze, or apprehensive of a further squeeze, and consequently disposed to offload some of their depleted holdings of gilt-edged. On Wednesday of this week selling of this character appears to have been the main factor in forcing War Loan and 3½ per cent Conversion Loan down by ⅞ths of a point on that day. By the close of business on Thursday War Loan stood at 73⅛, having touched 73, and old Consols at 55⅞; these were their lowest levels since the early 1930s, and compared with prices of 74¼ and 57 respectively, just before Mr Butler's statement on Thursday of last week. The market has also come under pressure from sales of a new £22 million *tranche* of 3½ per cent Coal Stock, 1977-80, allotted to former colliery owners last weekend at a price of 84⅝, but some cushion has obviously been provided against such selling. Industrial shares have reflected the weakness of gilt-edged, and by Wednesday's close the *Financial Times* index of industrial ordinary shares stood at 103.7, compared with 105.1 a week before.

To a greater extent than ever before, of course, investors are looking over their shoulder at the foreign exchange market, where sterling edged up irresolutely, from $2.78¼ to $2.78⅜, in the first four working days following Mr Butler's statement—only to relapse sharply to $2.78⅛ on Wednesday, and then to $2.78⅛ on Thursday. Despite the better showing of the gold reserves, it is clear that the markets are still uneasily questioning whether the Government's announced objective of external equilibrium in the second half of this year can be accomplishable without further stern measures to secure the diversion of exports to hard currency markets and to hold back internal demand.

* * *

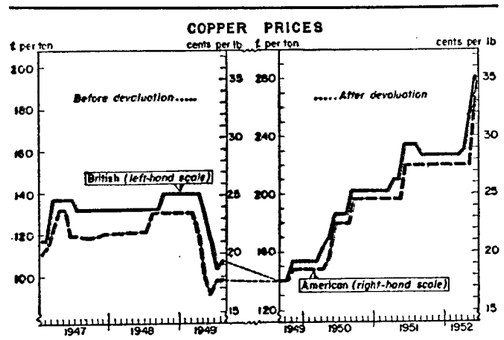
Mr Menzies Departs

The Australian Prime Minister, Mr R. G. Menzies, left London for the United States this week after a visit that appears to have covered an exceptionally wide agenda. Among the points raised and discussed were the problem of Australian food production and exports to Britain. This subject is to be pursued further in London. The Australians, for their part, have promised to make a real effort to reverse the drift towards urbanisation and to give food production the high priority that it deserves. Defence problems have also come into the question, and Britain has given certain promises to satisfy Australian defence requirements, and to shift some of the emphasis that now focuses on Europe to the defence problems of the Pacific. In announcing the result of talks with Mr Menzies, Mr Churchill this week stressed the desirability of holding a Commonwealth Economic Conference "at the earliest possible moment." At this conference, which is likely to be held next year, the financial problems of the sterling area will once again come to the fore, though it is by no means improbable that drastic developments will not have occurred in this sphere before then. On the subject of exchange policy, Mr Menzies this week stressed his belief in the goal of convertibility of sterling. He said that the protection and strengthening of sterling and the building up of a volume of trade that would underspin sterling would not be an element of hostility to any other trading or financial system or to the dollar area in particular.

Something appears to have been achieved during Mr Menzies' visit on the question of Australia's import restrictions. Mr Menzies, in a statement made just before his departure, pointed out that Australia was determined to live within her income and to maintain her international solvency at all costs. It was for these reasons alone that the import restrictions had been introduced. He accepted, however, the point that Australian importers might in some cases have used the import cuts as a pretext for dishonouring outstanding contracts where price movements had turned against them In order to put this matter beyond doubt the Australian Government has now decided to introduce some important changes in the procedure for issuing import licences for category B goods, in which imports were to be restricted to only 20 per cent on value of orders placed in 1950-51. Henceforth it will be made the general rule that where an Australian importer has placed firm orders for such goods before March 8th his quota for category B goods cannot be applied to licences for goods ordered after this date until the old orders have been satisfied. That should close a loophole through which a certain dishonourable avoidance of contracts has been attempted under the alleged protection of the Government's import cuts. Mr Menzies also promised a more sympathetic administration of the import quota regulations with a view to meeting exceptionally hard cases. But there was no hint in the discussions held in London of any general relaxation of Australia's import controls. If there were any suggestion that these import cuts might be eased if Britain were prepared to extend credits to Australia, they were made by implication only. There was no direct suggestion by Australia that its London funds might be reinforced through raising new short-term credit or long-term loans in the London market. In the United States, however, where Mr Menzies is now, he will be openly pursuing the quarry of new dollar facilities. What he has specifically in mind is a further $150 million loan from the International Bank. He spoke of it so confidently in London that it must be assumed that most of the preparatory work for this operation has been successfully completed.

Where the Credit Shoe Pinches

The latest of the quarterly analyses of bank advances reveals the effectiveness of the new monetary policy even more strikingly than the monthly totals of the clearing banks have done. In the three months to the date of the May analysis, a period of seasonally strong credit demands, the total of bank advances in Great Britain dropped by £52 million, to £2,004 million. This is easily the biggest decline shown in any quarter since the war, and is the first one since the second half of 1950, when electricity advances were being repaid out of the proceeds of a BEA loan. It is true that the latest figures were affected by similar repayments; but the distinctive feature of the analysis, as compared with the monthly figures, is that it shows the electricity repayments completed by the date of the May make-up to have been appreciably smaller than was at first supposed. Clearing bank advances (the figure for which includes advances abroad as well as some extraneous items) dropped in May by £62 million, or by roughly the amount then called on the loan; but it now appears that at that date only some of the banks had had the full benefit of repayments from the second call, and the quarterly figures for all banks reveal a decline of advances to public utilities by only £30 million over the three months, to £105 million. Advances to all other domestic borrowers therefore fell during the quarter by £22 million, which suggests that the credit shoe has pinched a good deal tighter in this period than it did in the first three months of the new discipline, when the total of such advances was just stabilised; in February/May, 1951, it rose by nearly £66 million.



This contraction of credit to the private sector of the economy has been achieved despite an increase in advances to the expanding metal-using industries (the engineering and iron and steel groups have each secured another £7 million) and despite two rather unexpected increases of £17 million in credits for food, drink and tobacco and £6 million for the "other financial" group, which includes finance corporations and certain holding companies. The big increase in the food category is seasonal, but the total for this group, at £184 million, is now £40 million more than it was at the same date last year. Seven other groups have each secured slightly increased credits—quarrying, non-ferrous metals, transport, agriculture (much less than seasonal), charities, entertainment (rather curiously) and cotton. This last increase, though it amounts to only £650,000, to £19.7 million, is significant in that it confirms that the banks are not putting any strong pressure on the holders of heavy stocks in this group.

*

On the other hand, the shoe may have been allowed to pinch elsewhere in textiles: credits to the wool group have contracted by £3.9 million, to £21.7 million, and those to "other textiles" by £6.2 million, to £61 million. The fall in raw material prices, however, must have substantially reduced the need for credit in these categories. A big fall in the chemicals group, which by February had reached the abnormally high total of £42 million, and is now down to under £29 million, is presumably attributable to repayments from the proceeds of recent capital issues. Small declines are shown in coal, shipping and shipbuilding, leather and rubber, retail trade (in sharp reversal of the seasonal trend), building materials and contractors, and local authorities; and a rather larger decline in "unclassifiable" industry, which is down by £8.3 million, at £139 million. It is impossible to guess from the figures the extent to which these declines reflect pressure from the banks rather than voluntary repayments; but there is no doubt at all that pressure has been a major source of the striking contraction, by £18.8 million, in credits to the large "personal and professional" group. At £410 million, this group is now £27 million below the peak reached last August.

Copper's Leap

At the end of last week the price of copper in Britain made its biggest leap, to its highest level. The Ministry of Materials, having at last seen a little more clearly through the confusion that is still reigning in the New York copper market, raised its selling price by no less than £50 a ton, to £281. This price is equivalent to 32½ cents a lb in New York, as £11 a ton has to be deducted to cover cost of freight, storage and delivery to consumer's works. The American export price is at present quoted as a range of 34-36½ cents a lb (£283-£300 a ton equivalent British price). The Ministry is not, therefore, keeping strictly to its recently announced policy of aligning British prices with those quoted by the *Engineering and Mining Journal*. Admittedly, it is difficult to discover the true price of copper, but according to quotations both in New York and on the continental "free" market, it is certainly above 32½ cents a lb. The Rhodesian producers, themselves, are probably not eager to obtain an undue price for their output, for wages in the mining belt are geared to the average price of copper related to current costs; and while wages follow this margin closely when it is expanding, they may not follow it so closely when it is contracting. But the confusion about the real price of copper emphasises the need for a proper world market—and that, by tradition and logic, should be in London.

Copper has now become a dear metal, though in relation to lead, it is no dearer than it was in the ten years before the war. But since the war, when the price of lead rose more sharply than that of copper, plumbers and builders substituted copper for it. If the prewar price relationship persists for any length of time, it is conceivable that they will revert to lead—at least to some extent. In that case the price of copper might drop from its present high level and the price of lead might rise. At current prices there might also be some switching from copper to zinc. Any comparison with the prewar period must be treated cautiously; but the recent leap in the price of copper is bound to reduce consumption in its marginal uses. The present spread between the prices of the three main base metals is the widest ever attained in the postwar period, and some narrowing of it would seem inevitable.

EPU and IMF

The Managing Board of the European Payments Union has been meeting in Paris this week to translate into precise and legalistic language the general agreement reached previously by the OEEC Council of Ministers on the extension of EPU after the end of this month. In general, the understanding they reached was sufficiently precise to allow the drafting to proceed smoothly. There is one point, however, at which the arrangements are causing some difficulty. This

concerns a provision in the agreement for dealing with Belgium's excess credits to EPU, under which it was proposed to fund $50 million of the excess in a form that would enable Belgium to monetise it immediately. The EPU side of this agreement was an undertaking to repay the $50 million in question to Belgium in five equal annual instalments, beginning in 1953. Belgium, for its part, hoped to borrow an equivalent amount of dollars from the International Monetary Fund for five years, and to repay the Fund out of the yearly instalments paid by EPU. The Governor of the National Bank of Belgium has gone to Washington this week to discuss the technical aspects of this operation, but the question has now been raised whether such an operation is permissible under the Articles of Agreement of the IMF. Belgium can by no stretch of imagination plead the temporary balance of payments difficulties that would entitle it to ask for assistance from the IMF. Nor do the articles of IMF allow it to enter into commitments involving obligations with parties other than member countries.

Another difficulty arises from the fact that the Paris agreement did not specifically commit EPU to make its annuity payments to Belgium in gold or dollars. Those annuity payments will be taken, as they fall due, into the EPU clearing. They will not, therefore, necessarily be made in gold but may merely serve to increase Belgium's credit with EPU. In these circumstances, it may be impossible for Belgium to link its proposed borrowing from IMF directly with the EPU funding; it may have to interpose itself as a direct party to the transaction, taking on its own shoulders the responsibility for the repayment of its proposed loan from the IMF, and leaving EPU out of the contract. It has also to be decided whether the proposed advance from IMF will be made under normal IMF procedures or whether it will be in addition to Belgium's quota with the IMF. So much new ground has to be covered in this interesting and original operation that it is not surprising that the highest Belgian banking authorities should have gone to Washington to discuss it.

Accountants and the Value of Money

This week over 2,500 accountants from thirty-three different countries have met in the Royal Festival Hall in London for the sixth International Congress on Accounting; the first of these congresses was held in the United States in 1904, and it is nearly twenty years since England was last the venue. Four main themes dominated the discussion—the appropriate accounting technique for dealing with fluctuating price levels, the incidence of taxation in different countries, the almost universal difficulty of raising or retaining capital for development, and the future role of the accountant both in public service and private and commercial practice.

More than thirty-five set papers, together with much informal discussion, were devoted to these four themes; it is impossible to attempt here any adequate précis of the contributions, which were themselves presented in admirably crisp form. Inevitably, however, the root problem that recurred again and again throughout the congress was the difficulty of replacing fixed assets under tax systems that permit allowances for depreciation only on the basis of original cost. Much less was heard than at the time of the Tucker Committee of the suggestion that there are moral arguments that preclude any economic valuation of both fixed assets and stocks for tax purposes. There was, however, still a distinct cleavage between those who favoured a once-for-all revaluation when (they assumed it was "when," not "if") the war and postwar inflation is passed, and those who favoured a continuing system to take account of a year-by-year change in the value of money; ingenious answers to some of the technical objections raised to the latter approach were outlined by Mr C. P. Barrowcliff of Britain and Professor W. J. Graham of the United States.

Perhaps the most interesting contribution came from accountants in countries such as France and Germany, where inflation has long since run far enough to show how absurd it is to regard a franc or mark (or for that matter a £) of the 1930s as the same accounting unit as a franc or mark of the 1950s. In particular, three accountants associated with the French Ministry of Finance gave a lucid description of the French system of relying on official coefficients that express the fall in the value of money since a given base date. Under French accounting and tax law the maximum value of each revalued fixed asset is obtained by multiplying the original cost of that asset by the coefficient fixed by the Government for the year of its acquisition; yearly accretions to depreciation reserves are revalued by applying appropriate coefficients taken from the same schedule, and the difference between the figures emerging from these two calculations is taken as the written-up value on which new depreciations are based. In the early postwar years the French government stipulated that depreciation should be spread over a minimum period of eight years for plant and twenty years for buildings, but since 1948 the remaining life of each asset has been the accepted basis.

German Debt Talks

The threatened deadlock in the discussions on Germany's prewar external debts has been successfully avoided. The discussions have been resumed in London. A reflection of this improved atmosphere is to be seen in the considerable recovery that German bonds have made from the low prices touched when news of the initial German offer and its summary rejection by the creditors became known. The fact that new proposals are being tentatively suggested from the German side seems to be implied in the holding of a full meeting of the Creditors' Committee in London this week. One of the points discussed at this meeting was the problem of the Standstill debts, on which full agreement is said to be within sight. The Standstill creditors argue that they should be given priority because a satisfactory settlement of their claims is an essential preliminary to the extension of new commercial credits to Germany and that this in its turn is necessary to revive Germany's export trade and capacity to meet the service on its prewar bonded external debt. That argument has now been accepted not only by Germany but by the American representatives, who until recently provided the main opposition to it. Another issue on which the American attitude is all-important is the treatment of gold and exchange clauses in German external bonds. A member of the delegation, Dr J. G. Rogers, has recently left London for New York in order to "consult" on this and other relevant issues with the American Bond Holders Protective Council of which he is the president. On present indications the talks with Germany are likely to continue for some time before final agreement is reached.

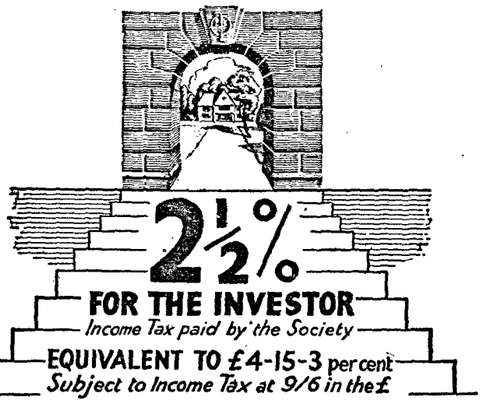
Third Class to Nairobi

The Government's policy for civil aviation has so far met with no serious opposition, and Tuesday's debate in the House of Lords suggests that, in spite of certain obvious weaknesses in it, none will be forthcoming. A good many questions, however, were asked about the future status of the reconstituted Air Transport Advisory Council, which will hear applications from the corporations and the private companies to operate new services. In his efforts to allay these fears, Lord Leathers, and Lord de l'Isle and Dudley who spoke after him, went some way towards reversing the impression about its new functions that was

PLOUGHING

FOR OIL PLANT

On the marshy Isle of Grain in Kent, some 750,000 cubic yards of soil, poor for farming, are being moved in the construction of Britain's latest oil plant.



On this site, Anglo-Iranian's fourth refinery in the United Kingdom is rapidly taking shape. By 1953 it will be in full operation, producing over two and a half million gallons of petroleum products a day; and one more stage will have been completed in Anglo-Iranian's world-wide programme of refinery expansion.

THE CASE OF THE SAVILE ROW TAILOR

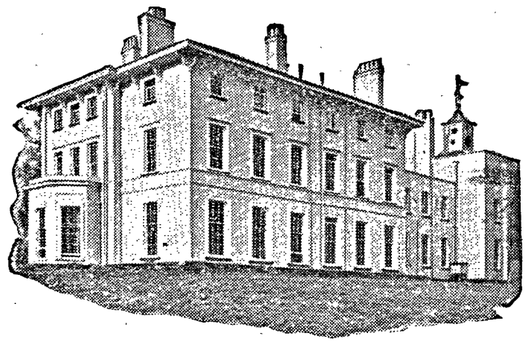
He was never kept waiting . . .

JOHN G. HARDY LIMITED, the London woollen merchants, are helping the tailor serve the public. Once the private customer has made his choice from the "bunches" of Hardy Suitings at his tailor's, or at Hardy's own showroom (where upwards of 1600 cloths are displayed and stocked), the transaction is made at wholesale level.

This novel merchandising method means obviously that sales records and agents' commission statements for a huge yardage of small lengths of cloth must be kept scrupulously up to date. Anxious to avoid a great deal of complicated paper work — and a consequent increase in office staff — Hardy's went for advice to machine accounting specialists of Burroughs Adding Machine Limited.

After a full investigation, Burroughs suggested that the firm could take care of all its accounting problems with the help of one Burroughs Typewriter Accounting Machine and a Desk Bookkeeping Machine.

John G. Hardy Limited display over 1600 cloths. To keep tabs on the rapid movement of stock they streamlined their office system . . .



Result: Hardy's office system is now as smoothly up to date as their showroom. Sales and commission statements go out on the dot to tailors and agents in 46 countries. Profit and loss figures (previously produced only twice a year) are available daily. In addition, the payroll for the firm's employees, which used to take the office a full day, is now produced in an *hour and a half.*

WHAT ABOUT YOU? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment.

Call Burroughs *today*. Sales and Service offices in principal cities round the world. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Painted 1926— repainted 1951

The brick and stucco of the Chadacre Agricultural Institute were painted with white lead in 1926. For a quarter of a century it was not touched. Then, last winter, the accumulated dirt was washed off before repainting — and that was all that was needed to be done: the original paint had worn thin, of course, but the film was smooth and unbroken; it formed a perfect foundation for the three coats of white lead. Although we do not pretend that 25 years between paintings usually gives the most economical maintenance, this building is a very good example of what we mean when we say white lead paint lasts.

created by Mr Lennox Boyd three weeks earlier. The Government had no intention, said Lord Leathers, of ever converting the ATAC into a statutory licensing body independent of Parliament; it was to continue as at present to act in a purely advisory capacity, making recommendations to the Minister.

Although the intended scope of the ATAC seems to be more restricted than was first expected, there has been no delay in putting its recommendations into practice. Last Saturday two private companies, Hunting Air Travel Ltd., and Airwork Ltd., started the first regular third-class air services to be authorised under the new policy. These two companies will operate a joint weekly service between London and Nairobi, a route already covered by BOAC. Using Vikings carrying about 25 passengers, the journey will take nearly three days, compared with roughly 24 hours by BOAC. But the single fare will be £98 compared with £140 for the corporation. The same journey by sea, in tourist class, might be about £30 cheaper still, but there would be more incidental expenses and the journey might take between two and three weeks. It would be foolish to pretend that this new service will not take some traffic from BOAC; it is already fully booked each way until November. But it may prove the theory—put forward by government speakers on Tuesday—that competition in the air has so far led to an increase in traffic carried by both types of operator. East Africa, with its poorly developed land communications, represents an ideal territory in which to put such a theory to the test.

Competition from these third-class services may lead to more rapid introduction by the corporations of their own tourist, or second class, flights on other routes besides the North Atlantic. The tourist fares have to be agreed by the International Air Transport Association, of which the big operators, but not the private charter companies, are all members. They are usually 30 per cent lower than the standard fare, which suggests that if BOAC were to decide to recapture traffic by introducing tourist rates to Nairobi, the private companies' third-class fares would have to be substantially reduced, when it might become difficult to make them pay.

The Middle East's Sterling

The contrasting problems of Egypt's and Iraq's sterling holdings have come to the fore simultaneously. Egypt has just deemed it necessary to decree a considerable contraction of imports and of credits covering import transactions. A long list of articles have been added to the list of those requiring import permits from the Exchange control. The restrictions are aimed primarily at saving sterling, Egypt's holdings of which have recently been seriously reduced. By the end of May the total of available sterling in the Egyptian No. 1 account had fallen to £12¼ million. The main reason for this decline in external reserves has been the failure to sell a large part of the cotton crop for the second year in succession.

The Iraqi delegates who are here in London to negotiate a renewal of the five-year financial agreement concluded in 1947 have a much more comfortable position to deal with. Thanks to increased oil royalty payments, Iraq has substantial sterling balances in its No. 1 account. The amount left in the blocked No. 2 account is between £20 and £30 million. The releases from No. 2 to No. 1 account, which have been proceeding regularly since 1947, may now make way for a more flexible arrangement. Iraq will also have to negotiate new agreements for allocation of hard currency from the sterling area pool. Under the previous agreement, specific allocations were made for 4 years from 1947, but in the latest year covered by that agreement Iraq was put on the usual basis accorded to members of the sterling area, and given free right of access to the gold and dollar pool on the understanding that it would exercise the usual restraint. It must now be decided whether for the coming year a similar informal and elastic arrangement will apply, or whether there is to be a return to specific dollar allocation. The Iraqi delegates are also discussing trade matters, and in particular trying to secure supplies of steel and other scarce commodities for implementing the ambitious economic development programme that has been put in hand in that country.

Cold Comfort from Courtaulds

The preliminary statement issued by Courtaulds for the year to March 31st will do nothing to allay the fears recently aroused by the closing of some of the company's factories. The sharp fall in sales of rayon goods, which the directors describe as "a major trade recession" in the industry here and abroad, did not really set in until the New Year. Production and sales were running at a sufficiently high rate in the first nine months of 1951-52 to bring about an actual increase in Courtauld's trading and investment income for the whole year, from £17,270,823 to the record figure of £19,018,402. But while this made it possible to pay out £1,627,500 in ordinary and preference dividends and thus maintain the ordinary dividend rate at 11¼ per cent, the directors warned shareholders that without a "rapid and material improvement in trade" the dividend may not be earned again in 1952-53. The company's problems are exacerbated by the fact that the slump in rayon sales has not only caused a serious cut in production and widespread dismissals, but has also led to the accumulation of substantial stocks of finished goods and raw materials. A good proportion of these stocks, and particularly those of wood pulp, must have been bought at prices considerably higher than they are today, and it may not be possible to dispose of the finished goods without some reduction in price. The likelihood of considerable losses on stocks is therefore a real one. The directors have made some provision against it by transferring £2,800,000 (against £2,600,000) to stock reserves, in addition to £2,158,452 (against £1,556,527) retained by subsidiaries and an appropriation of £1,912,674 (against £1,704,692) to fixed assets replacement reserves. The likely need for these provisions has been underlined by the news that another rayon company, Lansil Ltd, made a loss of £274,265 in the year to March 29th, largely because of the need to write off stock.

There have been some signs of a recovery in textile sales in the past few weeks, but nothing like the "rapid and material improvement" that Courtaulds apparently need to maintain their dividend. In particular the measures announced by the Government this week to expand the military uses of rayon have little material—though they may have considerable psychological—value at the present time. There are indications that sales of the more expensive acetate rayon are holding up rather better than those of viscose; for example, British Celanese's factory at Spondon has not had to introduce any additional short-time working since it first cut back to a short-time rota at the end of March. But the rayon industry is unfortunate in that it is essential that its mass production plants run to capacity if they are to run efficiently.

* * *

Fall in Prices Slackening?

The decline in wholesale prices during May was rather less steep than in the previous two months. The index of basic materials (June 30, 1949=100) fell by only 2.6 points to 162.1, but reached its lowest since October, 1950. The index is now 26 per cent below the peak touched in March last year and is 20 per cent lower than in May, 1951.

Only one major commodity increased in price during the month: wool prices, which had been declining steadily since

last autumn, rose by 13 per cent during May, reflecting the stronger demand for both merino and worsted wools. Prices of other textile materials continued to fall, with the exception of silk which remained stationary. East African sisal fell by 20 per cent, showing the biggest fall for any commodity during the month. Cotton and jute, on the other hand, were down only slightly, and the prices of their yarns followed

* Source: Board of Trade.

a similar trend. Among other materials, rubber fell by over 18 per cent on the month, to its lowest level for nearly two years. In the past week or so there has been some revival in the rubber market and this should be reflected in the index for June. In base metals, there have recently been several substantial reductions in the official prices of zinc and lead but most of the fall in zinc did not occur until June. The May indices showed a fall of 15.6 per cent in lead but only a very slight fall in zinc; copper remained stationary. Various miscellaneous materials declined in price during the month, including some vegetable oils (linseed and palm oil), shellac and rosin, woodpulp and imported timber. As a result of the falls in non-ferrous metal and timber prices, the indices of building material prices fell for the first time since last September; building and civil engineering materials fell by 2.6 points to 134.7 and housebuilding materials by 1.7 to 131.7.

* * *

Firmer Rubber

Since the beginning of this month a firmer tone has prevailed in the rubber market. During May, London prices had declined from 31½ pence a lb to 23⅜ pence a lb, the lowest point since the beginning of the Korean war in June, 1950. By Wednesday last the price was 27⅛ pence a lb in London. The slight improvement in the past fortnight probably indicates that last month the market was taking rather too gloomy a view of the prospects for natural rubber. The current issue of the Rubber Statistical Bulletin shows that world consumption of natural rubber in March was considerably higher than in the previous four months and that the surplus of production over consumption in the first three months of the year was much smaller than in the corresponding period last year. (It should be remembered that last year the United States bought about 300,000 tons of the stockpile; this year those purchases have ceased.) World stocks have dropped sharply—by 62,500 tons, to 772,500 tons, in the two months to end March—and this fact alone might prevent any drastic fall in price in the immediate future. As was to be expected, the reduction in stocks has been most pronounced in the consuming countries, especially in the United States, where the total (excluding the stockpile) was down to 66,193 tons, or less than 2 months' consumption, by the end of March, though it was still considerably higher than at the comparable date last year.

Recent reports from the United States suggest that synthetic production may be transferred to private industry within the next two years. Within the past few days the Senate has passed a bill calling on the President to present before April next a detailed plan for the transfer. An official has since been appointed to carry out the study. Meanwhile Congress is expected to pass a bill extending the life of the Rubber Act by a further 21 months; this is the act that ensures a minimum synthetic content in many American rubber manufactures. Natural rubber growers may benefit from the intention to make the transfer—if cuts in synthetic prices are halted in order to make the plants more attractive to private enterprise.

By-products from Bombs

Lord Cherwell's speech on atomic energy in the House of Lords last week was not so much a statement of policy as a reassessment of the prospects of nuclear power generation, and in some respects it was a disappointing one. He certainly cannot be accused of over-enthusiasm. Having said that "nobody claims that nuclear energy will be cheaper than energy from coal," he went on to say that by 1960 the tonnage of coal used for electricity generation might have risen from 35 million tons burnt last year to something approaching 48 million tons, so that the alternative of raising steam from nuclear piles rather than boilers might then be worth serious consideration by the electricity authorities. But the present type of reactor could hardly be used for this. Less than one per cent of the uranium charge in these reactors is actually effectively used to produce heat, and at this rate an annual consumption of 100 tons of uranium would produce less electricity than is at present produced by 2 million tons of coal, or barely 5 per cent of present coal consumption at the power stations. Such relatively large quantities of uranium would be hard to procure.

It will be essential to develop "breeder" reactors, which use some of their energy to convert what are normally non-fissile materials into less stable, fissile ones that can be put into the pile as fuel. The design of such piles involves what Lord Cherwell called the "most extraordinary novel technical difficulties." The major one, of extracting these newly created fissile materials from their stable surroundings, has been "more or less mastered," which suggests that there is now a reasonable chance of starting the construction of such a plant. But unfortunately Lord Cherwell made no reference whatever to the possibility of combining power generation with the production of plutonium for atomic weapons—a combination that reduces the cost of the electricity produced from the pile to a figure that may be below that of coal-generated electricity. A number of big American companies with awkwardly sited factories are considering building such plants, and it would have been interesting to know how such a development affected the prospect for nuclear power in this country.

A comparison between Lord Cherwell's speech and that made by President Truman two days later when the keel of the atomic submarine was laid is a typical example of the striking difference between the British and the American approach to the subject of the atom. British research in some fields is known to be ahead of American, but the speed with which this knowledge is applied is influenced by the desire of British scientists to make sure they can walk before they try to run. The first nuclear power generator built in this country will be an experimental one: the first to be built in the United States is being fitted direct into the hull of the *Nautilus*. President Truman spoke of this submarine in glowing and romantic terms, and described it rather ambiguously as a "working power plant for peace." But only in England, and possibly only in the House of Lords, could it have been said that one advantage of a stockpile

BLAST AND COUNTERBLAST

THE inside of a blast furnace deteriorates with use and every three to five years the refractory material with which it is lined has to be renewed. First, the furnace must be allowed to cool, then the old lining—up to 1,000 tons of it—must be prised out by men with crowbars and pneumatic hammers. In order to save time, many steel works have called in I.C.I., whose Nobel Division in Glasgow has developed a special technique, using new explosives, which enables furnace linings to be blasted out when still hot—without the delay of waiting for the shot holes to cool down to normal temperatures.

With this technique, a blast furnace at Scunthorpe in Lincolnshire was relined in the record time of 32 days, 11 hours and 39 minutes without damage to either the outer shell of the furnace or adjacent plant. A fair average time for the explosive method would be 50 days, as against about 150 days by the old hammer and crowbar method. This speed-up in the relining of furnaces is equivalent to a 4% increase in the total steel-producing capacity of the United Kingdom.

Surplus Oils and Fats

Last year marked the changeover from scarcity to plenty in oils and fats, and since June, 1951, prices have fallen steeply. This year, although world production will still not be large enough to cover the prewar consumption per head of population, there is likely to be a substantial

surplus over the current rate of consumption. In giving this forecast in his annual address to the International Association of Seed Crushers, Mr J. C. A. Faure, of Unilever, said that effective demand is falling, first because currency difficulties are restricting imports and secondly because of the increasing use of synthetic detergents. Hence, prices are likely to fall still further during the next 12 to 18 months. At present they are about 400 per cent above their prewar level; next year they might be only 100-300 per cent above it. Certain vegetable oils, like groundnuts and linseed, are scarce; their prices should remain above the general level.

Owing to a very heavy crop of olives in Europe, the world output of fats and oils is expected to reach 24,300,000 metric tons this year, or 920,000 tons more than in 1951. Most of the increase will be absorbed by the producing countries, so that exports are expected to rise by only about 123,000 tons, to 5,740,000 tons. Argentina, which normally accounts for 80 per cent of the world's exports of linseed, has had a serious drought, and the crop is expected to be one of the smallest on record. This reduction in supplies will accentuate the serious shortage that already exists outside the United States. Exports of copra from Indonesia are expected to fall this year, and so may shipments from the Philippines—not because of a reduction in supplies but because of the dwindling demand in the United States. On the other hand, the Nigerian crop of groundnuts is about three times the size of last year's, but for want of transport, only about 80 per cent of the crop can be exported.

This year European consumption and exports are estimated at 6,910,000 tons; 309,000 tons will be needed to build up stocks, making total requirements of 7,219,000 tons. Domestic production is expected to provide 3,569,000 tons of this, leaving 3,650,000 tons to be imported. In fact, about 530,000 tons more than this is likely to be available in exporting countries. Mr Faure concludes that, in the circumstances, "Europe does not strictly need to import oils and fats from the United States in 1952." The United Kingdom gets most of its supplies from the sterling area and, but for the need to achieve a surplus in the total balance of payments, as distinct from the dollar account, it would seem that margarine rationing could soon be ended.

Company Notes

Kaffir Dividends.—The recent resumption of buying of Kaffirs in the stock markets does not indicate that the June dividend announcements from the Rand have been better than generally expected; it simply indicates that investors—with one eye on the weakness of sterling and the other on recurrent rumours of a movement towards freer exchange rates—are gambling on the possibility of some future increase in the sterling price of gold. The June dividend payments announced so far contain an almost equal quota of pleasant and unpleasant surprises. All the operating companies in the Union Corporation group reduced their dividends, but these reductions were no bigger than had been expected, except in the case of Geduld, whose dividend of 6s. 3d. was as much as 9d. below some market forecasts. The dividends announced by the Central Mining group contained two rather pleasant surprises. The increase in the payment of Blyvooruitzicht (by 2d. to 1s. 6d.) exceeded the most optimistic expectations, while the maintenance of the dividend by Durban Deep at 2s. 6d. was also regarded as particularly satisfactory, in view of the heavy capital expenditures being financed out of current profits by this company. On the other hand, the reduction in the payment made by City Deep, another company that has made heavy capital outlays on the sinking of new shafts, was sharper than had been expected. The sharp reduction in the Crown dividend from 4s. 6d. to 2s. 6d. had been fore-shadowed, if not forecast, in the statement made by its chairman last month.

Royal Mail.—The burden of replacement costs under the present British system of tax assessment is a perennial theme in the speeches made by the chairmen of the Lines companies, and it is again stressed in the statement made by Mr Walter Warwick, the chairman of Royal Mail. For some years past Royal Mail has built up a large replacement account to provide against the increased costs of building new ships. This account now stands at £6,348,000, which is considerably in excess of the written down value (£3,710,766) of the Royal Mail fleet, but the chairman points out that it is "by no means too large in relation to prospective costs of replacement." Royal Mail has its own particular problem when considering the construction of new vessels. In the past, many of the company's ships were equipped with costly refrigeration installations for the shipment of meat from Argentina. The volume of this trade has now seriously declined; as a result, some of the ships thus equipped have had to be directed to other routes, and the uncertain prospect for the meat trade has given rise to "great difficulty in deciding what type of ship should be built in future for the South American trade."

The fact that group profits, after their setback to £2,373,551 in 1950, recovered to £3,590,993 last year, shows that Royal Mail has proved itself capable of quickly adapting its trade in times of adversity, but Mr Warwick warns shareholders that it would be "unrealistic to take too complacent a view of the future." The loss of meat shipments last year was to a large extent offset by an increase in the shipment of other refrigerated produce, notably fruit, but this trade is hampered by exchange difficulties. Moreover, while the company was able to maintain

tain its passenger and freight services to South American ports in 1951, Mr Warwick believes that a further contraction in trade to Argentina can be expected. Trading to Brazilian ports may not altogether make this good; even last year, when trade between Brazil and Britain was reasonably buoyant, the company was forced to divert some ships from Brazilian ports to load in other berths because of a lack of cargo. Last year's recovery in earnings enabled Royal Mail to increase the ordinary dividend from 7½ to 10 per cent—a step that was discussed in these columns on June 7th. The outlook for future dividend payments, as for the company's trade, must be regarded as unsettled, though not necessarily bleak.

★

Wiggins, Teape.—One after another the paper manufacturers have reported spectacular increases in profits in 1951. In most cases, as in the accounts of Wiggins, Teape, the advance owed a little to a genuine expansion in production, but in all cases the main cause was the automatic and fortuitous expansion of inventory profits as a legacy of last year's inflation in prices. By raising the tax free ordinary dividend from 4½ to 6½ per cent, the directors of Wiggins, Teape have presumably discounted the considerable element of inventory gains in the staggering bound in group trading profits, from £2,752,914 to £7,291,985, and are acknowledging the fact that part of this increase represented a genuine expansion in business. The days of real boom, however, seem to be over. Mr L. W. Farrow, the chairman, speaks of "a serious recession" in the demand for paper and paper products, not only in this country, but throughout the world. Consumers, who are now expecting further falls in the price of paper, are content at the moment to live on the stocks that were built up last year in the (partly false) anticipation of a shortage; they are therefore buying only enough to satisfy their barest current requirements. At home the recession has been made worse by the slump in the textile trades; abroad it has been affected by import quotas and restrictions.

Mr Farrow describes the outlook for the Wiggins, Teape group as "unpredictable," but he adds that the group has earned satisfactory profits in the first five months of 1952—before taking into account the depre-

ciation in the value of paper and material stocks, "for which ample provision has been made in the 1951 accounts." Here the chairman is referring to the group's appropriation of £695,913 (against £69,497) to a paper and raw materials stock reserve. This appropriation brings the total sum held in the stock reserve to £1 million; the directors are confident that this will amply cover any losses that may arise on stocks through a reduction in prices, particularly as these losses will be a charge against profits for taxation purposes. Such losses could, however, prove to be quite substantial, for the value of stocks increased from £3,589,451 to £6,973,115 in 1951—largely as a reflection of the inflation in prices. In order to finance this increased investment in working capital the company last year issued a 4½ per cent mortgage debenture stock; the receipts of £1,964,595 from this issue enabled it to pay off an unsecured bank loan of £500,000 and to reduce the amount owing on acceptance credits to £270,000. In assessing this year's prospects the chairman reveals that profits earned in the first five months of this year exceed the amount of the company's EPL standard profits for the whole year, and he indicates that if this is kept up then the same rate of ordinary dividend—6½ per cent—could be paid, leaving a margin for reserve appropriations.

★

Spillers.—In recent months the Treasury seems to have looked with more favour, and greater good sense, upon the capitalisation of company reserves in order to bring issued capital into closer relationship with the real capital employed. One of the latest companies to be granted permission to take this step is Spillers, whose directors also intend to take the opportunity to simplify the company's capital structure. By capitalising £3,054,058 from reserves, the directors propose to distribute one 6 per cent £1 preference stock for every £8 of ordinary stock, and one new ordinary £1 share for every £1 of ordinary stock and deferred ordinary stock; in addition, the deferred ordinary stock and the co-partnership stock are to be converted into ordinary stock. Following this reorganisation, the company's issued share capital, which at the moment consists of £1,143,023 of 6 per cent £1 preference stock, £1,897,485 of ordinary stock, £919,387 of deferred ordinary stock, and £200,000 of co-partnership stock, will become £1,380,209 of preference stock and £5,833,744 of ordinary stock.

£1 ordinary stock at 66s. 6d. yields £6 0s. per cent.

Although there was a slight increase in the gross return on the group's milling operations last year, the increase in the trading surplus, from £2,205,984 to £2,632,188, was mainly due to activities other than flour milling; presumably it largely reflected an increase in sales of animal foods. The increase in the volume of business has had to be financed at a time of rising prices, and Mr Arthur Whittaker joins many other chairmen in drawing attention to the marked increase in the amount of working capital required. Last year the book value of stocks increased (almost entirely due to price inflation) from £4,609,784 to £5,846,986, while debtors rose from £2,143,473 to £3,132,082. Mr Whittaker expects a further substantial increase in working capital requirements this year, following the decision to reduce the food subsidies. This, together with further capital outlays on development and modernisation (on which the group is already committed to spend £1,700,000), will bring about a further reduction in the company's liquid balances. It seems probable, therefore, that the directors will concentrate on strengthening reserves this year, so that shareholders should not expect that the revision of the ordinary capital will necessarily be accompanied by a higher dividend payment; in the latest financial year a rate of 20 per cent (on the old capital) was maintained.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 14, 1952, total ordinary revenue was £46,177,000, against ordinary expenditure of £86,486,000 and issues to sinking funds £450,000. Thus, including sinking fund allocations of £4,781,000 the deficit accrued since April 1, 1952, was £169,533,000 compared with a surplus of £20,864,000 for the corresponding period of the previous year.

COMPANY MEETINGS

MARKS AND SPENCER

INCREASE IN TURNOVER

IMPROVED VALUES OF MERCHANDISE

SIR SIMON MARKS ON SELLING PRICES

The twenty-sixth annual general meeting of Marks and Spencer Limited was held on June 12th at 82, Baker Street, London, W.

Sir Simon Marks, DSc, chairman and joint managing director, who presided, said: Ladies and gentlemen,—May I take it that in accordance with customary practice the directors' report and accounts as circulated to you be taken as read? (Agreed.)

You will be asked to confirm the appointment of Mr B. W. Goodman as a director of this company and to re-elect Mr Harry Sacher and Mr W. F. Norris. Mr Goodman has been with the company nearly 20 years and has been the company's secretary since 1940. He will continue to hold this office. His appointment to the board will be of advantage to the company.

Mr Sacher retires by rotation and a special notice has been received from a shareholder of his intention to propose that he should be reappointed a director of the company notwithstanding that Mr Sacher is of the age of 70, and I shall have pleasure later in putting this resolution to the meeting.

PROFIT AND LOSS ACCOUNT

The profits on last year's trading, after taxation, have amounted to £2,206,000. This compares with a profit of the previous year of £2,557,000. Taxation has required £2,790,000. It does not include any provision for Excess Profits Levy as on the taxable profits of this year's trading we are advised that we have no liability.

To the net profit of £2,206,000 there has been added £100,000, being tax overprovided in the past. The carry-forward from last year is £4,663,000. There is, therefore, available for distribution £6,969,000, compared with £6,528,000 a year ago.

We propose a final dividend of 65 per cent, making 80 per cent, less tax, for the year on the Ordinary and "A" Ordinary capital, which requires £950,000, as against £879,500 last year when the dividend was 75 per cent. The sum of £883,000 is transferred to the general reserve. After the dividends and other appropriations which have been recommended in the report of the directors, the sum of £4,506,000 will be carried forward.

RESERVES

The reserve funds at the date of the balance sheet amounted to £11,054,000, as compared with £9,332,000 a year ago. This is an increase of £1,722,000—£1,202,000 from the profits of the year retained in the business, and £520,000 from the net surplus arising from the disposal of properties and investments during the year.

You have already been advised that the Capital Issues Committee has given its consent to the capitalisation from our reserves of an amount of £2,261,745 on the basis of one "A" Ordinary share for each Ordinary or "A" Ordinary share held on May 17th—the date on which the registers were closed. This will raise our issued Ordinary capital to £4,523,000. After the capitalisation of reserves our reserve funds will amount to £8,793,000.

PROPERTIES AND EQUIPMENT

Our properties now stand in the balance sheet at £8,597,000. We have expended £553,000 this year—mainly on rebuilding stores destroyed during the war. On the general maintenance of our properties we have spent £429,000. Fixtures and equipment have risen from £1,671,000 to £2,348,000, after depreciation on our usual scale. This is a part of our programme of modernising and embellishing our stores.

STORE DEVELOPMENTS

We are operating 233 stores. Our stores at Exeter, Plymouth and Yarmouth have been rebuilt. These are the first full replacements which have come into operation. We were trading in temporary premises in Plymouth and Yarmouth. A number of extensions have been made and rebuilding is in progress at Bristol, Southampton and Swansea.

We have continued to carry out our policy of modernising our stores and have now made up much of the leeway resulting from the enforced neglect during the war.

This programme has called for a large investment of capital in the postwar years. Our properties are being brought to a high state of repair and good condition. This programme further entails a great deal of work in embellishing our stores to make them attractive to the public. It includes modern lighting, general decorative schemes, new counters, and fittings to display our merchandise to advantage. There is no doubt that our public appreciate the improvements we have carried out and that they enjoy shopping in a pleasing environment.

SUBSIDIARY COMPANIES

The operations of our subsidiary companies have resulted in a loss of £162,000 after tax recoveries as compared with a profit of £85,000 a year ago. This loss has been met from their own reserves, but their carry-forward to next year is reduced to £30,000.

Our export business showed a small decrease in the total amount shipped as compared with last year. In the main our exports went into the hard currency areas, but business there is not likely to be as high a volume during the current year.

GENERAL SURVEY

It is with satisfaction that we can report an increase in our turnover of 15 per cent over the previous year. Conditions of trading in textiles, which constitute 75 per cent of our business differed greatly in the past two years. The change was most evident in the latter part of the year under review, when a serious break in raw material prices occurred. This downward movement was intensified by the contraction of the export market, which threw large stocks of materials on to the home market. In the previous year, it will be remembered, the reverse trend was in progress. Goods ordered months in advance were then being sold below replacement cost. But in the latter part of the past year goods were being sold at prices higher than replacement cost.

Your board thought this conjuncture the propitious moment to scale down our selling prices. This approach accorded with our policy of passing on to the public the advantages of lower prices and better values as soon as possible.

The decision necessitated a writing down of stocks of materials held by our subsidiary companies and of goods held by the parent company. Speaking to you last year, I mentioned our anxiety in regard to the abnormal increase in the price of raw materials which the Korean war had brought in its train, for even then there was evidence of downward trends in certain key raw materials. To meet such an eventuality we increased our stock contingency reserve to £500,000. Because the trend of prices is still uncertain, we are recommending the appropriation of £500,000 from profits to increase that specific reserve to £1 million.

I would point out that our price reductions were borne entirely by the year's trading. We did not draw on our stock contingency reserve. It is the intention of your board to continue this policy, and not to draw on the stock contingency reserve unless necessary. If events prove that this reserve is not needed for its specific purpose it can be made available for other purposes.

PUBLIC RESPONSE TO LOWER PRICES

The lowering of prices met with immediate response from our customers and brought about an impressive increase in business. This course of action strengthened the confidence and the good will which we enjoy with the public, the solid foundation on which our business rests.

I am glad to record that our suppliers took similar action. They, like ourselves, had planned their own supplies of materials many months ahead at the prices then prevailing. By writing down their stocks and commitments and by operating jointly with us for a period at lower margins of profit, our trade expanded with mutual benefit. This collaboration testifies to the good relations which exist between our suppliers and ourselves; and I am happy to express to our friends our deep appreciation of their fine co-operative spirit.

SUPPLY POSITION

During the postwar years our efforts were directed to increasing our supplies of woven materials of uniform standards of quality. This is one of the largest sections of our business. Thanks to our arrangements with our textile manufacturers we were progressively able to provide our garment makers with the stocks they needed to operate more efficiently and economically, and were assured of a continuity of supply during a long period of shortage.

Our subsidiary companies act as service departments for these purposes. They are directed and controlled by the parent company. Their function is to buy the many varieties of woven cloths we need in their grey state and to convert them into the finished materials. They act as a pipeline of

supplies which are allocated to our garment makers. This system of operation gives us a high degree of flexibility, as the basic materials we use can be made up into many varieties of garments in quick response to changes in consumer demand.

The stocks of our subsidiary companies were high but they are now being used up rapidly in the ordinary course of business. The increased investment in our stock in trade at the stores was necessary to take care of our expanding business for the Easter and the summer seasons. Easter, a high peak of business, fell outside the year under review.

CURRENT YEAR'S TRADING

The first two months' trading of the current year has shown a noteworthy increase in our turnover. There has been a reduction in our overall stocks with a corresponding improvement in the cash position which, of course, varies with the amount of stock we provide in anticipation of a particular season or period.

During the years of austerity, the textile utility scheme served a useful purpose, but it was of necessity restrictive. It narrowed the selection of cloths we could use without attracting purchase tax. The ending of the utility scheme has brought within our range an extensive variety of new and better quality materials, affording us greater opportunities of improving our goods.

Business lives and thrives by initiative and the development of new ideas. It must be sensitive to changes of taste, fashion, or style on the part of the public. Our role is to interpret such changes to our manufacturers and guide their production accordingly. The public are most discerning. They demand higher standards of manufacture, more attractive and durable materials, better styling and finish at prices they can afford to pay.

I am glad to say that our suppliers are helping us to carry this policy into effect. It requires a close co-operative effort. This joint work is fundamental to our business, and our organisation is adapted to study and deal with the manifold problems involved. The fruits of this effort can be seen in our stores, and the transformation of our values is proceeding apace.

FOOD SECTION: UP-GRADE OF QUALITY

Our food section consists in the main of specialised lines. We have been able, with the co-operation of our suppliers, to improve the selection and up-grade their quality. Unlike textiles, the fall in world prices of key materials such as fats and sugar, is not yet reflected here.

We are vigilantly maintaining our campaign to ensure that the foods we handle are prepared and sold under hygienic conditions. It is gratifying to observe that many authorities use our premises to demonstrate what is a good standard of general cleanliness when they arrange their local food hygiene exhibitions.

If we look beyond the field of textiles the prices of most major raw materials are falling in the world markets. The Government have taken an important step in readjusting the selling prices of many commodities which they buy to the free market prices.

The whole economic trend is plainly towards lower prices—a movement which must have a beneficial effect on the cost of living. British industry with its unrivalled experience and modernised equipment is in the position to profit by this turn of events. It can, by even more efficient production, further reduce prices and thus expand the purchasing power of the community. There is little doubt that if management and labour work together in a spirit of harmony and understanding they can once again raise the standard of life of the people of this island.

STAFF AND WELFARE

The strength of a business lies not only in its merchandising ability, but also in the degree that it can obtain the wholehearted co-operation of its staff in the day-to-day work. Your board can say with truth that they are fortunate in having the services of a devoted and loyal body of co-workers who now number over 20,000.

As you are aware, the board has always been concerned with their well-being. This concern expresses itself in the many services and amenities which have been evolved during the years as an integral part of the business. It has been our experience that through these services we help to foster not only greater efficiency but also a happy team spirit.

The courteous, helpful service of our staff to our customers contributes in no small measure to the good will we enjoy with the public. On behalf of the board and in your name I thank them for their work in the past year.

The report and accounts were adopted and a resolution was passed approving the capitalisation of reserves, allotment letters in respect of which will be posted on June 30th.

At a subsequent extraordinary general meeting a resolution was passed increasing the capital of the company to £6,450,000 by the creation of 10 million additional Ordinary shares of 5s. each.

UNITED NEWSPAPERS

MR H. C. DRAYTON ON ONEROUS TAXATION

The thirty-third annual ordinary general meeting of United Newspapers, Limited, was held on June 12th in London.

Mr H. C. Drayton (the chairman), who presided, said:—

The gross profit of the group amounted to £578,000 as against £551,000 last year.

After deducting depreciation and directors' fees, but before providing for taxation, we have a gross sum available of £492,000 as against £470,000 last year—a result which, in view of the difficulties of the year 1951 and the rise in cost of wages and newsprint, is I suggest to you, remarkably good, but when we come to taxation we find we are mulcted of £148,000 for profits tax and £172,000 for income tax, leaving the net profit available at £122,000 as against £121,000. The proportion of the profits of £492,000 that are consumed by taxation amounts to approximately 70 per cent of the money that accrues from your efforts. That is a rate of taxation which our industry and our community cannot continue to bear if we are to have full employment and a prosperous country.

The incidence of excessive taxation is drawing off the life blood of companies and preventing them from carrying on their businesses in a reasonable and conservative manner.

During the course of the year our wage bill increased by 10.1 per cent and the cost of our newsprint increased by 41.6 per cent. The result of these increases is reflected in the consolidated balance sheet in newspaper costs, where our stocks have risen from £96,000 last year to £205,000 this year.

I am not unhopeful, when we meet next year, that we shall at least be able to show you a reasonable profit and one with which you will not be unduly disappointed.

The report and accounts were adopted and the final ordinary dividend of 15 per cent for the year was approved.

ENGLISH & CALEDONIAN INVESTMENT COMPANY

INCREASED REVENUE

The twenty-fifth annual general meeting of English & Caledonian Investment Company, Limited, was held on June 13th in London, Mr Henry S. Loebl (the chairman) presiding.

The following is an extract from his circulated statement.

I will first of all deal with the balance sheet, and it will be noted that the book value of the investments at March 31, 1952, was £1,107,229 compared with £1,061,973 at the end of the previous year. The value of the investments at March 31, 1952, was £1,482,161, showing an appreciation over the book value of £374,932, or of 33.86 per cent against 45.57 per cent at March 31, 1951. There has been a substantial decline in the value of securities during the period covered by the accounts, and it is gratifying to note that the fall of 11.71 points on the company's portfolio compares favourably with the fall of 17.3 points shown by the Investors' Chronicle Monthly Securities Index.

The changes made in the company's investments during the year resulted in a surplus which has been added to the contingency fund.

On the liabilities side it will be seen that the general reserve now stands at £100,000, following the appropriation of £15,000 from revenue account.

A new and unwelcome item appears in the balance sheet, this time in respect of an estimated liability for excess profits levy amounting to £1,700. I do not propose to enlarge upon this subject; unanimous opinion of investment trust company managers, with which your directors are in full accord, is already very well known. I sincerely hope that the Chancellor of the Exchequer will find it possible to amend the clause of the Finance Bill dealing with this matter.

Turning to the revenue account it will be noted that the total investment income of £98,212 shows the substantial increase of £15,568 over the investment income for the previous year. After deducting administrative and sundry expenses, directors' fees, debenture stock and other interest, the net revenue for the year was £73,528 compared with £58,153. After deducting the charge for taxation and the dividend on the preference stock for the year, the amount earned on the ordinary stock was £29,735, or 28.32 per cent compared with 21.15 per cent for the previous year.

An interim dividend of 3 per cent on the ordinary stock was paid in October last, and your directors now recommend the payment of a final dividend of 9½ per cent, making 12½ per cent for the year. The sum of £15,000 has been transferred to general reserve leaving a sum of £13,290 to be carried forward.

With regard to the prospects for the current year, it would not be reasonable to expect an increase in the revenue similar to that shown in the period under review, but your directors consider that there are grounds for hoping that the revenue figure will be maintained.

It is proposed to take the opportunity today of increasing the authorised capital of the company to £600,000 by the creation of 100,000 ordinary shares of £1 each and to offer 50,000 of the shares to ordinary stockholders for subscription at par in the proportion of one ordinary share for every £4 of ordinary stock held, fractions of new shares to be disregarded.

The report was adopted.

RECKITT AND COLMAN

(Manufacturers of Starch, Ultramarine, Toilet, Pharmaceutical and Food Preparations, etc.)

INCREASED WORLD SALES

WIDE-SPREAD ACTIVITIES

The annual general meeting of Reckitt and Colman, Limited, was held in London on June 4th.

The following is an extract from the directors' report for the year ended December 31, 1951:—

CONSOLIDATED ACCOUNTS

The accounts show that the consolidated trading profit was £4,420,018. This exceeds the comparable figure for 1950 by £336,563 and it was recorded in last year's report that the trading profit for 1950 was the highest in the history of the company. The increase is due almost entirely to higher sales, both at home and abroad.

The capital reserves now amount to £4,306,746. This year £350,000 has been allocated out of the taxed profits to the reserve for the replacement of fixed assets, which now stands at £1,061,739. (Normal depreciation based on original cost or valuations was £393,537, as compared with £387,614 in 1950.) The total present-day value of properties, plant and machinery is far greater than that at which those assets stand in the books.

The bonus to employees under the prosperity sharing scheme is based on the trading profits adjusted in accordance with the terms of that scheme. It amounts this year to £220,000, compared with £208,000 in 1950.

British, Dominion and foreign taxation absorbed £2,330,000 (£2,181,000 in 1950). This figure includes £1,115,439 (£968,649 in 1950) reserved for 1952-53 UK income-tax based on the 1951 profits. It is only after these payments and provisions have been made that funds become available for development and for the maintenance of the normal activities of the company in a period when inflation and high prices require increased working capital. The excess profits levy introduced in the 1952 Finance Bill may well add to the company's burden and can only be described as a penalty on enterprise and as a temptation to extravagance. As it is to be levied on profits earned abroad as well as at home, it will tend to diminish the country's incentive to expand the overseas trade on which so much depends.

The revision of the home pension funds, referred to in our 1950 report, was completed during the year and the company's back service liabilities were discharged; this required £35,000 in addition to the provisions previously made for this purpose and this sum has been written off before arriving at the trading profit. The revision of the overseas pension funds is now under consideration.

BALANCE SHEET ITEMS

The effects of both development and inflation are reflected in the balance sheet which shows that the value of properties, plant, machinery, etc., under the heading of fixed assets, has increased by £1,083,479 while, under the heading of current assets, stock in trade and stores have increased by £2,967,223. The latter figure includes an increase in the volume of raw and packing materials which your directors decided was a proper insurance against possible shortages.

Approximately one-half of the funds needed for the above purposes was provided out of the profits of the year, while £600,000 was borrowed from the holding companies, Reckitt and Sons, Ltd., and J. and J. Colman, Limited, as a short-term loan and holdings of tax reserve certificates and the balances at banks and cash in hand were reduced by £1,345,505.

Additional working capital was made available by limiting the dividend to 5 per cent, even though the profits earned in 1951 were so satisfactory. This method had the advantage that the higher rate of profits tax was not incurred on the amount by which the dividend was reduced and so cash will be saved by the company for the benefit of its shareholders.

The consolidated profit and loss account shows that, after taxation and provisions, the balance of profit for the year was £1,664,589, compared with £1,656,476 in 1950. Of this profit £1,193,320 is included in the accounts of Reckitt and Colman, Limited, and £471,269 is retained in the accounts of the subsidiaries.

A 5 per cent interim dividend was declared and paid in September, 1951, and after transferring £800,000 to general reserve (£500,000 in the previous year) the directors decided that no further dividend should be recommended in respect of the year 1951.

After other adjustments, there remains a balance of £2,445,578 to be carried forward to 1952.

The shareholders' capital and reserves employed in the group have increased during the year under review by £2,359,679. They now total £17,115,266, of which over £10 million has been accumulated since the formation of the company in 1938.

TRADE

The world sales of the company and its subsidiaries again increased in value during the year. Most sections of the business in the UK and overseas contributed to this result. The volume of sales, at home and abroad, also increased.

Of the world sales, nearly 60 per cent were effected overseas and, though substantial exports were made from UK factories, most of the overseas sales were of goods manufactured in the countries in which they were sold.

One of the strengths of the business is the spread of its trade over a number of different fields. The percentages of public sales of each main group of products at home and throughout the world in 1951 were:—

	UK only	World total
	%	%
Foodstuffs	37.6	50.8
Household supplies	28.7	29.4
Pharmaceuticals and toiletries	19.5	12.8
Bulk chemicals, colours, etc.	14.2	7.0
	100.0	100.0

The sales prospects of our existing lines are satisfactory and a vigorous development policy is being pursued, based on a programme of technical and market research which receives the constant attention of the board. The company's first-hand knowledge of the different markets in various parts of the world provides information on which to base research and stimulates its pursuit.

The rate of development, however, is governed by the amount of free money left after taxation and after providing for the effects of inflation should this continue. Although taxation at present rates may be immediately necessary, it is unfortunate for the country that the development of its industry continues to be retarded by such means.

UNITED KINGDOM

The value of goods sold increased during the year. Part of the increase was due to increased prices, which were put into effect with reluctance to meet the rise in the cost of raw materials and other elements of production, but the total tonnage despatched also increased.

The sales of food specialities produced in the Norwich and Peterborough factories were more than maintained and satisfactory profits were earned during the year. National distribution was obtained for Robinson's orange and lemon squashes; it is hoped that the high quality of these concentrated fruit drinks will earn for them the same distinction as that enjoyed by Robinson's barley water.

The system of joint depot distribution of goods made at our various factories has been extended to cover most of the country and has proved to be even more economical and expeditious than was expected. In view of the rising cost of transport and distribution, this development was very timely.

OVERSEAS

Our overseas trade again increased, both in value and in tonnage, to higher figures than have ever before been reached.

About 55 per cent of our overseas sales are made in North America. The high percentage of the world sales for which the food group is responsible is largely the result of the activities of The R.T. French Company of Rochester, USA.

The rest of the overseas trade is distributed approximately as follows:—

	%
British Commonwealth (excluding Canada, India and Pakistan)	14.0
South and Central America	12.5
Europe and North Africa	9.5
India, Pakistan, the Near and Far East	8.5
Sundry markets	0.5

Thus our business is widely spread and much the greater part of it lies in those countries which have the best prospects of political stability and economic expansion.

USA, CANADA, AUSTRALIA, ETC.

Our USA and Canadian subsidiaries achieved record sales in 1951 but, owing mainly to the increase in raw material prices which followed the outbreak of war in Korea and to the effects of price control, the profit ratio decreased. Towards the end of the year there was an improvement which we hope will continue. Every effort is being made to increase our North American trade because in that continent is the greatest market in the world and it offers the greatest scope for expansion. The active boards of these North American subsidiaries direct able and energetic managements. We look forward to further progress.

In Australia inflation continued during 1951, but there is now reason to hope that it will be checked. Our own business is healthy and, as we have good stocks of raw materials there, we do not expect to suffer in 1952 from the import restrictions which the Australian Government has had to impose. Our New Zealand business is also healthy but, in common with all other industries in that country, it suffered last year from the shipping and dock strikes; it is now recovering though the after effects of those disturbances are still being felt. In South Africa our trade developed satisfactorily and we hope that the country's undoubted economic potentialities will enable us to make further progress. The remainder of the African continent also offers good scope, of which we are doing our best to take advantage.

SOUTH AMERICA, EUROPE AND INDIA

The subsidiary operating in Argentina had another difficult year. Import licences for the raw materials needed to maintain full production were not obtainable and remittance of funds to the UK was almost completely prohibited. Our Brazilian company had a very successful year, but unfortunately a large part of the currency profit is blocked and may not, at present, be remitted to the UK. There is great scope for development in these two South American countries but, if the foreign capital which is needed for it is to be attracted, investors will have to be treated better than they have been in recent years. In the rest of South America and in Central America progress was made.

On the Continent of Europe our trade was maintained at the greatly expanded level of 1950 which was reached under the influence of the fear of shortages which rearmament might cause.

Our Indian subsidiary is extending its factory accommodation on its new site near Calcutta, and we expect that this development will continue during the next few years. In Pakistan our business is progressing well; it is being conducted by Reckitt and Colman of Pakistan, Limited, the new subsidiary which we said last year we intended to form. Our business in Egypt was disturbed to a remarkably small extent by the recent political difficulties, and trade in most of the Eastern markets was satisfactory.

GENERAL

We again tender our thanks to our employees at home and abroad for their loyalty and hard work. Many of them, in all grades, have been with us for a very long time and those who have retired with the pension to which they have contributed still take a keen interest in the progress of the firm.

The annual general meetings of Reckitt and Sons, Limited, and J. and J. Colman, Limited, will be held on July 7, 1952.

HARLAND AND WOLFF, LIMITED

LARGEST OUTPUT IN UNITED KINGDOM

ADEQUATE STEEL SUPPLY ESSENTIAL

SIR F. E. REBBECK ON SUBSTANTIAL FORWARD COMMITMENTS

The sixty-seventh annual general meeting of Harland and Wolff, Limited, was held on June 12th, at the registered offices of the company, Queen's Island, Belfast; Sir Frederick E. Rebbeck, DSc, DL, chairman and managing director, presided.

The secretary, Mr F. V. Spark, ACA, read the notice convening the meeting and the report of the auditors.

The chairman said:

As the statement of accounts and the directors' report have already been in your hands for some time, I propose with your permission to take them as read. (Agreed.)

You will see from the figures before you that the consolidated profit on trading for the year is £134,000 less than the previous year, and as the amount brought to credit in respect of settlement on contracts completed in previous years is only £19,076 against £261,869 in the previous year, which was of course an unusually high figure, the net profit after taxation is lower by £194,608, but the directors propose to make the same dividend payment on the ordinary stock as for the last few years and add to reserves and the carry-forward on profit and loss account a sum of £242,635 in the accounts of the parent company.

Our subsidiaries show profitable trading results, and after payment of dividends the balance of profit of £39,738 has been carried forward in the accounts of these companies.

The consolidated total of reserves and undivided profits now amounts to £4,577,914.

The lower profits, however, do not indicate any falling off in the amount of work that has been carried out, but are almost entirely due to contracts taken at fixed prices in the early months of 1950 when orders for new ships were scarce. In the latter part of that year the demand for shipping, particularly for tankers, increased, and the company has booked orders which will keep its facilities fully employed for some years. These latter contracts, the completion of which will begin in 1953 and carry on until about 1957, have not been contracted for at fixed prices.

HEAVY INCREASE IN COSTS

The outbreak of hostilities in Korea and the extensive rearmament programme which followed brought about conditions in this country and elsewhere which resulted in heavy increases in the cost of materials and rates of wages. Furthermore, in common with other shipbuilders, work has been slowed down owing to the inability to obtain full supplies of steel, with the result that the construction of these vessels has been thrown into a period when higher costs were in operation. All this has had an unfavourable effect on fixed price contracts, and, as a number of them have still to be completed, the results for 1952 will also be adversely affected.

TONNAGE LAUNCHED EXCEEDS 100,000 GROSS TONS

The output from the company's works was once again the largest in the United Kingdom, thirteen vessels being launched last year with a total gross tonnage of 155,388. This is the twelfth successive year in which the vessels launched from the company's works have exceeded 100,000 gross tons.

More than 80 ships are at present under construction, fitting out or on order, and these include large passenger vessels, cargo vessels, a cross-Channel passenger vessel, tankers for both British and foreign owners, Diesel passenger ferries, whalecatchers, and other small craft, while the naval work includes the light fleet carriers *Centaur* and *Bulwark* as well as other vessels for HM Navy.

During the year the Fleet Carrier HMS *Eagle* was commissioned, and has since completed her acceptance trials. You will no doubt have seen in the press many references to this vessel, which is the largest and fastest aircraft carrier in the Royal Navy.

SUBSTANTIAL ORDERS IN HAND

There is an increasing demand for our own Diesel engines, and many orders have been received for land installations in various parts of the world. I referred last year to the orders which the company had received for propelling engines to be installed in hulls built by other shipbuilders, and since then we have booked a further number of contracts of this nature.

Steady progress is being made with the manufacture of the Cooper-Bessemer type compressor sets under the licence arrangements made with that company.

Our ordnance works on the Clyde continue to be engaged on important rearmament work, and in addition have in hand, under the working arrangement with the English Electric Company, a considerable volume of work in connection with hydro-electric installations both for home and overseas markets.

Our electrical manufacturing division at Belfast is booked to full capacity, both on the AC and DC sides, on work for ships and land installations.

The steel constructional division has again been well employed, and the further orders taken during the year have resulted in our being fully booked for some time ahead.

STEEL SUPPLIES

In all these activities the key to what we are able to do is an adequate supply of steel, and until we can obtain nearly double the amount which we are now receiving it will not be possible to meet our delivery commitments in connection with the very considerable programme that lies ahead of us.

The position does not at the moment look promising, and from the discussion that took place in the House of Commons yesterday it is now indicated that the supply of steel instead of being, as was hoped, a little better is likely to be somewhat worse. We had hoped that the arrangements which had been made by the Government for supplies of American steel would help to alleviate the position, but the labour difficulties which are being experienced in the United States have, in the meantime, stopped any supplies of American steel to this country.

The company's property and plant have been well maintained during the year.

I take the opportunity to thank all those members of the staff and workmen who have worked well throughout the year.

As indicated in the report of the directors, Mr Atholl Blair retires from the board in accordance with the Articles of Association but is not offering himself for re-election. He also wishes to resign his executive position with the company, but I am glad to say he has agreed to remain in contact with us in a consultative capacity which, in view of his long and valuable experience in many of our specialised products, is very satisfactory.

Mr George Morton, CBE, congratulated the board on the statement of accounts and said he considered that in pursuing their conservative financial policy they were on sound lines and were acting in the best interests of the shareholders.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors who offered themselves for re-election, viz., Sir John Craig, Mr William Strachan, Jr, and Mr L. V. Dunlop, were re-elected. Messrs Price Waterhouse and Company were re-appointed auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the chair.

SPILLERS, LIMITED

DEPRECIATION, TAXATION AND REAL PROFITS

PROPOSED CAPITAL REORGANISATION

MR ARTHUR WHITTAKER'S STATEMENT

The sixty-fifth annual general meeting of Spillers, Limited, will be held on July 9th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, London, E.C.

The following is the statement by the chairman, Mr Arthur Whittaker, which has been circulated with the report and accounts for the year to January 31, 1952:—

Accounts—Comments upon the accounts are contained in the directors' report but there are certain broad aspects to which I should like to direct attention.

We have continued the policy of having some regard to the current cost of replacement in providing for depreciation and obsolescence of fixed operating assets. In my opinion such a course is essential if the physical capital of the undertaking is to be *kept intact and its earning power maintained.* If efficiency is lowered by inability to effect such replacements of buildings and plant as may be necessary to keep in line with the most modern developments, the result must ultimately be reflected in a falling off in competitive ability and in volume of production. Moreover, it is in my view equally essential that amounts set aside for this purpose should constitute a deduction in arriving at the trading profit and should not be regarded as an appropriation of profit.

It seems to me immaterial in this context whether such amounts are written off the book value of the asset or carried to a special reserve. What is material is that there should be no misconception as to the amount of real profit available for appropriation. I am particularly anxious to stress this in view of the last sentence in the report of the auditors in which they draw attention to the fact that in arriving at the profit of this company the allocation to the reserve for increased cost of replacement of fixed assets has been deducted. Your directors consider this to be a necessary and proper deduction in current circumstances and a similar deduction has in fact been made for some years past.

NEED FOR MORE CAPITAL

It will be observed from the balance sheet and from the comments in the directors' report that there has been a marked increase in the amount of working capital required during the past year and that this was due in the main to increased price levels. Prices of controlled commodities have been advanced again since the end of the financial year as a result of the Government's decision to reduce the food subsidies. Consequently there will be a further substantial increase in the working capital required in the current year. This, taken in conjunction with the capital outlay on modernisation and development, will bring about a further reduction in liquid balances.

The foregoing considerations point to the effect upon industrial operations of the major inflation in price levels which has occurred since 1939 and particularly in the last few years. A glance at our profit and loss account will indicate how much this problem is intensified by the heavy burden of taxation. The combination of these factors is giving rise to much anxiety about the provision of finance for industry generally and it is to be deplored that the taxation of industrial profits should have been increased by the Finance Bill when the need is for a reduction of the burden in the interests of industrial development.

It is worth commenting that the profit before taxation represents no more than 13 per cent of the book value of capital employed and the net profit after taxation only about 4 per cent. These returns—modest as they are—would be very considerably reduced if the capital employed was based upon the real value of the fixed assets by reference to current replacement costs.

NEW WORKS

It is hoped that the new flour mill at the Royal Victoria Dock, London, representing the reinstatement of that which was destroyed by enemy action, will come into operation about the end of the year thus enabling us to transfer operations from the mill at Silvertown which we have been working as a temporary measure.

At Hull progress is being made with the reinstatement of the flour mill but I regret to say that as a result of the Government's restriction on capital investment we have so far been unable to obtain permission to proceed with the reinstatement of the animal foods factory.

I am also sorry to have to report that although we have virtually completed a new factory at Cardiff for the processing of soya beans, it will be impossible for the time being to operate it on more than a very limited scale, if at all, by reason of the Government's decision to restrict the import of the necessary raw material because of the adverse balance of payments situation.

Control of Flour Milling—I am glad to say that consideration is now being given to the possibility of some radical alteration in the form of the existing control of flour milling. This company would welcome a move towards greater freedom of operation and the restoration so far as possible of the normal incentives to efficiency and enterprise.

CURRENT OPERATIONS

In these times when both the scale and results of trading may be affected by many factors outside the control and knowledge of management it is not possible to make any forecast even of the immediate future. I can do no more than say that the results of the early months of the current year have been no less favourable than for last year.

Staff Superannuation Arrangements—The arrangements to which I referred two years ago for placing the superannuation fund in a position to pay adequate pensions to the staff under current conditions have now been carried through. As a result firstly of the general increase in salary levels since that time but secondly, and in greater measure because of the decision to extend broadly similar benefits to the staffs of those subsidiary companies which do not come within the parent company's superannuation fund, the total cost is somewhat greater than I then indicated. The initial payments amount to approximately £550,000 and these are being funded over a period of years thus avoiding an immediate draft on the company's liquid resources.

RECONSTRUCTION OF SHARE CAPITAL

Details of the proposed scheme for reconstructing the share capital and capitalising a portion of the reserves together with a full explanatory memorandum are being sent to all stockholders. The various meetings of stockholders to consider these will be held immediately after the annual general meeting on July 9th.

In view of the detailed nature of the documents referred to, it is unnecessary for me to make much comment here. Broadly, the aim is to simplify the capital structure by having only two classes of stock—preference and ordinary—and to bring the issued capital more into line with that employed in the business by capitalising a portion of the reserves. It is proposed to achieve these objects by converting the existing deferred ordinary and co-partnership stock into ordinary stock and by issuing additional shares credited as fully paid up as follows:—

(1) One 6 per cent cumulative preference share of £1 for every £8 *existing* ordinary stock.

(2) One new ordinary share for every £1 of *existing* ordinary stock and deferred ordinary stock.

For the reasons set out in the memorandum the co-partnership stock which it is proposed to convert into freely transferable ordinary stock will not participate in the capitalisation of reserves. Although it is proposed that the co-partnership stock should disappear the co-partnership scheme will continue as at present except that in future the whole of the bonus arising under it will be payable in cash.

I need only add that after taking the best available advice the board are satisfied that the proposals are fair as between the different classes of stock and that their adoption would be in the best interests of the company.

Staff—It is with pleasure that I once more record our appreciation of the continued good work of the management, staff and operatives throughout the group.

BARTON AND SONS LIMITED

A SPLENDID RESULT

The ordinary general meeting of Barton and Sons Limited was held on June 13th in London, Mr A. H. Redfern (the chairman) presiding.

In the course of his speech the chairman said:—I am pleased to present a record of achievement unsurpassed in the history of your company. I am sure you will agree with me that this achievement calls for the highest praise for our managers and staffs who have contributed to this splendid result.

An important factor contributing to the improved results is the substantially increased turnover effected at a reduced cost of production.

The group trading profits amount to £772,766 compared with £490,740 for 1950. The net profit is £655,193, as compared with £403,231 for 1950. Out of this sum no less than £359,263 is taken for taxation.

After bringing in profits of £36,534 from last year, and crediting £12,494 for provision no longer required, there are profits available of £344,958. It is proposed that £150,000 be transferred to general reserve, preference dividends require £13,418 net, and if the final ordinary dividend of 10 per cent is approved ordinary dividends require £31,894 net, leaving a consolidated balance of £130,350 to be carried forward, against £36,534 brought in.

The output for the current year to date, as compared with that of last year, is very satisfactory.

The report was adopted.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

ANOTHER SUCCESSFUL YEAR

The ordinary general meeting of shareholders of the General Mining and Finance Corporation, Limited, was held on June 3rd, in Johannesburg. Mr C. S. McLean (deputy chairman) presided.

The chairman, in moving the adoption of the report and accounts for the past financial year, said:

Your corporation has had another successful year, the profit at £726,500 being £213,500 more than in the previous year. After maintaining the customary dividend of 5s. per share and making the usual appropriations as detailed in the accounts, it was possible to reinstate the investment reserve at £450,000.

An amount of £1,571,262 standing to the credit of share premium account was transferred to general reserve, increasing the total credit on the latter account to £2,571,262. The book value of investments appears in the balance sheet at £4,137,500, but the market value of your corporation's quoted investments is, of course, greatly in excess of this book value.

RISING PRODUCTION COSTS

You will remember that at the ordinary general meeting last year, you were reminded that the gold-mining industry is not able to combat increased production costs by increased output in times of shortages of manpower, and, because of the fixed price obtainable for its product, is unable to pass on to the purchaser the constantly increasing costs. *In general, the year 1951 again* reflected a story of continued rising costs for the gold-mining industry on the Witwatersrand, coupled with shortages of labour and power, the two latter items having their inevitable effect upon operations, and although the grade of ore milled showed no change, the enforced reduced scale of operations resulted in a decrease in gold produced of 184,800 ounces fine. The estimated average working profit declared decreased from 17s. 4d. per ton milled in 1950 to 15s. 2d. per ton in 1951. These disabilities were to some extent offset by additional revenue received from sales of gold for industrial and artistic purposes, but this revenue is not constant, and during and after the year under review has shown an almost constantly falling trend, with the result that the amount being *received now is at a much lower level than* it was a year ago.

Unfortunately the spiral of rising costs did not stop with the close of 1951, and over the four months to April 30, 1952, working costs per ton milled rose from the 1951 average of 31s. 9d. to an average for the four months of 33s. 10d., while declared working profits declined from 15s. 2d. to 13s. 3d. It is important to note that at the official price for gold of 248s. 3d. per ounce fine, there are thirteen mines working at a profit not exceeding 2s. 6d. per ton milled.

The supply of native labour, as in recent years, was below the requirements of the industry, and of the labour available, the new *mines in the Orange Free State demanded,* and will continue to demand, an increasing share.

POWER EXPANSION PROGRAMME

The demand for power at peak load periods has been in excess of supply, and the difficulties resulting therefrom have so far been met by a rearrangement of work, including Sunday milling on those mines not normally permitted to crush on Sundays. Further demands for power must be expected on an increasing scale to meet the requirements of the newer mines on the Far West Rand and in the Orange Free State. The Electricity Supply Commission has taken all feasible steps to meet this increasing demand for power, *and has co-operated in every way to* assist in overcoming the industry's present difficulties. A very large expansion programme is already in hand, and no efforts are being spared to bring new units into commission with the minimum of delay.

It is to be regretted that in the recent Budget the Minister of Finance did not see fit to reduce the formula tax on gold mining *companies, which have for many years borne* more than their fair share of the tax burden. The rate of normal tax on companies was, however, increased from 4s. 6d. to 5s. in the pound.

In the Orange Free State two mines commenced production during the year, thus marking a new era in the production of gold in South Africa.

In addition to the two mines already mentioned, there are at present eleven mines in various stages of development, and exploration of new areas by means of boreholes has continued, but on a somewhat reduced scale. Your corporation has interests in most of these companies.

It is to be regretted that conditions should have developed in recent months which increase the problem of securing the capital which is vitally needed to bring to full production the large number of gold mines in the early stages of shaft sinking and developing. We must all hope that the proper and timely development of this goldfield will not be delayed or curtailed by a state of affairs which, if not checked, can adversely affect the possibilities of increasing gold production, which is so essential to the welfare of this country. The prosperity of the goldmining industry still is, and must continue to be for many years to come, essential to the progress of South Africa.

The chairman then referred to the affairs of the companies in which the corporation is mainly interested, namely:—Consolidated Rand Investment and Trust Company, Limited; General Exploration Orange Free State, Limited; South Roodepoort Main Reef Areas, Limited; Van Ryn Gold Mines Estate, Limited; West Rand Consolidated Mines, Limited; Crown Mines, Limited; Durban Roodepoort Deep Limited, and East Rand Proprietary Mines, Limited.

He proceeded: I feel it necessary to refer again to the economic dangers which are being aggravated at the moment in South Africa. The prosperity of the goldmining industry of the Witwatersrand has been built up over a long period of time, largely assisted by overseas capital. The prosperity of the gold-mining industry has made possible the industrial and commercial development—again assisted by overseas capital—which has been so marked in recent years. It would be unfortunate if the mutual trust that has been so diligently fostered in the past should disappear, and particularly so at this time when capital requirements for development are still great. South Africa must depend on outside sources for a large portion of its capital needs, and this supply can only be expected if our own actions and outlook are viewed in a favourable light.

In conclusion I wish to record the directors' appreciation of the services rendered by the technical and administrative staffs of the corporation, both here and in London, and by the managers, staff and employees of the various companies under our control.

The directors' report, balance-sheet and accounts for the year ended December 31, 1951, were adopted, and the retiring directors re-elected.—Copies of the full report of proceedings can be obtained on application to the London office.

CONSTRUCTORS, LIMITED

SATISFACTORY TRADING RESULTS

MR R. S. DYBALL ON STEEL SUPPLIES

The thirtieth annual general meeting of Constructors, Limited, was held on June 12th at Erdington, Birmingham. Mr D. H. Finer presided in the absence of the chairman, Mr R. S. Dyball, who is at present on a business trip in USA.

The following is Mr R. S. Dyball's statement, which had been circulated with the report and accounts:—

In the chairman's statement circularised last year it was mentioned that Mr H. J. Finer, for health reasons, would relinquish the chairmanship and his position as joint managing director. I deeply regret that he has had to take this step, but I am sure you will be glad to hear that he has been appointed honorary president and will retain his seat on the board as a consultant. My colleagues on the board have asked me to take office as chairman, which I am only too pleased to accept, and, in doing so, look forward, with the help of all, to the *continued prosperity* of the company.

The chairman's statement was made too early last year to attempt any forecast of the profit for 1951, but I am now pleased to report that the group has had a satisfactory year's trading, with a group profit of £111,497, compared with £118,864. This slight drop was mainly caused through bad deliveries of steel in the early part of the year and, further, it must be borne in mind that during this year the profits have been charged with the full cost of the company's increased pension scheme, the introduction of which was mentioned in the chairman's *statement last year. The charges for taxation* are higher, at £72,530, against £67,379 for 1950, but after sundry appropriations, which are shown clearly in the directors' report, there is a disposable balance on the group account of £124,499, compared with £110,640 last year.

DIVIDENDS

The preference dividends were paid on the due dates and an interim dividend of 5 per cent, less income tax, was paid during the year on the ordinary shares. The board recommends a final dividend of 20 per cent, less income tax, which leaves a balance on the group profit and loss account to carry forward to next year of £100,480, against £86,853 brought in.

Turning to the consolidated balance sheet, you will see that fixed assets have increased, after depreciation, from £234,799 to £267,386. The first phase of the extension to the parent company's factory was substantially completed during the year, and additional plant has been purchased.

Regarding current assets, there are substantial increases in stocks, work in progress and in debtors, which has made it necessary to arrange overdraft facilities with our bankers.

I am glad to be able to report a continued increase in the demand for the company's

products in the overseas markets, though with the modern tendency of governments to close their markets overnight it is difficult to forecast the future. However, special attention is being given to this side of the business by Mr H. L. Finer.

THE CURRENT YEAR

As far as the current year is concerned, I am pleased to say that so far the output is in excess of last year's at the same date. We have substantial orders in hand, and whether we have another successful year virtually depends on the deliveries of steel. During the year under review we have been working under the nationalised steel system, the true effects of which have hardly had time to have any serious bearing on our supplies of steel. It is now said that the industry is to be denationalised, and I sincerely hope that the steel-makers of the country will, despite the disturbance to the industry being created by the politicians, somehow manage to produce the steel which the country so desperately needs and that this great industry will not be ruined by party politics.

While on the subject of profits for the current year I feel I should refer to the new and unfair burden placed on industry by the excess profits levy introduced in the recent Budget. Although we do not yet know what form the tax will ultimately take, we have made some preliminary calculations, and on the basis of the Finance Bill in its present form estimate that the profits standard for the purposes of this tax is in excess of the profit for the past year.

In conclusion, I particularly wish—in my first year as chairman—to thank the directors, the staff and employees, who have all contributed to the past year's successful trading.

The report was adopted.

PHILLIPS RUBBER SOLES LIMITED

RECORD SALES

Mr Peter Pettit, DSO, presided at the twenty-fifth annual general meeting held on June 12th in London. He stated that thanks to record sales the trading profit of the group amounting to £349,906 for the fifteen months was at the highest annual rate in the twenty-five years of the company's existence. The net profit of the group before taxation amounted to £241,501, an increase of £103,885 over the previous year. Of this increase, £98,000 had to be provided for taxation, which at £180,000 included only two months Excess Profits Levy.

Costs of manufacture and distribution had continued to rise during the period under review, but owing to very greatly increased turnover he was glad to say that with one small exception it had not been found necessary to increase prices of soles and heels to the trade since January, 1951, now 17 months ago. Yet, despite everything, the quality of Phillips rubber soles and Phillips heels had remained outstanding. The company's goodwill, with both trade and public, had never been stronger than at the present time. Exports, too, were on a record level during the period. This section of the company's business continued to be hampered by embargoes and restrictions as well as by heavy duties in many markets.

The current year had started slowly, and in the present condition of business generally it would be unwise to expect more records, but if nothing unforeseen occurred he hoped for a successful year's trading.

The report and accounts were unanimously adopted.

BRITISH TIMKEN LIMITED

MR JOHN PASCOE ON THE PROBLEMS OF AN EXPANDING BUSINESS

Mr John Pascoe, chairman, at the annual general meeting in Birmingham on June 11th of British Timken Limited, said:

The net profit of the Group for the year 1951 amounted to £464,227, against £295,671 for 1950 after debiting depreciation, taxation and other charges amounting to £997,538, against £779,460 in 1950.

The net profit of the parent, British Timken, amounted to £393,684, against £259,324, and on the British Timken ordinary shares we recommend a dividend of 25 per cent, less tax, absorbing £52,500—less than one-twelfth of the amount to be paid by the Group in income and profit taxes for the year. We are happy to recommend this dividend increase as an expression, although a small one, of our conviction that the shareholder is an essential partner in industry under a system of free enterprise, the only system which can offer any real hope of prosperity for the country.

Last year I referred to the increase in our productive capacity which would follow our large capital expenditure. Taking the Group as a whole, the amounts so expended on buildings and plant during the past few years have amounted to over £2 million and as at December 31, 1951, we had capital commitments amounting to £675,000. Our productive capacity can therefore be expected to expand still further during the coming year. Whether we shall undertake any further expansion will depend upon whether we can draw upon our imaginations for the incentive, and upon our reserves of energy and patience to overcome the apparently inevitable frustrations and delay associated with any expansion programme.

Not all our capital expenditure is for expansion. An increasing proportion is needed to maintain our productive capacity by replacement of obsolete and worn-out machine tools and equipment, and in our industry obsolescence is by far the more serious problem. The depreciation debited during 1951 in the British Timken accounts is £237,318. Even this year by year would not be sufficient to replace equipment at the speed with which it is becoming obsolete. Almost every company chairman has during the past few years drawn attention to the inadequacy of depreciation allowances. All that has been done is to increase the burdens on industry by EPL and to increase the strain on cash resources by abolishing the initial allowances.

From January 1, 1946, to December 31, 1951, at British Timken, raw material price increases ranged from 44 per cent to 95 per cent, and average wages and salaries increased by 25 per cent. But during this period our prices of our bearings have only increased by an average of 15 per cent, so that we may claim that our profits have been well and truly earned. To the staff, whose experience and ability and unremitting work have so largely contributed to these results, the greatest credit is due.

Last year I reported a very satisfactory increase in orders for our tapered roller bearing axleboxes and cannon boxes, and this year I can report still further expansion of this railway business. Orders received during the year amounted to approximately £1 million—the highest in any one year.

Our output and orders received for large bearings of the rolling mill type again showed a substantial increase, including orders for the continuous strip mills at Ebbw Vale, Margam, Trostre and Shotton, and, in addition, orders for this type of bearing from no fewer than seven overseas countries.

Our raw material position is still one of some difficulty, more particularly for the larger bearings. Although our output may suffer during the coming year, it will more likely be in the direction of the restriction of the rate of expansion; as barring unforeseen happenings, our turnover for 1952 should certainly exceed that for 1951.

With a greatly extended productive capacity and full order books, if times were normal one could look forward to the future with some optimism, but no one today can contemplate the future without considerable misgiving having regard to the very grave crisis through which the country is struggling. This year a new feature has to come into our calculations—the Conservative Government's Excess Profits Levy. I fully share the opinions which have been expressed from all sides in British industry condemning this tax. This Excess Profits Levy will, if conditions of trade remain as at present, have an effect on our profits, but not such as to jeopardise the payment of the modest total amount we distribute in ordinary dividend.

Last year I referred to the Decree of the Supreme Court of the United States, under the so-called Anti-Trust Laws, compelling the Timken Roller Bearing Company of Canton, Ohio, to accept and solicit orders from anywhere in the world, including those countries which had previously been exclusive British Timken territory.

Your directors have had lengthy negotiations with the directors of the Timken Roller Bearing Company resulting in an entirely new agreement between the two companies, under which the American company becomes the sole legal owner of the trademark "Timken" in all countries in which a licence or registered user may be granted to the British company. In all such countries the American company will grant to the British company without limitation of time the full right to manufacture and sell under the trademark. In countries where the British company formerly held title to the mark, no third party may receive a licence or right of registered user without the consent of the British company.

In summary, both companies hereafter are to be free to manufacture and sell under the same mark in competition in all countries. Your company will be free to export and sell into the United States and other American territory, just as the American company will be free to export and sell in the British company's territory.

Your directors are satisfied that the new agreement meets the requirements of the American company without any detriment to the interests of the British company, and that the new arrangement is more satisfactory to the British company than were the old agreements, in that the British company will now be able to use the trademark "Timken" in any country in the world without limitation of time.

Your directors wish to express their appreciation of the fair way in which the American company has met the problem.

[At an extraordinary general meeting which followed, the authorised capital of British Timken Limited was increased to £2,500,000 by the creation of 1,100,000 new ordinary shares. A second resolution capitalised £800,000 new ordinary shares of £1 each, credited as fully paid, these to be distributed among shareholders in the proportion of two fully paid new ordinary shares for every existing ordinary share.]

SHEFFIELD TWIST DRILL & STEEL

STRONG LIQUID POSITION

The fifth annual general meeting of the Sheffield Twist Drill & Steel Company, Limited, was held on June 19th at Sheffield, Mr Alexander Dormer (chairman and joint managing director) presiding.

The following is an extract from the chairman's circulated statement:—

The trading profit, after making all provisions other than for taxation, amounted to £766,080, as compared with £491,111 last year. Direct taxation takes nearly half a million pounds, or practically two-thirds of our total profit.

COMPANY'S FINANCIAL STRENGTH

The total assets of the company have increased by £291,378, and the financial strength of the company is apparent.

There are, of course, special reasons for the exceptional success in the year 1951. These are further improvements in the methods of production, coupled with the expansion of sales. During the whole of 1951, the additional factory space provided by the buildings erected and available for occupation in the autumn of 1950 have been fully utilised, and your directors have further similar plans on which they are very actively engaged. We continue to keep abreast with happenings abroad, in which connection we sent senior technical representatives to the United States of America and to several of our agents abroad.

DEMAND AFFECTED BY ANTICIPATORY ORDERING

I am bound to say that the demand for your company's products has been affected by anticipatory ordering by firms participating in the Government programme of rearmament for defence purposes, but I would not wish to leave you with the impression that profits such as were earned in 1951 can necessarily be repeated. Without being pessimistic, it does seem that in the near future we shall have to produce for a more competitive market and to increase our stock of finished goods in order to give that service which will be so essential if we are to continue to prosper. When this situation arises it will be appreciated that your company will have to employ its accumulated liquid funds in financing the increased stocks, and for which purpose £150,000 has been placed to general reserve this year, making a total reserve of £250,000.

Incidentally, the new proposed Excess Profits Levy will increase the taxation charge on your company, although as far as information thereon is available we have a very satisfactory standard.

In all the circumstances, your directors have felt that it would be fair and reasonable to increase the distribution to the shareholders, and therefore a final dividend of 1s. 4d. per unit is proposed, making a distribution for the year of 2s. per unit.

The loyalty of our agents abroad and our merchant customers in the United Kingdom is matched by that of our staff and employees, whom we feel sure are all proud to work with a successful company whose continued progress is greatly due to their efforts. I, on your behalf, extend to them our best thanks.

Having regard to the present market price of your company's ordinary stock units and to the provisions under the articles of association relating to the qualification of directors, it is proposed to ask the shareholders to sanction a modification.

The report and accounts were adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

IMPROVED PRODUCTION

The forty-fourth annual general meeting of the United Serdang (Sumatra) Rubber Plantations, Limited, was held on June 18th in London.

Sir Eric Miller, chairman of the company, in the course of his speech said: The financial strength of United Serdang is obvious from the balance sheet which shows that current assets exceed liabilities (including future taxation) by £480,000, equal to 8.1d. per 2s. stock unit, of which 2¼d. was in rupiah currency at that date.

Strong action taken by the local military and police last autumn against subversive elements contributed to a marked improvement in production on our estates, the crop of rubber harvested for the 9 months to May 31, 1952, being 9,081,930 lb against 5,108,278 lb for the like period of 1950/51, which latter, however, included the general strike.

CROPS AND PRICES

Of the 1951/52 rubber crop we have sold some 6½ million lb at an average price appreciably higher than that now obtainable and will also be participating in some satisfactory group forward sales which cannot be specifically allocated until time of shipment. The outturn of palm oil and kernels also shows an improvement over last year and most of this crop has been disposed of at prices well above the current levels. The staple food of South East Asia is, as you know, rice. Burma, Siam and Indo-China were and are the principal exporting countries, but owing to internal disturbances in Burma and Indo-China there has been a very marked contraction in the exportable surplus. It seems to me that the question of increasing rice production in South East Asia, particularly in Burma, is of primary importance in the struggle against the Communists, who find many more willing converts amongst the hungry than amongst those who enjoy a reasonable standard of living.

GOOD LONG RANGE PROSPECTS

The long range prospects for natural rubber are good, and could improve rapidly were the existing international tension to be definitely eased. We are, however, obliged to concern ourselves with market conditions from day to day, and I must say the recent sharp fall in price has been most disappointing. The lower price is bound to have the effect of reducing supplies from marginal areas. Meantime there are already signs that at current prices the lower grades of natural rubber are displacing GRS but the process is bound to be gradual as manufacturers will not hurriedly change their compounding formulæ.

What rubber means to the economy of South East Asia was well brought out at the Study Group Meeting and Sir Gerald Templer's recent announcement added pointed emphasis to the problems facing the governments of the producing areas. Whereas in Malaya the struggle with the Communists takes the form of jungle warfare, it assumes a more insidious form in Indonesia, and is putting the government there to an equally severe test. Having large interests in Indonesia may I, on behalf of the United Serdang stockholders, promise our support for any well considered measures which may be taken by the government in order to maintain a productive and sound economy, but we will not blindly follow the road to ruin.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES

ESTATES IN FIRST-CLASS ORDER

The forty-fifth annual general meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held on June 12th in London, Mr H. W. Horner, the chairman, presiding.

The following is an extract from his circulated statement:—

The accounts for 1951 show a profit before taxation of £395,872, nearly £80,000 less than the corresponding figure for 1950. In the case of tea, the crop showed an increase over the previous year of some 600,000 lb. In the case of rubber, the average increase in selling price of 2d. per pound has been more than offset by the lower crop and the increased cost of production.

The board have decided that it would be inadvisable to repeat the dividend at last year's exceptional total of 20 per cent, and they recommend a final payment for 1951 of 7½ per cent, making 15 per cent for the year.

Tea: The crop harvested for the year reached the very satisfactory total of 8,980,341 lb, representing a yield per acre in bearing of 829 lb, or 60 lb per acre more than in 1950.

Rubber: The sale of St. Leonard's-on-Sea Estate and the gradual elimination elsewhere of those rubber areas selected as more suitable for replanting with tea, resulted in a crop for the year of 1,632,822 lb, compared with the 1950 crop of 2,013,390 lb.

As regards prospects for the current year, the estates are in first-class order and easily capable of at least maintaining the tea crop at the very satisfactory figure of 1951 and of slightly improving upon the rubber crop.

The report was adopted.

RANGALLA CONSOLIDATED

DIVIDEND MAINTAINED

The twenty-ninth ordinary general meeting of Rangalla Consolidated Limited was held on June 16th in London, Mr Eric Davenport, ACA (the chairman), presiding.

The following is an extract from his circulated statement:

The accounts show a profit of £9,854 against £30,003 for 1950. Although crop for the season was higher at 1,359,675 lb than that of 1950 by 76,502 lb, considerably increased costs had to be faced at 2/5.34d. against 2/1.55d. for 1950, or an increase of 3.79d. per lb, whilst the net average selling price secured was 2/7.34d. or .19d. per lb below the previous year. Thus the increased yield per acre has had little effect on the cost of production.

Appropriations include the payment of an interim dividend of 15 per cent, thus maintaining the distribution at the same level as for 1950. No further payment is recommended for the year. Your directors felt justified in making this payment because of the company's sound financial position.

The tea crop at 1,359,675 lb compares with 1,283,173 lb in 1950; 616,857 lb were shipped to London and 742,818 lb disposed of locally.

A feature of the year 1951 has been the reopening of the London auctions. This market, however, is restricted by the ceiling placed on the retail price of packet tea and by the refusal of the Government to permit purchases for re-export. Sellers are disappointed with the working of the London auctions under control.

The report was adopted

GREEN, HEARN AND COMPANY, LIMITED

(Manufacturers of "Lyndale" Coats and Suits)

INCREASE IN SALES TURNOVER

CONTINUED DEMAND FOR QUALITY PRODUCTS

The fourteenth annual general meeting of Green, Hearn and Company, Limited, was held on June 13th in London, Mr Michael Marks (one of the joint managing directors) presiding.

The following is an extract from his circulated statement:—

Your directors are pleased to report a continued increase in sales turnover during the year although, like many others, our trade was not unaffected by the fluctuation in wool values which, together with a retrenchment in public spending, induced some hesitation amongst retail customers in placing orders with their accustomed confidence. We have, however, been able to maintain our production at a very high level owing to continued demands for our Lyndale coats and suits, which are of the highest quality and style.

Changes in the rates of tax by the budget in 1951 imposed an additional charge of nearly £6,000 upon the results achieved. The board recommend the maintenance of an overall dividend of 32½ per cent on the ordinary shares. Redemption of the preference shares has continued. This process can only have the effect of strengthening the ordinary shares whose security on the equity of the business increases correspondingly. Assuming that the proposed dividend is approved, then the balance of undistributed profits will amount to £67,702, equivalent to 75 per cent of the ordinary share capital. Obviously, ample reserves must, in prudence, be retained to meet any unknown contingencies of the future, but your directors do not overlook the propriety of transferring at the right time a proportion of these accumulations where they rightly belong, that is, in the hands and possession of the ordinary shareholders.

All members of the staff without exception merit your perennial tribute to their loyalty and steadfast work in the interests of the company. The Staff Pension scheme has again received substantial support out of current profits, and it is not doubted that you will consider the provision to be eminently deserved.

CONSOLIDATED BALANCE SHEET

In view of the circumstances, our stock position has been under constant and most careful supervision and, at the date of the balance sheet, was of a sufficient magnitude to sustain our level of trade, having regard to current values then prevailing. The difference on this account from last year is reflected in our available cash resources, which should permit later adjustments to Stock, according to our requirements without embarrassment.

The strength of our liquid resources has been maintained, and indeed increased, during the year, and shows a surplus of Current Assets over Liabilities of £189,875, being an increase of £22,008 over that of the previous year.

The net profit on trading amounts to £111,160, as compared with £109,767 in 1950. After making all provisions, the amount carried forward is £67,702, or £25,379 more than the amount brought in.

Finally, while the 1952 Finance Bill has not yet become Law, and may yet include amendments following Parliamentary consideration, so far as it is at all possible at the moment, to estimate it would appear that the company's standard for the excess profits levy will be such as not to endanger our recent rates of dividend, provided that our normal expectation of earnings is not unduly affected by other circumstances.

The report was adopted.

SIMMS MOTOR UNITS

A RECORD YEAR

The thirty-second ordinary general meeting of Simms Motor Units Limited was held on June 19th at the company's works.

Mr Tom Thornycroft (the chairman) who presided, in the course of his speech, said:—

I am pleased to be able to report a record year of continued progress with the highest sales and profit figures in the history of the company.

The profit and loss account shows an increase in net profit before taxation of £64,289 —from £194,587 to £258,876. Your directors have thought it wise to keep the dividend at the same rate as last year, namely 17½ per cent.

The full benefit of your directors' foresight in ordering plant and machinery in 1950, is only now becoming really effective.

Our results have been obtained by ever-increasing efficiency and hard work which has enabled your company to sell improved articles at a relatively small increase in price over 1939 level. We are now delivering fuel injection equipment in large volume including a contract from the Ford Motor Company for these units for fitment to their new diesel-engined major tractor.

I told you last year that I was convinced that the diesel or compression ignition engine which at that time was universal in all heavy duty transport, would become pre-eminent down to medium sized vehicles, agricultural and industrial tractors, moderate sized power plants and prime movers. This is now definitely established and the demand for our technical advice and service in this field is ever on the increase.

The report was adopted.

UNIVERSITY OF NOTTINGHAM
DEPARTMENT OF ECONOMICS

Applications are invited for the appointment of Assistant Lecturer in Economics, preferably with special interests in the field of international economics. Salary scale £450 by £25 to £500.

Form of Application and Conditions of Appointment may be obtained from the undersigned.

June 13, 1952. SPH. H. PICKBOURNE, Registrar.

UNIVERSITY OF ADELAIDE

Applications are invited for appointment as LECTURER IN ECONOMICS.

Salary range: £A600 x £50—£A1,000 a year. In addition a cost-of-living allowance, at present £A192 a year is payable. Commencing salary may be fixed within the scale in accordance with the successful candidate's qualifications.

Detailed terms of appointment and a leaflet about the department may be obtained from Dr. J. F. Foster, Secretary of the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

Applications, in duplicate, must reach the undersigned not later than *July 31, 1952.*

A. W. BAMPTON, Registrar.

The University of Adelaide, Adelaide, South Australia.

UNIVERSITY OF NATAL, DURBAN, SOUTH AFRICA

Applications are invited for the post of LECTURER IN COMMERCE.

Salary scale: Men—£550 x £25—£725 p.a.; Women—£450 x £25—£600 p.a. In addition, there is a temporary cost-of-living allowance at present amounting to £320 p.a. for a married person and £100 p.a. for a single person. Pending the introduction of revised salary scales, the lecturer will also receive in 1952 a non-pensionable allowance at the rate of £25 p.a. plus 10 per cent. of present salary.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is August 15, 1952.

SALES MANAGER REQUIRED BY LEADERS IN BASIC INDUSTRY. Capable of building sales force and planning, in conjunction with research laboratory and factories, sales development in the electronic field. Applications are invited only from those who are fully conversant with modern marketing techniques, used to co-operating with market consultants, advertising agents and internal publicity department and have successful marketing and sales promotion records. The post offers a substantial salary and, to the right man, future prospects of an attractive nature.—Box 972.

ADMINISTRATOR with wide experience of Government finance and commerce in India now desires an executive or secretarial post where his abilities can be wholly employed. Age 42, M.A. Honours (Cantab).—Write please to Box 974.

UNIVERSITY OF NOTTINGHAM
DEPARTMENTS OF ECONOMICS AND SOCIAL ADMINISTRATION

Applications are invited for the appointment of Research Assistant. Salary scale £300 to £450 per annum, with membership of the Federated Superannuation System for Universities.

Candidates should be graduates, preferably in the Social Sciences, and some knowledge of Statistics and ability to type are desirable.

Conditions of Appointment and Form of Application which should be returned as soon as possible, may be obtained from the undersigned.

June 14, 1952. H. PICKBOURNE, Registrar.

HER MAJESTY'S COLONIAL SERVICE
STATISTICIANS

A few vacancies exist for Statisticians in the Colonial Service. Appointments are usually on probation for permanent and pensionable employment. The work is varied, providing the essential statistical basis for development schemes and current administration. In the smaller territories a Statistician may be required to perform a wide range of duties. In the larger Statistics Departments in East and West Africa and Malaya there are opportunities for more specialised work, but even in these Colonies an officer's duties may cover a wide range of problems. Statistical Departments are organised to provide a central service and they are therefore closely linked with most other Government Departments.

Candidates should have a First or Second Class Honours Degree in Statistics or in Mathematics, Economics or other appropriate main subjects combined with Statistics. Graduates with a few years' experience in statistical work are preferred, but an increasing proportion of vacancies is being filled by young graduates without such experience.

Intending candidates should write for application forms to the Director of Recruitment (Colonial Service), Colonial Office, Great Smith Street, London, S.W.1.

GENATOSAN LTD. of Loughborough have a vacancy for an assistant to the Marketing Manager to deal with the sales promotion, marketing and advertising of the company's ethical preparations. Considerable expansion is planned in this direction and this represents a real opportunity for the right type of man to grow with the business. Age limit 40. The right kind of personality, ability to get things done and practical experience in the marketing department of a firm successfully engaged in the manufacture and sale of products of this kind, preferably including a period on the road as a medical detail man, are regarded as of more importance than academic qualifications. Very good conditions of employment, including pension scheme and life insurance.—Please write to the Marketing Manager, Genatosan Ltd., Loughborough, Leics. Envelope should be marked "Marketing Assistant, Confidential." This post is not subject to the control of engagements order.

TRANSPORT consultant offers advisory service to Traders, including fleet operation, licences, costings, freight charges, consigning of goods.—Box 973.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH ESTD. Branches throughout SCOTLAND 1825

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 18/20, Regent Street, Piccadilly Circus, W.1.

Every description of Banking Service undertaken.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES.—The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1952. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1952, may eventually be announced. The Scientific posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1952 may be admitted to compete before the result of their degree examination is known.

Age Limits: Senior Scientific Officers, between 26 and 31; for Scientific Officers and Patent Classes, between 21 and 28 during 1952 (up to 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers (men), £812—£1,022; (women) £681—£917; Scientific Officers (men), £440—£707; (women) £440—£576; Patent Examiner and Patent Officer Classes (men), £440—£655. (Rates for women under review.) Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S 53/52 for Senior Scientific Officers and S. 52/52 and S. 128/52 for the other posts.

THE International Labour Office invites applications from men and women aged between 23 and 35 years for a post of Member of Division in the Official Relations Division of the International Labour Office, Geneva, Switzerland. Qualifications required: (1) Nationality: United Kingdom; (2) University degree or the equivalent in experience; (3) Mother tongue: English; very good knowledge of French and Spanish; (4) General knowledge of social and labour questions.

For further particulars and application forms apply, enclosing stamped, addressed foolscap envelope, to the International Labour Office, 38/39 Parliament Street, London, S.W.1.

The closing date for the receipt in this Office of completed application forms is July 26, 1952.

UNILEVER LIMITED invites applications for the post of Head of the Economics and Statistics Department. The Department has a staff of 35 and its main task is the supply of regular and incidental information. Special studies are required occasionally. Applicants should be not older than 40 years, trained in economics and experienced in documentation. Organising and managing capacities are essential. Personal acquaintance with sources of information would be an asset. Initial salary £1,750-£2,500, according to qualifications.—Applications to Personnel Division, MWG/AT, Unilever House, Blackfriars, E.C.4.

CHARTERED or Incorporated Accountant required immediately for progressive company in the West Country, as Secretary and Chief Accountant. Age 30 to 40 years. Commencing salary about £1,250.—Applications, giving details of age, education, qualifications, experience and salaries, should be sent to Robson, Morrow & Co., 59 New Cavendish Street, London, W.1.

ACCOUNTANTS for Management and Industrial Consulting. Production-Engineering Ltd. invite applications from qualified Chartered Accountants, preferably with university degrees and with an interest in the problems facing management today; there are exceptional openings for first-class men with initiative requiring permanent posts in this type of work. Applicants should have experience of modern developments in financial control and its application in industrial management. After training there is a four-figure starting salary as well as life assurance and superannuation schemes; age should be between 27 and 38.—Write, giving age and full details of education, qualifications and experience, to Production-Engineering Ltd., 28 Bruton Street, London, W.1.

PROGRESSIVE Precision Engineering Company require Assistant to Sales Manager in Export Dept. Ability to converse and correspond in French and Spanish essential. Some Technical background an advantage. Excellent prospects for person of character and ability. State salary required and send details of education and previous appointments to Box 963.

W.C. 1.—In professional gentleman's private house; large single divan sitting-room, new and unused as yet. H. and c., etc., £4 4s. Small ditto, £2 12s 6d. Breakfast optional. Careful tenant.—TERminus 7869.

GRADUATE Economic Statistician, First Class Honours Oxford, wide experience research university and industry, seeks interesting well-paid post, preferably in East Midlands.—Box 969.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

GENTLEMAN, European (married), aged 39 years, residing in Bombay, desires change of employment in India or elsewhere. Sound legal, estate, commercial and group company Secretary experience in U.K., with large organisations. Present Manager of old-established Merchanting Company, Bombay. Served Indian Army. Excellent references.—Box 975.

MURRAY-WATSON
LIMITED

Advertising & Marketing
Home and Overseas

58 BROOK STREET, LONDON, W.1. GROSVENOR 3508-9
DUDLEY, WORCESTERSHIRE. DUDLEY 3162

UNIVERSITY OF CAPE TOWN

Applications are invited for the *LECTURESHIP IN THE DEPARTMENT OF GEOGRAPHY.*

The salary scale is £550 x £25—£800 per annum. There is also a temporary cost of living allowance: at present £320 per annum for a married man and £144 per annum for a single person. A Government Commission is at present inquiring into salary scales for staffs of Universities and improvement of scales is hoped for by 1953.

Applications (with copies of testimonials) should state age, experience, qualifications (including knowledge of foreign languages), and research completed or in progress, and give the names of at least three referees whom the University may consult. Two copies of the application and testimonials should reach the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (from whom a memorandum giving the general conditions of appointment should be obtained) not later than July 15, 1952. An additional copy should be sent direct by air mail to the Registrar, University of Cape Town, Private Bag, Rondebosch, Cape Town, South Africa, by the same date.

The post is vacant from February 1, 1953. The University reserves the right to appoint a person other than one of the applicants or to make no appointment.

UNIVERSITY OF SYDNEY, AUSTRALIA

Applications are invited for the position of SENIOR LECTURER IN ACCOUNTANCY.

The Senior Lecturer will be administratively responsible to the Professor of Economics but will be expected to take charge of commercial studies within the Faculty of Economics.

The salary will be within the range of £A1,050—£A1,300 per annum plus cost of living adjustment (at present £A200 males and £A152 females) with annual increments of £A50 and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is July 31, 1952.

VICTORIA UNIVERSITY COLLEGE, WELLINGTON, NEW ZEALAND

The Council of Victoria University College proposes shortly to appoint a LECTURER to the staff of the SCHOOL OF SOCIAL SCIENCE, and invites applications from suitably qualified persons for this post. Applicants must have a University degree in one of the Social Sciences. A qualification in Social Work, experience in University teaching and in Social Research will be considered additional qualifications.

The salary will be £800 per annum rising by annual increments of £50 to £950 per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

The successful applicant would be expected to take up his duties as soon as possible after appointment.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is July 1, 1952.

AUCKLAND UNIVERSITY COLLEGE
(UNIVERSITY OF NEW ZEALAND)

Applications are invited for appointment to a *LECTURESHIP IN GEOGRAPHY.*

The salary attached to the position will be £800 x £50—£950 per annum.

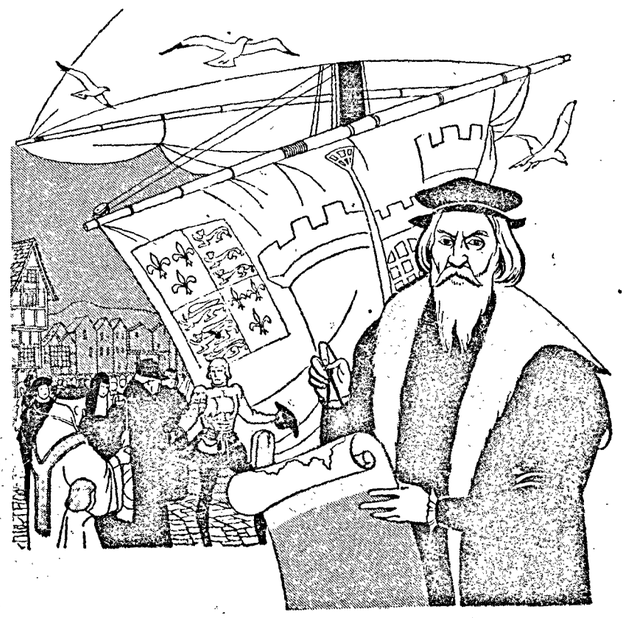
The successful applicant will be expected to take up his duties not later than February 1, 1953.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of application is July 31, 1952.

CHARTERED or Incorporated Accountant required immediately for progressive Public Company in London, as Secretary and Chief Accountant. Industrial experience essential. Age 30-40 years. Commencing salary about £1,500. Excellent prospects of advancement to higher administrative levels.—Applications, giving details of age, education, qualifications, experience and salaries, should be sent to Robson, Morrow and Co., Box No. 001, 59 New Cavendish Street, London, W.1.

EXPERIENCED Company Secretary, B.Sc.(Econ), B.Com., F.C.I.S., seeks Executive appointment. Present salary £1,500.—Box 968.



POSTAL TUITION for **B.Sc. ECON.**

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the examinations at home under the experienced guidance of Wolsey Hall (est. 1894); fees are reasonable and may be paid by instalments if desired. 765 Successes at Lond. B.Sc. Econ. Final Examinations, 1925/51.

Prospectus from the Director of Studies, Department P17 **WOLSEY HALL, OXFORD**

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland and Overseas 2d.—Saturday, June 21, 1952.

THE HISTORY OF ZINC

ZINC an exploration.

Bristol saw the start of the Cabots' first voyage of discovery. Brass—an alloy of zinc and copper was used extensively in the manufacture of those early scientific instruments which made it safer for explorers to go further into the unknown.

TODAY ZINC is one of the most important metals in industry. It is used in brass; as a protective covering for iron and steel; large quantities are used for die casting in the motor car and many other industries; and its pigments, Lithopone and Zinc Oxide are widely used by the paint, rubber, linoleum and associated industries.

During the last 30 years a great Zinc industry has been created in Britain by Imperial Smelting Corporation Limited, whose principal activities, in addition to the production of Zinc metal and Pigments, include the production of Sulphuric Acid, Fluorine and its compounds and a variety of other important chemicals.

Bombs on the Yalu

THE raids by hundreds of American aircraft on the power stations on the Korean bank of the Yalu River can hardly have caused more disturbance in that remote part of the world than they have done at Westminster. Question hour in the House of Commons on Tuesday was in a turmoil, and on Wednesday the Labour Party even abandoned a debate on their favourite topic of the cost of living in order to discuss the events in Korea. The main domestic political result has been to show, once again, how much less Mr Attlee differs from Mr Eden than he does from Mr Bevan and to give the Government a much-needed opportunity for showing firmness and reason.

What concerns the public, however, is not which party derives advantage from the incident but its inherent rights and wrongs. There are three separate questions involved, which the parliamentary discussion inevitably tended to confuse. The first is whether these raids went beyond the agreed policy for the conduct of the campaign in Korea. Clearly they did not. There has never been any question about the propriety of conducting hostilities anywhere in North Korea, or of air raids even beyond the Yalu should the necessity arise. That is agreed policy—agreed among the United Nations participating in the campaign and agreed between the parties (or at least between the two successive Governments) in this country.

The second question is whether the raids were wise—that is, whether they were calculated to hasten the end of the war. On that, opinions may legitimately differ. Those whose general approach is that any and every American action is *per se* dangerous, while every Communist action, however aggressive in appearance, is natural and forgivable, will have no difficulty in convincing themselves that the Americans are precipitating a world war. Others who do not share this prejudice will still have their doubts; strong action always involves risks. To the majority of people who try to preserve open minds, however, it will seem at least arguable that a forcible reminder of this kind may help to bring the everlasting truce negotiations to a conclusion. Whether or not General Clark's judgment on this was sound, the sequel will show soon enough. But he certainly has far better material for forming a judgment than laymen half a world away who have not been in contact with the Chinese and have no access to intelligence reports.

The third question is whether there should have been consultation with the British and other interested governments before the action was ordered. There was time for consultation, as the Joint Chiefs in Washington were consulted. Moreover, Lord Alexander and Mr Selwyn Lloyd were in Tokyo when the action was being planned; so the omission was clearly deliberate. The American argument can well be imagined: the Supreme Commander was appointed not by the United Nations, but by the President of the United States; if Britain were to be consulted, half a dozen others would also have to be told what was afoot; and if an international debate has to precede military

action, then there will be no secrets and no action.

These arguments have some force. Nevertheless, to take action of this particular kind in this particular place and at this particular time without any consultation with the associated governments is a capital blunder. It will revive (however unjustly) all the suspicions of the other free nations that the Americans are trigger-happy. It will provide fresh material for all those who argue (whether or not they believe it) that it is the ruthlessness of Washington rather than the aggressiveness of Moscow that most threatens the world's peace. It is a free gift to Bevanism all over the western world. There is very little doubt that the present British Government, had it been asked, would have given its agreement, though perhaps reluctantly. Yet the position of the American Administration would have been infinitely stronger *vis-à-vis* the rest of the world if it could have said so—and no weaker *vis-à-vis* its own public opinion.

The trouble would seem to be that these matters are settled in Tokyo on purely military, or at least local, considerations. There has been some talk of appointing a British military deputy to General Clark. It is an excellent idea; but it will not meet the real need, which is that the soldiers, of whatever nationality, should have someone at their side to tell them what the world-wide political consequences of their military actions are likely to be. It is the old story that the Americans, a civilian people if ever there was one, nevertheless do not seem to know how to keep their soldiers under civilian control. Yet they will have to if they wish to enjoy the full confidence of the rest of the world and keep the alliance of the free nations alive. As Clemenceau said, war is too serious a matter to be left to generals. If the Pentagon is allowed to treat the war in Korea as its own private show, the world will take the same attitude. And that would be a victory for the Communists far greater than any they can achieve by military victory in Korea.

Four-Power Talks?

IT is a pity that much of the comment upon the possibility of reopening four-power talks on the German problem has stressed the differences and the oscillations in the western approach. It is true that there have been *disagreements over timing* and even over a possible agenda, but such differences concern only the immediate tactics of western policy. The fundamental strategy—of building a secure and prosperous Atlantic community and of associating Germany with it—remains completely unchanged and nothing that Russia has to say or offer, short perhaps of massive disarmament, has the power to affect the western powers' fundamental objectives. In fact, there is really only one question to be asked of the Soviet Union's peremptory demand for immediate talks on Germany. Would the acceptance or the refusal of such talks better serve the process of building up Atlantic strength?

It has been the American belief—a belief shared by Dr Adenauer—that to open talks with Russia now would invite the German legislature to delay ratification of the Bonn agreements and would thus postpone the coming into effect of the European Defence Community. Those who want to open negotiations do not really hold the contrary; their motives are mixed, and there are strong tendencies in France—and some in Britain—to snatch at any chance that the Russians might have something new to say. But what seems likely to be decisive are the views held by the Germans themselves. Neither fears in Paris nor pressure from Washington can now alter the fact that Germany's contribution to western security will be decided in Germany by Germans. It is the attitude of the Federal Assemblies in Bonn that will determine ratification and it begins to look as though four-power talks on Russia, far from delaying German ratification, may have become a precondition of any ratification at all.

The warning has already been given by the Upper House at Bonn, which has laid down a clause-by-clause procedure for the ratification of the treaties. The Bundesrat, in thus delaying the decision, reflects a very widespread mood in Western Germany today, a mood of caution and indecision and of panic dislike for responsibility. The attitude is not surprising. The reversals in German—and indeed in Allied—philosophy and policy have been so startling in the last decade that no man feels sure that his views of today may not prove grounds for his imprisonment tomorrow. The cry that those who ratify the Bonn conventions are traitors to German unity has had its effect. In spite of all that has happened since 1947, the belief still persists that, if only the agreements are abandoned, German unity will be conceded by the Russians on terms that democrats can accept. Only if the western powers have proved quite conclusively and all over again that Russia's terms for reunion are too stiff for the West Germans themselves to swallow, will ratification go forward. In other words, it seems as though talks with Russia, far from being an obstacle to the development of western strength, represent the next tactical step towards achieving it.

The framework of any talks with Russia must, naturally, in no way contradict this objective. It would have to be made clear in the most unequivocal terms that the only German unity in which the West is interested is one based on the most complete freedom of speech and thought and political action; that though the future all-German government cannot be forced to take over Western Germany's membership in the Atlantic community, it must be free to do so, and will indeed be encouraged to do so; and that there can be no withdrawal of the western occupying forces from Germany until a lasting peace is fully assured. In short, the only thing worth negotiating about is the conditions that are necessary for genuinely free elections to proceed.

The western powers have the tactical advantage that elections conducted with scrupulous fairness can only lead to one result—the annexation of Eastern Germany by Western Germany. The main purpose of talks with the Russians would be to make it clear that this is the ineluctable price they would have to pay for unity, and to find out whether they are ready to pay it. The Western Germans, however hesitant they may be about committing themselves to the Bonn agreements, do not want unity at the cost of Herr Ulbricht's political police or Soviet domination. On the contrary, the brutality with which Russia has set about sealing off the zonal frontier has stiffened West German opinion.

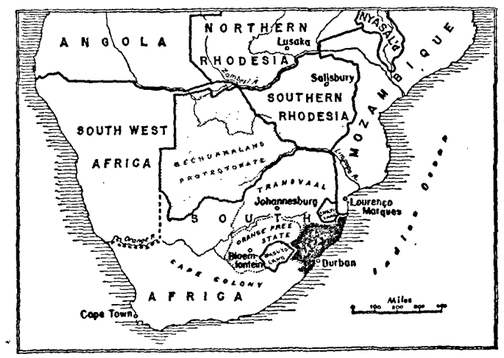
It is, of course, likely that if the western powers insist that really free elections are, at the moment, the only thing they will negotiate about, and if at the same time they make the general point clear that no shift in Soviet policy over Germany can set in motion any process of weakening or dismantling the Atlantic alliance, the talks will either be refused by the Russians or will prove completely abortive. But in either case, the impossibility of doing a deal with the Russians will have been proved once again and Bonn may be persuaded, with steadied nerves, to ratify the contractual agreements and enter the European Defence Community.

*

The three western ministers could, therefore, arrange for the reopening of negotiations in reasonable certainty that, at the cost of much talk and some propaganda, they would expose, once again, Russia's unwillingness to buy German unity at the cost of losing control of the eastern zone. Nevertheless, it would be unwise if they embarked on the course without full consideration of possible alternatives. There is just an outside chance that the Russians' tactics have changed. Their overriding aim is to secure the withdrawal of the United States from Europe. It is just possible that, as the price of "getting America out of Germany," the Russians would now be prepared to lose direct control of their zone and see an all-German government established as a result of free elections. There are some signs that they are beginning to believe that a united Germany possessing its own armed forces, even if the Communist party played little part in it, could be lured from a western to an eastern orientation. The Soviets may, with still more machiavellian subtlety, argue that even if an armed united Germany retained its western connections, the United States would come to rely on it as a buffer against Russia and as a substitute for a direct American commitment to Europe. Thus indirectly a Soviet retreat from total control of part of Germany might lead ultimately to a Soviet alliance with the whole of Germany or at the least to a semi-neutralisation of Europe. In either case, Russian power would be enormously, even decisively, reinforced.

It is no use denying that there are men in Western Germany to whom the idea of playing off West against East is already very attractive. A sovereign Germany, with an independent army, would recover a remarkable freedom of action either to make pacts with Russia or to lead a "neutral" Europe or to throw its weight upon the western side. Supporters of all three policies are already vocal in Western Germany and for the western powers no less than for Russia, the restoration to Germany of unity and sovereignty and freedom of choice would represent a tremendous gamble. The Russians, moreover, would enjoy certain marked advantages—political control over the "lost lands" in the East, for example, or economic control over the markets to which the whole of Eastern Germany's economy is now diverted. The Russians are undoubtedly directing their attention to these less immediate consequences of German sovereignty. Their recent switch in policy, from the demand for a demilitarised Germany to the proposal of an armed and soverign one, may well have sprung from long-term speculations on Europe's future balance of power.

It would be reassuring to think that the western powers had thought as frankly about the possible gamble on German unity which may lie not many months ahead. Have they, for example, decided, if Russia offers genuine unity after genuinely free elections, to accept the offer, to sacrifice the European Defence Community for the time being and to bank upon securing all-Germany's adherence to an Atlantic policy once a unified central government has been set up? They may feel that the risk is too great. Yet if they were to refuse, would Bonn ever ratify the EDC agreements?



Since, therefore, the possibility of an all-German government superseding Dr Adenauer's administration cannot be entirely ruled out, have the western powers seriously considered how they would set about anchoring such a reunited Germany to their side? It takes very little reflection to suggest that on two points, at least, western policy could be decisive. In the field of defence, Germany will not follow where weakness leads. If, for one moment, American participation in European affairs were to waver or American commitment to slacken, the Germans would inevitably look to their more powerful eastern neighbour, and the situation of 1939 would be restored. Only overwhelming western strength will keep Germany from an eastern orientation and only America can tip the balance down upon the western side. Weakness, division, withdrawal and neutralism would leave Germany master of Europe and probably allied to the Soviet Union into the bargain.

The second decisive area is that of trade and economic stability. At present, the government at Bonn has achieved a large measure of independence of American aid in balancing its international accounts. If, however, the eastern zone were to become its responsibility in a reunited state, the position would deteriorate sharply. The eastern zone is entirely dependent upon Soviet Russia, and if eastgoing trade were cut off, a depressed area would appear in Eastern Germany and a large gap in Germany's balance of payments. Unless the long-term alliance of the free world were to include measures to enable Germany to sell more extensively in dollar markets or to secure necessary dollars by other means, the economic attraction of Soviet Russia could become overwhelming. Russia has the ability to provide Germany with wheat and markets—even though the price would be heavy. A reunited sovereign Germany, compelled to face, under conditions of chronic dollar shortage, the problems of economic partnership with the West, would very probably be tempted to give up the ungrateful task. Nowhere is the lack of any long-term Atlantic economic strategy more apparent than here, at the point at which Germany has to be inserted into it.

Yet it is this larger strategy, and not immediate tactical discussions of the whereabouts or the personnel of four-power talks, that will determine a united Germany's ultimate reactions. One may indeed go further and say it will even determine the reactions of a divided Western Germany. A large measure of sovereignty has returned to Bonn, and Bonn, too, must be able to see the longer perspectives of western policy if it is to be persuaded fully to accept them. The chance—the outside chance—that the reunion of Germany lies not so far ahead only makes the need for a long-term Atlantic strategy more pressing. This imposes no new decisions of principle upon the western nations; they have all been taken long ago and embodied in formal undertakings. But it does impose upon them the task of working out the full logical implications of the policies to which they have put their hands.

The Split in South Africa

THE enactment of the High Court of Parliament Bill and Dr Malan's rejection of the request from Natal for a national convention have brought South Africa face to face with a political crisis which bears comparison with the period immediately before the Boer War fifty-three years ago. Today, it is true, the leaders of the opposition to Dr Malan have declared their intention of proceeding by peaceful means, even if this includes such downright political acts as the secession of Natal from the Union. But the split in the fabric of South Africa has lately widened so quickly and so deeply that it would be foolish to suppose that violence can necessarily be avoided. At the moment, the leader of the opposition in Parliament, Mr Strauss, has announced that, although the new Act overrides the powers of the Supreme Court, the United Party will apply to that court itself for a ruling on the Bill's validity. If the Supreme Court declares against the government—which it virtually must do if it is to maintain the position it took last year on the Separate Representation of Voters' Act—Dr Malan can hardly now avoid retaliating against the Court with action that would further undermine the basis of democratic government in the Union. If, after all, the Court declares the new Act valid, the rising temper of the opposition is such that desperate measures may be taken. In either event, the consequences are at present incalculable.

Events in South Africa have lately followed one another so fast that there is a danger of losing sight of the main issues. Nor are these issues South Africa's affair alone. The problems of race relations affect all who are concerned with the future of Africa and Asia. Above all, they matter to the Commonwealth, of which South Africa has been a founder member and of which even the fully sovereign members now include more non-whites than whites; already there is news from India, for instance, that the new and happy cordiality of Anglo-Indian relations is being clouded by mental association of the British with the deeds of Dr Malan. It may be easy in this country to protest that the overwhelming mass of opinion is with the South African opposition parties and against Dr Malan, but these things are not always understood abroad and the consequences of misunderstanding could be disastrous.

To seek to interfere in the domestic affairs of another country is normally wrong and dangerous, and particularly for Britain when that country forms part of the Commonwealth. There can, however, be no possibility of standing entirely aside from what is now happening in the Union, since the outcome of the present clash will directly affect the fortunes of all Africa for many years to come. Opinion in Britain, therefore, not only ought to know and understand the issues in South Africa, but it has a right to be heard. For one thing, the British Government has already been placed in a difficult position before the Trusteeship Council of the United Nations, and it is open to serious argument whether it will in future be able to maintain an attitude of neutrality towards South Africa on the world stage in spite of the Commonwealth tie. For another, South Africans, even those who support the government, are still sensitive to the voice of the outside world. There is still time for it to be heard in the narrow confines of their rather isolated country and to sway the trend of events there.

★

For the moment, the immediate struggle in South Africa is constitutional in form. (So, in the beginning, was the struggle between the northern and southern states in America ninety years ago.) It was precipitated last year when the government attempted to kill two political birds with one stone. In order to further the aims of his *apartheid* racial policy, Dr Malan sought to limit the effective franchise of the Coloured voters in Cape Province, thereby consolidating his own slender majority in parliament. Since this manœuvre was quashed by the Supreme Court, the storm it aroused has spread into ever wider areas of South African life. On the government side, as if in reaction to the wave of hostility which its tactics have provoked, the Suppression of Communism Act has been wielded with a new severity. It has been used in an effort to weaken the trade unions by silencing prominent labour leaders like Mr Sachs, to muffle parliamentary criticism by expelling a European member representing native opinion, and to stifle the free expression of opposition views by suppressing a weekly Cape newspaper, *The Guardian*. At the same time, Dr Malan has sought to whip up pro-government feeling by raising with the United Kingdom the issue of British trusteeship over the three native protectorates, and by hinting that, in so fiercely questioning the constitutionality of his actions, the opposition is siding with the British crown against the sovereignty and true interests of South Africa.

Against all this, it must be said that the government has a case. In spite of his own attempt to drive a steamroller over the constitution, Dr Malan may legitimately complain that his administration is now being threatened with two seditious acts—the strictly unconstitutional secession of Natal from the Union, and the exercise of political pressure by the launching of a mass civil disobedience campaign by the joint African and Indian National Congresses. The government can also argue that there has so far been no general division of opinion among white South Africans about the need to maintain white supremacy. It is the method, not the principle, which the United Party has in the past mainly attacked; indeed, in the eyes of left wing leaders like Mr Sachs, the official opposition differs from the Nationalists in the government only by the degree, not the kind, of its racial views. Moreover, it is a fact that anyone who has not been in South Africa finds it hard to understand the peculiar practical difficulties of a relatively large, permanently settled, white community living amid a black population at a very much earlier stage of development, but which outnumbers it by only three to one—apart from the Coloured and Indian communities. South Africans claim, not without justification, that the racial balance in their country renders their problems unique, and that even the most liberal-minded European visitor normally goes away with different views from those with which he came.

★

That being said, it is clear nevertheless that the Malan government is wrong and in the end will fail because it is trying to put the clock back. The world has changed a great deal in the last few years but nowhere has it moved faster than in the field of race relations. The idea of white supremacy, the belief that non-whites can be governed indefinitely without their consent or co-operation, has reached its last phase. Senator Heaton Nicholls was right in more ways than one when he declared about a month ago that "This is the end of the road." The only real question in South Africa now is not whether the present phase of *apartheid* will succeed, but how it will end and what will come after it.

The policy of racial segregation on a democratic basis can never work, when Africans are daily learning the ways of the west in school and factory, when the economy of South Africa is dependent on their doing so, and when the condemnation of world opinion comes flooding in by means of newspapers, films, books and the radio. Either South Africa must put up the shutters like a Communist state and revert to a tyrannical dictatorship, or the idea of racial equality must take root and grow. There is undoubtedly some substance in the accusation of the opposition that the more extreme Nationalists do in fact seek to perpetuate their rule by any means in their power and to set up a dictatorship. But this could certainly not now be completed without violence and a clash could no longer be confined to the white men alone.

SOAS LIBRARY

Fortunately, there is still probably some way to go before either the government or the opposition takes the law entirely into its own hands. Inside South Africa Natal has a strong card to play. Mr Nicholls has publicly expressed the hopeful belief that the government will not persist in its present course, if once it is convinced that the threat of secession is real. The people of Natal are in fact likely to be faced with the practical dilemma of staying in the Union and trying to save it, or of implementing their threat and leaving the rest of South Africa to the complete, if temporary, mercy of Nationalist policy. On its own, Natal could be an economically prosperous colony, with good eventual prospects of tighter political and constitutional links with Southern Rhodesia, and its economic loss to the Union would be great.

For Britain the choice of an attitude is tragic. There has been no more creditable page in imperial history than the Peace of Vereeniging and the Union of South Africa which followed from it. Ever since, the leadership of moderate opinion has lain with men of Dutch rather than British descent, and it is the work of those like Botha and Smuts which is now being turned to dust. But there can be no condoning the militant racialism of Dr Malan's coalition any more than aggression can be accepted in the international field. Such policies impinge on the vital interests not only of Britain but of the free world. If Natal does secede, there can be no question where British sympathy, support and strategic interest lie.

Hats Off

THE modest parade of hats at Ascot last week was little more than a nostalgic reminder of the heyday of millinery. It is now a far cry from the time when a lady could hardly pour out tea in her own drawing room without wearing a hat, let alone take up her windswept position in an Edwardian motor car without an enormous creation secured under the chin with a veil of necessary strength. Once she shaded her eyes with a wide brim; now, more often, she blacks them out with sunglasses. That is the hatter's tragedy.

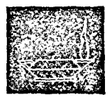
It is a recent tragedy. The first world war brought no revolution in the hat-wearing habits of British women. Between the wars, it is true, the hats they wore were of shapes that ought to have killed the millinery trade for all time; the worst was the hideous "cloche" that revealed only the lower half of the face, like a yashmak in reverse. But these hats were, apparently, worn happily, and when the second world war broke out the millinery trade was flourishing. But then came the deluge. After Dunkirk women's headwear consisted—apart from old stock—of service caps, scarves, and a few fashion-free hats that sold very quickly at very high prices. At the end of the war the hat manufacturers faced a public that had grown used to being hatless on fine days and wearing a scarf for wind and rain.

The diagnosis was straightforward. This was a clear case for a publicity campaign. All sections of the trade helped to finance the message that "a hat makes all the difference." The campaign was subtle. It sought to show that, for instance, a girl does not get offered a seat in an underground train unless she is wearing a hat. The utility of the hat was demonstrated for other occasions when the uninitiated might have expected it to be rather an encumbrance.

The publicity office that produced this campaign is now closing down but its work seems to have made an impression. Certainly sales of women's hats have risen fairly steadily since the end of the war. But the trade is still a shadow of its prewar self. Unfortunately, the statistics do not allow men's and women's hats to be distinguished in a comparison of prewar and postwar output. The most recent census of production showed that the gross output of firms with more than ten employees was £13 million in 1935 and only £14.8 million, at the prices then current, in 1948. This small rise in value represents a big fall in quantity. In 1935 the output of fur felt hats was 850,000 dozen. In 1948 manufacturers' sales were 336,000 dozen. (Figures for production in 1948 are not available, but the difference between production and sales can be taken as slight.)

The output of straw hats has fallen even more severely —from a production of 788,000 dozen in 1935 to sales of 69,000 dozen in 1948. More than half the firms that were in the hat trade in 1935 had by 1948 either dropped out or become amalgamated with others. These figures, however, exaggerate the decline so far as women's hats are concerned. Men's hats have suffered more severely. Altogether, the industry employed over 40,000 people in 1935 and only 20,000 in March, 1952.

*



The making of women's hats is heavily concentrated at Luton. The industry developed there when the surrounding districts grew the straw from which the hats were made. Now rayon substitute straw comes from Italy and paper panama from Japan, but Luton still makes hats. The factories have found some favourable circumstances to set against the wartime change in their customers' habits. If the old hat buying classes now buy less than they bought before the war, new sections of the population—particularly in the north of England —have taken to hats instead of the traditional shawls that used to be worn for all but the very best occasions. Surprisingly, perhaps, South Wales is a particularly good market for inexpensive hats; it favours hats with high trimmings, which give the small Welsh girl the extra height she seems to covet. But everywhere the best sellers are still sober and conservative. Of every dozen hats sold, six are black, navy blue or brown. The manufacturers do not find that their smaller postwar public is becoming much more "fashion conscious."

In spite of the extra demand that full employment has created, there is little optimism about regaining the pre-war volume of sales even among the firms making the cheapest hats. Where mass production is most developed, shapes come off the blocks in hundreds of dozens and all the trimming is done by machines. Yet even for these products prices are three or four times what they were before the war. There has been nothing comparable to the utility scheme to tempt the buyer. The concern about prices shown by many manufacturers suggests that the reduced demand for hats reflects other things besides the wartime change in fashions that the postwar publicity campaign was intended to counteract. Women spend more of their income than they used to do on cigarettes, on cosmetics and on visits to the hair-dresser. The last is probably particularly important. The frequent "hair-do" costs so much that it is a pity to cover it up with a hat.

The expensive end of the trade has been less affected by the prevailing hatlessness, but it has been affected by higher prices and taxes. It is divided into two levels corresponding to those of the fashion trade. There are the milliners who make directly for their customers and invite them each season to come and see the collection; and there are the Millinery Designers of London—the "wholesale couturiers" as they are called in the fashion trade—who show their collections to the buyers from big stores here and overseas. As in the fashion trade, there is a tendency for the couturier to combine his retail business with the wholesale market. Women who before the war bought seven or eight of the most expensive hats buy two or three today. There is "new money," of course, but it is more easily tapped through wholesale couture, which is also more profitable. The hats for the wholesale collection are expensive and hand made, but there are some economies from producing a number at a time. The designers with established names do a little exporting. One who recently visited Australia decided that there was a large potential market, and with a royal visit impending the prospects seemed particularly good; but hardly was everything arranged when the Australian Government made its import cuts.

*

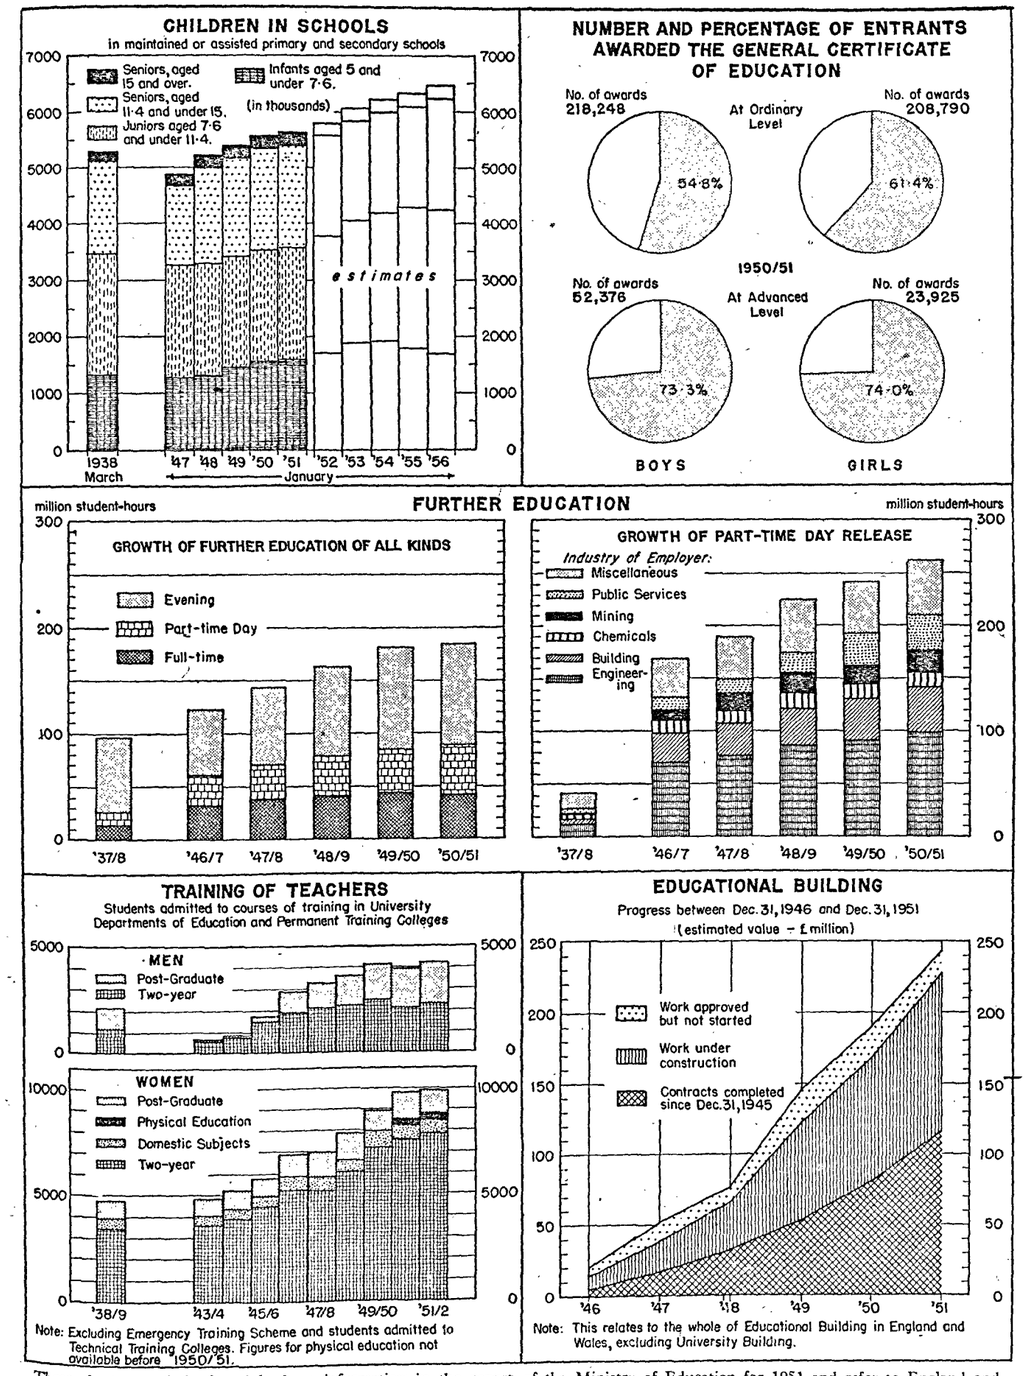
The contraction of the hat industry as a whole since 1939 is unlikely to be reversed, but there is a cheerful side to the picture. The trade has declined, but it is not declining. Indeed, it is the only branch of the textile and clothing industry that has not been hit by the recession of the last twelve months. The chief reason is that its prices never rocketed like those of most clothing. Many of the hat manufacturers had large stocks of materials to draw on and were therefore able to refuse the wool felt and fur felt hoods offered to them at high prices. The comparative steadiness of prices meant that there was no feverish buying and no subsequent reaction. A second reason for the comparative prosperity of the hat industry during the past twelve months seems to be that women who were refusing to buy new clothes still wanted a new appearance, and could achieve it relatively cheaply by buying a new hat. If that is so, it suggests a consolation for the hat trade. In contracting it has become more stable. Women will probably go on wearing hats less than they used to do, but the few that they do buy they will regard as almost indispensable; in a less hatted world, the hat industry has perhaps developed some immunity to the trade cycle.

ADVERTISING  WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.



In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

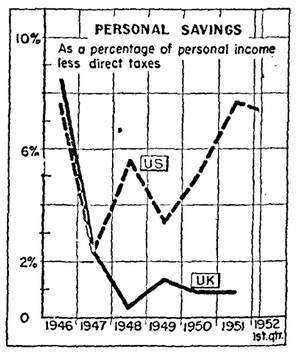
Commonwealth Development—IV



The Question of Capital

CAPITAL is of the essence of development. Indeed, a development plan is simply a programme for the investment of capital in ways that are expected to raise the country's subsequent standards of output. Since the war, the word capital has fallen into disrepute. Its mere mention conjures up in some people's minds—particularly in the undeveloped countries—the spectres of oppression, social injustice and even poverty. It is one of the paradoxes of the modern world that no previous generation has made such demands upon capital, in the sense of promising its citizens standards of living that can be attained only by means of highly capitalised industrial aggregations, and yet no previous generation has been so contemptuous of capital and its providers. This is partly, of course, because capital is equated with the capitalist and the capitalist with the rich man, who is under a cloud the whole world over. This is not the place to go into the equity or the economics of egalitarianism. It is enough to make the point that the development of under-developed countries is inconceivable without the investment of large sums of money in durable capital goods—in the early stages, quite particularly in means of transport, which are great eaters of capital. Those who believe in the development of the Commonwealth—whether it be the Labour party at home or the politicians in the countries to be developed—cannot be forced to love capitalists but it is compulsory for them to cherish capital.

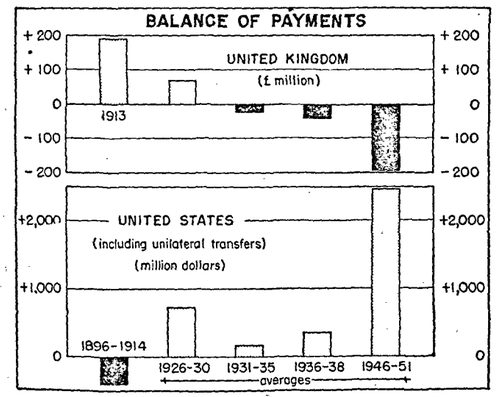
Moreover, they must make it clear that they will go on cherishing capital, not merely for the short period while it is being supplied and applied, but through the whole period while it slowly bears its fruit. Most projects of capital investment are remunerative, if at all, only over long periods of time, and unless the provider of the capital—be he a rich individual, an institution collecting the savings of poor men, or a governmental corporation—can be given confidence that the fruit will be allowed to ripen, and that he will get what he considers his fair share of it, he will not provide the capital in the first place—and there is no way he can be compelled to do so by preachments of social duty.

Stated in the abstract, this is a trite truism. Yet it is the factor in the present situation which is always passed over in silence. It is not polite in international discussion to suggest that very few of the undeveloped countries that are crying out for capital can be trusted, over the next thirty to fifty years, to treat it fairly. If few of them are yet iranian in their attitude towards foreign capital, many of them can properly be described as iranescent. Broadly speaking, there are only two sets of conditions which create enough confidence among the owners of capital to encourage a large inflow of capital. One is if the undeveloped country is, and is likely to remain, in the unfettered control of the capital-owner's country—that is, if it is and will remain a fully dependent colony. There are no parts of the Commonwealth of which that can safely be said today. The other is that the country has a long record of treating capital fairly, based on a real understanding of the part it plays in a mature economy. That can be said of some parts of the Commonwealth, but not of all. It is difficult for a community to be fully capital-minded unless it produces some savings of its own and has shown that it knows how to use them. If the capitalist is also exclusively a foreigner, the temptation to rob him, once he has made his investment, will be wellnigh irresistible.

There can be no doubt that the great growth in recent years of self-government in undeveloped countries, however desirable it may be on political grounds, puts very large obstacles in the way of their rapid development. The security is greater, and the obstacles are therefore less, in the Commonwealth than elsewhere. But with the rapid extension of self-government in the colonies, the security is no longer anything like as absolute as it used to be. By the same token, capital is shyer. Nor can the obstacles be got over by relying on large governmental corporations. They, too, are expected to show a fair return on their capital and, with a very few exceptions, will not invest without security of equitable treatment. Moreover, they cannot possibly provide all the capital required. It is not easy to name a figure for the capital requirements of the Commonwealth and sterling area. The Colombo Plan, which covers only part of the area, and part of that part's total needs, will require £1,084 million of outside finance over a period of six years. The cost of colonial development is at least £500 million over a period not much longer. Furthermore, these figures embrace only the relatively large projects; there will have to be a great mass of smaller projects if development is to be well rounded. The lowest figure that can safely be put on the capital requirements of the whole Commonwealth (excluding the United Kingdom itself) if development is to proceed faster in the future than in the past must be about £500 million a year, and may be much more. No governmental corporations, British, inter-Commonwealth or international, are going to find as much as that.

In the past, the capital needed for the Commonwealth came predominantly from the United Kingdom. Indeed, it is this capital nexus, more than trade relations or common monetary reserves, that holds the sterling area together. Seen from London, the chief content of "Commonwealth economic policy" may be current trade; seen from almost anywhere else in the Commonwealth, the availability of capital bulks at least as large, and in many countries much larger.

Can London be, in the future as in the past, the main—the almost exclusive—supplier of capital for the Commonwealth? There are plenty of people in this country, on both sides of the political fence, who are bravely ready to "talk big" in the promises they will make of the capital to be forthcoming. With a Budget approaching £4,000 million, even £500 million no longer looks as big as it used to. But an international capital transaction is a very different affair from the internal raising and spending of current money. Before it can be successful, four requirements have to be met by the lending country, apart from those that the borrower has to observe—



(a) The lending country must have genuine savings (i.e., its people must be consuming less than they produce) out of which the loan can be made. For a country to lend abroad except out of genuine savings is fully as inflationary as for it to indulge in capital expenditures of its own at home in excess of its savings.

(b) The lending country must have a surplus in its balance of payments sufficient to cover the loan. Otherwise, the only way in which it can lend is by itself borrowing (or drawing on reserves).

(c) It must be possible for the money to be spent on the actual goods needed for development—railway material, machinery, etc.

(d) The lending country must be able and willing to take payment of interest and of the eventual capital repayment in goods.

Britain has always had a good record in meeting the fourth condition. But postwar Britain shows up very

badly in the other three respects. Genuine national savings, with the element of pure inventory appreciation removed from them, are totally inadequate to provide anything like £500 million for the Commonwealth, on top of the United Kingdom's own manifold requirements for capital. Saving is a dying art in Britain, and without either a very large relaxation of taxation on the rich, or a sharp reduction in the demands of the poor for a high level of consumption, it is hard to see how the total of savings can be expected to increase.

The balance of payments of the United Kingdom has been erratic in the postwar years. There have been surpluses in only two years, and the largest was of only £244 million in 1950. The deficits have been larger than the surpluses and in two years, 1947 and 1951, they have been in the excess of £500 million. Throughout these years, London has in fact continued to perform its function of provider of long-term capital for the Commonwealth, but it has done so only at the cost of running down the reserves of the sterling area and piling up short-term debts to the members of the sterling area. This is crazy finance, and it obviously cannot go on for ever. It has, in fact, already gone about as far as it can. In future, London will be compelled to limit its loans to the Commonwealth to the total of its balance-of-payments surpluses—indeed, to less than the surpluses, for the reserves must be rebuilt and the short-term indebtedness paid off. It takes a formidable degree of optimism to believe that the surpluses on the balance of payments of the United Kingdom are going to be steadily in excess of £500 million a year.

The third condition is that the actual capital goods needed shall be available—and that means (in the case of a sterling loan) available from Britain, as sterling loans cannot be spent in America. It is impossible to give a detailed list of the types of goods required, for they are too numerous. But one of the first essentials in any development plan is to increase transport facilities and that means the provision of new railways and rolling stock, roads and trucks, possibly even airfields and aircraft, quite apart from new warehouses, increased handling facilities at the terminals, and an extension to the present shipping capacity of the ports. On the agricultural side, machinery (particularly heavy tractors) and implements will be required, fertilisers, storage space and even perhaps processing equipment. If the items on this list have one feature in common, it is that they all compete directly with rearmament. Even if Britain had the savings and the balance-of-payments surplus, the part it could play in Commonwealth development would clearly be limited for a number of years to come.

*

These facts make it imperative to examine the possibilities of obtaining non-British capital for the development of the Commonwealth. There is capital available in some European countries—Sweden, Switzerland, perhaps increasingly Germany. But in overwhelming measure "non-British capital" must mean "American capital." For some time after the war, the British Treasury seemed to pursue a policy of discouraging American investment in the Commonwealth, partly perhaps out of pride, partly out of apprehension of the burdens that the service of such loans might put on the dollar account. But latterly the attitude has appeared to change, as it has become apparent that Britain will not for a long time be able to find all the capital needed.

There is little doubt that the United States has the savings; the sums that the Commonwealth requires are no more than a small fraction of the buoyant savings of the American people. Nor does the American balance of payments create an obstacle. (How strong the United States is in these respects is illustrated in the accompanying charts.) Even in present circumstances, capital goods of most kinds are available in respectable volume. The fourth condition has in the past created difficulties; but America is increasingly becoming an importer of raw materials, and the difficulties may consequently not be so great in the future.

Hitherto, however, there has been an almost complete lack of enthusiasm in the United States for investing in the sterling area. The private American investor is very loth to place his money anywhere outside North America—except for the direct investments of the oil companies, where the impelling force is more their own thirst for oil than the desire to assist in the development of neglected

territories. The organs of the United States Government seem to be inhibited from investment in the Commonwealth by their dislike of "colonialism"—a dislike that is all the stronger for being based, usually, on total misinformation. (It may be that if the American investor knew how breakneck in its liberalism latter-day British colonial policy is, he would be even less ready to risk his money.) Rosy dreams of American participation in Commonwealth development can be deflated by recalling how cavalier has been the response even to so admirable a project as the Colombo plan. Moreover, even if Americans were prepared to pour billions of dollars into the Commonwealth, would they be entirely welcome? All unworthy jealousy apart, a Commonwealth whose development was financed predominantly from America would not long remain a British Commonwealth.

None of this means that opportunities of attracting American capital into the Commonwealth should not be assiduously sought, or that it is not possible to be reasonably hopeful of gradually building up a financial connection of great mutual value. But it does mean that it would be unwise to count on non-British capital for more than a fraction of what is needed. The United Kingdom may not in the future be the sole supplier of capital for the Commonwealth, but it will have to go on doing at least half the job.

If the Commonwealth and the sterling area are to continue, there will have to be development. If there is to be development, the United Kingdom will have to provide capital to the tune of something like £250 million a year. To do that the British people will have to save more than they do at present—which is the same thing as saying that they will have to reduce the level of their consumption relatively to their output. And they will have to make sure that they have a large surplus on their balance of payments.

This is a sobering conclusion. It means that Commonwealth development presents no escape from the harsh compulsions of the British economic problem. On the contrary, success at home in solving that problem is a pre-requisite of Commonwealth development.

(To be continued)

NOTES OF THE WEEK

Conservatives and the Poll

It is being said in Westminster that Mr Eden is turning a determinedly deaf ear to the suggestion that he should move from the Foreign Office in order to stiffen the Government's handling of domestic policy. The main argument seems to be that opinion abroad would be disturbed by a change at the Foreign Office before the European Defence Community is a working reality. This cannot be taken very seriously. It is hard to see that in fact any ally of Britain would have reason to fear a change in foreign policy as long as Mr Churchill remained Prime Minister.

But, whatever the real reason, it appears that for the moment Mr Eden may be content to couple his duties as Foreign Secretary with an increasingly active concern with domestic affairs in his capacity as Deputy Prime Minister. The link is provided particularly by the cabinet committees concerned with economic policy, in which Ernest Bevin used at times to make his influence felt. Certainly it is here that foreign and domestic affairs overlap most closely, and Mr Eden will do well to revive the former practice. But that is not in itself a major strengthening of the Government, and it would be a pity if Mr Eden tried to leave things at that. The probability is that a considerable reshuffle cannot be very long postponed.

Meanwhile, the concerned and discontented backbenchers at Westminster have not had their anxieties eased by the latest findings of the Gallup Poll, which the *News Chronicle* published on Monday. It showed that the Government had lost further ground with public opinion during the past month. The percentage of people who say that they would vote Conservative in an immediate general election has fallen to 40½ per cent, against 49 per cent for Labour. Labour's lead is thus 8½ points, compared with 5½ points a month ago. Perhaps most significant of all is the Gallup Poll's report that only one person in six believes that the Conservatives will retain power at the next election. Yet the politicians themselves surely ought not naïvely to follow this view. When Labour was in power last year it was more unpopular than the Tories are now. In August, 1951, the Gallup Poll gave the Tories a lead of 12½ points and even as late as September it was 10 points. If Labour could recover as far as it did in the month or two before the election, surely the Government has no reason to be depressed at this stage in its career—provided that it gets the worst over in the first two or three years. An increasing number of Conservative members seemed to be voicing the obvious conclusion within the party's councils: do not worry about the election; hesitancy, not boldness, is the thing that would be the Government's undoing. If this obvious view really grows stronger the Tories' prospects will certainly be brighter. But it would not make ministers' lives quieter; the Tory pressure for a stronger cabinet would necessarily increase at the same time.

* * *

Socialists and Philosophy

An important contribution to the Labour party's rethinking of its philosophy and policy has been made this week. Socialist Union, a discussion group formed last year, has written a pamphlet* with at least the informal blessing not only of Mr Attlee and Mr Griffiths but also of the party bureaucracy in the person of Mr Morgan Phillips. It is a blunt and intelligent assertion that British socialism is the doctrine of a progressive party, not of a revolutionary party.

As an intellectual proposition, this is hardly open to challenge. The trouble is that much of the Labour party has always been rather shamefaced about its own moderation. It has no practical doctrine of revolution but many of its members still feel that they ought to be revolutionary. It is this that finds expression in many of the quirks and weaknesses of Labour policy—and in the irresponsibility of much of its present behaviour in opposition. It is encouraging, therefore, to find a pamphlet, issued with such authority as this, which is in no way ashamed of moderation. The Labour movement is not, it argues, concerned with overthrowing capitalism and replacing it by something called socialism. "There are no two distinct and opposing systems, only an infinite series of gradations." All the social and economic changes from the capitalism of the nineteenth century cannot be seen as part of the transition to some definite socialist system. For "have any of us knowledge of a system of institutions which would mark the end of the transition? And if we had, would there be any agreement on their nature? Obviously no such knowledge and no such agreement exists."

* "Socialism: A New Statement of Principles." 63 pages. Published by Lincolns-Prager. 3s.

From this the pamphlet goes on to protest against the class war as an instrument of socialist advance; it declares roundly that the programmes and thoughts of socialists "have all grown out of the discontents of the past, and were designed to meet the injustices of a past age"; it not only objects to the identification of nationalisation with socialism but asks whether anyone knows what "socialisation" means; it is not only unhappy about the growth in the powers of the state but even raises as an open question: "Do we want more or less state action in the social services?"

All this is, of course, destructive. Positively, Socialist Union offers as yet ethical, not political, principles; and the best of ethics can lead men to almost any practical conclusions. But there is hope for the Labour party if the first stage of rethinking—the destruction of outworn doctrines and attitudes—is done in the spirit of Socialist Union. It is easy enough to see why Mr Bevan is so disturbed about the "fresh thinkers" who want to set his party free from the traditional fetters that he expresses.

* * *

The Lords and Procedure

Despite the presence in the House of Lords of several members of the Cabinet, its debates have been curiously lacking in force and interest in this Parliament. There have been some exceptions, as in the discussions on the BBC which brought Lord Reith forth in all his wrath. But none of the great issues of the day—defence, foreign policy or economic affairs—has produced in the Lords in recent months debating of the sort that did so much, in the early postwar years, to revive the strength and the dignity of the second chamber.

Lord Stansgate, who was elevated to the House of Lords after many years of vigorous service in the other place, last Wednesday called upon their lordships to grapple with this decline in their influence. Everyone will endorse one cure he propounded: that speeches should be spoken, not read. This vice, however, is even more prevalent in the House of Commons than in the Lords. It is a direct byproduct of the managerial revolution and the development of the party machines, which prefer the spokesman to the statesman. Lord Stansgate's other proposal—that the peers should resume their daily critical examination of ministers, and should in general show a more combative spirit—would be likely, however, to defeat its own object. If it were to be of real value, the "overlords," whom Lord Stansgate wants to harry in this manner, would frequently have to impart to the peers more information than their underlings had given to the House of Commons; and then the mutterings in the lower House would indeed swell to a real volume of antagonism.

Lord Salisbury's diagnosis is that all these troubles stem from the pruning in recent years of the powers of the Lords; the cure lies in "a moderate restoration" of its powers. But this is possible only if the upper chamber is reformed so as to remove its overwhelmingly Conservative character. Their lordships' debates have lost much of their interest in this Parliament precisely because, with a Conservative Government in power, they are no longer likely to exercise even the limited power of delay left to them under the last Parliament Act. When Labour was in office the House of Lords still held an ultimate reserve of power. It could block for one year a major piece of legislation; the existence of this threat, hedged about though it was, certainly delayed the nationalisation of steel until after the 1950 election. It was a real element in the political scene. Today, when the Government has a majority in both Houses, the reserve powers of the Lords are an empty threat. The second chamber may retain the influence and usefulness of 1945-51 if its composition is unchanged, provided that a moderate Labour Government is usually in office. But if a similar part is to be played whatever the party in power, the composition of the Lords must be reformed.

No Policy for Tunisia

A disastrous debate on Tunisia took place in the French Parliament last week. Its purpose was to widen support for the government in executing the plan of reforms which it has already offered to Tunisia. A resolution to this end was presented by the Radical M. René Mayer and was drafted as a compromise between the Tunisian desire for quick fulfilment of France's promise of autonomy, and the French settlers' fears of the fate they might suffer if all power were to pass into African hands. The resolution was not, as has sometimes happened, torpedoed by the intransigence of the settlers; these M. René Mayer, who is the deputy for Constantine and therefore of their kin, represented with statesmanship and moderation. It fell to simultaneous volleys from left and right. A Communist vote against it was a foregone conclusion. The Socialists voted against it as being insufficiently liberal, and the Gaullists because they dislike the whole foreign policy of the present government, and dislike M. Robert Schuman in particular. It was therefore lost by 328 votes to 258.

The worst aspect of the debate is that it was wholly negative. No party or group could get a majority for its version of what to do. Eleven negative votes do not make a policy. The government's only mandate to go ahead with offers it has already made is that no one can produce an approved alternative.

The likely repercussions of the debate are serious for France. In Tunisia, where sporadic troubles continue, such uncertain handling by Paris is bound to encourage the resistance of the Neo-Destour to compromise. And if compromise proves impossible to achieve among the relatively Francophile Tunisians, it becomes much less likely in Morocco. In the world at large, the incident is bound to reduce respect for France's authority in its overseas dependencies. This fact may become apparent if and when the Arab and Asiatic states succeed in their present demand for an extraordinary

meeting of the UN Assembly to discuss Tunisia. The Americans, who abstained when the question of debating Tunisia was last raised in the Security Council, have privately told the French that they cannot support them again unless they pursue a more liberal policy than that of arresting cabinet ministers and employing the Foreign Legion indiscriminately to stamp on whole villages. Too much notice need not be taken of a retort by Marshal Juin that such an attitude might hasten the day of France's withdrawal from the United Nations, since it is simply one more of his *gaffes* in a lamentable series that has now been running for some time.

* * *

Communist Fiasco in France

The French Communists have been quick to confess their sins. Last week *Humanité* carried a long report by Etienne Fajon, member of the Central Committee, in which last month's attempted uprising against the government's foreign and economic policy was ruthlessly dissected. The party, said M. Fajon, had made two main errors: it had alienated the mass of the workers by understressing their economic claims; it had repelled certain sections of the bourgeoisie by overstressing their allegiance to the American imperialists. (M. Francois Billoux on his return from Moscow had written before the riot about the absolute necessity of overthrowing the Pinay government, which represented a bourgeois Franco-American alliance against the interest of the workers.) M. Fajon remarked that quite a number of French manufacturers were threatened by the armament policy and their exclusion from Eastern European markets. These elements should have been associated with the workers in protest against the government. M. Fajon also referred to the inadequate welcome given by M. Pierre Courtade, *Humanité's* leader-writer, to a recent article by "Sirius" of *Le Monde* in which France's membership of the Atlantic Pact was once more adversely criticised. The party had been "sectarian and opportunist" in its neglect of these valuable allies.

The Central Committee's self-criticism is presumably designed to camouflage the original vacuity of the Kremlin's directives. No possibility existed in France this summer of stirring up "national indignation" against the Atlantic Pact. The workers, the neutralists and some entrepreneurs may dislike or fear it. But no conceivable action of the Communists could have united them against it. Street fighting against the bourgeois government's police could never have appealed to even the most anti-American French businessman. Riots in France spell first and foremost domestic revolution. And only men as ignorant of western Europe as the Moscow Politburo could imagine that the Communists could combine a campaign to overthrow the government with an appeal to the bourgeoisie. Yet that is precisely what the French and German Communists have been ordered to do. They have failed because the orders themselves were self-contradictory and not only because the local leaders did not quite understand what was required of them.

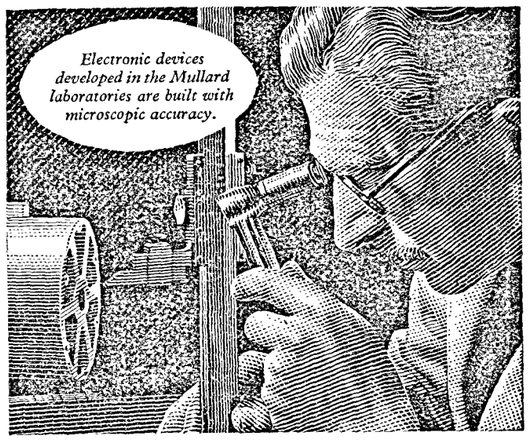
The Bacterial Deluge

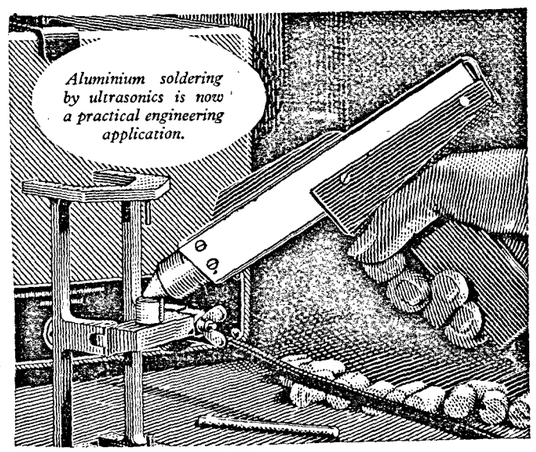
The Communist world propaganda campaign alleging American use of bacteriological weapons in Korea has now reached a stage at which it has become a critical issue in the Security Council. Perhaps the most noteworthy feature of the whole of this campaign—the most universal, intense and vituperative ever launched in political warfare—has been that it has been directed exclusively against the United States; no other nation has been accused of taking part in the alleged crime, or even of being an accessory, yet it is obvious that, even with an American commander-in-chief, the United Nations army in Korea is far too mixed a force for it to be possible for the Americans to carry on warfare of this kind (with all the attendant risks of the reverse spread of infections across the lines and the precautions which would have to be taken against it) except with the full knowledge and connivance of America's allies in the field. The basic purpose of the propaganda campaign is in fact to bring about the moral isolation of America, and it runs parallel to the general political line of mobilising everywhere all forces of every kind which have an anti-American bias, even though they may be altogether hostile to Communism as such.

The United States has now asked the Security Council to approve a proposal for an investigation of the charges by the International Red Cross, and Mr Malik, as chairman of the Council for this month, has countered by demanding that representatives of Communist China and North Korea be heard before the Security Council acts in the matter. What the Americans want is a proper inquiry into the accusations made against them; what the Soviet Union wants is a rhetorical tub-thumping debate about them in which nothing can be proved or disproved. The business of the Security Council is clearly not to pass a verdict itself, but to institute an impartial inquiry, which is what the Communists for the last five months have been trying to avoid. So far they have refused to submit their evidence to the scrutiny of any international body less committed to the Communist cause than the International Association of Democratic Lawyers—of which all that needs to be said is that the British delegate on its commission in Korea was a Mr Jack Gaster. Much has been made in Communist publicity of the confessions of two American airmen captured in Korea, but they are far from being strong evidence in support of the Communist case, even on the assumption that they are genuine and honest testimony. What is needed is investigation of the charges by a commission of impartial and technically competent persons, and there would never have been any difficulty in arranging such an investigation if the Communists had been willing. Their unwillingness creates a strong presumption that they are aware of having no evidence which will stand up to expert examination.



* * *

Wages, Prices and Taxes

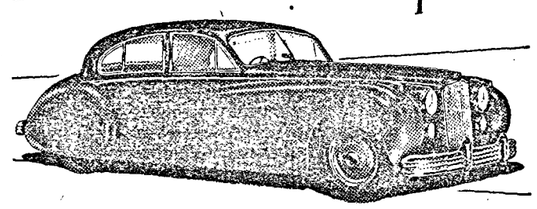


On Monday the Railway Executive flatly rejected the railway unions' application for a 10 per cent rise in rates of pay and some additional benefits. This was the first formal move in the round of negotiations and arbitration proceedings that has now begun in earnest. These negotiations directly concern claims advanced on behalf of nearly seven million workers. As had to be expected, the discussion on Tuesday between the Chancellor of the Exchequer and the economic committee of the TUC does not seem to have suggested any way in which the flood of wage claims can be stopped or even slowed down. The case for restraint is not helped by suggesting, as some Conservatives now seem to want to do, that if the cost of living rises further this year it will all be the fault of the trade unions for raising costs. In the accompanying chart the indices for retail prices and wage rates are recalculated by taking as 100 the average for the first half of 1950, the period of stability before the outbreak of the Korean war. This is as fair a basis for comparison as exists; since wage restraint had not then broken down, it is certainly not unduly favourable to the unions.

On this basis, wage rates lagged behind prices during the summer of 1951, caught up in the burst of pay advances at the end of the year, and have since fallen a little behind. Mr Butler said on Tuesday that between March and May higher food prices raised the general price index by 1 point out of the 4½ points that was estimated to be their full effect. This means that the recalculated index shown in the chart, which was 119 for May, is likely to rise to 122 during the

Progress in Electronics

RESEARCH The great variety of subjects under continual investigation in the Mullard laboratories include some that are truly revolutionary. Ultrasonics is an example. This science, involving the use of sound waves far beyond the range of human hearing, is likely to find increasing applications in numerous industrial processes. Its development is typical of Mullard initiative in research.



PRODUCTION Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

LONG-PLAYING MICROGROOVE
RECORDS

It has taken just over seven months for Nixa to become a household word amongst music-lovers. Although the variety, performance and quality of Nixa Records have won the enthusiastic praise of foremost critics, *it is the gramophone owner above* all who has enabled a *small independent* company to achieve so *prominent* a position so swiftly. The Nixa catalogue goes from strength to strength in an adventurous spirit of giving much that is new to the gramophone. If you enjoy the relaxation long playing records provide, you will welcome Nixa.

• COMPLETE OPERAS

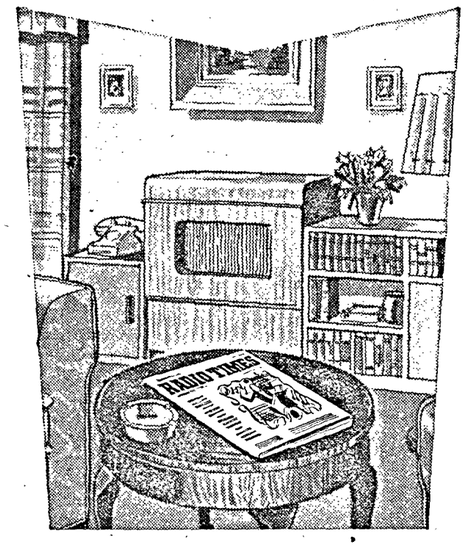
IDOMENEO *Mozart*
The only complete recording of the opera which is featured so prominently this season at *Glyndebourne*. With a *distinguished* Viennese cast, on four 12 in. Long Playing Records **HLP 2020-1 to 2020-4.**

COSI FAN TUTTE *Mozart*
Also in this season's Glyndebourne programme. With soloists, chorus and Ton Studio Orchestra of Stuttgart, on three 12 in. Long Playing Records **PLP 555-1 to 555-3.**

DON GIOVANNI *Mozart*
Vienna Symphony Orchestra and distinguished Viennese cast, conductor Hans Swarowsky. On four 12 in. Long Playing Records, **HLP 2030-1 to 2030-4.**

MANY OTHER UNUSUAL AND ATTRACTIVE OPERAS AVAILABLE

• Other NOTABLE RECORDINGS



Amongst a wealth of recordings which include the late quartets of Beethoven as well as the 3 'Rasumovsky' quartets, unusual works by Haydn, Bach, Schubert, etc., there are a number which feature the playing of the 'cellist, James Starker. His playing is rightfully classed amongst the world's best, and the superb recording does it complete justice. Starker's recordings include:—

Mozart Trios (piano, violin and 'cello) Nos. 1 and 6 **(PLP 523).**
Nos. 2 and 4 **(PLP 522),** Nos. 3 and 5 **(PLP 521).**
Sonata for 'Cello and Piano—Kodaly **PLP 702.**
Sonata for Unaccompanied 'Cello—Kodaly **PLP 510.**
Unaccompanied 'Cello Suites, No. 3 and 6—Bach **PLP 543.**

The complete NIXA L-P catalogue, price 6d. is available from your local NIXA stockist or direct.

summer; if money wage rates were kept stable at the May level, they would on this basis fall in real value to about 4 per cent less than real wages in the first half of 1950. In the past, of course, weekly earnings have generally risen more than wage rates, but this did not happen between March and October last year and is probably not happening now.

This argument in no way suggests that the present wage claims, or even any smaller claims, are desirable or justified. It does mean that many unions have a good case for more pay if they look purely at their sectional interest in maintaining their own members' real wages. It is true that for most workers higher food prices are offset by bigger family allowances and reduced taxes, but it would be dangerous to use this as an argument against wage rises. Are those

who do so prepared to accept the converse argument—that if in future the Government raises income tax, the unions are entitled to take this into account in claiming more pay? The unions' determination to defend the real gross earnings of their members can be damaging enough economically; if it becomes refined into an insistence on constant net real earnings after tax, future Chancellors will have no room for manœuvre whatever left to them. An appeal for wage restraint should, therefore, rest not on subtleties about taxation but on the simple proposition that a temporary fall in real wages will help to get the country through its difficulties with the most eventual benefit to the workers as a whole. If ministers feel unable to say this frankly, they are most unlikely to make any impression by more ingenuous appeals.

* * *

Town *versus* Country

The Government has already stated that it is unlikely to attempt the reform of local government areas this year or next, unless the local authorities can agree among themselves. The initiative for reform, which Mr Bevan summarily wrested from the Boundary Commission, has therefore been tossed back to the local authorities themselves. They are most unlikely to accept their opportunity. Disagreements between the various types of local authority seem to be as strong as ever; even if some compromise could be patched up between them, it by no means follows that the result would be satisfactory.

This further delay is giving rise to a new batch of arguments and proposals. One important question is whether the sharp distinction between urban and rural areas, which characterises the present system, ought to be preserved. Certainly there is no adequate reason for keeping urban boundaries within their present straitjackets. But some critics go further and argue that a union of rural with urban districts would revitalise the lower tier of local government, by creating authorities wealthy enough to possess an adequate staff and to be given greater powers. Such an arrangement would increase the population, but not the area, of the average county district.

This approach was recently criticised by Mr Neville Hobson, the chairman of the Rural District Councils Association. He argued that it would preclude the separate representation of each parish (a vital element in the present rural district) and that there would be no means of adjudicating fairly between the relative importance of, say, an urban and a rural sewerage scheme. Clearly he feared that the special needs of the countryside would be sacrificed to urban interests. An alternative approach was suggested by Mr Jack Whittle in his presidential address to the Institute of Municipal Treasurers and Accountants. His idea is to create within each county, by means of extensions and amalgamations, as many urban districts as possible with a population of over 40,000 or 50,000. This, in his view, is the minimum condition for giving minor authorities much stronger powers than they have. Rural districts, under this scheme, would be left alone. But are there, in fact, more than a few counties where it could produce substantial results unless parts of the countryside could be included in the new urban authorities? Are rural districts then sacrosanct? No scheme of local government reform can get far until this question is answered.

German Trade Union Extremists

Clouded from the outside world by such forbidding words as *Mitbestimmungsrecht* and *Betriebsverfassungsgesetz*, a dangerous struggle has for some time past been developing in the German Federal Republic between the Trade Union Federation and employers.

The Federation's leaders describe their aim as a revolution, and they are not far wrong. Broadly speaking, the Federation is claiming the right to a half-share in controlling the whole economic life of the country. Parity is demanded in a new economic chamber, and in subordinate local branches. Inside all but the very smallest firms and in the public services, the Federation proposes the setting up of works councils that will in effect be controlled by the headquarters of the unions. Even more obnoxious to every employer, however, is the Federation's demand that half the boards of directors shall consist of labour representatives, some of whom would be men nominated by the trade union executive and not employed in the firm. The labour representatives would be fully equal to the representatives of capital and the business managers, sharing all the secrets and decisions of the firm.

Last year the *Bundestag* passed a law giving labour co-determination in the iron, steel and coal industries. But instead of claiming a great victory the Trade Union Federation committed itself to winning all its objectives throughout the whole of the German economy. Any amateur politician in Britain could have told the German union leaders that it is wiser to gain kudos for a partial success than it is to proclaim a fight to a finish for an objective that is hardly likely to be achieved in full. The political advantages of a compromise are, however, not understood in Germany.

A draft bill on works councils and co-management prepared by a *Bundestag* committee was violently denounced last month by the Trade Union executive. In stirring terms, the Federation called on the workers to prevent the bill from becoming law, because it fell far short of the executive's demands. A series of short strikes was called, which the Communists inevitably attempted to turn into demonstrations against the new German treaties, and a "second revolutionary phase" of action was heralded if Dr Adenauer failed to submit to the Federation. It would have meant the end of parliamentary democracy in Germany if he had done so. Instead, the Chancellor protested against this undemocratic attempt to circumvent parliament, and refused

LIBRARY

to talk to the Federation's chairman, Herr Fette, until the strikes were called off. Dr Adenauer's delaying action seems to have succeeded. He has reminded Herr Fette that the bill is not in its final form, and has started negotiations on a Federal Economic Council. The Federation for its part has suspended its strike campaign. For the moment there is a useful lull, during which the Federation leaders would be well advised to recall that extremism may split the union movement. It may also lead employers into forming a "front" of their own that would support the development of reactionary parties and throw over Dr Adenauer.

* * *

The Amount of Sickness

The working of the national insurance scheme in the year 1950-51 is described in the Government actuary's second interim report (HMSO, 9d.). The experience of the first eighteen months was broadly repeated. The following table shows the expenditure from the national insurance fund in 1950-51, compared with the expected expenditure and the actual expenditure in 1949-50:—

(£ Million)

	Actual 1949-50	Expected 1950-51	Actual 1950-51
Unemployment benefit	14	94	13
Sickness benefit	66	78	69
Maternity benefit	9	9	9
Widows' benefits and guardians' allowance	22	24	22
Retirement pensions	249	244	248
Death grant	2	3	3
Administration	23	18	21
Loss on realisation of securities	2	...	1
	387	470	386

As the actuary points out, the expected figures for 1950-51 were still drawn up on the assumption that the average rate of unemployment would be 8½ per cent. The lower rate which the actuary has assumed since last year's legislation should bring the expected figures for 1951-52 much nearer the actual figures. The small fall in expenditure on retirement pensions compared with 1949-50 is attributable to the vagaries of the calendar—the incidence of Easter and the number of Fridays in the year (Friday being the usual pay day for pensioners).

The biggest change from 1949-50 to 1950-51 is in the level of sickness benefit. When the finances of the national insurance scheme were being calculated, the actuary assumed that the higher sickness benefit would lead to a markedly higher rate of claims for benefit than occurred under the old national health insurance scheme. Yet in both 1949-50 and 1950-51 actual expenditure on sickness benefit has been lower than the expected amount, and the increase in 1950-51 over the previous year is mainly accounted for by the influenza epidemic at the beginning of last year. The amount of sickness is high enough in all conscience. From a sample it is estimated that in the calendar year 1950 (which excludes the epidemic period) benefit was paid for 43 million weeks, that is, an average of two weeks per contributor. This excludes the sickness for which no benefit was paid and the sickness of civil servants (amounting to about 1 million weeks), for whom special arrangements are made. Nevertheless, it is reassuring that payments of sickness benefit are still lower than was expected. This reassurance provided by the actuary's report is strengthened by the findings of the Social Survey, whose survey of sickness shows no general increase in incapacity among the working population since the insurance scheme was introduced.

Poorer Scholars

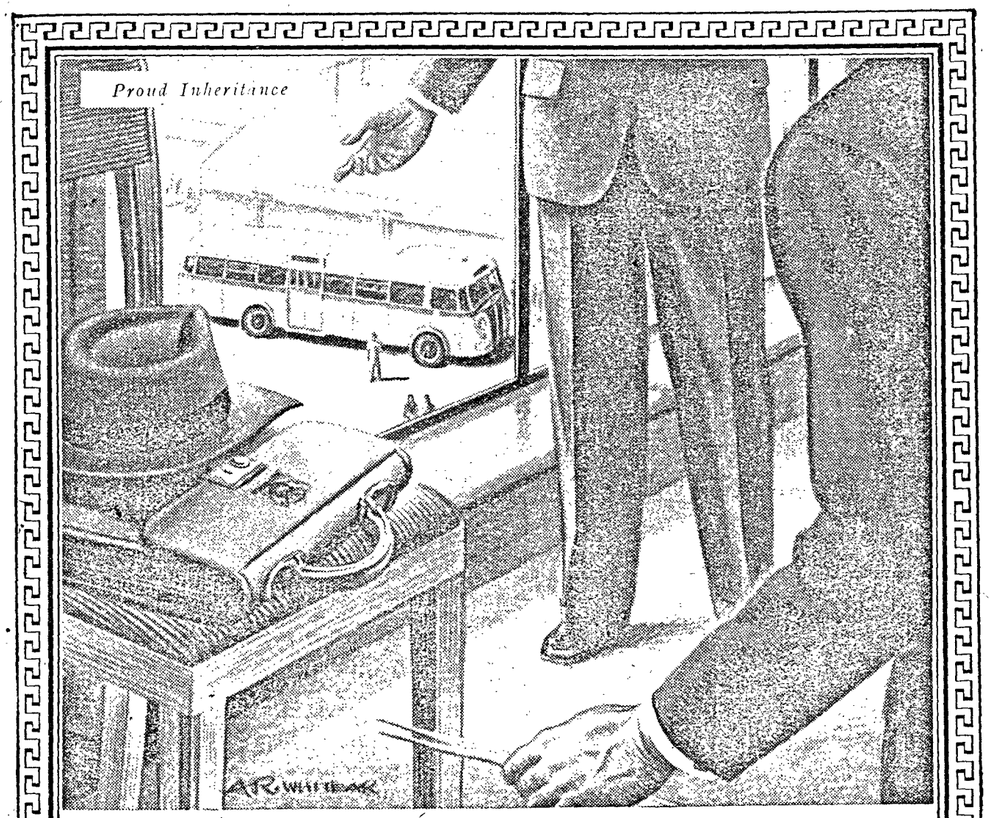
The Ministry of Education cannot be thanked for its revision of maintenance rates for university students. These rates are the amounts agreed with the university authorities as the cost of a university course. They were last fixed in 1949 and varied from £265 a year (including the vacation allowance) at Oxford and Cambridge to £215 at a provincial university with rates for London about half-way between. The new rates, which will apply from next October, range from £288 (including the vacation allowance, which has actually been reduced) to £230. The Minister says that these are the minimum sums needed to enable students to obtain proper benefit from a university course. But if the rates agreed on in 1949 provided the minimum, it is difficult to see how the new rates can possibly do so. They show increases of only 7 to 9 per cent. It is true that university fees have increased little or not at all; but the general cost of living is 22 per cent higher than it was in 1949, and this is a heavy extra burden for the student both in term and in vacation.

The Ministry does not pay the full maintenance rate to its state scholars. It only pays the difference between the rate and the amount which the parents are expected to contribute according to the Ministry's assessment scale. This scale was discussed more fully in an article in *The Economist* of December 22, 1951. Briefly, the present position is that parents with a net taxable income (that is, after allowance is made for such liabilities as mortgages and school fees for other children) of £500 a year are not asked to contribute anything, whereas, conversely, parents with a net taxable income of £2,200 will receive no grant. Next October, however, when the new maintenance rates come into force, the scale will drop by £50 at the bottom and will be unchanged at the top. This means that parents with a net taxable income of between £450 and £500 a year will make a small contribution for the first time. Other parents will have to contribute slightly more than they did.

This is an attempt to reconcile economy with the indisputable case for higher maintenance grants to meet the higher costs of a university course since 1949. But would not the wisest course be to spend the same amount of money on higher grants to fewer students? As it is, there will actually be more state scholars in the next academic year than at present. It would surely be preferable to economise by applying a higher educational standard for awards than by cheeseparing on the awards themselves.

* * *

Europe to Earn Its Dollars



Some of the wrappings around the American foreign aid package fell away last week, and it is now a little clearer what assistance Europeans can expect from the United States next year. Congress passed and President Truman signed a Bill that authorises foreign aid expenditure of $6,447,730,750 in the year beginning July 1st. The biggest share—$4,698,047,000—goes to Europe. This sum is nearly $1½ billion less than the President requested from Congress and may be cut even further during the next and final stage when the House and Senate Committees translate the authorisation into actual appropriations.

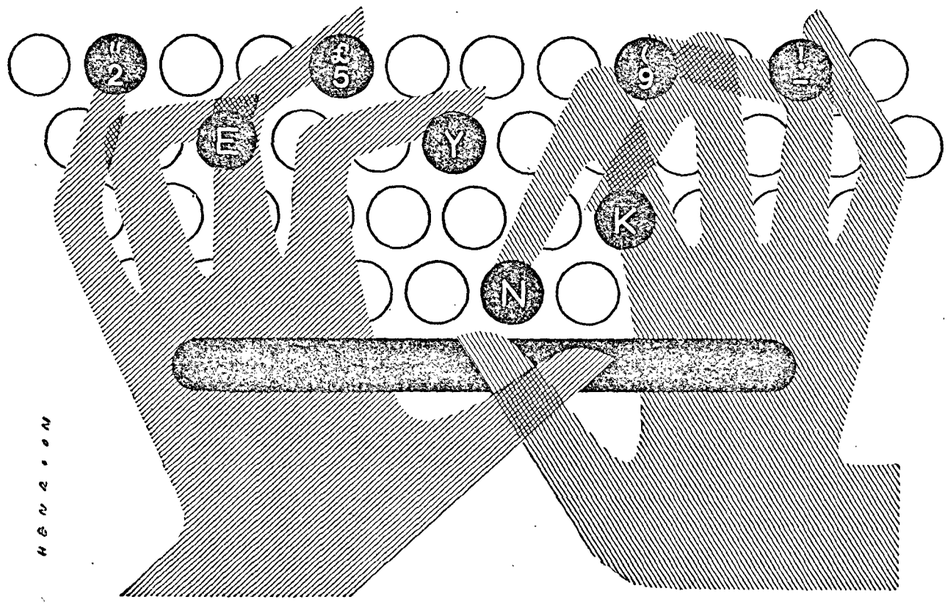
Where Europe is concerned the present Bill provides for assistance of two kinds—military help totalling $3,415,614,750 for the purchase of purely military equipment, and "defence support" aid amounting to $1,282,433,000 for purchases of dollar raw materials such as metals.

The President's original request called for a tentative allocation to Britain of some $600 million entirely in the "defence support" category. With the cut imposed by Congress, Britain's share is more likely to be in the neighbourhood of $400 million.

*

It is possible, however, that Britain will acquire more dollars as a result of the US Government's plan, announced

I shall recommend my Government to order more than a thousand!



It was one of the biggest orders for passenger vehicles that a British company had ever received; and coming as it did soon after the second Great War it showed the whole of Britain that her great reputation for quality was still intact. When the Netherlands Railways were faced with supplying their country with a completely new passenger vehicle system after the German occupation, they came to Crossley and ordered well over a thousand chassis from them . . . not because they had heard of the superlatively built vehicles produced for the Allied armies, nor even because of the fame Crossley engineers had won for advanced design (they built for example the very first British oil-engined bus in 1931): but because for more than forty years a policy of the highest possible mechanical standards had been faithfully pursued by the Company; a distinguishing quality which has always been associated with the famous name of Crossley.

rzw12

last week, to purchase complete aircraft from European manufacturers. Some of the funds for "offshore purchases"—that is, dollar purchases in Europe—are to be spent in this way. It is not yet known how much of the military aid funds will be devoted to offshore purchases, but the figure has been estimated at between $700 million and $1 billion.

What lies behind the new American plan is, in part, the hope of employing spare plant capacity in Western Europe which has been lying idle because governments lacked the money needed to finance orders. But it is also inspired by a genuine desire to build a co-operative production programme underpinned where necessary by dollars; in some cases the American Government will apparently take over orders already placed by European governments and in other instances the programme may even call for the expansion of existing plant. To Europeans the proposal is particularly welcome because it substitutes for dollar gifts the opportunity to earn dollars—in other words, the principle involved is "trade not aid."

To date the plan is no more than an expression of willingness. Whether it results in the placing of substantial dollar orders depends on a number of conditions—on the ability of European manufacturers to produce suitable models at competitive prices, on the speed with which production lines can be set in motion, on the readiness of European governments to contribute part of the funds, and on their ability to continue financing production once American aid is withdrawn.

The American Government has asked that the international staff of Lord Ismay, Secretary-General of Nato, should prepare a study on the best types of aircraft and the location of European productive capacity which would amount, in fact, to recommendations for a co-ordinated aircraft production programme for Europe. This study would serve as a guide to the US Secretary of Defence, who has the final decision on offshore purchases.

* * *

"Resources for Freedom"

The report of the President's Materials Policy Commission, which was published in the United States this week, is an epoch-making document. It runs to five massive tomes and its size alone would engender both wonder and surprise. But its recommendations reveal a new assessment—at least in official circles—of America's position in world economic affairs, and if they are adopted they would lead to two major changes in policy. The first is that the United States should help to develop foreign resources by negotiating commodity agreements, long-term contracts and loans, and the second is that America itself should move more rapidly towards freer trade.

The commission was set up in January, 1951, with the instruction "to study the materials problem of the United States and its relation to the free and friendly nations of the world." It was born at the height of the Korean commodity boom, when all countries were obsessed with the fear of a severe shortage of raw materials. And although this environment had undoubtedly some influence on the members of the commission, their analysis is sober and realistic. They believe in the principles of an expanding economy and they have assumed that the gross national product (GNP) of the United States will expand at the compound rate of 3 per cent a year for the next twenty-five years. In 1975 the American GNP will, therefore, be $566 billion (at 1950 prices) compared with $283 billion in 1950. In other words, it will double itself during this period. The total population is projected to increase from 151 million to 193 million and the working population from 62 million to 82 million. The demand for materials, on the other hand, is expected to rise by only 50-60 per cent during the twenty-five years. But the rise will be different for different products. The consumption of minerals (including metals and fuels) is estimated to increase by 90 per cent, agricultural products by 40 per cent and timber by only 10 per cent.

The commission investigated the extent to which the output of domestic resources could be increased and how far economies could be achieved in the use of materials. It reached the "inescapable" conclusion that imports would have to rise by 20-25 per cent above current levels. In order to stimulate foreign trade and the development of new resources, the commission recommended that the United States should negotiate inter-governmental commodity agreements, make long-term contracts with price guarantees, grant special loans to expand overseas production and expand geological surveys both at home and overseas. It also recommended that the "Buy American" Act (which it regarded as "a relic of depression psychology") should be repealed and that permanent legislation should be enacted to empower the government to abolish import duties on those materials that the United States must import, even without reciprocal action by other countries.

* * *

More Repairs

The Minister of Works has announced that the maximum sum which may be spent on building work without securing a licence will be raised from £100 to £200 for the twelve months from July 1st. The upper limit for industrial and agricultural building will remain at £500. The increase in the licence-free allowance does more than cover the increase in building costs, and it should help a little to arrest the widespread deterioration of old properties. Mr Eccles argued that this adjustment will not affect the rate of new building. The Government's financial policy is causing a certain amount of underemployment in the building industry, and the small builder can profitably combine more maintenance and repair work with new construction. This small concession is a minor victory for common sense, but no major improvement is possible until the Rent Restriction Acts are amended.

* * *

Fewer Accidents

The debate on road safety in the House of Commons at the end of last week was constructive. The Government spokesman, Mr Braithwaite, announced that over the next two years the Ministry of Transport plans to spend £750,000 on removing black spots on trunk roads; in addition, improvements on other roads will be made at a cost of £2,300,000. Expenditure on this scale is, of course, trifling in relation to the need to improve the road system, but it should help substantially to reduce the toll of bad accidents. Other safety measures are to include an increase in the number of police motor-cyclists and financial help to local authorities organising patrols at crossings outside schools. Finally, pedestrian crossings are to be illuminated at night by flashing orange beacons. This is a particularly sensible measure. The old-style crossings had earned the contempt of familiarity from both motorists and pedestrians, and the introduction of the zebra crossing has undoubtedly been effective, for a time at least, by making the necessary psychological break. But the new crossings are hard for the motorist to distinguish at night, especially in rain, and flashing beacons can be expected not only to make the roads safer at night but also to preserve the distinctiveness on which continued respect for the crossings at all times depends.

Letters to the Editor

The New Standard Tariffs

Sir,—Was there not a confusion in the opening paragraph of your first article on electricity tariffs in the implication that the Act of 1947 enjoins a standardisation of tariffs? Standardisation of methods of charge is indeed enjoined, but differentials of price in accord with differentials of cost are permitted. It is therefore misleading to claim that tariffs—which comprise the two separate elements of method of charge and of price—must by statutory requirement be standardised.

May I, *per contra*, plead that parallel with a standardisation of methods of charge the differentiation of price in accordance with variations in cost ought to be continued and indeed developed?

The poor widow in an area of high density of domestic and industrial consumption has a high rent charge—partly because of the lower price for electricity which has hitherto been related to the cheaper costs for the supply of such electricity to those in a dense area of consumption. The resident in the inaccessible valleyheads of the Lake District has a lower rent charge—largely because of the lack of amenities, including electricity. Now the effect of charging the urban widow more than cost in order that the backwoodsman may pay less than cost must surely be unfair. Moreover, is it not clear that in the long run the rents in the backwoods will rise to those in the towns and that the beneficiary by this misguided egalitarianism will be not the country resident but the country landlord?

Surely, too, if it is desired to subsidise the country dweller in his use of electricity, there are other and better ways which are not subject to the objections that they benefit only the landlord; that they are secret; and that they are imposed on one section of the community (generally the poorer) for the benefit of another section (generally the richer).

The majority of domestic consumers in Bath—and even more so in the great industrial communities—are in the lower income groups; in the country districts, however, those who are in the higher income groups get themselves connected while those in the lower income groups generally remain unconnected. In Bath in 1939 the charge for a small domestic consumer was 3½d for lighting; now in 1952 it is 5d per unit. In the Frome area (a typical nearby country district) the price now is the same as it is in Bath, that is, 5d a unit. It was 7d in 1939; that is to say Bath has gone up from 3½d to 5d while Frome has gone *down* from 7d to 5d, and the poorer is made to subsidise the richer.

What is the reason for this apparent injustice? Is it that egalitarianism is fashionable, or that the accounting staffs of Area Boards are now more idle or incapable than the staffs who used before nationalisation to collect money on a basis more closely related to the costs of the supply? Or is it that Consultative Councils do not represent consumers in those sectional interests which are at stake and being subservient to the Area Boards lend themselves to the bureaucratic outlook of these all-powerful monopolies?—Yours faithfully,

I. J. PITMAN

House of Commons

Hard Times for Government Scientists

Sir,—In the Business Notes of your issue of June 14th you refer to the annual report of the Department of Scientific and Industrial Research for 1950-51. The implication of the statement in reference to research associations that "some of these bodies appear to have been working on the same project since their establishment, with no very obvious results" is misleading and harmful. Again, my council would strongly dissent from the suggestion that "a transfer of some of the work (and of the income) of the associations to DSIR Laboratories might be of benefit to all parties." Such a proposal, in our opinion, has no merits on either technical or administrative grounds. Further, a step of this character would be contrary to the policy on which the grants to research associations have been based since they were instituted in 1917; in addition, it appears to involve the compulsory diversion by Government, to themselves, of funds voluntarily subscribed by industry.

Finally, it is a travesty of the discussions which have taken place between the University Grants Committee, the universities and the department on the future of the grants for nuclear physics research to suggest that DSIR has "got the worst of recent negotiations." The reasons which led to the agreement that these grants should continue to be made by DSIR are stated in our report (page 21). It is immaterial to the taxpayer whether the necessary funds are provided by the University Grants Committee or by DSIR, and if they were provided by the University Grants Committee the DSIR vote would be correspondingly reduced. This would obviously bring no relief to DSIR for the furtherance of its other activities.—Yours faithfully, I. M. HEILBRON

Chairman, Advisory Council for Scientific and Industrial Research

Pakistan and the Pathans

Sir,—In your issue of April 5th your correspondent in Karachi refers to the question of Pakhtunistan as "Afghan propaganda." The argument put forward in the first part of the article is the most one-sided statement which one expects to hear from Karachi. Your correspondent refers to the assumed willingness of Pakistan to submit the problem to the verdict of a plebiscite held under impartial international supervision. This is a principle respected and observed by all members of the United Nations; what the Pakhtuns want is the observance and respect of this principle which Afghanistan, as a member of the United Nations, supports, and which was the Pakistan suggestion for Kashmir.

As far as the views of the provisional government of Pakhtunistan are concerned, I would draw your attention to the statement by the President of Pakhtunistan that he was drafting an appeal to the United Nations. Asked why he did not negotiate with Pakistan, he said: "Because Karachi feels that we are a part of Pakistan, and thus rebels. The fact is that, before the setting up of Pakistan, we Pakhtuns were not consulted as to what we wanted."

If, in fact, the Government of Pakistan believes that a peaceful solution of the problem is possible, in accordance with the principles of the Charter of the United Nations and in harmony with her own policy in regard to the similar question of Kashmir; and if the Government of Pakistan believes in the preservation of peace and friendly international relations and the right of the people to self-determination, to which policy she pays lip-service in the similar dispute over the cause of freedom in Africa, there is then nothing to prevent anybody from believing that the Pakhtunistan question could be solved by the same good intentions and a policy based on respect for the will of the people. Afghanistan has clearly stated that she will bow to the decision of the people.

So far as the statement your correspondent makes about the economic and political survival of Pakhtunistan, I would draw his attention to two points: that the most fertile regions in that part of the world lie within the Pakhtunistan area, and that the people of this area are the equals in political development of any of their neighbours. Moreover, the last paragraph of your correspondent's article recognises the interdependence of the settled districts with the tribal areas.—Yours faithfully,

RAHMAN PAZHWAK

Afghan Embassy, London, S.W.7

Germany as an Ally

Sir,—On page 721 of your issue of June 14th you mock Mr M. Foot for holding that "plentiful evidence" is available proving that the majority of Germans oppose rearmament without first testing the Russian offers. On page 722 you state that the "obvious result" of new German general elections would be the abandonment of rearmament.

What, then, Sir, is your opinion?—Yours faithfully, T. BALOGH

Oxford

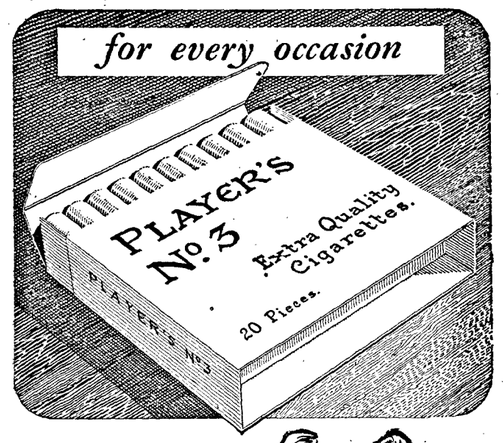
[We do not profess to know what the result of the next general election in Western Germany will be. But it does seem to us to be obvious that to hold up the ratification of the Bonn Agreement until the election takes place—which will probably be late next year—is to kill the European Defence Community. There is no inconsistency in our statements. Why does Mr Balogh waste his talents on such silly debating points?—EDITOR.]

SAFETY-FIRST INVESTMENT

2½% per annum

Income Tax paid by the Society

Equal to £4.15.3 per cent to investors subject to income tax at the Standard Rate



Abbey National announce that, with effect from April 1, the interest on shares has been raised from 2¼% to 2½%, and on deposit accounts from 1¾% to 2%, with income tax paid by the Society in each case. Sums up to a total holding of £5,000 are accepted for investment in Abbey National. For further particulars apply for a copy of the Society's Investment Booklet.

Total Assets £136,630,000

SENSIBLE SUMMER COMFORT FOR EVERY MAN

STEEGAN LTD., 222 REGENT ST., LONDON W.1

£4 Million for a Colonial Railway

Large areas of fertile agricultural country in Uganda—at present almost uninhabitable—are to be opened up by a major extension of the Uganda railway system, at a cost of £4 million, according to *New Commonwealth*.

This is only one of the many great industrial projects at present under way in British territories overseas. All of them will require capital equipment and, once they are complete, will open up substantially larger markets for British goods.

To reach the men who plan these schemes and control the vast expenditure they involve, the ideal advertising medium is *New Commonwealth*, the only journal exclusively devoted to Commonwealth affairs.

4th GERMAN HANDICRAFT FAIR

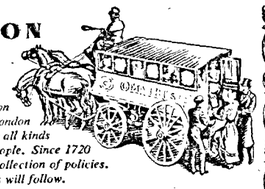
MUNICH

JULY 4th—JULY 20th, 1952

The important handicraft fair with international participation

1951: 1150 exhibitors
290,000 visitors

An extensive offer from 600 groups of exhibits.



Fashion saloon — International fashion parades—Model exhibition "The Modern Home."

Permits of entry are distributed free of charge in the German Consulates against presentation of the tickets for admission to the fair. Fare reductions.

Tickets for admission to the fair are available at all Chambers of Commerce, Travel Offices and Air Traffic Companies.

We call it

THE LONDON OMNIBUS

This is a Vehicle of Information —about the business of The London Assurance, which is to provide all kinds of insurance for all sorts of people. Since 1720 we have built up an omnibus collection of policies. Here are some of them; others will follow.

"Life" is what you make it

What kind of Life Assurance you need depends, of course, on you (not forgetting your dependants). Our booklet "How to be Well Assured" can help you to choose the policy that suits you best. Would you care to read it?

"Fore!" Thought

Golf is a dangerous game. You may injure yourself or someone else. You may, even (perish the thought!) break a club. Against all these hazards our Golfers' Policy insures you. The subscription is only 10/- a year.

Cosh in Transit

Almost daily, ruffians attack messengers carrying money to or from a bank. Our Cash in Transit Policy gives cast-iron protection, if not against the "cosh", at least against the loss of cash.

That's what we're here for

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally —pray make what use of us you wish. Our address is 1 King William Street, Dept. K6, London, E.C.4.

THE LONDON ASSURANCE

Very good people to deal with

Books and Publications

A Labour View of South East Asia

Southwards from China. By Woodrow Wyatt. *Hodder and Stoughton.* 200 pages. 10s. 6d.

In some ways this is a strange book. In it Mr Wyatt takes a competent and constructive look at a crucial area of the modern world; but he does so through heavily tinted political spectacles. His enthusiasm for the Labour party gives him a refreshing and distinctive approach; but every now and again the reader is pulled up sharp in the middle of an otherwise well-balanced and well-written account by some purely party point of view, which the facts by no means support. It is true enough, as Mr Wyatt takes care to point out, that the Labour attitude to colonial rule gave Britain a unique position among the imperial powers in the years immediately after the war. But even if the greatest act of the Attlee Government was the emancipation of India—as it probably was—history has not so far proved either that the British did quite so well to leave Burma as and when they did, or that, as Mr Wyatt says, "France and Holland . . . have done more to promote Communism in South East Asia than Moscow ever could have done unaided." Indo-China has become a rather special case and, although the Indonesians fought a long, hard struggle with the Dutch, their country is still remarkably free from Communist influence and many of them still work in private harmony with Dutchmen. Nor can it quite be true simply to assert, on these two analogies, that if the Conservatives had been in power instead of Mr Attlee, "Britain's moral influence in world affairs would have been negligible."

Mr Wyatt has had a good deal to do with southern Asia during the past few years and he draws considerably on his own experiences in giving successive surveys of India ("the great test case"), Burma ("success of a bold policy"), Indo-China ("the policy that failed"), Siam, Malaya, and Indonesia ("tragedy and hope"). He himself went to India in an official capacity on the parliamentary and Cripps missions of 1946, collecting incidentally from a Punjabi politician the gem about Mr Jinnah—that he "has a difficulty for every solution." One curious feature of the book is that the several maps, while in many ways excellent, have one or two striking errors. Why, for instance, still call Djakarta Batavia, or leave out Hanoi and Penang?

This is a challenging little book of general interest. In many things Mr Wyatt is right and forceful and interesting, and he has assembled his facts and arguments so expertly that they provide first-class reading about a subject on which many people no doubt feel that they know all too little. On the other hand, those who have a smattering of the subject will not always find his challenge too difficult to meet—which in itself is pleasant. While Mr Wyatt is right, for instance, to insist that, given peace, there is much more the British could and should do to accelerate social advance in Malaya and to promote secondary industries, he is wrong to say that "Britain should set a time limit on her stay in Malaya, as she did in India"; the problems are too different and the dangers of misinterpretation in Malaya too great. Nor would everyone agree that the British could have crushed the Indonesian Republic, or that it is the Indian—rather than Chinese—Communists who now direct the South East Asian Communist parties. It can, however, be argued that observations like these are matters of opinion. And much of the value of Mr Wyatt's book lies in the way he has set down his own thoughts so forthrightly and freshly against an informative background.

Economics in Society

What Do Economists Know? By *Benjamin Higgins. Cambridge University Press.* 166 pages. 15s.

This is one of those maddening books which one hails with delight because it deals with matters long neglected and crying out for treatment; which one reads, at first, with keen enjoyment of the author's originality, sincerity and liveliness of mind; which is built on the right lines, asks the right questions, faces the right difficulties; and which, after a certain crucial point, perhaps halfway through, collapses into the commonplace or into a mere rubble of personal prejudices.

Professor Higgins never, indeed, reaches this final stage of disintegration; his mind has too genuinely architectural a quality. The layout of the six lectures comprising this book is admirable. The first is concerned with the nature of economic laws; without attaining a profundity or exhaustiveness unnecessary in this context, this is as neat, just and sensible an assessment as has ever been presented to the intelligent layman. The next deals with the measure of agreement among economists, and puts up a very good, though not invulnerable, case for their capacity to reach practical conclusions from different methodological or political standpoints. The third examines the objectives of economic policy; and now the cracks begin to appear, for Professor Higgins's ideas of welfare simply have not been thought through and his discussion of equality is not only conducted at pat-ball level but is based on a curious ethic from which it would appear to follow (though he does not himself draw this conclusion) that all pretty girls should be taxed and all plain ones subsidised in the interests of hedonistic justice.

The remaining three chapters deal with the relation between economics and social conflict, with the major pressure groups, and with "ethics, politics, and the crisis of democracy"; they move, in fact, fast and far away from the question of what economists know to the question of what should be the foundations of Professor Higgins's *civitas humana*. They reveal their author as an eminently well-meaning, unevenly well-informed, somewhat nineteen-thirtyish ally of the angels, now shrewdly critical, now astonishingly naïf; his book ends with a remarkable plea that economics should become the preserve of an incorporated and self-regulating professional body whose duly qualified members should be given, on the analogy of medicine, "legal powers" to practise their skill on the economy. Where "legal powers" to experts, on the only scale relevant to this particular expertise, fit in with the normal notions of democracy is a question which he does not even recognise as needing an answer. As a contribution to controversy and stimulus to thought, "What do Economists Know?" is admirable. As a definitive answer to the question in its title, it is rather less so. As a practical programme for economists it inspires, even in the breast of a fellow-economist, a mistrust verging on dismay.

Glimpses of Stalin

Stalin. By Nikolaus Basseches. *Stapler Press.* 404 pages. 18s. 6d.

The portrait of a contemporary statesman may be drawn intimately on the basis of personal acquaintance or analytically, through an assessment of his historical role. With Stalin, the intimate approach is useless. Too little is known about his personal life; and in any case the individual seems subordinated to the politician. Hence the most that can be expected from an impressionist writer is not a portrait of Stalin, but glimpses of Stalinist Russia.

For this task M. Basseches, who was a correspondent in Moscow until 1937, was particularly suited, and the best passages of his new book are anecdotes, things seen or heard during his stay in Russia. But he was not content with writing his impressions and here lies the weakness of the book. He does not draw enough on his memory to make a coherent whole; nor does he follow Stalin closely enough against the moving background of the Soviet scene to make his analysis really valuable.

M. Basseches's reliance on his memory may account for the lack of references and the many errors of details. In addition, to have Moscow as observation post has its drawbacks. The incessant hymns to Stalin may insidiously affect even the most objective observer. M. Basseches is no apologist of Stalin. Contrary to the current Soviet legend of an omniscient genius, he emphasises that almost alone among the Bolshevik leaders Stalin is not an intellectual.

Even so he seems to praise too highly Stalin's writings on nationalism. This, however, may be a matter of interpretation. It is incorrect to assert that before Stalin's interest in the subject, nationalism did not exist for the Bolsheviks, since it was a source of bitter controversy from the very foundation of the Russian Social-Democratic Party.

The "Moscow flu" has graver effects on the author when he is writing about the purges. In one of his most interesting chapters M. Basseches describes the growth of a new managerial and bureaucratic class in Soviet society. Here is a possible explanation of Stalin's rise and the downfall of the other Bolshevik leaders—they representing the heroic, elemental stage of the Revolution and Stalin its second, stratified, bureaucratic phase. But for M. Basseches the defeat of Trotsky is explained almost exclusively by his pride, arrogance and poor statesmanship, while the enigma of the trial disappears, since confessions were merely admissions of facts.

It may be ventured that M. Basseches's interpretation is due less to prejudice than to his proneness to facile judgments and aversion from patient analysis. Thus the book falls between the two stools of impressionism and analysis and, despite vivid passages and interesting asides, adds but little to an understanding of Stalin and the Russian revolution.

Frying-pan and Fire

Out of Bondage. By Elizabeth Bentley. *Rupert Hart-Davis.* 256 pages. 12s. 6d.

Books by ex-Communists, justifying, explaining, capitalising their disillusionment, are now three a penny. This is the revelation of Miss Elizabeth Bentley, the feminine Whittaker Chambers, who helped to set going the postwar Red panic in the United States and is still feeding the McCarrans and McCarthys with tales of Communists in government departments. Her book is neither so controversial nor so moving as that of Mr Chambers, just published in the United States, seems to be. But it has some of the fictional excitement of a serial in one of the mass-circulation magazines, with its improbable reproduction of conversations ten and fifteen years old.

Many intellectuals of Miss Bentley's generation, sickened by the waste of the depression and the growth of Fascism, joined the American Communist party in the 1930s. Most of them were rudely disillusioned by the Nazi-Soviet pact. Miss Bentley, who emerges as a domesticated rather than a political person, was not. She remained faithful until the death of her lover in 1944, and her final decision to go to the Federal Bureau of Investigation seems to have been the product of the unpleasantness of dealing with the Russians, and their clumsiness in handling Americans, rather than of any great moral revulsion.

There are no new revelations in the book, except perhaps what a dream world of violence, drama and heroics Miss Bentley lived in. The thought that the United States might be a comparatively good place to live in never struck her till the last and, when she went to the FBI, she quite expected to be beaten and thrown into a dungeon. Instead she was escorted into the limelight, to identify her old comrades without any more apparent regret than it is only decent to express. Her main feeling was one of joy that she was alive, while they were reduced to shadows. Her enthusiasm for her new protectors of the FBI—clean-cut young Americans all—was consequently unbridled. Miss Bentley, one suspects, will never remain out of bondage for long.

Familiar Portrait

The British Worker. By Ferdynand Zweig. *Penguin Books.* 240 pages. 2s. 6d.

This book is another fruit of Mr Zweig's patient and highly personal researches in industry. Chapter by chapter it dissects the British worker. It shows him as a conservative character who hates to move away from his native heath, his methodical habits about his football pools and his pub-going, allows higher wages to change the amount but not the pattern of his spending, and frowns on ambitious friends as destroyers of the workers' solidarity. It shows him as an unromantic type who, especially in the older generation, spends his leisure in the company of his own sex, and—less credibly, perhaps—as rather prone to mother-fixation and celibacy. It shows that he dresses badly if he is married, well if he is courting, and very well if he happens to be coloured—an effort, Mr Zweig concludes, to throw off a feeling of inferiority. It shows that bitter memories, especially in the coal mining, cotton and building industries, are undimmed by more recent prosperity, and that young workers are less amenable than old.

After a life in the cloisters this book would be fascinating. But to anyone who has maintained normal contact with his fellows and has normal powers of observation, much of it is lacking in news value; and it must stand or fall by news value for it is essentially reporting rather than comment. There are curious details, such as that young ex-service men are more inclined to wear gloves than other workers; but the broad lines are familiar. Who doubts, for example, that some go to pubs because they are thirsty, some because they are sad, some because they want company, and all to relax? Who, confronted with Mr Zweig asking embarrassing questions about his attitude to life, would not unhesitatingly inform him that life is what you make it? To give such comments the dignity of a chapter is to treat them very solemnly indeed.

After a few pages Mr Zweig's style becomes wearisome. Its manner of random jottings, its lack of shape and flow, do not help the reader. The author is admittedly remarkably at ease with a language that is not his own, and his style has the great merit of simplicity; but he could with advantage pay more attention to the literary quality of his work.

Baltic Gap

A History of Latvia. By Alfred Bilmanis. *Princeton University Press.* London: *Geoffrey Cumberlege.* 441 pages. 40s.

Of all the gaps in our knowledge of European history, none gapes more widely than that labelled Latvia. It is bad enough on the mediæval and early modern periods about which the descendants of successive conquerors of Livonia and Kurland have perpetuated their various legends; but in the period of Latvia's independence (1918-1940) the gap is really shocking and is not likely ever to be filled, for the Russians are busy destroying the records and setting up their own Soviet myth. English historians of north-eastern Europe cannot be expected to step into the breach; they tend to be reared in schools of Scandinavian or of Slavonic studies, and Latvia has no proper place in either. We should be grateful, therefore, for this book, in which the late Dr Bilmanis of Riga has given us the first considerable history of Latvia in the English language.

He writes from the point of view of the Latvian people and has little respect for the legends of the civilising influence of Teutonic knights, Hanseatic merchants, Polish gentry or Russian officials. Of all Latvia's conquerors only the Swedes seem virtuous; Latvians still talk of "the good old Swedish days," and Dr Bilmanis makes us see why. His first 280 pages are sound text-book narrative, but when he comes to the two decades after 1918 his book is rather more than that and will take its place among the primary sources on the history of the independent Latvian Republic. This "History of Latvia" will become the standard work for the general reader. Its bibliography, together with the fuller list of books which Dr Bilmanis appended to his "Baltic Essays," will put the specialist scholar permanently in his debt.

Text and Reference Books

Who Was Who. Volume IV. 1941-1950. *Adam and Charles Black.* 1,277 pages. £4.

This companion to "Who's Who" contains biographies of those who died between 1941 and 1950 and in most cases the details are those which last appeared in "Who's Who." Three previous volumes of Who Was Who have dealt with those who died in 1897 to 1915, 1916 to 1928 and 1929 to 1940. The publishers state that future volumes will be issued at the close of each decade.

Public Finance Surveys: India. United Nations Department of Economic Affairs. *HMSO.* 101 pages. 5s.

This survey is the second in a series which is to deal with the public finance systems of selected under-developed countries. The countries are being chosen because they present problems of broad interest. The survey on India traces the development of a newly independent nation which already had a well-established administrative and fiscal structure which left wide powers of taxation and administration to the constituent States. The book gives the history of government finance from 1948-49 to 1950-51 and describes fiscal policy as one of high government outlay on development coupled with high taxation.

AMERICAN SURVEY

The Spectre at Chicago

Washington, D.C.

SENATOR ROBERT TAFT of Ohio has long been haunted by a ghost named He-Can't-Be-Elected. It was the sight of this durable spook, pale of visage and leering with a ghastly grin, that frightened Republicans away when the Senator presented himself at the Republican nominating conventions in 1940 and 1948. But in 1950, when Mr Taft was returned to the Senate by the voters of Ohio with the biggest majority they had ever given anyone, there were those who felt sure that the spectre had been exorcised for ever. Perhaps Senator Taft felt sure, too. Nevertheless, when six months or so ago he entered in earnest upon what he must have known to be his climactic campaign for the Republican nomination, it was to be observed that he was behaving like a man who intends to take no chances.

He travelled tirelessly and tirelessly made speeches. He lined up delegates. In Republican office-holders across the length and breadth of America he inspired a body-and-soul devotion to his cause; and long before it was time to get down to the serious work of organising the convention he had established an indisputable majority among the 104 members of the Republican National Committee. There was, therefore, no difficulty in arranging that nearly all the posts in which authority at next month's nominating convention would reside, from keynote speaker and temporary chairman to doorkeeper, should be awarded to Taft henchmen.

This, in Senator Taft's view, is the reward of industry, and with more delegates pledged to him than to General Eisenhower, the newcomer and political amateur who has worked nothing like as hard, everything ought to be in the bag. It is a cruel thing that at this most unsuitable moment the pasty face of He-Can't-Be-Elected should appear at the window. Cruellest of all is the knowledge that it was the very packing of the bag everything should be in that summoned back the grinning ghost.

Deep in the heart of Texas a delegation favourable to Senator Taft was appointed by Republicans who had, or thought they had, the control it is permissible to exercise. But then stories began to appear in the newspapers saying that the Taft men of Texas had excluded the Eisenhower men from their meetings and so had stolen a verdict which would have gone against them if they had not frustrated the will of the majority. Similar tactics were attributed to Taft men in other southern states. The newspaper stories spoke of the ruthless Taft steam-roller. Rival delegations-for-Eisenhower were chosen. From that moment something new had been added to the campaign.

Then General MacArthur, whose Taftist sympathies have been made plain, was appointed keynoter and Mr Walter Hallanan of West Virginia, one of Mr Taft's regional campaign managers, was established in the crucial job of temporary chairman at the convention. All that was needed was word from the Eisenhower headquarters in Denver, Colorado, that Ike was "fighting mad" at the tactics that were being used against him; and this word was furnished.

Senator Taft had an explanation for the events in Texas. It was that those excluded from the meetings had been very properly kept out because they were not real Republicans at all: they were a Democratic fifth column intent merely on securing the nomination for General Eisenhower. (If that was the way Texas Democrats were behaving, their actions could hardly have been cleared with President Truman, who has consistently said that the Democratic Party wants to see Senator Taft nominated in the belief that he will be easiest of all to beat.) As for the packing of the convention with Taft officials, the Senator indicated the view that since there was a pro-Taft majority on the Republican National Committee this was an admirable example of the correct exercise of control.

★

But it was probably already too late to expect explanations of this or any other sort to take effect. General Eisenhower had a speech arranged for last weekend in Dallas, Texas, and to nobody's surprise he there indicated his indignation and disgust at the thwarting of the will of the majority. In Texas, too, was Representative Hugh Scott of Pennsylvania, one of the General's most experienced lieutenants. According to Mr Scott, if Senator Taft and his men were to steam-roller through on the convention floor the "stolen" Texas delegation—right there where every move would appear on the television screens of the nation and no concealment could succeed—and if by such tactics Senator Taft were to win the nomination, the result would be certain defeat for the party in November. The voters would be disillusioned and disgusted by such political rigging. In these circumstances "the Republican nomination won't be worth a plugged nickel."

So there it was again, after all the striving. Control had been won, but the more control was exercised the closer came the old, indestructible apparition, cackling and shrieking louder than ever "Nominate him, if you like, but if you do, remember he can't be elected!" The newspapers recalled a deadly parallel: just forty years ago William Howard Taft, the Senator's father, had also had the machine behind him and had also exercised control over the Republican National Convention. Teddy Roosevelt, the public's favourite, had been ruthlessly steamrollered. And what happened then? The party was split and Taft went down to defeat before Woodrow Wilson. . . .

The Republican National Committee has announced that it will meet in Chicago next week, the week before the convention, to attempt to resolve cases involving 72 delegates and 70 alternates in which both Taft and Eisenhower forces claim the same seats—the Texas cases among them. The

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

committee may know some way of both safeguarding Senator Taft's interests and preventing an appeal under the television lights on the convention floor by the thwarted Eisenhower supporters; but nobody can yet see quite how the trick is to be done.

Senator Taft is suggesting that the 38 delegates from Texas, however they vote, will not determine the outcome. But in fact they, and others in the contested category, look at the moment as though they could in one set of circumstances come very close to doing just that. Despite the ebullient claims of the Senator, many people still think he and General Eisenhower may arrive at the convention each needing upwards of 100 delegates more than they can be sure of. In a recent estimate Mr Taft was shown with a "basic strength" of 464 pledged delegates, and with the prospect of collecting, as soon as he needs them, another three delegates pledged to General MacArthur, one pledged to General Wedemeyer, ten from Illinois and three from Puerto Rico—a total of 481. General Eisenhower's "basic strength" was put at 392, but he is expected to be able to call upon most of the 76 California delegates pledged to Governor Warren and the 25 pledged to Mr Harold Stassen. It will take 604 delegates to win the nomination.

If these predictions are accurate, it will be the 232 "uncommitted, unknown or contested" delegates who will decide the contest. Of these men of mighty power the two large groups are the Pennsylvania-Michigan-Maryland bloc (89 delegates) and the southern bloc consisting of Texas, Georgia, Louisiana and others (83 delegates). The most sanguine theory of the Eisenhower forces is that the unpledged delegates, or most of them (and especially those from Pennsylvania, Michigan and Maryland), will be assisted to a decision in General Eisenhower's favour if the Taft forces are revealed by the television cameras to be steamrollering the convention and thus creating a public revulsion which would make it impossible for Senator Taft to be elected. The theory may be proved false, but the Taft men cannot be certain that it will.

Pay Parade

Washington, D.C.

CONGRESS does not need to be told during an election year where economies can be safely effected and where they should not be attempted. It has just raised the pay and allowances of about 3,500,000 men and women in the United States armed services. Everyone in the Army, Navy, Air Force and Marines (to make no mention of those retired from the forces or in the Coast Guard and Geodetic Survey, or of students at the military and naval academies, or of others embraced within the fold of the armed services) now gets 4 per cent more pay. Subsistence allowances go up 14 per cent. The argument behind the new legislation—too far behind, in fact, to have received more than perfunctory public scrutiny—is that the average civilian factory worker in America has received wage increases amounting to 17.6 per cent since October, 1949, when the pay of the services was last raised.

The American soldier has been for some time the most expensive in the world. The theory that he had more money to spend (and more to eat and more to wear) than was good for him was being widely expounded among his foreign comrades-in-arms a long time before even the increases of 1949. Now, in the countries with lately-devalued currencies, he can be made to look more like a relative of Rockefeller than a GI Joe by the fairly simple process of turning his pay

and allowances into foreign currencies at present exchange rates.

This misleading exercise suggests that when allowance is made for the free food, housing and clothing he gets and for a share of the special bonuses and tax-exemptions for which he might qualify, a private with a wife and one child is being paid at the rate of £1,089 a year. The income of a colonel or Navy captain with two dependants is a few pounds short of £4,000 a year, and a full general or admiral comes out on this reckoning with £6,738 a year. But that way madness lies.

What the private, the colonel and the general receive are not the equivalents of what £1,089, £4,000 and £6,738 would buy in Britain. All the same, military pay and allowances are now being handed out by the United States Government on a distinctly handsome scale. No less handsome are the pensions which all ranks can expect after thirty years of service. Some examples that have been published in the wake of the latest legislation, based on average lengths of service and on the assumption of two dependants, are given below for Army, Air Force and Marine ranks, with parallel Navy ranks in brackets:

	Monthly Base Pay	Monthly Allowances	Retirement Pay
	$	$	$
Recruit (seaman recruit)	78·00	77·10	74·10
Private (1st class) (seaman)	99·37	77·10	114·66
Sergeant (petty officer, 2nd class)	160·52	77·10	177·69
2nd lieutenant (ensign)	222·30	133·40	244·53
Major (lieut.-commander)	414·96	167·70	400·14
Colonel (captain)	592·80	184·80	522·39
Major-general (rear admiral)	963·30	218·90	722·40

It may be too much to expect that soldiers in other nations of the North Atlantic alliance, who are paid various fractions of these sums, will discern any great virtue in the reasons why the United States Government needs to pay its armed forces on this scale, and to supplement this pay with further benefits no other armies and fleets enjoy. But there are some reasons and they are rooted in the facts of American life.

One of the simplest was set forth by General Bradley, the chairman of the Joint Chiefs of Staff, at the ceremonies a fortnight ago at the West Point Military Academy, which was marking its 150th anniversary. "The American soldier," he said,

> expects to be well cared for. In the city or on the farm, American boys have seen the good things of life provided in what we might consider a routine fashion.

And it is true that a nation which has produced so high a standard of living, and attaches so much significance to its enjoyment by the majority of Americans, cannot expect its soldiers and sailors to be content with less.

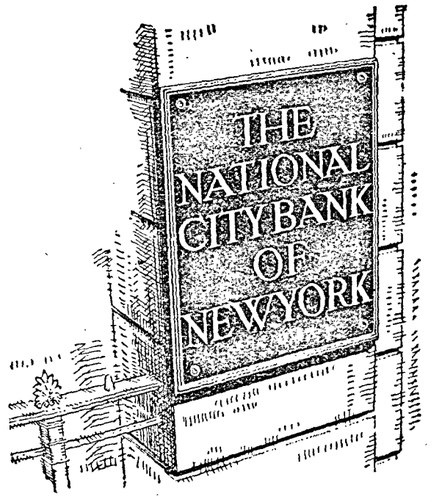
Another and certainly no less telling part of the reasoning is that the American electorate as a whole not only dislikes and intermittently distrusts the whole concept of military service and its machinery, but is continuously conscious of its power to modify that concept and dismantle that machinery. What happened after the Japanese surrender in 1945 was by no means the first exhibition of the readiness of the American public to demobilise and disarm at the first opportunity: it was merely the most reckless and the most thoroughgoing.

The events which brought about the reduction of the United States armed forces from something like 12 million

in June, 1945, to 3 million in June, 1946, and to 1,150,000 in June, 1947, take on the aspects of a nightmare for high officials in Washington who are responsible for the national security. Recalling the days of frantic demobilisation—the avalanches of telegrams to Congress from the troops, the Bring Back Daddy associations, the deafening clamour which no politician dared challenge—Mr Barry Bingham, in a recent article in the *Reporter*, a bi-monthly magazine, quoted a bitter observation by an officer at the Pentagon, the services' headquarters. The mothers of America, he said, had achieved in a few months a feat that Germany and Japan had failed to accomplish in years of conflict: they had destroyed the armed might of the United States.

Let the present danger diminish or appear to diminish and how long will it be before another clamour may threaten the reassembled military machinery, and so invite heaven knows what new dangers? Of all the pictures drawn by Communist propaganda the least true to life is probably the one which depicts the Pentagon as full of military adventurers poring over plans for imperialistic conquests. There is a lot of poring in the Pentagon; but the plans which occupy the waking hours of an astonishing proportion of its personnel have less to do with the means of conquering foreign foes than with the means of overcoming the resistance at home to the notion that armed forces are and long may be really necessary.

If Americans in large numbers could be persuaded to regard the Army, Navy, Air Force and Marines as profitable and agreeable careers, an attitude which up to now has found very limited acceptance, the high officials in Washington would feel more secure than they do. The new pay scales are designed to help to sell the armed services on a career basis. And so are many of the radio and television programmes, the advertisements, the millions spent on transport for military men's families, the recreation programmes and the army stations with cinemas, swimming pools, soda fountains and golf courses.



There are occasional growls from the tougher old soldiers. One, a Brigadier General, home not long ago from Korea, caused a brief raising of eyebrows by offering it as his opinion that American fighting men are being "fed too many ice-cream cones." But he had no responsibility for policy. If he had, and if he had studied the many evidences that Americans who join the armed forces fight fiercely and well when they must, but tend to become rapidly convinced that the whole thing is a waste of time when the necessity is less apparent, he might have spoken of ice-cream cones with more respect.

American Notes

Acrobatics in the Air

General Eisenhower's first forthright broadcast, though its delivery may have been less than inspiring, made it clear that he will not accept a Republican foreign policy plank unless it is based squarely on support for the United Nations and recognition that America must work with other friendly countries to secure peace. He repudiated those who prefer to sit comfortably and cheaply at home, basking in the illusion that the threat of retaliation by a big air force is all that is needed to make the United States safe. The General named no names, but it is Senator Taft who would put most of America's eggs in the Air Force basket, who would cut $10 billion a year from defence costs though he insists that the Administration has allowed American air-power to lag fatally behind that of Russia, and who has welcomed the Yalu bombings as a belated vindication of General MacArthur.

Senator Taft has received support, of a kind, from the Senate Preparedness subcommittee which in an interim report recently charged the Administration with ignoring

World-wide banking

Businessmen with international interests rely on a bank whose services are world wide. The National City Bank of New York provides a global network of 54 branches, as well as banking correspondents in every important centre of the world.

The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES: CITY: 117 OLD BROAD STREET, LONDON, E.C.2. WEST END: 11 WATERLOO PLACE, LONDON, S.W.1

the convictions of the Chiefs of Staff when it decided to slow down the aircraft programme. General Bradley told the subcommittee that 1954 is likely to be the year of greatest danger, for then Soviet strength will be at its peak, relative to that of the free world, and Russia will have enough atomic bombs to risk retaliation. The revised schedules call for a 143-group air force by the end of 1955, a more realistic date than 1954, a change Mr Bernard Baruch, America's elder statesman, nevertheless has also found deplorable; he doubts whether Russia can be intimidated by *blueprints*.

The Air Force generals, like Senator Taft, though probably not for the same motives of economy, lose no opportunity of rubbing in the inferiority of American air power, without reminding people, as Mr Truman has done, that there never was any intention of matching the Russians aircraft for aircraft, and that there are dangers in freezing models too soon. But neither the President, nor Mr Baruch, nor the services, nor Congress share Senator Taft's belief that air power is cheap. Several months ago the House, in a fit of election economy, cut nearly $5 billion from the $51 billion military budget and, to prevent extravagance with unspent funds, placed a ceiling of $46 million on the amount which might actually be paid out in the year beginning next month. But after representations from the Air Force that the ceiling would cost it some 3,000 aircraft, and postpone the 143-group strength until 1957, the House is visibly weakening, while the Senate is virtually certain to lift the ceiling, or remove it altogether. General Eisenhower has also promised drastic economies, though not until the world is a safer place. But if Senator Taft is elected, he may have to choose between his two chief campaign promises, air power and economy.

* * *

Democrats Wait for a Bandwagon

Mr Averell Harriman, the Mutual Security Director and a candidate for the Democratic nomination, has had his baptism of electoral fire in Washington, a city whose residents have no vote in the election, but who were allowed this year to show which candidates they prefer. Mr Harriman carried off all six of the delegates to the Democratic convention under the nose of Senator Kefauver, the candidate Democratic politicians fear they may have thrust upon them by the voters for the sheer lack of an attractive alternative. Mr Harriman is a fervent, uncompromising New Dealer, the only one in the field, and in a city which is one-third Negro, his denunciation of segregation and his uncompromising support of the President's civil rights programme found Senator Kefauver's Achilles heel. The Senator comes from a border state and, like almost all southerners, is not convinced that federal compulsion is the key to good race relations.

One of the things Mr Truman no doubt hoped would be shown in the Washington primary was the continued effectiveness of the civil rights programme in bringing out the votes of minorities in the cities which play so large a part in determining the result. The other may well have been to show that Senator Kefauver, for all his string of primary victories, is not unbeatable.

Whether Mr Harriman's victory will profit him much is questionable. Democrats hoping not to antagonise the south this year will not relish the spectacle of a band of Negroes four hundred strong, carrying Harriman banners and marching to the polls behind their pastor. The professional politicians, moreover, obstinately regard Mr Harriman's venture as an amateur crusade, valuable chiefly for keeping the big New York delegation safely on ice until the convention. The politicians' dream—and Mr Truman's—is that, when that time comes and it is known who the Republican candidate is to be, Governor Stevenson of Illinois can be persuaded to accept the Democratic nomination, which is steadily increasing in value as the Republicans quarrel among themselves and Senator Taft becomes more likely to prove the Republican choice. But it is also becoming steadily more difficult to hold in line Democratic delegations itching, now that the convention is only a month away, to find their proper places on the bandwagon of the winner. Hence the flood of reassuring rumours that Governor Stevenson's reluctance to run is weakening and that—as indeed seems very likely—it will disappear entirely if Senator Taft is to be his opponent.

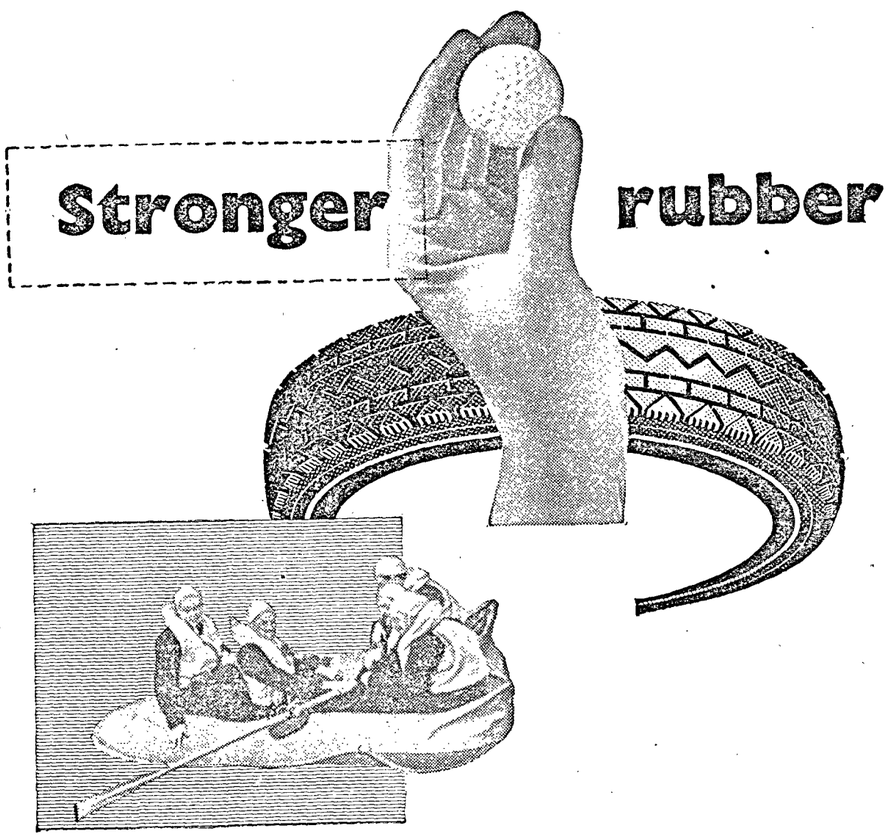
Passports under Fire

The President's courageous veto of the discriminatory immigration Bill, which is not likely to be overridden, is doubly welcome, coming as it does just after the State Department had made itself appear both foolish and illiberal by forbidding Professor Owen Lattimore to leave the country. This carried the policy of denial of passports to a new stage, for not only was Mr Lattimore, head of the School of International Relations at John Hopkins University, without a passport, but he had no intention of applying for one at present. The Department acted "as a precaution" on information that Mr Lattimore was making plans for a possible visit to eastern Europe. Four days after the announcement of the ban on Mr Lattimore the *Washington Post* revealed that the "information" was proven to be false.

The State Department's moral embarrassment over its precipitate action will perhaps be less than its financial embarrassment might be if Mr Lattimore's implacable foe, Senator McCarran, continues, as head of the Appropriations subcommittee, to hold up the Department's money. Mr Lattimore has remained one of the favourite targets of both Senator McCarran and Senator McCarthy, though a Senate committee two years ago found no evidence to support the charges against him. Moreover, the State Department has been in hot water with Congress more than once in the past year for allowing alleged Communist sympathisers to leave the country for innocent destinations and turn up in Moscow. On April 28th the Department made all US passports invalid for travel in eastern Europe and China except when special permission was granted.



Many liberal Americans are disturbed over the effects both on individual liberties and on American prestige abroad of the present procedure for granting passports. Final authority rests with the Secretary of State who has power to refuse to issue a passport as well as to restrict, withdraw or cancel one already issued; the reason usually given is that the individual's travel would be "contrary to the best interests of the United States." Although such refusal or withdrawal (since last July, 325,000 have been issued, 95 denied and 95 recalled) carries a strong suggestion of disloyalty, there is no assurance of hearings or review.

Early this month Senator Morse charged that in these matters the State Department was "judge, witness, prosecutor and jury all moulded into one mould of tyranny." Mr Acheson, the Secretary of State, in replying to such criticism, said last week that work was now under way to improve the procedure for issuing passports and that no arbitrary action had been taken. However, the Civil Liberties Union has indicated it will not be satisfied until legislation is passed making the granting of a passport mandatory except for specific reasons, and a group is created to review those cases in which a passport is withheld.

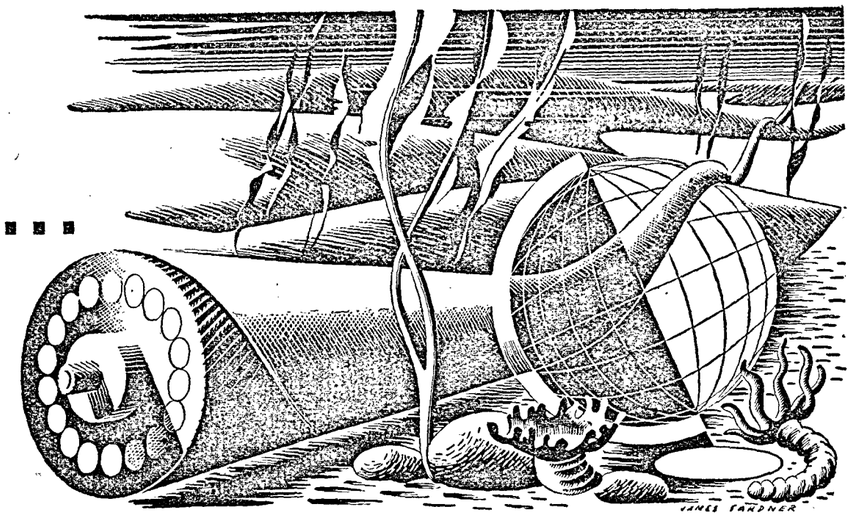
Pay As You Speed

The extraordinarily good business done on the New Jersey Turnpike since it opened five months ago largely explains the success of the huge issue of $326 million of 3½ per cent tax-free bonds for financing a similar toll-road in Ohio. Traffic on the 118-mile long highway from the



Shell Chemicals

The transition from raw material to industrial rubber, both natural and synthetic, is a complex process. Here, as in so many other industrial processes, chemicals from petroleum play their part, and Shell maintain rubber research laboratories at Thornton for this particular study. DUTREX R, a Shell product, is a softener and processing aid, made in Britain. Besides contributing to the tensile strength of the compound, DUTREX R gives the finished rubber greatest tear resistance with less abrasion loss, less flex cracking and lower crack growth. For the layman who may find such technical terms obscure, this means in plain words, greater durability and better value, whether it be in tyres, tubes, anti-vibration pads or any of the hundred and one other items for which high-quality rubber is essential.

"DUTREX" *is a Registered Trade Mark*

one inch thick...

...155,000 MILES LONG!

They are less than the thickness of a child's wrist, these underwater telegraph cables that link five continents. They do not seem elaborate, consisting as they do of copper conducting wire, insulated by gutta percha, bedded in jute, sheathed in galvanised steel. Their average diameter is barely an inch. But they carry in complete security the messages entrusted to Cable & Wireless Ltd. for passing between the United Kingdom, the Commonwealth and many foreign countries. There are 155,000 miles of them down on the sea bed, more than half of the world's total of submarine cables.

The traffic load they have to carry is heavy and there are times when their capacity is fully occupied even though transmission can be made at speeds up to 150 words a minute in both directions simultaneously. Nothing stops the flow; if a cable link is interrupted, a wireless link takes over. Continuity of service is maintained through the world-wide chains of Cable & Wireless stations by a staff whose professional pride it is to see that "the message gets through".

The Cable & Wireless system is extensive and its links are varied. It includes 195 wireless circuits for telegraphy, telephony and phototelegraphy. Twenty-five of them were new last year. There are twenty-three coast wireless stations: there are eight cable ships.

In the face of ever rising costs of labour and materials the Company has made solid progress in extending Britain's incoming and outgoing communications. Its operations in foreign countries are earning money for Britain, and further extensions are proposed. Cable & Wireless Ltd. are part of Britain's Business.

CABLE & WIRELESS LTD

ELECTRA HOUSE, VICTORIA EMBANKMENT, LONDON, W.C.2

CVS-21

Delaware river to New York City has already reached a volume, of 36,000 vehicles a day, that had not been expected until 1960, and the road will probably pay for itself in 15 instead of the promised 30 years. The Ohio Turnpike will be 240 miles long, and there is little doubt that eventually this road will be extended 150 miles across Indiana to Chicago. New York voters have authorised a bond issue to finance the state's through highway to Buffalo, and it is expected to be ready in about two years. When Boston is connected with the Thruway and the Merritt Parkway into New York, when the oldest of these toll roads, the Pennsylvania Turnpike, is joined with the New Jersey one and when that is extended into Washington, DC, over the nearly finished Chesapeake Bay bridge, then the east's big centres of population and industry will all be linked by these superhighways.

This is the only part of the country where the traffic is heavy enough to justify such an enormous interlocking system, but many other states either have or are considering

shorter toll roads on routes where enough people are prepared to pay for speed to make them a sound proposition. Both private motorists and businessmen sending their goods by lorry find the toll charges, of from 1 to 3.3 cents a mile, worth the time, petrol and energy that are saved on these direct, fast roads, where there are no delays for crossings or local traffic. The point about the turnpikes is that they are self-supporting, at least until a depression comes. But the calculations do not take into account the service facilities needed to filter the traffic from the toll road into the normal stream. For example, a third tube is needed for New York City's Lincoln Tunnel, largely as the result of the New Jersey Turnpike, and the municipal authorities insist that the scheme must include special by-passes so that drivers going to Connecticut and beyond will not add to the congestion in the city streets.

The $1,000 Ohio Turnpike bonds were oversubscribed and selling at a $25 premium on the first day, proving that it is easy to raise the money for such highways. Altogether about 2,000 miles of them are already completed or planned, but the country has over 3 million miles of ordinary roads, financed by state taxes, mainly on petrol, and federal grants, and for these it is much more difficult to find money. Congress has just extended the federal highway programme for another two years, authorising an expenditure of $1.4 billion in 1953 and 1954, but $4 billion a year is needed to make the roads fit for today's traffic. The size and speed of modern cars make most existing highways unsafe as well as crowded and the weight and number of lorries and trailers using them wear the roads out faster than they can be repaired.

* * *

Reprieve for the Spoils System

The Senate, which took one step toward better government when it gave up its patronage rights over the appointment of tax collectors, turned baulky last week. It defeated three reorganisation plans which would have ended Congressional control over the appointment of some 21,000 postmasters, 94 US marshals, and 54 top officials of the Customs Bureau, and thus would have left very few plums in the federal service for Senators to bestow upon the party faithful. What was lacking this time was the tax scandals which forced the Senate, somewhat grudgingly, to apply the merit system to the Bureau of Internal Revenue. It was not enough, in an election year, for the Citizens Committee for the Hoover Report—the monumental work on government reorganisation—to plead, perhaps with some exaggeration, that acceptance of the three plans would constitute the most important reform in federal employment practices since the Civil Service Act of 1883.

The Republicans who voted against the President's proposals could argue that they would merely freeze Democrats in their present jobs in what may prove a Republican year, though Senator Taft, to his credit, did not, and voted for reform. But the Southern Democrats, who contributed just as many votes to the defeat, and were even more active in rounding them up, had not even this excuse. The Democratic majority leader himself voted against the President.

So did Senator McCarran, the powerful anti-Administration chairman of the Judiciary committee, though it is hard to see why he should trouble about mere postmasterships when, by holding back appropriations and turning on investigations, he can make whole government departments dance to his tune. The "resignation" of high officials of the Department of Justice, who had incurred Senator McCarran's displeasure, is suspected, in Washington, to be a delicate return by the new Attorney-General, Mr McGranery, for the assistance Senator McCarran gave when Mr McGranery was having trouble in securing Senate confirma-

No Protection for Textiles

It seems impossible to repeat some facts sufficiently often to eradicate errors which particular parties have an interest in perpetuating. We still see in Protectionist addresses, written and spoken, an appeal for an import duty on corn, in order to place the farmer on the same footing as the manufacturer. . . . One good Free Trade correspondent asks us for a reply to it. . . . But the truth is, and we repeat it for the twentieth time, there are no such duties upon foreign manufactures as are referred to. So far as the manufacture of cotton, linen and woollen are concerned, they are exposed to the fiercest competition with all the world. No doubt there is a small duty on those articles when made up into clothes, but that is a protection to the tailor and the sempstress, and not to the manufacturer. A piece of Belgian cloth, or a piece of French printed muslin, can be imported into the shops of Regent Street, and pay no more in the shape of duty than the cloth of Yorkshire or the prints of Manchester. But if we are to take all the existing duties which remain in the tariff, upon goods of various descriptions which can be called manufactures, and upon articles of agricultural produce, we shall find that the latter exceed in amount the former by more than double. A Parliamentary paper has just been issued . . [from which] it appears that the whole of the protection afforded to British manufactures of every description, chiefly varying from 5 to 10 per cent, is represented by an amount of duties levied on foreign articles of £434,154; while the protection afforded to agricultural produce is represented by an amount of duties levied on foreign produce of £916,435. . . . We again repeat to our correspondent that there is no protection whatever enjoyed by the British manufacturers of "cottons and woollens": the superiority which they possess is derived only from their own energy, perseverance, and skill.

The Economist

June 26, 1852

tion. If so, it is a poor substitute for the house-cleaning of the Department of Justice which Mr McGranery promised when he was appointed and of which little more has been heard.

Metals in Reverse

While the House of Representatives was gleefully striking off most price controls, a rebellion which may make it impossible to secure an agreed extension of the Defence Production Act before it expires at the end of this month, the National Production Authority was also reversing engines on aluminium and copper. The steel strike has made it impossible to relax supplies for private construction, but small users of copper and aluminium have been freed entirely from the allocation scheme, in the first big step toward relaxing controls on basic materials. It is estimated that this will leave fewer than 5,000 large users under direct controls. Manufacturers of civilian durable goods, who have been on short rations of materials, had already been given an extra dividend of 100 million pounds of copper for the third quarter, raising their average consumption from 35 per cent to at least 50 per cent of the copper they used before the Korean war.

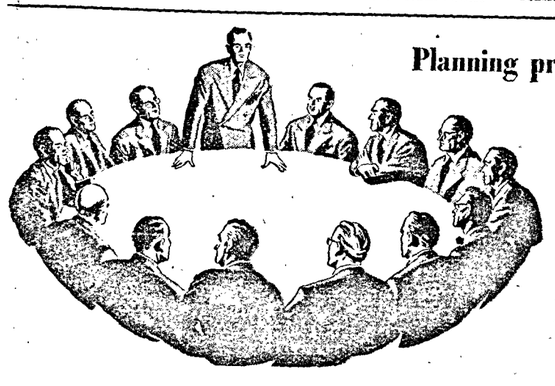
Copper has been the scarcest of the three basic metals, partly because domestic price controls made it unprofitable for American buyers to take up the whole of the American international allocation. Now that foreign copper has been exempted from price control the authorities hope that the United States will secure all the copper it is entitled to buy; the relaxation of controls on its use is designed to make sure that this will happen. If more copper is available, it will take some of the wind out of the sails of those who have persuaded both the Senate and the House to adopt amendments to the Defence Production Bill which would bring the International Materials Conference to an end. Moreover, copper might then be found for the strategic stockpile, from which 55,000 tons have been withdrawn in the past year, and to which none has been added since January.

Falling prices for non-ferrous metals are behind proposals to set up a "civilian stockpile." Such government purchases—one for lead has already been authorised—would maintain production of metals which the mobilisers believe may once more become scarce, and it would be easier to withdraw supplies for industry from such a hoard than it is to borrow them from the strategic stockpile. Falling prices and softening markets are also encouraging the strategic stockpilers to make up the deficits in their store-cupboard, which is barer than it should be because the needs of defence and civilian industries have been put first. This explains why, when aluminium is becoming plentiful, the government is still pressing Congress to agree to further expansion of domestic aluminium capacity or to the often rejected long-term purchase agreement with Canada. The Munitions Board is doubling its stockpile goal for aluminium and it is not believed that supplies, even with the present expansion programme, will be adequate. But Congress is as hostile as ever to the Canadian purchase scheme, and, like the Administration, is divided on the question of whether further domestic expansion should be turned over to the industry's big three or reserved for new independent producers.

Shorter Notes

Military aid totalling $4.6 billion and economic aid of $1.8 billion are authorised in the $6.4 billion Mutual Security Bill for the fiscal year 1953 which has been signed by President Truman, although it is considerably below the $7.9 billion he requested. This is the maximum which can be granted; actual appropriations must still be voted. Up to $1 billion of the military aid can be spent abroad for arms deliveries to allies. The ending of the fiscal year on June 30th will bring to $40 billion the money expended by America since 1945 in grants and loans to more than ninety nations and colonies.

*



The Senate, by a vote of 43 to 40, has once more rejected a Bill authorising American participation in the St. Lawrence Seaway project, despite a last-minute plea from President Truman that this would be a tragic economic mistake. For this session, at least, the proposal is now dead. Canada has maintained for months that it was prepared to build the Seaway alone, but permission will now be sought from the International Joint Commission to allow New York State to co-operate in the hydro-electric development which is part of the plan.

*

Limited operations have been resumed by two commercial airlines at the big Newark, New Jersey, airport which has been closed since February because of three crashes in nearby towns. New regulations permit use of the field only when there is a ceiling of at least 1,000 feet and a visibility of three miles. These restrictions are more severe than those usually in force at major air terminals, and will remain until the new runway is completed in November.

*

After years of investigation that included 17,000 pages of testimony at hearings, the government has set new standards for five types of bread—white, enriched, raisin, milk and whole wheat, the most popular types sold in the nation—if they are shipped in interstate commerce; local bakers are not legally bound by the regulations. In addition to banning the use of chemical "softeners" which make bread seem fresh for days after baking, the order also excludes from these five breads thirty other ingredients, such as black-strap molasses, concentrated extract of raisins and prunes, cotton-seed, peanut or oat flour, and rolled oats. Other types of bread not standardised must carry a complete list of ingredients.

Planning produces results in the dollar market

Successful selling in the U. S. market requires a carefully planned sales approach. As one of America's oldest commercial banks, Irving Trust Company knows this great market thoroughly ... will gladly work with you in locating competent organizations to help develop or expand your sales there.

THE WORLD OVERSEAS

Lean Years for Israel—I

The Struggle with Inflation

THE British well know how it feels to key themselves up for an emergency, to suffer privations to meet it, and then to find that, though the excitement is over, the screw of privation must still be turned. That is the state of affairs in Israel today. Its people suffered cheerfully in order to meet the exigencies of war and of the first great wave of "ingathering of the exiles." They are still years away from attaining the measure of self-support that will turn the country into a reasonably safe economic unit. As one Israeli put it: "We have done the impossible; the possible is still some way off: we are in the trough between." This experience has engendered a mood of self-criticism. By this is not meant grumbling, which is normal in the state of discomfort now being suffered; murmuring is in any case a hereditary trait. Other and more dynamic criticism is heard; people are beginning to question, in a healthy way, how much of the continuing hardship could be mitigated by better management.

Israel's crisis is worse than Britain's has ever been, because a young and poor country has much less room for economic manœuvre than an older economy. Abroad, its balance of payments position has been kept stable by expedients that range from borrowing to begging. At home, it is suffering an inflation that is perilously near to getting beyond control. The only sure remedy for both ills is an increase of production, but this—though it is on the way, particularly in foodstuffs—cannot be anticipated on any scale for four to five years. What is more, during those years the building of productive industries must exacerbate both the strain on the balance of international payments, and the tendency towards inflation; it increases the latter by creating purchasing power in a field of employment that is unproductive of consumer goods. The vicious circle is complete.

The problem has not suddenly arisen. Inflation has long been a danger. It has generated familiar complications in the field of economic morality, including the black market and the black market pound. But the extent to which it has in the last twelve months become a major preoccupation is well illustrated by a table of currency circulation:—

	Currency Circulation (IL millions)	Population
January 1950	50	1,180,000
January 1951	75	1,385,000
January 1952	100	1,578,000
May 1952	111	1,590,000

An increasing degree of inflation in the world of 1951-52 is anything but singular. Yet behind Israel's pernicious brand lies one cause which is unique. It is the multiplication, by immigration, of unproductive consumers who are too backward to be taught to produce quickly yet who must be provided with wages, housing and social services that will equate them with the rest of the nation. They must be so treated firstly in order to integrate them quickly, and secondly in order to give them an injection of the social justice that is the pride of a community that set uncommonly high standards during the sheltered years of the mandate.

Each of several obvious methods of arresting the inflation is distasteful. A year ago, any suggestion of, for instance, the limitation of immigration, or the absorption of purchasing power by admitting a few more consumer goods at the expense of capital goods, was met with the answer: "Impossible!" from a majority of the cabinet. Yet within the year something of both expedients has had to be sanctioned. After much heart-searching, selective immigration was instituted last winter; only immigrants who will quickly become productive are now encouraged to move; the rest are discouraged by the simple expedient of not paying for their journey. There remains, however, a generous loophole—the proviso that anyone in real danger must come. Also last winter, priority for the import of capital goods had to some extent to be abandoned. In December, an emissary was sent to persuade the United States Government that $25.7 million of last year's $50 million grant in aid under the Mutual Security Programme must be spent on back debts and consumer goods. He got his way, with the result that great parts of an agreed programme of technical assistance with capital works had to be jettisoned.

Four Months of NEP

In addition to severe rationing, coupled with price-fixing for essentials, monetary expedients have also been adopted to arrest the inflationary trend. Surplus money has been siphoned off by heavy taxation and borrowing. Credit has been restricted by demanding a high degree of liquidity from the banks. But by the beginning of this year it was plain that these measures were having only limited success. In February, therefore, a New Economic Policy was announced with three objectives: the combating of inflation, the speeding of production and the attraction of fresh foreign investment capital. The most orthodox anti-inflationary measures taken in its name have been increased efforts to balance Israel's three budgets—ordinary, defence, and development—by means of raising internal loans and increasing savings; a tightening of income tax collection; and stoppage of the issue of treasury bills to meet government obligations. The most recent measure is the forced loan announced last week, whereby holders of all notes in circulation were obliged to change them for new Bank of Israel notes whereon (for notes of £5 and over) the government retains 10 per cent as a 15-year loan bearing interest at 4 per cent. Ten per cent of all bank balances over IL50 was similarly treated, and there are rumours of a corresponding levy on property.

The most surprising monetary measure—surprising because it hits at rich and poor alike and is therefore contrary to the creed of a socialist state—was the introduction in February of a system of multiple exchange rates whereby the treasury now sells foreign exchange to importers at the old rate if they want a short list of essentials, but, for all less essential goods, at double or more than double the old rate of $2.80 to the Israel pound. (Details were given in *The Economist* of February 23rd.) Prices have therefore soared in recent weeks, and the hope is that they will mop up surplus money faster than salaries and wages (which are pegged to a cost of living index that is based on essentials) soar after them. As in Britain, therefore, bourgeois manifestations such as rationing by the purse are beginning to show their heads. The success of the measures clearly depends on a time-race between their possible advantageous and their possible disadvantageous results. The result is still open.

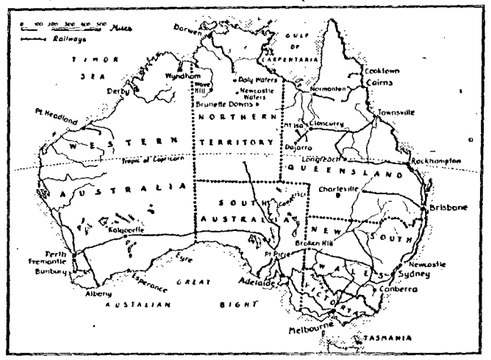
How much of Israel's inflation is due to factors that it could conquer by better organisation? Entirely outside its control must be numbered first, the legacy of the world war and the mandate, which endowed it with a lopsided economy; secondly, the aftermath of the Palestine war, which causes it to keep great numbers of productive hands under arms (though it mitigates this drawback by using military labour in agriculture); thirdly, the effect of the Arab boycott in restricting the delivery of oil to Haifa refinery; lastly the jump in world prices caused by the Korean war. Causes entirely within its control include the cocoons of red tape into which a civil service, laden too young with the burden of controls, has wound itself; lack of the efficient import programming that would cut out wasteful fights between various ministries and an investment centre; the intrusion of party considerations into administrative and economic decisions where they should have no place.

But there is a third set of important causes which are part in and part out of cabinet control, because to eradicate them altogether would produce a reaction that could not be afforded. They amount to vicious circles in an interlocking set. Immigration is one; it can be, and has been, curbed, but to cut it out would be to frustrate a main purpose of the state's foundation. The high standard of state socialism is another; it, too, has been partially dropped, willy-nilly, but to abandon it would be to destroy another foundation stone. High investment in non-productive goods is a third, but, as has already been shown, it cannot be avoided if the trough is ever to be passed. A cheap money policy is a fourth; one classic way of engineering deflation—the raising of the bank rate—therefore cannot be attempted.

Vicious circles that cannot be broken can sometimes be weakened at certain points. This is the expedient that is being adopted. In order to try a little of everything, theories are being cast aside. The emergency has given birth to experiments that are an encouraging sign of elasticity in people who were till lately doctrinaire. A second article will discuss how far these same measures affect the balance of international payments for good or ill, and what prospects there are of improving its sorry plight.

(To be continued)

Threat of Australian Beef Famine



[FROM OUR CORRESPONDENT]

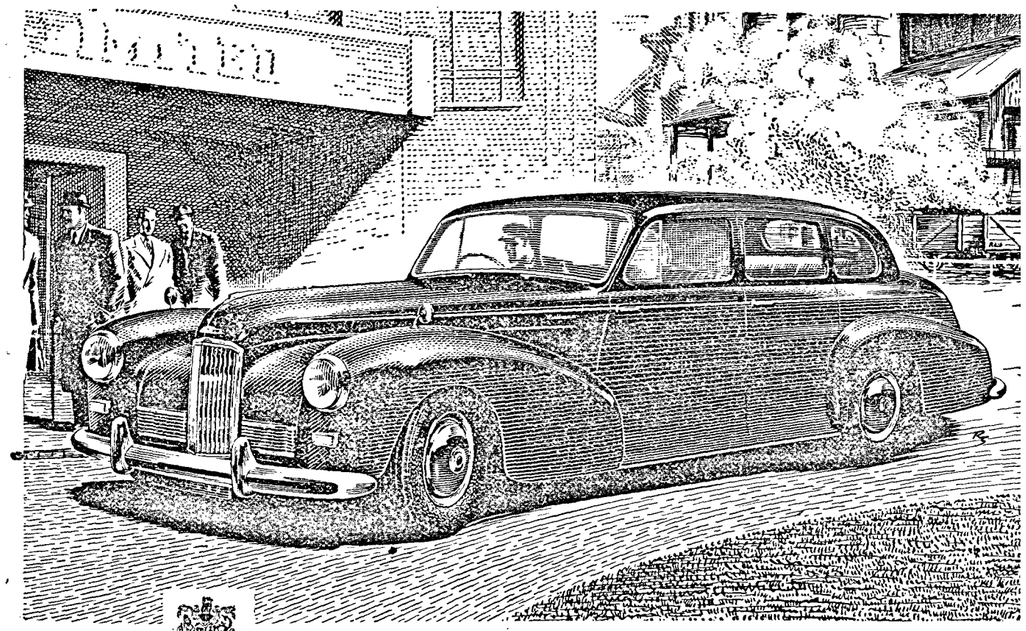
THE drought now raging in Northern Australia has killed any hope that the new meat agreement with Australia will solve the British meat shortage. The drought area extends northward from the Tropic of Capricorn to the Gulf of Carpentaria. There is 93 per cent of Northern Territory cattle in that area, as well as 79 per cent of Western Australian cattle and 68 per cent of Queensland cattle. Altogether they represent 8,600,000 of Australia's 12,800,000 cattle or more than half of the country's beef cattle.

Late in May storms brought up to two inches of rain south of the Tropic and also in Western Queensland, but they have been insufficient to break the drought which began eighteen months ago, and they have not touched the main cattle stations of the Northern Territory where three-quarters of Australia's beef breeding cattle are found. This area, north of the Tropic, depends on the summer monsoon (which was from December to March) for its rain, and cattlemen do not expect the drought to break until November when the pre-monsoon storms are due. The monsoon which was due last December failed to materialise. The previous monsoon, at the end of 1950, was heavy and promoted the growth of a tremendous amount of grass. But in the absence of the 1951 monsoon all this growth gave rise to spectacular grass and bush fires, which, unchecked by seasonal rains, swept across thousands of miles of country and intensified the fodder shortage.

This is the most destructive drought in the Northern Territory's history. Even those stations which can draw water from deep bore wells are losing cattle because grazing around the bores is either burnt off or eaten out. Already many thousands of young cattle have made the trek from the Northern Territory to Queensland grazing lands. But these represent only a fraction of the animals which cannot be moved either because the intervening country is impassable or because the animals are too weak to make the journey. Normally the Northern Territory produces 500,000 steers a year. These are fattened for export either in Queensland or in the Cooper River country of South Australia. This year so many calves have died that many stations will not brand their young stock.

While the immediate loss of meat animals is serious enough, mortality among the breeding cattle is so high that some Northern Territory authorities reckon it will take fifteen to twenty years to restock the stations. One station owner forecast that at the present rate of stock destruction Australia, far from having meat for export, might have to import beef from New Zealand by the end of 1953. Another cattleman, Mr. J. S. White, managing director of Brunette Downs station (4,000,000 acres) in the eastern part of the

Northern Territory, estimates that he will lose 12,000 breeding cattle this year. Normally Brunette Downs brands 18,000 young stock each year. This year there will be no branding. Such young stock as have survived will not stand it. At present Mr. White is trying to get 5,000 eight-month-old cattle out to Queensland to preserve a nucleus of breeding stock. But he is worried by the fact that owing to the price of meat in Australia many cattlemen are tempted to sell good quality young heifers to the butcher, thus further reducing breeding prospects.



Brunette Downs is a famous centre of cattle improvement in the Northern Territory and its rise is an indication of what could be done to increase Australian beef production when these herds have to be rehabilitated after the drought. In 1932, when Mr. White's father decided to start improving it, the station had only 90 miles of fencing, two bullock paddocks, and 35,000 cattle of indifferent quality. Calving was 21 per cent of breeding cattle and 4,000 animals were branded each year. Last year Brunette Downs had 50,000 cattle, the calving rate was 72 per cent, 17,500 animals were branded, and improvements included 529 miles of fencing and 23 paddocks. The station has two lakes which normally cover 1,000,000 acres with water, and 40 bore wells. Today the lakes are dry and the bores almost unusable. The quality of Brunette Downs steers has been improved out of all recognition by the addition of 1,326 bulls, all of excellent Shorthorn pedigree, in the past twelve years. Compared with the progeny of the scrub bulls used on the majority of Northern Territory cattle stations, steers by such sires put

SIMON ENGINEERING GROUP

It often happens that several companies or divisions of the Simon Engineering Group bring their widely differing services to bear upon a single contract. A large new phosphorus factory near Bristol for Albright & Wilson Ltd is a case in point. One division of Simon-Carves acted as consultant on siting and layout and is responsible for building and civil work; a second is dealing with materials handling and processing equipment, and a third with electrostatic dust precipitation; Simon Handling Engineers are supplying pneumatic discharging plants for unloading rock phosphate from ships.

on two hundredweight more beef and do it much more quickly. In other words, ten good cattle give as much beef as fifteen ordinary animals.

Since any increase in beef production must depend to a very large extent on developments in the Northern Territory, progressive cattlemen are inclined to think that the present disastrous drought might be a blessing in disguise if Northern Territory station owners can be induced to restock with better cattle. At present most of these cattle stations are in the same state as they were fifty years ago. The breeding strains are the same as those which were "overlanded" to the properties when they were first opened up. In an attempt to induce development the Northern Territory has been left free of Federal taxes, but this has merely led to lessees of the land pocketing their profits instead of making improvements. Today the situation is difficult because many of these station leases come up for renewal in 1964, and it seems likely that "do nothing" lessees will not get their leases renewed. For this reason they are not anxious to make considerable improvements now. In the meantime the cost of improvements has risen steeply. Fencing today costs £300 a mile compared with £15 before the war. Bores which used to cost £300, now cost £5,000.

Need for More Railways

But much improvement can be made in the quality of the livestock. At present it is almost impossible to go into a saleyard and buy 200 well bred young cattle. This situation could be overcome by sending 10,000 good bulls to the Northern Australian stations after the drought. If this was followed up by official action to get rid of scrub bulls a permanent improvement would be ensured. The second urgent need is more transport, especially railways. At present, for example, steers from the Brunette Downs station have to walk 400 miles to the railhead at Dajarra, and then spend a fortnight in trains. In 1950, which was a good year, a mob of 700 steers, averaging 800 lb each, made this trip and averaged 570 lb when killed—a loss of 161,000 lb of meat. If the 500,000 steers which come out of Northern Australia each year lose only 100 lb each on the way—a very conservative estimate—Australia loses 22,321 tons of beef a year—an amount which could have a significant effect on the British meat ration.

Northern Territory station owners point out that Australia has had no important rail development for thirty years. They suggest that, as a first step, a line should be run from either of the present railheads at Mount Isa and Dajarra as far as Newcastle Waters in the centre of the Northern Territory. This would be along the track of the normal cattle movement which is south-eastward into Queensland. With a railhead at Newcastle Waters the journey on foot for cattle from such western stations as Wave Hill would be reduced by more than half. The beef lift by air freighter, which is now operating in northern Western Australia, would not be so suitable for the Northern Territory where the flight would be much longer.

Those station owners who have watched Britain's large scale efforts to raise food by the peanut and egg schemes and the more recent sorghum and pig project in Queensland, suggest that British capital might be better employed in helping Australia to open up its beef country with more railways. Though a map of the Northern Territory shows a grid of cattle leases, a very great deal of land has yet to be brought into use, and even that which is already occupied is producing at far below capacity.

The prospects before the Australian cattle raiser are enormous. At a recent conference between the Commonwealth Government and the States, production targets for a five-year food drive were announced. They included raising beef and veal output from 652,000 tons in 1951-52 to 672,000 tons in 1957-58. That is a comparatively modest target. Commonwealth Government statisticians, working on the basis that by 1964 Australia's population will have grown from its present 8,250,000 to 12,000,000, reckon that meat production must double in that period.

India and the Colombo Plan

[FROM OUR CORRESPONDENT]

INDIA is three-quarters of the Colombo Plan. Alike in population, in the amount of money to be spent, and in the results expected, India's needs and India's efforts are predominant. The Indian plan now provides for an expenditure of £1,750 million in six years; this should give an increase in the national income of 10 per cent, or rather over £750 million. It is a measure of India's poverty that, with over seven times Great Britain's population, its national income is less than two-thirds as large. This 10 per cent increase will still give only a very small improvement in the standard of living, for the population may be expected to increase in the 6-year period of the plan by nearly 8 per cent. But even this improvement would be enough to restore hope and faith to a people who, for many years now, have seen their welfare decline as their population rose. Small though it is, however, it will be very hard to achieve. Where so many people live on the verge of subsistence, where income per head is only £25 per year and an agricultural labourer earns £1 per week, nothing is more difficult than saving. In 1950-51 India saved 4½ per cent of the national income; nothing is more dubious in the plan than the assumption that savings will reach 7 per cent by 1957.

The increase in governmental investment, from £196 million in 1950-1951 to £256 million in 1951-52 and to £307 million in 1952-53, is a measure of the great effort which is being made. Railway rates have been raised; sales taxes have been imposed everywhere; income tax and supertax have been kept at almost wartime levels; there are excise taxes on such necessities as matches and cooking fat; the export duties on jute goods and cotton textiles have been kept at levels which jeopardize their markets, and there are tariffs even on most imports of machinery and raw materials. On the expenditure side, the government is proceeding cautiously with all the non-productive social services, from compulsory primary education to hospitals. In Bombay, India's richest state, which has nearly as many children of school-going age as England, only £9½ million is being spent on education in 1952-53, and in Madras, with nearly 60 million people, health services get only £3½ million.

By stringent austerity, India hopes to find from internal resources some £1,200 million over the six-year period of the plan. This money is expected to come not only from taxation, but also from borrowings; some £40 million a year is expected from small savings, mainly the 3½ per cent tax free savings certificates of which the middle class is so fond. Only enough to meet maturing loans is expected to come from open market borrowing, which, in India, comes almost entirely from banks and insurance companies. These are not, by English standards, large figures, but they exhaust the Indian capital market so thoroughly that there has not been a successful equity issue for months.

The £600 million which still remains to be found must come from abroad. Sterling balances releases provide £35 million a year or £210 million over the whole period, and, in addition, India's surplus in its balance of payments in 1950-51 gave it a sufficient backlog to enable it to use £105 million in 1951-52 and still have £75 million (instead of £35 million) left for 1952-53. Beyond this, in the plan's first year, 1951-52, Canada gave £4 million, Australia £3 million and New Zealand £250,000. The Canadian money is being spent on vehicles for the Bombay State Transport Service and the Mayurakshi irrigation project in Bengal. The

Australian gift was in wheat and flour, and New Zealand is financing most of the cost of the All-India Medical Institute now being built in Delhi.

The remaining money required can come only from the United States, and the fact that an American observer now attends the plan's consultative committee is perhaps a sign that this is realised in Washington. Indeed, the United States has already given assistance, both by a loan of £64 million to enable India to buy 2 million tons of wheat, the funds from the sale of which become immediately available for development, and by a grant of £18 million which is being used partly for the import of fertiliser and partly for rural development. For 1952-53 the talk has been of an American grant of £90 million. This is almost exactly the amount required to make up the deficit both in the plan and in India's balance of payments, which has been very severely hit by the deterioration of perhaps 12 per cent in India's terms of trade over the last few months.

American Aid for Peasants

The most significant and the most exciting part of American aid is that for rural development. American experience in agricultural extension work is unique, and the experiment which has been made at Etawah has already shown that the money such work costs repays itself in improved yields within a very short period. Now the government of India is extending the Etawah principles to the whole countryside and hopes, within a few years, to cover 120 million people, at a cost of £200 million. It is early yet to say whether the Etawah success can be repeated elsewhere, but, if it can, it will transform India. There could be no use of American generosity more in keeping with American traditions.

Indian opinion accepts the Colombo Plan without any reservations. India is represented on the consultative committee, India is itself assisting—it has given £750,000 for technical co-operation and has lent three experts to Ceylon. Indeed, India has perhaps the greatest part to play in serving as a training ground for other countries of the area, for Indian problems are Asian problems. It is perhaps a pity that western prestige prevents Asian countries from realising this fully and makes them prefer training in New Zealand or Canada, where conditions are wholly different, to training in the Punjab or Madras, where the background is the same. India also finds the Plan attractive because, although the actual negotiations for assistance are bilateral, they always take place within the framework of its own plan. Nothing, therefore, is forced upon India and there are no strings.

Nor has there been any demand that India should get a larger share, though it could make out quite a good case for this. It is the poorest country of the area, and the one the success of whose democracy is perhaps the most vital; yet Pakistan, one-fifth the size, gets two-thirds as much from Canada, half as much from Australia, and fully as much from New Zealand; Malaya, one-fiftieth the size, is getting £60 million in grants from the United Kingdom, where India gets only a little technical assistance.

The reason is not any backwardness in Indian planning. On the contrary, the Indian plan is the only complete and detailed one in the area; it is also the only one on which a government is, in fact, basing all its policies. Since India's primary needs are water for irrigation and those basic utilities—transport and power—without which no development is possible, and since between them these take up two-thirds of the plan, there has unfortunately to be some delay before the public sees results. But, already the fertiliser factory at Sindri and the locomotive works at Chittaranjan have been opened; the Bokaro thermo-electric station should be giving 80,000 kW of power by 1953, and the Tungabradra scheme will water 700,000 acres by then, while the Lower Bhavani scheme will water 200,000 acres a year later. The results are coming.

Poland Needs Factory Workers

DURING the recent Rumanian purges Anna Pauker and the other "culprits" were simultaneously accused both of fostering the *Kulaks* and of adventurous attempts at forcible collectivisation. This contradictory accusation reflects the dilemma facing the East European rulers who would like to speed up the process of collectivisation but are afraid of the consequences of such a campaign. In a lengthy speech delivered before the Central Committee of the Polish Workers Party, its chairman, Mr Bierut, the Polish President, gave another example of the difficulties. On the one hand, he insisted in terms more emphatic than usual on the contradiction between socialised industry and the backward peasant economy in the countryside; he proclaimed openly that socialised agriculture is the goal and attacked the "Gomulka clique" as defenders of Kulak interests. On the other hand, and in the same breath, he stated that "more far-reaching (than a policy of restriction and limitation towards the Kulaks) and sectarian efforts should be branded as dangerous adventures."

The chief reason for collectivisation remains the desire to ensure a growing supply of cheap foodstuffs for the towns. But Mr Bierut indirectly revealed a further reason, namely the growing shortage of industrial manpower. It is expected that in the first half of the Six-Year Plan—i.e., between 1949 and 1952—Polish industrial production will have doubled, while the Plan foresaw a rise of only 70 per cent. Thus, despite certain deficiencies, such as the failure of the iron and steel industry to reach its targets, both in 1951 and in the first quarter of this year, Mr Bierut could boast of the achievements of socialised industry. Yet this progress was largely based on a vast influx of manpower into industry. Between 1946 and 1952 non-agricultural employment rose by 2½ million; in fact, it nearly doubled. Hitherto the bulk of this increase was accounted for by the flow from the overpopulated countryside into the towns. Now this stream has been reduced to a trickle and, in Mr Bierut's own words—"a new situation has arisen" in Poland.

After Russian Models

How will this new shortage be tackled? A greater employment of women is certainly not a sufficient cure, though the proportion of women in non-agricultural employment has risen to 30 per cent at the beginning of this year and is expected to increase still further. A shortage of labour is likely to be felt for some time to come and a partial answer to the new situation will probably lie in a shift from the extensive to the intensive use of this scarce factor. This, at least, is the impression one could gather from Mr Bierut's speech. A large part of it was devoted to the various methods of obtaining a larger output from the available labour resources, to mechanisation, to the struggle against slackness and absenteeism, to the preparation of skilled workers, of specialists—in short, to means for getting higher productivity.

Here Mr Bierut was modelling himself faithfully on the Soviet example. In his attack on those "petty-bourgeois" who oppose wage-differentiation and praise the levelling of wages as democratic, he was echoing almost literally Stalin's speeches from the early 1930s. He made it quite clear that no dreams about "socialist competition" would be tolerated and that in the present circumstances it is through the Stalinist version of Taylorism that the Poles hope to intensify the efforts of their working class. In another respect, too, a Russian model will be transplanted unchanged. Since the spontaneous migration of peasants has ceased, a special central body is to be formed to watch both to the necessary mobilisation of labour from the countryside and to its training and allocation to those branches of industry where demand is greatest.

These facts are published to show what British enterprise can achieve in spite of difficulties.

It can be done

On the 18th May 1952, Benghazi's new power station was opened by His Majesty King Idris of Libya. This was the first project carried out by a British contractor in Cyrenaica. The consulting engineers were Mackness and Shipley.

When the work began, the province was still suffering from the effects of war. Plant and materials—other than sand, of which there was more than enough—were carried from Britain and transhipped at Tripoli, for Benghazi harbour was badly damaged. Local labour was not yet trained in modern construction methods. There were dock strikes and shortages in Britain, drought in Cyrenaica. But the work was completed on time. The organisation which carried this job through is also engaged in construction works in Syria, Mauritius, Northern and Southern Rhodesia and the Union of South Africa, besides its activities in Britain.

A GREAT NEW TYRE BUILT TO CUT RUNNING COSTS

THE *de Luxe*

All-Weather Tyre by GOODYEAR

New all the way through! New Carcass! New Tread! New Shoulders! New Sidewalls! Tougher—Stronger—Steadier—Safer—The New de Luxe by Goodyear is the greatest car-tyre value obtainable at the Standard Price Level.

It will save you money. The tread is thicker, tougher, wider, flatter, for longer mileage. The strong, resilient cord carcass combines reliable sidewall construction with comfortable riding. The smart, rugged shoulders protect the sidewalls. The famous diamond-tread design, still further improved, ensures greatest grip on all surfaces and safer cornering. By all standards the new de Luxe is the right tyre for the times, at the right price, and obtainable now at your regular supplier.

When next you buy a tyre—insist on Goodyear

You can trust
GOODYEAR

FOR LONG LIFE AND LASTING WEAR

These references to the Soviet pattern were not only implicit in Mr Bierut's speech. He clearly stated that the Polish experience is not new, that "a similar situation arose in the Soviet Union during the first Five-Year Plan." Yet if there are similarities in the method of tackling the issue, there is also a basic departure from precedent, at least for the moment. In the Soviet Union the problem was attacked frontally towards the end of the first Plan by a ruthless collectivisation drive. Finally, it was the mass of peasants rendered redundant by this drive which provided the manpower necessary for rapid industrialisation. In Poland, for the time being, the process of collectivisation is still very slow. In the second half of 1951 there was an actual stagnation and in the first half of this year only 300 new collective farms were formed, bringing the total to 3,300. According to the Plan, socialised agriculture—i.e., both state and collective farms—should account in 1952 for only 16 per cent of the total value of agricultural production.

To Rush—Or Not To Rush

In the Soviet Union, it may be argued, the date and tempo of collectivisation were to a certain extent imposed on Stalin by the difficulty of getting the foodstuffs for the towns. In Poland last year's drought, which further increased the discrepancy between urban and rural development and caused an acute shortage of potatoes and meat, resulted only in the introduction of compulsory deliveries for a certain proportion of foodstuffs. Mr Bierut claims, though this must be taken with more than a grain of salt, that "the great majority of peasants had shown full understanding of the purpose and justice of the decree," and he added that the state had no intention of abolishing the free market for agricultural produce. It would appear that it is still through privileges, assistance and example that it is hoped to induce peasants to form collective farms: 335 tractor stations should be in operation at the end of this year; two large peasant delegations have recently visited Russian model farms; similar internal excursions are being organised. Yet here Soviet experience should have shown to Polish leaders that, in the short run at least, example is not an effective method for speeding up collectivisation. Will the Polish and other East European rulers be allowed to take time for carrying out this revolution? Will they dare to provoke peasant resistance in the present international situation? Hitherto, probably taught a lesson by the bloody Soviet experiment, they seem still to be preferring caution. Yet in the Soviet Union, too, the onslaught came as a surprise, unheralded. Satellite planners must often strike a Hamlet-like attitude and ponder: to rush or not to rush on with collectivisation.

General Templer's Start

[FROM A CORRESPONDENT IN SOUTH-EAST ASIA]

GENERAL SIR GERALD TEMPLER'S report to London on his first few months as High Commissioner for the Federation of Malaya is borne out in the views of a good many people on the spot. Members of all the communities—Chinese, Malay, Indian and European—agree that the new High Commissioner has made a good start. His forthright approach to the problem of banditry to which he has given a very proper priority has not met with any opposition. The somewhat cautious praise accorded to him, nevertheless, indicates that he would not lack critics if he failed or appeared to be failing. Public opinion in Malaya is still to some extent suspending judgment.

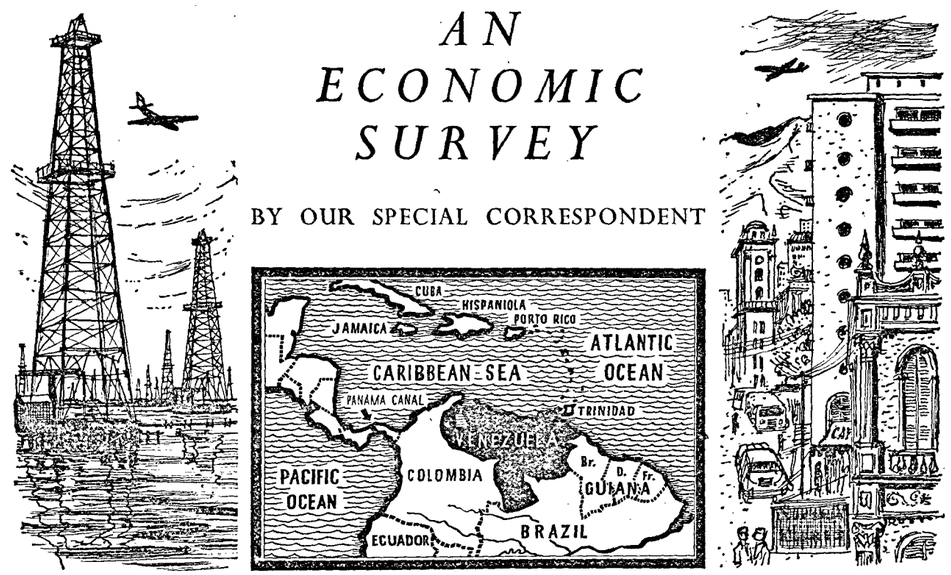
General Templer has made a good start because he knows what he wants and believes what he says. He realises that the restoration of law and order must come first. In this he is not handicapped, as some of his predecessors have been, by the intermittent exercise of overriding authority on the part of ministers in London; but for some time he will need to play a lone hand. Until he is able to demonstrate that his policy is likely to be effective, the professional humanitarians will be after him, ready to call his firmness brutality and to read oppression into his every positive act.

One of General Templer's major aims has been to gain the co-operation of the millions of peaceful Chinese in Malaya. He has stressed that Chinese partnership in quelling banditry is essential. At the same time he has condemned communalism. He has appreciated the difference between using the good qualities of the Chinese—and they have many—and setting up a self contained and self interested Chinese community. It is only by acknowledging their differences and accepting them that the three main communities in Malaya will ever work together as a team.

The new High Commissioner is wisely developing his policy step by step. As an expert in intelligence he is not likely to give his opponents, either foes or friends, the advantage of knowing and countering his plans in advance. It seems that he is to work upwards beginning with the villages. It is the right approach. Supporters are always to be found at the top, some genuine and some drawn by the lure of self advancement, but success depends on the mass of the people.

In his censure of the European town dweller, General Templer is less explicit. Against the extreme hazards of the lives of the planters and miners the ordinary civilian in Malaya does appear to take little interest in the problems of the country. But in the past he has had little encouragement to do otherwise. The Civil Service have been a class of their own; the military services, living in camps and barracks, have tended to keep to themselves. It is not to be wondered at that the ordinary commercial man feels that it is not his job to do more than play his part in maintaining the prosperity of the country. General Templer was right to point out this seeming indifference but he has so far not convinced people what the alternatives are to golf and racing.

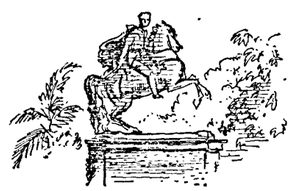
The Drop in Rubber



The sharp and steep fall in the price of rubber has, from General Templer's point of view, come at a bad time. For two years and more the rubber industry has kept going with the aid of boom conditions. High wages and high bonuses have helped to retain labour and supervisors through conditions of terror, though money alone would not have been enough. But without money, how many will feel that the effort is worth while? The rubber industry lives generally on a basis of forward sale, and so far the impact of the fall in price has not made itself felt to any great extent. The effect is bound to come and come soon.

How serious this new threat is to Malaya's economy is shown by General Templer's visit to London for further consultations. He is concerned, and rightly, with the inevitable fall in revenue and a possible shortfall in the funds needed to carry out his plans. If he is to succeed, the British Government may have to underwrite him. The fall in the price of rubber seems to have been halted for the present. At its present price, no doubt, the industry could carry on, were it not for taxation and the high cost of safety measures on the estates. The fall in purchasing power of a considerable section of the people of Malaya will ultimately spread itself over an ever wider circle and this will accentuate an existing tendency towards falling prices. But in itself this may not be a bad thing. It may be that a threat to the public purse will stimulate the idealists out of their complacency and cause them to put theories aside in the sterner practical business of living within their means. Provided it goes no further, the fall in the price of rubber may not be wholly disadvantageous to General Templer.

VENEZUELA



AN ECONOMIC SURVEY

BY OUR SPECIAL CORRESPONDENT

The Boom that Never Burst

IN only one country in the world is the US dollar virtually a soft currency. That country is Venezuela, the only Latin American state to come through the postwar years without foreign exchange problems or dislocation of its trading balances. The phenomenal prosperity of this Caribbean republic, which in 1951 could afford to import £230 million worth of both capital and consumer goods, has attracted remarkably little notice abroad—even in the United States, for some forty of whose exports Venezuela ranks as the best customer in the world. But other nations would do well to keep an eye on Venezuela, not only because of its importance in the pattern of international trade, but also because it is grappling with, and to a great extent overcoming, problems which countries both in Latin America and other regions now face, or will soon face. Moreover a nation of five million people which in this anxious age has no foreign debt, virtually no internal debt, perennially balanced budgets, and a gold reserve of some £120 million deserves the attention of every economist.

Venezuela's prosperity is immediately apparent even to the most casual visitor. Whether he lands at the newly enlarged port of La Guaira or the nearby, also newly enlarged, airport of Maiquetia, he will at once observe buildings being completed, ships and aircraft coming and going in increasing numbers, and a general air of bustling activity. On the twenty-mile drive up to the capital he will note not only the steady flow of goods traffic but also (if he can overcome his vertigo as he rounds the hundredth hairpin bend) the super-highway which is being bored through rock and flung across ravines a thousand feet below him. Even more striking is Caracas itself, with its gleaming new avenues and the gleaming new cars—one for every fifteen inhabitants—which throng them. Whether in the commercial centre or in the residential areas which in the past few years have mushroomed out to fill the narrow Caracas valley, one cannot turn a corner without seeing girders and scaffolding; and high up on every side of the valley the tireless bulldozer is at work carving out platforms for new buildings.

Over the past three years the total subscribed capital of limited companies registered in Caracas has increased at the rate of £2,500,000 a month, while the number of persons employed has risen by over 25 per cent. Since the end of the war the average wage in the capital has nearly doubled; and, even when a rise in the cost of living of over 40 per cent is allowed for, this represents an increase in real wages of over one third. Yet this great access of purchasing power has not created any scarcities. Shop windows are packed with goods, and modern "super-

markets" are springing up in which the Caraqueño can buy everything his heart desires.

The source of this new wealth is not far to seek. Venezuela is booming on a flood tide of oil. But not every oil-producing country presents the same lively picture. To some extent Venezuela's brisk tempo is explained simply by the richness of its oilfields; even today its output is abreast of that of the whole Middle East. But the oil companies operating in Venezuela are not local but foreign. What has happened here to disprove so vividly the hoary idea that foreign capital brings no benefit to the country where it is invested? In Venezuela the nation's share in the benefits of oil production is so great that, in the words of a report prepared for the UN Economic Commission for Latin America at its session in Mexico last year:

> We are thus again forced to the conclusion that, in spite of the fact that it operates with foreign capital, the oil industry is national, not only in a geographical sense, but also by virtue of its economic effects on the country.

Venezuelan statistics show that between 1945 and 1951 over 60 per cent of the total gross value of all petroleum exports was paid into the country. And more than half of the total of over $3,400 million brought into Venezuela by the companies during the past seven years has passed into the national exchequer. The State takes this handsome share of the proceeds of the industry by four principal methods. The first is taxation under the Hydrocarbons Law, mainly through the exploitation tax of one sixth of the full value of all oil extracted. The second is income tax; this includes not only a progressive surtax rising to 26 per cent, but an "additional tax," confined to petroleum and mining companies, which ensures that at least 50 per cent of each company's profits for any one year will pass to the exchequer. The third arises from import duties on supplies brought into Venezuela by the companies.

Finally, there are profits from exchange control regulations; these regulations require the oil companies to buy their bolivares at the rate of Bs. 3.09 to the dollar, while the dollars thus acquired by the Central Bank are then sold to Venezuelan importers at the rate of Bs. 3.35 to the dollar.

The net result is that in recent years the oil industry has directly contributed some 60 per cent of the national budget, while much of the remaining revenue arises from the flourishing external trade that the industry has made possible. Thus in 1951 the sources of State revenue were as follows:

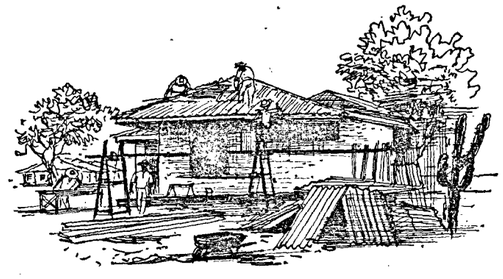
(Millions of Bolivares)	Arising Directly from Oil Industry	Other Sources	Totals
Hydrocarbons taxes	864·5	...	...
Income tax	394·0	110·3	504·3
Import duties	30·8	322·1	352·9
Exchange operations	110·7	...	...
Excise (liquor, matches, tobacco, petrol)	...	163·0	...
Dues (consular, port, postal, telegraphic, etc.)	...	146·5	...
Stamped paper	...	62·3	...
Other revenue	...	52·1	...
TOTALS	1,400·0	856·3	2,256·3

These figures are impressive. But to appreciate the full impact of the oil industry on the Venezuelan economy, it must be noted that in the thirty years since the industry really began to develop, the national revenue has grown to twenty-seven times its former size. The Central Bank estimates that the national income has risen from Bs. 1,500 million in 1936 to 5,000 million in 1947 and 7,195 million in 1951. This last estimate, translated into terms of 1936 prices, would still represent Bs. 3,334 million, or 222 per cent of the 1936 figure. Moreover, according to the Central Bank's estimate, the average share of the national income per head in 1951 was Bs. 1,419—£152 or $426. The corresponding figure for 1936 was Bs. 446; thus, although the population has increased by 50 per cent in the past fifteen years, the average real income has risen by 48 per cent.

Spreading the Wealth

It will, however, be asked how widely this great injection of wealth has been distributed. Naturally, part of the benefit which Venezuela obtains from the oil industry passes directly from the industry to individuals, in the form of wages and salaries, of payments for rights of way and areas of land, of contracts for auxiliary services, and of purchases of local supplies. But even in this matter of direct payments the industry reaches out to stimulate many areas, providing a market for such growing industries as cement, paints, and asbestos: and its purchases of foodstuffs have virtually called into being new and important rural activities, such as the modernised dairy farming in the state of Zulia. Wider still are the ripples of encouragement which the industry sends out at second remove, by increasing the purchasing power of those from whom it buys labour, services or goods; by providing better communications in the form of new roads and cheap petrol; and by facilitating the expansion of credit and thus the creation of new industries and activities.

Two further influences of the industry, however, are even more important, for they affect the whole nation as one unit. The first is oil's power to bring in hard foreign currencies, and at a very favourable rate. It has already been said that the dollar is virtually a soft currency in Venezuela. Indeed, the Venezuelan bolivar may well lay claim to the title of the hardest currency in the world. In the early 1930's the oil wells were already flowing freely, and against the background of those dismal years Venezuela paid off all its foreign debts and watched the bolivar rise from a rate of Bs. 7.75 to the dollar to Bs. 3.05. Never, in fact, has the currency strayed far from its original gold point. Today, with the bolivar at 3.35 to the dollar and 9.43 to the pound sterling, it is fantastically overvalued on any comparison of domestic buying power; the bolivar will buy in Caracas no more than sixpence would in London. Yet this is a genuine exchange value, not one maintained by artificial restrictions. The result is that to anyone whose income is in bolivares, even dollar goods seem cheap, while imports from soft currency countries can be brought in at astonishingly low cost. The normal penalty for over-valuation is an inability to export; but this difficulty is washed away by the flood of oil.



Thus, in 1951, petroleum products brought in 98.16 per cent of all Venezuela's earnings of foreign exchange; and of these petroleum earnings, 97.74 per cent—$606.9 million—were in dollars. This enabled the country to import in 1951 450,000 tons of food, 250,000 tons of cement, 57,000 tons of motor vehicles, 102,000 tons of other machinery, 87,000 tons of chemical products, 500,000 tons of metals for construction, and 450,000 tons of other goods. The

benefits of this influx of imports are most clearly visible in the towns. But in the countryside they appear in the form of new cottages built of cement blocks, with aluminium or asbestos roofs replacing the unhealthy thatch; well-stocked shops with big new deep-freezers; trucks carrying produce to market, and buses carrying country folk to town; and a rapidly growing number of radios, sewing machines, bicycles, small generators and pumps. But it is only imports that are cheap, and often the villager whose income has increased lives on in a mud shanty while he buys a refrigerator or a Packard; and these odd juxtapositions symbolise the abrupt change in the national economy.

EXPENDITURE BUDGET FOR 1951-52

(Millions of Bolivares)	Capital Expenditure		Current Expenditure	
Economic and Social Development:				
Communications	187		134	
Water supplies	89		...	
Agriculture and irrigation	50		70	
Industry and mining	66		14	
Housing	20		...	
Education	44		141	
Medical	20		100	
Social services	...		85	
Public construction	98		...	
Grants to States	102		...	
		676		544
Other Expenditure:				
Defence, security, justice	46		250	
Central Government	...		107	
Collection of revenue	...		65	
Amortisation of debt	8		...	
Grants to States	...		190	
Miscellaneous	...		65	
		54		677
Totals		**730**		**1,221**
Total Budget			**1,951**	

But most significant of all, both in scale and in scope, is the benefit which oil transmits through the national exchequer. As the figures already cited will have indicated, no less than 30 per cent of the whole national income now passes through the exchequer, and the bulk of this revenue is derived, directly or indirectly, from oil. The economic power thus placed in the hands of the central government is obviously decisive.

An analysis of the expenditure side of the budget for 1951-52 shows, in broad outline, how this power is used. A mere glance at these figures is enough to show that Venezuela's slogan, "sow the petroleum," is being translated into concrete form. State expenditure on this scale has meant the extension of the country's all-weather roads from 3,000 km in 1938 to over 9,000 km, nearly 3,000 km of them paved with concrete or asphalt; in 1951 750 km of new roads were built, while 770 km were paved and new bridges totalling 3,890 metres in length were constructed. Twenty-seven main airports and over sixty other airfields have been built. La Guaira, the port of Caracus, has been made an enclosed harbour and now handles 2,800,000 tons of shipping a year; other seaports have been improved, and new coasting vessels acquired. Irrigation has been provided for over 30,000 hectares, and water and sewage for almost every town. Since 1946 malaria has been virtually wiped out. Much more needs to be done to solve the enormous problem of housing, but a beginning has been made; and a real effort is under way to extend free and comprehensive education, and adequate health services, to all. The multiplicity of other developments is apparent to any visitor to Venezuela who sees throughout the country newly built clinics, playgrounds, pools, technical training centres, markets, slaughterhouses, telegraph offices and power plants.

The record of the past few years is impressive. The State is trying its best. But there are limits, even in the most honest country, to enrichment from above, and Venezuela is no more honest than most. Moreover, the foreign observer will naturally be inclined to ask whether the cornucopia is not being emptied too swiftly and lavishly into projects which, however admirable, are not all directed to Venezuela's most urgent needs. But to answer this question it is first necessary to look more closely at the general economic condition of the country.

The Venezuelan Paradox

KING MIDAS crops up in every economic conversation in Venezuela. Strange though it may seem, a favourable balance of payments, a fat gold reserve, a currency hard enough to cut through dollars, and a revenue which is not so much buoyant as airborne, are not enough to free a country of economic problems. Venezuela's most obvious problem is its dependence on one main export commodity, the value of which must fluctuate according to international conditions over which the country has no control. Successive governments have recognised that the only way of meeting this danger is to "sow the petroleum," to use the wealth derived from oil to diversify the national economy. The State has diverted huge sums, in the form of credits, grants, supplies and technical assistance, to both industry and agriculture; it has responded to numerous demands for tariff protection; it has co-operated in development projects sponsored by such independent groups as Mr Nelson Rockefeller's International Basic Economy Corporation. Much has thereby been achieved; but at first sight it would seem questionable whether either industry or agriculture has responded to an extent commensurate with the encouragement given it.

In recent years, indeed, production has declined in several branches of the economy. Thus, between 1947 and 1951 output of butter, biscuits, cigarettes, tinned milk and soap fell off, and textiles, although benefiting both by heavy protection and by a large share of State investment, fell off by a full 50 per cent.

These setbacks must be seen against the background of a general economic expansion which has greatly exceeded them in volume. Their importance should not be exaggerated. But they serve to show that the mere application of State aid, however generous, is not enough to

ensure a swift and universal development of industry and agriculture in circumstances of this kind. Some Venezuelans, looking at the huge and increasing figures for oil revenue and state expenditure, are inclined to attribute the failure of industry and agriculture to develop with similar speed either to the blighting effects of "mono-production," or to the priority given by the government to public works.

Neither of these beliefs will stand up to close examination. The idea that oil has killed a formerly thriving agriculture, burying it under an avalanche of imported food, is based on a startling misconception—one shared by such distinguished authorities as Señor de Madariaga, who has written of "a sea of oil" pouring itself over Venezuela's "once fertile valleys." In point of fact, few tropical countries are less fertile than Venezuela, and in few is farming a more hazardous enterprise.

Nature, indeed, has played many bitter tricks on the people of this apparently spacious country. The great plains north of the Orinoco—the *llanos*—which to the casual eye would seem to welcome the plough, are mostly covered with light soils which defy the farmer and make poor enough pasture; and each year sees them first dried brown and then drowned in summer-long floods. To the north, the coastal lowlands are scorched dry; La Guaira, for example, with an average temperature of 81 deg., gets only eleven inches of rain a year. Far south of the Orinoco, and in its delta, the dense forest is interspersed with a few promising areas, but these are still too remote. Throughout the history of the country the bulk of the population has therefore been found scattered along the mountain chain, a spur of the Andes, which runs from the south-western state of Táchira to that of Miranda, east of Caracas. These mountains are steep and badly eroded. The valley surrounding the Lake of Valencia is the only sizeable basin within their tight embrace; elsewhere cultivation is confined to small pockets of flatland and to such of the mountain sides as have retained their soil through centuries of torrential rain and destructive cultivation of the nomadic type.

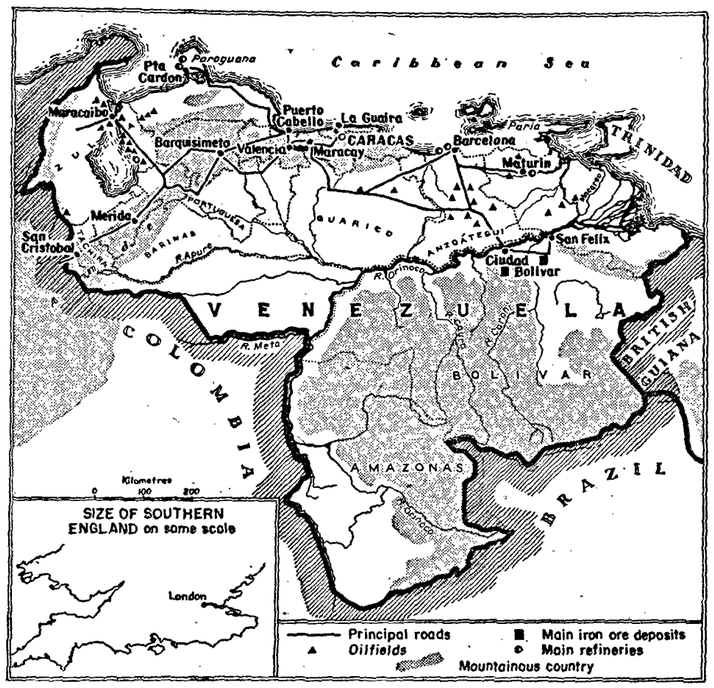
It is hardly surprising, therefore, that the agricultural history of Venezuela from the Spanish conquest until recent years shows little except extensive estates on which even such profitable crops as coffee, cacao, sugar and indigo were only made economic by the use of cheap, formerly slave, labour; and, alongside them, the wretched patches of hillside on which the *conuquero* or primitive smallholder contrived, or failed, to feed his family. The collapse of the market for indigo and the competition of better placed sugar-growing countries aggravated these difficulties; and in the early years of this century Venezuela was noted for a high-cost agriculture, ringed with a tariff wall behind which the landowners sought to protect their inefficient methods. Little

was done to improve matters during the long rule of the dictator Gómez (1908-1935), who, indeed, concentrated on securing all the best land for himself and his friends, and thus effectively discouraged efficiency. Gómez's ambitions were equally damaging to the *llanos*, for he acquired a virtual monopoly of the cattle trade by imposing crushing taxes on all movement of beasts from one Venezuelan state into another—the taxes paid on his own herds, of course, returning to his private purse via the exchequer. Farming developments since Gómez's death can be illustrated by the following table:

(Metric Tons)	Food Production 1937	1951
Maize	361,340	310,341
Potatoes	10,613	29,396
Black beans	30,182	32,018
Rice	8,000	38,647
Peas	7,428	8,000
Sugar*	21,000	45,265
Fish	14,400	43,451
Meat	60,860	85,598
Butter	830	1,069
	Export Crops	
Coffee	74,555	33,983
Cacao	24,098	14,090

* Not including papelon, a kind of solidified molasses, which is still produced on a much larger scale than sugar.

These figures show a considerable drop in production of maize, traditionally the staple food of the poorer Venezuelan; but they also show increases, some of them very striking, in the production of all other foods for home consumption, which greatly outweigh the decline of maize. Indeed, it has been officially estimated that total farm production for internal consumption has risen by over twenty per cent above the 1937 level. In the light of these facts, the picture of a prosperous farm economy ruined by imported food is replaced by one which shows that the great increase in imports in recent years has been partly due to the rapid rise of the population, and partly to a natural demand for a better diet; while the ability of local production to expand further has been limited less by foreign competition than by the physical shortcomings of the terrain.



From Coffee to Oil

This does not apply to the two export crops, whose decline has undoubtedly been hastened by the high cost levels created by Venezuela's prosperity and the strength of the bolívar. Yet the country has, in effect, freed itself from dependence on two export commodities, production of which was laborious, uncertain and uneconomic, and whose market value was perennially subject to wild fluctuation, and found in exchange a product that absorbs little of the national energies and brings in not only a far richer, but also a more stable, return.

It is, however, often asserted that oil has sucked labour away from the land and thereby injured agriculture. But according to the Ministry of Mines and Hydrocarbons, the petroleum industry was employing only 44,540 persons in 1951. In 1948, the industry's peak year, the figure was 58,418; but even this amounted only to 3.1 per cent of the country's working population. The real effect of oil on the labour situation has been the creation of many more jobs in industry, commerce, transport and public services; the numbers employed under these headings have risen from about 500,000 before the war to well over a million. But this has been achieved by natural increase rather than by robbing the land of labour; indeed, the number of persons actively engaged in agriculture, which before the war was about 630,000, has since shown a slight increase.

It has been suggested that Venezuela could virtually feed itself within less than a decade. Yet in view of the facts already cited it is clear that this can be no easy task. Modern methods are being introduced as fast as the conservative

nature of the farmer will allow; active research is going on to find better types of crop and to wipe out the various pests which prey on agriculture and livestock; state-sponsored farm settlements are springing up. But even more than this is needed. Although the problem varies from one area to another, nearly every potential increase in production calls for a very heavy investment. Dry areas need irrigation, wet areas drainage, while much of the most hopeful land, such as that in the states of Portuguesa and Barinas, has first to be cleared of trees and scrub. Neither the farming community itself nor the private investor can finance such huge works. Only the state can pay such a bill, and although it has already made a promising start it will have to maintain its efforts for some years, and greatly increase them if it is to tackle such vast problems as the disastrous floods which plague the lower *llanos*.

Moreover, one of the major paradoxes in this country of paradoxes is that its access to the outside world is much easier than its internal communications. Here again geography has played cruel tricks. The great plains and the Orinoco river, which offer relative ease of movement, are far to the south, remote from the centres of population. To the north, access to the sea is obstructed by the steep coastal ranges; to the west, the state of Zulia can only be reached by crossing other ranges. In the Andean states, the few roads soar and plunge over dizzy passes; and the tortuous nature of the mountains which surround Valencia and Caracas can be judged from the 86 tunnels and 217 bridges on the 112-mile narrow-gauge railway between those cities. The capital itself is a defiance of all normal geographical principles; for the narrow valley which it now fills to the brim is neither a natural junction nor the centre of an agricultural area which might support its population. To drive from Caracas to Ciudad Bolívar, far to the east, one must first head westward for fifty miles through a series of defiles; and the capital's daily food is either hauled through those defiles from the Valencia valley, flown in from the Orinoco, or shipped from New York.

Roads to Market

Thus, until the present programme of road building got under way, the Venezuelan farmer had little incentive to increase his output, for how should he bring it to market? Today the roads are opening his way to the city consumer. By 1953 the main highways are to be fully paved from San Cristóbal in the south-west, through Valencia and Maracay, to the Orinoco opposite Ciudad Bolívar. But many more roads are planned, despite the heavy costs inevitable in a land where almost every mile must be carved out of a mountain side swept by heavy rain, or embanked high above a plain that floods every summer. And, since the problem of high costs cannot be finally solved while the country remains entirely dependent on road transport, coastal shipping is being expanded and an ambitious plan has been worked out for the expansion of the few obsolescent railways—now acquired by the state—into a modern system spanning the country from east to west.

Access to the internal market is just as important to industry as to agriculture, and much of the progress recently made by Venezuelan industries can be traced to improved communications. As in the case of agriculture, the Gómez period was one of scant progress in industry, which was held back even more than other activities by the dictator's disapproval of any kind of education, technical or otherwise, that might make his subjects more difficult to handle. After Gómez's death a gradual advance began; in 1941 there were 206,700 persons engaged in industry, against 176,000 in 1936. The reduction of imports owing to the war, and the pressure of an internal purchasing power sustained by high petroleum exports, galvanised industrial production; but the war years also revealed the limitations of the economy, for despite the collapse of external competition and the eagerness of the market only a few products showed a marked increase. The postwar years have seen a further marked increase in total industrial production, due in part to generous credits and investments by government agencies; and it is interesting to note that while textiles, for example, have declined in spite of such aid and in spite of heavy protection by tariffs and quotas, products such as cement, tyres, and electricity, which are more closely linked to the general development of the country, have forged ahead.

	1938	1945	1951
Cement (metric tons)	39,863	115,784	621,491
Inner tubes	0	25,014	116,998
Tyres	0	33,508	126,173
Electricity ('000 kWh.)	106,531	212,087	617,727
Cigarettes (millions)	1,513	2,109	2,043
Soft drinks ('000 litres)	0	22,058	146,868
Beer ('000 litres)	14,139	40,104	107,396
Biscuits (metric tons)	665	2,480	3,763

Output of cotton cloth shot up from 717,332 metres in 1941 to 11,801,044 in 1946, but in 1951 was only 3,387,478. The rise and fall in output of most other tex-

tiles has been equally marked. Shining exceptions, however, are artificial silk—19,910,437 metres in 1951, against 1,874,496 in 1945; socks and stockings—3,905,000 pairs in 1951 against 1,845,000 in 1945; while rayon-cotton mixtures made their bow in 1951 with an output of 1,727,172 metres It is not difficult to detect a rising standard of living behind these shifts within the textile industry.

A glance at the table overleaf indicates the general nature of Venezuelan industry. On the one hand it is geared to the present intensive activity in construction and transport, and to the consumption demands of a people whose standards of life are rising rapidly but from a very low base; on the other, it is acutely restricted by lack of raw materials, heavy equipment and trained men. The unbalance in its structure emerges clearly from the fact that of the increase of Bs. 96 million (at 1947 prices) in the volume of industrial production between 1945 and 1949, 56.7 million represented beer. Yet even the significance of the boom in beer and soft drinks, now levelling off, will not be missed by anyone who knows how much these banal items, together with refrigeration, have done to ease life in the heat of Venezuela, and to reduce the drinking of *aguardiente*, with its pernicious consequences. Against the background of only a few years ago, every new enterprise, whether it produces paint, matches, plastic combs, upholstered furniture, or margarine, is a visible step forward.

Having passed almost in a flash from the age of the mule to that of the aeroplane, Venezuela now has to fill in the yawning gulf between. In terms of currency, it is already rich. But at bottom this is a difficult country, whose latent potentialities can only be brought out by spadework on a scale which amounts almost to changing nature. This transformation could never have been attempted without the resources provided by oil. Nor, in Venezuelan conditions, would it have come about through the normal processes by which commercial enterprise develops. Quite apart from the fact that most local businessmen have little taste for embarking on long-term projects when they can get so many quick returns—particularly from speculation in real estate—the greater part of what has to be done can offer no dividends. Social development cannot be distinguished from economic, in a country where education and better health were needed so urgently. Communications are of the essence; and if it is protested that spending on roads and public works is too lavish, it must be remembered that this is a people whose numbers look like doubling within a generation, and which must allow itself elbow room. It is true that Venezuela has to guard against falling into the habit of lavish spending; yet for the present it is hard to find an answer to those of its senior officials and economists who frankly acknowledge that money could be saved, but only at the cost of time. Time, indeed, is almost the only scarce commodity in the country; and no one who has experienced the pace of activity in Caracas will accuse Venezuela of merely allowing itself to be carried along on a flood of oil. Venezuela has a long and hard road to travel; but it is on the march.

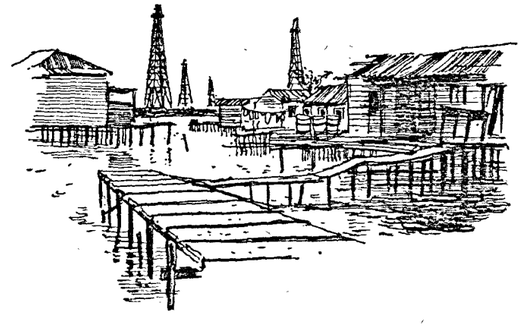
Oil Wells and Iron Mountains

VENEZUELA exports more oil than any country in the world, and as a producer of oil it is second only to the United States. In 1951 the country produced 15 per cent of the world's oil, and its production is still rising vigorously. In May the average daily output was 1,844,407 barrels a day; the 1951 average was 1,704,643, while as recently as 1947 it was only 1,191,478. Yet in spite of this prolific production new reserves are still being found, and estimates of known reserves revised upwards, on a scale greater than that of production; and in 1951 known reserves stood at the record figure of 1,590 million cubic metres, against 1,160 million in 1947. Thus Venezuela today holds some 12 per cent of known world reserves of oil; and, since its deep cretaceous beds are still largely untapped, while the third of its oil-bearing basins, the Barinas region, is scarcely even explored, there is ample evidence that the oil will continue to flow copiously for many years to come.

Given this wealth, the country's main problem in the field of petroleum is to keep the industry on an economic basis. Geographically, Venezuela is superbly sited for access to world markets. Tanker hauls from its ports to Europe are only half as long as hauls to Europe from the Persian Gulf; and hauls to United States east coast ports are actually shorter from Venezuela than from Texas. But the long shadow of the Middle East pipelines lies darkly across Venezuela, for oil carried through these pipes now competes on equal terms with Venezuelan oil in Europe. And Middle East oil is not only flowing with ever greater speed, but is also a cheaper product than Venezuela's. Canada's growing production also presents the alarming prospect of a rival who may soon be even better placed for access to American markets.

Many factors contribute to make the Venezuelan oil industry a high-cost one. Some of them are physical. While the country enjoys the advantage that the average production of each well is far higher than in such areas as Texas, the industry has had to overcome formidable obstacles to reach this richness. The most prolific area, the eastern shore of Lake Maracaibo, has set perhaps the worst problems. To exploit the wells landward of the coast, almost the whole area has had to be drained, and massive sea walls built to hold back the waters of the lake. The 2,500 wells which lie beneath the lake itself, some of them under 150 feet of water, have involved the development of other costly techniques. Caissons up to 200 feet high must be thrust into the lake bottom to form bases for the derricks; the derricks themselves cannot easily be removed for use elsewhere; and fleets of small craft must be maintained to service the weird marine forest of wells.

Oil has a habit of appearing in inhospitable areas, and in Venezuela this rule applies as much as elsewhere. Before the industry arrived, neither the swamps east of Lake Maracaibo, the bush west of Maracaibo city, nor the savannas of Anzoátegui held any considerable population. The companies have had to build their own roads—2,000 km of them—their own towns, schools, hospitals, and shops, to lay on electricity and water, and to take elaborate measures to protect health. And to meet the welfare requirements laid upon them by the government, and provide such other services as conditions necessitate, it has been estimated that the companies must find some $5,000 a year per worker. In addition to his pay packet, each man receives holiday pay, a share in profits, medical benefits and, on the ending of



his employment, a handsome severance grant. His family obtain free education, housing, and the right to use shops where foods and many other commodities are sold at controlled prices; the companies subsidise these supermarkets to the extent of some Bs 25 million a year. In sum, the oilfield workers—93 per cent of them Venezuelan—constitute a small welfare state.

Even more spectacular has been the creation, within the past six years, of new communities in the desolate Paraguaná peninsula. Against a flat Salvador Dali landscape in which only the cactus defies the unceasing wind, two great refineries have sprung up, with their attendant tank farms, pipelines, docks and townships. The bigger, Shell's Cardon refinery, will by 1953 have a throughput of 8½ million tons a year—over 140,000 barrels a day; its neighbour at Amuay Bay, run by the Creole Petroleum Corporation (a subsidiary of Standard Oil of New Jersey), can refine 60,000 barrels a day. The problems which the construction of these huge plants involved can be judged from the fact that their water supply must be piped for sixty miles from hills south of Coro on the mainland, at a cost of $10 million. Together with other new refineries at Puerto La Cruz, near Barcelona, these developments have nearly trebled Venezuelan refining capacity since 1945. By the end of 1953 it will amount to some 340,000 barrels a day, which may well prove its limit, in view of the increasing tendency of consuming countries to import crude oil and refine it on their own territory. By this massive expansion, the oil companies have handsomely exceeded the requirement of the 1943 Hydrocarbons Law that they should refine a tenth of their output in Venezuela.

Deepening the Lake Entrance

The companies have also agreed to lend Bs. 80 million towards the cost of deepening the entrance to Lake Maracaibo from 21 to 35 feet. This operation, which began this spring and is expected to take four years, will permit ocean-going vessels to enter the lake, and high hopes have been expressed about its stimulating effect on the whole area. It will not, however, bring much direct benefit to the oil industry, which had already invested heavily both in shallow-draught lake tankers and in pipelines which carry oil from the fields to the new deep-water terminals on the Paraguaná peninsula.

The fact that the industry has been able to make so many contributions to the Venezuelan economy without losing its ability to produce at an economic price is due not only to skilful management but also to the harmonious relationship between successive Venezuelan governments and the companies. The Ministry concerned, that of Mines and Hydrocarbons, has built up over a period of years a cadre of officials with practical experience of oil production and problems; and while the government's first concern has naturally been to turn the productiveness of the industry to the advantage of the whole country, no Venezuelan administration has lost sight of the hard fact that the golden goose is a bird to be squeezed but not decapitated. The result has been a steady flow of investment into the industry both from the United States and, through the Shell group, which accounts for nearly a third of Venezuelan production, from British and Dutch sources. As in other countries, the nature of the industry requires the companies to reinvest all but a fraction of their profits in order to maintain a healthy rate of expansion; and it is this reinvestment, not the mere sale of oil, that has kept Venezuela's external balances strong. The twelve companies and groups concerned have invested over $2,300 million in Venezuelan oil, some $1,600 million of it in the past seven years. Over $330 million is being invested this year.

Yet this rosy picture is not without its thorns. The jolt Venezuela received in 1949-50, when fuel oil prices fell for a time by nearly 25 per cent, was enough to dispel complacency. Although production in 1949 was only 1.3 per cent below the 1948 level, the expansion of the industry was checked for the first time since 1941, and the effects on the national economy were striking. The value of exports fell from Bs. 3,484 million in 1948 to Bs. 3,360 million in 1949, and between 1949 and 1950 treasury reserves fell from Bs. 474 million to Bs. 191 million. The close relationship between petroleum production and the development of Venezuelan industry was signally revealed; the rate of capital formation in the non-governmental sector of the economy, which had been rising sharply ever since 1943, fell by 8 per cent in 1949, and sales registered in Caracas dropped from Bs. 2.9 billion in 1948-49 to Bs. 2.65 billion in 1949-50.

At the heart of these setbacks was the inability of European countries to buy oil with hard currency, and their increasing reliance on the Middle East. In 1948 Europe bought 34 per cent of Venezuela's oil; in 1950, only 22 per cent. Venezuela is virtually resigned to the eventual loss of many of its former markets in Europe, and instead looks hopefully to the expanding demand of the western hemisphere. Recent years have given grounds for such hope.

PETROLEUM EXPORTS TO WESTERN HEMISPHERE (DIRECTLY OR VIA DUTCH WEST INDIES)

('000 of Barrels) *Destination:*	1949	1950	1951	1951 as % of Total 1951 Exports
United States	176,906	222,816	219,451	38·75
Canada	29,553	38,322	52,454	9·26
South America	52,907	59,045	70,060	12·37
Central America	8,052	7,419	8,373	1·48
	267,418	**327,602**	**350,338**	**61·86**

It remains to be seen, however, whether these western markets will develop quickly enough to solve Venezuela's problems. One of these problems is that, in 1951, payment for 97.7 per cent of the oil exported was made in dollars, although only 55 per cent of the oil went to the dollar area. How much longer can and will the non-dollar countries find hard currency with which to buy? This question cannot be avoided even if buyers for virtually all the country's output are found in the western hemisphere, for the South American countries which have recently stepped up their purchases so encouragingly are not dollar areas. The major oil companies are going to great pains to keep down the dollar element in their costs, but there are obvious limits to this in view of the large payments which must be made to the government in bolivares, the policy of buying Venezuelan supplies wherever possible, and the necessity for even non-American companies to buy much of their specialised equipment from manufacturers in the United States. The latter country must remain Venezuela's crucial market; and Venezuela's awareness of this is shown by its present vigorous efforts to secure new tariff concessions for its exports to the United States.

At the time of Venezuela's liberation the city of Angostura, three hundred miles up the Orinoco river, was an important centre. Here

Simón Bolívar convened the historic Congress of 1819; from here he set out on the amazing expedition that led him across the Andes to victory. Renamed Ciudad Bolívar in honour of the Liberator, the city nevertheless declined in importance with the passing of the years. But today it has become an outstanding boom town even in booming Venezuela. For in this region lie the great deposits of iron ore which will soon provide Venezuela with an export commodity second only to oil.

The existence of iron ore south of the Orinoco and on both sides of the Caroní river has been known since Spanish times. But the problem of inaccessibility defeated several attempts to exploit it in the nineteenth century, and a Canadian company which actually produced about 100,000 tons in 1912 gave up a year later. Several American companies explored the region between the wars, but it was not until 1941 that the Bethlehem Steel Company took the plunge and launched a development programme estimated to cost $65 million. To bring out ore from its main holding at El Pao, east of the Caroní, the company had to build a 34-mile railway through thick jungle from a point on the Orinoco near San Félix, and a new port on the Paria peninsula, where the ore is transferred from the barges which bring it through the Orinoco delta into ships. Ten years passed before the first shipload from El Pao came out in March, 1951, but by the end of that year 715,000 tons had been shipped and a further 750,000 tons mined. Output is now expected to rise rapidly to something like 2,700,000 tons a year. El Pao is estimated to hold 70 million tons of mineral, the ore containing from 58 to 68 per cent of iron, and neighbouring deposits can be expected to supplement this now that the primary job of opening up the area has been done.

A Rich Crust of Ore

An even more ambitious operation is being carried out west of the Caroní, where, in 1947, the United States Steel Corporation found the hill now known as Cerro Bolívar. Some 500 million tons of ore have since been proved in, or rather on, this steep, hog-backed ridge, which is thickly crusted with rich ore, averaging 63 per cent iron and virtually free of sulphur. In places the ore lies 400 feet deep. Neighbouring ridges, which have not yet received the same minute attention, are expected to yield iron on a similar scale.

Despite this amazing richness, which rivals that of the greatest of the Lake Superior pits, Cerro Bolívar presents an even more formidable transport problem than El Pao. For some time US Steel considered building a 274-mile railway northwards to Barcelona, with a four-mile bridge across the Orinoco. Finally, and at the wish of the Venezuelan Government, it decided last autumn to build a 91-mile railway to the junction of the Orinoco and the Caroní, and thence to dredge a channel 34 feet deep down the Orinoco and out to sea through the Macareo, the branch of the delta that offers the best possibilities, although the deepening of its tortuous 100-mile course is expected to cost at least $18 million. Altogether the corporation looks like spending some Bs. 400 million in Venezuela during its construction phase, and the ore will not get under way until 1954. But both the dredging and the laying out of the railway are already under way, and once the river is open to ocean-going ships it is hoped that Cerro Bolívar will yield some 15 million tons a year.

The significance of Venezuela's "iron mountains" for the United States, where in recent years there has been real anxiety about the rapid depletion of the Lake Superior reserves, is obvious enough. In spite of the heavy costs involved, it is expected that by using the largest oreships ore from Cerro Bolívar can be brought to the US Gulf and east coasts at a price fully competitive with that of domestic or Labrador ore.

The significance of the ore for Venezuela itself is equally clear. Unless the opening up of Bolívar state in the wake of the present development leads to the finding of even vaster mineral deposits, iron is never likely to mean as much to Venezuela as oil. But it will mean a great deal to the south-eastern part of the country. Already there has been much discussion about creating a steel industry near the Orinoco-Caroní junction, with the aid of hydro-electric power from the nearby Caroní falls. The Minister for Mines has spoken of the possible erection of a plant able to produce, initially, 70,000 tons of steel a year. The main obstacle to this plan is the country's lack of coking coal; but for some time investigation has been proceeding into the prospects of using natural gas, piped from the oilfields of Anzoátegui, to reduce the ore on the model of a similar technique used in Sweden. Since Venezuela can, in any case, afford to import enough coal to support a modest steel output, there are obvious possibilities here. Meanwhile plans have also been drawn up for the erection near the Caroní junction of a smelter to produce aluminium from bauxite brought from British or Dutch Guiana. This, however, must wait upon the execution of the project to obtain electricity from the Caroní falls. But whether the area of the lower Orinoco eventually becomes the centre of Venezuela's industry or not, there is no doubt as to the rapid development which it is now destined to undergo. For the first time in over a hundred years Venezuela's great river is about to assume a role consistent with its size and its ancient reputation.

A Quality Market

AMONG Britain's dollar account markets, Venezuela yields place only to the United States and Canada. Over the past three years it has bought from this country three times as many goods as Mexico, Colombia or Cuba, its nearest rivals. Yet in those same years the proportion of Venezuelan imports drawn from Britain has fallen from 7.9 per cent to 6.6 per cent. This decline is the more disturbing because there is much to indicate that its chief cause has been neither lack of goods nor lack of buyers, but a failure on the part of many British exporters to realise the possibilities of the Venezuelan market.

Thanks to its huge oil exports and the very high exchange value of its currency, Venezuela is in the happy position of being able to buy both capital and consumer goods on a lavish scale. In 1951 its imports amounted to the equivalent of 30 per cent of its whole national income. The United States is easily its largest supplier; but American goods, which in 1949 had accounted for 73.6 per cent of Venezuela's imports, in 1951 declined to 67.4 per cent, and Venezuelans as a whole are extremely anxious to become less dependent on one single source of supply. Traditionally, this is a high-tariff country; but the fact that the Venezuelan bolivar commands a rate of exchange three or four times greater than its internal buying power has made possible a large volume of imports even of those items which are subject to heavy duty, and in the case of industrial equipment and similar supplies many import duties have been waived in the interests of the country's development. Venezuela has protected certain of its industries, including most textiles, shoes, tyres, and certain foods, by quota restrictions in addition to tariffs; but in 1951, at the beginning of which year the restrictions were further tightened, 21,700 tons of textiles were still imported.

Moreover, Venezuela welcomes many imports which find few sales in the two greater dollar markets. The larger items among its imports from Britain last year included chemicals, paints, sheet glass, wrapping papers, tyres, lubricants, cement, sports equipment, sanitary equipment, agricultural implements, pumps, motor vehicles, radios, aeroplanes, and a wide variety of textiles, machinery and construction material. British firms have found buyers in Venezuela for barbed wire, disinfectants, tiles, builders' hoists, jewellery, bicycles, metal furniture, pottery, galvanised waterpipe, boilers and refractory bricks. It is, perhaps, superfluous to add that Scotch whisky is the country's most fashionable drink; but it is of some interest that much of the intake of this liquor consists of re-exports from the United States.

The attractiveness of the Venezuelan market is clear enough. Its difficulties are equally clear, but far from insurmountable. The dominance of the United States, cemented during the war, has naturally made Venezuelans familiar with American machinery, equipment, and nomenclature. Many Venezuelans have acquired their technical and commercial training in the United States. The American firms which are rapidly setting up local subsidiaries, or entering into partnerships with Venezuelan businessmen, further encourage the use of American supplies. And a businessman from New York or Chicago can reach Caracas overnight if he wants to clinch a deal—although even an American finds a prolonged stay in Venezuela heavy on the purse.

With its highly desirable currency, freely convertible into dollars at a strong rate, Venezuela has naturally been courted by many other exporting nations. After the United States and Britain its principal sources of supply in 1951 were Germany, Canada, France, Italy, Holland and Belgium, in that order. Canada's prominence was largely due to foodstuffs, including 58,000 tons of flour, but minerals, machinery, motor vehicles, tyres, newsprint and other paper accounted for considerable amounts. Iron and steel for construction provided the biggest French item, with cognac and wines which Venezuela imports on a larger scale than whisky—ranking second. Italy sent aluminium and other metals, rayons and rayon mixtures, and a variety of specialised foodstuffs. Cheeses, hams, condensed milk and other foods appeared high in the list of Dutch imports, followed by radios and miscellaneous machinery. Belgium contributed iron and steel construction material, wire, armaments, and a small quantity of coke.

The strongest competition, however, is now coming from Germany, which in 1951 secured 4.2 per cent of Venezuela's import trade, against 1.3 per cent in 1949 and 0.2 per cent in 1948. In volume, indeed, imports from Germany surpassed those from Britain last year, with 200,000 tons against 125,000; but they included 115,000 tons of cement. Other major items from Germany were structural steel, reinforcing bars, wire, railway equipment, motor-cars, motors of various types, scientific instruments, electrical plant and accessories, sheet glass, hand tools, pharmaceutical and chemical products, aluminium, sports equipment and miscellaneous machinery. Large numbers of travelling agents for German firms are now active in Venezuela; German, and joint German-Venezuelan, concerns have opened impressive new premises in Caracas; and newly built German motorships are discharging cargo at La Guaira almost weekly.

It must be admitted that German exporters have some strong cards to play. For generations Germans have settled in Venezuela, and although their numbers are not great their technical and commercial skill has made an important contribution to the economy. Many of them are related to senior technicians and managers in local contracting firms and official institutions, and it is only natural that one of the latter, hard pressed for the quick answer to some supply problem that is holding up an urgent job, should turn to his brother-in-law or cousin for advice. A Hamburg exporter can thus be sure of finding a local agent with lifelong experience of the country and excellent contacts. Moreover, German wares are thoroughly familiar to Venezuelans. Before the war Germany supplied more of the country's needs than any other country except the United States. In 1937 it had 14 per cent of the import trade to Britain's 9 per cent. Its reputation remained high throughout the wartime interlude, and although in some cases Venezuelan importers have been disappointed by the poor quality of the first hasty postwar consignments from Germany, German firms have recovered many of their traditional markets and are busy invading new ones.

Yet, even when all these advantages are enumerated, the main reason for the German exporters' rapid recovery has been their vigour and their attention to the needs of the market. With certain laudable exceptions, British exporters have failed to appreciate the scope and nature of the Venezuelan market. Several of their agents in Caracas, both British and Venezuelan, have come near to despair owing to the unresponsive attitude of London offices. The agents, if not the Venezuelan purchasers, fully appreciate that shortages and prior commitments have made it impossible to meet many of the demands for immediate delivery which are common in a country of such rapid development. But they find it hard to understand why some British firms confine their dollar-earning efforts to battering vainly on North American doors when Venezuela offers them an open portal; why some miss golden opportunities owing to apparent inability to learn that Caracas businessmen are in just as much of a hurry as those of New York; why others, not content with presenting their catalogues in English, complete with yards, avoirdupois and similar mysteries—proceed to demand payment for them.

The British exporter, of course, also has his grievances. One complaint is that British shipping services to Venezuela are, in comparison with continental, and especially German, lines, infrequent, slow, and, above all, irregular. Equally serious is the fact that air mail between London and Caracas has been known to take ten days or more in transit, while catalogues and documents sent by surface mail may not arrive for two months. London cannot expect such close contact with Caracas as New York enjoys; but it may well be asked why, if a Venezuelan importer makes simultaneous air mail inquiries in London, Hamburg and Amsterdam, he should have to wait a week longer for the reply from London. Venezuela is in a hurry, and one such experience is often enough to end all desire to investigate British sources.

Venezuela today is a quality market in the truest sense. The Venezuelan importer can buy wherever he will; he is keenly interested in competitive prices, but he can afford to buy the highest quality, and he has little use for the shoddy. It is doubtful, in this context, whether Japan's present determined efforts to bring in a wide range of cheap goods will get very far; the biggest Japanese item yet imported is sports equipment. Venezuela, as a country engaged in a brisk and violent battle to subdue its vast natural difficulties, needs above all sturdy, reliable equipment suited to extremes of climate, backed up by adequate stocks of spares and first-class technical service. In the past it has been precisely by meeting such needs that the British reputation for quality has been built up. Is it now, at this formative stage in the life of a fast growing nation, to be maintained or lost?

How to increase your exports to Latin America...

...yet keep your advertising costs down!

Visión Latin America's largest and most influential news magazine, enables you to reach the men with the means to buy your products in Latin America.

In this one publication, you can reach government officials, business executives, land owners and professional men in every Latin American market from Mexico to Tierra del Fuego. Your advertisement will carry greater force because it appears in the magazine with the greatest prestige throughout Latin America.

Printed in Spanish, and edited to the tastes and interests of Latin Americans, ***VISIÓN*** plays a highly effective role as an advertising medium. Nearly 100 distinguished export firms are using ***VISIÓN*** as one of their principal advertising media in Latin America.

Advertisements may be paid for in Sterling.

Additional facts on the advantages of ***VISIÓN*** as an advertising medium are available on request.

For sample copy of *VISIÓN*, Latin America's most important magazine, write today to:

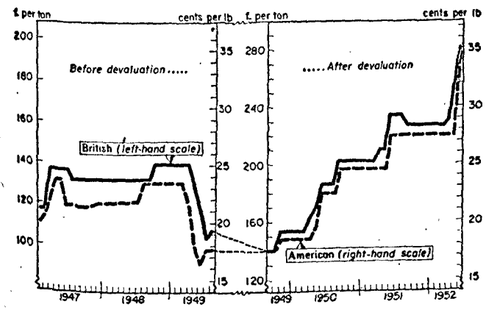
Frank V. Norall,
European Manager,
42 Lennox Gardens, London, S.W.1
Kensington 0546

Special note

***VISÃO**, a Brazilian equivalent, printed entirely in Portuguese, is available beginning July 22, 1952. Especially attractive advertising rates are available to firms wishing to advertise in both **VISIÓN** and **VISÃO**.*

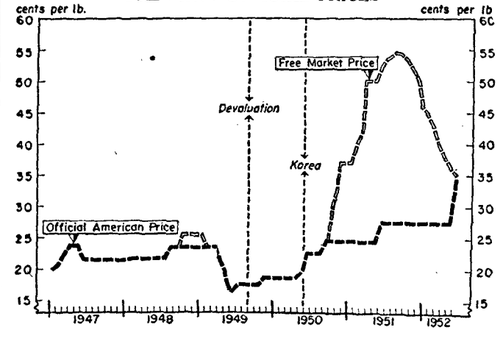
THE BUSINESS WORLD

Copper's New Peak



A BUSINESS NOTE in last week's issue of *The Economist* recorded the decision of the Ministry of Materials to raise its selling price for copper from £231 to £281 a ton. The Ministry has since provided a fuller explanation of this decision and of the part that Rhodesian and Canadian suppliers have played in keeping the rise in the price to no more than £50. This increase of between 20 and 25 per cent obviously required an explanation, for it puts the price of copper at one jump to the highest peak ever recorded. A market would behave more gently than a Ministry, but since there is no market, consumers have to put up with the departmental fell swoop. The fact is that the world has now so far perfected its economic arrangements that there is no single satisfactory world price of copper. Instead there is a range of official prices: the American domestic price; the American export price; the American import price—and all the various averages that can be worked out from them. The unfortunate Ministry of Materials has lost the central buttress of its pricing policy—an unchallengeable American price.

To dispel some of the confusion about copper, the first task is to restate in simple terms what has happened in the past six weeks. The Ministry of Materials buys copper from Rhodesian producers at a current price for delivery three months ahead; it buys from Chile or other foreign suppliers at the price ruling at the time of delivery. The price accepted by the Ministry and the various producers was the quotation published by the American *Engineering and Mining Journal*, with appropriate adjustments for grade. This arrangement worked quite well until May 8th, when Chile ended the agreement with the United States, under which it undertook to sell 80 per cent of its output at the official American export price and then sold the rest for what it could fetch in the "free" market. When the International Materials Conference introduced an allocation scheme for copper last autumn, it took cognisance of this agreement. But the effect of the allocation scheme has been to weaken the price of free copper, which fell from a peak of 55 cents a lb (£440 a ton) last autumn to about 40 cents a lb (£320 a ton) in the opening months of this year. Thus Chile soon found that its revenues from copper exports and from the tax it imposes on them was much smaller than was expected; it therefore pressed the United States Government to raise the ceiling price for copper. The American Government refused, and when the agreement expired last May Chile did not renew it and suspended shipments of copper.



*

Copper is a scarce metal and a grave shortage for American industry was averted only by the release of 77,000 tons from strategic reserves. The American Government was then faced with a choice: either to hold out against Chile's demand and so precipitate a copper famine; or to seek some new agreement. It chose the second course and amended the maximum prices for copper manufactures so that American users could pay "free" market prices for imported copper. On June 3rd the quotation for imported copper in the United States ranged between 32 and 36½ cents a lb. (£256-£292 a ton)—a range that speaks volumes for the limitations of the "free" market and for the confusion then prevailing in it. Unmoved by this spectacle, the Ministry of Materials maintained its selling price at £231 a ton (equivalent to £220 a ton in New York) in the hope—vain as it turned out—of preventing, or at least limiting, the rise in the world price of copper. A fortnight later the Ministry had to capitulate and raised its price. In the meantime, it had been paying for its supplies on the basis of the *Engineering and Mining Journal's* daily quotation which took into account these freak prices for imported copper. British manufacturers, realising that the price of copper was bound to rise, helped themselves at the old price to as much copper as they were allowed under the existing licensing scheme.

BRITISH AND AMERICAN COPPER PRICES

FREE AND OFFICIAL PRICES

At that, the Ministry, to limit its loss, stopped all forward sales beyond the end of June. It might have shown greater wisdom by raising its forward selling price, but apparently the Ministry was still convinced that the rise in the American market was merely temporary. When the Ministry realised that the rise in price had come to stay, at least for a time, it hurriedly conferred with the Rhodesian producers and prevailed upon them to accept 33 cents a lb (£264 a ton) for supplies contracted for up to the end of June, and the *EMJ* quotation was formally thrown overboard. On June 16th the Ministry's selling price was raised by £50 to £281 a ton—the sharpest increase and the highest price ever recorded. The present price is made up of £264 purchase price, £11 freight, storage and delivery to consumer works and £5 a ton to recover the losses that the Ministry made on its sales during the fortnight when it was making its vain

WORLD SMELTER PRODUCTION OF COPPER

* Excluding USSR.

bid for stable prices. British manufacturers are paying no more for their copper than their competitors pay and until recently they have been paying a good deal less. The Ministry of Materials, throwing aside previous declarations of price policy, intends to recoup its recent losses on sales made at an artificially cheap price—the losses were heavy and the £5 a ton charge is likely to outlast this year. Consumers and the official middleman come to no great harm because the Rhodesian copper industry is prepared to take less than it might get in what passes for a "free" or "world" market.

*

This explanation—painstaking, perhaps, rather than lucid—of what has been happening recently to copper poses two questions. First, is there a true price for copper and how will it move in the next three or four months? Secondly, at what price are the Rhodesian producers and the Ministry of Materials likely to agree for supplies after this month? The charts show how vigorously copper has been rising in the past three years. In a truly free market, copper would probably have risen much more sharply during the twelve months following the invasion of Korea than did the official American price, though perhaps not so feverishly as the so-called "free" market price. Consumption of copper has been high and increasing ever since the end of the war. World output of smelter copper was relatively stable between 1947 and 1949 at around 2,050,000 tons or 22½ per cent above its prewar level. In 1950 output rose by 10 per cent to 2,250,000 tons and in 1951 by a further 5 per cent to 2,370,000 tons. Output this year will probably show little change, and consumer requirements will by no means be fully met. Civilian use of copper is restricted in all the principal consuming countries and defence programmes are likely to take an increasing share of supplies as rearmament reaches its peak.

These factors suggest the continuation of a firm, and conceivably a strong, copper market in coming months. No doubt the immediate demand for copper may depend to a considerable extent on the supply of other metals; a shortage of steel could reduce the demand for copper, much as the American steel strike has already reduced the demand for zinc and caused a sharp fall in its price. Again, since copper is now much dearer than lead, plumbers and builders may begin to revert to their prewar practice of using more lead than copper. But lead itself has already begun to rise again, and the extent of substitution may not be wide. Perhaps the best guess of the "true" price for copper is that 33 cents a lb. is on the low side for spot. Unless the American economy behaves in a distinctly odd way in the second half of the year the likelihood of copper below 33 cents is certainly small.

To answer the second question involves foreknowledge of the actions of the Ministry of Materials. For how long will it seek to recoup past losses? What agreement can it reach with the Rhodesian producers for July and August? Will the flat rate of 33 cents a lb be retained, or will the parties decide to go back to the *Engineering and Mining Journal* quotation?—in which case a modest rise of about £8 a ton might follow. Since wages in the copper belt are geared to the difference between the price obtained for copper and current production costs, it may not necessarily follow that producers will be anxious to exact the highest possible price. Perhaps the best guess—and it is a guess—is that both the Ministry and producers may prefer to continue the present method of an agreed flat-rate price. Whatever arrangement may be made, the results will not be reflected in the Rhodesian producers' accounts until three months have passed. These accounts, indeed, have still to reflect the higher price that obtained earlier this month before the Ministry obtained the agreement for 33 cents a lb. Those observers who had convinced themselves that the commodity boom was finished might weigh these pointers. They may also reflect that Rhodesian production of copper has expanded continuously from just over 180,000 tons in 1946 to nearly 310,000 tons last year. Output of refined copper in Rhodesia has almost doubled, from 54,000 tons in 1946 to 103,000 tons last year, and in twelve months' time it should double again. Expansion is still hampered by lack of coal and transport, though on both counts improvement can be discerned. If it is not at this stage necessary to take a bearish view about copper, it is equally reasonable to hold that the Rhodesian producers have fair prospects.

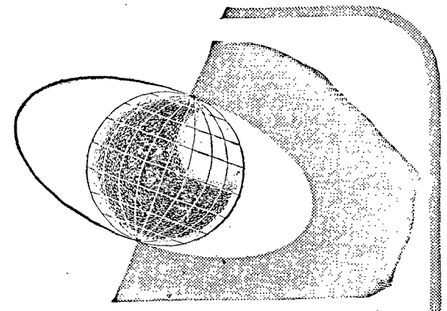
Sell to CANADA!

There is still room on the Canadian market for millions of dollars' worth of the right British goods. Canada's first and oldest Bank will be glad to offer valuable information and advice on trading conditions and opportunities.

Enquiries welcomed.

BANK OF MONTREAL



47 Threadneedle Street, London, E.C.2

Head Office MONTREAL

Over 570 Branches throughout Canada

Assets Exceed $2,000,000,000

(Incorporated in Canada in 1817 with Limited Liability)

Plans for **DEVELOPMENT**

Business men who have plans for development in overseas and colonial territories which call for medium or long term finance should write for our new booklet. It explains what the Corporation can do for you and gives details of the countries in which we operate. Please write to the Manager at the address given below.

BARCLAYS OVERSEAS DEVELOPMENT CORPORATION LIMITED

54, Lombard Street, London, E.C.3

Vested Interest

A short time ago we had a phone call from a manufacturer of woollen goods. He was concerned about the heavy increases in customs duties recently imposed in Venezuela on textiles. Was this likely to kill his export trade to that country?

We told him that, although the general opinion appeared to be that this increase had virtually closed the market, we were referring the matter to our Caracas Branch.

Within a few days we were able to quote him a report from this branch stating that there was still a market in Venezuela for high quality textiles of British manufacture, and that the demand was likely to continue.

Thus, thanks to our on-the-spot representation, we were able to obtain first hand, independent comment and clarify for the exporter, in a matter of days, a situation that might otherwise have remained obscure for weeks.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

Business Notes

Markets Rallying?

The malaise in stock markets persisted almost without intermission until Wednesday last. Even the effort of sterling to hoist itself above "support point" proved unable to lighten the gloom that had so noticeably deepened in Throgmorton Street in the previous week. On Friday, it is true, sterling had again dropped momentarily to its floor of $2.78, but it closed 3/16 above it and has since laboriously climbed to $2.78⅜—with the forward discounts, however, noticeably wider. The three months dollar was quoted on Wednesday at 2¼c. premium, compared with 1⅝c. premium a week previously. Meanwhile, prices of both gilt-edged and industrial stocks continued to sag. Though the fall was in general less marked than in the previous week (when the declines in gilt-edged ranged up to 1⅝), two of the nationalisation stocks lost a full point on Monday and Tuesday, while the net price of 3½ per cent War Loan reached a new nadir at 72¾, showing a loss of nearly 6 points, or 7½ per cent, since budget day. At the same time the ordinary share index of the *Financial Times* dropped a little further, to 103.1, a new low point since 1949. At these points, for no clearly detectable reason, some of the bears deemed it wise to take their profits, and on Wednesday there was a moderate rally throughout the markets, with the notable exception of foreign bonds. This firmer tendency persisted on Thursday; for all that, it is premature to seek rational explanations for a movement that was certainly "technical" and may yet prove to be shortlived. One popular suggestion in the markets themselves is that operators in industrials were impressed by the improvement in some commodity prices and by the recent contentions from business circles that the recession in retail and wholesale trade has touched bottom; but it is too soon to be sure that such arguments flow from any more convincing reason than the desire of certain trades to persuade the public that "now is the time to buy." They may be right; but much depends on the credit squeeze—on the need to continue it, and the Government's willingness to do so.

That, of course, is even more directly applicable to the problem of the future of gilt-edged. Although present prices should look attractive to buyers for the long pull, there is little reason to look for any notable change in the market unless it can reasonably be assumed that the requisite degree of toughness in bank lending policies can be sustained without any new initiatives in monetary policy. And, even if that were evident, it would still be hard to see how the authorities can avoid a funding operation in the fairly near future. This week's modest rally in the market was probably induced by the better tone elsewhere; but it may have owed something to the approach of the half-year-end—there were suggestions on Wednesday of a little tentative special buying of stocks known to be in short supply. The banks, at all events, will be grateful for even small mercies: their half-yearly balance sheets are known to have been causing them some severe headaches, and some of them, at least, are expected this time to modify their traditional practice in stating the valuation of their investments. The weakness of gilt-edged in these six months, coming after the steep declines of 1951 and earlier postwar years, has certainly put a very heavy strain upon the banks' inner reserves.

Conditional Agreement on "Standstill"

Except at one point, the German debt discussions have encountered heavy weather during the past week. The exception was the talks on the problem of the standstill debts, on which an effective understanding has been reached; but this understanding is subject to a general settlement, and the general negotiations have suffered a severe setback as a result of continuing differences between the American and other bondholders' representatives about the treatment of gold and dollar clauses in any settlement of bonded debts. The essence of the new standstill pact is the principle of "recommercialisation." This means that the standstill credits will cease to appear as frozen commitments but will be used to finance German foreign trade. Over a considerable period, this may lead to a net reduction in the outstanding amount of these credits, but for the time being there is no such prospect. If the re-utilisation and conversion of these standstill debts into revolving credits is accompanied by the repayment of any part of them, that repayment will arise merely because more credit will have been put into the pool through some other channel. All arrears of interest are to be calculated at 4 per cent per annum non-cumulative and can either be added to the principal amount owing or held for later payment. On the amount outstanding current interest rates and acceptance commission will become payable in the currencies in which the debts are expressed. There is to be no revival of the facilities for repayment in domestic German currency such as those provided in the 1930s for repayment in registered marks. It is intended, however, to continue the existing regulations under which debtors who wish to do so may voluntarily repay in Deutsche marks provided that they give 60 days' notice to all their other creditors.

The embroglio on the gold and dollar clauses has become more serious during the past week and is now threatening the progress of the whole negotiations. The United States Foreign Bondholders Protective Council has taken strong objection to the invocation of the dollar clause in a number of German bonds issued in terms of sterling, French francs and guilders. Under the German proposals the nominal amount of debt owing on all these bonds would have been reduced by about 50 per cent, but as a result of the invocation of the dollar clause the claims expressed in sterling, French francs and other non-dollar currencies would then have been substantially written up in terms of those currencies. Such compensation to creditors whose original claims were expressed in European currencies is apparently regarded by the American bondholders as a case of intolerable discrimination. They have therefore withdrawn their three representatives from the discussions. The United States Government representative on the Tripartite Commission, Mr W. L. Pierson, has expressed regret at this withdrawal, which suggests that this strange interpretation of the principle of nondiscrimination by the American bondholders' representatives is not necessarily shared by the American Administration. It has in the past been difficult enough to understand American resentment at gold clauses merely on the ground that they are no longer valid under United States law. It is even more difficult to understand why the United States should object to non-American bondholders receiving the protection of a dollar clause that American bondholders enjoy automatically by reason of the fact that their bonds are expressed in terms of United States currency.

Brighter Hopes in Coal

Six months of slightly increasing output, and rapidly increasing manpower, seem to have transformed the hopes of the Coal Board's planners—to judge by their views about future coal production. At the end of last year, when OEEC asked how much coal Britain expected to be producing in 1956, the Coal Board regretted that it could not guess,

complaining dolefully that output depended upon "questions of policy which have not yet been considered, still less decided, by the Government." It thought that it might hope for 223½ million tons this year; but when OEEC put forward an independent estimate of perhaps 234 million tons for British coal output in 1956, based upon an examination of current trends, the Coal Board commented that this might turn out to be ten million tons too high—suggesting a 1956 figure of perhaps 224 million tons, which would accord with its own long-term development plan.

All this now is changed. A ministerial group set up by OEEC, upon which the British representative is Lord Leathers, has now issued a report on short-term coal plans in Western Europe. Most of the countries have revised their estimates—few more so than Britain. This year, Lord Leathers told the group, production could reasonably be expected to reach nearly 226 million tons; and next year, unless the miners take the second week's holiday they have been promised, it might reach 236 million tons. These forecasts are based upon the assumptions that during this year and next productivity might rise by 3 per cent, giving about 6 million tons more coal, and the industry's labour force might rise by 25,000, giving about 8 million tons. Even if

ESTIMATES OF COAL PRODUCTION TRENDS IN EUROPE
(Million long tons)

Country	1937	1946	1950	1951	Est. 1952	Est. 1953
Britain ..	240·3	190·0	216·3	222·9	225·8	236·2
W. Germany...	134·8	54·1	109·0	117·1	124·0	129·9
France.....	44·4	48·0	51·2	53·5	56·5	57·3

the men can be found, it will not be easy to find about 10,000 of them room to work usefully at the coal face without interfering with current output. The assumption about productivity is perhaps more solidly based; though the present flow of newcomers into the industry may tend to depress productivity later this year (as experienced miners are taken from production to develop new coal faces and the less experienced men reach the stage of production) there should be a countervailing increase in output per manshift next year. To hope for 236 million tons by 1953, after considering 234 million tons probably too high for 1956, certainly represents a remarkable access of confidence: it may be surmised that the Government has now "considered and decided" those outstanding "questions of policy."

A slightly more tangible sign of confidence was given last weekend by Mr Lloyd, the Minister of Fuel and Power, when he increased the amount of coal that Britain should export this year by a million tons—to 12½ million tons. This is a more respectable figure, two-thirds more than last year's miserable total. At current prices, it should earn Britain nearly £22 million; and through the premium it charges for coal abroad, the Coal Board may earn perhaps £7 million more than it would by selling the same coal in Britain.

* * *

Reverse in Exports

The Australian import restrictions had a far more serious effect on British exports in May than in April. Indeed, the fall in exports to Australia last month was appreciably greater than the decline in Britain's total exports. Shipments to Australia amounted to only £12.1 million, compared with an average of £34.4 million in the first quarter of this year, when exports were exceptionally large, whereas total exports at £226 million were only £14 million smaller than the first quarter average. It has yet to be seen whether the full force of the restrictions has been felt, but British exports to Australia are now little more than half the monthly average for the base period of 1950-51 on which the Australian import cuts were calculated.

Textile exports again showed the largest reduction—an unhappy distinction they have now earned for several months. The total of £29.5 million was £10 million lower than the average for the first quarter of the year and £18½ million below the total for May, 1951. Shipments to Australia fell sharply, in contrast to April, when they showed little change; the average for the two months was less than a third of the monthly average for the first quarter of this year. Exports of textiles to both Canada and Europe were noticeably smaller than those of a year ago and these falls were only partially offset by slightly larger shipments to India, Pakistan and a few other Commonwealth markets. Exports of cotton goods last month were only £12 million compared with nearly £19 million in May, 1951, while exports of wool manufactures were £9 million against £16 million twelve months earlier. Exports of all other types of textiles were also smaller than in May of last year.

There is also room for uneasiness over the fact that engineering exports are no longer rising. The total for the five months to May is well above that for the same period last year, but the average for April and May was a little below the average for the first quarter of this year. Vehicle exports (the largest single group of exports) totalled over £44 million, but were £3½ million lower than those of May, 1951. More than £11 million worth of cars and chassis were exported during the month, which is lower than the rate of exports during the first quarter, though slightly above the figure for May last year. Increased exports to the United States partially offset the decline in shipments to Australia; the Canadian market also shows signs of revival, for although exports were still below the total for May, 1951, they were larger than during the earlier months of this year. Machinery exports enjoyed the biggest increase compared with a year ago; they amounted to £37½ million, or over £5½ million more than in May, 1951. One or two other smaller groups, such as electrical goods, iron and steel manufactures and oils and fats, also increased, but chemicals exports, which had been rising steadily for several months, were smaller in May than twelve months ago.

* * *

Cheaper Imported Materials

The fall in the value of imports in May—they totalled £320 million compared with £325½ million in April and a monthly average of £328 million in the first quarter—was due partly to a seasonal fall in food imports but mainly to a sharp drop in the price of raw materials. If these figures reflect any response to the Chancellor's double dose of cuts last November and February, it must be very slight. Imports last month were some £17 million less than in May, 1951. Food imports cost nearly £115 million or £5 million less than a year ago owing partly to much smaller imports of butter. Last month's imports of food were also slightly lower than those of April because the seasonal fall in grain and dairy products was only partially offset by increased supplies of fresh fruit and cocoa.

At present the saving on imports is being achieved mainly by smaller purchases of raw materials at lower prices. These imports in May amounted to some £125 million, £9 million less than the April total and £14 million less than that of May, 1951. But for the five months to the end of May, Britain spent £662 million on raw materials compared with £658 million in the same period last year. The recent decline is mainly due to lower prices; indeed the raw materials component of the Board of Trade's index of import prices (1951=100) has fallen from 108 in May, 1951, to 94 last month. Wool is a case in point; although more

raw wool was imported in the five months to May than in the same period in 1951, wool imports cost £71 million less. On the other hand, cotton imports cost less partly because a smaller quantity of raw cotton was imported. Imports of manufactured and semi-manufactured goods in May increased compared with both April this year and May, 1951. The biggest increase was in iron and steel manu-

factures, which were nearly £12 million above those of a year ago owing to larger quantities imported. Imports of non-ferrous metals were also larger than twelve months ago but the total cost did not increase proportionately.

In spite of the significant drop in the prices of raw materials in May, import prices as a whole fell only slightly since average prices of food imports again increased. But export prices fell for the first time this year; in May there was no increase in the price of metal and engineering exports to offset the fall in textile prices. As a result, the movement of the terms of trade in favour of this country, which had been in progress since the beginning of the year, appears to have been temporarily halted.

New Deal in Diamonds

The cold war in diamonds is over. At the annual general meeting of the Anglo American Corporation Sir Ernest Oppenheimer announced that a new sales agreement, settling all past disputes and covering current and future production, had been reached between Williamson Diamonds Ltd., owners of the rich Mwadui mine in Tanganyika, and the Diamond Corporation, which exercises effective control over the sales of all other principal diamond producers. The earlier agreement between the two companies did not officially lapse until the end of last year, but in the past two years Dr Williamson has refused to market the Mwadui diamonds through the corporation and has built up a stockpile of stones that is said to be worth £5 million. The release of this cache would have given De Beers's market a nasty knock; but the tumble in price that would have followed would have hit the Williamson organisation just as hard. Dr Williamson had taken up an adroit but precarious seat on the fence, and presumably he has come down from it now only on the offer of better terms. The new deal, which its negotiators believe "will lead to many years of happy relationship and added stability for the diamond industry," evokes a muted echo of the earlier and more boisterous history of the Rand. In those days, it might have been greeted by an appreciative chuckle from Cecil

Rhodes—and a wry smile from Veblen. In these more decorous days it was welcomed by the marking up of De Beers deferred shares by 1s. 6d. to 64s.

The announcement of the new diamond agreement was the tailpiece to Sir Ernest's address, the body of which was devoted to the difficulties confronting the OFS gold producers in securing additional capital for development. Sir Ernest emphasised again the need to broaden the stream of risk capital, now that its traditional source—the pocket of the private investor—is drying up. He suggested that, while the prior claims of shareholders should be recognised, a certain percentage of all new issues should be reserved for the general public, to "enable new shareholders to substitute for existing shareholders who are reluctant to follow up their investments because of their financial circumstances." He also believed that investment through the funds of the finance houses should be exploited more fully, and argued that "substantial funds are at present immobilised in various forms of financial investment" that would be used for the finance of new ventures but for the uncertainty in the minds of their holders "as to whether a profit not received in the ordinary course of business is subject to income tax or not." Finally, in reference to a measure that would be a more fundamental cure for the slow flow of new money to the OFS mines, Sir Ernest argued that an increase in the international price of gold is "an indispensable adjunct" to any attempt to put the world's economy on an even keel. The same view was expressed by Mr S. R. Fleischer, retiring president of the Transvaal Chamber of Mines, in a speech that has imbued some optimism into the Kaffir market this week. Mr Fleischer believed that the "march of events, which for some time has been against the investor in gold mines, will again turn in his favour"; and he noted that the case for an all-round increase in the price of gold had now gained official recognition in the report of the United Nations Committee on International Economic Stability and was supported by many governments.

* * *

Jets for Nato

If, in return for American dollars, this country decides to relieve American industry of at least part of the responsibility of providing equipment needed by the Nato forces, some painful decisions will have to be taken. The British rearmament programme—like the American—has already been "stretched out" into the indefinite future. If the Nato countries are to have any assurance of deliveries within a time that they would consider reasonable, it may be necessary to insist that orders for their equipment do not wait until the requirements of Britain's own forces have been met in full. Difficulties of expanding production, and especially aircraft production, may involve decisions on relative priority between the air defences of this country and the filling out of dollar-earning orders for the Nato allies.

It is certain that Nato countries would not accept such aircraft as the Meteor or Vampire. These could be provided immediately and in quantity, but the Russian MIG has made both obsolete (and with them the whole fighter force of the RAF with the possible exception—under certain special conditions—of the Venom). These aircraft, or their engines, are being built under licence in many European countries and they would in any circumstances be a poor exchange for the slightly faster F.86s originally promised from the United States. The aircraft that will be eagerly sought will be those with the performance of the Swift or Hunter fighters, the Canberra and Valiant bombers—all better aircraft than any that either the Russians or for that matter the Americans are likely to have in service for some years. But these are precisely the aircraft that have been accorded super-priority in order to meet the urgent needs of the RAF, which has at the present time a handful of Canberras in squadron service and the prospect of receiving the first Swifts before the end of the year. New production lines can certainly be laid down and if work were to begin now they could deliver aircraft in limited quantities by the end of 1954. It is less certain whether the industry's labour force could be expanded sufficiently to provide workers for those extra lines. The depression in the consumer industries, coupled with the stretch out of the defence programme, has solved the most pressing of the industry's labour problems, but the margin is a narrow one and shortages of labour persist in certain areas. The other difficulty is whether engine production and aircraft component production could expand sufficiently to keep pace with that of the airframe factories without causing sharp contraction in other branches of the engineering industry. On the other hand, all past experience suggests that if an attempt were made to build these aircraft and their engines under licence in European factories, the delays would be even longer.

To a certain degree, it is the duty of the British Government to see that the most pressing needs of the British air defences are met before aircraft are diverted to other countries, but it is hard to know where to draw the line. With each aircraft costing between £50,000 and £100,000 apiece and occasionally more, the dollars that could be earned by delivering complete aircraft cannot be lightly turned aside. Much will depend on how rapidly and to what size the British aircraft industry can expand in a peacetime economy, and, in the last resort, on whether Nato countries may be satisfied with delivery dates in 1955 and 1956, even though they know that the American industry can offer nothing better.

* * *

Gas Turbines on the Roads

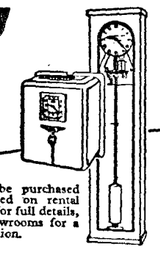
The impressive speeds of more than 140 mph attained by the Rover Motor Company's gas turbine car on trials this week have been closely followed by the rest of the motor industry. The Rover company alone among British car manufacturers has developed gas turbine transmission, and while there is much further work to be done no one can regard the project as a stunt. Gas turbines offer great possibilities to motor engineers because they combine high power with light weight and low maintenance. The Rover turbine, giving 200 brake horse-power, has been fitted without difficulty into a medium-sized chassis. But the motor industry has not been attracted towards gas turbine experiments on the ground that the high fuel consumption of this form of engine and the difficulties of mass producing its components might outweigh its other advantages. A gas turbine uses as much fuel at low power as it does at full power—in direct contrast to a reciprocating engine—and cars are run well below full power. With a heat exchanger the Rover turbine should do 10 to 12 miles to the gallon.

Other companies in the motor industry are now beginning to design gas turbines of their own; but the only immediate rival to the Rover company comes from outside the motor industry. A company of gas turbine specialists, Centrax Power Units, is about to bench-test a gas turbine that has attracted considerable attention at home and abroad. This engine is rated at 120 brake horse-power, with an estimated top speed of more than 100 mph. Its fuel consumption, however, is expected to be at least 20 miles per gallon—and if such a figure is attained the consumption of this new turbine engine would compare reasonably with that of a diesel engine of the same power. Expectations of such low consumption are based on certain radical departures in the design of both the turbine and compressor discs to improve part load performance, and of the heat exchanger. These changes may have the important secondary result of overcoming certain difficulties of mass-producing these two components. Six of these engines have so far been ordered, and if they prove as economical to operate and as simple to produce as the designers suggest they will be of immediate importance to builders and users of high-powered motor vehicles. The fact that development in this field is confined

Drawn by A. R. THOMSON, R.A.

He fights among the trees. It is on the constant war waged in the forests by entomologists like Walter Griswold, that world output of paper is greatly dependent. His enemies are the pests and parasites which attack the trees from which the wood pulp for newsprint is obtained. Thirty-two year old Griswold† graduated in Forestry at the University of New Brunswick and had already carried out research in the forests before joining Bowaters' staff. He is officer in charge of the Newfoundland field workers who pry into the cracks in the bark and beat the boughs over extended sheets to collect specimens of the pests threatening the growing trees. Once these pests have been identified in the Dominion Entomological Laboratory it is Griswold's job, in co-operation with Canadian Government experts, to plan the appropriate counter-attack. One successful method is the introduction of species of parasites and virus disease as allies to prey on those already in possession. It is largely upon the success or failure of this silent struggle to protect the forests that the supply of paper to keep pace with the world-wide spread of literacy depends in the years to come.

* * *



The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper—the 'know-how' in short—is freely at your service.

—You'll get action with colour

Yes action!—and speed in your office. Colour in copies clarifies comparisons, gives instant identification and emphasis, producing immediate effect. Increased effectiveness of colour in stimulating *action* is shown in actual records of experience by users of the Banda 'Master' Method, which reproduces up to seven colours at once, without inks, stencils or gelatine, from a single 'Master' sheet of paper, typed, written or drawn. The Banda 'Master' Method increases efficiency, saves time and in some cases cuts costs by 75%. Banda brings colour to your copywork and control to your office. Copies are brighter, points are clearer. Organisation runs more smoothly in routine or emergency, with maximum ease and clean simplicity of Banda operation. Colour — with the Banda 'Master' Method—gets what every director and every executive wants — *action!*

to Rover and Centrax suggests that close experience of gas turbine engineering (which Rover acquired in the war) is necessary to make a successful beginning in gas turbines for cars. Perhaps the motor industry generally may have to enlist help from gas turbine engineers in developing this new form of power.

Cars and Quotas

The Ministry of Supply's decision effectively to raise the home market quota of passenger cars from 60,000 to 90,000 cars for the year will prevent the unedifying spectacle of actual deliveries outstripping the quota by a margin of 100 per cent. Deliveries to the home market in the first four months of the year amounted to 40,000 cars, an annual rate of 120,000 compared with deliveries of 110,000 cars last year. "The industry," according to the Minister, "have undertaken to endeavour to export not less than 80 per cent of their output of passenger cars," which, out of a possible production of 450,000 cars for the year, would leave a balance of 90,000 for home buyers. This broad industry undertaking is a departure from the specific home quota which was laid down in recent years not only for the industry as a whole, but for each individual company. It will operate "flexibly"; only the bigger companies are likely to find foreign markets for as much as 80 per cent of their output under the increasingly difficult conditions that they are now meeting abroad. One or two of those companies, on the other hand, might be able to export an even higher percentage. It follows that the change may lead to an increase in the number of more expensive cars reaching the home market and a possible decrease in the number of cheaper, popular models.

This apparent surrender of the policy of restricting home deliveries would lay the Ministry open to severe criticism, but for Mr Sandys's assurance that "allocations of steel to the industry will in future be more closely related to export performance." Three weeks earlier his Parliamentary Secretary, Mr Low, had given the same assurance, with the rider that the distribution of those exports between hard currency and sterling markets would also be taken into account. This is not a policy that finds much favour in the industry, which has based its case in the past on the global export figures.

Canada's Exchange Freedom

The report of the Canadian Foreign Exchange Board for 1951 refers, almost in the manner of an aside, to the termination of exchange control on December 14th last year. This report, therefore, is a milestone in a series that has become conspicuous for clarity and economic good sense. The story of 1951 is impressive, but the report does not touch on subsequent history, including the achievement of parity by the Canadian dollar with the American dollar in January and its subsequent attainment of a 2 per cent premium. No longer is the Canadian dollar less eligible among hard currencies.

At the end of 1951, Canada's official holdings of gold and US dollars were valued at $US1,778.6 million—a figure, say, $100 million higher than the present presumptive level of the sterling area reserves. At the end of 1947, the reserves stood at just over $500 million; by the end of 1950 they had recorded a truly astonishing gain to $US1,741.5 million. By the records of earlier years, therefore, last year's increase in Canada's reserves was a very modest affair; but its significance rests less in its size than in the diverse movements of current and capital payments of which it was the resultant. Last year's inflow of capital (almost entirely from the United States) was much smaller—$561 million against $953 million in 1950—but the deficit on current payments much larger at $524 million against $329 million in 1950. Indeed, the deficit with the United States reached $955 million—not far short of the 1947 deficit—compared with $403 million in 1950. An important part of this increase in imports seems to have been accounted for by defence supplies from the United States.

Last year in fact saw something of a return to the prewar pattern of Canadian trade—a considerable commodity surplus with the sterling area and the rest of the world and a growing deficit with the United States. The deterioration in the exchange reserves of many countries with which Canada earned a current surplus last year might be discouraging for Canadian trade prospects but for one important fact, duly underlined in the report:

CANADA'S BALANCE OF PAYMENTS, 1950 AND 1951
($Can. mn.)

	1950	1951
Current Account		
United States	−403	−955
Sterling Area	+ 5	+191
Other Countries	+ 69	+240
	−329	−524
Capital Account		
Capital items, including exchange adjustment, errors and omissions	+953	+561
Change in official reserves (US $mn.)	+624	+ 37

> Our sales of non-essential goods were already severely restricted and an element of strength in the present position is the essential and strategic character of most of our exports to these countries.

There are recent indications that the Canadian capital account is in balance—the inflow of American capital, particularly into oil development, being balanced by Canadian investment in US securities—and that the current account may lately have been showing a small surplus. Here again is another astonishing transformation that bears witness to the vigour of Canada's economic advance. Evidently, the improvement in the terms of trade is providing major support to Canada's balance of payments. By the end of 1951, import prices were only 4 per cent higher than a year earlier while export prices had risen by 12 per cent—and that before the Canadian dollar moved to a premium. The recent rise in newsprint and non-ferrous metal prices should accentuate this movement in the Canadian terms of trade.

Belgium Gets Its Dollars

The negotiations in Washington for monetising through the International Monetary Fund the $50 million of Belgium's excess credits to the European Payments Union have been successful. Belgium will be entitled, under a special "stand-by" agreement, to purchase up to $50 million in currencies from the IMF. The agreement is for an initial period of six months but will be subject to renewal, though the currencies purchased must be finally resold by 1957, by which time the $50 million due to Belgium by the EPU will have been finally paid. If Belgium exercises its rights under the agreement with IMF, the currencies it purchases (they would presumably be US dollars) will be counted against Belgium's normal quota facilities with the Fund. The suggestion that this might be a loan outside the usual procedure laid down in the IMF articles of agreement has been turned down by Washington. The "stand-by" agreement under which Belgium may raise the $50 million due to it over the next five years from EPU will not prejudice Belgium's rights to seek further assistance from the Fund in the unlikely event of such aid being required. The one point at which the arrangements seem to depart from normal IMF procedure is in the thinness of Belgium's disguise as a country in temporary difficulties on its balance of payments—but it is supposed to wear this disguise in order to pass through the lending door of the Fund. As the Duke of Wellington said to the stranger who had accosted him with the words 'Mr Smith, I believe,'—"If you believe that, Sir, you will believe anything."

Record Fiduciary Issue

In anticipation of the usual seasonal increase in demand for currency the fiduciary issue has been raised by another £50 million, to the record level of £1,500 million. This increase was inevitable, and it may indeed be only just enough to tide over the holiday period. After it was made last Wednesday the note reserve in the Bank of England stood at just over £58 million; between June 26th and August Bank Holiday week last year the active note circulation increased by more than £44½ million—and it must be expected that it will increase rather more sharply this summer. When the Government took office in October the active circulation, at over £1,346 million, was about £74 million higher than a year before. It rose by over £91 million between end-October and the Christmas peak, and then fell by £84 million in the next five weeks (compared with a rise of £85 million followed by a fall of £75 million in the equivalent periods of 1950-51). By end-January the active circulation, at £1,354 million, was £71 million higher than in January, 1951, but it has risen by more than £89 million in the last five months (compared with a rise of some £67 million in the same period of 1951). In part the rapidity of the recent increase in the active circulation may have been due to a tendency by the public to draw fewer but bigger cheques, and thus hold more cash in their pockets, as a reaction to higher bank charges. But the main influence behind the increase in the public's note holdings, of course, is that individuals need to carry more cash about with them because they are having to pay more for the goods they buy. The active note circulation has increased by about 7 per cent (or by £93 million to £1,442 million) in the past year; retail prices have risen by about 8 per cent in the same period.

Stock Exchange on Taxation

The Stock Exchange Council' this week gave oral evidence on its second statement of evidence to the Royal Commission on Taxation, and also released the text of its first statement of evidence, which it had sent to the commission just over a year ago. The memorandum presented last year had done little more than quote *The Economist's* statistics on capital issues (from the *Records and Statistics* supplement of January 6, 1951), draw attention to the familiar fact that the burden of profits tax is causing far too much new capital to be raised on fixed interest terms instead of on equities, and recommend that dividends on preference shares should be a deductible item when the liability for profits tax is assessed. The opportunity was missed of marshalling any more detailed facts about the demise of the private investor and its implications for the future flexibility and vigour of the economy; and the point was not rubbed home that British industry, weighed down by this mounting burden of prior charges, may be in danger of being precipitated into a full-scale financial panic in the event of a slump.

The Council's second statement of evidence, which was presented this week by Mr H. B. Turle, was in response to the commission's request for evidence on specific issues that are of direct professional concern to the House. Mr Turle made three main points. First, he argued that companies should generally be taxed only on profits earned or remitted to the United Kingdom; if such a provision had been in effect the recent exodus of copper companies to Northern Rhodesia would have been avoided. Secondly, he endorsed the Tucker Committee's recommendation that surtax should be spread at the taxpayers' option over average income in a five-year period, and argued that earned income relief should be extended beyond the £2,000 a year limit. Finally, and most exhaustively, Mr Turle presented an able case against politically-inspired proposals for a capital gains tax, together with some caustic comments on the way in which the

American tax—by encouraging investors to hold on to securities in a rising market and sell them in a falling one—is a sovereign nostrum for aggravating both booms and slumps. In a time of stable real wealth and prices, a capital gains tax (accompanied by rebates for capital losses) necessarily has no net yield to the Exchequer; it merely involves a transfer from those who have invested in the right things to those who have invested in the wrong ones. In a time of stable real wealth but rising prices a capital gains tax would have a positive net yield—for it would, in fact, be exactly tantamount to a capital levy. In a time of rising real wealth but stable prices it would also have a positive net yield—but only at the expense of aggravating the risk capital problem. When the Stock Exchange chooses to defend itself on specific issues, it does so ably; the more is the pity that it does not make this choice more often—and that it does not recognise that the best form of defence is attack.

* * *

Too Much Sugar

Although Britain still has to suffer all the impediments of sugar rationing, the surplus in the world market this season is so large as to be embarrassing. At the meeting of the International Sugar Council in London this week, supplies for the free (i.e. non-preferential) market in 1951-52 were estimated at 7,335,000 metric tons compared with requirements of only 4,950,000 tons. The surplus of 2,385,000 tons will be held by producers, or more accurately by one producer—Cuba. It is therefore not surprising that the council has decided to continue its study of a new international agreement. The existing agreement has been in operation since May 6, 1937, but no export quotas have been in force since the end of the war. As these quotas were drawn up before the war, they could hardly be applied now without drastic amendment.

The special committee set up by the council to work out the new agreement is to meet again in September, and if by then it has concluded its work the council will ask the United Nations secretariat to convene an international sugar conference. Cuba is the country which is suffering most from the present surfeit of sugar, for it supplies the largest quantity to the free market. Its crop this season has amounted to at least 6¾ million tons, or 1 million tons more than it expected. It has already decided to set up a single selling agency and has agreed to stockpile up to 2 million tons of sugar which it intends to sell alongside current crops over the next four years. Production next season is to be reduced to 5 million tons. These are clearly emergency measures until a new international agreement is put into force, for Cuba cannot hope to gain from unilateral crop restriction over any period of time. The irony of it all is the simple fact that if Cuba were willing to accept sterling, it could dispose of a substantial part of its stocks to Britain.

Metals Roundabout

It is two years since the price of lead was higher than that of zinc. Current American prices are 16 cents a lb for lead and 15 cents a lb for zinc: Ministry of Materials prices have moved in sympathy and are £137 a ton and £130 a ton respectively. The fall in lead prices which began about a year ago culminated in sharp reductions in the American price during April. This week the fall seems to have been decisively reversed: within two days the price rose twice, by ½ cent a lb on each occasion. American zinc prices, which had remained steady for some while after lead had begun to slide, have been reduced four times since the beginning of June, including a reduction of 1 cent a lb last week.

Before the war lead usually cost more than zinc, but since the war and particularly since rearmament this "normal" pattern has been upset. Lead has few defence

uses; on the other hand, zinc is required for military vehicles of all descriptions. In the past year or so the comparative cheapness of lead has encouraged manufacturers to substitute it for zinc wherever possible. This inducement has vanished, at least for the time being, and some reversal of the substitution process can be expected which will inevitably tend to force up the price of zinc in terms of lead. There are better reasons for believing that zinc is at present undervalued. Admittedly American consumption of high grade metal has been sagging for some time. But this softening in demand would not account for the 23 per cent fall in zinc prices during the last month. Undoubtedly the steel strike in America has been one of the prime reasons for the fall, because the iron and steel industry absorbs large quantities of zinc for galvanising. If the strike continues there is the added risk that reduced supplies of steel for the motor industry will further reduce the demand for zinc. Yet, even on the most pessimistic view of the future, it is hard to justify the present price for zinc. It is perhaps significant that when trading in zinc futures was resumed in New York this week after a year's suspension, September metal rose to a premium of ¼ per cent a lb above the current spot level.

The rise in lead prices was not entirely unexpected, though the swiftness with which the second increase followed the first was a little surprising. Consumers in this country and the United States may have been living on stocks during the last few months in anticipation of further falls in price. When, however, the American price for lead dropped to 15 cents a lb it was generally believed to have found its floor, and the firmer tone that has recently developed in the American market probably reflects some restocking by industry. Whether this process will continue in the face of cheaper zinc is doubtful. And whether lead falls or zinc rises, the latter is likely sooner or later to regain its premium over lead.

Fats and Plenty

Butter is rapidly becoming a luxury food. Supplies are dwindling and costs of production are rising. It takes approximately two and a half gallons of milk to make a pound of butter, so that butter production becomes profitable only when supplies of milk are well in excess of demand in the liquid milk market, and the demand for liquid milk has risen in practically all the major consuming countries. These facts were emphasised by the Minister of Food some little while ago, and they form the background of the speech made by Sir Geoffrey Heyworth, chairman of Unilever, at the British company's annual general meeting. Sir Geoffrey showed that there was a direct relation between the consumption of edible fats and the standard of living. The accompanying table shows that countries with a higher national income per head of population also enjoy a higher consumption of edible fats. The figures refer to 1949 and were computed by the United Nations secretariat.

National income per head	Consumption of edible fats per head
Below $100	7.9 lb
$100—$300	16.2 lb
$300—$500	29.1 lb
Over $500	42.7 lb

It is here that margarine has played an important role in the past and may become even more important in the future. Butter still has a distinctive flavour which a large proportion of the population prefers—though the best quality margarine (which few remember in this country) runs it close. The real choice between margarine and butter depends on relative prices. As agricultural wages have risen sharply so, too, have costs of milk production. But margarine is made from vegetable oils and whale oil and although during the Korean boom the prices of those oils rose sharply together with other commodity prices, in the past twelve months they have fallen and show signs of falling still further. Thus the difference between the unsubsidised prices of butter and margarine in Britain is likely to increase rather than decline, and when this comes about the Ministry of Food might well throw aside its caution and abolish the ration of both.

Shorter Notes

The appointment of Mr Godfrey H. Owtram as managing director of Petrochemicals Ltd. follows the resignation last week of Dr Kind and Dr Tugendhat from the posts of joint managing directors that they have filled since the company was formed in 1946. Dr Kind remains on the board of the company. Both continue to hold the posts of joint managing directors of Manchester Oil Refinery Ltd. and of Petrocarbon Ltd., the company responsible for designing the plant used by Petrochemicals.

*

The General Electric Company has joined the rapidly growing lists of companies that have recently received permission from the Treasury to make a bonus issue of ordinary shares. The directors of GEC intend to capitalise £5,877,720 from the share premium account, recently reinforced by part of the proceeds from the rights issue of £1 ordinary shares at 72s. 6d. each, in order to distribute one new £1 bonus share for every £1 ordinary stock held. These new shares, unlike the February cash issue, do not rank for the final dividend for the financial year that ended on March 31st. The GEC scrip bonus is another indication that the Treasury is behaving more logically and with better sense on the question of bonus issues, but the real test of a change in heart will come when ICI asks again—as it intends to do—for permission to capitalise part of its reserves, which were substantially augmented following the revaluation of the company's fixed assets in 1950.

IMPORTANT ANNOUNCEMENT

QUICKER PRESENTATION OF ACCOUNTS and Financial Statements is but one of the many problems facing the Accountant to-day, both at home and overseas.

We have recently conducted an investigation into the various ways in which the Gestetner process might be used to help the Accountant.

Our conclusions have been assembled in a small booklet called "Gestetner and The Professional Accountant." We shall be glad to send a complimentary copy of this booklet to all who are interested in the achievement of greater efficiency and economy in Professional methods of accountancy.

Please address your application to:

GESTETNER ACCOUNTANCY SERVICE

ALDWYCH HOUSE, LONDON, W.C.2

Company Notes

Metal Box.—Following a year of record turnover and profits in 1951-52, Metal Box is yet another company that is now finding it more difficult to sell its goods. Sir Robert Barlow, the chairman, remarks that "in many directions there has been a recession in demand" and that overseas markets are much more difficult to expand or even hold. The accounts drawn up on March 31st do not reflect any of these doubts: they merely provide a rosy record of last year's boom. At home the value of sales and income from investments rose from £21,037,000 to £26,529,000; abroad where they increased from £7,272,000 to £9,894,000. This expansion in business, which was achieved despite a shortage of tinplate, led to an increase in home profits (after depreciation) from £1,701,032 to £2,545,130, and in overseas profits from £934,601 to £1,175,200. As already reported, these increases enabled the directors to raise the ordinary dividend from 12½ to 15 per cent. This decision prepared the way for a rights issue of ordinary shares that will provide about £1,775,000 in new money; Sir Robert declares that this new capital is needed because the sums retained out of last year's profits (£752,000 by the British company and £212,000 by the overseas group) are inadequate for the requirements of the business.

The need for this new capital is underlined by the balance sheet—which shows that the value of stocks increased from £7,114,314 to £10,645,279 last year—and by the announcement that the parent company is already committed to spend about £850,000 and the subsidiary companies about £700,000 on capital projects. Moreover, as Sir Robert points out, in an organisation trading all over the world the assets of one company cannot now normally be used to meet the liabilities of another. The consolidated balance sheet shows that the total of bank balances on March 31st was £1,516,878, but this sum was not available to pay off a secured bank loan to an overseas subsidiary of £708,743. Before raising the equity dividend and making the offer of new shares to ordinary shareholders, the directors must have been aware of the recent slackening in demand for Metal Box's products. It seems unlikely, therefore, that the recession has yet gone far enough to endanger the payment of a dividend of 15 per cent on the revised capital.

Kaffir Dividends.—The June season of Kaffir dividends has ended on the same note as it began—that of a general reduction in payments. Indeed, the last batch of dividends, by companies in the Anglo-American and the Johannesburg groups, contained a rather bigger crop of disappointments than those that were announced earlier. The maintained payments by Daggafontein and Western Reefs and the cut in the Springs dividend were in line with market forecasts, but the payment of a 7½d. dividend by Brakpan fell short of some expectations by as much as 4½d.; the distributions by East Daggafontein and South African Land were also slightly lower than had been forecast. The two finance houses in the Anglo-American group, New Era Consolidated and West Rand Investment Trust, have maintained their interim payments, at 6d. and 7½d. respectively. In the Johannesburg Consolidated group the reduction in New States Areas (from 7½d. to 4½d.) was less than had been expected, but the reduction in Randfontein's dividend (from 1s. to 9d.) was a disappointment. In general, the market had underestimated—though only very slightly—the effect that the rise in operating costs and the decline in the "free" gold premium has had upon profits in the first six months of the year. In the next six months investors will still have to keep an eye on costs and labour difficulties, but most of their attention will be rivetted upon political developments in South Africa and—even more closely—on the possibility of a revision of exchange rates.

British Plaster Board.—Between July and December last year British Plaster Board was harassed by a discriminatory price control, imposed upon it (but not upon its competitors) by the Labour Government following the company's withdrawal from the earlier voluntary price agreements. Despite this, it earned surprisingly good profits in the year to March 31st last. Trading profits and investment income rose from £1,389,194 to £1,595,932, and, although about £165,000 more has been provided for taxation, group net profits rose by just under £40,000 to £405,354. A year ago the chairman, Lord Belper, indicated that an increase in the ordinary dividend was prevented by the fall in profit margins (which led to the dispute with the Government). Now the directors have been encouraged to recommend a modest increase to 17½ per cent, compared with the effective rate of 16⅔ per cent that has been in force for many years. In addition, the appropriation to general reserves has been increased from £11,000 to £114,285, while £50,000 was appropriated to a central obsolescence and replacement reserve; nothing has been added to this reserve in 1951-52. Last year's appropriation, however, was not intended as an indication of the additional annual sum needed to provide against the eventual cost of replacement. It was simply a general provision made in advance of the revaluation of fixed assets on which the company has been working in the financial year just ended.

COMPANY MEETINGS

UNILEVER LIMITED

REPORT OF ANNUAL MEETING

THE PLACE OF MARGARINE IN THE ECONOMICS OF NUTRITION

IMPORTANCE OF EDIBLE FATS

SIR GEOFFREY HEYWORTH'S REVIEW

The annual General Meeting of the members of Unilever Limited was held on June 23rd, at The Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided. Addressing the meeting the chairman said:—

My Lords, Ladies and Gentlemen,

For some years it has been my custom at the annual general meeting to deal with a subject which is not only of immediate concern to Unilever but which also has an interest for the general public. In accordance with this custom, I shall try to show you how, in one particular field, the rise in the world's standard of nutrition has been dependent, and how in future it is likely to be still more dependent, upon the margarine industry.

Our generation is faced not only with the problem of maintaining, or possibly improving, the standard of living in the well developed countries, but most certainly with that of raising the standard of living in the underdeveloped areas of the world.

WORLD FOOD REQUIREMENTS

There has been some speculation recently as to whether the earth can supply all the foodstuffs necessary for these tasks in view of the fact that every day the world has 70,000 more mouths to be fed. Taking this into account, there would be needed by 1960, according to a 1946 Survey of the Food and Agriculture Organisation, an increase of 34 per cent in the production of oils and fats, 46 per cent in the production of meat, 100 per cent in the production of milk and a large increase in various other foods in order to bring the nutrition of the nations in different parts of the world up to a reasonable minimum.

This would be impracticable; it will be difficult enough to provide for the increasing population, even up to existing standards. I am not too pessimistic about the long term prospects, because I have faith in the resource of mankind. I am quite sure, however, that not only shall we have to use all our intelligence in exploiting the natural resources of the soil, but we shall probably have to be ready to take our supplies in whatever form will give the maximum amount of nutrition from each acre. In other words, it is most probable that as time goes on people will have to make some sacrifice of their personal tastes in order to obtain sufficient nourishment for all.

SUPPLY AND DEMAND OF EDIBLE FATS

Unilever is particularly interested in these problems in the sphere of edible fats, which are an essential item of the world's diet. We are, therefore, constantly studying the trends in this particular field and thinking of the contributions we can make to solve problems of supply and demand as they may present themselves. This, in fact, is no new problem to us. The first Lord Leverhulme and Mr Anton Jurgens were at times greatly worried by the possibility of a shortage of raw materials—Lord Leverhulme, in particular, feeling that the edible trade could afford to pay more for their fats and thus make it difficult for him as a soapmaker. Both made attempts to secure their position—Lord Leverhulme by starting plantations—Anton Jurgens by the extension of his buying organisations. Problems and anxieties of this nature keep cropping up, and, in fact, margarine itself was the answer to one such problem of supply, namely, the shortage of spreadable fats on the western European markets.

My remarks today are going to be confined to edible fats, which constitute about 78 per cent of the world's animal and vegetable oil and fat production, the remainder being approximately 13 per cent for soap and 9 per cent for other technical purposes.

NUTRITIONAL VALUES

First of all, let me deal with the nutritional value of oils and fats. Research work upon this is constantly going on, and it has been proved that they provide the body with heat and energy, they prolong the staying power of meals, they assist towards a gradual and easy digestion of other foods, and promote the growth of young people; perhaps of equal importance and a condition of the rest is that they make meals more palatable.

All this will explain the fact that the *per capita* consumption of edible fats is closely related to the standard of living, and this applies to consumers all over the world. More fats are added to the diet as the level of prosperity rises, and a saturation point has probably not been reached anywhere, not even in the USA.

INCOME AND CONSUMPTION

The relationship between income and consumption is illustrated by comparing the national income figures for 1949, as computed by the United Nations Organisation, with the consumption of edible fats. Calculating this on a fat contents basis, the picture is as follows:—

Countries with a *per capita* income under $100, fat consumption 7.9 lb.

Countries with a *per capita* income between $100 and $300, fat consumption 16.2 lb.

Countries with a *per capita* income between $300 and $500, fat consumption 29.1 lb.

Countries with a *per capita* income over $500, fat consumption 42.7 lb.

Climatic conditions, of course, should be considered, for the human body needs less fuel, and therefore less fat, in the tropics than elsewhere, but wide variations of the level within the same climatic zone can be adequately explained only by differences in the standard of living. In the United Kingdom between 1900 and 1938 the *per capita* consumption of edible fats rose from 34 lb to 46.3 lb—an increase of 36 per cent. Official figures of national income were not published for the earlier years, but it is accepted by economists that the prosperity of the people was greater by at least a third in 1938 than in 1900—illustrating that within the same country consumption of fats increases with the national income.

This relationship between the standard of living and consumption of fats has had a tremendous impact on the total demand for fats in the nineteenth and twentieth centuries, particularly in the USA and Western Europe. I should estimate that in Western Europe the *per capita* consumption of edible oils and fats has doubled since 1850, and in addition to that the population has about doubled also, so that the total demand in this area has about quadrupled in a century.

These extra supplies might theoretically have come by increases in the traditional sources of fat supplies—for example, from dairy farming and the carcass fat of pigs and cattle, but in fact these supplies are relatively inelastic. Butter production, for example, is limited by natural conditions. High standard dairy farming requires a temperate climate, a sufficient amount of rain throughout the year, suitable soil, and selected cattle and, except where really good grass is available for most of the year, it needs concentrates such as oil cake and cereals, but mainly cereals. Cereals, however, are at present urgently wanted for humans, so that their use for dairy farming must of necessity be restricted. There is also the fact that the increased consumption of liquid milk, which I will refer to later, has prevented a solution of the problem by increasing the production of butter.

EXPANSION OF OIL-BEARING SEED PRODUCTION ESSENTIAL

It is clear that the immense requirements of edible fats could not be met except by the expansion of production of oil bearing seeds. These seeds have the advantage of being grown in various climates—coconuts, palm kernels, palm oil, cotton seed and groundnuts in tropical and sub-tropical countries; olives, soyabeans, sunflower seeds, linseed and rapeseed in temperate areas. In the liquid form, the oils obtained from these seeds did not meet the requirements of the consumers—they wanted a fat that could be spread.

It was the margarine industry that met this want. When it began, in 1870, it used animal fats as raw material, but in course of time could not get enough of these. Coconut oil and palm kernel oil were the only vegetable oils which had a melting point high enough to serve as a basis for a spreadable fat, but they could not be used to any considerable extent because of their brittle texture and because technical skill in refining oils was not sufficiently advanced.

About 1900, however, a process was discovered of raising the melting point of all liquid oils and thus turning them into solid fats. This process, called hydrogenation, or hardening, changed the outlook for the whole industry, for after the process had been developed the margarine industry was able to fill its needs by drawing on the great potential of vegetable oil production from all over the world.

EXPANSION OF MARGARINE PRODUCTION

A glance at a few figures will show the growth of the trade. In Germany, for example, where the records go back to 1895, the production of margarine for that year was 90,000 tons; in 1913, it was 225,000 tons; in 1929, it was 452,000 tons; though in 1938—due to Government restrictions—it was 385,000 tons. In Western Europe, including Germany, the margarine production in 1913 was 520,000 tons, and in 1929 it had reached 1,075,000 tons a year, and in 1938—mainly due to the fall in Germany and Holland—it was 991,000 tons.

It should be noted that in the same period, butter production in Western Europe rose from an average of 1,055,000 tons for the years 1909-13 to 1,218,000 tons in 1929 and 1,462,000 tons in 1938.

In choosing between butter and margarine, the consumer does not need to worry about any difference in nutritional value. There have been many discussions about this, but I think it is safe to agree with the conclusion of a Dutch scientist, Dr G. Smits, of the Central Institute for Nutrition Research, Utrecht. He made a study of 74 publications by scientists from various parts of the world dealing with the nutritional value of butter compared with that of other fats, especially margarine. Amongst his sources are well-known authorities, such as Hilditch, Kon, von Eulei, Deuel and others. Dr Smits' conclusion, published in the Dutch journal *Nutrition* of August, 1950, is as follows: "There is no proof of a superiority of butter over margarine as has been assumed by some investigators; provided the margarine is enriched with vitamins A and D to a content about equal to that in butter." I may add that in the United Kingdom and Holland, as in most other countries, this addition of vitamins is made.

PRICE RELATIONSHIP BETWEEN BUTTER AND MARGARINE

The choice, therefore, between margarine and butter will depend upon how much the housewife is prepared to pay for the distinctive flavour of butter. Many people do prefer the flavour of butter to that of margarine, though this may not always be so, for the technique of margarine making has made considerable progress and is still improving.

The premium she will pay will obviously depend on the relative supplies of butter and margarine—for example, if there were a quite inadequate supply of butter there would always be some people who would be prepared to pay an exorbitant price for it, whereas if the quantity were abnormally large the premium would obviously decline, as it would be necessary to tempt masses of people to increase their normal consumption of it. The price relationship, therefore, between butter and margarine is affected by the proportion of the milk supply which is used for butter production, and this brings us to a very important question, namely, the proper utilisation of milk. I use this word "proper" deliberately, to imply what is best for the world as a whole from a nutritional point of view.

RISE IN MILK PRODUCTION COSTS

We have first to note that in milk-producing countries wages and incomes since 1939 have risen faster in agriculture than in industry, and of all agriculture, dairy farming is the most exacting in its demands upon labour. Roughly speaking, agricultural wages in Holland are about three times as high as before the war, whereas industrial wages are about twice as high; in the United Kingdom the trend has been similar.

This, in itself, means that milk production is likely to be relatively a more costly process than in prewar days, but there is also the question of what happens to the milk. There has been since 1938 a great increase in the consumption of liquid milk in many countries, in particular in the United Kingdom, Holland, Australia, New Zealand, Canada and the United States. The consumer appreciates more and more that milk is a highly valuable food, but this does not depend on its fat content. The Dictionary of Dairying states that of the constituents of milk, the non-fatty portion is more valuable than the butterfat. Butterfat is interchangeable with other fats but the specific value of milk lies in the proteins, vitamins, and minerals that it contains.

INCREASE IN MILK CONSUMPTION

The tendency for milk consumption to increase still continues. It is evident, for example, in the case of Australia. Many people in Britain are worried about the decline in Australian butter exports, which have fallen from 104,000 tons in 1938-39 to 56,000 tons in 1950-51. The milk production in Australia, however, was slightly more in 1950 than in 1938 and the *per capita* butter consumption in Australia is less now than it was in 1938. The explanation of the declining butter exports is that a smaller proportion of the milk is used for butter production than before, some being diverted to cheese production and processed milk, and some being consumed in liquid form.

This extra consumption of liquid milk in most cases brings a better return to the farmer, for there are few countries in the world where he does not have to accept a lower price for that portion of his milk which is used for butter making.

High prices of meat in most parts of the world, themselves due to shortage, are causing people to look to other sources of protein, and this means that there should be a great future for cheese production. Cheese is a highly concentrated and digestible food and is easily the cheapest available combination of proteins and fat in the solid form, being only about half the price of meat in units of comparable nutritional value. World consumption of cheese is at present estimated at about 30 per cent higher than it was before the war. The effect of all this is that world production of butter is now about 16 per cent lower than it was before the war, whereas world population has since increased by about 14 per cent.

MARGARINE INDUSTRY'S AID TO DAIRYING

It is often assumed that the margarine industry is the enemy of the dairying industry, but this is simply not the case. Apart from the fact that, in making margarine, the industry through its seed-crushing activities supplies immense quantities of oil cakes and meals to the dairying industry which they would not otherwise obtain, the margarine industry satisfies the needs for spreadable fats which the dairying industry could not possibly do and which, in time to come owing to the better return obtained from liquid milk and cheese, it would probably not wish to satisfy.

WORLD PRODUCTION FIGURES OF BUTTER AND MARGARINE

I gave you figures showing the way the Western European production of margarine had grown up to 1929, whereas the production of butter had shown only a slight increase. However, in recent years butter production has declined, whereas margarine production has increased considerably. I have no figures for Russia and the satellite countries, but excluding these, I estimate the world production of butter and ghee at 3.30 million tons against 3.93 million tons in 1938, a decrease of 16 per cent, whereas I estimate the production of margarine and vegetable ghee at 2.33 million tons against 1.25 million tons in 1938, an increase of 86 per cent.

RELAXATION OF RESTRICTIONS

It is probably well known to you that, prompted by agricultural interests, various countries have, in their time, imposed restrictions on the margarine industry, but these restrictions are yielding to the pressure of economic necessities and to the realisation that there is a social need for margarine which must be satisfied.

Developments in the United States confirm this trend. In 1947 there were still 23 American states where the sale of coloured margarine was forbidden, the intention being to make margarine look unattractive and so reduce the public demand for it. Since then, and particularly following the abolition in 1950 of a Federal tax on margarine, 16 states have abolished this kind of regulation, leaving the manufacturers free to supply according to the housewife's choice.

A similar state of affairs exists in Canada where, until 1948, to protect the dairying interests, the production of margarine was forbidden altogether. It is now permitted and, although colouring restrictions are imposed, margarine consumption in Canada has risen to the same *per capita* level as in the United States and is still rising.

DISCRIMINATORY LEGISLATION IN SOUTH AFRICA AND INDIA

There are still one or two other places where margarine suffers from discriminatory legislation—for example, in South Africa it is forbidden to colour margarine, and apart from that, quotas have been imposed upon the margarine industry instead of allowing the consumer to determine how much is wanted. In France also there are still restrictions upon the colouring of margarine.

Present restrictions on colouring must have been solely designed to impede the progress of margarine; for any real grounds of objection to colouring margarine would also apply to butter, which often has colour added to it.

In India, where the standard of living is low and the consumption of fat very small, the milk product, which is comparable to butter, is called ghee, and the vegetable product, comparable to margarine, is called vanaspati. But notwithstanding the great benefit to the people of ample supplies of this highly nutritious product made from India's own production of oilseeds, this industry suffers discrimination by taxation, and in other ways, compared with ghee in spite of which it continues to make headway.

It is my opinion that in spite of obstructions the trade in margarine and similar edible fats will go on increasing steadily, because as the population of the world increases, the need for the most efficient use of the land will become more and more obvious. It is a startling thought that crops when fed to animals lose at least two-thirds of their calorific value before they re-emerge in the form of meat and milk.

It is frequently forgotten that the soil and the climate—and especially the rainfall—settle decisively the kind of product—animal or vegetable which can be grown. Practically all the land, which is reasonably good for raising human food, is already in use, though there is still scope for increased yields. To extend the acreage, however, it will be necessary to go to places unsuitable for the generality of crops. The most notable of these places are in the Equatorial Forest areas of South America, Africa and South East Asia, where it is always hot and wet. No grain-producing crop can grow in these areas, conditions are unsuitable for rice, livestock are practically ruled out—but the oil palm is quite at home. Any palm oil used for margarine reduces the demand

for other oils and fats which might well be using land which can produce other human foods—hence the development of the oil palm must become extremely important to the people of Western Europe.

MAXIMUM NUTRITION AIMS

No doubt the change will be a gradual one, but with the relentless increase in the population of the world, in relation to the available arable and pasture land, it will be more and more necessary to use the soil for the production of the maximum amount of nutrition even though the diet may become less varied and pleasant.

Milk is a very special food, and the proteins in meat have nutritional qualities which vegetable products may lack, and thus milk and meat will always remain staple products. Future generations, however, who may be short of grain, milk, and meat, are not likely to tolerate any unnecessary sacrifices of land for the production of butter which has no nutritional advantages over vegetable fats. I can illustrate my point by mentioning a study made in 1943 by Raymond P. Christensen, a US Department of Agriculture economist. Comparing the cow and the soya bean as fat producers, he found that per acre the cow yielded 46 lb of butterfat against 150 lb of vegetable fat from soya bean production.

I should not like it to be thought that I am urging that positive action should be taken to decrease supplies of butter. The world's increasing need of milk and cheese, as also the demand for butter, which no doubt will persist for a long time to come, will ensure the dairy farmers' continued prosperity. The object of my talk has been to direct attention to the importance of the best use of land and to state what we, in this company, have long believed to be a certain prospect—that there will be a greater and greater need for margarine as industrialisation proceeds and population increases.

The chairman concluded by moving the adoption of the report and accounts.

Sir Herbert Davis, CBE, vice-chairman, seconded the resolution and it was carried unanimously.

The proposed final dividend of 8½ per cent on the ordinary stock and a dividend of 6 per cent on the deferred stock payable on July 4, 1952, were approved, the retiring directors were reappointed and the remuneration of the auditors, Messrs Cooper Brothers and Company and Messrs Price, Waterhouse and Company, who had been reappointed under the provisions of the Companies Act, 1948, was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and all employees.

UNILEVER N.V.

The annual general meeting of the members of Unilever NV was held on June 23rd at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Unilever, Limited, reported above.

The report and accounts for the year 1951 were adopted. The proposed final dividend of 7.5 per cent (being the equivalent of the final dividend for the same year to be paid by Unilever, Limited, to its ordinary stockholders calculated in accordance with the provisions of the Equalisation Agreement and converted at a rate of exchange of Fl 10.64 to the £ sterling) was approved, the retiring directors were reappointed, Mr A. M. Knox was appointed a director, and the auditors, Messrs Price, Waterhouse and Company and Messrs Cooper Brothers and Company were reappointed.

OTTOMAN BANK

ECONOMIC DEVELOPMENT OF TURKEY

LORD LATYMER'S REVIEW

The eighty-fifth annual general meeting of Ottoman Bank was held on June 25th at Winchester House, Old Broad Street, London, E.C.

The Rt. Hon. Lord Latymer (the chairman) presided and in the course of his speech said:

I am happy to be able to inform you that under the authority of article 21 of the statutes a new agreement has just been signed with the Turkish Government. Immediately this agreement has been ratified by the Turkish Grand National Assembly, your committee propose to convene a further general meeting of shareholders in order to give an account of the matter and to ask the shareholders to pass resolutions to make such changes in the statutes of the bank as may be necessary to conform with the new conditions.

In September last Turkey was invited to join the members of the North Atlantic Treaty Organisation. Her adherence was formally ratified in February, 1952. Turkey has thus strengthened the bonds uniting her to the nations who share the same democratic ideals—an event of great political importance which cannot fail to have widespread effect. From the economic point of view, 1951 witnessed remarkable development on all sides; in agriculture, in mining, in industry, in foreign trade and in the general equipment of the country. The authorities have been most anxious to encourage private enterprise. Here, the Industrial Development Bank of Turkey, which came into operation in 1951, has been able to help with the granting of a number of credit facilities.

The Ottoman Bank, with its widespread connections in banking, industrial and commercial spheres, will always offer the fullest support to the efforts which Turkey is making to interest foreign elements in her economic development.

Egypt: Early hopes for an untroubled year were not fulfilled. Taxation, direct and indirect, personal and industrial, increased. The cotton export tax was doubled early in the year.

Tension between the British and Egyptian Governments became more acute and in October Egypt abrogated the Anglo-Egyptian Treaty of 1936 and the 1899 Condominium Agreement for the Sudan. This was attended and followed by marked unrest, by the virtual isolation of the Canal Zone and later (although outside the period under review) by the disastrous riots in Cairo early this year.

Egypt's trade figures for the year 1951 show a substantial increase upon the previous totals. Imports reached LEg. 279 million (including over LEg. 40 million of gold). Exports increased, in value if not in volume, to LEg. 203 million.

For your branches it was a very busy time, although there was, as might be expected, a falling off in the activity of the Canal Zone branches during the latter months of the year.

Sudan: For the Sudan it was an excellent year. The political scene was indeed far calmer than agitation abroad and repeated reference in the press might have suggested, and thus permitted the Sudan Government to press forward towards its object of self-government for the country by the end of this year. The preparation of the new constitution is now in hand. Our three branches in the Sudan have had a busy and satisfactory year.

Israel: The year brought an appreciable increase in the business handled by our branches in Israel, whose services are well patronised by all sections of the community.

Jordan: In spite of many anxieties and of increasing competition, it was for our branches in Jordan an active and on the whole successful year. They continued to serve a numerous and widely spread clientele and to foster, by means of long and medium-term facilities to municipalities, the development of amenities and progress in many of the outlying towns.

Iraq: The violence and unrest noticeable in many countries of the Near and Middle East during the year could but have some repercussion in Iraq. Nevertheless, 1951 was, in many respects, a year of planned reorganisation and confident development. The Government was able to devote its full concentration to the important negotiations for fresh agreements with the oil companies operating in the country. It is a real tribute to the foresight and patience of all concerned that these negotiations have resulted in the new agreement with the Iraq Petroleum Company and its subsidiaries, which was signed and ratified a few months ago.

Lord Latymer then reviewed other countries in which the Bank has interests, and continued:—

Balance sheet: Once again the total exceeds that of the previous year and now stands at more than £96 million.

It will be seen that cash and money at call together total £3,800,000 more than last year while bills receivable have increased by £4,500,000. Investments show an increase of some £3,300,000 and are mainly short-dated British Government securities, an important consideration at a time when the protection afforded by short-dated stocks has become so necessary.

Advances to customers have risen by nearly £6 million.

Turning to the profit and loss account, the result for the year is £303,038 compared with £320,475 for 1950. To this figure is added £113,945 of remittances of profits of previous years and in this connection I would mention that it is becoming increasingly difficult to remit profits so that they can be included in the figures for the year in which they were earned. So far, in almost all the territories where your Bank is established, it has been possible with the help of the Exchange Authorities of the countries concerned, to arrange for the remittance of profits to this country. The conditions necessary for the freeing of international exchanges, however, are still a very long way from being realised and until these conditions are attained both international trade and banking rest on insecure foundations.

The continued financing of international trade depends among other things upon the power to remit a reasonable profit earned by those who carry out this important service.

Your Bank has so far been fortunate in that this fact has been generally recognised by countries throughout the Near and Middle East.

The committee propose that a dividend of 8s. per share be paid again this year.

I am sure that you would like to join me in conveying our thanks to the management and to the staff of all the branches of your Bank. 1951 was not an easy year, but the hard work and loyalty of our staff have helped us to surmount the many problems with which we were faced.

The report was adopted.

BANK OF BRITISH WEST AFRICA, LIMITED

YEAR OF STEADY PROGRESS

The fifty-eighth annual general meeting of the Bank of British West Africa, Limited, will be held on July 17th at 37 Gracechurch Street, London, E.C.

The following are extracts from the statement by the chairman, The Rt. Hon. Lord Harlech, KG, GCMG, which has been circulated with the report and accounts for the year ended March 31, 1952:—

It is 26 years since, as then Under Secretary of State at the Colonial Office, I made a three months' tour of British West Africa, and I had hoped to make another extensive tour on behalf of the Bank. Various circumstances compelled me to limit my visit to three weeks, but thanks to the development of air travel I was able to visit our branches at Lagos, Ibadan, Port Harcourt, Enugu and Kano in Nigeria, and Accra, Kumasi, Takoradi and Sekondi on the Gold Coast, and to make useful contacts with the governments, representatives of leading customers and members of our European and African staff. Everywhere I received a most friendly welcome, and I am satisfied that our Bank is performing its ever-increasing duties with efficiency, good public relations and success. I am equally clear that our opportunities for expansion and development are great. Such expansion will require new buildings both of Bank offices and houses for our European staff, and these are some of the best possible investments we can make. In our existing offices there is serious overcrowding and all too much overtime has to be worked. I found an excellent esprit de corps among our European and African staff, as well as mutual regard and good understanding between them.

RISE OF LIVING COSTS

Local living costs have risen rapidly, especially on the Gold Coast, the inevitable corollary of high prices for food, goods and services of all kinds, and in the year under review our scales of salaries and allowances have had to be increased to meet these conditions.

Great political changes are taking place in the West African Colonies, and the business of government has to some extent been transferred to representative Africans. In the course of my tour I was able to meet many of the new Ministers of Government and was impressed by their keenness and good will.

Unfortunately, during the last quarter of the bank's financial year there was a sharp fall in the market value of our investments in British and British Colonial Government securities, but we have made full provision out of reserves and profits for meeting the difference between the book and market value of such securities—no mean achievement. I should add that all our investments are represented by securities redeemable at par, with maturity dates fixed at relatively short or medium periods, and in this we are very favourably situated in comparison with a number of other banks.

THE ACCOUNTS

Figures and results shown in the balance-sheet and profit and loss account will, I believe, be accepted with satisfaction, indicating as they do a steady degree of progress in nearly every section of our activities. This progress has, I am pleased to say, kept in step with the general economic expansion that has been seen in the West African Colonies during recent years and their growth as an important factor in the sterling area.

A sum of £50,000 has been added to the reserve fund out of profits, making the new total £1,050,000. A further sum of £100,000, also taken from profits, has been placed to contingencies account. Current, deposit and other accounts at £54,566,977 show an increase of £1,856,388 over last year. Liabilities on acceptances, confirmed credits and other engagements on behalf of customers at £9,348,576 have decreased by £1,201,263.

On the assets side, cash holdings at £7,812,945 are higher by £2,589,526, while money at call and at short notice at £22,239,286 is lower by £3,360,714.

HIGH DEGREE OF LIQUIDITY

It will be apparent on examination of these figures that a high degree of liquidity is consistently maintained, and I think I should emphasise that this is essential in a business such as ours where many heavy calls are made on our resources for the financing of West African crops and general merchandise, both on an increasing scale. Investments stand at £10,371,572.

Once again I have to draw your attention to a steady expansion of business in advances, loans and overdrafts during the year. At £14,385,575, these are up by £5,185,767.

Owing to the upward trend in our profits, your directors have felt it necessary to deliberate carefully with regard to the payment of the dividend this year. It will be recalled that in 1951 the dividend was increased by 2 per cent, bringing the amount paid to shareholders up to 9 per cent. After reviewing all possible aspects and keeping in mind the possibility of price falls in some of the products financed by the bank, a decision has been reached to adopt a conservative policy this year, and I hope shareholders will appreciate that this will be in their true interests. An interim dividend of 3 per cent was paid in December, 1951, and I now have to recommend that a final dividend be paid at the rate of 6 per cent, making once more a total of 9 per cent for the full year.

WORLD DEMAND FIRM

World demand for the minerals and crops of West Africa continues to be firm, and high prices are still being paid for most of them. During recent months, there has been evidence of price falls in timber and rubber, and it may be that other West African products will, before long, suffer similar price recessions.

The commodities that the West African Colonies have to offer are extensive in variety, covering as they do tin concentrates, manganese, iron ore, gold, industrial diamonds, hides and skins, palm oil and kernels, groundnuts, cocoa, cotton, etc. Also, after a period of development, it is expected that a further one will be added when the new Nigerian lead-zinc mines come into operation. There will always be a world market for such primary products and even if prices should decline, West Africa is indeed fortunate in possessing such natural wealth of a kind so much needed by so many countries.

I have feelings of confidence with regard to the future of West Africa. Many changes are taking place and much progress is being made. Our bank is well equipped and has ample resources at its disposal for assisting in these developments and, having a progressive outlook, is well prepared for the services it will be called upon to perform.

LAMBERT BROTHERS

RECORD PROFITS

The forty-ninth annual general meeting of Lambert Brothers, Limited, was held on June 26th in London, Mr R. Ratcliff Steel, the chairman, presiding.

The following is an extract from his circulated statement for the year 1951:—

The consolidated profit and loss account shows profits amounting to £1,451,098 before providing for taxation which absorbs £808,510. Out of the net profits of £642,588, the sum of £365,965 has been put to fleet replacement reserve and the sum of £25,886 has been brought in from provisions no longer required. After deducting the preference dividends for the year and an interim dividend on the ordinary stock already paid, and providing for a final dividend at the rate of 15 per cent, plus 5 per cent bonus there remains the sum of £223,266.

The freight market continued to advance for the whole of 1951, breaking one record after another. The profits for 1951 have by far exceeded those for any year in the company's history, which enables us to propose the bonus of 5 per cent in addition to the final dividend and thus mark in an agreeable way our fiftieth year of incorporation.

A VALUABLE SERVICE

It is a further satisfaction that, due to the worldwide nature of our business, most of the revenue accrues from exports, invisible as well as visible. Your company, therefore, is performing a valuable service to this country's economy in the earnings which we make from our overseas trading.

It is fortunate that we were in a position to take advantage of the strong freight market and thus provide for leaner years which must be expected if and when a more normal state of the world's trade is brought about. Apart from the present heavy taxation which takes so large a proportion of the profit, we have considered it advisable to retain in the business what may seem to some of you an excessive amount. The shipping trade is subject to such sudden and drastic changes that your board have felt it only prudent to do so. These large profits which we obtained last year are due to exceptional conditions which cannot be expected to continue to anything like the same extent, but our aim is to maintain steady dividends so far as circumstances permit.

SUBSIDIARY COMPANY

Your shipowning company, the Temple Steamship Company, Limited, has contributed a very large share of the profits. Our ship management department manage a number of ships for clients and have been operating certain additional tonnage on charter which also contributed materially to the year's results.

Our coal bunkering stations abroad have had a good year considering the steady decline in the use of coal as a fuel for ships.

Our insurance subsidiary, Lambert Brothers (Insurance) Limited, has once more increased its business both in clientele and brokerage.

Our shipbroking, consignments and aviation departments have all considerably extended their business.

Your youngest subsidiary company, Lambert Brothers (Merchandise), Limited, has made further progress, although the difficulties of overseas trading do not diminish.

As regards the future, I feel that your company is in a position to hold its own in its various activities, but we cannot expect another year equal to the last, which has been a fitting jubilee.

The report was adopted.

CADBURY BROTHERS LIMITED

HOME AND EXPORT SALES EXCEED £30 MILLION

NEED FOR EQUATING SUPPLY WITH EFFECTIVE DEMAND

MR L. J. CADBURY ON THE FINANCIAL STRUCTURE

The fifty-third ordinary general meeting of Cadbury Brothers Limited was held on June 23rd at Bournville, Birmingham.

Mr L. J. Cadbury, the chairman, in moving the adoption of the report and accounts, said:—

The year 1951 opened with high hopes for our industry. At its beginning the ration was 5 oz per head per week, and the allocation of sugar (which is the present determining factor in production) was at the rate of 62½ per cent of the datum year (1938). In January, 1951, the domestic sugar ration was increased to 10 oz followed by six bonuses, a sign that sugar supplies were improving. Although our sugar allocation remained unchanged the use of unallocated raw materials allowed production to rise and the ration was raised to 5½ oz in February, to 6 oz in May, and to 6½ oz in July. At that level the amount of money required to buy the complete ration is about £150 million, which is nearly three times the amount which the public spent on chocolate and sweets before the war. We felt we were again moving towards the abolition of rationing.

But in the early autumn our hopes were dashed. To secure the necessary economy in dollars for the sterling area as a whole, the Ministry decided to make cuts in sugar allocations to manufacturers, and our industry was cut to 54 per cent of the datum year. The ration was reduced to 6 oz in December, 1951, where it still remains.

Turning to our own results, home sales increased in value from just over £18 million in 1950 to £27 million in 1951. About half of this additional £9 million arose from a larger output, and the other half from the increase of prices in March that followed a general price review by the Ministry of Food. Home and export sales together totalled just over £30 million.

The increased supplies of unallocated raw materials that put up our production and that of the trade generally were facilitated by the freeing of trade under the European Payments Union. This made a considerable range of sugar and fat mixtures available for importation from about the middle of 1950. We also earned a valuable sugar bonus from our exports to dollar markets and received a substantial amount of milk chocolate crumb from our postwar factory in County Kerry.

RACEHORSES TROTTING IN ALLOTTED CIRCUS PLACES

Unfortunately, when the House reassembled in January the Chancellor announced that serious cuts would have to be made in the import of nuts and of sweetened fats and fondants from the Continent. Luckily the industry had stocks of these raw materials, so the full effect of smaller supplies has not yet been felt. But we are warned that the ration may fall further.

As the use of unallocated raw materials is now to be severely restricted, our output will once again be brought more closely into line with our sugar ration. This is a percentage of our 1938-39 consumption. In the changing postwar world it is disturbing to realise that an important industry, which in the long run can only thrive and make its contribution to the national economy through lively competition, is still tied to a quota nearly 14 years old. We, who were once racehorses, are still trotting round in our allotted places in a circus.

EXPORT INCENTIVES

The true solution is, of course, to equate supply with effective demand. Until the extra sugar is available to make this possible, any other method requires careful consideration. Such consideration should certainly be given to the review the Ministry is at present making of the prewar basis of our sugar allocations in the light of outputs that have been achieved by firms in the industry through the use of unallocated and other supplementary supplies. The latter include the existing export bonuses that have already brought about a substantial departure from the basic-year system. If the Ministry desires to cause a further departure, it can do so by encouraging still greater export enterprise with larger incentives. Where, however, increased output has been achieved by the use of very substantial amounts of imported sweetened fats and fondants, new allocations revised on this basis would, in practice, cause some very unfair anomalies.

COCOA

I have dealt at some length with our sugar supplies, which at the moment control the volume of our output. Our basic raw material, however, continues, of course, to be cocoa.

During the season 1951-52 the panel system for the purchase of cocoa, described in last year's report, was operated. In accordance with the notice given in 1951, this has now been terminated and will not operate for the next season, 1952-53.

Mention was also made last year of the new Constitution in the Gold Coast and of a meeting some of us had with Dr Nkrumah, who has now assumed the full title of Prime Minister, to discuss cocoa production and particularly the swollen shoot disease. One of the first acts of his new Government had been the abolition of compulsory cutting out, the only method that has so far been proved to be a practical cure. In its place we were promised a voluntary campaign, with increased compensation for cut-out trees and higher grants for replanting. Later in the year another African member of the Government, Mr A. Casely-Hayford, the Minister of Agriculture and Natural Resources, visited Bournville and attended a cocoa conference in London. Every effort was made to impress on him the importance of active steps against cocoa disease, and through our staff in Accra and visits from home directors we have continued to prod, press and persuade those responsible for Gold Coast affairs to deal with the problem. I am glad to say that in April the Gold Coast Government decided to reintroduce compulsion where necessary in cutting out infected trees. This is good news as far as it goes; but it only means that the real effort to fight the disease and to replant has just commenced.

It is fitting that all interested in West Africa should acknowledge the very great service that British officials have performed during this difficult period of transition. It has only been through the devoted work of such people as Sir Charles Arden-Clarke, the Governor of the Gold Coast, and his assistants that there has been no breakdown in the public administration and that the economic life of the country has been able to carry on so successfully.

We are naturally very interested in the ambitious proposals for damming the Volta River and in the various schemes for hydro-electric power and irrigation. They should broaden the Coast's economy and we hope will not withdraw labour and enterprise from the production of cocoa. It is some comfort that the Gold Coast Prime Minister and Government freely confess that their future developments depend on the continued success of their cocoa crop. Our industry relies on British West Africa cocoa more than on supplies from any other source. At the same time we are continuing our world-wide survey of actual and potential cocoa-growing countries, and our small pilot plantation in Malaya is progressing.

Before the war, cocoa, at its then price, was not a very attractive crop compared with other tropical products. The position is now reversed. For instance, under a recent agreement the New Guinea planter gets a return of about £20 per acre per annum if he grows copra. Cocoa, at 300s. per cwt, should produce a return of about £100 per acre. This is too big a discrepancy to last for ever, and sooner or later it must have its effect both on the price and supply of cocoa.

MILK

Milk is our third most important ingredient and we are still restricted in this country to about one-fifth of our prewar supply. We, therefore, read with interest the remarks of Mr Peacock at the recent annual meeting of the Milk Marketing Board.

He emphasised the desirability of more milk for manufacturing purposes, especially for cheese. We agree the desirability of cheese, but we are anxious and willing ourselves to process more milk for chocolate and to pay a higher price for it than the cheesemaker. Unfortunately, we are met by Government restriction though it is not easy to see why this should be. To allow more freedom in the utilisation of manufacturing milk would stimulate the extra production that is desirable and would relieve the Exchequer of expense.

OVERSEAS ACTIVITIES

Overseas, we have made satisfactory progress in South Africa, New Zealand and Southern Ireland; but in Australia and Canada, though cash returns were maintained, the tonnage outputs were down. In the last-named country we have been hit by a reintroduced sales tax that caused 5-cent bars to be raised to 7 cents, with unfortunate results on sales.

At all our overseas factories there have been building and plant developments, and satisfactory progress is being made in erecting the new factory mentioned in last year's report, at Moreton, near Wallasey, in the Wirral Peninsula.

I have already stated the further rise that took place last year in the sales of this company. The increases in those of its subsidiaries and of other subsidiaries of our holding company, the British Cocoa and Chocolate Company, have raised the consolidated turnover of the latter at home and overseas to £50,400,000.

FINANCIAL STRUCTURE

At the end of the year we made certain changes in the financial structure of the British Cocoa and Chocolate Company so that the share capital has been brought more nearly into line with the assets. The general reserves of Cadbury Brothers, Limited, at the end of the year amounted to a little over £13 million. We have paid a special dividend from this fund of £6,237,000 to our parent company; the latter in turn has capitalised this sum and has issued three bonus ordinary shares for every four and two six per cent. preference shares for every five ordinary shares held. It is not our intention that our shareholders will receive substantially more in dividends from the business than before; in fact, it is unlikely there will be more than a fractional change, and of course it must always be remembered dividends on ordinary shares must depend each year on there being enough left over to pay them after the business has met all its commitments.

Reserves are, as you know, past profits that have paid income tax and profits tax, but have not been distributed to shareholders. Instead they have been retained in the business to meet possible contingencies. By this conversion operation a portion of them now becomes part of our paid-up capital and a permanent addition to the strength of our financial structure. The reserves that remain unconverted are in our view adequate for any calls that are likely to be made upon them.

The report and accounts were adopted.

THE INDUSTRIAL AND GENERAL TRUST

The sixty-fourth annual general meeting of The Industrial and General Trust, Limited, was held on June 19th in London.

Mr L. A. Stride, the chairman, in the course of his speech, said: Our gross income from investments is at £978,357, again a record. This represents an improvement of £119,727. Unfortunately, our liability for income tax and profits tax has increased by £96,035 to £417,524, in spite of which our net increase for the year is some £50,000.

Your directors recommend a final dividend of 12 per cent, making 20 per cent for the year, and a bonus of 5 per cent, thereby increasing the total distribution to 25 per cent.

The valuation of our investments at the date of the balance sheet was £14,609,376, which gives an appreciation over book cost of 63½ per cent, as compared with 80 per cent at the same time last year. That the fall is no greater is attributable to wise investment policy which has resulted in a widely distributed and inherently strong portfolio.

Looking no further than 12 months ahead, our revenue should remain buoyant, although I expect to see some fall from its present peak. Beyond this I cannot go. Our future is bound up with the success or failure of the industries and trade of this country. These will only succeed if the "alarm" sounded by the Prime Minister last week in his speech to the Press Association is heeded by all sections of the community.

The results we have set before you today justify, we consider, the policy which we have been pursuing, and which has placed the Trust now in such an exceptionally strong financial position.

The report was adopted.

IMPERIAL CHEMICAL INDUSTRIES LIMITED

YEAR OF OUTSTANDING PROGRESS

VITAL IMPORTANCE OF CAPITAL PROGRAMME

MR J. ROGERS ON CURRENT TRADING CONDITIONS

The twenty-fifth annual general meeting of Imperial Chemical Industries, Limited, was held on June 19th at Wigmore Hall, 36, Wigmore Street, London, W.1.

Mr J. Rogers, OBE, LLD, the chairman, presided and in the course of his speech said:—

As the report shows, the company has again broken records, both in turnover and in profits. It is true that some part of the increase in turnover is due to rising prices, but the physical volume of turnover has also increased to record levels.

The appropriations to the stock replacement reserve of £7 million and £5 million to the obsolescence and replacement of assets reserve have been made in order to guard the physical volume of the company's assets from the ravages of inflation, and the board consider that only after such transfers have been made is there a balance of profit available for distribution and the further building up of the company's reserves. As the accounts show, it is possible to make these provisions for the year 1951, to pay a final dividend of 10 per cent on the ordinary stock, making 13 per cent for the year, and still to leave a small increase in the balance on the profit and loss appropriation account.

It is the considered opinion of the directors that, after full provision has been made for the proper maintenance of the productive assets of the company, stockholders should be given, by way of increased dividends, some part of the increased profits due to the progressive expansion of the company. The total ordinary dividend for 1951, 13 per cent, before taxation, is still smaller in purchasing power than the dividend of 8 per cent paid for a number of years before and during the war. Wage earners and salary earners get increases which help to compensate them for the increased cost of living, and it is not unreasonable to consider stockholders in the same way.

RECORD OF PROGRESS

As you will have seen from the report, the company's record for 1951 is one of outstanding progress. That progress continues, and the directors have before them no shortage of important and profitable schemes of expansion and development in which the company's resources can be employed. Many of these schemes arise from years of patient and well directed research. The programme of capital extensions for the next two or three years, however, will have to be held back, in part, at any rate, because of the shortage of essential equipment and building resources for which, quite properly, priority is being given to rearmament.

Exports are as important, or almost as important, as rearmament. The company's direct exports are now running at well over a million pounds a week. In addition to the company's direct exports, it has to be remembered that a substantial proportion of our products goes to other industries which are producing for export. For this reason it is in the interests of the country, as well as of the company, that our capital programme should be pressed forward with no more delay than is absolutely necessary during the present crisis conditions. Another reason for pressing on with this programme is that we must keep ahead of foreign competition.

I have said that we have no shortage of important and profitable proposals for capital expenditure. Indeed, the board have been aware for some time of the need to be selective and to concentrate upon those projects for which the company is particularly well placed, having regard to its accumulated experience and its large and specialised research and development organisation. The company's forward capital programme is, therefore, under constant review.

FUTURE TRADING PROSPECTS

So far as our future trading prospects are concerned, I should be unwise if I attempted any prophecy today. 1952 has brought new problems to some industries which a year or two ago were having difficulty in finding enough materials and labour to cope with an excessive demand, but which today are unable to find adequate markets either at home or overseas for their output. The setback in the textile industries, for example, is not a problem peculiar to this country, but is world wide, and this setback inevitably affects the demand for dyestuffs. For other industries there has been similar change from anxiety about raw materials to anxiety about markets. Nevertheless it is difficult to interpret these signs as foreshadowing a general depression. So far in 1952 we have not been seriously affected by these conditions and our turnover has been satisfactory, notwithstanding the resurgence of German and Japanese competition. The directors remain, however, keenly alive to the need to watch changes in trading conditions, both at home and overseas, and to adapt ourselves quickly to these conditions.

EPL—A HARMFUL TAX

I am confident that we can meet this competition and that we shall continue to expand our business in spite of the obstacles to expansion placed in our way, and in the way of other progressive companies, in the form of penal taxation, which seems almost to have been designed to encourage stagnation and to prevent progress. I refer, in particular, to the new Excess Profits Levy. The chairmen of almost all important companies who have had the opportunity of making public statements since the announcement of this levy have condemned it as a most unwise piece of legislation which cannot fail to do great harm to Britain's trade and industry, and I am in complete agreement with this condemnation. Whatever the yield of this tax and whatever its purpose in terms of party politics, this tax, even in its modified form, will do much more harm than good to the country, and it is bound to hit hardest those progressive companies whose activities are most likely to assist the country to get out of its present economic troubles, particularly those engaged in the export trade.

The report and accounts were adopted.

The proposed alteration to the articles of association was approved and the proposal to increase the company's capital from £95 million to £120 million by the creation of £25 million unclassified shares of £1 each was sanctioned.

THE AUSTRALIAN ESTATES COMPANY LIMITED

A SATISFACTORY YEAR'S TRADING

SIR DENYS LOWSON ON THE OUTLOOK

The annual general meeting of The Australian Estates Company Limited will be held on July 9th in London.

In the course of his review, which has been circulated to shareholders, the chairman, Sir Denys Lowson, said:

Your directors have pleasure in presenting another satisfactory year's trading with a gross profit, almost unchanged from the year before, of £1,338,937; compared with a gross profit of £1,405,238 for the preceding 12 months.

After deducting depreciation, other charges and Australian and British tax (which together take no less than £720,064), we are left with an eventual net profit of £274,756.

The board have therefore recommended a dividend of 10 per cent, together with a special bonus of 5 per cent, out of the profits distributed by the joint organisation for the disposal of wartime wool stocks.

After providing for this distribution, and the appropriations set out in the profit and loss account, including the transfer of £50,000 to general reserve, the amount to be carried forward to 1952 is £149,625.

Since the close of our last accounts, we mourn the passing of Mr R. C. Whitcroft, who had been a director of this company for no less than 17 years. In his place we warmly welcome Mr A. G. Allen; and we feel certain that his wise guidance, sound counsel, and wide business experience, will be of great benefit to the company.

The year 1950 was one of exceptionally high wool prices, and again in 1951 the return from our sheep and most of our cattle properties was very satisfactory; while the agency department results were also unusually good. Due to the unfavourable weather and dry season, supplies of cane to our sugar mills were greatly reduced, as also the sugar content of the cane, and the returns from the mills were, therefore, disappointing.

Since the close of the year, in March, 1952, a second interim distribution has been made to Australian wool growers from profits arising from the wartime purchase of Australian wool clips by the Government of the United Kingdom, and the operations of UK-Dominion Disposals Limited. This was at the rate of 6¼ per cent and amounted to £25 million; the company's share being £84,000. It will be recalled that a similar amount was distributed in 1949; and there will be some further distributions in due course on dates to be fixed by the Commonwealth Government.

Expenses continued to rise during the year, mainly due to the periodical adjustment of wages based on the cost of living in Australia, which rose each quarter; and all costs are now two or three times higher than they were a few years ago.

These increases also make the cost of replacement of buildings, plant and machinery extremely expensive, and in most cases the depreciation allowed for tax is a long way below the amount needed for future replacement. It is therefore essential to provide substantial reserves to safeguard replacements, and the high rate of taxation makes it difficult even then to make adequate provision.

The company has aimed at maintaining first-class improvements on all its pastoral properties, and installing the most modern machinery and equipment in its mills, and so playing its part in the development of Australian primary industries. During recent years large sums have been spent to this end, and the company takes some pride in feeling that its policy has been justified by improved efficiency throughout, and by the appreciation of its staff and employees. It is also evidence of the confidence held by the company in the future of Australia, despite occasional setbacks from droughts and low prices.

PASTORAL

After the unusually severe wet season in Queensland and New South Wales, mentioned in my last report, the rainfall for the year 1951 fell to an extremely low level in Queensland, which affected the wool clips and lambings; but it was a healthier stock year, and the mortality losses were light as compared with the heavy losses from blow-fly in 1950.

The very wet season in 1950 resulted in a particularly heavy growth of grass, and other edible matter, which naturally during the drought of 1951 dried up and became very inflammable; with the result that in many parts of the country there were some of the worst bush fires on record. Our properties, in the main, escaped from the fires through the energetic measures taken by the various station staffs; though we suffered a certain amount of damage to fencing, and loss of stragglers among the animals.

The wool clip from all the company's Australian stations was 8,201 bales, as compared with 9,083 the previous year, the reduction being due to a lighter cut per head all round. The average price realised for the clip was about 25 per cent lower than 1950, which, as already mentioned, was a year of exceptionally high values.

Ordinary station expenditure on all properties again rose more than 40 per cent above the 1950 figure, and was over 68 per cent above that for 1949.

RESEARCH

Apart from the useful work continued by our Research Departments at Kalamia and Pleystowe Sugar Mills, agricultural experiments were continued at our North-Western and South-Western properties. These, however, have not met with great success due to the variable seasons. Much valuable advice has been given from time to time by the Queensland Department of Agriculture; but it appears now that we can hope for comparatively little assistance from agriculture in those districts, and that it would not be safe to rely on this special cultivation for providing a permanent source of feed for our animals except possibly for a few of our special pedigree stock.

SUGAR

Rainfall on nearly all sugar districts of Queensland was well below the average; and, as a consequence, the lower cane crop yielded only about 705,000 tons of sugar, as compared with 879,648 tons the previous year, a reduction of over 170,000 tons.

The consumption of sugar in Australia is increasing; and, while last year approximately 56 per cent of the production was used in Australia, it is expected that in 1951 this may be increased to nearly 70 per cent; due, of course, partly to the reduced production but also to the increased population and increased use of sugar in Australia.

Our Kalamia Mill crushed 198,464 tons of cane, as compared with 253,828 tons in 1950, a reduction of about 21 per cent. Our own cane farms harvested 11,335 tons of cane, as compared with 11,237 tons.

In the Mackay district the Pleystowe Mill crushed only 190,238 tons of cane, as compared with 265,127 tons the previous year, a reduction of about 28 per cent; that district had an exceptionally bad season due to the drought following on the excessive rainfall of the previous year, which had already killed much of the young cane.

AGENCY

The wool and produce, stock and station and general agency branch of our business had a satisfactory year, and the Victorian business particularly showed a good return from the company's organisation and subsidiaries.

During the year the company acquired the business of the original John McNamara & Company at Shepparton and Tatura, in Victoria, which will, in future, together with the company's Numurkah sub-branch, come under our existing subsidiary company, John McNamara & Company Pty. Limited.

IMPROVEMENTS

During the last few years your directors have had in hand a comprehensive programme of improvements and betterments to all your properties, so as to bring them up to the best possible standards and to ensure efficient working, together with a well-satisfied staff and organisation. As regards the Pastoral properties, the original programme should be substantially completed during the course of the current year; but we are still faced with a considerable outlay at our sugar mills which, with the big rise in prices since the programme was initiated in 1949 and the subsequent delays in the delivery of machinery, will mean that we shall have to spend considerably more than originally anticipated.

WOOL

At the end of August, just prior to the opening of the Australian wool-selling season, 1951-52, two important decisions affecting the wool auction system were made in Australia—the first, that the wool growers had rejected by a majority of four to one a reserve price plan, and the second that Australia would not be a party to any wool allocation scheme. This scheme was outlined in my last report. All uncertainties regarding any change in the established method of disposing of the Australian clip—except under actual war conditions—were thus removed.

A comparison of clean costs on the show floor for average 64s from figures supplied by The Australian Wool Realisation Commission shows the drastic fall in wool prices during the last year:—

March, 1951	377d.
August, 1951	150d.
February, 1952	130d.
April, 1952	120d.

Falling prices have been disturbing, but there has been good competition, although not so animated or widespread as in the previous season.

Great Britain, while buying in smaller volume than in 1950-51, was again the largest purchaser, followed by France, the United States of America, Japan and Italy. Reduced quantities were obtained by Belgium, Germany (Western Zone) and Poland.

The Australian Wool clip in 1950-51 amounted to 3,520,313 bales, and it is estimated will number 3,440,000 bales in 1951-52. The decline is mainly due to a lighter cutting clip in New South Wales and dry seasonal conditions in Queensland.

During the 11 months ending May 31, 1952, 3,181,835 bales had been sold, which realised £287,532,743, at an average price of 73.23d. per lb. For the same period last year, 3,353,102 bales realised £616,238,187, the average per lb being 148.63d.

A fall in cash receipts of over £300 million in 11 months was bound to be seriously felt by the Australian wool industry, and it has also had repercussions on the whole Australian economy.

OUTLOOK

Our latest advice from Australia is that the seasonal prospects for 1952 in the sheep districts of Queensland and New South Wales (which were dry for the first portion of the year) are now reasonably good and should hold for the greater part of 1952.

In the cattle districts of far North-West Queensland the drought which commenced in 1951 still continues; as the wet season, which invariably comes in January-March, failed, and except for a few thunderstorms there has been little relief.

The losses in breeding cattle will unfortunately be felt for some years to come and, from past records, it is one of the worst periods that the North Queensland cattle-industry has ever experienced.

Similar conditions exist in the Northern Territory of Australia, where the owners are in even a worse plight than ourselves, in that the roads are closed and there are no railways to enable them to get cattle out.

The prospects in the sugar industry are slightly better than they were last year, although, unfortunately, crushings are expected still to be below average, as the drought has adversely affected the growth of the cane.

STAFF

We should again like to place on record our warm thanks and regard for the magnificent work carried out by our Australian director and general manager, Mr G. S. Colman, and all those under him, both at head office and in control of our various branches and departments. Without their unremitting attention and zeal, under Mr Colman's leadership, it would not be possible to lay before the shareholders the results which we do today; and we must again express our great gratitude to them all.

J. & P. COATS, LIMITED

SATISFACTORY RESULTS—INCREASED PROFITS

HEAVY BURDEN OF TAXATION

MR ROBERT LAIDLAW'S REVIEW

The sixty-second annual general meeting of J. & P. Coats, Limited, was held in Glasgow on June 19th.

Mr Robert Laidlaw, chairman of the company, who presided, said in the course of his speech:—

THE YEAR'S RESULTS

First of all let me say a few words on the year's profit. If, for the purpose of comparison, we eliminate the exceptional exchange gain of £2,800,000 in 1950, we find that the 1951 profit is higher by just over £2 million. This is an exceptional result, but our view of it has to be tempered by the fact that fully half of it resulted from sales made from stocks, the cost of which was appreciably below the level at which they had to be replaced. We are bound to modify our view still further by reference to the penal burden of taxation with which these earnings are charged. The total charge in the year's accounts for United Kingdom taxation was £5,180,000. In addition, before our overseas profits reached us they had already suffered £3,291,000 of foreign taxation.

You will notice that the parent company received a greater proportion of the group earnings than in 1950. This is a situation largely out of our control, since it depends, so far as much of our overseas earnings are concerned, on the existence of remittance facilities. From this point of view it may be taken that 1951 was a fortunate year.

REPLACEMENT VALUE OF ASSETS

A year ago I said that we hoped at this meeting to give an idea as to the current replacement value of the fixed assets of our various companies. These stand in the balance sheet at an original cost of £26 million. Today the same assets could not be replaced below a cost of £113 million. While this figure will fluctuate with changing prices, the difference between original and replacement cost is itself a solid reason for the conservation of earnings.

The increase in the stock valuation from £39 million to £53 million between December, 1950, and December, 1951, was due, firstly, to a marked increase in raw cotton prices during the year, to which I will make reference later, and, secondly, to an increase in volume.

Apart from capital excessively tied up in stocks, there is the ever present danger of an inventory write-down consequent on falling values of raw cotton—a possibility all the more marked by the trend of recent cotton prices. Under these circumstances your directors saw no alternative but to reduce production in the mills both in this country and abroad. The curtailment of our production has varied between mills, but practically all mills everywhere have been affected. The decision to curtail output was taken with the greatest reluctance, as your directors are well aware of the hardship this is bound to cause. The world situation and the high level of our stocks made the decision inescapable.

DIVIDEND POLICY

Taking into consideration what I have said, and as events have turned out, I feel that the dividend policy your board has followed over the past few years has been justified to the full. There is nothing in prospect at the present time which would cause them to propose an increase. They decided, therefore, to recommend to you that £3,500,000 should be added to the general reserve and that the ordinary dividend should be maintained at 12½ per cent.

TRADING CONDITIONS

For twelve years, trading in textiles has been on a sellers' market. Now that this is no longer true, our customers, whether they be manufacturers, wholesalers, retailers or consumers, find that they can work with much smaller current stocks than they had previously supposed. The reducing of their high stocks accounts to a great extent for the severity of the present falling off in the demand for our products.

The volume of Government orders in the home market has increased, but so far forms an insignificant proportion of your company's sales in this market.

In a time of declining trade, competition for the volume that still remains inevitably becomes more severe. Our experience is no exception to this rule. We have to match the efforts of our large international competitors and also local competitors growing up in individual markets who become ever more numerous.

INTERNATIONAL TRADE

The present international fashion of cutting imports when foreign trade gets out of balance is bound to do more harm than good when it is applied between countries which are normally complementary in terms of trade. In the long run, this country, of all others, can least afford any reduction in the volume of international trade. The present trend appears to be that all countries desire to export the maximum amount of goods and to import the minimum. The international effect of this is, of course, to reduce trade to its minimum. If the aim of each nation is to attain self-sufficiency, international trade will tend to the level of the 18th century, when it virtually consisted of luxury articles and a few raw materials.

SYNTHETIC FIBRES

You may have seen, some months ago, references in the Press to the influence synthetic fibres might have on your company. I therefore propose to say a few words on this subject. So far the thread uses in which synthetic fibres are superior to cotton are marginal, but, of course, synthetics are still in their infancy. It seems probable that all synthetic fibres will not be equally satisfactory for all thread purposes; the use of each synthetic may be limited. Your company, therefore, is keeping abreast of all synthetic developments at home and abroad, and has already produced a range of synthetic threads. It intends to lead in their development as it has led in the development of cotton threads. We hope to give our customers, and particularly our industrial customers, not only supplies of the synthetic thread they require, but advice as to what is best suited to their needs. Owing to the variety of synthetics now being developed in various markets, and the complexity of the subject, our task is not easy, but we are fully alive to its importance.

COTTON

With regard to our supplies of raw cotton, during 1951 the world price of the longer staples of Egyptian cotton fell from the high prices ruling in the early part of the year, until the late summer, but, owing to the poor quality of the new crop, prices took a severe upward swing in the autumn and reached an all-time peak about the end of the year when the best quality of Karnak cotton was quoted at 140d. per pound. Since then there has been a considerable decline in the

Alexandria market and the same cotton is today quoted at about 94d. The 1951 crop in Egypt was lacking in the high grades of cotton we require for our specialised purposes and, although we received every assistance from the Raw Cotton Commission, we were forced to make changes in our cotton qualities. Luckily, the 1951 Sudan crop was not only exceptionally good in quantity, but also in quality, and to a large extent we were able to make up the deficiency in Karnak from this source.

I have referred several times in the past to the fact that we believe the Government method of buying cotton in bulk, more particularly when purchasing the highest grades, to be inherently unsound, despite the best efforts of the Raw Cotton Commission. The report of the Hopkins Committee on the import of raw cotton into this country has been recently issued and its recommendations have been accepted in principle by Her Majesty's Government. This report proposes that spinners who elect to purchase for themselves may do so under certain specified conditions. I consider this a step in the right direction and we propose to take advantage of it.

OVERSEAS MILLS

I mentioned last year that we had decided to erect a mill in Southern India, and, despite delays which have taken place in regard to the necessary constructional materials, the first part is approaching completion. We hope to commence small scale production in the late autumn of this year.

We have taken an interest in a small manufacturing unit in Turkey, which we hope will also be in production before the end of this year.

The report and accounts were adopted.

KILLINGHALL TIN

WORKING IN GOOD GROUND—EXCESSIVE TAXATION

The twenty-second annual meeting of Killinghall Tin, Limited, was held on June 19th at the registered office, Asia House, 32, Lime Street, E.C.

Mr Jack Addinsell, the chairman, in his statement, issued with the report and accounts, alluded to the fortitude in difficult and dangerous circumstances of the general managers, Messrs Osborne and Chappel, and the mine staff, and said:—

Although the 465½ tons of tin ore recovered during the year is less by 58 tons than in the previous year, the higher price for our product resulted in a satisfactory profit of £141,894. From this must be deducted taxation in Malaya and this country, £94,300. The Malayan Government received £55,855 in royalty and tin duty, making a total contribution to the revenues of the United Kingdom and Malaya of £150,155. A figure of such magnitude is surely excessive.

An additional 15 per cent of the War Damage Assessment has been received and offset against the Government advance, reducing the amount of the advance outstanding to £13,602, which further payments should more than cover.

The forecast that during the current year the dredge would continue to work ground of good value is being borne out, but high taxation and the overall political position in Malaya are causes for concern.

An interim dividend of 15 per cent has been paid and £20,000 transferred to general reserve. Your directors recommend a final dividend of 15 per cent, leaving £14,598 to carry forward.

SUEZ CANAL COMPANY

A CREDITABLE ACHIEVEMENT

INTERNATIONAL SERVICE MAINTAINED THROUGHOUT CRISIS

The annual general meeting of the Suez Canal Company was held on June 10th in Paris.

M. Francois Charles-Roux, the president, in the course of his speech, said:—

Although the report of your board of directors deals only with the results of the year 1951, it does give a hint that those of the first few months of 1952 show a marked increase. This is all the more interesting since receipts have increased in spite of the reduction in transit dues. For this reason, we have decided to keep this reduction in force although we are not yet half way through 1952.

It seems to us, therefore, that the report presented to you is not devoid of factors which inspire confidence. It remains for me to pick out one, which is by no means the least, and that is the way in which your company has faced up to a political situation to which it was in no way a party, but of which both the canal and the company suffered the repercussions. It ensured the transit of a record number of ships through the canal during this period of crisis and succeeded in avoiding interruptions in traffic except on very rare occasions and then only for a few hours. The obvious devotion of your company to the duties devolving upon it, its single-minded concern to fulfil them in the best possible way and to remain equal to them whatever the circumstances, and the added activity it displayed to serve users of the canal, forced the esteem of the opponents in a conflict to which the company was not a party, and permitted it to remain on the best terms with both of them.

I mentioned to you, in my address last year, that your company was striving to be the most useful screen between Egypt and the general interests centred on the Suez Canal. This is what it was during this troubled period of the winter 1951-52, during which it kept the canal working, though 37 per cent of its traffic sails under the British flag, while the events I have briefly described to you were taking place on its banks. The company thus did what would have been difficult for the Egyptian Government to do of its own accord and what would have been damaging to it not to do.

Neither did your company fail in its humanitarian duty. Your administrative department, your surgeons and doctors, the nuns from your hospital and the branch of the French Red Cross at Ismailia, came to the assistance of personal or collective misfortunes which could not but follow from affrays and incidents.

So it seems to me that your company has written a page of its history which in no way detracts from the consideration it needs to discharge the great international service it provides.

TWO INTERESTS

One last remark is worth making. Circumstances have laid particular emphasis on two interests. One is the international interest in the canal, that is to say the desirability of uninterrupted and regular traffic for all nations using this waterway. The other is the interest of Egypt and of the Egyptian Government not to incur the responsibility of interrupting traffic. These two interests tally with one another and with that of your company. They combine to make it desirable as much for the many users of the canal as for the conceding power and the concessionary company itself that traffic be guarded against all possibilities of stoppage, interruption or impediment. It is so rare nowadays to find common agreement between various interests on an important subject that I should blame myself if I did not mention this instance to you.

DIRECTORS' REPORT

The following are extracts from the directors' report:

The financial year 1951 recorded a pause, as it were, in the upward trend, which had been continuous since the end of the war, in your company's receipts, seeing that, in 1951 these were within 1.4 per cent of the previous year's figure. It is remarkable that the falling off was so small considering the events which affected the operation of the canal during the past year.

Two factors could have reduced the volume of traffic: the opening of the Trans-Arabian pipeline and the cessation of production at the Persian oil wells and the closing of the Abadan refinery. The effect of these two factors was compensated by the soaring production of crude oil in the Persian Gulf countries other than Iran, and by a new feature consisting in the export from Europe of large quantities of refined petroleum products to ports east of Suez.

The fact that the net tonnage of transiting vessels, at 80,356,000 tons, and the number of transits, at 11,694, show only a slight reduction, not more than 1.8 per cent compared with the previous year, is attributable to these two favourable factors.

Cargo carried through the canal reached the record figure of 76,753,000 tons weight, an increase of 4,144,000 tons, i.e. 5.7 per cent. The increase in the tonnage of goods was due entirely to south-bound traffic, which totalled 17,420,000 tons showing over 1950 a remarkable increase of 43.5 per cent, attained chiefly in the second half of the year.

Goods carried by north-bound vessels, at 59,333,000 tons, showed a reduction of 1,135,000 tons, 1.9 per cent, entirely attributable to petroleum products.

The prospects with regard to traffic during the current year appear encouraging both for petroleum products and for other commodities and except for unforeseeable circumstances it may be hoped that on the whole, traffic in 1952 will reach a level at least comparable with that of the preceding year.

Receipts for 1951 amounted to Frs. 27,633,623,806, a reduction of Frs. 386,662,424, whereas expenses, which totalled Frs. 12,821,158,910 were higher by Frs. 2,115,663,980. There remains available a profit of Frs. 13,659,852,813. To the available balance of Frs. 13,659,852,813 is to be added the balance brought forward from the previous year, Frs. 62,240,904, making a total of Frs. 13,722,093,717. The proposed allocations will bring the total reserves to a level more in line with the magnitude of the company's operations.

The total gross dividend will thus be Frs. 9,000 to which will be added, for capital shares, the statutory interest for 1951 amounting to Frs. 1,429.

The full report, in French, will be sent on application to the Suez Canal Company, 6, Bishopsgate, London, E.C.2.

VENNER, LIMITED

IMPROVED FINANCIAL RESULTS

RECORD OUTPUT

The forty-first annual general meeting of Venner, Limited, was held on June 24th, at New Malden, Surrey, Mr Arthur A. Rowse, CBE, MIMechE, MICE, MIEE (the chairman), presiding.

The following is an extract from his circulated statement:—

It is gratifying to be able to report that the progress shown in the last report has been continued during the past year and is reflected in the improved financial results. The output reached a figure which is a record in the company's history.

The figures in the balance-sheet show modifications commensurate with the change in the volume of trading. Stock and work-in-progress has risen from £261,663 to £314,275; debtors are slightly down at £100,897 compared with £119,183; the trade creditors have risen from £50,662 to £72,427. The bank overdraft is slightly down at £3,130 compared with £4,477. The current assets have risen to £425,818 and exceed the current liabilities of £136,470 by £289,348, being a reduction of £13,681, due mainly to provision for taxation which it will be observed has risen from £15,190 to £43,903, and the considerable expenditure during the year on additions to plant and other fixed assets.

In the current accounts there is no provision for excess profits levy, but indications are that it will be necessary in the accounts for next year. It is unfortunately the case that the base years for the excess profits levy are years in which the company was struggling to overcome its post-war difficulties, and this levy will have an adverse effect on the progress of your company.

These post-war difficulties were largely brought about by governmental restrictive legislation and nationalisation schemes. They constituted operating conditions quite outside the control of the company and completely unrelated to its commercial efficiency or otherwise. They were nevertheless a serious brake on the rate of recovery. It is peculiarly inappropriate that the position as we go to press is that the necessarily meagre results of these years, or any two of them, should now be taken as the standard above which additional profits are regarded as an excess and on which punitive taxation is levied. It is one more illustration of the far-reaching effects of governmental interference in business, and the great difficulty of avoiding unfairness as between different companies. It is to be hoped that the manifest unfairness of the levy in cases such as this will be recognised and rectified.

FACTORY EXTENSIONS

The company is, as foreshadowed in the last report, engaged upon rearmament work and this, coupled with the increased volume of general business, has rendered it necessary to proceed with the factory extensions which were then indicated as a possibility. This factory space should come into production towards the end of the current year and will be a valuable addition to the manufacturing resources.

The operations of Venner Accumulators, Limited, our wholly owned subsidiary, continue to show great promise. Development work has continued without interruption throughout the year and considerable progress was made in detail technical improvements. The battery has now been adopted as standard on certain defence requirements; one well-known British aircraft has captured a number of world's records on a plane fitted with the battery, which has given complete satisfaction. During the year the company secured the right to export batteries to Canada and this field of application is promising. Indications are that before long the volume of production will necessitate serious consideration being given to the problem of additional premises.

THE YEAR'S RESULTS

The profit for the year, after making all the necessary provisions including depreciation and the writing off of the accumulator development costs, amounts to £66,694. To this must be added the balance of £14,077 brought forward from last year's accounts, making a total of £80,771.

Income tax absorbs £11,184 and profits tax £22,185, making a total of £33,369. The net amount available—namely, £47,402, is proposed to be allocated as follows: dividend on Eight per Cent Cumulative Preference shares for the year ending September 30, 1951, £1,290; to general reserve £15,000; to pay a dividend of 15 per cent on the ordinary stock, absorbing £17,010, leaving to be carried forward the sum of £14,102.

The present government has rightly advised against excessive dividends and the previous government had proposed to limit them by law. We are proposing an increase in the dividend rate for the current year. It must not be lost sight of that development of new processes and new industries is done at the risk of the money subscribed by the shareholders of those enterprises. Moreover, work of this character must go on if the company is to maintain its position in the industry. Capital will not be attracted into this development work unless it is remunerated fairly over the years.

FUTURE OUTLOOK

The future outlook is so largely conditioned by circumstances outside the company's control that any accurate forecast would be out of the question. There has, as is well known, for various reasons—among them the credit restrictions consequent on the increase in the Bank rate—been a general trade recession in the demand for consumer goods. Additionally, Australia which was one of the company's best markets is, for the time being, practically closed, due to the action of the Australian Government. Other overseas markets have been restricted. On the other hand, the company's products are of such a nature that they must be among the first to recover, being in many cases essential to development schemes involving the use of electric power. Additionally, the new products which the company has developed, have gone some way to balancing the foregoing reductions in demand.

There is the final consideration which is, of course, of great importance—namely, that so far as rearmament is directly or indirectly responsible for these restrictions in demand, the company's turnover will be, and is being, improved by the demand for defence supplies.

There is no reason to anticipate that the current level of activity is likely to fall off at least during the present year, 1952: but the residual benefit to the company and to the stockholders is very largely contingent on the taxation that is eventually levied.

The report was adopted.

JOHN BRIGHT AND BROTHERS

INCREASED PROFIT

DR E. P. ANDREAE ON THE OUTLOOK

The twenty-ninth annual general meeting of John Bright and Brothers, Limited, was held on June 25th in London.

Dr E. P. Andreae, chairman of the company, in the course of his speech, said:—

The report and accounts cover the twelve months' period ended March 31st last. When addressing you at this time last year, I told you that I looked forward with some degree of optimism to a year of full production, in spite of the many difficulties we were bound to encounter. The accounts amply justify the forecast, in that they record a trading profit of £1,391,617, as compared with the previous year's figure of £936,757.

We are recommending a final dividend of 1s. per share on the ordinary shares, which, with the interim dividend already paid, makes a total of 1s. 3d. for the year.

When a company has to record a drop in profit, shareholders, quite rightly, expect some explanation as to the causes. On the other hand, a marked rise in profits nowadays, if not explained, is often misunderstood, and in some quarters may even be thought to carry with it the stigma of "exploitation."

I would, therefore, like to take this opportunity of telling you why it is that your company has progressed apparently against the tide of general depression in the Lancashire cotton industry. The fact is that the "tide" has not been against us. I must emphasise that we cater for the industrial field. We are specialists in the production of all types of industrial fabrics and, as such, the factors governing the level of our activities are totally different from those governing the general trade of the textile industry.

PLANTS WELL OCCUPIED

It may be said, therefore, that on the whole our various plants have been well occupied throughout the year, and that new installations coming progressively into operation have increased efficiency, and contributed notably to the improved results shown, while at the same time enabling us to deal effectively with a volume of trade some 15 per cent greater than last year.

During the past five years we have spent on plant and buildings nearly one million pounds out of earnings, and this fact, together with all the organisation that goes with it, provides whatever explanation may be needed to justify the continued growth of our company.

For some years past, the Raw Cotton Commission has been the sole authority for importing and distributing raw cotton to British users. Recently the recommendations of the Cotton Import Committee were adopted, with the result that spinners now have the option, at stated intervals, of "contracting out" or buying on their own behalf, either their total requirements or their requirements of a stated group of growths. We feel that it is a step in the right direction. Although we have had consistently excellent service from the Raw Cotton Commission, we propose to avail ourselves of this opportunity of "contracting out" and expect thereby to effect a considerable saving in the cost of our raw material.

In these times of quick changes and general uncertainties, no forecast of the prospects of any industry can be made with any degree of confidence.

In general, while I think it would be unwise to expect for the current year such record figures as we achieved this year, I do look forward to another successful year.

The report was adopted.

THE CONSOLIDATED ZINC CORPORATION, LIMITED

VERY SATISFACTORY RESULTS

MR JOHN R. GOVETT ON PRICE FACTOR

The third annual general meeting of the Consolidated Zinc Corporation, Limited, was held on June 25th, at 37, Dover Street, London, W.1, Mr J. R. Govett (the chairman) presiding.

The following are extracts from his circulated statement:—

The results for 1951 are very satisfactory, with prices for lead and zinc maintained at a high level throughout the year. The group profit, before taxation, amounted to £7,031,874, compared with £4,570,800 for 1950, an increase of £2,461,074. Taxation absorbs £4,483,113, as against £3,011,419 for the previous year. The net profit for the year available for distribution is £2,404,708, which shows an increase of £975,028. The directors consider that the results justify an increase in the final distribution and they recommend a final dividend of 2s. per share, together with a bonus of 1s. per share. These proposals give a total distribution for the year of 4s. per share, compared with 2s. 6d. per share for 1950. The total sum retained in the group out of revenue and capital profits earned during the year amounts to £1,747,302. The year's results reflect not only a high level of prices for our products, but a high degree of efficiency throughout our operations.

In January, 1951, the United States Government imposed ceiling prices on both lead and zinc at the 17 and 17½ cents level; these prices being subsequently raised on October 1st last to 19 and 19½ cents respectively. Following upon this policy of price control a heavy demand for both metals developed in the rest of the free world, where market quotations rose substantially above the United States ceiling prices.

THE SCRAMBLE FOR SUPPLIES

To deal with the scramble for supplies, which was prevalent also in a number of other important commodities, the International Materials Conference was held in Washington in the spring of 1951. The object of this conference and of the committees which were then formed has been to allocate amongst the free world the available tonnages of such strategic materials as were considered to be in short supply. Zinc, in view of its importance to the defence programme, was given a high place in the discussions, and with the agreement of the participating countries an international allocation scheme came into effect in the last quarter of 1951. Lead, although the assumed shortage was almost as great, is no longer regarded as having the same strategic importance as zinc, hence this metal was not included in the scheme, although from time to time it was announced that a close watch was being kept on its position.

It may be said with some confidence that if the more violent movements in commodity prices can be ironed out without interfering with the natural laws of substitution, producers will be able to enter into long-term capital and labour commitments without incurring the tremendous risks that have faced them in the past.

The high prices of the past two years have encouraged the search for fresh sources of production, and though time must elapse before new supplies reach the market it is hoped that the normal growth in the world's requirements on a peacetime basis will take care of this increase and reward the venturesome for their enterprise.

The report was adopted.

PENGKALEN, LIMITED

MR STANLEY WICKETT'S REVIEW

The forty-fourth ordinary general meeting of Pengkalen, Limited, was held, on June 20th, at the Registered Office, Redruth. Mr Stanley Wickett (chairman) presided.

Before proceeding with the ordinary business the chairman referred to the loss sustained by the company since the close of the financial year by the death on March 6, 1952, of Mr J. W. Horton Bolitho, who had been a director from the inception of the company in 1907. His services had been greatly valued, and the meeting stood in silence as a mark of respect.

The report and accounts for the year ended September 30, 1951, having been circulated for the prescribed time, were taken as read, as was also the chairman's statement, circulated with the accounts, which was as follows:—

The statement of accounts for the year ended September 30, 1951, submitted herewith shows a gross profit of £285,874. The sum of £63,116 has been transferred to general reserve, and out of this sum £50,000 has been earmarked against the amount which the company will probably have to provide out of its own coffers when final settlement is made by the Malayan Government towards the cost of rehabilitating the company's plant and machinery. This company's claim has been drastically scaled down as foreshadowed in my last year's address, and apparently there is no redress.

Dividends during the year absorbed £46,250 net. Provision for taxation required £161,418, in addition to which the Malayan Government received £67,289 in respect of royalty on sales of tin ore.

The figures given above illustrate the important contribution this company is making to the armaments drive and to the revenues of Malaya and Britain. They clearly demonstrate the justice of the claim presented to the Chancellor of the Exchequer by the Malayan Chamber of Mines and by your board for total exclusion from the Excess Profits Levy.

After sundry debits and credits the profit and loss balance has been increased from £20,851 to £34,387, which amount the board proposed carrying forward to the next account.

CURRENT YEAR'S OUTPUTS

Outputs for the current year have been:—

October to December, 1951,
2,260 piculs of tin ore = 134½ tons.
January to March, 1952,
2,330 piculs of tin ore = 138½ tons.

The report of the general managers, Messrs Osborne and Chappel, which is attached, gives full particulars of the work at the mine during the year.

I am happy to state that no serious incidents occurred at the mine although Communist terrorist activity was frequent in the vicinity. That efficiency is maintained is proof of the fortitude of the men and women who have few opportunities for recreation, and who for approximately four years have played a leading part in steadfastly withstanding Communist aggression.

To our general managers, the staff at the mine, their wives, and the labour force, I once again record our thanks, and I am sure that shareholders will approve the action of the directors in authorising the payment, at the discretion of the general managers, of substantial special gratuities with respect to the year 1951.

The statement of accounts and balance sheet, together with the directors' report, were received and adopted.

PATALING RUBBER ESTATES

INCREASED PROFIT

The thirty-second annual general meeting of the Pataling Rubber Estates, Limited, was held on June 23rd in London.

Sir Eric Miller, the chairman, in the course of his speech, said: When I addressed you a year ago I referred to forward sales we had entered into for 1951 and added that one way or another we should be able to put up a good showing for the year. In the event the profit before taxation was £100,000 higher than for 1950 and the net profit £48,000 higher. While the average sale price of 4s. per lb London landed terms was gratifying, our production costs increased over those ruling for 1950 by about 7½d. per lb, due to higher wage rates and a steep increase in the rate of export duty.

LABOUR WAGE RATES

Labour wage rates have been automatically regulated since July, 1951, by a freely negotiated agreement between the Malayan Planting Industries Employers' Association and the Pan Malayan Rubber Workers' Union, with due regard to changes in the market price of rubber, cost of living and other relevant factors. The basis for renewal of this agreement is now under negotiation, to fit in with the changed circumstances of the industry. Similarly the steeply rising scale of *ad valorem* export duty introduced in Malaya as from January 1, 1951, at a time when the price of rubber was near the top, should be promptly reviewed in the light of the changed conditions.

On our 1951 crop the export duty worked out at about 5½d. per lb which was 3½d. per lb higher than the duty on our 1950 crop. Part of the 1951 duty was collected as a cess for replanting and new planting, in which respect we have qualified for the repayment of our contributions less administrative expenses.

We recommend the payment of a final dividend of 25 per cent, making 50 per cent for the year, the same as for 1950. We deem it our duty to stockholders to pursue a continuous policy of modernisation, and in view of the severe fall in the price of rubber the conservative policy adopted will, I am sure, meet with your approval, in particular the addition of £50,000 to dividend equalisation reserve. Reports upon all the company's estates continue to be satisfactory.

We continued our rejuvenation programme to the extent of replanting 225 acres, and in addition we undertook new plantings of 212 acres. During the current year we have budgeted for a modest extension programme of 121 acres of new rubber plantings and, in addition, the replanting of a further 140 acres, all of course with the best material.

THE CURRENT YEAR

We are estimating for a rubber crop in 1952 of about five million lb, a figure well within the capacity of the estates. We are participating in some group forward sales for shipment through 1952 at prices which look particularly satisfactory today, and in addition that part of our crop which is turned out in the form of sole crepe, though on a smaller scale than in recent years, should secure a reasonable premium over ordinary rubber.

The price of rubber is a matter of primary importance to South East Asia, which area is in the front line of the conflict with Communism. It seems extraordinarily difficult to get effective co-ordinated action along the lines which statesmanship calls for at this critical period.

The report was adopted.

LONDON ELECTRIC WIRE AND SMITHS, LIMITED

RECORD RESULTS

The forty-third annual general meeting of the London Electric Wire Company and Smiths, Limited, was held on June 25th in London.

Mr W. J. Terry (chairman and managing director), in the course of his speech, said: The total reserves and unappropriated profits now amount to £3,690,007 which is more than two and a half times the total issued capital and constitutes one of the outstanding features of the balance sheet.

I am pleased to say that there has been some easement during the last few months in respect to supplies of some of the raw materials used in our manufactures but copper, our principal raw commodity, is still much restricted. This shortage has been a great embarrassment because it has meant limiting deliveries to our customers, thus causing them considerable inconvenience and frustration.

It is our opinion, which is generally shared by other consumers both in this country and on the Continent, that the only way to stabilise prices on a world basis is to re-open the London Metal Exchange as soon as can be.

DIVIDEND AND BONUS

The results of last year's trading constitute a record for this company and I trust will be regarded with satisfaction. To some extent the profits have been increased by inflation and a physical reduction in stocks. In the circumstances, your board felt justified in recommending a bonus of 2½ per cent in addition to an ordinary dividend of 10 per cent for the year. The new £1 ordinary shares were issued last year at 40s. per share and the return on this issue is therefore 6¼ per cent.

So much has been said about the iniquities of the excess profits levy that it is difficult to say anything new about this obviously ill-conceived and inequitable piece of promised legislation. It was ill-conceived because at the very beginning it was introduced as party vote-catching propaganda—in this respect neither of the two principal parties can be absolved—and now, unfortunately, the Government cannot go back upon its election manifesto however much it might desire to do so.

EXTRAVAGANT GOVERNMENT EXPENDITURE

The country has suffered many consecutive years of extravagant Government expenditure for which the public must foot the bill, a consequence which is not generally understood; nor is the unfortunate plight in which this country finds itself as yet realised by the community. Existing circumstances demand no gentle measures but a bold policy of retrenchment in Government expenditure carried through with courage and conviction. It is a misnomer to call this country a "Welfare State" when far more is taken out of the public in taxes than is returned in benefits, and taxation must be drastically reduced in order to restore the required incentive to effort.

The financial strength of the company, as disclosed by the balance sheet, is backed by factories which are well equipped with plant and machinery and operated by loyal employees, prepared to make the best use of all available opportunities and, although the lack of copper supplies has forced us to disappoint some of our customers, the company's goodwill remains very high due to the standard of quality and service which it is our constant endeavour to maintain.

The report was adopted.

THE FORESTAL LAND, TIMBER AND RAILWAYS COMPANY

The forty-sixth annual general meeting of The Forestal Land, Timber and Railways Company, Limited, was held on June 25th in London, Mr Gerard d'Erlanger, CBE, ACA (the chairman), presiding.

The following is an extract from his circulated review: The profits for the year are the best which we have ever been able to report. The profit earned by the group, excluding Argentina, £957,438, is twice as large this year as compared with last year, whilst the profit of the Argentine group is more than three times as large. However, since the end of our financial year a serious recession has descended upon the tanning trade. The results for the current year, therefore, cannot be so successful.

Quoting from the annual report of the President of La Forestal Argentina, the statement continues: "The year's production of quebracho extract totalled 127,516 tons, representing the highest production since the year 1934, whilst the total exports together with local sales aggregating 138,038 tons, established a record since the formation of the company. Taking into account the smaller volume of sales effected during the first quarter of the year and also prevailing market conditions, it cannot be expected that the current year's total sales will reach normal figures."

The Natal Tanning Extract Company continued on its successful way during the year.

Our Kenya subsidiary, the East African Tanning Extract Company, Limited, has enjoyed a successful year of trading.

The report was adopted.

LONDON ASIATIC RUBBER

In his statement which accompanies the annual report and accounts for 1951 of the London Asiatic Rubber and Produce Company, Limited, the chairman, Sir Eric Macfadyen, says: Our issued capital and capital reserves amount to £1,579,924; revenue reserves (general £650,000, dividend equalisation £125,000; undistributed profit £101,899) to £876,899. Together these items total £2,456,823, a figure which compares with £2,220,817 a year ago. Fixed assets, including trade investments, stand at £1,650,711. Current assets at £2,033,400 are substantially in excess of current liabilities (including taxation) £1,364,376.

The proceeds of rubber were the highest in our history, but the profit was below the previous year's. Cost of production was £1,056,379, plus Malayan export duty £322,313, and replanting expenditure was £86,548. These three together exceed the corresponding items a year ago by over 55 per cent. Estate expenditure has risen to a level which gives one pause. Including the export duty, taxation alone calls for no less than £981,520 and leaves a net profit of £462,637. And whereas the average price realised per lb was just under four shillings (London landed) in these accounts, the corresponding market price today is barely two shillings. The price collapse was rapid—to get costs down is going to be a slower process.

In recommending a final dividend of 15 per cent, to cost £87,878, making 35 per cent for the year, my colleagues and I feel that we are going to the limit of what can be justified in the circumstances. Transfers to various reserves absorb £269,023, and there will be a reduction of £6,236 in the carry forward.

GODFREY PHILLIPS, LIMITED

A SATISFACTORY RESULT

The forty-third annual general meeting of Godfrey Phillips, Limited, was held on June 26th in London.

Mr P. A. Godfrey Phillips (chairman and managing director), in the course of his speech, said: If you will turn to the consolidated profit and loss account you will observe that the profit, after deducting taxation, shown as attributable to the shareholders of Godfrey Phillips, Limited, and including provisions no longer required, is £650,000, compared with £661,000; I think we have every reason to be satisfied with this result. After writing off the whole of the discount and expenses incurred in the issue of the 4¼ per cent loan in London and certain other expenses, and after payment of preference dividends and, if confirmed by this meeting, a total dividend of 15 per cent for the year, the carry forward will be increased from £1,651,000 to £1,961,000.

THE OUTLOOK

It is rather more difficult this year than it has recently been to forecast trading results; however, it is already apparent that we cannot expect to maintain this year the same results that we enjoyed during 1950 and 1951, and I must warn shareholders to anticipate a considerable drop.

Although we can reasonably hope to maintain this year a total sale of cigarettes in the United Kingdom equal to that of last year, the cost of our raw material has continued to rise, as also has our wage bill, and profit margins are tending consequently to diminish. Our overseas factories are more than maintaining their previous sales level, but their costs, too, have risen.

EXPORT SHOCKS

In the export trade we have had several shocks since the beginning of the year. Australia has introduced a quota system for imports and the French Government have applied to the importation of cigarettes barter conditions which we find unacceptable; in the case of Australia the blow hits us in three places, as we have for some time been shipping not inconsiderable quantities of cigarettes to that market; this was a source of some profit to the parent company and a considerable help towards the distribution overheads of our Australian offshoot; furthermore it was the intention temporarily to use the Salisbury factory, designed primarily for shadow purposes to supplement supplies to Australia, using locally grown leaf which might otherwise not have been available for shipment to this country. We do not yet know what steps the Australian Government will take to ensure that smokers in that Dominion do not have to go short, for domestic cigarette production to date falls very far short of the present absorptive capacity; we naturally hope that they will grant our Australian company considerable additional facilities for the acquisition of leaf and that the necessary labour and capital facilities for an increase in production will be available for an industry which can now be considered essential.

It does begin to look as if the export trade will steadily become more difficult as one country after another attempts to pass its crisis on to its neighbours.

It is a source of considerable encouragement to me that the group is so well represented by its agents and its own staff throughout the world. I should particularly like to congratulate the management of our overseas companies on the excellent results.

The report was adopted.

VENT-AXIA LIMITED

RECORD TRADING RESULTS

The sixteenth annual general meeting of Vent-Axia Limited was held on June 24th in London, Mr J. C. Akester (chairman and *managing* director) presiding.

The following is an extract from his circulated statement:—

The company's trading profit for the year was £105,559. This is the best result we have had so far, and represents an improvement of £26,808 on last year.

Stock and work-in-progress is substantially higher at £72,595 against £29,995. Your directors regard this as an improvement, and consider it is desirable to maintain stocks at a higher level than hitherto. Last year due to material shortages our production failed to keep pace with the increased demand and our stocks became too small, but we have managed during the past twelve months to increase production, and are now, for the present at any rate, obtaining satisfactory supplies.

Taxation again takes the lion's share of our profits, absorbing £66,097 against £46,806 last year. This includes the Excess Profits Levy for three months of the year. Our standard profit, so far as can be computed at this stage, will be just over £70,000. Your directors do not feel it would be prudent to make any increased distribution this year, and have therefore placed £20,000 to general reserve against £10,000 last year. It is proposed to pay a final dividend of 37½ per cent (less tax) making 62½ per cent (less tax) for the year.

Despite the prevailing conditions, the current demand for our products is not unsatisfactory. Certain export markets are at present closed to us, but it is hoped these restrictions will prove to be temporary.

The report was adopted.

TELEPHONE RENTALS LIMITED

INEXPLICABLE ATTITUDE OF CAPITAL ISSUES COMMITTEE

The twenty-third annual general meeting of Telephone Rentals Limited was held on June 23rd in London.

Mr Fred. T. Jackson, OBE, CompIEE (chairman and joint managing director), who presided, said:—

As you will have read my address circulated with the accounts, in which I stated that the Capital Issues Committee had refused our applications for obtaining additional capital, no doubt you will expect me to make some further comment on the position in which your company finds itself.

The position has not changed; and I consider the attitude of the Capital Issues Committee is quite inexplicable. Your company has been a successful one over the whole period of its existence, and it has shown increasing profits every year, which proves that the services we render to industry are of great value.

The Capital Issues Committee consists of five or six of the leading City men in the realms of finance and industry, and the only conclusion I can come to is that we have failed to put over to this Committee the importance of the services we render to the commercial and industrial concerns in this country.

It is not a service that is easy to put over in words, but only by practical demonstration. And I feel that this is demonstrated by the fact that among our subscribers we embrace a large number of leading concerns in this country, and also public utilities and public services.

There was never a period in the country's history when it was more essential to introduce something which would increase productive efficiency, save time and improve costing methods.

A very interesting leading article appeared in *The Times* of Friday, June 13th, under the heading of "A Long Task," and the last paragraph of this leader sets out in a few words what we claim to do: "It is an unromantic battle, to be fought in terms of a few less minutes wasted in the day and an addition of a few units to the day's output, just as the consumer has to fight it by paying a few shillings more for his rations. It is only thus that it will be won."

All I can say at present is that we are not prepared to accept the negative attitude of the Capital Issues Committee, and we shall keep on keeping on until they are converted.

We are working strictly within the statement I made in my address issued with the accounts, and are limiting our services to firms engaged on defence work, export and public authorities, and, of course, carrying out our contractual obligations.

At the moment, I am not able to say more than this. But you will be advised in the Press of any change for the better in the situation.

The report was adopted.

NEW BROKEN HILL CONSOLIDATED

EXCELLENT PROGRESS WITH DEVELOPMENT PROGRAMME

The sixteenth annual general meeting of New Broken Hill Consolidated, Limited, was held on June 25th at 37 Dover Street, London, W.1, Mr John R. Govett, the chairman, presiding.

The following is an extract from his circulated statement:—

The net profit for the year 1951, after providing for taxation, amounted to £619,024 compared with £450,541 for the previous year. An interim dividend of 1s. per share was declared in November last, and the board now recommend that a final dividend of 1s. 6d. per share be paid, making a total distribution for the year of 2s. 6d. per share, compared with 1s. 6d. for 1950.

Excellent progress has been made in 1951 with our programme of development, particularly in regard to completion of the new surface buildings and plants, in spite of late delivery of some items of equipment and shortages of certain essential supplies having in some instances had a retarding effect on the programme as planned.

The company's ore reserves total 2 million tons assaying 9.7 per cent lead, 2.4 oz silver, 11.2 per cent zinc.

Our target for production this year is 256,000 tons of ore milled and, from the experience of the year's working to date, there seems every reason to hope that this figure will be reached, if not exceeded. Unless further delays in delivery of materials or of equipment from overseas slow down our present rate of progress, this year should see the company's mine operating as an independent producer to a far greater degree than hitherto, although we shall continue to have the great benefit of the surface openings and underground connections provided by the adjacent workings of the Zinc Corporation's Mine.

The report was adopted.

SCAMMELL LORRIES, LIMITED

ANOTHER SUCCESSFUL YEAR

The twenty-ninth annual general meeting of this company was held on June 24th at Watford, Herts, Mr E. R. Cartwright, CBE, MICE (the chairman), presiding.

The following is an extract from his circulated statement:—

It gives me great pleasure to inform you of another successful year of trading, particularly as the year, at all too frequent intervals, was beset with numerous difficulties of both short and long term nature.

The net profit for the year before taxation is £384,322. After deducting income tax and profits tax of £213,247, the balance is £171,075.

Your directors, having regard to the generally unsettled supply position, the serious possibility of restricted output mainly due to steel shortage, and the burden of crushing taxation which makes it vital and prudent to conserve our cash resources, feel that they are not justified in recommending a dividend of more than 10 per cent, less income tax.

The results before you are a clear indication of the success of the policy we adopted three years ago of increasing throughout our manufacturing efficiency, at the same time reducing the profit margin in order to make the price of our vehicles more competitive.

The future presents a picture similar to recent years as regards its uncertainty. The order book, which usually is a manufacturer's chief worry, gives us no anxiety at present, but shortages of material and the possibility of wage increases make the task of improving, or even maintaining, output extremely costly and accurate forecasting impossible.

The report was unanimously adopted.

THE ARGUS PRESS HOLDINGS LIMITED

The twenty-third ordinary general meeting of The Argus Press Holdings Limited was held on June 25th in London.

Mr H. C. Drayton, the chairman, in the course of his speech, said: The trading profit for the year amounts to £179,000 as against £123,000 last year. After deducting expenses and depreciation the net profit is £147,000 as against £90,900, but from that you have to deduct profits and income tax totalling £93,500, leaving a profit available of only £53,500 as against £40,000 last year.

Supplies of paper today are somewhat easier than a year ago, and we are hopeful that it will become still easier in the course of the year. We have had one small decrease in price and it seems to be the opinion in the trade that we are going to get another. As regards the increased supply of paper we are confident that we can use more. Our publications are capable of expanding their circulations, and that should bring in, over the course of two years, increased profits.

So far as the current year is concerned, we have the figures for the first five months' trading, and I am pleased to state that our profits are up compared with the corresponding period for last year, but I must sound a note of warning. In my view some of that increased profit—not all of it—is likely to be absorbed because on July 1st we have increased wages to pay. Nevertheless, I think I can say that I shall be disappointed if next year the results are not as good as those for the past year, although I do not expect them to be a great deal better.

The report was adopted.
